# INTRODUCTION

*CFML Reference* is your primary ColdFusion Markup Language (CFML) reference. Use this manual to learn about CFML tags and functions, ColdFusion expressions, and using JavaScript objects for WDDX in Macromedia ColdFusion MX 7. It also provides detailed references for Java and C++ CFX interfaces.

## About Macromedia ColdFusion MX documentation

The ColdFusion MX documentation is designed to provide support for the complete spectrum of participants.

### Documentation set

The ColdFusion documentation set includes the following titles:

| Manual   | Description  |
|--|--|
| <i>Installing and Using ColdFusion MX</i>                  | Describes system installation and basic configuration for Windows, Solaris, Linux, and HP-UX.  |
| <i>Configuring and Administering ColdFusion MX</i>         | Part I describes how to manage the ColdFusion environment, including connecting to your data sources and configuring security for your applications. Part II describes Verity search tools and utilities that you can use for configuring the Verity K2 Server search engine, as well as creating, managing, and troubleshooting Verity collections. |
| <i>ColdFusion MX Developer's Guide</i>                     | Describes how to develop your dynamic web applications, including retrieving and updating your data, and using structures and forms.   |
| <i>Getting Started Building ColdFusion MX Applications</i> | Contains an overview of ColdFusion features and application development procedures. Includes a tutorial that guides you through the process of developing an example ColdFusion application.   |
| <i>CFML Reference</i>                                      | Provides descriptions, syntax, usage, and code examples for all ColdFusion tags, functions, and variables.   |
| <i>CFML QuickReference</i>                                 | A brief guide that shows the syntax of ColdFusion tags, functions, and variables.  |

## Viewing online documentation

All ColdFusion MX documentation is available online in HTML and Adobe Acrobat Portable Document Format (PDF) files. Go to the documentation home page for ColdFusion MX on the Macromedia website: [www.macromedia.com](http://www.macromedia.com).

# CHAPTER 1

## Reserved Words and Variables

This chapter provides information on Macromedia ColdFusion reserved words, and lists scope variables.

### Contents

|   |    |
|---|----|
| Reserved words .....                    | 7  |
| Scope-specific built-in variables ..... | 9  |
| ColdFusion tag-specific variables ..... | 11 |
| CGI environment variables .....         | 17 |

### Reserved words

The following list indicates words you must not use for ColdFusion variables, user-defined function names, or custom tag names. While some of these words can be used safely in some situations, you can prevent errors by avoiding them entirely.

- Any name starting with `cf`. However, when you call a CFML custom tag directly, you prefix the custom tag page name with `cf_`.
- Built-in function names, such as `Now` or `Hash`
- Scope names, such as `Form` or `Session`
- Operators, such as `NE` or `IS`
- The names of any built-in data structures, such as `Error` or `File`
- The names of any built-in variables, such as `RecordCount` or CGI variable names
- CFScript language element names such as `for`, `default`, or `continue`

Remember that ColdFusion is not case-sensitive. For example, all of the following are reserved words: `IS`, `Is`, `iS`, and `is`.

## Reserved words in forms

You must also not create form field names ending in any of the following, except to specify a form field validation rule using a hidden form field name.

- `_integer`
- `_float`
- `_range`
- `_date`
- `_time`
- `_eurodate`

## Reserved words in queries

The following table lists SQL keywords that are reserved in ColdFusion queries of queries. This list includes all reserved words in the SQL standard, and should be avoided in variables used in all queries. Do not use these keywords as variable names in any queries.

**Note:** Many database management systems have additional reserved words that you cannot use as variable names in queries to their databases. For a detailed list, see your DBMS documentation.

---

## Scope-specific built-in variables

ColdFusion returns variables, such as those returned in a `cfdirectory` or `cfhttp` operation. A variable is usually referenced by *scoping* it according to its type: naming it according to the code context in which it is available; for example, `Session.varname`, or `Application.varname`. For more information on ColdFusion scopes, see Chapter 3, “Using ColdFusion Variables” in *ColdFusion MX Developer’s Guide*

You use the `cflock` tag to limit the scope of CFML constructs that modify shared data structures, files, and CFXs, to ensure that modifications occur sequentially. For more information, see [cflock on page 270](#), and Chapter 15, “Using Persistent Data and Locking” in *ColdFusion MX Developer’s Guide*.

## Variable scope

ColdFusion supports the Variables scope. Unscoped variables created with the `cfset` tag acquire the Variables scope by default. For example, the variable created by the statement `<CFSET linguist = Chomsky>` can be referenced as `#Variables.linguist#`

## Caller scope

### History

ColdFusion MX: The Caller scope is accessible as a structure. (In earlier releases, it was not.)

## Client variables

The following client variables are reserved:

```
Client.CFID  
Client.CFToken  
Client.HitCount  
Client.LastVisit  
Client.TimeCreated  
Client.URLToken
```

## Server variables

Use the Server prefix to reference server variables, as follows:

```
Server.ColdFusion.ProductName  
Server.ColdFusion.ProductVersion  
Server.ColdFusion.ProductLevel  
Server.ColdFusion.SerialNumber  
Server.ColdFusion.SupportedLocales  
Server.ColdFusion.AppServer  
Server.ColdFusion.Expiration  
Server.ColdFusion.RootDir  
Server.OS.Name  
Server.OS.AdditionalInformation  
Server.OS.Version  
Server.OS.BuildNumber
```

## Application and session variables

To enable application and session variables, use the `cfapplication` tag or `Application.cfc`. Reference them as follows:

```
Application.myvariable  
Session.myvariable
```

To ensure that modifications to shared data occur in the intended sequence, use the `cflock` tag. For more information, see [cflock on page 270](#).

The predefined application and session variables are as follows:

```
Application.ApplicationName  
Session.CFID  
Session.CFToken  
Session.URLToken
```

## Custom tag variables

A ColdFusion custom tag returns the following variables:

```
ThisTag.ExecutionMode  
ThisTag.HasEndTag  
ThisTag.GeneratedContent  
ThisTag.AssocAttrs[index]
```

A custom tag can set a Caller variable to provide information to the caller. The Caller variable is set as follows:

```
<cfset Caller.variable_name = "value">
```

The calling page can access the variable with the `cfoutput` tag, as follows:

```
<cfoutput>#variable_name#</cfoutput>
```

## Request variable

Request variables store data about the processing of one page request. Request variables store data in a structure that can be passed to nested tags, such as custom tags, and processed once.

To provide information to nested tags, set a Request variable, as follows:

```
<CFSET Request.field_name1 = "value">  
<CFSET Request.field_name2 = "value">  
<CFSET Request.field_name3 = "value">  
...
```

Each nested tag can access the variable with the `cfoutput` tag, as follows:

```
<CFOUTPUT>#Request.field_name1#</CFOUTPUT>
```

## Form variable

ColdFusion supports the Form variable `FieldNames`. `FieldNames` returns the names of the fields on a form. You use it on the action page associated with a form, as follows:

```
Form.FieldNames
```

## ColdFusion tag-specific variables

Some ColdFusion tags return data as variables. For example, the `cffile` tag returns file size information in the `FileSize` variable, referenced as `CFFILE.FileSize`.

The following tags return data that can be referenced in variables:

```
cfcatch  
cfdirectory  
cferror
```

```
cffile  
cfftp  
cfhttp  
cfindex  
cfldap  
cfpop  
cfquery  
cfregistry  
cfsearch  
cfstoredproc
```

## ColdFusion query variables

A ColdFusion tag that returns a query object supports the following variables, where *queryname* is the value of the `name` attribute:

```
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList
```

## CFCATCH variables

Within a `cfcatch` block, the active exception properties can be accessed as the following variables:

```
CFCATCH.Type  
CFCATCH.Message  
CFCATCH.Detail  
CFCATCH.ErrNumber  
CFCATCH.NativeErrorCode  
CFCATCH.SQLState  
CFCATCH.LockName  
CFCATCH.LockOperation  
CFCATCH.MissingFileName  
CFCATCH.TagContext  
CFCATCH.ErrorCode  
CFCATCH.ExtendedInfo
```

Within a `cfcatch` block, database exception properties can be accessed as the following variables:

```
CFCATCH.QueryError  
CFCATCH.SQL  
CFCATCH.Where  
CFCATCH.Datasource
```

Within a `cfcatch` block, undefined variable exception properties can be accessed as the following variable:

```
CFCATCH.Name
```

Within a `cfcatch` block, syntax and parsing exception properties can be accessed as the following variables:

```
CFCATCH.TokenText  
CFCATCH.Snippet  
CFCATCH.Column  
CFCATCH.KnownColumn
```

CFCATCH.Line  
CFCATCH.KnownLine

## CFDIRECTORY variables

The `cfdirectory` tag, with `action=list`, returns a query object as follows, where *queryname* is the name attribute value:

*queryname*.Name  
*queryname*.Size  
*queryname*.Type  
*queryname*.DateLastModified  
*queryname*.Attributes  
*queryname*.Mode

## CFERROR variables

When `cferror` generates an error page, the following error variables are available if `type="request"` or `"exception"`.

Error.Diagnostics  
Error.MailTo  
Error.DateTime  
Error.Browser  
Error.GeneratedContent  
Error.RemoteAddress  
Error.HTTPReferer  
Error.Template  
Error.QueryString

The following error variables are available if `type="validation"`.

Error.ValidationHeader  
Error.InvalidFields  
Error.ValidationFooter

Any `cfcatch` variable that applies to exception type can be accessed within the Error scope, as follows:

Error.Type  
Error.Message  
Error.Detail  
Error.ErrNumber  
Error.NativeErrorCode  
Error.SQLState  
Error.LockName  
Error.LockOperation  
Error.MissingFileName  
Error.TagContext  
Error.ErrorCode  
Error.ExtendedInfo

**Note:** You can substitute the prefix `CFERROR` for `Error`, if `type = "Exception"`; for example, `CFERROR.Diagnostics`, `CFERROR.Mailto`, or `CFERROR.DateTime`.

## CFFILE ACTION=Upload variables

File variables are read-only. Use the `CFFILE` prefix to reference file variables; for example, `CFFILE.ClientDirectory`. The `File` prefix is deprecated in favor of the `CFFILE` prefix.

```
CFFILE.AttemptedServerFile
CFFILE.ClientDirectory
CFFILE.ClientFile
CFFILE.ClientFileExt
CFFILE.ClientFileName
CFFILE.ContentSubType
CFFILE.ContentType
CFFILE.DateLastAccessed
CFFILE.FileExisted
CFFILE.FileSize
CFFILE.FileWasAppended
CFFILE.FileWasOverwritten
CFFILE.FileWasRenamed
CFFILE.FileWasSaved
CFFILE.OldFileSize
CFFILE.ServerDirectory
CFFILE.ServerFile
CFFILE.ServerFileExt
CFFILE.ServerFileName
CFFILE.TimeCreated
CFFILE.TimeLastModified
```

## CFFTP error variables

When you use the `cfftp stoponerror` attribute, these variables are populated:

```
CFFTP.Succeeded
CFFTP.ErrorCode
CFFTP.ErrorText
```

## CFFTP ReturnValue variable

Some `cfftp` file and directory operations provide a return value, in the variable `CFFTP.ReturnValue`. Its value is determined by the results of the `action` attribute. When you specify any of the following actions, `cfftp` returns a value:

```
GetCurrentDir
GetCurrentURL
ExistsDir
ExistsFile
Exists
```

## CFFTP query object columns

When you use the `cfftp tag` with the `listdir` action, `cfftp` returns a query object, where *queryname* is the name attribute value, and *row* is the row number of each file or directory entry:

```
queryname.Name[row]
queryname.Path[row]
queryname.URL[row]
queryname.Length[row]
```

```
queryname.LastModified[row]  
queryname.Attributes  
queryname.IsDirectory  
queryname.Mode
```

## CFHTTP variables

A `cfhttp get` operation can return text and binary files. Files are downloaded and the contents stored in a variable or file, depending on the MIME type, as follows:

```
CFHTTP.FileContent  
CFHTTP.MimeType  
CFHTTP.Header  
CFHTTP.ResponseHeader [http_hd_key]  
CFHTTP.StatusCode
```

## CFLDAP variables

The `cfldap action=query` tag returns information about the LDAP query, as follows:

```
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList
```

## CFPOP variables

The `cfpop tag` returns the following result columns, depending on the `action` attribute value and the use of other attributes, such as `attachmentpath`, where *queryname* is the name attribute value:

```
queryname.Date  
queryname.From  
queryname.Body  
queryname.Header  
queryname.MessageNumber  
queryname.ReplyTo  
queryname.Subject  
queryname.CC  
queryname.To  
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList  
queryname.Attachments  
queryname.AttachmentFiles
```

## CFQUERY and CFSTOREDPROC variables

The `cfquery tag` returns information about the query in this variable:

```
CFQUERY.ExecutionTime
```

The `cfquery tag` uses the query name to scope the following data about the query:

```
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList
```

The `cfstoredproc` tag returns the following variables:

```
CFSTOREDPROC.ExecutionTime  
CFSTOREDPROC.StatusCode
```

## CFREGISTRY variables

The `cfregistry` tag returns a query record set that you can reference after executing the `GetAll` action, as follows, where *queryname* is the name attribute value:

```
queryname.Entry  
queryname.Type  
queryname.Value
```

## CFSEARCH variables

A `cfsearch` operation returns the following variables, where *searchname* is the name attribute value:

```
searchname.URL  
searchname.Key  
searchname.Title  
searchname.Score  
searchname.Custom1 and Custom2  
searchname.Summary  
searchname.RecordCount  
searchname.CurrentRow  
searchname.RecordsSearched  
searchname.ColumnList
```

## Standard CGI variables

The CGI variables that are available for your use vary with the web server and configuration. This section lists the CGI 1.1 variables that some web servers create when a CGI script is called. Some of the following variables may not be available.

### Request

```
CGI.AUTH_TYPE  
CGI.CONTENT_LENGTH  
CGI.CONTENT_TYPE  
CGI.METHOD  
CGI.PATH_INFO  
CGI.PATH_TRANSLATED  
CGI.QUERY_STRING  
CGI.REMOTE_ADDR  
CGI.REMOTE_HOST  
CGI.REMOTE_USER  
CGI.REQUEST_METHOD  
CGI.SCRIPT_NAME
```

## Server

```
CGI.GATEWAY_INTERFACE  
CGI.SERVER_NAME  
CGI.SERVER_PORT  
CGI.SERVER_PROTOCOL  
CGI.SERVER_SOFTWARE
```

## Client

```
CGI.CERT_ISSUER  
CGI.CERT_SUBJECT  
CGI.CLIENT_CERT_ENCODED  
CGI.HTTP_ACCEPT  
CGI.HTTP_IF_MODIFIED_SINCE  
CGI.HTTP_USER_AGENT
```

The `CERT_ISSUER`, `CERT_SUBJECT`, `CLIENT_CERT_ENCODED` variables are available only when you use client certificates.

## CGI environment variables

When a browser makes a request to a server, the web server and the browser create environment variables. In ColdFusion, these variables are referred to as *CGI environment variables*. They take the CGI prefix regardless of whether the server uses a server API or CGI to communicate with the ColdFusion server.

Environment variables contain data about the transaction between the browser and the server, such as the IP Address, browser type, and authenticated username. You can reference CGI environment variables for a given page request anywhere in the page. CGI variables are read-only.

**Note:** The environment variables available to applications depend on the browser and server software.

## Testing for CGI variables

Because some browsers do not support some CGI variables, ColdFusion always returns True when it tests for the existence of a CGI variable, regardless of whether the browser supports the variable. To determine if the CGI variable is available, test for an empty string, as shown in the following example:

```
<cfif CGI.varname IS NOT "">  
    CGI variable exists  
<cfelse>  
    CGI variable does not exist  
</cfif>
```

## CGI server variables

The following table describes common CGI environment variables that the server creates (some of these are not available with some servers):

---

| <b>CGI server variable</b> | <b>Description</b>  |
|----------------------------|---|
| SERVER_SOFTWARE            | Name and version of the information server software answering the request (and running the gateway). Format: name/version.  |
| SERVER_NAME                | Server's hostname, DNS alias, or IP address as it appears in self-referencing URLs.   |
| GATEWAY_INTERFACE          | CGI specification revision with which this server complies. Format: CGI/revision.   |
| SERVER_PROTOCOL            | Name and revision of the information protocol this request came in with. Format: protocol/revision.   |
| SERVER_PORT                | Port number to which the request was sent.  |
| REQUEST_METHOD             | Method with which the request was made. For HTTP, this is Get, Head, Post, and so on.   |
| PATH_INFO                  | Extra path information, as given by the client. Scripts can be accessed by their virtual pathname, followed by extra information at the end of this path. The extra information is sent as PATH_INFO. |
| PATH_TRANSLATED            | Translated version of PATH_INFO after any virtual-to-physical mapping.  |
| SCRIPT_NAME                | Virtual path to the script that is executing; used for self-referencing URLs.   |
| QUERY_STRING               | Query information that follows the ? in the URL that referenced this script.  |
| REMOTE_HOST                | Hostname making the request. If the server does not have this information, it sets REMOTE_ADDR and does not set REMOTE_HOST.  |
| REMOTE_ADDR                | IP address of the remote host making the request.   |
| AUTH_TYPE                  | If the server supports user authentication, and the script is protected, the protocol-specific authentication method used to validate the user.   |
| REMOTE_USER<br>AUTH_USER   | If the server supports user authentication, and the script is protected, the username the user has authenticated as. (Also available as AUTH_USER.)   |
| REMOTE_IDENT               | If the HTTP server supports RFC 931 identification, this variable is set to the remote username retrieved from the server. Use this variable for logging only.  |
| CONTENT_TYPE               | For queries that have attached information, such as HTTP POST and PUT, this is the content type of the data.  |
| CONTENT_LENGTH             | Length of the content as given by the client.   |

---

## CGI client variables

The following table describes common CGI environment variables the browser creates and passes in the request header:

---

| CGI client variable    | Description  |
|------------------------|--|
| HTTP_REFERER           | The referring document that linked to or submitted form data.  |
| HTTP_USER_AGENT        | The browser that the client is currently using to send the request.<br>Format: software/version library/version.   |
| HTTP_IF_MODIFIED_SINCE | The last time the page was modified. The browser determines whether to set this variable, usually in response to the server having sent the LAST_MODIFIED HTTP header. It can be used to take advantage of browser-side caching. |

---

## CGI client certificate variables

ColdFusion makes available the following client certificate data. These variables are available when running Microsoft IIS 4.0 or Netscape Enterprise under SSL if your web server is configured to accept client certificates.

---

| CGI client certificate variable | Description  |
|---------------------------------|--|
| CERT_SUBJECT                    | Client-specific information provided by the web server. This data typically includes the client's name, e-mail address, and so on; for example:<br>O = "VeriSign, Inc.", OU = VeriSign Trust Network, OU = "www.verisign.com/repository/RPA Incorp. by Ref.,LIAB.LTD(c)98", OU = Persona Not Validated, OU = Digital ID Class 1 - Microsoft, CN = Matthew Lund, E = mlund@macromedia.com |
| CERT_ISSUER                     | Information about the authority that provided the client certificate; for example:<br>O = "VeriSign, Inc.", OU = VeriSign Trust Network, OU = "www.verisign.com/repository/RPA Incorp. By Ref.,LIAB.LTD(c)98", CN = VeriSign Class 1 CA Individual Subscriber-Persona Not Validated  |
| CLIENT_CERT_ENCODED             | The entire client certificate binary, base-64 encoded. This data is typically of interest to developers, so they can integrate with other software that uses client certificates.  |

---

# CHAPTER 2

## ColdFusion Tags

ColdFusion Markup Language (CFML) includes a set of tags that you use in Macromedia ColdFusion MX 7 pages to interact with data sources, manipulate data, and display output. CFML tag syntax is similar to HTML element syntax.

This chapter contains categorized and alphabetical lists of the tags followed by the detailed tag descriptions.

### Contents

|  |    |
|--|----|
| Tag summary . . . . .                    | 21 |
| Tags by function . . . . .               | 26 |
| Tag changes since ColdFusion 5 . . . . . | 29 |
| Tag descriptions . . . . .               | 36 |

### Tag summary

The following table briefly describes CFML tags:

| CFML tag                   | Category                   | Description  |
|----------------------------|----------------------------|--|
| <code>cfabort</code>       | Flow-control tags          | Stops the processing of a ColdFusion page at the tag location  |
| <code>cfapplet</code>      | Forms tags                 | Embeds Java applets in a <code>cfform</code> tag   |
| <code>cfapplication</code> | Application framework tags | Defines an application name; activates client variables; specifies client variable storage mechanism |
| <code>cfargument</code>    | Extensibility tags         | Creates a parameter definition within a component definition; defines a function argument            |
| <code>cfassociate</code>   | Application framework tags | Enables subtag data to be saved with a base tag  |
| <code>cfbreak</code>       | Flow-control tags          | Breaks out of a CFML looping construct   |
| <code>cfcache</code>       | Page processing tags       | Caches ColdFusion pages  |

| <b>CFML tag</b>                   | <b>Category</b>   | <b>Description</b>   |
|-----------------------------------|---|--|
| <a href="#">cfcalendar</a>        | <a href="#">Forms tags</a>  | Provides a calendar from which to select a date  |
| <a href="#">cfcase</a>            | <a href="#">Flow-control tags</a>   | Used with the <a href="#">cfswitch</a> and <a href="#">cfdefaultcase</a> tags                    |
| <a href="#">cfcatch</a>           | <a href="#">Exception handling tags</a> ,<br><a href="#">Flow-control tags</a>          | Catches exceptions in ColdFusion pages   |
| <a href="#">cfchart</a>           | <a href="#">Data output tags</a>  | Generates and displays a chart   |
| <a href="#">cfchartdata</a>       | <a href="#">Data output tags</a>  | Defines chart data points  |
| <a href="#">cfchartseries</a>     | <a href="#">Data output tags</a>  | Defines style in which chart data displays   |
| <a href="#">cfcol</a>             | <a href="#">Data output tags</a>  | Defines table column header, properties  |
| <a href="#">cfcollection</a>      | <a href="#">Extensibility tags</a>  | Administers Verity collections   |
| <a href="#">cfcomponent</a>       | <a href="#">Extensibility tags</a>  | Creates and defines a component object   |
| <a href="#">cfcontent</a>         | <a href="#">Data output tags</a> ,<br><a href="#">Page processing tags</a>              | Defines content type and filename of a file to be downloaded by current page                     |
| <a href="#">cfcookie</a>          | <a href="#">Variable manipulation tags</a>  | Defines and sets cookie variables, including expiration and security options                     |
| <a href="#">cfdefaultcase</a>     | <a href="#">Flow-control tags</a>   | Receives control if there is no matching <a href="#">cfcase</a> tag value                        |
| <a href="#">cfdirectory</a>       | <a href="#">File management tags</a>  | Performs typical directory-handling tasks from within a ColdFusion application                   |
| <a href="#">cfdocument</a>        | <a href="#">Data output tags</a>  | Creates PDF or FlashPaper output from a text block containing CFML and HTML                      |
| <a href="#">cfdocumentitem</a>    | <a href="#">Data output tags</a>  | Specifies action items, such as header, footer, and page break, for a PDF or FlashPaper document |
| <a href="#">cfdocumentsection</a> | <a href="#">Data output tags</a>  | Divides a PDF or FlashPaper document into sections   |
| <a href="#">cfdump</a>            | <a href="#">Debugging tags</a> ,<br><a href="#">Variable manipulation tags</a>          | Outputs variables for debugging  |
| <a href="#">cfelse</a>            | <a href="#">Flow-control tags</a>   | Creates IF-THEN-ELSE constructs  |
| <a href="#">cfelseif</a>          | <a href="#">Flow-control tags</a>   | Creates IF-THEN-ELSE constructs  |
| <a href="#">cferror</a>           | <a href="#">Exception handling tags</a> ,<br><a href="#">Application framework tags</a> | Displays custom HTML error pages when errors occur   |
| <a href="#">cfexecute</a>         | <a href="#">Flow-control tags</a> ,<br><a href="#">Extensibility tags</a>               | Executes developer-specified process on server computer  |
| <a href="#">cfexit</a>            | <a href="#">Flow-control tags</a>   | Aborts processing of executing CFML tag  |
| <a href="#">cffile</a>            | <a href="#">File management tags</a>  | Performs typical file-handling tasks from within ColdFusion application                          |

| CFML tag                      | Category   | Description   |
|-------------------------------|--|---|
| <code>cfflush</code>          | Data output tags,<br>Page processing tags                    | Flushes currently available data to client  |
| <code>cfform</code>           | Forms tags   | Builds input form; performs client-side input validation  |
| <code>cfformgroup</code>      | Forms tags   | Groups form control into a containing object  |
| <code>cfformitem</code>       | Forms tags   | Adds text and dividing rules to Flash forms   |
| <code>cfftp</code>            | Forms tags,<br>Extensibility tags,<br>Internet Protocol tags | Permits FTP file operations   |
| <code>cffunction</code>       | Extensibility tags   | Defines function that you build in CFML   |
| <code>cfgrid</code>           | Forms tags   | Displays tabular grid control, in <code>cfform</code> tag   |
| <code>cfgridcolumn</code>     | Forms tags   | Used in <code>cfform</code> ; defines columns in a <code>cfgrid</code>                                |
| <code>cfgridrow</code>        | Forms tags   | Defines a grid row; used with <code>cfgrid</code>   |
| <code>cfgridupdate</code>     | Forms tags   | Directly updates ODBC data source from edited grid data   |
| <code>cfheader</code>         | Data output tags,<br>Page processing tags                    | Generates HTTP headers  |
| <code>cfhtmlhead</code>       | Page processing tags   | Writes text and HTML to HEAD section of page  |
| <code>cfhttp</code>           | Internet Protocol tags                                       | Performs GET and POST to upload file or post form, cookie, query, or CGI variable directly to server  |
| <code>cfhttpparam</code>      | Internet Protocol tags                                       | Specifies parameters required for a <code>cfhttp</code> POST operation; used with <code>cfhttp</code> |
| <code>cfif</code>             | Flow-control tags  | Creates IF-THEN-ELSE constructs   |
| <code>cfimport</code>         | Application framework tags                                   | Imports JSP tag libraries into a CFML page  |
| <code>cfinclude</code>        | Flow-control tags  | Embeds references to ColdFusion pages   |
| <code>cfindex</code>          | Extensibility tags   | Creates Verity search indexes   |
| <code>cfinput</code>          | Forms tags   | Creates an input element (radio button, check box, text entry box); used in <code>cfform</code>       |
| <code>cfinsert</code>         | Database manipulation tags                                   | Inserts records in a data source  |
| <code>cfinvoke</code>         | Extensibility tags   | Invokes component methods from a ColdFusion page or component   |
| <code>cfinvokeargument</code> | Extensibility tags   | Passes a parameter to a component method or a web service   |
| <code>cfldap</code>           | Internet Protocol tags                                       | Provides access to LDAP directory servers   |
| <code>cflocation</code>       | Flow-control tags  | Controls execution of a page  |

| <b>CFML tag</b>                       | <b>Category</b>  | <b>Description</b>  |
|---------------------------------------|--|---|
| <a href="#">cflock</a>                | <a href="#">Application framework tags</a>                       | Ensures data integrity and synchronizes execution of CFML code                      |
| <a href="#">cflog</a>                 | <a href="#">Data output tags</a> ,<br><a href="#">Other tags</a> | Writes a message to a log file  |
| <a href="#">cflogin</a>               | <a href="#">Security tags</a>                                    | Defines a container for user login and authentication code                          |
| <a href="#">cfloginuser</a>           | <a href="#">Security tags</a>                                    | Identifies an authenticated user to ColdFusion                                      |
| <a href="#">cflogout</a>              | <a href="#">Security tags</a>                                    | Logs the current user out   |
| <a href="#">cfloop</a>                | <a href="#">Flow-control tags</a>                                | Repeats a set of instructions based on conditions                                   |
| <a href="#">cfmail</a>                | <a href="#">Internet Protocol tags</a>                           | Assembles and posts an e-mail message   |
| <a href="#">cfmailparam</a>           | <a href="#">Internet Protocol tags</a>                           | Attaches a file or adds a header to an e-mail message                               |
| <a href="#">cfmailpart</a>            | <a href="#">Internet Protocol tags</a>                           | Contains one part of a multi-part mail message                                      |
| <a href="#">cfmodule</a>              | <a href="#">Application framework tags</a>                       | Invokes a custom tag for use in a ColdFusion page                                   |
| <a href="#">cfNTauthenticate</a>      | <a href="#">Security tags</a>                                    | Authenticates user information against an NT domain                                 |
| <a href="#">cfobject</a>              | <a href="#">Extensibility tags</a>                               | Creates COM, component, CORBA, Java, and web service objects                        |
| <a href="#">cfobjectcache</a>         | <a href="#">Database manipulation tags</a>                       | Flushes the query cache   |
| <a href="#">cfoutput</a>              | <a href="#">Data output tags</a>                                 | Displays the output of a database query or other operation                          |
| <a href="#">cfparam</a>               | <a href="#">Variable manipulation tags</a>                       | Defines a parameter and its default value   |
| <a href="#">cfpop</a>                 | <a href="#">Internet Protocol tags</a>                           | Gets and deletes messages from POP mail server                                      |
| <a href="#">cfprocessingdirective</a> | <a href="#">Data output tags</a>                                 | Suppresses white space and other output   |
| <a href="#">cfprocparam</a>           | <a href="#">Database manipulation tags</a>                       | Holds parameter information for stored procedure                                    |
| <a href="#">cfprocresult</a>          | <a href="#">Database manipulation tags</a>                       | Result set name that ColdFusion tags use to access result set of a stored procedure |
| <a href="#">cfproperty</a>            | <a href="#">Extensibility tags</a>                               | Defines components  |
| <a href="#">cfquery</a>               | <a href="#">Database manipulation tags</a>                       | Passes SQL statements to a database   |
| <a href="#">cfqueryparam</a>          | <a href="#">Database manipulation tags</a>                       | Checks data type of a query parameter   |

| CFML tag                      | Category   | Description   |
|-------------------------------|--|---|
| <a href="#">cfregistry</a>    | <a href="#">Other tags</a> ,<br><a href="#">Variable manipulation tags</a>     | Reads, writes, and deletes keys and values in a Windows system registry                   |
| <a href="#">cfreport</a>      | <a href="#">Exception handling tags</a>  | Embeds a ColdFusion Report Builder or Crystal Reports report                              |
| <a href="#">cfreportparam</a> | <a href="#">Exception handling tags</a>  | Passes an input parameter to a ColdFusion Report Builder report                           |
| <a href="#">cfrethrow</a>     | <a href="#">Exception handling tags</a>  | Rethrows currently active exception   |
| <a href="#">cfreturn</a>      | <a href="#">Extensibility tags</a>   | Returns results from a component method   |
| <a href="#">cfsavecontent</a> | <a href="#">Variable manipulation tags</a>                                     | Saves generated content inside tag body in a variable                                     |
| <a href="#">cfschedule</a>    | <a href="#">Variable manipulation tags</a>                                     | Schedules page execution; optionally, produces static pages                               |
| <a href="#">cfscript</a>      | <a href="#">Application framework tags</a>                                     | Encloses a set of <code>cfscript</code> statements  |
| <a href="#">cfsearch</a>      | <a href="#">Extensibility tags</a>   | Executes searches against data indexed in Verity collections, using <code>cfindex</code>  |
| <a href="#">cfselect</a>      | <a href="#">Forms tags</a>   | Creates a drop-down list box form element; used in <code>cfform</code> tag                |
| <a href="#">cfset</a>         | <a href="#">Variable manipulation tags</a>                                     | Defines a variable  |
| <a href="#">cfsetting</a>     | <a href="#">Other tags</a> ,<br><a href="#">Variable manipulation tags</a>     | Defines and controls ColdFusion settings  |
| <a href="#">cfsilent</a>      | <a href="#">Data output tags</a> ,<br><a href="#">Page processing tags</a>     | Suppresses CFML output within tag scope   |
| <a href="#">cfslider</a>      | <a href="#">Forms tags</a>   | Creates slider control; used in <code>cfform</code>                                       |
| <a href="#">cfstoredproc</a>  | <a href="#">Database manipulation tags</a>                                     | Holds database connection information; identifies a stored procedure to execute           |
| <a href="#">cfswitch</a>      | <a href="#">Flow-control tags</a>  | Evaluates passed expression; passes control to matching <code>cfcase</code> tag           |
| <a href="#">cftable</a>       | <a href="#">Data output tags</a>   | Builds a table in a ColdFusion page   |
| <a href="#">cftextarea</a>    | <a href="#">Forms tags</a>   | Puts a multiline text box in a form   |
| <a href="#">cfthrow</a>       | <a href="#">Exception handling tags</a> ,<br><a href="#">Flow-control tags</a> | Throws a developer-specified exception  |
| <a href="#">cftimer</a>       | <a href="#">Debugging tags</a>   | Displays execution time for a block of code   |
| <a href="#">cftrace</a>       | <a href="#">Debugging tags</a>   | Displays and logs application debugging data  |
| <a href="#">cftransaction</a> | <a href="#">Database manipulation tags</a>                                     | Groups <code>cfquery</code> operations into one transaction; performs rollback processing |

| CFML tag                | Category                                      | Description  |
|-------------------------|---|--|
| <code>cftree</code>     | Forms tags                                    | Creates tree control element; used in <code>cfform</code>                  |
| <code>cftreeitem</code> | Forms tags                                    | Populates a tree control element in a form; used with <code>cftree</code>  |
| <code>cftry</code>      | Exception handling tags,<br>Flow-control tags | Catches exceptions in ColdFusion pages                                     |
| <code>cfupdate</code>   | Database manipulation tags                    | Updates rows in a database data source                                     |
| <code>cfwddx</code>     | Extensibility tags                            | Serializes and de-serializes CFML data structures to XML-based WDDX format |
| <code>cfxml</code>      | Extensibility tags                            | Creates an XML document object   |

## Tags by function

The following tables list Tags by their function or purpose.

|                                      |    |
|--------------------------------------|----|
| Application framework tags . . . . . | 26 |
| Database manipulation tags . . . . . | 27 |
| Data output tags . . . . .           | 27 |
| Debugging tags . . . . .             | 27 |
| Exception handling tags . . . . .    | 27 |
| Extensibility tags . . . . .         | 27 |
| File management tags . . . . .       | 27 |
| Flow-control tags . . . . .          | 28 |
| Forms tags . . . . .                 | 28 |
| Internet Protocol tags . . . . .     | 28 |
| Page processing tags . . . . .       | 28 |
| Security tags . . . . .              | 28 |
| Variable manipulation tags . . . . . | 28 |
| Other tags . . . . .                 | 29 |

## Application framework tags

|                            |                       |                       |
|----------------------------|-----------------------|-----------------------|
| <code>cfapplication</code> | <code>cfimport</code> | <code>cfscript</code> |
| <code>cfassociate</code>   | <code>cflock</code>   |                       |
| <code>cferror</code>       | <code>cfmodule</code> |                       |

## Database manipulation tags

|                            |                            |                            |
|----------------------------|----------------------------|----------------------------|
| <code>cfinsert</code>      | <code>cfproccresult</code> | <code>cfstoredproc</code>  |
| <code>cfobjectcache</code> | <code>cfquery</code>       | <code>cftransaction</code> |
| <code>cfprocparam</code>   | <code>cfqueryparam</code>  | <code>cfupdate</code>      |

## Data output tags

|                            |                                |                                    |
|----------------------------|--------------------------------|------------------------------------|
| <code>cfchart</code>       | <code>cfdocumentitem</code>    | <code>cfoutput</code>              |
| <code>cfchartdata</code>   | <code>cfdocumentsection</code> | <code>cfprocessingdirective</code> |
| <code>cfchartseries</code> | <code>cfflush</code>           | <code>cfreport</code>              |
| <code>cfcol</code>         | <code>cfheader</code>          | <code>cfreportparam</code>         |
| <code>cfcontent</code>     | <code>cflog</code>             | <code>cfsilent</code>              |
| <code>cfdocument</code>    | <code>cfoutput</code>          | <code>cftable</code>               |

## Debugging tags

|                     |                      |                      |
|---------------------|----------------------|----------------------|
| <code>cfdump</code> | <code>cftimer</code> | <code>cftrace</code> |
|---------------------|----------------------|----------------------|

## Exception handling tags

|                      |                        |                    |
|----------------------|------------------------|--------------------|
| <code>cfcatch</code> | <code>cfrethrow</code> | <code>cftry</code> |
| <code>cferror</code> | <code>cfthrow</code>   |                    |

## Extensibility tags

|                            |                               |                            |
|----------------------------|-------------------------------|----------------------------|
| <code>cfchart</code>       | <code>cffunction</code>       | <code>cfreportparam</code> |
| <code>cfchartdata</code>   | <code>cfindex</code>          | <code>cfreturn</code>      |
| <code>cfchartseries</code> | <code>cfinvoke</code>         | <code>cfsearch</code>      |
| <code>cfcollection</code>  | <code>cfinvokeargument</code> | <code>cfwddx</code>        |
| <code>cfcomponent</code>   | <code>cfobject</code>         | <code>cfxml</code>         |
| <code>cfexecute</code>     | <code>cfproperty</code>       |                            |
| <code>cfftp</code>         | <code>cfreport</code>         |                            |

## File management tags

|                          |                      |                    |
|--------------------------|----------------------|--------------------|
| <code>cfdirectory</code> | <code>cf file</code> | <code>cfftp</code> |
|--------------------------|----------------------|--------------------|

## Flow-control tags

|                            |                         |                        |
|----------------------------|-------------------------|------------------------|
| <code>cfabort</code>       | <code>cfexecute</code>  | <code>cfrethrow</code> |
| <code>cfbreak</code>       | <code>cfexit</code>     | <code>cfswitch</code>  |
| <code>cfcase</code>        | <code>cfif</code>       | <code>cfthrow</code>   |
| <code>cfdefaultcase</code> | <code>cfinclude</code>  | <code>cftry</code>     |
| <code>cfelse</code>        | <code>cflocation</code> |                        |
| <code>cfelseif</code>      | <code>cfloop</code>     |                        |

## Forms tags

|                          |                           |                          |
|--------------------------|---------------------------|--------------------------|
| <code>cfapplet</code>    | <code>cfgrid</code>       | <code>cfselect</code>    |
| <code>cfcalendar</code>  | <code>cfgridcolumn</code> | <code>cfslider</code>    |
| <code>cfform</code>      | <code>cfgridrow</code>    | <code>cftextarea</code>  |
| <code>cfformgroup</code> | <code>cfgridupdate</code> | <code>cf tree</code>     |
| <code>cfformitem</code>  | <code>cfinput</code>      | <code>cf treeitem</code> |

## Internet Protocol tags

|                          |                          |                         |
|--------------------------|--------------------------|-------------------------|
| <code>cfftp</code>       | <code>cfldap</code>      | <code>cfmailpart</code> |
| <code>cfhttp</code>      | <code>cfmail</code>      | <code>cfpop</code>      |
| <code>cfhttpparam</code> | <code>cfmailparam</code> |                         |

## Page processing tags

|                        |                         |                                    |
|------------------------|-------------------------|------------------------------------|
| <code>cfcache</code>   | <code>cfheader</code>   | <code>cfprocessingdirective</code> |
| <code>cfcontent</code> | <code>cfhtmlhead</code> | <code>cfsetting</code>             |
| <code>cfflush</code>   | <code>cfinclude</code>  | <code>cfsilent</code>              |

## Security tags

|                          |                               |
|--------------------------|-------------------------------|
| <code>cflogin</code>     | <code>cflogout</code>         |
| <code>cfloginuser</code> | <code>cfNTauthenticate</code> |

## Variable manipulation tags

|                       |                            |                        |
|-----------------------|----------------------------|------------------------|
| <code>cfcookie</code> | <code>cfregistry</code>    | <code>cfset</code>     |
| <code>cfdump</code>   | <code>cfsavecontent</code> | <code>cfsetting</code> |
| <code>cfparam</code>  | <code>cfschedule</code>    |                        |

## Tag changes since ColdFusion 5

The following tables list Tags, attributes, and values that have changed since ColdFusion 5.0 and indicate the specific release in which the change was made.

|   |                    |
|---|--------------------|
| <a href="#">New tags, attributes, and values . . . . .</a>        | <a href="#">29</a> |
| <a href="#">Deprecated tags, attributes, and values . . . . .</a> | <a href="#">34</a> |
| <a href="#">Obsolete tags, attributes, and values . . . . .</a>   | <a href="#">35</a> |

## New tags, attributes, and values

This table lists tags, attributes, and attribute values that have been added since the ColdFusion MX release:

| Tag                           | Attribute or value                               | Added in this ColdFusion release |
|-------------------------------|--|----------------------------------|
| <a href="#">cfapplication</a> | scriptProtect                                    | ColdFusion MX 7                  |
|                               | loginStorage                                     | ColdFusion MX 6.1                |
| <a href="#">cfargument</a>    | xml value of type attribute                      | ColdFusion MX 7                  |
|                               | All  | ColdFusion MX                    |
| <a href="#">cfcache</a>       | cachedirectory, timespan attributes              | ColdFusion MX                    |
| <a href="#">cfcalendar</a>    | All  | ColdFusion MX 7                  |
| <a href="#">cfchart</a>       | style, title attributes                          | ColdFusion MX 7                  |
|                               | xAxisType, yAxisType attributes                  | ColdFusion MX 6.1                |
|                               | All  | ColdFusion MX                    |
| <a href="#">cfchartdata</a>   | All  | ColdFusion MX                    |
| <a href="#">cfchartseries</a> | dataLabelStyle attribute                         | ColdFusion MX 7                  |
|                               | column value of type attribute                   |                                  |
|                               | All  | ColdFusion MX                    |
| <a href="#">cfcollection</a>  | categories attribute                             | ColdFusion MX 7                  |
|                               | New values of the language attribute             |                                  |
|                               | list and categoryList values of action attribute |                                  |
|                               | name attribute                                   | ColdFusion MX                    |

| Tag                            | Attribute or value   | Added in this ColdFusion release |
|--------------------------------|--|----------------------------------|
| <code>cfcomponent</code>       | <p><code>style</code>, <code>namespace</code>, <code>serviceportname</code>, <code>porttypename</code>, <code>wsdlfile</code>, and <code>bindingname</code> attributes</p> <hr/> <p>Extended functionality for the <code>hint</code> and <code>displayname</code> attributes when publishing document-literal style web services</p> <hr/> <p>All</p>  | ColdFusion MX 7                  |
| <code>cfcontent</code>         | variable attribute   | ColdFusion MX 7                  |
| <code>cfdirectory</code>       | <code>recurse</code> attribute for <code>list</code> and <code>delete</code> actions   | ColdFusion MX 7                  |
| <code>cfdocument</code>        | All  | ColdFusion MX 7                  |
| <code>cfdocumentitem</code>    | All  | ColdFusion MX 7                  |
| <code>cfdocumentsection</code> | All  | ColdFusion MX 7                  |
| <code>cfexecute</code>         | variable attribute   | ColdFusion MX 6.1                |
| <code>cffile</code>            | <p><code>result</code> attribute for <code>upload</code> action</p> <hr/> <p><code>fixnewline</code> attribute for <code>action="append"</code> and <code>action="write"</code></p>  | ColdFusion MX 7                  |
| <code>cfform</code>            | <p><code>name</code> and <code>action</code> attributes are optional</p> <hr/> <p><code>accessible</code>, <code>format</code>, <code>height</code>, <code>width</code>, <code>method</code>, <code>onError</code>, <code>preloader</code>, <code>scriptsrc</code>, <code>skin</code>, <code>style</code>, <code>timeout</code>, <code>wMode</code> attributes</p> <hr/> <p><code>onReset</code> event</p> | ColdFusion MX 7                  |
| <code>cfformgroup</code>       | All  | ColdFusion MX 7                  |
| <code>cfformitem</code>        | All  | ColdFusion MX 7                  |
| <code>cfftp</code>             | result attribute   | ColdFusion MX 7                  |
| <code>cffunction</code>        | <p><code>description</code> attributes</p> <hr/> <p>All</p>  | ColdFusion MX 7                  |
| <code>cfgrid</code>            | <p><code>format</code> attribute and support for Flash and XML output</p> <p><code>enabled</code>, <code>onChange</code>, <code>style</code>, <code>tooltip</code>, <code>visible</code> attributes (Flash format only)</p>  | ColdFusion MX 7                  |
| <code>cfgridcolumn</code>      | <p><code>mask</code> attribute</p> <hr/> <p>currency value of <code>type</code> attribute</p>  | ColdFusion MX 7                  |

| <b>Tag</b>  | <b>Attribute or value</b>  | <b>Added in this ColdFusion release</b> |
|-------------|--|---|
| cfhttp      | result attribute   | ColdFusion MX 7                         |
|             | HEAD, PUT, DELETE, OPTIONS, and TRACE values of method attribute   | ColdFusion MX 6.1                       |
|             | multipart, getasbinary, proxyUser, proxyPassword attributes  |   |

## Deprecated tags, attributes, and values

The following tags, attributes, and attribute values are deprecated. Do not use them in ColdFusion applications. They might not work, and might cause an error, in releases later than ColdFusion MX.

| Tag          | Attribute or value  | Deprecated as of this ColdFusion release     |
|--------------|---|--|
| cfcache      | cachedirectory, timeout attributes  | ColdFusion MX                                |
| cfcollection | map and repair options of the action attribute  | ColdFusion MX 7                              |
| cferror      | monitor option of the exception attribute   | ColdFusion MX                                |
| cffile       | system value for attributes attribute   | ColdFusion MX                                |
|              | temporary value for attributes attribute  | ColdFusion MX                                |
| cfform       | passthrough attribute   | ColdFusion MX 7                              |
|              | enableCAB attribute   | ColdFusion MX                                |
| cfftp        | agentname attribute   | ColdFusion MX                                |
| cfgraph      | All   | ColdFusion MX                                |
| cfgraphdata  | All   | ColdFusion MX                                |
| cfgridupdate | connectString, dbName, dbServer, dbType, provider, providerDSN attributes                         | ColdFusion MX                                |
| cfinput      | passthrough attribute   | ColdFusion MX 7                              |
| cfinsert     | connectString, dbName, dbServer, dbType, provider, providerDSN attributes                         | ColdFusion MX                                |
| cfldap       | filterFile attribute  | ColdFusion MX                                |
| cflog        | date, thread, time attributes   | ColdFusion MX                                |
| cfquery      | connectString, dbName, dbServer, provider, providerDSN, sql attributes                            | ColdFusion MX                                |
|              | The following dbType attribute values:<br>dynamic, ODBC, Oracle73, Oracle80, Sybase11, OLEDB, DB2 | ColdFusion MX<br>(The value query is valid.) |
| cfregistry   | All, on UNIX only   | ColdFusion MX                                |
| cfsearch     | external, language attributes   | ColdFusion MX                                |
| cfselect     | passthrough attribute   | ColdFusion MX 7                              |

| <b>Tag</b>    | <b>Attribute or value</b>  | <b>Deprecated as of this ColdFusion release</b> |
|---------------|--|---|

## Obsolete tags, attributes, and values

The following tags, attributes, and attribute values are obsolete. Do not use them in ColdFusion applications. They do not work, and might cause an error, in releases later than ColdFusion 5.

| <b>Tag</b>                 | <b>Attribute or value</b>                                 | <b>Obsolete as of this ColdFusion release</b>                       |
|----------------------------|---|---|
| cfauthenticate             | All   | ColdFusion MX   |
| cfchart                    | rotated <b>attribute</b>                                  | ColdFusion MX 7   |
| cffile                     | <b>attributes attribute value archive</b>                 | ColdFusion MX   |
| cfimpersonate              | All   | ColdFusion MX   |
| cfindex                    | <b>action attribute value optimize external attribute</b> | ColdFusion MX   |
| cfinternaladminsecurity    | All   | ColdFusion MX<br>This tag did not appear in <i>CFML Reference</i> . |
| cfldap                     | fileterConfig <b>attribute</b>                            | ColdFusion MX   |
| cfnewinternaladminsecurity | All   | ColdFusion MX<br>This tag did not appear in <i>CFML Reference</i> . |
| cfsetting                  | catchExceptionsByPattern <b>attribute</b>                 | ColdFusion MX   |

# cfabort

## Description

Stops the processing of a ColdFusion page at the tag location. ColdFusion returns everything that was processed before the tag. The tag is often used with conditional logic to stop processing a page when a condition occurs.

## Category

[Flow-control tags](#)

## Syntax

```
<cfabort  
  showError = "error_message">
```

## See also

[cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#); “cfabort and cfexit” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| showError | Optional |         | Error to display, in a standard ColdFusion error page, when tag executes. |

## Usage

When you use the `cfabort` and `cferror` tags together, the `cfabort` tag halts processing immediately; the `cferror` tag redirects output to a specified page.

If this tag does not contain a `showError` attribute value, processing stops when the tag is reached and ColdFusion returns the page contents up to the line that contains the `cfabort` tag.

When you use this tag with the `showError` attribute, but do not define an error page using `cferror`, page processing stops when the `cfabort` tag is reached. The message in `showError` displays to the client.

When you use this tag with the `showError` attribute and an error page using `cferror`, ColdFusion redirects output to the error page specified in the `cferror` tag.

## Example

This example shows the use of `cfabort` to stop processing. In the second example, where `cfabort` is used, the result never displays.

```
<h3>Example A: Let the instruction complete itself</h3>  
<!-- first, set a variable -->  
<cfset myVariable = 3>  
<!-- now, perform a loop that increments this value -->  
<cfloop from = "1" to = "4" index = "Counter">  
  <cfset myVariable = myVariable + 1>  
</cfloop>  
  
<cfoutput>
```

```
<p>The value of myVariable after incrementing through the loop #Counter# times  
is:  
#myVariable#  
</cfoutput>
```

```
<h3>Example B: Use cfabort to halt the instructions with showmessage attribute  
and cferror</h3>
```

```
<!-- Reset the variable and show the use of cfabort. -->
```

```
<cfset myVariable = 3>
```

```
<!-- now, perform a loop that increments this value -->
```

```
<cfloop from = "1" to = "4" index = "Counter">
```

```
<!-- on the second time through the loop, cfabort -->
```

```
<cfif Counter is 2>
```

```
<!-- Take out the cferror line to see cfabort error processed by CF error  
page -->
```

```
<cferror type="request" template="request_err.cfm">
```

```
<cfabort showerror="CFABORT has been called for no good reason">
```

```
<!-- Processing is stopped, and subsequent operations are not carried out. -->
```

```
<cfelse>
```

```
<cfset myVariable = myVariable + 1>
```

```
</cfif>
```

```
</cfloop>
```

```
<cfoutput>
```

```
<p> The value of myVariable after incrementing through the loop#counter# times
```

```
is: #myVariable#
```

```
</cfoutput>
```

# cfapplet

## Description

This tag references a registered custom Java applet. To register a Java applet, in the ColdFusion Administrator, click Extensions > Java Applets.

Using this tag within a `cfform` tag is optional. If you use it within `cfform`, and the `method` attribute is defined in the Administrator, the return value is incorporated into the form.

## Category

[Forms tags](#)

## Syntax

```
<cfapplet
  appletSource = "applet_name"
  name = "form_variable_name"
  height = "height_in_pixels"
  width = "width_in_pixels"
  vSpace = "space_above_and_below_in_pixels"
  hSpace = "space_on_each_side_in_pixels"
  align = "alignment_option"
  notSupported = "message_to_display_for_nonJava_browser"
  param_1 = "applet_parameter_name"
  param_2 = "applet_parameter_name"
  param_n = "applet_parameter_name">
```

## See also

[cfform](#), [cfformgroup](#), [cfformitem](#), [cfgrid](#), [cfinput](#), [cfobject](#), [cfselect](#), [cfservlet](#), [cfslider](#), [cftextarea](#), [cftree](#)

## History

ColdFusion MX:

- Removed the requirement that you use this tag within a `cfform` tag.
- Changed the behavior when this tag is used within a `cfform` tag; if the `method` attribute is defined in the Administrator, the return value of the applet's method is incorporated into the form.

## Attributes

| Attribute                 | Req/Opt  | Default | Description                                  |
|---------------------------|----------|---------|--|
| <code>appletSource</code> | Required |         | Name of registered applet                    |
| <code>name</code>         | Required |         | Form variable name for applet                |
| <code>height</code>       | Optional |         | Height of applet, in pixel                   |
| <code>width</code>        | Optional |         | Width of applet, in pixels                   |
| <code>vSpace</code>       | Optional |         | Space above and below applet, in pixels      |
| <code>hSpace</code>       | Optional |         | Space on left and right of applet, in pixels |

| Attribute    | Req/Opt  | Default         | Description  |
|--------------|----------|-----------------|--|
| align        | Optional |                 | Alignment: <ul style="list-style-type: none"> <li>• Left</li> <li>• Right</li> <li>• Bottom</li> <li>• Top</li> <li>• TextTop</li> <li>• Middle</li> <li>• AbsMiddle</li> <li>• Baseline</li> <li>• AbsBottom</li> </ul>   |
| notSupported | Optional | See Description | Text to display if a page that contains a Java applet-based cform control is opened by a browser that does not support Java or has Java support disabled. For example:<br>notSupported = "<b>Browser must support Java to view ColdFusion Java Applets</b>"<br>Default:<br><b>Browser must support Java to<br> view ColdFusion Java Applets!</b> |
| param_n      | Optional |                 | Registered parameter for applet. Specify only to override values for applet in ColdFusion Administrator.   |

## Usage

You can specify the applet `method` attribute only in the Administrator, Java Applets view. For other attributes, you can accept the default values in the Administrator view, or specify values in this tag and override the defaults.

If Java applet components are stored in a JAR file, enter the filename in the ColdFusion Administrator, Java Applets window, Archive text box. For more information, see “Embedding Java applets” in Chapter 27, “Building Dynamic Forms with cform Tags” in *ColdFusion MX Developer’s Guide*

## Example

```
<p>cfapplet lets you reference custom Java applets that have been
  registered using the ColdFusion Administrator.
<p>To register a Java applet, open the ColdFusion Administrator and
  click "Applets" link under "extensions" section.
<p>This example applet copies text that you type into a form. Type
  some text, and then click "copy" to see the copied text.

<cform action = "index.cfm">
  <cfapplet appletsources = "copytext" name = "copytext">
</cform>
```

# cfapplication

## Description

Defines the scope of a ColdFusion application; enables and disables storage of Client variables; specifies the Client variable storage mechanism; enables Session variables; and sets Application variable timeouts.

## Category

[Application framework tags](#)

## Syntax

```
<cfapplication
  name = "application_name"
  loginStorage = "cookie" or "session"
  clientManagement = "yes" or "no"
  clientStorage = "datasource_name" or "Registry" or "Cookie"
  setClientCookies = "yes" or "no"
  sessionManagement = "yes" or "no"
  sessionTimeout = #CreateTimeSpan(days, hours, minutes, seconds)#
  applicationTimeout = #CreateTimeSpan(days, hours, minutes, seconds)#
  setDomainCookies = "yes" or "no"
  scriptProtect = "none", "all", or list>
```

## History

ColdFusion MX 7: Added `scriptProtect` attribute

ColdFusion MX 6.1: Added `loginStorage` attribute

ColdFusion MX:

- Changed how persistent scopes are available: Server, Session, and Application scope variables are stored in memory as structures. In earlier releases, only Session and Application scope variables were stored this way. You cannot access the UDF function scope as a structure.
- Changed the algorithm for setting the CFTOKEN variable value: if the registry key `UUIDToken` is a non-zero value, ColdFusion uses a number constructed from the UUID plus a random number. Otherwise, ColdFusion sets the CFTOKEN variable default value using a positive random integer. (In earlier releases, ColdFusion always used a number constructed from the UUID plus a random number.)

## Attributes

| Attribute          | Req/Opt         | Default   | Description  |
|--------------------|-----------------|---|--|
| name               | See Description |   | Name of application. Up to 64 characters.<br>For Application and Session variables: Required.<br>For Client variables: Optional  |
| loginStorage       | Optional        | cookie  | <ul style="list-style-type: none"><li>• cookie: store login information in the Cookie scope.</li><li>• session: store login information in the Session scope.</li></ul>  |
| clientManagement   | Optional        | no  | <ul style="list-style-type: none"><li>• yes: enables client variables.</li><li>• no</li></ul>  |
| clientStorage      | Optional        | registry  | How client variables are stored: <ul style="list-style-type: none"><li>• datasource_name: in ODBC or native data source. You must create storage repository in the Administrator.</li><li>• registry: in the system registry.</li><li>• cookie: on client computer in a cookie. Scalable. If client disables cookies in the browser, client variables do not work.</li></ul> |
| setClientCookies   | Optional        | yes   | <ul style="list-style-type: none"><li>• yes: enables client cookies.</li><li>• no: ColdFusion does not automatically send CFID and CFTOKEN cookies to client browser; you must manually code CFID and CFTOKEN on the URL for every page that uses Session or Client variables.</li></ul>   |
| sessionManagement  | Optional        | no  | <ul style="list-style-type: none"><li>• yes: enables session variables.</li><li>• no</li></ul>   |
| sessionTimeout     | Optional        | Specified in Variables page of ColdFusion Administrator | Lifespan of session variables. CreateTimeSpan function and values in days, hours, minutes, and seconds, separated by commas.   |
| applicationTimeout | Optional        | Specified in Variables page of ColdFusion Administrator | Lifespan of application variables. CreateTimeSpan function and values in days, hours, minutes, and seconds, separated by commas.   |

| Attribute        | Req/Opt  | Default   | Description  |
|------------------|----------|---|--|
| setDomainCookies | Optional | no  | <ul style="list-style-type: none"> <li>• yes: uses domain cookies for CFID and CFTOKEN cookies and for all Client variables when using cookies for client variable storage. Required for applications running on clusters.</li> <li>• no: uses host-specific cookies for CFID, CFTOKEN, and all client variable cookies.</li> </ul>                                      |
| scriptProtect    | Optional | Determined by ColdFusion MX Administrator Enable Global Script Protection setting | <p>Specifies whether to protect variables from cross-site scripting attacks</p> <ul style="list-style-type: none"> <li>• none: do not protect variables</li> <li>• all: protect Form, URL, CGI, and Cookie variables</li> <li>• comma-delimited list of ColdFusion scopes: Protect variables in the specified scopes.</li> </ul> <p>For more information, see Usage.</p> |

## Usage

This tag is typically used in the Application.cfm file, to set defaults for a ColdFusion application.

**Note:** You can also set the application defaults in the Application.cfc file. For more information, see [“Application variables” on page 945](#).

This tag enables application variables, unless they are disabled in the ColdFusion Administrator. The Administrator setting also overrides the `sessionManagement` attribute. For more information, see *Configuring and Administering ColdFusion MX*.

If ColdFusion is running on a cluster, you must specify `clientStorage = "cookie"` or a data source name; you cannot specify "registry".

ColdFusion generates an error if the application name is longer than 64 characters.

The CFTOKEN variable is 8 bytes in length. Its range is 10000000 —99999999.

**Note:** If you specify `ClientStorage=cookie`, any Client scope variables set following a `cfflush` tag are not saved in the Client browser.

## Protecting variables from cross-site scripting attacks

The `ScriptProtect` attribute lets you protect one or more variable scopes from cross-site scripting attacks, where a client attempts to get your application to send malicious code back to a user's browser. In these attacks, user input (for example, from form fields or from URL variables) sets a CF variable which is destined for user output. The submitted data includes malicious code, such as JavaScript or an applet or object reference, which then executes on the user's system.

**Note:** The ColdFusion MX Administrator Settings page Enable Global Script Protection option determines the default script protection setting. You can use the `scriptProtect` attribute to override the Administrator setting. You can also use the Application.cfc initialization code to set the protection value.

The ColdFusion MX cross-site scripting protection operation is done when ColdFusion MX processes the application settings at the beginning of a request. Thus, it can process the URL, and Cookie, CGI, and Form variables in a user's request. By default, it replaces occurrences of the following tag names with the text *InvalidTag*: object, embed, script, applet, and meta. It allows these names in plain text, replaces the words if they are used as tag names.

You can specify any or all ColdFusion scopes for protection, but only the Form, URL, CGI, and Cookie scopes have variables that are often provided by unknown sources. Also, protecting a scope requires additional processing. For these reasons, the `all` attribute value applies protection to only the four scopes.

The script protection mechanism applies a regular expression that is defined in the `cf_root/lib/neo-security.xml` file in the server configuration, or the `cf_root/WEB-INF/cfusion/lib/neo-security.xml` file in the J2EE configuration to the variable value. You can customize the patterns that ColdFusion replaces by modifying the regular expression in the `CrossSiteScriptPatterns` variable.

### Locking server, application, and session variables

When you set or update variables in the server, application, and session scopes, use the `cflock` tag with the `scope` attribute set to the following value:

- For server variables, specify "server"
- For application variables, specify "application"
- For session variables, specify "session"

In some cases, you should also lock code that reads variables in these scopes. For information about locking scopes, see [cflock on page 270](#).

#### Example

```
<!-- This example shows how to use cflock to prevent race conditions during
data updates to variables in Application, Server, and Session scopes. -->
<h3>cfapplication Example</h3>
<p>cfapplication defines scoping for a ColdFusion application and enables or
disables application and/or session variable storage. This tag is placed in
a special file called Application.cfm that automatically runs before any
other CF page in a directory (or subdirectory) where the Application.cfm
file appears.</p>

<cfapplication name = "ETurtle"
sessionTimeout = #CreateTimeSpan(0, 0, 0, 60)#
sessionManagement = "Yes">

<!-- Initialize session and application variables used by E-Turtleneck. -->
<cfparam name="application.number" default="1">
<cfparam name="session.color" default= "">
<cfparam name="session.size" default="">

<cfif IsDefined("session.numPurchased") AND
IsNumeric(trim(session.cartTotal))>
```

```
<!-- Use the application scope for the application variable to prevent race
condition. This variable keeps track of total number of turtle necks sold. --
->
<cflock scope = "Application" timeout = "30" type = "Exclusive">
<cfset application.number = application.number + session.numPurchased>
</cflock>
</cfif>

<cfoutput>
E-Turtle neck is proud to say that we have sold #application.number# turtle necks
to date.
</cfoutput>
<!-- End of Application.cfm -->
```

# cfargument

## Description

Creates a parameter definition within a component definition. Defines a function argument. Used within a `cffunction` tag.

## Category

[Extensibility tags](#)

## Syntax

```
<cfargument  
  name="string"  
  type="data type"  
  required="yes" or "no"  
  default="default value"  
  displayname="descriptive name"  
  hint="extended description">
```

## See also

[cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfinvokeargument](#), [cfobject](#), [cfproperty](#), [cfreturn](#)

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| name      | Required |         | String; an argument name.   |
| type      | Optional | any     | String; a type name; data type of the argument. <ul style="list-style-type: none"><li>any</li><li>array</li><li>binary</li><li>boolean</li><li>date</li><li>guid: the argument must be a UUID or GUID of the form xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx where each x is a character representing a hexadecimal number (0-9A-F).</li><li>numeric</li><li>query</li><li>string</li><li>struct</li><li>uuid: the argument must be a ColdFusion UUID of the form xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx where each x is a character representing a hexadecimal number (0-9A-F).</li><li>variableName: a string formatted according to ColdFusion variable naming conventions.</li><li>xml: XML objects and XML strings</li><li>a component name: if the type attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</li></ul> |

| Attribute   | Req/Opt  | Default              | Description  |
|-------------|----------|----------------------|--|
| required    | Optional | no                   | <p><b>Note:</b> All arguments are required when invoked as a web service, irrespective of how they are defined.</p> <p>Specifies whether the parameter is required to execute the component method. The parameter is <i>not</i> required if you specify a <code>default</code> attribute.</p> <ul style="list-style-type: none"> <li>• true or "yes"</li> <li>• false or "no"</li> </ul> |
| default     | Optional |                      | If no argument is passed, specifies a default argument value.  |
| displayname | Optional | name attribute value | Meaningful only for CFC method parameters. A value to be displayed when using introspection to show information about the CFC.   |
| hint        | Optional |                      | Meaningful only for CFC method parameters. Text to be displayed when using introspection to show information about the CFC. The <code>hint</code> attribute value follows the <code>displayname</code> attribute value in the parameter description line. This attribute can be useful for describing the purpose of the parameter.  |

### Usage

This tag must be in a `cffunction` tag, before any other tags in the `cffunction` tag body.

Arguments that are passed when a method is invoked can be accessed from the method body in the following ways:

- With shorthand syntax: `#myargument#`  
(This example accesses the argument `myargument`.)
- Using the arguments scope as an array: `#arguments[1]#`  
(This example accesses the first defined argument in the `cffunction`.)
- Using the arguments scope as a struct: `#arguments.myargument#`  
(This example accesses the argument `myargument` in the array.)

### Example

```
<!-- This example defines a function that takes a course number parameter
and returns the course description. -->
<cffunction name="getDescription">
  <!-- Identify argument -->
  <cfargument name="Course_Number" type="numeric" required="true">
  <!-- Use the argument to get a course description from the database -->
  <cfquery name="Description" datasource="cfdocexamples">
    SELECT Descript
    FROM Courses
    WHERE Number = '#Course_Number#'
  </cfquery>
  <!-- Specify the variable that the function returns -->
  <cfreturn Description.Descript>
</cffunction>
```

# cfassociate

## Description

Allows subtag data to be saved with a base tag. Applies only to custom tags.

## Category

[Application framework tags](#)

## Syntax

```
<cfassociate
  baseTag = "base_tag_name"
  dataCollection = "collection_name">
```

## See also

[cfapplication](#), [cferror](#), [cflock](#), [cfmodule](#); “High-level data exchange” in Chapter 11, “Creating and Using Custom CFML Tags,” in *ColdFusion MX Developer’s Guide*.

## Attributes

| Attribute      | Req/Opt  | Default      | Description                                     |
|----------------|----------|--------------|---|
| baseTag        | Required |              | Base tag name.                                  |
| dataCollection | Optional | AssocAttribs | Structure in which base tag stores subtag data. |

## Usage

Call this tag within a subtag, to save subtag data in the base tag.

When ColdFusion passes subtag attributes back to the base tag, it saves them in a structure whose default name is `AssocAttribs`. To segregate subtag attributes (in a base tag that can have multiple subtags), specify a structure name, in the `dataCollection` attribute. The structure is appended to an array whose name is `thisTag.collectionName`.

Within the custom tag code, the attributes passed to the tag by using the `attributeCollection` attribute are saved as independent values, with no indication that they are grouped into a structure by the custom tag’s caller. Therefore, in the called tag, if you assign a value to a specific attribute, it replaces the value passed in the `attributeCollection` attribute that you used when calling the subtag.

## Example

```
<!--- Find the context. --->
<cfif thisTag.executionMode is "start">
  <!--- Associate attributes. --->
  <cfassociate baseTag = "CF_TAGBASE">

  <!--- Define defaults for attributes. --->
  <cfparam name = "attributes.happy" default = "yes">
  <cfparam name = "attributes.sad" default = "no">
  ...
```

## cfauthenticate

### Description

This tag is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*.

### History

ColdFusion MX: this tag is obsolete. It does not work in ColdFusion MX and later releases.

# cfbreak

## Description

Used within a `cfloop` or `cfswitch` tag. Breaks out of a loop or switch block.

## Category

[Flow-control tags](#)

## Syntax

```
<cfbreak>
```

## See also

[cfabort](#), [cfexecute](#), [cfif](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#); “`cfloop` and `cfbreak`” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer's Guide*

## Example

```
<!--- This shows the use of cfbreak to exit a loop when a condition is met.--->
<!--- Select courses; use cfloop to find a condition; then break the loop. --->
<!--- Check that number is numeric. --->
<cfif IsDefined("form.course_number")>
    <cfif Not IsNumeric(form.course_number)>
        <cfabort>
    </cfif>
</cfif>
<cfquery name="GetCourses" datasource="cfdocexamples">
    SELECT *
    FROM Courses
    ORDER by course_number
</cfquery>
```

<p> This example uses CFLOOP to cycle through a query to find a value. (In our example, a list of values corresponding to courses in the Snippets datasource). When the conditions of the query are met, CFBREAK stops the loop.

<p> Please enter a Course Number, and hit the "submit" button:

```
<form action="cfbreak.cfm" method="POST">
    <select name="courseNum">
        <cfoutput query="GetCourses">
            <option value="#course_number#">#course_number#
        </cfoutput>
    </select>
    <input type="Submit" name="" value="Search on my Number">
</form>
<!--- If the courseNum variable is not defined,
    don't loop through the query.--->
<cfif IsDefined ("form.courseNum") IS "True">
<!--- Loop through query until value found, then use CFBREAK to exit query.--->
    <cfloop query="GetCourses">
        <cfif GetCourses.course_number IS form.courseNum>
            <cfoutput>
                <h4>Your Desired Course was found:</h4>
                <pre>#course_number# #descript#</pre>
            </cfoutput>
            <cfbreak>
```

```
<cfelse>
  <br> Searching...
</cfif>
</cfloop>
</cfif>
```

# cfcache

## Description

Stores a copy of a page on the server and/or client computer, to improve page rendering performance. To do this, the tag creates temporary files that contain the static HTML returned from a ColdFusion page.

Use this tag if it is not necessary to get dynamic content each time a user accesses a page.

You can use this tag for simple URLs and for URLs that contain URL parameters.

## Category

[Page processing tags](#)

## Syntax

```
<cfcache
  action = "action"
  directory = "directory_name"
  timespan = "value"
  expireURL = "wildcarded_URL_reference"
  username = "username"
  password = "password"
  port = "port_number"
  protocol = "protocol">
```

## See also

[cflush](#), [cfheader](#), [cfhtmlhead](#), [cfsetting](#), [cfsilent](#)

## History

ColdFusion MX:

- Deprecated the `cachedirectory` and `timeout` attributes. They might not work, and might cause an error, in later releases.
- Added the `timespan` attribute.
- Changed how pages are cached: the default `action` attribute value, `cache`, caches a page on the server and the client. (In earlier releases, this option cached a page only on the server.)
- Changed the source of the `protocol` and `port` values: the default `protocol` and `port` values are now taken from the current page URL. (In earlier releases, they were "http" and "80", respectively.)
- Changed how session state is handled when caching a page: this tag can cache pages that depend on session state, including pages that are secured with a ColdFusion login. (In earlier releases, the session state was cleared when caching the page, causing authentication to be lost.)
- Changed how files are cached: this tag uses a `hash()` of the URL for the filename to cache a file. (In earlier releases, ColdFusion used the `cfcache.map` file.)

## Attributes

| Attribute | Req/Opt  | Default   | Description  |
|-----------|----------|---|--|
| action    | Optional | cache   | <ul style="list-style-type: none"><li>• cache: server-side and client-side caching.</li><li>• flush: refresh cached page(s).</li><li>• clientcache: browser-side caching only. To cache a personalized page, use this option.</li><li>• servercache: server-side caching only. Not recommended.</li><li>• optimal: same as "cache".</li></ul>  |
| directory | Optional | cf_root/cache   | Absolute path of cache directory.  |
| timespan  | Optional | Page is flushed only when <code>cfcache action = "flush"</code> is executed | The interval until the page is flushed from the cache. <ul style="list-style-type: none"><li>• A decimal number of days. For example:<ul style="list-style-type: none"><li>▪ - ".25", for one-fourth day (6 hours)</li><li>▪ - "1", for one day</li><li>▪ - "1.5", for one and one half days</li></ul></li><li>• A return value from the <code>CreateTimeSpan</code> function; for example, "<code>#CreateTimeSpan(0, 6, 0, 0)#</code>".</li></ul> |
| expireURL | Optional | Flush all cached pages  | Used with <code>action = "flush"</code> . A URL reference. ColdFusion matches it against the mappings in the specified cache directory. Can include wildcards. For example: " <code>*/view.cfm?id=*</code> ".  |
| username  | Optional |   | A username. Provide this if the page requires authentication at the web server level.  |
| password  | Optional |   | A password. Provide this if the page requires authentication at the web server level.  |
| port      | Optional | The current page port   | Port number of the web server from which the URL is requested. In the internal call from <code>cfcache</code> to <code>cfhttp</code> , ColdFusion resolves each URL variable in the page; this ensures that links in the page remain functional.   |
| protocol  | Optional | The current page protocol   | Protocol that is used to create URL from cache. <ul style="list-style-type: none"><li>• http://</li><li>• https://</li></ul>   |

## Usage

Use this tag in pages whose content is not updated frequently. Taking this action can greatly improve the performance of your application.

The output of a cached page is stored in a file on the client browser and/or the ColdFusion server. Instead of regenerating and downloading the output of the page each time it is requested, ColdFusion uses the cached output. ColdFusion regenerates and downloads the page only when the cache is flushed, as specified by the `timespan` attribute, or by invoking `cfcache action=flush`.

To enable a simple form of caching, put a `cfcache` tag, specifying the `timespan` attribute, at the top of a page. Each time the specified time span passes, ColdFusion flushes (deletes) the copy of the page from the cache and caches a new copy for users to access.

You can specify client-side caching or a combination of client-side and server-side caching (the default), using the action attribute. The advantage of client-side caching is that it requires no ColdFusion resources; the browser stores pages in its own cache, improving performance. The advantage of combination caching is that it optimizes server performance; if the browser does not have a cache of the page, the server can get data from its own cache. (Macromedia recommends that you do not use server-side only caching. Macromedia recommends that you use combination caching.)

If a page contains personalized content, use the action = "clientcache" option to avoid the possibility of caching a personalized copy of a page for other users.

Debug settings have no effect on cfcache unless the application page enables debugging. When generating a cached file, cfcache uses cfsetting showDebugOutput = "no".

The cfcache tag evaluates each unique URL, including URL parameters, as a distinct page, for caching purposes. For example, the output of http://server/view.cfm?id=1 and the output of http://server/view.cfm?id=2 are cached separately.

The cfcache tag uses the cfhttp tag to get the contents of a page to cache. If there is an HTTP error accessing the page, the contents are not cached. If a ColdFusion error occurs, the error is cached.

For more information, see "Caching ColdFusion pages that change infrequently" in Chapter 13, "Optimizing ColdFusion applications," in *ColdFusion MX Developer's Guide*.

### Example

```
<!-- This example produces as many cached files as there are
URL parameter permutations. You can see that the page is cached when the
timestamp doesn't change.-->
```

```
<cfcache
timespan="#createTimeSpan(0,0,10,0)#">
<body>

<h3>This is a test of some simple output</h3>

<cfoutput>
This page was generated at #now()#<br>
</cfoutput>

<cfparam name = "URL.x" default = "no URL parm passed" >
<cfoutput>The value of URL.x = # URL.x #</cfoutput>
```

# cfcalendar

## Description

Puts an interactive Macromedia Flash format calendar in an HTML or Flash form. Not supported in XML format forms. The calendar lets a user select a date for submission as a form variable.

## Category

[Forms tags](#)

## Syntax

```
<cfcalendar  
  name = "name of calendar"  
  height = "height"  
  width = "width"  
  selectedDate = "date"  
  startRange = "first disabled date"  
  endRange = "last disabled date"  
  disabled = "true", "false", or no attribute value  
  mask = "character pattern"  
  dayNames = "days-of-the-week labels"  
  monthNames = "month labels"  
  visible = "Yes" or "No"  
  enabled = "Yes" or "No"  
  tooltip = "Tip text"  
  onChange = "actionscript to invoke">
```

## History

ColdFusion MX 7: Added tag.

## Attributes

| Attribute    | Req/Opt  | Default                              | Description   |
|--------------|----------|--------------------------------------|---|
| name         | Required |                                      | The name of the calendar.   |
| height       | Optional | Determined by Flash                  | The vertical dimension of the calendar specified in pixels.   |
| width        | Optional | Determined by Flash                  | The horizontal dimension of the calendar specified in pixels.   |
| selectedDate | Optional | None (Flash shows the current month) | The date that is initially selected. It is highlighted in a color determined by the form skin. Must be in mm/dd/yyyy or dd/mm/yyyy format, depending on the current locale. (Use the <code>setlocale</code> tag to set the locale, if necessary.) |

| Attribute      | Req/Opt  | Default  | Description   |
|----------------|----------|--|---|
| startRange     | Optional |  | The start of a range of dates that are disabled. Users cannot select dates from this date through the date specified by the <code>endRange</code> attribute.  |
| endRange       | Optional |  | The end of a range of dates that are disabled. Users cannot select dates from the date specified by the <code>startRange</code> attribute through this date.  |
| disabled       | Optional | not disabled   | Disables all user input, making the control read-only. To disable input, specify <code>disabled</code> without an attribute or <code>disabled="Yes"</code> (or any ColdFusion positive boolean value, such as <code>True</code> ). To enable input, omit the attribute or specify <code>disabled="No"</code> (or any ColdFusion negative boolean value, such as <code>False</code> ).   |
| mask           | Optional | MM/DD/YYYY   | A pattern that specifies the format of the submitted date. Mask characters are: <ul style="list-style-type: none"> <li>• D = day; can use 0–2 mask characters</li> <li>• M = month; can use 0–4 mask characters</li> <li>• Y = year; can use 0, 2, or 4 characters</li> <li>• E = day in week; can use 0–4 characters</li> <li>• Any other character = put the character in the specified location</li> </ul> For more information on masking, see <a href="#">“Masking input data”</a> in the <code>cfinput</code> reference page. |
| firstDayOfWeek | Optional | 0  | Integer in the range 0–6 specifying the first day of the week in the calendar: 0 indicates Sunday; 6 indicates Saturday.  |
| dayNames       | Optional | S, M, T, W, Th, F, S   | A comma-delimited list that sets the names of the weekdays displayed in the calendar. Sunday is the first day and the rest of the weekday names follow in the normal order.   |
| monthNames     | Optional | January, February, March, April, May, June, July, August, September, October, November, December | A comma-delimited list of the month names that are displayed at the top of the calendar.  |
| style          | Optional |  | Flash ActionScript style or styles to apply to the calendar. For more information, see Chapter 29, “Setting styles and skins in Flash forms” in <i>ColdFusion MX Developer’s Guide</i> .  |
| enabled        | Optional | Yes  | Flash only: Boolean value specifying whether the control is enabled. A disabled control appears in light gray. This is the inverse of the <code>disabled</code> attribute.  |

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| visible   | Optional | Yes     | Flash only: Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank. |
| tooltip   | Optional |         | Flash only: Text to display when the mouse pointer hovers over the control.  |
| onChange  | Optional |         | ActionScript that runs when the user selects a date.   |

### Usage

The `cfcalendar` tag displays a calendar month, showing the month, the year, a grid of the days of the month, and headings for the days of the week. The calendar contains forward and back arrow buttons to let you change the month and year that are displayed.

If you include a value for the `selectedDate` attribute, that date is highlighted in green and determines the month and year that display initially. Changing the month and year display does not change the selected date. A user can change the selected date by clicking a different date on the calendar. The `onChange` attribute can specify an ActionScript event handler function that runs when the user selects a date.

The current date is highlighted in reverse (that is, a white number on a black background). If the selected date is in a different month or year, however, the current date does not appear unless you move to it by clicking the forward or back arrows.

The `mask` attribute lets you specify the format of the selected date that is returned to the application.

You can use the keyboard to access and select dates from a `cfcalendar` control:

- Use the Up, Down, Left, and Right Arrow keys to change the selected date.
- Use the Home and End keys to reach the first and last enabled date in a month, respectively.
- Use the Page Up and Page Down keys to reach the previous and next month, respectively.

**Note:** The `cfcalendar` tag is not supported in XML format forms.

### Example

This example produces a 200-pixel by 150-pixel calendar with a Flash `haloBlue` skin. It displays abbreviated month names and two-character days of the week. It initially displays today's date as determined by the `selectedDate` attribute. When you click the Save button, the form submits back to the current page, which displays the submitted information.

The example also has three `dateField` controls that let the user change the initial selected date that displays on the calendar and a blocked-out date range. The initial blocked-out date is a four-day period immediately preceding today's date.

**Note:** This example must be modified to work in locales that do not use `mm/dd/yyyy` date formats. To do so, use the `LSDateFormat` function in place of the `DateFormat` function and a mask that is appropriate for your locale, such as `dd/mm/yyyy`.

```
<!-- Set initial selected and blocked-out dates.-->
<cfparam name="Form.startdate" default="#dateFormat(now()-5, 'mm/dd/yyyy')#">
```

```

<cfparam name="Form.enddate" default="#dateformat(now()-1, 'mm/dd/yyyy')#">
<cfparam name="Form.selectdate" default="#dateformat(now(), 'mm/dd/yyyy')#">

<!-- If the form has been submitted, display the selected date. -->
<cfif isDefined("Form.submitit")>
  <cfoutput><b>You selected #Form.selectedDate#</b><br><br></cfoutput>
</cfif>

<b>Please select a date on the calendar and click Save.</b><br>
<br>
<cfform name="form1" format="Flash" skin="haloBlue" width="375" height="350" >
  <cfcalendar name="selectedDate"
    selectedDate="#Form.selectdate#"
    startRange="#Form.startdate#"
    endRange="#Form.enddate#"
    mask="mmm dd, yyyy"
    dayNames="SU,MO,TU,WE,TH,FR,SA"
    monthNames="JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, DEC"
    style="rolloverColor:##FF0000"
    width="200" height="150" >
    <cfinput type="dateField" name="startdate" label="Block out starts"
      width="100" value="#Form.startdate#">
    <cfinput type="dateField" name="enddate" label="Block out ends" width="100"
      value="#Form.enddate#">
    <cfinput type="dateField" name="selectdate" label="Initial date" width="100"
      value="#Form.selectdate#" >
    <cfinput type="Submit" name="submitit" value="Save" width="100">
  </cfform>

```

# cfcase

## Description

Used only inside the `cfswitch` tag body. Contains code to execute when the expression specified in the `cfswitch` tag has one or more specific values.

## Category

[Flow-control tags](#)

## Syntax

```
<cfcase  
  value = "value or delimited set of values"  
  delimiters = "delimiter characters">
```

## See also

[cfdefaultcase](#), [cfswitch](#); “`cfswitch`, `cfcase`, and `cfdefaultcase`” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer's Guide*

## Attributes

| Attribute | Req/Opt  | Default   | Description  |
|-----------|----------|-----------|--|
| value     | Required |           | The value or values that the <code>expression</code> attribute of the <code>cfswitch</code> tag must match. To specify multiple matching values, separate the values with the <code>delimiter</code> character. The value or values must be simple constants or constant expressions, not variables. |
| delimiter | Optional | , (comma) | Specifies the delimiter character or characters that separate multiple values to match. If you specify multiple delimiter characters, you can use any of them to separate the values to be matched.  |

## Usage

The contents of the `cfcase` tag body executes only if the `expression` attribute of the `cfswitch` tag evaluates to a value specified by the `value` attribute. The contents of the `cfcase` tag body can include HTML and text, and CFML tags, functions, variables, and expressions. You do not have to explicitly break out of the `cfcase` tag, as you do in some languages.

One `cfcase` tag can match multiple `expression` values. To do this, separate the matching values with the `delimiter` character, which is the comma by default. For example the following line matches "red", "blue", or "green":

```
<cfcase value="red,blue,green">
```

You can use the `delimiter` attribute to specify one or more delimiters to use in place of the comma. For example, the following line matches "cargo, live", "cargo, liquid", and "cargo, solid":

```
<cfcase value="cargo, live;cargo, liquid-cargo, solid" delimiters=";-">
```

## Example

The following example displays a grade based on a 1-10 score. Several of the `cfcase` tags match more than one score. For simplicity, the example sets the score to 7.

```
<cfset score="7">
<cfswitch expression="#score#">
  <cfcase value="10">
    <cfset grade="A">
  </cfcase>
  <cfcase value="9;8" delimiters=";">
    <cfset grade="B">
  </cfcase>
  <cfcase value="7;6" delimiters=";">
    <cfset grade="C">
  </cfcase>
  <cfcase value="5;4;" delimiters=";">
    <cfset grade="D">
  </cfcase>
  <cfdefaultcase>
    <cfset grade="F">
  </cfdefaultcase>
</cfswitch>
<cfoutput>
  Your grade is #grade#
</cfoutput>
```

# cfcatch

## Description

Used inside a `cftry` tag. Together, they catch and process exceptions in ColdFusion pages. *Exceptions* are events that disrupt the normal flow of instructions in a ColdFusion page, such as failed database operations, missing include files, and developer-specified events.

## Category

[Exception handling tags](#)

## Syntax

```
<cfcatch type = "exceptiontype">
    Exception processing code here
</cfcatch>
```

## See also

[cftry](#), [cferror](#), [cfrethrow](#), [cfthrow](#), [onError](#); Chapter 14, “Handling Errors,” in *ColdFusion MX Developer's Guide*

## History

ColdFusion MX:

- Changed SQLSTATE value behavior: the SQLSTATE return value in a `cfcatch` tag depends on the database driver type:
  - Type 1 (JDBC-ODBC bridge): the value is the same as in ColdFusion 5
  - Type 4 (100% Java, no native methods): the value might be different

If your application depends on SQLSTATE values for flow control, the application might produce unexpected behavior with ColdFusion MX.

- Changed the behavior of this tag when `type="any"`: it is not necessary, when you include a `cfcatch` tag with `type="any"`, to do so in the last `cfcatch` tag in the block, to ensure that all other tests are executed before it. ColdFusion finds the best-match `cfcatch` block.
- Changed the behavior of the `cfscript` tag: it includes `try` and `catch` statements that are equivalent to the `cftry` and `cfcatch` tags.
- Changed object modification: you cannot modify the object returned by `cfcatch`.
- Changed thrown exceptions: the `cfcollection`, `cfindex`, and `cfsearch` tags can throw the SEARCHENGINE exception. In earlier releases, an error in processing these tags threw only an UNKNOWN exception.

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| type      | Optional | Any     | <ul style="list-style-type: none"><li>• application: catches application exceptions</li><li>• database: catches database exceptions</li><li>• template: catches ColdFusion page exceptions</li><li>• security: catches security exceptions</li><li>• object: catches object exceptions</li><li>• missingInclude: catches missing include file exceptions</li><li>• expression: catches expression exceptions</li><li>• lock: catches lock exceptions</li><li>• <i>custom_type</i>: catches the specified custom exception type that is defined in a <code>cfthrow</code> tag</li><li>• searchengine: catches Verity search engine exceptions</li><li>• any: catches all exception types</li></ul> |

## Usage

You must code at least one `cfcatch` tag within a `cftry` block. Put `cfcatch` tags at the end of a `cftry` block. ColdFusion MX tests `cfcatch` tags in the order in which they appear. This tag requires an end tag.

If `type="any"`, ColdFusion MX catches exceptions from any CFML tag, data source, or external object. To get the exception type use code such as the following:

```
#cfcatch.type#
```

Applications can use the `cfthrow` tag to throw developer-defined exceptions. Catch these exceptions with any of these `type` options:

- "custom\_type"
- "Application"
- "Any"

The *custom\_type* type is a developer-defined type specified in a `cfthrow` tag. If you define a custom type as a series of strings concatenated by periods (for example, "MyApp.BusinessRuleException.InvalidAccount"), ColdFusion MX can catch the custom type by its character pattern. ColdFusion MX searches for a `cfcatch` tag in the `cftry` block with a matching exception type, starting with the most specific (the entire string), and ending with the least specific.

For example, you could define a type as follows:

```
<cfthrow type = "MyApp.BusinessRuleException.InvalidAccount">
```

If you have the following `cfcatch` tag, it will handle the exception:

```
<cfcatch type = "MyApp.BusinessRuleException.InvalidAccount">
```

Otherwise, if you have the following `cfcatch` tag, it will handle the exception:

```
<cfcatch type = "MyApp.BusinessRuleException">
```

Finally, if you have the following `cfcatch` tag, it will handle the exception:

```
<cfcatch type = "MyApp">
```

You can code `cfcatch` tags in any order to catch a custom exception type.

If you specify `type = "Application"`, the `cfcatch` tag catches only custom exceptions that have the `Application` type in the `cfthrow` tag that defines them.

The `cfinclude`, `cfmodule`, and `cferror` tags throw an exception of `type = "template"`.

An exception that is thrown within a `cfcatch` block cannot be handled by the `cftry` block that immediately encloses the `cfcatch` tag. However, you can rethrow the currently active exception with the `cfrethrow` tag.

The `cfcatch` variables provide the following exception information:

---

| <b>cfcatch variable</b>              | <b>Content</b>  |
|--------------------------------------|---|
| <code>cfcatch.type</code>            | Type: Exception type, as specified in <code>cfcatch</code> .  |
| <code>cfcatch.message</code>         | Message: Exception's diagnostic message, if provided; otherwise, an empty string; in the <code>cfcatch.message</code> variable.   |
| <code>cfcatch.detail</code>          | Detailed message from the CFML interpreter or specified in a <code>cfthrow</code> tag. When the exception is generated by ColdFusion (and not <code>cfthrow</code> ), the message can contain HTML formatting and can help determine which tag threw the exception. |
| <code>cfcatch.tagcontext</code>      | An array of tag context structures, each representing one level of the active tag context at the time of the exception.   |
| <code>cfcatch.NativeErrorCode</code> | Applies to <code>type = "database"</code> . Native error code associated with exception. Database drivers typically provide error codes to diagnose failing database operations. Default: -1.   |
| <code>cfcatch.SQLState</code>        | Applies to <code>type = "database"</code> . SQLState associated with exception. Database drivers typically provide error codes to help diagnose failing database operations. Default: -1.   |
| <code>cfcatch.Sql</code>             | Applies to <code>type = "database"</code> . The SQL statement sent to the data source.  |
| <code>cfcatch.queryError</code>      | Applies to <code>type = "database"</code> . The error message as reported by the database driver.   |
| <code>cfcatch.where</code>           | Applies to <code>type = "database"</code> . If the query uses the <code>cfqueryparam</code> tag, query parameter name-value pairs.  |
| <code>cfcatch.ErrNumber</code>       | Applies to <code>type = "expression"</code> . Internal expression error number.   |
| <code>cfcatch.MissingFileName</code> | Applies to <code>type = "missingInclude"</code> . Name of file that could not be included.  |
| <code>cfcatch.LockName</code>        | Applies to <code>type = "lock"</code> . Name of affected lock (if the lock is unnamed, the value is "anonymous").   |
| <code>cfcatch.LockOperation</code>   | Applies to <code>type = "lock"</code> . Operation that failed (Timeout, Create Mutex, or Unknown).  |
| <code>cfcatch.ErrorCode</code>       | Applies to <code>type = "custom"</code> . String error code.  |
| <code>cfcatch.ExtendedInfo</code>    | Applies to <code>type = "application"</code> and <code>"custom"</code> . Custom error message; information that the default exception handler does not display.   |

---

## Advanced Exception types

You can specify the following advanced exception types in the `type` attribute:

---

### ColdFusion advanced exception type

### Example

```
<!-- cfcatch example, using TagContext to display the tag stack. -->
<h3>cftry Example</h3>
<!-- Open a cftry block. -->
<cftry>
  <!-- Note misspelled tablename "employees" as "employeeas". -->
  <cfquery name = "TestQuery" dataSource = "cfdocexamples">
    SELECT *
    FROM EMPLOYEEAS
  </cfquery>
  <!-- Other processing goes here. -->
  <!-- Specify the type of error for which we search. -->
  <cfcatch type = "Database">
    <!-- the message to display. -->
    <h3>You've Thrown a Database <b>Error</b></h3>
  </cfoutput>
  <!-- The diagnostic message from ColdFusion MX. -->
  <p>#cfcatch.message#</p>
```

```
<p>Caught an exception. type = #CFCATCH.TYPE# </p>
<p>The contents of the tag stack are:</p>
<cfdump var="#cfcatch.tagcontext#">
</cfoutput>
</cfcatch>
</cftry>
```

# cfchart

## Description

Generates and displays a chart.

## Category

[Data output tags](#), [Extensibility tags](#); “Controlling chart appearance” in Chapter 31, “Creating Charts and Graphs,” in *ColdFusion MX Developer’s Guide*

## Syntax

### Syntax 1

```
<!-- This syntax uses an XML file or string to specify the chart style. -->
<cfchart
  style = "XML string or filename">
</cfchart>
```

### Syntax 2

```
<!-- This syntax uses the attributes of the cfchart tag to specify the chart
style. -->
<cfchart
  backgroundColor = "Hex value or Web color"
  chartHeight = "integer number of pixels"
  chartWidth = "integer number of pixels"
  dataBackgroundColor = "Hex value or Web color"
  font = "font name"
  fontBold = "yes" or "no"
  fontItalic = "yes" or "no"
  fontSize = "integer font size"
  foregroundColor = "Hex value or Web color"
  format = "flash" or "jpg" or "png"
  gridlines = "integer number of lines"
  labelFormat = "number, currency, percent, date"
  markerSize = "integer number of pixels"
  name = "String">
  pieSliceStyle = "solid, sliced"
  scaleFrom = "integer minimum value"
  scaleTo = "integer maximum value"
  seriesPlacement = "default, cluster, stacked, percent"
  show3D = "yes" or "no"
  showBorder = "yes" or "no"
  showLegend = "yes" or "no"
  showMarkers = "yes" or "no"
  showXGridlines = "yes" or "no"
  showYGridlines = "yes" or "no"
  sortXAxis = "yes" or "no"
  tipBGColor = "hex value or web color"
  tipStyle = "MouseDown, MouseOver, none"
  title = "title of chart"
  url = "onClick destination page"
  xAxisTitle = "title text"
  xAxisType = "scale or category"
  xOffset = "number between -1 and 1"
  yAxisTitle = "title text"
  yAxisType = "scale or category"
  yOffset = "number between -1 and 1"
</cfchart>
```

## See also

[cfchartdata](#), [cfchartseries](#)

## History

ColdFusion MX 7:

- Added `style` and `title` attributes.
- Added support for eight-digit hexadecimal values to specify RGB color and transparency.
- Removed the `rotated` attribute.
- Renamed the column chart type to be horizontalbar chart type.

ColdFusion MX 6.1:

- Added the `xAxisType` and `yAxisType` attributes.
- Changed interpolation behavior: the tag now interpolates data points on line charts with multiple series.

ColdFusion MX: Added this tag.

## Attributes

| Attribute                        | Req/Opt  | Default | Description   |
|----------------------------------|----------|---------|---|
| <code>backgroundColor</code>     | Optional |         | Color of the area between the data background and the chart border, around labels and around the legend.<br>Hexadecimal value or supported named color; see the name list in Usage. For a hexadecimal value, use the form " <code>##xxxxxx</code> " or " <code>##xxxxxxxx</code> ", where x = 0-9 or A-F; use two number signs or none. |
| <code>chartHeight</code>         | Optional | 240     | Chart height; integer number of pixels.   |
| <code>chartWidth</code>          | Optional | 320     | Chart width; integer number of pixels.  |
| <code>dataBackgroundColor</code> | Optional | white   | Color of area around chart data.<br>Hexadecimal value or supported named color; see the name list in Usage.<br>For a hexadecimal value, use the form " <code>##xxxxxx</code> " or " <code>##xxxxxxxx</code> ", where x = 0-9 or A-F; use two number signs or none.  |
| <code>font</code>                | Optional | arial   | Name of text font: <ul style="list-style-type: none"><li>• arial</li><li>• times</li><li>• courier</li><li>• arialunicodeMS. This option is required, if you are using a double-byte character set on UNIX, or using a double-byte character set in Windows with a file type of Flash.</li></ul>  |

| <b>Attribute</b> | <b>Req/Opt</b> | <b>Default</b>               | <b>Description</b>  |
|------------------|----------------|------------------------------|---|
| fontBold         | Optional       | no                           | Whether to make the text bold: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>  |
| fontItalic       | Optional       | no                           | Whether to make the text italicized: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>  |
| fontSize         | Optional       | 11                           | Font size; integer.   |
| foregroundColor  | Optional       | black                        | Color of text, grid lines, and labels. Hexadecimal value or supported named color; see name list in Usage. For a hexadecimal value, use the form "#xxxxxx" or "##xxxxxxxx", where x = 0-9 or A-F; use two number signs or none.             |
| format           | Optional       | flash                        | File format in which to save the graph: <ul style="list-style-type: none"> <li>• flash</li> <li>• jpg</li> <li>• png</li> </ul>   |
| gridlines        | Optional       | 10, including top and bottom | Number of grid lines to display on the value axis, including axis; positive integer.  |
| labelFormat      | Optional       | number                       | Format for y-axis labels: <ul style="list-style-type: none"> <li>• number</li> <li>• currency</li> <li>• percent</li> <li>• date</li> </ul>   |
| markerSize       | Optional       | (Automatic)                  | Size of data point marker in pixels; integer.   |
| name             | Optional       |                              | Page variable name; string. Generates the the graph as binary data and assigns it to the specified variable. Suppresses chart display. You can use the <code>name</code> value in the <code>cffile</code> tag to write the chart to a file. |
| pieSliceStyle    | Optional       | sliced                       | Applies to the <code>cfchartseries</code> type attribute value <code>pie</code> . <ul style="list-style-type: none"> <li>• solid: displays pie as if unsliced.</li> <li>• sliced: displays pie as if sliced.</li> </ul>                     |
| rotated          | Optional       | no                           | Whether to rotate the chart 90 degrees: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>   |
| scaleFrom        | Optional       | Determined by data           | Y-axis minimum value; integer.  |
| scaleTo          | Optional       | Determined by data           | Y-axis maximum value; integer.  |

| Attribute       | Req/Opt  | Default | Description   |
|-----------------|----------|---------|---|
| seriesPlacement | Optional | default | Relative positions of series in charts that have more than one data series. <ul style="list-style-type: none"> <li>• default: ColdFusion determines relative positions, based on graph types</li> <li>• cluster</li> <li>• stacked</li> <li>• percent</li> </ul>                          |
| show3D          | Optional | yes     | Whether to display the chart with three-dimensional appearance: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>   |
| showBorder      | Optional | no      | Whether to display a border around the chart: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>   |
| showLegend      | Optional | yes     | Whether to display the legend if the chart contains more than one data series: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>  |
| showMarkers     | Optional | yes     | Whether to display markers at data points in line, curve, and scatter graphs: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>   |
| showXGridlines  | Optional | no      | Whether to display x-axis gridlines: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>  |
| showYGridlines  | Optional | yes     | Whether to display y-axis gridlines: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>  |
| sortXAxis       | Optional | no      | Whether to display column labels in alphabetic order along the x-axis: <ul style="list-style-type: none"> <li>• yes:</li> <li>• no</li> </ul> Ignored if the <code>xAxisType</code> attribute is <code>scale</code> .   |
| style           | Optional |         | XML file or string to use to specify the style of the chart.  |
| title           | Optional |         | Title of the chart.   |
| tipbgcolor      | Optional | white   | Background color of tips. Applies only to Flash format graph files. Hexadecimal value or supported named color; see the name list in the Usage section. For a hexadecimal value, use the form " <code>##xxxxxx</code> ", where <code>x</code> = 0-9 or A-F; use two number signs or none. |

| Attribute  | Req/Opt  | Default   | Description  |
|------------|----------|-----------|--|
| tipStyle   | Optional | mouseOver | <p>Determines the action that opens a pop-up window to display information about the current chart element.</p> <ul style="list-style-type: none"> <li>• mouseDown: display if the user positions the cursor at the element and clicks the mouse. Applies only to Flash format graph files. (For other formats, this option functions the same as mouseOver.)</li> <li>• mouseOver: displays if the user positions the cursor at the element</li> <li>• none: suppresses display</li> </ul>  |
| url        | Optional |           | <p>URL to open if the user clicks item in a data series; the <code>onClick</code> destination page. You can specify variables within the URL string; ColdFusion passes current values of the variables.</p> <ul style="list-style-type: none"> <li>• \$VALUE\$: the value of the selected row. If none, the value is an empty string.</li> <li>• \$ITEMLABEL\$: the label of the selected item. If none, the value is an empty string.</li> <li>• \$SERIESLABEL\$: the label of the selected series. If none, the value is an empty string.</li> </ul> <p>For example:</p> <pre>somepage.cfm?item=\$ITEMLABEL\$&amp;series=\$SERIESLABEL\$&amp;value=\$VALUE\$</pre> <ul style="list-style-type: none"> <li>• "javascript:...": executes a client-side script</li> </ul> |
| xAxisTitle | Optional |           | Title that appears on the x-axis; text.  |
| xAxisType  | Optional | category  | <p>Whether the x-axis indicates data or is numeric:</p> <ul style="list-style-type: none"> <li>• category: The axis indicates the data category. Data is sorted according to the <code>sortXAxis</code> attribute.</li> <li>• scale: The axis is numeric. All <code>cfchartdataitem</code> attribute values must be numeric. The x-axis is automatically sorted numerically.</li> </ul>  |
| xOffset    | Optional | 0.1       | <p>Number of units by which to display the chart as angled, horizontally. Applies if <code>show3D="yes"</code>. The number can be between -1 and 1, where "-1" specifies 90 degrees left and "1" specifies 90 degrees right.</p>   |
| yAxisTitle | Optional |           | Title of the y-axis; text.   |

| Attribute | Req/Opt  | Default  | Description  |
|-----------|----------|----------|--|
| yAxisType | Optional | category | Currently has no effect, as the y-axis is always used for data values.   |
| yOffset   | Optional | 0.1      | Number of units by which to display the chart as angled, vertically. Applies if show3D="yes". The number can be between -1 and 1, where "-1" specifies 90 degrees left and "1" specifies 90 degrees right. |

## Usage

The `cfchart` tag defines a *container* in which a graph displays: its height, width, background color, labels, and so on. The `cfchartseries` tag defines the chart style in which data displays: bar, line, pie, and so on. The `cfchartdata` tag defines a data point.

Data is passed to the `cfchartseries` tag in the following ways:

- As a query
- As data points, using the `cfchartdata` tag

For the `font` attribute value `ArialUnicodeMS`, the following rules apply:

- In Windows, to permit Flash charts (`type = "flash"`) to render a double-byte character set, you must select this value.
- On UNIX, for all `type` values, to render a double-byte character set, you must select this value.
- If this value is selected, the `fontBold` and `fontItalic` attributes have no effect.

The following table lists W3C HTML 4 named color value or hexadecimal values that the `color` attribute accepts:

| Color name | RGB value             |
|------------|-----------------------|
| Aqua       | <code>##00FFFF</code> |
| Black      | <code>##000000</code> |
| Blue       | <code>##0000FF</code> |
| Fuchsia    | <code>##FF00FF</code> |
| Gray       | <code>##808080</code> |
| Green      | <code>##008000</code> |
| Lime       | <code>##00FF00</code> |
| Maroon     | <code>##800000</code> |
| Navy       | <code>##000080</code> |
| Olive      | <code>##808000</code> |
| Purple     | <code>##800080</code> |
| Red        | <code>##FF0000</code> |
| Silver     | <code>##C0C0C0</code> |

| Color name | RGB value |
|------------|-----------|
| Teal       | ##008080  |
| White      | ##FFFFFF  |
| Yellow     | ##FFFF00  |

For all other color values, you must enter the hexadecimal value. You can enter a six-digit value, which specifies the RGB value, or an eight-digit value, which specifies the RGB value and the transparency. The first two digits of an eight-digit hexadecimal value specify the degree of transparency, with FF indicating opaque and 00 indicating transparent. Values between 00 and FF are allowed.

For more color names that are supported by popular browsers, go to [www.w3.org/TR/css3-color](http://www.w3.org/TR/css3-color)

You can specify whether charts are cached in memory, the number of charts to cache, and the number of chart requests that ColdFusion can process concurrently. To set these options in the ColdFusion Administrator, select Server Settings > Charting.

### Example

<!--The following example analyzes the salary data in the cfdocexamples database and generates a bar chart showing average salary by department. The body of the cfchartseries tag includes one cfchartdata tag to include data that is not available from the query. -->

```
<!-- Get the raw data from the database. -->
<cfquery name="GetSalaries" datasource="cfdocexamples">
SELECT Deptmt.Dept_Name,
Employee.Dept_ID,
Employee.Salary
FROM Deptmt, Employee
WHERE Deptmt.Dept_ID = Employee.Dept_ID
</cfquery>
```

```
<!-- Use a query of queries to generate a new query with -->
<!-- statistical data for each department. -->
<!-- AVG and SUM calculate statistics. -->
<!-- GROUP BY generates results for each department. -->
<cfquery dbtype = "query" name = "DataTable">
SELECT
Dept_Name,
AVG(Salary) AS avgSal,
SUM(Salary) AS sumSal
FROM GetSalaries
GROUP BY Dept_Name
</cfquery>
```

```
<!-- Reformat the generated numbers to show only thousands. -->
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
<cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
<cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>
```

```
<h1>Employee Salary Analysis</h1>
<!-- Bar graph, from Query of Queries -->
<cfchart format="flash"
xaxisitle="Department"
yaxisitle="Salary Average">

<cfchartseries type="bar"
query="DataTable"
itemcolumn="Dept_Name"
valuecolumn="avgSal">

<cfchartdata item="Facilities" value="35000">

</cfchartseries>
</cfchart>
```

# cfchartdata

## Description

Used with the [cfchart](#) and [cfchartseries](#) tags. This tag defines chart data points. Its data is submitted to the [cfchartseries](#) tag.

## Category

[Data output tags](#), [Extensibility tags](#)

## Syntax

```
<cfchartdata
  item = "text"
  value = "number">
```

## See also

[cfchart](#), [cfchartseries](#); Chapter 31, “Creating Charts and Graphs,” in *ColdFusion MX Developer’s Guide*

ColdFusion MX: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description                             |
|-----------|----------|---------|---|
| item      | Required |         | Data point name; string.                |
| value     | Required |         | Data point value; number or expression. |

## Example

```
<!-- The following example analyzes the salary data in the cfdocexamples
database and generates a bar chart showing average salary by department. The
body of the cfchartseries tag loops over a cfchartdata tag to include data
available from the query. -->
```

```
<!-- Get the raw data from the database. -->
<cfquery name="GetSalaries" datasource="cfdocexamples">
SELECT Deptmt.Dept_Name,
Employee.Dept_ID,
Employee.Salary
FROM Deptmt, Employee
WHERE Deptmt.Dept_ID = Employee.Dept_ID
</cfquery>
```

```
<!-- Use a query of queries to generate a new query with -->
<!-- statistical data for each department. -->
<!-- AVG and SUM calculate statistics. -->
<!-- GROUP BY generates results for each department. -->
<cfquery dbtype = "query" name = "DataTable">
SELECT
Dept_Name,
AVG(Salary) AS avgSal,
SUM(Salary) AS sumSal
FROM GetSalaries
GROUP BY Dept_Name
```

```
</cfquery>

<!-- Reformat the generated numbers to show only thousands. --->
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
<cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
<cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>
<!-- Bar graph, from Query of Queries. --->
<cfchart format="flash"
xaxisitle="Department"
yaxisitle="Salary Average">

<cfchartseries type="bar"
itemcolumn="Dept_Name"
valuecolumn="avgSal">

<cfloop query="DataTable">
<cfchartdata item="#DataTable.Dept_Name#" value="#DataTable.avgSal#">
</cfloop>

</cfchartseries>
</cfchart>
```

# cfchartseries

## Description

Used with the `cfchart` tag. This tag defines the chart style in which the data displays: bar, line, pie, and so on.

## Category

[Data output tags](#), [Extensibility tags](#)

## Syntax

```
<cfchartseries
  colorlist = "list">
  itemColumn="queryColumn"
  markerStyle="style"
  paintStyle="plain, raise, shade, light"
  query="queryName"
  seriesColor="Hex value or Web color"
  seriesLabel="Label Text"
  type="type"
  valueColumn="queryColumn"
  dataLabelStyle="style"
</cfchartseries>
```

[cfchart](#), [cfchartdata](#); Chapter 31, “Creating Charts and Graphs,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `dataLabelStyle` attribute and the `horizontalbar` chart type.

ColdFusion MX 6.1: Changed interpolation behavior: the tag now interpolates data points on line charts with multiple series.

ColdFusion MX: Added this tag.

## Attributes

| Attribute   | Req/Opt   | Default   | Description   |
|-------------|---|-----------|---|
| colorlist   | Optional  |           | <p>Sets colors for each data point. Applies if the <code>cfchartseries</code> type attribute is <code>pie</code>, <code>pyramid</code>, <code>area</code>, <code>horizontalbar</code>, <code>cone</code>, <code>cylinder</code>, or <code>step</code>.</p> <p>Comma-delimited list of hexadecimal values or supported, named web colors; see the name list and information about six- and eight-digit hexadecimal values in the <code>cfchart</code> Usage section.</p> <p>For a hexadecimal value, use the form "<code>##xxxxxx</code>" or "<code>##xxxxxxxx</code>", where <code>x</code> = 0-9 or A-F; use two number signs or none.</p> |
| itemColumn  | Required if <code>query</code> attribute is specified |           | <p>Name of a column in the query specified in the <code>query</code> attribute; contains the item label for a data point to graph.</p>  |
| markerStyle | Optional  | rectangle | <p>Sets the icon that marks a data point for two-dimensional line, curve, and scatter graphs:</p> <ul style="list-style-type: none"><li>• rectangle</li><li>• triangle</li><li>• diamond</li><li>• circle</li><li>• letter</li><li>• mcross</li><li>• snow</li><li>• rcross</li></ul>   |
| paintStyle  | Optional  | plain     | <p>Sets the paint display style of the data series:</p> <ul style="list-style-type: none"><li>• plain: solid color.</li><li>• raise: the appearance of a button.</li><li>• shade: gradient fill, darker at the edges.</li><li>• light: a lighter shade of color; gradient fill.</li></ul>   |
| query       | Optional  |           | <p>Name of the ColdFusion query from which to get data to graph.</p>  |
| seriesColor | Optional  |           | <p>Color of the main element (such as the bars) of a chart. For a pie chart, the color of the first slice.</p> <p>Hexadecimal value or supported named color; see the name list and information about six- and eight-digit hexadecimal values in the Usage section for the <code>cfchart</code> tag.</p> <p>For a hexadecimal value, use the form "<code>##xxxxxx</code>" or "<code>##xxxxxxxx</code>", where <code>x</code> = 0-9 or A-F; use two number signs or none.</p>  |
| seriesLabel | Optional  |           | <p>Text of the data series label</p>  |

| Attribute      | Req/Opt                                  | Default | Description  |
|----------------|--|---------|--|
| type           | Required                                 |         | Sets the chart display style: <ul style="list-style-type: none"> <li>• bar</li> <li>• line</li> <li>• pyramid</li> <li>• area</li> <li>• horizontalbar</li> <li>• cone</li> <li>• curve</li> <li>• cylinder</li> <li>• step</li> <li>• scatter</li> <li>• pie</li> </ul>   |
| valueColumn    | Required if query attribute is specified |         | Name of a column in the query specified in the query attribute; contains data values to graph.   |
| dataLabelStyle | Optional                                 | None    | Specifies the way in which the color is applied to the item in the series: <ul style="list-style-type: none"> <li>• none: nothing is printed.</li> <li>• value: the value of the datapoint.</li> <li>• rowLabel: the row's label.</li> <li>• columnLabel: the column's label.</li> <li>• pattern: combination of column label, value, and aggregate information, such as columnLabel value for the percentage of total graph; for example, Sales 55,000 20% of 277,000.</li> </ul> |

### Usage

For a pie chart, ColdFusion sets pie slice colors as follows:

- If the `seriesColor` attribute is omitted, ColdFusion automatically determines the colors of the slices.
- If the `seriesColor` attribute is specified, ColdFusion automatically determines the colors of the slices after the first one, starting with the specified color for the first slice.

### Example

```
<!-- The following example analyzes the salary data in the cfdocexamples
database and generates a bar chart showing average salary by department. -->

<!-- Get the raw data from the database. -->
<cfquery name="GetSalaries" datasource="cfdocexamples">
SELECT Departmt.Dept_Name,
Employee.Dept_ID,
Employee.Salary
FROM Departmt, Employee
WHERE Departmt.Dept_ID = Employee.Dept_ID
</cfquery>
```

```

<!-- Use a query of queries to generate a new query with -->
<!-- statistical data for each department. -->
<!-- AVG and SUM calculate statistics. -->
<!-- GROUP BY generates results for each department. -->
<cfquery dbtype = "query" name = "DataTable">
SELECT
Dept_Name,
AVG(Salary) AS avgSal,
SUM(Salary) AS sumSal
FROM GetSalaries
GROUP BY Dept_Name
</cfquery>

<!-- Reformat the generated numbers to show only thousands. -->
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
<cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
<cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>
<!-- Bar graph, from Query of Queries -->
<cfchart format="flash"
xaxisitle="Department"
yaxisitle="Salary Average">

<cfchartseries type="bar"
query="DataTable"
itemcolumn="Dept_Name"
valuecolumn="avgSal" />
</cfchart>

```

# cfcol

## Description

Defines table column header, width, alignment, and text. Used within a `cftable` tag.

## Category

[Data output tags](#)

## Syntax

```
<cfcol  
  header = "column_header_text"  
  width = "number_indicating_width_of_column"  
  align = "left" or "right" or "center"  
  text = "column_text">
```

## See also

[cfcontent](#), [cfoutput](#), [cftable](#); “Performing file operations with `cfftp`” in Chapter 40, “Interacting with Remote Servers,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added the ability to construct dynamic `cfcol` statements.

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| header    | Required |         | Column header text. To use this attribute, you must also use the <a href="#">cftable colHeaders</a> attribute.   |
| width     | Optional | 20      | Column width. If the length of data displayed exceeds this value, data is truncated to fit. To avoid this, use an HTML <code>table</code> tag. If the surrounding <code>cftable</code> tag includes the <code>htmltable</code> attribute, <code>width</code> specifies the percent of the table width and it does not truncate text; otherwise, <code>width</code> specifies the number of characters. |
| align     | Optional | left    | Column alignment: <ul style="list-style-type: none"><li>• left</li><li>• right</li><li>• center</li></ul>  |
| text      | Required |         | Double-quotation mark-delimited text; determines what to display. Rules: same as for <code>cfoutput</code> sections. You can embed hyperlinks, image references, and input controls.   |

## Usage

At least one `cfcol` tag is required within the `cftable` tag. You must put `cfcol` and `cftable` tags adjacent in a page. The only tag that you can nest within the `cftable` tag is the `cfcol` tag. You cannot nest `cftable` tags.

To display the `cfcol` header text, you must specify the `cfcol` header and the `cftable colHeader` attribute. If you specify either attribute without the other, the header does not display. No error is thrown.

## Example

```
<!-- This example shows the use of cfcol and cftable to align
information returned from a query. -->
<!-- query selects information from cfdocexamples data source. -->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
</cfquery>
<html>
<body>
<h3>cfcol Example</h3>
<!-- Uses the HTMLTable attribute to display cftable as an HTML
table, rather than PRE formatted information -->
<cftable
    query = "GetEmployees"
    startRow = "1" colSpacing = "3"
    HTMLTable colheaders>
<!-- Each cfcol tag sets the width of a column in the table,
the header information, and the text/CFML for the cell. -->
<cfcol header = "<b>ID</b>"
    align = "Left"
    width = 2
    text = "#Emp_ID#">
<cfcol header = "<b>Name/Email</b>"
    align = "Left"
    width = 15
    text = "<a href = 'mailto:#Email#'>#FirstName# #LastName#</A>">
<cfcol header = "<b>Phone Number</b>"
    align = "Center"
    width = 15
    text = "#Phone#">
</cftable>
```

# cfcollection

## Description

Creates and administers Verity search engine collections.

## Category

[Extensibility tags](#)

## Syntax

```
<cfcollection
  action = "action"
  collection = "collection_name"
  path = "path_to_verity_collection"
  language = "language"
  name = "queryname"
  categories = "yes" or "no">
```

## See also

[cfexecute](#), [cfindex](#), [cfobject](#), [cfreport](#), [cfsearch](#), [cfwddx](#)

## History

ColdFusion MX 7:

- Removed reference to external collections.
- Deprecated the `map` and `repair` options of the `action` attribute. They might not work, and might cause an error, in later releases.
- Added `categories` attribute and `categorylist` action.
- Added `CATEGORIES`, `SIZE`, `DOCCOUNT`, and `LASTMODIFIED` to list of variables returned by the `list` action.
- Marked as obsolete the `MAPPED`, `ONLINE`, and `REGISTERED` variables returned by the `list` action.

ColdFusion MX:

- Changed the requirements for the `action` attribute: it is now required.
- Added the `action` attribute `list` value. It is the default.
- Changed the requirements for the `action` attribute value `map`: it is not necessary to specify the `action` attribute value `map`. (ColdFusion detects collections and creates maps collections as required.)
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed thrown exceptions: this tag can throw the `SEARCHENGINE` exception.

## Attributes

| Attribute  | Req/Opt             | Default | Description   |
|------------|---------------------|---------|---|
| action     | Required; see Usage | list    | <ul style="list-style-type: none"><li>categorylist: retrieves categories from the collection and indicates how many documents are in each one. Returns a structure of structures in which the category representing each substructure is associated with a number of documents. For a category in a category tree, the number of documents is the number at <i>or below</i> that level in the tree.</li><li>create: registers the collection with ColdFusion.<ul style="list-style-type: none"><li>If the collection is present: creates a map to it.</li><li>If the collection is not present: creates it.</li></ul></li><li>delete: unregisters a collection and deletes its directories.</li><li>list: returns a query result set, named from the <code>name</code> attribute value, of the attributes of the collections that are registered by ColdFusion.</li><li>map: creates a map to a collection. If the action is <code>create</code> and the collection already exists, Coldfusion also creates a map to the collection.</li><li>optimize: optimizes the structure and contents of the collection for searching; recovers space. Causes collection to be taken offline, preventing searches and indexing.</li><li>repair: deprecated. Does nothing.</li></ul> |
| collection | See Usage           |         | <ul style="list-style-type: none"><li>A collection name. The name can include spaces.</li></ul>   |
| path       | See Usage           |         | Absolute path to a Verity collection.<br>To map an existing collection, specify a fully qualified path to the collection (not including the collection name); for example, "C:\MyCollections\".   |
| language   | See Usage           | English | Although English is the default language, Englishx, a more advanced English locale, is also provided. For a list of options, see Usage.<br>Requires the appropriate (European or Asian) Verity Locales language pack.   |
| name       | See Usage           |         | Name for the query results returned by the <code>list</code> and <code>categorylist</code> actions.   |
| categories | See Usage           | no      | Used only for creating a collection: <ul style="list-style-type: none"><li>yes: this collection includes support for categories.</li><li>no: this collection does not support categories.</li></ul>   |

## Usage

With this tag you can create, register, and administer a Verity collection that was created by ColdFusion or by a Verity application.

The following table shows the dependence relationships among this tag's attribute values:

| This attribute is required, optional, or unnecessary (blank): | For this action attribute value: |          |          |          |          |          |              |
|---|----------------------------------|----------|----------|----------|----------|----------|--------------|
|   | list                             | create   | map      | optimize | repair   | delete   | categorylist |
| collection  |                                  | Required | Required | Required | Required | Required | Required     |
| path  |                                  | Required | Required |          |          |          |              |
| language  |                                  | Optional | Optional |          |          |          |              |
| name  | Required                         |          |          |          |          |          | Required     |
| categories  |                                  |          |          |          |          |          |              |

The following examples illustrate the structures returned by the `categorylist` action:

### CATEGORIES

|         |    |
|---------|----|
| blue    | 10 |
| green   | 3  |
| magenta | 3  |
| purple  | 2  |

### CATEGORYTREES

|              |    |
|--------------|----|
| a/           | 10 |
| a/b          | 10 |
| a/b/c        | 10 |
| a/b/c/subdir | 3  |

The `list` action returns the following information in a result set that contains one row per collection:

| Column     | Contents  |
|------------|---|
| CATEGORIES | <ul style="list-style-type: none"> <li>• yes: the collection has category support enabled.</li> <li>• no: the collection does not have category support enabled.</li> </ul>   |
| CHARSET    | The character set of the collection.  |
| CREATED    | The date and time that the collection was created.  |
| DOCCOUNT   | The number of documents in this collection.   |
| EXTERNAL   | <ul style="list-style-type: none"> <li>• yes: the collection is external.</li> <li>• no: the collection is not external.</li> <li>• Not Found: the collection is registered but is not available in the defined path .</li> </ul> |
| LANGUAGE   | The locale setting of the collection.<br>This information is not available for K2Server collections.  |

| Column       | Contents  |
|--------------|---|
| LASTMODIFIED | The date and time that the collection was last changed. |
| MAPPED       | Obsolete  |
| NAME         | The name of the collection.                             |
| ONLINE       | Obsolete  |
| PATH         | Absolute path to the collection.                        |
| REGISTERED   | Obsolete  |
| SIZE         | The size of the collection, expressed in kilobytes.     |

The ColdFusion MX Administrator Verity > Collections page displays the information that is returned when you use the `list` attribute.

If the Verity Server is not running when the `list` action is executed, the tag throws an error.

To determine whether a collection exists, use code, such as the following, to execute a query of queries:

```
<cfcollection action="list" name="myCollections" >
<cfquery name="qoq" dbtype="query">
  select * from myCollections
  where myCollections.name = 'myCollectionName'
</cfquery>
<cfif qoq.recordcount GT 0>
  <!--- Collection exists --->
  <cfdump var = #qoq#>
</cfif>
```

To get a result set with values for all the collections that are registered with the Verity server, use code such as the following:

```
<cfcollection action="list" name="myCollections">
<cfoutput query="myCollections">
  #name#<br>
</cfoutput>
```

To add content to a collection, use [cfindex](#). To search a collection, use [cfsearch](#).

The `language` attribute of this tag supports the following options:

---

|                                |         |            |                     |
|--------------------------------|---------|------------|---------------------|
| Asian Language Pack            |         |            |                     |
| Japanese                       | Korean  | Chinese    | Traditional Chinese |
| Multilanguage Language Pack    |         |            |                     |
| Unicode                        |         |            |                     |
| Western European Language Pack |         |            |                     |
| Bokmal                         | Finnish | Italian    | Spanish             |
| Danish                         | French  | Nynorsk    | Swedish             |
| Dutch                          | German  | Portuguese |                     |

---

## Eastern European/Middle Eastern Language Pack

|           |           |          |         |
|-----------|-----------|----------|---------|
| Arabic    | Greek     | Polish   | Turkish |
| Bulgarian | Hebrew    | Russian  |         |
| Czech     | Hungarian | Russian2 |         |

---

The default location of Verity collections is as follows:

- Server configuration:
  - Windows: C:\CFusionMX7\verity\collections
  - UNIX system: /opt/coldfusionmx7/verity/collections
- J2EE configuration: *webapp\_root*/WEB-INF/cfusion/verity/collections

### Example

```
<!-------
(coll_actn.cfm)
Check for server platform and use its default Verity Collection directory.
If you did not install ColdFusion MX in the default directory, or if you use
the J2EE configuration, or if your webroot is not C:\CFusionMX7\wwwroot, you
might need to change the path in this example. For example, for JRun4 the path
might be C:\JRun4\Verity\Collections\
----->
<cfif Find("Windows", Server.OS.Name)>
  <cfset collPath = "C:\JRun4\Verity\Collections\">
<cfelse>
  <cfset collPath = "/opt/coldfusionmx7/verity/collections/">
</cfif>

<!-------
Process form input and do the requested cfcollection operation.
----->

<cfif IsDefined("form.CollectionName") AND IsDefined("form.CollectionAction")>
  <cfif form.CollectionName is not "">
    <cfswitch expression="#FORM.CollectionAction#">
      <cfcase value="Create">
        <cfcollection action="CREATE" collection="#FORM.CollectionName#"
          path="#collPath#" categories="yes">
          <h3>Collection created.<br>
          Use CFINDEX to populate it.</h3>
        </cfcase>
      <cfcase value="Repair">
        <cfcollection action="REPAIR" collection="#FORM.CollectionName#">
          <h3>Collection repaired.</h3>
        </cfcase>
      <cfcase value="Optimize">
        <cfcollection action="OPTIMIZE" collection="#FORM.CollectionName#">
          <h3>Collection optimized.</h3>
        </cfcase>
      <cfcase value="Delete">
        <cfcollection action="DELETE" collection="#FORM.CollectionName#">
          <h3>Collection deleted.</h3>
        </cfcase>
    </cfswitch>
  </cfif>
</cfif>
```

```

        </cfcase>
    </cfswitch>
    <cfelse>
    <h3>Please enter a name for your collection</h3>
    </cfif>
</cfif>

<!------->
(coll_form.cfm)
Form to specify the collection name and action
    coll_form.cfm
----->

<form action="coll_actn.cfm" method="POST" >
<select name="CollectionAction">
    <option value="Create">Create this collection
    <option value="Optimize">Optimize this collection
    <option value="Repair">Repair this collection
    <option value="Delete">Delete this collection
</select>

<p><strong>Collection on which to act</strong><br>
Use the default value or enter your own Collection name<br>
<input type="Text" name="CollectionName" value="My_coll"></p>

<input type="Submit" name="" value="alter or create my collection">
</form>

```

# cfcomponent

## Description

Creates and defines a component object; encloses functionality that you build in CFML and enclose within `cffunction` tags. This tag contains one or more `cffunction` tags that define methods. Code within the body of this tag, other than `cffunction` tags, is executed when the component is instantiated.

A component file has the extension CFC and is stored in any directory of an application.

A component method is invoked in the following ways:

- Within the `cfinvoke` tag in a ColdFusion page
- Within a URL that calls a CFC file and passes a method name as a URL parameter
- Within the `cfscript` tag
- As a web service
- From Flash code

## Category

[Extensibility tags](#)

## Syntax

```
<cfcomponent
  extends = "anotherComponent"
  output = "yes" or "no"
  style = "rpc" or "document"
  namespace = "default service namespace"
  serviceportname = "port element name"
  porttypename = "porttype element name"
  bindingname = "binding element name"
  wsdlfile = "path to hard-coded wsdl file"
  displayname = "text string">
  hint = "text string">
  variable declarations
  <cffunction ...>
  ...
</cffunction>

  <cffunction ...>
  ...
</cffunction>
</cfcomponent>
```

## History

ColdFusion MX 7:

- Added support for publishing document-literal style web services.
- Added the `style`, `namespace`, `serviceportname`, `porttypename`, `wsdlfile`, and `bindingname` attributes.
- Extended functionality for the `hint` and `displayname` attributes when publishing document-literal style web services.

ColdFusion MX: Added this tag.

## Attributes

| Attribute                    | Req/Opt  | Default   | Description  |
|------------------------------|----------|---|--|
| <code>extends</code>         | Optional |   | Name of parent component from which to inherit methods and properties.   |
| <code>output</code>          | Optional | Component body displayable text is processed as standard CFML | Specifies whether constructor code in the component can generate HTML output; does not affect output in the body of <code>cffunction</code> tags in the component. <ul style="list-style-type: none"><li>• <code>yes</code>: Constructor code is processed as if it were within a <code>cfoutput</code> tag. Variable names surrounded by number signs (#) are automatically replaced with their values.</li><li>• <code>no</code>: Constructor code is processed as if it were within a <code>cfsilent</code> tag.</li><li>• If you do not specify this attribute, constructor code is processed as standard CFML. Any variables must be in <code>cfoutput</code> tags.</li></ul> |
| <code>style</code>           | Optional | <code>rpc</code>  | Specifies whether a CFC used for web services uses RPC-encoded style or document-literal style: <ul style="list-style-type: none"><li>• <code>rpc</code>: RPC-encoded style</li><li>• <code>document</code>: document-literal style</li></ul>  |
| <code>namespace</code>       | Optional | <code>classname</code>  | Specifies the namespace used in the WSDL when using the CFC as a document-literal style web service. If you don't specify this attribute, ColdFusion MX derives the value from the CFC class name.<br><br>This attribute applies only when <code>style="document"</code> .   |
| <code>serviceportname</code> | Optional |   | Specifies the <code>name</code> attribute of the <code>port</code> element in the WSDL. If you don't specify this attribute, ColdFusion MX derives the value from the CFC class name.<br><br>This attribute applies only when <code>style="document"</code> .  |

| Attribute    | Req/Opt  | Default | Description   |
|--------------|----------|---------|---|
| porttypename | Optional |         | Specifies the <code>name</code> attribute of the <code>porttype</code> element in the WSDL. If you don't specify this attribute, ColdFusion MX derives the value from the CFC class name.<br><br>This attribute applies only when <code>style="document"</code> .   |
| bindingname  | Optional |         | Specifies the <code>binding</code> attribute of the <code>port</code> element in the WSDL. If you don't specify this attribute, ColdFusion MX derives the value from the CFC class name.<br><br>This attribute applies only when <code>style="document"</code> .  |
| wSDLfile     | Optional |         | A properly formatted WSDL file to be used instead of WSDL generated by ColdFusion MX.<br><br>This attribute applies only when <code>style="document"</code> .   |
| displayname  | Optional |         | A string to be displayed when using introspection to show information about the CFC. The information appears on the heading, following the component name.<br><br>If the <code>style</code> attribute is set to <code>document</code> , ColdFusion MX uses the <code>displayname</code> attribute as the <code>name</code> attribute of the <code>service</code> element in the WSDL.   |
| hint         | Optional |         | Text to be displayed when using introspection to show information about the CFC. The <code>hint</code> attribute value appears below the component name heading. This attribute can be useful for describing the purpose of the parameter.<br><br>If the <code>style</code> attribute is set to <code>document</code> , ColdFusion MX uses the <code>hint</code> attribute as the content of the <code>documentation</code> element of the service in the WSDL. |

## Usage

If you specify the `extends` attribute, the data and methods of the parent component are available to CFC methods as if they were parts of the current component. If the `managerCFC` component extends the `employeeCFC` component, and the `employeeCFC` component has a `getEmployeeName` method, you can call this method using the `managerCFC`, as follows:

```
<cfinvoke component="managerCFC" method="getEmployeeName"
  returnVariable="managerName" EmployeeID=#EmpID#>
```

This tag requires an end tag.

If you specify `style="document"`, ColdFusion MX publishes the CFC as a document-literal style web service. For more information, see “Publishing document-literal style web services” in Chapter 36, “Using Web Services” in *ColdFusion MX Developer’s Guide*.

**Example**

```
<cfcomponent>
  <cffunction name="getEmp">
    <cfquery name="empQuery" datasource="cfdoexamples" >
      SELECT FIRSTNAME, LASTNAME, EMAIL
      FROM tblEmployees
    </cfquery>
    <cfreturn empQuery>
  </cffunction>

  <cffunction name="getDept">
    <cfquery name="deptQuery" datasource="cfdoexamples" >
      SELECT *
      FROM tblDepartments
    </cfquery>
    <cfreturn deptQuery>
  </cffunction>
</cfcomponent>
```

# cfcontent

## Description

Does either or both of the following:

- Sets the MIME content encoding header for the current page; if the encoding information includes a character encoding, sets the character encoding of generated output.
- Sends the contents of a file, or of a variable that contains binary data, as the page output.

To restrict this tag, use the Sandbox Security feature of the ColdFusion MX Administrator. For more information, see the Administrator online Help.

## Category

[Data output tags](#)

## Syntax

```
<cfcontent  
  type = "file_type"  
  deleteFile = "yes" or "no"  
  file = "filename"  
  variable = "variablename"  
  reset = "yes" or "no">
```

## History

ColdFusion MX 7: Added the `variable` attribute.

## Attributes

| Attribute  | Req/Opt  | Default | Description   |
|------------|----------|---------|---|
| type       | Optional |         | <p>The MIME content type of the page, optionally followed by a semicolon and the character encoding. By default, ColdFusion sends pages as text/html content type in the UTF-8 character encoding.</p> <p>The content type determines how the browser or client interprets the page contents.</p> <p>The following are some of the content type values you can use:</p> <ul style="list-style-type: none"><li>• text/html</li><li>• text/plain</li><li>• application/x-shockwave-flash</li><li>• application/msword</li><li>• image/jpeg</li></ul> <p>The following list includes commonly used character encoding values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>For example:</p> <pre>type = "text/html" type = "text/html; charset=ISO-8859-1"</pre> |
| deleteFile | Optional | no      | <p>Applies only if you specify a file with the <code>file</code> attribute.</p> <ul style="list-style-type: none"><li>• yes: deletes the file on the server after sending its contents to the client.</li><li>• no: leaves the file on the server.</li></ul>  |
| file       | Optional |         | <p>Name of file whose contents will be the page output. The file name must start with a drive letter and a colon, or a forward or backward slash. When using ColdFusion in a distributed configuration, the <code>file</code> attribute must refer to a path on the system on which the web server runs. When you use this attribute, any other output on the current CFML page is ignored; only the contents of the file are sent to the client.</p>   |

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| variable  | Optional |         | Name of a ColdFusion MX binary variable whose contents can be displayed by the browser, such as the contents of a chart generated by the <code>cfchart</code> tag or a PDF or Excel file retrieved by a <code>cffile</code> <code>action="readBinary"</code> tag. When you use this attribute, any other output on the current CFML page is ignored; only the contents of the file are sent to the client. |
| reset     | Optional | yes     | If you specify a <code>file</code> or <code>variable</code> attribute, this attribute has no effect; otherwise, it does the following: <ul style="list-style-type: none"> <li>• yes: discards output that precedes call to <code>cfcontent</code></li> <li>• no: preserves output that precedes call to <code>cfcontent</code>. In this case, all output is sent with the specified type.</li> </ul>       |

## Usage

To set the character encoding (character set) of generated output, including the page HTML, use code such as the following:

```
<cfcontent type="text/html; charset=ISO-8859-1">
```

When ColdFusion processes an HTTP request, it determines the character encoding to use for the data it returns in the HTTP response. By default, ColdFusion returns character data using the Unicode UTF-8 format, regardless of the value of an HTML `meta` tag in the page. You can use the `cfcontent` tag to override the default character encoding of the response. For example, to tell ColdFusion MX to return the page using Japanese EUC character encoding, use the `type` attribute, as follows:

```
<cfcontent type="text/html; charset=EUC-JP">
```

If you call the `cfcontent` tag from a custom tag, and you do not want the tag to discard the current page when it is called from another application or custom tag, set `reset = "no"`.

If a file delete operation is unsuccessful, ColdFusion throws an error.

Do not use this tag after the `cfflush` tag on a page, it will have no effect or ColdFusion will throw an error.

The following tag can force most browsers to display a dialog box that asks users whether they want to save the contents of the file specified by the `cfcontent` tag using the filename specified by the `filename` value. If the user selects to open the file, most browsers open the file in the related application, not the browser window.

```
<cfheader name="Content-Disposition" value="attachment;
  filename=filename.ext">
```

Some file types, such as PDF documents, do not use executable code and can display directly in most browsers. To request the browser to display the file directly, use a `cfheader` tag similar to the following:

```
<cfheader name="Content-Disposition" value="inline; filename=name.ext">
```

You can use any value for the `filename` part of the `filename` attribute, but the `ext` part must be the standard Windows extension for the file type.

For file types that might contain executable code, such as Microsoft Excel documents, most browsers always ask before opening the document. For these file types, the inline content disposition specification requests the browser to display the file directly if the user selects to open the file.

For more information on character encodings, see the following web pages:

- [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html) provides general information on character encodings and the web, and has several useful links.
- [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets) is a complete list of character sets names used on the Internet, maintained by the Internet Assigned Numbers Authority.
- [java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html](http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html) lists the character encodings that Java, and therefore ColdFusion, can interpret. This list uses Java internal names, not the IANA character encoding names that you use in the `SetEncoding charset` parameter and other ColdFusion attributes and parameters. ColdFusion MX 6.0 Updater 3 uses JDK 1.3. CFMX 6.1 uses JDK 1.4.2; for encoding support, see <http://java.sun.com/j2se/1.4.2/docs/guide/intl/encoding.doc.html>.

For a complete list of media types used on the Internet, see [www.iana.org/assignments/media-types/](http://www.iana.org/assignments/media-types/).

### Example

```
<!-- CFCONTENT Example 1
This example shows the use of cfcontent to return the contents of the CF
Documentation page dynamically to the browser. You might need to change the
path and/or drive letter depending on how ColdFusion is installed on your
system. Notice that the graphics do not display and the hyperlinks do not work,
because the html page uses relative filename references.
The root of the reference is the ColdFusion page, not the location of the
html page. -->
```

```
<cfcontent type = "text/html"
  file = "C:\CFusionMX7\wwwroot\cfdocs\dochome.htm"
  deleteFile = "no">
```

```
<!-- CFCONTENT EXAMPLE 2
This example shows how the Reset attribute changes text output. Notice how the
first text section ("This example shows how the Reset attribute changes output
for text reset = "Yes":123) does NOT print out to the screen. -->
```

```
<p>This example shows how the Reset attribute changes output for text.</p>
<p>reset = "Yes": 123 <BR> <cfcontent type = "text/html" reset = "Yes">456</p>
<p>This example shows how the Reset attribute changes output for text.</p>
<p>reset = "No": 123 <BR> <cfcontent type = "text/html" reset = "No">456</p>
```

```
<!-- CFCONTENT EXAMPLE 3
This example triggers a download of an Excel file. The user will be prompted
with an option to save the file or open it in the browser. -->
```

```
<cfheader name="Content-Disposition" value="inline; filename=acmesales03.xls">
  <cfcontent type="application/vnd.ms-excel" file="c:\temp\acmesales03.xls">
```

<!-- CFCONTENT EXAMPLE 4

This example triggers a download of a Word document then deletes the original from the "temp" directory. The user will be prompted with an option to save the file or open it in the browser. --->

```
<cfheader name="Content-Disposition" value="inline; filename=temp.doc">
<cfcontent type="application/msword" file="c:\temp\Cable.doc"
  deletefile="yes">
```

<!-- CFCONTENT EXAMPLE 5

This example causes the browser to treat the HTML table as Excel data. Excel interprets the table format. Because Excel can include executable code, the browser prompts the user whether to save the file or open it in a browser. --->

```
<cfheader name="Content-Disposition" value="inline; filename=acmesalesQ1.xls">
<cfcontent type="application/vnd.msexcel">
```

```
<table border="2">
<tr><td>Month</td><td>Quantity</td><td>$ Sales</td></tr>
<tr><td>January</td><td>80</td><td>$245</td></tr>
<tr><td>February</td><td>100</td><td>$699</td></tr>
<tr><td>March</td><td>230</td><td>$2036</td></tr>
<tr><td>Total</td><td>=Sum(B2..B4)</td><td>=Sum(C2..C4)</td></tr>
</table>
```

# cfcookie

## Description

Defines web browser cookie variables, including expiration and security options.

## Category

[Forms tags](#), [Variable manipulation tags](#)

## Syntax

```
<cfcookie
  name = "cookie_name"
  value = "text"
  expires = "period"
  secure = "yes" or "no"
  path = "url"
  domain = ".domain">
```

## See also

[cfdump](#), [cfparam](#), [cfregistry](#), [cfsavecontent](#), [cfschedule](#), [cfset](#)

## History

ColdFusion MX 6.1:

- Changed the `expires` attribute: it now accepts a date time object.
- Cookie names can include all ASCII characters except commas, semicolons, or whitespace characters.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| name      | Required |         | Name of cookie variable. ColdFusion converts cookie names to all-uppercase. Cookie names set using this tag can include any printable ASCII characters except commas, semicolons or white space characters.  |
| value     | Optional |         | Value to assign to cookie variable. Must be a string or variable that can be stored as a string.   |
| expires   | Optional |         | Expiration of cookie variable. <ul style="list-style-type: none"><li>• The default: the cookie expires when the user closes the browser, that is, the cookie is "session only".</li><li>• A date or date/time object (for example, 10/09/97)</li><li>• A number of days (for example, 10, or 100)</li><li>• now: deletes cookie from client cookie.txt file (but does not delete the corresponding variable the Cookie scope of the active page).</li><li>• never: The cookie expires in 30 years from the time it was created (effectively never in web years).</li></ul> |

| Attribute | Req/Opt   | Default | Description   |
|-----------|---|---------|---|
| secure    | Optional  |         | <p>If browser does not support Secure Sockets Layer (SSL) security, the cookie is not sent. To use the cookie, the page must be accessed using the https protocol.</p> <ul style="list-style-type: none"> <li>• yes: Variable must be transmitted securely.</li> <li>• no</li> </ul>  |
| path      | Optional  |         | <p>URL, within a domain, to which the cookie applies; typically a directory. Only pages in this path can use the cookie. By default, all pages on the server that set the cookie can access the cookie.<br/>path = "/services/login"</p> <p>To specify multiple URLs, use multiple <code>cfcookie</code> tags.<br/>If you specify <code>path</code>, you must also specify <code>domain</code>.</p>   |
| domain    | Required if <code>path</code> attribute is specified.<br>Optional otherwise |         | <p>Domain in which cookie is valid and to which cookie content can be sent from the user's system. By default, the cookie is only available to the server that set it. Use this attribute to make the cookie available to other servers.</p> <p>Must start with a period. If the value is a subdomain, the valid domain is all domain names that end with this string. This attribute sets the available subdomains on the site upon which the cookie can be used.</p> <p>For a <code>domain</code> value that ends in a country code, the specification must contain at least three periods; for example, ".mongo.state.us". For top-level domains, two periods are required; for example, ".mgm.com".<br/>You cannot use an IP address as a domain.</p> |

## Usage

If this tag specifies that a cookie is to be saved beyond the current browser session, the client browser writes or updates the cookie in its local cookies file. Until the browser is closed, the cookie resides in browser memory. If the `expires` attribute is not specified, the cookie is not written to the browser cookies file.

If you use this tag after the `cfflush` tag on a page, ColdFusion does not send the cookie to the browser; however, the value you set is available to ColdFusion in the Cookie scope during the browser session.

**Note:** You can also create a cookie that expires when the current browser session expires by using the `cfset` tag or a CFScript assignment statement to set a variable in the Cookie scope, as in `<cfset Cookie.mycookie="sugar">`. To get a cookie's value, refer to the cookie name in the Cookie scope, as in `<cfif Cookie.mycookie is "oatmeal">`.

You can use dots in cookie names, as the following examples show:

```
<cfcookie name="person.name" value="wilson, john">
<cfset cookie.person.lastname="Santiago">
```

To access cookies, including cookies that you set and all cookies that are sent by the client, use the Cookie scope. For example, to display the value of the `person.name` cookie set in the preceding code, use the following line:

```
<cfoutput>#cookie.person.name#</cfoutput>
```

## Example

```
<!-- This example shows how to set/delete a cfcookie variable. -->
<!-- Select users who have entered comments into a sample database. -->
<cfquery name = "GetAolUser" dataSource = "cfdocexamples">
    SELECT EMail, FromUser, Subject, Posted
    FROM Comments
</cfquery>
<html>
<body>
<h3>cfcookie Example</h3>
<!-- If the URL variable delcookie exists, set cookie expiration date
to NOW -->
<cfif IsDefined("url.delcookie") is True>
    <cfcookie name = "TimeVisited"
        value = "#Now()#"

# cfdefaultcase

## Description

Used only inside the `cfswitch` tag body. Contains code to execute when the expression specified in the `cfswitch` tag does not match a of the value specified by a `cfcase` tag.

## Category

[Flow-control tags](#)

## Syntax

```
<cfdefaultcase>
```

## See also

[cfcase](#), [cfswitch](#); “`cfswitch`, `cfcase`, and `cfdefaultcase`” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed placement requirements: this tag does not have to follow all `cfcase` tags in the `cfswitch` tag body.

## Usage

The contents of the `cfdefaultcase` tag body is executes if the `expression` attribute of the `cfswitch` tag does not match any of the values specified by the `cfcase` tags in the `cfswitch` tag body. The contents of the `cfdefaultcase` tag body can include HTML and text, and CFML tags, functions, variables, and expressions.

You can specify only one `cfdefaultcase` tag within a `cfswitch` tag. You can put the `cfdefaultcase` tag at any position within a `cfswitch` statement; it is not required to be the last item, but it is good programming practice to put it last.

## Example

```
<!-- The following example displays a grade based on a 1-10 score.
      Several of the cfcase tags match more than one score.
      For simplicity, the example sets the score to 7. -->
<cfset score="7">
<cfswitch expression="#score#">
  <cfcase value="10">
    <cfset grade="A">
  </cfcase>
  <cfcase value="9;8" delimiters=";">
    <cfset grade="B">
  </cfcase>
  <cfcase value="7;6" delimiters=";">
    <cfset grade="C">
  </cfcase>
  <cfcase value="5;4;" delimiters=";">
    <cfset grade="D">
  </cfcase>
  <cfdefaultcase>
    <cfset grade="F">
```

```
    </cfdefaultcase>
</cfswitch>
<cfoutput>
    Your grade is #grade#
</cfoutput>
```

# cfdirectory

## Description

Manages interactions with directories.

## Category

[File management tags](#)

## Syntax

```
<cfdirectory
  action = "directory action"
  directory = "directory name"
  name = "query name"
  filter = "list filter"
  mode = "permission"
  sort = "sort specification"
  newDirectory = "new directory name"
  recurse = "yes" or "no">
```

## See also

[cffile](#)

## History

ColdFusion MX 7: Added the `recurse` attribute (named `recursive` in Alpha 1) and `directory` result-set column.

ColdFusion MX:

- Changed behavior for `action = "list"`:
  - On Windows, `cfdirectory` `action = "list"` no longer returns the directory entries `."` (dot) or `.."` (dot dot), which represent "the current directory" and "the parent directory."
  - On Windows, `cfdirectory` `action = "list"` no longer returns the values of the `Archive` and `System` attributes.
  - On UNIX and Linux, `cfdirectory` `action = "list"` does not return any information in the `mode` column.

## Attributes

| Attribute    | Req/Opt                                 | Default | Description  |
|--------------|---|---------|--|
| action       | Optional                                | List    | <ul style="list-style-type: none"><li>list: returns a query record set of the files in the specified directory. The directory entries "." (dot) and ".." (dot dot), which represent the current directory and the parent directory, are not returned.</li><li>create</li><li>delete</li><li>rename</li></ul>   |
| directory    | Required                                |         | Absolute pathname of directory against which to perform action.<br>You can use an IP address, as in the following example:<br><pre>&lt;cfdirectory directory="//12.3.123.123/c_drive/" name="dirQuery" action="LIST"&gt;</pre>   |
| name         | Required if<br>action =<br>"list"       |         | Name for output record set.  |
| filter       | Optional if<br>action =<br>"list"       |         | File extension filter applied to returned names; for example, *.cfm. One filter can be applied.  |
| mode         | Optional                                |         | Used with action = "create". Permissions. Applies only to UNIX and Linux. Octal values of chmod command. Assigned to owner, group, and other, respectively. For example: <ul style="list-style-type: none"><li>644: assigns read/write permission to owner; read permission to group and other.</li><li>777: assigns read/write/execute permission to all.</li></ul> |
| sort         | Optional; used<br>if action =<br>"list" | ASC     | Query column(s) by which to sort directory listing. Delimited list of columns from query output.<br>To qualify a column, use: <ul style="list-style-type: none"><li>asc: ascending (a to z) sort order.</li><li>desc: descending (z to a) sort order.</li></ul> For example:<br><pre>sort = "directory ASC, size DESC, datelastmodified"</pre>                       |
| newDirectory | Required if<br>action =<br>"rename"     |         | New name for directory.  |
| recurse      | Optional                                | no      | Whether ColdFusion performs the action on subdirectories: <ul style="list-style-type: none"><li>yes</li><li>no</li></ul> Valid for action="list" and action="delete".  |

## Usage

If you put ColdFusion applications on a server that is used by multiple customers, you must consider the security of files and directories that could be uploaded or otherwise manipulated with this tag by unauthorized users. For more information about securing ColdFusion tags, see *Configuring and Administering ColdFusion MX*.

If `action = "list"`, `cfdirectory` returns the following result columns, which you can reference in a `cfoutput` tag:

- `name` Directory entry name. The entries "." and ".." are not returned.
- `directory` Directory containing the entry.
- `size` Directory entry size.
- `type` File type: File, for a file; Dir, for a directory.
- `dateLastModified` The date that an entry was last modified.
- `attributes` File attributes, if applicable.
- `mode` Empty column; retained for backward compatibility with ColdFusion 5 applications on UNIX.

You can use the following result columns in standard CFML expressions, preceding the result column name with the query name:

```
#mydirectory.name#  
#mydirectory.directory#  
#mydirectory.size#  
#mydirectory.type#  
#mydirectory.dateLastModified#  
#mydirectory.attributes#  
#mydirectory.mode#
```

**Note:** If the `cfdirectory` tag does not appear to work, for example, if a `list` operation returns an empty result set, make sure that you have correct permissions to access the directory. For example, if you run ColdFusion as a service on Windows, it operates by default as System, and cannot access directories on a remote system or mapped drive; to resolve this issue, do not run ColdFusion using the local system account.

The `filter` attribute specifies a pattern of one or more characters. All names that match that pattern are included in the list. On Windows systems, pattern matching ignores text case, on UNIX and Linux, pattern matches are case-sensitive.

The following two characters have special meaning in the pattern and are called metacharacters:

- \* matches any zero or more characters
- ? matches any single character

The following table shows examples of patterns and file names that they match:

---

| Pattern | Matches  |
|---------|--|
| foo.*   | Any file called foo with any extension; for example, foo.html, foo.cfm, and foo.xml. |
| *.html  | All files with the suffix .html, but not files with the suffix .htm.                 |
| ??      | All files with two-character names.  |

---

### Example

```
<!-- EXAMPLE 1: Creating and Renaming
Check that the directory exists to avoid getting a
ColdFusion error message. -->
<cfset newDirectory = "otherNewDir">
<cfset currentDirectory = GetDirectoryFromPath(GetTemplatePath()) & "newDir">
<!-- Check to see if the Directory exists. -->
<cfif DirectoryExists(currentDirectory)>
<!-- If TRUE then rename the directory. -->
<cfdirectory action = "rename" directory = "#currentDirectory#" newDirectory
= "#newDirectory#" >
<cfoutput>
<p>The directory existed and the name has been changed to: #newDirectory#</
p>
</cfoutput>
<cfelse>
<!-- If FALSE, create the directory. -->
<cfdirectory action = "create" directory = "#currentDirectory#" >
<cfoutput><p>Your directory has been created.</p></cfoutput>
</cfif>
```

```
<!-- EXAMPLE 2: Deleting a directory
Check that the directory exists and that files are not in the directory
to avoid getting ColdFusion error messages. -->

<cfset currentDirectory = GetDirectoryFromPath(GetTemplatePath()) &
"otherNewDir">
<!-- Check to see if the Directory exists. -->
<cfif DirectoryExists(currentDirectory)>
<!-- If TRUE, check to see if there are files in the directory before
deleting. -->
<cfdirectory action="list" directory="#currentDirectory#"
name="myDirectory">
<cfif myDirectory.recordcount gt 0>
<!-- If TRUE, delete the files from the directory. -->
<cfoutput>
<p>Files exist in this directory. Either delete the files or code
something to do so.</P>
</cfoutput>
<cfelse>
<!-- Directory is empty - just delete the directory. -->
<cfdirectory action = "delete" directory = "#currentDirectory#">
<cfoutput>
<p>The directory existed and has been deleted.</P>
</cfoutput>
```

```

    </cfif>
<cfelse>
    <!-- If FALSE, post message or do some other function. --->
    <cfoutput><p>The directory did NOT exist.</p></cfoutput>
</cfif>
<!--EXAMPLE 3: List directories
The following example creates both an array of directory names and a query that
contains entries for the directories only. --->

<cfdirectory directory="C:/temp" name="dirQuery" action="LIST">

<!-- Get an array of directory names. --->
<cfset dirsArray=arraynew(1)>
<cfset i=1>
<cfloop query="dirQuery">
<cfif dirQuery.type IS "dir">
    <cfset dirsArray[i]=dirQuery.name>
    <cfset i = i + 1>
</cfif>
</cfloop>
<cfdump var="#dirsArray#">
<br>
<!-- Get all directory information in a query of queries.--->
<cfquery dbtype="query" name="dirsOnly">
SELECT * FROM dirQuery
WHERE TYPE='Dir'
</cfquery>
<cfdump var="#dirsOnly#">

```

# cfdocument

## Description

Creates PDF or FlashPaper output from a text block containing CFML and HTML.

## History

ColdFusion MX 7: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| format    | Required |         | Specifies the report format: <ul style="list-style-type: none"><li>• PDF</li><li>• FlashPaper</li></ul>  |
| filename  | Optional |         | Specifies the name of a file to contain the PDF or FlashPaper output.<br>If you omit the <code>filename</code> attribute, ColdFusion MX streams output to the browser. |

| Attribute                | Req/Opt  | Default  | Description  |
|--------------------------|----------|----------|--|
| overwrite                | Optional | no       | Specifies whether ColdFusion MX overwrites an existing file. Used in conjunction with the <code>filename</code> attribute  |
| name                     | Optional |          | Specifies the name of an existing variable into which the tag stores the PDF or FlashPaper output.   |
| pagetype                 | Optional | A4       | Specifies the page size into which ColdFusion generates the report: <ul style="list-style-type: none"> <li>• legal: 8.5 inches x 14 inches.</li> <li>• letter: 8.5 inches x 11 inches.</li> <li>• A4: 8.27 inches x 11.69 inches.</li> <li>• A5: 5.81 inches x 8.25 inches.</li> <li>• B5: 9.81 inches x 13.88 inches.</li> <li>• Custom: custom height and width. If you specify <code>custom</code>, you must also specify the <code>pageheight</code> and <code>pagewidth</code> attributes, can optionally specify margin attributes, and can optionally specify whether the units are inches or centimeters.</li> </ul> |
| pageheight               | Optional |          | Specifies the page height in inches (default) or centimeters. This attribute is only valid if <code>pagetype=custom</code> . To specify page height in centimeters, include the <code>unit=cm</code> attribute.  |
| pagewidth                | Optional |          | Specifies the page width in inches (default) or centimeters. This attribute is only valid if <code>pagetype=custom</code> . To specify page width in centimeters, include the <code>unit=cm</code> attribute.  |
| orientation              | Optional | portrait | Specifies the page orientation: <ul style="list-style-type: none"> <li>• portrait</li> <li>• landscape</li> </ul>  |
| margin <sub>top</sub>    | Optional |          | Specifies the top margin in inches (default) or centimeters. To specify the top margin in centimeters, include the <code>unit=cm</code> attribute.   |
| margin <sub>bottom</sub> | Optional |          | Specifies the bottom margin in inches (default) or centimeters. To specify the bottom margin in centimeters, include the <code>unit=cm</code> attribute.   |
| margin <sub>left</sub>   | Optional |          | Specifies the left margin in inches (default) or centimeters. To specify the left margin in centimeters, include the <code>unit=cm</code> attribute.   |
| margin <sub>right</sub>  | Optional |          | Specifies the right margin in inches (default) or centimeters. To specify the right margin in centimeters, include the <code>unit=cm</code> attribute.   |
| unit                     | Optional | in       | Specifies the default unit for the <code>pageheight</code> , <code>pagewidth</code> , and <code>margin</code> attributes: <ul style="list-style-type: none"> <li>• in: inches.</li> <li>• cm: centimeters.</li> </ul>  |

| Attribute         | Req/Opt  | Default                  | Description  |
|-------------------|----------|--------------------------|--|
| encryption        | Optional | None                     | (format="PDF" only) Specifies whether the output is encrypted: <ul style="list-style-type: none"> <li>• 128-bit</li> <li>• 40-bit</li> <li>• none</li> </ul>   |
| ownerpassword     | Optional |                          | (format="PDF" only) Specifies an owner password.   |
| userpassword      | Optional |                          | (format="PDF" only) Specifies a user password.   |
| permissions       | Optional |                          | (format="PDF" only) Specifies one or more of the following permissions: <ul style="list-style-type: none"> <li>• AllowPrinting</li> <li>• AllowModifyContents</li> <li>• AllowCopy</li> <li>• AllowModifyAnnotations</li> <li>• AllowFillIn</li> <li>• AllowScreenReaders</li> <li>• AllowAssembly</li> <li>• AllowDegradedPrinting</li> </ul> Separate multiple permissions with a comma. |
| fontembed         | Optional | yes                      | Specifies whether ColdFusion embeds fonts in the output: <ul style="list-style-type: none"> <li>• yes: embed fonts.</li> <li>• no: do not embed fonts.</li> </ul> Selective: embed all fonts except Java fonts and core fonts. For more information, see Usage.  |
| backgroundvisible | Optional | no                       | Specifies whether the background prints when the user prints the document: <ul style="list-style-type: none"> <li>• yes: include the background when printing.</li> <li>• no: do not include the background when printing.</li> </ul>  |
| scale             | Optional | Calculated by ColdFusion | Specifies a scale factor as a percentage. Use this option to reduce the size of the HTML output so that it fits on that paper. Specify a number less than 100.   |

## Usage

Use the `cfdocument` tag to render HTML and CFML output into PDF or FlashPaper format. ColdFusion MX does not return HTML and CFML outside of the `<cfdocument>` `</cfdocument>` pair.

The `cfdocument` tag can render HTML that supports the following standards:

- HTML 4.01
- XML 1.0
- DOM Level 1 and 2
- CSS1 and CSS2

The `cfdocument` tag does not support the Internet Explorer-specific HTML generated by Microsoft Word.

The PDF or FlashPaper document returned by the `cfdocument` tag overwrites any previous HTML in the input stream and ignores any HTML after the `</cfdocument>` tag.

You cannot embed a `cfreport` tag in a `cfdocument` tag.

When you use the `cfdocument` tag, ColdFusion MX creates a new scope named `cfdocument`. This scope contains the following variables:

- `currentpagenumber`
- `totalpagecount`

**Note:** The `cfdocument` scope variables are reserved for page number rendering. Do not use them in ColdFusion expressions. For example, the following code does not work:

```
<cfif cfdocument.currentpagenumber gt 1>
  <cfoutput>#cfdocument.currentpagenumber-1#</cfoutput>
</cfif>
```

### Example

```
<cfdocument format="flashpaper">
<p>This is a document rendered by the cfdocument tag.</p>

<table width="50%" border="2" cellspacing="2" cellpadding="2">
  <tr>
    <td><strong>Name</strong></td>
    <td><strong>Role</strong></td>
  </tr>
  <tr>
    <td>Bill</td>
    <td>Lead</td>
  </tr>
  <tr>
    <td>Susan</td>
    <td>Principal Writer</td>
  </tr>
  <tr>
    <td>Adelaide</td>
    <td>Part Time Senior Writer</td>
  </tr>
  <tr>
    <td>Thomas</td>
    <td>Full Time for 6 months</td>
  </tr>
  <tr>
    <td>Michael</td>
    <td>Full Time for 4 months</td>
  </tr>
</table>
</cfdocument>
```

# cfdocumentitem

## Description

Specifies action items for a PDF or FlashPaper document created by the `cfdocument` tag. Actions include the following:

- Page break
- Header
- Footer

## Category

[Data output tags](#)

## Syntax

```
<cfdocument ...>
```

### Syntax 1

```
<cfdocumentitem type = "pagebreak"/>
```

### Syntax 2

```
<cfdocumentitem  
  type = "header" or "footer">  
  header/footer text  
</cfdocumentitem>
```

```
</cfdocument>
```

## See also

[cfreport](#), [cfdocument](#), [cfdocumentsection](#)

## History

ColdFusion MX 7: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| type      | Required |         | Specifies the action: <ul style="list-style-type: none"><li>• pagebreak: start a new page at the location of the tag.</li><li>• header: use the text between the <code>&lt;cfdocumentitem&gt;</code> and <code>&lt;/cfdocumentitem&gt;</code> tags as the running header.</li><li>• footer: use the text between the <code>&lt;cfdocumentitem&gt;</code> and <code>&lt;/cfdocumentitem&gt;</code> tags as the running footer.</li></ul> |

## Usage

Use the `cfdocumentitem` tag to control the formatting of a PDF or FlashPaper report. This tag must be wrapped inside a `<cfdocument>` `</cfdocument>` pair.

Write code for one `cfdocumentitem` tag for each pagebreak, running header, or running footer.

You can use the `cfdocument` scope variable, `cfdocument.currentpagenumber`, to display the current page number in a header or footer. You can also use `cfdocument.totalpagecount` to display the total number of pages. For example:

```
...
<cfdocumentitem type= "footer">
  #cfdocument.currentpagenumber# of #cfdocument.totalpagecount#
</cfdocumentitem>
```

You can use `cfdocumentitem` tags with or without the `cfdocumentsection` tag, as follows:

**Without `cfdocumentsection`** The `cfdocumentitem` attribute applies to the entire document, as follows:

- If the tag is at the top of the document, it applies to the entire document.
- If the tag is in the middle of the document, it applies to the rest of the document.
- If the tag is at the end of the document, it has no affect.

**With `cfdocumentsection` tags** The `cfdocumentitem` attribute applies only to the section and overrides previously specified header and footer specifications.

### Example

```
<cfquery datasource="cfdocexamples" name="parksQuery">
SELECT parkname, suptmgr from parks
</cfquery>

<cfdocument format="PDF">
  <cfdocumentitem type="header">National Parks Report</cfdocumentitem>
  <!-- Use a footer with current page of totalpages format -->
  <cfdocumentitem type="footer">
    <cfoutput>Page #cfdocument.currentpagenumber# of
    #cfdocument.totalpagecount#</cfoutput>
  </cfdocumentitem>

<h1>Park list</h1>
<table width="95%" border="2" cellspacing="2" cellpadding="2" >
  <tr >
    <th>Park</th>
    <th>Manager</th>
  </tr>
  <cfoutput query="parksQuery">
    <tr>
      <td><font size="-1">#parkname#</font></td>
      <td><font size="-1">#suptmgr#</font></td>
    </tr>
  </cfoutput>
</table>
</cfdocument>
```

# cfdocumentsection

## Description

Divides a PDF or FlashPaper document into sections. By using this tag in conjunction with a [cfdocumentitem](#) tag, each section can have unique headers, footers, and page numbers.

## Category

[Data output tags](#)

## Syntax

```
<cfdocument ...>

  <cfdocumentsection
    margintop = "number"
    marginbottom = "number"
    marginleft = "number"
    marginright = "number">

    HTML, CFML, and cfdocumentitem tags
  </cfdocumentsection>

</cfdocument>
```

## See also

[cfreport](#), [cfdocument](#), [cfdocumentitem](#)

## History

ColdFusion MX 7: Added this tag and the `margintop`, `marginbottom`, `marginleft`, `marginright` attributes.

## Attributes

| Attribute                 | Req/Opt  | Default | Description  |
|---------------------------|----------|---------|--|
| <code>margintop</code>    | Optional |         | Specifies the top margin in inches (default) or centimeters. To specify the top margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.       |
| <code>marginbottom</code> | Optional |         | Specifies the bottom margin in inches (default) or centimeters. To specify the bottom margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag. |
| <code>marginleft</code>   | Optional |         | Specifies the left margin in inches (default) or centimeters. To specify the left margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.     |
| <code>marginright</code>  | Optional |         | Specifies the right margin in inches (default) or centimeters. To specify the right margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.   |

## Usage

Use the `cfdocumentsection` tag to divide a report into sections. Within each `cfdocumentsection` tag, you can use one or more `cfdocumentitem` tags to specify unique headers and footers for each section.

When using `cfdocumentsection`, ColdFusion MX ignores HTML and CFML not enclosed within `cfdocumentsection` tags.

The margin attributes override margins specified in previous sections or in the parent `cfdocument` tag. If you specify margin attributes, the units are controlled by the `unit` attribute of the parent `cfdocument` tag; the `unit` attribute has a default value of inches.

## Example

```
<cfquery datasource="cfdocexamples" name="empSalary">
SELECT Emp_ID, firstname, lastname, e.dept_id, salary, d.dept_name
FROM employee e, departmt d
WHERE e.dept_id = d.dept_id
ORDER BY d.dept_name
</cfquery>

<cfdocument format="PDF">
  <cfoutput query="empSalary" group="dept_id">
    <cfdocumentsection>
      <cfdocumentitem type="header">
        <font size="-3"><i>Salary Report</i></font>
      </cfdocumentitem>
      <cfdocumentitem type="footer">
        <font size="-3">Page #cfdocument.currentpagenumber#</font>
      </cfdocumentitem>
      <h2>#dept_name#</h2>
      <table width="95%" border="2" cellspacing="2" cellpadding="2" >
        <tr>
          <th>Employee</th>
          <th>Salary</th>
        </tr>

            </td>
            <td align="right"><font size="-1">
              #DollarFormat(empSalary.salary)#</font>
            </td>
          </tr>
          <cfset deptTotal = deptTotal + empSalary.salary>
        </cfoutput>
        <tr>
          <td align="right"><font size="-1">Total</font></td>
          <td align="right"><font size="-1">#DollarFormat(deptTotal)#</font></td>
        </tr>
        <cfset deptTotal = 0>
      </table>
```

```
</cfdocumentsection>  
</cfoutput>  
</cfdocument>
```

# cfdump

## Description

Use the `cfdump` tag to get the elements, variables, and values of most kinds of ColdFusion objects. Useful for debugging. You can display the contents of simple and complex variables, objects, components, user-defined functions, and other elements.

## Category

[Debugging tags](#), [Variable manipulation tags](#)

## Syntax

```
<cfdump
  var = "#variable#"
  expand = "yes" or "no"
  label = "text"
  top = "number of rows or levels">
```

## See also

[cfcookie](#), [cfparam](#), [cfsavecontent](#), [cfschedule](#), [cfset](#), [cftimer](#), [cfwddx](#)

## History

- ColdFusion MX 7: Added the `top` attribute.
- ColdFusion MX 6.1: Added the ability to dump COM objects; it displays the methods and Get and Put properties typeinfo information for the object.

## Attributes

| Attribute           | Req/Opt  | Default | Description  |
|---------------------|----------|---------|--|
| <code>var</code>    | Required |         | Variable to display. Enclose a variable name in number signs. These kinds of variables yield meaningful <code>cfdump</code> displays: <ul style="list-style-type: none"><li>• array</li><li>• CFC</li><li>• COM object</li><li>• Java object</li><li>• simple</li><li>• query</li><li>• structure</li><li>• UDF</li><li>• wddx</li><li>• xml</li></ul> |
| <code>expand</code> | Optional | yes     | <ul style="list-style-type: none"><li>• yes: in Internet Explorer and Mozilla, expands views.</li><li>• no: contracts expanded views.</li></ul>  |
| <code>label</code>  | Optional |         | A string; header for the dump output.  |
| <code>top</code>    | Optional | 9999    | The number of rows to display. For a structure, this is the number of nested levels to display.  |

## Usage

The expand/contract display capability is useful when working with large structures, such as XML document objects, structures, and arrays.

To display a construct, use code such as the following, in which *myDoc* is a variable of type `XmlDocument`:

```
<cfif IsXmlDoc(mydoc) is "yes">
  <cfdump var="#mydoc#">
</cfif>
```

The tag output is color-coded according to data type.

If a table cell is empty, this tag displays "[empty string]".

## Example

```
<!-- This example shows how to use this tag to display the CGI scope as a
structure: -->
```

```
<cfdump var="#cgi#">
```

# cfelse

## Description

Used as the last control block in a `cfif` tag block to handle any case not identified by the `cfif` tag or a `cfelseif` tag.

## Category

[Flow-control tags](#)

## Syntax

```
<cfif expression>  
    HTML and CFML tags  
<cfelseif expression>  
    HTML and CFML tags  
<cfelse>  
    HTML and CFML tags  
</cfif>
```

## See also

[cfif](#), [cfelseif](#), [cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

## Usage

If the values of the *expressions* in the containing `cfif` tag and all `cfelseif` tags are false, ColdFusion processes the code between this tag and the `cfif` end tag. This tag must be inside a `cfif` tag block. It does not require an end tag.

For more information and an example, see [cfif on page 227](#).

# cfelseif

## Description

Used as a control block in a `cfif` tag block to handle any case not identified by the `cfif` tag or a `cfelseif` tag.

## Category

[Flow-control tags](#)

## Syntax

```
<cfif expression>  
    HTML and CFML tags  
<cfelseif expression>  
    HTML and CFML tags  
<cfelse>  
    HTML and CFML tags  
</cfif>
```

## See also

[cfif](#), [cfelse](#), [cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

## Usage

If the value of the *expression* in this tag is true, and the values of the *expressions* in the containing `cfif` tag and preceding `cfelseif` tags are false, ColdFusion processes the code between this tag and a following `cfelseif` or `cfelse` tag, or the `cfif` end tag and then skips to the code following the `cfif` end tag. Otherwise, ColdFusion skips the code.

This tag must be inside a `cfif` tag block. It does not require an end tag.

For more information and an example, see [cfif on page 227](#).

# cferror

## Description

Displays a custom HTML page when an error occurs. This lets you maintain a consistent look and feel among an application's functional and error pages.

## Category

[Exception handling tags](#), [Extensibility tags](#), [Application framework tags](#)

## Syntax

```
<cferror  
  type = "a type"  
  template = "template_path"  
  mailTo = "email_address"  
  exception = "exception_type">
```

## See also

[cfrethrow](#), [cfthrow](#), [cftry](#), Chapter 14, "Handling Errors" in *ColdFusion MX Developer's Guide*.

## History

ColdFusion MX: Deprecated the `monitor` option of the `exception` attribute. It might not work, and might cause an error, in later releases.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| type      | Required |         | Type of error that the custom error page handles. The type also determines how ColdFusion handles the error page. For more information, see "Specifying a custom error page" in Chapter 14, "Specifying a custom error page," in <i>ColdFusion MX Developer's Guide</i> . <ul style="list-style-type: none"><li>exception: an exception of the type specified by the <code>exception</code> attribute.</li><li>validation: errors recognized by server-side type validation.</li><li>request: any encountered error.</li></ul> |
| template  | Required |         | Relative path to the custom error page. (A ColdFusion page was formerly called a template.)  |

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| mailTo    | Optional |         | An e-mail address. This attribute is available on the error page as the variable <code>error.mailto</code> . ColdFusion does not automatically send anything to this address.   |
| exception | Optional | Any     | Type of exception that the tag handles: <ul style="list-style-type: none"> <li>• application: application exceptions.</li> <li>• database: database exceptions.</li> <li>• template: ColdFusion page exceptions.</li> <li>• security: security exceptions.</li> <li>• object: object exceptions.</li> <li>• missingInclude: missing include file exceptions.</li> <li>• expression: expression exceptions.</li> <li>• lock: lock exceptions.</li> <li>• <i>custom_type</i>: developer-defined exceptions, defined in the <code>cfthrow</code> tag.</li> <li>• any: all exception types.</li> </ul> For more information on exception types, see <a href="#">cftry</a> . |

## Usage

Use this tag to provide custom error messages for pages in an application. This lets you maintain a consistent look and feel within the application, even when errors occur.

You generally embed this tag in your Application CFC or Application.cfm file to specify error-handling responsibilities for an entire application. You **must** put it in one of these files if you specify `type="validation"`; ColdFusion ignores it on any other page.

The `cftry` and `cfcatch` tags provide a more interactive way to handle ColdFusion errors within a ColdFusion page than the `cferror` tag, but the `cferror` tag is a good safeguard against general errors.

To ensure that error pages display successfully, avoid using the `cfencode` utility to encode pages that include the `cferror` tag.

## Page types

The following table describes the types of errors you can specify and code you can use on the pages that handle these error type:

| Page type | Description  | Use  |
|-----------|--|--|
| Exception | Dynamically invoked by the CFML language processor when it detects an unhandled exception condition.<br>Uses the full range of CFML tags. Error variables must be in <code>cfoutput</code> tags. | Can handle specific exception types or display general information for exceptions. |

| Page type  | Description  | Use  |
|------------|--|--|
| Request    | Includes the error variables described in the Error Variables section.<br>Cannot include CFML tags, but you can display values of the error variables by enclosing them in number signs (#), as in <code>#error.MailTo#</code> .   | Use as a backup error handler to other error handling methods, including exception type. |
| Validation | Handles data input validation errors that occur when submitting a form that uses hidden form-field validation or <code>onSubmit</code> validation.<br>Cannot include CFML tags, but you can display values of the error variables by enclosing them in number signs (#), as in <code>#Error.InvalidFields#</code> .<br>You must specify the validation error handler in the <code>Application.cfc</code> or <code>Application.cfm</code> file. | Handles hidden form-field or <code>onSubmit</code> format validation errors only.        |

## Error variables

The exception-handling page specified in the `cferror` tag `template` attribute contains one or more error variables. ColdFusion substitutes the value of the error variable when an error displays.

The following table lists error variables:

| Page type             | Error variable                      | Description   |
|-----------------------|-------------------------------------|---|
| Validation only       | <code>error.validationHeader</code> | Validation message header text.   |
|                       | <code>error.invalidFields</code>    | Unordered list of validation errors.  |
|                       | <code>error.validationFooter</code> | Validation message footer text.   |
| Request and Exception | <code>error.diagnostics</code>      | Detailed error diagnostics from ColdFusion MX.                              |
|                       | <code>error.mailTo</code>           | E-mail address (same as value in <code>cferror.MailTo</code> ).             |
|                       | <code>error.dateTime</code>         | Date and time when error occurred.  |
|                       | <code>error.browser</code>          | Browser that was running when error occurred.                               |
|                       | <code>error.remoteAddress</code>    | IP address of remote client.  |
|                       | <code>error.HTTPReferer</code>      | Page from which client accessed link to page where error occurred.          |
|                       | <code>error.template</code>         | Page executing when error occurred.   |
|                       | <code>error.generatedContent</code> | The content generated by the page up to the point where the error occurred. |
|                       | <code>error.queryString</code>      | URL query string of client's request.                                       |

| Page type      | Error variable   | Description  |
|----------------|------------------|--|
| Exception only | error.message    | Error message associated with the exception.   |
|                | error.rootCause  | The root cause of the exception. This structure contains the information that is returned by a <code>cfcatch</code> tag. For example, for a database exception, the SQL statement that caused the error is in the <code>error.RootCause.Sql</code> variable. For Java exceptions, this variable contains the Java servlet exception reported by the JVM as the cause of the "root cause" of the exception. |
|                | error.tagContext | Array of structures containing information for each tag in the tag stack. The tag stack consists of each tag that is currently open.   |
|                | error.type       | Exception type.  |

**Note:** If `type = "exception"`, you can substitute the prefix `cferror` for `Error`; for example, `cferror.diagnostics`, `cferror.mailTo`, or `cferror.dateTime`.

### Example

```
<h3>cferror Example</h3>

<!-- Example of cferror call within a page.
      NOTE: If you use cferror type="VALIDATION" you MUST put it in
      Application.cfc or Application.cfm -->
<cferror type = "REQUEST"
template = "request_err.cfm"
mailto = "admin@mywebsite.com">
<!-- This query calls a non-existent datasource, triggering an error to be
      handled. -->
<cfquery name="testQuery" datasource="doesNotExist">
select * from nothing
</cfquery>

<!-- Example of the page (request_err.cfm) to handle this error. -->
<html>
<head>
<title>We're sorry -- An Error Occurred</title>
</head>
<body>
<h2>We're sorry -- An Error Occurred</h2>
<p>
If you continue to have this problem, please contact #error.mailTo#
with the following information:</p>
<p>
<ul>
<li><b>Your Location:</b> #error.remoteAddress#
<li><b>Your Browser:</b> #error.browser#
<li><b>Date and Time the Error Occurred:</b> #error.dateTime#
<li><b>Page You Came From:</b> #error.HTTPReferer#
<li><b>Message Content</b>:
<p>#error.diagnostics#</p>
</ul>
```

# cfexecute

## Description

Executes a ColdFusion developer-specified process on a server computer.

## Category

[Extensibility tags](#), [Flow-control tags](#)

## Syntax

```
<cfexecute
  name = "application name"
  arguments = "command line arguments"
  outputFile = "output filename"
  variable = "variable name"
  timeout = "timeout interval">
  ...
</cfexecute>
```

## See also

[cfcollection](#), [cfindex](#), [cfobject](#), [cfreport](#), [cfsearch](#), [cfwddx](#)

## History

ColdFusion MX 6.1:

- Added the `variable` attribute.
- Changed file path behavior for the `outputFile` attribute: if you do not specify an absolute file path in the `outputFile` attribute, the path is relative to the ColdFusion temporary directory.

## Attributes

| Attribute              | Req/Opt  | Default | Description  |
|------------------------|----------|---------|--|
| <code>name</code>      | Required |         | Absolute path of the application to execute. On Windows, you must specify an extension; for example, <code>C:\myapp.exe</code> .   |
| <code>arguments</code> | Optional |         | Command-line variables passed to application. If specified as string, it is processed as follows: <ul style="list-style-type: none"><li>• Windows: passed to process control subsystem for parsing.</li><li>• UNIX: tokenized into an array of arguments. The default token separator is a space; you can delimit arguments that have embedded spaces with double-quotation marks.</li></ul> If passed as array, it is processed as follows: <ul style="list-style-type: none"><li>• Windows: Elements are concatenated into a string of tokens, separated by spaces. Passed to process control subsystem for parsing.</li><li>• UNIX: Elements are copied into an array of <code>exec()</code> arguments.</li></ul> |

| Attribute  | Req/Opt  | Default | Description  |
|------------|----------|---------|--|
| outputFile | Optional |         | File to which to direct program output. If no <code>outputFile</code> or <code>variable</code> attribute is specified, output is displayed on the page from which it was called.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.  |
| variable   | Optional |         | Variable in which to put program output. If no <code>outputFile</code> or <code>variable</code> attribute is specified, output is displayed on page from which it was called.  |
| timeout    | Optional | 0       | Length of time, in seconds, that ColdFusion waits for output from the spawned program. <ul style="list-style-type: none"> <li>• 0: equivalent to nonblocking mode.</li> <li>• A very high value: equivalent to blocking mode.</li> </ul> If the value is 0: <ul style="list-style-type: none"> <li>• ColdFusion starts a process and returns immediately. ColdFusion may return control to the calling page before any program output displays. To ensure that program output displays, set the value to 2 or higher.</li> <li>• If the <code>outputFile</code> attribute is not specified, any program output is discarded</li> </ul> |

### Usage

Do not put other ColdFusion tags or functions between the start and end tags of `cfexecute`. You cannot nest `cfexecute` tags.

### Exceptions

Throws the following exceptions:

- If the application name is not found: `java.io.IOException`
- If the effective user of the ColdFusion executing thread does not have permissions to execute the process: a security exception

The time out values must be between zero and the longest time out value supported by the operating system.

### Example

```
<h3>cfexecute</h3>
<p>This example executes the Windows NT version of the netstat network monitoring program, and places its output in a file.

<cfexecute name = "C:\WinNT\System32\netstat.exe"
  arguments = "-e"
  outputFile = "C:\Temp\output.txt"
  timeout = "1">
</cfexecute>
```

# cfexit

## Description

This tag aborts processing of the currently executing CFML custom tag, exits the page within the currently executing CFML custom tag, or re-executes a section of code within the currently executing CFML custom tag.

## Category

[Debugging tags](#), [Flow-control tags](#)

## Syntax

```
<cfexit  
  method = "method">
```

## See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfif](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#);  
“cfabort and cfexit” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| method    | Optional | exitTag | <ul style="list-style-type: none"><li>exitTag: aborts processing of currently executing tag.</li><li>exitTemplate: exits page of currently executing tag.</li><li>loop: re-executes body of currently executing tag.</li></ul> |

## Usage

If this tag is encountered outside the context of a custom tag, for example in the base page or an included page, it executes in the same way as `cfabort`. The `cfexit` tag can help simplify error checking and validation logic in custom tags.

The `cfexit` tag function depends on its location and execution mode:

| Method value | Location of cfexit call | Behavior                          |
|--------------|-------------------------|-----------------------------------|
| exitTag      | Base page               | Terminate processing              |
|              | Execution mode = Start  | Continue after end tag            |
|              | Execution mode = End    | Continue after end tag            |
| exitTemplate | Base page               | Terminate processing              |
|              | Execution mode = Start  | Continue from first child in body |
|              | Execution mode = End    | Continue after end tag            |
| loop         | Base page               | Error                             |
|              | Execution mode = Start  | Error                             |
|              | Execution mode = End    | Continue from first child in body |

## Example

```
<h3>cfexit Example</h3>
<p>cfexit can be used to abort the processing of the currently executing
  CFML custom tag. Execution resumes following the invocation of
  the custom tag in the page that called the tag.
<h3>Usage of cfexit</h3>
<p>cfexit is used primarily to perform a conditional stop of processing
  inside a custom tag. cfexit returns control to the page that
  called that custom tag, or in the case of a tag called by another
  tag, to the calling tag.

<!-- cfexit can be used within a CFML custom tag, as follows: -->
<!-- Place this code (uncomment the appropriate sections) within the
  customtags directory. -->

<!-- MyCustomTag.cfm -->
<!-- This simple custom tag checks for the existence.
of myValue1 and myValue2. If they are both defined,
the tag adds them and returns the result to the calling
page in the variable "result". If either or both of the
expected attribute variables is not present, an error message
is generated, and cfexit returns control to the
calling page. -->

<!-- <cfif NOT IsDefined("attributes.myValue2")>
  <cfset caller.result = "Value2 is not defined">
  <cfexit method = "exitTag">
  <cfelseif NOT IsDefined("attributes.myValue1")>
  <cfset caller.result = "Value1 is not defined">
  <cfexit method = "exitTag">
  <cfelse>
  <cfset value1 = attributes.myValue1>
  <cfset value2 = attributes.myValue2>
  <cfset caller.result = value1 + value2>
  </cfif> -->
<!-- End MyCustomTag.cfm -->

<!-- Place this code within your page -->

<!-- <p>The call to the custom tag, and then the result:
<CF_myCustomTag
  myvalue2 = 4>
<cfoutput>#result#</cfoutput> -->
<p>If cfexit is used outside a custom tag, it functions like a cfabort.
  For example, the text after this message is not processed:
<cfexit>
<p>This text is not executed because of the cfexit tag above it.
```

# cffile

## Description

Manages interactions with server files.

The following sections describe the actions of the `cffile` tag:

- `cffile action = "append"` on page 131
- `cffile action = "copy"` on page 133
- `cffile action = "delete"` on page 135
- `cffile action = "move"` on page 136
- `cffile action = "read"` on page 138
- `cffile action = "readBinary"` on page 140
- `cffile action = "rename"` on page 141
- `cffile action = "upload"` on page 143
- `cffile action = "write"` on page 146

**Note:** To execute, this tag must be enabled in the ColdFusion Administrator. For more information, see *Configuring and Administering ColdFusion MX*.

If your ColdFusion applications run on a server used by multiple customers, consider the security of the files that could be uploaded or manipulated by `cffile`. For more information, see *Configuring and Administering ColdFusion MX*.

## Category

[File management tags](#)

## Syntax

The tag syntax depends on the `action` attribute value. See the following sections.

## See also

[cfdirectory](#)

## History

ColdFusion MX 7: Added the `result` attribute, which allows you to specify an alternate variable in which to receive result parameters. Used for `action = "upload"` action.

ColdFusion MX 6.1:

- Changed file path requirements: if you do not specify an absolute file path, the path is relative to the ColdFusion temporary directory, which is returned by the `GetTempDirectory` function.
- Changed behavior for `action="read"`: if the file starts with a byte order mark (BOM) ColdFusion uses it to determine the character encoding.
- Changed behavior for `action="upload" nameConflict="MakeUnique"` ColdFusion now makes filenames unique by appending an incrementing number, 1 for the first file, 2 for the second and so on, to the name. In ColdFusion MX filenames were made unique by appending an additional "1" for each file, as in 1, 11, 111, and so on.

## ColdFusion MX:

- Changed use of slashes in paths: you can use forward (/) or backward (\) slashes in paths on both UNIX and Windows systems.
- Changed file hierarchy requirements: ColdFusion does not require that you put files and directories that you manipulate with this tag below the root of the web server document directory.
- Changed directory path requirements for the `destination` attribute: a directory path that you specify in the `destination` attribute does not require a trailing slash.
- Deprecated the `system` value of the `attributes` attribute.
- Deprecated the `temporary` value of the `attributes` attribute. In ColdFusion MX, it is a synonym for `normal`. It might not work in later releases.
- Changed the action attribute options `read`, `write`, `append` and `move`: they support a new attribute, `charset`.
- The `archive` value of the `attributes` attribute is obsolete and has no effect.

### Example

```
<!-- This shows how to write, read, update, and delete a file using CFFILE.
This is a view-only example. -->
<!--
<cfif IsDefined("form.formsubmit") is "Yes">
  <!-- The form has been submitted, now do the action. -->
  <cfif form.action is "new">
    <!-- make a new file -->
    <cffile action="Write"
      file="#GetTempDirectory()#foobar.txt"
      output="#form.the_text#"
    </cffile>
  <cfif form.action is "read">
    <!-- read existing file -->
    <cffile action="Read"
      file="#GetTempDirectory()#foobar.txt"
      variable="readText">
    </cffile>

  <cfif form.action is "add">
    <!-- update existing file -->
    <cffile action="Append"
      file="#GetTempDirectory()#foobar.txt"
      output="#form.the_text#"
    </cffile>

  <cfif form.action is "delete">
    <!-- delete existing file -->
    <cffile action="Delete"
      file="#GetTempDirectory()#foobar.txt">
    </cffile>
  </cfif>
</cfif>
<!-- Set some variables. -->
<cfparam name="fileExists" default="no">
<cfparam name="readText" default="">
```

```

<!-- First, check whether canned file exists. -->

# cffile action = "append"

## Description

Appends text to a text file on the server.

## Syntax

```
<cffile
  action = "append"
  file = "full_path_name"
  output = "string"
  addNewLine = "yes" or "no"
  attributes = "file_attributes_list"
  mode = "mode"
  charset = "charset_option" >
```

## Attributes

| Attribute  | Req/Opt  | Default | Description   |
|------------|----------|---------|---|
| action     | Required |         | Type of file manipulation that the tag performs.  |
| file       | Required |         | Pathname of the file to which to append content of <code>output</code> attribute.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.  |
| mode       | Optional |         | Applies only to UNIX and Linux. Permissions. Octal values of UNIX <code>chmod</code> command. Assigned to owner, group, and other, respectively. For example: <ul style="list-style-type: none"><li>• <code>644</code>: assigns read/write permission to owner; read permission to group and other.</li><li>• <code>777</code>: assigns read/write/execute permission to all.</li></ul> |
| output     | Required |         | String to append to the file.   |
| addNewLine | Optional | yes     | <ul style="list-style-type: none"><li>• <code>yes</code>: appends newline character to text written to file.</li><li>• <code>no</code></li></ul>  |

| Attribute  | Req/Opt  | Default                        | Description  |
|------------|----------|--------------------------------|--|
| attributes | Optional |                                | <p>Applies to Windows. A comma-delimited list of attributes to set on the file.</p> <p>If omitted, the file's attributes are maintained.</p> <p>Each value must be specified explicitly. For example, if you specify <code>attributes = "readOnly"</code>, all other attributes are overwritten.</p> <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code></li> </ul>   |
| charset    | Optional | JVM default file character set | <p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• <code>utf-8</code></li> <li>• <code>iso-8859-1</code></li> <li>• <code>windows-1252</code></li> <li>• <code>us-ascii</code></li> <li>• <code>shift_jis</code></li> <li>• <code>iso-2022-jp</code></li> <li>• <code>eur-jp</code></li> <li>• <code>eur-kr</code></li> <li>• <code>big5</code></li> <li>• <code>eur-cn</code></li> <li>• <code>utf-16</code></li> </ul> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> |
| fixnewline | Optional | No                             | <ul style="list-style-type: none"> <li>• Yes: changes embedded line-ending characters in string variables to operating-system specific line endings</li> <li>• No: (default) do not change embedded line-ending characters in string variables.</li> </ul> <p>See "<a href="#">cffile action = "write"</a>" for an example that uses this attribute.</p>   |

### Example

```

<!--The first example creates the file \temp\foo on a windows system and sets
attributes to normal. --->
<cffile action = "write" file = "\temp\foo" attributes = normal output = "some
text">
<!-- The second example appends to the file. --->
<cffile action = "append" file = "\temp\foo" attributes = normal output = "Is
this a test?">

```

# cffile action = "copy"

## Description

Copies a file from one directory to another on the server.

## Syntax

```
<cffile
  action = "copy"
  source = "full_path_name"
  destination = "full_path_name"
  mode = "mode"
  attributes = "file_attributes_list">
```

## See also

[cfdirectory](#)

## History

## Attributes

| Attribute   | Req/Opt  | Default | Description   |
|-------------|----------|---------|---|
| action      | Required |         | Type of file manipulation that the tag performs.  |
| source      | Required |         | Pathname of the file to copy.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.  |
| destination | Required |         | Pathname of a directory or file on web server where the file will be copied. If you specify a filename without a directory path, ColdFusion copies it relative to the source directory.   |
| mode        | Optional |         | Applies only to UNIX and Linux. Permissions. Octal values of UNIX chmod command. Assigned to owner, group, and other, respectively. For example: <ul style="list-style-type: none"><li>• 644: assigns read/write permission to owner; read permission to group and other.</li><li>• 777: assigns read/write/execute permission to all.</li></ul>                                    |
| attributes  | Optional |         | Applies to Windows. A comma-delimited list of attributes to set on the file.<br>If omitted, the file's attributes are maintained.<br>Each value must be specified explicitly. For example, if you specify <code>attributes = "readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"><li>• readOnly</li><li>• hidden</li><li>• normal</li></ul> |

## Example

This example copies the `keymemo.doc` file to the `c:\files\backup\` directory:

```
<cffile action = "copy"  
  source = "c:\files\upload\keymemo.doc"  
  destination = "c:\files\backup\">
```

## cffile action = "delete"

### Description

Deletes a file on the server.

### Syntax

```
<cffile  
  action = "delete"  
  file = "full_path_name">
```

### See also

[cfdirectory](#)

### Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| action    | Required |         | Type of file manipulation that the tag performs.   |
| file      | Required |         | Pathname of the file to delete.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function. |

### Example

The following example deletes the specified file:

```
<cffile action = "delete"  
  file = "c:\files\upload\#{Variables.DeleteFileName#}">
```

# cffile action = "move"

## Description

Moves a file from one location to another on the server.

## Syntax

```
<cffile
  action = "move"
  source = "full_path_name"
  destination = "full_path_name"
  mode = "mode"
  attributes = "file_attributes_list"
  charset = "charset_option">
```

## Attributes

| Attribute   | Req/Opt  | Default | Description  |
|-------------|----------|---------|--|
| action      | Required |         | Type of file manipulation that the tag performs.   |
| source      | Required |         | Pathname of the file to move.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.   |
| destination | Required |         | Pathname of the destination directory or file. If not an absolute path, it is relative to the source directory.  |
| mode        | Optional |         | Applies only to UNIX and Linux. Permissions. Octal values of UNIX chmod command. Assigned to owner, group, and other, respectively. For example: <ul style="list-style-type: none"><li>• 644: assigns read/write permission to owner; read permission to group and other.</li><li>• 777: assigns read/write/execute permission to all.</li></ul> |

| Attribute  | Req/Opt  | Default                        | Description  |
|------------|----------|--------------------------------|--|
| attributes | Optional |                                | <p>Applies to Windows. A comma-delimited list of attributes to set on the file.</p> <p>If omitted, the file's attributes are maintained.</p> <p>Each value must be specified explicitly. For example, if you specify <code>attributes = "readOnly"</code>, all other attributes are overwritten.</p> <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code></li> </ul>   |
| charset    | Optional | JVM default file character set | <p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• <code>utf-8</code></li> <li>• <code>iso-8859-1</code></li> <li>• <code>windows-1252</code></li> <li>• <code>us-ascii</code></li> <li>• <code>shift_jis</code></li> <li>• <code>iso-2022-jp</code></li> <li>• <code>eur-jp</code></li> <li>• <code>eur-kr</code></li> <li>• <code>big5</code></li> <li>• <code>eur-cn</code></li> <li>• <code>utf-16</code></li> </ul> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> |

### Example

The following example moves the `keymemo.doc` file from the `c:\files\upload\` directory to the `c:\files\memo\` directory in Windows:

```
<cffile
  action = "move"
  source = "c:\files\upload\keymemo.doc"
  destination = "c:\files\memo\">
```

In this example, the destination directory is “memo.”

## cffile action = "read"

### Description

Reads a text file on the server. The file is read into a dynamic, local variable that you can use in the page. For example:

- Read a text file; insert the file's contents into a database
- Read a text file; use the find and replace function to modify the file's contents

**Note:** This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because this can bring down the server.

### Syntax

```
<cffile  
  action = "read"  
  file = "full_path_name"  
  variable = "var_name"  
  charset = "charset_option" >
```

### See also

### History

See the History section of the main [cffile](#) tag page.

### Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| action    | Required |         | Type of file manipulation that the tag performs.   |
| file      | Required |         | Pathname of the file to read.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function. |

| Attribute | Req/Opt  | Default   | Description   |
|-----------|----------|---|---|
| variable  | Required |   | Name of variable to contain contents of text file.  |
| charset   | Optional | Character encoding identified by the file's byte order mark, if any; otherwise, JVM default file character set. | <p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• big5</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> <p>If the file starts with a byte order mark and you set this attribute to a conflicting character encoding, ColdFusion generates an error.</p> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> |

## Usage

The following example creates a variable named `Message` for the contents of the file `message.txt`:

```
<cffile action = "read"
  file = "c:\web\message.txt"
  variable = "Message">
```

The variable `Message` can be used in the page. For example, you could display the contents of the `message.txt` file in the final web page as follows:

```
<cfoutput>#Message#</cfoutput>
```

ColdFusion supports functions for manipulating the contents of text files. You can also use the variable that is created by a `cffile action = "read"` operation in the [ArrayToList](#) and [ListToArray](#) functions.

**Note:** If you use this tag to read a file that is encoded using the Windows Cp1252 (windows-1252) encoding of the Latin-1 character set on a system whose default character encoding is Cp1252, and the files has characters encoded in the Hex 8x or 9x range, you must specify `charset="windows-1252"` attribute, even though this is the default encoding. Otherwise, some characters in the Hex8x and 9x ranges that do not map correctly and display incorrectly.

# cffile action = "readBinary"

## Description

Reads a binary file (such as an executable or image file) on the server, into a binary object parameter that you can use in the page. To send it through a web protocol (such as HTTP or SMTP) or store it in a database, first convert it to Base64 using the [ToBase64](#) function.

**Note:** This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because they can bring down the server.

## Syntax

```
<cffile
  action = "readBinary"
  file = "full_path_name"
  variable = "var_name">
```

## See also

[cfdirectory](#)

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| action    | Required |         | Type of file manipulation that the tag performs.  |
| file      | Required |         | Pathname of a binary fine to read.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function. |
| variable  | Required |         | Name of variable to contain contents of binary file.  |

## Usage

You convert the binary file to Base64 to transfer it to another site.

## Example

The following example reads the binary file `somewhere.jpg`, writes it to a different folder as `somewhereB.jpg`, and then displays the new file:

```
<cffile action = "readBinary" file =
  "C:\inetpub\wwwroot\cfdocs\getting_started\photos\somewhere.jpg" variable =
  "aBinaryObj">
<!-- Output binary object to JPEG format for viewing. -->
<cffile action="write" file = "c:\files\updates\somewhereB.jpg" output =
  "#toBinary(aBinaryObj)#">
<!-- HTML to view image. -->

```

# cffile action = "rename"

## Description

Renames or moves a file on the server.

## Syntax

```
<cffile
  action = "rename"
  source = "full_path_name"
  destination = "path_name"
  mode = "mode"
  attributes = "file_attributes_list">
```

## See also

[cfdirectory](#)

## History

See the History section of the main [cffile](#) tag page.

## Attributes

| Attribute   | Req/Opt  | Default | Description   |
|-------------|----------|---------|---|
| action      | Required |         | Type of file manipulation that the tag performs.  |
| source      | Required |         | Pathname of file to rename.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.  |
| destination | Required |         | Destination file or directory. If not an absolute path, it is relative to the source directory.   |
| mode        | Optional |         | Applies only to UNIX and Linux. Permissions. Octal values of UNIX chmod command. Assigned to owner, group, and other. For example: <ul style="list-style-type: none"><li>• 644: assigns read/write permission to owner; read permission to group and other.</li><li>• 777: assigns read/write/execute permission to all.</li></ul>                                      |
| attributes  | Optional |         | Applies to Windows. A comma-delimited list of attributes to set on the file.<br>If omitted, the file's attributes are maintained.<br>Each value must be specified explicitly. For example, if <code>attributes = "readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"><li>• hidden</li><li>• normal</li><li>• readOnly</li></ul> |

## Usage

The `rename` action renames or move a file. The `destination` attribute must be a pathname, not just a new name for the file. If the destination is a directory, the file is moved and not renamed.

## Example

### Windows Example:

```
<!-- Source Document is read-only but when renamed it becomes normal (not
hidden or read-only). -->
<cffile action = "rename" source = "c:\files\memo\readonlymemo.doc"
destination = "c:\files\memo\normalmemo.doc" attributes="normal">
```

### Unix Example:

```
<cffile action = "rename" source = "#myWR#/memo/sample.txt" destination =
"#myWR#/memo/other_sample.txt" mode="666">
```

# cffile action = "upload"

## Description

Copies a file to a directory on the server.

## Syntax

```
<cffile
  action = "upload"
  fileField = "formfield"
  destination = "full_path_name"
  nameConflict = "behavior"
  accept = "mime_type/file_type"
  mode = "permission"
  attributes = "file_attribute_or_list">
  result = "result_name"
```

## See also

## Attributes

| Attribute    | Req/Opt  | Default | Description  |
|--------------|----------|---------|--|
| action       | Required |         | Type of file manipulation that the tag performs.   |
| fileField    | Required |         | Name of form field used to select the file.<br>Do not use number signs (#) to specify the field name.  |
| destination  | Required |         | Pathname of directory in which to upload the file. If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.   |
| nameConflict | Optional | Error   | Action to take if filename is the same as that of a file in the directory. <ul style="list-style-type: none"><li>• Error: file is not saved. ColdFusion stops processing the page and returns an error.</li><li>• Skip: file is not saved. This option permits custom behavior based on file properties.</li><li>• Overwrite: replaces file.</li><li>• MakeUnique: forms a unique filename for the upload; name is stored in the file object variable <code>serverFile</code>.</li></ul> |
| accept       | Optional |         | Limits the MIME types to accept. Comma-delimited list. For example, to permit JPEG and Microsoft Word file uploads:<br><code>accept = "image/jpg, application/msword"</code><br>The browser uses file extension to determine file type.  |

| Attribute  | Req/Opt  | Default | Description   |
|------------|----------|---------|---|
| mode       | Optional |         | Applies only to UNIX and Linux. Permissions. Octal values of <code>chmod</code> command. Assigned to owner, group, and other, respectively. For example: <ul style="list-style-type: none"> <li>• <code>644</code>: assigns read/write permission to owner; read permission to group and other.</li> <li>• <code>777</code>: assigns read/write/execute permission to all.</li> </ul>   |
| attributes | Optional |         | Applies to Windows. A comma-delimited list of attributes to set on the file.<br>If omitted, the file's attributes are maintained.<br>Each value must be specified explicitly. For example, if you specify <code>attributes = "readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code> (if you use this option with other attributes, it is overridden by them)</li> </ul> |
| result     | Optional |         | Allows you to specify a name for the variable in which <code>cffile</code> returns the result (or status) parameters. If you do not specify a value for this attribute, <code>cffile</code> uses the prefix 'cffile'. For more information, see the Usage section.  |

## Usage

After a file upload is completed, you can get status information using file upload parameters. To refer to parameters, use either the `cffile` prefix or, if you specified an alternate name in the `result` attribute, the name you specified there. For example, if you did not specify a name in the `result` attribute, access the `fileExisted` parameter as `#cffile.fileExisted#`. If you set the `result` attribute to `myResult`, however, access `fileExisted` as `#myResult.fileExisted#`.

Status parameters can be used anywhere that other ColdFusion parameters can be used.

**Tip:** The `result` attribute allows functions or CFCs that get called from multiple pages at the same time to avoid overwriting the results of one call with another.

**Note:** The `file` prefix is deprecated, in favor of the `cffile` prefix. Do not use the `file` prefix in new applications.

**Tip:** If your page is uploading a file that was selected on a form or was otherwise sent to your page via a multipart/form-data HTTP message, you can determine the approximate size of the file by checking the value of the `CGI.content_length` variable. This variable includes the file length plus the length of any other request content.

The following file upload status parameters are available after an upload:

| Parameter                        | Description  |
|----------------------------------|--|
| <code>attemptedServerFile</code> | Initial name ColdFusion used when attempting to save a file            |
| <code>clientDirectory</code>     | Directory location of the file uploaded from the client's system       |
| <code>clientFile</code>          | Name of the file uploaded from the client's system                     |
| <code>clientFileExt</code>       | Extension of the uploaded file on the client system (without a period) |

| Parameter          | Description   |
|--------------------|---|
| clientFileName     | Name of the uploaded file on the client system (without an extension) |
| contentSubType     | MIME content subtype of the saved file                                |
| contentType        | MIME content type of the saved file                                   |
| dateLastAccessed   | Date and time the uploaded file was last accessed                     |
| fileExisted        | Whether the file already existed with the same path (yes or no)       |
| fileSize           | Size of the uploaded file   |
| fileWasAppended    | Whether ColdFusion appended uploaded file to a file (yes or no)       |
| fileWasOverwritten | Whether ColdFusion overwrote a file (yes or no)                       |
| fileWasRenamed     | Whether uploaded file renamed to avoid a name conflict (yes or no)    |
| fileWasSaved       | Whether ColdFusion saves a file (yes or no)                           |
| oldFileSize        | Size of a file that was overwritten in the file upload operation      |
| serverDirectory    | Directory of the file saved on the server                             |
| serverFile         | Filename of the file saved on the server                              |
| serverFileExt      | Extension of the uploaded file on the server (without a period)       |
| serverFileName     | Name of the uploaded file on the server (without an extension)        |
| timeCreated        | Time the uploaded file was created                                    |
| timeLastModified   | Date and time of the last modification to the uploaded file           |

**Note:** File status parameters are read-only. They are set to the results of the most recent `cffile` operation. If two `cffile` tags execute, the results of the second overwrite the first, unless you have specified a different result variable in the `result` attribute.

### Example

The following example creates a unique filename, if there is a name conflict when the file is uploaded on Windows:

```
<!-- Windows Example -->
<!-- Check to see if the Form variable exists. -->
<cfif isDefined("Form.FileContents") >
  <!-- If TRUE, upload the file. -->
  <cffile action = "upload"
    fileField = "FileContents"
    destination = "c:\files\upload\"
    accept = "text/html"
    nameConflict = "MakeUnique">
<cfelse>
  <!-- If FALSE, show the Form. -->
  <form method="post" action=<cfoutput>#cgi.script_name#</cfoutput>
    name="uploadForm" enctype="multipart/form-data">
    <input name="FileContents" type="file">
    <br>
    <input name="submit" type="submit" value="Upload File">
  </form>
</cfif>
```

# cffile action = "write"

## Description

Writes a text file on the server, based on dynamic content. You can create static HTML files from the content, or log actions in a text file.

## Syntax

```
<cffile
  action = "write"
  file = "full_path_name"
  output = "content"
  mode = "permission"
  addNewLine = "yes" or "no"
  attributes = "file_attributes_list"
  charset = "charset_option" >
```

## Attributes

| Attribute  | Req/Opt  | Default | Description  |
|------------|----------|---------|--|
| action     | Required |         | Type of file manipulation that the tag performs.   |
| file       | Required |         | Pathname of the file to write.<br>If not an absolute path (starting a with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.  |
| output     | Required |         | Content of the file to be created.   |
| mode       | Optional |         | Applies only to UNIX and Linux. Permissions. Octal values of UNIX chmod command. Assigned to owner, group, and other, respectively. For example: <ul style="list-style-type: none"><li>• 644: assigns read/write permission to owner; read permission to group and other.</li><li>• 777: assigns read/write/execute permission to all.</li></ul> |
| addNewLine | Optional | yes     | <ul style="list-style-type: none"><li>• yes: appends newline character to text written to file.</li><li>• no</li></ul>   |

| Attribute  | Req/Opt  | Default                         | Description  |
|------------|----------|---------------------------------|--|
| attributes | Optional |                                 | <p>Applies to Windows. A comma-delimited list of attributes to set on the file.</p> <p>If omitted, the file's attributes are maintained.</p> <p>Each value must be specified explicitly. For example, if you specify <code>attributes = "readOnly"</code>, all other attributes are overwritten.</p> <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code></li> </ul>   |
| charset    | Optional | JVM default file character set. | <p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• <code>utf-8</code></li> <li>• <code>iso-8859-1</code></li> <li>• <code>windows-1252</code></li> <li>• <code>us-ascii</code></li> <li>• <code>shift_jis</code></li> <li>• <code>iso-2022-jp</code></li> <li>• <code>eur-jp</code></li> <li>• <code>eur-kr</code></li> <li>• <code>big5</code></li> <li>• <code>eur-cn</code></li> <li>• <code>utf-16</code></li> </ul> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> |
| fixnewline | Optional | No                              | <ul style="list-style-type: none"> <li>• Yes: changes embedded line-ending characters in string variables to operating-system specific line endings.</li> <li>• No: (default) do not change embedded line-ending characters in string variables.</li> </ul>  |

### Example

This example creates a file with information a user entered in an HTML insert form:

```
<cffile action = "write"
  file = "c:\files\updates\#Form.UpdateTitle#.txt"
  output = "Created By: #Form.FullName#
  Date: #Form.Date#
  #Form.Content#">
```

If the user submitted a form with the following:

```
UpdateTitle = "FieldWork"
FullName = "World B. Frueh"
Date = "10/30/01"
Content = "We had a wonderful time in Cambridgeport."
```

ColdFusion would create a file named `FieldWork.txt` in the `c:\files\updates\` directory and the file would contain the following text:

```
Created By: World B. Frueh
Date: 10/30/01
We had a wonderful time in Cambridgeport.
```

This example shows the use of the `mode` attribute for UNIX. It creates the file `/tmp/foo` with permissions `rw-r--r--` (owner = read/write, group = read, other = read):

```
<cffile action = "write"
  file = "/tmp/foo"
  mode = 644>
```

This example appends to the file and sets permissions to read/write (`rw`) for all:

```
<cffile action = "append"
  destination = "/home/tomj/testing.txt"
  mode = 666
  output = "Is this a test?">
```

This example uploads a file and gives it the permissions owner/group/other = read/write/execute):

```
cffile action = "upload"
  fileField = "fieldname"
  destination = "/tmp/program.exe"
  mode = 777>
```

This example uses the `fixnewline` attribute to changes embedded line-ending characters in `xmlString`, which is derived from `xmlData`, to operating-system specific line endings.

```
<cfxml variable="xmlData">
  <docroot>
    <payload type="string">This is some plain text</payload>
  </docroot>
</cfxml>
<cfset xmlString = toString(xmlData)>

<cfset key = createUUID()>
<cfset encString=encrypt(xmlString, key)>
<cffile action="write" addnewline="yes"
  file="C:\CFusionMX7\wwwroot\test\store.dat" output="#encString#"
  fixnewline="yes">
<cffile action="read" file="C:\CFusionMX7\wwwroot\test\store.dat"
  variable="retrievedString">
<cfset decString=decrypt(retrievedString, key)>
<cfdump var="#decString#">
<cfset newXML = xmlParse(decString)>
<cfdump var="#newXML#">
```

# cfflush

## Description

Flushes currently available data to the client.

## Category

[Data output tags](#), [Page processing tags](#)

## Syntax

```
<cfflush  
  interval = "integer number of bytes">
```

## See also

[cfcache](#), [cfheader](#), [cfinclude](#), [cfsetting](#), [cfsilent](#)

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| interval  | Optional |         | Integer. Flushes output each time this number of bytes becomes available. HTML headers, and data that is already available when the tag is executed, are omitted from the count. |

## Usage

The first occurrence of this tag on a page sends back the HTML headers and any other available HTML. Subsequent `cfflush` tags on the page send only the output that was generated after the previous flush.

When you flush data, ensure that enough information is available, as some browsers might not respond if you flush only a small amount. Similarly, set the `interval` attribute for a few hundred bytes or more, but not thousands of bytes.

Use the `interval` attribute only when a large amount of output will be sent to the client, such as in a `cfloop` or a `cfoutput` of a large query. Using this form globally (such as in the `Application.cfm` file) might cause unexpected errors when CFML tags that modify HTML headers are executed.

**Caution:** Because the `cfflush` tag sends data to the browser when it executes, it has several limitations, including the following: Using any of the following tags or functions on a page anywhere after the `cfflush` tag can cause errors or unexpected results: `cfcontent`, `cfcookie`, `cfform`, `cfheader`, `cfhtmlhead`, `cflocation`, and `SetLocale`. (These tags and functions normally modify the HTML header, but cannot do so after a `cfflush` tag, because the `cfflush` sends the header.) Using the `cfset` tag to set a cookie anywhere on a page that has a `cfflush` tag does not set the cookie in the browser. Using the `cfflush` tag within the body of several tags, including `cfsavecontent`, `cfquery`, and custom tags, cause errors. If you save Client variables as cookies, any client variables that you set after a `cfflush` tag are not saved in the browser.

**Note:** Normally, the `cferror` tag discards the current output buffer and replaces it with the contents of the error page. The `cfflush` tag discards the current buffer. As a result, the `Error.GeneratedContent` variable resulting from a `cferror` tag after a `cfflush` contains any contents of the output buffer that has not been flushed. This content is not sent to the client. The content of the error page displays to the client after the bytes that have been sent.

# cfform

## Description

Builds a form with CFML custom control tags; these provide more functionality than standard HTML form input elements. You can include the resulting form on the client page as HTML or Flash content, and generate the form using XML and XSLT.

## Category

[Forms tags](#)

## Syntax

```
<cfform
  name = "name"
  action = "form_action"
  method = "POST" or "GET"
  format = "HTML" or "Flash" or "XML"
  skin = "Flash or XSL skin"
  style = "style specification"
  preserveData = "yes" or "no"
  onSubmit = "javascript"
  scriptSrc = "path"
  codeBase = "URL"
  archive = "URL"
  The following attributes are supported in Flash and XML only
  width = "pixels or percent"
  height = "pixels or percent"
  The following attributes are supported in Flash only
  onError = "ActionScript code"
  wMode = "window" or "transparent" or "opaque"
  accessible = "yes" or "no"
  preloader = "yes" or "no"
  timeout = "seconds"
  The following attributes are supported in HTML and XML only
  class = "form class"
  enctype = "Internet media type"
  id = "HTML id"
  onload = "load event script"
  onreset = "reset event script"
  target = "target window or frame">
  ...
</cfform>
```

## History

ColdFusion MX 7:

- Added ability to set the default value of the `scriptSrc` attribute in the ColdFusion MX Administrator.

- Deprecated the `passthrough` attribute. The tag now supports all HTML form tag attributes directly.
- Added the `method` attribute and support for the GET method.
- Added support for Flash and XML output, including the `format`, `height`, `width`, `preloader`, `timeout`, `wMode`, `accessible`, and `skin` attributes.
- Added `cfformgroup`, `cfformitem`, and `cftextarea` child tags.

#### ColdFusion MX:

- Deprecated the `enableCAB` attribute. It might not work, and might cause an error, in later releases.
- Changed the `name` and `action` attributes to optional.
- Changed integer validation to require an integer value. In previous releases it would convert a floating point value to an integer.

### Attributes

The following table lists attributes that ColdFusion uses directly. For HTML format forms, this tag also supports the standard HTML form tag attributes that are not on this list, and passes them directly to the browser. ColdFusion also includes all supported HTML attributes in the XML.

| Attribute           | Applies to       | Req/Opt | Default               | Description   |
|---------------------|------------------|---------|-----------------------|---|
| <code>name</code>   | HTML, Flash, XML | Opt     | <code>CFForm_n</code> | A name for the form.<br>In HTML format, if you omit this attribute and specify an <code>id</code> attribute, ColdFusion does not include a name attribute in the HTML sent to the browser; this behavior lets you use the <code>cfform</code> tag to create XHTML-compliant forms. If you omit the <code>name</code> attribute and the <code>id</code> attribute, ColdFusion generates a name of the form <code>CFForm_n</code> where <code>n</code> is a number that assigned serially to the forms on a page. |
| <code>action</code> | HTML, Flash, XML | Opt     | See Description       | Name of ColdFusion page to execute when the form is submitted for processing.<br>If you omit this attribute, the form posts to the page identified by the <code>CGI.SCRIPT_NAME</code> variable, the requested page that resulted in displaying the form.   |
| <code>method</code> | HTML, Flash, XML | Opt     | <code>post</code>     | The method the browser uses to send the form data to the server: <ul style="list-style-type: none"> <li>• <code>post</code>: sends the data using the HTTP post method, This method sends the data in a separate message to the server.</li> <li>• <code>get</code>: sends the data using the HTTP get method, which puts the form field contents in the URL query string.</li> </ul>   |

| Attribute | Applies to       | Req/ Opt | Default                              | Description   |
|-----------|------------------|----------|--------------------------------------|---|
| format    | HTML, Flash, XML | Opt      | HTML                                 | <ul style="list-style-type: none"> <li>HTML: generates an HTML form and send it to the client. <code>cfgrid</code> and <code>cftree</code> child controls can be in Flash or applet format.</li> <li>Flash: generates a Flash form and send it to the client. All controls are in Flash format.</li> <li>XML: generates XForms-compliant XML and save the results in a variable specified by the <code>name</code> attribute. By default, ColdFusion also applies an XSL skin and displays the result. For more information, see the <code>skin</code> attribute.</li> </ul>  |
| skin      | Flash, XML       | Opt      | Flash: haloGreen<br>XML: default.xml | <p><b>Flash:</b> Use a Macromedia halo color to stylize the output. The skin determines the color used for highlighted and selected elements.</p> <ul style="list-style-type: none"> <li>haloSilver</li> <li>haloBlue</li> <li>haloGreen</li> <li>haloOrange</li> </ul> <p><b>XML:</b> Specifies whether to apply an XSL skin and display the resulting HTML to the client. Can be any of the following:</p> <ul style="list-style-type: none"> <li>ColdFusion MX skin name: applies the specified skin.</li> <li>XSL file name: applies the skin located in the specified path.</li> <li>“none”: does not apply an XSL skin. Your CFML page must process the XML that ColdFusion saves in the variable specified by the <code>name</code> attribute and display any results.</li> <li>(omitted) or “default”: uses the ColdFusion MX default skin.</li> </ul> <p>You can specify the following ColdFusion MX skins (located in the <code>cf_webroot\CFIDE\scripts\xsl</code> directory):</p> <ul style="list-style-type: none"> <li>basic</li> <li>basiccss</li> <li>beige</li> <li>blue</li> <li>bluegray</li> <li>lightgray</li> <li>red</li> <li>silver</li> </ul> <p>A filename can be any of the following:</p> <ul style="list-style-type: none"> <li>absolute URL</li> <li>URL relative to the web root</li> <li>absolute file path</li> <li>name of a file in the scripts folder or a subdirectory of the <code>cf_webroot\CFIDE\scripts</code> directory. In this case, do not specify the <code>.xml</code> suffix.</li> </ul> |

| Attribute    | Applies to       | Req/ Opt | Default | Description   |
|--------------|------------------|----------|---------|---|
| style        | HTML, Flash, XML | Opt      |         | <p>Styles to apply to the form. In HTML or XML format, ColdFusion passes the style attribute to the browser or XML.</p> <p>In Flash format, must be a style specification in CSS format. For detailed information on specifying Flash styles, see Chapter 29, “Creating Forms in Macromedia Flash” in <i>ColdFusion MX Developer’s Guide</i>.</p>   |
| preserveData | HTML XML         | Opt      | no      | <p>When the cform action attribute posts back to the page that contains the form, this determines whether to override the control values with the submitted values.</p> <ul style="list-style-type: none"> <li>• false: uses values specified in the control tag attributes.</li> <li>• true: uses corresponding submitted values.</li> </ul> <p>Applies to these controls:</p> <ul style="list-style-type: none"> <li>• cfinput, cfslider, cftextinput: overrides the value attribute value.</li> <li>• cfselect controls that are populated from queries: Overrides the selected attribute. See cfselect.</li> <li>• cftree controls: overrides the cftreeitem expand attribute. If true, expands previously-selected elements. The cftree completePath attribute must be set to yes.</li> <li>• cfgrid controls: has no effect. (This avoids confusion as to whether data has been resubmitted to the database by the control.)</li> </ul> |
| onLoad       | HTML XML         | Opt      |         | JavaScript to execute when the form loads.  |
| onReset      | HTML XML         | Opt      |         | JavaScript to execute when the user clicks a reset button.  |
| onSubmit     | HTML Flash XML   | Opt      |         | JavaScript or ActionScript function to execute to preprocess data before form is submitted. See <i>ColdFusion MX Developer’s Guide</i> . If any child tags specify onSubmit field validation, ColdFusion does the validation before executing this JavaScript.  |

| Attribute | Applies to              | Req/ Opt | Default         | Description  |
|-----------|-------------------------|----------|-----------------|--|
| scriptSrc | HTML, Flash XML         | Opt      | See Description | <p>Specifies the URL, relative to the web root, of the directory that contains the cform.js file with the client-side JavaScript used by this tag and its child tags. For XML format forms, this directory is also the default directory for XSLT skins.</p> <p>This attribute is useful if the file is not in the default location. This attribute may be required in some hosting environments and configurations that block access to the /CFIDE directory.</p> <p>The default location is set in the ColdFusion MX Administrator; by default, it is /CFIDE/scripts/cform.js.</p> <p>If the Administrator has an empty default value, ColdFusion looks for the script in the directory that contains the ColdFusion page.</p> |
| codeBase  | applets in HTML and XML | Opt      | See Description | <p>URL of downloadable JRE plug-in for Internet Explorer; used for <code>cfgrid</code>, <code>cfslider</code>, and <code>cftree</code> Java applet controls.</p> <p>Default: /CFIDE/classes/cf-j2re-win.cab</p>  |
| archive   | applets in HTML and XML | Opt      | See Description | <p>URL of downloadable Java classes for <code>cfgrid</code>, <code>cfslider</code>, and <code>cftree</code> applet controls.</p> <p>Default: /CFIDE/classes/cfapplets.jar</p>  |
| height    | Flash XML               | Opt      | 100%            | <p>The height of the form. Use a number to specify pixels. In Flash, you can use a percentage value, such as "<code>height=60%</code>" to specify a percentage of the available width. The displayed height might be less than the specified size.</p>   |
| width     | Flash XML               | Opt      | 100%            | <p>The width of the form. Use a number to specify pixels. In Flash, you can use a percentage value, such as "<code>width=60%</code>" to specify a percentage of the available width..</p>  |
| onError   | Flash                   | Opt      |                 | <p>Applies only for <code>onSubmit</code> or <code>onBlur</code> validation; has no effect for <code>onServer</code> validation.</p> <p>An ActionScript expression or expressions to execute if the user submits a form with one or more validation errors.</p>  |

| Attribute  | Applies to | Req/ Opt | Default | Description  |
|------------|------------|----------|---------|--|
| wMode      | Flash      | Opt      | Window  | Specifies how the Flash form appears relative to other displayable content that occupies the same space on an HTML page. <ul style="list-style-type: none"> <li>• window: the Flash form is the topmost layer on the page and obscures anything that would share the space, such as drop-down dynamic HTML lists.</li> <li>• transparent: the Flash form honors the z-index of dhtml so you can float items above it. If the Flash form is above any item, transparent regions in the form show the content that is below it.</li> <li>• opaque: the Flash form honors the z-index of dhtml so you can float items above it. If the Flash form is above any item, it blocks any content that is below it.</li> </ul> |
| accessible | Flash      | Opt      | No      | Specifies whether to include support screen readers in the Flash form. Screen reader support adds approximately 80KB to the SWF file sent to the client.   |
| preloader  | Flash      | Opt      | true    | Specifies whether to display a progress bar when loading the Flash form.   |
| timeout    | Flash      | Opt      | 0       | Integer number of seconds for which to keep the form data in the Flash cache on the server. A value of 0 prevents the data from being cached. For more information, see “Caching data in Flash forms” in <i>ColdFusion MX Developer’s Guide</i> .  |

**Note:** Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML as html namespace attributes to the `form` tag.

## Usage

This tag requires an end tag.

You can use the following ColdFusion form control tags within the `cfform` tag:

- `cfapplet` Used in HTML and XML format only; embeds a registered Java applet.
- `cfformgroup` Used in Flash and XML format only; groups and arranges child controls.
- `cfformitem` Used in Flash and XML format only; adds horizontal rules, vertical rules, and text to the form.
- `cfgrid` Creates a grid control to display tabular data.
- `cfinput` Creates and an input element.
- `cfselect` Creates a drop-down list box.
- `cfslider` Used in HTML and XML format only; creates a slider control.
- `cftextarea` Creates a multi-line text input box.
- `cftree` Creates a tree control.

In HTML format, all tags, and in Flash format the `cfmtree` and `cfgrid` tags, require JavaScript support on the browser. The `cfapplet` tag and applet format `cfgrid`, `cfslider`, and `cfmtree` tags require the client to download a Java applet.

If you specify Flash format in the `cfform` tag, ColdFusion ignores any HTML in the form body. You must use ColdFusion tags, such as `cfinput`, for all form controls. You can include individual Flash format `cfgrid` and `cfmtree` controls in an HTML format `cfform` tag.

In Flash format, if your forms do not request sensitive data (such as credit card numbers), consider setting the `timeout` attribute. This can prevent users from getting "The form data has expired, Please reload this page in your browser" errors if they use the browser back button to return to the form. For more information, see "Caching data in Flash forms" in Chapter 29, "Caching data in Flash forms," in *ColdFusion MX Developer's Guide*.

**Note:** In Flash format, if you do not specify `height` and `width` attributes, Flash reserves browser space equal to the area of the browser window. If any other output follows the form, users must scroll to see it. Therefore, if you follow a Flash form with additional output, specify the `height` and `width` values.

If attribute value text must include quotation marks, escape them by doubling them.

### Using the `onError` attribute in Flash forms

If you use `onSubmit` or `onBlur` validation, the `onError` attribute lets you specify ActionScript code to execute if the user tries to submit a Flash form with validation errors, as follows:

- If you specify one or more valid Flash expressions, Flash executes the expressions.
- If you omit the attribute, Flash displays a dialog box with all applicable error messages.
- If you specify `onError=""` (an empty string) Flash does not display any message, but does not submit the form.

Your ActionScript can use the `errors` variable to determine the fields and errors. The `errors` object has the following fields:

| Field                | Contents   |
|----------------------|--|
| <code>name</code>    | The <code>name</code> attribute of the control's CFML tag.   |
| <code>field</code>   | The internal name used by Flash for the field. <code>name</code> (for example, <code>_level0.field1</code> ) |
| <code>value</code>   | The value in the field.  |
| <code>message</code> | The <code>message</code> attribute of the control's CFML tag.  |

The following example shows `cfform` tags with an `onError` attribute that selects the tab in an accordion or tabnavigator that contains a `lastName` field with an invalid entry:

```
<cfform name="form1" format="flash" width="800" height="500"
  onError="if (errors['lastName'] != undefined
    ){tabA.selectedIndex=0; _root.lastName.setFocus();}">
```

## Incorporating HTML form tags and attributes

In HTML format, the `cform` tag lets you incorporate the following standard HTML elements. They are not available in Flash format:

- Standard HTML form tag attributes and values. The attributes and values are included in the form tag that `cform` outputs in the page. For example, you can use form tag attributes like `target` or `onMouseOver` with `cform`.
- HTML tags that can ordinarily be put within the HTML form tag. For example, you can use the HTML `input` tag to create a submit button in a `cform`, without the other features of `cfinput`:

```
<cform>
  <input type = "Submit" value = " update... ">
</cform>
```

### Examples

```
<h3>cform Example</h3>
<!-- If Form.oncethrough exists, the form has been submitted. -->
<cfif IsDefined("Form.oncethrough")>
  <cfif IsDefined("Form.testVal1")>
    <h3>Results of Radio Button Test</h3>
    <cfif Form.testVal1>Your radio button answer was yes
    <cfelse>Your radio button answer was no
  </cfif>
</cfif>
<h3>Results of Checkbox Test</h3>
<cfif IsDefined("Form.chkTest2")>
  Your checkbox answer was yes
<cfelse>
  Your checkbox answer was no
</cfif>
<cfif IsDefined("Form.textSample") AND Form.textSample is not "">
  <h3>Results of Credit Card Input</h3>
  Your credit card number, <cfoutput>#Form.textSample#</cfoutput>,
  was valid under the MOD 10 algorithm.
</cfif>
<cfif IsDefined("Form.sampleSlider")>
  <cfoutput>

  label = "Page Value: " range = "1,10"
  message = "Please enter a value from 1 to 10"> 10
<p><cfinput type = "submit" name = "submit" value = "show me the result">
<cfinput type = "hidden" name = "oncethrough" value = "Yes"></p>
</cform>

```

## A Simple XML form

The following example shows a simple XML-format form. It uses the default.xml transform that is supplied with ColdFusion to generate the HTML output for display:

```

<cform name="testXForm" format="XML" skin="basic">
  <!-- Use cformgroup to put the first and last names on a single line. -->
  <cformgroup type="horizontal">
    <cfinput type="text" name="firstname" label="First Name:" value="Robert">
    <cfinput type="text" name="lastname" label="Last Name:" value="Smith">
  </cformgroup>
  <cfinput type="password" name="password" label="Password:" value="">
  <cfinput type="hidden" name="hidden" label="hidden:" value="">
  <cfselect name="state" style="width:200" label="State">
    <option>California</option>
    <option selected>Utah</option>
    <option>Iowa</option>
    <option selected>New York</option>
  </cfselect>
  <cftextarea name="description" label="Description:" rows="5" cols="40">this
  is sample text.</cftextarea>
</cform>

```

# cformgroup

## Description

Creates a container control for multiple form controls. Used in the `cform` tag body of Macromedia Flash and XML forms. Ignored in HTML forms.

## Category

[Forms tags](#)

## Syntax

```
<cformgroup
  type = "group type"
  label = "label"
  style = "style specification"
  selectedIndex = "page number">
  width = "pixels"
  height = "pixels"
  enabled = "Yes" or "No"
  visible = "Yes" or "No"
  OnChange = "ActionScript expression"
  tooltip = "Tip text"
  ...ColdFusion forms controls
</cformgroup>
or
<cformgroup
  type = "repeater"
  query = "query object"
  startrow = "row number"
  maxrows = "integer">
  ...ColdFusion forms controls
</cformgroup>
```

## History

ColdFusion MX 7: Added this tag.

## Attributes

The following table lists the attributes and their behavior in Flash forms. For XML, if not otherwise noted, the attribute is passed to the XML but is not interpreted by the basic XSL style sheet provided with ColdFusion MX.

**Note:** Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML

| Attribute | Req/Opt;<br>Formats        | Default | Description   |
|-----------|----------------------------|---------|---|
| type      | Required;<br>Flash and XML |         | <p><b>XML:</b> Can be any XForms group type defined in the XSLT. The XSL skins provided with ColdFusion MX support the following types:</p> <ul style="list-style-type: none"><li>horizontal: align child tags horizontally within a form and put this tag's <code>label</code> attribute to the left of the children.</li><li>vertical: align child tags vertically within a form and put this tag's <code>label</code> attribute to the left of the children.</li><li>fieldset: corresponds to the HTML <code>fieldset</code> tag, which groups its children, typically by drawing a box around them and replacing part of the top line with legend text. To specify the legend, use the <code>label</code> attribute. To specify the box dimensions, use the <code>style</code> attribute with <code>height</code> and <code>width</code> values. You must explicitly use <code>cfformgroup type="vertical"</code> inside this formgroup to align its child tags vertically.</li></ul> <p><b>Flash:</b> Must be one of the following:</p> <ul style="list-style-type: none"><li>repeater: dynamically creates an instance of the <code>cfformgroup</code>'s child tag or tags for each row of a query object, without requiring ColdFusion to recompile the Flash SWF file when the number of rows changes.</li><li>horizontal: aligns child tags horizontally within a form and put this tag's <code>label</code> attribute to the left of the children. Use this tag to arrange individual controls horizontally.</li><li>vertical: aligns child tags vertically within a form and puts this tag's <code>label</code> attribute to the left of the children. Use this tag to arrange individual controls vertically.</li><li>hbox: aligns children horizontally. Use this type to arrange groups of form controls horizontally. Do not use this attribute to align individual controls horizontally, because the child controls do not align properly; use the horizontal type instead.</li><li>vbox: aligns children vertically. Use this type to arrange groups of controls vertically. Do not use this attribute to align individual controls vertically, as the child controls will not align properly; use the vertical type instead.</li></ul> |

| Attribute           | Req/Opt;<br>Formats   | Default | Description  |
|---------------------|---|---------|--|
| type<br>(continued) |   |         | <ul style="list-style-type: none"> <li>• <code>hdividedbox</code>: aligns children horizontally. Each child is in a box with a border, and there are dividers between the boxes that users can move to change the relative sizes of the children. Use a tag with this attribute to arrange groups of form controls horizontally. You cannot use this attribute to align individual controls horizontally.</li> <li>• <code>vdividedbox</code>: aligns children vertically. Each child is in a box with a border, and there are dividers between the boxes that users can move to change the relative sizes of the children. Use this type to group form controls, for example as a unit in an <code>hbox</code> form group. Do not use this attribute to align individual tags vertically.</li> <li>• <code>panel</code>: a container consisting of a title bar containing the <code>label</code> attribute text, a border, and a content area with vertically arranged children.</li> <li>• <code>tile</code>: places the children in a rectangular grid.</li> <li>• <code>accordion</code>: places each child in a pleat of an expanding and contracting accordion. Define each pleat using a <code>cfformgroup type="page"</code> tag.</li> <li>• <code>tabnavigator</code>: places the children in a tabbed dialog box. Define each tab using a <code>cfformgroup type="page"</code> tag.</li> <li>• <code>page</code>: places the children tags, aligned vertically, in a single tab of a parent <code>tabnavigator</code> or pleat of an accordion container.</li> </ul> |
| query               | Required for<br><code>type=</code><br><code>repeater</code> ,<br>ignored<br>otherwise;<br>Flash |         | The query to use with the <code>repeater</code> . Flash creates an instance of each of the <code>cfformgroup</code> tag's child tags for each row in the query. You can use the <code>bind</code> attribute in the child tags to use data from the query row for the instance.   |
| startrow            | Optional;<br>Flash  | 0       | Used only for the <code>repeater</code> type; ignored otherwise. Specifies the row number of the first row of the query to use in the Flash form repeater. This attribute is zero-based: the first row is row 0, not row 1 (as in most ColdFusion tags).   |
| maxrows             | Optional;<br>Flash  |         | Used only for the <code>repeater</code> type; ignored otherwise. Specifies the maximum number of query rows to use in the Flash form repeater. If the query has more rows than the sum of the <code>startrow</code> attribute and this value, the repeater does not use the remaining rows.  |

| Attribute     | Req/Opt;<br>Formats        | Default | Description   |
|---------------|----------------------------|---------|---|
| label         | Optional;<br>Flash and XML |         | Label to apply to the form group.<br>In Flash, does the following: <ul style="list-style-type: none"> <li>For a page or panel form group, determines the label to put on the corresponding accordion pleat, the tabnavigator tab, or the panel title bar. For a Flash horizontal or vertical form group, specifies the label to put to the left of the group.</li> <li>Ignored in Flash for repeater, hbox, hdividedbox, vbox, vdividedbox, tile, accordion, and tabnavigator types.</li> </ul> |
| style         | Optional;<br>Flash and XML |         | <b>Flash:</b> A Flash style specification in CSS format. For detailed information on specifying Flash styles, see Chapter 29, “Creating Forms in Macromedia Flash” in <i>ColdFusion MX Developer’s Guide</i> .<br><b>XML:</b> An inline CSS style specification.  |
| selectedIndex | Optional;<br>Flash only    |         | Used only for accordion and tabnavigator types; ignored otherwise. Specifies the page control to display as open, where 0 (not 1) specifies the first page control defined in the group.  |
| width         | Optional;<br>Flash and XML |         | Width of the group container, in pixels. If you omit this attribute, Flash automatically sizes the container width. Ignored for Flash repeater type.  |
| height        | Optional;<br>Flash         |         | Height of the group container, in pixels. If you omit this attribute, Flash automatically sizes the container height. Ignored for Flash repeater type.  |
| enabled       | Optional;<br>Flash         | Yes     | Boolean value specifying whether the controls in the form group are enabled. Disabled controls appear in light gray.  |
| visible       | Optional;<br>Flash         | Yes     | Boolean value specifying whether the controls in the form group are visible. If the controls are invisible, the space that would be occupied by visible controls is blank.  |
| onChange      | Optional;<br>Flash         |         | Tabnavigator and accordion types only: ActionScript expression or expressions to execute when a new tab or accordion page is selected.<br><b>Note:</b> The onChange event occurs when the form first appears.   |
| tooltip       | Optional;<br>Flash         |         | Text to display when the mouse pointer hovers in the form group area. If a control in the form group also specifies a tooltip, Flash displays the control’s tooltip when the mouse pointer hovers over the control.   |

### Usage

This tag requires an end tag. This tag is ignored if the `cfform` type is HTML; any tag body’s contents are interpreted as if the surrounding `cfformgroup` does not exist.

In Flash format forms, this tag organizes the contents of the form. It groups and arranges child tags. The body of this tag can contain the following tags; all other tags and text are ignored:

- `cfformgroup`
- `cfformitem`
- `cfcalendar`
- `cfgrid`
- `cfinput`
- `cfselect`
- `cftextarea`
- `cftree`

For more information on using this tag in Flash forms, see Chapter 29, “Creating Forms in Macromedia Flash” in *ColdFusion MX Developer’s Guide*.

In XML format, ColdFusion passes the tag and its attributes to the XML; it is the responsibility of the skin XSLT to handle the XML. The ColdFusion basic skin supports the `horizontal`, `vertical`, and `dualselectlist` styles only. For more information on using this tag in XML forms, see Chapter 29, “Creating Forms in Macromedia Flash” in *ColdFusion MX Developer’s Guide*.

### Example

For a simple example of an XML form that uses a single `cfformgroup` tag, see `cfform`.

The following example shows how to use the `cfformgroup` tag to arrange elements on a Flash form. It creates an `hdividedbox` container that has a `vbox` container on each side. The left box has heading text and two radio buttons. The right box has heading text and three check boxes.

```
<h3>Simple cfformgroup Example</h3>
<cfform name="myform" height="450" width="500" format="Flash" >
  <cfformgroup type="hdividedbox" >
    <cfformgroup type="VBox">
      <cfformitem type="text" height="20">
        Pets:
      </cfformitem>
      <cfinput type="Radio" name="pets" label="Dogs" value="Dogs"
        checked>
      <cfinput type="Radio" name="pets" label="Cats" value="Cats">
    </cfformgroup>

    <cfformgroup type="VBox">
      <cfformitem type="text" height="20">
        Fruits:
      </cfformitem>
      <cfinput type="Checkbox" name="chk1" Label="Apples"
        value="Apples">
      <cfinput type="Checkbox" name="chk2" Label="Bananas"
        value="Bananas">
      <cfinput type="Checkbox" name="chk3" Label="Pears"
        value="Pears">
    </cfformgroup>
```

```
</cfformgroup>
</cfform>
```

The following more complex example shows more fully how you can use `cfformgroup` tags to arrange controls in a Flash form. It also shows many of the text formatting features that you can use in a text `cfformgroup` body. When you submit the form, the page dumps the contents of the Forms scope, to show you the submitted data.

```
<h2>cfformgroup Example</h2>
<cfif IsDefined("form.oncethrough")>
  <h3>The form submitted the following information to ColdFusion MX:</h3>
  <cfdump var="#form#"><br><br><br>
</cfif>

<h3>A Flash form using cfformgroup tags</h3>
<cfform name="myform" height="450" width="500" format="Flash">

<!-- The following formgroup shows how you can present formatted text. -->
  <cfformitem type="html">
    <b><font color="#FF0000" size="+4" face="serif">
      This form has two tabs, asking for the following:</font></b><br>
    <li>contact information</li>
    <li><i>preferences</i></li>
    <b>Try entering information on both tabs</b><br>
    Submit the form and see what ColdFusion gets in the Forms scope.</b><br>
    <a href="http://www.macromedia.com/" target="_blank">
      <font color="#0000FF"><u>
        This link displays the Macromedia home page in a new browser window
      </u></font></a><br>
    &nbsp;<br>
  </cfformitem>

  <!-- Use a tabnavigator with two tabs for user input. -->
  <cfformgroup type="tabnavigator" height="220">
    <cfformgroup type="page" label="Contact Information">
      <!-- Align the first and last name fields horizontally -->
      <cfformgroup type="horizontal" label="Your Name">
        <cfinput type="text" required="Yes" name="firstName" label="First"
          value="" width="100"/>
        <cfinput type="text" required="Yes" name="lastName" label="Last"
          value="" width="100"/>
      </cfformgroup>
      <cfformitem type="html"><textformat indent="95"><font size="-2">
        Flash fills the email field in automatically.
        You can replace any of the text.
      </font></textformat>
    </cfformitem>
    <!-- The bind attribute gets the field contents from the firstname
        and lastName fields as they get filled in. -->
    <cfinput type="text" name="email" label="email"
      bind="{firstName.text}.{lastName.text}@mm.com">

    <cfinput type="text" name="phone" validate="telephone" required="Yes"
      label="Phone Number">
  </cfformgroup>
```

```

<cfformgroup type="page" label="Preferences">
  <cfformitem type="text" height="30">
    <b>Tell us your preferences</b>
  </cfformitem>
  <!-- Put the pet selectors to the left of the fruit selectors. -->
  <cfformgroup type="hbox">
    <!-- Group the pet selector box contents, aligned vertically. -->
    <cfformgroup type="vbox">
      <cfformitem type="text" height="20">
        Pets:
      </cfformitem>
      <cfformgroup type="vertical">
        <cfinput type="Radio" name="pets" label="Dogs" value="Dogs"
          checked>
        <cfinput type="Radio" name="pets" label="Cats" value="Cats">
      </cfformgroup>
    </cfformgroup>
  <!-- Group the fruit selector box contents, aligned vertically. -->
  <cfformgroup type="vbox">
    <cfformitem type="text" height="20">
      Fruits:
    </cfformitem>
    <cfformgroup type="tile" width="200" label="Tile box">
      <!-- Flash requires unique names for all controls -->
      <cfinput type="Checkbox" name="chk1" Label="Apples"
        value="Apples">
      <cfinput type="Checkbox" name="chk2" Label="Bananas"
        value="Bananas">
      <cfinput type="Checkbox" name="chk3" Label="Pears"
        value="Pears">
      <cfinput type="Checkbox" name="chk4" Label="Oranges"
        value="Oranges">
      <cfinput type="Checkbox" name="chk5" Label="Grapes"
        value="Grapes">
      <cfinput type="Checkbox" name="chk6" Label="Cumquats"
        value="Cumquats">
    </cfformgroup>
  </cfformgroup>
</cfformgroup>
</cfformgroup>
</cfformgroup>
</cfformgroup>

<cfformgroup type="horizontal">
  <cfinput type="submit" name="submit" width="100" value="Show Results">
  <cfinput type="reset" name="reset" width="100" value="Reset Fields">
  <cfinput type="hidden" name="oncethrough" value="Yes">
</cfformgroup>
</cfform>

```

# cfformitem

## Description

Inserts a horizontal line, a vertical line, a spacer, or text in a Flash form. Used in the `cfform` or `cfformgroup` tag body for Flash and XML forms. Ignored in HTML forms.

## Category

[Forms tags](#)

## Syntax

```
<cfformitem
  type = "hrule, vrule, or spacer"
  style = "style specification"
  width = "pixels"
  height = "pixels"
  visible = "Yes" or "No"/>
```

or

```
<cfformitem
  type= "html or text"
  style = "style specification"
  width = "pixels"
  height = "pixels"
  visible = "Yes" or "No"
  enabled = "Yes" or "No"
  tooltip = "Tip text"
  bind = "bind expression">
  ...text
</cfformitem>
```

## History

ColdFusion MX 7: Added tag

## Attributes

The following table lists the attributes and their behavior in Flash forms. For XML format, if not otherwise noted, the attribute is passed to the XML but is not interpreted by the basic XSL style sheet provided with ColdFusion MX.

**Note:** Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML in all controls except text and html types.

| Attribute | Req/Opt;<br>Formats           | Default | Description   |
|-----------|-------------------------------|---------|---|
| type      | Required;<br>Flash and<br>XML |         | <p>Flash:</p> <ul style="list-style-type: none"><li>• <b>html:</b> place the text in the body of this tag on the form. For Flash forms, you can use the following text formatting tags, most of which correspond to HTML tags, in the text: <code>a</code>, <code>b</code>, <code>br</code>, <code>font</code>, <code>i</code>, <code>img</code>, <code>li</code>, <code>p</code>, <code>textformat</code>, and <code>u</code>. For details on using these formatting tags, see the Flash documentation. The <code>style</code> attribute has no effect on the format of the text in type.</li><li>• <b>text:</b> place the text in the body of this tag on the form verbatim, without interpreting any markup. You can control the overall appearance of the text by using the <code>style</code> attribute.</li><li>• <b>spacer:</b> places an invisible spacer of the specified height and width on the form. Used to place space between form controls. This tag must not have any children.</li><li>• <b>hrule:</b> places a horizontal rule on the form. This tag must not have any children.</li><li>• <b>vrule:</b> places a vertical rule on the form. This tag must not have any children.</li></ul> <p>XML:</p> <ul style="list-style-type: none"><li>• <b>html:</b> puts the CFML tag's body text in a CDATA section in an XML <code>xf:output</code> element.</li><li>• <b>text:</b> XML-formats (escapes characters such as <code>&lt;</code>) the CFML tag's body text and puts it in a CDATA section in an XML <code>xf:output</code> element.</li><li>• <b>hrule:</b> puts an <code>hr</code> tag in the output. Use the <code>style</code> attribute to specify all rule characteristics, including height and width. This tag must not have any children.</li><li>• <b>Any other string:</b> generates an XML <code>xf:group</code> element with the type name as the <code>appearance</code> attribute. The CFML tag body is put in a CDATA section in a <code>cf:attribute name="body"</code> element. The XSL transforms provided with ColdFusion MX ignore these elements.</li></ul> |
| style     | Optional;<br>Flash and<br>XML |         | <p><b>Flash:</b><br/>Must be a style specification in CSS format. Ignored if the <code>type</code> attribute is <code>html</code> or <code>text</code>. For detailed information on specifying Flash styles, see Chapter 29, "Creating Forms in Macromedia Flash" in <i>ColdFusion MX Developer's Guide</i>. Not used with the <code>spacer</code> type.</p> <p><b>XML:</b><br/>ColdFusion passes the <code>style</code> attribute to the XML. ColdFusion skins include the <code>style</code> attribute in the generated HTML.</p>   |

| Attribute | Req/Opt;<br>Formats | Default | Description   |
|-----------|---------------------|---------|---|
| width     | Optional;<br>Flash  |         | Width of the item, in pixels. If you omit this attribute, Flash automatically sizes the width. In ColdFusion XSL skins, use the <code>style</code> attribute, instead.  |
| height    | Optional;<br>Flash  |         | Height of the item, in pixels. If you omit this attribute, Flash automatically sizes the width. In ColdFusion XSL skins, use the <code>style</code> attribute, instead.   |
| enabled   | Optional;<br>Flash  | Yes     | Boolean value specifying whether the control is enabled. Disabled text appear in light gray. Has no effect on spacers and rules.  |
| visible   | Optional;<br>Flash  | Yes     | Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank. Has no effect on spacers.  |
| tooltip   | Optional;<br>Flash  |         | Text to display when the mouse pointer hovers over the control. Has no effect on spacers.   |
| bind      | Optional;<br>Flash  |         | A Flash bind expression that populates the field with information from other form fields. If you use this attribute, ColdFusion MX ignores any text that you specify in the body of the <code>cftextitem</code> tag. This attribute can be useful if the <code>cfformitem</code> tag is in a <code>cfformgroup type="repeater"</code> tag. See Usage. For details, see <a href="#">“Flash form data binding”</a> in the <code>cfinput</code> tag description. |

**Note:** Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML in all controls except text and html types.

## Usage

This tag requires an end tag or a slash before the closing end character of the opening tag, as the following example shows:

```
<cfformitem type="hrule" />
```

For more information on using this tag in Flash forms, see Chapter 29, “Creating Forms in Macromedia Flash” in *ColdFusion MX Developer’s Guide*.

## Example

The following example shows a simple Flash form using horizontal rules and text:

```
<h3>cfformitem Example</h3>
<cfform name="myform" height="450" width="500" format="Flash" >
  <cfformitem type="hrule" />
  <cfformitem type="text">
    This simple form has two hrule cfformitem tags around the cfformitem tag
    that contains this text.
  </cfformitem>
  <cfformitem type="hrule" />
</cfform>
```

For a more complex form, see [cfformgroup](#).

# cfftp

## Description

Lets users implement File Transfer Protocol (FTP) operations.

## Category

[File management tags](#), [Internet Protocol tags](#)

## Syntax

The tag syntax depends on the `action` attribute value. See the following sections:

- “[cfftp: Opening and closing FTP server connections](#)” on page 171
- “[cfftp: Connection: File and directory operations](#)” on page 174
- “[cfftp action = "listDir"](#)” on page 178

## See also

[cfhttp](#), [cfldap](#), [cfmail](#), [cfpop](#); “Performing file operations with `cfftp`” in Chapter 40, “Interacting with Remote Servers,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `result` attribute for file and directory operations.

ColdFusion MX: Deprecated the `agentname` attribute. It might not work, and might cause an error, in later releases.

## Usage

Use this tag to move files between a ColdFusion server and an FTP server.

This tag does not move files between a ColdFusion server and a client browser. You do this as follows:

- To transfer files from a client to a ColdFusion server: `cffile` `action = "upload"`
- To transfer files from a ColdFusion server to a client: the `cfcontent` tag

## Security settings

ColdFusion MX security settings can prevent the `cfftp` tag from executing. If you run ColdFusion applications on a server that is used by multiple customers, consider the security of the files that the customer can move. For more information, see the “Administering Security” section of *Configuring and Administering ColdFusion MX*.

# cfftp: Opening and closing FTP server connections

## Description

To establish a connection with an FTP server, you use the `open` action with a `connection` attribute.

## Syntax

```
<cfftp
  action = "action"
  username = "name"
  password = "password"
  server = "server"
  timeout = "timeout in seconds"
  port = "port"
  connection = "name"
  proxyServer = "proxy server"
  retryCount = "number"
  stopOnError = "yes" or "no"
  passive = "yes" or "no">
```

## See also

[cfhttp](#), [cfldap](#), [cfmail](#), [cfpop](#)

## Attributes

| Attribute                | Req/Opt  | Default | Description  |
|--------------------------|--|---------|--|
| <code>action</code>      | Required   |         | FTP operation to perform. <ul style="list-style-type: none"><li><code>open</code>: creates an FTP connection</li><li><code>close</code>: terminates an FTP connection</li></ul>  |
| <code>username</code>    | Required if <code>action = "open"</code>                               |         | User name to pass in the FTP operation.  |
| <code>password</code>    | Required if <code>action = "open"</code>                               |         | Password to log in the user.   |
| <code>server</code>      | Required if <code>action = "open"</code>                               |         | FTP server to which to connect; for example, <code>ftp.myserver.com</code>   |
| <code>timeout</code>     | Optional   | 30      | Value in seconds for the timeout of all operations, including individual data request operations.  |
| <code>port</code>        | Optional   | 21      | Remote port to which to connect.   |
| <code>connection</code>  | Optional, but always used with <code>open</code> or <code>close</code> |         | Name of the FTP connection. If you specify the <code>username</code> , <code>password</code> , and <code>server</code> attributes, and if no connection exists for them, ColdFusion creates one. Calls to <code>cfftp</code> with the same connection name reuse the connection. |
| <code>proxyServer</code> | Optional   |         | String. Name of proxy server (or servers) to use, if proxy access is specified.  |

| Attribute   | Req/Opt  | Default | Description   |
|-------------|----------|---------|---|
| retryCount  | Optional | 1       | Number of retries until failure is reported.  |
| stopOnError | Optional | no      | <ul style="list-style-type: none"> <li>• yes: halts processing, displays an appropriate error.</li> <li>• no: populates these variables: <ul style="list-style-type: none"> <li>▪ cfftp.succeeded - yes or no.</li> <li>▪ cfftp.errorCode - Error number. See the IETF Network Working Group RFC 959: File Transfer Protocol (FTP) <a href="http://www.ietf.org/rfc/rfc0959.txt">www.ietf.org/rfc/rfc0959.txt</a>.</li> <li>▪ cfftp.errorText - Message text.</li> </ul> </li> </ul> <p>For conditional operations, use <code>cfftp.errorCode</code>. Do not use <code>cfftp.errorText</code> for this purpose.</p> |
| passive     | Optional | no      | <ul style="list-style-type: none"> <li>• yes: enables passive mode.</li> <li>• no</li> </ul>  |

### Usage

When you establish a connection with `cfftp action="open"` and specify a name in the `connection` attribute, ColdFusion caches the connection so that you can reuse it to perform additional FTP operations. When you use a cached connection for subsequent FTP operations, you do not have to specify the `username`, `password`, or `server` connection attributes. The FTP operations that use the same `connection` name automatically use the information stored in the cached connection. Using a cached connection helps save connection time and improves file transfer performance.

You do not need to open a connection for single, simple, FTP operations, such as `GetFile` or `PutFile`.

To keep a connection open throughout a session or longer, put the connection name in the `Session` or `Application` scope; for example, specify `connection="Session.FTPConnection"`. However, if you do this, you must specify the full variable name in all FTP operations, and you must use the `close` action when you are finished. Keeping a connection open prevents others from using the FTP server; so close a connection as soon as possible. If you do not assign the connection name to `Session` or `Application` variable, the connection remains open for the current page only, and you do not have to close it manually.

Changes to a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

### Example

```
<p>cfftp lets users implement File Transfer Protocol operations.
  By default, cfftp caches an open connection to an FTP server.
<p>cfftp operations are usually of two types:
<ul>
  <li>Establishing a connection
  <li>Performing file and directory operations
</ul>
<p>This example opens and verifies a connection, lists the files in a
  directory, and closes the connection.
<p>Open a connection
<cfftp action = "open"
```

```
username = "anonymous"
connection = "My_query"
password = "youremail@email.com"
server = "ftp.tucows.com"
stopOnError = "Yes">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
<p>List the files in a directory:
<cfftp action = "LISTDIR"
    stopOnError = "Yes"
    name = "ListFiles"
    directory = "/"
    connection = "my_query">
<cfoutput query = "ListFiles">
    #name#<br>
</cfoutput>

<p>Close the connection:
<cfftp action = "close"
connection = "My_query"
stopOnError = "Yes">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
```

## cfftp: Connection: File and directory operations

### Description

Use this form of the `cfftp` tag to perform file and directory operations with `cfftp`.

### Syntax

```
<cfftp
  action = "action"
  username = "name"
  password = "password"
  name = "query_name"
  server = "server"
  ASCIIExtensionList = "extensions"
  transferMode = "mode"
  failIfExists = "yes" or "no"
  directory = "directory name"
  localFile = "filename"
  remoteFile = "filename"
  item = "directory or file"
  existing = "file or directory name"
  new = "file or directory name"
  proxyServer = "proxy server"
  passive = "yes" or "no">
  result = "result_name"
```

### Attributes

| Attribute             | Req/Opt                                  | Default | Description  |
|-----------------------|--|---------|--|
| <code>action</code>   | Required if connection is not cached     |         | FTP operation to perform: <ul style="list-style-type: none"><li>• <code>changedir</code></li><li>• <code>createDir</code></li><li>• <code>listDir</code></li><li>• <code>removeDir</code></li><li>• <code>getFile</code></li><li>• <code>putFile</code></li><li>• <code>rename</code></li><li>• <code>remove</code></li><li>• <code>getCurrentDir</code></li><li>• <code>getCurrentURL</code></li><li>• <code>existsDir</code></li><li>• <code>existsFile</code></li><li>• <code>exists</code></li></ul> |
| <code>username</code> | Required if connection is not cached     |         | User name to pass in the FTP operation.  |
| <code>password</code> | Required if <code>action</code> = "open" |         | Password to log in the user.   |

| Attribute          | Req/Opt  | Default                                      | Description  |
|--------------------|--|--|--|
| name               | Required if action = "listDir"   |  | Query name of directory listing.   |
| server             | Required if FTP connection is not cached                                 |  | FTP server to which to connect; for example, ftp.myserver.com.   |
| ASCIIExtensionList | Optional   | txt;htm;html;cfm;cfml;shtm;shtml;css;asp;asa | Delimited list of file extensions that force ASCII transfer mode, if transferMode = "auto".  |
| transferMode       | Optional   | Auto   | <ul style="list-style-type: none"> <li>• ASCII FTP transfer mode</li> <li>• Binary FTP transfer mode</li> <li>• Auto FTP transfer mode</li> </ul>  |
| failIfExists       | Optional   | yes  | <ul style="list-style-type: none"> <li>• yes: if a local file with same name exists, the getFile action will fail.</li> <li>• no</li> </ul>  |
| directory          | Required if action = "changedir", "createDir", "listDir", or "existsDir" |  | Directory on which to perform an operation.  |
| localFile          | Required if action = "getFile" or "putFile"                              |  | Name of the file on the local file system.   |
| remoteFile         | Required if action = "getFile", "putFile", or "existsFile"               |  | Name of the file on the FTP server file system.  |
| item               | Required if action = "exists" or "remove"                                |  | Object of these actions: file or directory.  |
| existing           | Required if action = "rename"  |  | Current name of the file or directory on the remote server.  |
| new                | Required if action = "rename"  |  | New name of file or directory on the remote server.  |
| proxyServer        | Optional   |  | String. Name of the proxy server (s) to use, if proxy access is specified.   |
| passive            | Optional   | no   | <ul style="list-style-type: none"> <li>• yes: enables passive mode.</li> <li>• no</li> </ul>   |
| result             | Optional   |  | Specifies a name for the structure in which cfftp stores the returnValue variable. If set, this value replaces cfftp as the prefix to use when accessing returnValue. See the Usage section for more information |

## Usage

If you use connection caching to an active FTP connection, you do not have to respecify the username, password, or server connection attributes.

Changing a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

If `action = "listDir"`, the attributes `column` returns `directory` or `normal`. Other platform-specific values, such as `hidden` and `system`, are no longer supported.

If `action = "listDir"`, a mode `column` is returned. The column contains an octal string representation of UNIX permissions; for example, "777."

The `cfftp.returnValue` variable provides the return value for these actions:

- `getCurrentDir`
- `getCurrentURL`
- `existsDir`
- `existsFile`
- `exists`

For more information, see *ColdFusion MX Developer's Guide*.

**Caution:** Object (file and directory) names are case-sensitive.

### Action (cfftp.returnValue variable)

The results of an action determine the value of the `returnValue` variable, as the following table shows:

| <b>cfftp action</b>        | <b>Value of cfftp.returnValue</b> |
|----------------------------|-----------------------------------|
| <code>getCurrentDir</code> | String. Current directory.        |
| <code>getCurrentURL</code> | String. Current URL.              |
| <code>existsDir</code>     | yes or no.                        |
| <code>existsFile</code>    | yes or no.                        |
| <code>exists</code>        | yes or no.                        |

To access the `returnValue` variable, you must prefix it with either `cfftp` or the value specified by the `result` attribute, if it is set. The `result` attribute provides a way for `cfftp` calls from multiple pages, possibly at the same time, to avoid overwriting the results of one with another. If you set the `result` attribute to `myResult`, for example, you would access the `returnVariable` variable as `myResult.returnValue`. Otherwise, you would access it as `cfftp.returnValue`.

## Example

The following example opens a connection and gets a file listing showing file or directory name, path, URL, length, and modification date:

```
<p>Open a connection
<cffftp connection = "myConnection"
  username = "myUserName"
  password = "myUserName@allaire.com"
  server = "ftp.allaire.com"
  action = "open"
  stopOnError = "Yes">

<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>
<cffftp connection = "myConnection"
  action = "LISTDIR"
  stopOnError = "Yes"
  name = "ListDirs"
  directory = "/">

<p>FTP Directory Listing:<br>
<cftable query = "ListDirs" HTMLTable = "Yes" colHeaders = "Yes">
  <cfcol header = "<b>Name</b>" text = "#name#">
  <cfcol header = "<b>Path</b>" text = "#path#">
  <cfcol header = "<b>URL</b>" text = "#url#">
  <cfcol header = "<b>Length</b>" text = "#length#">
  <cfcol header = "<b>LastModified</b>"
    text = "#DateFormat(lastmodified)#">
  <cfcol header = "<b>IsDirectory</b>" text = "#isdirectory#">
</cftable>

<p>Move Image File to Remote Server:<br></p>
<!-- The image will be put into the root directory of the FTP server unless
otherwise noted.
i.e. remoteFile = "somewhere_put.jpg" vs remoteFile = "/support/
somewhere_put.jpg"
-->
<cffftp
connection = "myConnection"
action = "putFile"
name = "uploadFile"
transferMode = "binary"
localFile = "C:\files\upload\somewhere.jpg"
remoteFile = "somewhere_put.jpg"
>
<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>

<p>Close the connection:
<cffftp connection = "myConnection"
  action = "close"
  stopOnError = "Yes">
<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>
```

## cfftp action = "listDir"

### Description

To access the columns in a query object, use this tag with `action = "listDir"`.

### Usage

When you use this action, you must specify a value for the `name` attribute. This value holds the results of the `listDir` action in a query object. The query object consists of columns that you can reference, in the form `queryname.columnname[row]`, where `queryname` is the name of the query, specified in the `name` attribute; and `columnname` is a column returned in the query object. The value `row` is the row number of each file/directory entry returned by the `listDir` operation. A separate row is created for each entry:

| cfftp query object column | Description   |
|---------------------------|---|
| Name                      | Filename of the current element.                                |
| Path                      | File path (without drive designation) of the current element.   |
| URL                       | Complete URL for the current element (file or directory).       |
| Length                    | File size of the current element.                               |
| LastModified              | Unformatted date/time value of the current element.             |
| Attributes                | String. Attributes of the current element: normal or Directory. |
| IsDirectory               | Boolean. Whether object is a file or directory.                 |
| Mode                      | Applies only to UNIX and Linux. Permissions. Octal string.      |

**Note:** Previously supported query column values that pertain to system-specific information are not supported; for example, `hidden` and `system`.

# cfunction

## Description

Defines a function that you can call in CFML. Required to define ColdFusion component methods.

## History

ColdFusion MX 7: Added the XML value to the `returnType` attribute.

ColdFusion MX: Added this tag.

## Category

[Extensibility tags](#)

## Syntax

```
<cfunction
  name = "methodName"
  returnType = "dataType"
  roles = "securityRoles"
  access = "methodAccess"
  description = "function description"
  output = "yes" or "no"
  displayName = "name"
  Hint = "hint text">
```

## See also

[cfargument](#), [cfcomponent](#), [cfinvoke](#), [cfinvokeargument](#), [cfobject](#), [cfproperty](#), [cfreturn](#)

## Attributes

| Attribute  | Req/Opt  | Default    | Description   |
|------------|--|------------|---|
| name       | Required   |            | A string; a component method that is used within the <code>cfcomponent</code> tag.  |
| returnType | Required for a web service; Optional, otherwise. | any        | String; a type name; data type of the function return value: <ul style="list-style-type: none"><li>• any</li><li>• array</li><li>• binary</li><li>• boolean</li><li>• date</li><li>• guid - The argument must be a UUID or GUID of the form <code>xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx</code> where each <code>x</code> is a character representing a hexadecimal number (0-9A-F).</li><li>• numeric</li><li>• query</li><li>• string</li><li>• struct</li><li>• uuid: the argument must be a ColdFusion UUID of the form <code>xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx</code> where each <code>x</code> is a character representing a hexadecimal number (0-9A-F).</li><li>• <code>variableName</code>: a string formatted according to ColdFusion variable naming conventions.</li><li>• <code>void</code>: does not return a value</li><li>• <code>xml</code>: allows web service functions to return CFML XML objects and XML strings.</li><li>• a component name: if the type attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</li></ul> |
| roles      | Optional   | "" (empty) | A comma-delimited list of ColdFusion security roles that can invoke the method. Only users who are logged in with the specified roles can execute the function. If this attribute is omitted, all users can invoke the method.  |

| Attribute   | Req/Opt  | Default                                     | Description  |
|-------------|----------|---|--|
| access      | Optional | public                                      | The client security context from which the method can be invoked: <ul style="list-style-type: none"> <li>private: available only to the component that declares the method and any components that extend the component in which it is defined.</li> <li>package: available only to the component that declares the method, components that extend the component, or any other components in the package.</li> <li>public: available to a locally executing page or component method.</li> <li>remote: available to a locally or remotely executing page or component method, or a remote client through a URL, Flash, or a web service. To publish the function as a web service, this option is required.</li> </ul> |
| description | Optional |   | Supplies a short text description of the function.   |
| output      | Optional | Function body is processed as standard CFML | Specifies under which conditions the function can generate HTML output. <ul style="list-style-type: none"> <li>yes: the entire function body is processed as if it were within a <code>cfoutput</code> tag. Variables names surrounded by number signs (#) are automatically replaced with their values.</li> <li>no: the function is processed as if it were within a <code>cfsilent</code> tag</li> </ul> If you do not specify this attribute, the function body is processed as standard CFML. Any variables must be in <code>cfoutput</code> tags.  |
| displayname | Optional |   | Meaningful only for CFC method parameters. A value to be displayed in parentheses following the function name when using introspection to show information about the CFC.  |
| hint        | Optional |   | Meaningful only for CFC method parameters. Text to be displayed when using introspection to show information about the CFC. The <code>hint</code> attribute value follows the syntax line in the function description.   |

## Usage

The `cffunction` tag can define a function that you call in the same manner as a ColdFusion built-in function.

To define a ColdFusion component (CFC) method, you must use a `cffunction` tag.

The following example shows `cffunction` tag attributes for a simple CFC method that returns a ColdFusion Query object.

```
<cffunction
  name="getEmployees"
  access="remote"
  returnType="query"
  hint="This query returns all records in the employee database. It can
  drill-down or narrow the search, based on optional input parameters.">
```

For information on using the `cffunction` tag for ColdFusion components, see Chapter 10, “Building and Using ColdFusion Components” in *ColdFusion MX Developer’s Guide*.

If you specify a `roles` attribute, the function executes only if a user is logged in and belongs to one of the specified roles.

If you specify `variableName` for the `returnType` attribute, the function must return a string that is in ColdFusion variable name format; that is, the function must return a string that starts with a letter, underscore, or Unicode currency symbol, and consist of letters, numbers, and underscores (—), periods, and Unicode currency symbols, only. ColdFusion does not check whether the value corresponds to an existing ColdFusion variable.

### Example

```
<cfcomponent>
  <cffunction name="getEmp">
    <cfquery
      name="empQuery" datasource="ExampleApps" >
      SELECT FIRSTNAME, LASTNAME, EMAIL
      FROM tblEmployees
    </cfquery>
    <cfreturn empQuery>
  </cffunction>
  <cffunction name="getDept">
    <cfquery
      name="deptQuery" datasource="ExampleApps" >
      SELECT *
      FROM tblDepartments
    </cfquery>
    <cfreturn deptQuery>
  </cffunction>
</cfcomponent>
```

# cfgraph

## Description

This tag is deprecated. Use the `cfchart`, `cfchartdata`, and `cfchartseries` tags instead.

Displays data graphically.

## History

ColdFusion MX: Deprecated this tag. It works differently than it did in ColdFusion 5, and it might not work in later releases.

The incompatibilities between the ColdFusion MX implementation and earlier implementations of this tag are as follows:

| cfgraph tag attribute | ColdFusion MX functionality   |
|-----------------------|---|
| Title                 | Ignored.  |
| Titlefont             | Ignored.  |
| Barspacing            | Ignored.  |
| Bordercolor           | Color used for border, gridlines, and text displays.  |
| Colorlist             | List of colors to use for each data point for bar, pyramid, area, horizontalbar, cone, cylinder, step, and pie charts.  |
| Valuelabelfont        | Sets value label text font. If the <code>ValueLabelfont</code> , <code>ItemLabelfont</code> , and <code>Legendfont</code> values differ, ColdFusion uses the last value that you specify in the tag.<br>Arial is not supported; it is mapped to <code>Dialog</code> . |
| Itemlabelfont         | Sets item label text font. If the <code>ValueLabelfont</code> , <code>ItemLabelfont</code> , and <code>Legendfont</code> values differ, ColdFusion uses the last value that you specify in the tag.<br>Arial is not supported; it is mapped to <code>Dialog</code> .  |
| Legendfont            | Sets legend text font. If the <code>ValueLabelfont</code> , <code>ItemLabelfont</code> , and <code>Legendfont</code> values differ, ColdFusion uses the last value that you specify in the tag.<br>Arial is not supported; it is mapped to <code>Dialog</code> .      |
| ShowLegend            | <ul style="list-style-type: none"><li>• above, below, left, right: these options cause the legend to display, but have no effect on its location.</li><li>• none: prevents display of a legend.</li></ul>   |
| ValueLabelsize        | Sets value label text size. If the <code>ValueLabelsize</code> and <code>ItemLabelsize</code> values differ, ColdFusion uses the last value that you specify in the tag.  |
| ItemLabelsize         | Sets item label text size.  |
| ItemLabelorientation  | Ignored. ColdFusion calculates best orientation based on label and graph size.  |
| Borderwidth           | <ul style="list-style-type: none"><li>• a nonzero number: default-width border, regardless of number value.</li><li>• 0: no border.</li></ul>   |

---

| <b>cfgraph tag attribute</b> | <b>ColdFusion MX functionality</b>  |
|------------------------------|---|
| Depth                        | <ul style="list-style-type: none"> <li>• 0: displays graph with two-dimensional appearance.</li> <li>• any other value: displays graph with threedimensional appearance.</li> </ul>   |
| Linewidth                    | Ignored.  |
| Showvaluelabel               | <ul style="list-style-type: none"> <li>• yes: displays values on mouse-click.</li> <li>• no: suppresses value displays.</li> <li>• rollover: displays values on mouse-over.</li> </ul>  |
| Valuelocation                | Ignored.  |
| url                          | <p>URL of page to open if any item in the graph is clicked.</p> <p>The following variables may be used within the URL; they are substituted with real values before the URL is accessed:</p> <ul style="list-style-type: none"> <li>• "\$value\$": selected row/column value or an empty string.</li> <li>• "\$itemlabel\$": selected item (column) value or an empty string.</li> <li>• "\$serieslabel\$": selected series (row) value or an empty string.</li> <li>• "javascript:...": executes client side scripts.</li> </ul> |
| Urlcolumn                    | Ignored.  |
| Type="HorizontalBar"         | The (0,0) coordinate is located at the lower-left.  |
| ScaleFrom                    | If the smallest value in the data is less than scaleFrom or the largest value in the data is greater than scaleTo, the respective data value is used as the minimum or maximum on the Y scale. Therefore, regardless of the scaleFrom or scaleTo value, all data values display.  |

---

# cfgraphdata

## Description

This tag is deprecated. Use the [cfchart](#), [cfchartdata](#), and [cfchartseries](#) tags instead.

Displays a data point in a graph. Used within the [cfgraph](#) tag.

## History

ColdFusion MX: Deprecated this tag. It works differently than in ColdFusion 5 and might not work in later releases.

# cfgrid

## Description

Used within the `cfform` tag. Puts a grid control (a table of data) in a ColdFusion form. To specify grid columns and row data, use the `cfgridcolumn` and `cfgridrow` tags, or use the `query` attribute, with or without `cfgridcolumn` tags.

## Category

[Forms tags](#)

## Syntax

```
<cfgrid
  name = "name"
  format = "applet" or "Flash" or "xml"
  height = "integer"
  width = "integer"
  query = "query_name"
  selectMode = "mode"
  insert = "yes" or "no"
  delete = "yes" or "no"
  font = "column_font"
  fontSize = "size"
  italic = "yes" or "no"
  bold = "yes" or "no"
  textColor = "web color"
  gridLines = "yes" or "no"
  rowHeight = "pixels"
  colHeaders = "yes" or "no"
  colHeaderFont = "font_name"
  colHeaderFontSize = "size"
  colHeaderItalic = "yes" or "no"
  colHeaderBold = "yes" or "no"
  colHeaderTextColor = "web color"
  bgColor = "web color"
  maxRows = "number"
  The following works in Flash format only
  style= "style specification"
  enabled = "Yes" or "No"
  visible = "Yes" or "No"

### History

ColdFusion MX 7:

- Added the `format` attribute and support for Flash and XML output.
- Added `enabled`, `onChange`, `style`, `tooltip`, and `visible` attributes (Flash format only).

ColdFusion MX: Changed the `rowHeaderWidth` attribute: ColdFusion does not use the `rowHeaderWidth` attribute. You can omit it.

## Attributes

**Note:** In XML format, ColdFusion MX passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format grids, but do display applet and Flash format grids.

| Attribute  | Req/Opt;<br>Formats | Default  | Description   |
|------------|---------------------|--|---|
| name       | Required;<br>All    |  | Name of the grid control.   |
| format     | Optional;<br>All    | applet   | <ul style="list-style-type: none"><li>• applet: generates a Java applet.</li><li>• Flash: generates a Flash grid control.</li><li>• xml: generates an XML representation of the grid.<br/>In XML format forms, includes the generated XML in the form.<br/>In HTML format forms, puts the XML in a string variable with the name specified by the <code>name</code> attribute.</li></ul>  |
| height     | Optional;<br>All    | 300 (applet<br>only)                                 | Height of the control, in pixels.<br>If you omit the attribute in Flash format, the grid sizes automatically..  |
| width      | Optional;<br>All    | 300 (applet<br>only)                                 | Width of the control, in pixels.<br>If you omit the attribute in Flash format, the grid sizes automatically.  |
| query      | Optional;<br>All    |  | Name of the query associated with the control.  |
| selectMode | Optional;<br>All    | Applet<br>format:<br>Browse;<br>Flash<br>format: Row | Selection mode for items in the control. <ul style="list-style-type: none"><li>• Edit: user can edit grid data. Selecting a cell opens the editor for the cell type.</li><li>• Row: user selections automatically extend to the row that contains selected cell.</li></ul> The following are used in applet format only; Flash interprets these as Row: <ul style="list-style-type: none"><li>• Single: user selections are limited to selected cell.</li><li>• Column: user selections automatically extend to column that contains selected cell.</li><li>• Browse: user can only browse grid data.</li></ul> |
| font       | Optional;<br>All    |  | Font of text.   |
| fontSize   | Optional;<br>All    |  | Size of text, in points.  |
| italic     | Optional;<br>All    | no   | <ul style="list-style-type: none"><li>• yes: displays text in italics.</li><li>• no</li></ul>   |
| bold       | Optional;<br>All    | no   | <ul style="list-style-type: none"><li>• yes: displays text in bold.</li><li>• no</li></ul>  |

| Attribute          | Req/Opt;<br>Formats | Default | Description   |
|--------------------|---------------------|---------|---|
| textColor          | Optional;<br>All    | Black   | Color of text. Can be a hexadecimal value or a named color.<br>For a hexadecimal value, use the form " <code>##xxxxxx</code> ", where x = 0-9 or A-F; use two number signs or none.<br>For a list of the supported named colors, see <a href="#">cfchart</a> .                  |
| selectColor        | Optional;<br>All    |         | Background color for a selected item.<br>• Options: same as for <code>textColor</code> attribute  |
| gridLines          | Optional;<br>All    | yes     | • yes: enables row and column rules.<br>• no  |
| rowHeight          | Optional;<br>All    |         | Minimum row height, in pixels. Used with <code>cfgridcolumn type = "Image"</code> ; defines space for graphics to display in row.   |
| colHeaders         | Optional;<br>All    | yes     | • yes: displays column headers.<br>• no   |
| colHeaderFont      | Optional;<br>All    |         | Font of column header.  |
| colHeaderFontSize  | Optional;<br>All    |         | Size of column header text, in points.  |
| colHeaderItalic    | Optional;<br>All    | no      | • yes: displays column headers in italics.<br>• no  |
| colHeaderBold      | Optional;<br>All    | no      | • yes: displays column headers in bold.<br>• no   |
| colHeaderTextColor | Optional;<br>All    |         | Color of column headers.<br>• Options: same as for <code>textColor</code> attribute.  |
| bgColor            | Optional;<br>All    |         | Background color of the control.<br>• Options: for applet format, same as for <code>textColor</code> attribute; for Flash format, must be a hexadecimal value.<br>• Flash format only: to specify background colors for alternating rows, separate the two colors with a comma. |
| maxRows            | Optional;<br>All    |         | Maximum number of rows to display in the grid.  |
| style              | Optional;<br>Flash  |         | Must be a style specification in CSS format. Ignored for <code>type="text"</code> .   |
| enabled            | Optional;<br>Flash  | Yes     | Flash format only: Boolean value specifying whether the control is enabled. A disabled control appears in light gray.   |

| Attribute | Req/Opt;<br>Formats | Default | Description  |
|-----------|---------------------|---------|--|
| visible   | Optional;<br>Flash  | Yes     | Flash format only: Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank.  |
| tooltip   | Optional;<br>Flash  |         | Flash format only: text to display when the mouse pointer hovers over the control.   |
| onChange  | Optional;<br>Flash  |         | ActionScript to run when the control changes due to user action in the control.  |
| autoWidth | Optional;<br>applet | no      | <ul style="list-style-type: none"> <li>• yes: sets column widths so that all columns display within the grid width. Widths are equal or the proportions are determined by the relative <code>cfgridcolumn width</code> attribute values. Horizontal scroll bars are not available.</li> <li>• no: sets columns to equal widths or the values specified in the <code>cfgridcolumn width</code> attributes.</li> </ul> |
| vSpace    | Optional;<br>applet |         | Vertical space above and below the control, in pixels.   |
| hSpace    | Optional;<br>applet |         | Horizontal space to the left and right of the control, in pixels.  |
| align     | Optional;<br>applet |         | <p>Alignment of the grid cell contents:</p> <ul style="list-style-type: none"> <li>• Top</li> <li>• Left</li> <li>• Bottom</li> <li>• Baseline</li> <li>• Texttop</li> <li>• Absbottom</li> <li>• Middle</li> <li>• Absmiddle</li> <li>• Right</li> </ul>  |
| insert    | Optional;<br>applet | no      | <ul style="list-style-type: none"> <li>• yes: users can insert row data in the grid; takes effect only if <code>selectmode="edit"</code>.</li> <li>• no</li> </ul>   |
| delete    | Optional;<br>applet | no      | <ul style="list-style-type: none"> <li>• yes: users can delete row data from the grid; takes effect only if <code>selectmode="edit"</code>.</li> <li>• no</li> </ul>   |
| sort      | Optional;<br>applet | no      | <p>Adds sort buttons to perform simple text sorts on a user-selected column:</p> <ul style="list-style-type: none"> <li>• yes: put sort buttons on the grid control.</li> <li>• no</li> </ul> <p>Independent of this setting, users can sort columns by clicking the column head. If <code>selectMode="browse"</code>, the table cannot be sorted.</p>   |

| Attribute          | Req/Opt;<br>Formats | Default | Description  |
|--------------------|---------------------|---------|--|
| href               | Optional;<br>applet |         | URL or name of a query column that contains URLs to hyperlink each grid cell with.   |
| target             | Optional;<br>applet |         | The target frame or window in which to display the href URL; for example, "_blank".  |
| appendKey          | Optional;<br>applet | yes     | <ul style="list-style-type: none"> <li>• yes: when used with href, appends "CFGRIDKEY=" and information about the selected items. For details see <a href="#">"Using the href attribute"</a>.</li> <li>• no</li> </ul> |
| hrefKey            | Optional;<br>applet |         | A query column to use for the value appended to the href URL of each cell, if appendKey="True". If you use cfgridcolumn tags, the column must be specified in one of these tags.                                       |
| highlightHref      | Optional;<br>applet | yes     | <ul style="list-style-type: none"> <li>• yes: highlights links associated with an href attribute value.</li> <li>• no</li> </ul>   |
| onValidate         | Optional;<br>applet |         | A JavaScript function to validate user input. The form object, input object, and input object value are passed to the function, which must return True if validation succeeds; False otherwise.                        |
| onError            | Optional;<br>applet |         | A JavaScript function to execute if validation fails.  |
| gridDataAlign      | Optional;<br>applet | Left    | <ul style="list-style-type: none"> <li>• Left: left-aligns data within the column.</li> <li>• Right: right-aligns data within the column.</li> <li>• Center: centers data within the column.</li> </ul>                |
| rowHeaders         | Optional;<br>applet | yes     | <ul style="list-style-type: none"> <li>• yes: displays a column of numeric row labels.</li> <li>• no</li> </ul>  |
| rowHeaderAlign     | Optional;<br>applet | Left    | <ul style="list-style-type: none"> <li>• Left: left-aligns the row header text.</li> <li>• Right: right-aligns the row header text.</li> <li>• Center: centers the row header text.</li> </ul>                         |
| rowHeaderFont      | Optional;<br>applet |         | Font for the row labels.   |
| rowHeaderFontSize  | Optional;<br>applet |         | Text size of the row labels, in points.  |
| rowHeaderItalic    | Optional;<br>applet | no      | <ul style="list-style-type: none"> <li>• yes: displays row label text in italics.</li> <li>• no</li> </ul>   |
| rowHeaderBold      | Optional;<br>applet | no      | <ul style="list-style-type: none"> <li>• yes: displays row label text in bold.</li> <li>• no</li> </ul>  |
| rowHeaderTextColor | Optional;<br>applet | Black   | Text color of grid control row headers. <ul style="list-style-type: none"> <li>• Options: same as for the <code>textColor</code> attribute.</li> </ul>   |

| Attribute            | Req/Opt;<br>Formats | Default              | Description   |
|----------------------|---------------------|----------------------|---|
| colHeaderAlign       | Optional;<br>applet | Left                 | <ul style="list-style-type: none"> <li>• Left: left-aligns the column header text.</li> <li>• Right: right-aligns the column header text.</li> <li>• Center: centers the column header text.</li> </ul>       |
| notSupported         | Optional;<br>applet | (See<br>Description) | Text to display if the browser does not support Java or has Java support disabled.<br>Default: "<b> Browser must support Java to view ColdFusion Java Applets</b>"  |
| pictureBar           | Optional;<br>applet | no                   | <ul style="list-style-type: none"> <li>• yes: puts images (and no text) on the Insert, Delete, and Sort buttons.</li> <li>• no: puts text (and no images) on the Insert, Delete, and Sort buttons.</li> </ul> |
| insertButton         | Optional;<br>applet | Insert               | Insert button text; takes effect only if <code>selectmode="edit"</code> .   |
| deleteButton         | Optional;<br>applet | Delete               | Delete button text; takes effect only if <code>selectmode="edit"</code> .   |
| sortAscendingButton  | Optional;<br>applet | A -> Z               | Sort button text.   |
| sortDescendingButton | Optional;<br>applet | Z -> A               | Sort button text.   |

## Usage

This tag must be in a `cfform` block.

An applet format grid requires the client to download a Java applet. Also, if the client does not have an up-to-date Java plugin installed, the system might also have to download an updated Java plugin to display the an applet format grid. A Flash format grid generates a Flash control, and can be embedded in an HTML format `cfform` tag. For this tag to work properly in either Flash or applet format, the browser must also be JavaScript-enabled.

**Note:** If you specify Flash format for this tag in an HTML format form, and you do not specify `height` and `width` attributes, Flash takes up more than the remaining visible area on the screen. If any other output follows the grid, including any form controls, users must scroll to see it. Therefore, if you follow a Flash grid in an HTML form with additional output, specify `height` and `width` values.

You can populate a `cfgrid` with data from a `cfquery`. If you do not specify any `cfgridcolumn` tags in the `cfgrid` body, ColdFusion generates a grid with the following:

- A column for each column in the query.
- A default header for each column, created by replacing hyphen or underscore characters in the table column name with spaces. The first character, and any character after a space, are changed to uppercase; all other characters are lowercase.

This tag requires an end tag.

**Note:** Clicking the submit button while editing a grid cell occasionally causes the cell changes to be lost. To ensure that changes are submitted properly, Macromedia recommends that after user updates data in a cell, they click another cell before submitting the form.

## How data is returned from cfgrid

This tag returns data by setting form variables in the data submitted to the form's action page, as an HTML form control does. Because the data can vary, depending on the tag's `SelectMode` attribute value, the form variables that are returned also vary depending on this value.

In general, the data returned falls into one of these categories:

- Simple data, returned from simple select operations
- Complex data, returned from insert, update and delete operations

### Simple selection data (`SelectMode = Single, Column, or Row`)

The data that form variables return to the `cfform`'s action page contains information about which cells the user selected. In general, ColdFusion makes this data available in the action page, as ColdFusion variables in the Form scope, with the naming convention

```
form.#GridName#.#ColumnName#
```

Each `SelectMode` returns these form variable(s):

- `SelectMode="single"`  
`form.#GridName#.#ColumnName# = "SelectedCellValue"`
- `SelectMode="column"`  
`form.#GridName#.#ColumnName# = "ValueOfCellRow1,  
ValueOfCellRow2, ValueOfCellRowN"`
- `SelectMode="row"`  
`form.#GridName#.#Column1Name# = "ValueOfCellInSelectedRow"`  
`form.#GridName#.#Column2Name# = "ValueOfCellInSelectedRow"`  
`form.#GridName#.#ColumnNName# = "ValueOfCellInSelectedRow"`

### Complex update data (`SelectMode = Edit`)

The grid returns a large amount of data, to inform the action page of inserts, updates or deletes that the user made to the grid. In most cases, you can use the `cfgridupdate` tag to automatically gather the data from the form variables; the tag collects data, writes SQL calls, and updates the data source.

If you cannot use `cfgridupdate` (if, for example, you must distribute the returned data to more than one data source), you must write code to read form variables. In this mode, ColdFusion creates the following array variables in the Form scope for each `cfgrid`:

```
form.#GridName#.#ColumnName#  
form.#GridName#.original.#ColumnName#  
form.#GridName#.RowStatus.Action
```

Each table row that contains an update, insert, or deletion has a parallel entry in each of these arrays. To view all the information for all the changes, you can traverse the arrays, as in this example. To make it work with a `cfgrid` on a submitted `cfform`, set the `GridName` variable to the name of the grid and the `ColNameList` to a list of the grid columns.

```
<cfloop index="ColName" list="#ColNameList#">
  <cfif IsDefined("form.#GridName#.#ColName#")>
    <cfoutput><br>form.#GridName#.#ColName#:<br></cfoutput>

    <cfset Array_New = form.[#GridName#][#ColName#]>
    <cfset Array_Orig = form[#GridName#]['original'][#ColName#]>
    <cfset Array_Action = form[#GridName#]RowStatus.Action>

    <cfif NOT IsArray(Array_New)>
      <b>The form variable is not an array!</b><br>
    <cfelse>
      <cfset size = ArrayLen(Array_New)>
      <cfoutput>
        Result Array Size is #size#.<br>
        Contents:<br>
      </cfoutput>

      <cfif size IS 0>
        <b>The array is empty.</b><br>
      <cfelse>
        <table BORDER="yes">
          <tr>
            <th>Loop Index</th>
            <th>Action</th>
            <th>Old Value</th>
            <th>New Value</th>
          </tr>
          <cfloop index="LoopCount" from="1" to=#size#>
            <cfset Val_Orig= Array_Orig[#LoopCount#]>
            <cfset Val_New = Array_New[#LoopCount#]>
            <cfset Val_Action= Array_Action[#LoopCount#]>
            <cfoutput>
              <tr>
                <td>#LoopCount#</td>
                <td>#Val_Action#</td>
                <td>#Val_Orig#</td>
                <td>#Val_New#</td>
              </tr>
            </cfoutput>
          </cfloop>
        </table>
      </cfif>
    </cfif>
  </cfloop>

  <cfelse>
    <cfoutput>form.#GridName#.#ColName#: NotSet!</cfoutput><br>
  </cfif>
</cfloop>
```

## Using the href attribute

When specifying a URL with grid items using the `href` attribute, the `selectMode` attribute value determines whether the appended key value is limited to one grid item or extends to a grid column or row. When a user clicks a linked grid item, a `cfgridkey` variable is appended to the URL, in this form:

```
http://myserver.com?cfgridkey=selection
```

If the `appendKey` attribute is set to `no`, no grid values are appended to the URL.

The value of *selection* is determined by the value of the `selectMode` and attribute:

- If you specify a `hrefKey` attribute, *selection* is the field value of the column specified by the attribute. Otherwise, it is one of the following:
- If `selectMode="Single"`, *selection* is the value of the column clicked.
- If `selectMode="Row"`, *selection* is a comma-delimited list of column values in the clicked row, beginning with the value of the first cell in the row.
- If `selectMode="Column"`, *selection* is a comma-delimited list of row values in the clicked column, beginning with the value of the first cell in the column.

### Example

The following example creates a Flash form that displays a set of available courses from the `CourseList` table in the `cfdocexamples` database. For more complex examples that use the `cfgrid` tag, see `cfgridcolumn`, `cfgridrow`, and `cfgridupdate`.

```
<!-- Query the database to fill up the grid. -->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
SELECT Course_ID, Dept_ID, CorNumber,
CorName, CorLevel
FROM CourseList
ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<h3>cfgrid Example</h3>
<I>Currently available courses</I>
<!-- cfgrid must be inside a cfform tag. -->
<cfform>
  <cfgrid name = "FirstGrid" format="Flash"
    height="320" width="580"
    font="Tahoma" fontsize="12"
    query = "GetCourses">
  </cfgrid>
</cfform>
```

# cfgridcolumn

## Description

Used with the `cfgrid` tag in a `cfform`. Formats a columns and optionally populates the column from a query. The font and alignment attributes used in `cfgridcolumn` override global font or alignment settings defined in `cfgrid`.

## Category

[Forms tags](#)

## Syntax

```
<cfgridcolumn
  name = "column_name"
  header = "header"
  width = "column_width"
  type = "type"
  display = "yes" or "no"
  select = "yes" or "no"
  font = "column_font"
  fontSize = "size"
  italic = "yes" or "no"
  bold = "yes" or "no"
  textColor = "web color" or "expression"
  bgColor = "web color" or "expression"
  dataAlign = "position"
  The following attribute applies to Flash format only
  mask= "format mask"
  The following attribute applies to applet format only
  href = "URL"
  hrefKey = "column_name"
  target = "URL_target"
  headerFont = "font_name"
  headerFontSize = "size"
  headerItalic = "yes" or "no"
  headerBold = "yes" or "no"
  headerTextColor = "web color"
  headerAlign = "position"
  numberFormat = "format"
  values = "Comma-separated strings and/or numeric range"
  valuesDisplay = "Comma-separated strings and/or numeric range"
  valuesDelimiter = "delimiter character">
```

## History

ColdFusion MX 7: Added the `mask` attribute, and the `currency` type attribute value.

ColdFusion MX: Changed behavior if `select="no"`: a user cannot select and edit the cell data, regardless of the `cfgrid selectmode` attribute value. When clicked, the cell border (and, depending on the `selectColor` value, the cell background) changes color, but the cell data cannot be edited.

### Attributes

**Note:** In XML format, ColdFusion MX passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format grids, but do display applet and Flash format grids.

| Attribute | Req/Opt;<br>Formats | Default              | Description  |
|-----------|---------------------|----------------------|--|
| name      | Required;<br>All    |                      | Name of the grid column element. If the grid uses a query, this attribute must be the name of the query column that populates the grid column. |
| header    | Optional;<br>All    | yes                  | Column header text. Used only if the <code>cfgrid colHeaders</code> attribute is True (the default).   |
| width     | Optional;<br>All    | Column head<br>width | Column width, in pixels.   |

| Attribute | Req/Opt;<br>Formats | Default                                | Description   |
|-----------|---------------------|--|---|
| type      | Optional;<br>All    |  | <p>You can specify the following values in all formats:</p> <ul style="list-style-type: none"> <li>image: grid displays the image specified by the URL in the column. If you use a relative URL, the image must be in the CFIDE\classes directory or a subdirectory. If image is larger than column cell, it is clipped to fit. Flash images must be JPEG files. Applet images can be JPEG or GIF files.</li> <li>boolean: column displays as check box; if cell is editable, user can change the check mark.</li> <li>numeric: user can sort grid data numerically.</li> <li>string_noCase: user can sort grid data as case-insensitive text.</li> </ul> <p>You can specify the following attribute in applet format; it does not work in Flash grids.</p> <ul style="list-style-type: none"> <li>image: you can use the following built-in ColdFusion image names, in addition to paths to image files, in the column values: <ul style="list-style-type: none"> <li>- cd</li> <li>- computer</li> <li>- document</li> <li>- element</li> <li>- folder</li> <li>- floppy</li> <li>- fixed</li> <li>- remote</li> </ul> </li> </ul> <p>You can specify the following attribute in Flash format; it does not work in applet grids:</p> <ul style="list-style-type: none"> <li>currency: formats the column data as currency, aligning it around the decimal point. If users sort the grid using this column, it will sort correctly for the currency. Use the mask attribute to specify a currency symbol, which defaults to the dollar sign (\$).</li> </ul> |
| display   | Optional;<br>All    | yes                                    | <ul style="list-style-type: none"> <li>yes</li> <li>no: hides the column.</li> </ul>  |
| select    | Optional;<br>All    | yes                                    | <p>Determines selection behavior if the <code>cfgrid</code> <code>selectmode</code> attribute value is column, edit, or single; ignored for row or browse values.</p> <ul style="list-style-type: none"> <li>yes: users can select the column or select or edit cells in the column, as specified by the <code>selectmode</code> attribute.</li> <li>no: users cannot select the column or select or edit cells in the column.</li> </ul>   |

| headerAlign     | Optional;<br>Applet | as specified<br>by <code>cfgrid</code> | <p>Column header text alignment:</p> <ul style="list-style-type: none"> <li>• Left</li> <li>• Right</li> <li>• Center</li> </ul>  |

| Attribute       | Req/Opt;<br>Formats | Default   | Description  |
|-----------------|---------------------|-----------|--|
| numberFormat    | Optional;<br>Applet |           | Format for displaying numeric data in the grid. See <a href="#">“numberFormat mask characters” on page 201</a> .                                 |
| values          | Optional;<br>Applet |           | Formats cells in column as drop-down list boxes; specify items in drop-down list. For example:<br>values = "arthur, scott, charles, 1-20, mabel" |
| valuesDisplay   | Optional;<br>Applet |           | Maps elements in the values attribute to string to display in the drop-down list. Delimited strings and/or numeric range(s).                     |
| valuesDelimiter | Optional;<br>Applet | , [comma] | Delimiter in values and valuesDisplay attributes.  |

### numberFormat mask characters

In applet format only, you can use the following numberFormat attribute mask characters to format output in U.S. numeric and currency styles. For more information on using these mask characters, see [NumberFormat on page 783](#). (The cfgridcolumn tag does not support international number formatting.)

| Character | Meaning  |
|-----------|--|
| _         | (Underscore) Digit placeholder.  |
| 9         | Digit placeholder.   |
| .         | (Period) Location of mandatory decimal point.  |
| 0         | Located to left or right of mandatory decimal point; pads with zeros.  |
| ()        | Puts parentheses around mask if number is less than 0.   |
| +         | Puts plus sign before positive numbers, minus sign before negative numbers.  |
| -         | Puts space before positive numbers, minus sign before negative numbers.  |
| ,         | (Comma) Separates every third decimal-place with a comma.  |
| L,C       | Left-justify or center-justify number within width of mask column. First character of mask must be L or C. Default: right-justified. |
| \$        | Puts dollar sign before formatted number. Must be the first character of mask.   |
| ^         | (Caret) Separates left from right formatting.  |

## date/time formats in mask attribute

By default, Flash displays date/time values in grid columns using a format that shows values such as Oct 29 2004 11:03:21. Use the `mask` attribute to display the date or time in a different format, as described in the following table:

---

| Pattern letter | Description   |
|----------------|---|
| Y              | Year. If the number of pattern letters is two, the year is truncated to two digits; otherwise, it appears as four digits. The year can be zero-padded, as the third example shows in the following set of examples:<br>Examples:<br>YY = 03<br>YYYY = 2003<br>YYYYY = 02003   |
| M              | Month in year. The format depends on the following criteria: <ul style="list-style-type: none"><li>• If the number of pattern letters is one, the format is interpreted as numeric in one or two digits.</li><li>• If the number of pattern letters is two, the format is interpreted as numeric in two digits.</li><li>• If the number of pattern letters is three, the format is interpreted as short text.</li><li>• If the number of pattern letters is four, the format is interpreted as full text.</li></ul> Examples:<br>M = 7<br>MM = 07<br>MMM = Jul<br>MMMM = July |
| D              | Day in month.<br>Examples:<br>D = 4<br>DD = 04<br>DD = 10   |
| E              | Day in week. The format depends on the following criteria: <ul style="list-style-type: none"><li>• If the number of pattern letters is one, the format is interpreted as numeric in one or two digits.</li><li>• If the number of pattern letters is two, the format is interpreted as numeric in two digits.</li><li>• If the number of pattern letters is three, the format is interpreted as short text.</li><li>• If the number of pattern letters is four, the format is interpreted as full text.</li></ul> Examples:<br>E = 1<br>EE = 01<br>EEE = Mon<br>EEEE = Monday |
| A              | AM/PM indicator.  |
| J              | Hour in day (0-23).   |
| H              | Hour in day (1-24).   |
| K              | Hour in am/pm (0-11).   |

---

| Pattern letter | Description  |
|----------------|--|
| L              | Hour in am/pm (1-12).  |
| N              | Minute in hour.<br>Examples:<br>N = 3<br>NN = 03   |
| S              | Second in minute.  |
| Other text     | You can add other text into the pattern string to further format the string. You can use punctuation, numbers, and all lowercase letters. You should avoid uppercase letters because they may be interpreted as pattern letters.<br>Example:<br>EEEE, MMM. D, YYYY at H:NN A = Tuesday, Sept. 8, 2003 at 1:26 PM |

### Example

The following example lets you update certain fields of the CourseList table in the cfdocexamples database. It uses cfgridcolumn tags to structure the table.

```
<!-- If the gridEntered field exists, the form has been submitted.
      Update the database. -->
<cfif IsDefined("form.gridEntered")>
  <cfgridupdate grid = "FirstGrid" dataSource = "cfdocexamples"
    tableName = "CourseList" keyOnly = "Yes">
</cfif>

<!-- Query the database to fill up the grid. -->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
  SELECT Course_ID, Dept_ID, CorNumber,
    CorName, CorLevel, CorDesc
FROM CourseList
ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<html>
<head>
<title>cfgrid Example</title>
</head>
<body>
<h3>cfgrid Example</h3>
<I>You can update the Name, Level, and Description information for courses.</I>
<!-- The cfform tag must surround a cfgrid control. -->
<cfform action = "#CGI.SCRIPT_NAME#">
  <cfgrid name = "FirstGrid" width = "500"
    query = "GetCourses" colheaderbold="Yes"
    font = "Tahoma" rowHeaders = "No"
    selectColor = "Red" selectMode = "Edit" >
    <!-- cfgridcolumn tags arrange the table and control the display. -->
    <!-- Hide the primary key, required for update -->
    <cfgridcolumn name = "Course_ID" display = "No">
    <!-- select="No" does not seem to have any effect !!! -->
    <cfgridcolumn name = "Dept_ID" header = "Department" Select="No"
      width="75" textcolor="blue" bold="Yes">
```

```
<cfgridcolumn name = "CorNumber" header = "Course ##" Select="No"
width="65">
<cfgridcolumn name = "CorName" header = "Name" width="125">
<cfgridcolumn name = "CorLevel" header = "Level" width="85">
<cfgridcolumn name = "CorDesc" header = "Description" width="125">
</cfgrid>
<br>
<cfinput type="submit" name="gridEntered">
</cform>
</body>
</html>
```

# cfgridrow

## Description

Lets you define a `cfgrid` control that does not use a query as source for row data. If a query attribute is specified in the `cfgrid` tag, the `cfgridrow` tags are ignored.

## Category

[Forms tags](#)

## Syntax

```
<cfgridrow  
  data = "col1, col2, ...">
```

## See also

[cfgrid](#), [cfgridcolumn](#), [cfgridupdate](#), [cform](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftextarea](#), [cftree](#)

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| data      | Required |         | Comma-delimited list of column values. If a value contains a comma, it must be escaped with another comma. |

## Example

The following example shows how you use the `cfgridrow` tag can populate a `cfgrid` tag from list data:

```
<!-- Set two lists, each with the data for a grid column. -->  
<cfset cities = "Rome,Athens,Canberra,Brasilia,Paris">  
<cfset countries = "Italy,Greece,Australia,Brazil,France">  
  
<cform name = "cities">  
  <cfgrid name="GeoGrid" autowidth = "yes" vspace = "4"  
    height = "120" font="tahoma" rowheaders="no">  
    <cfgridcolumn name="City" header="City">  
    <cfgridcolumn name="Country" header="Country">  
    <!-- Loop through the lists using cfgridrow to poplulate the grid. -->  
    <cfloop index="i" from="1" to="#ListLen(cities)#">  
      <cfgridrow data = "#ListGetAt(cities, i)#,#ListGetAt(countries, i)#">  
    </cfloop>  
  </cfgrid><br><br>  
</cform>
```

# cfgridupdate

## Description

Used within a `cfgrid` tag. Updates data sources directly from edited grid data. This tag provides a direct interface with your data source.

This tag applies delete row actions first, then insert row actions, then update row actions. If it encounters an error, it stops processing rows.

## Category

[Forms tags](#)

## Syntax

```
<cfgridupdate
  grid = "gridname"
  dataSource = "data source name"
  tableName = "table name"
  username = "data source username"
  password = "data source password"
  tableOwner = "table owner"
  tableQualifier = "qualifier"
  keyOnly = "yes" or "no">
```

## See also

[cfgrid](#), [cfgridcolumn](#), [cfgridrow](#), [cform](#), [cfapplet](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftextInput](#), [cftree](#)

## History

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

## Attributes

| Attribute               | Req/Opt  | Default | Description  |
|-------------------------|----------|---------|--|
| <code>grid</code>       | Required |         | Name of the <code>cfgrid</code> form element that is the source for the update action.   |
| <code>dataSource</code> | Required |         | Name of the data source for the update action.   |
| <code>tableName</code>  | Required |         | Name of the table to update.<br>For ORACLE drivers, entry must be upper-case.<br>For Sybase driver, entry is case-sensitive; must be same case as used when table was created. |
| <code>username</code>   | Optional |         | Overrides username value specified in ODBC setup.  |
| <code>password</code>   | Optional |         | Overrides password value specified in ODBC setup.  |
| <code>tableOwner</code> | Optional |         | Table owner, if supported.   |

| Attribute      | Req/Opt  | Default | Description   |
|----------------|----------|---------|---|
| tableQualifier | Optional |         | Table qualifier, if supported. Purpose: <ul style="list-style-type: none"> <li>• SQL Server and Oracle driver: name of database that contains the table.</li> <li>• Intersolv dBASE driver: directory of DBF files.</li> </ul>                        |
| keyOnly        |          | no      | Applies to the <code>update</code> action: <ul style="list-style-type: none"> <li>• yes: the WHERE criteria are limited to the key values.</li> <li>• no: the WHERE criteria include key values and the original values of changed fields.</li> </ul> |

### Example

The following example lets you update a database by using a `cfgrid` tag to add and delete entire records or to update the data in individual cells. The `cfgridupdate` tag processes the data from the submitted form and updates the database.

```
<!-- If the gridEntered form field exists, the form was submitted.
      Perform gridupdate. -->
<cfif IsDefined("form.gridEntered") is True>
  <cfgridupdate grid = "FirstGrid" dataSource = "cfdocexamples" Keyonly="true"
    tableName = "CourseList">
</cfif>

<!-- Query the database to fill up the grid. -->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
SELECT Course_ID, Dept_ID, CorNumber,
      CorName, CorLevel, CorDesc
FROM CourseList
ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<h3>cfgrid Example</h3>
<I>Try adding a course to the database, and then deleting it.</i>
<cfform>
<cfgrid name = "FirstGrid" width = "450"
  query = "GetCourses" insert = "Yes" delete = "Yes"
  font = "Tahoma" rowHeaders = "No"
  colHeaderBold = "Yes"
  selectMode = "EDIT"
  insertButton = "Insert a Row" deleteButton = "Delete selected row" >
</cfgrid><br>
<cfinput type="submit" name="gridEntered">
</cfform>...
```

# cfheader

## Description

Generates custom HTTP response headers to return to the client.

## Category

[Data output tags](#), [Page processing tags](#)

## Syntax

```
<cfheader
  name = "header_name"
  value = "header_value"
  charset="charset">
or
<cfheader
  statusCode = "status_code"
  statusText = "status_text">
```

## See also

[cfcache](#), [cfflush](#), [cfhtmlhead](#), [cfinclude](#), [cfsetting](#), [cfsilent](#), [cfcontent](#)

## History

ColdFusion MX 6.1: Changed behavior for the name attribute: `cfheader name="Content-Disposition"` uses the default file character encoding to encode this header's value, so the name of a file can include characters in the character encoding used in the file.

## Attributes

| Attribute | Req/Opt   | Default | Description  |
|-----------|---|---------|--|
| name      | Required if <code>statusCode</code> not specified |         | Header name.   |
| value     | Optional  |         | HTTP header value.   |
| charset   | Optional  | UTF-8   | The character encoding in which to encode the header value. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For more information about character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> . |

---

| Attribute  | Req/Opt                        | Default | Description               |
|------------|--------------------------------|---------|---------------------------|
| statusCode | Required if name not specified |         | Number. HTTP status code. |
| statusText | Optional                       |         | Explains the status code. |

---

### Usage

If you use this tag after the `cfflush` tag on a page, an error is thrown.

### Example

```
<h3>cfheader Example</h3>
```

```
<p>cfheader generates custom HTTP response headers to return to the client.  
<p>This example forces browser client to purge its cache of requested file.  
<cfheader name="Expires" value="#GetHttpTimeString(Now())#">
```

# cfhtmlhead

## Description

Writes text to the head section of a generated HTML page.

## Category

[Page processing tags](#)

## Syntax

```
<cfhtmlhead  
  text = "text">
```

## See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfheader](#), [cfinclude](#), [cfsetting](#), [cfsilent](#)

## Attributes

| Attribute | Req/Opt  | Default | Description                                     |
|-----------|----------|---------|---|
| text      | Required |         | Text to add to the <head> area of an HTML page. |

## Usage

Use this tag for embedding JavaScript code, or putting other HTML tags, such as meta, link, title, or base in an HTML page header.

If you use this tag after the `cfflush` tag on a page, an error is thrown.

## Example

```
<!-- This example displays the information provided by the Macromedia  
Designer & Developer Center XML feed,

  cfhttpparam tags [optional for some methods]
</cfhttp>
```

## See also

[cfhttpparam](#), [GetHttpRequestData](#), [cftp](#), [cfdap](#), [cfmail](#), [cfpop](#), [SetEncoding](#)

## History

ColdFusion MX 7: Added the `result` attribute, which allows you to specify an alternate variable in which to receive a result.

ColdFusion MX 6.1:

- Added support for the following methods: HEAD, PUT, DELETE, OPTIONS, TRACE.
- Added `multipart`, `getAsBinary`, `proxyUser`, and `proxyPassword` attributes.
- Changed `httpparam` behavior: all operations can have `httpparam` tags.
- Added the `cfhttp.errorDetail` return variable.

- Modified response body content types considered to be text.
- Changed behavior for multiple headers: multiple headers of the same type are returned in an array.
- Added support for HTTPS proxy tunneling.
- Fixed bugs in code and documentation.

#### ColdFusion MX:

- Added the `charset` and `firstrowasheaders` attributes.
- Changed Secure Sockets Layer (SSL) support: ColdFusion uses the Sun JSSE library, which supports 128-bit encryption, to support SSL.

#### Attributes

The following attributes control the HTTP transaction and can be used for all HTTP methods:

| Attribute         | Req/Opt | Default                      | Description  |
|-------------------|---------|------------------------------|--|
| <code>url</code>  | Req     | Uses the http protocol       | Address of the resource on the server which will handle the request. The URL must include the hostname or IP address.<br>If you do not specify the transaction protocol ( <code>http://</code> or <code>https://</code> ), ColdFusion defaults to <code>http</code> .<br>If you specify a port number in this attribute, it overrides any <code>port</code> attribute value.<br>The <code>cfhttpparam</code> tag <code>URL</code> attribute appends query string attribute-value pairs to the URL. |
| <code>port</code> | Opt     | 80 for http<br>443 for https | Port number on the server to which to send the request. A port value in the <code>url</code> attribute overrides this value.   |

| Attribute     | Req/Opt | Default     | Description  |
|---------------|---------|-------------|--|
| method        | Opt     | GET         | <ul style="list-style-type: none"> <li>• GET: requests information from the server. Any data that the server requires to identify the requested information must be in the URL or in <code>cfhttp type="URL"</code> tags.</li> <li>• POST: sends information to the server for processing. Requires one or more <code>cfhttpparam</code> tags. Often used for submitting form-like data.</li> <li>• PUT: requests the server to store the message body at the specified URL. Use this method to send files to the server.</li> <li>• DELETE: requests the server to delete the specified URL.</li> <li>• HEAD: identical to the GET method, but the server does not send a message body in the response. Use this method for testing hypertext links for validity and accessibility, determining the type or modification time of a document, or determining the type of server.</li> <li>• TRACE: requests that the server echo the received HTTP headers back to the sender in the response body. Trace requests cannot have bodies. This method enables the ColdFusion application to see what is being received at the server, and use that data for testing or diagnostic information.</li> <li>• OPTIONS: a request for information about the communication options available for the server or the specified URL. This method enables the ColdFusion application to determine the options and requirements associated with a URL, or the capabilities of a server, without requesting any additional activity by the server.</li> </ul> |
| proxyServer   | Opt     |             | Host name or IP address of a proxy server to which to send the request.  |
| proxyPort     | Opt     | 80          | Port number to use on the proxy server.  |
| proxyUser     | Opt     |             | User name to provide to the proxy server.  |
| proxyPassword | Opt     |             | Password to provide to the proxy server.   |
| username      | Opt     |             | Use to pass a user name to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.   |
| password      | Opt     |             | Use to pass a password to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.  |
| userAgent     | Opt     | Cold Fusion | Text to put in the user agent request header. Used to identify the request client software. Can make the ColdFusion application appear to be a browser.  |

| Attribute    | Req/Opt | Default   | Description   |
|--------------|---------|---|---|
| charset      | Opt     | For request: UTF-8<br>For response: charset specified by response Content-Type header, or UTF-8 if response does not specify charset. | The character encoding of the request, including the URL query string and form or file data, and the response. The following list includes commonly used values: <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• big5</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> .   |
| resolveURL   | Opt     | no  | <ul style="list-style-type: none"> <li>• no: does not resolve URLs in the response body. As a result, any relative URL links in the response body do not work.</li> <li>• yes: resolves URLs in the response body to absolute URLs, including the port number, so that links in a retrieved page remain functional. Applies to these HTML tags: <ul style="list-style-type: none"> <li>▪ - img src</li> <li>▪ - a href</li> <li>▪ - form action</li> <li>▪ - applet code</li> <li>▪ - script src</li> <li>▪ - embed src</li> <li>▪ - embed pluginspace</li> <li>▪ - body background</li> <li>▪ - frame src</li> <li>▪ - bgsound src</li> <li>▪ - object data</li> <li>▪ - object classid</li> <li>▪ - object codebase</li> <li>▪ - object usemap</li> </ul> </li> </ul> Does not resolve URLs if the <code>file</code> and <code>path</code> attributes are used. |
| throwOnError | Opt     | no  | <ul style="list-style-type: none"> <li>• yes: if the server returns an error response code, throws an exception that can be caught using the <code>cftry</code> and <code>cfcatch</code> or ColdFusion error pages.</li> <li>• no: does not throw an exception if an error response is returned. In this case, your application can use the <code>cfhttp.StatusCode</code> variable to determine if there was an error and its cause.</li> </ul>  |

| Attribute   | Req/Opt | Default | Description  |
|-------------|---------|---------|--|
| redirect    | Opt     | yes     | <p>If the response header includes a Location field AND ColdFusion receives a 300-series (redirection) status code, specifies whether to redirect execution to the URL specified in the field:</p> <ul style="list-style-type: none"> <li>• yes: redirects execution to the specified page.</li> <li>• no: stops execution and returns the response information in the <code>cfhttp</code> variable, or throws an error if the <code>throwOnError</code> attribute is True.</li> </ul> <p>The <code>cfhttp.responseHeader.Location</code> variable contains the redirection path. ColdFusion follows a maximum of four redirects on a request. If there are more, ColdFusion functions as if <code>redirect = "no"</code>.</p> <p>Note: The <code>cflocation</code> tag generates an HTTP 302 response with the <code>url</code> attribute as the Location header value.</p>   |
| timeout     | Opt     |         | <p>Value, in seconds, that is the maximum time the request can take. If the timeout passes without a response, ColdFusion considers the request to have failed.</p> <p>If the client specifies a timeout in the URL search parameter (for example, <code>?RequestTime=120</code>) ColdFusion uses the lesser of the URL timeout and the <code>timeout</code> attribute value; this ensures that the request times out before, or at the same time as, the page.</p> <p>If the URL does not specify a timeout, ColdFusion uses the lesser of the Administrator timeout and the <code>timeout</code> attribute value.</p> <p>If the timeout is not set in any of these, ColdFusion waits indefinitely for the <code>cfhttp</code> request to process.</p>  |
| getAsBinary | Opt     | no      | <ul style="list-style-type: none"> <li>• no: if ColdFusion does not recognize the response body type as text, converts it to a ColdFusion object.</li> <li>• Auto: if ColdFusion does not recognize the response body type as text, converts it to ColdFusion Binary type data.</li> <li>• yes: always converts the response body content into ColdFusion Binary type data, even if ColdFusion recognizes the response body type as text.</li> </ul> <p>ColdFusion recognizes the response body as text if:</p> <ul style="list-style-type: none"> <li>• the header does not specify a content type.</li> <li>• the content type starts with "text".</li> <li>• the content type starts with "message".</li> <li>• the content type is "application/octet-stream".</li> </ul> <p>If ColdFusion does not recognize the body as text and converts it to an object, but the body consists of text, the <code>cfoutput</code> tag can display it. The <code>cfoutput</code> tag cannot display Binary type data. (To convert binary data to text, use the <code>ToString</code> function.)</p> |

The following attribute is used with the PUT method to determine how to send data specified with `httpparam type="formField"`:

| Attribute | Req/Opt  | Default   | Description   |
|-----------|----------|---|---|
| multipart | Optional | no<br>(Sends as multipart only if request includes File type data.) | Tells ColdFusion to send all data specified by <code>cfhttpparam type="formField"</code> tags as multipart form data, with a Content-Type of <code>multipart/form-data</code> . By default, ColdFusion sends <code>cfhttp</code> requests that contain only formField data with a Content Type of <code>application/x-www-form-urlencoded</code> . (If the request also includes File type data, ColdFusion uses the <code>multipart/form-data</code> content type for all parts.)<br><br>If yes, ColdFusion also sends the request's charset in each Content-Type description. All form field data must be encoded in this character encoding, and ColdFusion does not URLEncode the data. (The field name must be in ISO-88591-1 or ASCII.) Some http parsers, including the one used by previous versions of ColdFusion, ignore the multipart form field character encoding description. |

The following attribute allows you to specify the name of the variable in which you would like the results of the operation returned. The name you specify replaces `cfhttp` as the prefix by which you access the returned variables. For example, if you set the `result` attribute to `myResult`, you would access `fileContent` as `#myResult.fileContent#`.

The `result` attribute allows functions or CFCs that are called from multiple pages at the same time to avoid overwriting the results of one call with another. For information about the variables returned by a `cfhttp` get operation, see [“Variables returned by a cfhttp get operation”](#) in the Usage section.

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| result    | Optional |         | Specifies the name of the variable in which you want the result returned. |

The following attributes tell ColdFusion to put the HTTP response body in a file. You can put the response body in a file for GET, POST, PUT, DELETE, OPTIONS, and TRACE methods, but it is generally not useful with the DELETE or OPTIONS method.

| Attribute | Req/Opt   | Default         | Description  |
|-----------|---|-----------------|--|
| path      | Required if <code>file</code> is specified.                     |                 | Tells ColdFusion to save the HTTP response body in a file. Contains the absolute path to the directory in which to store the file.   |
| file      | Required if <code>path</code> is specified and not a GET method | See Description | Name of the file in which to store the response body. For a GET operation, the default is the file requested in the URL, if there is one. For example, if the URL in a GET method is <code>http://www.myco.com/test.htm</code> , the default file is <code>test.htm</code> .<br><br>Do not specify the path to the directory in this attribute; use the <code>path</code> attribute. |

The following attributes tell ColdFusion to convert the HTTP response body into a ColdFusion query object. They can be used with the GET and POST methods only.

| Attribute         | Req/Opt | Default                                      | Description   |
|-------------------|---------|--|---|
| name              | Opt     |  | Tells ColdFusion to create a query object with the given name from the returned HTTP response body.   |
| columns           | Opt     | First row of response contains column names. | <p>The column names for the query, separated by commas, with no spaces. Column names must start with a letter. The remaining characters can be letters, numbers, or underscore characters (_).</p> <p>If there are no column name headers in the response, specify this attribute to identify the column names.</p> <p>If you specify this attribute, and the <code>firstrowasHeader</code> attribute is True (the default), the column names specified by this attribute replace the first line of the response. You can use this behavior to replace the column names retrieved by the request with your own names.</p> <p>If a duplicate column heading is encountered in either this attribute or in the column names from the response, ColdFusion appends an underscore to the name to make it unique.</p> <p>If the number of columns specified by this attribute does not equal the number of columns in the HTTP response body, ColdFusion generates an error.</p> |
| firstrowasheaders | Opt     | yes  | <p>Determines how ColdFusion processes the first row of the query record set:</p> <ul style="list-style-type: none"><li>• yes: processes the first row as column heads. If you specify a <code>columns</code> attribute, ColdFusion ignores the first row of the file.</li><li>• no: processes the first row as data. If you do not specify a <code>columns</code> attribute, ColdFusion generates column names by appending numbers to the word "column"; for example, "column_1".</li></ul>   |
| delimiter         | Opt     | , [comma]                                    | A character that separates query columns. The response body must use this character to separate the query columns.  |
| textQualifier     | Opt     | " [double-quotation mark]                    | <p>A character that, optionally, specifies the start and end of a text column. This character must surround any text fields in the response body that contain the delimiter character as part of the field value.</p> <p>To include this character in column text, escape it by using two characters in place of one. For example, if the qualifier is a double-quotation mark, escape it as "".</p>  |

## Usage

The `cfhttp` tag is a general-purpose tool for creating HTTP requests and handling the returned results. It enables you to generate most standard HTTP request types. You use embedded `cfhttpparam` tags to specify request headers and body content.

When ColdFusion receives a response to a `cfhttp` request, it can put the response body (if any) in a file or the `cfhttp.FileContent` string variable. If the body text is structured as a result set, ColdFusion can put the body text in query object. You can also access the values of all returned headers and specify how to handle error status and redirections, and specify a timeout to prevent requests from hanging.

The HTTP protocol is the backbone of the World Wide Web and is used for every web transaction. Because the `cfhttp` tag can generate most types of requests, it provides significant flexibility. Possible uses include:

- Interacting with dynamic web sites and services that are not available as web services. (Use the `cfinvoke` tag to access SOAP web services.)
- Getting the contents of an HTML page or other file such as an image on a web server for use in your CFML page or storage in a file.
- Sending a secure request to a server by specifying the `https` protocol in the `url` attribute.
- Using the POST method to send a multipart/form-data style post to any URL that can handle such data and return results, including CGI executables or even other ColdFusion pages.
- Using the PUT method to upload files to a server that does not accept FTP requests.

This tag can, and for PUT and POST requests must, have a body that contains `cfhttpparam` tags. If this tag has `cfhttpparam` tags, it must have a `</cfhttp>` end tag.

To use HTTPS with the `cfhttp` tag, you might need to manually import the certificate for each web server into the keystore for the JRE that ColdFusion uses. This procedure should not be necessary if the certificate is signed (issued) by an authority that the JSSE (Java Secure Sockets Extension) recognizes (for example, Verisign); that is, if the signing authority is in the `cacerts` already. However, you might need to use the procedure if you are issuing SSL (secure sockets layer) certificates yourself.

**To manually import a certificate:**

1. Go to a page on the SSL server in question.
2. Double-click the lock icon.
3. Click the Details tab.
4. Click Copy To File.
5. Select the base64 option and save the file.
6. Copy the CER file into `C:\CFusionMX7\runtime\jre\lib\security` (or whichever JRE ColdFusion is using).
7. Run the following command in the same directory (`keytool.exe` is located in `C:\CFusionMX7\runtime\jre\bin`):

```
keytool -import -keystore cacerts -alias giveUniqueName -file filename.cer
```

## Variables returned by a cfhttp get operation

The `cfhttp` tag returns the following variables. If you set the `result` attribute, the name you assign replaces `cfhttp` as the prefix. For additional information, see the `result` attribute.

| Name                               | Description   |
|------------------------------------|---|
| <code>cfhttp.charset</code>        | Response character character set (character encoding) specified by the response Content-Type header.  |
| <code>cfhttp.errorDetail</code>    | If the connection to the HTTP server fails, contains details about the failure. For instance: "Unknown host: my.co.com"; otherwise, the empty string. Macromedia recommends that you check this variable for an error condition before checking other variables.  |
| <code>cfhttp.fileContent</code>    | Response body; for example, the contents of a html page retrieved by a GET operation. Empty if you save the response in a file.   |
| <code>cfhttp.header</code>         | Raw response header containing all header information in a single string. Contains the same information as the <code>cfhttp.responseHeader</code> variable.   |
| <code>cfhttp.mimeType</code>       | MIME type specified by the response Content-Type header; for example, text/html.  |
| <code>cfhttp.responseHeader</code> | The response headers formatted into a structure. Each element key is the header name, such as Content-Type or Status_Code. If there is more than one instance of a header type, the type values are put in an array. One common technique is to dynamically access the <code>cfhttp.responseHeader</code> structure as a dynamic array; for example, <code>#cfhttp.resonseHeader[fieldVariable]#</code> . |
| <code>cfhttp.statusCode</code>     | The HTTP <code>status_code</code> header value followed by the HTTP Explanation header value; for example, "200 OK".  |
| <code>cfhttp.text</code>           | Boolean; True if the response body content type is text. ColdFusion recognizes the response body as text if: <ul style="list-style-type: none"><li>• the header does not specify a content type.</li><li>• the content type starts with "text".</li><li>• the content type starts with "message".</li><li>• the content type is "application/octet-stream".</li></ul>                                     |

## Building a query from a delimited text file

The `cfhttp` tag can create a ColdFusion query object from the response body. To do so, the response body must consist of lines of text, with each line having fields that are delimited by a character that identifies the column breaks. The default delimiter is a comma (.). The response data can also use a text qualifier; the default is a double-quotation mark ("). If you surround a string field in the text qualifier, the field can contain the delimiter character. To include the text qualifier in field text, escape it by using a double character. The following line shows a two-line request body that is converted into a query. It has three comma-delimited fields:

```
Field1,Field2,Field3
"A comma, in text","A quote: ""Oh My!""",Plain text
```

Run the following code to show how ColdFusion treats this data:

```
<cfhttp method="Get"
    url="127.0.0.1:8500/tests/escapetest.txt"
    name="onerow">
<cfdump var="#onerow#"><br>
```

Column names can be specified in three ways:

- By default, ColdFusion uses the first row of the response as the column names.
- If you specify a comma-delimited `columns` attribute, ColdFusion uses the names specified in the attribute as the column names. Set `firstRowAsHeaders="no"` if the first row of the response contains data. Otherwise, ColdFusion ignores the first row.
- If you do not specify a `columns` attribute and set `firstrowasheaders="no"`, ColdFusion generates column names of the form `Column_1`, `Column2`, etc.

The `cfhttp` tag checks to ensure that column names in the data returned by the tag start with a letter and contain only letters, numbers, and underscore characters (`_`).

ColdFusion checks for invalid column names. Column names must start with a letter. The remaining characters can be letters, numbers, or underscores (`_`). If a column name is not valid, ColdFusion generates an error.

## Notes

- For the ColdFusion MX Administrator timeout and the URL timeout to take effect, you must enable the timeout in the ColdFusion MX Administrator, Server Settings page. For more information, see *Configuring and Administering ColdFusion MX*.
- The `cfhttp` tag supports Basic Authentication for all operations.
- The `cfhttp` tag uses SSL to negotiate secure transactions.
- If you put the HTTP response body in a file, ColdFusion does not put it in the `CFHTTP.FileContent` variable or generate a query object. If you do not put the response body in a file, ColdFusion puts it in the `CFHTTP.FileContent` variable; if you specify a `name` attribute ColdFusion generates a query object.
- The `cfhttp` tag does not support NTLM or Digest Authentication.

## Example

```
<!-- This example displays the information provided by the Macromedia
Designer & Developer Center XML feed,
http://www.macromedia.com/desdev/resources/macromedia_resources.xml
See http://www.macromedia.com/desdev/articles/xml_resource_feed.html
for more information on this feed. --->

<!-- Set the URL address. --->
<cfset urlAddress="http://www.macromedia.com/desdev/resources/
    macromedia_resources.xml">

<!-- Use the CFHTTP tag to get the file content represented by urladdress.
    Note that />, not an end tag, terminates this tag. --->
<cfhttp url="#urladdress#" method="GET" resolveurl="Yes" throwOnError="Yes"/>
```

```

<!-- Parse the XML and output a list of resources. -->
<cfset xmlDoc = XmlParse(CFHTTP.FileContent)>
<!-- Get the array of resource elements, the xmlChildren of the xmlroot. -->
<cfset resources=xmlDoc.xmlroot.xmlChildren>
<cfset numresources=ArrayLen(resources)>

<cfloop index="i" from="1" to="#numresources#">
  <cfset item=resources[i]>
  <cfoutput>
    <strong><a href=#item.url.xmltext#>#item.title.xmltext#</strong></
a><br>
    <strong>Author</strong>&nbsp;&nbsp;&nbsp;#item.author.xmltext#<br>
    <strong>Applies to these products</strong><br>
    <cfloop index="i" from="4" to="#arraylen(item.xmlChildren)#">
      #item.xmlChildren[i].xmlAttributes.Name#<br>
    </cfloop>
    <br>
  </cfoutput>
</cfloop>

```

# cfhttpparam

## Description

Allowed inside `cfhttp` tag bodies only. Required for `cfhttp` POST operations. Optional for all others. Specifies parameters to build an HTTP request.

## Category

[Internet Protocol tags](#)

## Syntax

```
<cfhttpparam
  type = "transaction type"
  name = "data name"
  value = "data value"
  file = "filename"
  encoded = "yes" or "no"
  mimeType = "MIME type designator">
```

## See also

[cfhttp](#), [GetHttpRequestData](#), [cftp](#), [cfdap](#), [cfmail](#), [cfmailparam](#), [cfpop](#)

## History

ColdFusion MX 6.1:

- Added the `header` and `body` types.
- Added the `encoded` and `mimeType` attributes.
- Changed HTTP method behavior: all HTTP methods can have `httpparam` tags.
- Changed the `name` attribute requirements: it is not required for all types.

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|--|---------|---|
| type      | Required   |         | Information type: <ul style="list-style-type: none"><li>• header: specifies an HTTP header. ColdFusion does not URL encode the header.</li><li>• CGI: specifies an HTTP header. ColdFusion URL encodes the header by default.</li><li>• body: specifies the body of the HTTP request. ColdFusion does not automatically set a content-type header or URL encode the body contents. To specify the content-type, use a separate <code>cfhttp</code> tag with <code>type=header</code>.</li><li>• XML: identifies the request as having a content-type of text/xml. Specifies that the <code>value</code> attribute contains the body of the HTTP request. Used to send XML to the destination URL. ColdFusion does not URL encode the XML data.</li><li>• file: tells ColdFusion to send the contents of the specified file. ColdFusion does not URL encode the file contents.</li><li>• URL: specifies a URL query string name-value pair to append to the <code>cfhttpurl</code> attribute. ColdFusion URL encodes the query string.</li><li>• formField: specifies a form field to send. ColdFusion URL encodes the Form field by default.</li><li>• cookie: specifies a cookie to send as an HTTP header. ColdFusion URL encodes the cookie.</li></ul> |
| name      | Required.<br>Optional (and ignored) for Body and XML types |         | Variable name for data that is passed. Ignored for Body and XML types. For File type, specifies the filename to send in the request.  |
| value     | Required.<br>Optional (and ignored) for File type          |         | Value of the data that is sent. Ignored for File type. The value must contain string data or data that ColdFusion can convert to a string for all <code>type</code> attributes except Body. Body types can have string or binary values.  |
| file      | Required only if <code>type="File"</code>                  |         | Applies to File type; ignored for all other types. The absolute path to the file that is sent in the request body.  |
| encoded   | Optional   | yes     | Applies to FormField and CGI types; ignored for all other types. Specifies whether to URL encode the form field or header.  |
| mimeType  | Optional   |         | Applies to File type; invalid for all other types. Specifies the MIME media type of the file contents. The content type can include an identifier for the character encoding of the file; for example, <code>text/html; charset=ISO-8859-1</code> indicates that the file is HTML text in the ISO Latin-1 character encoding.   |

## Usage

Specifies header or body data to send in the HTTP request. The `type` attribute identifies the information that the parameter specifies. A `cfhttp` tag can have multiple `cfhttpparam` tags, subject to the following limitations:

- An XML type attribute cannot be used with additional XML type attributes, or with `body`, `file`, or `formField` type attributes.
- A body type attribute cannot be used with additional body type attributes, or with XML, `file`, or `formField` type attributes.
- The XML and body type attributes cannot be used with the `cfhttp` tag TRACE method.
- The file type attribute is only meaningful with the `cfhttp` tag POST and PUT methods.
- The `formField` type attribute is only meaningful with the `cfhttp` tag POST and GET methods.

If you send an HTTP request to a ColdFusion page, all HTTP headers, not just those sent using the CGI type, are available as CGI scope variables. However, any custom variables (such as "myVar") do not appear in a dump of the CGI scope.

When you send a file using the `type="file"` attribute, the file content is sent in the body of a multipart/form-data request. If you send the file to a ColdFusion page, the Form scope of the receiving page contains an entry with the name you specified in the `cfhttpparam` tag `name` attribute as the key. The value of this variable is the path to a temporary file containing the file that you sent. If you also send Form field data, the location of the filename in the `form.fieldnames` key list depends on the position of the `cfhttpparam` tag with the file relative to the `cfhttp` tags with the form data.

URL-encoding preserves special characters (such as the ampersand) when they are passed to the server. For more information, see the function [URLEncodedFormat](#) on page 899.

To send arbitrary data in a "raw" HTTP message, use a `cfhttpparam` tag with a `type="body"` attribute to specify the body content and use `cfhttpparam` tags with a `type="header"` attributes to specify the headers.

## Example

```
<!-- This example consists of two CFML pages.
     The first page posts to the second. -->

<!-- The first, posting page.
     This page posts variables to another page and displays the body
     of the response from the second page.
     Change the URL and port as necessary for your environment. -->

# cfif

## Description

Creates simple and compound conditional statements in CFML. Tests an expression, variable, function return value, or string. Used, optionally, with the `cfelse` and `cfelseif` tags.

## Category

[Flow-control tags](#)

## Syntax

```
<cfif expression>  
  HTML and CFML tags  
<cfelseif expression>  
  HTML and CFML tags  
<cfelse>  
  HTML and CFML tags  
</cfif>
```

## See also

[cfelse](#), [cfelseif](#), [cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

## Usage

If the value of the expression in the `cfif` tag is True, ColdFusion processes all the code that follows, up to any `cfelseif` or `cfelse` tag, and then skips to the `cfif` end tag. Otherwise, ColdFusion does not process the code that immediately follows the `cfif` tag, and continues processing at any `cfelseif` or `cfelse` tag, or with the code that follows the `cfif` end tag.

When testing the return value of a function that returns a Boolean, you do not have to define the True condition explicitly. This example uses the `isArray` function:

```
<cfif isArray(myarray)>
```

If successful, `isArray` evaluates to yes, the string equivalent of the Boolean True. This is preferred over explicitly defining the True condition this way:

```
<cfif isArray(myarray) IS True>
```

This tag requires an end tag.

## Example

In this example, variables are shown within number signs. This is not required.

```
<!-- This example shows the interaction of cfif, cfelse, and cfelseif. -->  
<!-- First, perform a query to get some data. -->  
<cfquery name="getCenters" datasource="cfdocexamples">  
  SELECT Center_ID, Name, Address1, Address2, City, State, Country,  
         PostalCode, Phone, Contact  
  FROM Centers  
  ORDER by City, State, Name  
</cfquery>  
<p>CFIF gives us the ability to perform conditional logic based on a condition  
or set of conditions.  
<p>For example, we can output the list of Centers from the snippets datasource  
by group and only display them <b>IF</b> City = San Diego.
```

```

<hr>
<!-- Use CFIF to test a condition when outputting a query. ---->
<p>The following centers are in San Diego:
<cfoutput query="getCenters">
    <cfif Trim(City) is "San Diego">
        <br><b>Name/Address:</b>#Name#, #Address1#, #City#, #State#
        <br><b>Contact:</b> #Contact#
        <br>
    </cfif>
</cfoutput>
<hr>
<p>If we would like more than one condition to be the case, we can ask for
a list of the centers in San Diego <b>OR</b> Santa Ana. If the center
does not follow this condition, we can use CFELSE to show only
the names and cities of the other centers.
<p>Notice how a nested CFIF is used to specify the location of
the featured site (Santa Ana or San Diego).
<!-- Use CFIF to specify a conditional choice for multiple options;
also note the nested CFIF. --->
<p>Complete information is shown for centers in San Diego or Santa Ana.
All other centers are listed in italics:
<cfoutput query="getCenters">
    <cfif Trim(City) is "San Diego" OR Trim(City) is "Santa Ana">
        <h4>Featured Center in
        <cfif Trim(City) is "San Diego">
            San Diego
        <cfelse>
            Santa Ana
        </cfif>
        </h4> <b>Name/Address:</b>#Name#, #Address1#, #City#, #State#
        <br><b>Contact:</b> #Contact#<br>
    <cfelse>
        <br><i>#Name#, #City#</i>
    </cfif>
</cfoutput>
<hr>
<p>Finally, we can use CFELSEIF to cycle through a number of conditions and
produce varying output. Note that you can use CFCASE and CFSWITCH for a more
elegant representation of this behavior.
<!-- Use CFIF in conjunction with CFELSEIF to specify more than one
branch in a conditional situation. --->
<cfoutput query="getCenters">
    <cfif Trim(City) is "San Diego" OR Trim(City) is "Santa Ana">
        <br><i>#Name#, #City#</i> (this one is in
        <cfif Trim(City) is "San Diego">San Diego
        <cfelse>Santa Ana
        </cfif>)
    <cfelseif Trim(City) is "San Francisco">
        <br><i>#Name#, #City#</i> (this one is in San Francisco)
    <cfelseif Trim(City) is "Suisun">
        <br><i>#Name#, #City#</i> (this one is in Suisun)
    <cfelse> <br><i>#Name#</i>
        <br><b>Not in a city we track</b>
    </cfif>
</cfoutput>

```

# cfimpersonate

## Description

This tag is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*.

## History

ColdFusion MX: This tag is obsolete. It does not work in ColdFusion MX and later releases.

# cfimport

## Description

You can use the `cfimport` tag to import either of the following:

- All ColdFusion pages in a directory, as a tag custom tag library.
- A Java Server Page (JSP) tag library. A JSP tag library is a packaged set of tag handlers that conform to the JSP 1.1 tag extension API.

## Category

[Application framework tags](#)

## Syntax

```
<cfimport  
  taglib = "taglib-location"  
  prefix = "custom">
```

## See also

[cfapplication](#)

## History

ColdFusion MX: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| taglib    | Required |         | <p>Tag library URI. The path must be relative to the web root (and start with /), the current page location, or a directory specified in the Administrator ColdFusion mappings page.</p> <ul style="list-style-type: none"><li>• A directory in which custom ColdFusion tags are stored. In this case, all the cfm pages in this directory are treated as custom tags in a tag library.</li><li>• A path to a JAR in a web-application; for example, <code>"/WEB-INF/lib/sometags.jar"</code></li><li>• A path to a tag library descriptor; for example, <code>"/sometags.tld"</code></li></ul> <p><b>Note:</b> You must put JSP custom tag libraries in the <code>/WEB-INF/lib</code> directory. This limitation does not apply to ColdFusion pages.</p> |
| prefix    | Required |         | <p>Prefix by which to access the imported custom CFML tags JSP tags.</p> <p>If you import a CFML custom tag directory and specify an empty value, <code>" "</code>, for this attribute, you can call the custom tags without using a prefix. You must specify and use a prefix for a JSP tag library.</p>   |

## Usage

The following example imports the tags from the directory `myCustomTags`:

```
<cfimport
  prefix="mytags"
  taglib="myCustomTags">
```

You can import multiple tag libraries using one prefix. If there are duplicate tags in a library, the first one takes precedence.

JSP tags have fixed attributes; however, if the tag supports runtime attribute expressions, most tag libraries support the use of the syntax `#expressions#`.

To reference a JSP tag in a CFML page, use the syntax `<prefix:tagname>`. Set the prefix value in the `prefix` attribute.

### To use JSP custom tags in a ColdFusion page:

1. Put a JSP tag library JAR file (for example, `myjsptags.jar`) into the ColdFusion server directory `wwwroot/WEB-INF/lib`. If the tag library has a separate TLD file, put it in the same directory as the JAR file.
2. At the top of a CFML page, insert code such as the following:

```
<cfimport
  prefix="mytags"
  taglib="/WEB-INF/lib/myjsptags.jar">
```

To reference a JSP tag from a JAR file, use the following syntax:

```
<cfoutput>
  <mytags:helloTag message="#mymessage#" />
</cfoutput>
```

The `cfimport` tag must be on the page that uses the imported tags. For example, if you use a `cfimport` tag on a page that you include with the `cfinclude` call, you cannot use the imported tags on the page that has the `cfinclude` tag. Similarly, if you have a `cfimport` tag on your `Application.cfm` page, the imported tags are available on the `Application.cfm` page only, not on the other pages in the application. ColdFusion does not throw an error in these situations, but the imported tags do not run.

You cannot use the `cfimport` tag to suppress output from a tag library.

For more information, see the Java Server Page 1.1 specification.

## Example

```
<h3>cfimport example</h3>
<p>This example uses the random JSP tag library that is available from the
Jakarta Taglibs project, at http://jakarta.apache.org/taglibs/

<cfimport taglib="/WEB-INF/lib/taglibs-random.jar" prefix="randomnum">

<randomnum:number id="randPass" range="000000-999999" algorithm="SHA1PRNG"
  provider="SUN" />
<cfset myPassword = randPass.random>
<cfoutput>
  Your password is #myPassword#<br>
</cfoutput>
```

# cfinclude

## Description

Embeds references to ColdFusion pages in CFML. You can embed `cfinclude` tags recursively. For another way to encapsulate CFML, see [cfmodule on page 305](#). (A ColdFusion page was formerly sometimes called a ColdFusion template or a template.)

## Category

[Flow-control tags](#), [Page processing tags](#)

## Syntax

```
<cfinclude  
  template = "template_name">
```

## See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfhtmlhead](#), [cfsetting](#), [cfsilent](#)

## History

ColdFusion MX: Changed error behavior: if you use this tag to include a CFML page whose length is zero bytes, you do not get an error.

## Attributes

| Attribute | Req/Opt  | Default | Description                          |
|-----------|----------|---------|--------------------------------------|
| template  | Required |         | A logical path to a ColdFusion page. |

## Usage

ColdFusion searches for included files in the following locations:

1. In the directory of the current page or a directory relative to the current page
2. In directories mapped in the ColdFusion MX Administrator

You cannot specify an absolute URL or file system path for the file to include. You can only use paths relative to the directory of the including page or a directory that is registered in the ColdFusion MX Administrator Mappings. The following `cfinclude` statements will work, assuming that the `myinclude.cfm` file exists in the specified directory:

```
<cfinclude template="myinclude.cfm">  
<cfinclude template="../myinclude.cfm">  
<cfinclude template="/CFIDE/debug/myinclude.cfm">
```

But these will not work:

```
<cfinclude template="C:\CFusionMX7\wwwroot\doccomments\myinclude.cfm">  
<cfinclude template="http://localhost:8500/doccomments/myinclude.cfm">
```

The included file must be a syntactically correct and complete CFML page. For example, to output data from within the included page, you must have a `cfoutput` tag, including the end tag, on the included page, not the referring page. Similarly, you cannot span a `cfif` tag across the referring page and the included page; it must be complete within the included page.

You can specify a variable for the `template` attribute, as the following example shows:

```
<cfset templatetouse="../header/header.cfm">  
<cfinclude template="#templatetouse#">
```

### Example

```
<!--- This example shows the use of cfinclude to paste CFML  
or HTML code into another page dynamically. --->
```

```
<h4>This example includes the dohome.htm page from the CFDOCS directory.
```

```
The images do not display, because they are located in  
a separate directory. However, the page appears fully rendered  
within the contents of this page.</h4>
```

```
<cfinclude template = "../cfdocs/dohome.htm">
```

# cfindex

## Description

Populates a Verity collection with metadata and creates indexes for searching it. Verity is a search engine that you can integrate in a ColdFusion application to search physical files of various types or a database query. Indexing database columns that result from a query lets users search the query data much faster than they could if you used multiple SQL queries to return the same data.

You must define a Verity collection using the ColdFusion MX Administrator or the `cfcollection` tag before creating indexes for the collection.

You also can index a Verity collection using the ColdFusion MX Administrator or by using a native Verity indexing tool, such as Vspider or MKVDK. These options, however, limit you to indexing a collection of files in a directory path.

For more information on creating, indexing, and searching a Verity collection, see Chapter 24, “Building a Search Interface” in *ColdFusion MX Developer’s Guide*.

## Category

[Extensibility tags](#)

## Syntax

```
<cfindex
  collection = "collection_name"
  action = "action"
  type = "type"
  title = "title"
  key = "ID"
  body = "body"
  custom1 = "custom_value"
  custom2 = "custom_value"
  custom3 = "custom_value"
  custom4 = "custom_value"
  category = "category_name"
  categoryTree = "category_tree"
  URLpath = "URL"
  extensions = "file_extensions"
  query = "query_name"
  recurse = "yes" or "no"
  language = "language">
  status = "status">
```

## See also

[cfcollection](#), [cfexecute](#), [cfobject](#), [cfreport](#), [cfsearch](#), [cfwddx](#)

## History

ColdFusion MX 7:

- Added the `status`, `category`, and `categoryTree` attributes.
- Removed reference to external collections.
- Removed suggested `cflock` usage.

## ColdFusion MX:

- The `action` attribute value `optimize` is obsolete. It does not work, and might cause an error, in ColdFusion MX.
- Changed the `external` attribute behavior: it is not necessary to specify the `external` attribute. (ColdFusion automatically detects whether a collection is internal or external.)
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed thrown exceptions: this tag can throw the `SEARCHENGINE` exception.
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed query result behavior: the `cfindex` tag can index the query results from a `cfsearch` tag.

## Attributes

| Attribute               | Req/Opt  | Default  | Description  |
|-------------------------|----------|--|--|
| <code>collection</code> | Required |  | Name of a collection that is registered by ColdFusion; for example, "personnel".   |
| <code>action</code>     | Required |  | <ul style="list-style-type: none"><li>• <code>update</code>: updates a collection and adds <code>key</code> to the index.</li><li>• <code>delete</code>: removes collection documents as specified by the <code>key</code> attribute.</li><li>• <code>purge</code>: deletes all of the documents in a collection. Causes the collection to be taken offline, preventing searches.</li><li>• <code>refresh</code>: deletes all of the documents in a collection, and then performs an update.</li></ul>   |
| <code>type</code>       | Optional | <code>custom</code> , if <code>query</code> attribute is specified. Otherwise, <code>file</code> . | <ul style="list-style-type: none"><li>• <code>file</code>: applies <code>action</code> value to filename, including path. Expects a filename in the <code>key</code> attribute.</li><li>• <code>path</code>: applies <code>action</code> to files in a directory path that pass the <code>extensions</code> filter. Expects a directory name in the <code>key</code> attribute.</li><li>• <code>custom</code>: applies <code>action</code> to custom data; for example, to data from a query.</li></ul>  |
| <code>title</code>      | Optional |  | Provides a title for the document if one cannot be extracted from the document.  |
| <code>key</code>        | Required | (empty string)   | The value specified for <code>key</code> depends on the <code>type</code> attribute: <ul style="list-style-type: none"><li>• If <code>type</code> = "file", the directory path and filename for the file,</li><li>• If <code>type</code> = "path", the directory path for the location of the files.</li><li>• If <code>type</code> = "custom", a unique identifier that specifies the location of the data, For a query, the name of the column that holds the primary key, for example. If not a query, an identifier such as the URL for a web page, for example.</li></ul> |

| Attribute    | Req/Opt                         | Default  | Description  |
|--------------|---------------------------------|--|--|
| body         | Required if<br>type =<br>custom |  | <ul style="list-style-type: none"> <li>• ASCII text to index.</li> <li>• Query column names, if name is specified in query.</li> </ul> You can specify columns in a delimited list; for example: "emp_name, dept_name, location".<br>This attribute is ignored if type is file or path, and is invalid if action is delete.                                |
| custom1      | Optional                        |  | Use to index discrete values in collection records, which lets you search for specific records using the Verity MATCHES operator. By contrast, values specified in the body attribute are concatenated and searched as a body of text using the specified criteria.<br>If type = query, a query column name. If type = custom, a data field to be indexed. |
| custom2      | Optional                        |  | Usage is the same as for custom1.  |
| custom3      | Optional                        |  | Usage is the same as for custom1.  |
| custom4      | Optional                        |  | Usage is the same as for custom1.  |
| category     | Optional                        |  | A string value that specifies one or more search categories for which to index the data. You can define multiple categories, separated by commas, for a single index.  |
| categoryTree | Optional                        |  | A string value that specifies a hierarchical category or category tree for searching. It is a series of categories separated by forward slashes ("/"). You can specify only one category tree.   |
| URLpath      | Optional                        |  | If type is file or path, specifies the URL path. During indexing, this pathname is prefixed to filenames and returned from a search as the url.  |
| extensions   | Optional                        | htm,<br>html,<br>cfm,<br>cfml,<br>dbm,<br>dbml | Delimited list of file extensions that ColdFusion uses to index files, if type = "Path".<br>"*" returns files with no extension. ".*" returns all files.<br>For example, the following code returns files with a listed extension or no extension:<br><pre>extensions == ".htm, .html, .cfm, .cfml, "*."</pre>   |
| query        | Optional.                       |  | The name of the query against which the collection is generated.   |
| recurse      | Optional                        | no   | <ul style="list-style-type: none"> <li>• yes: if type = "path", indexes qualified files in directories below the path specified in the key attribute.</li> <li>• no</li> </ul>   |
| language     | Optional                        | English  | For options, see <a href="#">cfcollection</a> . Requires the appropriate Verity Locales language pack (Western Europe, Asia, Multilanguage, Eastern Europe/Middle Eastern).  |
| status       | Optional                        |  | The name of the structure into which ColdFusion MX returns status information.   |

## Usage

The attributes settings that the `cfindex` tag requires depend on whether you set the `query` attribute. If you set the `query` attribute to a valid query name, it specifies that `cfindex` is to index the data in the query rather than indexing documents on a disk. If you do *not* set the `query` attribute, `cfindex` assumes it is indexing a file (`type = file`), a set of files in a directory path (`type = path`), or text that you provide in the `body` attribute (`type = custom`).

If you set the `query` attribute to a valid query name, the `cfindex` tag creates indexes as specified by the following attributes and their values:

---

| Type   | Attribute values   |
|--------|--|
| File   | The <code>key</code> attribute is the name of a column in the query that contains a full filename (including path).  |
| Path   | The <code>key</code> attribute is the name of a column in the query that contains a directory pathname.<br><br>The <code>extensions</code> and <code>recurse</code> attributes, if specified, elaborate on which files are included. If the action is <code>delete</code> , <code>cfindex</code> deletes keys for the collection.  |
| Custom | The <code>key</code> attribute specifies a column name that contains anything you want; for example, the primary key value in the database. It must be unique because this is the primary key in the collection. If the action is <code>delete</code> , the <code>key</code> attribute is the name of a column in the query that contains the keys to delete.<br><br>The <code>body</code> attribute is required and is a comma-delimited list of the names of the columns that contain the text data to be indexed. |

---

If you do *not* set the `query` attribute, the `cfindex` tag creates indexes as specified by the following attributes and their values:

---

| Type   | Attribute values   |
|--------|--|
| File   | The <code>key</code> attribute is required and is a full pathname to a file.   |
| Path   | The <code>key</code> attribute is required and it is a directory pathname.<br><br>The <code>extensions</code> and <code>recurse</code> attributes, if specified, designate which types of files are included. If the action is <code>delete</code> , both the keys and the document files are deleted. |
| Custom | The <code>key</code> attribute is an identifier that specifies the key. If the action is <code>delete</code> , the <code>key</code> attribute is the document key to delete.<br><br>The <code>body</code> attribute is required and is the text to be indexed.   |

---

If `type` is not specified but `query` is set, ColdFusion sets the `type` to the default value of `custom`.

If neither `type` nor `query` is set, ColdFusion sets `type` to the default value of `file`.

If `type` equals `custom`, all attributes except for `key` and `body` can specify a literal value, not only a column name. This allows you to change a field to empty in the collection.

## Status attribute

The `status` attribute provides the following information and diagnostics about the result of a `cfindex` operation:

| Key      | Type   | Description   |
|----------|--------|---|
| BADKEYS  | Struct | A structure of keys with diagnostic messages about the indexing of these keys. If there are no bad keys, this key does not exist.                                     |
| DELETED  | Number | The number of keys deleted.   |
| MESSAGES | Array  | An array of diagnostic messages, including nonfatal errors and warnings, returned from the Verity K2 Index server. If there are no messages, this key does not exist. |
| INSERTED | Number | The number of keys inserted into the collection.  |
| UPDATED  | Number | The number of keys updated in the collection.   |

### Example

```
<!-- EXAMPLE #1 Index a file, type = "file". ----->
<!-- Example dumps content of status variable (info). ----->
<cfindex collection="CodeColl"
  action="refresh"
  type="file"
  key="C:\blackstone\wwwroot\vw_files\cfindex.htm"
  urlpath="http://localhost:8500/vw_files/"
  language="English"
  title="Cfindex Reference page"
  status="info">

<!-- Search for Attributes. --->
<cfsearch
  name = "mySearch"
  collection = "CodeColl"
  criteria = "Attributes"
  contextpassages = "1"
  maxrows = "100">
<cfoutput>
  key=#mySearch.key#<br />
  title=#mySearch.title#<br />
  context=#mySearch.context#<br />
  url=#mySearch.url#<br />
</cfoutput>

<cfdump var="#info#">

<!-- EXAMPLE #2 Index a path (type = "path"). ----->
<cfindex collection="CodeColl"
  action="refresh"
  type="path"
  key="C:\inetpub\wwwroot\vw_files\newspaper\sports"
  urlpath="http://localhost/vw_files/newspaper/sports"
  extensions = ".htm, .html"
  recurse="no">
```

```

    language="English"
    categoryTree="vw_files/newspaper/sports"
    category="Giants">

<!-- Search for any references to criteria. -->
<cfsearch
    name = "mySearch"
    collection = "CodeColl"
    categoryTree="vw_files/newspaper/sports"
    category="Giants"
    criteria = "Williams"
    contextpassages = "1"
    maxrows = "100">
<cfoutput>
    key=#mySearch.key#<br />
    title=#mySearch.title#<br />
    context=#mySearch.context#<br />
    url=#mySearch.url#<br />
</cfoutput>

<!--EXAMPLE #3: Index a QUERY (type = "custom") using custom1. ----->
<!-- Retrieve data from the table. -->
<cfquery name="getCourses" datasource="cfdocexamples">
    SELECT * FROM COURSES
</cfquery>

<!-- Update the collection with the above query results. -->
<!-- key is Course_ID in the Courses table. ---->
<!-- body specifies the columns to be indexed for searching. --->
<!-- custom1 specifies the value of the Course_Number column. --->

<cfindex
    query="getCourses"
    collection="CodeColl"
    action="Update"
    type="Custom"
    key="Course_ID"
    title="Courses"
    body="Course_ID,Descript"
    custom1="Course_Number"
>
<h2>Indexing Complete</h2>
<!-- cno supplies value for searching custom1;
    could be form input instead. --->
<cfset cno = "540">
<cfsearch
    name = "mySearch"
    collection = "CodeColl"
    criteria = "CF_CUSTOM1 <MATCHES> #cno#"
    contextpassages = "1"
    maxrows = "100">
<!-- Returns indexed values (Course_ID and Descript) for
    Course_Number 540. --->

# cfinput

## Description

Used within the `cfform` tag, to place input controls that support input validation on a form.

## Category

[Forms tags](#)

## Syntax

```
<cfinput
  name = "name"
  type = "input type"
  label = "text"
  style = "style specification"
  required = "yes" or "no"
  mask = "masking pattern"
  validate = "data type"
  validateAt= one or more of "onBlur", "onServer", "onSubmit"
  message = "text"
  range = "min_value, max_value"
  maxlength = "number"
  pattern = "regexp"
  onValidate = "script name"
  onError = "script name"
  size = "integer"
  value = "initial value"
  bind = "bind expression"
  checked
  disabled = "true" or "false" or no attribute value
  src = "image URL"
  onKeyUp = "JavaScript or ActionScript"
  onKeyDown = "JavaScript or ActionScript"
  onMouseUp = "JavaScript or ActionScript"
  onMouseDown = "JavaScript or ActionScript"
  onChange = "JavaScript or ActionScript"
  onClick = "JavaScript or ActionScript"
  firstDayOfWeek = "day name"
  dayNames = "days-of-the-week labels"
  monthNames = "month labels"
  enabled = "Yes" or "No"
  visible = "Yes" or "No"
  toolTip = "Tip text"
  height = "number of pixels"
  width = "number of pixels"

## History

ColdFusion MX 7:

- Added support for button, file, hidden, image, reset, and submit controls.
- Added support for generating Flash and XML controls (specified in the `cfform` tag).
- Added `datefield` type (Flash forms only) and the supporting `daynames` and `monthnames` attributes.
- Added `bind`, `enabled`, `height`, `label`, `tooltip`, `visible`, and `width` attributes for use in Flash forms.
- Added support for `onBlur` and `onServer` validation, including the `validateAt` attribute.
- Added `USdate`, `range`, `boolean`, `email`, `URL`, `uuid`, `guid`, `maxlength`, `noblanks`, and `submitOnce` validation attribute values.
- Added support for preventing multiple submissions.
- Added the `mask` attribute.
- Deprecated the `passthrough` attribute. The tag now supports all HTML input tag attributes directly.

ColdFusion MX: Changed the `cfform` `preserveData` attribute behavior: if it is set to `True`, ColdFusion checks radio and check box values only if their value matches the posted value for the control. (In earlier releases, if the posted value did not match any of the `cfinput` check boxes or radio buttons for the control, the `checked` attribute was used.

## Attributes

The following table lists attributes that ColdFusion uses directly. The tag also supports all HTML form tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML.

| Attribute         | Req/Opt;<br>Formats | Default           | Description  |
|-------------------|---------------------|-------------------|--|
| <code>name</code> | Required;<br>All    |                   | Name for form input element.   |
| <code>type</code> | Optional;<br>All    | <code>text</code> | The input control type to create: <ul style="list-style-type: none"><li>• <code>button</code>: push button.</li><li>• <code>checkbox</code>: check box.</li><li>• <code>file</code>: file selector; not supported in Flash.</li><li>• <code>hidden</code>: invisible control.</li><li>• <code>image</code>: clickable button with an image.</li><li>• <code>password</code>: password entry control; hides input values.</li><li>• <code>radio</code>: radio button.</li><li>• <code>reset</code>: form reset button.</li><li>• <code>submit</code>: form submission button.</li><li>• <code>text</code>: text entry box.</li><li>• <code>datefield</code>: Flash only; date entry field with an expanding calendar for selecting dates.</li></ul> |

| Attribute  | Req/Opt;<br>Formats            | Default  | Description   |
|------------|--------------------------------|----------|---|
| label      | Optional;<br>Flash and<br>XML  |          | Label to put next to the control on a Flash form. Not used for button, hidden, image, reset, or submit types.   |
| style      | Optional;<br>All               |          | In HTML or XML format, ColdFusion passes the style attribute to the browser or XML.<br>In Flash format, must be a style specification in CSS format. For detailed information on specifying Flash styles, see Chapter 29, "Creating Forms in Macromedia Flash" in <i>ColdFusion MX Developer's Guide</i> .<br>In XML format, ColdFusion passes the style attribute to the XML.  |
| required   | Optional;<br>All               | no       | <ul style="list-style-type: none"> <li>• yes: the field must contain data.</li> <li>• no: allows an empty field.</li> </ul>   |
| mask       | Optional;<br>Flash and<br>HTML |          | <p>A mask pattern that controls the character pattern that users can enter, or that the form sends to ColdFusion.</p> <p><b>HTML and Flash:</b> For tags with <code>type="text"</code>. Mask characters and the corresponding valid input characters are:</p> <ul style="list-style-type: none"> <li>• A = [A-Za-z]</li> <li>• X = [A-Za-z0-9]</li> <li>• 9 = [0-9]</li> <li>• ? = Any character</li> <li>• All other characters = insert the literal character</li> </ul> <p><b>Flash only:</b> For tags with <code>type="datefield"</code>. ColdFusion uses the mask pattern to format the selected date. Mask characters are:</p> <ul style="list-style-type: none"> <li>• D = day; can use 0-2 mask characters.</li> <li>• M = month; can use 0-4 mask characters.</li> <li>• Y = year; can use 0, 2, or 4 characters.</li> <li>• E = day in week; can use 0-4 characters.</li> </ul> <p>For more information, see "<a href="#">Masking input data</a>" in Usage.</p> |
| validate   | Optional;<br>All               |          | The type or types of validation to do. Available validation types and algorithms depend on the format. For details, see Usage.  |
| validateAt | Optional;<br>All               | onSubmit | <p>How to do the validation; one or more of the following:</p> <ul style="list-style-type: none"> <li>• onSubmit</li> <li>• onServer</li> <li>• onBlur</li> </ul> <p>onBlur and onSubmit are identical in Flash forms. For multiple values, use a comma-delimited list. For details, see Usage.</p>   |
| message    | Optional;<br>All               |          | Message text to display if validation fails.  |

| Attribute  | Req/Opt;<br>Formats  | Default | Description   |
|------------|--|---------|---|
| range      | Optional;<br>All   |         | <p>Minimum and maximum allowed numeric values. ColdFusion uses this attribute only if you specify <i>range</i> in the <code>validate</code> attribute.</p> <p>If you specify a single number or a single number followed by a comma, it is treated as a minimum, with no maximum. If you specify a comma followed by a number, the maximum is set to the specified number, with no minimum.</p> |
| maxLength  | Optional;<br>All   |         | <p>Maximum length of text entered, if <code>type = "Text"</code> or <code>"password"</code>. For complete length validation, specify <code>maxLength</code> validation in a <code>validate</code> attribute; otherwise, this attribute prevents users from typing beyond the specified length, but does not prevent them from pasting in a longer value.</p>                                    |
| pattern    | Required if<br><code>validate = "regex"</code> ;<br>HTML and<br>XML<br>format only |         | <p>JavaScript regular expression pattern to validate input. ColdFusion uses this attribute only if you specify <i>regex</i> in the <code>validate</code> attribute.</p> <p>Omit leading and trailing slashes. For examples and syntax, see Chapter 27, "Building Dynamic Forms with <code>cform</code> Tags" in <i>ColdFusion MX Developer's Guide</i>.</p>                                     |
| onValidate | Optional;<br>HTML and<br>XML only  |         | <p>Custom JavaScript function to validate user input. The form object, input object, and input object values are passed to the routine, which should return <code>True</code> if validation succeeds, and <code>False</code> otherwise. If used, the <code>validate</code> attribute is ignored.</p>  |
| onError    | Optional;<br>HTML and<br>XML only  |         | <p>Custom JavaScript function to execute if validation fails.</p>   |
| size       | Optional;<br>All   |         | <p>Size of input control. Ignored, if <code>type = "radio"</code> or <code>"checkbox"</code>. If specified in a Flash form, ColdFusion sets the control width pixel value to 10 times the specified size and ignores the <code>width</code> attribute</p>   |
| value      | depends on<br>type<br>setting;<br>All  |         | <p>HTML: corresponds to the HTML value attribute. Its use depends on control type.</p> <p>Flash: optional; specifies text for button type inputs: button, submit, and image.</p>  |
| bind       | Optional;<br>Flash only  |         | <p>A Flash bind expression that populates the field with information from other form fields. For details, see Usage.</p>  |
| checked    | Optional;<br>All   | False   | <p>Selects a radio or checkbox control:</p> <ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>   |

| Attribute      | Req/Opt;<br>Formats            | Default   | Description  |
|----------------|--------------------------------|---|--|
| disabled       | Optional;<br>All               | not<br>disabled   | Disables user input, making the control read-only. To disable input, specify disabled without an attribute or <code>disabled="Yes"</code> (or any ColdFusion positive Boolean value, such as True). To enable input, omit the attribute or specify <code>disabled="No"</code> (or any ColdFusion negative Boolean value, such as False). |
| src            | Optional;<br>Flash and<br>HTML |   | Applies to Flash button, reset, submit, and image types, and the HTML image type. URL of an image to use on the button. Flash does not support GIF images.   |
| onKeyUp        | Optional;<br>All               |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.   |
| onKeyDown      | Optional;<br>All               |   | JavaScript (HTML/XML) or ActionScript (Flash) ActionScript to run when the user presses a keyboard key in the control.   |
| onMouseUp      | Optional;<br>All               |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.  |
| onMouseDown    | Optional;<br>All               |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.   |
| onChange       | Optional;<br>All               |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action. In Flash, applies to datefield, password, and text types only.   |
| onClick        | Optional;<br>All               |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user clicks the control. In Flash, applies to button, checkbox, image, radio, reset, and submit types only.  |
| dayNames       | Optional;<br>All               | S, M, T, W,<br>Th, F, S   | Applies to <code>datefield</code> type only. A comma-delimited list that sets the names of the weekdays displayed in the calendar. Sunday is the first day; the rest of the weekday names follow in the normal order.  |
| firstDayOfWeek | Optional;<br>All               | 0   | Applies to <code>datefield</code> type only. Integer in the range 0-6 specifying the first day of the week in the calendar: 0 indicates Sunday; 6 indicates Saturday.  |
| monthNames     | Optional;<br>All               | January,<br>February,<br>March,<br>April, May,<br>June, July,<br>August,<br>September,<br>October,<br>November,<br>December | Applies to <code>datefield</code> type only. A comma-delimited list of the month names that are displayed at the top of the calendar.  |

| Attribute | Req/Opt;<br>Formats             | Default | Description   |
|-----------|---------------------------------|---------|---|
| enabled   | Optional;<br>Flash              | Yes     | Boolean value specifying whether the control is enabled. A disabled control appears in light gray. The inverse of the <code>disabled</code> attribute.  |
| visible   | Optional;<br>Flash              | Yes     | Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank.  |
| tooltip   | Optional;<br>Flash              |         | Text to display when the mouse pointer hovers over the control.   |
| height    | Optional;<br>see<br>Description |         | Applies to most Flash types, HTML image type on some browsers. The height of the control, in pixels. The displayed height might be less than the specified size.  |
| width     | Optional;<br>see<br>Description |         | Applies to most Flash types, HTML image type on some browsers. The width of the control, in pixels. For Flash forms, ColdFusion ignores this attribute if you also specify a <code>size</code> attribute value. |

**Note:** Attributes that are marked as not supported in XML are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML.

## Usage

For this tag to work properly, the browser must be JavaScript-enabled.

If the `cfform preserveData` attribute is true and the form posts back to the same page, the posted value of the `cfinput` control is used, instead of its `Value` or `Checked` attribute.

You can use the keyboard to access and select dates from a `datefield` Flash input: press Tab to go to the field and press the Spacebar to open the menu. Use the Up, Down, Left, and Right Arrow keys to change the selected date. Use the Home and End keys to reach the first and last enabled date in a month, respectively. Use the Page Up and Page Down keys to reach the previous and next month, respectively.

**Note:** To clear a datefield entry, select the field to open the menu, and click the selected date.

For more information, see `cfform`. For information on using JavaScript regular expressions with this tag, see Chapter 27, “Building Dynamic Forms with `cfinput` Tags” in *ColdFusion MX Developer’s Guide*.

## Validation

The following sections describe how to do validation in `cfinput` tags.

**Validation methods** ColdFusion provides four methods of validation of `cfinput` text and password fields.

You can specify one or a combination of the following in the `validateAt` attribute:

- `onSubmit` The form page on the browser includes JavaScript functions that perform validation before the form is submitted to the server. In Flash format forms, this option is identical to `onBlur`.

- **onBlur** In HTML format the form page on the browser includes JavaScript functions that perform validation when the field loses the focus. In Flash format, the attribute is equivalent to `onSubmit`. `OnBlur` validation uses the same algorithms as `onSubmit` validation. `OnBlur` validation was added in ColdFusion MX 7.
- **onServer** ColdFusion performs the validation on the server. Some `onServer` algorithms vary from the `onSubmit` algorithms. `OnServer Date` and `Time` validation allow more patterns than `onSubmit` validation. `OnServer` validation was added in ColdFusion MX 7, and automatically generates hidden fields to support the validation.

You can also omit a `validate` attribute and specify the type of validation for the field in a separate hidden form field. This form of validation is equivalent to `onServer` validation, but it allows you to specify separate messages for each validation that you do on the field. It is backward compatible with previous ColdFusion releases. For more information on hidden form field validation, see `cf form` and “Validating form data using hidden fields” in Chapter 28, “Validating form data using hidden fields,” in *ColdFusion MX Developer’s Guide*.

**validation types** You can use the following values in the `validate` attribute to specify input validation for all validation methods. Most attributes apply only to password or text fields. You can specify multiple validation types in a comma-delimited list, but only some combinations are meaningful.

| Type                          | Description   |
|-------------------------------|---|
| date                          | If <code>validateAt="onServer"</code> , allows any date format that returns True in the <code>IsDate</code> function; otherwise, same as <code>USdate</code> .                                  |
| USdate                        | A US date of the format <code>mm/dd/yy</code> <code>mm-dd-yy</code> or <code>mm.dd.yy</code> , with 1-2 digit days and months, 1-4 digit years.   |
| eurodate                      | A date of the format <code>dd/mm/yy</code> , with 1-2 digit days and months, 1-4 digit years.. The format can use <code>/</code> , <code>-</code> , or <code>.</code> characters as delimiters. |
| time                          | Time format <code>hh:mm:ss</code>   |
| float or numeric              | A number; allows integers.  |
| integer                       | An integer.   |
| range                         | A numeric range.  |
| boolean                       | A value that can be converted to a Boolean value: Yes, No, True, False, or a number.  |
| telephone                     | Standard U.S. telephone formats. Allows an initial 1 long-distance designator and up to 5-digit extensions, optionally starting with x.   |
| zipcode                       | U.S. 5- or 9-digit ZIP code format <code>#####-####</code> . The separator can be a hyphen (-) or a space.  |
| creditcard                    | Strips blanks and dashes; verifies number using mod10 algorithm. Number must have 13-16 digits.   |
| ssn or social_security_number | US. Social Security number format, <code>###-##-####</code> . The separator can be a hyphen (-) or a space.   |

| Type                        | Description  |
|-----------------------------|--|
| email                       | A valid e-mail address of the form name@server.domain. ColdFusion validates the format only; it does not check that entry is a valid active e-mail address.  |
| URL                         | A valid URL pattern; supports http, https, ftp file, mailto, and news URLs.  |
| guid                        | A unique identifier that follows the Microsoft/DCE format, xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx, where x is a hexadecimal number.  |
| uuid                        | A universally unique identifier (UUID) that follows the ColdFusion format, xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx, where x is a hexadecimal number.  |
| maxlength                   | Limits the input to a maximum number of characters.  |
| noblanks                    | Does not allow fields that consist only of blanks.   |
| regex or regular_expression | Matches input against the <code>pattern</code> attribute. Valid in HTML and XML format only; ignored in Flash format.  |
| SubmitOnce                  | Used only with submit and image types; prevents the user from submitting the same form multiple times before until the next page loads (for example, submitting an order a second time before getting the first order confirmation). Valid in HTML and XML format only; ignored in Flash format. |

**Validation differences** The preceding table describes the general validation behavior. The underlying validation code must differ depending on the validation method and the form type. As a result, the algorithms used vary in some instances, including the following:

- The validation algorithms used for date/time values varies between onSubmit/OnBlur and OnServer.
- The algorithms used for onSubmit/OnBlur validation in Flash vary from those used for HTML/XML format, and generally follow simpler rules.

The table describes the onSubmit/OnBlur behavior in HTML format. For detailed information on the OnServer validation algorithms, see “Data validation types” in Chapter 28, “Data validation types,” in *ColdFusion MX Developer’s Guide*.

For more information on validation, including discussions of the advantages and disadvantages of different validation types, see Chapter 28, “Validating Data” in *ColdFusion MX Developer’s Guide*.

### Masking input data

The `mask` attribute controls the format of data that can be entered into a field. You can combine masking and validation on a field.

- In HTML and Flash form format the mask can control the format of data entered into a `text` field.
- In Flash format, the mask can also control the format of the date chosen using the `datefield` input control.

In text fields, ColdFusion automatically inserts any literal mask characters, such as - characters in telephone numbers. Users type only the variable part of the field.

The following pattern enforces entry of a part number of the format EB-1234-c1-098765, where the user starts the entry by typing the first numeric character, such as 3. ColdFusion fills in the preceding EA prefix and all - characters. The user must enter four numbers, followed by two alphanumeric characters, followed by six numbers.

```
<cfinput type="text" name="newPart" mask="EB-9999-XX-999999" />
```

**Note:** To force a pattern to be all-uppercase or all-lowercase, use the ColdFusion `UCASE` or `LCASE` functions in the action page.

For tags with `type="datefield"` (and `cfcalendar` tags), the number of pattern characters determines the format of the output, as follows:

| Mask | Pattern   |
|------|---|
| D    | Single- or double-digit day of month, such as 1 or 28 |
| DD   | Double-digit day of month, such as 01 or 28           |
| M    | Single- or double-digit month, such as 1 or 12        |
| MM   | Double-digit month, such as 01 or 12                  |
| MMM  | Abbreviated month name, such as Jan or Dec            |
| MMMM | Full month name, such as January or December          |
| YY   | Two-character year, such as 05                        |
| YYYY | Four-character year, such as 2005                     |
| E    | Single-digit day of week, such as 1 or 7              |
| EEE  | Abbreviated day of week name, such as Mon or Sun      |
| EEEE | Full month day of week name, such as Monday or Sunday |

The following pattern specifies that the Flash forms sends the date selected using a `datefield` input control to ColdFusion as text in the format 04/29/2004:

```
<cfinput name="startDate" type="datefield" label="date:" mask="mm/dd/yyyy"/>
```

### Flash form data binding

The `bind` attribute lets you populate form fields using the contents of other form fields. To specify text from another field in a `cftextarea` `bind` attribute, use the following format:

```
{sourceTagName.text}
```

For example, the following line uses the values from the `firstName` and `lastName` fields to construct an email address. (The user can change or replace this value with a typed entry.)

```
<cfinput type="text" name="email" label="email"
  bind="{firstName.text}.{lastName.text}@mm.com">
```

### Example

```
<!-- This example shows the use of cfinput within a cform to ensure simple
validation of text items. -->
<cform action = "cfinput.cfm">
<!-- Phone number validation. -->
```

```

Phone Number Validation (enter a properly formatted phone number): <br>
<cfinput
  type = "Text" name = "MyPhone"
  message = "Enter telephone number, formatted xxx-xxx-xxxx (e.g. 617-761-
2000)"
  validate = "telephone" required = "yes">
  <font size = -1 color = red>Required</font>
<!-- Zip code validation. -->
<p>Zip Code Validation (enter a properly formatted zip code):<br>
<cfinput
  type = "Text" name = "MyZip"
  message = "Enter zip code, formatted xxxxx or xxxxx-xxxx"
  validate = "zipcode" required = "yes">
  <font size = -1 color = red>Required</font>
<!-- Range validation. -->
<p>Range Validation (enter an integer from 1 to 5): <br>
<cfinput
  type = "Text" name = "MyRange" range = "1,5"
  message = "You must enter an integer from 1 to 5"
  validate = "integer" required = "no">
<!-- Date validation. -->
<p>Date Validation (enter a properly formatted date):<br>
<cfinput
  type = "Text" name = "MyDate"
  message = "Enter a correctly formatted date (dd/mm/yy)"
  validate = "date" required = "no">
<input
  type = "Submit" name = ""
  value = "send my information">
</cform>

```

# cfinsert

## Description

Inserts records in data sources from data in a ColdFusion form or form Scope.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfinsert
  dataSource = "ds_name"
  tableName = "tbl_name"
  tableOwner = "owner"
  tableQualifier = "tbl_qualifier"
  username = "username"
  password = "password"
  formFields = "formfield1, formfield2, ...">
```

## See also

[cfpropparam](#), [cfprocresult](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#), [cfupdate](#)

## History

**ColdFusion MX:** Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

## Attributes

| Attribute                   | Req/Opt  | Default | Description  |
|-----------------------------|----------|---------|--|
| <code>dataSource</code>     | Required |         | Data source; contains table.   |
| <code>tableName</code>      | Required |         | Table in which to insert form fields.<br>ORACLE drivers: must be uppercase.<br>Sybase driver: case-sensitive. Must be the same case used when table was created  |
| <code>tableOwner</code>     | Optional |         | For data sources that support table ownership (such as SQL Server, Oracle, and Sybase SQL Anywhere), use this field to specify the owner of the table.   |
| <code>tableQualifier</code> | Optional |         | For data sources that support table qualifiers, use this field to specify qualifier for table. The purpose of table qualifiers varies among drivers. For SQL Server and Oracle, qualifier refers to name of database that contains table. For Intersolv dBASE driver, qualifier refers to directory where DBF files are located. |
| <code>username</code>       | Optional |         | Overrides username specified in ODBC setup.  |

| Attribute  | Req/Opt  | Default                    | Description  |
|------------|----------|----------------------------|--|
| password   | Optional |                            | Overrides password specified in ODBC setup.  |
| formFields | Optional | (all on form, except keys) | Comma-delimited list of form fields to insert. If not specified, all fields in the form are included.<br>If a form field is not matched by a column name in the database, ColdFusion throws an error.<br>The database table key field must be present in the form. It may be hidden. |

### Example

```

<!-- This example shows how to use cfinsert instead of cfquery to put
data in a datasource. -->
<!-- If form.POSTED exists, we insert new record, so begin cfinsert tag. -->
<cfif IsDefined ("form.posted")>
  <cfinsert dataSource = "cfdoexamples"
    tableName = "Comments"
    formFields = "Email,FromUser,Subject,MessText,Posted">
  <h3><i>Your record was added to the database.</i></h3>
</cfif>

<cfif IsDefined ("form.posted")>
  <cfif Server.OS.Name IS "Windows NT">
    <cfinsert datasource="cfdoexamples" tablename="Comments"
      formfields="EMail,FromUser,Subject,MessText,Posted">
  <cfelse>
    <cfinsert datasource="cfdoexamples" tablename="Comments"
      formfields="CommentID,EMail,FromUser,Subject,MessText,Posted">
  </cfif>
  <h3><i>Your record was added to the database.</i></h3> </cfif>

<!-- Use a query to show the existing state of the database. -->
<cfquery name = "GetComments" dataSource = "cfdoexamples">
  SELECT
    CommentID, EMail, FromUser, Subject, CommtType, MessText, Posted,
    Processed
  FROM
    Comments
</cfquery>

<html>
<head></head>
<h3>cfinsert Example</h3>
<p>First, show a list of the comments in the cfdoexamples datasource.
<!-- show all the comments in the db -->
<table>
  <tr>
    <td>From User</td><td>Subject</td><td>Comment Type</td>
    <td>Message</td><td>Date Posted</td>
  </tr>
  <cfoutput query = "GetComments">
    <tr>
      <td valign = top><a href = "mailto:#Email#">#FromUser#</A></td>
      <td valign = top>#Subject#</td>

```

```

        <td valign = top>#CommtType#</td>
        <td valign = top><font size = "-2">#Left(MessText, 125)#</font></td>
        <td valign = top>#Posted#</td>
    </tr>
</cfoutput>
</table>
<p>Next, we'll offer the opportunity to enter a comment:
<!-- make a form for input -->
<form action = "cfinsert.cfm" method = "post">
    <pre>
    Email: <input type = "Text" name = "email">
    From: <input type = "Text" name = "fromUser">
    Subject:<input type = "Text" name = "subject">
    Message:<textarea name = "MessText" COLS = "40" ROWS = "6"></textarea>
    Date Posted: <cfoutput>#DateFormat(Now())#</cfoutput>
    <!-- dynamically determine today's date -->
    <input type = "hidden"
        name = "posted" value = "<cfoutput>#Now()#</cfoutput>">
    </pre>
    <input type = "Submit"
        name = "" value = "insert my comment">
</form>

```

# cfinvoke

## Description

Does either of the following:

- Invokes a component method from within a ColdFusion page or component.
- Invokes a web service.

This tag works as follows:

- Transiently instantiates a component or web service and invokes a method on it.
- Invokes a method on an instantiated component or web service.

This tag can pass parameters to a method in the following ways:

- With the `cfinvokeargument` tag
- As named attribute-value pairs, one attribute per parameter
- As a structure, in the `argumentCollection` attribute

## Category

[Extensibility tags](#)

## Syntax

### Syntax 1

```
<!-- This syntax invokes a method of a component. -->
<cfinvoke
  component = "component name or reference"
  method = "method name"
  returnVariable = "variable name"
  argumentCollection = "argument collection"
...>
OR
```

### Syntax 2

```
<!-- This syntax can invoke a method of a component only
from within the component. -->
<cfinvoke
  method = "method name"
  returnVariable = "variable name"
  argumentCollection = "argument collection"
...
>
OR
```

### Syntax 3

```
<!-- This syntax invokes a web service. -->
<cfinvoke
  webservice = "URLtoWSDL_location"
  method = "operation_name"
  username = "user name"
  password = "password"
  timeout = "request timeout in seconds"
```

```

proxyServer = "WSDL proxy server URL"
proxyPort = "port on proxy server"
proxyUser = "user id for proxy server"
proxyPassword = "password for proxy server"
servicePort = "WSDL port name"
inputParam1 = "value1"
inputParam2 = "value2"
...
returnVariable = "var_name"
...>
OR

```

#### Syntax 4A

```

<!-- This syntax invokes a component.
This syntax shows instantiation with the cfunction tag.
This cfunction syntax applies to instantiating a component
with the cfunction tag and to instantiating a component
with the CreateObject function. --->
<cfunction
component = "component name"
name = "mystringname for instantiated object">
<cfunction
<!-- value is object name, within number signs. --->
component = "#mystringname for instantiated component#"
method = "method name"
returnVariable = "variable name"
argumentCollection = "argument collection"
...
>
OR

```

#### Syntax 4B

```

<!-- This syntax invokes a web service.
This syntax shows instantiation with the cfunction tag.
This cfunction syntax applies to instantiating a web service
with the cfunction tag and to instantiating a web service
with the CreateObject function. --->
<cfunction
webservice = "web service name"
name = "mystringname for instantiated object"
method = "operation_name">
<cfunction
<!-- value is object name, within number signs. --->
webservice = "#my stringname for instantiated web service#"
timeout = "request timeout in seconds"
proxyServer = "WSDL proxy server url"
proxyPort = "numeric port on proxy server"
proxyUser = "string user id for proxy server"
servicePort = "WSDL port name"
proxyPassword = "string user password for proxy server"
>

```

## History

ColdFusion MX 7: Added the `servicePort` attribute.

ColdFusion MX 6.1: Added the following attributes: `timeout`, `proxyServer`, `proxyPort`, `proxyUser`, and `proxyPassword`.

ColdFusion MX: Added this tag.

## Attributes

| Attribute                       | Req/Opt    | Default   | Description  |
|---------------------------------|------------|---|--|
| <code>component</code>          | See Usage. |   | String or component object; a reference to a component, or component to instantiate. |
| <code>method</code>             | See Usage. |   | Name of a method. For a web service, the name of an operation.                       |
| <code>returnVariable</code>     | Optional   |   | Name of a variable for the invocation result.  |
| <code>argumentCollection</code> | Optional   |   | Name of a structure; associative array of arguments to pass to the method.           |
| <code>username</code>           | Optional   |   | Overrides username specified in Administrator > Web Services.                        |
| <code>password</code>           | Optional   |   | Overrides password specified in Administrator > Web Services.                        |
| <code>webservice</code>         | Required   |   | The URL of the WSDL file for the web service.  |
| <code>timeout</code>            | Optional   |   | The timeout for the web service request, in seconds                                  |
| <code>proxyServer</code>        | Optional   | <code>http.proxyHost</code> system property, if any.    | The proxy server required to access the webservice URL.                              |
| <code>proxyPort</code>          | Optional   | <code>http.proxyPort</code> system property, if any.    | The port to use on The proxy server.   |
| <code>proxyUser</code>          | Optional   | <code>http.proxyUser</code> system property, if any     | The user ID to send to the proxy server.   |
| <code>proxyPassword</code>      | Optional   | <code>http.proxyPassword</code> system property, if any | The user's password on the proxy server.   |

| Attribute               | Req/Opt  | Default                      | Description  |
|-------------------------|----------|------------------------------|--|
| servicePort             | Optional | First port found in the WSDL | The port name for the web service. This value is case-sensitive and corresponds to the <code>port</code> element's <code>name</code> attribute under the <code>service</code> element.<br><br>Specify this attribute if the web service contains multiple ports. |
| <i>input_params ...</i> |          |                              | Input parameters. For each named input parameter specify <i>paramName=paramValue</i> .   |

**Note:** If you do not specify any the proxy attributes, and a corresponding system property is set (typically in the JVM startup arguments) ColdFusion uses the system property value.

## Usage

The following table shows when you can use each attribute:

| This attribute is required, optional, ignored, or invalid: | For this <code>cfinvoke</code> tag syntax: |          |          |           |           |
|--|--|----------|----------|-----------|-----------|
|  | Syntax 1                                   | Syntax 2 | Syntax 3 | Syntax 4A | Syntax 4B |
| component  | Required                                   | Optional | Invalid  | Required  | Invalid   |
| method   | Required                                   | Required | Required | Required  | Required  |
| returnVariable   | Optional                                   | Optional | Optional | Optional  | Optional  |
| argumentCollection   | Optional                                   | Optional | Optional | Optional  | Optional  |
| username   | Ignored                                    | Ignored  | Optional | Ignored   | Optional  |
| password   | Ignored                                    | Ignored  | Optional | Ignored   | Optional  |
| webservice   | Ignored                                    | Ignored  | Required | Ignored   | Required  |
| timeout  | Invalid                                    | Invalid  | Optional | Invalid   | Optional  |
| proxyServer  | Invalid                                    | Invalid  | Optional | Invalid   | Optional  |
| proxyPort  | Invalid                                    | Invalid  | Optional | Invalid   | Optional  |
| proxyUser  | Invalid                                    | Invalid  | Optional | Invalid   | Optional  |
| proxyPassword  | Invalid                                    | Invalid  | Optional | Invalid   | Optional  |
| servicePort  | Invalid                                    | Invalid  | Optional | Invalid   | Optional  |
| <i>input_params ...</i>                                    | Optional                                   | Optional | Optional | Optional  | Optional  |

If the `component` attribute specifies a component name, the component with the corresponding name is instantiated, the requested method is invoked, and then the component instance is immediately destroyed. If the attribute contains a reference to an instantiated component object, no instantiation or destruction of the component occurs.

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lower case. If it does not find the file, it looks for a file name that matches the component name exactly, with the identical character casing.

Method arguments can be passed in any of the following ways. If an argument is passed in more than one way with the same name, this order of precedence applies:

1. Using the `cfinvokeargument` tag
2. Passing directly as attributes of the `cfinvoke` tag (they cannot have the same name as a registered `cfinvoke` attribute: `method`, `component`, `webservice`, `returnVariable`)
3. Passing as struct keys, using the `argumentCollection` attribute

For example, the `params` struct contains three keys: `a=1`, `b=1`, `c=1`. The following call is evaluated as if the arguments were passed to the method in the order `a=3`, `b=2`, `c=1`:

```
<cfinvoke ... a=2 b=2 argumentCollection=params>
  <cfinvokeargument name="a" value="3">
</cfinvoke>
```

**Note:** The following `cfinvoke` tag attribute names are reserved; they cannot be used for argument names: `component`, `method`, `argumentCollection`, and `result`.

### Example1

This example uses Syntax 1.

```
<!--- Immediate instantiation and destruction. --->
<cfinvoke
  component="nasdaq.quote"
  method="getLastTradePrice"
  returnVariable="res">
  <cfinvokeargument
    name="symbol"
    value="macr">
</cfinvoke>
<cfoutput>#res#</cfoutput>
```

### Example2

This example uses Syntax 1.

```
<!--- Passing the arguments using argumentCollection. --->
<cfset args = StructNew()>
<cfset args.symbol = "macr">
<cfinvoke
  component="nasdaq.quote"
  method="getLastTradePrice"
  argumentCollection="#args#"
  returnVariable="res">
<cfoutput>#res#</cfoutput>
```

### Example3

This example uses Syntax 2.

```
<!--- Called only from within a component, MyComponent. --->
<cfinvoke
  method = "a method name of MyComponent"
  returnVariable = "variable name">
```

#### Example4

This example uses Syntax 3.

```
<!-- Using cfinvoke to consume a web service using a ColdFusion component.-->
<cfinvoke
  webservice="http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
  method="getTemp"
  returnvariable="aTemp">
  <cfinvokeargument name="zipcode" value="55987"/>
</cfinvoke>
<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```

For more information on web services, see Chapter 36, “Using Web Services” in *ColdFusion MX Developer’s Guide*.

#### Example5

This example uses Syntax 4A.

```
<!-- Separate instantiation and method invocation; useful for
multiple invocations using different methods or values. -->
<cfobject
  name="quoteService"
  component="nasdaq.quote">
<cfinvoke
  component="#quoteService#"
  method="getLastTradePrice"
  symbol="macr"
  returnVariable="res_macr">
<cfoutput>#res#</cfoutput>
<cfinvoke
  component="#quoteService#"
  method="getLastTradePrice"
  symbol="mot"
  returnVariable="res_mot">
<cfoutput>#res#</cfoutput>
```

# cfinvokeargument

## Description

Passes the name and value of a parameter to a component method or a web service. This tag is used within the `cfinvoke` tag.

## Category

[Extensibility tags](#)

## Syntax

```
<cfinvokeargument  
  name="argument name"  
  value="argument value"  
  omit = "yes" or "no">
```

## See also

[cfargument](#), [cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfobject](#), [cfproperty](#), [cfreturn](#)

## History

ColdFusion MX 7: Added the `omit` attribute.

ColdFusion MX: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| name      | Required |         | Argument name.   |
| value     | Required |         | Argument value.  |
| omit      | Optional | "no"    | Enables you to omit a parameter when invoking a web service. It is an error to specify <code>omit="yes"</code> if the <code>cfinvoke webservice</code> attribute is not specified.<br>"yes": omit this parameter when invoking a web service.<br>"no": do not omit this parameter when invoking a web service. |

## Usage

You can have multiple `cfinvokeargument` tags in a `cfinvoke` tag body.

You can use `cfinvokeargument` tag to dynamically determine the arguments to be passed. For example, you can use conditional processing to determine the argument name, or you can use a `cfif` tag to determine whether to execute the `cfinvokeargument` tag.

If you are invoking a web service, you can omit a parameter by setting the `omit` attribute to "yes". If the WSDL specifies that the argument is nillable, ColdFusion MX sets the associated argument to null. If the WSDL specifies `minoccurs=0`, ColdFusion MX omits the argument from the WSDL.

### Example1

```
<cfinvoke
  component="nasdaq.quote"
  method="getLastTradePrice"
  returnVariable="res">
  <cfinvokeargument
    name="symbol" value="mot">
  <cfinvokeargument
    name="symbol" value="macr">
</cfinvoke>

<cfoutput>#res#</cfoutput>
```

### Example2

```
<cfinvoke
  webservice ="http://www.xmethods.net/sd/2001/BabelFishService.wsdl"
  method ="BabelFish"
  returnVariable = "varName"
  >
  <cfinvokeargument
    name="translationmode" value="en_es">
  <cfinvokeargument
    name="sourcedata" value="Hello world, friend">
</cfinvoke>
<cfoutput>#varName#</cfoutput>
```

# cfldap

## Description

Provides an interface to a Lightweight Directory Access Protocol (LDAP) directory server, such as the Netscape Directory Server.

## Category

[Internet Protocol tags](#)

## Syntax

```
<cfldap
  server = "server_name"
  port = "port_number"
  username = "name"
  password = "password"
  action = "action"
  name = "name"
  timeout = "seconds"
  maxRows = "number"
  start = "distinguished_name"
  scope = "scope"
  attributes = "attribute, attribute"
  returnAsBinary = "column_name, column_name"
  filter = "filter"
  sort = "attribute[, attribute]..."
  sortControl = "nocase" and/or "desc" or "asc"
  dn = "distinguished_name"
  startRow = "row_number"
  modifyType = "replace" or "add" or "delete"
  rebind = "yes" or "no"
  referral = "number_of_allowed_hops"
  secure = "multi_field_security_string"
  separator = "separator_character"
  delimiter = "delimiter_character">
```

## See also

[cftp](#), [cfhttp](#), [cfmail](#), [cfmailparam](#), [cfpop](#), Chapter 23, “Managing LDAP Directories” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `returnAsBinary` attribute.

ColdFusion MX:

- Changed the `name` attribute behavior: this tag validates the query name in the `name` attribute.
- Changed sorting behavior: this tag does not support client-side sorting of query results. (It supports server-side sorting; use the `sort` and `sortcontrol` attributes.)
- Changed how results are sorted: server-side sorting results might be sorted slightly differently than in ColdFusion 5. If you attempt a sort against a server that does not support it, ColdFusion MX throws an error.

- Deprecated the `filterfile` attribute. It might not work, and might cause an error, in later releases.

## Attributes

| Attribute             | Req/Opt  | Default               | Description   |
|-----------------------|--|-----------------------|---|
| <code>server</code>   | Required   |                       | Host name or IP address of LDAP server.   |
| <code>port</code>     | Optional   | 389                   | Port.   |
| <code>username</code> | Required if<br><code>secure = "CFSSL_BASIC"</code> | (anonymous)           | User ID.  |
| <code>password</code> | Required if<br><code>secure = "CFSSL_BASIC"</code> |                       | Password that corresponds to user name. If <code>secure = "CFSSL_BASIC"</code> , V2 encrypts the password before transmission.  |
| <code>action</code>   | Required   | <code>query</code>    | <ul style="list-style-type: none"> <li>• <code>query</code>: returns LDAP entry information only. Requires <code>name</code>, <code>start</code>, and <code>attributes</code> attributes.</li> <li>• <code>add</code>: adds LDAP entries to LDAP server. Requires <code>attributes</code> attribute.</li> <li>• <code>modify</code>: modifies LDAP entries, except distinguished name <code>dn</code> attribute, on LDAP server. Requires <code>dn</code>. See <code>modifyType</code> attribute.</li> <li>• <code>modifyDN</code>: modifies distinguished name attribute for LDAP entries on LDAP server. Requires <code>dn</code>.</li> <li>• <code>delete</code>: deletes LDAP entries on an LDAP server. Requires <code>dn</code>.</li> </ul> |
| <code>name</code>     | Required if<br><code>action = "Query"</code>       |                       | Name of LDAP query. The tag validates the value.  |
| <code>timeout</code>  | Optional   | 60000                 | Maximum length of time, in milliseconds, to wait for LDAP processing.   |
| <code>maxRows</code>  | Optional   |                       | Maximum number of entries for LDAP queries.   |
| <code>start</code>    | Required if<br><code>action = "Query"</code>       |                       | Distinguished name of entry to be used to start a search.   |
| <code>scope</code>    | Optional   | <code>oneLevel</code> | Scope of search, from entry specified in <code>start</code> attribute for <code>action = "Query"</code> . <ul style="list-style-type: none"> <li>• <code>oneLevel</code>: entries one level below entry.</li> <li>• <code>base</code>: only the entry.</li> <li>• <code>subtree</code>: entry and all levels below it.</li> </ul>   |

| Attribute      | Req/Opt   | Default           | Description  |
|----------------|---|-------------------|--|
| attributes     | Required if<br>action =<br>"Query", "Add",<br>"ModifyDN", or<br>"Modify"  |                   | For queries: comma-delimited list of attributes to return. For queries, to get all attributes, specify "*".<br>If action = "add" or "modify", you can specify a list of update columns. Separate attributes with a semicolon.<br>If action = "ModifyDN", ColdFusion passes attributes to the LDAP server without syntax checking.    |
| returnAsBinary | Optional  |                   | A comma-delimited list of columns that are to be returned as binary values.  |
| filter         | Optional  | "objectclass = *" | Search criteria for action = "query".<br>List attributes in the form:<br>"(attribute operator value)"<br>For example: "(sn = Smith)"   |
| sort           | Optional  |                   | Attribute(s) by which to sort query results. Use a comma delimiter.  |
| sortControl    | Optional  | asc               | <ul style="list-style-type: none"> <li>• nocase: case-insensitive sort.</li> <li>• asc: ascending (a to z) case-sensitive sort.</li> <li>• desc: descending (z to a) case-sensitive sort.</li> </ul> You can enter a combination of sort types; for example, sortControl = "nocase, asc".  |
| dn             | Required if<br>action = "Add",<br>"Modify",<br>"ModifyDN", or<br>"delete" |                   | Distinguished name, for update action; for example, "cn = Bob Jensen, o = Ace Industry, c = US"  |
| startRow       | Optional  | 1                 | Used with action = "query". First row of LDAP query to insert into a ColdFusion query.   |
| modifyType     | Optional  | replace           | How to process an attribute in a multi-value list: <ul style="list-style-type: none"> <li>• add: appends it to any attributes.</li> <li>• delete: deletes it from the set of attributes.</li> <li>• replace: replaces it with specified attributes.</li> </ul> You cannot add an attribute that is already present or that is empty. |
| rebind         | Optional  | no                | <ul style="list-style-type: none"> <li>• yes: attempts to rebind referral callback and reissue query by referred address using original credentials.</li> <li>• no: referred connections are anonymous.</li> </ul>   |
| referral       | Optional  |                   | Integer. Number of hops allowed in a referral. A value of 0 disables referred addresses for LDAP; no data is returned.   |

| Attribute | Req/Opt  | Default       | Description  |
|-----------|----------|---------------|--|
| secure    | Optional |               | Security to employ, and required information. One option: <ul style="list-style-type: none"> <li>CFSSL_BASIC</li> </ul> "CFSSL_BASIC" provides V2 SSL encryption and server authentication.  |
| separator | Optional | , [comma]     | Delimiter to separate attribute values of multi-value attributes. Used by <code>query</code> , <code>add</code> , and <code>modify</code> actions, and by <code>cfldap</code> to output multi-value attributes. <p>For example, if \$ (dollar sign), the <code>attributes</code> attribute could be <code>objectclass = top\$person</code>, where the first value of <code>objectclass</code> is <code>top</code>, and the second value is <code>person</code>. This avoids confusion if values include commas.</p>  |
| delimiter | Optional | ; [semicolon] | Separator between attribute name-value pairs. Use this attribute if either of these situations exist: <ul style="list-style-type: none"> <li>the <code>attributes</code> attribute specifies more than one item</li> <li>an attribute contains the default delimiter (semicolon). For example: <code>mgrpmsgrejecttext;lang-en</code></li> </ul> Used by <code>query</code> , <code>add</code> , and <code>modify</code> actions, and by <code>cfldap</code> to output multivalued attributes. <p>For example, if \$ (dollar sign), you could specify <code>"cn = Double Tree Inn\$street = 1111 Elm; Suite 100</code>, where the semicolon is part of the street value.</p> |

## Usage

If you use the `query` action, `cfldap` creates a query object, allowing access to information in the query variables, as follows:

| Variable name                      | Description   |
|------------------------------------|---|
| <code>queryname.recordCount</code> | Number of records returned by query                           |
| <code>queryname.currentRow</code>  | Current row of query that <code>cfoutput</code> is processing |
| <code>queryname.columnList</code>  | Column names in query   |

If you use the `security="CFSSL_BASIC"` option, ColdFusion determines whether to trust the server by comparing the server's certificate with the information in the `jre/lib/security/cacerts` keystore of the JRE used by ColdFusion MX. The ColdFusion MX default `cacerts` file contains information about many certificate granting authorities. If you must update the file with additional information, you can use the `keytool` utility in the ColdFusion `jre/bin` directory to import certificates that are in X.509 format. For example, enter the following:

```
keytool -import -keystore cacerts -alias ldap -file ldap.crt -keypass bl19mq
```

Then restart ColdFusion MX. The keytool utility initial keypass password is "change it". For more information on using the keytool utility, see the Sun JDK documentation.

Characters that are illegal in ColdFusion can be used in LDAP attribute names. As a result, the `cfldap` tag could create columns in the query result set whose names contain illegal characters and are, therefore, inaccessible in CFML. In ColdFusion, illegal characters are automatically mapped to the underscore character; therefore, column names in the query result set might not exactly match the names of the LDAP attributes.

For usage examples, see *ColdFusion MX Developer's Guide*.

### Example

```
<h3>cfldap Example</h3>
<p>Provides an interface to LDAP directory servers. The example uses the
University of Connecticut public LDAP server. For more public LDAP servers,
see <a href="http://www.emailman.com">http://www.emailman.com</a>.</p>
<p>Enter a name and search the public LDAP resource.
An asterisk before or after the name acts as a wildcard.</p>
<!-- If form.name exists, the form was submitted; run the query. -->
<cfif IsDefined("form.name")>
  <!-- Check to see that there is a name listed. -->
  <cfif form.name is not "">
    <!-- Make the LDAP query. -->
    <cfldap
      server = "ldap.uconn.edu"
      action = "query"
      name = "results"
      start = "dc=uconn,dc=edu"
      filter = "cn=#name#"
      attributes = "cn,o,title,mail,telephonenumber"
      sort = "cn ASC">
    <!-- Display results. -->
    <center>
    <table border = 0 cellspacing = 2 cellpadding = 2>
      <tr>
        <th colspan = 5>
          <cfoutput>#results.recordCount# matches found
          </cfoutput></TH>
      </tr>
      <tr>
        <th><font size = "-2">Name</font></th>
        <th><font size = "-2">Organization</font></th>
        <th><font size = "-2">Title</font></th>
        <th><font size = "-2">E-Mail</font></th>
        <th><font size = "-2">Phone</font></th>
      </tr>
      <cfoutput query = "results">
        <tr>
          <td><font size = "-2">#cn#</font></td>
          <td><font size = "-2">#o#</font></td>
          <td><font size = "-2">#title#</font></td>
          <td><font size = "-2">
            <A href = "mailto:#mail#">#mail#</A></font></td>
          <td><font size = "-2">#telephonenumber#</font></td>
```

```
        </tr>
      </cfoutput>
    </table>
  </center>
</cfif>
</cfif>
```

```
<form action="#cgi.script_name#" method="POST">
<p>Enter a name to search in the database.
<p>
<input type="Text" name="name">
<input type="Submit" value="Search" name="">
</form>
```

# cflocation

## Description

Stops execution of the current page and opens a ColdFusion page or HTML file.

## Category

[Flow-control tags](#), [Page processing tags](#)

## Syntax

```
<cflocation  
  url = "url"  
  addToken = "yes" or "no">
```

## See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| url       | Required |         | URL of HTML file or CFML page to open.  |
| addToken  | Optional |         | clientManagement must be enabled (see <a href="#">cfapplication on page 40</a> ). <ul style="list-style-type: none"><li>• yes: appends client variable information to URL.</li><li>• no</li></ul> |

## Usage

You might write a standard message or response in a file, and call it from several applications. You could use this tag to redirect the user's browser to the standard file.

This tag has no effect if you use it after the `cfflush` tag on a page.

## Example

```
<h3>cflocation Example</h3>  
<p>This tag redirects the browser to a web resource; normally, you would use this tag to go to a CF page or an HTML file on the same server. The addToken attribute lets you send client information to the target page.  
<p>If you remove the comments, this code redirects you to CFDOCS home page:  
  
<!--- <cflocation url = "http://localhost:8500/cfdocs/dochome.htm"  
  addToken = "no"> --->
```

# cflock

## Description

Ensures the integrity of shared data. Instantiates the following kinds of locks:

**Exclusive** Allows single-thread access to the CFML constructs in its body. The tag body can be executed by one request at a time. No other requests can start executing code within the tag while a request has an exclusive lock. ColdFusion issues exclusive locks on a first-come, first-served basis.

**Read-only** Allows multiple requests to access CFML constructs within the tag body concurrently. Use a read-only lock only when shared data is read and not modified. If another request has an exclusive lock on shared data, the new request waits for the exclusive lock to be released.

## Category

[Application framework tags](#)

## Syntax

```
<cflock
  timeout = "timeout in seconds "
  scope = "Application" or "Server" or "Session"
  name = "lockname"
  throwOnTimeout = "yes" or "no"
  type = "readOnly" or "exclusive ">
  <!--- CFML to be synchronized --->
</cflock>
```

## See also

[cfapplication](#), [cfassociate](#), [cfmodule](#), Chapter 15, “Using Persistent Data and Locking” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute      | Req/Opt  | Default   | Description   |
|----------------|----------|-----------|---|
| timeout        | Required |           | Maximum length of time, in seconds, to wait to obtain a lock. If lock is obtained, tag execution continues. Otherwise, behavior depends on <code>throwOnTimeout</code> attribute value. If you set <code>timeout="0"</code> , the timeout is determined by the "Timeout Requests after x" setting in the ColdFusion MX Administrator Settings page, if that setting is enabled. However, if the setting is not enabled, and you set <code>timeout="0"</code> , ColdFusion can wait indefinitely to obtain the lock. |
| scope          | Optional |           | Lock scope. Mutually exclusive with the <code>name</code> attribute. Lock name. Only one request in the specified scope can execute the code within this tag (or within any other <code>cflock</code> tag with the same lock scope) at a time. <ul style="list-style-type: none"><li>• Application</li><li>• Server</li><li>• Session</li></ul>   |
| name           | Optional |           | Lock name. Mutually exclusive with the <code>scope</code> attribute. Only one request can execute the code within a <code>cflock</code> tag with a given name at a time. Cannot be an empty string. Permits synchronizing access to resources from different parts of an application. Lock names are global to a ColdFusion server. They are shared among applications and user sessions, but not clustered servers.  |
| throwOnTimeout | Optional | yes       | How timeout conditions are handled: <ul style="list-style-type: none"><li>• yes: exception is generated for the timeout.</li><li>• no: execution continues past this tag.</li></ul>   |
| type           | Optional | Exclusive | <ul style="list-style-type: none"><li>• <code>readOnly</code>: lets more than one request read shared data.</li><li>• <code>exclusive</code>: lets one request read or write shared data.</li></ul>   |

**Note:** Limit the scope of code that updates shared data structures, files, and CFXs. Exclusive locks are required to ensure the integrity of updates, but read-only locks are faster. In a performance-sensitive application, substitute read-only locks for exclusive locks where possible; for example, when reading shared data.

## Usage

ColdFusion MX is a multithreaded server; it can process multiple page requests at a time. Use the `cflock` tag for these purposes:

- To ensure that modifications to shared data and objects made in concurrently executing requests occur sequentially.
- Around file manipulation constructs, to ensure that file updates do not fail because files are open for writing by other applications or tags.
- Around CFX invocations, to ensure that ColdFusion can safely invoke CFXs that are not implemented in a thread-safe manner. (This applies only to CFXs developed in C++.)

To work safely with ColdFusion, a C++ CFX that maintains and manipulates shared (global) data structures must be made thread-safe; however, this requires advanced knowledge. You can use a CFML custom tag wrapper around a CFX to make its invocation thread-safe.

When you display, set, or update variables in a shared scope, use the `scope` attribute to identify the scope as Server, Application or Session.

## Deadlocks

A deadlock is a state in which no request can execute the locked section of a page. Once a deadlock occurs, neither user can break it, because all requests to the protected section of the page are blocked until the deadlock can be resolved by a lock timeout.

The `cflock` tag uses kernel level synchronization objects that are released automatically upon timeout and/or the abnormal termination of the thread that owns them. Therefore, while processing a `cflock` tag, ColdFusion never deadlocks for an infinite period of time. However, very large timeouts can block request threads for long periods, and radically decrease throughput. To prevent this, always use the minimum timeout value.

Another cause of blocked request threads is inconsistent nesting of `cflock` tags and inconsistent naming of locks. If you nest locks, everyone accessing the locked variables must consistently nest `cflock` tags in the same order. Otherwise, a deadlock can occur.

These examples show situations that cause deadlocks:

---

### Example deadlock with two users

| User 1   | User 2   |
|--|--|
| Locks the session scope.   | Locks the Application scope.   |
| Deadlock: Tries to lock the Application scope, but it is already locked by User 2. | Deadlock: Tries to lock the Session scope, but it is already locked by User 1. |

The following deadlock could occur if you tried to nest an exclusive lock inside a read lock:

---

### Example deadlock with one user

#### User 1

Locks the Session scope with a read lock.

Attempts to lock the Session scope with an exclusive lock.

Deadlock: Cannot lock the Session scope with an exclusive lock because the scope is already locked for reading.

The following code shows this scenario:

```
<cflock timeout = "60" scope = "SESSION" type = "readOnly">
    .....
    <cflock timeout = "60" scope = "SESSION" type = "Exclusive">
        .....
    </cflock>
</cflock>
```

To avoid a deadlock, everyone who nests locks must do so in a well-specified order and name the locks consistently. If you must lock access to the Server, Application, and Session scopes, you must do so in this order:

1. Lock the Session scope. In the `cflock` tag, specify `scope = "session"`.
2. Lock the Application scope. In the `cflock` tag, specify `scope = "Application"`.
3. Lock the Server scope. In the `cflock` tag, specify `scope = "server"`.
4. Unlock the Server scope.
5. Unlock the Application scope.
6. Unlock the Session scope.

**Note:** If you do not have to lock a scope, you can skip any pair of these lock/unlock steps. For example, if you do not have to lock the Server scope, you can skip Steps 3 and 4. Similar rules apply for named locks.

For more information, see the following:

- Chapter 15, “Using Persistent Data and Locking” in *ColdFusion MX Developer’s Guide*
- Article #20370, *ColdFusion Locking Best Practices*, on the Macromedia website at [www.macromedia.com/support/service/](http://www.macromedia.com/support/service/)

### Example

```
<!-- This example shows how cflock can guarantee consistency of data updates
to variables in the Application, Server, and Session scopes. -->

<!-- Copy the following code into an Application.cfm file in the application
root directory. -->
<!------- Beginning of Application.cfm code ----->
<!-- cfapplication defines scoping for a ColdFusion application and
enables or disables storing of application and session variables.
Put this tag in a special file called Application.cfm.
It is run before any other ColdFusion page in its directory. -->

<!-- Enable session management for this application. -->
<cfapplication name = "ETurtle"
    sessionTimeout = #CreateTimeSpan(0,0, 0, 60)#
    sessionManagement = "yes">

<!-- Initialize session and application variables used by E-Turtleneck.
Use session scope for the session variables. -->
<cflock scope = "Session"
    timeout = "30" type = "Exclusive">
    <cfif NOT IsDefined("session.size")>
        <cfset session.size = "">
    </cfif>
    <cfif NOT IsDefined("session.color")>
        <cfset session.color = "">
    </cfif>
</cflock>
```

```

<!-- Use an application lock for the application-wide variable that
      keeps track of the number of turtlesnecks sold.
      For a more efficient, but more complex, way of handling Application scope
      locking, see "ColdFusion MX Developer's Guide"--->
<cflock scope = "Application" timeout = "30" type = "Exclusive">
  <cfif NOT IsDefined("application.number")>
    <cfset application.number = 0>
  </cfif>
</cflock>

<!------- End of Application.cfm ----->

<h3>cflock Example</h3>

<cfif IsDefined("form.submit")>
<!-- The form has been submitted; process the request. --->
  <cfoutput>
    Thanks for shopping E-Turtlesneck. You chose size <b>#form.size#</b>,
    color <b>#form.color#</b>. <br><br>
  </cfoutput>

<!-- Lock the code that assigns values to session variables. ---->
  <cflock scope = "Session" timeout = "30" type = "Exclusive">
    <cfparam name = session.size Default = #form.size#>
    <cfparam name = session.color Default = #form.color#>
  </cflock>

<!-- Lock the code that updates the Application scope number of
      turtlesnecks sold. --->
  <cflock scope = "Application" timeout = "30" type = "Exclusive">
    <cfset application.number = application.number + 1>
  <cfoutput>
    E-Turtlesneck has now sold #application.number# turtlesnecks!
  </cfoutput>
</cflock>

<cfelse>
<!-- Show the form only if it has not been submitted. --->
  <cflock scope = "Application" timeout = "30" type = "Readonly">
    <cfoutput>
      E-Turtlesneck has sold #application.number# turtlesnecks to date.
    </cfoutput>
  </cflock>

<form method="post" action="cflocktest.cfm">
  <p>Congratulations! You selected the most comfortable turtlesneck in the
world.
  Please select color and size.</p>
  <table cellspacing = "2" cellpadding = "2" border = "0">
    <tr>
      <td>Select a color.</td>
      <td><select type = "Text" name = "color">
        <option>red
        <option>white
        <option>blue

```

```
        <option>turquoise
        <option>black
        <option>forest green
    </select>
</td>
</tr>
<tr>
    <td>Select a size.</td>
    <td><select type = "Text" name = "size" >
        <option>XXsmall
        <option>Xsmall
        <option>small
        <option>medium
        <option>large
        <option>Xlarge
    </select>
    </td>
</tr>
<tr>
    <td>Press Submit when you are finished making your selection.</td>
    <td><input type = "Submit" name = "submit" value = "Submit"> </td>
</tr>
</table>
</form>
</cfif>
```

# cflog

## Description

Writes a message to a log file.

## Category

[Data output tags](#)

## Syntax

```
<cflog  
  text = "text"  
  log = "log type"  
  file = "filename"  
  type = "message type"  
  application = "yes" or "no">
```

## See also

[cfcol](#), [cfcontent](#), [cfoutput](#), [cftable](#)

## History

ColdFusion MX: Deprecated the `thread`, `date`, and `time` attributes. They might not work, and might cause an error, in later releases. (In earlier releases, these attributes determined whether the respective data items were output to the log. In ColdFusion MX, this data is always output.)

## Attributes

| Attribute   | Req/Opt  | Default     | Description   |
|-------------|----------|-------------|---|
| text        | Required |             | Message text to log.  |
| log         | Optional |             | If you omit the <code>file</code> attribute, writes messages to standard log file. Ignored, if you specify <code>file</code> attribute. <ul style="list-style-type: none"><li>• Application: writes to <code>Application.log</code>, normally used for application-specific messages.</li><li>• Scheduler: writes to <code>Scheduler.log</code>, normally used to log the execution of scheduled tasks.</li></ul> |
| file        | Optional |             | Message file. Specify only the main part of the filename. For example, to log to the <code>Testing.log</code> file, specify "Testing". The file must be located in the default log directory. You cannot specify a directory path. If the file does not exist, it is created automatically, with the suffix <code>.log</code> .   |
| type        | Optional | Information | Type (severity) of the message: <ul style="list-style-type: none"><li>• Information</li><li>• Warning</li><li>• Error</li><li>• Fatal</li></ul>   |
| application | Optional | yes         | <ul style="list-style-type: none"><li>• yes: logs the application name, if it is specified in a <code>cfapplication</code> tag or <code>Application.cfc</code> file.</li><li>• no</li></ul>   |

## Usage

This tag logs custom messages to standard or custom log files. You can specify a file for the log message or send messages to the default application or scheduler log. The log message can include ColdFusion expressions. Log files must have the suffix `.log` and must be located in the ColdFusion log directory.

Log entries are written as comma-delimited lists with these fields:

- type
- coio
- date
- time
- application
- text

Values are enclosed in double-quotation marks. If you specify `no` for the `application` attribute, the corresponding entry in the list is empty.

You can disable `cflog` tag execution. For more information, see the ColdFusion Administrator Basic Security page.

The following example logs the name of a user that logs on an application. The message is logged to the file `myAppLog.log` in the ColdFusion log directory. It includes the date, time, and thread ID, but not the application name.

```
<cflog file="myAppLog" application="no"
  text="User #Form.username# logged on.">
```

For example, if a user enters "Sang Thornfield" in a form's username field, this entry is added to the `myApplog.log` file entry:

```
"Information","153","02/28/01","14:53:40",,"User Sang Thornfield logged on."
```

# cflogin

## Description

A container for user login and authentication code. ColdFusion runs the code in this tag if a user is not already logged in. You put code in the tag that authenticates the user and identifies the user with a set of roles. Used with [cfloginuser](#) tag.

## Category

[Security tags](#)

## Syntax

```
<cflogin
  idletimeout = "value"
  applicationToken = "token"
  cookieDomain = "domain"
  ...
  <cfloginuser
    name = "name"
    password = "password-string"
    roles = "roles">
  ...>
</cflogin>
```

## See also

[cfloginuser](#), [cflogout](#), [GetAuthUser](#), [IsUserInRole](#), Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 6.1: Changed behavior: the `cflogin` variable exists when ColdFusion receives a request with NTLM or Digest (CFHTTP Negotiated header) authentication information.

ColdFusion MX: Added this tag.

## Attributes

| Attribute                     | Req/Opt  | Default                      | Description   |
|-------------------------------|----------|------------------------------|---|
| <code>idletimeout</code>      | Optional | 1800                         | Time interval, in seconds, after which ColdFusion logs off the user.  |
| <code>applicationtoken</code> | Optional | The current application name | Unique application identifier. Limits the login validity to one application, as specified by the <code>cfapplication</code> tag or the <code>Application.cfc</code> file.   |
| <code>cookiedomain</code>     | Optional |                              | Domain of the cookie that is used to mark a user as logged in. Use this attribute to enable a user login cookie to work with multiple clustered servers in the same domain. |

## Usage

The body of this tag executes only if there is no logged-in user. When using application-based security, you put code in the body of the `cflogin` tag to check the user-provided ID and password against a data source, LDAP directory, or other repository of login identification. The body must include a `cfloginuser` tag to establish the authenticated user's identity in ColdFusion.

You control the data source and are responsible for coding the SQL within the `cflogin` tag, and you must make sure that the associated database has user, password, and role information.

The `cflogin` tag has a built-in `cflogin` structure that contains two variables, `cflogin.name` and `cflogin.password`, if the page is executing in response to any of the following:

- Submission of a form that contains input fields with the names `j_username` and `j_password`.
- A request that uses CFHTTP Basic authentication, and therefore includes an Authorization header with the username and password.
- A request that uses NTLM or Digest authentication. In this case, the username and password are hashed using a one-way algorithm in the Authorization header; ColdFusion gets the username from the web server and sets the `cflogin.password` value to the empty string.

You can use these values in the `cflogin` tag body to authenticate the user, and, in the `cfloginuser` tag, to log the user in. The structure is only available in the `cflogin` tag body.

## Example

The following example shows a simple authentication. This code is typically in the `Application.cfc` `onRequestStart` method or in the `application.cfm` page.

```
<cflogin>
  <cfif NOT IsDefined("cflogin")>
    <cfinclude template="loginform.cfm">
    <cfabort>
  <cfelse>
    <cfif cflogin.name eq "admin">
      <cfset roles = "user,admin">
    <cfelse>
      <cfset roles = "user">
    </cfif>
    <cfloginuser name = "#cflogin.name#" password = "#cflogin.password#"
      roles = "#roles#" />
  </cfif>
</cflogin>
```

The following view-only example checks the user ID and password against a data source:

```
<cfquery name="qSecurity"
  datasource="UserRolesDb">
  select Roles FROM SecurityRoles
  where username=<cfqueryparam value="#cflogin.name#"
    CFSQLTYPE="CF_SQL_VARCHAR"
  and password=<cfqueryparam value="#cflogin.password#"
    CFSQLTYPE="CF_SQL_VARCHAR"
</cfquery>
```

```
<cfif qSecurity.recordcount gt 0>  
<cfloginuser name = "#cflogin.name#"  
password = "#cflogin.password#"  
roles = "#trim(qSecurity.Roles)#" >  
</cfif>
```

# cfloginuser

## Description

Identifies an authenticated user to ColdFusion. Specifies the user ID and roles. Used within a `cflogin` tag.

## Category

[Security tags](#)

## Syntax

```
<cfloginuser
  name = "name"
  password = "password-string"
  roles = "roles">
```

## See also

[cflogin](#), [cflogout](#), [GetAuthUser](#), [IsUserInRole](#), [cfapplication](#), Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 6.1: Changed behavior: if the Session scope is enabled, and the `cfapplication` tag `loginStorage` attribute is set to Session, the login remains in effect until the session expires or the user is logged out by the `cflogout` tag.

ColdFusion MX: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| name      | Required |         | A username.  |
| password  | Required |         | A user password.   |
| roles     | Required |         | A comma-delimited list of role identifiers.<br>ColdFusion processes spaces in a list element as part of the element. |

## Usage

Used inside the `cflogin` tag to identify the authenticated user to ColdFusion. After you call this function, the `GetAuthUser` and `IsUserInRoles` return the user name and role information.

**Note:** By default, the user information is stored as memory-only cookies. The `cfapplication` tag or the `Application.cfc` `This.loginStorage` variable can specify that login information be stored in the Session scope.

## Example

See [cflogin](#) on page 278.

# cflogout

## Description

Logs the current user out. Removes knowledge of the user ID, password, and roles from the server. If you do not use this tag, the user is automatically logged out when the session ends.

## Category

[Security tags](#)

## Syntax

```
<cflogout>
```

## See also

[cflogin](#), [cfloginuser](#), Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 6.1: Changed behavior: if the Session scope is enabled, a login remains in effect until the session expires or the user is logged out by the `cflogout` tag.

ColdFusion MX: Added this tag.

## Example

```
<cflogin>
  <cfloginuser
    name = "foo"
    password = "bar"
    roles = "admin">
</cflogin>
<cfoutput>Authorized user: #getAuthUser()#</cfoutput>
<cflogout>
<cfoutput>Authorized user: #getAuthUser()#</cfoutput>
```

# cfloop

## Description

Looping is a programming technique that repeats a set of instructions or displays output repeatedly until one or more conditions are met. This tag supports the following types of loops:

- “[cfloop: index loop](#)” on page 284
- “[cfloop: conditional loop](#)” on page 286
- “[cfloop: looping over a date or time range](#)” on page 287
- “[cfloop: looping over a query](#)” on page 288
- “[cfloop: looping over a list or file](#)” on page 290
- “[cfloop: looping over a COM collection or structure](#)” on page 292

For more information, see “[cfloop and cfbreak](#)” in Chapter 2, “Elements of CFML,” and “[Populating arrays with data](#)” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer's Guide*.

## Category

[Flow-control tags](#)

## cfloop: index loop

### Description

An index loop repeats for a number of times that is determined by a numeric value. An index loop is also known as a FOR loop.

### Syntax

```
<cfloop
  index = "parameter_name"
  from = "beginning_value"
  to = "ending_value"
  step = "increment">
  ... HTML or CFML code ...
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfdirectory](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfrethrow](#), [cfswitch](#), [cfthrow](#), [cftry](#); “cfloop and cfbreak” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

### Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| index     | Required |         | Index value. ColdFusion sets it to the <code>from</code> value and increments or decrements by <code>step</code> value, until it equals the <code>to</code> value. |
| from      | Required |         | Beginning value of index.  |
| to        | Required |         | Ending value of index.   |
| step      | Optional | 1       | Step by which to increment or decrement the index value.   |

### Usage

Using anything other than integer values in the `from` and `to` attributes of an index loop can produce unexpected results. For example, if you increment through an index loop from 1 to 2, with a step of 0.1, ColdFusion outputs "1,1.1,1.2,...,1.9", but not "2". This is a programming language problem regarding the internal representation of floating point numbers.

**Note:** The `to` value is evaluated once, when the `cfloop` tag is encountered. Any change to this value within the loop block, or within the expression that evaluates to this value, does not affect the number of times the loop is executed.

### Example

In this example, the code loops five times, displaying the index value each time:

```
<cfloop index = "LoopCount" from = "1" to = "5">
  The loop index is <cfoutput>#LoopCount#</cfoutput>.<br>
</cfloop>
```

The output of this loop is as follows:

```
The loop index is 1.
The loop index is 2.
```

The loop index is 3.  
The loop index is 4.  
The loop index is 5.

In this example, the code loops four times, displaying the index value each time. The value of `j` is decreased by one for each iteration. This does not affect the value of `to`, because it is a copy of `j` that is made before entering the loop.

```
<cfset j = 4>  
<cfloop index = "LoopCount" from = "1" to = #j#>  
  <cfoutput>The loop index is #LoopCount#</cfoutput>.<br>  
  <cfset j = j - 1>  
</cfloop>
```

The output of this loop is as follows:

The loop index is 1.  
The loop index is 2.  
The loop index is 3.  
The loop index is 4.

As before, the value of `j` is decremented by one for each iteration, but this does not affect the value of `to`, because its value is a copy of `j` that is made before the loop is entered.

In this example, `step` has the default value, 1. The code decrements the index:

```
<cfloop index = "LoopCount"  
  from = "5"  
  to = "1"  
  step = "-1">  
The loop index is <cfoutput>#LoopCount#</cfoutput>.<br>  
</cfloop>
```

The output of this loop is as follows:

The loop index is 5.  
The loop index is 4.  
The loop index is 3.  
The loop index is 2.  
The loop index is 1.

## cfloop: conditional loop

### Description

A conditional loop iterates over a set of instructions as long as a condition is True. To use this type of loop correctly, the instructions must change the condition every time the loop iterates, until the condition is False. Conditional loops are known as WHILE loops, as in, "loop WHILE this condition is true."

### Syntax

```
<cfloop
  condition = "expression">
  ...
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfswitch](#), [cfthrow](#), [cftry](#); "cfloop and cfbreak" in Chapter 2, "Elements of CFML," in *ColdFusion MX Developer's Guide*

### Attributes

| Attribute | Req/Opt  | Default | Description                       |
|-----------|----------|---------|-----------------------------------|
| condition | Required |         | Condition that controls the loop. |

### Example

The following example increments CountVar from 1 to 5.

```
<!--- Set the variable CountVar to 0. --->
<cfset CountVar = 0>
<!--- Loop until CountVar = 5. --->
<cfloop condition = "CountVar LESS THAN OR EQUAL TO 5">
  <cfset CountVar = CountVar + 1>
  The loop index is <cfoutput>#CountVar#</cfoutput>.<br>
</cfloop>
```

The output of this loop is as follows:

```
The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.
The loop index is 5.
```

## cfloop: looping over a date or time range

### Description

Loops over the date or time range specified by the `from` and `to` attributes. By default, the step is 1 day, but you can change the step by creating a `timespan`. The `cfloop` tag loops over tags that cannot be used within a `cfoutput` tag.

### Syntax

```
<cfloop
  from = "start_time"
  to = "end_time"
  index = "current_value"
  step = "increment">
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfdirectory](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfrethrow](#), [cfswitch](#), [cfthrow](#), [cftry](#); “`cfloop` and `cfbreak`” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

### Attributes

| Attribute          | Req/Opt  | Default | Description  |
|--------------------|----------|---------|--|
| <code>from</code>  | Required |         | The beginning of the date or time range.   |
| <code>to</code>    | Required |         | The end of the date or time range.   |
| <code>index</code> | Required | 1 day   | Index value. ColdFusion sets it to the <code>from</code> value and increments by the <code>step</code> value, until it equals the <code>to</code> value. |
| <code>step</code>  | Optional |         | Step, expressed as a <code>timespan</code> , by which the index increments.  |

### Example

The following example loops from today’s date to today’s date plus 30 days, stepping by 7 days at a time and displaying the date:

```
<cfset startDate = Now()>
<cfset endDate = Now() + 30>
<cfloop from="#startDate#" to="#endDate#" index="i"
  step="#CreateTimeSpan(7,0,0,0)#">
  <cfoutput>#dateFormat(i, "mm/dd/yyyy")#<br /></cfoutput>
</cfloop>
```

The following example displays the time in 30-minute increments, starting from midnight and ending 23 hours, 59 minutes, and 59 seconds later:

```
<cfset startTime = CreateTime(0,0,0)>
<cfset endTime = CreateTime(23,59,59)>
<cfloop from="#startTime#" to="#endTime#" index="i"
  step="#CreateTimeSpan(0,0,30,0)#">
  <cfoutput>#TimeFormat(i, "hh:mm tt")#<br /></cfoutput>
</cfloop>
```

## cfloop: looping over a query

### Description

A loop over a query executes for each record in a query record set. The results are similar to those of the `cfoutput` tag. During each iteration, the columns of the current row are available for output. The `cfloop` tag loops over tags that cannot be used within a `cfoutput` tag.

### Syntax

```
<cfloop
  query = "query_name"
  startRow = "row_num"
  endRow = "row_num">
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfoutput](#), [cfswitch](#), [cfthrow](#), [cftry](#); For more information, see “`cfloop` and `cfbreak`” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

### Attributes

| Attribute | Req/Opt  | Default | Description                                      |
|-----------|----------|---------|--|
| query     | Required |         | Query that controls the loop.                    |
| startRow  | Optional |         | First row of query that is included in the loop. |
| endRow    | Optional |         | Last row of query that is included in the loop.  |

### Example

```
<cfquery name = "MessageRecords"
  dataSource = "cfdoexamples">
  SELECT * FROM Messages
</cfquery>
<cfloop query = "MessageRecords">
  <cfoutput>#Message_ID#</cfoutput><br>
</cfloop>
```

The `cfloop` tag also iterates over a record set with dynamic start and stop points. This gets the next *n* sets of records from a query. This example loops from the fifth through the tenth record returned by the `MessageRecords` query:

```
<cfset Start = 5>
<cfset End = 10>
<cfloop query = "MessageRecords"
  startRow = "#Start#"
  endRow = "#End#">
  <cfoutput>#MessageRecords.Message_ID#</cfoutput><br>
</cfloop>
```

The loop stops when there are no more records, or when the current record index is greater than the value of the `endRow` attribute.

The following example combines the pages that are returned by a query of a list of page names into one document, using the `cfinclude` tag:

```
<cfquery name = "GetTemplate"  
dataSource = "Library"  
maxRows = "5">  
SELECT TemplateName  
FROM Templates  
</cfquery>  
<cfloop query = "GetTemplate">  
<cfinclude template = "#TemplateName#">  
</cfloop>
```

# cfloop: looping over a list or file

## Description

Looping over a list steps through elements contained in any of these entities:

- A variable
- A value that is returned from an expression
- A file

## Syntax

```
<cfloop
  index = "index_name"
  list = "list_items"
  delimiters = "item_delimiter">
  ...
</cfloop>
```

## See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfswitch](#), [cfthrow](#), [cftry](#); “[cfloop](#) and [cfbreak](#)” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute  | Req/Opt  | Default | Description  |
|------------|----------|---------|--|
| index      | Required |         | In a list loop, the variable to receive the next list element. |
| list       | Required |         | A list, variable, or filename; contains a list.                |
| delimiters | Optional |         | Character(s) that separates items in list.                     |

## Example

This loop displays four names:

```
<cfloop index = "ListElement"
  list = "John,Paul,George,Ringo">
  <cfoutput>#ListElement#</cfoutput><br>
</cfloop>
```

You can put more than one character in the `delimiters` attribute, in any order. For example, this loop processes commas, colons, and slashes as list delimiters:

```
<cfloop index = "ListElement"
  list = "John/Paul,George::Ringo"
  delimiters = ",:/">
  <cfoutput>#ListElement#</cfoutput><br>
</cfloop>
```

ColdFusion skips the second and subsequent consecutive delimiters between list elements. Thus, in the example, the two colons between "George" and "Ringo" are processed as one delimiter.

To loop over each line of a file, use the tag this way:

```
<cfloop list="#theFile#"
  index="curLine"
  delimiters="#chr(10)##chr(13)#">
  ...
</cfloop>
```

## cfloop: looping over a COM collection or structure

### Description

The `cfloop collection` attribute loops over every object within a COM/DCOM collection object, or every element in a structure:

- A COM/DCOM collection object is a set of similar items referenced as a group. For example, the group of open documents in an application is a collection.
- A structure contains a related set of items, or it can be used as an associative array. Looping is particularly useful when using a structure as an associative array.

In the loop, each item is referenced by the variable name in the `item` attribute. The loop executes until all items have been accessed.

The `collection` attribute is used with the `item` attribute. In the example that follows, `item` is assigned a variable called `file2`, so that with each cycle in the `cfloop`, each item in the collection is referenced. In the `cfoutput` section, the name property of the `file2` item is referenced for display.

For more information, see Chapter 38, “Integrating COM and CORBA Objects in CFML Applications,” in *ColdFusion MX Developer’s Guide*.

### Example

This example uses a COM object to output a list of files. In this example, `FFunc` is a collection of `file2` objects.

```
<cfobject
  class = FileFunctions.files
  name = FFunc
  action = Create>
<cfset FFunc.Path = "c:\">
<cfset FFunc.Mask = "*.*" >
<cfset FFunc.attributes = 16 >
<cfset x = FFunc.GetFilesList()>
<cfloop collection = #FFUNC# item = "file2">
  <cfoutput>#file2.name# <br> </cfoutput>
</cfloop>
<!-- Loop through a structure that is used as an associative array: -->
...<!-- Create a structure and loop through its contents. -->
<cfset Departments = StructNew()>
<cfset val = StructInsert(Departments, "John ", "Sales ")>
<cfset val = StructInsert(Departments, "Tom ", "Finance ")>
<cfset val = StructInsert(Departments, "Mike ", "Education ")>
<!-- Build a table to display the contents -->
<cfoutput>
<table cellpadding = "2 " cellspacing = "2 ">
  <tr>
    <td><b>Employee</b></td>
    <td><b>Dept.</b></td>
  </tr>
<!-- Use item to create the variable person to hold value of key
as loop runs. -->
<cfloop collection = #Departments# item = "person ">
```

```
<tr>
  <td>#person#</td>
  <td>#StructFind(Departments, person)#</td>
</tr>
</cfloop>
</table>
</cfoutput>
```

# cfmail

## Description

Sends an e-mail message that optionally contains query output, using an SMTP server.

## Category

[Internet Protocol tags](#)

## Syntax

```
<cfmail
  to = "recipient"
  from = "sender"
  cc = "copy_to"
  bcc = "blind_copy_to"

[cfmailparam](#), [cfmailpart](#), [cfpop](#), [cfftp](#), [cfhttp](#), [cfldap](#), [Wrap](#); “Using ColdFusion with mail servers” in Chapter 39, “Sending and Receiving E-Mail,” in *ColdFusion MX Developer’s Guide*

ColdFusion MX 6.1:

- Added the following attributes: `charset`, `failto`, `replyto`, `username`, `password` and `wraptext`.
  - Added support for multiple mail servers in the `server` attribute.
  - Added several configuration options to the ColdFusion MX Administrator Mail Settings page.
- ColdFusion MX: Added the `SpoolEnable` attribute.

## Attributes

| Attribute | Req/Opt  | Default          | Description  |
|-----------|----------|------------------|--|
| to        | Required |                  | Message recipient e-mail addresses: <ul style="list-style-type: none"><li>• Static address; for example, "support@macromedia.com".</li><li>• Variable that contains an address; for example, "#Form.Email#".</li><li>• Name of a query column that contains an address; for example, "#Email#". An e-mail message is sent for each returned row.</li></ul>                           |
| from      | Required |                  | E-mail message sender: <ul style="list-style-type: none"><li>• A static string; for example, "support@mex.com"</li><li>• A variable; for example, "#GetUser.EmailAddress#".</li></ul> This attribute does not have to be a valid Internet address; it can be any text string.  |
| cc        | Optional |                  | Address(es) to which to copy the message.  |
| bcc       | Optional |                  | Address(es) to which to copy the message, without listing them in the message header.  |
| subject   | Required |                  | Message subject. Can be dynamically generated. For example, to send messages that give customers status updates: "Status of Order Number #Order_ID#".  |
| replyto   | Optional |                  | Address(es) to which the recipient is directed to send replies.  |
| failto    | Optional |                  | Address to which mailing systems should send delivery failure notifications. Sets the mail envelope reverse-path value.  |
| username  | Optional |                  | A user name to send to SMTP servers that require authentication. Requires a <code>password</code> attribute.   |
| password  | Optional |                  | A password to send to SMTP servers that require authentication. Requires a <code>username</code> attribute.  |
| wraptext  | Optional | Do not wrap text | Specifies the maximum line length, in characters of the mail text. If a line has more than the specified number of characters, replaces the last white space character, such as a tab or space, preceding the specified position with a line break. If there are no white space characters, inserts a line break at the specified position. A common value for this attribute is 72. |

| Attribute           | Req/Opt  | Default  | Description  |
|---------------------|----------|--|--|
| charset             | Optional | Character encoding selected in ColdFusion MX Administrator Mail page; default is UTF-8 | <p>Character encoding of the mail message, including the headers. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• iso-2022-kr</li> <li>• big5</li> <li>• hz-gb-2312</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> <p>For more information on character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> |
| type                | Optional | text/plain   | <p>MIME type of the message. Can be a valid MIME media type or one of the following:</p> <ul style="list-style-type: none"> <li>• text: specifies text/plain type.</li> <li>• plain: specifies text/plain type.</li> <li>• html: specifies text/html type.</li> </ul> <p>For a list of all registered MIME media types, see <a href="http://www.iana.org/assignments/media-types/">www.iana.org/assignments/media-types/</a>.</p>  |
| MIMEAttach          | Optional |  | <p>Path of file to attach to message. Attached file is MIME-encoded. ColdFusion attempts to determine the MIME type of the file; use the <code>cfmailparam</code> tag to send an attachment and specify the MIME type.</p>   |
| query               | Optional |  | <p>Name of <code>cfquery</code> from which to draw data for message(s). Use this attribute to send more than one message, or to send query results within a message.</p>   |
| group               | Optional | CurrentRow   | <p>Query column to use when you group sets of records to send as a message. For example, to send a set of billing statements to a customer, group on "Customer_ID." Case-sensitive. Eliminates adjacent duplicates when data is sorted by the specified field.</p>   |
| groupCase Sensitive | Optional | No   | <p>Boolean. Whether to consider case when using the group attribute. To group on case-sensitive records, set this attribute to Yes.</p>  |
| startRow            | Optional | 1  | <p>Row in a query to start from.</p>   |
| maxRows             | Optional |  | <p>Maximum number of messages to send when looping over a query.</p>   |

| Attribute   | Req/Opt  | Default                          | Description  |
|-------------|----------|----------------------------------|--|
| server      | Optional |                                  | SMTP server address, or (Enterprise edition only) a comma-delimited list of server addresses, to use for sending messages. At least one server must be specified here or in the ColdFusion MX Administrator. A value here overrides the Administrator. A value that includes a port specification overrides the <code>port</code> attribute. See the Usage section for details.  |
| port        | Optional |                                  | TCP/IP port on which SMTP server listens for requests (normally 25). A value here overrides the Administrator.   |
| mailerID    | Optional | ColdFusion MX Application Server | Mailer ID to be passed in X-Mailer SMTP header, which identifies the mailer application.   |
| timeout     | Optional |                                  | Number of seconds to wait before timing out connection to SMTP server. A value here overrides the Administrator.   |
| spoolEnable | Optional |                                  | Specifies whether to spool mail or always send it immediately. Overrides the ColdFusion MX Administrator Spool mail messages to disk for delivery setting. <ul style="list-style-type: none"> <li>• Yes: saves a copy of the message until the sending operation is complete. Pages that use this option might run slower than those that use the No option.</li> <li>• No: queues the message for sending, without storing a copy until the operation is complete. If a delivery error occurs when this option is No, ColdFusion generates an Application exception and logs the error to the mail.log file.</li> </ul> |
| debug       | Optional | No                               | <ul style="list-style-type: none"> <li>• Yes: sends debugging output to standard output. By default, if the console window is unavailable, ColdFusion sends output to <code>cf_root\runtime\logs\coldfusion-out.log</code> on server configurations. On J2EE configurations, with JRun, the default location is <code>jrun_home/logs/servername-out.log</code>.<br/><i>Caution:</i> If you set this option to Yes, ColdFusion MX writes detailed debugging information to the log, including all message contents, and can generate large logs quickly.</li> <li>• No: does not generate debugging output.</li> </ul>    |

### Usage

Sends a mail message to the specified address. Mail messages can include attachments. The tag body can include CFML code to generate mail output. The `cfmailparam` and `cfmailpart` tags can only be used in the `cfmail` tag body.

Mail messages can be single or multipart. If you send a multi-part mail message, all message content must be in `cfmailpart` tags; ColdFusion ignores multipart message text that is not in `cfmailpart` tags.

**Note:** The `cfmail` tag does not make copies of attachments when spooling mail to disk. If you use the `cfmail` tag to send a message with an attachment with spooling enabled and you use the `cffile` tag to delete the attachment file, ColdFusion might not send the mail because the mailing process might execute after the file was deleted. (When this happens, the mail log includes a `FileNotFoundException` exception and the e-mail is not sent.) You can prevent this problem by setting `SpoolEnable="No"` in the attribute or disabling spooling in the ColdFusion MX Administrator. Disabling spooling causes the e-mail to be delivered immediately.

## Mail addressing

Mail addresses can have any of the following forms:

| Format   | Example   |
|--|---|
| <code>user@server</code>                       | <code>rsmith@company.com</code>                     |
| <code>&lt;user@server&gt;</code>               | <code>&lt;rsmith@company.com&gt;</code>             |
| <code>DisplayName &lt;user@server&gt;</code>   | <code>Rob Smith &lt;rsmith@company.com&gt;</code>   |
| <code>"DisplayName" &lt;user@server&gt;</code> | <code>"Rob Smith" &lt;rsmith@company.com&gt;</code> |
| <code>user@server (DisplayName)</code>         | <code>rsmith@company.com (Rob Smith)</code>         |

## Specifying mail servers

The `server` attribute can specify one or more mail servers.

**Note:** If you specify multiple mail servers in ColdFusion MX Standard, the `cfmail` tag uses only the first server in the specification. ColdFusion logs a warning message to the mail log file and ignores the additional servers.

For each server, you can optionally specify a username, password, and port. These values override the corresponding attributes, if any. The `server` attribute has the following format:

```
[user:password@]server[:port],[user:password@]server[:port],...
```

For example, the following line specifies one server, `mail.myco.com` that uses the default port and no user or password, and a second server with a user, password, and specific port:

```
server=mail.myco.com,mail_admin:adm2qzf@mail2.myco.com:24
```

When you specify multiple mail servers in ColdFusion Enterprise, ColdFusion tries the available servers in the order they are listed until it connects to a server. ColdFusion does not try to connect to a server that was unavailable in the last 60 seconds.

### Example

```
<h3>cfmail Example</h3>
```

```
<!-- Delete the surrounding comments to use this example.
```

```
<cfif IsDefined("form.mailto")>
  <cfif form.mailto is not ""
    AND form.mailfrom is not ""
    AND form.Subject is not "">
    <cfmail to = "#form.mailto#"
      from = "#form.mailFrom#"
      subject = "#form.subject#">
```

This message was sent by an automatic mailer built with cfmail:

```
=====
#form.body#
</cfmail>
<h3>Thank you</h3>
<p>Thank you, <cfoutput>#mailfrom#: your message, #subject#, has
  been sent to #mailto#</cfoutput>.
</cfif>
</cfif>
<p>
<form action = "cfmail.cfm">
  <pre>
  TO: <input type = "Text" name = "MailTo">
  FROM: <input type = "Text" name = "MailFrom">
  SUBJECT: <input type = "Text" name = "Subject">
  <hr>
  MESSAGE BODY:
  <textarea name = "body" cols="40" rows="5" wrap="virtual"></textarea>
  </pre>
  <!-- Establish required fields. -->
  <input type = "hidden" name = "MailTo_required" value = "You must enter
  a recipient">
  <input type = "hidden" name = "MailFrom_required" value = "You must
  enter a sender">
  <input type = "hidden" name = "Subject_required" value = "You must enter
  a subject">
  <input type = "hidden" name = "Body_required" value = "You must enter
  some text">
  <p><input type = "Submit" name = "">
</form>
-->
```

# cfmailparam

## Description

Attaches a file or adds a header to an e-mail message.

## Category

[Internet Protocol tags](#)

## Syntax

```
<cfmail
  to = "recipient"
  subject = "msg_subject"
  from = "sender"
  ...more attributes... >

<cfmailparam
  file = "file-name"
  type = "media type"
  contentID = "content ID"
  disposition = "disposition type">
or
<cfmailparam
  name = "header-name"
  value = "header-value" >
...
</cfmail>
```

## See also

## History

ColdFusion MX 6.x: Added the `Disposition` and `ContentID` attributes.

ColdFusion MX 6.1: Added the `type` attribute.

## Attributes

| Attribute         | Req/Opt  | Default | Description   |
|-------------------|--|---------|---|
| <code>file</code> | Required if you do not specify <code>name</code> attribute |         | Attaches a file in a message. Mutually exclusive with <code>name</code> attribute. The file is MIME encoded before sending. |
| <code>name</code> | Required if you do not specify <code>file</code> attribute |         | Name of header. Case-insensitive. Mutually exclusive with <code>file</code> attribute.                                      |

| Attribute   | Req/Opt  | Default    | Description  |
|-------------|----------|------------|--|
| type        | Optional |            | The MIME media type of the file. Not used with the name attribute. Can be a valid MIME media type or one of the following: <ul style="list-style-type: none"> <li>• text: specifies text/plain type.</li> <li>• plain: specifies text/plain type.</li> <li>• html: specifies text/html type.</li> </ul> <b>Note:</b> For a list of all registered MIME media types, see <a href="http://www.iana.org/assignments/media-types/">www.iana.org/assignments/media-types/</a> . |
| value       | Optional |            | Value of the header. Not used with the file attribute.   |
| contentID   | Optional |            | The Identifier for the attached file. This ID should be globally unique and is used to identify the file in an IMG or other tag in the mail body that references the file content.   |
| disposition | Optional | attachment | How the attached file is to be handled. Can be one of the following: <ul style="list-style-type: none"> <li>• attachment: presents the file as an attachment.</li> <li>• inline: displays the file contents in the message.</li> </ul>   |

## Usage

This tag attaches a file or adds a header to an e-mail message. It can only be used in the `cfmail` tag. You can use multiple `cfmailparam` tags within a `cfmail` tag.

You can use this tag to include a file, such as an image, in an HTML mail message. The file can be displayed inline in an HTML message, or as an attachment. To include multiple files, use multiple `cfmailparam` tags.

### To display a file inline in a mail message:

1. Specify `type="html"` in the `cfmail` tag.
2. Specify `disposition="inline"` and a ContentID attribute in the `cfmailparam` tag.
3. Use a `src="cid:ContentIDValue"` attribute to identify the content to include in the HTML tag such as the `img` tag.

The second example shows this use.

## Examples

```
<h3>cfmailparam Examples</h3>
<p>This view-only example uses cfmailparam to 1) add header to a message and 2)
  attach files and 3) to return a receipt to the sender.</p>
<cfmail from = "peter@domain.com" To = "paul@domain.com"
  Subject = "See Important Attachments and Reply">
  <cfmailparam name = "Importance" value = "High">
  Please review the new logo. Tell us what you think.
  <cfmailparam file = "c:\work\readme.txt" type="text/plain">
  <cfmailparam file = "c:\work\logo.gif" type="image/gif">
  <cfmailparam name="Disposition-Notification-To" value="peter@domain.com">
```

```
</cfmail>
<p>This view-only example displays an image in the body of
an HTML message.</p>
<cfmail type="HTML"
  to = "#form.mailto#"
  from = "#form.mailFrom#"
  subject = "Sample inline image">
  <cfmailparam file="C:\Inetpub\wwwroot\web.gif"
    disposition="inline"
    contentID="image1">
  <P>There should be an image here</p>
  
  <p> After the picture</p>
</cfmail>
```

# cfmailpart

## Description

Specifies one part of a multipart e-mail message. Can only be used in the `cfmail` tag. You can use more than one `cfmailpart` tag within a `cfmail` tag.

## Category

[Internet Protocol tags](#)

## Syntax

```
<cfmail
... >
  (Optional cfmailparam entries)
  <cfmailpart
    type="mime type"
    charset="character encoding"
    wraptext="number"
  >
    Mail part contents
  </cfmailpart>
...
</cfmail>
```

## History

ColdFusion MX 6.1: Added this tag.

## See also

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| type      | Required |         | The MIME media type of the part. Can be a can be valid MIME media type or one of the following: <ul style="list-style-type: none"><li>• text: specifies text/plain type.</li><li>• plain: specifies text/plain type.</li><li>• html: specifies text/html type.</li></ul> <b>Note:</b> For a list of all registered MIME media types, see <a href="http://www.iana.org/assignments/media-types/">www.iana.org/assignments/media-types/</a> . |

| Attribute | Req/Opt  | Default  | Description  |
|-----------|----------|--|--|
| wraptext  | Optional | Do not wrap text   | Specifies the maximum line length, in characters of the mail text. If a line has more than the specified number of characters, replaces the last white space character, such as a tab or space, preceding the specified position with a line break. If there are no white space characters, inserts a line break at the specified position. A common value for this attribute is 72.   |
| charset   | Optional | Character encoding specified by charset attribute of <code>cfmail</code> tag | The character encoding in which the part text is encoded. The following list includes commonly used values: <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• iso-2022-kr</li> <li>• big5</li> <li>• hz-gb-2312</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> For more information on character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> . |

## Usage

Use this tag to create mail messages with alternative versions of the message that duplicate the content in multiple formats. The most common use is to send a plain text version of the message that can be read by all mail readers followed by a version formatted in HTML for display by HTML-compatible mail readers. Specify the simplest version first, with more complex versions afterwards. For more information, see [www.ietf.org/rfc/rfc2046.txt](http://www.ietf.org/rfc/rfc2046.txt).

## Example

```
<h3>cfmailpart Example</h3>
<cfmail from = "peter@domain.com" To = "paul@domain.com"
  Subject = "Which version do you see?">
  <cfmailpart
    type="text"
    wraptext="74">
    You are reading this message as plain text, because your mail reader
    does not handle HTML text.
  </cfmailpart>>
  <cfmailpart
    type="html">
    <h3>HTML Mail Message</h3>
    <p>You are reading this message as <strong>HTML</strong>.</p>
    <p>Your mail reader handles HTML text.</p>
  </cfmailpart>
</cfmail>
```

# cfmodule

## Description

Invokes a custom tag for use in ColdFusion application pages. This tag processes custom tag name conflicts.

## Category

[Application framework tags](#)

## Syntax

```
<cfmodule
  template = "path"
  name = "tag_name"
  attributeCollection = "collection_structure"
  attribute_name1 = "valuea"
  attribute_name2 = "valueb"
  ...>
```

## See also

[cfapplication](#), [cfassociate](#), [cflock](#); Chapter 11, “Creating and Using Custom CFML Tags” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior when using this tag within a custom tag: if the `attribute_name` parameter is the same as a key element within the `attributeCollection` parameter, ColdFusion now uses the name value that is within the `attributeCollection` parameter. (Earlier releases did not process this consistently.)

## Attributes

| Attribute | Req/Opt   | Default | Description   |
|-----------|---|---------|---|
| template  | Required<br>unless <code>name</code><br>attribute is used     |         | Mutually exclusive with the <code>name</code> attribute. A path to the page that implements the tag. <ul style="list-style-type: none"><li>Relative path: expanded from the current page.</li><li>Absolute path: expanded using ColdFusion mapping.</li></ul> A physical path is not valid.   |
| name      | Required<br>unless <code>template</code><br>attribute is used |         | Mutually exclusive with the <code>template</code> attribute. A custom tag name, in the form "Name.Name.Name..." Identifies subdirectory, under the ColdFusion tag root directory, that contains custom tag page. For example (Windows format):<br><pre>&lt;cfmodule name = "macromedia.Forums40.   GetUserOptions"&gt;</pre> This identifies the page <code>GetUserOptions.cfm</code> in the directory <code>CustomTags\macromedia\Forums40</code> under the ColdFusion root directory. |

| Attribute           | Req/Opt  | Default | Description   |
|---------------------|----------|---------|---|
| attributeCollection | Optional |         | Structure. A collection of key-value pairs that represent attribute names and values. You can specify multiple key-value pairs. You can specify this attribute only once. |
| attribute_name      | Optional |         | Attribute for a custom tag. You can include multiple instances of this attribute to specify the parameters of a custom tag.   |

## Usage

To name a ColdFusion page that contains the custom tag definition, including its path, use the `template` attribute. To refer to the custom tag in the ColdFusion installation directory, using dot notation to indicate its location, use the `name` attribute.

On UNIX systems, ColdFusion searches first for a file with a name that matches the `name` attribute, but is all lower case. If it does not find the file, it looks for a file name that matches the attribute with identical character casing.

You can use `attributeCollection` and `attribute_name` in the same call.

Within the custom tag code, the attributes passed with `attributeCollection` are saved as independent attribute values, with no indication that they are grouped into a structure by the custom tag's caller.

Similarly, if the custom tag uses a `cfassociate` tag to save its attributes, the attributes passed with `attributeCollection` are saved as independent attribute values, with no indication that they are grouped into a structure by the custom tag's caller.

If you specify an end tag to `cfmodule`, ColdFusion calls your custom tag as if it had both a start and an end tag. For more information, see “Handling end tags” of Chapter 11, “Creating and Using Custom CFML Tags” in *ColdFusion MX Developer's Guide*.

## Example

```
<h3>cfmodule Example</h3>
<p>This view-only example shows use of cfmodule to call a custom tag inline.</p>
<p>This example uses a sample custom tag that is saved in myTag.cfm in the snippets directory. You can also save ColdFusion custom tags in the CFusionMX7\CustomTags directory.
<cfset attrCollection1 = StructNew()
<cfparam name="attrCollection1.value1" default="22">
<cfparam name="attrCollection1.value2" default="45">
<cfparam name="attrCollection1.value3" default="88">
<!-- Call the tag with CFMODULE with Name-->
<cfmodule
  Template="myTag.cfm"
  X="3"
  attributeCollection=#attrCollection1#
  Y="4">
<!-- Show the code. -->
<HR size="2" color="#0000A0">
<P>Here is one way in which to invoke the custom tag,
```

```

using the TEMPLATE attribute.</P>
<cfoutput>#HTMLCodeFormat(" <CFMODULE
    Template="myTag.cfm"
    X=3
    attributeCollection=##attrCollection1##
    Y=4>")#
</cfoutput>
<P>The result: <cfoutput>#result#</cfoutput>
<!-- Call the tag with CFMODULE with Name. --->
<!--
    <CFMODULE
        Name="myTag"
        X="3"
        attributeCollection=##attrCollection1#
        Y="4">
    --->
<!-- Show the code. --->
<HR size="2" color="#0000A0">
<P>Here is another way to invoke the custom tag,
using the NAME attribute.</P>
<cfoutput>#HTMLCodeFormat(" <CFMODULE
    NAME='myTag'
    X=3
    attributeCollection=##attrCollection1##
    Y=4>")#
</cfoutput>
<P>The result: <cfoutput>#result#</cfoutput>
<!-- Call the tag using the shortcut notation. --->
<!--
<CF_myTag
    X="3"
    attributeCollection=##attrCollection1#
    Y="4">
    --->

<!-- Show the code. --->
<p>Here is the short cut to invoking the same tag.</p>
<cfoutput>#HTMLCodeFormat("<cf_mytag
    x = 3
    attributeCollection = ##attrcollection1##
    y = 4>")#
</cfoutput>
<p>The result: <cfoutput>#result#</cfoutput></p>

```

# cfNTauthenticate

## Description

Authenticates a user name and password against the Windows NT domain on which the ColdFusion server is running, and optionally retrieves the user's groups.

## Category

[Security tags](#)

## Syntax

```
<cfNTauthenticate
  username="username"
  password="password"
  domain="nt_domain"
  result="result variable"
  listGroups = "yes" or "no"
  throwOnError = "yes" or "no">
```

## See also

[cflogin](#), [cfloginuser](#), [IsUserInRole](#), [GetAuthUser](#)

## History

ColdFusion MX 7: Added this tag.

## Attributes

| Attribute    | Req/Opt  | Default          | Description  |
|--------------|----------|------------------|--|
| name         | Required |                  | User's login name.   |
| password     | Required |                  | User's password.   |
| domain       | Required |                  | Domain against which to authenticate the user. The ColdFusion J2EE server must be running on this domain.  |
| result       | Optional | cfntauthenticate | Name of the variable in which to return the results.   |
| listGroups   | Optional | No               | Boolean value specifying whether to include a comma-delimited list of the user's groups in the result structure.   |
| throwOnError | Optional | No               | Boolean value specifying whether to throw an exception if the validation fails. If this attribute is Yes, ColdFusion throws an error if the user name or password is invalid; the application must handle such errors in a try/catch block or ColdFusion error handler page. |

## Usage

Use this function to authenticate a user against a Windows NT domain and optionally get the user's groups. This function does not work with the Microsoft Active Directory directory service, and does nothing on UNIX and Linux systems. You typically use this tag inside a `cflogin` tag to authenticate the user for a `cfloginuser` tag, as shown in the example.

**Note:** ColdFusion must run as a user that has the privilege to authenticate other users in the specified domain.

The structure specified in the `result` attribute contains the following information:

| Field               | Value  |
|---------------------|--|
| <code>auth</code>   | Whether the user is authenticated: <ul style="list-style-type: none"><li>• Yes</li><li>• No</li></ul>  |
| <code>groups</code> | A comma-delimited list of the user's groups in the specified domain. The structure includes this field only if the <code>listGroups</code> attribute is Yes.   |
| <code>name</code>   | The user name; equals the tag's <code>name</code> attribute.   |
| <code>status</code> | The authentication status. One of the following: <ul style="list-style-type: none"><li>• success</li><li>• UserNotInDirFailure: the user is not listed in the directory.</li><li>• AuthenticationFailure: the user is in the directory, but the password is not valid.</li></ul> |

This tag provides two models for handling authentication: status checking and exception handling. If the `throwOnError` attribute is No, use the result variable's `auth` and `status` fields to determine whether the user was authenticated and, if not, the reason for the failure. If the `throwOnError` attribute is Yes, ColdFusion throws an exception error if the user is not valid. In this case, use try/catch error handling. The catch block must handle any authentication failure.

### Example

The following example uses the `auth` and `status` fields to determine whether the user is authenticated and the failure cause. It consists of three files that you put in the same directory:

- A main `cfntauthexample.cfm` page that displays the name if the user is authenticated and contains a logout link.
- A login form page that is displayed if the user is not logged in.
- The `Application.cfm` page, which contains all the login, authentication, and logout processing code.

For a full description of login processing, see *ColdFusion MX Developer's Guide*. For information on how this example works, see the comments in the code.

Save the following page as `cfntauthenticateexample.cfm`. To run the example, request this page in your browser or IDE.

```
<!-- The Application.cfm page, which is processed each time a user
      requests this page, ensures that you log in first. -->
<cfoutput>
  <h3>Welcome #GetAuthUser()#</h3>
  <!-- A link to log out the user. -->
  <a href="#CGI.script_name#?logout=Yes">Log Out</a>
</cfoutput>
```

### Save the following page as loginform.cfm:

```
<!-- A simple login form that posts back to the page whose request initiated
the login. -->
<H2>Please Log In</H2>
<cfform action="#CGI.script_name#">
  <!-- j_username and j_password are special names that populate cflogin tag
variables. -->
  User Name: <cfinput type="text" name="j_username" value="cfqa_user1"
required="Yes"><br>
  Password: <cfinput type="password" name="j_password" value="cfqa_user1"
required="Yes"><br>
  Domain: <cfinput type="text" name="domain" value="rnd" required="Yes"><br>
  <input type="submit" value="Log In">
</cfform>
```

### Save the following page as Application.cfm:

```
<!-- If this page is executing in response to the user clicking a logout link,
log out the user. The cflogin tag code will then run. -->
<cfif IsDefined("URL.logout") AND URL.logout>
  <cflogout>
</cfif>

<!-- The cflogin body code runs only if a user is not logged in. -->
<cflogin>
  <!-- cflogin variable exists only if login credentials are available. -->
  <cfif NOT IsDefined("cflogin")>
    <!-- Show a login form that posts back to the page whose request
initiated the login, and do not process the rest of this page. -->
    <cfinclude template="loginform.cfm">
    <cfabort>
  <cfelse>
    <!-- Trim any leading or trailing spaces from the username and password
submitted by the form. -->
    <cfset theusername=trim(form.j_username)>
    <cfset thepassword=trim(form.j_password)>
    <cfset thedomain=trim(form.domain)>
    <cfntauthenticate username="#thexusername#" password="#thepassword#"
domain="#thedomain#" result="authresult" listgroups="yes">
    <!-- authresult.auth is True if the user is authenticated. -->
    <cfif authresult.auth>
      <!-- Log user in to ColdFusion and set roles to the user's Groups. -->
      <cfloginuser name="#thexusername#" password="#thepassword#"
roles="authresult.groups">
    <cfelse>
      <!-- The user was not authenticated.
Display an error message and the login form. -->
      <cfoutput>
        <cfif authresult.status IS "AuthenticationFailure">
          <!-- The user is valid, but not the password. -->

</cflogin>
```

# cfobject

## Description

Creates a ColdFusion object, of a specified type.

**Note:** You can enable and disable this tag in the ColdFusion Administrator page, under ColdFusion Security, Sandbox Security.

## Category

[Extensibility tags](#)

## Syntax

The tag syntax depends on the object type. Some types use the `type` attribute; others do not. See the following sections:

- [“cfobject: COM object” on page 313](#)
- [“cfobject: component object” on page 315](#)
- [“cfobject: CORBA object” on page 316](#)
- [“cfobject: Java or EJB object” on page 318](#)
- [“cfobject: web service object” on page 320](#)

**Note:** On UNIX, this tag does not support COM objects.

## See also

[cfargument](#), [cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfinvokeargument](#), [cfproperty](#), [cfreturn](#); “Using Java objects” in Chapter 37, “Integrating J2EE and Java Elements in CFML Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed instantiation behavior: this tag, and the `CreateObject` function, can now instantiate ColdFusion components (CFCs); you can use them within the `cfscript` tag.
- For CORBA object: changed the Naming Service separator format for addresses from a dot to a forward slash. For example, if `context=NameService`, for a class, use either of the following formats for the `class` parameter:
  - `"Macromedia/Eng/CF"`
  - `"Macromedia.current/Eng.current/CF"`(In earlier releases, the format was `"Macromedia.Eng.CF"`.)
- For CORBA object: changed the `locale` attribute; it specifies the Java configuration that contains the properties file.

## cfobject: COM object

### Description

Creates and manipulates a Component Object Model (COM) object. Invokes a registered automation server object type.

For information on OLEView, and about COM and DCOM, see the Microsoft OLE Development website: [www.microsoft.com](http://www.microsoft.com).

To use this tag, you must provide the object's program ID or filename, the methods and properties available through the IDispatch interface, and the arguments and return types of the object's methods. For most COM objects, you can get this information with the OLEView utility.

**Note:** On UNIX, this tag does not support COM objects.

### Syntax

```
<cfobject
  type = "com"
  action = "action"
  class = "program_ID"
  name = "text"
  context = "context"
  server = "server_name">
```

### See also

[ReleaseComObject](#), [cfcollection](#), [cfexecute](#); “COM” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer's Guide*

### Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| type      | Optional |         | Object type: <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li></ul> (The other object types do not take the type attribute.)   |
| action    | Required |         | <ul style="list-style-type: none"><li>• create: instantiates a COM object (typically, a DLL) before invoking methods or properties.</li><li>• connect: connects to a COM object (typically, an EXE) running on server.</li></ul> |
| class     | Required |         | Component ProgID for the object to invoke. When using Java stubs to connect to the COM object, the class must be the ProgID of the COM object.   |
| name      | Required |         | String; name for the instantiated component.   |

| Attribute | Req/Opt                        | Default | Description   |
|-----------|--------------------------------|---------|---|
| context   | Optional                       |         | <ul style="list-style-type: none"> <li>• inproc</li> <li>• local</li> <li>• remote</li> </ul> On Windows: If not specified, uses Registry setting.  |
| server    | Required if context = "Remote" |         | Server name, using Universal Naming Convention (UNC) or Domain Name Serve (DNS) convention, in one of these forms: <ul style="list-style-type: none"> <li>• \\lanserver</li> <li>• lanserver</li> <li>• http://www.servername.com</li> <li>• www.servername.com</li> <li>• 127.0.0.1</li> </ul> |

### Example

```

<h3>cfobject (COM) Example</h3>
<!-- Create a COM object as an inproc server (DLL). (class = prog-id)-->
<cfobject action = "Create"
  type = "COM"
  class = Allaire.DocEx1.1
  name = "obj">

<!-- Call a method. Methods that expect no arguments should be called
  using empty parentheses. --->
<cfset obj.Init()>

<!-- This is a collection object. It should support, at a minimum:
  Property : Count
  Method : Item(inarg, outarg)
  and a special property called _NewEnum
  --->
<cfoutput>
  This object has #obj.Count# items.
  <br> <HR>
</cfoutput>

<!-- Get the 3rd object in the collection. --->
<cfset emp = obj.Item(3)>
<cfoutput>
  The last name in the third item is #emp.lastname#.
  <br> <HR>
</cfoutput>

<!--Loop over all the objects in the collection.-->
<p>Looping through all items in the collection:
<br>
<cfloop
  collection = #obj#
  item = file2>
  <cfoutput>Last name: #file2.lastname# <br></cfoutput>
</cfloop>

```

# cfobject: component object

## Description

Creates an instance of a ColdFusion component (CFC) object.

## Syntax

```
<cfobject
  name = "variable name"
  component = "component name">
```

## See also

[cfcollection](#), [cfcomponent](#), [cfexecute](#), [cfindex](#), [cfreport](#), [cfsearch](#), [cfwddx](#); “Using ColdFusion components” in Chapter 10, “Building and Using ColdFusion Components,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| name      | Required |         | String; name for the instantiated component. The name must not have a period as the first or last character. |
| component | Required |         | Name of component to instantiate.  |

## Usage

When the `cfobject` tag creates an instance of the CFC, ColdFusion executes any constructor code in the CFC; that is, it runs code that is not in the method definitions.

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lowercase. If it does not find the file, it looks for a filename that matches the component name exactly, with the identical character casing.

## Example

```
<!--- Separate instantiation and method invocation; permits multiple
      invocations. --->
<cfobject
  name="quoteService"
  component="nasdaq.quote">
<cfinvoke
  component="#quoteService#"
  method="getLastTradePrice"
  symbol="macr"
  returnVariable="res">
<cfoutput>#res#</cfoutput><br>

<cfinvoke
  component="#quoteService#"
  method="getLastTradePrice"
  symbol="mot"
  returnVariable="res">
<cfoutput>#res#</cfoutput>
```

## cfunction: CORBA object

### Description

Calls methods on a registered CORBA object.

### Syntax

```
<cfunction
  type = "corba"
  context = "context"
  class = "file or naming service"
  name = "text"
  locale = "type-value arguments">
```

### See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [cfreport](#), [cfsearch](#), [cfwddx](#); “CORBA” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

### History

See the History section of the main [cfunction](#) tag page.

### Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| type      | Optional |         | Object type: <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li></ul> (The other object types do not take the <code>type</code> attribute.)  |
| context   | Required |         | <ul style="list-style-type: none"><li>• <code>ior</code>: ColdFusion uses Interoperable Object Reference (IOR) to access CORBA server.</li><li>• <code>nameservice</code>: ColdFusion uses naming service to access server. This option is valid only with the InitialContext of a VisiBroker Orb.</li></ul>   |
| class     | Required |         | <ul style="list-style-type: none"><li>• If <code>context = "ior"</code>: absolute path of file that contains string version of the Interoperable Object Reference (IOR). ColdFusion must be able to read file; it should be local to ColdFusion server or accessible on network.</li><li>• If <code>context = "nameservice"</code>: forward slash-delimited naming context for naming service. For example: <code>Allaire//Doc/empobject</code>.</li></ul> |
| name      | Required |         | String; name for the instantiated component. An application uses it to reference the CORBA object’s methods and attributes.  |
| locale    | Optional |         | Sets arguments for a call to <code>init_orb</code> . Use of this attribute is specific to VisiBroker ORBs. It is available on C++, Version 3.2. The value must be in the form:<br><code>locale = " -ORBagentAddr 199.99.129.33 -ORBagentPort 19000"</code><br>Each type-value pair must start with a hyphen.   |

## Usage

ColdFusion Enterprise version 4.0 and later supports CORBA through the Dynamic Invocation Interface (DII). To use `cfobject` with CORBA objects, you must provide the name of the file that contains a string-formatted version of the IOR, or the object's naming context in the naming service; and the object's attributes, method names, and method signatures.

User-defined types (for example, structures) are not supported.

## Example

```
<cfobject type = "corba"  
  context = "ior"  
  class = "c:\\myobject.ior"  
  name = "GetName">
```

# cfobject: Java or EJB object

## Description

Creates and manipulates a Java and Enterprise Java Bean (EJB) object.

## Syntax

```
<cfobject
  type = "Java"
  action = "Create"
  class = "Java class"
  name = "object name">
```

## See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [cfreport](#), [cfsearch](#), [cfwddx](#); “Using Java objects” in Chapter 37, “Integrating J2EE and Java Elements in CFML Applications,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| type      | Optional |         | Object type: <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li></ul> (The other object types do not take the <code>type</code> attribute.) |
| action    | Required |         | Create: Creates a Java or WebLogic Environment object.  |
| class     | Required |         | Java class.   |
| name      | Required |         | String; name for the instantiated component.  |

## Usage

To call Java CFXs or Java objects, ColdFusion uses a Java Virtual Machine (JVM) that is embedded in the process. You can configure JVM loading, location and settings in the ColdFusion Administrator.

Any Java class available in the class path that is specified in the ColdFusion Administrator can be loaded and used from ColdFusion, using the `cfobject` tag.

To access Java methods and fields, do the following steps:

1. Call the `cfobject` tag, to load the class. See the example code.
2. Use the `init` method with appropriate arguments, to call a constructor. For example:

```
<cfset ret = myObj.init(arg1, arg2)>
```

Calling a public method on the object without first calling the `init` method results in an implicit call to the default constructor. Arguments and return values can be any Java type (simple, array, object). ColdFusion makes the conversions if strings are passed as arguments, but not if they are received as return values.

Overloaded methods are supported if the number of arguments is different.

## Calling EJBs

To create and call EJB objects, use the `cfoject` tag. In the second example below, the WebLogic JNDI is used to register and find EJBHome instances.

### Example

```
<!-- Example of a Java Object, this cfoject call loads the class MyClass
but does not create an instance object. Static methods and fields
are accessible after a call to cfoject. -->
<cfoject
  action = "create"
  type = "java"
  class = "myclass"
  name = "myobj">

<!--- Example of an EJB - The cfoject tag creates the Weblogic Environment
object, which is used to get InitialContext. The context object is
used to look up the EJBHome interface. The call to Create() results
in getting an instance of stateless session EJB. -->

<cfoject
  action = "create"
  type = "java"
  class = "weblogic/jndi/Environment"
  name = "wlEnv">

<cfset ctx = wlEnv.getInitialContext()>
<cfset ejbHome = ctx.lookup("statelessSession.TraderHome")>
<cfset trader = ejbHome.Create()>
<cfset value = trader.shareValue(20, 55.45)>
<cfoutput>
  Share value = #value#
</cfoutput>
<cfset value = trader.remove()>
```

## cfobject: web service object

### Description

Creates a web service proxy object.

### Syntax

```
<cfobject  
  webservice= "http://...?wsdl" or "name set in Administrator"  
  name = "myobjectname">
```

### See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [cfreport](#), [cfsearch](#), [cfwddx](#); “Consuming web services” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

### Attributes

| Attribute  | Req/Opt  | Default | Description  |
|------------|----------|---------|--|
| webservice | Required |         | URL to web service WSDL file: <ul style="list-style-type: none"><li>• Absolute URL of web service.</li><li>• Name (string) assigned in the Administrator to the web service.</li></ul> |
| name       | Required |         | Local name for the web service. String.  |

### Usage

Instantiates a proxy object for a web service. You can enter the absolute URL in this tag, or refer to a web service that is entered in the ColdFusion Administrator. To minimize potential code maintenance, enter the web service in the Administrator, and then refer to that name in this tag.

# cfojectcache

## Description

Flushes the query cache.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfojectcache  
  action = "clear">
```

## See also

[cfoject](#)

## History

ColdFusion 5: Added this tag.

## Attributes

---

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| action    | Required |         | clear: clears queries from the cache in the Application scope. |

---

# cfoutput

## Description

Displays output that can contain the results of processing ColdFusion variables and functions. Can loop over the results of a database query.

## Category

[Data output tags](#)

## Syntax

```
<cfoutput
  query = "query_name"
  group = "query_column"
  groupCaseSensitive = "yes" or "no"
  startRow = "start_row"
  maxRows = "max_rows_output">
</cfoutput>
```

## See also

[cfcol](#), [cfcontent](#), [cfdirectory](#), [cftable](#)

## History

ColdFusion 4.5.0: Added the `groupCaseSensitive` attribute.

## Attributes

| Attribute           | Req/Opt  | Default           | Description  |
|---------------------|----------|-------------------|--|
| query               | Optional |                   | Name of <code>cfquery</code> from which to draw data for output section.   |
| group               | Optional |                   | Query column to use to group sets of records. Eliminates adjacent duplicate rows when data is sorted. Use if you retrieved a record set ordered on one or more a query columns. For example, if a record set is ordered on "Customer_ID" in the <code>cfquery</code> tag, you can group the output on "Customer_ID." |
| groupCase Sensitive | Optional | Yes               | Boolean. Whether to consider the case in grouping rows.  |
| startRow            | Optional | 1                 | Row from which to start output.  |
| maxRows             | Optional | displays all rows | Maximum number of rows to display.   |

## Usage

In the `cfoutput` tag body, ColdFusion treats text that is surrounded by number signs (`#`) as a ColdFusion variable or function call. For example, the following code displays the text "Hello World!":

```
<cfset myVar="Hello World!">
<cfoutput>#myVar#</cfoutput>
```

When you specify a `query` attribute, this tag loops over the query rows and produces output for each row within the range specified by the `startRow` and `maxRows` values, and groups or eliminates duplicate entries as specified by the grouping attribute values, if any. It also sets the `query.currentRow` variable to the current row being processed.

If you nest `cfoutput` blocks that process a query, you specify the `query` and `group` attributes at the top-most level; you can specify a `group` attribute for each inner block except the innermost `cfoutput` block.

This tag requires an end tag.

### Example

```
<!-- EXAMPLE: This example shows how cfoutput operates. -->
<!-- Run a sample query. -->
<cfquery name = "GetCourses" dataSource = "cfdoexamples">
  SELECT Dept_ID, CorName, CorLevel
  FROM courseList
  ORDER by Dept_ID, CorLevel, CorName
</cfquery>
<h3>cfoutput Example</h3>
<p>cfoutput tells ColdFusion Server to begin processing, and then to hand back
  control of page rendering to the web server.
<p>For example, to show today's date, you could write #DateFormat("#Now()#").
  If you enclosed that expression in cfoutput, the result would
  be<cfoutput>#DateFormat(Now())#</cfoutput>.

<p>In addition, cfoutput may be used to show the results of a query operation,
  or only a partial result, as shown:

<p>There are <cfoutput>#getCourses.recordCount#</cfoutput> total records in
  our query. Using the maxRows parameter, we are limiting our display to 4
  rows.
<p><cfoutput query = "GetCourses" maxRows = 4>
  #Dept_ID# #CorName# #CorLevel#<br>
</cfoutput>

<p>EXAMPLE: The next example uses the group attribute to eliminate duplicate
  lines from a list of course levels taught in each department.</p>
<p><cfquery name = "GetCourses" dataSource = "cfdoexamples">
  SELECT Dept_ID, CorLevel
  FROM courseList
  ORDER by Dept_ID, CorLevel
</cfquery>
<p><cfoutput query = "GetCourses" group="CorLevel" GroupCaseSensitive="True">
  #Dept_ID# #CorLevel#<br>
</cfoutput>

<p>cfoutput can also show the results of a more complex expression,
  such as getting the day of the week from today's date. We first
  extract the integer representing the Day of the Week from
  the server function Now() and then apply the result to
  the DayofWeekAsString function:

<br>Today is #DayofWeekAsString(DayofWeek(Now()))#
```

```

<br>Today is <cfoutput>#DayofWeekAsString(DayofWeek(Now()))#</cfoutput>
<p> EXAMPLE: This last example shows nested cfoutput tags:<p>
<cfquery datasource="cfdocexamples" name="empSalary">
SELECT Emp_ID, firstname, lastname, e.dept_id, salary, d.dept_name
FROM employee e, departmt d
WHERE e.dept_id = d.dept_id
ORDER BY d.dept_name
</cfquery>

<!--- Outer cfoutput. --->
<cfoutput query="empSalary" group="dept_id">
  <h2>#dept_name#</h2>
  <table width="95%" border="2" cellspacing="2" cellpadding="2" >
    <tr>
      <th>Employee</th>
      <th>Salary</th>
    </tr>
    <cfset deptTotal = 0 >
    <!--- Inner cfoutput. --->
    <cfoutput>
      <tr>
        <td>#empSalary.lastname#, #empSalary.firstname#</td>
        <td align="right">#DollarFormat(empSalary.salary)#</td>
      </tr>
      <cfset deptTotal = deptTotal + empSalary.salary>
    </cfoutput>
    <tr>
      <td align="right">Total</td>
      <td align="right">#DollarFormat(deptTotal)#</td>
    </tr>
    <cfset deptTotal = 0>
  </table>
</cfoutput>

```

# cfparam

## Description

Tests for the existence of a parameter (that is, a variable), validates its data, and, if a default value is not assigned, optionally provides one.

## Category

[Variable manipulation tags](#)

## Syntax

```
<cfparam  
  name = "param_name"  
  type = "data_type"  
  default = "value"  
  max = "value"  
  min = "value"  
  pattern = "regular expression">
```

## See also

[cfcookie](#), [cfregistry](#), [cfsavecontent](#), [cfschedule](#), [cfset](#); “Validating data with the IsValid function and the cfparam tag” in Chapter 28, “Validating Data,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7:

- Added `min`, `max`, and `pattern` attributes.
- Added `creditcard`, `email`, `eurodate`, `float`, `integer`, `range`, `regex`, `regular_expression`, `ssn`, `social_security_number`, `time`, `URL`, `USdate`, and `zipcode` attributes of the `type` attribute.

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| name      | Required |         | Name of the parameter (variable) to test (such as "Client.Email " or "Cookie.BackgroundColor "). If omitted, and if the parameter does not exist, an error is thrown.   |
| type      | Optional | any     | <p>The valid format for the data; one of the following. For detailed information on validation algorithms, see "Validating form data using hidden fields" in Chapter 28, "Validating Data," in <i>ColdFusion MX Developer's Guide</i>.</p> <ul style="list-style-type: none"><li>• any: any type of value.</li><li>• array: an array of values.</li><li>• binary: a binary value.</li><li>• boolean: a Boolean value: yes, no, true, false, or a number.</li><li>• creditcard: a 13-16 digit number conforming to the mod10 algorithm.</li><li>• date or time: a date-time value.</li><li>• email: a valid e-mail address.</li><li>• eurodate: a date-time value. Any date part must be in the format dd/mm/yy. The format can use /, -, or . characters as delimiters.</li><li>• float or numeric: a numeric value.</li><li>• guid: a Universally Unique Identifier of the form "XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX" where 'X' is a hexadecimal number.</li><li>• integer: an integer.</li><li>• query: a query object.</li><li>• range: a numeric range, specified by the <code>min</code> and <code>max</code> attributes.</li><li>• regex or regular_expression: matches input against <code>pattern</code> attribute.</li><li>• ssn or social_security_number: a U.S. social security number.</li><li>• string: a string value or single character.</li><li>• struct: a structure.</li><li>• telephone: a standard U.S. telephone number.</li><li>• URL: an http, https, ftp, file, mailto, or news URL.</li><li>• UUID: a ColdFusion Universally Unique Identifier, formatted 'XXXXXXXX-XXXX-XXXX-XXXXXXXXXXXXXXXX', where 'X' is a hexadecimal number. See <a href="#">CreateUUID on page 544</a>.</li><li>• USdate: a U.S. date of the format mm/dd/yy, with 1-2 digit days and months, 1-4 digit years.</li><li>• variableName: a string formatted according to ColdFusion variable naming conventions.</li><li>• xml: XML objects and XML strings.</li><li>• zipcode: U.S., 5- or 9-digit format ZIP codes.</li></ul> |
| default   | Optional |         | Value to set parameter to if it does not exist. Any expression used for the default attribute is evaluated, even if the parameter exists. The result is not assigned if the parameter exists, but if the expression has side effects, they still occur.   |
| max       | Optional |         | The maximum valid value; used only for <code>range</code> validation.   |

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| min       | Optional |         | The minimum valid value; used only for range validation.   |
| pattern   | Optional |         | A JavaScript regular expression that the parameter must match; used only for regex or regular_expression validation. |

## Usage

You can use this tag to make the following tests:

- To test whether a required variable exists, use this tag with only the `name` attribute. If it does not exist, ColdFusion MX stops processing the page and returns an error.
- To test whether a required variable exists, and that it is of the specified type, use this tag with the `name` and `type` attributes. If the variable does not exist or its value is not of the specified type, ColdFusion returns an error.
- To set a default value for the variable, use this tag with the `name` and `default` attributes. If the variable does not exist, it is created and set to the `default` attribute value. If the variable exists, processing continues; the value is not changed.

If you specify `variableName` for the `type` attribute, the parameter's value must be a string that is in ColdFusion variable name format; that is, starts with a letter, underscore (`_`), or Unicode currency symbol, and contains letters, numbers, underscores, periods, and Unicode currency symbols, only. ColdFusion does not check whether the parameter value corresponds to an existing ColdFusion variable.

**Tip:** To improve performance, avoid using the `cfparam` tag in ColdFusion functions, including in CFC methods. Instead, place the `cfparam` tags in the body of the CFML pages.

## Example

```
<!-- This example shows how to use CFPARAM to define default values for page
variables. ----->
<cfparam name = "storeTempVar" default = "my default value">
<cfparam name = "tempVar" default = "my default value">

<!-- Check if form.tempVar was passed. --->
<cfif IsDefined("form.tempVar") is "True">
  <!-- Check if form.tempVar is not blank. --->
  <cfif form.tempVar is not "">
    <!-- If not, set tempVar to value of form.tempVar --->
    <cfset tempVar = form.tempVar>
  </cfif>
</cfif>

<body>
<h3>cfparam Example</h3>
<p>cfparam is used to set default values so that a developer does not have to
check for the existence of a variable using a function like IsDefined.

<p>The default value of our tempVar is
  "<cfoutput>#StoreTempVar# </cfoutput>"

<!-- Check if tempVar is still the same as StoreTempVar.
and that tempVar is not blank --->
```

```
<cfif tempVar is not #StoreTempVar#
  and tempVar is not "">
  <h3>The value of tempVar has changed: the new value is
    <cfoutput>#tempVar#</cfoutput></h3>
</cfif>

<p>

# cfpop

## Description

Retrieves or deletes e-mail messages from a POP mail server.

## Category

[Internet Protocol tags](#)

## Syntax

```
<cfpop
  server = "servername"
  port = "port_number"
  username = "username"
  password = "password"
  action = "action"
  name = "queryname"
  messageNumber = "number"
  uid = "number"
  attachmentPath = "path"
  timeout = "seconds"
  maxRows = "number"
  startRow = "number"
  generateUniqueFilenames = "yes" or "no"
  debug = "yes" or "no">
```

## See also

[cfftp](#), [cfhttp](#), [cfldap](#), [cfmail](#), [cfmailparam](#), [SetLocale](#); Chapter 39, “Sending and Receiving E-Mail” in *ColdFusion MX Developer’s Guide*.

## History

ColdFusion MX 6.1:

- Added support for multipart mail messages with Text and HTML parts.
- Changed the attachment name separator: the TAB character is now the separator between attachment names in the `attachments` and `attachmentfiles` query fields if a message has multiple attachments. This behavior is identical to ColdFusion 5 and earlier versions.

ColdFusion MX: Changed the attachment name separator: the comma separates names in the `attachments` and `attachmentfiles` query fields if a message has multiple attachments.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| server    | Required |         | POP server identifier: <ul style="list-style-type: none"><li>• A host name; for example, "biff.upperlip.com".</li><li>• An IP address; for example, "192.1.1.2.225".</li></ul> |
| port      | Optional | 110     | POP port.  |
| username  | Optional |         | A user name.   |

| Attribute       | Req/Opt   | Default                      | Description  |
|-----------------|---|------------------------------|--|
| password        | Optional  |                              | Password that corresponds to <code>username</code> .   |
| action          | Optional  | getHeaderOnly                | <ul style="list-style-type: none"> <li>• <code>getHeaderOnly</code>: returns message header information only</li> <li>• <code>getAll</code>: returns message header information, message text, and attachments if <code>attachmentPath</code> is specified</li> <li>• <code>delete</code>: deletes messages on POP server</li> </ul>   |
| name            | Required if <code>action = "getAll" or "getHeaderOnly"</code> |                              | Name for query object that contains the retrieved message information.   |
| message Number  |   |                              | Message number or comma-delimited list of message numbers to get or delete. Invalid message numbers are ignored. Ignored if <code>uid</code> is specified.   |
| uid             |   |                              | UID or a comma-delimited list of UIDs to get or delete. Invalid UIDs are ignored.  |
| attachment Path | Optional  |                              | <p>If <code>action="getAll"</code>, specifies a directory in which to save any attachments. If the directory does not exist, ColdFusion creates it.</p> <p>If you omit this attribute, ColdFusion does not save any attachments. If you specify a relative path, the path root is the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.</p> |
| timeout         | Optional  | 60                           | Maximum time, in seconds, to wait for mail processing.   |
| maxRows         | Optional  | retrieves all available rows | Number of messages to return or delete, starting with the number in <code>startRow</code> . Ignored if <code>messageNumber</code> or <code>uid</code> is specified.  |
| startRow        | Optional  | 1                            | First row number to get or delete. Ignored if <code>messageNumber</code> or <code>uid</code> is specified.   |

| Attribute                 | Req/Opt  | Default | Description   |
|---------------------------|----------|---------|---|
| generate Unique Filenames | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: generate unique filenames for files attached to an e-mail message, to avoid naming conflicts when files are saved.</li> <li>• No</li> </ul>   |
| debug                     | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: sends debugging output to standard output. By default, if the console window is unavailable on server configurations, ColdFusion sends output to <code>cf_root/runtime/logs/coldfusion-out.log</code>. On J2EE configurations, with JRun, the default location is <code>jrun_home/logs/servername-out.log</code>.<br/><i>Caution:</i> If you set this option to Yes, ColdFusion MX writes detailed debugging information to the log, including all retrieved message contents, and can generate large logs quickly.</li> <li>• No: does not generate debugging output.</li> </ul> |

### Usage

The `cfpop` tag retrieves one or more mail messages from a POP server and populates a ColdFusion query object with the resulting messages, one message per row. Alternatively, it deletes one or more messages from the POP server.

**Note:** When the `cfpop` tag encounters malformed mail messages, it does not generate errors; instead, it returns empty fields.

To optimize performance, two retrieve options are available. Message header information is typically short, and therefore quick to transfer. Message text and attachments can be very long, and therefore take longer to process.

### cfpop query variables

The following table describes the variables that provide information about the query that is returned by `cfpop`:

| Variable names                     | Description  |
|------------------------------------|--|
| <code>queryname.recordCount</code> | Number of records returned by query                  |
| <code>queryname.currentRow</code>  | Current row that <code>cfoutput</code> is processing |
| <code>queryname.columnList</code>  | List of column names in query                        |
| <code>queryname.UID</code>         | Unique identifier for the e-mail message file        |

## Query message header and body columns

The following table lists the message header and body columns that are returned if `action = "getHeaderOnly"` or `"getAll"`:

| Column name                            | getHeaderOnly returns | getAll returns |
|--|-----------------------|----------------|
| <code>queryname.date</code>            | yes                   | yes            |
| <code>queryname.from</code>            | yes                   | yes            |
| <code>queryname.messageNumber</code>   | yes                   | yes            |
| <code>queryname.messageid</code>       | yes                   | yes            |
| <code>queryname.replyto</code>         | yes                   | yes            |
| <code>queryname.subject</code>         | yes                   | yes            |
| <code>queryname.cc</code>              | yes                   | yes            |
| <code>queryname.to</code>              | yes                   | yes            |
| <code>queryname.body</code>            | no                    | yes            |
| <code>queryname.textBody</code>        | no                    | yes            |
| <code>queryname.HTMLBody</code>        | no                    | yes            |
| <code>queryname.header</code>          | yes                   | yes            |
| <code>queryname.attachments</code>     | no                    | yes            |
| <code>queryname.attachmentfiles</code> | no                    | yes            |

If the mail message includes a part with a Content-Type of `text/plain`, the `queryname.textBody` column contains the part's message content. If the mail message includes a part with a Content-Type of `text/HTML`, the `queryname.HTMLBody` column contains the part's message content. If no Content-Type matches these types, the columns are empty. The `queryname.Body` column always contains the first message body found.

The `queryname.attachments` column contains a tab-separated list of all the attachment names. The `queryname.attachmentfiles` column contains a tab-separated list of the locations of the attachment files. Use the `cffile` tag to delete these temporary files when you have processed them.

To create a ColdFusion date/time object from the date-time string that is extracted from a mail message in the `queryname.date` column, use the following table:

| Locale       | How to create a ColdFusion date/time object from queryname.date   |
|--------------|---|
| English (US) | Use the <a href="#">ParseDateTime</a> function. If you specify the <code>pop-conversion</code> attribute, the function adjusts the date/time object to UTC. |
| Other        | Extract the date part of string; pass it to the <a href="#">LSParseDateTime</a> function.   |

**Note:** To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

For more information on cfpop, see Chapter 39, "Sending and Receiving E-Mail" in *ColdFusion MX Developer's Guide*.

### Example

```
<!-- This view-only example shows the use of cfpop. --->
<h3>cfpop Example</h3>
<p>cfpop lets you retrieve and manipulate mail in a POP3 mailbox.
  This view-only example shows how to create one feature of
  a mail client, to display the mail headers in a POP3 mailbox.
<p>To execute this, un-comment this code and run with a mail-enabled CF Server.
<!--
<cfif IsDefined("form.server ")>
  <!-- Make sure server, username are not empty. --->
  <cfif form.server is not "" and form.username is not "">
    <cfpop server = "#form.popserver#" username = "#form.username#" password =
    #form.pwd#
    action = "getHeaderOnly" name = "GetHeaders ">
    <h3>Message Headers in Your Inbox</h3>
    <p>Number of Records:
    <cfoutput>#GetHeaders.recordCount#</cfoutput></p>

    <ul>
      <cfoutput query = "GetHeaders">
        <li>Row: #currentRow#: From: #From# -- Subject: #Subject#
        </cfoutput>
      </ul>
    </cfif>
  </cfif>
</cfif>

```

# cfprocessingdirective

## Description

Provides the following information to ColdFusion about how to process the current page:

- Specifies whether to remove excess whitespace character from ColdFusion generated content in the tag body.
- Identifies the character encoding (character set) of the page contents.

## Category

[Data output tags](#), [Page processing tags](#)

## Syntax

```
<cfprocessingdirective
  pageencoding = "page-encoding literal string" />
or
<cfprocessingdirective
  suppressWhiteSpace = "yes" or "no"
  pageEncoding = "page-encoding literal string">
CFML tags
</cfprocessingdirective>
```

## See also

[cfcol](#), [cfcontent](#), [cfoutput](#), [cfsetting](#), [cfsilent](#), [cftable](#), [SetEncoding](#); Chapter 17, “Developing Globalized Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed `suppresswhitespace` attribute value behavior: you can specify the `suppresswhitespace` attribute value as a string variable. (ColdFusion 5 supported setting it only as a constant.)
- Added the `pageEncoding` attribute.

## Attributes

| Attribute          | Req/Opt  | Default   | Description   |
|--------------------|----------|---|---|
| suppressWhiteSpace | Optional |   | Boolean; whether to suppress white space characters within the <code>cfprocessingdirective</code> block that are generated by CFML tags and often do not affect HTML appearance. Does not affect any white space in HTML code.  |
| pageEncoding       | Optional | Character encoding identified by the page byte order mark, if any; otherwise, system default encoding | A string literal; cannot be a variable. Identifies the character encoding of the current CFML page. This attribute affects the entire page, not just the <code>cfprocessing</code> tag body. The value may be enclosed in single- or double-quotation marks, or none. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For more information on character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> . |

## Usage

The `cfprocessingdirective` tag has limitations that depend on the attribute you use. For this reason, Macromedia recommends that you include either the `pageencoding` or `suppresswhitespace` attribute in a `cfprocessingdirective` tag, not both. To specify both values, use separate tags.

In a ColdFusion component (.cfc file), the `cfprocessingdirective` tag must follow the `cfcomponent` tag.

If you use the `pageEncoding` attribute, the following rules apply:

- You must put the tag within the first 4096 bytes of a page. It can be positioned after a `cfsetting` or `cfsilent` tag.
- If you use the tag on a page that includes other pages by using the `cfinclude` or `cfmodule` tags, custom tag invocation, and so on, the tag has no effect on the included pages.

- You cannot embed the tag within conditional logic, because the `pageEncoding` attribute is evaluated when ColdFusion compiles a page (not when it executes the page). For example, the following code has no effect at execution time, because the `cfprocessingdirective` tag has already been evaluated:

```
<cfif dynEncoding is not "dynamic encoding is not possible">
  <cfprocessingdirective pageencoding=#dynEncoding#>
</cfif>
```

- If you have multiple `cfprocessingdirective` tags in one page that specify the `pageEncoding` attribute, they must all specify the same value; if not, ColdFusion throws an error.
- If you specify only the `pageencoding` attribute, do not use a separate end tag.
- ColdFusion accepts character encoding names that are supported by the Java platform. If an invalid name is specified, ColdFusion throws an `InvalidEncodingSpecification` exception.
- If a page has a byte order mark (BOM), and a `pageencoding` attribute specifies an encoding that differs from the BOM, ColdFusion generates an error.

The following rules apply to the `suppressWhiteSpace` attribute:

- You can specify the `suppresswhitespace` attribute value as a constant or a variable. To use a variable: define the variable (for example, `whitespaceSetting`), assign it the value `yes` or `no`, and code a statement such as the following:

```
<!-- ColdFusion allows suppression option to be set at runtime -->
<cfprocessingdirective suppresswhitespace=#whitespaceSetting#>
  code to whose output the setting is applied
</cfprocessingdirective>
```

- The `suppresswhitespace` attribute only affects code that you put between the `<cfprocessingdirective>` begin tag and the `</cfprocessingdirective>` end tag.

The following example shows the use of a nested `cfprocessingdirective` tag. The outer tag suppresses unnecessary whitespace during computation of a large table; the inner tag retains whitespace, to output a preformatted table.

### Example

```
<cfprocessingdirective suppressWhiteSpace = "Yes">
  <!-- CFML code -->
  <cfprocessingdirective suppressWhiteSpace = "No">
    <cfoutput>#table_data#
  </cfoutput>
  </cfprocessingdirective>
</cfprocessingdirective>
```

The following example shows the use of the `pageencoding` attribute:

```
<cfprocessingdirective pageencoding = "shift_jis">
```

# cfprocparam

## Description

Defines stored procedure parameters. This tag is nested within a `cfstoredproc` tag.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfprocparam
  type = "in" or "out" or "inout"
  variable = "variable name"
  value = "parameter value"
  CFSQLType = "parameter datatype"
  maxLength = "length"
  scale = "decimal places"
  null = "yes" or "no">
```

## See also

[cfinsert](#), [cfprocresult](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#), [cfupdate](#); “Optimizing ColdFusion applications” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- The `maxrows` attribute is obsolete.
- Changed the `dbvarname` attribute behavior: it is now ignored for all drivers. ColdFusion MX uses JDBC 2.2 and does not support named parameters.
- Changed the `maxLength` attribute behavior: it now applies to IN and INOUT parameter values.

## Attributes

| Attribute             | Req/Opt  | Default         | Description  |
|-----------------------|--|-----------------|--|
| <code>type</code>     | Optional   | <code>in</code> | <ul style="list-style-type: none"><li>• <code>in</code>: the parameter is used to send data to the database system only. Passes the parameter by value.</li><li>• <code>out</code>: the parameter is used to receive data from the database system only. Passes the parameter as a bound variable.</li><li>• <code>inout</code>: the parameter is used to send and receive data. Passes the parameter as a bound variable.</li></ul> |
| <code>variable</code> | Required if <code>type = "OUT" or "INOUT"</code> |                 | ColdFusion variable name; references the value that the output parameter has after the stored procedure is called. This is ignored for IN parameters.  |
| <code>value</code>    | Required if <code>type = "IN"</code>             |                 | Value that ColdFusion passes to the stored procedure. This is optional for INOUT parameters.   |

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| CFSQLType | Required |         | <p>SQL type to which the parameter (any type) is bound. ColdFusion supports the following values, where the last element of the name corresponds to the SQL data type. Different database systems might support different subsets of this list. See your DBMS documentation for information on supported parameter types.</p> <ul style="list-style-type: none"> <li>• CF_SQL_BIGINT</li> <li>• CF_SQL_BIT</li> <li>• CF_SQL_BLOB</li> <li>• CF_SQL_CHAR</li> <li>• CF_SQL_CLOB</li> <li>• CF_SQL_DATE</li> <li>• CF_SQL_DECIMAL</li> <li>• CF_SQL_DOUBLE</li> <li>• CF_SQL_FLOAT</li> <li>• CF_SQL_IDSTAMP</li> <li>• CF_SQL_INTEGER</li> <li>• CF_SQL_LONGVARCHAR</li> <li>• CF_SQL_MONEY</li> <li>• CF_SQL_MONEY4</li> <li>• CF_SQL_NUMERIC</li> <li>• CF_SQL_REAL</li> <li>• CF_SQL_REFCURSOR</li> <li>• CF_SQL_SMALLINT</li> <li>• CF_SQL_TIME</li> <li>• CF_SQL_TIMESTAMP</li> <li>• CF_SQL_TINYINT</li> <li>• CF_SQL_VARCHAR</li> </ul> <p>For a mapping of ColdFusion SQL data types to JDBC data types, See also <a href="#">cfqueryparam</a>.</p> |
| maxLength | Optional | 0       | <p>Maximum length of a string or character IN or INOUT value attribute. A <code>maxLength</code> of 0 allows any length. The <code>maxLength</code> attribute is not required when specifying <code>type=out</code>.</p>  |
| scale     | Optional | 0       | <p>Number of decimal places in numeric parameter. A <code>scale</code> of 0 limits the value to an integer.</p>   |
| null      | Optional | No      | <p>Whether the parameter is passed in as a null value. Not used with OUT type parameters.</p> <ul style="list-style-type: none"> <li>• Yes: tag ignores the <code>value</code> attribute.</li> <li>• No</li> </ul>  |

### Usage

Use this tag to identify stored procedure parameters and their data types. Code one `cfprocparam` tag for each parameter. The parameters that you code vary based on parameter type and DBMS. ColdFusion MX supports positional parameters only and you must code `cfprocparam` tags in the same order as the associated parameters in the stored procedure definition.

Output variables are stored in the ColdFusion variable specified by the `variable` attribute.

You cannot use the `cfprocparam` tag for Oracle 8 and 9 reference cursors. Instead, use the `cfprocresult` tag.

### Example

The following example shows how to invoke an Oracle 8 PL/SQL stored procedure. It makes use of Oracle 8 support of the Reference Cursor type.

The following package, `Foo_Data`, houses a procedure `refcurproc` that declares output parameters as Reference Cursor:

- Parameter `pParam1` returns the rows in the EMP table
- Parameter `pParam2` returns the rows in the DEPT table

The procedure declares one input parameter as an integer, and one output parameter as a two-byte char varying type. Before the `cfstoredproc` tag can call this procedure, it must be created, compiled, and bound in the RDBMS environment.

```
CREATE OR REPLACE PACKAGE Foo_Data AS
  TYPE EmpTyp IS REF CURSOR RETURN Emp%ROWTYPE;
  TYPE DeptTyp IS REF CURSOR RETURN Dept%ROWTYPE;
  PROCEDURE refcurproc(pParam1 in out EmpTyp, pParam2 in out DeptTyp,
    pParam3 in integer, pParam4 out varchar2);
END foo_data;
```

```
CREATE OR REPLACE PACKAGE BODY Foo_Data AS
  PROCEDURE RefCurProc(pParam1 in out EmpTyp,
    pParam2 in out DeptTyp,
    pParam3 in integer,
    pParam4 out varchar2) IS
  BEGIN
    OPEN pParam1 FOR select * from emp;
    OPEN pParam2 FOR select * from dept;
    IF pParam3 = 1
    THEN
      pParam4 := 'hello';
    ELSE
      pParam4 := 'goodbye';
    END IF;
  END RefCurProc;
END Foo_Data;
```

The following CFML example shows how to invoke the `RefCurProc` procedure using `cfstoredproc`, `cfprocparam`, and `cfprocresult`:

```
<cfstoredproc procedure = "foo_data.refcurproc"
  dataSource = "oracle8i"
  username = "scott"
  password = "tiger"
  returnCode = "No">

<cfprocparam type = "Out" CFSQLType = "CF_SQL_REFCURSOR"
  variable = "param1">
<cfprocparam type = "Out" CFSQLType = "CF_SQL_REFCURSOR"
```

```

    variable = "param2">
<cfprocparam type = "IN" CFSQLType = "CF_SQL_INTEGER" value = "1">

<cfprocparam type = "OUT" CFSQLType = "CF_SQL_VARCHAR"
    variable = "F00">
<cfprocresult name = "rs1">
<cfprocresult name = "rs2" resultSet = "2">
</cfstoredproc>

<b>The first result set:</b><br>
<hr>
<cftable query = "rs1" colHeaders HTMLTable border = "1">
    <cfcol header = "EMPNO" text = "#EMPNO#">
    <cfcol header = "EMPLOYEE name" text = "#ENAME#">
    <cfcol header = "JOB" text = "#JOB#">
    <cfcol header = "SALARY" text = "#SAL#">
    <cfcol header = "DEPT NUMBER" text = "#DEPTNO#">
</cftable>

<hr>
<b>The second result set:</b><br>

<cftable query = "rs2" colHeaders HTMLTable border = "1">
    <cfcol header = "DEPT name" text = "#DNAME#">
    <cfcol header = "DEPT NUMBER" text = "#DEPTNO#">
</cftable>
<hr>
<cfoutput>
    <b>The output parameter is:</b>'#F00#'
</cfoutput>

```

# cfproresult

## Description

Associates a query object with a result set returned by a stored procedure. Other ColdFusion tags, such as `cfoutput` and `cfTable`, use this query object to access the result set. This tag is nested within a `cfstoredproc` tag.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfproresult
  name = "query_name"
  resultSet = "1-n"
  maxRows = "maxrows">
```

## See also

[cfinsert](#), [cfprocparam](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#), [cfupdate](#); “Optimizing database use” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default  | Description  |
|-----------|----------|----------|--|
| name      | Required |          | Name for the query result set.                                   |
| resultSet | Optional | 1        | Names one result set, if stored procedure returns more than one. |
| maxRows   | Optional | -1 (All) | Maximum number of rows returned in result set.                   |

## Usage

To enable access to data returned by the stored procedure, specify one or more `cfproresult` tags. If the stored procedure returns more than one result set, use the `resultSet` attribute to specify which of the stored procedure’s result sets to return.

The `resultSet` attribute must be unique within the scope of the `cfstoredproc` tag. If you specify a result set twice, the second occurrence overwrites the first.

CFML supports Oracle 8 and 9 Reference Cursor type, which passes a parameter by reference. Parameters that are passed this way can be allocated and deallocated from memory within the execution of one application. To use reference cursors in packages or stored procedures, use the `cfproresult` tag. This causes the ColdFusion JDBC database driver to put Oracle reference cursors into a result set. (You cannot use this method with Oracle’s ThinClient JDBC drivers.)

## Example

```
<!-- This example executes a Sybase stored procedure that returns three
  result sets, two of which we want. The stored procedure returns
  status code and one output parameter, which we display. We use
  named notation for parameters. -->
<!-- cfstoredproc tag -->
<cfstoredproc procedure = "foo_proc"
```

```

    dataSource = "MY_SYBASE_TEST" username = "sa"
    password = "" dbServer = "scup" dbName = "pubs2"
    returnCode = "Yes" debug = "Yes">
<!-- cfprocresult tags -->
<cfprocresult name = RS1>

...

```

# cfproperty

## Description

Defines properties of a ColdFusion component (CFC). Used to create complex data types for web services. The attributes of this tag are exposed as component metadata and are subject to inheritance rules.

## Category

[Extensibility tags](#)

## Syntax

```
<cfproperty
  name="name"
  type="type"
  required="boolean"
  default="default value"
  displayname="descriptive name"
  hint="extended description"
>
```

## See also

“Documenting CFCs” in Chapter 10, “Building and Using ColdFusion Components,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this tag.

## Attributes

| Attribute   | Req/Opt  | Default | Description   |
|-------------|----------|---------|---|
| name        | Required |         | A string; a property name. Must be a static value.  |
| type        | Optional | any     | A string; identifies the property data type: <ul style="list-style-type: none"><li>• any</li><li>• array</li><li>• binary</li><li>• boolean</li><li>• date</li><li>• guid: the argument must be a UUID or GUID of the form xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx where each x is a character representing a hexadecimal number (0-9A-F).</li><li>• numeric</li><li>• query</li><li>• string</li><li>• struct</li><li>• uuid: The argument must be a ColdFusion UUID of the form xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx where each x is a character representing a hexadecimal number (0-9A-F).</li><li>• variableName: a string formatted according to ColdFusion variable naming conventions.</li><li>• a component name: if the type attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When The function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</li></ul> |
| required    | Optional | no      | Whether the parameter is required: <ul style="list-style-type: none"><li>• yes</li><li>• no</li></ul>   |
| default     | Optional |         | If no property value is set when the component is used for a web service, specifies a default value.<br>If this attribute is present, the <code>required</code> attribute must be set to "no" or not specified.   |
| displayname | Optional |         | A value to be displayed when using introspection to show information about the CFC. The value appears in parentheses following the property name.   |
| hint        | Optional |         | Text to be displayed when using introspection to show information about the CFC. This attribute can be useful for describing the purpose of the parameter.  |

## Usage

You must position `cfproperty` tags at the beginning of a component, above executable code and function definitions.

If a component is not used as a web service, The `cfproperty` only provides metadata information when the component is viewed using introspection; for example, by opening the CFC file directly in the browser. It does not define variables or set values that you can then use in your component.

For web services that you create in ColdFusion, the `cfproperty` tag defines complex variables used by the web service.

### Example

The following code defines a component in the file `address.cfc` that contains properties that represent a street address:

```
<cfcomponent>
  <cfproperty name="Number" type="numeric">
  <cfproperty name="Street" type="string">
  <cfproperty name="City" type="string">
  <cfproperty name="State" type="string">
  <cfproperty name="Country" type="string">
</cfcomponent>
```

This component represents a complex data type that can be used in a component that is exported as a web service, such as the following:

```
<cfcomponent>
  <cffunction name="echoAddress" returnType="address" access="remote">
    <cfargument name="input" type="address">
    <cfreturn arguments.input>
  </cffunction>
</cfcomponent>
```

# cfquery

## Description

Passes queries or SQL statements to a data source.

Macromedia recommends that you use the `cfqueryparam` tag within every `cfquery` tag, to help secure your databases from unauthorized users. For more information, see Security Bulletin ASB99-04, "Multiple SQL Statements in Dynamic Queries," in the Macromedia Security Zone, [www.macromedia.com/devnet/security/security\\_zone/asb99-04.html](http://www.macromedia.com/devnet/security/security_zone/asb99-04.html), and Chapter 20, "Accessing and Retrieving Data" in *ColdFusion MX Developer's Guide*.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfquery
  name = "query_name"
  dataSource = "ds_name"
  dbtype = "query"
  username = "username"
  password = "password"
  maxRows = "number"
  blockFactor = "blocksize"
  timeout = "seconds"
  cachedAfter = "date"
  cachedWithin = "timespan"

  Either of the following:
  debug = "yes" or "no"
  or:
  debug
>
  result = "result_name"
</cfquery>
```

## History

ColdFusion MX 7:

- Added the `result` attribute for specifying an alternate name for the structure that holds the result variables.
- Added result variables for the SQL statement executed (`sql`), the number of records returned (`recordcount`), whether the query was cached (`cached`), an array of `cfqueryparam` values (`sqlparameters`), and the list of columns in the returned query (`columnlist`).

## ColdFusion MX:

- Changed Query of Queries behavior: it now supports a larger subset of standard SQL.
- Changed dot notation support: ColdFusion now supports dot notation within a record set name. ColdFusion interprets such a name as a structure.
- Deprecated the `connectString`, `dbName`, `dbServer`, `provider`, `providerDSN`, and `sql` attributes, and all values of the `dbtype` attribute except `query`. They do not work, and might cause an error, in releases later than ColdFusion 5.
- New query object variable: `cfquery.ExecutionTime`.
- No longer supports native drivers. It now uses JDBC (and ODBC-JDBC bridge) for database connectivity.

## Attributes

| Attribute                | Req/Opt                                     | Default  | Description   |
|--------------------------|---|----------|---|
| <code>name</code>        | Required                                    |          | Name of query. Used in page to reference query record set. Must begin with a letter. Can include letters, numbers, and underscores.   |
| <code>dataSource</code>  | Required unless <code>dbtype=query</code> . |          | Name of data source from which query gets data. You must specify either <code>dbtype</code> or <code>dataSource</code> .  |
| <code>dbtype</code>      | Optional                                    |          | Use this value to specify the results of a query as input. You must specify either <code>dbtype</code> or <code>dataSource</code> .   |
| <code>username</code>    | Optional                                    |          | Overrides username in data source setup.  |
| <code>password</code>    | Optional                                    |          | Overrides password in data source setup.  |
| <code>maxRows</code>     | Optional                                    | -1 (All) | Maximum number of rows to return in record set.   |
| <code>blockFactor</code> | Optional                                    | 1        | Maximum rows to get at a time from server. Range: 1 - 100. Might not be supported by some database systems.   |
| <code>timeout</code>     |   |          | Maximum number of seconds that each action of a query is permitted to execute before returning an error. The cumulative time may exceed this value.<br>For JDBC statements, ColdFusion sets this attribute. For other drivers, check driver documentation.  |
| <code>cachedAfter</code> | Optional                                    |          | Date value (for example, April 16, 1999, 4-16-99). If date of original query is after this date, ColdFusion uses cached query data. To use cached data, current query must use same SQL statement, data source, query name, user name, password.<br>A date/time object is in the range 100 AD-9999 AD.<br>When specifying a date value as a string, you must enclose it in quotation marks. |

| Attribute    | Req/Opt  | Default | Description  |
|--------------|--|---------|--|
| cachedWithin | Optional                                       |         | Timespan, using the <code>CreateTimeSpan</code> function. If original query date falls within the time span, cached query data is used. <code>CreateTimeSpan</code> defines a period from the present, back. Takes effect only if query caching is enabled in the Administrator.<br>To use cached data, the current query must use the same SQL statement, data source, query name, user name, and password. |
| debug        | Optional; value and equals sign may be omitted |         | <ul style="list-style-type: none"> <li>• Yes, or if omitted: if debugging is enabled, but the Administrator Database Activity option is not enabled, displays SQL submitted to datasource and number of records returned by query.</li> <li>• No: if the Administrator Database Activity option is enabled, suppresses display.</li> </ul>   |
| result       | Optional                                       |         | Specifies a name for the structure in which <code>cfquery</code> returns the result variables. For more information, see the Usage section .   |

## Usage

Use this tag to execute a SQL statement against a ColdFusion data source. Although you can use the `cfquery` tag to execute any SQL Data Definition Language (DDL) or Data Manipulation Language (DML) statement, you typically use it to execute a SQL SELECT statement.

**Note:** To call a stored procedure, use the `cfstoredproc` tag.

This tag creates a query object, providing this information in query variables:

| Variable name                       | Description  |
|-------------------------------------|--|
| <code>query_name.CurrentRow</code>  | Current row of query that <code>cfoutput</code> is processing. |
| <code>query_name.columnList</code>  | Comma-delimited list of the query columns.                     |
| <code>query_name.RecordCount</code> | Number of records (rows) returned from the query.              |

The `cfquery` tag also returns the following result variables in a structure. You can access these variables with a prefix of the name you specified in the `result` attribute. For example, if you assign the name `myResult` to the `result` attribute, you would retrieve the name of the SQL statement that was executed by accessing `#myResult.sql#`. The `result` attribute provides a way for functions or CFCs that are called from multiple pages, possibly at the same time, to avoid overwriting results of one call with another.

| Variable name                          | Description  |
|--|--|
| <code>result_name.sql</code>           | The SQL statement that was executed.                           |
| <code>result_name.recordcount</code>   | Current row of query that <code>cfoutput</code> is processing. |
| <code>result_name.cached</code>        | True if the query was cached; False otherwise.                 |
| <code>result_name.sqlparameters</code> | An ordered Array of <code>cfqueryparam</code> values.          |

| Variable name                          | Description                                    |
|--|--|
| <code>result_name.columnList</code>    | Comma-delimited list of the query columns.     |
| <code>result_name.ExecutionTime</code> | Cumulative time required to process the query. |

You can cache query results and execute stored procedures. For information about this and about displaying `cfquery` output, see *ColdFusion MX Developer's Guide*.

Because the `timeout` attribute only affects the maximum time for each suboperation of a query, the cumulative time may exceed its value. To set a timeout for a page that might get a very large result set, set the Administrator > Server Settings > Timeout Requests option to an appropriate value or use the `RequestTimeout` attribute of the `cfsetting` tag (for example, `<cfsetting requestTimeout="300">`).

The Caching page of the ColdFusion MX Administrator specifies the maximum number of cached queries. Setting this value to 0 disables query caching.

You cannot use ColdFusion reserved words as query names.

You cannot use SQL reserved words as variable or column names in a Query of Queries, unless they are escaped. The escape character is the bracket `[]`; for example:

```
SELECT [count] FROM MYTABLE.
```

For a list of reserved keywords in ColdFusion MX, see “Escaping reserved keywords” in Chapter 22, “Using Query of Queries” in *ColdFusion MX Developer's Guide*.

### Example

```
<!-- This example shows the use of CreateTimeSpan with CFQUERY ----->
<!-- to cache a record set. Define startrow and maxrows to ---->
<!-- facilitate 'next N' style browsing. ---->
<cfparam name="MaxRows" default="10">
<cfparam name="StartRow" default="1">
<!-------
Query database for information if cached database information has
not been updated in the last six hours; otherwise, use cached data.
----->

<cfquery
name="GetParks" datasource="cfdocexamples"
cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
SELECT PARKNAME, REGION, STATE
FROM Parks
ORDER BY ParkName, State
</cfquery>
<!-- Build HTML table to display query. ----->
<table cellpadding="1" cellspacing="1">
  <tr>
    <td bgcolor="f0f0f0">
      &nbsp;
    </td>
    <td bgcolor="f0f0f0">
      <b><i>Park Name</i></b>
    </td>
    <td bgcolor="f0f0f0">
```

```

        <b><i>Region</i></b>
    </td>
    <td bgcolor="f0f0f0">
        <b><i>State</i></b>
    </td>
</tr>
<!-- Output the query and define the startrow and maxrows parameters.
Use the query variable CurrentCount to keep track of the row you
are displaying. ----->
<cfoutput query="GetParks" startrow="#StartRow#" maxrows="#MaxRows#">
    <tr>
        <td valign="top" bgcolor="ffffed">
            <b>#GetParks.CurrentRow#</b>
        </td>
        <td valign="top">
            <font size="-1">#ParkName#</font>
        </td>
        <td valign="top">
            <font size="-1">#Region#</font>
        </td>
        <td valign="top">
            <font size="-1">#State#</font>
        </td>
    </tr>
</cfoutput>
<!-- If the total number of records is less than or equal
to the total number of rows, then offer a link to
the same page, with the startrow value incremented by
maxrows (in the case of this example, incremented by 10). ----->
    <tr>
        <td colspan="4">
            <cfif (StartRow + MaxRows) LTE GetParks.RecordCount>
                <cfoutput><a href="#CGI.SCRIPT_NAME#?startrow=#Evaluate(StartRow +
MaxRows)#">
                    See next #MaxRows# rows</a></cfoutput>
            </cfif>
        </td>
    </tr>
</table>

```

# cfqueryparam

## Description

Verifies the data type of a query parameter and, for DBMSs that support bind variables, enables ColdFusion to use bind variables in the SQL statement. Bind variable usage enhances performance when executing a `cfquery` statement multiple times.

This tag is nested within a `cfquery` tag, embedded in a query SQL statement. If you specify optional parameters, this tag performs data validation.

Macromedia recommends that you use the `cfqueryparam` tag within every `cfquery` tag, to help secure your databases from unauthorized users. For more information, see Security Bulletin ASB99-04, “*Multiple SQL Statements in Dynamic Queries*,” at [www.macromedia.com/devnet/security/security\\_zone/asb99-04.html](http://www.macromedia.com/devnet/security/security_zone/asb99-04.html), and Chapter 20, “Accessing and Retrieving Data” in *ColdFusion MX Developer’s Guide*.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfquery
  name = "query_name"
  dataSource = "ds_name"
  ...other attributes...
  SQL STATEMENT column_name =
  <cfqueryparam value = "parameter value"
    CFSQLType = "parameter type"
    maxLength = "maximum parameter length"
    scale = "number of decimal places"
    null = "yes" or "no"
    list = "yes" or "no"
    separator = "separator character">
  AND/OR ...additional criteria of the WHERE clause...
</cfquery>
```

## See also

“Enhancing security with `cfqueryparam`” in Chapter 20, “Accessing and Retrieving Data,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default                             | Description   |
|-----------|--|-------------------------------------|---|
| value     | Required   |                                     | Value that ColdFusion passes to the right of the comparison operator in a <code>where</code> clause.<br>If <code>CFSQLType</code> is a date or time option, ensure that the date value uses your DBMS-specific date format. Use the <code>CreateODBCDateTime</code> or <code>DateFormat</code> and <code>TimeFormat</code> functions to format the date value.  |
| CFSQLType | Optional   | CF_SQL_CHAR                         | SQL type that parameter (any type) is bound to: <ul style="list-style-type: none"><li>• CF_SQL_BIGINT</li><li>• CF_SQL_BIT</li><li>• CF_SQL_CHAR</li><li>• CF_SQL_BLOB</li><li>• CF_SQL_CLOB</li><li>• CF_SQL_DATE</li><li>• CF_SQL_DECIMAL</li><li>• CF_SQL_DOUBLE</li><li>• CF_SQL_FLOAT</li><li>• CF_SQL_IDSTAMP</li><li>• CF_SQL_INTEGER</li><li>• CF_SQL_LONGVARCHAR</li><li>• CF_SQL_MONEY</li><li>• CF_SQL_MONEY4</li><li>• CF_SQL_NUMERIC</li><li>• CF_SQL_REAL</li><li>• CF_SQL_REFCURSOR</li><li>• CF_SQL_SMALLINT</li><li>• CF_SQL_TIME</li><li>• CF_SQL_TIMESTAMP</li><li>• CF_SQL_TINYINT</li><li>• CF_SQL_VARCHAR</li></ul> |
| maxLength | Optional   | Length of string in value attribute | Maximum length of parameter. Ensures that the length check is done by ColdFusion before the string is sent to the DBMS, thereby helping to prevent the submission of malicious strings.   |
| scale     | Optional   | 0                                   | Number of decimal places in parameter. Applies to <code>CF_SQL_NUMERIC</code> and <code>CF_SQL_DECIMAL</code> .   |
| null      | Optional   | No                                  | Whether parameter is passed as a null value: <ul style="list-style-type: none"><li>• Yes: tag ignores the <code>value</code> attribute.</li><li>• No</li></ul>  |
| list      | Optional   | No                                  | <ul style="list-style-type: none"><li>• Yes: the <code>value</code> attribute value is a delimited list.</li><li>• No</li></ul>   |
| separator | Required, if you specify a list in value attribute | , (comma)                           | Character that separates values in list, in <code>value</code> attribute.   |

## Usage

Use the `cfqueryparam` tag in any SQL statement (for example, SELECT, INSERT, UPDATE, and DELETE) that uses ColdFusion variables.

You cannot use the `cfquery` `cachedAfter` or `cachedWithin` attributes with `cfqueryparam`.

For maximum validation of string data, specify the `maxLength` attribute.

This tag does the following:

- Allows the use of SQL bind parameters, which improves performance.
- Ensures that variable data matches the specified SQL type.
- Allows long text fields to be updated from a SQL statement.
- Escapes string variables in single-quotation marks.

To benefit from the enhanced performance of bind variables, you must use `cfqueryparam` for all ColdFusion variables, and your DBMS must support bind variables. If a DBMS does not support bind parameters, ColdFusion validates and substitutes the validated parameter value back into the string. If validation fails, it returns an error message.

The validation rules are as follows:

- For these types, a data value can be converted to a numeric value: `CF_SQL_SMALLINT`, `CF_SQL_INTEGER`, `CF_SQL_REAL`, `CF_SQL_FLOAT`, `CF_SQL_DOUBLE`, `CF_SQL_TINYINT`, `CF_SQL_MONEY`, `CF_SQL_MONEY4`, `CF_SQL_DECIMAL`, `CF_SQL_NUMERIC`, and `CF_SQL_BIGINT`
- For these types, a data value can be converted to a date supported by the target data source: `CF_SQL_DATE`, `CF_SQL_TIME`, `CF_SQL_TIMESTAMP`
- For all other types, if the `maxLength` attribute is used, a data value cannot exceed the maximum length specified.

ColdFusion debug output shows the bind variables as question marks and lists the values beneath the query, in order of usage.

**Note:** To insert an empty string into a Microsoft Access table using the SequelLink ODBC Socket or SequelLink Access driver, the `CFSQLType` attribute must specify `CF_SQL_LONGVARCHAR`.

The following table shows the mapping of ColdFusion SQL data types with JDBC SQL types and those of the listed database management systems:

| ColdFusion                 | JDBC   | DB2                  | Informix         | Oracle      | MSSQL               |
|----------------------------|--------|----------------------|------------------|-------------|---------------------|
| <code>CF_SQL_ARRAY</code>  | ARRAY  |                      |                  |             |                     |
| <code>CF_SQL_BIGINT</code> | BIGINT | Bigint               | int8,<br>serial8 |             |                     |
| <code>CF_SQL_BINARY</code> | BINARY | Char for Bit<br>Data |                  |             | binary<br>timestamp |
| <code>CF_SQL_BIT</code>    | BIT    |                      | boolean          |             | bit                 |
| <code>CF_SQL_BLOB</code>   | BLOB   | Blob                 | blob             | blob, bfile |                     |

| <b>ColdFusion</b>   | <b>JDBC</b>  | <b>DB2</b>                      | <b>Informix</b>                      | <b>Oracle</b>  | <b>MSSQL</b>                            |
|---------------------|--------------|---------------------------------|--------------------------------------|----------------|---|
| CF_SQL_CHAR         | CHAR         | Char                            | char,<br>nchar                       | char,<br>nchar | char,<br>nchar,<br>unique<br>identifier |
| CF_SQL_CLOB         | CLOB         | Clob                            | clob                                 | clob,nlob      |   |
| CF_SQL_DATE         | DATE         | Date                            | date,<br>datetime,<br>year to<br>day |                |   |
| CF_SQL_DECIMAL      | DECIMAL      | Decimal                         | decimal,<br>money                    | number         | decimal,<br>money,<br>small<br>money    |
| CF_SQL_DISTINCT     | DISTINCT     |                                 |                                      |                |   |
| CF_SQL_DOUBLE       | DOUBLE       | Double                          |                                      |                |   |

| CF_SQL_VARCHAR   | VARCHAR   | Varchar   | varchar,<br>nvarchar,<br>lvarchar                                     | varchar2,<br>nvarchar2 | varchar,<br>nvarchar,<br>sysname |

### Example

```

<!-- This example shows cfqueryparam with VALID input in Course_ID. --->
<h3>cfqueryparam Example</h3>
<cfset Course_ID = 12>
<cfquery name = "getFirst" dataSource = "cfdoexamples">
    SELECT *
    FROM courses
    WHERE Course_ID = <cfqueryPARAM value = "#Course_ID#"
    CFSQLType = "CF_SQL_INTEGER">
</cfquery>
<cfoutput query = "getFirst">
    <p>Course Number: #Course_ID#<br> Description: #descript#</p>
</cfoutput>

<!-- This example shows the use of CFQUERYPARAM when INVALID string data is
in Course_ID. ---->
<p>This example throws an error because the value passed in the CFQUERYPARAM
tag exceeds the MAXLENGTH attribute</p>

<cfset LastName="Peterson; DELETE employees WHERE LastName='Peterson'">
<!------- Note that for string input you must specify the MAXLENGTH attribute
for validation. ----->
<cfquery
name="getFirst" datasource="cfdoexamples">
    SELECT *
    FROM employees
    WHERE LastName=<cfqueryparam
        value="#LastName#"
        cfsqltype="CF_SQL_VARCHAR"
        maxlength="17">
</cfquery>
<cfoutput
query="getFirst"> <p>
    Course Number: #FirstName# #LastName#
    Description: #Department# </p>
</cfoutput>

```

# cfregistry

## Description

This tag is deprecated for the UNIX platform.

Reads, writes, and deletes keys and values in the system registry. Provides persistent storage of client variables.

**Note:** For this tag to execute, it must be enabled in the ColdFusion MX Administrator. For more information, see *Configuring and Administering ColdFusion MX*.

## Category

[Other tags](#), [Variable manipulation tags](#)

## Syntax

The tag syntax depends on the `action` attribute value. See the following sections:

- `cfregistry action = "getAll"` [on page 357](#)
- `cfregistry action = "get"` [on page 359](#)
- `cfregistry action = "set"` [on page 360](#)
- `cfregistry action = "delete"` [on page 361](#)

## See also

[cfcookie](#), [cfparam](#), [cfsavecontent](#), [cfschedule](#), [cfset](#); “About resource and sandbox security” in Chapter 16, “Securing Applications,” and Chapter 15, “Using Persistent Data and Locking,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Deprecated this tag on the UNIX platform. It might not work, and might cause an error, in later releases.
- Changed how persistent data is stored: ColdFusion now stores most persistent data outside the system registry, in XML files.

# cfregistry action = "getAll"

## Description

Returns all registry keys and values defined in a branch. You can access the values as you would any record set.

## Syntax

```
<cfregistry  
  action = "getAll"  
  branch = "branch"  
  type = "data type"  
  name = "query name"  
  sort = "criteria">
```

## See also

Chapter 15, "Using Persistent Data and Locking," in *ColdFusion MX Developer's Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| action    | Required |         | Always <code>getAll</code> .  |
| branch    | Required |         | Name of a registry branch.  |
| type      | Optional | String  | <ul style="list-style-type: none"><li>string: returns string values.</li><li>dWord: returns DWord values.</li><li>key: returns keys.</li><li>any: returns keys and values.</li></ul>  |
| name      | Required |         | Name of record set to contain returned keys and values.   |
| sort      | Optional | ASC     | Sorts query column data (case-insensitive). Sorts on Entry, Type, and Value columns as text. Specify a combination of columns from query output, in a comma-delimited list. For example:<br><code>sort = "value desc, entry asc"</code> <ul style="list-style-type: none"><li>asc: ascending (a to z) sort order.</li><li>desc: descending (z to a) sort order.</li></ul> |

## Usage

This tag returns `#entry#`, `#type#`, and `#value#` in a record set that you can access through tags such as `cfoutput`. To fully qualify these variables, use the record set name, as specified in the `name` attribute.

If `#type#` is a key, `#value#` is an empty string.

If you specify `type= "any"`, `getAll` also returns binary registry values. For binary values, the `#type#` variable contains `UNSUPPORTED` and `#value#` is blank.

## Example

```
<!-- This example uses cfregistry with the getAll action. -->  
<cfregistry action = "getAll"  
  branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"  
  type = "Any" name = "RegQuery">
```

```
<p><h1>cfregistry action = "getAll"</h1>
<cfquery query = "RegQuery" colHeaders HTMLTable border = "Yes">
<cfcol header = "<b>Entry</b>" width = "35" text = "#RegQuery.Entry#">
<cfcol header = "<b>Type</b>" width = "10" text = "#RegQuery.type#">
<cfcol header = "<b>Value</b>" width = "35" text = "#RegQuery.Value#">
</cfquery>
```

# cfregistry action = "get"

## Description

Accesses a registry value and stores it in a ColdFusion variable.

## Syntax

```
<cfregistry
  action = "get"
  branch = "branch"
  entry = "key or value"
  variable = "variable"
  type = "data type">
```

## See also

Chapter 15, "Using Persistent Data and Locking," in *ColdFusion MX Developer's Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| action    | Required |         | Always get.   |
| branch    | Required |         | Name of a registry branch.  |
| entry     | Required |         | Registry value to access.   |
| variable  | Required |         | Variable into which to put value.   |
| type      | Optional | string  | <ul style="list-style-type: none"><li>string: returns string value.</li><li>dWord: returns DWord value.</li><li>key: returns key's default value.</li></ul> |

## Usage

If the value does not exist, the `cfregistry` tag does not create an entry.

## Example

```
<!--- This example uses cfregistry with the get action. --->
<cfregistry action = "get"
  branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"
  entry = "ClassPath" type = "String" variable = "RegValue">
<h1>cfregistry action = "get"</h1>
<cfoutput>
  <p>Java ClassPath value is #RegValue#
</cfoutput>
```

# cfregistry action = "set"

## Description

Adds a registry key, adds a value, or updates a value.

## Syntax

```
<cfregistry  
  action = "set"  
  branch = "branch"  
  entry = "key or value"  
  type = "value type"  
  value = "data">
```

## See also

Chapter 15, "Using Persistent Data and Locking," in *ColdFusion MX Developer's Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| action    | Required |         | Always set.   |
| branch    | Required |         | Name of a registry branch.  |
| entry     | Required |         | Key or value to set.  |
| type      | Optional |         | <ul style="list-style-type: none"><li>string: sets a string value (default).</li><li>dWord: sets a DWord value.</li><li>key: creates a key.</li></ul>   |
| value     | Optional |         | Value data to set. If you omit this attribute, the cfregistry tag creates default value, as follows: <ul style="list-style-type: none"><li>string: creates an empty string: "".</li><li>dWord: creates a value of 0 (zero).</li></ul> |

## Usage

If it does not exist, the cfregistry tag creates the key or value.

## Example

```
<!-- This example uses the cfregistry set action to modify registry value  
data. -->  
<!-- Normally you pass in a filename instead of setting one here. -->  
<cfset FileName = "dummy.cfm">  
<cfregistry action = "set"  
  branch = "HKEY_LOCAL_MACHINE\Software\cflangref"  
  entry = "LastCFM01" type = "String" value = "#FileName#">  
<h1>cfregistry action = "set"</h1>
```

# cfregistry action = "delete"

## Description

Deletes a registry key or value.

## Syntax

```
<cfregistry  
  action = "delete"  
  branch = "branch"  
  entry = "keyorvalue">
```

## See also

Chapter 15, "Using Persistent Data and Locking," in *ColdFusion MX Developer's Guide*

## Attributes

| Attribute | Req/Opt                     | Default | Description  |
|-----------|-----------------------------|---------|--|
| action    | Required                    |         | Always delete.   |
| branch    | Required                    |         | <ul style="list-style-type: none"><li>For key deletion: name of registry key to delete. Do not specify the entry attribute.</li><li>For value deletion: name of registry branch that contains value to delete. You must specify the entry attribute.</li></ul> |
| entry     | Required for value deletion |         | Value to delete.   |

## Usage

If you delete a key, the cfregistry tag also deletes values and subkeys defined beneath it.

## Example

```
<cfregistry action = "delete"  
  branch = "HKEY_LOCAL_MACHINE\Software\cflangref\tempkey"  
  entry = "LastCFM01">  
</cfregistry>
```

# cfreport

## Description

Used to do either of the following:

- Execute a report definition created with the ColdFusion Report Builder, displaying it in PDF, FlashPaper, or Excel format. You can optionally save this report to a file.
- Run a predefined Crystal Reports report. Applies only to Windows systems. Uses the CFCRYSTAL.exe file to generate reports. Sets parameters in the Crystal Reports engine according to its attribute values.

## Category

### Data output tags

## Syntax

```
<!-- Syntax 1 - Use this syntax with the ColdFusion Report Builder. -->
<cfreport
  template = "report definition filename"
  format = "PDF or FlashPaper" or "excel"
  name = "cf variable"
  filename = "output filename"
  query = "query variable"
  overwrite = "yes" or "no"
  encryption = "128-bit" or "40-bit" or "none"
  ownerpassword = "password"
  userpassword = "password"
  permissions = "permission list"
>
  cfreportparam tags [optional]

</cfreport>
OR
<!-- Syntax 2 - Use this syntax with Crystal Reports. -->
<cfreport
  report = "report_path"
  dataSource = "ds_name"
  type = "type"
  timeout = "number of seconds"
  orderBy = "result_order"
  username = "username"
  password = "password"
  formula = "formula">
</cfreport>
```

## History

ColdFusion MX 7: Added support for the ColdFusion Report Builder.

ColdFusion MX: Changed data source connection behavior: Crystal Reports now establishes an independent connection to the data source. The connection is not subject to any ColdFusion data source-specific restrictions. For example, the Crystal Reports server can access a data source, regardless of whether it is disabled in the ColdFusion MX Administrator.

## Attributes

| Attribute     | Applies to     | Req/Opt | Default | Description  |
|---------------|----------------|---------|---------|--|
| template      | Report Builder | Req     |         | Specifies the path to the report definition file, relative to the web root.  |
| format        | Report Builder | Req     |         | Specify one of the following: <ul style="list-style-type: none"><li>• PDF</li><li>• FlashPaper</li><li>• Excel</li></ul>   |
| name          | Report Builder | Opt     |         | The name of the ColdFusion variable that will hold the report output. You cannot specify both <code>name</code> and <code>filename</code> .  |
| filename      | Report Builder | Opt     |         | The filename to contain the report. You cannot specify both <code>name</code> and <code>filename</code> .  |
| query         | Report Builder | Opt     |         | The name of the query that contains input data for the report. If you omit this parameter, the report definition obtains data from the internal SQL or from <code>cfreportparam</code> items.        |
| overwrite     | Report Builder | Opt     | No      | Specifies whether to overwrite files that have the same name as that specified in the <code>filename</code> attribute. Specify Yes or No.  |
| encryption    | Report Builder | Opt     | None    | ( <code>format="PDF"</code> only) Specifies whether the output is encrypted. Specify one of the following: <ul style="list-style-type: none"><li>• 128-bit</li><li>• 40-bit</li><li>• none</li></ul> |
| ownerpassword | Report Builder | Opt     |         | ( <code>format="PDF"</code> only) Specifies an owner password.   |
| userpassword  | Report Builder | Opt     |         | ( <code>format="PDF"</code> only) Specifies a user password.   |

| Attribute   | Applies to      | Req/ Opt | Default  | Description  |
|-------------|-----------------|----------|----------|--|
| permissions | Report Builder  | Opt      |          | (format="PDF" only) Specifies one or more of the following permissions: <ul style="list-style-type: none"> <li>• AllowPrinting</li> <li>• AllowModifyContents</li> <li>• AllowCopy</li> <li>• AllowModifyAnnotations</li> <li>• AllowFillIn</li> <li>• AllowScreenReaders</li> <li>• AllowAssembly</li> <li>• AllowDegradedPrinting</li> </ul> Separate multiple permissions with a comma. |
| datasource  | Crystal Reports | Opt      |          | Name of registered or native data source.  |
| type        | Crystal Reports | Opt      | standard | <ul style="list-style-type: none"> <li>• standard (not valid for Crystal Reports 8.0)</li> <li>• netscape</li> <li>• microsoft</li> </ul>  |
| timeout     | Crystal Reports | Opt      |          | Maximum time, in seconds, in which a connection must be made to a Crystal Reports file.  |
| report      | Crystal Reports | Required |          | Report path. Store Crystal Reports files in the same directories as ColdFusion page files.   |
| orderBy     | Crystal Reports | Opt      |          | Orders results according to your specifications.   |
| username    | Crystal Reports | Opt      |          | Username required for entry into database from which report is created. Overrides default settings for data source in ColdFusion MX Administrator.   |
| password    | Crystal Reports | Opt      |          | Password that corresponds to username required for database access. Overrides default settings for data source in the ColdFusion Administrator.  |
| formula     | Crystal Reports | Opt      |          | <p>One or more named formulas. Terminate each formula with a semicolon. Use the format:</p> <pre>formula = "formulaname1 = 'formula1';formulaname2 = 'formula2';"</pre> <p>If you use a semicolon in a formula, you must escape it by typing it twice (;). For example:</p> <pre>formula = "Name1 = 'Val_1a;;;Val_1b';Name2 = 'Val2';"</pre>   |

## Usage

Use this tag to generate a report using a report definition created in either ColdFusion Report Builder or in Crystal Reports. (For more information on using the ColdFusion Report Builder, display the online help by opening the Report Builder and pressing F1.)

**Note:** The Excel report output format type provides limited support for the formatting options available in ColdFusion MX 7 Reporting. Images and charts are not supported and numeric data containing formatting (commas, percents, currency, and so on) appear as plain text in Excel. The Excel output format supports simple reports only and Macromedia recommends that you give careful design and layout consideration to reports designed for Excel output.

This tag requires an end tag.

### Example

```
<!-- Example 1: This example shows the use of cfreport for the
      ColdFusion Report Builder. -->
<cfquery name="northwindemployees" datasource="localnorthwind">
  SELECT EmployeeID, LastName, FirstName, Title, City, Region, Country
  FROM Employees
  ORDER BY Country, City
</cfquery>

<CFREPORT format="PDF" template="FifthReport.cfr"
  query="#northwindemployees#" />

<!-- Example 2:
      This view-only example shows the use of cfreport for Crystal Reports. -->
<h3>cfreport Tag</h3>
<p>cfreport lets reports from the Crystal Reports Professional report writer
  display through a ColdFusion interface. To run, the tag requires the
  name of the report. cfreport can also pass information to the report
  file displayed, to change the output conditions.
<p>This example would run a report called "monthliesales.rpt " and pass it an
  optional filter condition to show only the information for a subset
  of the report.

<cfreport report = '/reports/monthliesales.rpt'>
  {Departments.Department} = 'International'
</cfreport>

<p>Substitute your report files and filters for this code. cfreport can put
  Crystal Reports into web pages.
```

# cfreportparam

## Description

Passes input parameters to a ColdFusion Report Builder report definition. Allowed inside `cfreport` tag bodies only.

## Category

[Data output tags](#)

## Syntax

```
<cfreportparam
  name = "data name"
  value = "data value">
```

## See also

[cfreport](#); Chapter 32, “Creating Reports for Printing,” in *ColdFusion MX Developer’s Guide*; Report Builder online Help

## History

ColdFusion MX 7: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| name      | Required |         | Variable name for data that is passed. The ColdFusion Report Builder report definition must include an input parameter that matches this name. |
| value     | Required |         | Value of the data that is sent.  |

## Usage

Specifies an input parameter to a ColdFusion Report Builder report definition. The ColdFusion Report Builder report definition must include an input parameter that matches the `name` attribute.

You can use `cfreportparam` to pass data to a report definition, as an alternative to the `cfreport` query attribute.

## Example

```
<cfquery name="coursedept" datasource="cfdocexamples">
  SELECT Departments.Dept_ID as dDept_ID, Departments.Dept_Name,
         CourseList.Course_ID, CourseList.Dept_ID as cDept_ID,
         CourseList.CorNumber, CourseList.CorName,
         CourseList.CorLevel
  FROM Departments, CourseList
  WHERE Departments.Dept_ID = CourseList.Dept_ID
  ORDER BY CourseList.Dept_ID
</cfquery>
```

```
<cfreport format="PDF" template="FourthReport.cfr" query="#coursedept#"
  overwrite="yes">
  <cfreportparam NAME="ReportTime" VALUE="#DateFormat(Now()),
    #TimeFormat(Now())#">
</cfreport>
```

# cfrethrow

## Description

Rethrows the currently active exception. Preserves the exception's `cfcatch.type` and `cfcatch.tagContext` variable values.

## Category

[Exception handling tags](#), [Extensibility tags](#)

## Syntax

```
<cfrethrow>
```

## See also

[cferror](#), [cfthrow](#), [cftry](#); “Handling runtime exceptions with ColdFusion tags” in Chapter 14, “Handling Errors,” in *ColdFusion MX Developer's Guide*

## Usage

Use this tag within a `cfcatch` block. This tag is useful in error handling code, if the error handler cannot handle an error that it catches. For example, if `cfcatch type = "any"` gets a DATABASE exception, and the code is designed to handle only CFX exceptions, the handler raises the exceptions again, with details intact, so that a higher-level handler can process the error information. If you used the `cfthrow` tag, the type and details of the original exception would be lost.

## Example

```
<h3>cfrethrow Example</h3>
<!--- Rethrow a DATABASE exception. --->
<cftry>
  <cftry>
    <cfquery name = "GetMessages" dataSource = "cfdocexamples">
      SELECT *
      FROM Messages
    </cfquery>
    <cfcatch type = "DATABASE">
      <!--- If database signalled a 50555 error, ignore; otherwise, rethrow
      exception. --->
      <cfif cfcatch.sqlstate neq 50555>
        <cfrethrow>
      </cfif>
    </cfcatch>
  </cftry>
</cfcatch>
<h3>Sorry, this request can't be completed</h3>
<h4>Catch variables</h4>
<cfoutput>
  <cfloop collection = #cfcatch# item = "c">
    <br>
    <cfif IsSimpleValue(cfcatch[c])>#c# = #cfcatch[c]#
  </cfif>
</cfloop>
</cfoutput>
</cfcatch>
</cftry>
```

# cfreturn

## Description

Returns result values from a component method. Contains an expression returned as result of the function.

## Return value

An expression; the result of the function from which this tag is called.

## Category

[Extensibility tags](#)

## Syntax

```
<cfreturn  
  expr>
```

## See also

[cfargument](#), [cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfinvokeargument](#), [cfobject](#), [cfproperty](#); “Creating reports with the ColdFusion MX 7 reporting” in Chapter 32, “Creating Reports for Printing,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description                         |
|-----------|----------|---------|-------------------------------------|
| expr      | Required |         | Function result; value of any type. |

## Usage

This tag is equivalent to a `return` statement within a `cfscript` tag. It accepts one return variable argument. To return more than one value, populate a structure with name-value-pairs, and return the structure with this tag.

To access the result value from this tag, you use the variable scope that is the value of the `cfinvoke` tag `returnVariable` attribute.

You can code a maximum of one `cfreturn` tag within a function.

For example code, see Chapter 10, “Building and Using ColdFusion Components” in *ColdFusion MX Developer’s Guide*.

## Example

```
<cfcomponent>  
  <cffunction name="getEmp">  
    <cfquery name="empQuery" datasource="ExampleApps" >  
      SELECT FIRSTNAME, LASTNAME, EMAIL  
      FROM tblEmployees  
    </cfquery>  
    <cfreturn empQuery>
```

```
</cffunction>
<cffunction name="getDept">
  <cfquery name="deptQuery" datasource="ExampleApps" >
    SELECT *
    FROM tblDepartments
  </cfquery>
  <cfreturn deptQuery>
</cffunction>
</cfcomponent>
```

# cfsavecontent

## Description

Saves the generated content of the `cfsavecontent` tag, including the results of evaluating expressions and executing custom tags, in the specified variable.

## Category

[Variable manipulation tags](#)

## Syntax

```
<cfsavecontent
  variable = "variable name">
  the content
</cfsavecontent>
```

## See also

“Caching parts of ColdFusion pages” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| variable  | Required |         | Name of the variable in which to save the generated content of the tag. |

## Usage

This tag requires an end tag.

You cannot use this tag to suppress output from a tag library.

## Example

The following example uses a custom tag to generate a report and saves the report in the variable `CONTENT`. It replaces all instances of the word "report" with the phrase "MyCompany Quarterly Report" and outputs the result.

```
<cfsavecontent variable="content">
  <CF_OutputBigReport>
</cfsavecontent>
<cfoutput>
  #replace(content, "report", "MyCompany Quarterly Report", "all")#
</cfoutput>
```

# cfschedule

## Description

Provides a programmatic interface to the ColdFusion scheduling engine. Can run a CFML page at scheduled intervals, with the option to write the page output to a static HTML page. This feature enables you to schedule pages that publish data, such as reports, without waiting while a database transaction is performed to populate the page.

## Category

[Variable manipulation tags](#)

## Syntax

```
<cfschedule
  action = "update"
  task = "taskname"
  operation = "HTTPRequest"
  file = "filename"
  path = "path_to_file"
  startDate = "date"
  startTime = "time"
  url = "URL"
  port = "port_number"
  publish = "yes" or "no"
  endDate = "date"
  endTime = "time"
  interval = "seconds"
  requestTimeout = "seconds"
  username = "username"
  password = "password"
  proxyServer = "hostname"
  proxyPort = "port_number">

<cfschedule
  action = "delete"
  task = "TaskName">

<cfschedule
  action = "run"
  task = "TaskName">
```

## See also

[cfcookie](#), [cfparam](#), [cfregistry](#), [cfsavecontent](#), [cfset](#)

## History

ColdFusion MX 6.1: Changed the way intervals are calculated. The day length now reflects changes between standard and daylight saving times. The month length is now the calendar month length, not four weeks. The scheduler handles leap years correctly.

## Attributes

| Attribute      | Req/Opt                                    | Default | Description  |
|----------------|--|---------|--|
| action         | Required                                   |         | <ul style="list-style-type: none"><li>delete: deletes the specified task.</li><li>update: updates an existing task or creates a new task, if one with the name specified by the <code>task</code> attribute does not exist.</li><li>run: executes the specified task.</li></ul>                                      |
| task           | Required                                   |         | Name of the task.  |
| operation      | Required if <code>action = "update"</code> |         | Operation that the scheduler performs. Must be <code>HTTPRequest</code> .  |
| file           | Required if <code>publish = "Yes"</code>   |         | Name of the file in which to store the published output of the scheduled task.   |
| path           | Required if <code>publish = "Yes"</code>   |         | Path to the directory in which to put the published file.  |
| startDate      | Required if <code>action = "update"</code> |         | Date on which to first run the scheduled task.   |
| startTime      | Required if <code>action = "update"</code> |         | Time at which to run the scheduled of task starts.   |
| url            | Required if <code>action = "update"</code> |         | URL of the page to execute.  |
| port           | Optional                                   | 80      | Port to use on the server that is specified by the <code>url</code> parameter. If <code>resolveURL = "yes"</code> , retrieved document URLs that specify a port number are automatically resolved, to preserve links in the retrieved document. A port value in the <code>url</code> attribute overrides this value. |
| publish        | Optional                                   | No      | <ul style="list-style-type: none"><li>Yes: saves the result to a file.</li><li>No</li></ul>  |
| endDate        | Optional                                   |         | Date when scheduled task ends.   |
| endTime        | Optional                                   |         | Time when scheduled task ends (seconds).   |
| interval       | Required if <code>action = "update"</code> |         | Interval at which task is scheduled: <ul style="list-style-type: none"><li>number of seconds</li><li>once</li><li>daily</li><li>weekly</li><li>monthly</li></ul>   |
| requestTimeout | Optional                                   |         | Can be used to extend the default timeout period.  |
| username       | Optional                                   |         | Username, if URL is protected.   |

| Attribute     | Req/Opt  | Default | Description  |
|---------------|----------|---------|--|
| password      | Optional |         | Password, if URL is protected.   |
| proxyServer   | Optional |         | Host name or IP address of a proxy server.   |
| proxyPort     | Optional | 80      | Port number to use on the proxy server.  |
| proxyUser     | Opt      |         | User name to provide to the proxy server.  |
| proxyPassword | Opt      |         | Password to provide to the proxy server.   |
| resolveURL    | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: resolves links in the output page to absolute references.</li> <li>• No</li> </ul> |

## Usage

This tag and the ColdFusion MX Administrator Scheduled task page schedule ColdFusion tasks. Tasks that you add or change using this tag are visible in the Administrator. You can disable this tag in the Administrator Sandbox/Resource security page. This tag's success or failure status is written to the schedule.log file in the *cf\_root/logs* directory (*cf\_webapp\_root/WEB-INF/cfusion/logs* in the multiserver and J2EE configurations).

When you create a task, you specify the URL of the ColdFusion page to execute, the date, time and frequency of execution, and whether to publish the task output to a HTML file. If the output is published, you specify the output file path and file.

If you schedule a job to run monthly on any date in the range 28-31, the scheduler does the following:

- If you schedule a monthly job to run on the last day of a month, the scheduled job will run on the last day of each month. For example, if you schedule a monthly job to start on January 31, it will run on January 31, February 28 or 29, March 31, April 30, and so on.
- If you schedule a monthly job to run on the 29th or 30th of the month, the job will run on the specified day of each month for 30 or 31-day months, and the last day of February. For example, if you schedule a monthly job to start on January 30, the job will run on January 30, February 28 or 29, March 30, April 30, and so on.

If you schedule a job to run once, the starting time is in the past, and the task has not yet run, it runs immediately. If you schedule a recurring job with a start time in the past, ColdFusion schedules the job to run on the next closest interval in the future.

The Scheduler configuration file, *cf\_root\lib\neo-cron.xml* contains all scheduled events, as individual entries.

## Example

```
<h3>cfschedule Example</h3>
<!-- This read-only example schedules a task.
      To run the example, remove the comments around the code
      and change the startDate, startTime, url, file, and path attributes
      to appropriate values. -->
<!--
<cfschedule action = "update"
            task = "TaskName"
```

```
operation = "HTTPRequest"
url = "http://127.0.0.1/playpen/history.cfm"
startDate = "8/7/03"
startTime = "12:25 PM"
interval = "3600"
resolveURL = "Yes"
publish = "Yes"
file = "sample.html"
path = "c:\inetpub\wwwroot\playpen"
requestTimeout = "600">
-->
```

# cfscript

## Description

Encloses a code block that contains `cfscript` statements.

## Category

[Application framework tags](#), [Other tags](#)

## Syntax

```
<cfscript>
  cfscript code here
</cfscript>
```

## See also

[cfinvoke](#), [cfmodule](#), [CreateObject](#); Chapter 6, “Extending ColdFusion Pages with CFML Scripting” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed how to invoke component methods: this tag can now invoke component methods, using the `CreateObject` function
- Changed use of reserved words: you cannot use ColdFusion reserved words within this tag
- Added the `try` and `catch` statements.

## Usage

Performs processing in CFScript. This tag uses ColdFusion functions, expressions, and operators. You can read and write ColdFusion variables within this tag.

For a detailed description of the CFScript scripting language, including documentation of CFScript statements and the CFScript equivalents of CFML tags, see Chapter 6, “Extending ColdFusion Pages with CFML Scripting” in *ColdFusion MX Developer’s Guide*.

You can use this tag to enclose a series of assignment statements that would otherwise require `cfset` statements.

**Caution:** If you code a `cftry/cfcatch` block within this tag using an exception’s Java class name, you must provide the fully qualified class name.

You cannot use some ColdFusion reserved words in this tag. You cannot put a user-defined function whose name begins with any of these strings within this tag:

- `cf`
- `cf_`
- `_cf`
- `coldfusion`
- `coldfusion_`
- `_coldfusion`

You cannot use the `elseif` construct within a `cfscript` tag. You can use code such as the following:

```
else if ( condition )
{
...
}
```

## Exception handling with the `cfscript` tag

To handle exceptions with this tag, use `try` and `catch` statements, which are equivalent to the `cftry` and `cfcatch` tags. For each `try` statement, you must have a `catch` statement. In the `catch` block, the variable `exceptionVariable` contains the exception type. This variable is the equivalent of the `cfcatch` tag built-in variable `cfcatch.Type`. For more information, see Chapter 6, “Extending ColdFusion Pages with CFML Scripting” in *ColdFusion MX Developer’s Guide*.

## Invoking ColdFusion components with the `cfscript` tag

CFScript invokes component methods using the `CreateObject` function.

The following example shows how to invoke a component object with the `cfscript` tag, using ordered arguments:

```
<cfscript>
quote = CreateObject( "component", "nasdaq.quote" );
<!--- Invocation using ordered arguments. --->
res = quote.getLastTradePrice( "macr" );
</cfscript>
```

The following example shows how to use an attribute collection within the `cfscript` tag to pass parameters when invoking a component object. An attribute collection is a structure in which each key corresponds to a parameter name and each value is the parameter value passed for the corresponding key.

```
<cfscript>
  stArgs = structNew();
  stArgs.translationmode = "en_es";
  stArgs.sourceData= "Hello world, friend";
</cfscript>
...
<cfinvoke
  webservice = "http://www.xmethods.net/sd/2001/BabelFishService.wsdl"
  method      = "BabelFish"
  argumentCollection = "#stArgs#"
  returnVariable = "varName">
<cfoutput>#varName#</cfoutput>
```

In this example, the structure is created in a `cfscript` block, but you can use any ColdFusion method to create the structure.

## Consuming web services with the cfscript tag

The following example shows how to consume a web service with the `cfscript` tag. You use the `CreateObject` function to connect to the web service.

```
<cfscript>
    ws = CreateObject("webservice",
        "http://www.xmethods.net/sd/2001/BabelFishService.wsdl");
    xlatstring = ws.BabelFish("en_es", "Hello world, friend");
    writeoutput(xlatstring);
</cfscript>
```

For more information, see Chapter 36, “Using Web Services” in *ColdFusion MX Developer’s Guide*.

### Example

```
<p>This simple example shows variable declaration and manipulation.
<cfif IsDefined("form.myValue")>
    <cfif IsNumeric(form.myValue)>
        <cfset x = form.myValue>
        <cfscript>
            y = x;
            z = 2 * y;
            StringVar = form.myString;
        </cfscript>
        <cfoutput><p>twice #x# is #z#.
        <p>Your string value was: <b><I>#StringVar#</i></b></cfoutput>
    <cfelse>
```

# cfsearch

## Description

Searches one or more Verity collections.

A collection must be created and indexed before this tag can return search results.

A collection can be *created* in these ways:

- With the `cfcollection` tag
- In the ColdFusion MX Administrator
- Using a native Verity indexing tool, such as Vspider or MKVDK. For more information on Vspider and MKVDK, see Chapter 8, “Introducing Verity and Verity Tools” in *Configuring and Administering ColdFusion MX*.

If you use a native Verity tool to create a collection, it must be registered. A collection can be *registered with ColdFusion* in the following ways:

- With the `cfcollection` tag
- In the ColdFusion MX Administrator

A collection can be *indexed* in the following ways:

- In ColdFusion, with the `cfindex` tag
- In the ColdFusion MX Administrator, which calls the `cfindex` tag
- Using a native Verity indexing tool, such as Vspider or MKVDK

For more information, see Chapter 24, “Building a Search Interface” in *ColdFusion MX Developer’s Guide*.

## Category

[Extensibility tags](#)

## Syntax

```
<cfsearch
  name = "search_name"
  collection = "collection_name"
  category = "category[,category2,...]"
  categoryTree = "tree_location"
  status = ""
  type = "criteria"
  criteria = "search_expression"
  maxRows = "number"
  startRow = "row_number"
  suggestions = "suggestion_option"
  contextPassages = "number_of_passages"

  language = "language">
```

## See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [cfobject](#), [cfreport](#), [cfwdx](#)

## History

### ColdFusion MX 7:

- Added `category`, `categoryTree`, `status`, `suggestions`, `contextPassages`, `contextBytes`, `contextHighlightBegin`, `contextHighlightEnd`, and `previousCriteria` attributes.
- Added `author`, `category`, `categoryTree`, `context`, `rank`, `size`, `recordsSearched`, and `type` result columns.
- Added information on the status structure and its associated keys.
- Removed references to a separate K2 server and `k2server.ini` file.
- Removed references to unregistered collections.
- Removed references to external collections. ColdFusion MX now manages all collections through the Verity Search service.
- Changed `cflock` recommendation. It is no longer a best practice to surround the `cfsearch` tag with a `cflock` tag.

### ColdFusion MX:

- Deprecated the `external` attribute. It might not work, and might cause an error, in later releases. (ColdFusion stores this information about each collection; it automatically detects whether a collection is internal or external.) This tag supports absolute (also known as fully qualified) collection pathnames and mapped collection names.
- Changed query result behavior: the `cfindex` tag can index the query results from a `cfsearch` operation.
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed multiple collection behavior: this tag can search multiple collections. In a multiple collection search, you cannot combine collections that are registered with K2Server and registered in another way.
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed the following support: this tag supports Verity 2.6.1 and the LinguistX and ICU locales.
- Changed thrown exceptions: this tag can throw the SEARCHENGINE exception.

## Attributes

| Attribute               | Req/Opt  | Default | Description   |
|-------------------------|----------|---------|---|
| <code>name</code>       | Required |         | Name of the search query.   |
| <code>collection</code> | Required |         | One or more collection names. You can specify more than one collection unless you are performing a category search (that is, specifying <code>category</code> or <code>categoryTree</code> ). |

| Attribute    | Req/Opt  | Default | Description  |
|--------------|----------|---------|--|
| category     | Optional |         | A list of categories, separated by commas, to which the search is limited. If specified, and the collection does not have categories enabled, ColdFusion throws an exception.  |
| categoryTree | Optional |         | The location in a hierarchical category tree at which to start the search. ColdFusion searches at and below this level. If specified, and the collection does not have categories enabled, ColdFusion throws an exception. Can be used in addition to the <code>category</code> attribute.   |
| status       | Optional |         | Specifies the name of the structure variable into which ColdFusion places search information, including alternative criteria suggestions (spelling corrections). For a list of keys in this structure, see <a href="#">“Status structure keys” on page 384</a> .   |
| type         | Optional | simple  | Used to specify the parser that Verity uses to process the criteria. <ul style="list-style-type: none"> <li>• simple: STEM and MANY operators are implicitly used.</li> <li>• explicit: operators must be invoked explicitly. Also known as Bool_Plus.</li> <li>• internet: for documents that are mostly WYSIWIG (what-you-see-is-what-you-get) documents. Also known as Internet_advanced.</li> <li>• internet_basic: minimizes search time.</li> <li>• natural: specifies the Query By Example (QBE) parser. Also known as FreeText.</li> </ul> For more information, see Chapter 25, “Using Verity Search Expressions” in <i>ColdFusion MX Developer’s Guide</i> . Also see your Verity documentation. |
| criteria     | Optional |         | Search criteria. Follows the syntax rules of the <code>type</code> attribute. If you pass a mixed-case entry in this attribute, the search is case-sensitive. If you pass all uppercase or all lowercase, the search is case-insensitive. Follow Verity syntax and delimiter character rules; see Chapter 25, “Using Verity Search Expressions” in <i>ColdFusion MX Developer’s Guide</i> .  |
| maxRows      | Optional | All     | Maximum number of rows to return in query results.   |
| startRow     | Optional | 1       | First row number to get.   |

| Attribute             | Req/Opt  | Default | Description   |
|-----------------------|----------|---------|---|
| suggestions           | Optional | never   | Specifies whether Verity returns spelling suggestions for possibly misspelled words. Use one of the following options: <ul style="list-style-type: none"> <li>• Always: Verity always returns spelling suggestions.</li> <li>• Never: Verity never returns spelling suggestions.</li> <li>• positive integer: Verity returns spelling suggestions if the number of documents retrieved by the search is less than or equal to the number specified.</li> </ul> There is a small performance penalty for retrieving suggestion data. |
| contextPassages       | Optional | 0       | The number of passages/sentences Verity returns in the context summary (that is, the <code>context</code> column of the results). The default is 0, which disables context summary.   |
| contextBytes          | Optional | 300     | The maximum number of bytes Verity returns in the context summary.  |
| contextHighlightBegin | Optional | <b>     | The HTML to prepend to search terms in the context summary. Use this attribute in conjunction with <code>contextHighlightEnd</code> to highlight search terms in the context summary.   |
| contextHighlightEnd   | Optional | </b>    | The HTML to append to search terms in the context summary. Use this attribute in conjunction with <code>contextHighlightBegin</code> to highlight search terms in the context summary.  |
| previousCriteria      | Optional |         | The name of a result set from an existing set of search results. Verity searches the result set for <code>criteria</code> without regard to the previous search score or rank. Use this attribute to implement searching within result sets.  |
| language              | Optional | english | Deprecated. This attribute is now ignored and the language of the collection is used to perform the search.   |

## Usage

The `cfsearch` tag returns a query object whose columns you can reference in a `cfoutput` tag. For example, the following code specifies a search for the exact terms "filming" or "filmed":

```
<cfsearch
  name = "mySearch"
  collection = "myCollection"
  criteria = '<WILDCARD>`film{ing,ed}`'
  type="explicit"
  startrow=1
  maxrows = "100">
<cfdump var = "#mySearch#>
```

In this example, the single-quotation mark (') and backtick (`) characters are used as delimiters; for more information, see Chapter 25, “Using Verity Search Expressions” in *ColdFusion MX Developer's Guide*.

To optimize search performance, always specify the `maxrows` attribute, setting it to a value that matches your application's needs. A value less than 300 helps to ensure optimal performance.

Macromedia does not recommend using the `cflock` tag with this tag; Verity provides the locking function. Using the `cflock` tag slows search performance.

## The `cfsearch` tag result columns

---

| Variable   | Description   |
|--|---|
| <code>context</code>   | A context summary containing the search terms, highlighted in bold (by default). This is enabled if you set the <code>contextpassages</code> attribute to a number greater than zero.   |
| <code>url</code>   | Value of <code>urlpath</code> attribute in the <code>cfindex</code> tag used to populate a collection.  |
| <code>key</code>   | Value of the <code>key</code> attribute in the <code>cfindex</code> tag used to populate a collection.  |
| <code>title</code>   | Value of <code>title</code> attribute in <code>cfindex</code> tag used to populate the collection, including PDF and Office document titles. If a title is not extracted from the document, the tag uses the <code>cfindex title</code> attribute value for each row. |
| <code>score</code>   | Relevancy score of document based on search criteria  |
| <code>custom1</code> , <code>custom2</code> ,<br><code>custom3</code> , <code>custom4</code> | Value of custom fields in <code>cfindex</code> tag used to populate a collection.   |
| <code>size</code>  | The number of bytes in the index document.  |
| <code>rank</code>  | The rank of this document in the search results.  |
| <code>author</code>  | Extracted from the HTML, Office, and PDF documents when available.  |
| <code>type</code>  | The MIME type of the document.  |
| <code>category</code>  | A list of the categories that were specified for this document when it was indexed.   |
| <code>categoryTree</code>  | A hierarchical category tree, or serial list of categories, that was specified for this document when it was indexed. Only a single tree is returned.   |
| <code>summary</code>   | Contents of automatic summary generated by <code>cfindex</code> .   |
| <code>recordCount</code>   | Number of records returned in record set  |
| <code>currentRow</code>  | Current row that <code>cfoutput</code> is processing.   |
| <code>columnList</code>  | List of column names within record set.   |
| <code>recordsSearched</code>   | Number of records searched. This is the same value for each row in the record set. Corresponds to the <code>searched</code> key in the status structure.  |

---

## Status structure keys

| Variable       | Description   |
|----------------|---|
| found          | The number of documents that contain the search criteria.   |
| searched       | The number of documents searched. Corresponds to the <code>recordsSearched</code> column in the search results.   |
| time           | The number of milliseconds the search took, as reported by the Verity K2 search service.  |
| suggestedQuery | An alternative query, as suggested by Verity, that might produce better results. This often contains corrected spellings of search terms. Present only when the <code>suggestions</code> tag attribute criteria is met. |
| keywords       | A structure containing each search term as a key to an array of up to five possible alternative terms, in order of preference. Present only when the <code>suggestions</code> attribute criteria is met.                |
| keywordScore   | A structure in the same format as for keywords, except it also includes Verity-reported weighted values from 0 to .99, in which higher scores indicate better-quality results.  |

To permit application users to search Verity collections for nonstandard strings, words, or characters (for example, "AB23.45.67" or "--->") that would otherwise cause an error, you can create a text file that lists these elements and defines their formats for Verity. Name the file `style.lex` and put copies of the file in these directories:

- Windows:
  - `cf_root\verity\k2\common\style` (typically, `cf_root = C:\CFusionMX7`)
  - `cf_root\verity\Data\stylesets\ColdFusionK2`
- UNIX:
  - `cf_root//verity/k2/common/style` (typically, `cf_root = /opt/coldfusionmx7`)
  - `cf_root/verity/Data/stylesets/ColdFusionK2`

In the multiserver and J2EE configurations, you install Verity in a separate directory.

**Note:** To search for a character such as an angle bracket (< or >), you must use a `criteria` attribute value such as "&lt;" or "&gt;". The bracket characters are reserved in Verity, and using a backslash to escape the character (`criteria="\<`") does not work in this context. For more information, see Chapter 25, "Using Verity Search Expressions" in *ColdFusion MX Developer's Guide*.

### Example

```
<!-- #1 (TYPE=SIMPLE) ----->
<cfsearch
  name="name"
  collection="snippets,syntax,snippets"
  criteria="example"
  maxrows = "100">
<p>
<cfoutput>Search Result total = #name.RecordCount# </cfoutput><br>
<cfoutput>
  url=#name.url#<br>
  key=#name.key#<br>
```

```

    title=#name.title#<br>
    score=#name.score#<br>
    custom1=#name.custom1#<br>
    custom2=#name.custom2#<br>
    summary=#name.summary#<br>
    recordcount=#name.recordcount#<br>
    currentrow=#name.currentrow#<br>
    columnlist=#name.columnlist#<br>
    recordssearched=#name.recordssearched#<br>
</cfoutput>
<cfdump var = #name#>
<br>

<!-- #2 (TYPE=EXPLICIT) ----->
<cfsearch
    name = "snippets"
    collection = "snippets"
    criteria = '<wildcard>`film{ing,ed}`'
    type="explicit"
    startrow=1
    maxrows = "100">
<cfoutput
    query="snippets">
    url=#url#<br>
    key=#key#<br>
    title=#title#<br>
    score=#score#<br>
    custom1=#custom1#<br>
    custom2=#custom2#<br>
    summary=#summary#<br>
    recordcount=#recordcount#<br>
    currentrow=#currentrow#<br>
    columnlist=#columnlist#<br>
    recordssearched=#recordssearched#<br>
</cfoutput>
<cfdump var = #snippets#>
<br>

<!-- #3 (search by CF key) ----->
<cfsearch
    name = "book"
    collection = "custom_book"
    criteria = "cf_key=bookid2"
    maxrows = "100">
<cfoutput>
    url=#book.url#<br>
    key=#book.key#<br>
    title=#book.titleE#<br>
    score=#book.score#<br>
    custom1=#book.custom1#<br>

columnlist=#book.columnlist#<br>
recordssearched=#book.recordssearched#<br>
</cfoutput>
<cfdump var = #book#>
```

# cfselect

## Description

Constructs a drop-down list box form control. Used within a `cfform` tag. You can populate the list from a query, or by using the `HTML` option tag.

## Category

[Forms tags](#)

## Syntax

```
<cfselect
  name = "name"
  label = "label"
  style = "style specification"
  size = "integer"
  required = "yes" or "no"
  message = "text"
  onError = "text"
  multiple = "yes" or "no"
  query = "queryname"
  value = "text"
  display = "text">
  group = "query column name"
  queryPosition = "above" or "below"
  selected = "value or list"
  onKeyUp = "JavaScript or ActionScript"
  onKeyDown = "JavaScript or ActionScript"
  onMouseUp = "JavaScript or ActionScript"
  onMouseDown = "JavaScript or ActionScript"
  onChange = "JavaScript or ActionScript"
  onClick = "JavaScript or ActionScript"
  visible = "Yes" or "No"
  enabled = "Yes" or "No"
  tooltip = "tip text"
  height = "number of pixels" Flash only
  width = "number of pixels" Flash only
>
zero or more HTML option tags
</cfselect>
```

## History

ColdFusion MX 7:

- Added support for specifying multiple values to the `selected` attribute.
- Deprecated the `passthrough` attribute. The tag now supports all HTML `select` tag attributes directly.

- Added on-prefixed attributes.
- Added enabled, group, height, label, queryPosition, tooltip, visible, and width attributes.

## Attributes

The following table lists attributes that ColdFusion uses directly. The tag also supports all HTML `select` tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML.

| Attribute | Req/Opt;<br>Format            | Default | Description  |
|-----------|-------------------------------|---------|--|
| name      | Required;<br>All              |         | Name of the select form element.   |
| label     | Optional;<br>Flash and<br>XML |         | Label to put next to the control on a Flash or XML-format form.  |
| style     | Optional;<br>All              |         | In HTML or XML format forms, ColdFusion passes the style attribute to the browser or XML.<br>In Flash format, must be a style specification in CSS format, with the same syntax and contents as used in Macromedia Flex for the corresponding Flash element.   |
| size      | Optional;<br>All              | 1       | Number of entries to display at one time. The default, 1, displays a drop-down list. Any other value displays a list box with <code>size</code> number of entries visible at one time.   |
| required  | Optional;<br>All              | No      | <ul style="list-style-type: none"> <li>• Yes: a list element must be selected when the form is submitted.</li> </ul> <p><b>Note:</b> This attribute has no effect if you omit the <code>size</code> attribute or set it to 1, because the browser always submits the displayed item. You can work around this issue: format forms by having an initial <code>option</code> tag with <code>value=""</code> (note the space character between the quotation marks).</p> <ul style="list-style-type: none"> <li>• No</li> </ul> |
| message   | Optional;<br>All              |         | Message to display if <code>required = "Yes"</code> and no selection is made.  |
| onError   | Optional;<br>HTML and<br>XML  |         | Custom JavaScript function to execute if validation fails.   |
| multiple  | Optional;<br>All              | No      | <ul style="list-style-type: none"> <li>• Yes: allows selecting multiple elements in drop-down list.</li> <li>• No</li> </ul>   |
| query     | Optional;<br>All              |         | Name of query to populate drop-down list.  |
| value     | Optional;<br>All              |         | Query column to use for the value of each list element. Used with the <code>query</code> attribute.  |

| Attribute     | Req/Opt;<br>Format           | Default                                     | Description  |
|---------------|------------------------------|---|--|
| display       | Optional;<br>All             | Value of<br><code>value</code><br>attribute | Query column to use for the display label of each list element. Used with the <code>query</code> attribute.  |
| group         | Optional;<br>HTML and<br>XML |   | Query column to use to group the items in the drop-down list into a two-level hierarchical list.   |
| queryPosition | Optional;<br>All             | above                                       | If you populate the options list with a query and use HTML <code>option</code> child tags to specify additional entries, determines the location of the items from the query relative to the items from the <code>option</code> tags: <ul style="list-style-type: none"> <li>• above: puts the query items above the <code>options</code> items.</li> <li>• below: puts the query items below the <code>options</code> items.</li> </ul> |
| selected      | Optional;<br>All             |   | One or more option values to preselect in the selection list. To specify multiple values, use a comma-delimited list. This attribute applies only if selection list items are generated from a query. The <code>cfformpreservedata</code> attribute value can override this value.   |
| onKeyUp       | Optional;<br>All             |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.   |
| onKeyDown     | Optional;<br>All             |   | JavaScript (HTML/XML) or ActionScript (Flash) ActionScript to run when the user presses a keyboard key in the control.   |
| onMouseUp     | Optional;<br>All             |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.  |
| onMouseDown   | Optional;<br>All             |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.   |
| onChange      | Optional;<br>All             |   | JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action.  |
| onClick       | Optional;<br>HTML and<br>XML |   | JavaScript to run when the user clicks the control.  |
| enabled       | Optional;<br>Flash           | Yes   | Boolean value specifying whether the control is enabled. A disabled control appears in light gray. The inverse of the <code>disabled</code> attribute.   |
| visible       | Optional;<br>Flash           | Yes   | Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank.   |
| tooltip       | Optional;<br>Flash           |   | Text to display when the mouse pointer hovers over the control.  |

| Attribute | Req/Opt;<br>Format | Default | Description                           |
|-----------|--------------------|---------|---------------------------------------|
| height    | Optional;<br>Flash |         | The height of the control, in pixels. |
| width     | Optional;<br>Flash |         | The width of the control, in pixels.  |

**Note:** Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML.

## Usage

This tag requires an end tag and can include HTML `option` and `optgroup` child tags.

To ensure that a selected list box item persists across postbacks, use the `cfform preserveData` attribute with a list generated from a query. (This strategy works only with data that is populated from a query.)

If the `cfform preserveData` attribute is true and the form posts back to the same page, and if the control is populated by a query, the posted selection(s) for the `cfselect` control are used instead of the `Selected` attribute. For controls that are populated with regular HTML `option` tags, the developer must dynamically add the `Selected` attribute to the appropriate `option` tag(s).

The `group` option generates a query using SQL GROUP BY syntax and places the `value` column entries from each group in an indented list under the `group` column's field value. This option generates an HTML `optgroup` tag for each entry in the `group` column.

Close each HTML `option` tag in the `cfselect` tag body with a `</option>` end tag. If you do not do so, and you specify `queryPosition="below"`, the first item from the query might not appear in the list.

For this tag to work properly, the browser must be JavaScript-enabled.

For more information, see the `cfform` tag entry.

## Example

The following example lets you select one or more employee names from a list of all employees, grouped by departments, and displays the selected names and the employee's email addresses. It includes an option to get data for all employees.

```
<!-- Get the employee names from the database. -->
<!-- Use SQL to create a Name field with first and last names. -->
<cfquery name = "GetAllEmployees" dataSource = "cfdocexamples"
    cachedwithin="#createTimeSpan(0,1,0,0)#">
    SELECT Emp_ID, EMail, Phone, Department, FirstName, LastName, FirstName + '
    +lastName as Name
    FROM Employees
    GROUP BY Department, Emp_ID, EMail, Phone, FirstName, LastName, FirstName
</cfquery>
```

```
<h2>cfselect Example</h2>
```

```
<!-- The cfif statement is true if the form was submitted.
```

```

    Show the selected names. --->
<cfif IsDefined("form.employeeid")>
  <!-- The form was submitted. --->
  <h4>You Selected the following employees</h3>
  <cfif form.employeeid IS "">
    <!-- Select All option was selected. Show all employees. --->
    <cfoutput query="GetAllEmployees">
      #name#<br>
      Email: #email#<br><br>
    </cfoutput>
  <cfelse>
    <!-- Use a query of queries to get the data for the selected users.
    Form.employeeid is a comma-delimited list of selected employee IDs. --->
    <cfquery name = "GetSelectedEmployees" dbtype="query">
      SELECT Emp_ID, EMail, Phone, Department, FirstName, LastName, FirstName
        + ' ' + LastName as Name
      FROM   GetAllEmployees
      WHERE Emp_ID in (#form.employeeid#)
    </cfquery>
    <!-- Display the names and e-mail addresses from the query. --->
    <cfoutput query="GetSelectedEmployees">
      #firstName# #lastName#<br>
      Email: #email#<br>
      <br>
    </cfoutput>
  </cfif>
</cfif>

<!-- The cfform tag posts back to the current page. --->
<h3>Select one or more employees</h3>
<cfform action = "#CGI.SCRIPT_NAME#">
  <!-- Use cfselect to present the query's LastName column, grouped by
  department.
  Allow Multiple selections.--->
  <cfselect
    name = "employeeid"
    size = "15"
    multiple="yes"
    required = "Yes"
    message = "Select one or more employee names"
    query = "GetAllEmployees"
    group="Department"
    display = "name"
    value ="emp_id"
    queryPosition="Below">
    <!-- Add an option to select all employees. --->
    <option value = "">Select All</option>
  </cfselect><br><br>
  <input type="Submit">
</cfform>

```

# cfervlet

## Description

This tag is deprecated. Executes a Java servlet on a JRun engine.

To access servlets that run on the same server as ColdFusion, use code such as the following, in which *path* specifies a servlet, JSP, or anything else:

```
GetPageContext().include(path)  
GetPageContext().forward(path)
```

For more information, see the JSP PageContext API or the Servlet RequestDispatcher API.

## History

ColdFusion MX: Deprecated this tag. It might not work, and it might cause an error, in later releases.

# cfServletparam

## Description

This tag is deprecated.

A child tag of the `cfServlet` tag. Passes data to a servlet. Each `cfServletparam` tag within the `cfServlet` block passes a separate item of data to the servlet.

To access servlets that run on the same server as ColdFusion, use code such as the following, in which *path* specifies a servlet, JSP, or anything else:

```
GetPageContext().include(path)
GetPageContext().forward(path)
```

For more information, see the JSP PageContext API or the Servlet RequestDispatcher API.

## History

ColdFusion MX: Deprecated this tag. It might not work, and it might cause an error, in later releases.

# cfset

## Description

Sets a value in ColdFusion. Used to create a variable, if it does not exist, and assign it a value. Also used to call functions.

## Category

[Variable manipulation tags](#)

## Syntax

```
<cfset  
  var variable_name = expression  
>
```

## See also

[cfcookie](#), [cfparam](#), [cfregistry](#), [cfsavecontent](#), [cfschedule](#); Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute     | Req/Opt  | Default | Description  |
|---------------|----------|---------|--|
| var           | Optional |         | A keyword. Does not take a value. Identifies the variable as being local to a function. The variable only exists for the time of the current invocation of the function. |
| variable_name | Required |         | A variable.  |

## Usage

The following sections provide detailed descriptions of some of the uses for the `cfset` tag.

### Calling functions

When you use the `cfset` tag to call a function, you do not need to assign the function return value to a variable if the function does not return a value or you do not need to use the value returned by the function. For example, the following line is a valid ColdFusion `cfset` tag for deleting the `MyVariable` variable from the Application scope:

```
<cfset StructDelete(Application, "MyVariable")>
```

### Arrays

The following example assigns a new array to the variable `months`:

```
<cfset months = ArrayNew(1)>
```

This example creates a variable `Array_Length` that resolves to the length of the array `Scores`:

```
<cfset Array_Length = ArrayLen(Scores)>
```

This example assigns, to index position two in the array `months`, the value `February`:

```
<cfset months[2] = "February">
```

## Dynamic variable names

In this example, the variable name is itself a variable:

```
<cfset myvariable = "current_value">
<cfset "#myvariable#" = 5>
```

## Function local variables

The `var` keyword specifies that the variable being defined is only available inside the body of a function that you define using the `cffunction` tag. The variable value that is set in one invocation of the function is not available in any other invocation of the function. The `var` keyword is the equivalent of the `var` statement in CFScript. The following rules apply to the `var` keyword:

- Any `cfset` tag that uses the `var` keyword must be inside the body of a `cffunction` tag. If you use the `var` keyword in a `cfset` tag outside a `cffunction` tag body, ColdFusion displays an error message.
- You must place all `cfset` tags that use the `var` keyword at the beginning of the `cffunction` tag body, before any other ColdFusion tags.

The following example shows how to use the new keyword:

```
<cffunction name="myFunc">
  <cfset var myVar = "This is a test">
  <cfreturn myVar & " Message.">
</cffunction>
<cfoutput>#myFunc()#</cfoutput>
```

In this example, the variable `myVar` exists only when the function `myFunc` executes, and it is not available elsewhere on the ColdFusion page.

## COM objects

In this example, a COM object is created. A `cfset` defines a value for each method or property in the COM object interface. The last `cfset` creates a variable to store the return value from the COM object's `SendMail` method.

```
<cfobject action = "Create"
  name = "Mailer"
  class = "SMTPsvg.Mailer">

<cfset MAILER.FromName = form.fromname>
<cfset MAILER.RemoteHost = RemoteHost>
<cfset MAILER.FromAddress = form.fromemail>
<cfset MAILER.AddRecipient("form.fromname", "form.fromemail")>
<cfset MAILER.Subject = "Testing cfobject">
<cfset MAILER.BodyText = "form.msgbody">
<cfset Mailer.SMTPLog = "logfile">
<cfset success = MAILER.SendMail()>
<cfoutput> #success# </cfoutput>
```

## Example

```
<!-- This example shows how to use cfset. --->
<cfquery name = "GetMessages" dataSource = "cfdocexamples">
    SELECT *
    FROM   Messages
</cfquery>

<h3>cfset Example</h3>
<p>cfset sets and reassigns values to local or global variables within a page.

<cfset NumRecords = GetMessages.recordCount>
<p>For example, the variable NumRecords has been declared on this
page to hold the number of records returned from query
(<cfoutput>#NumRecords#</cfoutput>).

<p>In addition, cfset can be used to pass variables from other pages,
such as this example, which takes the url parameter Test from this link:
(<a href = "cfset.cfm?test = <cfoutput>
    #URLEncodedFormat("hey, you, get off of my cloud")#</cfoutput>
">click here</A>) to display a message:

<p>
<cfif IsDefined ("url.test") is "True">
    <cfoutput><b><I>#url.test#</i></b></cfoutput>
<cfelse>
    <h3>The variable url.test has not been passed from another page.</h3>
</cfif>

<p>cfset can also be used to collect environmental variables, such as the
time, the IP address of the user, or another function or expression.

<cfset the_date = #DateFormat(Now())# & " " & #TimeFormat(Now())#>
<cfset user_ip = CGI.REMOTE_ADDR>
<cfset complex_expr = (23 MOD 12) * 3>
<cfset str_example = Reverse(Left(GetMessages.body, 35))>

<cfoutput>
    <ul>
        <li>The date: #the_date#
        <li>User IP Address: #user_ip#
        <li>Complex Expression ((23 MOD 12) * 3): #complex_expr#
        <li>String Manipulation (the first 35 characters of
            the body of the first message in our query)
            <br><b>Reversed</b>: #str_example#
            <br><b>Normal</b>: #Reverse(str_example)#
        </li>
    </ul>
</cfoutput>
```

# cfsetting

## Description

Controls aspects of page processing, such as the output of HTML code in pages.

## Category

[Page processing tags](#), [Variable manipulation tags](#)

## Syntax

```
<cfsetting  
  enableCFoutputOnly = "yes" or "no"  
  showDebugOutput = "yes" or "no"  
  requestTimeout = "value in seconds" >
```

## See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfhtmlhead](#), [cfinclude](#), [cfprocessingdirective](#), [cfsilent](#);  
“Controlling debugging output with the cfsetting tag” in Chapter 18, “Debugging and Troubleshooting Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 6.1: Changed behavior: if the tag has a body, ColdFusion executes its contents.

ColdFusion MX:

- Added the `requestTimeout` attribute.
- The `catchExceptionsByPattern` attribute is obsolete. It does not work, and causes an error, in releases later than ColdFusion 5.
- Changed exception handling: the structured exception manager searches for the best-fit `cfcatch` handler. (In earlier releases, an exception was handled by the first `cfcatch` block that could handle an exception of its type.)

## Attributes

| Attribute                       | Req/Opt  | Default | Description  |
|---------------------------------|----------|---------|--|
| <code>enableCFoutputOnly</code> | Required |         | <ul style="list-style-type: none"><li>• Yes: blocks output of HTML that is outside <code>cfoutput</code> tags.</li><li>• No: displays HTML that is outside <code>cfoutput</code> tags.</li></ul>   |
| <code>showDebugOutput</code>    | Optional | Yes     | <ul style="list-style-type: none"><li>• Yes: if debugging is enabled in the Administrator, displays debugging information.</li><li>• No: suppresses debugging information that would otherwise display at the end of the generated page.</li></ul> |
| <code>requestTimeout</code>     | Optional |         | <ul style="list-style-type: none"><li>• Integer; number of seconds. Time limit, after which ColdFusion processes the page as an unresponsive thread. Overrides the timeout set in the ColdFusion Administrator.</li></ul>                          |

## Usage

The `cfsetting requestTimeout` attribute replaces the use of `requestTimeout` within a URL. To enforce a page timeout, detect the URL variable and use code such as the following to change the page timeout:

```
<cfsetting RequestTimeout = "#URL.RequestTimeout#">
```

You can use this tag to manage whitespace in ColdFusion output pages.

If you nest `cfsetting` tags: to make HTML output visible, you must match each `enableCFoutputOnly = "Yes"` statement with an `enableCFoutputOnly = "No"` statement. For example, after five `enableCFoutputOnly = "Yes"` statements, to enable HTML output, you must have five corresponding `enableCFoutputOnly = "No"` statements.

If HTML output is enabled (no matter how many `enableCFoutputOnly = "No"` statements have been processed) the first `enableCFoutputOnly = "Yes"` statement blocks output.

If the debugging service is enabled and `showDebugOutput = " Yes"`, the `IsDebugMode` function returns Yes; otherwise, No.

**Note:** Releases after ColdFusion MX allow a `</cfsetting>` end tag; however, this end tag does not affect processing. The `cfsetting` attributes affect code inside and outside the `cfsetting` tag body. ColdFusion MX ignored code between `cfsetting` start and end tags.

## Example

```
<p>CFSETTING is used to control the output of HTML code in ColdFusion pages.  
This tag can be used to minimize the amount of generated whitespace.
```

```
<cfsetting enableCFoutputOnly = "Yes">  
This text is not shown  
<cfsetting enableCFoutputOnly = "No">  
<p>This text is shown  
<cfsetting enableCFoutputOnly = "Yes">  
<cfoutput>  
  <p>Text within cfoutput is always shown  
</cfoutput>  
<cfsetting enableCFoutputOnly = "No">  
<cfoutput>  
  <p>Text within cfoutput is always shown  
</cfoutput>
```

# cfsilent

## Description

Suppresses output produced by CFML within a tag's scope.

## Category

[Data output tags](#), [Page processing tags](#)

## Syntax

```
<cfsilent>
...
</cfsilent>
```

## See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfhtmlhead](#), [cfinclude](#), [cfsetting](#); Chapter 9, “Writing and Calling User-Defined Functions,” in *ColdFusion MX Developer's Guide*

## Usage

This tag requires an end tag.

## Example

```
<h3>cfsilent</h3>
```

```
<cfsilent>
  <cfset a = 100>
  <cfset b = 99>
  <cfset c = b-a>
  <cfoutput>Inside cfsilent block<br>
  b-a = #c#</cfoutput><br>
</cfsilent>
```

```
<p>Even information within cfoutput tags does not display within a
cfsilent block.<br>
<cfoutput>
  b-a = #c#
</cfoutput>
</p>
```

# cfslider

## Description

Puts a slider control, for selecting a numeric value from a range, in a ColdFusion form. The slider moves over the slider groove. As the user moves the slider, the current value displays. Used within a `cfform` tag. Not supported with Flash forms.

## Category

[Forms tags](#)

## Syntax

```
<cfslider
  name = "name"
  label = "text"
  range = "min_value, max_value"
  scale = "uinteger"
  value = "integer"
  onValidate = "script_name"
  message = "text"
  onError = "text"
  height = "integer"
  width = "integer"
  vSpace = "integer"
  hSpace = "integer"
  align = "alignment"
  lookAndFeel = "motif" or "windows" or "metal"
  vertical = "yes" or "no"
  bgColor = "color"
  textColor = "color"
  font = "font_name"
  fontSize = "integer"
  italic = "yes" or "no"
  bold = "yes" or "no"
  notSupported = "text">
```

## See also

[cfapplet](#), [cfcalendar](#), [cfform](#), [cfformgroup](#), [cfformitem](#), [cfgrid](#), [cfinput](#), [cfselect](#), [cftextarea](#), [cftree](#); Chapter 26, “Introduction to Retrieving and Formatting Data,” and Chapter 27, “Building Dynamic Forms with `cfform` Tags,” in *ColdFusion MX Developer’s Guide*

## History

**ColdFusion MX:** Deprecated the `img`, `imgStyle`, `grooveColor`, `refreshLabel`, `tickmarklabels`, `tickmarkmajor`, `tickmarkminor`, and `tickmarkimages` attributes. They might not work, and might cause an error, in later releases.

## Attributes

| Attribute   | Req/Opt  | Default          | Description  |
|-------------|----------|------------------|--|
| name        | Required |                  | Name of <code>cfslider</code> control.   |
| label       | Optional |                  | Label to display with control; for example, "Volume" This displays: "Volume %value%"<br>To reference the value, use "%value%". If %% is omitted, slider value displays directly after label.   |
| range       | Optional | "0,100"          | Numeric slider range values.<br>Separate values with a comma.  |
| scale       | Optional |                  | Unsigned integer. Defines slider scale, within <code>range</code> . For example, if <code>range</code> = "0,1000" and <code>scale</code> = "100", the display values are:<br>0, 100, 200, 300, ...<br>Signed and unsigned integers in ColdFusion are in the range -2,147,483,648 to 2,147,483,647. |
| value       | Optional | Minimum in range | Starting slider setting. Must be within the <code>range</code> values.   |
| onValidate  | Optional |                  | Custom JavaScript function to validate user input; in this case, a change to the default slider value.<br>Specify only the function name.  |
| message     | Optional |                  | Message text to appear if validation fails.  |
| onError     | Optional |                  | Custom JavaScript function to execute if validation fails.<br>Specify only the function name.  |
| height      | Optional | 40               | Slider control height, in pixels.  |
| width       | Optional |                  | Slider control width, in pixels.   |
| vSpace      | Optional |                  | Vertical spacing above and below slider, in pixels.  |
| hSpace      | Optional |                  | Horizontal spacing to left and right of slider, in pixels.   |
| align       | Optional |                  | Alignment of slider: <ul style="list-style-type: none"><li>• top</li><li>• left</li><li>• bottom</li><li>• baseline</li><li>• texttop</li><li>• absbottom</li><li>• middle</li><li>• absmiddle</li><li>• right</li></ul>   |
| lookAndFeel | Optional | Windows          | <ul style="list-style-type: none"><li>• motif: renders slider using Motif style.</li><li>• windows: renders slider using Windows style.</li><li>• metal: renders slider using Java Swing style.</li></ul> If platform does not support choice, the tag defaults to the platform's default style.   |

| Attribute    | Req/Opt  | Default | Description  |
|--------------|----------|---------|--|
| vertical     | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: renders slider in browser vertically. You must set <code>width</code> and <code>height</code> attributes; ColdFusion does not automatically swap width and height values.</li> <li>• No: renders slider horizontally.</li> </ul>   |
| bgColor      | Optional |         | Background color of slider label.<br>For a hexadecimal value, use the form: <code>bgColor = "#xxxxxx"</code> , where x = 0-9 or A-F; use two number signs or none. <ul style="list-style-type: none"> <li>• Any color, in hexadecimal format</li> <li>• black</li> <li>• red</li> <li>• blue</li> <li>• magenta</li> <li>• cyan</li> <li>• orange</li> <li>• darkgray</li> <li>• pink</li> <li>• gray</li> <li>• white</li> <li>• lightgray</li> <li>• yellow</li> </ul> |
| textColor    | Optional |         | Options: same as for <code>bgColor</code> attribute.   |
| font         | Optional |         | Font name for label text.  |
| fontSize     | Optional |         | Font size for label text, in points.   |
| italic       | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: label text in italics.</li> <li>• No: normal text.</li> </ul>  |
| bold         | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: label text in bold.</li> <li>• No: medium text.</li> </ul>   |
| notSupported | Optional |         | Text to display if a page that contains a Java applet-based <code>cfform</code> control is opened by a browser that does not support Java or has Java support disabled. For example:<br><code>"&lt;b&gt; Browser must support Java to view ColdFusion Java Applets&lt;/b&gt;"</code><br>Default message:<br><code>&lt;b&gt;Browser must support Java to &lt;br&gt;view ColdFusion Java Applets!&lt;/b&gt;</code>   |

### Usage

This tag requires the client to download a Java applet. Using this tag may be slightly slower than using an HTML form element to display the same information. Also, if the client does not have an up-to-date Java plugin installed, the system might also have to download an updated Java plugin to display the tag.

For this tag to work properly, the browser must be JavaScript-enabled.

If the following conditions are true, a user's selection from query data that populates this tag's options continues to display after the user submits the form:

- The `cfform preserveData` attribute is set to "Yes".
- The `cfform action` attribute posts to the same page as the form itself (this is the default), or the action page has a form that contains controls with the same names as corresponding controls on the user entry form.

For more information, see the [cfform](#) tag entry.

### Example

```
<!-- This example shows how to use cfslider within cfform. --->
<h3>cfslider Example</h3>
<p>cfslider, used within a cfform, can provide functionality
to Java-enabled browsers.
<p>Try moving the slider back and forth to see the real-time value change.
Then, submit the form to show how cfslider passes its value on to a new page.
<cfif isdefined("form.mySlider") is true>
  <h3>You slid to a value of <cfoutput>#mySlider#</cfoutput></h3>
  Try again!
</cfif>
<cfform action = "cfslider.cfm">
  <cfslider name = "mySlider" value = "12"
    label = "Actual Slider Value "
    range = "1,100" align = "BASELINE"
    message = "Slide the bar to get a value between 1 and 100"
    height = "50" width = "150" font = "Verdana"
    bgColor = "Silver" bold = "No"
    italic = "Yes" refreshLabel = "Yes"> 100
  <p><input type = "Submit" name = "" value = "Show the Result">
</cfform>
```

# cfstoredproc

## Description

Executes a stored procedure in a server database. It specifies database connection information and identifies the stored procedure.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfstoredproc
  procedure = "procedure name"
  dataSource = "ds_name"
  username = "username"
  password = "password"
  blockFactor = "blocksize"
  debug = "yes" or "no"
  returnCode = "yes" or "no">
  result = "result_name"
```

## See also

[cfinsert](#), [cfqueryparam](#), [cfprocparam](#), [cfprocresult](#), [cftransaction](#), [cfquery](#), [cfupdate](#);  
“Optimizing database use” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `result` attribute.

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5. (ColdFusion MX uses Type 4 JDBC drivers.)

## Attributes

| Attribute                | Req/Opt  | Default | Description  |
|--------------------------|----------|---------|--|
| <code>procedure</code>   | Required |         | Name of stored procedure on database server.   |
| <code>dataSource</code>  | Required |         | Name of data source that points to database that contains stored procedure.                                    |
| <code>username</code>    | Optional |         | Overrides username in data source setup.   |
| <code>password</code>    | Optional |         | Overrides password in data source setup.   |
| <code>blockFactor</code> | Optional | 1       | Maximum number of rows to get at a time from server. Range is 1 to 100.  |
| <code>debug</code>       | Optional | No      | <ul style="list-style-type: none"><li>• Yes: lists debug information on each statement.</li><li>• No</li></ul> |

| Attribute  | Req/Opt  | Default | Description   |
|------------|----------|---------|---|
| returnCode | Optional | No      | <ul style="list-style-type: none"> <li>• Yes: populates <code>cfstoredproc.statusCode</code> with status code returned by the stored procedure.</li> <li>• No</li> </ul>  |
| result     | Optional |         | Specifies a name for the structure in which <code>cfstoredproc</code> returns the <code>statusCode</code> and <code>ExecutionTime</code> variables. If set, this value replaces <code>cfstoredproc</code> as the prefix to use when accessing those variables. For more information, see the Usage section. |

## Usage

Use this tag to call a database stored procedure. Within this tag, you code `cfprocresult` and `cfprocparam` tags as follows:

- `cfprocresult` If the stored procedure returns one or more result sets, code one `cfprocresult` tag per result set.
- `cfprocparam` If the stored procedure uses input or output parameters, code one `cfprocparam` tag per parameter, ensuring that you include every parameter in the stored procedure definition. Additionally, you must code `cfprocparam` tags in the same order as the parameters in the stored procedure definition.

If you set `returnCode = "Yes"`, this tag sets the variable `prefix.statusCode`, which holds the status code for a stored procedure. Status code values vary by DBMS. For the meaning of code values, see your DBMS documentation.

This tag sets the variable `prefix.ExecutionTime`, which contains the execution time of the stored procedure, in milliseconds.

The value of `prefix` is either `cfstoredproc` or the value specified by the `result` attribute, if it is set. The `result` attribute provides a way for stored procedures that are called from multiple pages, possibly at the same time, to avoid overwriting the results of one call with another. If you set the `result` attribute to `myResult`, for example, you would access `ExecutionTime` as `myResult.ExecutionTime`. Otherwise, you would access it as `cfstoredproc.ExecutionTime`.

Before implementing this tag, ensure that you understand stored procedures and their usage.

The following examples use a Sybase stored procedure; for an example of an Oracle 8 or 9 stored procedure, see `cfprocparam`.

## Example

```
<!-- This view-only example executes a Sybase stored procedure that
returns three result sets, two of which we want. The stored
procedure returns the status code and one output parameter,
which we display. We use named notation for the parameters. -->
<!--
<cfstoredproc procedure = "foo_proc"
  dataSource = "MY_SYBASE_TEST" username = "sa"
  password = "" dbServer = "scup" dbName = "pubs2"
  returnCode = "Yes" debug = "Yes">
  <cfprocresult name = RS1>
  <cfprocresult name = RS3 resultSet = 3>
```

```

    <cfprocparam type = "IN" CFSQLType = CF_SQL_INTEGER
        value = "1" dbVarName = @param1>
    <cfprocparam type = "OUT" CFSQLType = CF_SQL_DATE
        variable = F00 dbVarName = @param2>
</cfstoredproc>
--->
<!---
<cfoutput>The output param value: '#foo#'  
</cfoutput>
<h3>The Results Information</h3>
<cfoutput query = RS1>#name#,#DATE_COL#<br></cfoutput><p>
<cfoutput>
    <hr>
    <p>Record Count: #RS1.recordCount# >p>Columns: #RS1.columnList#<hr>
</cfoutput>
<cfoutput query = RS3>#col1#,#col2#,#col3#<br>
</cfoutput><p>
<cfoutput>
    <hr>
    <p>Record Count: #RS3.recordCount# <p>Columns: #RS3.columnList#<hr>
    The return code for the stored procedure is: '#cfstoredproc.statusCode#'<br>
</cfoutput>
--->

```

# cfswitch

## Description

Evaluates a passed expression and passes control to the `cfcase` tag that matches the expression result. You can, optionally, code a `cfdefaultcase` tag, which receives control if there is no matching `cfcase` tag value.

## Category

[Flow-control tags](#)

## Syntax

```
<cfswitch  
  expression = "expression">  
  one or more cfcase tags  
  zero or one cfdefaultcase tags  
</cfswitch>
```

## See also

[cfcase](#), [cfdefaultcase](#), [cfabort](#), [cfloop](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfrethrow](#), [cfthrow](#), [cftry](#); “`cfswitch`, `cfcase`, and `cfdefaultcase`” in Chapter 2, “Elements of CFML,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed `cfdefaultcase` tag placement requirements: you can put the `cfdefaultcase` tag at any position within a `cfswitch` statement; it is not required to be the last item.

## Attributes

| Attribute  | Req/Opt  | Default | Description   |
|------------|----------|---------|---|
| expression | Required |         | ColdFusion expression that yields a scalar value. ColdFusion converts integers, real numbers, Booleans, and dates to numeric values. For example, True, 1, and 1.0 are all equal. |

## Usage

This tag requires an end tag. All code within this tag must be within a `cfcase` or `cfdefaultcase` tag. Otherwise, ColdFusion throws an error.

Use this tag followed by one or more `cfcase` tags. Optionally, include a `cfdefaultcase` tag. This tag selects the matching alternative from the `cfcase` and `cfdefaultcase` tags, jumps to the matching tag, and executes the code between the `cfcase` start and end tags.

The `cfswitch` tag provides better performance than a series of `cfif/cfelseif` tags, and the code is easier to read.

## Example

```
<!-- This example shows the use of cfswitch and cfcase to
exercise a case statement in CFML. -->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
  SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
  FROM   Employees
</cfquery>

<h3>cfswitch Example</h3>
<!-- By outputting the query and using cfswitch, we classify the
output without using a cfloop construct. -->
<p>Each time the case is fulfilled, the specific information is printed;
if the case is not fulfilled, the default case is output </p>
<cfoutput query="GetEmployees">
<cfswitch expression="#Trim(Department)#">
  <cfcase value="Sales">
    #FirstName# #LastName# is in <b>sales</b><br><br>
  </cfcase>
  <cfcase value="Accounting">
    #FirstName# #LastName# is in <b>accounting</b><br><br>
  </cfcase> <cfcase value="Administration">
    #FirstName# #LastName# is in <b>administration</b><br><br>
  </cfcase>
  <cfdefaultcase>
    #FirstName# #LastName# is not in Sales, Accounting, or
    Administration.<br><br>
  </cfdefaultcase>
</cfswitch>
</cfoutput>
```

# cftable

## Description

Builds a table in a ColdFusion page. This tag renders data as preformatted text, or, with the `HTMLTable` attribute, in an HTML table. If you don't want to write HTML table tag code, or if your data can be presented as preformatted text, use this tag.

Preformatted text (defined in HTML with the `<pre>` and `</pre>` tags) displays text in a fixed-width font. It displays white space and line breaks exactly as they are written within the pre tags. For more information, see an HTML reference guide.

To define table column and row characteristics, use the `cfcol` tag within this tag.

## Category

[Data output tags](#)

## Syntax

```
<cftable
  query = "query_name"
  maxRows = "maxrows_table"
  colSpacing = "number_of_spaces"
  headerLines = "number_of_lines"
  HTMLTable
  border
  colHeaders
  startRow = "row_number">
  ...
</cftable>
```

## See also

[cfcol](#), [cfcontent](#), [cflog](#), [cfoutput](#), [cfprocessingdirective](#), [cftable](#); “Retrieving data” in Chapter 20, “Accessing and Retrieving Data,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute                | Req/Opt  | Default | Description  |
|--------------------------|----------|---------|--|
| <code>query</code>       | Required |         | Name of <code>cfquery</code> from which to draw data.  |
| <code>maxRows</code>     | Optional |         | Maximum number of rows to display in the table.  |
| <code>colSpacing</code>  | Optional | 2       | Number of spaces between columns.  |
| <code>headerLines</code> | Optional | 2       | Number of lines to use for table header (the default leaves one line between header and first row of table).   |
| <code>HTMLTable</code>   | Optional |         | Renders data in an HTML 3.0 table.<br>If you use this attribute (regardless of its value), ColdFusion renders data in an HTML table.   |
| <code>border</code>      | Optional |         | Displays border around table.<br>If you use this attribute (regardless of its value), ColdFusion displays a border around the table.<br>Use this only if you use the <code>HTMLTable</code> attribute. |

| Attribute  | Req/Opt  | Default | Description  |
|------------|----------|---------|--|
| colHeaders | Optional |         | Displays column heads. If you use this attribute, you must also use the <code>cfcol</code> tag header attribute to define them. If you use this attribute (regardless of its value), ColdFusion displays column heads. |
| startRow   | Optional | 1       | The query result row to put in the first table row.  |

## Usage

This tag aligns table data, sets column widths, and defines column heads.

At least one `cfcol` tag is required within this tag. You must put `cfcol` and `cftable` tags adjacent in a page. The only tag that you can nest within this tag is the `cfcol` tag. You cannot nest `cftable` tags.

To display the `cfcol` header text, you must specify the `cfcol` header and the `cftable` `colHeader` attribute. If you specify either attribute without the other, the header does not display and no error is thrown.

## Example

```
<!-- This example shows the use of cfcol and cftable to align information
returned from a query. -->
<!-- This query selects employee information from cfdoexamples
datasource. -->
<cfquery name = "GetEmployees" dataSource = "cfdoexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
</cfquery>

<html>
<body>
<h3>cftable Example</h3>

<!-- Note use of HTMLTable attribute to display cftable as an HTML table,
rather than as PRE formatted information. -->
<cftable query = "GetEmployees"
startRow = "1" colSpacing = "3" HTMLTable>
<!-- Each cfcol tag sets width of a column in table, and specifies header
information and text/CFML with which to fill cell. -->
<cfcol header = "<b>ID</b>"
align = "Left"
width = 2
text = "#Emp_ID#">

<cfcol header = "<b>Name/Email</b>"
align = "Left"
width = 15
text = "<a href = 'mailto:#Email#'>#FirstName# #LastName#</A>">

<cfcol header = "<b>Phone Number</b>"
align = "Center"
width = 15
text = "#Phone#">
```

```
</cftable>  
</body>  
</html>
```

# cftextarea

## Description

Puts a multiline text entry box in a `cfform` tag and controls its display characteristics.

## Category

[Forms tags](#)

## Syntax

```
<cftextarea
  name = "name"
  label = "text"
  required = "yes" or "no"
  style = "style specification"
  validate = "data type"
  validateAt= one or more of "onBlur", "onServer", "onSubmit"
  message = "text"
  range = "min_value, max_value"
  maxlength = "number"
  pattern = "regexp"
  onValidate = "script name"
  onError = "script name"
  disabled = "true" "false" or no attribute value
  value = "text"
  onKeyUp = "JavaScript or ActionScript"
  onKeyDown = "JavaScript or ActionScript"
  onMouseUp = "JavaScript or ActionScript"
  onMouseDown = "JavaScript or ActionScript"
  onChange = "JavaScript or ActionScript"
  onClick = "JavaScript or ActionScript"
  visible = "Yes" or "No"
  enabled = "Yes" or "No"
  tooltip = "Tip text"
  height = "number of pixels" Flash only
  width = "number of pixels" Flash only
>
  text
</cftextarea>
```

## History

ColdFusion MX 7: Added this tag.

## Attributes

The following table lists attributes that ColdFusion uses directly. In HTML format, the tag also supports all HTML `textarea` tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML.

| Attribute  | Req/Opt;<br>Format            | Default  | Description   |
|------------|-------------------------------|----------|---|
| name       | Required;<br>All              |          | Name of the <code>cfTextInput</code> control.   |
| label      | Optional;<br>Flash and<br>XML |          | Label to put beside the control on a form.  |
| style      | Optional;<br>All              |          | In HTML or XML format forms, ColdFusion passes the <code>style</code> attribute to the browser or XML.<br>In Flash format forms, must be a style specification in CSS format, with the same syntax and contents as used in Macromedia Flex for the corresponding Flash element.   |
| required   | Optional;<br>All              | no       | <ul style="list-style-type: none"><li>• yes: the field must contain text.</li><li>• no: the field can be empty.</li></ul>   |
| validate   | Optional;<br>All              |          | The type or types of validation to do. Available validation types and algorithms depend on the format. For details, see the Usage section of the <code>cfInput</code> tag reference.  |
| validateAt | Optional;<br>HTML and<br>XML  | onSubmit | How to do the validation; one or more of the following: <ul style="list-style-type: none"><li>• onSubmit</li><li>• onServer</li><li>• onBlur</li></ul> For Flash format forms, onSubmit and onBlur are identical; validation is done when the user submits the form. For multiple values, use a comma-delimited list. For details, see the Usage section of the <code>cfInput</code> tag reference. |
| message    | Optional;<br>All              |          | Message text to display if validation fails.  |
| range      | Optional;<br>All              |          | Minimum and maximum allowed numeric values. ColdFusion uses this attribute only if you specify <code>range</code> in the <code>validate</code> attribute.<br>If you specify a single number or a single number followed by a comma, it is treated as a minimum, with no maximum. If you specify a comma followed by a number, the maximum is set to the specified number, with no minimum.          |
| maxLength  | Optional;<br>All              |          | The maximum length of text that can be entered. ColdFusion uses this attribute only if you specify <code>maxlength</code> in the <code>validate</code> attribute.   |

| Attribute   | Req/Opt;<br>Format  | Default      | Description  |
|-------------|---|--------------|--|
| pattern     | Required if <code>validate = "regular_expression"</code><br>HTML and XML. |              | JavaScript regular expression pattern to validate input. Omit leading and trailing slashes. ColdFusion uses this attribute only if you specify <i>regex</i> in the <code>validate</code> attribute. For examples and syntax, see Chapter 27, "Building Dynamic Forms with <code>cfform</code> Tags" in <i>ColdFusion MX Developer's Guide</i> .  |
| onValidate  | Optional;<br>HTML and XML   |              | Custom JavaScript function to validate user input. The JavaScript DOM form object, input object, and input object value are passed to routine, which should return True if validation succeeds, False otherwise. If you specify this attribute, ColdFusion ignores the <code>validate</code> attribute.  |
| onError     | Optional;<br>HTML and XML   |              | Custom JavaScript function to execute if validation fails.   |
| disabled    | Optional;<br>All  | not disabled | Disables user input, making the control read-only. To disable input, specify <code>disabled</code> without an attribute, or <code>disabled="Yes"</code> (or any ColdFusion positive Boolean value, such as True). To enable input, omit the attribute or specify <code>disabled="No"</code> (or any ColdFusion negative Boolean value, such as False).   |
| value       | Optional;<br>All  |              | Initial value to display in text control. You can specify an initial value as an attribute or in the tag body, but not in both places. If you specify the value as an attribute, you must put the closing <code>cftextarea</code> tag immediately after the opening <code>cftextarea</code> tag, with no spaces or line feeds between, or place a closing slash at the end of the opening <code>cftextarea</code> tag; for example <code>&lt;cftextarea name="description" value="Enter a description." /&gt;</code> . |
| bind        | Optional;<br>Flash  |              | A Flex bind expression that populates the field with information from other form fields. For details, see Usage.   |
| onKeyUp     | Optional;<br>All  |              | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.   |
| onKeyDown   | Optional;<br>All  |              | JavaScript (HTML/XML) or ActionScript (Flash) ActionScript to run when the user presses a keyboard key in the control.   |
| onMouseUp   | Optional;<br>All  |              | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.  |
| onMouseDown | Optional;<br>All  |              | JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.   |
| onChange    | Optional;<br>All  |              | JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action.  |
| onClick     | Optional;<br>All  |              | JavaScript (HTML/XML) to run when the user clicks the control. Not supported for Flash forms.  |

| Attribute | Req/Opt;<br>Format | Default | Description  |
|-----------|--------------------|---------|--|
| enabled   | Optional;<br>Flash | Yes     | Boolean value specifying whether the control is enabled. A disabled control appears in light gray. The inverse of the <code>disabled</code> attribute. |
| visible   | Optional;<br>Flash | Yes     | Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank.                                   |
| tooltip   | Optional;<br>Flash |         | Text to display when the mouse pointer hovers over the control.  |
| height    | Optional;<br>Flash |         | The height of the control, in pixels.  |
| width     | Optional;<br>Flash |         | The width of the control, in pixels.   |

**Note:** Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion MX. They are, however, included in the generated XML.

### Usage

For this tag to work properly in HTML format, the browser must be JavaScript-enabled.

If you put text in the tag body, the control displays all text characters between the `cftextarea` opening and closing tags; therefore, if you use line feeds or white space to format your source text, they appear in the control.

If the `cfform preserveData` attribute is "yes", and the form posts back to the same page, the posted value (not the value of the `value` attribute) of the `cftextinput` control is used.

### Validation

For a detailed description of the `validation` attribute and the types of validation supported by ColdFusion, see the Usage section of the `cfinput` tag reference. For more details on ColdFusion MX validation techniques, see Chapter 28, "Validating Data" in *ColdFusion MX Developer's Guide*.

### Flash form data binding

The `bind` attribute lets you populate form fields using the contents of other form fields. To specify text from another field in a `cftextarea` `bind` attribute, use the following format:

```
{sourceTagName.text}
```

For example, the following line uses the value of the text that the user enters in the form from the `userName` field in the greeting in the comment text box. The user can change or replace this message with a typed entry.

```
<cfformitem type="text">
Enter your name here</cfformitem>
<cftextarea name="userName" height="20" width="500"/>
<cftextarea name="comment" html height="300" width="500"
```

```
bind="Hello {userName.text}!  
Enter your comments here." />
```

## Example

This example has two `cftextarea` controls. When you submit the form, ColdFusion copies the text from the first control into the second. The `onBlur` `maxlength` validation prevents you from entering more than 100 characters. The `>` character that closes the `cftextarea` opening tag, the text in the tag body, and the `cftextarea` closing tag are on a single line to ensure that only the desired text displays, but the line is split in this example for formatting purposes.

```
<h3>cftextarea Example</h3>  
<cfparam name="text2" default="">  
<cfif isdefined("form.textarea1") AND (form.textarea1 NEQ "")>  
    <cfset text2=form.textarea1>  
</cfif>  
  
<cfform name="form1">  
    <cftextarea name="textarea1" wrap="virtual" rows="5" cols="25"  
        validate="maxlength" validateAt="onBlur" maxlength="100"  
        >Replace this text. Maximum length is 100 Characters, and this text is  
        currently 99 characters long.</cftextarea>  
    <cftextarea name="textarea2" wrap="virtual" rows="5" cols="50"  
        value="#text2#" /><br><br>  
    <input type="submit" value="submit field"><br>  
</cfform>
```

# cfTextInput

## Description

Puts a single-line text entry box in a `cfform` tag and controls its display characteristics.

This tag is deprecated, and is not supported in XML format forms. In its place, you should use a `cfinput` or `cfTextArea` tag and use a cascading style sheet (CSS) to specify the text style characteristics.

## History

ColdFusion MX 7: This tag is deprecated. In later releases it might not work, and might cause an error.

ColdFusion MX 6.1: Changed the `validate = "creditcard"` option requirements: the text entry must have 13-16 digits.

# cfthrow

## Description

Throws a developer-specified exception, which can be caught with a `cfcatch` tag that has any of the following `type` attribute options:

- `type = "custom_type"`
- `type = "Application"`
- `type = "Any"`

## Category

[Exception handling tags](#), [Flow-control tags](#)

## Syntax 1

```
<cfthrow
  type = "exception_type "
  message = "message"
  detail = "detail_description "
  errorCode = "error_code "
  extendedInfo = "additional_information"
  object = "java_except_object">
```

## Syntax 2

```
<cfthrow
  object = #object_name#>
```

## See also

[cferror](#), [cfrethrow](#), [cftry](#), [onError](#); Chapter 14, “Handling Errors” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed thrown exceptions: this tag can throw ColdFusion component method exceptions.

## Attributes

| Attribute              | Req/Opt  | Default     | Description  |
|------------------------|----------|-------------|--|
| <code>type</code>      | Optional | Application | <ul style="list-style-type: none"><li>• A custom type</li><li>• Application</li></ul> Do not enter another predefined type; types are not generated by ColdFusion applications. If you specify Application, you need not specify a type for <code>cfcatch</code> . |
| <code>message</code>   | Optional |             | Message that describes exception event.  |
| <code>detail</code>    | Optional |             | Description of the event. ColdFusion appends error position to description; server uses this parameter if an error is not caught by your code.   |
| <code>errorCode</code> | Optional |             | A custom error code that you supply.   |

| Attribute    | Req/Opt  | Default | Description   |
|--------------|----------|---------|---|
| extendedInfo | Optional |         | A custom error code that you supply.  |
| object       | Optional |         | Requires the value of the <code>cfobject</code> tag <code>name</code> attribute. Throws a Java exception from a CFML tag. This attribute is mutually exclusive with all other attributes of this tag. |

## Usage

Use this tag within a `cftry` block, to throw an error. The `cfcatch` block can access accompanying information, as follows:

- Message, with `cfcatch.message`
- Detail, with `cfcatch.detail`
- Error code, with `cfcatch.errorcode`

To get more information, use `cfcatch.tagContext`. This array shows where control switches from one page to another in the tag stack (for example, `cfinclude`, `cfmodule`).

To display the information displayed by `tagContext`: in the ColdFusion MX Administrator, Debugging page, select Enable CFML Stack Trace.

**Using the object parameter** To use this tag with the `object` parameter, you must first use a `cfobject` tag that specifies a valid Java exception class. For example, the following `cfobject` tag defines an object, `obj`, of the exception class `myException` (which you must create in Java):

```
<cfobject
  type="java"
  action="create"
  class="myException"
  name="obj">
```

If your exception class has constructors that take parameters, such as a message, you can use the special `init` method to invoke the constructor, as in the following line. If you do not need to specify any constructor attributes, you can omit this step.

```
<cfset obj.init("You must save your work before preceding")>
```

You can then use the, the `cfthrow` statement to throw the exception as follows:

```
<cfthrow object=#obj#>
```

For more information on using Java objects in ColdFusion, see Chapter 37, “Integrating J2EE and Java Elements in CFML Applications” in *ColdFusion MX Developer’s Guide*.

## Example 1

```
<h3>cfthrow Example</h3>
<!-- Open a cftry block. -->
<cftry>
<!-- Define a condition upon which to throw the error. -->
<cfif NOT IsDefined("URL.myID")>
  <!-- throw the error -->
  <cfthrow message = "ID is not defined">
</cfif>
```

```

<!-- Perform the error catch. -->
<cfcatch type = "application">
<!-- Display your message. -->
  <h3>You've Thrown an <b>Error</b></h3>
<cfoutput>
  <!-- And the diagnostic feedback from the application server. -->
  <p>#cfcatch.message#</p>
  <p>The contents of the tag stack are:</p>
  <cfloop
    index = i
    from = 1 to = #ArrayLen(cfcatch.tagContext)#>
    <cfset sCurrent = #cfcatch.tagContext[i]#>
    <br>#i# #sCurrent["ID"]#
    (#sCurrent["LINE"]#, #sCurrent["COLUMN"]#)
    #sCurrent["TEMPLATE"]#
  </cfloop>
</cfoutput>
</cfcatch>
</cftry>

```

## Example2

The following example shows how to throw an exception from a component method:

```

<cfcomponent>
  <cffunction name="getEmp">
    <cfargument name="lastName" required="yes">
      <cfquery name="empQuery" datasource="cfdoexamples" >
        SELECT LASTNAME, FIRSTNAME, EMAIL
        FROM tblEmployees
        WHERE LASTNAME LIKE '#arguments.lastName#'
      </cfquery>
      <cfif empQuery.recordcount LT 1>
        <cfthrow type="noQueryResult"
          message="No results were found. Please try again.">
      <cfelse>
        <cfreturn empQuery>
      </cfif>
    </cffunction>
  </cfcomponent>

```

For an explanation of the example and more information, see Chapter 10, “Building and Using ColdFusion Components” in *ColdFusion MX Developer’s Guide*.

# cftimer

## Description

Displays execution time for a specified section of CFML code. ColdFusion MX displays the timing information along with any output produced by the timed code.

**Note:** To permit this tag to execute, you must enable the Timer Information option under Debugging Settings in the ColdFusion MX Administrator.

## Category

[Debugging tags](#)

## Syntax

```
<cftimer
  label= "text"
  type = "inline" or "outline" or "comment" or "debug" >

  CFML statement(s)

</cftimer>
```

## See also

[cfdump](#), [cftrace](#); Chapter 18, “Debugging and Troubleshooting Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description  |
|-----------|----------|---------|--|
| label     | Optional | " "     | Label to display with timing information.  |
| type      | Optional | debug   | <ul style="list-style-type: none"><li>inline: displays timing information inline, following the resulting HTML.</li><li>outline: displays timing information and also displays a line around the output produced by the timed code. The browser must support the FIELDSET tag to display the outline.</li><li>comment: displays timing information in an HTML comment in the format <code>&lt;!-- label: elapsed-time ms --&gt;</code>. The default label is <code>cftimer</code>.</li><li>debug: displays timing information in the debug output under the heading CFTimer Times.</li></ul> |

## Usage

Use this tag to determine how long it takes for a block of code to execute. You can nest `cftimer` tags.

This tag is useful for debugging CFML code during application development. In production, you can leave `cftimer` tags in your code as long as you have disabled the debugging option in the ColdFusion MX Administrator.

## Example1

```
...
<!-- type="inline" -->
  <cftimer label="Query and Loop Time Inline" type="inline">
    <cfquery name="empquery" datasource="cfdocexamples">
      select *
      from Employees
    </cfquery>

    <cfloop query="empquery">
      <cfoutput>#lastname#, #firstname#</cfoutput><br>
    </cfloop>
  </cftimer>
<hr><br>

<!-- type="outline" -->
  <cftimer label="Query and CFOUTPUT Time with Outline" type="outline">
    <cfquery name="coursequery" datasource="cfdocexamples">
      select *
      from CourseList
    </cfquery>
    <table border="1" width="100%">
      <cfoutput query="coursequery">
        <tr>
          <td>#Course_ID#</td>
          <td>#CorName#</td>
          <td>#CorLevel#</td>
        </tr>
      </cfoutput>
    </table>
  </cftimer>
<hr><br>

<!-- type="comment" -->
  <cftimer label="Query and CFOUTPUT Time in Comment" type="comment">
    <cfquery name="parkquery" datasource="cfdocexamples">
      select *
      from Parks
    </cfquery>
    <p>Select View &gt; Source to see timing information</p>
    <table border="1" width="100%">
      <cfoutput query="parkquery">
        <tr>
          <td>#Parkname#</td>
        </tr>
      </cfoutput>
    </table>
  </cftimer>
<hr><br>

<!-- type="debug" -->
  <cftimer label="Query and CFOUTPUT Time in Debug Output" type="debug">
    <cfquery name="deptquery" datasource="cfdocexamples">
      select *
```

```
        from Departments
    </cfquery>
    <p>Scroll down to CFTimer Times heading to see timing information</p>
    <table border="1" width="100%">
    <cfoutput query="deptquery">
    <tr>
    <td>#Dept_ID#</td>
    <td>#Dept_Name#</td>
    </tr>
    </cfoutput>
    </table>
</cftimer>
...
```

# cftrace

## Description

Displays and logs debugging data about the state of an application at the time the `cftrace` tag executes. Tracks runtime logic flow, variable values, and execution time. Displays output at the end of the request or in the debugging section at the end of the request; or, in Dreamweaver MX and later, in the Server Debug tab of the Results window.

ColdFusion logs `cftrace` output to the file `logs\cftrace.log`, in the ColdFusion installation directory.

**Note:** To permit this tag to execute, you must enable debugging in the ColdFusion MX Administrator. Optionally, to report trace summaries, enable the Trace section.

## Category

[Debugging tags](#), [Variable manipulation tags](#)

## Syntax

```
<cftrace
  abort = "Yes" or "No"
  category = "string"
  inline = "Yes" or "No"
  text = "string"
  type = "format"
  var = "variable_name"
</cftrace>
```

## See also

[cfdump](#), [cferror](#), [cfrethrow](#), [cftimer](#), [cftry](#); Chapter 18, “Debugging and Troubleshooting Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this tag.

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| abort     | Optional | No      | <ul style="list-style-type: none"><li>• Yes: calls a <code>cfabort</code> tag when the tag is executed.</li><li>• No</li></ul>  |
| category  | Optional |         | User-defined string for identifying trace groups.   |
| inline    | Optional | No      | <ul style="list-style-type: none"><li>• Yes: displays trace code in line on the page in the location of the <code>cftrace</code> tag, in addition to the debugging information output.</li><li>• No</li></ul> |
| text      | Optional |         | User-defined string, which can include simple variables, but not complex variables such as arrays. Outputs to the <code>cflog</code> <code>text</code> attribute.   |

| Attribute | Req/Opt  | Default     | Description  |
|-----------|----------|-------------|--|
| type      | Optional | Information | Corresponds to the <code>cflog type</code> attribute; displays an appropriate icon: <ul style="list-style-type: none"> <li>• Information</li> <li>• Warning</li> <li>• Error</li> <li>• Fatal Information</li> </ul> |
| var       | Optional |             | The name of a simple or complex variable to display. Useful for displaying a temporary value, or a value that does not display on any CFM page.  |

## Usage

You cannot put application code within this tag. (This avoids problems that can occur if you disable debugging.)

This tag is useful for debugging CFML code during application development.

You can display `cftrace` tag output in the following ways:

- As a section in the debugging output
- In-line in an application page, and as a section in debugging output. If you specify in-line tracing, ColdFusion flushes all output up to the `cftrace` tag, and displays the trace output when it encounters the tag.

This is an example of a log file entry:

```
"Information","web-4","04/08/02","23:21:30", "[30 ms (1st trace)]
[C:\CFusionMX7\wwwroot\generic.cfm @ line: 9] -
  [thisPage = /generic.cfm] "
"Information","web-0","04/08/02","23:58:58", "[5187 ms (10)]
[C:\CFusionMX7\wwwroot\generic.cfm @ line: 14] - [category]
  [thisPage = /generic.cfm] [ABORTED] thisPage "
```

For a complex variable, ColdFusion lists the variable name and the number of elements in the object; it does not log the contents of the variable.

## Example

The following example traces a FORM variable that is evaluated by a `cfif` block:

```
<cftrace var="FORM.variable"
  text="doing equivalency check for FORM.variable"
  category="form_vars"
  inline="true">
<cfif isDefined("FORM.variable") AND #FORM.variable# EQ 1>
  <h1>Congratulations, you're a winner!</h1>
<cfelse>
  <h1>Sorry, you lost!</h1>
</cfif>
```

# cftransaction

## Description

For enterprise database management systems that support transaction processing, instructs the database management system to treat multiple database operations as a single transaction. Provides database commit and rollback processing. See the documentation for your database management system to determine whether it supports SQL transaction processing.

## Category

[Database manipulation tags](#)

## Syntax

```
<cftransaction  
  action = "begin" or "commit" or "rollback"  
  isolation = "read_uncommitted" or "read_committed" or  
    "repeatable_read" >  
</cftransaction>
```

## See also

[cfinsert](#), [cfproccparam](#), [cfprocresult](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cfupdate](#);  
“Commits, rollbacks, and transactions” in Chapter 19, “Introduction to Databases and SQL,” in *ColdFusion MX Developer’s Guide*

## Attributes

| Attribute | Req/Opt  | Default | Description   |
|-----------|----------|---------|---|
| action    | Optional | begin   | <ul style="list-style-type: none"><li>begin: the start of the block of code to execute.</li><li>commit: commits a pending transaction.</li><li>rollback: rolls back a pending transaction.</li></ul>  |
| isolation | Optional |         | ODBC lock type: <ul style="list-style-type: none"><li>read_uncommitted: reads without regard for other transactions that are taking place. Sometimes called a ‘dirty read’ because data that is read can be in a transitional state and therefore not accurate.</li><li>read_committed: uses shared locks to assure that no other transaction modifies rows that this transaction uses.</li><li>repeatable_read: same as read_committed, except that rows in the recordset are exclusively locked until the transaction completes. Due to high overhead, Macromedia does not recommend this isolation level for normal database access.</li><li>serializable: places an exclusive lock on every data table in use for the duration of the transaction. Causes access to the database to be single-threaded and is therefore not recommended for normal database access.</li></ul> |

## Usage

If you do not specify a value for the `action` attribute, automatic transaction processing proceeds as follows:

- If the `cfquery` operations within the transaction block complete without an error, the transaction is committed.
- If a `cfquery` tag generates an error within a `cftransaction` block, all `cfquery` operations in the transaction roll back.

If you do not specify a value for the `isolation` attribute, ColdFusion uses the default isolation level for the associated database.

Using CFML error handling and the `action` attribute, however, you can also explicitly control whether a transaction is committed or rolled back, based on the success or failure of the database query. Within a transaction block, you can do the following:

- Commit a database transaction by nesting the `<cftransaction action = "commit"/>` tag within the block
- Roll back a transaction by nesting the `<cftransaction action = "rollback"/>` tag within the block

(In these examples, the slash is alternate syntax that is the equivalent of an end tag.)

Within a transaction block, you can write queries to more than one database, but you must commit or roll back a transaction to one database before writing a query to another.

To control how the database engine performs locking during the transaction, use the `isolation` attribute.

## Example

`<p>CFTRANSACTION` can be used to group multiple queries that use `CFQUERY` into one business event. Changes to data that is requested by the queries are not committed to the `datasource` until all actions within the transaction block have executed successfully.

`<p>`This a view-only example.

`<!---`

`<cftransaction>`

`<cfquery name='makeNewCourse' datasource='Snippets'>`

`INSERT INTO Courses`

`(Number, Descript)`

`VALUES`

`( '#myNumber#', '#myDescription#' )`

`</cfquery>`

`<cfquery name='insertNewCourseToList' datasource='Snippets'>`

`INSERT INTO CourseList`

`(CorNumber, CorDesc, Dept_ID,`

`CorName, CorLevel, LastUpdate)`

`VALUES`

`( '#myNumber#', '#myDescription#', '#myDepartment#',`

`'#myDescription#', '#myCorLevel#', #Now()# )`

`</cfquery>`

`</cftransaction>`

`--->`

# cf tree

## Description

Inserts a tree control in a form. Validates user selections. Used within a `cfform` tag block. You can use a ColdFusion query to supply data to the tree.

## Category

[Forms tags](#)

## Syntax

```
<cf tree name = "name"
  format="applet", "flash", xml, or "object"
  required = "yes" or "no"
  delimiter = "delimiter"
  completePath = "yes" or "no"
  appendKey = "yes" or "no"
  highlightHref = "yes" or "no"
  onValidate = "script_name"
  message = "text"

## History

ColdFusion MX 7:

- Added the `format` attribute and support for generating Flash and XML and object output.
- Added `enabled`, `onChange`, `style`, `tooltip`, and `visible` attributes (Flash format only).

ColdFusion MX: Changed behavior: ColdFusion renders a tree control regardless of whether there are any `treeitems` within it.

## Attributes

**Note:** In XML format, ColdFusion MX passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format trees, but do display applet and Flash format trees.

| Attribute                 | Req/Opt Format                 | Default | Description  |
|---------------------------|--------------------------------|---------|--|
| <code>name</code>         | Required;<br>All               |         | Name for tree control.   |
| <code>format</code>       | Optional;<br>All               | applet  | <ul style="list-style-type: none"><li>• <code>applet</code>: displays the tree using a Java applet in the browser.</li><li>• <code>flash</code>: displays the tree using a Flash control</li><li>• <code>object</code>: returns the tree as a ColdFusion structure with the name specified by the <code>name</code> attribute. For details of the structure contents, see <a href="#">"object format"</a>.</li><li>• <code>xml</code>: generates an XML representation of the tree. In XML format forms, includes the generated XML in the form. In HTML format forms, puts the XML in a string variable with the name specified by the <code>name</code> attribute.</li></ul>                     |
| <code>required</code>     | Optional;<br>Applet,<br>Flash  | No      | <ul style="list-style-type: none"><li>• Yes: user must select an item in the tree control.</li><li>• No</li></ul>  |
| <code>delimiter</code>    | Optional;<br>All               | \\      | Character to separate elements in the <code>Form.treename.path</code> variable of the action page.   |
| <code>completePath</code> | Optional;<br>Applet,<br>object | No      | <ul style="list-style-type: none"><li>• Yes: starts the <code>Form.treename.path</code> variable with the root of the tree path when <code>cftree</code> is submitted.</li><li>• No: omits the root level from the <code>Form.treename.path</code> variable; the value starts with the first child node in the tree.</li></ul> <p>For the <code>preserveData</code> attribute of <code>cfform</code> to work with the tree, you must set this attribute to Yes.</p> <p>For tree items populated by a query, if you use the <code>cftreeitem queryasroot</code> attribute to specify a root name, that value is returned. If you do not specify a root name, ColdFusion returns the query name.</p> |

| Attribute     | Req/Opt Format           | Default           | Description   |
|---------------|--------------------------|-------------------|---|
| appendKey     | Optional; All            | Yes               | <ul style="list-style-type: none"> <li>• Yes: if you use <code>cftreeitem href</code> attributes, ColdFusion appends a <code>CFTREEITEMKEY</code> query string variable with the value of the selected tree item to the <code>cfform</code> action URL.</li> <li>• No: does not append the tree item value to the URL.</li> </ul> |
| highlightHref | Optional; Applet, Object | Yes               | <ul style="list-style-type: none"> <li>• Yes: highlights as a link the displayed value for any <code>cftreeitem</code> tag that specifies an <code>href</code> attribute.</li> <li>• No: disables highlighting.</li> </ul>  |
| onValidate    | Optional; Applet         |                   | JavaScript function to validate user input. The JavaScript DOM form object, input object, and input object value are passed to the specified routine, which should return True if validation succeeds; False, otherwise.  |
| message       | Optional; Applet         |                   | Message to display if validation fails.   |
| onError       | Optional; Applet         |                   | JavaScript function to execute if validation fails.   |
| lookAndFeel   | Optional; Applet, object | windows           | <ul style="list-style-type: none"> <li>• motif: renders the slider in Motif style.</li> <li>• windows: renders the slider in Windows style.</li> <li>• metal: renders the slider in Java Swing style.</li> </ul> If the platform does not support a style option, the tag defaults to platform default style.                     |
| font          | Optional; Applet         |                   | Font name for text in the tree control.   |
| fontSize      | Optional; Applet, Flash  |                   | Font size for text in the tree control, in points.  |
| italic        | Optional; Applet, Flash  | No                | <ul style="list-style-type: none"> <li>• Yes: displays tree control text in italics.</li> <li>• No</li> </ul>   |
| bold          | Optional; Applet, Flash  | No                | <ul style="list-style-type: none"> <li>• Yes: displays tree control text in bold.</li> <li>• No</li> </ul>  |
| height        | Optional; Applet, Flash  | 320 (applet only) | Tree control height, in pixels. If you omit this attribute in Flash format, Flash automatically sizes the tree.   |
| width         | Optional; Applet, Flash  | 200 (applet only) | Tree control width, in pixels. If you omit this attribute in Flash format, Flash automatically sizes the tree.  |
| vSpace        | Optional; Applet         |                   | Vertical margin above and below tree control, in pixels.  |
| hSpace        | Optional; Applet         |                   | Horizontal spacing to left and right of tree control, in pixels.  |

| Attribute    | Req/Opt Format                 | Default | Description  |
|--------------|--------------------------------|---------|--|
| align        | Optional;<br>Applet,<br>object |         | <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• bottom</li> <li>• baseline</li> <li>• texttop</li> <li>• absbottom</li> <li>• middle</li> <li>• absmiddle</li> <li>• right</li> </ul>  |
| border       | Optional;<br>Applet,<br>object | Yes     | <ul style="list-style-type: none"> <li>• Yes: displays a border around the tree control.</li> <li>• No</li> </ul>  |
| hScroll      | Optional;<br>Applet,<br>object | Yes     | <ul style="list-style-type: none"> <li>• Yes: permits horizontal scrolling.</li> <li>• No</li> </ul>   |
| vScroll      | Optional;<br>Applet,<br>object | Yes     | <ul style="list-style-type: none"> <li>• Yes: permits vertical scrolling.</li> <li>• No</li> </ul>   |
| style        | Optional;<br>Flash             |         | Must be a style specification in CSS format, with the same syntax and contents as used in Macromedia Flex for the corresponding Flash element.   |
| enabled      | Optional;<br>Flash             | Yes     | Flash format only: Boolean value specifying whether the control is enabled. A disabled control appears in light gray.  |
| visible      | Optional;<br>Flash             | Yes     | Flash format only: Boolean value specifying whether to show the control. Space that would be occupied by an invisible control is blank.  |
| tooltip      | Optional;<br>Flash             |         | Flash format only: Text to display when the mouse pointer hovers over the control.   |
| onChange     | Optional;<br>Flash             |         | <p>ActionScript to run when the control changes due to user action.</p> <p>If you specify an onChange event handler, the Form scope of the ColdFusion action page does not automatically get information about selected items. The ActionScript onChange event handler must handle all changes and selections.</p>   |
| notSupported | Optional;<br>Applet            |         | <p>Text to display if a page that contains a Java applet-based <code>cfform</code> control is opened by a browser that does not support Java or has Java support disabled. For example:</p> <pre>"&lt;b&gt; Browser must support Java to view ColdFusion Java Applets&lt;/b&gt;"</pre> <p>Default message:</p> <pre>&lt;b&gt;Browser must support Java to &lt;br&gt;view ColdFusion Java Applets&lt;/b&gt;</pre> |

**Note:** All attributes are passed to the XML generated in XML format, but no ColdFusion MX skin interprets `cftree` XML.

## Usage

This tag must be in a `cfform` tag block.

The applet format tree requires the client to download a Java applet. Also, if the client does not have an up-to-date Java plugin installed, the system might also have to download an updated Java plugin to display an applet format tree. The Flash format tree uses a Flash control, and can be embedded in an HTML format `cfform` tag. For this tag to work properly in either Flash or applet format, the browser must also be JavaScript-enabled.

**Note:** If you specify Flash format for this tag in an HTML format form, and you do not specify `height` and `width` attributes, Flash takes up more than the remaining visible area on the screen. If any other output follows the tree, including any form controls, users must scroll to see it. Therefore, if you follow a Flash tree in an HTML form with additional output, specify `height` and `width` values.

If the following conditions are true, a user's selection from query data that populates this tag's options continues to display after the user submits the form:

- The `cfform preserveData` attribute is set to "Yes"
- The `cfform action` attribute posts to the same page as the form itself (this is the default), or the action page has a form that contains controls with the same names as corresponding controls on the user entry form

For more information, see the `cfform` tag entry.

## Form variables

When you select a tree item and submit the form that contains the tree, ColdFusion creates a structure with two variables in the action page Form scope. The structure name is the tree name. The fields are as follows:

| Field | Value   |
|-------|---|
| path  | The path through the tree to the selected node, in the form <code>[root\]node_1\node_2\...</code> . In applet format, the path includes the root node only if the <code>completePath</code> attribute is True. In Flash format, the path always includes the root node. |
| node  | The value of the selected tree node.  |

## object format

If you specify `object` in the `format` attribute, ColdFusion returns the tree as a ColdFusion structure, and does not send the tree to the browser. You can, for example, loop over the structure to populate a menu, generate "breadcrumb" links for page navigation, or create a dhtml tree.

**Note:** If you specify an object format tree in an XML format form, ColdFusion does not generate the tree.

The structure variable name is specified by the `cftree` name attribute. The top level of the structure has two types of entries:

- Attribute settings
- A children array

### Attribute settings

The structure has top-level entries with the values of the following `cftree` attributes:

|                        |                           |                            |                          |
|------------------------|---------------------------|----------------------------|--------------------------|
| <code>align</code>     | <code>completePath</code> | <code>highlightHref</code> | <code>lookAndFeel</code> |
| <code>appendKey</code> | <code>delimiter</code>    | <code>hScroll</code>       | <code>name</code>        |
| <code>bold</code>      | <code>fontWeight</code>   | <code>italic</code>        | <code>vscroll</code>     |
| <code>border</code>    |                           |                            |                          |

### Children array

The top-level children entry is an array of items entries. Each item has the following entries:

| Field                    | Value  |
|--------------------------|--|
| <code>children</code>    | This item's child items; an array of item structures.  |
| <code>display</code>     | Tree item label, as determined by the <code>cftreeitem display</code> attribute.                                   |
| <code>expand</code>      | Whether to expand the item to display any children; value of <code>cftreeitem expand</code> attribute.             |
| <code>href</code>        | The URL to link to when the user selects the item; value of the <code>cftreeitem href</code> attribute.            |
| <code>img</code>         | The tree image icon Image to display as an icon for the tree item; value of <code>cftreeitem img</code> attribute. |
| <code>imgOpen</code>     | Image to display when the tree item is open (expanded); value of <code>cftreeitem imgopen</code> attribute.        |
| <code>parent</code>      | Value of this item's parent item in the tree.  |
| <code>path</code>        | The node path from the tree root to the current element.   |
| <code>queryAsRoot</code> | Whether the query is the root of the item; value of <code>cftreeitem queryAsRoot</code> attribute.                 |
| <code>target</code>      | The link target, such as <code>_blank</code> ; value of the item's <code>cftreeitem target</code> attribute.       |
| <code>value</code>       | The item's value, as determined by the <code>cftreeitem value</code> attribute.                                    |

### Example

The following example creates a tree that shows available courses from the `CourseList` table of the `cfdocexamples` database, and puts each department's courses in a folder. This example is displayed in Flash and uses the `Departments` list to get department names.

```
<cfquery name="getCourses" datasource="cfdocexamples">
  select d.dept_name, c.course_id, c.CorName, c.CorLevel, c.corName + ' ( '
  +c.corLevel + ' )' as corLabel
```

```

    from CourseList c, Departments d
    where d.Dept_ID = c.Dept_ID
    order by d.dept_Name, c.corName, c.corLevel
</cfquery>

<cfform name="studentForm" format="flash" width="400" height="450">
  <cftree name="courseTree" width="350" height="400">
    <cftreeitem
      query="getCourses"
      value="dept_name, Course_id"
      display="dept_name, CorLabel" queryasroot="NO" expand="yes,no">
    </cftree>
  </cform>

```

The following example creates a tree that shows the basic information about all employees in an organization, organized by department. The departments are expanded to show all employees. You can click the + signs to display additional information. If you click the employee name, ColdFusion links back to the same page and displays the Path and node values for the selection.

```

<!-- Query the datasource to get employee information. -->
<!-- Group the output by Department.
  (All fields are required in Group By clause.) -->
<cfquery name = "GetEmployees" dataSource = "cfdoexamples">
  SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
  FROM Employees
  GROUP BY Department, Emp_ID, FirstName, LastName, EMail, Phone
</cfquery>
<html>
<body>
<h3>cftree Example</h3>

<!-- The following runs if the user clicked on a link in the tree.
  A complete application would use the ID for additional processing. -->

<cfif isdefined("Form.fieldnames")>
<b>Selected item information</b><br>
<cfoutput>
<b>Path: </b>#form.Employees.Path#<br>
<b>node: </b>#form.Employees.node#<br>
<br>
</cfoutput>
</cfif>

<!-- Display the tree. The cftree tag must be in a cfform. -->
<cfform action="#cgi.script_name#" preservedata="Yes" format="Flash">
  <cftree name = "Employees" height = "400" width = "400"
    font = "Arial Narrow" italic="yes" highlighthref="No" HScroll="no"
    VScroll="no"
    completepath="no" lookandfeel="windows" border="No" required="yes">
  <!-- cfform tag with a group attribute loops over the departments. -->
  <cfoutput group="Department" query = "GetEmployees">
    <cftreeitem value="#Department#" parent="Employees" expand="yes">
    <!-- This cfoutput tag loops over the records for the department.
      The cfoutput tag does not need any attributes. -->
    <cfoutput>

```

```

<!-- Create an item for each employee in the department.
Do not expand children. Each employee name links to this page,
and sends the employee ID in the query string.-->
<cfTREEitem value = "#LastName#, #FirstName#"
    parent = "#Department#" expand="false" img="cd"
    href="#cgi.script_name#?user_id=#emp_id#">
<!-- Each Employee entry has Id, and contact info children. --->
<cfTREEitem value = "#Emp_ID#" display = "Employee ID: #Emp_ID#"
    parent = "#LastName#, #FirstName#" img="remote">
<!-- Each node must be unique value, so use Emp_ID om value. --->
<cfTREEitem value = "#Emp_ID#_ContactInfo" img="computer"
    display = "Contact Information"

</cfFORM>

```

# cftreeitem

## Description

Populates a form tree control, created with the `cftree` tag, with one or more elements.

## Category

[Forms tags](#)

## Syntax

```
<cftreeitem  
  value = "text"  
  display = "text"  
  parent = "parent_name"  
  img = "filename"  
  imgopen = "filename"  
  href = "URL"  
  target = "URL_target"  
  query = "queryname"  
  queryAsRoot = "yes" or "no"  
  expand = "yes" or "no">
```

## Attributes

**Note:** In XML format, ColdFusion MX passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format trees, but do display applet and Flash format trees.

| Attribute | Req/Opt; Default Format | Description   |
|-----------|-------------------------|---|
| value     | Required; All           | Value passed when <code>cform</code> is submitted. When populating a tree with data from a <code>cfquery</code> , you can specify multiple columns to use in a delimited list; for example, <code>value = "dept_id,emp_id"</code> . In this case, each column generates an item that is a child of the column that precedes it in the list. |
| display   | Optional; value All     | Tree item label. When populating a tree with data from a query, specify names in a delimited list. Example: <code>display = "dept_name,emp_name"</code>   |
| parent    | Optional; All           | Value of the tree item parent. Determines the item’s placement in the tree hierarchy. If omitted, the item is placed at the tree root level, or if the <code>queryAsRoot</code> attribute is True, directly under the query.  |

| Attribute | Req/Opt;<br>Format             | Default | Description   |
|-----------|--------------------------------|---------|---|
| img       | Optional;<br>Applet,<br>object | folder  | <p>Image name, filename, or file URL for tree item icon. The following values are provided:</p> <ul style="list-style-type: none"> <li>• cd</li> <li>• computer</li> <li>• document</li> <li>• element</li> <li>• folder</li> <li>• floppy</li> <li>• fixed</li> <li>• remote</li> </ul> <p>You can also specify a custom image. To do so, include path and file extension; for example:</p> <pre>img = "../images/page1.gif"</pre> <p>Custom images are not supported for Flash format.</p> <p>To specify more than one image in a tree, or an image at the second or subsequent level, use commas to separate names, corresponding to level; for example:</p> <pre>img = "folder,document"</pre> <pre>img = ",document" (example of second level)</pre> |
| imgopen   | Optional;<br>Applet,<br>object |         | Icon displayed with open tree item, as describe for the <code>img</code> attribute.   |
| href      | Optional;<br>All               |         | <p>URL to link to if the user clicks the tree item. If you use a <code>query</code> attribute, the <code>href</code> attribute can specify a query column that contains URLs. If <code>href</code> is not a query column, the attribute text must be a URL or list of URLs.</p> <p>When populating a tree with data from a query, specify the URLs in a comma-delimited list; for example:</p> <pre>href = "http://dept_svr,http://emp_svr"</pre>   |
| target    | Optional;<br>All               |         | <p>Target attribute of <code>href</code> URL. When populating a tree with data from a query, specify <code>target</code> in delimited list:</p> <pre>target = "FRAME_BODY,_blank"</pre>   |
| query     | Optional;<br>Applet,<br>Flash  |         | <p>Query name to use to populate the <code>treeitem</code>. ColdFusion generates an item for each field value in the query column list specified by the <code>value</code> attribute. The fields in each row are hierarchically linked to the first column.</p>   |

| Attribute   | Req/Opt;<br>Format | Default | Description  |
|-------------|--------------------|---------|--|
| queryAsRoot | Optional;<br>All   | Yes     | <p>Applies only if you specify a <code>query</code> attribute. Defines the query as the root level for all items generated by this tag. This attribute enables you to avoid creating a parent <code>cftreeitem</code>.</p> <ul style="list-style-type: none"> <li>• Yes: generates a parent (root) item for all other items generated by the tag, with the query name as its value; if you specify a <code>parent</code> attribute, the root item is a child of the specified parent.</li> <li>• No: uses the item specified by the <code>parent</code> attribute as the immediate parent of all items generated by this tag. If there is no <code>parent</code> attribute, use the query as the parent.</li> <li>• A string: creates a root item and uses the specified string as the item name; if you specify a <code>parent</code> attribute, the root item is a child of the specified parent.</li> </ul> |
| expand      | Optional;<br>All   | Yes     | <ul style="list-style-type: none"> <li>• Yes: expands tree to show tree item children.</li> <li>• No: keeps tree item collapsed.</li> </ul>  |

## Usage

This tag requires the client to download a Java applet. Downloading an applet takes time; therefore, using this tag might be slightly slower than using an HTML form element or the `cfinput` tag to get the same information.

For this tag to work properly, the browser must be JavaScript-enabled.

If you do not use a query to populate this tag, it creates a single tree item. If you do use a query, it creates multiple items; each row of the query creates a hierarchically nested set of items with one item per column.

## Example

The following example creates a simple tree using a single `cftreeitem` tag and a query:

```
<cfform action = "#cgi.script_name#">
  <cftree name = "Employees" height = "400" width = "200">
    <cftreeitem value="LastName, FirstName, Emp_ID" query="getEmployees"
      queryAsRoot="False">
  </cftree>
</cfform>
```

The following example creates a tree that shows the basic information about all employees in an organization, organized by department. The departments are expanded to show all employees. You can click the + signs to display additional information. If you click the employee name, ColdFusion links back to the same page and displays the selected employee's ID.

```
<!-- Query the datasource to get employee information.-->
<!-- Group the output by Department.
  (All fields are required in Group By clause.) -->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
  SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
  FROM Employees
  GROUP BY Department, Emp_ID, FirstName, LastName, EMail, Phone
</cfquery>
```

```

<html>
<body>
<h3>cftreeitem Example</h3>

<!-- The following runs if the user clicked on a link in the tree.
A complete application would use the ID for additional processing. -->
<cfif isdefined("URL.user_ID")>
  <cfoutput>
    <!-- URL.cftreeitemkey is the selected tree item's value attribute. -->
    You Requested information on #URL.cftreeitemKey#; User ID #URL.user_ID#
  </cfoutput>
  <br><br>
</cfif>
<!-- Display the tree. The cftree tag must be in a cfform. -->
<cfform>
  <cftree name = "Employees" height = "400" width = "200"
    font = "Arial Narrow" highlighthref="No" hscroll="No">
    <!-- cfoutput tag with a group attribute loops over the departments. -->
    <cfoutput group="Department" query = "GetEmployees">
      <cftreeitem value="#Department#" parent="Employees" expand="yes">
        <!-- This cfoutput tag loops over the records for the department.
        The cfoutput tag does not need any attributes. -->
        <cfoutput>
          <!-- Create an item for each employee in the department.
          Do not expand children. Each employee name links to this page,
          and sends the employee ID in the query string.-->
          <cftreeitem value = "#LastName#, #FirstName#"
            display = "#LastName#, #FirstName#"
            parent = "#Department#" expand="no"
            href="#cgi.script_name#?user_id=#emp_id#">
          <!-- Each Employee entry has ID and ContactInfo children. -->
          <cftreeitem value = "#Emp_ID#" display = "Employee ID: #Emp_ID#"
            parent = "#LastName#, #FirstName#">
          <!-- Each node must be unique value, so use Emp_ID om value. -->
          <cftreeitem value = "#Emp_ID#_ContactInfo"
            display = "Contact Information"
            parent = "#LastName#, #FirstName#" expand = "No">
          <!-- ContactInfo has two children. -->
          <cftreeitem value = "#Phone#" parent = "#Emp_ID#_ContactInfo">
          <cftreeitem value = "#Email#" parent = "#Emp_ID#_ContactInfo">
        </cfoutput>
      </cfoutput>
    </cftree>
  </cfform>

```

# cftry

## Description

Used with one or more [cfcatch](#) tags. Together, they catch and process exceptions in ColdFusion pages. *Exceptions* are events that disrupt the normal flow of instructions in a ColdFusion page, such as failed database operations, missing include files, and developer-specified events.

## Category

[Exception handling tags](#)

## Syntax

```
<cftry>
  Code that might throw an exception
  One or more cfcatch blocks
</cftry>
```

## See also

[cfcatch](#), [cferror](#), [cfrethrow](#), [cfthrow](#), [onError](#); Chapter 14, “Handling Errors” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed [cfscript](#) to include `try` and `catch` statements that are equivalent to the `cftry` and `cfcatch` tags.

## Usage

Within a `cftry` block, put the code that might throw an exception, followed by one or more `cfcatch` tags that catch and process exceptions. This tag requires an end tag.

## Example

```
<!--- cftry example, using TagContext to display the tag stack. --->
<h3>cftry Example</h3>
<!--- Open a cftry block. --->
<cftry>
  <!--- Note misspelled tablename "employees" as "employeeas". --->
  <cfquery name = "TestQuery" dataSource = "cfdoexamples">
    SELECT *
    FROM EMPLOYEEAS
  </cfquery>

  <!--- <p>... other processing goes here --->
  <!--- specify the type of error for which we search --->
  <cfcatch type = "Database">
    <!--- the message to display --->
    <h3>You've Thrown a Database <b>Error</b></h3>
    <cfoutput>
      <!--- and the diagnostic message from the ColdFusion server --->
      <p>#cfcatch.message#</p>
      <p>Caught an exception, type = #CFCATCH.TYPE# </p>
      <p>The contents of the tag stack are:</p>
      <cfloop index = i from = 1
        to = #ArrayLen(CFCATCH.TAGCONTEXT)#>
```

```
<cfset sCurrent = #CFCATCH.TAGCONTEXT[i]#>
<br>#i# #sCurrent["ID"]#
    (#sCurrent["LINE"]#, #sCurrent["COLUMN"]#)
    #sCurrent["TEMPLATE"]#
</cfloop>
</cfoutput>
</cfcatch>
</cftry>
```

# cfupdate

## Description

Updates records in a data source from data in a ColdFusion form or form Scope.

## Category

[Database manipulation tags](#)

## Syntax

```
<cfupdate
  dataSource = "ds_name"
  tableName = "table_name"
  tableOwner = "name"
  tableQualifier = "qualifier"
  username = "username"
  password = "password"
  formFields = "field_names">
```

## See also

[cfinsert](#), [cfproccparam](#), [cfprocresult](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#); “Creating an update action page with cfupdate” in Chapter 21, “Updating Your Database,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

## Attributes

| Attribute                   | Req/Opt  | Default | Description   |
|-----------------------------|----------|---------|---|
| <code>dataSource</code>     | Required |         | Name of the data source that contains the table.  |
| <code>tableName</code>      | Required |         | Name of table to update. <ul style="list-style-type: none"><li>For ORACLE drivers, must be uppercase.</li><li>For Sybase driver, case-sensitive; must be in same case as used when the table was created.</li></ul>   |
| <code>tableOwner</code>     | Optional |         | For data sources that support table ownership (for example, SQL Server, Oracle, Sybase SQL Anywhere), the table owner.  |
| <code>tableQualifier</code> | Optional |         | For data sources that support table qualifiers. The purpose of table qualifiers is as follows: <ul style="list-style-type: none"><li>SQL Server and Oracle: name of the database that contains the table</li><li>Intersolv dBASE driver: directory of DBF files</li></ul> |
| <code>username</code>       | Optional |         | Overrides <code>username</code> value specified in ODBC setup.  |

| Attribute  | Req/Opt  | Default                    | Description   |
|------------|----------|----------------------------|---|
| password   | Optional |                            | Overrides the password value specified in ODBC setup.   |
| formFields | Optional | (all on form, except keys) | Comma-delimited list of form fields to update. If a form field is not matched by a column name in the database, ColdFusion throws an error. The formFields lies must include the database table primary key field, which must be present in the form. It can be hidden. |

### Example

```

<!-- This example allows you to update a person's telephone number in the
employee table. -->
<cfif isDefined("form.phone")>
  <cfupdate datasource="cfdocexamples" tablename="Employees">
</cfif>

<cfquery name="empTable" datasource="cfdocexamples">
  select * from employees
</cfquery>

<!-- This code shows the contents of the employee table and allows you to
choose a row for updating. -->
<table border="1">
<cfoutput query="empTable">
  <tr>
    <td>#firstName#</td>
    <td>#lastName#</td>
    <td>#phone#</td>
    <td><a href="cfupdate.cfm?id=#emp_id#">Edit</a></td>
  </tr>
</cfoutput>
</table>

<cfif isDefined("url.id")>
  <cfquery name="phoneQuery" datasource="cfdocexamples">
    select * from employees where emp_id=#url.id#
  </cfquery>
<!-- This code displays the row to edit for update. -->
<cfoutput query="phoneQuery">
  <form action="cfupdate.cfm" method="post">
    #phoneQuery.firstName# #phoneQuery.lastName#
    <input name="phone" type="text" value="#phone#" size="12">
    <input type="submit" value="Update">
    <input name="emp_id" type="hidden" value="#emp_id#">
    <!-- The emp_id is passed as a hidden field to be used as a primary key in
the CFUPDATE. -->
  </form>
</cfoutput>
</cfif>

```

# cfwddx

## Description

Serializes and deserializes CFML data structures to the XML-based WDDX format. The WDDX is an XML vocabulary for describing complex data structures in a standard, generic way. Implementing it lets you use the HTTP protocol to such information among application server platforms, application servers, and browsers.

This tag generates JavaScript statements to instantiate JavaScript objects equivalent to the contents of a WDDX packet or CFML data structure. Interoperates with Unicode.

## Category

[Extensibility tags](#)

## Syntax

```
<cfwddx
  action = "action"
  input = "inputdata"
  output = "result variable name"
  topLevelVariable = "top-level variable name for JavaScript"
  useTimeZoneInfo = "yes" or "no"
  validate = "yes" or "no" >
```

## See also

Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX

- Changed column name case behavior: ColdFusion preserves the case of column names in JavaScript. (Earlier releases converted query column names to lowercase.)
- Changed encoding format support: this tag supports several encoding formats. The default encoding format is UTF-8. The tag interoperates with Unicode.

## Attributes

| Attribute | Req/Opt                                | Default | Description   |
|-----------|--|---------|---|
| action    | Required                               |         | <ul style="list-style-type: none"><li>• cfml2wddx: serializes CFML to WDDX.</li><li>• wddx2cfml: deserializes WDDX to CFML.</li><li>• cfml2js: serializes CFML to JavaScript.</li><li>• wddx2js: deserializes WDDX to JavaScript.</li></ul> |
| input     | Required                               |         | A value to process.   |
| output    | Required if<br>action =<br>"wddx2cfml" |         | Name of variable for output. If action = "WDDX2JS" or "CFML2JS", and this attribute is omitted, result is output in HTML stream.  |

| Attribute        | Req/Opt   | Default | Description  |
|------------------|---|---------|--|
| topLevelVariable | Required if<br><code>action = "wddx2js" or "cfml2js"</code> |         | Name of top-level JavaScript object created by deserialization. The object is an instance of the <code>WddxRecordset</code> object.  |
| useTimeZoneInfo  | Optional  | Yes     | Whether to output time-zone information when serializing CFML to WDDX. <ul style="list-style-type: none"> <li>• Yes: the hour-minute offset, represented in ISO8601 format, is output.</li> <li>• No: the local time is output.</li> </ul>   |
| validate         | Optional  | No      | Applies if <code>action = "wddx2cfml" or "wddx2js"</code> . <ul style="list-style-type: none"> <li>• yes: validates WDDX input with an XML parser using WDDX DTD. If parser processes input without error, packet is deserialized. Otherwise, an error is thrown.</li> <li>• no: does not perform input validation.</li> </ul> |

### Usage

ColdFusion preserves the case of column names cases in JavaScript.

The `wddx2js` and `cfml2js` actions create a `WddxRecordset` javascript object when they encounter a `RecordSet` java object. The serialized JavaScript code requires a `wddx.js` file.

This tag performs the following conversions:

| From | To         |
|------|------------|
| CFML | WDDX       |
| CFML | JavaScript |
| WDDX | CFML       |
| WDDX | JavaScript |

For more information, and a list of the ColdFusion array and structure functions that you can use to manage XML document objects and functions, see Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*.

**Note:** The `cfwddx` tag throws an exception if you attempt to serialize a CFC or user-defined function (UDF).

### Example

```
<!-- This example shows basic use of the cfwddx tag. --->
<html>
<body>
<!-- Create a simple query. --->
<cfquery name = "q" dataSource = "cfdocexamples">
  select Message_Id, Thread_id, Username from messages
</cfquery>
```

```
The recordset data is:...<p>
<cfoutput query = q>
```

```
    #Message_ID# #Thread_ID# #Username#<br>
</cfoutput><p>

<!-- Serialize data to WDDX format. -->
Serializing CFML data...<p>
<cfwddx action = "cfml2wddx" input = #q# output = "wddxText">

<!-- Display WDDX XML packet. -->
Resulting WDDX packet is:
<xmp><cfoutput>#wddxText#</cfoutput></xmp>

<!-- Deserialize to a variable named wddxResult. -->
Deserializing WDDX packet...<p>
<cfwddx action = "wddx2cfml" input = #wddxText# output = "qnew">

The recordset data is:...<p>
<cfoutput query = qnew>
    #Message_ID# #Thread_ID# #Username#<br>
</cfoutput><p>
```

# cfxml

## Description

Creates a ColdFusion XML document object that contains the markup in the tag body. This tag can include XML and CFML tags. ColdFusion processes the CFML code in the tag body, and then assigns the resulting text to an XML document object variable, which is always stored in Unicode.

## Category

[Extensibility tags](#)

## Syntax

```
<CFXML
  variable="xmlVarName"
  caseSensitive="yes" or "no">
```

## See also

[IsXmlDoc](#), [IsXmlElement](#), [IsXmlRoot](#), [ToString](#), [XmlChildPos](#), [XmlNew](#), [XmlParse](#), [XmlSearch](#), [XmlTransform](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added support for using an XML declaration at the start of the text.

ColdFusion MX: Added this tag.

## Attributes

| Attribute     | Req/Opt  | Default | Description   |
|---------------|----------|---------|---|
| variable      |          |         | Name of the document object.  |
| caseSensitive | Optional | no      | <ul style="list-style-type: none"><li>• yes: maintains the case of document elements and attributes.</li><li>• no</li></ul> |

## Usage

If your XML object is case-sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";
MyDoc.xmlRoot.XmlAttributes.Version = "12b";
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

Use the `XmlFormat` function to escape special characters such as `&`, `>` and `<`.

To convert an XML document object back into a string, use the `ToString` function, at which time ColdFusion automatically prepends the `<?xml version="1.0" encoding="UTF-8" ?>` XML declaration.

To change the declaration to specify another encoding, use the `Replace` function. To specify the encoding of the text that is returned to a browser or other application, use the `cfcontent` tag.

The following example illustrates this process:

```
<cfprocessingdirective suppresswhitespace="Yes">
<cfcontent type="text/xml; charset=utf-16">
<cfxml variable="xmlobject">
<breakfast_menu>
  <food>
    <name quantity="50">Belgian Waffles</name>
    <description>Our famous Belgian Waffles</description>
  </food>
</breakfast_menu>
</cfxml>

<!-- <cfdump var="#xmlobject#">-->

<cfset myvar=toString(xmlobject)>
<cfset mynewvar=replace(myvar, "UTF-8", "utf-16")>

<!--<cfdump var="#mynewvar#">-->

<cfoutput>#mynewvar#</cfoutput>
</cfprocessingdirective>
```

The `cfprocessingdirective` tag prevents ColdFusion from putting white space characters in front of the XML declaration.

### Example

This following example creates a document object whose root element is `MyDoc`. The object includes text that displays the value of the ColdFusion variable `testVar`. The code creates four nested child elements, which are generated by an indexed `cfloop` tag. The `cfdump` tag displays the XML document object.

```
<cfset testVar = True>
<cfxml variable="MyDoc">
  <?xml version='1.0' encoding='utf-8' ?>
  <MyDoc>
    <cfif testVar IS True>
      <cfoutput>The value of testVar is True.</cfoutput>
    <cfelse>
      <cfoutput>The value of testVar is False.</cfoutput>
    </cfif>
    <cfloop index = "LoopCount" from = "1" to = "4">
      <childNodes>
        This is Child node <cfoutput>#LoopCount#.</cfoutput>
      </childNodes>
    </cfloop>
  </MyDoc>
</cfxml>
<cfdump var=#MyDoc#>
```

# CHAPTER 3

## ColdFusion Functions

This chapter lists and categorizes ColdFusion Markup Language (CFML) functions.

### Contents

|   |     |
|---|-----|
| Function list. . . . .                        | 449 |
| Functions by category . . . . .               | 452 |
| Function changes since ColdFusion 5 . . . . . | 457 |
| Tag descriptions . . . . .                    | 461 |

### Function list

ColdFusion Markup Language (CFML) includes a set of functions that you use in Macromedia ColdFusion MX 7 pages to perform logical and arithmetic operations and manipulate data.

The following table lists CFML functions:

---

|                       |                      |                      |
|-----------------------|----------------------|----------------------|
| Abs                   | GetFunctionList      | Max                  |
| ACos                  | GetGatewayHelper     | Mid                  |
| AddSOAPRequestHeader  | GetHttpRequestData   | Min                  |
| AddSOAPResponseHeader | GetHttpRequestTime   | Minute               |
| ArrayAppend           | GetLocale            | Month                |
| ArrayAvg              | GetLocaleDisplayName | MonthAsString        |
| ArrayClear            | GetMetaData          | Now                  |
| ArrayDeleteAt         | GetMetricData        | NumberFormat         |
| ArrayInsertAt         | GetPageContext       | ParagraphFormat      |
| ArrayIsEmpty          | GetProfileSections   | ParseDateTime        |
| ArrayLen              | GetProfileString     | Pi                   |
| ArrayMax              | GetSOAPRequest       | PreserveSingleQuotes |
| ArrayMin              | GetSOAPRequestHeader | Quarter              |
| ArrayNew              | GetSOAPResponse      | QueryAddColumn       |

---

|                    |                       |                    |
|--------------------|-----------------------|--------------------|
| ArrayPrepend       | GetSOAPResponseHeader | QueryAddRow        |
| ArrayResize        | GetTempDirectory      | QueryNew           |
| ArraySet           | GetTempFile           | QuerySetCell       |
| ArraySort          | GetTickCount          | QuotedValueList    |
| ArraySum           | GetTimeZoneInfo       | Rand               |
| ArraySwap          | GetToken              | Randomize          |
| ArrayToList        | Hash                  | RandRange          |
| Asc                | Hour                  | REFind             |

## Array functions

---

|             |              |              |             |
|-------------|--------------|--------------|-------------|
| ArrayAppend | ArrayIsEmpty | ArrayPrepend | ArraySwap   |
| ArrayAvg    | ArrayLen     | ArrayResize  | ArrayToList |
| ArrayClear  | ArrayMax     | ArraySet     | IsArray     |

---

|               |          |           |             |
|---------------|----------|-----------|-------------|
| ArrayDeleteAt | ArrayMin | ArraySort | ListToArray |
| ArrayInsertAt | ArrayNew | ArraySum  |             |

## Conversion functions

|               |             |                  |              |
|---------------|-------------|------------------|--------------|
| ArrayToList   | Hash        | ToScript         | XmlFormat    |
| BinaryDecode  | LCase       | ToString         | XmlParse     |
| BinaryEncode  | ListToArray | URLDecode        | XmlTransform |
| CharsetDecode | ToBase64    | URLEncodedFormat |              |
| CharsetEncode | ToBinary    | Val              |              |

## Date and time functions

|                    |                   |                 |               |
|--------------------|-------------------|-----------------|---------------|
| CreateDate         | DateFormat        | GetTimeZoneInfo | MonthAsString |
| CreateDateTime     | DatePart          | Hour            | Now           |
| CreateODBCDate     | Day               | IsDate          | ParseDateTime |
| CreateODBCDateTime | DayOfWeek         | IsLeapYear      | Quarter       |
| CreateODBCTime     | DayOfWeekAsString | IsNumericDate   | Second        |
| CreateTime         | DayOfYear         | LSDateFormat    | TimeFormat    |
| CreateTimeSpan     | DaysInMonth       | LSIsDate        | Week          |
| DateAdd            | DaysInYear        | LSParseDateTime | Year          |
| DateCompare        | FirstDayOfMonth   | LSTimeFormat    |               |
| DateConvert        | GetHttpTimeString | Minute          |               |
| DateDiff           | GetTickCount      | Month           |               |

## Decision functions

|                  |                            |                |                 |
|------------------|----------------------------|----------------|-----------------|
| DirectoryExists  | IsDefined                  | IsSimpleValue  | IsXmlNode       |
| FileExists       | IsK2ServerABroker          | IsStruct       | IsXmlRoot       |
| IIf              | IsK2ServerDocCountExceeded | IsUserInRole   | LSIsCurrency    |
| IsArray          | IsK2ServerOnline           | IsValid        | LSIsDate        |
| IsBinary         | IsLeapYear                 | IsWDDX         | LSIsNumeric     |
| IsBoolean        | IsNumeric                  | IsXML          | StructIsEmpty   |
| IsCustomFunction | IsNumericDate              | IsXmlAttribute | StructKeyExists |
| IsDate           | IsObject                   | IsXmlDoc       | YesNoFormat     |
| IsDebugMode      | IsQuery                    | IsXmlElement   |                 |

## Display and formatting functions

---

|                      |                      |                     |                 |
|----------------------|----------------------|---------------------|-----------------|
| CJustify             | HTMLCodeFormat       | LSIsDate            | NumberFormat    |
| DateFormat           | HTMLEditFormat       | LSNumberFormat      | ParagraphFormat |
| DecimalFormat        | LJustify             | LSParseCurrency     | RJustify        |
| DollarFormat         | LSCurrencyFormat     | LSParseDateTime     | StripCR         |
| FormatBaseN          | LSDateFormat         | LSParseEuroCurrency | TimeFormat      |
| GetLocale            | LSEuroCurrencyFormat | LSParseNumber       | YesNoFormat     |
| GetLocaleDisplayName | LSIsCurrency         | LSTimeFormat        |                 |

---

## Dynamic evaluation functions

---

|    |          |     |             |
|----|----------|-----|-------------|
| DE | Evaluate | Iif | SetVariable |
|----|----------|-----|-------------|

---

## Extensibility functions

---

|                  |                    |          |
|------------------|--------------------|----------|

| GetGatewayHelper | SendGatewayMessage |          |

---

## Full-text search functions

### History

ColdFusion MX 6.1: These functions are deprecated. They might not work, and might cause errors, in a future release.

---

|                          |                            |                  |
|--------------------------|----------------------------|------------------|
| GetK2ServerDocCount      | IsK2ServerABroker          | IsK2ServerOnline |
| GetK2ServerDocCountLimit | IsK2ServerDocCountExceeded |                  |

---

## International functions

---

|                      |                      |                 |                     |
|----------------------|----------------------|-----------------|---------------------|
| DateConvert          | GetTimeZoneInfo      | LSIsDate        | LSParseEuroCurrency |
| GetEncoding          | LSIsCurrency         | LSParseDateTime | LSParseNumber       |
| GetHttpTimeString    | LSCurrencyFormat     | LSIsNumeric     | LSTimeFormat        |
| GetLocale            | LSDateFormat         | LSNumberFormat  | SetEncoding         |
| GetLocaleDisplayName | LSEuroCurrencyFormat | LSParseCurrency | SetLocale           |

---

## List functions

---

|             |                        |                    |             |
|-------------|------------------------|--------------------|-------------|
| ArraySort   | FindNoCase             | ListContainsNoCase | ListQualify |
| ArrayToList | FindOneOf              | ListDeleteAt       | ListRest    |
| Asc         | FormatBaseN            | ListFind           | ListSetAt   |
| Chr         | GetClientVariablesList | ListFindNoCase     | ListSort    |
| CJustify    | LCase                  | ListFirst          | ListToArray |

---

|               |                  |              |                      |
|---------------|------------------|--------------|----------------------|
| Compare       | Left             | ListGetAt    | ListValueCount       |
| CompareNoCase | Len              | ListInsertAt | ListValueCountNoCase |
| Decrypt       | ListAppend       | ListLast     | ReplaceList          |
| Encrypt       | ListChangeDelims | ListLen      |                      |
| Find          | ListContains     | ListPrepend  |                      |

## Mathematical functions

|              |                |                |           |
|--------------|----------------|----------------|-----------|
| Abs          | BitNot         | FormatBaseN    | Randomize |
| ACos         | BitOr          | IncrementValue | RandRange |
| ArrayAvg     | BitSHLN        | InputBaseN     | Round     |
| ArraySum     | BitSHRN        | Int            | Sgn       |
| ASin         | BitXor         | Log            | Sin       |
| Atn          | Ceiling        | Log10          | Sqr       |
| BitAnd       | Cos            | Max            | Tan       |
| BitMaskClear | DecrementValue | Min            |           |
| BitMaskRead  | Exp            | Pi             |           |
| BitMaskSet   | Fix            | Rand           |           |

## Other functions

|                      |                        |                      |
|----------------------|------------------------|----------------------|
| CreateUUID           | GetBaseTagList         | PreserveSingleQuotes |
| DeleteClientVariable | GetBaseTemplatePath    | URLSessionFormat     |
| GetBaseTagData       | GetClientVariablesList | WriteOutput          |

## Query functions

|                |             |                 |           |
|----------------|-------------|-----------------|-----------|

|---------|-------------------|------------------|--------------|
| Decrypt | GetAuthUser       | GetTempDirectory | IsUserInRole |
| Encrypt | GenerateSecretKey | Hash             |              |

## String functions

### History

ColdFusion MX: ColdFusion now supports the Java UCS-2 representation of Unicode character values 0–65535. (Earlier releases supported ASCII values.)

String-processing functions process any of these characters (including ASCII 0 (NUL) characters), and continue counting subsequent characters of the string, if any. (In earlier releases, some string-processing functions processed the ASCII 0 (NUL) character, but did not process subsequent characters of the string.)

## Function changes since ColdFusion 5

The following tables list functions, parameters and values that have changed since ColdFusion 5.0 and indicate the specific release in which the change was made.

|  |     |
|--|-----|
| <a href="#">New functions, parameters, and values</a> . . . . .        | 457 |
| <a href="#">Deprecated functions, parameters, and values</a> . . . . . | 459 |
| <a href="#">Obsolete functions, parameters, and values</a> . . . . .   | 460 |

## New functions, parameters, and values

| Function                          | Parameter or value                | Added in this ColdFusion release |
|-----------------------------------|-----------------------------------|----------------------------------|
| <a href="#">BinaryDecode</a>      | All                               | ColdFusion MX 7                  |
| <a href="#">BinaryEncode</a>      | All                               | ColdFusion MX 7                  |
| <a href="#">CharsetDecode</a>     | All                               | ColdFusion MX 7                  |
| <a href="#">CharsetEncode</a>     | All                               | ColdFusion MX 7                  |
| <a href="#">CreateObject</a>      | portName parameter                | ColdFusion MX 7                  |

## Deprecated functions, parameters, and values

The following functions, parameters, and values are deprecated. Do not use them in ColdFusion applications. They might not work, and might cause an error, in releases later than ColdFusion MX.

| Function                                    | Parameter or value                 | Deprecated as of this ColdFusion release                   |
|---|------------------------------------|--|
| <a href="#">GetMetricData</a>               | cachepops parameter                | ColdFusion MX  |
| <a href="#">GetK2ServerDocCount</a>         | All                                | ColdFusion MX 6.1  |
| <a href="#">GetK2ServerDocCount Limit</a>   | All                                | ColdFusion MX 6.1  |
| <a href="#">GetTemplatePath</a>             | All                                | ColdFusion MX  |
| <a href="#">IsK2ServerABroker</a>           | All                                | ColdFusion MX 6.1  |
| <a href="#">IsK2ServerDocCount Exceeded</a> | All                                | ColdFusion MX 6.1  |
| <a href="#">IsK2ServerOnLine</a>            | All                                | ColdFusion MX 6.1  |
| <a href="#">ParameterExists</a>             | All                                | ColdFusion MX. Use the <a href="#">IsDefined</a> function. |
| <a href="#">SetLocale</a>                   | locale = "Spanish (Mexican)" value | ColdFusion MX. Use Spanish (Standard).                     |

## Obsolete functions, parameters, and values

The following functions, parameters, and values are obsolete. Do not use them in ColdFusion applications. They do not work in releases later than ColdFusion 5.

| Function             | Parameter or value | Obsolete as of this ColdFusion release |
|----------------------|--------------------|--|
| AuthenticatedContext | All                | ColdFusion MX                          |
| AuthenticatedUser    | All                | ColdFusion MX                          |
| isAuthenticated      | All                | ColdFusion MX                          |
| isAuthorized         | All                | ColdFusion MX                          |
| isProtected          | All                | ColdFusion MX                          |

# Abs

## Description

Absolute-value function. The absolute value of a number is the number without its sign.

## Returns

The absolute value of a number.

## Category

[Mathematical functions](#)

## Function syntax

`Abs(number)`

## See also

[Sgn](#)

## Parameters

---

| Parameter | Description |
|-----------|-------------|
| number    | A number    |

---

## Example

```
<h3>Abs Example</h3>
```

```
<p>The absolute value of the following numbers:
```

```
1,3,-4,-3.2,6 is
```

```
<cfoutput>
```

```
#Abs(1)#,#Abs(3)#,#Abs(-4)#,#Abs(-3.2)#,#Abs(6)#
```

```
</cfoutput>
```

```
<p>The absolute value of a number is the number without its sign.
```

# ACos

## Description

Arccosine function. The arccosine is the angle whose cosine is *number*.

## Returns

The arccosine, in radians, of a number.

## Category

[Mathematical functions](#)

## Function syntax

`ACos(number)`

## See also

[Cos](#), [Sin](#), [ASin](#), [Tan](#), [Atn](#), [Pi](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| number    | Cosine of an angle. The value must be between -1.0 and 1.0, inclusive. |

## Usage

The range of the result is 0 to  $\pi$ .

To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

## Example

```
<h3>ACos Example</h3>
<!-- output its arccosine value --->
<cfif IsDefined("FORM.CosNum")>
  <cfif IsNumeric(FORM.CosNum)>
    <cfif Abs(FORM.CosNum) LESS THAN OR EQUAL TO 1>
      <cfoutput>ACos(#FORM.CosNum#) = #ACos(FORM.cosNum)# Radians</cfoutput>
      <br>or<br>
      <cfoutput>ACos(#FORM.CosNum#) = #ACos(FORM.cosNum) * 180/PI()#</
cfoutput>
    <cfelse>
      <!-- if it is empty, output an error message --->
      <h4>Enter a number between -1 and 1</h4>
    </cfif>
  </cfif>
</cfif>

<form method="post" action = "acos.cfm">
<p>Enter a number to get its arccosine in Radians and Degrees.
<br><input type = "Text" name = "cosNum" size = "25">
<p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

# AddSOAPRequestHeader

## Description

Adds a SOAP header to a web service request before making the request.

## Returns

Nothing.

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
AddSOAPRequestHeader(webservice, namespace, name, value [, mustunderstand])
```

## See also

[AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter                   | Description  |
|-----------------------------|--|
| <code>webservice</code>     | A web service object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function. |
| <code>namespace</code>      | A string that is the namespace for the header.   |
| <code>name</code>           | A string that contains the name of the SOAP header in the request.   |
| <code>value</code>          | The value for the SOAP header; this can be a CFML XML value.   |
| <code>mustunderstand</code> | Optional. True or False (default). Sets the SOAP <code>mustunderstand</code> value for this header.            |

## Usage

Used within CFML code by a consumer of a web service *before* it calls the web service.

If you pass XML in the `value` parameter, ColdFusion ignores the `namespace` and `name` parameters. If you require a namespace, define it within the XML itself.

## Example

There are two parts to this example. The first part is the web service CFC that this function (as well as the other ColdFusion SOAP functions) uses to demonstrate its interaction with a web service. To implement the web service for this function, see the example for [AddSOAPResponseHeader](#).

Execute the following example as a client to see how the `AddSOAPRequestHeader` function operates.

```

<!-- Note that you might need to modify the URL in the CreateObject function
to match your server and the location of the headerservice.cfc file if it is
different than shown here. Likewise for the cfinvoke tag at the end. --->

<h3>AddSOAPRequestHeader Example</h3>
<cfscript>
    // Create the web service object.
    ws = CreateObject("webservice", "http://localhost/soapheaders/
        headerservice.cfc?WSDL");

    // Set the username header as a string.
    addSOAPRequestHeader(ws, "http://mynamespace/", "username", "tom", false);

    // Set the password header as a CFML XML object.
    doc = XmlNew();
    doc.password = XmlElemNew(doc, "http://mynamespace/", "password");
    doc.password.XmlText = "My Voice is my Password";
    doc.password.XmlAttributes["xsi:type"] = "xsd:string";
    addSOAPRequestHeader(ws, "ignoredNameSpace", "ignoredName", doc);

    // Invoke the web service operation.
    ret = ws.echo_me("argument");

    // Get the first header as an object (string) and as XML.
    header = getSOAPResponseHeader(ws, "http://www.tomj.org/myns",
        "returnheader");
    XMLheader = getSOAPResponseHeader(ws, "http://www.tomj.org/myns",
        "returnheader", true);

    // Get the second header as an object (string) and as XML.
    header2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns",
        "returnheader2");
    XMLheader2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns",
        "returnheader2", true);
</cfscript>
<hr>
<cfoutput>
Soap Header value: #HTMLCodeFormat(header)#<br>
Soap Header XML value: #HTMLCodeFormat(XMLheader)#<br>
Soap Header 2 value: #HTMLCodeFormat(header2)#<br>
Soap Header 2 XML value: #HTMLCodeFormat(XMLheader2)#<br>
Return value: #HTMLCodeFormat(ret)#<br>
</cfoutput>
<hr>

<cfinvoke component="soapheaders.headerservice" method="echo_me"
    returnvariable="ret" in_here="hi">
</cfinvoke>
<cfoutput>Cfinvoke returned: #ret#</cfoutput>

```

# AddSOAPResponseHeader

## Description

Adds a SOAP response header to a web service response. Call only from within a CFC web service function that is processing a request as a SOAP web service.

## Returns

Nothing

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
AddSOAPResponseHeader(namespace, name, value [, mustunderstand])
```

## See also

[AddSOAPRequestHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter      | Description  |
|----------------|--|
| namespace      | A string that is the namespace for the header.   |
| name           | A string that contains the name of the SOAP header in the request.                     |
| value          | The value for the SOAP header; this can be a CFML XML value.                           |
| mustunderstand | Optional. True or False (default). Sets the SOAP mustunderstand value for this header. |

## Usage

Call this function only from within a CFC web service function. It throws an error if it is invoked in a context that is not a web service request.

If you pass XML in the `value` parameter, ColdFusion ignores the namespace and name parameters. If you require a namespace, define it within the XML itself.

Use the `IsSOAPRequest` function to determine if the CFC is running as a web service.

## Example

This example creates a CFC web service that illustrates the operation of the `AddSOAPResponseHeader` function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as `headerservice.cfc` in a folder called `soapheaders` under your web root. Test its operation, and specifically the operation of the `AddSOAPResponseHeader` function, by executing the examples that invoke this web service. For example, see the example for [AddSOAPRequestHeader](#).

```

<h3>AddSOAPResponseHeader Example</h3>
<!-- The headerservice.cfc CFC Web Service. -->
<cfcomponent displayName="tester" hint="Test for SOAP headers">
<cffunction name="echo_me"
    access="remote"
    output="false"
    returnType="string"
    displayName="Echo Test" hint="Header test">

    <cfargument name="in_here" required="true" type="string">

<cfset isSOAP = isSOAPRequest()
<cfif isSOAP>
    <!-- Get the first header as a string and as XML. -->
    <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
    <cfset return = "The service saw username: " & username>
    <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username",
        "TRUE")>
    <cfset return = return & "<br> as XML: " & xmlusername>

    <!-- Get the second header as a string and as XML. -->
    <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
    <cfset return = return & "The service saw password: " & password>
    <cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password",
        "TRUE")>
    <cfset return = return & "<br> as XML: " & xmlpassword>

    <!-- Add a header as a string. -->
    <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader",
        "AUTHORIZED VALUE", false)>

    <!-- Add a second header using a CFML XML value. -->
    <cfset doc = XmlNew()>
    <cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
    <cfset x.XmlText = "hey man, here I am in XML">
    <cfset x.XmlAttributes["xsi:type"] = "xsd:string">
    <cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>
<cfelse>
    <!-- Add a header as a string - Must generate error!
    <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader",
        "AUTHORIZED VALUE", false)>
    -->
    <cfset return = "Not invoked as a web service">
</cfif>

<cfreturn return>
</cffunction>
</cfcomponent>

```

# ArrayAppend

## Description

Appends an array element to an array.

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArrayAppend(array, value)
```

## See also

[ArrayPrepend](#); “Adding elements to an array” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description                  |
|-----------|------------------------------|
| array     | Name of an array             |
| value     | Value to add at end of array |

## Example

```
<h3>ArrayAppend Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- create an array -->
<cfset myArray = ArrayNew(1)>
<!--- set element one to show where we are -->
<cfset myArray[1] = "Test Value">
<!--- loop through the query; append these names successively to the last
element -->
<cfloop query = "GetEmployeeNames">
  <cfoutput>#ArrayAppend(myArray, "#FirstName# #LastName#")#
  </cfoutput>, Array was appended<br>
</cfloop>
<!--- show the resulting array as a list -->
<cfset myList = ArrayToList(myArray, ",")>
<!--- output the array as a list -->
<cfoutput>
  <p>The contents of the array are as follows:
  <p>#myList#
</cfoutput>
```

# ArrayAvg

## Description

Calculates the average of the values in an array.

## Returns

Number. If the `array` parameter value is an empty array, returns zero.

## Category

[Array functions](#), [Mathematical functions](#)

## Function syntax

```
ArrayAvg(array)
```

## See also

[ArraySum](#); “Basic array techniques” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter          | Description      |
|--------------------|------------------|
| <code>array</code> | Name of an array |

## Usage

The following example uses the ColdFusion built-in variable `Form.fieldNames`, which is available on the action page of a form. It contains a comma-delimited list of the names of the fields on the form.

## Example

```
<!-- This example shows the use of ArrayAvg -->
<!-- The following lines of code keep track of the form fields that can
be dynamically generated on the screen. It uses the Fieldnames variable
with the ListLen function to determine the number of fields on the form. -->
<cfset FormElem = 2>
  <cfif Isdefined("Form.Submit")>
    <cfif Form.Submit is "More">
      <cfset FormElem = ListLen(Form.Fieldnames)>
    </cfif>
  </cfif>

<html>
<head>
<title>ArrayAvg Example</title>
</head>
<body>
<h3>ArrayAvg Example</h3>
<p> This example uses ArrayAvg to find the average of the numbers that you
enter
into an array.<br>
To enter more than two numbers press the <b>more</b> button.
</p>
```

```

<form action = "arrayavg.cfm">
<!-- The following code initially creates two fields. It adds fields if the
user presses MORE. FormElem is initialized to two at the beginning of this
code to show that the form has two fields. ---->
<input type = "submit" name = "submit" value = "more">
<table cellpadding = "2" cellspacing = "2" border = "0">
<cfloop index = "LoopItem" from = "1" to = "#FormElem#">
  <tr>
    <cfoutput>
      <th align = "left">Number #LoopItem#</th>
      <td><input type = "text" name = "number#LoopItem#"></td>
    </cfoutput>
  </tr>
</cfloop>
</table>
<input type = "submit" name = "submit" value = "get the average">
</form>

<!-- create an array --->
<cfif IsDefined("FORM.submit")>
  <cfset myNumberArray = ArrayNew(1)>
  <cfset Count = 1>
  <cfloop index = "ListItem" list = "#Form.Fieldnames#">
    <cfif Left(ListItem,3) is "Num">
      <cfset myNumberArray[Count] = Val("number#Count#")>
      <cfset count = IncrementValue(Count)>
    </cfif>
  </cfloop>

  <cfif Form.Submit is "get the average">
    <!-- use ArrayAvg to get the average of the two numbers --->
    <p>The average of the numbers that you entered is
    <cfoutput>#ArrayAvg(myNumberArray)#.</cfoutput>
  <cfelse>
    <cfoutput>Try again. You must enter at least two numeric values.
    </cfoutput>
  </cfif>
</cfif>
</body>
</html>

```

# ArrayClear

## Description

Deletes the data in an array.

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArrayClear(array)
```

## See also

[ArrayDeleteAt](#); “Functions for XML object management” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter          | Description      |
|--------------------|------------------|
| <code>array</code> | Name of an array |

## Example

```
<h3>ArrayClear Example</h3>
<!-- create a new array -->
<cfset MyArray = ArrayNew(1)>
<!-- populate an element or two -->
<cfset MyArray[1] = "Test">
<cfset MyArray[2] = "Other Test">
<!-- output the contents of the array -->
<p>Your array contents are:
<cfoutput>#ArrayToList(MyArray)#</cfoutput>
<!-- check if the array is empty -->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
<p>Now, clear the array:
<!-- now clear the array -->
<cfset Temp = ArrayClear(MyArray)>
<!-- check if the array is empty -->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
```

# ArrayDeleteAt

## Description

Deletes an element from an array.

When an element is deleted, ColdFusion recalculates index positions. For example, in an array that contains the months of the year, deleting the element at position 5 removes the entry for May. After this, to delete the entry for June, you would delete the element at position 5 (not 6).

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArrayDeleteAt(array, position)
```

## See also

[ArrayInsertAt](#); “Functions for XML object management” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed behavior: this function can be used on XML objects.
- Changed thrown exceptions: this function can throw the `InvalidArrayIndexException` error.

## Parameters

| Parameter | Description      |
|-----------|------------------|
| array     | Name of an array |
| position  | Array position   |

## Throws

If this function attempts to delete an element at position 0, or specifies a value for `position` that is greater than the size of `array`, this function throws an `InvalidArrayIndexException` error.

## Example

```
<h3>ArrayDeleteAt Example</h3><p>
<!-- create an array -->
<cfset DaysArray = ArrayNew(2)>
<!-- populate an element or two -->
<cfset DaysArray[1][1] = "Monday">
<cfset DaysArray[2][1] = "Tuesday">
<cfset DaysArray[3][1] = "Wednesday">
<cfset DaysArray[1][2] = "April 12">
<cfset DaysArray[2][2] = "April 13">
<cfset DaysArray[3][2] = "April 14">
<p>This is what the array looks like before delete:<br>
```

```
<cfoutput>
#DaysArray[1][1]#&nbsp;&nbsp;&nbsp;#DaysArray[1][2]#<br>
#DaysArray[2][1]#&nbsp;&nbsp;&nbsp;#DaysArray[2][2]#<br>
#DaysArray[3][1]#&nbsp;&nbsp;&nbsp;#DaysArray[3][2]#<br>
</cfoutput>
```

```
<cfoutput>
We delete this element of the array:<br>
#ArrayDeleteAt(DaysArray,2)#<br>
</cfoutput>
<!-- the formerly third element, "Wednesday" is second element -->
<p>This is what the array looks like after delete:<br>
<cfoutput>
#DaysArray[1][1]#&nbsp;&nbsp;&nbsp;#DaysArray[1][2]#<br>
#DaysArray[2][1]#&nbsp;&nbsp;&nbsp;#DaysArray[2][2]#<br>
</cfoutput>
```

# ArrayInsertAt

## Description

Inserts a value into an array. Array elements whose indexes are equal to or greater than the new position are incremented by one. The array length increases by one.

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArrayInsertAt(array, position, value)
```

## See also

[ArrayDeleteAt](#); “Functions for XML object management” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed behavior: this function can be used on XML objects.
- Changed thrown exceptions: this function can throw the `InvalidArrayIndexException` error.

## Parameters

| Parameter | Description                             |
|-----------|---|
| array     | Name of an array                        |
| position  | Index position at which to insert value |
| value     | Value to insert                         |

## Usage

To apply the `ArrayInsert()` function to a multidimensional array, you must specify all but the last index in the `array` parameter. For example, the following code inserts an element at `myarray[2][4]`:

```
<cfset ArrayInsertAt(myarray[2], 4, "test")>
```

## Throws

If this function attempts to insert an element at position 0, or specifies a value for `position` that is greater than the size of `array`, this function throws an `InvalidArrayIndexException` error.

## Example

```
<h3>ArrayInsertAt Example</h3><p>  
<!-- create a new array -->  
<cfset DaysArray = ArrayNew(1)>  
<!-- populate an element or two -->
```

```
<cfset DaysArray[1] = "Monday">
<cfset DaysArray[2] = "Tuesday">
<cfset DaysArray[3] = "Thursday">
<!--- add an element before position 3 --->
<p>Add an element before position 3:
  <cfoutput>#ArrayInsertAt(DaysArray,3,"Wednesday")#</cfoutput>
<p>Now output the array as a list:
<cfoutput>#ArrayToList(DaysArray)#</cfoutput>
<!--- The array now has four elements. Element 3, "Thursday", has become
  element four --->
```

# ArrayIsEmpty

## Description

Determines whether an array is empty of data elements.

## Returns

True, if the array is empty; False, otherwise.

## Category

[Array functions](#)

## Function syntax

```
ArrayIsEmpty(array)
```

## See also

[ArrayLen](#), “Functions for XML object management” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description      |
|-----------|------------------|
| array     | Name of an array |

## Example

```
<h3>ArrayIsEmpty Example</h3>
<!-- create a new array -->
<cfset MyArray = ArrayNew(1)>
<!-- populate an element or two -->
<cfset MyArray[1] = "Test">
<cfset MyArray[2] = "Other Test">
<!-- output the contents of the array -->
<p>Your array contents are:
<cfoutput>#ArrayToList(MyArray)#</cfoutput>
<!-- check if the array is empty -->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
<p>Now, clear the array:
<!-- now clear the array -->
<cfset Temp = ArrayClear(MyArray)>
<!-- check if the array is empty -->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
```

# ArrayLen

## Description

Determines the number of elements in an array.

## Returns

The number of elements in an array.

## Category

[Array functions](#)

## Function syntax

```
ArrayLen(array)
```

## See also

[ArrayIsEmpty](#); “Functions for XML object management” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on child XML objects.

## Parameters

| Parameter          | Description      |
|--------------------|------------------|
| <code>array</code> | Name of an array |

## Example

```
<h3>ArrayLen Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- create an array --->
<cfset myArray = ArrayNew(1)>
<!--- set element one to show where we are --->
<cfset myArray[1] = "Test Value">
<!--- loop through the query and append these names
successively to the last element --->
<cfloop query = "GetEmployeeNames">
    <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>
<!--- show the resulting array as a list --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- output the array as a list --->
<cfoutput>
    <p>The contents of the array are as follows:
    <p>#myList#
    <p>This array has #ArrayLen(MyArray)# elements.
</cfoutput>
```

# ArrayMax

## Description

Array maximum function.

## Returns

The largest numeric value in an array. If the array parameter value is an empty array, returns zero.

## Category

[Array functions](#)

## Function syntax

ArrayMax(*array*)

## Parameters

| Parameter | Description      |
|-----------|------------------|
| array     | Name of an array |

## Example

```
<h3>ArrayMax Example</h3>
<p>This example uses ArrayMax to find the largest number in an array.<br> </p>
<!-- After checking whether the form has been submitted, the code creates an
array
and assigns the form fields to the first two elements in the array. ---->
<cfif IsDefined("FORM.submit")>
  <cfset myNumberArray = ArrayNew(1)>
  <cfset myNumberArray[1] = number1>
  <cfset myNumberArray[2] = number2>
  <cfif Form.Submit is "Maximum Value">
    <!-- use ArrayMax to find the largest number in the array --->
    <p>The largest number that you entered is
    <cfoutput>#ArrayMax(myNumberArray)#.</cfoutput>
  </cfif>
</cfif>
<!-- The following form provides two numeric fields that are compared when
the
form is submitted. --->
<form action = "arraymax.cfm">
<input type = "hidden" name = "number1_Float">
<input type = "hidden" name = "number2_Float">
<input type = "text" name = "number1"><br>
<input type = "text" name = "number2"><br>
<input type = "submit" name = "submit" value = "Maximum Value">
</form>
```

# ArrayMin

## Description

Array minimum function.

## Returns

The smallest numeric value in an array. If the `array` parameter value is an empty array, returns zero.

## Category

[Array functions](#)

## Function syntax

`ArrayMin(array)`

## Parameters

| Parameter          | Description      |
|--------------------|------------------|
| <code>array</code> | Name of an array |

## Example

```
<h3>ArrayMin Example</h3>
<p>This example uses ArrayMin to find the smallest number in an array.<br></p>
<!-- After checking whether the form has been submitted, this code creates an
    array and assigns the form fields to the first two elements. ----->
<cfif IsDefined("FORM.submit")>
    <cfset myNumberArray = ArrayNew(1)>
    <cfset myNumberArray[1] = FORM.number1>
    <cfset myNumberArray[2] = FORM.number2>

    <cfif Form.Submit is "Minimum Value">
        <!-- use ArrayMin to find the smallest number in the array --->
        <p>The smallest number that you entered is
            <cfoutput>#ArrayMin(myNumberArray)#.</cfoutput>
        </cfif>
    </cfif>
<!-- The following form provides two numeric fields that are compared when
    the form is submitted. ----->
<form action = "arraymin.cfm">
<input type = "hidden" name = "number1_Float">
<input type = "hidden" name = "number2_Float">
<input type = "text" name = "number1"><br>
<input type = "text" name = "number2"><br>
<input type = "submit" name = "submit" value = "Minimum Value">
</form>
```

# ArrayNew

## Description

Creates an array of 1–3 dimensions. Index array elements with square brackets: [].

ColdFusion arrays expand dynamically as data is added.

## Returns

An array

## Category

[Array functions](#)

## Function syntax

```
ArrayNew(dimension)
```

## Parameters

| Parameter | Description                                      |
|-----------|--|
| dimension | Number of dimensions in new array:<br>1, 2, or 3 |

## Example

```
<h3>ArrayNew Example</h3>
<!-- Make an array -->
<cfset MyNewArray = ArrayNew(1)>
<!-- ArrayToList does not function properly if the Array is not initialized
with
ArraySet -->
<cfset temp = ArraySet(MyNewArray, 1,6, "")>

<!-- set some elements -->
<cfset MyNewArray[1] = "Sample Value">
<cfset MyNewArray[3] = "43">
<cfset MyNewArray[6] = "Another Value">

<!-- is it an array? -->
<cfoutput>
  <p>Is this an array? #isArray(MyNewArray)#
  <p>It has #arrayLen(MyNewArray)# elements.
  <p>Contents: #arrayToList(MyNewArray)#
<!-- the array has expanded dynamically to six elements with the use of
ArraySet,
even though we only set three values -->
</cfoutput>
```

# ArrayPrepend

## Description

Inserts an array element at the beginning of an array.

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArrayPrepend(array, value)
```

## See also

[ArrayAppend](#); “Adding elements to an array” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                           |
|-----------|---------------------------------------|
| array     | Name of an array                      |
| value     | Value to insert at beginning of array |

## Example

```
<h3>ArrayPrepend Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- create an array --->
<cfset myArray = ArrayNew(1)>
<!--- set element one to show where we are --->
<cfset myArray[1] = "Test Value">
<!--- loop through query. Append names successively before last element (list
    reverses itself from the standard queried output, as it keeps
    prepending the array entry) --->
<cfloop query = "GetEmployeeNames">
    <cfoutput>#ArrayPrepend(myArray, "#FirstName# #LastName#")#
    </cfoutput>, Array was prepended<br>
</cfloop>
<!--- show the resulting array as a list --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- output the array as a list --->
<cfoutput>
    <p>The contents of the array are as follows:
    <p>#myList#
</cfoutput>
```

# ArrayResize

## Description

Resets an array to a specified minimum number of elements. This can improve performance, if used to size an array to its expected maximum. For more than 500 elements, use `ArrayResize` immediately after using the `ArrayNew` tag.

ColdFusion arrays expand dynamically as data is added.

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArrayResize(array, minimum_size)
```

## Parameters

| Parameter    | Description        |
|--------------|--------------------|
| array        | Name of an array   |
| minimum_size | Minimum array size |

## Example

```
<h3>ArrayResize Example</h3>
<!-- perform a query to get the list -->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
SELECT * FROM Courses
</cfquery>
<!-- make a new array -->
<cfset MyArray = ArrayNew(1)>
<!-- resize that array to the number of records
in the query -->
<cfset temp = ArrayResize(MyArray, GetCourses.RecordCount)>
<cfoutput>
The array is now #ArrayLen(MyArray)# elements, to match
the query of #GetCourses.RecordCount# records.
</cfoutput>
```

# ArraySet

## Description

In a one-dimensional array, sets the elements in a specified index range to a value. Useful for initializing an array after a call to [ArrayNew](#).

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArraySet(array, start_pos, end_pos, value)
```

## See also

[ArrayNew](#); “Populating arrays with data” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description   |
|-----------|---|
| array     | Name of an array.   |
| start_pos | Starting index position of range to set.  |
| end_pos   | Ending index position of range to set. If this value is greater than array length, ColdFusion adds elements to array. |
| value     | Value to which to set each element in the range.  |

## Example

```
<h3>ArraySet Example</h3>

<!-- Make an array -->
<cfset MyNewArray = ArrayNew(1)>
<!-- ArrayToList does not function properly if the Array has not been
    initialized
    with ArraySet -->
<cfset temp = ArraySet(MyNewArray, 1,6, "Initial Value")>

<!-- set some elements -->
<cfset MyNewArray[1] = "Sample Value">
<cfset MyNewArray[3] = "43">
<cfset MyNewArray[6] = "Another Value">
...
```

# ArraySort

## Description

Sorts array elements numerically or alphanumerically.

## Returns

True, if sort is successful; False, otherwise.

## Category

[Array functions](#), [List functions](#)

## Function syntax

```
ArraySort(array, sort_type [, sort_order ])
```

## History

ColdFusion MX:

- Changed thrown exceptions: this function can throw the `ArraySortSimpleValueException` error and `ValueNotNumeric` error.
- Changed the order in which sorted elements are returned: in a `textnocase`, descending sort, this function might return elements in a different sort order than in earlier releases. If `sort_type = "textnocase"` and `sort_order = "desc"`, ColdFusion MX processes elements that *differ only in case* differently from earlier releases, as follows:
  - ColdFusion MX reverses the elements' original order.
  - Earlier releases of ColdFusion do not change the elements' original order.For example, in a `textnocase, desc` sort of `d, a, a, b, A`, the following occurs:
  - ColdFusion MX returns `d, b, A, a, a`
  - Earlier ColdFusion releases return `d, b, a, a, A`

## Parameters

---

| Parameter          | Description      |
|--------------------|------------------|
| <code>array</code> | Name of an array |

---

| Parameter  | Description   |
|------------|---|
| sort_type  | <ul style="list-style-type: none"> <li>• numeric: sorts numbers</li> <li>• text: sorts text alphabetically, taking case into account (also known as case sensitive). All letters of one case precede the first letter of the other case: <ul style="list-style-type: none"> <li>- aabzABZ, if sort_order = "asc" (ascending sort)</li> <li>- ZBAzbaa, if sort_order = "desc" (descending sort)</li> </ul> </li> <li>• textnocase: sorts text alphabetically, without regard to case (also known as case-insensitive). A letter in varying cases precedes the next letter: <ul style="list-style-type: none"> <li>- aAaBbBzzZ, in an ascending sort; preserves original intra-letter order</li> <li>- ZzzBbBaAa, in a descending sort; reverses original intra-letter order</li> </ul> </li> </ul> |
| sort_order | <ul style="list-style-type: none"> <li>• asc - ascending sort order. Default. <ul style="list-style-type: none"> <li>- aabzABZ or aAaBbBzzZ, depending on value of sort_type, for letters</li> <li>- from smaller to larger, for numbers</li> </ul> </li> <li>• desc - descending sort order. <ul style="list-style-type: none"> <li>- ZBAzbaa or ZzzBbBaAa, depending on value of sort_type, for letters</li> <li>- from larger to smaller, for numbers</li> </ul> </li> </ul>   |

### Throws

If an array element is other than a simple element, this function throws an `ArraySortSimpleValueException` error. If `sort_type` is numeric and an array element is not numeric, this function throws a `ValueNotNumeric` error.

### Example

```
<!-- This example shows ArraySort -->
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
SELECT FirstName, LastName FROM Employees
</cfquery>
<!-- create an array -->
<cfset myArray = ArrayNew(1)>
<!-- loop through the query and append these names successively to the last
element -->
<cfloop query = "GetEmployeeNames">
  <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>
<!-- show the resulting array as a list -->
<cfset myList = ArrayToList(myArray, ",")>
<!-- sort that array descending alphabetically -->
<cfset isSuccessfull = ArraySort(myArray, "textnocase", "desc")>
...
```

# ArraySum

## Description

Array sum function.

## Returns

The sum of values in an array. If the `array` parameter value is an empty array, returns zero.

## Category

[Array functions](#), [Mathematical functions](#)

## Function syntax

`ArraySum(array)`

## Parameters

| Parameter          | Description      |
|--------------------|------------------|
| <code>array</code> | Name of an array |

## Example

```
<h3>ArraySum Example</h3>
<p>This example uses ArraySum to add two numbers together.<br> </p>
<!-- After checking whether the form has been submitted, the code creates
  an array and assigns the form fields to the first two elements in
  the array. -->
<cfif IsDefined("FORM.submit")>
  <cfset myNumberArray = ArrayNew(1)>
  <cfset myNumberArray[1] = number1>
  <cfset myNumberArray[2] = number2>

  <cfif Form.Submit is "Add">
    <!-- use ArraySum to add the number in the array -->
    <p>The sum of the numbers is
    <cfoutput>#ArraySum(myNumberArray)#.</cfoutput>
  </cfif>
</cfif>
<!-- This form provides two numeric fields that are added when the form is
  submitted. -->
<form action = "arraysum.cfm" method="post">
  <input type = "hidden" name = "number1_Float">
  <input type = "hidden" name = "number2_Float">
  <input type = "text" name = "number1">
  <br>
  <input type = "text" name = "number2">
  <br>
  <input type = "submit" name = "submit" value = "Add">
</form>
```

# ArraySwap

## Description

Swaps array values of an array at specified positions. This function is more efficient than multiple `cfset` tags.

## Returns

True, on successful completion.

## Category

[Array functions](#)

## Function syntax

```
ArraySwap(array, position1, position2)
```

## See also

“Functions for XML object management” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| array     | Name of an array                   |
| position1 | Position of first element to swap  |
| position2 | Position of second element to swap |

## Example

```
<h3>ArraySwap Example</h3>

<cfset month = ArrayNew(1)>
<cfset month[1] = "February">
<cfset month[2] = "January">
<cfset temp = ArraySwap(month, 1, 2)>
<cfset temp = ArrayToList(month)>

<p>Show the results: <cfoutput>#temp#</cfoutput>
```

# ArrayToList

## Description

Converts a one-dimensional array to a list.

## Returns

Delimited list, as a string.

## Category

[Array functions](#), [Conversion functions](#), [List functions](#)

## Function syntax

```
ArrayToList(array [, delimiter ])
```

## Parameters

| Parameter | Description   |
|-----------|---|
| array     | Name of array   |
| delimiter | Character or multicharacter string to separate list elements. The default value is comma. |

## Example

```
<h3>ArrayToList Example</h3>

<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
SELECT FirstName, LastName FROM Employees
</cfquery>

<!--- create an array --->
<cfset myArray = ArrayNew(1)>

<!--- loop through query, append names successively to last element --->
<cfloop query = "GetEmployeeNames">
  <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>

<!--- show the resulting array as a list --->
<cfset myList = ArrayToList(myArray, ",")>

<!--- sort that array descending alphabetically --->
<cfset myAlphaArray = ArraySort(myArray, "textnocase", "desc")>

<!--- show the resulting alphabetized array as a list --->
<cfset myAlphaList = ArrayToList(myAlphaArray, ",")>

<!--- output the array as a list --->
<cfoutput>
  <p>The contents of the array are as follows:
  <p>#myList#
  <p>This array, alphabetized by first name (descending):
  <p>#myAlphaList#
  <p>This array has #ArrayLen(MyArray)# elements.
</cfoutput>
```

# Asc

## Description

Determines the value of a character.

## Returns

The value of the first character of a string; if string is empty, returns zero.

## Category

[String functions](#)

## Function syntax

`Asc(string)`

## See also

[Chr](#)

## History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode characters, up to a value of 65536. (Earlier releases supported 1-255.)

## Parameters

| Parameter | Description |
|-----------|-------------|
| string    | A string    |

## Example

```
<h3>Asc Example</h3>
<!-- if the character string is not empty, output its ASCII value -->
<cfif IsDefined("FORM.charVals")>

    <cfif FORM.charVals is not "">
        <cfoutput>#Left(FORM.charVals,1)# =
            #Asc(FORM.charVals)#</cfoutput>
    <cfelse>
<!-- if it is empty, output an error message -->
        <h4>Enter a character</h4>
    </cfif>
</cfif>

<form action = "asc.cfm" method=post>
<p>Enter a character to see its ASCII value
<br><input type = "Text" name = "CharVals" size = "1" maxlength = "1">
<p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

# ASin

## Description

Determines the arcsine of a number. The arcsine is the angle whose sine is *number*.

## Returns

The arcsine, in radians, of a number.

## Category

[Mathematical functions](#)

## Function syntax

ASin(*number*)

## See also

[Sin](#), [Cos](#), [ACos](#), [Tan](#), [Atn](#), [Pi](#)

## Parameters

---

| Parameter | Description  |
|-----------|--|
| number    | Sine of an angle. The value must be between -1 and 1, inclusive. |

---

## Usage

The range of the result is  $-\pi/2$  to  $\pi/2$  radians. To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

## Example

```
<h3>ASin Example</h3>
<!-- output its arcsine value -->
<cfif IsDefined("FORM.SinNum")>
  <cfif IsNumeric(FORM.SinNum)>
    <cfif FORM.SinNum LESS THAN OR EQUAL TO 1>
      <cfif FORM.SinNum GREATER THAN OR EQUAL TO -1>
        ASin(<cfoutput>#FORM.SinNum#</cfoutput>) =
          <cfoutput>#ASin(FORM.sinNum)# Radians</cfoutput>
          <br> or <br>ASin(<cfoutput>#FORM.SinNum#</cfoutput>) =
          <cfoutput>
            #ASin(FORM.sinNum) * 180/Pi()# Degrees
          </cfoutput>
      <cfelse>
<!-- if it is less than negative one, output an error message -->
        <h4>Enter the sine of the angle to calculate, in degrees and radians.
          The value must be between 1 and -1, inclusive.</h4>
      </cfif>
    <cfelse>
<!-- if it is greater than one, output an error message -->
        <h4>Enter the sine of the angle to calculate, in degrees and radians. The
          value must be between 1 and -1, inclusive.</h4>
      </cfif>
  </cfif>
</cfif>
```

```
<cfelse>
<!--- if it is empty, output an error message --->
    <h4>Enter the sine of the angle to calculate, in degrees and radians. The
value must be between 1 and -1,inclusive.</h4>
    </cfif>
</cfif>
<form action = "./evaltest.cfm" method="post">
<p>Enter a number to get its arcsine in Radians and Degrees.
<br><input type = "Text" name = "SinNum" size = "25">
<p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

# Atn

## Description

Arctangent function. The arctangent is the angle whose tangent is *number*.

## Returns

The arctangent, in radians, of a number.

## Category

[Mathematical functions](#)

## Function syntax

`Atn(number)`

## See also

[Atn](#), [Sin](#), [ASin](#), [Cos](#), [ACos](#), [Pi](#)

## Parameters

| Parameter | Description         |
|-----------|---------------------|
| number    | Tangent of an angle |

## Usage

The range of the result is  $-\pi/2$  to  $\pi/2$  radians. To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

## Example

```
<h3>Atn Example</h3>
<!-- output its Atn value -->
<cfif IsDefined("FORM.AtnNum")>
  <cfif IsNumeric(FORM.AtnNum)>
    Atn(<cfoutput>#FORM.AtnNum#</cfoutput>) is
    <cfoutput>#Atn(FORM.AtnNum)# radians is #Atn(FORM.AtnNum * 180/PI())#
    Degrees</cfoutput>
  <cfelse>
<!-- if it is empty, output an error message -->
  <h4>Enter a number</h4>
  </cfif>
</cfif>
<form action = "evaltest.cfm" method="post">
<p>Enter a number to get its arctangent in Radians and Degrees
<br><input type = "Text" name = "atnNum" size = "25">
<p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

# AuthenticatedContext

## Description

This function is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*.

## History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

# AuthenticatedUser

## Description

This function is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*.

## History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

# BinaryDecode

## Description

Converts a string to a binary object. Used to convert binary data that has been encoded into string format back into binary data.

## Returns

A binary object.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

```
BinaryDecode(string, binaryencoding)
```

## See also

[BinaryEncode](#), [CharsetEncode](#), [CharsetDecode](#)

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter      | Description  |
|----------------|--|
| string         | A string containing encoded binary data.   |
| binaryencoding | A string specifying the algorithm used to encode the original binary data into a string; must be one of the following: <ul style="list-style-type: none"><li>Hex: the characters 0-9 and A-F represent the hexadecimal value of each byte; for example, 3A.</li><li>UU: data is encoded using the UNIX UUencode algorithm.</li><li>Base64: data is encoded using the Base64 algorithm, as specified by IETF RFC 2045, at <a href="http://www.ietf.org/rfc/rfc2045.txt">www.ietf.org/rfc/rfc2045.txt</a>.</li></ul> |

## Usage

Use this function to convert a binary-encoded string representation of binary data back to a binary object for use in your application. Binary data is often encoded as a string for transmission over many Internet protocols, such as HTTP and SMTP, or for storage in a database.

Macromedia recommends that you use the `BinaryDecode` function, not the `ToBinary(base64data)` function, to convert Base64-encoded data to binary data in all new applications.

See the following pages for additional information on handling binary data:

- [cffile](#) for loading and reading binary data in files
- [cfwddx](#) for serializing and deserializing binary data
- [IsBinary](#) for checking variables for binary format
- [Len](#) for determining the length of a binary object

## Example

The following example reads a GIF file as binary data, converts it to a binary-encoded string, converts the binary-encoded data back to binary data and writes the result to a file. It displays the encoded string and the image in the output file.

```
<h3>Binary Encoding Conversion Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.binEncoding")>

  <!-- Read in a binary data file. -->
  <cffile action="readbinary"
  file="C:\CFusionMX7\wwwroot\CFIDE\administrator\images\help.gif"
  variable="binimage">

  <!-- Convert the read data to binary encoding and back to binary data. -->
  <cfscript>
    binencode=BinaryEncode(binimage, Form.binEncoding);
    bindecode=BinaryDecode(binencode, Form.binEncoding);
  </cfscript>

  <!-- Write the converted results to a file. -->
  <cffile action="write" file="C:\temp\help.gif" output="#bindecode#"
  addnewline="No" >

  <!-- Display the results. -->
  <cfoutput>
    <p><b>The binary encoding:</b> #Form.binEncoding#</p>

    <p><b>The image converted into a binary-encoded string by BinaryEncode
    </b><br>
    #binencode#</p>
    <p><b>The image as written back to a file after converting back to binary
    using BinaryDecode</b><br>
    <br>
  </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select binary encoding</b><br>
  <select size="1" name="binEncoding" >
    <option selected>UU</option>
    <option>Base64</option>
    <option>Hex</option>
  </select><br>
  <br>
  <input type = "Submit" value = "convert my data">
</form>
```

# BinaryEncode

## Description

Converts binary data to a string.

## Returns

An encoded string representing the binary data.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

```
BinaryEncode(binarydata, encoding)
```

## See also

[BinaryDecode](#), [CharsetEncode](#), [CharsetDecode](#)

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter               | Description  |
|-------------------------|--|
| <code>binarydata</code> | A variable containing the binary data to encode.   |
| <code>encoding</code>   | A string specifying the encoding method to use to represent the data; one of the following: <ul style="list-style-type: none"><li>Hex: use the characters 0-9 and A-F to represent the hexadecimal value of each byte; for example, 3A.</li><li>UU: use the UNIX UUencode algorithm to convert the data.</li><li>Base64: use the Base64 algorithm to convert the data, as specified by IETF RFC 2045, at <a href="http://www.ietf.org/rfc/rfc2045.txt">www.ietf.org/rfc/rfc2045.txt</a>.</li></ul> |

## Usage

Binary objects and, in some cases, 8-bit characters, cannot be transported over many Internet protocols, such as HTTP and SMTP, and might not be supported by some database systems. By Binary encoding the data, you convert the data into a format that you can transfer over any Internet protocol or store in a database as character data. To convert the data back to a binary format, use the [BinaryDecode](#) function.

Macromedia recommends that you use the `BinaryEncode` function, and not the `ToBase64(binarydata)` function, to convert binary data to Base64 data in all new applications.

This function provides a superset of the functionality of the `ToBase64(binarydata)` function.

See the following pages for additional information on handling binary data:

- [cffile](#) for loading and reading binary data
- [cfwddx](#) for serializing and deserializing binary data

- `IsBinary` for checking variables for binary format
- `Len` for determining the length of a binary object

### Example

The following example reads a GIF file as binary data, converts it to a binary-encoded string, converts the binary-encoded data back to binary data, and writes the result to a file. It displays the encoded string and the image in the output file.

```
<h3>Binary Encoding Conversion Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.binEncoding")>

    <!-- Read in a binary data file. -->
    <cffile action="readbinary"
    file="C:\CFusionMX7\wwwroot\CFIDE\administrator\images\help.gif"
    variable="binimage">

    <!-- Convert the read data to binary encoding and back to binary data. -->
    <cfscript>
        binencode=BinaryEncode(binimage, Form.binEncoding);
        bindecode=BinaryDecode(binencode, Form.binEncoding);
    </cfscript>

    <!-- Write the converted results to a file. -->
    <cffile action="write" file="C:\temp\help.gif" output="#bindecode#"
    addnewline="No" >

    <!-- Display the results. -->
    <cfoutput>
        <p><b>The binary encoding:</b> #Form.binEncoding#</p>

        <p><b>The image converted into a binary-encoded string by BinaryEncode
        </b><br>
        #binencode#</p>
        <p><b>The image as written back to a file after converting back to binary
        using BinaryDecode</b><br>
        <br>
    </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select binary encoding</b><br>
    <select size="1" name="binEncoding" >
        <option selected>UU</option>
        <option>Base64</option>
        <option>Hex</option>
    </select><br>
    <br>
    <input type = "Submit" value = "convert my data">
</form>
```

# BitAnd

## Description

Performs a bitwise logical AND operation.

## Returns

The bitwise AND of two long integers.

## Category

[Mathematical functions](#)

## Function syntax

```
BitAnd(number1, number2)
```

## See also

[BitNot](#), [BitOr](#), [BitXor](#)

## Parameters

| Parameter            | Description           |
|----------------------|-----------------------|
| <code>number1</code> | 32-bit signed integer |
| <code>number2</code> | 32-bit signed integer |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitAnd Example</h3>
```

```
<p>Returns the bitwise AND of two long integers.
```

```
<p>BitAnd(5,255): <cfoutput>#BitAnd(5,255)#</cfoutput>
```

```
<p>BitAnd(5,0): <cfoutput>#BitAnd(5,0)#</cfoutput>
```

```
<p>BitAnd(128,128): <cfoutput>#BitAnd(128,128)#</cfoutput>
```

# BitMaskClear

## Description

Performs a bitwise mask clear operation.

## Returns

A number, bitwise cleared, with *length* bits beginning at *start*.

## Category

[Mathematical functions](#)

## Function syntax

`BitMaskClear(number, start, length)`

## See also

[BitMaskRead](#), [BitMaskSet](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | 32-bit signed integer                                     |
| start     | Integer, in the range 0-31, inclusive; start bit for mask |
| length    | Integer, in the range 0-31, inclusive; length of mask     |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitMaskClear Example</h3>
```

```
<p>Returns number bitwise cleared with length bits beginning from start.
```

```
<p>BitMaskClear(255, 4, 4): <cfoutput>#BitMaskClear(255, 4, 4)#</cfoutput>
```

```
<p>BitMaskClear(255, 0, 4): <cfoutput>#BitMaskClear(255, 0, 4)#</cfoutput>
```

```
<p>BitMaskClear(128, 0, 7): <cfoutput>#BitMaskClear(128, 0, 7)#</cfoutput>
```

# BitMaskRead

## Description

Performs a bitwise mask read operation.

## Returns

An integer, created from *length* bits of *number*, beginning at *start*.

## Category

[Mathematical functions](#)

## Function syntax

`BitMaskRead(number, start, length)`

## See also

[BitMaskClear](#), [BitMaskSet](#)

## Parameters

| Parameter           | Description   |
|---------------------|---|
| <code>number</code> | 32-bit signed integer to mask                             |
| <code>start</code>  | Integer, in the range 0-31, inclusive; start bit for read |
| <code>length</code> | Integer, in the range 0-31, inclusive; length of mask     |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitMaskRead Example</h3>
<p>Returns integer created from <em>length</em> bits of <em>number</em>,
beginning
with <em>start</em>.</p>
<p>BitMaskRead(255, 4, 4): <cfoutput>#BitMaskRead(255, 4, 4)#
</cfoutput>
<p>BitMaskRead(255, 0, 4): <cfoutput>#BitMaskRead(255, 0, 4)#
</cfoutput>
<p>BitMaskRead(128, 0, 7): <cfoutput>#BitMaskRead(128, 0, 7)#
</cfoutput>
```

# BitMaskSet

## Description

Performs a bitwise mask set operation.

## Returns

A number, bitwise masked with *length* bits of *mask* beginning at *start*.

## Category

[Mathematical functions](#)

## Function syntax

`BitMaskSet(number, mask, start, length)`

## See also

[BitMaskClear](#), [BitMaskRead](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | 32-bit signed integer                                     |
| mask      | 32-bit signed integer; mask                               |
| start     | Integer, in the range 0-31, inclusive; start bit for mask |
| length    | Integer, in the range 0-31, inclusive; length of mask     |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitMaskSet Example</h3>
```

```
<p>Returns number bitwise masked with length bits of mask beginning at start.
```

```
<p>BitMaskSet(255, 255, 4, 4):
```

```
<cfoutput>#BitMaskSet(255, 255, 4, 4)#</cfoutput>
```

```
<p>BitMaskSet(255, 0, 4, 4):
```

```
<cfoutput>#BitMaskSet(255, 0, 4, 4)#</cfoutput>
```

```
<p>BitMaskSet(0, 15, 4, 4):
```

```
<cfoutput>#BitMaskSet(0, 15, 4, 4)#</cfoutput>
```

# BitNot

## Description

Performs a bitwise logical NOT operation.

## Returns

A number; the bitwise NOT of a long integer.

## Category

[Mathematical functions](#)

## Function syntax

```
BitNot(number)
```

## See also

[BitAnd](#), [BitOr](#), [BitXor](#)

## Parameters

| Parameter | Description           |
|-----------|-----------------------|
| number    | 32-bit signed integer |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitNot Example</h3>
```

```
<p>Returns the bitwise NOT of a long integer.
```

```
<p>BitNot(0): <cfoutput>#BitNot(0)#</cfoutput>
```

```
<p>BitNot(255): <cfoutput>#BitNot(255)#</cfoutput>
```

# BitOr

## Description

Performs a bitwise logical OR operation.

## Returns

A number; the bitwise OR of two long integers.

## Category

[Mathematical functions](#)

## Function syntax

```
BitOr(number1, number2)
```

## See also

[BitAnd](#), [BitNot](#), [BitXor](#)

## Parameters

| Parameter            | Description           |
|----------------------|-----------------------|
| <code>number1</code> | 32-bit signed integer |
| <code>number2</code> | 32-bit signed integer |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitOr Example</h3>
```

```
<p>Returns the bitwise OR of two long integers.
```

```
<p>BitOr(5,255): <cfoutput>#BitOr(5,255)#</cfoutput>
```

```
<p>BitOr(5,0): <cfoutput>#BitOr(5,0)#</cfoutput>
```

```
<p>BitOr(7,8): <cfoutput>#BitOr(7,8)#</cfoutput>
```

# BitSHLN

## Description

Performs a bitwise shift-left, no-rotation operation.

## Returns

A number, bitwise shifted without rotation to the left by *count* bits.

## Category

[Mathematical functions](#)

## Function syntax

`BitSHLN(number, count)`

## See also

[BitSHRN](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | 32-bit signed integer   |
| count     | Integer, in the range 0-31, inclusive; number of bits to shift the number |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

`<h3>BitSHLN Example</h3>`

`<p>Returns the number, bitwise shifted, without rotation, to the left by count bits.`

`<p>BitSHLN(1,1): <cfoutput>#BitSHLN(1,1)#</cfoutput>`

`<p>BitSHLN(1,30): <cfoutput>#BitSHLN(1,30)#</cfoutput>`

`<p>BitSHLN(1,31): <cfoutput>#BitSHLN(1,31)#</cfoutput>`

`<p>BitSHLN(2,31): <cfoutput>#BitSHLN(2,31)#</cfoutput>`

# BitSHRN

## Description

Performs a bitwise shift-right, no-rotation operation.

## Returns

A number, bitwise shifted, without rotation, to the right by *count* bits.

## Category

[Mathematical functions](#)

## Function syntax

`BitSHRN(number, count)`

## See also

[BitSHLN](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | 32-bit signed integer   |
| count     | Integer, in the range 0-31, inclusive. Number of bits to shift the number |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitSHRN Example</h3>
```

```
<p>Returns a number, bitwise shifted, without rotation, to the right, by count bits.
```

```
<p>BitSHRN(1,1): <cfoutput>#BitSHRN(1,1)#</cfoutput>
```

```
<p>BitSHRN(255,7): <cfoutput>#BitSHRN(255,7)#</cfoutput>
```

```
<p>BitSHRN(-2147483548,1): <cfoutput>#BitSHRN(-2147483548,1)#</cfoutput>
```

# BitXor

## Description

Performs a bitwise logical XOR operation.

## Returns

Bitwise XOR of two long integers.

## Category

[Mathematical functions](#)

## Function syntax

```
BitXor(number1, number2)
```

## See also

[BitAnd](#), [BitNot](#), [BitOr](#)

## Parameters

| Parameter            | Description           |
|----------------------|-----------------------|
| <code>number1</code> | 32-bit signed integer |
| <code>number2</code> | 32-bit signed integer |

## Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

## Example

```
<h3>BitXor Example</h3>
```

```
<p>Returns the bitwise XOR of two long integers.
```

```
<p>BitXor(5,255): <cfoutput>#BitXor(5,255)#</cfoutput>
```

```
<p>BitXor(5,0): <cfoutput>#BitXor(5,0)#</cfoutput>
```

```
<p>BitXor(128,128): <cfoutput>#BitXor(128,128)#</cfoutput>
```

# Ceiling

## Description

Determines the closest integer that is greater than a specified number.

## Returns

The closest integer that is greater than a given number.

## Category

[Mathematical functions](#)

## Function syntax

`Ceiling(number)`

## See also

[Int](#), [Fix](#), [Round](#)

## Parameters

---

| Parameter | Description   |
|-----------|---------------|
| number    | A real number |

---

## Example

```
<h3>Ceiling Example</h3>
```

```
<cfoutput>
<p>The ceiling of 3.4 is #ceiling(3.4)#
<p>The ceiling of 3 is #ceiling(3)#
<p>The ceiling of 3.8 is #ceiling(3.8)#
<p>The ceiling of -4.2 is #ceiling(-4.2)#
</cfoutput>
```

# CharsetDecode

## Description

Converts a string to a binary representation.

## Returns

A binary object that represents the string.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

```
CharsetDecode(string, encoding)
```

## See also

[BinaryDecode](#), [BinaryEncode](#), [CharsetEncode](#); “Determining the page encoding of server output” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description   |
|-----------|---|
| string    | A string containing data to encode in binary format.  |
| encoding  | A string specifying encoding of the input data. Must be a character encoding name recognized by the Java runtime. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For a complete list of character encoding names supported by Sun Java runtimes, see <a href="http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html</a> and <a href="http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html</a> . |

## Usage

This function converts a string directly to a binary object. In releases of ColdFusion through ColdFusion MX 6.1, you had to use the `ToBase64` function to convert the string to Base64 and then use the `ToBinary` function to convert strings to binary data.

## Example

The following example uses the `CharsetDecode` function to convert a string from a form to a binary object, and uses the `CharsetEncode` function to convert it back to the original value. You can change the character encoding that ColdFusion uses for the conversion. Notice that if you select the Asian language encodings, characters that are not in the specified character set do get successfully converted.

```
<h3>Character Encoding Conversion Example</h3>
<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>

    <!-- Do the conversions. -->
    <cfscript>
        chardecode=CharsetDecode(Form.myString, Form.charEncoding);
        charencode=CharsetEncode(chardecode, Form.charEncoding);
    </cfscript>

    <!-- Display the input values and results. -->
    <cfoutput>
        <h3>Parameter Settings</h3>
        <p><b>The string:</b><br>
            #Form.myString#</p>
        <p><b>The character encoding:</b> #Form.charEncoding#</p>

        <h3>Results of the operations:</h3>
        <p><b>Dump of the string converted to a binary object by CharsetDecode:
            </b><br>
            <cfdump var="#chardecode#"></p>
        <p><b>The binary object converted back to a string by CharsetEncode:
            </b><br>
            #charencode#</p>
    </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select the character encoding</b><br>
    <!-- This is a subset, additional encodings are available. -->
    <select size="1" name="charEncoding" >
        <option selected>UTF-8</option>
        <option>ASCII</option>
        <option>IS08859_1</option>
        <option>CP1252</option>
        <option>SJIS</option>
        <option>MS932</option>
        <option>EUC_CN</option>
        <option>Big5</option>
    </select><br>
    <br>
    <b>Enter a string</b><br>
```

```
<textArea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">
The following four characters are not in all character encodings: ½àç±
</textArea><br>
<br>
<input type = "Submit" value = "convert my data">
</form>
```

# CharsetEncode

## Description

Uses the specified encoding to convert binary data to a string.

## Returns

A string representation of the binary object.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

```
CharsetEncode(binaryobject, encoding)
```

## See also

[BinaryDecode](#), [BinaryEncode](#), [CharsetDecode](#); “Determining the page encoding of server output” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter                 | Description  |
|---------------------------|--|
| <code>binaryobject</code> | A variable containing binary data to decode into text.   |
| <code>encoding</code>     | The character encoding that was used to encode the string into binary format. It must be a character encoding name recognized by the Java runtime. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For a complete list of character encoding names supported by Sun Java runtimes, see <a href="http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html</a> and <a href="http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html</a> . |

## Usage

Macromedia recommends that you use this function, and not the [ToString](#) function, to convert binary data to strings in all new applications.

## Example

The following example uses the `CharsetDecode` function to convert a string from a form to a binary object, and uses the `CharsetEncode` function to convert it back to the original value. You can change the character encoding that ColdFusion uses for the conversion. Notice that if you select the Asian language encodings, characters that are not in the specified character set do get successfully converted.

```
<h3>Character Encoding Conversion Example</h3>
<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>

  <!-- Do the conversions. -->
  <cfscript>
    chardecode=CharsetDecode(Form.myString, Form.charEncoding);
    charencode=CharsetEncode(chardecode, Form.charEncoding);
  </cfscript>

  <!-- Display the input values and results. -->
  <cfoutput>
    <h3>Parameter Settings</h3>
    <p><b>The string:</b><br>
      #Form.myString#</p>
    <p><b>The character encoding:</b> #Form.charEncoding#</p>

    <h3>Results of the operations:</h3>
    <p><b>Dump of the string converted to a binary object by CharsetDecode:
      </b><br>
      <cfdump var="#chardecode#"></p>
    <p><b>The binary object converted back to a string by CharsetEncode:
      </b><br>
      #charencode#</p>
  </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select the character encoding</b><br>
  <!-- This is a subset, additional encodings are available. -->
  <select size="1" name="charEncoding" >
    <option selected>UTF-8</option>
    <option>ASCII</option>
    <option>IS08859_1</option>
    <option>CP1252</option>
    <option>SJIS</option>
    <option>MS932</option>
    <option>EUC_CN</option>
    <option>Big5</option>
  </select><br>
  <br>
  <b>Enter a string</b><br>
```

```
<textArea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">
The following four characters are not in all character encodings: ½àç÷
</textArea><br>
<br>
<input type = "Submit" value = "convert my data">
</form>
```

# Chr

Converts a numeric value to a UCS-2 character.

## Returns

A character with the specified UCS-2 character code.

## Category

[String functions](#)

## Function syntax

`Chr(number)`

## See also

[Asc](#)

## History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode characters, up to a value of 65535. (Earlier releases supported 1-255.)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | A value (a number in the range 0 to 65535, inclusive) |

## Usage

The values 0 – 31 are standard, nonprintable codes. For example:

- `Chr(10)` returns a linefeed character
- `Chr(13)` returns a carriage return character
- The two-character string `Chr(13) & Chr(10)` returns a Windows newline

**Note:** For a complete list of the Unicode characters and their codes, see [www.unicode.org/charts/](http://www.unicode.org/charts/).

## Example

```
<!-- If the character string is not empty, then
      output its Chr value. -->
<cfif IsDefined("form.charVals")>
    <cfoutput>#form.charVals# = #Chr(form.charVals)#</cfoutput>
</cfif>

<cfform action="#CGI.script_name#" method="POST">
    <p>Type an integer character code from 1 to 65535<br>
      to see its corresponding character.<br>
    <cfinput type="Text"
      name="CharVals"
      range="1,65535"
      message="Please enter an integer from 1 to 65535"
      validate="integer"
      required="Yes"
      size="5"
```

```
        maxlength="5"  
    >  
<p><input type="Submit" name=""> <input type="RESET">  
</cform>
```

# CJustify

## Description

Centers a string in a field length.

## Returns

String, center-justified by adding spaces before or after the input parameter. If *length* is less than the length of the input parameter string, the string is returned unchanged.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

```
Cjustify(string, length)
```

## See also

[LJustify](#), [RJustify](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A string or a variable that contains one. May be empty. If it is a variable that is defined as a number, the function processes it as a string.  |
| length    | A positive integer or a variable that contains one. Length of field.<br>Can be coded as: <ul style="list-style-type: none"><li>• A number; for example, 6</li><li>• A string representation of a number; for example, "6"</li></ul> Any other value causes ColdFusion to throw an error. |

## Example

```
<!-- This example shows how to use CJustify -->
<CFPARAM name = "jstring" DEFAULT = "">

<cfif IsDefined("FORM.submit")>
<cfdump var="#Form#">
  <cfset jstring = Cjustify("#FORM.justifyString#", 35)>
</cfif>
<html>
<head>
<title>CJustify Example</title>
</head>
<body>
<h3>CJustify</h3>
<p>Enter a string; it will be center-justified within the sample field.
<form action = "cjustify.cfm" method="post">
<p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>"
  size = 35 name = "justifyString">
<p><input type = "Submit" name = "submit">
<input type = "RESET">
</form>
</body>
</html>
```

# Compare

## Description

Performs a case-sensitive comparison of two strings.

## Returns

- -1, if *string1* is less than *string2*
- 0, if *string1* is equal to *string2*
- 1, if *string1* is greater than *string2*

## Category

[String functions](#)

## Function syntax

```
Compare(string1, string2)
```

## See also

[CompareNoCase](#), [Find](#)

## Parameters

| Parameter      | Description                              |
|----------------|--|
| <i>string1</i> | A string or a variable that contains one |
| <i>string2</i> | A string or a variable that contains one |

## Usage

Compares the values of corresponding characters in *string1* and *string2*.

## Example

```
<h3>Compare Example</h3>
<p>The compare function performs a <I>case-sensitive</I> comparison of two strings.

<cfif IsDefined("FORM.string1")>
  <cfset comparison = Compare(FORM.string1, FORM.string2)>
  <!-- switch on the variable to give various responses -->
  <cfswitch expression = #comparison#>
    <cfcase value = "-1">
      <h3>String 1 is less than String 2</h3>
      <I>The strings are not equal</I>
    </cfcase>
    <cfcase value = "0">
      <h3>String 1 is equal to String 2</h3>
      <I>The strings are equal!</I>
    </cfcase>
    <cfcase value = "1">
      <h3>String 1 is greater than String 2</h3>
      <I>The strings are not equal</I>
    </cfcase>
  </cfswitch>
</cfif>
```

```
        <h3>This is the default case</h3>
    </CFDEFAULTCASE>
</cfswitch>
</cfif>
<form action = "compare.cfm" method="post">
<p>String 1
<br><input type = "Text" name = "string1">
<p>String 2
<br><input type = "Text" name = "string2">
<p><input type = "Submit" value = "Compare these Strings" name = "">
    <input type = "RESET">
</form>
```

# CompareNoCase

## Description

Performs a case-insensitive comparison of two strings.

## Returns

An indicator of the difference:

- A negative number, if *string1* is less than *string2*
- 0, if *string1* is equal to *string2*
- A positive number, if *string1* is greater than *string2*

## Category

[String functions](#)

## Function syntax

```
CompareNoCase(string1, string2)
```

## See also

<P>String 2
<BR><INPUT TYPE="Text" NAME="string2">
<P><INPUT TYPE="Submit" VALUE="Compare these Strings" NAME="">
  <INPUT TYPE="RESET">
</FORM>
```

# Cos

## Description

Calculates the cosine of an angle that is entered in radians.

## Returns

A number; the cosine of the angle.

## Category

[Mathematical functions](#)

## Function syntax

`Cos(number)`

## See also

[ACos](#), [Sin](#), [ASin](#), [Tan](#), [Atn](#), [Pi](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| number    | Angle, in radians, for which to calculate the cosine |

## Usage

The range of the result is -1 to 1.

To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

**Note:** Because the function uses floating point arithmetic, it returns a very small number (such as 6.12323399574E-017) for angles that should produce 0. To test for a 0 value, check whether the value is less than 0.000000000001.

## Example

```
<h3>Cos Example</h3>
<!-- Calculate cosine if form has been submitted -->
<cfif IsDefined("FORM.cosNum")>
<!-- Make sure input is a number -->
  <cfif IsNumeric("#FORM.cosNum#")>
<!-- Convert degrees to radians, call the Cos function. -->
  <cfset cosValue=#Cos((Form.cosNum * PI()) / 180)#>
<!-- 0.000000000001 is the function's precision limit.
  If absolute value of returned cosine value is
  less, set result to 0 -->
  <cfif Abs(cosValue) LT 0.000000000001>
    <cfset cosValue=0>
  </cfif>
  <cfoutput>
    Cos(#FORM.cosNum#) = #cosValue#<br><br>
  </cfoutput>
</cfif>
<!-- If input is not a number, show an error message -->
<h4>You must enter a numeric angle in degrees.</h4>
```

# CreateDate

## Description

Creates a date/time object.

## Returns

A date/time value.

## Category

[Date and time functions](#)

## Function syntax

```
CreateDate(year, month, day)
```

## See also

[CreateDateTime](#), [CreateODBCDate](#); “Date-time functions and queries when ODBC is not supported” in Chapter 3, “Using ColdFusion Variables” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| year      | Integer in the range 0-9999. Integers in the range 0-29 are converted to 2000-2029. Integers in the range 30-99 are converted to 1930-1999. You cannot specify dates before AD 100. |
| month     | Integer in the range 1 (January)-12 (December)  |
| day       | Integer in the range 1-31   |

## Usage

CreateDate is a subset of [CreateDateTime](#).

The time in the returned object is set to 00:00:00.

## Example

```
<h3>CreateDate Example</h3>
<CFIF IsDefined("form.year")>
<p>Your date value, generated with CreateDate:
<CFSET yourDate = CreateDate(form.year, form.month, form.day)>
<cfoutput>
<ul>
  <li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#
  <li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month,
form.day, 12,13,0)#
  <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#
  <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#
</ul>

<p>The same value can be formatted with DateFormat:
<ul>
```

```

<li>Formatted with CreateDate and DateFormat:
    #DateFormat(CreateDate(form.year, form.month, form.day), "mmm-dd-
yyyy")#
<li>Formatted with CreateDateTime and DateFormat:
    #DateFormat(CreateDateTime(form.year, form.month, form.day, 12,13,0))#
<li>Formatted with CreateODBCDate and DateFormat:
    #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#
<li>Formatted with CreateODBCDateTime and DateFormat:
    #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#
</ul>
</cfoutput>
</CFIF>
<CFFORM ACTION="createdate.cfm" METHOD="POST">
<p>Enter the year, month and day, as integers:
<PRE>
Year<CFINPUT TYPE="Text" NAME="year" VALUE="1998" VALIDATE="integer"

# CreateDateTime

## Description

Creates a date-time object.

## Returns

A date/time value.

## Category

[Date and time functions](#)

## Function syntax

```
CreateDateTime(year, month, day, hour, minute, second)
```

## See also

[CreateDate](#), [CreateTime](#), [CreateODBCDateTime](#), [Now](#); “Date-time functions and queries when ODBC is not supported” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| year      | Integer in the range 0-9999. Integers in the range 0-29 are converted to 2000-2029. Integers in the range 30-99 are converted to 1930-1999. You cannot specify dates before AD 100. |
| month     | Integer in the range 1 (January)-12 (December)  |
| day       | Integer in the range 1-31   |
| hour      | Integer in the range 0-23   |
| minute    | Integer in the range 0-59   |
| second    | Integer in the range 0-59   |

## Example

```
<h3>CreateDateTime Example</h3>

<CFIF IsDefined("form.year")>
Your date value, generated with CreateDateTime:
<CFSET yourDate = CreateDateTime(form.year, form.month, form.day,
    form.hour, form.minute, form.second)>

<cfoutput>
<ul>
    <li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#
    <li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month,
        form.day, form.hour, form.minute, form.second)#
    <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#
    <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#
</ul>
```

```

<p>The same value can be formatted with DateFormat:
<ul>
  <li>Formatted with CreateDate and DateFormat:
    #DateFormat(CreateDate(form.year, form.month, form.day), "mmm-dd-yyyy")#
  <li>Formatted with CreateDateTime and DateFormat:
    #DateFormat(CreateDateTime(form.year, form.month, form.day,
    form.hour, form.minute, form.second))#
  <li>Formatted with CreateODBCDate and DateFormat:
    #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#
  <li>Formatted with CreateODBCDateTime and DateFormat:
    #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#
</ul>
</cfoutput>
</CFIF>

```

```

<CFFORM ACTION="createdatetime.cfm" METHOD="POST">
<p>Please enter the year, month, and day, in integer format, for a date to
view:
<PRE>
Year<CFINPUT TYPE="Text" NAME="year" VALUE="1998" VALIDATE="integer"
REQUIRED="Yes">
Month<CFINPUT TYPE="Text" NAME="month" VALUE="6" RANGE="1,12"
MESSAGE="Please enter a month (1-12)" VALIDATE="integer"

REQUIRED="Yes">
</PRE>
<p><INPUT TYPE="Submit" NAME=""> <INPUT TYPE="RESET">
</cform>

```

# CreateObject

## Description

Creates a ColdFusion object, of a specified type.

## Returns

An object, of the specified type.

**Note:** You can enable and disable this function in the ColdFusion Administrator, ColdFusion Basic Security, Tag Restrictions page.

## Category

[Extensibility functions](#)

## History

ColdFusion MX 7: For web service object: added the `portName` parameter, which specifies a port named in the `service` element of the WSDL.

ColdFusion MX:

- Changed instantiation behavior: this function, and the `cfoject` tag, can instantiate ColdFusion components and web services. Executing operations on a CFC object executes CFML code that implements the CFC's method in the CFC file.  
For more information, see *ColdFusion MX Developer's Guide*.
- For CORBA object: changed the Naming Service separator format for addresses from a dot to a forward slash. For example, if "context=NameService", for a class, use either of the following formats for the `class` parameter:
  - "Macromedia/Eng/CF"
  - "Macromedia.current/Eng.current/CF"(In earlier releases, the format was "Macromedia.Eng.CF".)
- For CORBA object: changed the `locale` parameter; it specifies the Java config that contains the properties file.

## CreateObject object types

For information about using this function, see these sections:

- [“CreateObject: COM object” on page 528](#)
- [“CreateObject: component object” on page 530](#)
- [“CreateObject: CORBA object” on page 531](#)
- [“CreateObject: Java or EJB object” on page 533](#)
- [“CreateObject: web service object” on page 534](#)

**Note:** On UNIX, this function does not support COM objects.

# CreateObject: COM object

## Description

The `CreateObject` function can create a Component Object Model (COM) object.

To create a COM object, you must provide this information:

- The object's program ID or filename
- The methods and properties available to the object through the `IDispatch` interface
- The arguments and return types of the object's methods

For most objects, you can get this information from the `OLEView` utility.

**Note:** On UNIX, this function does not support COM objects.

## Returns

A COM object.

## Function syntax

```
CreateObject(type, class, context, serverName)
```

## See also

[ReleaseComObject](#), [cfobject](#); Chapter 38, "Integrating COM and CORBA Objects in CFML Applications" in *ColdFusion MX Developer's Guide*.

## Parameters

| Parameter               | Description   |
|-------------------------|---|
| <code>type</code>       | Type of object to create. <ul style="list-style-type: none"><li>• <code>com</code></li><li>• <code>corba</code></li><li>• <code>java</code></li><li>• <code>component</code></li><li>• <code>webservice</code></li></ul>  |
| <code>class</code>      | Component ProgID for the object to invoke   |
| <code>context</code>    | <ul style="list-style-type: none"><li>• <code>InProc</code></li><li>• <code>Local</code></li><li>• <code>Remote</code></li></ul>  |
| <code>serverName</code> | Server name, using UNC or DNS convention, in one of these forms: <ul style="list-style-type: none"><li>• <code>\\lanserver</code></li><li>• <code>lanserver</code></li><li>• <code>http://www.servername.com</code></li><li>• <code>www.servername.com</code></li><li>• <code>127.0.0.1</code></li></ul> If <code>context = "remote"</code> , this parameter is required. |

## Usage

The following example creates the Windows Collaborative Data Objects (CDO) for NTS NewMail object to send mail. You would use this code within a `cfscript` tag.

```
Mailer = CreateObject("COM", "CDONTS.NewMail");
```

## CreateObject: component object

### Description

The `CreateObject` function can create an instance of a ColdFusion component (CFC) object.

### Returns

A component object.

### Function syntax

```
CreateObject(type, component-name)
```

### See also

Chapter 10, “Building and Using ColdFusion Components” in *ColdFusion MX Developer’s Guide*

### Parameters

| Parameter      | Description   |
|----------------|---|
| type           | Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul>   |
| component-name | The CFC name; corresponds to the name of the file that defines the component; for example, use <code>engineComp</code> to specify the component defined in the <code>engineComp.cfc</code> file |

### Usage

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lowercase. If it does not find the file, it looks for a file name that matches the component name exactly, with the identical character casing.

In the following example, the CFScript statements assign the `tellTimeCFC` variable to the `tellTime` component using the `CreateObject` function. The `CreateObject` function references the component in another directory. To invoke component methods, you use function syntax.

```
<b>Server's Local Time:</b>
<cfscript>
    tellTimeCFC=CreateObject("component","appResources.components.
        tellTime");
    tellTimeCFC.getLocalTime();
</cfscript>
<br>
<b>Calculated UTC Time:</b>
<cfscript>
    tellTimeCFC.getUTCTime();
</cfscript>
```

# CreateObject: CORBA object

## Description

The `CreateObject` function can call a method on a CORBA object. The object must be defined and registered for use.

## Returns

A handle to a CORBA interface.

## Function syntax

```
CreateObject(type, context, class, locale)
```

## See also

Chapter 38, “Integrating COM and CORBA Objects in CFML Applications” in *ColdFusion MX Developer’s Guide*

## History

See the History section of the main `CreateObject` function page.

## Parameters

| Parameter | Description  |
|-----------|--|
| type      | Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul>  |
| context   | <ul style="list-style-type: none"><li>• IOR: ColdFusion uses IOR to access CORBA server</li><li>• NameService: ColdFusion uses naming service to access server. Valid only with the InitialContext of a VisiBroker ORB.</li></ul>  |
| class     | <ul style="list-style-type: none"><li>• If <code>context = "ior"</code>: absolute path of file that contains string version of the Interoperable Object Reference (IOR). ColdFusion must be able to read file; it should be local to ColdFusion server or accessible on network</li><li>• If <code>context = "nameservice"</code>: forward slash-delimited naming context for naming service. For example: <code>Allaire//Doc/empobject</code></li></ul> |
| locale    | The name of the Java config that holds the properties file. For more information, see <i>Configuring and Administering ColdFusion MX</i> .   |

## Usage

In the `class` parameter, if "`context=NameService`", use a dot separator for the first part of the string. Use either of the following formats:

- "Macromedia/Eng/CF"
- "Macromedia.current/Eng.current/CF"

ColdFusion Enterprise supports CORBA through the Dynamic Invocation Interface (DII). To use this function with CORBA objects, you must provide the name of the file that contains a string version of the IOR, or the object's naming context in the naming service. You must provide the object's attributes, method names and method signatures.

This function supports user-defined types (structures, arrays, and sequences).

### Example

```
myobj = CreateObject("corba", "d:\temp\tester.ior", "ior",  
    "visibroker") // uses IOR  
  
myobj = CreateObject("corba", "Macromedia/Eng/CF",  
    "nameservice", "visibroker") // uses nameservice  
  
myobj = CreateObject("corba", "d:\temp\tester.ior",  
    "nameservice") // uses nameservice and default configuration
```

# CreateObject: Java or EJB object

## Description

The `CreateObject` function can create a Java object, and, by extension, an EJB object.

## Returns

A Java object.

## Function syntax

```
CreateObject(type, class)
```

## Parameters

| Parameter | Description   |
|-----------|---|
| type      | Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul> |
| class     | A Java class name   |

## Usage

Any Java class available in the class path that is specified in the ColdFusion Administrator can be loaded and used from ColdFusion with the `CreateObject` function.

To access Java methods and fields:

1. Call the `CreateObject` function or the `cfobject` tag to load the class.
2. Use the `init` method, with appropriate arguments, to call an instance of the class. For example:

```
<cfset ret = myObj.init(arg1, arg2)>
```

Calling a public method on the object without first calling the "init" method invokes a static method. Arguments and return values can be any Java type (simple, array, object). If strings are passed as arguments, ColdFusion does the conversions; if strings are received as return values, ColdFusion does no conversion.

Overloaded methods are supported if the number of arguments is different. Future enhancements will let you use cast functions that allow method signatures to be built more accurately.

# CreateObject: web service object

## Description

This function can create a web service object.

## Returns

A web service object.

## Function syntax

```
CreateObject(type, urltowsdl [, portname ])
```

## Parameters

| Parameter | Description   |
|-----------|---|
| type      | Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul>   |
| urltowsdl | WSDL file URL; location of web service  |
| portname  | The port name for the web service. This value is case-sensitive and corresponds to the <code>port</code> element's <code>name</code> attribute under the <code>service</code> element. Specify this parameter if the web service contains multiple ports. If no port name is specified, ColdFusion uses the first port found in the WSDL. |

## Usage

You can use the `CreateObject` function to create a web service.

## Example

```
<cfscript>
    ws = CreateObject("webservice",
        "http://www.xmethods.net/sd/2001/TemperatureService.wsdl");
    xlatstring = ws.getTemp(zipcode = "55987");
    writeoutput("The temperature at 55987 is " & xlatstring);
</cfscript>
```

# CreateODBCDate

## Description

Creates an ODBC date object.

## Returns

A date object, in normalized ODBC date format.

## Category

[Date and time functions](#)

## Function syntax

```
CreateODBCDate(date)
```

## See also

[CreateDate](#), [CreateODBCDateTime](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| date      | Date or date/time object in the range 100 AD-9999 AD. |

## Usage

This function does not parse or validate values. To ensure that dates are entered and processed correctly (for example, to ensure that a day/month/year entry is not confused with a month/day/year entry, and so on), Macromedia recommends that you parse entered dates with the `DateFormat` function, using the `mm-dd-yyyy` mask, into three elements. Ensure that values are within appropriate ranges; for example, to validate a month value, use the attributes `validate = "integer"` and `range = "1,12"`.

## Example

```
<h3>CreateODBCDate Example</h3>
<CFIF IsDefined("form.year")>
<p>Your date value, generated with CreateDateTime:
<cfset yourDate = CreateDateTime(form.year, form.month, form.day, form.hour,
  form.minute, form.second)>
<cfoutput>
<ul>
  <li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#
  <li>Formatted with CreateDateTime:
    #CreateDateTime(form.year, form.month, form.day, form.hour, form.minute,
    form.second)#
  <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#
  <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#
</ul>
<p>The same value can be formatted with DateFormat:
<ul>
  <li>Formatted with CreateDate and DateFormat:
    #DateFormat(CreateDate(form.year,form.month, form.day), "mmm-dd-yyyy")#
  <li>Formatted with CreateDateTime and DateFormat:
```

```

    #DateFormat(CreateDateTime(form.year, form.month, form.day, form.hour,
form.minute, form.second))#
<li>Formatted with CreateODBCDate and DateFormat:
    #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#
</li>Formatted with CreateODBCDateTime and DateFormat:
    #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#
</ul>
</cfoutput>
</cfif>
<cfform action="createodbcdate.cfm" method="POST">
<p>Enter the year, month and day, as integers:
<pre>
Year<cfinput type="text" name="year" value="1998" validate="integer"
required="yes">
Month<cfinput type="text" name="month" value="6" range="1,12"
message="please enter a month (1-12)" validate="integer"
REQUIRED="Yes">
Day    <cfinput type="text" name="day" value="8" range="1,31"
MESSAGE="Please enter a day of the month (1-31)" VALIDATE="integer"
REQUIRED="Yes">
Hour  <cfinput type="text" name="hour" value="16" range="0,23"
MESSAGE="You must enter an hour (0-23)" VALIDATE="integer"

<p><INPUT TYPE="Submit" NAME=""> <INPUT TYPE="RESET">
</cfform>

```

# CreateODBCDateTime

## Description

Creates an ODBC date-time object.

## Returns

A date-time object, in ODBC timestamp format.

## Category

[Date and time functions](#)

## Function syntax

```
CreateODBCDateTime(date)
```

## See also

[CreateDateTime](#), [CreateODBCDate](#), [CreateODBCTime](#), [Now](#); “Evaluation and type conversion issues” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                                   |
|-----------|---|
| date      | Date-time object in the range 100 AD–9999 AD. |

## Usage

When passing a date-time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date-time object.

## Example

```
<!-- This example shows how to use CreateDate, CreateDateTime,
      CreateODBCDate, and CreateODBCDateTime -->
<h3>CreateODBCDateTime Example</h3>

<cfif IsDefined("form.year")>
Your date value, generated using CreateDateTime:
<cfset yourDate = CreateDateTime (form.year, form.month, form.day,
    form.hour,form.minute, form.second)>
<cfoutput>
<ul>
  <li>Formatted with CreateDate: #CreateDate(form.year, form.month,form.day)#
  <li>Formatted with CreateDateTime: #CreateDateTime(form.year,form.month,
    form.day,form.hour,form.minute,form.second)#
  <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#
  <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#
</ul>
<p>The same value can be formatted with DateFormat:
<ul>
  <li>Formatted with CreateDate and DateFormat:
    #DateFormat(CreateDate(form.year,form.month,form.day), "mmm-dd-yyyy")#
  <li>Formatted with CreateDateTime and DateFormat:
    #DateFormat(CreateDateTime(form.year,form.month,form.day,
    form.hour,form.minute,form.second))#
```

```

<li>Formatted with CreateODBCDate and DateFormat:
    #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#
<li>Formatted with CreateODBCDateTime and DateFormat:
    #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#
</ul>
</cfoutput>
</cfif>
<CFFORM ACTION="createodbcdatetime.cfm" METHOD="POST">
<p>Enter a year, month and day, as integers:
<pre>

Year <CFINPUT
    TYPE="Text" NAME="year" VALUE="1998" VALIDATE="integer"

    REQUIRED="Yes">

Second<cfinput type="text" name="second" value="0" range="0,59"
    MESSAGE="You must enter a seconds value (0-59)" VALIDATE="integer"
    REQUIRED="Yes">
</pre>
<p><INPUT TYPE="Submit" NAME=""> <INPUT TYPE="RESET">
</cform>

```

# CreateODBCTime

## Description

Creates an ODBC time object.

## Returns

A time object, in ODBC timestamp format.

## Category

[Date and time functions](#)

## Function syntax

```
CreateODBCTime(date)
```

## See also

[CreateODBCDateTime](#), [CreateTime](#), “Evaluation and type conversion issues” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                                   |
|-----------|---|
| date      | Date/time object in the range 100 AD–9999 AD. |

## Usage

When passing a date-time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date-time object.

## Example

```
<h3>CreateODBCTime Example</h3>
<cfif IsDefined("form.hour")>
Your time value, created with CreateTime...
<cfset yourTime = CreateTime(form.hour, form.minute, form.second)>
<cfoutput>
<ul>
  <li>Formatted with CreateODBCTime: #CreateODBCTime(yourTime)#
  <li>Formatted with TimeFormat: #TimeFormat(yourTime)#
</ul></cfoutput>
</cfif>
<cfform action="createodbctime.cfm" method="post">
<pre>
Hour<cfinput type="Text" name="hour" value="16" range="0,23" message="You must
  enter an hour (0-23)" validate="integer" required="Yes">
Minute<cfinput type="Text" name="minute" value="12" range="0,59" message="You
  must
  enter a minute value (0-59)" validate="integer" required="yes">
second<cfinput type="text" name="second" value="0" range="0,59" message="You
  must
  enter a value for seconds (0-59)" validate="integer" required="yes">
</PRE>
<p><input type="Submit" name=""> <input type="reset">
</cform>
```

# CreateTime

## Description

Creates a time variable.

## Returns

A time variable.

## Category

[Date and time functions](#)

## Function syntax

```
CreateTime(hour, minute, second)
```

## See also

[CreateODBCTime](#), [CreateDateTime](#); “Evaluation and type conversion issues” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description              |
|-----------|--------------------------|
| hour      | Number in the range 0-23 |
| minute    | Number in the range 0-59 |
| second    | Number in the range 0-59 |

## Usage

CreateTime is a subset of [CreateDateTime](#).

A time variable is a special case of a date-time variable. The date part of a time variable is set to December 30, 1899.

## Example

```
<h3>CreateTime Example</h3>
<cfif IsDefined("FORM.hour")>
Your time value, presented using CreateTime time function:
<cfset yourTime = CreateTime(FORM.hour, FORM.minute, FORM.second)>
<cfoutput><ul>
  <li>Formatted with timeFormat: #TimeFormat(yourTime)#
  <li>Formatted with timeFormat and hh:mm:ss: #TimeFormat(yourTime,
    'hh:mm:ss')#
</ul></cfoutput>
</cfif>
<CFFORM action="createtime.cfm" METHOD="post">
<PRE>Hour<CFINPUT TYPE="Text" NAME="hour" VALUE="16" RANGE="0,23"
  MESSAGE="You must enter an hour (0-23)" VALIDATE="integer" REQUIRED="Yes">
Minute <cfinput type="text" name="minute" value="12" range="0,59"
  MESSAGE="You must enter a minute value (0-59)" VALIDATE="integer"
  REQUIRED="Yes">
Second <cfinput type="text" name="second" value="0" range="0,59"
```

```
MESSAGE="You must enter a value for seconds (0-59)" VALIDATE="integer"  
REQUIRED="Yes">  
</PRE>  
<p><input type="submit" name=""> <input type="reset">  
</cform>
```

# CreateTimeSpan

## Description

Creates a date/time object that defines a time period. You can add or subtract it from other date-time objects and use it with the `cachedWithin` attribute of `cfquery`.

## Returns

A date-time object.

## Category

[Date and time functions](#)

## Function syntax

`CreateTimeSpan(days, hours, minutes, seconds)`

## See also

[CreateDateTime](#), [DateAdd](#), [DateConvert](#); “Defining application-level settings and variables” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| days      | Integer in the range 0–32768; number of days in time period |
| hours     | Number of hours in time period                              |
| minutes   | Number of minutes in time period                            |
| seconds   | Number of seconds in time period                            |

## Usage

Creates a special date-time object that should be used only to add and subtract from other date-time objects or with the `cfquery` `cachedWithin` attribute.

If you use the `cachedWithin` attribute of `cfquery`, and the original query date falls within the time span you define, cached query data is used. In this case, the `CreateTimeSpan` function is used to define a period of time from the present backwards. The `cachedWithin` attribute takes effect only if you enable query caching in the ColdFusion Administrator. For more information, see [cfquery](#).

## Example

```
<!--- This example shows the use of CreateTimeSpan with cfquery --->
<h3>CreateTimeSpan Example</h3>
<!--- define startrow and maxrows to facilitate 'next N' style browsing --->
<cfparam name = "MaxRows" default = "10">
<cfparam name = "StartRow" default = "1">
<!--- Query database for information, if cached database information has not
      been updated in the last six hours. ----->
<cfoutput>
<cfquery name = "GetParks" datasource = "cfdoexamples"
```

```

        cachedWithin = "#CreateTimeSpan(0, 6, 0, 0)#"
SELECT  PARKNAME, REGION, STATE
FROM    Parks
ORDER  by ParkName, State
</cfquery>
</cfoutput>
<!-- build HTML table to display query -->

# CreateUUID

## Description

Creates a Universally Unique Identifier (UUID). A UUID is a 35-character string representation of a unique 128-bit integer.

## Returns

A ColdFusion format UUID, in the format `xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx`, where `x` is a hexadecimal digit (0-9 or A-F). (The character groups are 8-4-4-16.)

## Category

[Other functions](#)

## Function syntax

```
CreateUUID()
```

## Usage

The ColdFusion UUID generation algorithm uses the unique time-of-day value, the IEEE 802 Host ID, and a cryptographically strong random number generator to generate UUIDs that conform to the principles laid out in the draft IEEE RFC "*UUIDs and GUIDs*."

The ColdFusion UUID format is as follows:

```
xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx (8-4-4-16).
```

This does not conform to the Microsoft/DCE standard, which is as follows:

```
xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx (8-4-4-4-12)
```

There are UUID test tools and a user-defined function called `CreateGUID`, which converts CFML UUIDs to UUID/Microsoft GUID format, available on the web at [www.cflib.org](http://www.cflib.org).

Use this function to generate a persistent identifier in a distributed environment. To a very high degree of certainty, this function returns a unique value; no other invocation on the same or any other system returns the same value.

UUIDs are used by distributed computing frameworks, such as DCE/RPC, COM+, and CORBA. In ColdFusion, you can use UUIDs as primary table keys for applications in which data is stored in shared databases. In such cases, using numeric keys can cause primary-key constraint violations during table merges. Using UUIDs, you can eliminate these violations.

## Example

```
<h3>CreateUUID Example</h3>
<p> This example uses CreateUUID to generate a UUID when you submit the form.
  You can submit the form more than once. </p>
<!-- Checks whether the form was submitted; if so, creates UUID. -->
<cfif IsDefined("Form.CreateUUID") Is True>
  <hr>
  <p>Your new UUID is: <cfoutput>#CreateUUID()#</cfoutput></p>
</cfif>
<form action = "createuuid.cfm">
<p><input type = "Submit" name = "CreateUUID"> </p>
</form>
```

# DateAdd

## Description

Adds units of time to a date.

## Returns

A date/time object.

## Category

[Date and time functions](#)

## Function syntax

```
DateAdd("datepart", number, "date")
```

## See also

[DateConvert](#), [DatePart](#), [CreateTimeSpan](#)

## History

ColdFusion MX 6.1: Added the *datepart* character L or l to represent milliseconds.

## Parameters

| Parameter | Description   |
|-----------|---|
| datepart  | String: <ul style="list-style-type: none"><li>• yyyy: Year</li><li>• q: Quarter</li><li>• m: Month</li><li>• y: Day of year</li><li>• d: Day</li><li>• w: Weekday</li><li>• ww: Week</li><li>• h: Hour</li><li>• n: Minute</li><li>• s: Second</li><li>• l: Millisecond</li></ul> |
| number    | Number of units of <i>datepart</i> to add to <i>date</i> (positive, to get dates in the future; negative, to get dates in the past). Number must be an integer.   |
| date      | Date/time object, in the range 100 AD-9999 AD.  |

## Usage

The *datepart* specifiers *y*, *d*, and *w* add a number of days to a date.

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

## Example

```
<!-- This example shows the use of DateAdd -->  
<cfparam name="value" default="70">  
<cfparam name="type" default="m">
```

```

<!-- if numbers passed, then use those -->
<cfif IsDefined("form.value")>
    <cfset value = form.value>
</cfif>
<cfif IsDefined("form.type")>
    <cfset type = form.type>
</cfif>

<cfquery name="GetMessages" datasource="cfdoexamples">
SELECT    UserName, Subject, Posted
FROM      Messages
</cfquery>

<p>This example uses DateAdd to determine when a message in
the database will expire. Currently, messages older
than <cfoutput>#value#</cfoutput>

# DateCompare

## Description

Performs a full date/time comparison of two dates.

## Returns

- -1, if *date1* is earlier than *date2*
- 0, if *date1* is equal to *date2*
- 1, if *date1* is later than *date2*

## Category

[Date and time functions](#)

## Function syntax

```
DateCompare("date1", "date2" [, "datePart"])
```

## See also

[CreateDateTime](#), [DatePart](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| date1     | Date/time object, in the range 100 AD-9999 AD.  |
| date2     | Date/time object, in the range 100 AD-9999 AD.  |
| datePart  | Optional. String. Precision of the comparison. <ul style="list-style-type: none"><li>• s Precise to the second (default)</li><li>• n Precise to the minute</li><li>• h Precise to the hour</li><li>• d Precise to the day</li><li>• m Precise to the month</li><li>• yyyy Precise to the year</li></ul> |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

## Example

```
<h3>DateCompare Example</h3>
<p>The DateCompare function compares two date/time values.
<cfif IsDefined("FORM.date1")>
  <cfif IsDate(FORM.date1) and IsDate(FORM.date2)>
    <cfset comparison = DateCompare(FORM.date1, FORM.date2, FORM.precision)>

<!-- switch on the variable to give various responses -->
  <cfswitch expression = #comparison#>
    <cfcase value = "-1">
      <h3><cfoutput>#DateFormat(FORM.date1)#
        #TimeFormat(FORM.date1)#</cfoutput> (Date 1) is

        </option>
    </select>
<p><input type = "Submit" value = "Compare these dates" name = "">
<input type = "reset">
</form>
```

# DateConvert

## Description

Converts local time to Coordinated Universal Time (UTC), or UTC to local time. The function uses the daylight savings settings in the executing computer to compute daylight savings time, if required.

## Returns

UTC- or local-formatted time object.

## Category

[Date and time functions](#)

## Function syntax

```
DateConvert("conversion-type", "date")
```

## See also

[GetTimeZoneInfo](#), [CreateDateTime](#), [DatePart](#)

## Parameters

| Parameter       | Description   |
|-----------------|---|
| conversion-type | <ul style="list-style-type: none"><li>local2Utc: Converts local time to UTC time.</li><li>utc2Local: Converts UTC time to local time.</li></ul> |
| date            | Date and time string or a variable that contains one.<br>To create, use <a href="#">CreateDateTime</a> .  |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) or [Now](#) function as the `date` parameter of this function; for example: `#DateConvert(CreateDate(2001, 3, 3))#`

## Example

```
<h3>DateConvert Example</h3>
<!-- This shows conversion of current date - time to UTC and back. -->
<cfset curDate = Now()>
<p><cfoutput>The current date and time: #curDate#. </cfoutput></p>
<cfset utcDate = DateConvert("local2utc", curDate)>
<cfoutput>
  <p>The current date and time converted to UTC time: #utcDate#.</p>
</cfoutput>
<!-- This code checks whether form was submitted. If so, the code generates
the CFML date with the CreateDateTime function. -->
<cfif IsDefined("FORM.submit")>
  <cfset yourDate = CreateDateTime(FORM.year, FORM.month, FORM.day,
FORM.hour, FORM.minute, FORM.second)>
  <p><cfoutput>Your date value, presented as a ColdFusion date/time
string: #yourdate#.</cfoutput></p>
```

```

<cfset yourUTC = DateConvert("local2utc", yourDate)>
<p><cfoutput>Your date and time value, converted to Coordinated Universal
Time
(UTC): #yourUTC#.</cfoutput></p>
<p><cfoutput>Your UTC date and time, converted back to local date and time:
#DateConvert("utc2local", yourUTC)#.
</cfoutput></p>
<cfelse>
  Type the date and time, and press Enter to see the conversion.
</cfif>
<Hr size = "2" color = "#0000A0">
<form action = "dateconvert.cfm">
<p>Enter year, month and day in integer format for date value to view:
<table cellpadding = "2" cellspacing = "2" border = "0">
<tr>
  <td>Year</td>
  <td><input type = "Text" name = "year" value = "1998"
  validate = "integer" required = "Yes"></td></tr>
<tr>
  <td>Month</td>
  <td><input type = "Text" name = "month" value = "6"
  range = "1,12" message = "Enter a month (1-12)"
  validate = "integer" required = "Yes"></td></tr>
<tr>
  <td>Day</td>
  <td><input type = "Text" name = "day" value = "8"

  <td><input type = "RESET"></td></tr>
</table>

```

# DateDiff

## Description

Determines the integer number of units by which *date1* is less than *date2*.

## Returns

A number of units, of type *datepart*.

## Category

[Date and time functions](#)

## Function syntax

```
DateDiff("datepart", "date1", "date2")
```

## See also

[DateAdd](#), [DatePart](#), [CreateTimeSpan](#)

## History

ColdFusion MX:

- Changed how negative date differences are calculated: this function calculates negative date differences correctly; its output may be different from that in earlier releases.
- Changed the *w* and *ww* masks; they determine the number of full weeks between the two dates.

## Parameters

| Parameter | Description   |
|-----------|---|
| datepart  | String specifying the units in which to count; for example <i>yyyy</i> requests a date difference in whole years. <ul style="list-style-type: none"><li>• <i>yyyy</i>: Years</li><li>• <i>q</i>: Quarters</li><li>• <i>m</i>: Months</li><li>• <i>y</i>: Days of year (same as <i>d</i>)</li><li>• <i>d</i>: Days</li><li>• <i>w</i>: Weekdays (same as <i>ww</i>)</li><li>• <i>ww</i>: Weeks</li><li>• <i>h</i>: Hours</li><li>• <i>n</i>: Minutes</li><li>• <i>s</i>: Seconds</li></ul> |
| date1     | Date/time object, in the range 100 AD-9999 AD.  |
| date2     | Date/time object, in the range 100 AD-9999 AD.  |

## Usage

The `DateDiff` function determines the number of complete *datepart* units between the two dates; for example, if the *datepart* parameter is "m" and the dates differ by 55 days, the function returns 1.

Enclose string constant dates in quotation marks. If the text contains only numbers (such 1932), and is not surrounded by quotation marks, ColdFusion interprets it as a date/time object, resulting in an incorrect value.

### Example

```
<cfif IsDefined("form.value")>
  <cfset value = form.value>
</cfif>
<cfif IsDefined("form.type")>
  <cfset type = form.type>
</cfif>

<cfif IsDefined("form.date1") and IsDefined("form.date2")>

  <cfif IsDate(form.date1) and IsDate(form.date2)>

    <p>This example uses DateDiff to determine the difference
    in
    <cfswitch expression = "#form.type#">
      <cfcase value="yyy">years</cfcase>
      <cfcase value="q">quarters</cfcase>
      <cfcase value="m">months</cfcase>
      <cfcase value="y">days</cfcase>
      <cfcase value="d">days</cfcase>

<input type="Submit" name=""><input type="RESET">
</form>

```

.

# DateFormat

## Description

Formats a date value using U.S. date formats. For international date support, use [LSDateFormat](#).

## Returns

A text string representing the date formatted according to the mask. If no mask is specified, returns the value in *dd-mmm-yy* format.

## Category

[Date and time functions](#)

## Function syntax

```
DateFormat("date" [, "mask" ])
```

## See also

[Now](#), [CreateDate](#), [LSDateFormat](#), [LSParseDateTime](#), [LSTimeFormat](#), [TimeFormat](#), [ParseDateTime](#)

## History

ColdFusion MX: Added support for the following mask parameter options: `short`, `medium`, `long`, and `full`.

## Parameters

| Parameter         | Description   |
|-------------------|---|
| <code>date</code> | Date/time object, in the range 100 AD-9999 AD.  |
| <code>mask</code> | Characters that show how ColdFusion displays a date: <ul style="list-style-type: none"><li>• <code>d</code>: Day of the month as digits; no leading zero for single-digit days.</li><li>• <code>dd</code>: Day of the month as digits; leading zero for single-digit days.</li><li>• <code>ddd</code>: Day of the week as a three-letter abbreviation.</li><li>• <code>dddd</code>: Day of the week as its full name.</li><li>• <code>m</code>: Month as digits; no leading zero for single-digit months.</li><li>• <code>mm</code>: Month as digits; leading zero for single-digit months.</li><li>• <code>mmm</code>: Month as a three-letter abbreviation.</li><li>• <code>mmmm</code>: Month as its full name.</li><li>• <code>yy</code>: Year as last two digits; leading zero for years less than 10.</li><li>• <code>yyyy</code>: Year represented by four digits.</li><li>• <code>gg</code>: Period/era string. Ignored. Reserved.</li></ul> The following masks tell how to format the full date and cannot be combined with other masks: <ul style="list-style-type: none"><li>• <code>short</code>: equivalent to <code>m/d/y</code></li><li>• <code>medium</code>: equivalent to <code>mmm d, yyyy</code></li><li>• <code>long</code>: equivalent to <code>mmmm d, yyyy</code></li><li>• <code>full</code>: equivalent to <code>dddd, mmmm d, yyyy</code></li></ul> |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the `CreateDate` function or `Now` function as the `date` parameter of this function ; for example: `#DateFormat(CreateDate(2001, 3, 3))#`

Date and time values in database query results can vary in sequence and formatting unless you use functions to format them. To ensure that application users correctly understand displayed dates and times, Macromedia recommends that you use this function and the `LSDateFormat`, `TimeFormat`, and `LSTimeFormat` functions to format resultset values. For more information and examples, see TechNote 22183, "*ColdFusion Server (5 and 4.5.x) with Oracle: Formatting Date and Time Query Results*," on the Macromedia website at [www.coldfusion.com/Support/KnowledgeBase/SearchForm.cfm](http://www.coldfusion.com/Support/KnowledgeBase/SearchForm.cfm).

**Note:** The `DateFormat` function is best used for formatting output, not for formatting input. For formatting input, use one of the date/time creation functions (for example, `CreateDate`) instead.

## Example

```
<cfset todayDate = Now()>
<body>
<h3>DateFormat Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using DateFormat, we can display that date in different ways:
<cfoutput>
<ul>
<li>#DateFormat(todayDate)#
<li>#DateFormat(todayDate, "mmm-dd-yyyy")#
<li>#DateFormat(todayDate, "mmm d, yyyy")#
<li>#DateFormat(todayDate, "mm/dd/yyyy")#
<li>#DateFormat(todayDate, "d-mmm-yyyy")#
<li>#DateFormat(todayDate, "ddd, mmmm dd, yyyy")#
<li>#DateFormat(todayDate, "short")#
<li>#DateFormat(todayDate, "medium")#
<li>#DateFormat(todayDate, "long")#
<li>#DateFormat(todayDate, "full")#
</ul>
</cfoutput>
```

# DatePart

## Description

Extracts a part from a date value.

## Returns

Part of a date, as an integer.

## Category

[Date and time functions](#)

## Function syntax

```
DatePart("datepart", "date")
```

## See also

[DateAdd](#), [DateConvert](#)

## History

ColdFusion MX 6.1: Added the *datepart* character L or l to represent milliseconds.

## Parameters

| Parameter | Description   |
|-----------|---|
| datepart  | String: <ul style="list-style-type: none"><li>• yyyy: Year</li><li>• q: Quarter</li><li>• m: Month</li><li>• y: Day of year</li><li>• d: Day</li><li>• w: Weekday</li><li>• ww: Week</li><li>• h: Hour</li><li>• n: Minute</li><li>• s: Second</li><li>• l: Millisecond</li></ul> |
| date      | Date/time object, in the range 100 AD-9999 AD.  |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

## Example

```
<!-- This example shows information available from DatePart --->
<cfset todayDate = Now()>
<h3>DatePart Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using datepart, we extract an integer representing the dateparts from that
value
<cfoutput>
```

```
<ul>
  <li>year: #DatePart("yyyy", todayDate)#
  <li>quarter: #DatePart("q", todayDate)#
  <li>month: #DatePart("m", todayDate)#
  <li>day of year: #DatePart("y", todayDate)#
  <li>day: #DatePart("d", todayDate)#
  <li>weekday: #DatePart("w", todayDate)#
  <li>week: #DatePart("ww", todayDate)#
  <li>hour: #DatePart("h", todayDate)#
  <li>minute: #DatePart("n", todayDate)#
  <li>second: #DatePart("s", todayDate)#
</ul>
</cfoutput>
```

# Day

## Description

Determines the day of the month, in a date.

## Returns

The ordinal for the day of the month, ranging from 1 to 31.

## Category

[Date and time functions](#)

## Function syntax

```
Day("date")
```

## See also

[DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD-9999 AD. |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the date parameter of this function; for example: `#Day(CreateDate(2001, 3, 3))#`

## Example

```
<h3>Day Example</h3>
<cfif IsDefined("FORM.year")>
  <p>More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Date: #DateFormat(yourDate)#. <br>
    It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
    day #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(YourDate)#
    in the month of #MonthAsString(Month(yourDate))#,
    which has #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(YourDate)#
    (day #DayofYear(yourDate)# of #DaysinYear(yourDate)#).
    <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
      <cfelse>This is not a leap year</cfif>
  </cfoutput>
</cfif>
```

# DayOfWeek

## Description

Determines the day of the week, in a date.

## Returns

The ordinal for the day of the week, as an integer in the range 1 (Sunday) to 7 (Saturday).

## Category

[Date and time functions](#)

## Function syntax

```
DayOfWeek("date")
```

## See also

[Day](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD-9999 AD. |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the date parameter of this function; for example, `#DayOfWeek(CreateDate(2001, 3, 3))#`

## Example

```
<h3>DayOfWeek Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(YourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(YourDate)# (day
    #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
    <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year</cfif>
  </cfoutput>
</cfif>
```

# DayOfWeekAsString

## Description

Determines the day of the week, in a date, as a string function.

## Returns

The day of the week, as a string in the current locale, that corresponds to *day\_of\_week*.

## Category

[Date and time functions](#), [String functions](#)

## Function syntax

```
DayOfWeekAsString(day_of_week)
```

## See also

[Day](#), [DayOfWeek](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

## History

ColdFusion MX 7: Changed behavior. The returned string is now in the language of the current locale.

## Parameters

| Parameter                | Description                                    |
|--------------------------|--|
| <code>day_of_week</code> | Integer, in the range 1(Sunday) - 7(Saturday). |

## Example

The following example shows the use of the `DayOfWeekAsString` function. It is the action page for a form that submits year, month, and day fields.

```
<h3>DayOfWeekAsString Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>

<cfoutput>
<p>Your date, #DateFormat(yourDate)#.
<br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
<br>This is day #Day(yourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
<br>We are in week #Week(yourDate)# of #Year(yourDate)# (day
    #DayOfYear(yourDate)#
    of #DaysInYear(yourDate)#).
<br><cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year</cfif>
</cfoutput>
</cfif>
```

# DayOfYear

## Description

Determines the day of the year, in a date.

## Returns

The ordinal value of day of the year, as an integer.

## Category

[Date and time functions](#)

## Function syntax

```
DayOfYear("date")
```

## See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD-9999 AD. |

## Usage

This function accounts for leap years.

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the `date` parameter of this function; for example, `#DayOfYear(CreateDate(2001, 3, 3))#`

## Example

```
<h3>Day70fYear Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
    day #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(yourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(yourDate)#
    (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
    <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year</cfif>
  </cfoutput>
</cfif>
```

# DaysInMonth

## Description

Determines the number of days in a month.

## Returns

The number of days in the month in *Date*.

## Category

[Date and time functions](#)

## Function syntax

```
DaysInMonth("date")
```

## See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInYear](#), [FirstDayOfMonth](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD-9999 AD. |

## Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [Now](#) function or the [CreateDate](#) function as the *date* parameter of this function; for example: `#DaysInMonth(CreateDate(2001, 3, 3))#`

## Example

```
<h3>DaysInMonth Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayofWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(YourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(YourDate)#
    (day #DayofYear(yourDate)# of #DaysinYear(yourDate)#).
    <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year</cfif>
  </cfoutput>
</cfif>
```

# DaysInYear

## Description

Determines the number of days in a year.

## Returns

The number of days in a year.

## Category

[Date and time functions](#)

## Function syntax

```
DaysInYear("date")
```

## See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#), [IsLeapYear](#)

## Parameters

| Parameter | Description                                      |
|-----------|--|
| date      | • Date/time object, in the range 100 AD-9999 AD. |

## Usage

`DaysInYear` accounts for leap years.

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or the [Now](#) function as the `date` parameter of this function; for example: `#DaysInYear(CreateDate(2001, 3, 3))#`

## Example

```
<h3>DaysInYear Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(YourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(yourDate)# (day
    #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
  </cfif>
```

# DE

## Description

Escapes any double-quotation marks in the parameter and wraps the result in double-quotation marks.

## Returns

Parameter, surrounded by double-quotation marks, with any inner double-quotation marks escaped.

## Category

[Dynamic evaluation functions](#)

## Function syntax

`DE(string)`

## See also

[Evaluate](#), [IIf](#), Chapter 4, “Using Expressions and Number Signs” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                     |
|-----------|---------------------------------|
| string    | String to evaluate, after delay |

## Usage

The `DE` function postpones evaluation of a string that is passed as a parameter to the `IIf` or `Evaluate` functions.

This function is especially useful with the `IIf` function, which automatically evaluates its second and third parameters as expressions. You can use the `DE` function to prevent the function from evaluating a string parameter that is to be output as a variable, and should not be treated as an expression. The following example show this use; it uses `IIF` to alternate table-row background colors, white and gray, and uses the `DE` function to prevent ColdFusion from evaluating the color strings.

```
<cfoutput>
<table border="1" cellpadding="3">
<cfloop index="i" from="1" to="10">
  <tr bgcolor="#IIF( i mod 2 eq 0, DE("white"), DE("gray") )#">
    <td>
      hello #i#
    </td>
  </tr>
</cfloop>
</table>
</cfoutput>
```

The `DE` function does not delay evaluation of variable names that are surrounded by number signs (`#`). ColdFusion function evaluates the variable regardless of whether the `DE` function is present.

The following example shows how you can use the DE function and number signs together, and shows how the function works with an IIF function:

```
<cfoutput>
<cfset var1=Blue>
<cfset var2=Green>
<cfset myresult=IIf( 1 eq 2, DE(#Var1#), DE(#Var2#))>
The expression is #myresult#
</cfoutput>
```

ColdFusion processes this code as follows:

1. ColdFusion sets the variables `var1` and `var2` to be the strings Blue and Green.
2. In the fourth line, ColdFusion evaluates the variables surrounded by number signs first, replacing them with the strings Blue and Green, the values of the variables.
3. The IIF function evaluates the test expression, determines that it is False, and then evaluates the third parameter.
4. The third parameter is a DE function, which takes the string Green and surrounds it in quotation marks
5. The IIF function returns the string "Green", including the quotation marks.
6. The `cfset` tag gets the expression `result="Green"`, and sets the value of the `myresult` variable to the string Green.
7. ColdFusion evaluates `#myresult#` in the output text, replaces the variable with its value, the string Green, and displays the result.

### Example

```
<!--- This example shows the use of DE and Evaluate --->
<h3>DE Example</h3>
<cfif IsDefined("FORM.myExpression")>
  <cftry>
    <!--- Show the expression and the results of evaluating it --->
    <cfoutput>
      <h3>Evaluate the Expression #FORM.MyExpression#</h3>
    </cfoutput>
    The code:<br>
    #Evaluate(FORM.myExpression)#
    <br><br>
    The result:<br>
    <cfoutput>
      #Evaluate(FORM.myExpression)#
    </cfoutput>

    <h3>Use DE to prevent the Evaluate function from evaluating</h3>
    The code:<br>
    #Evaluate(DE(FORM.MyExpression))#<br><br>
    The result:<br>
    <cfoutput>
      #Evaluate(DE(FORM.MyExpression))#
    </cfoutput>
    <!--- Error handling code for bad expressions and any other error.--->
    <cfcatch type = "Any">
```

```
<!-- the message to display -->
<h3>Sorry, there's been an <B>Error</B>.
Try a simple expression, such as "2+2".</h3>
<cfoutput>
<!-- Display the diagnostic message from ColdFusion. -->
  <p>#cfcatch.message#
</cfoutput>
</cfcatch>
</cftry>
</cfif>

<h3>Enter any valid ColdFusion expression</h3>
<cfform>
  <cfinput name="myExpression" type="Text" size="40">
  <cfinput type="submit" name="submitit">
</cfform>
```

# DecimalFormat

## Description

Converts a number to a decimal-formatted string.

## Returns

A *number* as a string formatted with two decimal places and a thousands separator.

## Category

[Display and formatting functions](#)

## Function syntax

`DecimalFormat(number)`

## See also

[DollarFormat](#), [NumberFormat](#)

## Parameters

---

| Parameter | Description      |
|-----------|------------------|
| number    | Number to format |

---

## Example

```
<h3>DecimalFormat Function</h3>
<p>Returns a number to two decimal places.
<p>
<cfloop FROM = 1 TO = 20 INDEX = "counter">
  <cfoutput>
    #counter# * Square Root of 2:
    #DecimalFormat(counter * sqr(2))#
  </cfoutput>
  <br>
</cfloop>
```

# DecrementValue

## Description

Decrements the integer part of a number.

## Returns

Integer part of *number*, decremented by one.

## Category

[Mathematical functions](#)

## Function syntax

```
DecrementValue(number)
```

## See also

[IncrementValue](#)

## Parameters

---

| Parameter | Description         |
|-----------|---------------------|
| number    | Number to decrement |

---

## Example

```
<h3>DecrementValue Example</h3>
<p>Returns the integer part of a number decremented by one.
<p>DecrementValue(0):
  <cfoutput>#DecrementValue(0)#</cfoutput>
<p>DecrementValue("1"):
  <cfoutput>#DecrementValue("1")#</cfoutput>
<p>DecrementValue(123.35):
  <cfoutput>#DecrementValue(123.35)#</cfoutput>
```

# Decrypt

## Description

Decrypts a string that is encrypted using a standard encryption technique, including strings encrypted by the `Encrypt` function.

## Returns

An unencrypted string.

## Category

[Security functions](#), [String functions](#)

## Function syntax

```
Decrypt(encrypted_string, key[, algorithm[, encoding]])
```

## See also

[Duplicate](#), [Encrypt](#)

ColdFusion MX 7: Added the *algorithm* and *encoding* parameters.

## Parameters

| Parameter                     | Description  |
|-------------------------------|--|
| <code>encrypted_string</code> | String to decrypt.   |
| <code>key</code>              | String. For the CFMX_COMPAT algorithm, the seed that was used to encrypt the string; for all other algorithms, the key that was used to encrypt the string.  |
| <code>algorithm</code>        | (Optional) The algorithm to use to decrypt the string. Must be the same as the algorithm used to encrypt the string. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</li><li>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>• DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul> If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms. |
| <code>encoding</code>         | (Optional; if you specify this parameter, you must also specify the <i>algorithm</i> parameter.) The binary encoding used to represent the data as a string. Must be the same as the algorithm used to encrypt the string. <ul style="list-style-type: none"><li>• Base64: the Base64 algorithm, as specified by IETF RFC 2045.</li><li>• Hex: the characters A-F and 0-9 represent the hexadecimal byte values.</li><li>• UU: the UNIX standard UUEncode algorithm (default).</li></ul>   |

## Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt a string. The parameter values must match the values used to encode string. The security of the encrypted string depends on maintaining the secrecy of the key.

ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

## Example

```
<h3>Decrypt Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>
  <cfscript>
    /* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm,
       so use the key from the form.
    */
    if (Form.myAlgorithm EQ "CFMX_COMPAT")
      theKey=Form.MyKey;
    // For all other encryption techniques, generate a secret key.
    else
      theKey=generateSecretKey(Form.myAlgorithm);
    //Encrypt the string
    encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm,
      Form.myEncoding);
    //Decrypt it
    decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
  </cfscript>

  <!-- Display the values used for encryption and decryption,
       and the results. -->
  <cfoutput>
    <b>The algorithm:</b> #Form.myAlgorithm#<br>

<input type = "Submit" value = "Encrypt my String">
</form>
```

# DeleteClientVariable

## Description

Deletes a client variable. (To test for the existence of a variable, use `IsDefined`.)

## Returns

True, if the variable is successfully deleted; false, otherwise.

## Category

[Other functions](#)

## Function syntax

```
DeleteClientVariable("name")
```

## See also

[GetClientVariablesList](#)

## History

ColdFusion MX: Changed behavior: if the variable is not present, this function now returns `False`. (In earlier releases, it threw an error.)

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | Name of a client variable to delete, surrounded by double-quotation marks |

## Example

```
<!-- This view-only example shows DeleteClientVariable --->
<h3>DeleteClientVariable Example</h3>

<p>This view-only example deletes a client variable called "User_ID", if it
exists in the list of client variables returned by GetClientVariablesList.
<p>This example requires the existence of an Application.cfm file and client
management to be in effect.
<!--
<cfset client.somevar = "">
<cfset client.user_id = "">
<p>Client variable list:<cfoutput>#GetClientVariablesList()#</cfoutput>
<cfif ListFindNoCase(GetClientVariablesList(), "User_ID") is not 0>

    <cfset temp = DeleteClientVariable("User_ID")>
    <p>Was variable "User_ID" Deleted? <cfoutput>#temp#</cfoutput>
</cfif>
<p>Amended Client variable list:<cfoutput>#GetClientVariablesList()#
</cfoutput>
--->
```

# DirectoryExists

## Description

Determines whether a directory exists.

## Returns

Yes, if the specified directory exists; No, otherwise.

## Category

[System functions](#)

## Function syntax

DirectoryExists(*absolute\_path*)

## See also

[FileExists](#)

## Parameters

| Parameter                  | Description      |
|----------------------------|------------------|
| <code>absolute_path</code> | An absolute path |

## Example

```
<h3>DirectoryExists Example</h3>
<h3>Enter a directory to check for existence.</h2>
<form action = "directoryexists.cfm" method="post">
  <input type = "text" name = "yourDirectory">
  <br>
  <input type = "submit" name = "submit">
</form>

<cfif IsDefined("FORM.yourDirectory")>
  <cfif FORM.yourDirectory is not "">
    <cfset yourDirectory = FORM.yourDirectory>
    <cfif DirectoryExists(yourDirectory)>
      <cfoutput>
        <p>Your directory exists. Directory name: #yourDirectory#
      </cfoutput>
    <cfelse>
      <p>Your directory does not exist.</p>
    </cfif>
  </cfif>
</cfif>
```

# DollarFormat

## Description

Formats a string in U.S. format. (For other currencies, use [LSCurrencyFormat](#) or [LSEuroCurrencyFormat](#).)

## Returns

A number as a string, formatted with two decimal places, thousands separator, and dollar sign. If *number* is negative, the return value is enclosed in parentheses. If *number* is an empty string, returns zero.

## Category

[Display and formatting functions](#)

## Function syntax

`DollarFormat(number)`

## See also

[DecimalFormat](#), [NumberFormat](#)

## Parameters

| Parameter | Description      |
|-----------|------------------|
| number    | Number to format |

## Example

```
<!-- This example shows the use of DollarFormat -->
...
<h3>DollarFormat Example</h3>
<cfloop from = 8 to = 50 index = counter>
  <cfset full = counter>
  <cfset quarter = counter + (1/4)>
  <cfset half = counter + (1/2)>
  <cfset threefourth = counter + (3/4)>
  <cfoutput>
  <pre>
bill#DollarFormat(full)##DollarFormat(quarter)#
  #DollarFormat(half)# #DollarFormat(threefourth)#
18% tip#DollarFormat(full * (18/100))#
  #DollarFormat(quarter * (18/100))#
  #DollarFormat(half * (18/100))#
  #DollarFormat(threefourth * (18/100))#
  </pre>
  </cfoutput>
</cfloop>
...
```

# Duplicate

## Description

Returns a clone, also known as a deep copy, of a variable. There is no reference to the original variable.

## Returns

A clone of a variable.

## Category

[Structure functions](#), [System functions](#)

## Function syntax

```
Duplicate(variable_name)
```

## See also

[StructCopy](#), other [Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>variable_name</code> | Name of a variable to duplicate |

## Usage

Use this function to duplicate complex structures, such as nested structures and queries.

**Note:** The `Duplicate` function throws an exception if you attempt to duplicate a CFC.

**Note:** With this function, you cannot duplicate a COM, CORBA, or JAVA object returned from the `cfobject` tag or the `CreateObject` function. If an array element or structure field is a COM, CORBA, or JAVA object, you cannot duplicate the array or structure.

## Example

```
<h3>Duplicate Example</h3>
<cfset s1 = StructNew()>
<cfset s1.nested = StructNew()>
<cfset s1.nested.item = "original">
<cfset copy = StructCopy(s1)>
<cfset clone = Duplicate(s1)>
<!--- modify the original --->
<cfset s1.nested.item = "modified">
<cfoutput>
<p>The copy contains the modified value: #copy.nested.item#</p>
<p>The duplicate contains the original value: #clone.nested.item#</p>
</cfoutput>
```

# Encrypt

## Description

Encrypts a string using a specific algorithm and encoding method.

## Returns

String; can be much longer than the original string.

## Category

[Security functions](#), [String functions](#)

## Function syntax

```
Encrypt(string, key[, algorithm[, encoding]])
```

## See also

[Decrypt](#)

## History

ColdFusion MX 7: Added the *algorithm* and *encoding* parameters.

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | String to encrypt.   |
| key       | String. Key or seed used to encrypt the string. <ul style="list-style-type: none"><li>• For the CFMX_COMPAT algorithm, any combination of any number of characters; used as a seed used to generate a 32-bit encryption key.</li><li>• For all other algorithms, a key in the format used by the algorithm. For these algorithms, use the <a href="#">GenerateSecretKey</a> function to generate the key.</li></ul>  |
| algorithm | (Optional) The algorithm to use to decrypt the string. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</li><li>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>• DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul> If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms. |
| encoding  | (Optional; if you specify this parameter, you must also specify the <i>algorithm</i> parameter) The binary encoding in which to represent the data as a string. <ul style="list-style-type: none"><li>• Base64: the Base64 algorithm, as specified by IETF RFC 2045.</li><li>• Hex: the characters I-FO-9 represent the hexadecimal byte values.</li><li>• UU: the UUEncode algorithm (default).</li></ul>   |

## Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt a string. The security of the encrypted string depends on maintaining the secrecy of the key.

For all algorithms except the default algorithm, ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

The default algorithm, which is the same as was used in ColdFusion 5 and ColdFusion MX, uses an XOR-based algorithm that uses a pseudo-random 32-bit key, based on a seed passed by the user as a function parameter. This algorithm is less secure than the other available algorithms.

## Example

The following example encrypts and decrypts a text string. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX\_COMPAT algorithm. For all other algorithms, it generates a secret key.

```
<h3>Encrypt Example</h3>
<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>
  <cfscript>
    /* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm,
       so use the key from the form.
    */
    if (Form.myAlgorithm EQ "CFMX_COMPAT")
      theKey=Form.MyKey;
    // For all other encryption techniques, generate a secret key.
    else
      theKey=generateSecretKey(Form.myAlgorithm);
    //Encrypt the string
    encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm,
      Form.myEncoding);
    //Decrypt it
    decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
  </cfscript>

  <!-- Display the values used for encryption and decryption,
       and the results. -->
  <cfoutput>
    <b>The algorithm:</b> #Form.myAlgorithm#<br>
    <b>The key:</b> #theKey#<br>
    <br>
    <b>The string:</b> #Form.myString# <br>
    <br>
    <b>Encrypted:</b> #encrypted#<br>
    <br>
    <b>Decrypted:</b> #decrypted#<br>
  </cfoutput>
</cfif>
```

```

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select the encoding</b><br>
  <select size="1" name="myEncoding" >
    <option selected>UU</option>
    <option>Base64</option>
    <option>Hex</option>
  </select><br>
  <br>
  <b>Select the algorithm</b><br>
  <select size="1" name="myAlgorithm" >
    <option selected>CFMX_COMPAT</option>
    <option>AES</option>
    <option>DES</option>
    <option>DESEDE</option>
  </select><br>
  <br>
  <b>Input your key</b> (used for CFMX_COMPAT encryption only)<br>
  <input type = "Text" name = "myKey" value = "MyKey"><br>
  <br>
  <b>Enter string to encrypt</b><br>
  <textArea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">This
  string will be encrypted (you can replace it with more typing).
  </textArea><br>
  <input type = "Submit" value = "Encrypt my String">
</form>

```

# Evaluate

## Description

Evaluates one or more string expressions, dynamically, from left to right. (The results of an evaluation on the left can have meaning in an expression to the right.) Returns the result of evaluating the rightmost expression.

## Returns

An object; the result of the evaluation(s).

## Category

[Dynamic evaluation functions](#)

## Function syntax

```
Evaluate(string_expression1 [, string_expression2 [, ... ] ] )
```

## See also

[DE](#), [IIf](#)

## Parameters

| Parameter  | Description             |
|--|-------------------------|
| <i>string_expression1</i> ,<br><i>string_expression2</i> ... | Expressions to evaluate |

## Usage

String expressions can be complex. If a string expression contains a single- or double-quotation mark, the mark must be escaped.

This function is useful for forming one variable from multiple variables. For example, to reference a column of the query `qNames` with a variable, `var`, using an index value to traverse rows, you could use the following code:

```
<cfset var=Evaluate("qNames.#{colname#[#index#]}")>
```

For more information, see Chapter 4, “Using Expressions and Number Signs” in *ColdFusion MX Developer’s Guide*.

## Example

```
<!-- This example shows the use of DE and Evaluate -->
<h3>Evaluate Example</h3>
<cfif IsDefined("FORM.myExpression")>
<cftry>
<!-- Evaluate the expression -->
<cfset myExpression = Evaluate(FORM.myExpression)>
<!-- Use DE to output the value of the variable, unevaluated -->
<cfoutput>
The value of the expression #Evaluate(DE(FORM.MyExpression))#
is #MyExpression#.
</cfoutput>
...
```

# Exp

## Description

Calculates the exponent whose base is  $e$  that represents *number*. The constant  $e$  equals 2.71828182845904, the base of the natural logarithm. This function is the inverse of `Log`, the natural logarithm of *number*.

## Returns

The constant  $e$ , raised to the power of *number*.

## Category

[Mathematical functions](#)

## Function syntax

`Exp(number)`

## See also

[Log](#), [Log10](#)

## Parameters

| Parameter           | Description                       |
|---------------------|-----------------------------------|
| <code>number</code> | Exponent to apply to the base $e$ |

## Usage

To calculate powers of other bases, use the exponentiation operator (`^`).

## Example

```
<h3>Exp Example</h3>
<cfif IsDefined("FORM.Submit")>
  <cfoutput>
    <p>Your number, #FORM.number#
    <br>#FORM.number# raised to the E power: #exp(FORM.number)#
  </cfif FORM.number LTE 0>
    <br>You must enter a positive real number to see its natural logarithm
  <cfelse><br>
    The natural logarithm of #FORM.number#: #log(FORM.number)#
  </cfif>
  <cfif FORM.number LTE 0><br>
    You must enter a positive real number to see its logarithm to base 10
  <cfelse><br>
    The logarithm of #FORM.number# to base 10: #log10(FORM.number)#
  </cfif>
</cfoutput>
</cfif>
<cfform action = "exp.cfm">
  Enter a number to see its value raised to the E power, its natural logarithm,
  and the logarithm of number to base 10.
  <cfinput type = "Text" name = "number" message = "You must enter a number"
    validate = "float" required = "No">
  <input type = "Submit" name = "Submit">
</cfform>
```

# ExpandPath

## Description

Creates an absolute, platform-appropriate path that is equivalent to the value of *relative\_path*, appended to the base path. This function (despite its name) can accept an absolute or relative path in the *relative\_path* parameter

The base path is the currently executing page's directory path. It is stored in `pageContext.getServletContext()`.

## Returns

A string. If the relative path contains a trailing forward slash or backward slash, the return value contains the same trailing character.

## Category

[System functions](#)

## Function syntax

```
ExpandPath(relative_path)
```

## See also

[FileExists](#), [GetCurrentTemplatePath](#), [GetFileFromPath](#)

## History

ColdFusion MX: Changed behavior for the *relative\_path* parameter: this function can now accept an absolute or relative path in the *relative\_path* parameter. To resolve a path, this function uses virtual mappings that are defined in the ColdFusion Administrator. This function does not reliably use virtual mappings that are defined in IIS, Apache, or other web servers.

## Parameters

| Parameter                  | Description  |
|----------------------------|--|
| <code>relative_path</code> | Relative or absolute directory reference or file name, within the current directory, ( <code>\</code> and <code>..</code> ) to convert to an absolute path. Can include forward or backward slashes. |

## Usage

If the parameter or the returned path is invalid, the function throws an error.

These examples show the valid constructions of `relative_path`:

- `ExpandPath( "*.*)"`
- `ExpandPath( "/" )`
- `ExpandPath( "\" )`
- `ExpandPath( "/mycfpage.cfm" )`
- `ExpandPath( "mycfpage.cfm" )`
- `ExpandPath( "myDir/mycfpage.cfm" )`
- `ExpandPath( "/myDir/mycfpage.cfm" )`
- `ExpandPath( "../..mycfpage.cfm" )`

## Example

```
<h3>ExpandPath Example - View Only</h3>
<!--
<cfset thisPath=ExpandPath("*.*)">
<cfset thisDirectory=GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#

<cfif IsDefined("form.yourFile")>
<cfif form.yourFile is not "">
<cfset yourFile = form.yourFile>
  <cfif FileExists(ExpandPath(yourfile))>
    <p>Your file exists in this directory. You entered
    the correct file name, #GetFileFromPath("#thisPath#/#yourfile#")#
  <CFELSE>
    <p>Your file was not found in this directory:
    <br>Here is a list of the other files in this directory:
    <!-- use CFDIRECTORY to give the contents of the
    snippets directory, order by name and size -->
    <CFDIRECTORY DIRECTORY="#thisDirectory#"
    NAME="myDirectory"
    SORT="name ASC, size DESC">
    <!-- Output the contents of the CFDIRECTORY as a CFTABLE -->
    <CFTABLE QUERY="myDirectory">
    <CFCOL HEADER="NAME:"
      TEXT="#Name#">
    <CFCOL HEADER="SIZE:"
      TEXT="#Size#">
    </CFTABLE>
  </cfif>
</cfif>
<cfelse>
<h3>Please enter a file name</h3>
</CFIF>
</cfoutput>

<FORM action="expandpath.cfm" METHOD="post">
<h3>Enter the name of a file in this directory <I>
  <FONT SIZE="-1">(try expandpath.cfm)</FONT></I></h3>
<INPUT TYPE="Text" NAME="yourFile">
<INPUT TYPE="Submit" NAME="">
</form>
-->
```

# FileExists

## Description

Determines whether a file exists.

## Returns

Yes, if the file specified in the parameter exists; No, otherwise.

## Category

[System functions](#), [Decision functions](#)

## Function syntax

```
FileExists(absolute_path)
```

## See also

[DirectoryExists](#), [ExpandPath](#), [GetTemplatePath](#)

## Parameters

| Parameter                  | Description      |
|----------------------------|------------------|
| <code>absolute_path</code> | An absolute path |

## Usage

To access a file on a remote system, the account (for Windows) or user (for UNIX and Linux) that is running ColdFusion must have permission to access the file, directory, and remote system. For example, if you run ColdFusion MX in the Server Configuration as a Windows service, by default it runs under the local system account, which does not have sufficient privileges to access remote systems. You can change this, however, on the Log On page of the Services Properties dialog box.

## Example

```
<h3>FileExists Example</h3>

<cfset thisPath = ExpandPath("*.*)">
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
<cfif FORM.yourFile is not "">
<cfset yourFile = FORM.yourFile>
  <cfif FileExists(ExpandPath(yourfile))>
  <p>Your file exists in this directory. You entered
the correct file name, #GetFileFromPath("#thisPath#/#yourfile#")#
  <cfelse>
```

# Find

## Description

Finds the first occurrence of a *substring* in a *string*, from a specified start position. The search is case-sensitive.

## Returns

A number; the position of *substring* in *string*; or 0, if *substring* is not in *string*.

## Category

[String functions](#)

## Function syntax

```
Find(substring, string [, start ])
```

## See also

[FindNoCase](#), [Compare](#), [FindOneOf](#), [REFind](#), [Replace](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| substring | A string or a variable that contains one. String for which to search. |
| string    | A string or a variable that contains one. String in which to search.  |
| start     | Start position of search.   |

## Example

```
<cfoutput>
  <cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">
  #find("the",stringToSearch)#<br>
  #find("the",stringToSearch,35)#<br>
  #find("no such substring",stringToSearch)#<br>
  <br>
  #findnocase("the",stringToSearch)#<br>
  #findnocase("the",stringToSearch,5)#<br>
  #findnocase("no such substring",stringToSearch)#<br>
  <br>
  #findoneof("aeiou",stringToSearch)#<br>
  #findoneof("aeiou",stringToSearch,4)#<br>
  #findoneof("@%^*()",stringToSearch)#<br>
</cfoutput>
```

# FindNoCase

## Description

Finds the first occurrence of a *substring* in a *string*, from a specified start position. If *substring* is not in *string*, returns zero. The search is case-insensitive.

## Returns

The position of *substring* in *string*; or 0, if *substring* is not in *string*.

## Category

[String functions](#)

## Function syntax

```
FindNoCase(substring, string [, start ])
```

## See also

[Find](#), [CompareNoCase](#), [FindOneOf](#), [REFind](#), [Replace](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| substring | A string or a variable that contains one. String for which to search. |
| string    | A string or a variable that contains one. String in which to search.  |
| start     | Start position of search.   |

## Example

In the following example, the `Find` function returns 33 as the first position found because "the" is lowercase. The `FindNoCase` function returns 1 as the first position because the case is ignored.

```
<cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">  
  
stringToSearch = <cfoutput>#stringToSearch#</cfoutput><br>  
<p>  
Find Function:<br>  
Find("the",stringToSearch) returns <cfoutput>#find("the",stringToSearch)#</  
cfoutput><br>  
<p>  
FindNoCase Function:<br>  
FindNoCase("the",stringToSearch) returns  
<cfoutput>#FindNoCase("the",stringToSearch)#</cfoutput>
```

# FindOneOf

## Description

Finds the first occurrence of *any one of a set of characters* in a *string*, from a specified start position. The search is case-sensitive.

## Returns

The position of the first member of *set* found in *string*; or 0, if no member of *set* is found in *string*.

## Category

[String functions](#)

## Function syntax

```
FindOneOf(set, string [, start ])
```

## See also

[Find](#), [Compare](#), [REFind](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| set       | A string or a variable that contains one. String that contains one or more characters to search for. |
| string    | A string or a variable that contains one. String in which to search.                                 |
| start     | Start position of search.  |

## Example

```
<cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">
#find("the",stringToSearch)#<br>
#find("the",stringToSearch,35)#<br>
#find("no such substring",stringToSearch)#<br>
<br>
#findnocase("the",stringToSearch)#<br>
#findnocase("the",stringToSearch,5)#<br>
#findnocase("no such substring",stringToSearch)#<br>
<br>
#findoneof("aeiou",stringToSearch)#<br>
#findoneof("aeiou",stringToSearch,4)#<br>
#findoneof("@%^*()",stringToSearch)#<br>
```

# FirstDayOfMonth

## Description

Determines the ordinal (day number, in the year) of the first day of the month in which a given date falls.

## Returns

A number corresponding to a day-number in a year.

## Category

[Date and time functions](#)

## Function syntax

```
FirstDayOfMonth(date)
```

## See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD-9999 AD. |

## Usage

When passing a date/time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

## Example

```
<h3>FirstDayOfMonth Example</h3>
```

```
<cfoutput>
```

```
The first day of #MonthAsString(Month(Now()))#, #Year(Now())# was  
day #FirstDayOfMonth(Now())# of the year.
```

```
</cfoutput>
```

# Fix

## Description

Converts a real number to an integer.

## Returns

If *number* is greater than or equal to 0, the closest integer less than *number*.

If *number* is less than 0, the closest integer greater than *number*.

## Category

[Mathematical functions](#)

## Function syntax

`Fix(number)`

## See also

[Ceiling](#), [Int](#), [Round](#)

## Parameters

---

| Parameter | Description |
|-----------|-------------|
| number    | A number    |

---

## Example

```
<h3>Fix Example</h3>
<p>Fix returns the closest integer less than the number if the number is
  greater than or equal to 0. Fix returns the closest integer greater than
  the number if number is less than 0.
</p>
<cfoutput>
<p>The fix of 3.4 is #Fix(3.4)#
<p>The fix of 3 is #Fix(3)#
<p>The fix of 3.8 is #Fix(3.8)#
<p>The fix of -4.2 is #Fix(-4.2)#
</cfoutput>
```

# FormatBaseN

## Description

Converts *number* to a string, in the base specified by *radix*.

## Returns

String that represents *number*, in the base *radix*.

## Category

[Display and formatting functions](#), [Mathematical functions](#), [String functions](#)

## Function syntax

FormatBaseN(*number*, *radix*)

## See also

[InputBaseN](#)

## Parameters

| Parameter | Description        |
|-----------|--------------------|
| number    | Number to convert  |
| radix     | Base of the result |

## Example

```
<h3>FormatBaseN Example</h3>
<p>Converts a number to a string in the base specified by Radix.
<p>
<cfoutput>
<br>FormatBaseN(10,2): #FormatBaseN(10,2)#
<br>FormatBaseN(1024,16): #FormatBaseN(1024,16)#
<br>FormatBaseN(125,10): #FormatBaseN(125,10)#
<br>FormatBaseN(10.75,2): #FormatBaseN(10.75,2)#
</cfoutput>
<h3>InputBaseN Example</h3>
<p>InputBaseN returns the number obtained by converting a string,
    using base specified by Radix (an integer from 2 to 36).

<cfoutput>
<br>InputBaseN("1010",2): #InputBaseN("1010",2)#
<br>InputBaseN("3ff",16): #InputBaseN("3ff",16)#
<br>InputBaseN("125",10): #InputBaseN("125",10)#
<br>InputBaseN(1010,2): #InputBaseN(1010,2)#
</cfoutput>
```

# GenerateSecretKey

## Description

Gets a secure key value for use in the [Encrypt](#) function.

## Returns

A string containing the encryption key.

## Category

[Security functions](#), [String functions](#)

## Function syntax

```
GenerateSecretKey(algorithm)
```

## See also

[Decrypt](#), [Encrypt](#)

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description  |
|-----------|--|
| algorithm | The encryption algorithm for which to generate the key. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>• DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul> |

## Usage

You cannot use the `GenerateSecretKey` function to generate a key for the ColdFusion default encryption algorithm (CFMX\_COMPAT) of the `Encrypt` and `Decrypt` functions.

ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

## Example

The following example encrypts and decrypts a text string. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX\_COMPAT algorithm. For all other algorithms, it uses the `GenerateSecretKey` function to generate a secret key.

```
<h3>Decrypt Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>
  <cfscript>
    /* GenerateSecretKey does not generate keys for the CFMX_COMPAT algorithm,
       so we use a key from the form.
    */
    if (Form.myAlgorithm EQ "CFMX_COMPAT")
      theKey=Form.MyKey;
    // For all other encryption techniques, generate a secret key.
    else
      theKey=generateSecretKey(Form.myAlgorithm);
    //Encrypt the string.
    encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm,
      Form.myEncoding);
    //Decrypt it.
    decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
  </cfscript>

  <!-- Display the values used for encryption and decryption,
       and the results. -->
  <cfoutput>
    <b>The algorithm:</b> #Form.myAlgorithm#<br>
    <b>The key:</b> #theKey#<br>
    <br>
    <b>The string:</b> #Form.myString# <br>
    <br>
    <b>Encrypted:</b> #encrypted#<br>
    <br>
    <b>Decrypted:</b> #decrypted#<br>
  </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select the encoding</b><br>
  <select size="1" name="myEncoding" >
    <option selected>UU</option>
    <option>Base64</option>
    <option>Hex</option>
  </select><br>
  <br>
  <b>Select the algorithm</b><br>
  <select size="1" name="myAlgorithm" >
    <option selected>CFMX_COMPAT</option>
    <option>AES</option>
    <option>DES</option>
  </select>
</form>
```

```
    <option>DESEDE</option>
</select><br>
<br>
<b>Input your key</b> (used for CFMX_COMPAT encryption only)<br>
<input type = "Text" name = "myKey" value = "foobar"><br>
<br>
<b>Enter string to encrypt</b><br>
<textarea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">This
string will be encrypted (you can replace it with more typing).
</textarea><br>
<input type = "Submit" value = "Encrypt my String">
</form>
```

# GetAuthUser

## Description

Gets the name of an authenticated user.

## Returns

The name of an authenticated user.

## Category

[Security functions](#)

## Function syntax

```
GetAuthUser()
```

## See also

[IsUserInRole](#), [cflogin](#), [cfloginuser](#); Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Usage

This function works with `cflogin` authentication or web server authentication. It checks for a logged-in user as follows:

1. It checks for a login made with `cfloginuser`.
2. If no user was logged in with `cfloginuser`, it checks for a web server login (`cgi.remote_user`).

## Example

```
<H3>GetAuthUser Example</H3>
```

```
<P>Authenticated User: <cfoutput>#GetAuthUser()#</cfoutput>
```

# GetBaseTagData

## Description

Used within a custom tag. Finds calling (ancestor) tag by name and accesses its data.

## Returns

An object that contains data (variables, scopes, and so on) from an ancestor tag. If there is no ancestor by the specified name, or if the ancestor does not expose data (for example, `cfif`), an exception is thrown.

## Category

[Other functions](#)

## Function syntax

```
GetBaseTagData( tagname [, instancenumbers ] )
```

## See also

[GetBaseTagList](#); “High-level data exchange” in Chapter 11, “Creating and Using Custom CFML Tags,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter       | Req/Opt  | Description   |
|-----------------|----------|---|
| tagname         | Required | Ancestor tag name for which to return data  |
| instancenumbers | Optional | Number of ancestor levels to jump before returning data. The default value is 1 (closest ancestor). |

## Example

```
<!-- This example shows the use of GetBaseTagData
function. Typically used in custom tags.-->
...
<cfif trim(inCustomTag) neq "">
  <cfoutput>
    Running in the context of a custom
    tag named #inCustomTag#.<p>
  </cfoutput>
  <!-- Get the tag instance data -->
  <cfset tagData = GetBaseTagData(inCustomTag)>
  <!-- Find the tag's execution mode -->
  Located inside the
  <cfif tagData.thisTag.executionMode neq 'inactive'>
    template
  <cfelse>
    BODY
  </cfif>
```

# GetBaseTagList

## Description

Gets ancestor tag names, starting with the parent tag.

## Returns

A comma-delimited list of uppercase ancestor tag names, as a string. The first list element is the current tag. If the current tag is nested, the next element is the parent tag. If the function is called for a top-level tag, it returns an empty string. If an ancestor does not expose data (see [GetBaseTagData](#)), its name might not be returned.

## Category

[Other functions](#)

## Function syntax

```
GetBaseTagList()
```

## See also

[GetBaseTagData](#); “High-level data exchange” in Chapter 11, “Creating and Using Custom CFML Tags,” in *ColdFusion MX Developer’s Guide*

## Usage

This function does not display the following tags or end tags in the ancestor tag list:

- `cfif`, `cfelseif`, `cfelse`
- `cfswitch`, `cfcase`, `cfdefaultcase`
- `cftry`, `cfcatch`

This function displays the following tags only under the following conditions:

- `cfloop`: if it uses a query attribute
- `cfoutput`: if at least one of its children is a complex expression
- `cfprocessingdirective`: if it has at least one other attribute besides `pageencoding`

## Example

```
<!-- This example shows the use of GetBaseTagList function.
Typically used in custom tags. -->
<cfif thisTag.executionMode is "start">
  <!-- Get the tag context stack
  The list will look something like "CFIF,MYTAGNAME..." -->
  <cfset ancestorList = GetBaseTagList()>
  <br><br>Dump of GetBaseTagList output:<br>
  <cfdump var="#ancestorList#"><br><br>
  <!-- Output current tag name -->
  <cfoutput>This is custom tag #ListGetAt(ancestorList,1)#</cfoutput><br>
  <!-- Determine whether this is nested inside a loop -->
  <cfset inLoop = ListFindNoCase(ancestorList, "cfloop")>
  <cfif inLoop>
    Running in the context of a cfloop tag.<br>
  </cfif>
</cfif>
```

# GetBaseTemplatePath

## Description

Gets the absolute path of an application's base page.

## Returns

The absolute path of the application base page, as a string.

## Category

[Other functions](#), [System functions](#)

## Function syntax

```
GetBaseTemplatePath()
```

## See also

[GetCurrentTemplatePath](#), [FileExists](#), [ExpandPath](#)

## Example

```
<h3>GetBaseTemplatePath Example</h3>
```

```
<p>The template path of the current page is:  
<cfoutput>#GetBaseTemplatePath()#</cfoutput>
```

# GetClientVariablesList

## Description

Finds the client variables to which a page has write access.

## Returns

Comma-delimited list of non-read-only client variables, as a string.

## Category

[List functions](#), [Other functions](#)

## Function syntax

```
GetClientVariablesList()
```

## See also

[DeleteClientVariable](#)

## Usage

The list of variables returned by this function is compatible with ColdFusion list functions.

## Example

```
<!--- This example is view-only. --->

<h3>GetClientVariablesList Example</h3>

<p>This view-only example deletes a client variable called "User_ID", if it
exists
in the list of client variables returned by GetClientVariablesList().
<p>This example requires the existence of an Application.cfm file and that
client
management be in effect.
<!---
<cfset client.somevar = "">
<cfset client.user_id = "">
<p>Client variable list:<cfoutput>#GetClientVariablesList()#</cfoutput>

<cfif ListFindNoCase(GetClientVariablesList(), "User_ID") is not 0>
<!--- delete that variable
<cfset temp = DeleteClientVariable("User_ID")>
<p>Was variable "User_ID" Deleted? <cfoutput>#temp#</cfoutput>
</cfif>

<p>Amended Client variable list:<cfoutput>#GetClientVariablesList()#
</cfoutput>
--->
```

# GetContextRoot

## Description

Returns path to the J2EE server context root for the current request.

## Returns

The path from the web root to the context root for the current page. The path starts with a forward slash character (/) but does not end with a forward slash character (/). For applications in the default (root) context, returns the empty string.

## Category

[System functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
GetContextRoot()
```

## See also

[GetPageContext](#)

## Usage

This function is equivalent to calling `GetPageContext().getRequest().getContextPath()`. On J2EE configurations, it returns the path from the Web root to the J2EE context root of the ColdFusion MX J2EE application. On server configurations, it returns the empty string, because the context root is at the web root.

This function is useful in applications that might be installed at varying J2EE context roots.

## Example

The ColdFusion MX Administrator uses the following line to get the location of the administrator directory:

```
<cfset request.thisURL = "#getContextRoot()#/CFIDE/administrator/">
```

The Administrator uses the returned value in places where it uses a URL to access Administrator resources, such as images, as in the following line:

```
<a href="index.cfm"></a>
```

# GetCurrentTemplatePath

## Description

Gets the path of the page that calls this function.

## Returns

The absolute path of the page that contains the call to this function, as a string.

## Category

[System functions](#)

## Function syntax

```
GetCurrentTemplatePath()
```

## See also

[GetBaseTemplatePath](#), [FileExists](#), [ExpandPath](#)

## Usage

If the function call is made from a page included with a `cfinclude` tag, this function returns the page path of an included page. Contrast this with the `GetBaseTemplatePath` function, which returns the path of the top-level page, even if it is called from an included page.

## Example

```
<!--- This example uses GetCurrentTemplatePath to show the
      template path of the current page --->
<h3>GetCurrentTemplatePath Example</h3>

<p>The template path of the current page is:
<cfoutput>#GetCurrentTemplatePath()#</cfoutput>
```

# GetDirectoryFromPath

## Description

Extracts a directory from an absolute path.

## Returns

Absolute path, without the filename. The last character is a forward or backward slash, depending on the operating system.

## Category

[System functions](#)

## Function syntax

`GetDirectoryFromPath(path)`

## See also

[ExpandPath](#), [GetFileFromPath](#)

## Parameters

| Parameter         | Description   |
|-------------------|---|
| <code>path</code> | Absolute path (drive, directory, filename, and extension) |

## Example

```
<h3>GetDirectoryFromPath Example</h3>
<cfset thisPath = ExpandPath("*.*)">
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
  <cfif FORM.yourFile is not "">
    <cfset yourFile = FORM.yourFile>
    <cfif FileExists(ExpandPath(yourfile))>
      <p>Your file exists in this directory. You entered the correct file
name,
#GetFileFromPath("#thisPath#/#yourfile#")#
    </cfif>
  </cfif>
  <p>Your file was not found in this directory:
  <br>Here is a list of the other files in this directory:
  <!-- use cfdirectory show directory, order by name & size -->
  <cfdirectory directory = "#thisDirectory#"
    name = "myDirectory" SORT = "name ASC, size DESC">
  <!-- Output the contents of the cfdirectory as a CFTABLE -->
  <cftable query = "myDirectory">
    <cfcol header = "NAME:" text = "#Name#">
    <cfcol header = "SIZE:" text = "#Size#">
  </cftable>
  </cfif>
</cfif>
</cfoutput>
<cfelse>
  <H3>Please enter a file name</H3>
</cfif>
```

```
</cfoutput>
<form action="getdirectoryfrompath.cfm" METHOD="post">
  <H3>Enter the name of a file in this directory <I><FONT SIZE="-1">
    (try expandpath.cfm)</FONT></I></H3>
  <input type="Text" NAME="yourFile">
  <input type="Submit" NAME="">
</form> --->
```

# GetEncoding

## Description

Returns the encoding (character set) of the Form or URL scope.

## Returns

String; the character encoding of the specified scope.

## Category

[International functions](#), [System functions](#)

## Function syntax

```
GetEncoding(scope_name)
```

## See also

[SetEncoding](#), [cfcontent](#), [cfprocessingdirective](#), [URLDecode](#), [URLEncodedFormat](#)

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter  | Description   |
|------------|---|
| scope_name | <ul style="list-style-type: none"><li>Form</li><li>URL.</li></ul> |

## Usage

Use this function to determine the character encoding of the URL query string or the fields of a form that was submitted to the current page. The default encoding, if none has been explicitly set, is UTF-8.

For more information, see [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets).

## Example

```
<!-- This example sends the contents of two fields and interprets them as
      big5 encoded text. -->
<cfcontent type="text/html; charset=big5">
<form action='#cgi.script_name#' method='get'>
<input name='xxx' type='text'>
<input name='yyy' type='text'>
<input type="Submit" value="Submit">
</form>

<cfif IsDefined("URL.xxx")>
<cfscript>
  SetEncoding("url", "big5");
  WriteOutput("URL.XXX is " & URL.xxx & "<br>");
  WriteOutput("URL.YYY is " & URL.yyy & "<br>");
  theEncoding = GetEncoding("URL");
  WriteOutput("The URL variables were decoded using '" & theEncoding & "'
encoding.");
```

```
        WriteOutput("The encoding is " & theEncoding);  
</cfscript>  
</cfif>
```

# GetException

## Description

Used with the `cftry` and `cfcatch` tags. Retrieves a Java exception object from a Java object.

## Returns

Any Java exception object raised by a previous method call on the Java object.

## Category

[System functions](#)

## Syntax

```
GetException(object)
```

## Parameters

| Parameter           | Description    |
|---------------------|----------------|
| <code>object</code> | A Java object. |

## Usage

ColdFusion stores a Java exception object for each method call on a Java object. Subsequent method calls reset the exception object. To get the current exception object, you must call `GetException` on the Java object before other methods are invoked on it.

## Example

```
<!--- Create the Java object reference --->
<cfobject action = create type = java class = primitivetype name = myObj>
<!--- Calls the object's constructor --->
<cfset void = myObj.init()>
<cftry>
<cfset void = myObj.DoException() >
<Cfcatch type = "Any">
  <cfset exception = GetException(myObj)>
<!--- User can call any valid method on the exception object.--->
  <cfset message = exception.toString()>
  <cfoutput>
    Error<br>
    I got exception <br>
    <br> The exception message is: #message# <br>
  </cfoutput>
</cfcatch>
</cftry>
```

# GetFileFromPath

## Description

Extracts a filename from an absolute path.

## Returns

Filename, as a string.

## Category

[System functions](#)

## Function syntax

`GetFileFromPath(path)`

## See also

[ExpandPath](#), [GetCurrentTemplatePath](#)

## Parameters

| Parameter         | Description   |
|-------------------|---|
| <code>path</code> | Absolute path (drive, directory, filename, and extension) |

## Example

```
<h3>GetFileFromPath Example</h3>
<cfset thisPath = ExpandPath("*..*")>
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
<cfif FORM.yourFile is not "">
<cfset yourFile = FORM.yourFile>
<cfif FileExists(ExpandPath(yourfile))>
  <p>Your file exists in this directory. You entered the correct file
  name, #GetFileFromPath("#thisPath#/#yourfile#")#
<cfelse>
  <p>Your file was not found in this directory:
  <br>Here is a list of the other files in this directory:
  <!--- use cfdirectory to give the contents of the snippets
  directory, order by name and size --->
  <cfdirectory
    directory = "#thisDirectory#"
    name = "myDirectory"
    sort = "name ASC, size DESC">
  <!--- Output the contents of the cfdirectory as a cftable --->
  <cftable query = "myDirectory">
  <cfcol header = "NAME:" text = "#Name#">
  <cfcol header = "SIZE:" text = "#Size#">
  ...
```

# GetFunctionList

## Description

Displays a list of the functions that are available in ColdFusion.

## Returns

A structure of functions.

## Category

[System functions](#)

## Function syntax

```
GetFunctionList()
```

## Example

```
<!------ This example shows the use of GetFunctionList. ---->
<cfset fList = GetFunctionList()>
<cfoutput>#StructCount(fList)# functions<br><br>
</cfoutput>
<cfloop collection = "#fList#" item = "key">
  <cfoutput>#key#<br>
</cfoutput>
</cfloop>
```

# GetGatewayHelper

## Description

Gets a Java GatewayHelper object that provides methods and properties for use with a ColdFusion event gateway.

## Returns

A Java GatewayHelper object.

## Category

[Extensibility functions](#)

## Function syntax

```
GetGatewayHelper(gatewayID)
```

## See also

[SendGatewayMessage](#)

## History

ColdFusion MX 7: Added the function.

## Parameters

| Parameter | Description   |
|-----------|---|
| gatewayID | Identifier of the gateway that provides the GatewayHelper object. Must be the Gateway ID of one of the ColdFusion event gateway instances configured on the ColdFusion MX Administrator Event Gateways section's Gateways page. |

## Usage

The ColdFusion `GetGatewayHelper` function returns a Java GatewayHelper object that provides event gateway-specific helper methods and properties. To use this function, the event gateway must provide access to a class that implements the GatewayHelper class. For example, an instant messaging event gateway might make buddy-list management functions available in a GatewayHelper object.

An event gateway listener CFC can get the `gatewayID` value from the `CFEvent` structure of the incoming message.

You access the GatewayHelper object's methods and properties using standard ColdFusion Java object access techniques. For more information, see "The role of the GatewayHelper object" in Chapter 42, "Using Event Gateways," in *ColdFusion MX Developer's Guide*.

## Example

If an event gateway's helper class includes an `addBuddy` method that takes a single `String` parameter, you could use the following code to get the `GatewayHelper` object and add a buddy to the buddies list:

```
<h3>GetGatewayHelper Example</h3>
<cfscript>
    myHelper = getGatewayHelper(myGatewayID);
    status = myHelper.addBuddy("jsmith");
</cfscript>
```

# GetHttpRequestData

## Description

Makes HTTP request headers and body available to CFML pages. Useful for capturing SOAP request data, which can be delivered in an HTTP header.

## Returns

A ColdFusion structure.

## Category

[System functions](#)

## Function syntax

```
GetHttpRequestData()
```

## Returns

The function returns a structure containing the following entries:

| Parameter | Description  |
|-----------|--|
| content   | Raw content from form submitted by client, in string or binary format. For content to be considered string data, the FORM request header "CONTENT_TYPE" must start with "text/" or be special case "application/x-www-form-urlencoded". Other types are stored as a binary object. |
| headers   | Structure that contains HTTP request headers as value pairs. Includes custom headers, such as SOAP requests.   |
| method    | String that contains the CGI variable Request_Method.  |
| protocol  | String that contains the Server_Protocol CGI variable.   |

## Usage

To determine whether data is binary, use `IsBinary(x.content)`. To convert data to a string value, if it can be displayed as a string, use `ToString(x.content)`.

## Example

The following example shows how this function can return HTTP header information.

```
<cfset x = GetHttpRequestData()>
<cfoutput>
<table cellpadding = "2" cellspacing = "2">
  <tr>
    <td><b>HTTP Request item</b></td>
    <td><b>Value</b></td> </tr>
<cfloop collection = #x.headers# item = "http_item">
  <tr>
    <td>#http_item#</td>
    <td>#StructFind(x.headers, http_item)#</td></tr>
</cfloop>
<tr>
  <td>request_method</td>
  <td>#x.method#</td></tr>
```

```
<tr>
  <td>server_protocol</td>
  <td>#x.protocol#</td></tr>
</table>
<b>http_content --- #x.content#</b>
</cfoutput>
```

# GetHttpTimeString

## Description

Gets the current time, in the Universal Time code (UTC).

## Returns

The time, as a string, according to the HTTP standard described in RFC 1123 and its underlying RFC, 822. This format is commonly used in Internet protocols, including HTTP.

## Category

[Date and time functions](#), [International functions](#)

## Function syntax

```
GetHttpTimeString(date_time_object)
```

## See also

[GetLocale](#), [GetTimeZoneInfo](#), [SetLocale](#)

## Parameters

| Parameter                     | Description  |
|-------------------------------|--|
| <code>date_time_object</code> | A ColdFusion date-time object string or Java Date object |

## Usage

The time in the returned string is UTC, consistent with the HTTP standard.

## Example

```
<cfoutput>  
#GetHttpTimeString(now())#  
</cfoutput>
```

# GetK2ServerDocCount

## Description

This function is deprecated.

## Returns

The number of collection metadata items stored in Verity collections.

## Category

[Full-text search functions](#), [Query functions](#)

## Function syntax

```
GetK2ServerDocCount()
```

## See also

[GetK2ServerDocCountLimit](#)

## History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

## Example

```
<cfoutput>GetK2ServerDocCount =  
  $#GetK2ServerDocCount()#*$</cfoutput>
```

# GetK2ServerDocCountLimit

## Description

This function is deprecated.

## Returns

Number of collection metadata items that the K2 server permits, as an integer

## Category

[Full-text search functions](#), [Query functions](#)

## Function syntax

```
GetK2ServerDocCountLimit()
```

## See also

[GetK2ServerDocCount](#)

## History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

## Usage

If a search generates a larger number of documents than the limit, ColdFusion puts a warning message in the Administrator and in the log file.

## Example

```
<cfoutput>GetK2ServerDocCountLimit =  
  $*#GetK2ServerDocCountLimit()*#*$</cfoutput>
```

# GetLocale

## Description

Gets the current ColdFusion MX geographic/language locale value.

To set the default display format of date, time, number, and currency values in a ColdFusion application session, you use the [SetLocale](#) function.

## Returns

The current locale value, as an English string. If a locale has a Java name and a name that ColdFusion MX used prior to the ColdFusion MX 7 release (for example, en\_US and English (US)), ColdFusion MX returns the ColdFusion name (for example, English (US)).

## Category

[Display and formatting functions](#), [International functions](#), [System functions](#)

## Function syntax

```
GetLocale()
```

## See also

[GetLocaleDisplayName](#), [SetLocale](#)

## History

ColdFusion MX 7: Added support for all Java locales and locale names.

ColdFusion MX: Changed behavior to that described in usage.

## Usage

This function returns the locale name as it is represented in ColdFusion MX; for example, Portuguese (Brazilian), or ca\_ES. To get a locale name in the language of the locale, use the [GetLocaleDisplayName](#) function, which returns português (Brasil) and català (Espanya).

This function determines whether a locale value is set for ColdFusion MX. (The value is set with the [SetLocale](#) function.)

- If the ColdFusion MX locale value is present, the function returns it.
- If the ColdFusion MX locale has not been explicitly set, ColdFusion now determines whether the default locale of the ColdFusion server computer operating system is among the locale values it supports. (The default locale is stored in the user environment variables user.language and user.region.)

If the default locale value is not supported, the function returns English (US). ColdFusion sets the locale in the JVM to this value; it persists until the server is restarted or it is reset with the [SetLocale](#) function.

This function does not access a web browser's Accept-Language HTTP header setting.

**Note:** When ColdFusion is started, it stores the supported locale values in the variable `Server.ColdFusion.SupportedLocales`. ColdFusion MX supports the locales supported by its Java runtime environment. The `SupportedLocales` value lists the Java names for the supported locales and the corresponding names that ColdFusion MX used prior to the ColdFusion MX 7 release.

For more information, see “Locales” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*.

### Example

```
<h3>Example: Using SetLocale and GetLocale</h3>
<cfoutput>
  <!--- For each new request, the locale gets reset to the JVM locale --->
  Initial locale's ColdFusion name: #GetLocale()#<br>
  <br>
  <!--- Do this only if the form was submitted. --->
  <cfif IsDefined("form.mylocale")>
    <b>Changing locale to #form.mylocale#</b><br>
    <br>
    <!--- Set the locale to the submitted value and save the old ColdFusion
    locale name. --->
    <cfset oldlocale=SetLocale("#form.mylocale#")>
    <!--- Get the current locale. It should have changed. --->
    New locale: #GetLocale()#<br>
  </cfif>

  <!--- Self-submitting form to select the new locale. --->
  <cfform>
    <h3>Please select the new locale:</h3>
    <cfselect name="mylocale">
      <!--- The server.coldfusion.supportedlocales variable is a
      list of all supported locale names. Use a list cfloop tag
      to create an HTML option tag for each name in the list. --->
      <cfloop index="i" list="#server.coldfusion.supportedlocales#">
        <option value="#i#">#i#</option>
      </cfloop>
    </cfselect><br>
    <br>
    <cfinput type="submit" name="submitit" value="Change Locale">
  </cfform>
</cfoutput>
```

# GetLocaleDisplayName

## Description

Gets a locale value and displays the name in a manner that is appropriate to a specific locale. By default, gets the current locale in the current locale's language.

## Returns

The localized display name of the locale, in the language of the specified locale.

## Category

[Display and formatting functions](#), [International functions](#), [System functions](#)

## Function syntax

```
GetLocaleDisplayName([locale[, inLocale]])
```

## See also

[GetLocale](#), [SetLocale](#)

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description  |
|-----------|--|
| locale    | The locale whose name you want. The default is the current ColdFusion locale, or if no ColdFusion locale has been set, the JVM locale.         |
| inlocale  | The locale in which to return the name. The default is the current ColdFusion locale, or if no ColdFusion locale has been set, the JVM locale. |

## Example

The following example expands on the [GetLocale](#) example to show the use of the `GetLocaleDisplayName` function to display locale names in the current locale and in other locales. It lets you select a locale from all supported locales, changes the ColdFusion MX locale to the selected locales, and displays the old and new locale names.

```
<html>
<head>
  <title>Displaying locales</title>
</head>

<body>
<h3>Example: Changing and Displaying Locales</h3>
<cfoutput>
  <!-- For each new request, the locale gets reset to the JVM locale -->
  Initial locale's ColdFusion name: #GetLocale()#<br>
  Initial locale's display name: #GetLocaleDisplayName()#<br>
  <br>
  <!-- Do this only if the form was submitted. -->
  <cfif IsDefined("form.mylocale")>
    <b>Changing locale to #form.mylocale#</b><br>
```

```

<br>
<!-- Set the locale to the submitted value.
    SetLocale returns the old ColdFusion locale name. --->
<cfset oldlocale=SetLocale("#form.mylocale#")>
<!-- Get the current locale's ColdFusion name.
    It should have changed. --->
<cfset newlocale=GetLocale()>
New locale's ColdFusion name: #newlocale#<br>
New locale's display name in current locale: #GetLocaleDisplayName()#<br>
New locale's display name in old locale:
    #GetLocaleDisplayName(newlocale, oldlocale)#<br>
New locale's display name in en_US:
    #GetLocaleDisplayName(newlocale, "en_US")#<br>
<br>
Old locale's display name in current locale:
    #GetLocaleDisplayName(oldlocale)#<br>
Old locale's display name in en_US:
    #GetLocaleDisplayName(oldlocale, "en_US")#<br>
</cfif>

<!-- Self-submitting form to select the new locale. --->
<cfform>
    <h3>Please select the new locale:</h3>
    <cfselect name="mylocale">
        <!-- The server.coldfusion.supportedlocales variable is a
            list of all supported locale names. Use a list cfloop tag
            to create an HTML option tag for each name in the list. --->
        <cfloop index="i" list="#server.coldfusion.supportedlocales#">
            <!-- In the select box, we use the US English display names for
                the locales. You can change en_US to your preferred locale. --->
            <option value="#i#">#GetLocaleDisplayName(i, "en_US")#</option>
        </cfloop>
    </cfselect><br>
    <br>
    <cfinput type="submit" name="submitit" value="Change Locale">
</cfform>
</cfoutput>

</body>
</html>

```

# GetMetaData

## Description

Gets metadata (such as the methods, properties, and parameters of a component) associated with an object that is deployed on the ColdFusion server.

## Returns

Structured metadata information: for ColdFusion components (CFCs) and user defined functions (UDFs), a structure; for query objects, an array of structures.

## Category

[System functions](#)

## Function syntax

```
GetMetaData(object)
```

## See also

[CreateObject](#), [QueryAddColumn](#), [QueryNew](#)

## History

ColdFusion MX 7: Added support for getting query object metadata.

ColdFusion MX: Added this function.

## Parameters

---

| Parameter | Description  |
|-----------|--|
| object    | A ColdFusion component, user-defined function, or query object. Within a CFC, the parameter can also specify the This scope. |

---

## Usage

This function provides information about application data, and lets applications dynamically determine the structure of an object and how to use it. This function is useful for CFCs and query objects. The metadata for a CFC includes information on the component and its functions, arguments, and properties. The `getMetaData` function also returns metadata for user-defined functions that not part of CFCs.

The following table lists the data returned by the function for supported object types:

| Object    | Field        | Description  |
|-----------|--------------|--|
| Component |              | A structure containing the following fields:   |
|           | displayname  | Value of the <code>cfcomponent</code> tag <code>displayname</code> attribute, if any.  |
|           | extends      | Metadata for the component's ancestor component. Components that do not explicitly extend another component extend the <code>WEB-INF.cftags.component</code> .             |
|           | functions    | Array of metadata structures for the component's functions.  |
|           | hint         | Value of the <code>cfcomponent</code> tag <code>displayname</code> attribute, if any.  |
|           | name         | Component name, including the period-delimited path from a component search root such as the web root or a directory specified in the administrator Custom Tag Paths page. |
|           | output       | Value of the <code>cfcomponent</code> tag <code>output</code> attribute, if any  |
|           | path         | Absolute path to the component.  |
|           | properties   | Array of structures containing metadata specified by the component's <code>cfproperty</code> tags, if any.   |
|           | type         | Always, component.   |
|           | userMetadata | User-specified attributes in the <code>cfcomponent</code> tag  |
| Function  |              | A structure containing the following fields.   |
|           | access       | Value of the <code>cffunction</code> tag <code>access</code> attribute, if any.  |
|           | displayname  | Value of the <code>cffunction</code> tag <code>displayname</code> attribute, if any.   |
|           | hint         | Value of the <code>cffunction</code> tag <code>hint</code> attribute, if any.  |
|           | name         | Function name.   |
|           | output       | Value of the <code>cffunction</code> tag <code>output</code> attribute, if any.  |
|           | parameters   | Array of structures containing metadata for the function parameters.   |
|           | returntype   | Value of the <code>cffunction</code> tag <code>returntype</code> attribute, if any.  |
|           | roles        | Value of the <code>cffunction</code> tag <code>output</code> attribute, if any.  |
|           | userMetadata | User-specified attributes in the <code>cffunction</code> tag.  |

| Object                | Field           | Description   |
|-----------------------|-----------------|---|
| Parameter or Property |                 | A structure containing the following fields:  |
|                       | default         | Value of the <code>cfargument</code> or <code>cfproperty</code> tag <code>default</code> attribute, if any.     |
|                       | displayname     | Value of the <code>cfargument</code> or <code>cfproperty</code> tag <code>displayname</code> attribute, if any. |
|                       | hint            | Value of the <code>cfargument</code> or <code>cfproperty</code> tag <code>hint</code> attribute, if any.        |
|                       | name            | Function parameter or CFC property name.  |
|                       | required        | Value of the <code>cfargument</code> or <code>cfproperty</code> tag <code>required</code> attribute, if any.    |
|                       | type            | Value of the <code>cfargument</code> or <code>cfproperty</code> tag <code>type</code> attribute, if any.        |
|                       | userMetadata    | User-specified attributes in the <code>argument</code> tag.   |
| Query                 |                 | An array of structures containing the following elements:   |
|                       | IsCaseSensitive | Boolean value indicating whether character data must be case correct.   |
|                       | Name            | The column name.  |
|                       | TypeName        | The SQL data type (Omitted if the query object is created with <code>QueryNew</code> without specifying types.) |

**Note:** Use the `This` scope to access component metadata inside the CFC. The `This` scope is available at runtime in the component body and in the CFC methods. It is used to read and write variables that are present during the life of the component.

For more information, see “Using introspection to get information about components” in Chapter 10, “Building and Using ColdFusion Components,” in *ColdFusion MX Developer’s Guide*.

### Example

The following example uses the `cfdump` tag to display metadata for the utilities CFC that is used by the ColdFusion component browser. It also displays the names and data types of the fields in the `cfdocexamples` database `Employees` table.

```
<!--- Create an instance of the Component Explorer utilities CFC.
      and get its metadata --->
<cfscript>
componentutils = createObject("component", "cfide.componentutils.utils");
utilmetadata = getMetaData(componentutils);
</cfscript>

<h4>Metadata for the CFC component utilities</h4>
<cfdump var="#utilmetadata#">

<!--- use GetMetadata to get the names and data types of the fields in the
      cfdocexamples Employees table --->
```

```
<cfquery name="getemployees" datasource="cfdocexamples">
SELECT      *
FROM        Employees
</cfquery>
<cfset employeemeta=getMetaData(getemployees)>

<h4>The Employees table has the following columns</h4>
<cfloop index="i" from="1" to="#arrayLen(employeemeta)#">
  <cfoutput>
    #employeemeta[i].name# #employeemeta[i].TypeName#
    #employeemeta[i].isCaseSensitive#<br>
  </cfoutput>
</cfloop>
```

# GetMetricData

## Description

Gets server performance metrics.

## Returns

ColdFusion structure that contains metric data, depending on the `mode` value.

## Category

[System functions](#)

## Function syntax

```
GetMetricData(mode)
```

## History

ColdFusion MX: Deprecated the `cachepops` parameter. It might not work, and it might cause an error, in later releases.

## Parameters

| Parameter | Option        | Description   |
|-----------|---------------|---|
| mode      | perf_monitor  | Returns internal data, in a structure.<br>To receive data, you must enable PerfMonitor in ColdFusion Administrator before executing the function.<br>On Windows, this data is otherwise displayed in the Windows PerfMonitor.                                     |
|           | simple_load   | Returns an integer value that is computed from the state of the server's internal queues. Indicates the overall server load.  |
|           | prev_req_time | Returns the time, in milliseconds, that it took the server to process the previous request.   |
|           | avg_req_time  | Returns the average time, in milliseconds, that it takes the server to process a request.<br>Changing the setting to 0 prevents the server from calculating the average and removes overhead associated with gathering data.<br>The default value is 120 seconds. |

## Usage

If `mode = "perf_monitor"`, the function returns a structure with these data fields:

| Field        | Description   |
|--------------|---|
| InstanceName | The name of the ColdFusion server. The default value is <code>cfserver</code> . |
| PageHits     | Number of HTTP requests received since ColdFusion MX was started.               |
| ReqQueued    | Number of HTTP requests in the staging queue, waiting for processing.           |
| DBHits       | Number of database requests since the server was started.                       |

| Field        | Description  |
|--------------|--|
| ReqRunning   | Number of HTTP requests currently running.<br>In the ColdFusion Administrator, you can set the maximum number of requests that run concurrently. |
| ReqTimedOut  | Number of HTTP requests that timed out while in the staging queue or during processing.  |
| BytesIn      | Number of bytes in HTTP requests to ColdFusion MX.   |
| BytesOut     | Number of bytes in HTTP responses from ColdFusion MX.  |
| AvgQueueTime | For the last two HTTP requests (current and previous), the average length of time the request waited in the staging queue.                       |
| AvgReqTime   | For the last two HTTP requests (current and previous), the average length of time the server required to process the request                     |
| AvgDBTime    | For the last two HTTP requests (current and previous), the average length of time the server took to process CFQueries in the request.           |
| cachepops    | This parameter is deprecated. ColdFusion automatically sets its value to -1.   |

### Example

```
<!--- This example gets and displays metric data from Windows NT PerfMonitor -
-->
<cfset pmData = GetMetricData( "PERF_MONITOR" ) >
<cfoutput>
  Current PerfMonitor data is: <p>
  InstanceName:#pmData.InstanceName# <p>
  PageHits:#pmData.PageHits# <p>
  ReqQueued: #pmData.ReqQueued# <p>
  DBHits: #pmData.DBHits# <p>
  ReqRunning: #pmData.ReqRunning# <p>
  ReqTimedOut: #pmData.ReqTimedOut# <p>
  BytesIn: #pmData.BytesIn# <p>
  BytesOut: #pmData.BytesOut# <p>
  AvgQueueTime: #pmData.AvgQueueTime# <p>
  AvgReqTime: #pmData.AvgReqTime# <p>
  AvgDBTime: #pmData.AvgDBTime# <p>
</cfoutput>
```

# GetPageContext

## Description

Gets the current ColdFusion MX PageContext object that provides access to page attributes and configuration, request, and response objects.

## Returns

The current ColdFusion MX Java PageContext Java object.

## Category

[System functions](#)

## Function syntax

```
GetPageContext()
```

## History

ColdFusion MX: Added this function.

## Usage

The ColdFusion MX PageContext class is a wrapper class for the Java PageContext object that can resolve scopes and perform case-insensitive variable lookups.

The PageContext object exposes fields and methods that can be useful in J2EE integration. It includes the `include` and `forward` methods that provide the equivalent of the corresponding standard JSP tags. You use these methods to call JSP pages and servlets. For example, you use the following code in CFScript to include the JSP page `hello.jsp` and pass it a `name` parameter:

```
GetPageContext().include("hello.jsp?name=Bobby"); ===
```

When you use `GetPageContext` to include a JSP page in a CFML page on WebLogic, you may need to flush the output of the CFML page with `cfflush` before calling the JSP page. Otherwise, the ColdFusion output appears after the JSP output.

For more information, see your Java Server Pages (JSP) documentation.

## Example

```
<!-- this example shows using the page context to set a page
variable and access the language of the current locale -->
<cfset pc = GetPageContext()>

<cfset pc.setAttribute("name","John Doe")>
<cfoutput>name: #variables.name#<br></cfoutput>

<cfoutput>Language of the current locale is
#pc.getRequest().getLocale().getDisplayLanguage()#</cfoutput>>.
```

# GetProfileSections

## Description

Gets all the sections of an initialization file.

An initialization file assigns values to configuration variables, also known as entries, that are set when the system boots, the operating system comes up, or an application starts. An initialization file has the suffix INI; for example, `boot.ini`, `Win32.ini`.

## Returns

An initialization file, as a struct whose format is as follows:

- Each initialization file section name is a key in the struct
- Each list of entries in a section of an initialization file is a value in the struct

If there is no value, returns an empty string.

## Category

[System functions](#)

## Function syntax

```
GetProfileSections(iniFile)
```

## See also

[GetProfileString](#), [SetProfileString](#)

## History

ColdFusion MX: Added this function.

## Parameters

---

| Parameter            | Description   |
|----------------------|---|
| <code>iniFile</code> | Absolute path (drive, directory, filename, extension) of initialization file; for example, <code>C:\boot.ini</code> |

---

# GetProfileString

## Description

Gets an initialization file entry.

An initialization file assigns values to configuration variables, also known as entries, that are set when the system boots, the operating system comes up, or an application starts. An initialization file has the suffix INI; for example, `boot.ini`, `Win32.ini`.

## Returns

An entry in an initialization file, as a string. If there is no value, returns an empty string.

## Category

[System functions](#)

## Function syntax

```
GetProfileString(iniPath, section, entry)
```

## See also

[GetProfileSections](#), [GetProfileString](#), [SetProfileString](#)

## Parameters

| Parameter            | Description   |
|----------------------|---|
| <code>iniPath</code> | Absolute path (drive, directory, filename, extension) of initialization file; for example, <code>C:\boot.ini</code> |
| <code>section</code> | Section of initialization file from which to extract information  |
| <code>entry</code>   | Name of value to get  |

## Example

```
<h3>GetProfileString Example</h3>
Uses GetProfileString to get the value of timeout in an initialization file.
Enter
the full path of your initialization file, and submit the form.
<!-- If the form was submitted, it gets the initialization path and timeout
value specified in the form -->
<cfif Isdefined("Form.Submit")>
  <cfset IniPath = FORM.iniPath>
  <cfset Section = "boot loader">
  <cfset timeout = GetProfileString(IniPath, Section, "timeout")>
  <h4>Boot Loader</h4>
  <!-- If no entry in an initialization file, nothing displays -->
  <p>Timeout is set to: <cfoutput>#timeout#</cfoutput>.</p>
</cfif>
<form action = "getprofilestring.cfm">
<table cellpadding = "2" cellspacing = "2" border = "0">
  <tr>
    <td>Full Path of Init File</td>
    <td><input type = "Text" name = "IniPath" value = "C:\myboot.ini">
  </td>
</tr>
```

```
<tr>
  <td><input type = "Submit" name = "Submit" value = "Submit"></td>
  <td></td>
</tr></table>
</form>
```

# GetSOAPRequest

## Description

Returns an XML object that contains the entire SOAP request. Usually called from within a web service CFC.

## Returns

An XML object that contains the entire SOAP request.

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
GetSOAPRequest()
```

## See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| webservice | Optional. A webservice object as returned from the <code>cfoobject</code> tag or the <code>CreateObject</code> function.<br>Required if the function is called from the client. |

## Usage

Call this function to obtain a web service request object after the web service has been invoked. If you call this function from outside a web service CFC without the `webservice` parameter, it throws the following expression error:

```
Unable to use getSOAPRequest: not processing a web service request.
```

If you call this function from within a web service CFC, you can omit the `webservice` argument. The function executes against the request that it is currently processing.

You can use CFML XML functions to examine the returned XML object.

## Example

This example makes a request to execute the `echo_me` function of the `headerservice.cfc` web service. For information on implementing the `headerservice.cfc` web service and also to see the `echo_me` function and the content of the web service CFC, see the example for either the [AddSOAPResponseHeader](#) function or the [GetSOAPRequestHeader](#) function.

```
<!-- Note that you might need to modify the URL in the CreateObject function to match your server and the location of the headerservice.cfc file if it is
```

different than shown here.

Note, too, that getSOAPRequest is called from the client here, whereas often it would be called from within the web service CFC. --->

```
<cfscript>
    ws = CreateObject("webservice",
        "http://localhost/soapheaders/headerservice.cfc?WSDL");
    ws.echo_me("hello world");
    req = getSOAPRequest(ws);
</cfscript>
<cfdump var="#req#">
```

# GetSOAPRequestHeader

## Description

Obtains a SOAP request header. Call only from within a CFC web service function that is processing a request as a SOAP web service.

## Returns

A SOAP request header.

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
GetSOAPRequestHeader(namespace, name [, asXML])
```

## See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| namespace | A String that is the namespace for the header.   |
| name      | A String that is the name of the header.   |
| asXML     | If True, the header is returned as a CFML XML object; if False (default), the header is returned as a Java object. |

## Usage

If you specify `False` for the `asXML` parameter, ColdFusion first attempts to retrieve the header using the data type specified in the header’s `xsi:type` attribute. If the `xsi:type` attribute is not available, ColdFusion attempts to retrieve the header as a string. If you specify `True` for the `asXML` parameter, ColdFusion retrieves the header as raw XML.

This function throws an error if it is invoked in a context that is not a web service request. Use the [IsSOAPRequest](#) function to determine whether the CFC is running as a web service.

## Example

This example creates a CFC web service that illustrates the operation of the `GetSOAPRequestHeader` function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as `headerservice.cfc` in a folder called `soapheaders` under your web root. Test its operation, and specifically the operation of the `GetSOAPRequestHeader` function, by executing the examples that invoke this web service. For example, see the example for [AddSOAPRequestHeader](#).

```

<h3>GetSOAPRequestHeader Example</h3>
<cfcomponent displayName="tester" hint="Test for SOAP headers">

<cffunction name="echo_me"
    access="remote"
    output="false"
    returntype="string"
    displayname="Echo Test" hint="Header test">

    <cfargument name="in_here" required="true" type="string">

<cfset isSOAP = isSOAPRequest()>
<cfif isSOAP>

    <!--- Get the first header as a string and as XML --->
    <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
    <cfset return = "The service saw username: " & username>
    <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username",
    "TRUE")>
    <cfset return = return & "<br> as XML: " & xmlusername>

    <!--- Get the second header as a string and as XML --->
    <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
    <cfset return = return & "The service saw password: " & password>
    <cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password",
    "TRUE")>
    <cfset return = return & "<br> as XML: " & xmlpassword>

    <!--- Add a header as a string --->
    <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader",
    "AUTHORIZED VALUE", false)>

    <!--- Add a second header using a CFML XML value --->
    <cfset doc = XmlNew()>
    <cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
    <cfset x.XmlText = "hey man, here I am in XML">
    <cfset x.XmlAttributes["xsi:type"] = "xsd:string">
    <cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>

<cfelse>
    <!--- Add a header as a string - Must generate error!
    <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader",
    "AUTHORIZED VALUE", false)>
    --->
    <cfset return = "Not invoked as a web service">
</cfif>

<cfreturn return>

</cffunction>

</cfcomponent>

```

# GetSOAPResponse

## Description

Returns an XML object that contains the entire SOAP response after invoking a web service.

## Returns

An XML object that contains the entire SOAP response.

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
GetSOAPResponse(webservice)
```

## See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| webservice | A webservice object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function. |

## Usage

You must first invoke the web service before attempting to get the response. You can use CFML XML functions to examine the XML response.

## Example

This example makes a request to execute the `echo_me` function of the `headerservice.cfc` web service. Following the request, the example calls the `GetSOAPResponse` function to get the SOAP response, and then calls `cfdump` to display its content.

for information on implementing the `headerservice.cfc` web service and also to see the `echo_me` function and the content of the web service CFC, see the example for either the [AddSOAPResponseHeader](#) function or the [GetSOAPRequestHeader](#) function.

```
<!--- Note that you might need to modify the URL in the CreateObject function to match your server and the location of the headerservice.cfc file if it is different than shown here. --->
```

```
<cfscript>
    ws = CreateObject("webservice",
        "http://localhost/soapheaders/headerservice.cfc?WSDL");
    ws.echo_me("hello world");
    resp = getSOAPResponse(ws);
</cfscript>
<cdump var="#resp#">
```

# GetSOAPResponseHeader

## Description

Returns a SOAP response header. Call this function from within code that is invoking a web service *after* making a web service request.

## Returns

A SOAP response header.

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
GetSOAPResponseHeader(webservice, namespace, name [, asXML])
```

## See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [IsSOAPRequest](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter               | Description  |
|-------------------------|--|
| <code>webservice</code> | A webservice object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function.      |
| <code>namespace</code>  | A String that is the namespace for the header.   |
| <code>name</code>       | A String that is the name of the SOAP header.  |
| <code>asXML</code>      | If True, the header is returned as a CFML XML object. If False (default), the header is returned as a Java object. |

## Usage

If you specify `false` for the `asXML` parameter, ColdFusion first attempts to retrieve the header using the data type specified in the header’s `xsi:type` attribute. If the `xsi:type` attribute is not available, ColdFusion attempts to retrieve the header as a string. If you specify `True` for the `asXML` parameter, ColdFusion retrieves the header as raw XML.

Used within CFML code by a consumer of a web service *after* it calls the web service with `cfinvoke`.

## Example

There are two parts to this example. The first part is the web service CFC that this function (as well as the other ColdFusion SOAP functions) uses to demonstrate its interaction with a web service. To implement the web service for this function, see the example for either the [AddSOAPResponseHeader](#) function or the [GetSOAPRequestHeader](#) function.

Execute the following example to see how the `GetSOAPResponseHeader` function operates:

<!-- Note that you might need to modify the URL in the `CreateObject` function to match your server and the location of the `headerservice.cfc` file if it is different than shown here. Likewise for the `cfinvoke` tag at the end -->

```
<h3>GetSOAPResponseHeader Example</h3>
<cfscript>
  // Create the web service object
  ws = CreateObject("webservice", "http://localhost/soapheaders/
    headerservice.cfc?WSDL");

  // Set the username header as a string
  addSOAPRequestHeader(ws, "http://mynamespace/", "username", "tom", false);

  // Set the password header as a CFML XML object
  doc = XmlNew();
  doc.password = XmlElemNew(doc, "http://mynamespace/", "password");
  doc.password.XmlText = "My Voice is my Password";
  doc.password.XmlAttributes["xsi:type"] = "xsd:string";
  addSOAPRequestHeader(ws, "ignoredNameSpace", "ignoredName", doc);

  // Invoke the web service operation
  ret = ws.echo_me("argument");

  // Get the first header as an object (string) and as XML
  header = getSOAPResponseHeader(ws, "http://www.tomj.org/mysn",
    "returnheader");
  XMLheader = getSOAPResponseHeader(ws, "http://www.tomj.org/mysn",
    "returnheader", true);

  // Get the second header as an object (string) and as XML
  header2 = getSOAPResponseHeader(ws, "http://www.tomj.org/mysn",
    "returnheader2");
  XMLheader2 = getSOAPResponseHeader(ws, "http://www.tomj.org/mysn",
    "returnheader2", true);
</cfscript>
<hr>
<cfoutput>
Soap Header value: #HTMLCodeFormat(header)#<br>
Soap Header XML value: #HTMLCodeFormat(XMLheader)#<br>
Soap Header 2 value: #HTMLCodeFormat(header2)#<br>

```

# GetTempDirectory

## Description

Gets the path of the directory that ColdFusion uses for temporary files. The directory depends on the account under which ColdFusion is running and other factors. Before using this function in an application, test to determine the directory it returns under your account.

## Returns

The absolute pathname of a directory, including a trailing slash, as a string.

## Category

[System functions](#)

## Function syntax

```
GetTempDirectory()
```

## See also

[GetTempFile](#)

## History

ColdFusion MX: Changed behavior: on Windows, this function now returns the temporary directory of the embedded Java application server. On other platforms, it returns the temporary directory of the operating system.

## Example

```
<h3>GetTempDirectory Example</h3>
```

```
<p>The temporary directory for this ColdFusion server is
```

```
<cfoutput>#GetTempDirectory()#</cfoutput>.
```

```
<p>We have created a temporary file called:
```

```
<cfoutput>#GetTempFile(GetTempDirectory(),"testFile")#</cfoutput>
```

# GetTempFile

## Description

Creates a temporary file in a directory whose name starts with (at most) the first three characters of *prefix*.

## Returns

Name of a temporary file, as a string.

## Category

[System functions](#)

## Function syntax

```
GetTempFile(dir, prefix)
```

## See also

[GetTempDirectory](#)

## Parameters

---

| Parameter           | Description  |
|---------------------|--|
| <code>dir</code>    | Directory name   |
| <code>prefix</code> | Prefix of a temporary file to create in the <code>dir</code> directory |

---

## Example

```
<h3>GetTempFile Example</h3>
<p>The temporary directory for this ColdFusion Server is
  <cfoutput>#GetTempDirectory()#</cfoutput>.
<p>We have created a temporary file called:
  <cfoutput>#GetTempFile(GetTempDirectory(),"testFile")#</cfoutput>
```

# GetTemplatePath

## Description

This function is deprecated. Use the [GetBaseTemplatePath](#) function instead.

Gets the absolute path of an application's base page.

## History

ColdFusion MX: Deprecated this function. It might not work, and it might cause an error, in later releases.

# GetTickCount

## Description

Returns the current value of an internal millisecond timer.

## Returns

A string representation of the system time, in milliseconds.

## Category

[Date and time functions](#), [System functions](#)

## Function syntax

```
GetTickCount()
```

## Usage

This function is useful for timing CFML code segments or other page processing elements. The value of the counter has no meaning. To generate useful timing values, take the difference between the results of two `GetTickCount` calls.

## Example

```
<!--- Setup timing test --->
<cfset iterationCount = 1000>
<!--- Time an empty loop with this many iterations --->
<cfset tickBegin = GetTickCount()>
<cfloop Index = i From = 1 To = #iterationCount#></cfloop>
<cfset tickEnd = GetTickCount()>
<cfset loopTime = tickEnd - tickBegin>

<!--- Report --->
<cfoutput>Loop time (#iterationCount# iterations) was: #loopTime#
  milliseconds</cfoutput>
```

# GetTimeZoneInfo

## Description

Gets local time zone information for the computer on which it is called, relative to Universal Time Coordinated (UTC). UTC is the mean solar time of the meridian of Greenwich, England, used as the basis for calculating standard time throughout the world.

ColdFusion stores date and time values as date-time objects: real numbers on a universal time line. It converts an object to a time zone when it formats an object; it converts a date/time value from a time zone to a real number when it parses a value.

## Returns

Structure that contains these elements and keys:

- `utcTotalOffset`: offset of local time, in seconds, from UTC
  - A plus sign indicates a time zone west of UTC (such as a zone in North America)
  - A minus sign indicates a time zone east of UTC (such as a zone in Germany)
- `utcHourOffset`: offset, in hours of local time, from UTC
- `utcMinuteOffset`: offset, in minutes, beyond the hours offset. For North America, this is 0. For countries that are not exactly on the hour offset, the number is between 0 and 60. For example, standard time in Adelaide, Australia is offset 9 hours and 30 minutes from UTC.
- `isDSTOn`: True, if Daylight Savings Time (DST) is on in the host; False, otherwise

## Category

[Date and time functions](#), [International functions](#)

## Function syntax

```
GetTimeZoneInfo()
```

## See also

[DateConvert](#), [CreateDateTime](#), [DatePart](#)

## Example

```
<h3>GetTimeZoneInfo Example</h3>
<!-- This example shows the use of GetTimeZoneInfo --->
<cfoutput>
The local date and time are #now()#.
</cfoutput>

<cfset info = GetTimeZoneInfo()>
<cfoutput>
<p>Total offset in seconds is #info.utcTotalOffset#.</p>
<p>Offset in hours is #info.utcHourOffset#.</p>
<p>Offset in minutes minus the offset in hours is
#info.utcMinuteOffset#.</p>
<p>Is Daylight Savings Time in effect? #info.isDSTOn#.</p>
</cfoutput>
```

# GetToken

## Description

Determines whether a token of the list in the `delimiters` parameter is present in a string.

## Returns

The token found at position *index* of the string, as a string. If *index* is greater than the number of tokens in the string, returns an empty string.

## Category

[String functions](#)

## Function syntax

```
GetToken(string, index [, delimiters ])
```

## See also

[Left](#), [Right](#), [Mid](#), [SpanExcluding](#), [SpanIncluding](#)

## Parameters

| Parameter               | Description   |
|-------------------------|---|
| <code>string</code>     | A string or a variable that contains one. String in which to search.  |
| <code>index</code>      | Positive integer or a variable that contains one. The position of a token.  |
| <code>delimiters</code> | A string or a variable that contains one. A delimited list of delimiters. Elements may consist of multiple characters.<br>Default list of delimiters: space character, tab character, newline character; or their codes: " <code>chr(32)</code> ", " <code>chr(9)</code> ", " <code>chr(10)</code> ".<br>Default list delimiter: comma character. |

## Usage

The following examples show how this function works.

**Example A:** Consider the following code:

```
GetToken("red,blue;;red,black,tan;;red,pink,brown;;red,three", 2, ";;")
```

This function call requests element number 2 from the string, using the delimiter ";;". The output is as follows:

```
red,black,tan
```

**Example B:** Consider the following code:

```
<cfset mystring = "four,"  
& #chr(32)# & #chr(9)# & #chr(10)#  
& ",five,nine,zero;"  
& #chr(10)#  
& "nine,ten:,eleven;;twelve;;thirteen,"  
& #chr(32)# & #chr(9)# & #chr(10)#  
& ",four">
```

```
<cfoutput>
  #mystring#<br><br>
</cfoutput>
```

The output is as follows:

```
four,
,five, nine,zero;;
nine,ten:., eleven::twelve::thirteen,
,four
```

The `GetToken` function recognizes explicit spaces, tabs, or newline characters as the parameter delimiters (To specify a space character, the code is `chr(32)`; a tab character, `chr(9)`; and a newline character, `chr(10)`.)

In the example string `mystring`, there is:

- A forced space between the substrings "four," and ",five"
- A literal space between "five," and "nine"
- A literal space between "ten:," and "eleven,"
- A forced space between "thirteen," and ",four"

In the following call against `mystring`, no spaces are specified in delimiters (it is omitted), so the function uses the space character as the string delimiter:

```
<br>
<cfoutput>
  GetToken(mystring, 3) is : #GetToken(mystring, 3)#
</cfoutput><br>
```

The output of this code is as follows:

```
GetToken(mystring, 3) is : nine,zero;;
```

The function finds the third delimiter, and returns the substring just before it that is between the second and third delimiter. This substring is "nine,zero;;".

**Example C:** Consider the following code:

```
<cfset mystring2 = "four,"
  &#chr(9)# & #chr(10)#
  & ",five,nine,zero:;"
  & #chr(10)#
  & "nine,ten:,eleven::twelve::thirteen,"
  & #chr(9)# & #chr(10)# & ",four">
<cfoutput>
  #mystring2#<br>
</cfoutput>
```

The output is as follows:

```
four,
,five,nine,zero;;
nine,ten:,eleven::twelve::thirteen,
,four
```

The following is a call against `mystring2`:

```
<cfoutput>
  GetToken(mystring2, 2) is : #GetToken(mystring2, 2)#
</cfoutput>
```

The output is as follows:

```
GetToken(mystring2, 2) is : ,five,nine,zero::;
```

The function finds the second delimiter, and returns the substring just before it that is between the first and second delimiter. This substring is `",five,nine,zero::"`.

### Example

```
<h3>GetToken Example</h3>
<cfif IsDefined("FORM.yourString")>
<!-- set delimiter -->
<cfif FORM.yourDelimiter is not "">
  <cfset yourDelimiter = FORM.yourDelimiter>
<cfelse>
  <cfset yourDelimiter = " ">
</cfif>
<!-- check whether number of elements in list is greater than or
equal to the element sought to return -->
<cfif ListLen(FORM.yourString, yourDelimiter) GTE FORM.returnElement>
  <cfoutput>
    <p>Element #FORM.ReturnElement# in #FORM.yourString#,
delimited by "#yourDelimiter#"
    <br>is:#GetToken(FORM.yourString, FORM.returnElement, yourDelimiter)#
  </cfoutput>
  ...
```

# Hash

## Description

Converts a variable-length string to a fixed-length string that can act as a “fingerprint” or unique identifier for the original string. It is not possible to convert the hash result back to the source string.

## Returns

A string.

## Category

[Conversion functions](#), [Security functions](#), [String functions](#)

## Function syntax

```
Hash(string[, algorithm[, encoding]] )
```

## History

ColdFusion MX 7: Added the *algorithm* and *encoding* parameters.

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | String to hash.  |
| algorithm | (Optional) The algorithm to use to hash the string. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• CFMX_COMPAT: Generates a hash string identical to that generated by ColdFusion MX and ColdFusion MX 6.1 (default).</li><li>• MD5: (Default) Generates a 32-character, hexadecimal string, using the MD5 algorithm (The algorithm used in ColdFusion MX and prior releases).</li><li>• SHA: Generates a 28-character string using the Secure Hash Standard SHA-1 algorithm specified by Nation Institute of Standards and Technology (NIST) FIPS-180-2.</li><li>• SHA-256: Generates a 44-character string using the SHA-256 algorithm specified by FIPS-180-2.</li><li>• SHA-384: Generates a 64-character string using the SHA-384 algorithm specified by FIPS-180-2.</li><li>• SHA-512: Generates an 88-character string using the SHA-1 algorithm specified by FIPS-180-2.</li></ul> If you install a security provider with additional cryptography algorithms, you can also specify any of its hashing algorithms. |
| encoding  | (Optional; to use this attribute you must also specify the <i>algorithm</i> parameter) A string specifying the encoding to use when converting the string to byte data used by the hash algorithm. Must be a character encoding name recognized by the Java runtime. The default value is the value specified by the defaultCharset entry in the neo-runtime.xml file, which is normally UTF-8. Ignored when using the CFMX_COMPAT algorithm.  |

## Usage

The result of this function is useful for comparison and validation. For example, you can store the hash of a password in a database without exposing the password. You can check the validity of the password by hashing the entered password and comparing the result with the hashed password in the database.

ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

The `encoding` attribute is normally not required. It provides a mechanism for generating identical hash values on systems with different default encodings. ColdFusion uses a default encoding of UTF-8 unless you modify the `defaultCharset` entry in the `neo-runtime.xml` file.

## Example

The following example lets you enter a password and compares the hashed password with a hash value saved in the `SecureData` table of the `cfdocexamples` database. This table has the following three entries:

| User ID | Password |
|---------|----------|
| 12      | abc      |
| 14      | def      |
| 15      | ghi      |

```
<h3>Hash Example</h3>
```

```
<!-- Do the following if the form is submitted. -->
```

```
<cfif IsDefined("Form.UserID")>
```

```
    <!-- query the data base. -->
```

```
    <cfquery name = "CheckPerson" datasource = "cfdocexamples">
```

```
        SELECT PasswordHash
```

```
        FROM SecureData
```

```
        WHERE UserID = <cfqueryparam value = "#Form.userID#"
```

```
            cfsqltype = "CF_SQL_CHARVAR">
```

```
    </cfquery>
```

```
    <!-- Compare query PasswordHash field and the hashed form password  
        and display the results. -->
```

```
    <cfoutput>
```

```
        <cfif Hash(Form.password, "SHA") is not checkperson.passwordHash>
```

```
            User ID #Form.userID# or password is not valid. Try again.
```

```
        <cfelse>
```

```
            Password is valid for User ID #Form.userID#.
```

```
        </cfif>
```

```
    </cfoutput>
```

```
</cfif>
```

```
<!-- Form for entering ID and password. -->  
<form action="#CGI.SCRIPT_NAME#" method="post">  
  <b>User ID: </b>  
  <input type = "text" name="UserID" ><br>  
  <b>Password: </b>  
  <input type = "text" name="password" ><br><br>  
  <input type = "Submit" value = "Encrypt my String">  
</form>
```

# Hour

## Description

Gets the current hour of the day.

## Returns

Ordinal value of the hour, in the range 0 - 23.

## Category

[Date and time functions](#)

## Function syntax

Hour(*date*)

## See also

[DatePart](#), [Minute](#), [Second](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD-9999 AD. |

## Usage

When passing a date/time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

## Example

```
<!-- This example shows the use of Hour, Minute, and Second -->  
<h3>Hour Example</h3>  
<cfoutput>  
The time is currently #TimeFormat(Now())#.  
We are in hour #Hour(Now())#, Minute #Minute(Now())#  
and Second #Second(Now())# of the day.  
</cfoutput>
```

# HTMLCodeFormat

## Description

Replaces special characters in a string with their HTML-escaped equivalents and inserts `<pre>` and `</pre>` tags at the beginning and end of the string.

## Returns

HTML-escaped string *string*, enclosed in `<pre>` and `</pre>` tags. Return characters are removed; line feed characters are preserved. Characters with special meanings in HTML are converted to HTML character entities such as `&gt;`.

## Category

[Display and formatting functions](#)

## Function syntax

```
HTMLCodeFormat(string [, version ])
```

## See also

[HTMLEditFormat](#)

## Parameters

| Parameter            | Description   |
|----------------------|---|
| <code>string</code>  | A string or a variable that contains one.   |
| <code>version</code> | HTML version to use; currently ignored. <ul style="list-style-type: none"><li>-1: The latest implementation of HTML</li><li>2.0: HTML 2.0 (Default)</li><li>3.2: HTML 3.2</li></ul> |

## Usage

This function converts the following characters to HTML character entities:

| Text character     | Encoding                |
|--------------------|-------------------------|
| <code>&lt;</code>  | <code>&amp;lt;</code>   |
| <code>&gt;</code>  | <code>&amp;gt;</code>   |
| <code>&amp;</code> | <code>&amp;amp;</code>  |
| <code>"</code>     | <code>&amp;quot;</code> |

This function typically increases the length of a string. This can cause unpredictable results when performing certain string functions (`Left`, `Right`, and `Mid`, for example) against the expanded string.

The only difference between this function and `HTMLEditFormat` is that `HTMLEditFormat` does not surround the text in an HTML `pre` tag.

## Example

```
<!-- This example shows the effects of HTMLCodeFormat and
      HTMLEditFormat. View it in your browser, then View it
      using your browser's the View Source command. -->
<cfset testString="This is a test
      & this is another
<This text is in angle brackets>

Previous line was blank!!!">

<cfoutput>
  <h3>The text without processing</h3>
  #testString#<br>
  <h3>Using HTMLCodeFormat</h3>
  #HTMLCodeFormat(testString)#
  <h3>Using HTMLEditFormat</h3>
  #HTMLEditFormat(testString)#
</cfoutput>
```

# HTMLEditFormat

## Description

Replaces special characters in a string with their HTML-escaped equivalents.

## Returns

HTML-escaped string *string*. Return characters are removed; line feed characters are preserved. Characters with special meanings in HTML are converted to HTML character entities such as `&gt;`;

## Category

[Display and formatting functions](#)

## Function syntax

```
HTMLEditFormat(string [, version ])
```

## See also

[HTMLCodeFormat](#), [cfapplication](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| string    | A string or a variable that contains one.   |
| version   | HTML version to use; currently ignored. <ul style="list-style-type: none"><li>• -1: The latest implementation of HTML</li><li>• 2.0: HTML 2.0 (Default)</li><li>• 3.2: HTML 3.2</li></ul> |

## Usage

This function converts the following characters to HTML character entities:

| Text character | Encoding |
|----------------|----------|
| <              | &lt;     |
| >              | &gt;     |
| &              | &amp;    |
| "              | &quot;   |

This function can be used to help protect ColdFusion pages that return user-provided data to the client browser from cross-site scripting attacks. However, the `scriptprotect` attribute of the `cfapplication` tag or the equivalent `This.scriptProtect` variable setting in `Application.cfc` can be preferable in most instances, because you only need to specify it once for an application.

This function typically increases the length of a string. This can cause unpredictable results when performing certain string functions (`Left`, `Right`, and `Mid`, for example) against the expanded string.

The only difference between this function and `HTMLCodeFormat` is that `HTMLCodeFormat` surrounds the text in an HTML `pre` tag.

### Example

```
<!-- This example shows the effects of HTMLCodeFormat and
      HTMLEditFormat. View it in your browser, then View it
      using your browser's the View Source command. -->
<cfset testString="This is a test
      & this is another
<This text is in angle brackets>

Previous line was blank!!!">

<cfoutput>
  <h3>The text without processing</h3>
  #testString#<br>
  <h3>Using HTMLCodeFormat</h3>
  #HTMLCodeFormat(testString)#
  <h3>Using HTMLEditFormat</h3>
  #HTMLEditFormat(testString)#
</cfoutput>
```

## IIf

### Description

Evaluates a Boolean conditional dynamic expression. Depending on whether the expression is true or false, dynamically evaluates one of two string expressions and returns the result. This function is convenient for incorporating a `cfif` tag in-line in HTML.

For general conditional processing, see [cfif](#). For error handling, see [cftry](#). For more information, see *ColdFusion MX Developer's Guide*.

### Returns

If result is True, returns the value of `Evaluate(string_expression1)`; otherwise, returns the value of `Evaluate(string_expression2)`.

### Category

[Decision functions](#), [Dynamic evaluation functions](#)

### Function syntax

```
IIf(condition, string_expression1, string_expression2)
```

### See also

[DE](#), [Evaluate](#)

### Parameters

| Parameter          | Description  |
|--------------------|--|
| condition          | An expression that can be evaluated as a Boolean.  |
| string_expression1 | A string or a variable that contains one. Expression to evaluate and return if condition is True.  |
| string_expression2 | A string or a variable that contains one. Expression to evaluate and return if condition is False. |

### Usage

The `IIf` function is a shortcut for the following construct:

```
<cfif condition>  
  <cfset result = Evaluate(string_expression1)>  
<cfelse>  
  <cfset result = Evaluate(string_expression2)>  
</cfif>
```

The expressions *string\_expression1* and *string\_expression2* must be string expressions, so that they are not evaluated immediately as the parameters of `IIf`. For example:

```
IIf(y is 0, DE("Error"), x/y)
```

If `y = 0`, this generates an error, because the third expression is the value of `x/0` (invalid expression).

ColdFusion evaluates *string\_expression1* and *string\_expression2*. To return the string itself, use the [DE](#) function.

**Note:** If you use number signs (#) in `string_expression1` or `string_expression2`, ColdFusion evaluates the part of the expression in number signs first. If you misuse the number signs, you can cause unexpected results from the `IIf` function. For example, if you use number signs around the whole expression in `string_expression1`, and if there is an undefined variable in `string_expression1`, the function might fail, with the error 'Error Resolving Parameter.'

If a variable is undefined, ColdFusion throws an error when it processes this function. The following example shows this problem:

```
#IIf(IsDefined("Form.Deliver"), DE(Form.Deliver), DE("no"))#
```

This returns "Error resolving parameter FORM.DELIVER".

To avoid this problem, use the `DE` and `Evaluate` functions in code such as the following:

```
#IIf(IsDefined("Form.Deliver"), Evaluate(DE("Form.Deliver")), DE("no"))#
```

This returns "no"; ColdFusion does not throw an error.

In the following example, `LocalVar` is undefined; however, if you omit number signs around `LocalVar`, the code works properly:

```
<cfoutput>
  #IIf(IsDefined("LocalVar"), "LocalVar",
      DE("The variable is not defined.))#
</cfoutput>
```

The output is:

```
    The variable is not defined.
```

The number signs around `LocalVar` in the following code cause it to fail with the error message 'Error Resolving Parameter', because ColdFusion never evaluates the original condition `IsDefined("LocalVar")`.

Here is another example:

```
<cfoutput>
#IIf(IsDefined("LocalVar"), DE("#LocalVar#"), DE("The variable is not
  defined.))#
</cfoutput>
```

The error message would be as follows:

```
    Error resolving parameter LOCALVAR
```

The `DE` function has no effect on the evaluation of `LocalVar`, because the number signs cause it to be evaluated immediately.

### Example

```
<h3>IIf Function Example</h3>
<p>IIf evaluates a condition, and does an Evaluate on string
  expression 1 or string expression 2 depending on the Boolean
  outcome <I>(True: run expression 1; False: run expression 2)</I>.</p>
<p>The result of the expression
IIf( Hour(Now()) GTE 12,
    DE("It is afternoon or evening"),
    DE("It is morning"))
is:<br><b>
```

```
<cfoutput>
  #IIf( Hour(Now()) GTE 12,
    DE("It is afternoon or evening"),
    DE("It is morning"))#
</cfoutput>
</b>
```

# IncrementValue

## Description

Adds one to an integer.

## Returns

The integer part of *number*, incremented by one.

## Category

[Mathematical functions](#)

## Function syntax

`IncrementValue(number)`

## See also

[DecrementValue](#)

## Parameters

| Parameter | Description         |
|-----------|---------------------|
| number    | Number to increment |

## Example

```
<h3>IncrementValue Example</h3>
<p>Returns the integer part of a number incremented by one.
<p>IncrementValue(0): <cfoutput>#IncrementValue(0)#</cfoutput>
<p>IncrementValue("1"): <cfoutput>#IncrementValue("1")#</cfoutput>
<p>IncrementValue(123.35): <cfoutput>#IncrementValue(123.35)#</cfoutput>
```

# InputBaseN

## Description

Converts *string*, using the base specified by *radix*, to an integer.

## Returns

A number in the range 2-36, as a string.

## Category

[Mathematical functions](#)

## Function syntax

`InputBaseN(string, radix)`

## See also

[FormatBaseN](#)

## Parameters

| Parameter           | Description  |
|---------------------|--|
| <code>string</code> | A string or a variable that contains one. String that represents a number, in the base specified by <code>radix</code> . |
| <code>radix</code>  | Base of the number represented by <code>string</code> , in the range 2–36.   |

## Example

```
<h3>InputBaseN Example</h3>
```

```
<p>FormatBaseN converts a number to a string in the base specified by Radix.
```

```
<p>
```

```
<cfoutput>
```

```
<br>FormatBaseN(10,2): #FormatBaseN(10,2)#
```

```
<br>FormatBaseN(1024,16): #FormatBaseN(1024,16)#
```

```
<br>FormatBaseN(125,10): #FormatBaseN(125,10)#
```

```
<br>FormatBaseN(10.75,2): #FormatBaseN(10.75,2)#
```

```
</cfoutput>
```

```
<h3>InputBaseN Example</h3>
```

```
<p>InputBaseN returns the number obtained by converting a string,
```

```
using the base specified by Radix..
```

```
<cfoutput>
```

```
<br>InputBaseN("1010",2): #InputBaseN("1010",2)#
```

```
<br>InputBaseN("3ff",16): #InputBaseN("3ff",16)#
```

```
<br>InputBaseN("125",10): #InputBaseN("125",10)#
```

```
<br>InputBaseN(1010,2): #InputBaseN(1010,2)#
```

```
</cfoutput>
```

# Insert

## Description

Inserts a substring in a string after a specified character position. If `position = 0`, prefixes the substring to the string.

## Returns

A string.

## Category

[String functions](#)

## Function syntax

```
Insert(substring, string, position)
```

## See also

[RemoveChars](#), [Len](#)

## Parameters

| Parameter              | Description  |
|------------------------|--|
| <code>substring</code> | A string or a variable that contains one. String to insert.                                    |
| <code>string</code>    | A string or a variable that contains one. String into which to insert <code>substring</code> . |
| <code>position</code>  | Integer or variable; position in string after which to insert <code>substring</code> .         |

## Example

```
<h3>Insert Example</h3>

<cfif IsDefined("FORM.myString")>
  <!-- if the position is longer than the length of the string, err -->
  <cfif FORM.insertPosition GT Len(MyString)>
    <cfoutput>
      <p>This string only has #Len(MyString)# characters; therefore,
      you cannot insert the substring #FORM.mySubString# at position
      #FORM.insertPosition#.
    </cfoutput>
  </cfif>
<cfelse>
  <cfoutput>
    <p>You inserted the substring #FORM.MySubString# into the string
    #FORM.MyString#, resulting in the following string:
    <br>#Insert(FORM.MySubString, FORM.myString,
    FORM.insertPosition)#
  </cfoutput>
</cfif>
```

# Int

## Description

Calculates the closest integer that is smaller than *number*. For example, it returns 3 for `Int(3.3)` and for `Int(3.7)`; it returns -4 for `Int(-3.3)` and for `Int(-3.7)`.

## Returns

An integer, as a string.

## Category

[Mathematical functions](#)

## Function syntax

`Int(number)`

## See also

[Ceiling](#), [Fix](#), [Round](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| number    | Real number to round down to an integer. |

## Example

```
<h3>Int Example</h3>
```

```
<p>Int returns the closest integer smaller than a number.
```

```
<p>Int(11.7) : <cfoutput>#Int(11.7)#</cfoutput>
```

```
<p>Int(-11.7) : <cfoutput>#Int(-11.7)#</cfoutput>
```

```
<p>Int(0) : <cfoutput>#Int(0)#</cfoutput>
```

# isArray

## Description

Determines whether a value is an array.

## Returns

True, if *value* is an array, or a query column object.

## Category

[Array functions](#), [Decision functions](#)

## Function syntax

```
isArray(value [, number ])
```

## See also

[Array functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed behavior: if the *value* parameter contains a reference to a query result column, this function now returns True. For example: `isArray(MyQuery['Column1'])` returns True. (In earlier releases, it returns False.)
- Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description  |
|-----------|--|
| value     | Variable or array name   |
| number    | Dimension; function tests whether the array has exactly this dimension |

## Usage

Use this function to determine whether a value is an array or query column. This function evaluates a Java array object, such as a vector object, as having one dimension.

## Example

```
<h3>isArray Example</h3>

<!-- Make an array -->
<cfset MyNewArray = ArrayNew(1)>
<!-- set some elements -->
<cfset MyNewArray[1] = "element one">
<cfset MyNewArray[2] = "element two">
<cfset MyNewArray[3] = "element three">
<!-- is it an array? -->
<cfoutput>
  <p>Is this an array? #isArray(MyNewArray)#
  <p>It has #ArrayLen(MyNewArray)# elements.
  <p>Contents: #ArrayToList(MyNewArray)#
</cfoutput>
```

# IsAuthenticated

## Description

This function is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*.

## History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

# IsAuthorized

## Description

This function is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later releases.

# IsBinary

## Description

Determines whether a value is stored as binary data.

## Returns

True, if the value is binary; False, otherwise.

## Category

[Decision functions](#)

## Function syntax

IsBinary(*value*)

## See also

[ToBinary](#), [ToBase64](#), [IsNumeric](#), [YesNoFormat](#)

## Parameters

| Parameter | Description      |
|-----------|------------------|
| value     | Number or string |

## Example

```
<!-- Create a string of all ASCII characters (32-255)
      and concatenate them together. -->
<cfset charData="">
<cfloop index="data" from="32" to="255">
  <cfset ch=chr(data)>
  <cfset charData=charData & ch>
</cfloop>

<b>The following string is the concatenation of all characters (32 to 255) from
the ASCII table.</b><br><br>
<cfoutput>#htmleditformat(charData)#</cfoutput>
<br><br>
<!-- Create a Base 64 representation of this string. -->
<cfset data64=toBase64(charData)>
<!-- Convert string to binary. -->
<cfset binaryData=toBinary(data64)>
<!-- Check to see if it really is a binary value. -->
<cfif IsBinary(binaryData)>
  The binaryData variable is binary!<br>
</cfif>
<!-- Convert binary data back to Base 64. -->
<cfset another64=toBase64(binaryData)>
<cfif Not IsBinary(another64)>
  The another64 variable is NOT binary!<br>
</cfif>
<!-- Compare another64 with data64 to ensure that they are equal. -->
<cfif another64 eq data64>
  Base 64 representation of binary data is identical to the Base 64
  representation of string data.
```

```
<cfelse>  
  <h3>Conversion error.</h3>  
</cfif>
```

# IsBoolean

## Description

Determines whether a value can be converted to Boolean

## Returns

True, if the parameter can be converted to Boolean; False, otherwise.

## Category

[Decision functions](#)

## Function syntax

```
IsBoolean(value)
```

## See also

[IsNumeric](#), [IsValid](#), [YesNoFormat](#)

## Parameters

| Parameter | Description      |
|-----------|------------------|
| value     | Number or string |

## Example

```
<h3>IsBoolean Example</h3>

<cfif IsDefined("FORM.theTestValue")>
  <cfif IsBoolean(FORM.theTestValue)>
    <h3>The expression <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is
    Boolean</h3>
  <cfelse>
    <h3>The expression <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is not
    Boolean</h3>
  </cfif>
</cfif>

<form action = "isBoolean.cfm">
<p>Enter an expression, and discover whether it can be evaluated to a
  Boolean value.

<input type = "Text" name = "TheTestValue" value = "1">
<input type = "Submit" value = "Is it Boolean?" name = "">
</form>
```

# IsCustomFunction

## Description

Determines whether a name represents a custom function.

## Returns

True, if *name* can be called as a custom function; False, otherwise.

## Category

[Decision functions](#)

## Function syntax

```
IsCustomFunction(name)
```

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | Name of a custom function. Must not be in quotation marks. If not a defined variable or function name, ColdFusion generates an error. |

## Usage

The `IsCustomFunction` function returns `True` for any function that can be called as a custom function, including functions defined using `CFScript` function declarations and `cffunction` tags, and functions that are ColdFusion component methods. For CFC methods, you must first instantiate the component.

**Note:** To prevent undefined variable exceptions, always precede `IsCustomFunction` with an `IsDefined` test, as shown in the example.

## Example

```
<h3>IsCustomFunction Example</h3>
<cfscript>
function realUDF() {
    return 1;
}
</cfscript>
<cfset X = 1>

<!-- Example that fails existence test -->
<cfif IsDefined("Foo") AND IsCustomFunction(Foo)>
    Foo is a UDF.<br>
</cfif>

<!-- Example that passes existence test but fails IsCustomFunction -->
<cfif IsDefined("X") AND IsCustomFunction(X)>
    X is a UDF.<br>
</cfif>

<!-- Example that passes both tests-->
<cfif IsDefined("realUDF") AND IsCustomFunction(realUDF)>
    realUDF is a function.<br>
</cfif>
```

```
<!--- Example using a CFC, defined in TestCFC.cfc-->  
<cfobject component="TestCFC" name="myTestCFCobject">  
<CFIF IsDefined("myTestCFCobject.testFunc") AND  
    IsCustomFunction(myTestCFCobject.testFunc)>  
    myTestCFCobject.testFunc is a function.  
</CFIF>
```

# IsDate

## Description

Determines whether a string or Java object can be converted to a date/time value.

## Returns

True, if *string* can be converted to a date/time value; False, otherwise. ColdFusion converts the Boolean return value to its string equivalent, "Yes" or "No."

## Category

[Date and time functions](#), [Decision functions](#)

## Function syntax

```
IsDate(string)
```

## See also

[CreateDateTime](#), [IsNumericDate](#), [IsValid](#), [LSDateFormat](#), [LSIsDate](#), [ParseDateTime](#)

## Parameters

| Parameter | Description                               |
|-----------|---|
| string    | A string or a variable that contains one. |

## Usage

This function checks against U.S. date formats only. For other date support, see [LSDateFormat](#).

A date/time object falls in the range 100 AD–9999 AD.

## Example

```
<h3>IsDate Example</h3>
<cfif IsDefined("FORM.theTestValue")>
  <cfif IsDate(FORM.theTestValue)>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput>
    is a valid date</h3>
  <cfelse>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput>
    is not a valid date</h3>
  </cfif>
</cfif>
<form action = "isDate.cfm">
<p>Enter a string, find whether it can be evaluated to a date value.
<p><input type = "Text" name = "TheTestValue" value = "<cfoutput>#Now()#
  </cfoutput>">
<input type = "Submit" value = "Is it a Date?" name = "">
</form>
```

# IsDebugMode

## Description

Determines whether debugging output is enabled.

## Returns

True, if debugging mode is set in the ColdFusion Administrator; False if debugging mode is disabled.

## Category

[Decision functions](#)

## Function syntax

```
IsDebugMode()
```

## See also

[cfsetting](#)

## Description

If debugging output is enabled in ColdFusion Administrator and has not been overridden by setting the `cfsetting` tag `showDebugOutput` attribute to `No`, the `IsDebugMode` function returns `Yes`; `No`, otherwise.

## Example

```
<h3>IsDebugMode Example</h3>
<cfif IsDebugMode()>
  <h3>Debugging is set in the ColdFusion Administrator</h3>
<cfelse>
  <h3>Debugging is disabled</h3>
</cfif>
```

# IsDefined

## Description

Evaluates a string value to determine whether the variable named in it exists.

This function is an alternative to the [ParameterExists](#) function, which is deprecated.

## Returns

True, if the variable is found, or, for a structure, if the specified key is defined; False, otherwise.

The return value is False for an array or structure element referenced using bracket notation. For example, `IsDefined("myArray[3]")` always returns False, even if the array element *myArray[3]* has a value.

## Category

[Decision functions](#)

## Function syntax

```
IsDefined("variable_name")
```

## See also

[Evaluate](#)

## History

ColdFusion MX: Changed behavior: this function can process only the following constructs:

- A simple variable
- A named variable with dot notation
- A named structure with dot notation (for example: `mystruct.key`)

## Parameters

| Parameter                  | Description  |
|----------------------------|--|
| <code>variable_name</code> | String, enclosed in quotation marks. Name of variable to test for. |

## Usage

When working with scopes that ColdFusion exposes as structures, the `StructKeyExists` function can sometimes replace this function. The following lines are equivalent:

```
if(isDefined("form.myVariable"))
if(structKeyExists(form,"myVariable"))
```

## Example

```
<cfif IsDefined("form.myString")>
  <p>The variable form.myString has been defined, so show its contents.
  This construction allows us to place a form and its resulting action code
  on the same page and use IsDefined to control the flow of execution.</p>
  <p>The value of "form.myString" is <b><i>
  <cfoutput>#form.myString#</cfoutput></i></b>
<cfelse>
```

```
<p>During the first time through this template, the variable "form.myString"  
has not yet been defined, so we do not try to evaluate it.  
</cfif>  
  
<form action="#CGI.Script_Name" method="POST">  
<input type="Text" name="MyString" value="My sample value">  
<input type="Submit" name="">  
</form>
```

# IsK2ServerABroker

## Description

This function is deprecated.

## Returns

True, if K2Broker is in configured with ColdFusion; False, otherwise.

## Category

[Decision functions](#), [Full-text search functions](#), [Query functions](#)

## Function syntax

```
IsK2ServerABroker()
```

## See also

[GetK2ServerDocCountLimit](#), [IsK2ServerDocCountExceeded](#), [IsK2ServerOnline](#)

## History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

## Example

```
<cfoutput>IsK2ServerABroker =  
  $#IsK2ServerABroker()*$</cfoutput>
```

# IsK2ServerDocCountExceeded

## Description

This function is deprecated.

## Returns

True, if the document count limit is exceeded; False, otherwise.

## Category

[Decision functions](#), [Full-text search functions](#), [Query functions](#)

## Function syntax

```
IsK2ServerDocCountExceeded()
```

## See also

[GetK2ServerDocCountLimit](#), [IsK2ServerABroker](#)

## History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion 5: Added this function.

## Example

```
<cfoutput>IsK2ServerDocCountExceeded =  
  $*#IsK2ServerDocCountExceeded()*$</cfoutput>
```

# IsK2ServerOnline

## Description

This function is deprecated because the K2Server is always running when ColdFusion is running.

## Returns

True, if the K2Server is available to perform a search; False, otherwise.

## Category

[Decision functions](#), [Full-text search functions](#), [Query functions](#)

## Function syntax

```
IsK2ServerOnline()
```

## See also

[IsK2ServerABroker](#)

## History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

## Example

```
<cfoutput>IsK2ServerOnline =  
  $#IsK2ServerOnline()#*$</cfoutput>
```

# IsLeapYear

## Description

Determines whether a year is a leap year.

## Returns

True, if *year* is a leap year; False, otherwise.

## Category

[Date and time functions](#), [Decision functions](#)

## Function syntax

IsLeapYear(*year*)

## See also

[DaysInYear](#)

## Parameters

---

| Parameter | Description                |
|-----------|----------------------------|
| year      | Number representing a year |

---

## Example

```
<h3>IsLeapYear Example</h3>

<cfif IsDefined("FORM.theTestValue")>
  <cfif IsLeapYear(FORM.theTestValue)>
    <h3>The year value <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is a Leap
    Year</h3>
  <cfelse>
    <h3>The year value <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is not a
    Leap Year</h3>
  </cfif>
</cfif>

<form action = "isLeapYear.cfm">
<p>Enter a year value, and find out whether it is a Leap Year.
<p><input type = "Text" name = "TheTestValue" value = "
  <cfoutput>#Year(Now())#</cfoutput>">
<input type = "Submit" value = "Is it a Leap Year?" name = "">
</form>
```

# IsNumeric

## Description

Determines whether a string can be converted to a numeric value. Supports numbers in U.S. number format. For other number support, use [LSIsNumeric](#).

## Returns

True, if *string* can be converted to a number; False, otherwise.

## Category

[Decision functions](#)

## Function syntax

IsNumeric(*string*)

See also

[IsBinary](#), [IsValid](#)

## Parameters

| Parameter | Description                               |
|-----------|---|
| string    | A string or a variable that contains one. |

## Example

```
<h3>IsNumeric Example</h3>
<cfif IsDefined("FORM.theTestValue")>
  <cfif IsNumeric(FORM.theTestValue)>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput> can be
    converted to a number</h3>
  <cfelse>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput> cannot be
    converted to a number</h3>
  </cfif>
</cfif>

<form action = "isNumeric.cfm">
<p>Enter a string, and find out whether it can be evaluated to a numeric value.

<p><input type = "Text" name = "TheTestValue" value = "123">
<input type = "Submit" value = "Is it a Number?" name = "">
</form>
```

# IsNumericDate

## Description

Evaluates whether a real number is a valid representation of a date (date/time object).

## Returns

True, if the parameter represents a valid date/time object; False, otherwise.

## Category

[Date and time functions](#), [Decision functions](#)

## Function syntax

```
IsNumericDate(number)
```

## See also

[IsDate](#), [ParseDateTime](#)

## Parameters

| Parameter | Description   |
|-----------|---------------|
| number    | A real number |

## Usage

ColdFusion, by default, evaluates any input parameter and attempts to convert it to a real number before it passes the parameter to the `IsNumericDate` function. As a result, parameter values such as 12/12/03 and `{ts '2003-01-14 10:04:13'}` return `True`, because ColdFusion converts valid date string formats to date/time objects, which are real numbers.

## Example

```
<h3>IsNumericDate Example</h3>
<cfif IsDefined("form.theTestValue")>
<!-- test if the value represents a number or a pre-formatted Date value -->

  <cfif IsNumeric(form.theTestValue) or IsDate(form.theTestValue)>
<!-- if this value is a numericDate value, then pass -->
    <cfif IsNumericDate(form.theTestValue)>
      <h3>The string <cfoutput>#DE(form.theTestValue)#</cfoutput> can be
converted to a valid numeric date</h3>
    <cfelse>
      <h3>The string <cfoutput>#DE(form.theTestValue)#</cfoutput> can not be
converted to a valid numeric date</h3>
    </cfif>
  <cfelse>
    <h3>The string <cfoutput>#DE(form.theTestValue)#</cfoutput> is not a valid
numeric date</h3>
  </cfif>

</cfif>

<form action="#cgi.script_name#" method="POST">
<p>Enter a value, and discover if it can be evaluated to a date value.
```

```
<p>  
<input type="Text" name="TheTestValue" value="<CFOUTPUT>#Now()#</CFOUTPUT>">  
<input type="Submit" value="Is it a Date?" name="">  
</form>
```

# IsObject

## Description

Determines whether a value is an object.

## Returns

True, if the value represents a ColdFusion object. False if the value is any other type of data, such as an integer, string, date, or struct.

## Category

[Decision functions](#)

## Function syntax

```
IsObject(value)
```

## See also

[IsDate](#), [IsNumeric](#), [IsNumericDate](#), [IsQuery](#), [IsSimpleValue](#), [IsStruct](#), [IsWDDX](#), [IsXmlDoc](#), [IsXmlElement](#), [IsXmlRoot](#)

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter | Description                                |
|-----------|--|
| value     | A value, typically the name of a variable. |

## Usage

This function returns False for query and XML objects.

## Example

```
<!-- to use this example, create a color.cfc component as follows: -->
<!--
<cfcomponent>
    <cffunction name="myFunction" access="public" returntype="string">
        <!-- Create a structure object -->
        <cfset myColor = "Blue">
        <cfreturn myColor>
    </cffunction>
</cfcomponent>
-->

<!-- Create an instance of the color.cfc component -->
<cfobject name="getColor" component="color">

<cfif IsObject(getColor)>
    <!-- Invoke the myFunction method -->
    <cfinvoke
        component="#getColor#"
        method="myFunction"
```

```
    returnVariable="myColor">
</cfinvoke>

<cfif IsDefined("myColor")>
  <!-- Output the returned variable -->
  The value of myColor = <cfoutput>#myColor#</cfoutput><p>
</cfif>
</cfif>
```

# IsProtected

## Description

This function is obsolete. Use the newer security tools; see [“Conversion functions” on page 453](#) and Chapter 16, “Securing Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later releases.

# IsQuery

## Description

Determines whether *value* is a query.

## Returns

True, if *value* is a query.

## Category

[Decision functions](#), [Query functions](#)

## Function syntax

IsQuery(*value*)

## See also

[QueryAddRow](#)

## Parameters

---

| Parameter | Description    |
|-----------|----------------|
| value     | Query variable |

---

## Example

```
<!-- Shows an example of IsQuery and IsSimpleValue -->
<h3>IsQuery Example</h3>
<!-- define a variable called "GetEmployees" -->
<CFPARAM name = "GetEmployees" DEFAULT = "#Now()#">

<p>Before the query is run, the value of GetEmployees is
  <cfoutput>#GetEmployees#</cfoutput>

<cfif IsSimpleValue(GetEmployees)>
  <p>GetEmployees is currently a simple value
</cfif>
<!-- make a query on the snippets datasource -->
<cfquery name = "GetEmployees" datasource = "cfdoexamples">
SELECT *
FROM employees
</cfquery>

<p>After the query is run, GetEmployees contains a number of rows
  that look like this (display limited to three rows):
<cfoutput QUERY = "GetEmployees" MaxRows = "3">
<pre>#Emp_ID# #FirstName# #LastName#</pre>
</cfoutput>
<cfif IsQuery(GetEmployees)>
  GetEmployees is no longer a simple value, but the name of a query
</cfif>
```

# IsSimpleValue

## Description

Determines the type of a value.

## Returns

True, if value is a string, number, Boolean, or date/time value; False, otherwise.

## Category

[Decision functions](#)

## Function syntax

```
IsSimpleValue(value)
```

## See also

[IsValid](#)

## Parameters

| Parameter | Description            |
|-----------|------------------------|
| value     | Variable or expression |

## Example

```
<!-- Shows an example of IsQuery and IsSimpleValue -->
<h3>IsSimpleValue Example</h3>
<!-- define a variable called "GetEmployees" -->
<cfparam name = "GetEmployees" default = "#Now()#">

<p>Before the query is run, the value of GetEmployees is
  <cfoutput>#GetEmployees#</cfoutput>

<cfif IsSimpleValue(GetEmployees)>
  <p>GetEmployees is currently a simple value
</cfif>
<!-- make a query on the snippets datasource -->
<cfquery name = "GetEmployees" datasource = "cfdoexamples">
SELECT *
FROM employees
</cfquery>
<p>After the query is run, GetEmployees contains a number of rows
  that look like this (display limited to three rows):
<cfoutput QUERY = "GetEmployees" MaxRows = "3">
<pre>#Emp_ID# #FirstName# #LastName#</pre>
</cfoutput>

<cfif IsQuery(GetEmployees)>
  GetEmployees is no longer a simple value, but the name of a query
</cfif>
```

# IsSOAPRequest

## Description

Determines whether a CFC is being called as a web service.

## Returns

True if CFC is being called as a web service; False, otherwise.

## Category

[XML functions](#)

## History

ColdFusion MX 7: Added this function.

## Function syntax

```
IsSOAPRequest()
```

## See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#); “Basic web service concepts” in Chapter 36, “Using Web Services,” in *ColdFusion MX Developer’s Guide*.

## Usage

Call this function within a CFC to determine if it is running as a web service.

## Example

This example creates a CFC web service that illustrates the operation of the `IsSOAPRequest` function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as `headerservice.cfc` in a folder called `soapheaders` under your web root. Test its operation, and specifically the operation of the `IsSOAPRequest` function, by executing the examples that invoke this web service. For example, see the example for [AddSOAPRequestHeader](#).

```
<h3>IsSOAPRequest Example</h3>
<cfcomponent displayName="tester" hint="Test for SOAP headers">

    <cffunction name="echo_me"
        access="remote"
        output="false"
        returnType="string"
        displayName="Echo Test" hint="Header test">

        <cfargument name="in_here" required="true" type="string">

    <cfset isSOAP = isSOAPRequest()>
    <cfif isSOAP>

        <!--- Get the first header as a string and as XML --->
        <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
```

```

<cfset return = "The service saw username: " & username>
<cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username",
"TRUE")>
<cfset return = return & "<br> as XML: " & xmlusername>

<!--- Get the second header as a string and as XML --->
<cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
<cfset return = return & "The service saw password: " & password>
<cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password",
"TRUE")>
<cfset return = return & "<br> as XML: " & xmlpassword>

<!--- Add a header as a string --->
<cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader",
"AUTHORIZED VALUE", false)>

<!--- Add a second header using a CFML XML value --->
<cfset doc = XmlNew()>
<cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
<cfset x.XmlText = "hey man, here I am in XML">
<cfset x.XmlAttributes["xsi:type"] = "xsd:string">
<cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>

<cfelse>
<!--- Add a header as a string - Must generate error!
<cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader",
"AUTHORIZED VALUE", false)>
--->
<cfset return = "Not invoked as a web service">
</cfif>

<cfreturn return>

</cffunction>

</cfcomponent>

```

# IsStruct

## Description

Determines whether a variable is a structure.

## Returns

True, if *variable* is a ColdFusion structure or is a Java object that implements the java.lang.Map interface. The return value is False if the object in *variable* is a user-defined function (UDF).

## Category

[Decision functions](#), [Structure functions](#)

## Function syntax

```
IsStruct(variable)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description   |
|-----------|---------------|
| variable  | Variable name |

## Example

```
<!-- This view-only example shows the use of IsStruct. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew,
  StructClear, and StructDelete. It is an example of a custom tag used to
  add employees. Employee information is passed through the employee
  structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.
<!--
<cfswitch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif IsStruct(attributes.EMPINFO)>
      <cfoutput>Error. Invalid data.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelse>
      <cfquery name = "AddEmployee" datasource = "cfdocexamples">
        INSERT INTO Employees
        (FirstName, LastName, Email, Phone, Department)
        VALUES
      <cfoutput>
      (
        '#StructFind(attributes.EMPINFO, "firstname")#' ,
        '#StructFind(attributes.EMPINFO, "lastname")#' ,
        '#StructFind(attributes.EMPINFO, "email")#' ,
        '#StructFind(attributes.EMPINFO, "phone")#' ,
        '#StructFind(attributes.EMPINFO, "department")#'
      )
    </cfoutput>
    </cfquery>
  </cfcase>
</cfswitch>
```

```
)  
</cfoutput>  
</cfquery>  
</cfif>  
<cfoutput><hr>Employee Add Complete</cfoutput>  
</cfcase>  
</cfswitch> --->
```

# IsUserInRole

## Description

Determines whether an authenticated user belongs to the specified Role.

## Returns

True, if the authenticated user, belongs to the specified Role; False, otherwise.

## Category

[Security functions](#), [Decision functions](#)

## Function syntax

```
IsUserInRole("role_name")
```

## See also

[GetAuthUser](#), [cflogin](#), [cfloginuser](#); Chapter 16, “Securing Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter | Description             |
|-----------|-------------------------|
| role_name | Name of a security role |

## Usage

Role names are case-sensitive.

To check if a user is in multiple roles, specify them in a comma-delimited list, such as "Admin,HR". Lists with multiple roles cannot contain spaces as separators; for example, do not use "Admin, HR".

## Example

```
<cfif IsUserInRole("Admin") >  
  <cfoutput>Authenticated user is an administrator</cfoutput>  
<cfelse IsUserInRole("User") >  
  <cfoutput>Authenticated user is a user</cfoutput>  
</cfif>
```

# IsValid

## Description

Tests whether a value meets a validation or data type rule.

## Returns

True, if the value conforms to the rule; False, otherwise.

## Category

[Decision functions](#)

## Function syntax

```
IsValid(type, value)  
isValid("range", value, min, max)  
isValid("regex" or "regular_expression", value, pattern)
```

## See also

[cfparam](#), [cform](#), [IsBoolean](#), [IsDate](#), [IsNumeric](#), [IsSimpleValue](#); “Validating data with the IsValid function and the cfparam tag” in Chapter 28, “Validating Data,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description   |
|-----------|---|
| type      | <p>The valid format for the data; one of the following. For detailed information on validation algorithms, see “Validating form data using hidden fields” in Chapter 28, “Validating Data,” in <i>ColdFusion MX Developer’s Guide</i>.</p> <ul style="list-style-type: none"><li>• any: any simple value. Returns false for complex values, such as query objects;; equivalent to the <code>IsSimpleValue</code> function.</li><li>• array: an ColdFusion array; equivalent to the <code>IsArray</code> function.</li><li>• binary: a binary value;; equivalent to the <code>IsBinary</code> function.</li><li>• boolean: a Boolean value: yes, no, true, false, or a number; equivalent to the <code>IsBoolean</code> function.</li><li>• creditcard: a 13-16 digit number conforming to the mod10 algorithm.</li><li>• date or time: any date-time value, including dates or times;; equivalent to the <code>IsDate</code> function..</li><li>• email: a valid email address.</li><li>• eurodate: any date-time value, including US date formats and time values,</li><li>• float or numeric: a numeric value; equivalent to the <code>IsNumeric</code> function.</li><li>• guid: a Universally Unique Identifier of the form "XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX" where 'x' is a hexadecimal number.</li><li>• integer: an integer.</li><li>• query: a query object; equivalent to the <code>IsQuery</code> function.</li><li>• range: a numeric range, specified by the <code>min</code> and <code>max</code> attributes.</li><li>• regex or regular_expression: matches input against <code>pattern</code> attribute.</li><li>• ssn or social_security_number: A U.S. social security number.</li><li>• string: a string value, including single characters and numbers</li><li>• struct: a structure; equivalent to the <code>IsStruct</code> function.</li><li>• telephone: a standard US telephone number.</li><li>• URL: an http, https, ftp, file, mailto, or news URL,</li><li>• UUID: a ColdFusion Universally Unique Identifier, formatted 'XXXXXXXX-XXXX-XXXX-XXXXXXXXXXXXXXXX', where 'x' is a hexadecimal number. See <a href="#">CreateUUID</a>.</li><li>• USdate: a U.S. date of the format mm/dd/yy, with 1-2 digit days and months, 1-4 digit years.</li><li>• variableName: a string formatted according to ColdFusion variable naming conventions.</li><li>• zipcode: U.S., 5- or 9-digit format ZIP codes.</li><li>•</li></ul> |
| value     | The value to test   |
| min       | The minimum valid value; used only for <code>range</code> validation  |
| max       | The maximum valid value; used only for <code>range</code> validation  |
| pattern   | A JavaScript regular expression that the parameter must match; used only for <code>regex</code> or <code>regular_expression</code> validation.  |

## Usage

The `IsValid` function lets you assure that validation is performed on the server. You can use the `cfparam` tag to perform equivalent validation.

## Example

The following example checks whether a user has submitted a numeric ID and a valid email address and phone number. If any of the submitted values does not meet the validation test, it displays an error message.

```
<cfif isDefined("form.saveSubmit")>
  <cfif isValid("integer", form.UserID) and isValid("email", form.emailAddr)
    and isValid("telephone", form.phoneNo)>
    <cfoutput>
      <!-- Application code to update the database goes here -->
      <h3>The email address and phone number for user #Form.UserID#
        have been added</h3>
    </cfoutput>
  <cfelse>
    <H3>You must supply a valid User ID, phone number, and email address.</H2>
  </cfif>
</cfif>

<cfform action="#CGI.SCRIPT_NAME#">
  User ID:<cfinput type="Text" name="UserID"><br>
  Phone: <cfinput type="Text" name="phoneNo"><br>
  email: <cfinput type="Text" name="emailAddr"><br>
  <cfinput type="submit" name="saveSubmit" value="Save Data"><br>
</cfform>
```

# IsWDDX

## Description

Determines whether a value is a well-formed WDDX packet.

## Returns

True, if the value is a well-formed WDDX packet; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Syntax

```
IsWDDX(value)
```

## See also

“Using WDDX” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: if the `value` parameter is not a WDDX packet, ColdFusion returns False. (In earlier releases, ColdFusion threw an error.)

## Parameters

| Parameter          | Description   |
|--------------------|---------------|
| <code>value</code> | A WDDX packet |

## Usage

This function processes a WDDX packet with a validating XML parser, which uses the WDDX Document Type Definition (DTD).

To prevent CFWDDX deserialization errors, you can use this function to validate WDDX packets from unknown sources.

## Example

```
<cfset packet="
  <wddxPacket version='1.0'>
  <header></header>
  <data>
    <struct>
      <var name='ARRAY'>
        <array length='3'>
          <string>one</string>
          <string>two</string>
        </array>
      </var>
      <var name='NUMBER'>
        <string>5</string>
      </var>
      <var name='STRING'>
        <string>hello</string>
      </var>
    </struct>
  </data>
</wddxPacket>
```

```
        </struct>
    </data>
    </wddxPacket>"
  >
<hr>
<xmp>
<cfoutput>#packet#
</xmp>
IsWDDX() returns #IsWDDX(packet)#<br>
</cfoutput>
```

# IsXML

## Description

Determines whether a string is well-formed XML text.

## Returns

True, if the function parameter is a string that contains well-formed XML text; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Function syntax

```
IsXML(value)
```

## See also

[IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElement](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlParse](#), [XmlValidate](#);  
Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description                               |
|-----------|---|
| value     | A string containing the XML document text |

## Usage

This function determines whether text is well-formed XML, that is, it conforms to all XML syntax and structuring rules. The string does not have to be a complete XML document. The function does not validate against a Document Type Definition (DTD) or XML Schema.

## Example

The following example creates two strings, and tests whether they are well-formed XML text:

```
<!-- A well formed XML string -->
<cfset xmlString1='<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>'
>

<!-- An invalid XML string, missing the </item> close tag -->
<cfset xmlString2='<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
```

```
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </items>
  </order>'
>
```

```
<!-- Test the strings to see if they are well formed XML -->
<cfoutput>
xmlString1 contains the following text:<br><br>
#HTMLCodeFormat(xmlString1)#
Is it well formed XML text? #IsXML(xmlString1)#<br><br>
<hr>
xmlString2 contains the following text:<br><br>
#HTMLCodeFormat(xmlString2)#
Is it well formed XML text? #IsXML(xmlString2)#
</cfoutput>
```

# IsXmlAttribute

## Description

Determines whether the function parameter is an XML Document Object Model (DOM) attribute node.

## Returns

True, if the function argument is an XML attribute node; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Function syntax

```
IsXmlAttribute(value)
```

## See also

[IsXML](#), [IsXmlDoc](#), [IsXmlElement](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlGetType](#), [XmlValidate](#), Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description              |
|-----------|--------------------------|
| value     | Name of an XML attribute |

## Usage

This function determines whether the parameter is an XML DOM attribute node, a node with an XMLType value of ATTRIBUTE. It is useful for determining whether a value returned by the XmlSearch function is an XML attribute.

The DOM, and therefore ColdFusion MX, treats XML attributes as properties of an element and does not directly expose them as DOM nodes. For this reason, the XmlAttributes entries in ColdFusion XML document objects do not represent DOM attribute nodes, and tests such as the following always return False:

```
IsXmlAttribute(myxmlelement.XmlAttributes);  
IsXmlAttribute(myxmlelement.XmlAttributes.myattribute);
```

The XmlSearch function does return attributes as XML DOM attribute nodes. For example, the following line returns an array of attribute nodes containing the quantity attributes in the xmlobject document object:

```
quantities = XmlSearch(xmlobject, '//@quantity');
```

## Example

The following example creates an XML document object and gets parts of it. It then tests whether these parts are attribute nodes.

```

<!-- Create an XML document object --->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

```

```

<!-- Get an array with all lastname quantity DOM attribute nodes
(In this example there is only one entry) --->
<cfset lastnames = XmlSearch(xmlobject, '//@lastname')>

```

```

<!-- Test objects to see if they are attributes --->
<cfoutput>
<h3>Are the following XML Attribute nodes?</h3>
<!-- The order element id attribute.
This a simple variable, not a DOM attribute node.--->
node.xmlobject.order.XmlAttributes.id:
  #IsXmlAttribute(xmlobject.order.XmlAttributes.id)#<br>
<!-- The items element --->
xmlobject.order.items: #IsXmlAttribute(xmlobject.order.items)#<br>
lastnames[1] returned by XmlSearch:
  #isXmlAttribute(lastnames[1])#<br>
</cfoutput>

```

# IsXmlDoc

## Description

Determines whether the function parameter is a ColdFusion XML document object.

## Returns

True, if the function argument is an XML document object; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Function syntax

```
IsXmlDoc(value)
```

## See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlElement](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlValidate](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| value     | Name of an XML document object |

## Example

The following example creates an XML Document object and a Java object and tests whether they are XML document objects:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!-- Create a Java object -->
<cfobject type="JAVA" action="create" class="java.lang.Error"
  name="javaobject" >

<!-- Test the objects -->
<cfoutput>
Is xmlobject an XML document object? #IsXmlDoc(xmlobject)#<br>
Is javaobject an XML document object? #IsXmlDoc(javaobject)#<br>
</cfoutput>
```

# IsXmlElem

## Description

Determines whether the function parameter is an XML document object element.

## Returns

True, if the function argument is an XML document object element; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Function syntax

```
IsXmlElem(value)
```

## See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlGetNodeType](#), [XmlValidate](#);  
Chapter 35, "Using XML and WDDX" in *ColdFusion MX Developer's Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter | Description                            |
|-----------|--|
| value     | Name of an XML document object element |

## Example

The following example tests whether an XML document object, the document root, and an element are elements:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!-- Test parts of the document object to see if they are elements -->
<cfoutput>
  <h3>Are the following XML document object elements?</h3>
  xmlobject: #IsXmlElem(xmlobject)#<br>
  xmlobject.XMLRoot: #IsXmlElem(xmlobject.XMLRoot)#<br>
  xmlobject.order.items: #IsXmlElem(xmlobject.order.items)#<br>
</cfoutput>
```

# IsXmlNode

## Description

Determines whether the function parameter is an XML document object node.

## Returns

True, if the function argument is an XML document object node, including an element; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Function syntax

```
IsXmlNode(value)
```

## See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElement](#), [IsXmlRoot](#), [XmlGetNodeType](#), [XmlSearch](#), [XmlValidate](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| value     | Name of an XML document object node. |

## Usage

This function returns True for the following components of an XML document object:

- The document object
- Elements in the object
- XmlNode objects in an element’s XmlNodeNodes array

It also returns True for XML node objects returned by the [XmlSearch](#) function. It does not return True for most entries in an element, including XmlText, XmlComment, XmlCdata, or the XmlAttributes array (or individual XML attributes).

## Example

The following example tests whether an XML document object, an element, an attribute in the object, and an attribute returned by an [XmlSearch](#) function are nodes:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
```

```
        <quantity>1</quantity>
        <unitprice>15.95</unitprice>
    </item>
</items>
</order>
</cfxml>
```

```
<!-- use XmlSearch to get an attribute node. -->
<cfset lastnames = XmlSearch(xmlobject, '//@lastname')>
```

```
<!-- Test the objects to see if they are XML nodes-->
<cfoutput>
<h3>Are the following XML nodes?</h3>
xmlobject: #IsXmlNode(xmlobject)#<br>
<!-- The items element -->
xmlobject.order.items: #IsXmlNode(xmlobject.order.items)#<br>
<!-- The order element id attribute; a simple variable, not a DOM node.-->
xmlobject.order.XmlAttributes.id:
    #IsXmlNode(xmlobject.order.XmlAttributes.id)#<br>
lastnames[1] returned by XmlSearch:
    #isXmlNode(lastnames[1])#
</cfoutput>
```

# IsXmlRoot

## Description

Determines whether the function parameter is the root element of an XML document object.

## Returns

True, if the function argument is the root object of an XML document object; False, otherwise.

## Category

[Decision functions](#), [XML functions](#)

## Function syntax

```
IsXmlRoot(value)
```

## See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlNode](#), [XmlGetNodeType](#), [XmlValidate](#);  
Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| value     | Name of an XML document object |

## Example

The following example tests whether an XML document object, its root element, and a child element are XML root elements:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
  <?xml version="1.0" encoding="UTF-8"?>
  <order id="4323251">
    <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
    <items>
      <item id="43">
        <quantity>1</quantity>
        <unitprice>15.95</unitprice>
      </item>
    </items>
  </order>
</cfxml>

<!-- Test objects to see if they are XML root elements -->
<cfoutput>
<h3>Are the following the XML Root?</h3>
xmlobject: #IsXmlRoot(xmlobject)#<br>
xmlobject.order: #IsXmlRoot(xmlobject.order)#<br>
<!-- The order element id attribute -->
xmlobject.order.XmlAttributes.id:
  #IsXmlRoot(xmlobject.order.XmlAttributes.id)#<br>
</cfoutput>
```

# JavaCast

## Description

Converts the data type of a ColdFusion variable to pass as an argument to an overloaded method of a Java object. Use only for scalar and string arguments.

## Returns

The variable, as type *type*.

## Category

[String functions](#)

## Function syntax

`JavaCast(type, variable)`

## See also

[CreateObject](#), [cfobject](#)

## Parameters

| Parameter             | Description   |
|-----------------------|---|
| <code>type</code>     | Data type to which to convert variable: <ul style="list-style-type: none"><li>• boolean</li><li>• int</li><li>• long</li><li>• float</li><li>• double</li><li>• string</li><li>• null</li></ul> |
| <code>variable</code> | A ColdFusion variable that holds a scalar or string type. Must be "" if type is null.   |

## Usage

Use after creating a Java object with the `cfobject` tag, before calling one of its methods. If the method takes more than one overloaded argument, you must call `JavaCast` for each one. Use `JavaCast` only when a method is overloaded (because its arguments can take more than one data type, not because the method can take a variable number of arguments).

`JavaCast` cannot be used to cast between complex objects, nor to cast to a super-class.

Use the result of this function only on calls to Java objects, as shown in the following example:

```
<cfscript>
    x = CreateObject("java", "test.Hello");
    x.init();
    ret = x.sayHello(JavaCast("null", ""));
</cfscript>
```

**Warning:** Do not assign the results of `JavaCast("null", "")` to a ColdFusion variable. Unexpected results will occur.

Because there is not a one-to-one correspondence between internally stored ColdFusion types and Java scalar types, some conversions cannot be performed.

### Example

The method `fooMethod` in the class `fooClass` takes one overloaded argument. The `fooClass` class is defined as follows:

```
public class fooClass {
    public fooClass () {
    }
    public String fooMethod(String arg) {
        return "Argument was a String";
    }
    public String fooMethod(int arg) {
        return "Argument was an Integer";
    }
}
```

Within ColdFusion, you use the following code:

```
<cfobject
action="create"
    type = "java"
    class = "fooClass"
    name = obj>
```

```
<!--- ColdFusion can treat this as a string or a real number --->
<cfset x = 33>
```

Perform an explicit cast to an int and call `fooMethod`:<br>

```
<cfset myInt = JavaCast("int", x)>
<cfoutput>#obj.fooMethod(myInt)#</cfoutput>
<br><br>
```

Perform an explicit cast to a string and call `fooMethod`:<br>

```
<cfset myString = javaCast("String", x)>
<cfoutput>#obj.fooMethod(myString)#</cfoutput>
```

# JSStringFormat

## Description

Escapes special JavaScript characters, such as single-quotation mark, double-quotation mark, and newline.

## Returns

A string that is safe to use with JavaScript.

## Category

[String functions](#)

## Function syntax

```
JSStringFormat(string)
```

## Parameters

| Parameter | Description                               |
|-----------|---|
| string    | A string or a variable that contains one. |

## Usage

Escapes special JavaScript characters, so you can put arbitrary strings safely into JavaScript.

## Example

```
<!-- This example shows the use of the JSStringFormat function. ---->
<h3>JSStringFormat</h3>
<cfset stringValue = "An example string value with a tab chr(8),
  a newline (chr10) and some "quoted" 'text'">

<p>This is the string we have created:<br>
<cfoutput>#stringValue#</cfoutput>
</p>
<cfset jsStringValue = JSStringFormat(#stringValue#)>
<!-- Generate an alert from the JavaScript string jsStringValue. ---->
<SCRIPT>
s = "<cfoutput>#jsStringValue#</cfoutput>";
alert(s);
</SCRIPT>
```

# LCase

## Description

Converts the alphabetic characters in a string to lowercase.

## Returns

A string, converted to lowercase.

## Category

[String functions](#)

## Function syntax

LCase(*string*)

## See also

[UCase](#)

## Parameters

---

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

---

## Example

```
<h3>LCase Example</h3>

<cfif IsDefined("FORM.sampleText")>
  <cfif FORM.sampleText is not "">
    <cfoutput>
      <p>Your text, <b>#FORM.sampleText#</b>, returned in lowercase is
      <b>#LCase(FORM.sampleText)#</b>.</p>
    </cfoutput>
  <cfelse>
    <p><b><i>Please enter some text.</i></b></p>
  </cfif>
</cfif>

<p>Enter your text. Press "submit" to see it returned in lowercase: </p>

<form method="post" action = "<cfoutput>#cgi.script_name#</cfoutput>"
  name="lcaseForm">
<input type = "Text" name = "SampleText" value = "SAMPLE">
<input type = "Submit" name = "" value = "submit">
</form>
```

# Left

## Description

Returns the leftmost *count* characters in a string.

## Returns

String; the first *count* characters in the *string* parameter.

## Category

[String functions](#)

## Function syntax

`Left(string, count)`

## See also

[Right](#), [Mid](#), [Len](#)

## Parameters

---

| Parameter | Description   |
|-----------|---|
| string    | A string or a variable that contains one.   |
| count     | A positive integer or a variable that contains one. Number of characters to return. |

---

## Example

```
<h3>Left Example</h3>

<cfif IsDefined("Form.myText")>
<!-- If len returns 0 (zero), then show error message. -->
  <cfif Len(Form.myText)>
    <cfif Len(Form.myText) LTE Form.RemoveChars>
      <cfoutput><p style="color: red; font-weight: bold">Your string
#Form.myText# only has #Len(Form.myText)# characters. You cannot output
the #Form.removeChars# leftmost characters of this string because it is
not long enough.</p></cfoutput>
    <cfelse>
      <cfoutput><p>Your original string: <strong>#Form.myText#</strong></p>
      <p>Your changed string, showing only the <strong>#Form.removeChars#
      </strong> leftmost characters:
      <strong>#Left(Form.myText, Form.removeChars)#</strong></p>
    </cfoutput>
  </cfif>
<cfelse>
  <p style="color: red; font-weight: bold">Please enter a string of more
than 0 (zero) characters.</p>
</cfif>
</cfif>

<form action="#<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
<p>Type in some text<br />
<input type="Text" name="myText"></p>
<p>How many characters from the left do you want to show?
```

```
<select name="RemoveChars">
<option value="1">1
<option value="3" selected>3
<option value="5">5
<option value="7">7
<option value="9">9</select>
<input type="Submit" name="Submit" value="Remove characters"></p>
</form>
```

# Len

## Description

Determines the length of a string or binary object.

## Returns

Number; length of a string or a binary object.

## Category

[String functions](#)

## Function syntax

`Len(string or binary object)`

## See also

[ToBinary](#), [Left](#), [Right](#), [Mid](#)

## History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (ColdFusion 5 and earlier releases supported ASCII values 1–255. When calculating a length, some string-processing functions processed the ASCII 0 (NUL) character, but did not process subsequent characters of the string.)

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A string, the name of a string, or a binary object |

## Example

```
<h3>Len Example</h3>

<cfif IsDefined("Form.MyText")>
  <!-- If len returns 0 (zero), then show error message. -->
  <cfif Len(FORM.myText)>
    <cfoutput><p>Your string, <strong>"#FORM.myText#"</strong>,
      has <strong>#Len(FORM.myText)#</strong> characters.</cfoutput>
  <cfelse>
    <p style="color: red; font-weight: bold">Please enter a string of more
      than 0 characters.</p>
  </cfif>
</cfif>

<form action = "<cfoutput>#CGI.SCRIPT_NAME#</cfoutput>" method="POST">
<p>Type in some text to see the length of your string.</p>

<input type = "Text" name = "MyText"><br />
<input type = "Submit" name="Submit" value = "Count characters"><br>
</form>
```

# ListAppend

## Description

Concatenates a list or element to a list.

## Returns

A copy of the list, with *value* appended. If *delimiter* = "", returns a copy of the list, unchanged.

## Category

[List functions](#)

## Function syntax

```
ListAppend(list, value [, delimiters ])
```

## See also

[ListPrepend](#), [ListInsertAt](#), [ListGetAt](#), [ListLast](#), [ListSetAt](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description  |
|------------|--|
| list       | A list or a variable that contains one.  |
| value      | An element or a list of elements.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion uses only the first character. |

## Usage

ColdFusion inserts a delimiter character before *value*.

The following table shows examples of ListAppend processing:

| Statement                                     | Output           | Comment   |
|---|------------------|---|
| ListAppend('elem1,elem2', '' )                | elem1,elem2,     | Appended element is empty; delimiter is last character in list; list length is 2. |
| ListAppend('', 'elem1,elem2' )                | elem1,elem2      | List length is 2.   |
| ListAppend<br>("one__two", "three",<br>"___") | "one__two_three" | Inserted the first character of delimiters before "three."                        |

## Example

```
<h3>ListAppend Example</h3>  
<!-- First, query to get some values for our list elements-->  
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">  
SELECT PARKNAME,CITY,STATE  
FROM PARKS WHERE PARKNAME LIKE 'AL%'  
</cfquery>  
<cfset temp = ValueList(GetParkInfo.ParkName)>
```

```
<cfoutput>
<p>The original list: #temp#
</cfoutput>
<!--- now, append a park name to the list --->
<cfset temp2 = ListAppend(Temp, "ANOTHER PARK")>
...
```

# ListChangeDelims

## Description

Changes a list delimiter.

## Returns

A copy of the list, with each delimiter character replaced by *new\_delimiter*.

## Category

[List functions](#)

## Function syntax

```
ListChangeDelims(list, new_delimiter [, delimiters ])
```

## See also

[ListFirst](#), [ListQualify](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter     | Description   |
|---------------|---|
| list          | A list or a variable that contains one.   |
| new_delimiter | Delimiter string or a variable that contains one. Can be an empty string. ColdFusion processes the string as one delimiter.   |
| delimiters    | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Example

```
<h3>ListChangeDelims Example</h3>
<p>ListChangeDelims lets you change the delimiters of a list.
<!-- First, query to get some values for our list elements-->
<CFQUERY NAME="GetParkInfo" DATASOURCE="cfdocexamples">
SELECT PARKNAME,CITY,STATE
  FROM Parks
   WHERE PARKNAME LIKE 'BA%'
</CFQUERY>
<CFSET temp = ValueList(GetParkInfo.ParkName)>
<cfoutput>
<p>The original list: <p>#temp#
</cfoutput>
<!-- Change the delimiters in the list -->
<CFSET temp2 = ListChangeDelims(Temp, " |:P|", ",")>
<cfoutput>
<p>After executing the statement
  <strong>ListChangeDelims(Temp, " |:P|", ",")</strong>,
  the updated list: <p>#temp2#
</cfoutput>
```

```
    as "two", both ListContains and ListFind find it, in the second element:
    <p>&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;<strong>ListContains</strong>:
    <cfoutput>
    The string "two" is in <b>element #ListContains(aList, "two")#</b> of the list.
    </cfoutput>
    &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;<p><strong>ListFind</strong>:
    <cfoutput>
    The string "two" is in <b>element #ListFind(aList, "two")#</b> of the list.
    </cfoutput>
```

# ListContainsNoCase

## Description

Determines the index of the first list element that contains a specified substring.

## Returns

Index of the first list element that contains *substring*, regardless of case. If not found, returns zero.

## Category

[List functions](#)

## Function syntax

```
ListContainsNoCase(list, substring [, delimiters ])
```

## See also

[ListContains](#), [ListFindNoCase](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| substring  | A string or a variable that contains one. The search is case-insensitive.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<h3>ListContainsNoCase Example</h3>
<cfif IsDefined("form.letter")>
  <!-- First, query to get some values for our list -->
  <cfquery name="GetParkInfo" datasource="cfdoexamples">
    SELECT PARKNAME,CITY,STATE
    FROM Parks
    WHERE PARKNAME LIKE '#form.letter#%'
  </cfquery>
  <cfset tempList = #ValueList(GetParkInfo.City)#>
  <cfif ListContainsNoCase(tempList, form.yourCity) is not 0>
    There are parks in your city!
  <cfelse>
    <p>Sorry, there were no parks found for your city.
    Try searching under a different letter.
  </cfif>
</cfif>
```

# ListDeleteAt

## Description

Deletes an element from a list.

## Returns

A copy of the list, without the specified element.

## Category

[List functions](#)

## Function syntax

```
ListDeleteAt(list, position [, delimiters ])
```

## See also

[ListGetAt](#), [ListSetAt](#), [ListLen](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| position   | A positive integer or a variable that contains one. Position at which to delete element. The first list position is 1.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

To use this and other functions with the default delimiter (comma), you can code as follows:

```
<cfset temp2 = ListDeleteAt(temp, "3")>
```

To specify another delimiter, you code as follows:

```
<cfset temp2 = ListDeleteAt(temp, "3", ";")>
```

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<!--- First, query to get some values for our list elements--->
<CFQUERY NAME="GetParkInfo" DATASOURCE="cfdoexamples">
    SELECT PARKNAME,CITY,STATE
    FROM Parks
    WHERE PARKNAME LIKE 'CHI%'
</CFQUERY>
<CFSET temp = ValueList(GetParkInfo.ParkName)>
<CFSET deleted_element = ListGetAt(temp, "3", ",")>
<cfoutput>
<p>The original list: #temp#
```

```
</cfoutput>
<!--- Delete the third element from the list --->
<CFSET temp2 = ListDeleteAt(Temp, "3")>
<cfoutput>
<p>The changed list: #temp2#
<p><I>This list element:<br>#deleted_element#<br> is no longer present
  at position three of the list.</I> </cfoutput>
```

# ListFind

## Description

Determines the index of the first list element in which a specified value occurs. Case-sensitive.

## Returns

Index of the first list element that contains *value*, with matching case. If not found, returns zero. The search is case-sensitive.

## Category

[List functions](#)

## Function syntax

```
ListFind(list, value [, delimiters ])
```

## See also

[ListContains](#), [ListFindNoCase](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one  |
| value      | A string, a number, or a variable that contains one. Item for which to search. The search is case-sensitive.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<!-- Uses ListFind and ListFindNoCase to see if a substring exists
in a list -->
<form action="/listfind.cfm" method="POST">
  <p>Try changing the case in Leary's last name:
  <br><input type="Text" size="25" name="myString" value="Leary">
  <p>Pick a search type:
  <select name="type">
    <option value="ListFind" selected>Case-Sensitive
    <option value="ListFindNoCase">Case-Insensitive
  </select>
  <input type="Submit" name="" value="Search Employee List">
</form>

<!-- wait to have a string for searching defined -->
<cfif IsDefined("form.myString") and IsDefined("form.type")>
```

```

<cfquery name="SearchEmpLastName" datasource="cfdoexamples">
  SELECT  FirstName, RTrim(LastName) AS LName, Phone, Department
  FROM    Employees
</cfquery>

<cfset myList = ValueList(SearchEmpLastName.LName)>
<!--- Is this case-sensitive or case-insensitive searching --->
<cfif form.type is "ListFind">
  <cfset temp = ListFind(myList, form.myString)>
  <cfif temp is 0>
    <h3>An employee with that exact last name was not found</h3>
  <cfelse>
    <cfoutput>
      <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
      #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
      #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department,
      can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone),
      temp)#.
      <p>This was the first employee found under this case-sensitive last name
      search.
    </cfoutput>
  </cfif>
<cfelse>
  <cfset temp = ListFindNoCase(myList, form.myString)>
  <cfif temp is 0>
    <h3>An employee with that exact last name was not found</h3>
  <cfelse>
    <cfoutput>
      <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
      #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
      #ListGetAt(ValueList(SearchEmpLastName.Department), temp)#
      Department, can be reached at
      #ListGetAt(ValueList(SearchEmpLastName.Phone), temp)#.
      <p>This was the first employee found under this case-insensitive last
      name search.
    </cfoutput>
  </cfif>
</cfif>
</cfif>
</cfif>

```

# ListFindNoCase

## Description

Determines the index of the first list element in which a specified value occurs.

## Returns

Index of the first list element that contains *value*. If not found, returns zero. The search is case-insensitive.

## Category

[List functions](#)

## Function syntax

```
ListFindNoCase(list, value [, delimiters ])
```

## See also

[ListContains](#), [ListFind](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| value      | Number or string for which to search. The search is case-insensitive.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<!-- Uses ListFind and ListFindNoCase to see if a substring exists
in a list -->
<form action="/listfind.cfm" method="POST">
  <p>Try changing the case in Leary's last name:
  <br><input type="Text" size="25" name="myString" value="Leary">
  <p>Pick a search type:
    <select name="type">
      <option value="ListFind" selected>Case-Sensitive
      <option value="ListFindNoCase">Case-Insensitive
    </select>
    <input type="Submit" name="" value="Search Employee List">
</form>

<!-- wait to have a string for searching defined -->
<cfif IsDefined("form.myString") and IsDefined("form.type")>

<cfquery name="SearchEmpLastName" datasource="cfdocexamples">
```

```

    SELECT  FirstName, RTrim(LastName) AS LName, Phone, Department
    FROM    Employees
</cfquery>

<cfset myList = ValueList(SearchEmpLastName.LName)>
<!--- Is this case-sensitive or case-insensitive searching --->
<cfif form.type is "ListFind">
    <cfset temp = ListFind(myList, form.myString)>
    <cfif temp is 0>
        <h3>An employee with that exact last name was not found</h3>
    <cfelse>
        <cfoutput>
            <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
            #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
            #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department,
            can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone),
            temp)#.
            <p>This was the first employee found under this case-sensitive last name
            search.
        </cfoutput>
    </cfif>
<cfelse>
    <cfset temp = ListFindNoCase(myList, form.myString)>
    <cfif temp is 0>
        <h3>An employee with that exact last name was not found</h3>
    <cfelse>
        <cfoutput>
            <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
            #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
            #ListGetAt(ValueList(SearchEmpLastName.Department), temp)#
            Department, can be reached at
            #ListGetAt(ValueList(SearchEmpLastName.Phone), temp)#.
            <p>This was the first employee found under this case-insensitive last
            name search.
        </cfoutput>
    </cfif>
</cfif>
</cfif>
</cfif>

```

# ListFirst

## Description

Gets the first element of a list.

## Returns

The first element of a list. If the list is empty, returns an empty string.

## Category

[List functions](#)

## Function syntax

```
ListFirst(list [, delimiters ])
```

## See also

[ListGetAt](#), [ListLast](#), [ListQualify](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains a list.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<h3>ListFirst Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdoexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>

<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:&nbsp;&nbsp;&nbsp;</p>
<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<!-- Show the first user in the list -->
<p>The first user in the list is:
<cfoutput>#ListFirst(temp)#</cfoutput>
<p>The rest of the list is:&nbsp;&nbsp;&nbsp;<cfoutput>#ListRest(temp)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The last user in the list is: <cfoutput>#ListLast(temp)#</cfoutput>
```

# ListGetAt

## Description

Gets a list element at a specified position.

## Returns

Index of the list element at position *position*.

## Category

[List functions](#)

## Function syntax

```
ListGetAt(list, position [, delimiters ])
```

## See also

[ListFirst](#), [ListLast](#), [ListQualify](#), [ListSetAt](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| position   | A positive integer or a variable that contains one. Position at which to get element. The first list position is 1.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

If you use list functions on strings that are delimited by a delimiter character and a space, a returned list element might contain a leading space; you use the `trim` function to remove such spaces from a returned element. For example, consider this list:

```
<cfset myList = "one hundred, two hundred, three hundred">
```

To get a value from this list, use the `trim` function to remove the space before the returned value:

```
<cfset MyValue = #trim(listGetAt(myList, 2))#>
```

With this usage, `MyValue = "two hundred"`, not `" two hundred"`, and spaces within a list element are preserved.

ColdFusion ignores empty list elements; thus, the list `"a,b,c,,d"` has four elements.

## Example

```
<h3>ListGetAt Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdoexamples">
    SELECT Username, Subject, Posted
    FROM Messages
```

```
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<!-- loop through the list and show it with ListGetAt -->
<h3>This list of usernames who have posted messages numbers
<cfoutput>#ListLen(temp)#</cfoutput> users.</h3>
<ul>
<cfloop From = "1" To = "#ListLen(temp)#" index = "Counter">
  <cfoutput><li>Username #Counter#: #ListGetAt(temp, Counter)# </cfoutput>
</cfloop>
</ul>
```

# ListInsertAt

## Description

Inserts an element in a list.

## Returns

A copy of the list, with *value* inserted at the specified position.

## Category

[List functions](#)

## Function syntax

```
ListInsertAt(list, position, value [, delimiters ])
```

## See also

[ListDeleteAt](#), [ListAppend](#), [ListPrepend](#), [ListSetAt](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| position   | A positive integer or a variable that contains one. Position at which to insert element. The first list position is 1.  |
| value      | An element or a list of elements.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

When inserting an element, ColdFusion inserts a delimiter. If `delimiters` contains more than one delimiter, ColdFusion uses the first delimiter in the string; if `delimiters` is omitted, ColdFusion uses a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<!--- This example shows ListInsertAt --->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
SELECT PARKNAME,CITY,STATE
FROM PARKS
WHERE PARKNAME LIKE 'DE%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfset insert_at_this_element = ListGetAt(temp, "3", ",")>
<cfoutput>
<p>The original list: #temp#
</cfoutput>
<cfset temp2 = ListInsertAt(Temp, "3", "my Inserted Value")>
```

# ListLast

## Description

Gets the last element of a list.

## Returns

The last element of the list.

## Category

[List functions](#)

## Function syntax

```
ListLast(list [, delimiters ])
```

## See also

[ListGetAt](#), [ListFirst](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description  |
|------------|--|
| list       | A list or a variable that contains a list.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter; you cannot specify a multicharacter delimiter. |

## Usage

If you use list functions on strings that separated by a delimiter character and a space, a returned list element might contain a leading space; use the `trim` function to remove leading and trailing spaces from a returned element. For example, consider this list:

```
<cfset myList = "one hundred, two hundred, three hundred">
```

To get a value from this list, use the `trim` function to remove the space before the returned value:

```
<cfset MyValue = #trim(ListLast(myList))#>
```

With this usage, the `MyValue` variable gets the value "three hundred", not " three hundred", and spaces within a list element are preserved.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<h3>ListFirst, ListLast, and ListRest Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
```

# ListLen

## Description

Determines the number of elements in a list.

Integer; the number of elements in a list.

## Category

[List functions](#)

## Function syntax

```
ListLen(list [, delimiters ])
```

## See also

[ListAppend](#), [ListDeleteAt](#), [ListInsertAt](#), [ListPrepend](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

Here are some examples of ListLen processing:

| Statement                             | Output | Comment               |
|---------------------------------------|--------|-----------------------|
| ListLen('a,b, c,,d')                  | 4      | Third element is " c" |
| ListLen('a,b, c,,d',' ,')             | 4      | Fourth element is "d" |
| ListLen('elem_1__elem_2__elem_3')     | 1      |                       |
| ListLen('elem*1***elem*2***elem*3')   | 1      |                       |
| ListLen('elem_1__elem_2__elem_3','_') | 6      |                       |

## Example

```
<h3>ListLen Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
  SELECT Username, Subject, Posted
  FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<!-- loop through the list and show it with ListGetAt -->
<h3>This is a list of usernames who have posted messages
```

```
<cfoutput>#ListLen(temp)#</cfoutput> users.</h3>
<ul>
<cfloop From = "1" TO = "#ListLen(temp)#" INDEX = "Counter">
  <cfoutput><li>Username #Counter#:
    #ListGetAt(temp, Counter)#</cfoutput>
</cfloop>
</ul>
```

# ListPrepend

## Description

Inserts an element at the beginning of a list.

## Returns

A copy of the list, with *value* inserted at the first position.

## Category

[List functions](#)

## Function syntax

```
ListPrepend(list, value [, delimiters ])
```

## See also

[ListAppend](#), [ListInsertAt](#), [ListSetAt](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| value      | An element or a list of elements.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion only uses the first character and ignores the others. |

## Usage

When prepending an element to a list, ColdFusion inserts a delimiter. If *delimiters* contains more than one delimiter character, ColdFusion uses the first delimiter in the string; if *delimiters* is omitted, ColdFusion uses a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

If the *delimiters* parameter is the empty string (""), ColdFusion returns the contents of the *value* parameter.

## Example

```
<!-- This example shows ListPrepend -->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM PARKS
    WHERE PARKNAME LIKE 'DE%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfset first_element = ListFirst(temp)>
<cfoutput><p>The original list: #temp#</cfoutput>
<!-- now, insert an element at position 1-->
<cfset temp2 = ListPrepend(Temp, "my Inserted Value")>
```

# ListQualify

## Description

Inserts a string at the beginning and end of list elements.

## Returns

A copy of the list, with *qualifier* before and after the specified element(s).

## Category

[List functions](#)

## Function syntax

```
ListQualify(list, qualifier [, delimiters ] [, elements ])
```

## See also

“Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: as the `elements` parameter value, you must specify "all" or "char"; otherwise, ColdFusion throws an exception. (In earlier releases, the function ignored an invalid value, and used "all"; this was inconsistent with other functions.)

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| qualifier  | A string or a variable that contains one. Character or string to insert before and after the list elements specified in the <code>elements</code> parameter.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion uses the first character as the delimiter and ignores the remaining characters. |
| elements   | <ul style="list-style-type: none"><li>all: all elements</li><li>char: elements that are composed of alphabetic characters</li></ul>   |

## Usage

The new list might not preserve all of the delimiters in the list.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">  
SELECT FirstName, LastName  
FROM Employees  
</cfquery>
```

```
<h3>ListQualify Example</h3>
```

```
<p>This example uses ListQualify to put the full names of the  
employees in the query within quotation marks.</p>
```

```

<cfset myArray = ArrayNew(1)>

<!-- loop through query; append these names successively
to the last element --->
<cfloop query = "GetEmployeeNames">
  <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>

<!-- sort that array descending alphabetically --->
<cfset myAlphaArray = ArraySort(myArray, "textnocase")>

<!-- show the resulting array as a list --->
<cfset myList = ArrayToList(myArray, ",")>

<cfoutput>
  <p>The contents of the unqualified list are as follows:</p>
  #myList#
</cfoutput>

<!-- show the resulting alphabetized array as a qualified list with
single quotation marks around each full name. --->
<cfset qualifiedList1 = ListQualify(myList,"'",",","CHAR")>

<!-- output the array as a list --->
<cfoutput>
  <p>The contents of the qualified list are as follows:</p>
  <p>#qualifiedList1#</p>
</cfoutput>

<!-- show the resulting alphabetized array as a qualified list with quotation
marks around each full name. We use &quot; to denote quotation marks
because the quotation mark character is a control character. --->
<cfset qualifiedList2 = ListQualify(myList,"&quot;","&quot;","CHAR")>

<!-- output the array as a list --->
<cfoutput>
  <p>The contents of the second qualified list are:</p>
  <p>#qualifiedList2#</p>
</cfoutput>

```

# ListRest

## Description

Gets a list, without its first element.

## Returns

A copy of *list*, without the first element. If *list* has one element, returns an empty list.

## Category

[List functions](#)

## Function syntax

```
ListRest(list [, delimiters ])
```

## See also

[ListFirst](#), [ListGetAt](#), [ListLast](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

If the list begins with one or more empty entries, this function drops them, as well as the first element.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<h3>ListFirst, ListLast, and ListRest Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>

<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:&nbsp;&nbsp;&nbsp;<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The first user in the list is:
<cfoutput>#ListFirst(temp)# </cfoutput>
<p>The rest of the list is:&nbsp;&nbsp;&nbsp;<cfoutput>#ListRest(temp)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The last user in the list is: <cfoutput>#ListLast(temp)#</cfoutput>
```

# ListSetAt

## Description

Replaces the contents of a list element.

## Returns

A copy of a list, with a new value assigned to the element at a specified position.

## Category

[List functions](#)

## Function syntax

```
ListSetAt(list, position, value [, delimiters ])
```

## See also

[ListDeleteAt](#), [ListGetAt](#), [ListInsertAt](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed delimiter modification: ColdFusion MX does not modify delimiters in the list. (In earlier releases, in some cases, replaced delimiters with the first character in the delimiters parameter.)

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| position   | A positive integer or a variable that contains one. Position at which to set a value. The first list position is 1.   |
| value      | An element or a list of elements.   |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Usage

When assigning an element to a list, ColdFusion inserts a delimiter. If `delimiters` contains more than one delimiter, ColdFusion uses the first delimiter in the string, or, if `delimiters` was omitted, a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<h3>ListSetAt Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdoexamples">
SELECT Username, Subject, Posted
FROM Messages
```

```
</cfquery>

<cfset temp = ValueList(GetMessageUser.Subject)>

<!-- loop through the list and show it with ListGetAt -->
<h3>This is a list of <cfoutput>#ListLen(temp)#</cfoutput>
subjects posted in messages.</h3>

<cfset ChangedElement = ListGetAt(temp, 2)>
<cfset TempToo = ListSetAt(temp, 2, "I changed this subject", ",")>
<ul>
<cfloop From = "1" To = "#ListLen(temptoo)#" INDEX = "Counter">
  <cfoutput><li>(<#Counter#>) SUBJECT: <#ListGetAt(temptoo, Counter)#>
  </cfoutput>
</cfloop>
</ul>
<p>Note that element 2, "<cfoutput>#changedElement#</cfoutput>",
  has been altered to "I changed this subject" using ListSetAt.
```

# ListSort

## Description

Sorts list elements according to a sort type and sort order.

## Returns

A copy of a list, sorted.

## Category

[List functions](#)

## Function syntax

```
ListSort(list, sort_type [, sort_order] [, delimiters ])
```

## See also

“Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed the order in which sorted elements are returned: in a `textnocase`, descending sort, this function might return elements in a different sort order than in earlier releases. If `sort_type = "textnocase"` and `sort_order = "desc"`, ColdFusion MX processes elements that *differ only in case* differently from earlier releases. ColdFusion MX outputs the elements in the reverse of the ascending order. Earlier releases do not change order of elements that differ only in case. Both operations are correct. The new operation ensures that an ascending and descending sort output elements in exactly reverse order.

For example, in a `textnocase, desc` sort of `d, a, a, b, A`, the following occurs:

- ColdFusion MX returns `d, b, A, a, a`
- Earlier ColdFusion releases return `d, b, a, a, A`

(In a `textnocase, asc` sort, all ColdFusion releases return `a, a, A, b, d`.)

## Parameters

| Parameter              | Description  |
|------------------------|--|
| <code>list</code>      | A list or a variable that contains one.  |
| <code>sort_type</code> | <ul style="list-style-type: none"><li>• numeric: sorts numbers</li><li>• text: sorts text alphabetically, taking case into account (also known as case sensitive). All letters of one case precede the first letter of the other case:<ul style="list-style-type: none"><li>- <code>aabzABZ</code>, if <code>sort_order = "asc"</code> (ascending sort)</li><li>- <code>ZBAzbaa</code>, if <code>sort_order = "desc"</code> (descending sort)</li></ul></li><li>• <code>textnocase</code>: sorts text alphabetically, without regard to case (also known as case-insensitive). A letter in varying cases precedes the next letter:<ul style="list-style-type: none"><li>- <code>aAaBbBzzZ</code>, in an ascending sort; preserves original intra-letter order</li><li>- <code>ZzzBbBaAa</code>, in a descending sort; reverses original intra-letter order</li></ul></li></ul> |

---

**Parameter Description**

---

|            |  |
|------------|--|
| sort_order | <ul style="list-style-type: none"><li>• asc - ascending sort order. Default.<ul style="list-style-type: none"><li>- aabzABZ or aAaBbBzzZ, depending on value of sort_type, for letters</li><li>- from smaller to larger, for numbers</li></ul></li><li>• desc - descending sort order.<ul style="list-style-type: none"><li>- ZBAzbaa or ZzzBbBaAa, depending on value of sort_type, for letters</li><li>- from larger to smaller, for numbers</li></ul></li></ul> |
| delimiters | <p>A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.</p> <p>If this parameter contains more than one character, ColdFusion uses the first character in the string as the delimiter, and ignores the rest.</p>  |

---

**Usage**

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

**Example**

```
<h3>ListSort Example</h3>
```

```
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdoexamples">
SELECT  Username, Subject, Posted
FROM    Messages
</cfquery>

<cfset myList = ValueList(GetMessageUser.UserName)>
<p>Here is the unsorted list. </p>
<cfoutput>#myList#
</cfoutput>
<p>Here is the list sorted alphabetically:</p>
<cfset sortedList = ListSort(myList, "Text")>
<cfoutput>#sortedList#
</cfoutput>

<p>Here is a numeric list that is to be sorted in descending order.</p>
<cfset sortedNums = ListSort("12,23,107,19,1,65","Numeric", "Desc")>
<cfoutput>#sortedNums# </cfoutput>

<p>Here is a list that must be sorted numerically, since it contains
negative and positive numbers, and decimal numbers. </p>
<cfset sortedNums2 = ListSort("23.75;-34,471:100,-9745","Numeric", "ASC",
";,:")>
<cfoutput>#sortedNums2# </cfoutput>

<p>Here is a list to be sorted alphabetically without consideration of case.</p>
<p>
<cfset sortedMix =
ListSort("hello;123,HELLO:jeans,-345,887;ColdFusion:coldfusion",
"TextNoCase", "ASC", ";,:")>
<cfoutput>#sortedMix# </cfoutput>
```

# ListToArray

## Description

Copies the elements of a list to an array.

## Returns

An array

## Category

[Array functions](#), [Conversion functions](#), [List functions](#)

## Function syntax

```
ListToArray(list [, delimiters ])
```

## See also

[ArrayToList](#); Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description  |
|------------|--|
| list       | A list or a variable that contains one. You define a list variable with a <code>cfset</code> statement.                              |
| delimiters | A string or a variable that contains one. ColdFusion treats each character in the string as a delimiter. The default value is comma. |

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

ColdFusion treats each character in the `delimiters` parameter as a separate delimiter. Therefore, if the parameter is "+," ColdFusion will break the list at *either* a comma or a plus sign.

## Example

```
<h3>ListToArray Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
SELECT Username, Subject, Posted
FROM Messages
</cfquery>
<cfset myList = ValueList(GetMessageUser.UserName)>
<p>My list is a list with <cfoutput>#ListLen(myList)#</cfoutput>
elements.
<cfset myArrayList = ListToArray(myList)>
<p>My array list is an array with <cfoutput>#ArrayLen(myArrayList)#
</cfoutput> elements.
```

# ListValueCount

## Description

Counts instances of a specified value in a list. The search is case-sensitive.

## Returns

The number of instances of *value* in the list.

## Category

[List functions](#), [String functions](#)

## Function syntax

```
ListValueCount(list, value [, delimiters ])
```

## See also

[ListValueCountNoCase](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| value      | String or number, or a variable that contains one. Item for which to search. The search is case-sensitive.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Example

```
<cfquery name = "SearchByDepartment" datasource = "cfdocexamples">
SELECT Department
FROM Employees
</cfquery>
<h3>ListValueCount Example</h3>
<p>This example uses ListValueCount to count employees in a department.

<form action = "listvaluecount.cfm">
<p>Select a department:</p>
  <select name = "departmentName">
    <option value = "Accounting">
      Accounting
    </OPTION>
    <option value = "Administration">
      Administration
    </OPTION>
    <option value = "Engineering">
      Engineering
    </OPTION>
    <option value = "Sales">
```

```

        Sales
    </OPTION>
</select>
<input type = "Submit" name = "Submit" value = "Search Employee List">
</form>

<!-- wait to have a string for searching defined -->
<cfif IsDefined("FORM.Submit") and IsDefined("FORM.departmentName")>
    <cfset myList = ValueList(SearchByDepartment.Department)>
    <cfset numberInDepartment = ListValueCount(myList, FORM.departmentName)>

    <cfif numberInDepartment is 0>
        <h3>There are no employees in <cfoutput>#FORM.departmentName#</cfoutput></
        h3>
    <cfelseif numberInDepartment is 1>
        <cfoutput><p>There is only one person in #FORM.departmentName#.
        </cfoutput>
    <cfelse>
        <cfoutput><p>There are #numberInDepartment# people in
        #FORM.departmentName#.
        </cfoutput>
    </cfif>
</cfif>

```

# ListValueCountNoCase

## Description

Counts instances of a specified value in a list. The search is case-insensitive.

## Returns

The number of instances of *value* in the list.

## Category

[List functions](#)

## Function syntax

```
ListValueCountNoCase(list, value [, delimiters ])
```

## See also

[ListValueCount](#); “Lists” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| list       | A list or a variable that contains one.   |
| value      | String or number, or a variable that contains one. Item for which to search. The search is case-insensitive.  |
| delimiters | A string or a variable that contains one. Character(s) that separate list elements. The default value is comma.<br>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter. |

## Example

```
<cfquery name = "SearchByDepartment" datasource = "cfdocexamples">
SELECT Department
FROM Employees
</cfquery>
```

```

        <cfoutput><p>There are #numberInDepartment# people in
        #FORM.departmentName#.
        </cfoutput>
    </cfif>
</cfif>

```

# LJustify

## Description

Left justifies characters in a string of a specified length.

## Returns

A copy of a string, left-justified.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

`LJustify(string, length)`

## See also

[CJustify](#), [RJustify](#)

## Parameters

| Parameter | Description                                |
|-----------|--|
| string    | A string or a variable that contains one   |
| length    | Length of field in which to justify string |

## Example

```
<!-- This example shows how to use LJustify -->
<cfparam name = "jstring" default = "">

<cfif IsDefined("FORM.justifyString")>
  <cfset jstring = LJustify(FORM.justifyString, 35)>
</cfif>

  size = 35 name = "justifyString">

<p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

# Log

## Description

Calculates the natural logarithm of a number. Natural logarithms are based on the constant  $e$  (2.71828182845904).

## Returns

The natural logarithm of a number.

## Category

[Mathematical functions](#)

## Function syntax

`Log(number)`

## See also

[Exp](#), [Log10](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | Positive real number for which to calculate the natural logarithm |

## Example

```
<h3>Log Example</h3>

<cfif IsDefined("FORM.number")>
  <cfoutput>
    <p>Your number, #FORM.number#
    <br>#FORM.number# raised to the E power: #exp(FORM.number)#

# Log10

## Description

Calculates the logarithm of *number*, to base 10.

## Returns

Number; the logarithm of *number*, to base 10.

## Category

[Mathematical functions](#)

## Function syntax

Log10(*number*)

## See also

[Exp](#), [Log](#)

## Parameters

---

| Parameter | Description   |
|-----------|---|
| number    | Positive real number for which to calculate the logarithm |

---

## Example

```
<h3>Log10 Example</h3>
<cfif IsDefined("FORM.number")>
  <cfoutput>
    <p>Your number, #FORM.number#
    <br>#FORM.number# raised to the E power: #exp(FORM.number)#
    <cfif FORM.number LTE 0><br>You must enter a positive real number to
    see the natural logarithm of that number
    <cfelse><br>The natural logarithm of #FORM.number#: #log(FORM.number)#
    </cfif>
    <cfif #FORM.number# LTE 0><br>You must enter a positive real number to
    see the logarithm of that number to base 10
    <cfelse><br>The logarithm of #FORM.number# to base 10:
    #log10(FORM.number)#
    </cfif>
  </cfoutput>
</cfif>
<cform action = "log10.cfm">
  Enter a number to find its value raised to the E power, its natural
  logarithm, and the logarithm of number to base 10.
  <cfinput type = "Text" name = "number" message = "You must enter a number"
  validate = "float" required = "No">
  <input type = "Submit" name = "">
</cform>
```

# LSCurrencyFormat

## Description

Formats a number in a locale-specific currency format. For countries that use the euro, the result depends on the JVM.

## Returns

A formatted currency value.

## Category

[Display and formatting functions](#), [International functions](#)

## Function syntax

```
LSCurrencyFormat(number [, type ])
```

## See also

[LSEuroCurrencyFormat](#), [LSIsCurrency](#), [LSParseCurrency](#), [LSParseEuroCurrency](#), [SetLocale](#); “Handling data in ColdFusion MX” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. If a negative number is passed to it, it returns a negative number. If `type = "local"`, it returns the value in the current locale’s standard format. If `type = "international"`, it returns the value in the current locale’s international standard format. This function uses Java standard locale formatting rules on all platforms.

## Parameters

| Parameter           | Description  |
|---------------------|--|
| <code>number</code> | Currency value   |
| <code>type</code>   | <ul style="list-style-type: none"><li>• <code>local</code>: the currency format and currency symbol used in the locale.<ul style="list-style-type: none"><li>- With JDK 1.3, the default for Euro Zone countries is their local currency.</li><li>- With JDK 1.4, the default for Euro Zone countries is the euro.</li></ul></li><li>• <code>international</code>: the international standard currency format and currency symbol of the locale.</li><li>• <code>none</code>: the currency format used in the locale; no currency symbol</li></ul> |

## Usage

This function uses Java standard locale formatting rules on all platforms.

**Note:** With a Sun 1.3.1-compliant JVM, use the [LSEuroCurrencyFormat](#) function to format euro currency values.

## Currency output

The following table shows sample currency output. For locales that use Euro, the Local and International columns contains two entries. The first is entry is the result with a Sun the 1.4.1-compliant JVM, the second entry is the result with a 1.3.1-compliant JVM.

| Locale                 | Type = Local                  | Type = International           | Type = None |

| Spanish (Modern)      | 100.000,00 €<br>10.000.000 Pts | EUR10.000.000<br>ESP10.000.000 | 10.000.000  |
| Spanish (Standard)    | 100.000,00 €<br>10.000.000 Pts | ESP10.000.000<br>EUR10.000.000 | 10.000.000  |
| Swedish               | 100.000,00 kr                  | SEK100.000,00                  | 100.000,00  |

**Note:** ColdFusion maps Spanish (Modern) to the Spanish (Standard) format.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>LSCurrencyFormat Example</h3>
<p>LSCurrencyFormat returns a currency value using the locale
  convention. Default value is "local."
<!-- loop through list of locales; show currency values for 100,000 units -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
  index = "locale" delimiters = ",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><b><I>#locale#</I></b><br>
    Local: #LSCurrencyFormat(100000, "local")#<br>
    International: #LSCurrencyFormat(100000, "international")#<br>
    None: #LSCurrencyFormat(100000, "none")#<br>
  <hr noshade>
</cfoutput>
</cfloop>
```

# LSDateFormat

## Description

Formats the date part of a date/time value in a locale-specific format.

## Returns

A formatted date/time value. If no mask is specified, the value is formatted according to the locale setting of the client computer.

## Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#)

## Function syntax

```
LSDateFormat(date [, mask ])
```

## See also

[LSParseDateTime](#), [LSTimeFormat](#), [DateFormat](#), [SetLocale](#); “Handling data in ColdFusion MX” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Added support for the following *mask* parameter options: `short`, `medium`, `long`, and `full`.

## Parameters

| Parameter | Description  |
|-----------|--|
| date      | A date/time object, in the range 100 AD-9999 AD.   |
| mask      | <p>Characters that show how ColdFusion displays the date:</p> <ul style="list-style-type: none"><li>• d: Day of month. Digits; no leading zero for single-digit days</li><li>• dd: Day of month. Digits; leading zero for single-digit days</li><li>• ddd: Day of week, abbreviation</li><li>• dddd: Day of week. Full name</li><li>• m: Month. Digits; no leading zero for single-digit months</li><li>• mm: Month. Digits; leading zero for single-digit months</li><li>• mmm: Month. abbreviation (if appropriate)</li><li>• mmmm: Month. Full name</li><li>• y: Year. Last two digits; no leading zero for years less than 10</li><li>• yy: Year. Last two digits; leading zero for years less than 10</li><li>• yyyy: Year. Four digits</li><li>• gg: Period/era string. Not processed. Reserved for future use</li></ul> <p>The following conform to Java locale-specific time encoding standards. Their exact formats depend on the locale:</p> <ul style="list-style-type: none"><li>• short: dd, mm, and yy separated by / marks</li><li>• medium: text format using mmm, d, and yyyy</li><li>• long: text format using mmmm, d, and yyyy</li><li>• full: text format using dddd, mmmm, d, and yyyy</li></ul> <p>The default value is medium</p> <p>For more information on formats, see <a href="#">LSParseDateTime</a>.</p> |

## Usage

This function uses Java standard locale formatting rules on all platforms.

When passing date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

To calculate a difference between time zones, use the [GetTimeZoneInfo](#) function.

## Example

```
<h3>LSDateFormat Example</h3>
<p>LSDateFormat formats the date part of a date/time value using the
  locale convention.
<!-- loop through a list of locales; show date values for Now()-->
<cfloop list = "#Server.Coldfusion.SupportedLocales#"
  index = "locale" delimiters = ", ">
  <cfset oldlocale = SetLocale(locale)>

  <cfoutput><p><B><I>#locale#</I></B><br>
    #LSDateFormat(Now(), "mmm-dd-yyyy")#<br>
    #LSDateFormat(Now(), "mmm d, yyyy")#<br>
    #LSDateFormat(Now(), "mm/dd/yyyy")#<br>
    #LSDateFormat(Now(), "d-mmm-yyyy")#<br>
    #LSDateFormat(Now(), "ddd, mmmm dd, yyyy")#<br>
    #LSDateFormat(Now(), "d/m/yy")#<br>
    #LSDateFormat(Now())#<br>
```

```
<hr noshade>  
</cfoutput>  
</cfloop>
```

# LSEuroCurrencyFormat

## Description

Formats a number in a locale-specific currency format.

## Returns

A formatted currency value. For countries in the Euro currency zone, the function uses the locale's rule's for formatting currency in euros.

## Category

[Display and formatting functions](#), [International functions](#)

## Function syntax

```
LSEuroCurrencyFormat(currency-number [, type ])
```

## See also

[LSParseEuroCurrency](#), [LSCurrencyFormat](#), [SetLocale](#); “Locale-specific content” in Chapter 17, “Developing Globalized Applications,” *ColdFusion MX Developer's Guide*

## History

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java locale formatting rules on all platforms, except that it uses the rule detailed in the Usage section for countries in the Euro currency zone. As a result, it format currencies for non Euro zone locales using the country's currency, not euros.

## Parameters

| Parameter       | Description   |
|-----------------|---|
| currency-number | Currency value.   |
| type            | <ul style="list-style-type: none"><li>local: the currency format used in the locale. (Default.)</li><li>international: the international standard currency format of the locale. For example, EUR10.00</li><li>none: the currency format used in the locale; no currency symbol</li></ul> |

## Usage

This function uses euro currency formatting rules for all JVM versions, as follows:

- If the country of the current locale belongs to the Euro Zone (whose members have converted to the euro) the formatted output for the local type includes the Euro currency sign (€); for the international type, the output includes the euro currency symbol (EUR). If the value is negative, the format includes a negative sign before the value or parentheses around the value, according to the formatting rules of the current locale.
- If the country of the current locale is not in the Euro Zone, the currency sign or symbol of the current locale displays. If the value is negative, the format includes a negative sign before the value or parentheses around the value, according to the formatting rules of the current locale.

For a list of the locale options that ColdFusion supports, and information on setting the default display format of date, time, number, and currency values, see [SetLocale on page 835](#).

## Currency output

The following table shows examples of currency output:

| Locale                 | Type = Local    | Type = International | Type = None |
|------------------------|-----------------|----------------------|-------------|
| Chinese (China)        | ¥100,000.00     | CNY100,000.00        | 100,000.00  |
| Chinese (Hong Kong)    | HK\$100,000.00  | HKD100,000.00        | 100,000.00  |
| Chinese (Taiwan)       | NT\$100,000.00  | TWD100,000.00        | 100,000.00  |

| French (Standard)      | 100 000,00 €    | EUR100 000,00        | 100 000,00  |
| French (Swiss)         | SFr. 100'000.00 | CHF100'000.00        | 100'000.00  |
| German (Austrian)      | €100.000,00     | EUR100.000,00        | 100.000,00  |
| German (Standard)      | 100.000,00 €    | EUR100.000,00        | 100.000,00  |
| German (Swiss)         | SFr. 100'000.00 | CHF100'000.00        | 100'000.00  |
| Italian (Standard)     | €100.000,00     | EUR10.000.000        | 10.000.000  |
| Italian (Swiss)        | SFr. 100'000.00 | CHF100'000.00        | 100'000.00  |
| Japanese               | ¥100,000        | JPY100,000           | JPY100,000  |
| Korean                 | ₩100,000        | KRW100,000           | 100,000     |
| Norwegian (Bokmal)     | kr 100 000,00   | NOK100 000,00        | 100 000,00  |
| Norwegian (Nynorsk)    | kr 100 000,00   | NOK100 000,00        | 100 000,00  |
| Portuguese (Brazilian) | R\$100.000,00   | BRC100.000,00        | 100.000,00  |
| Portuguese (Standard)  | 100.000,00 €    | EUR100.000,00        | 100.000,00  |
| Spanish (Mexican)      | \$100,000.00    | MXN100,000.00        | 100,000.00  |
| Spanish (Modern)       | 100.000,00 €    | EUR10.000.000        | 10.000.000  |
| Spanish (Standard)     | 100.000,00 €    | ESP10.000.000        | 10.000.000  |
| Swedish                | 100.000,00 kr   | SEK100.000,00        | 100.000,00  |

**Note:** ColdFusion uses the Spanish (Standard) formats for Spanish (Modern) and Spanish (Standard).

The following example shows how the function formats negative values. The format includes a negative sign before the value, or parentheses around the value, according to the formatting rules of the current locale.

---

| Input value | Output if locale = French (Standard) | Output if locale = English (US) |
|-------------|--------------------------------------|---------------------------------|
| -1234.56    | -1234,56 €                           | (\$1,234.56)                    |

---

### Example

```
<h3>LSEuroCurrencyFormat Example</h3>
<p>LSEuroCurrencyFormat returns a currency value using the locale
  convention. Default value is "local."
<!-- Loop through list of locales, show currency values for 100,000 units -->
<cfloop list = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><B><I>#locale#</I></B><br>
    Local: #LSEuroCurrencyFormat(100000, "local")#<br>
    International: #LSEuroCurrencyFormat(100000, "international")#<br>
    None: #LSEuroCurrencyFormat(100000, "none")#<br>
  <Hr noshade>
</cfoutput>
</cfloop>
```

# LSIsCurrency

## Description

Determines whether a string is a valid representation of a currency amount in the current locale.

## Returns

True, if the parameter is formatted as a valid currency amount, including the appropriate currency indicator. The return value is True for amounts in the local, international, or none currency formats.

## Category

[Display and formatting functions](#), [Decision functions](#), [International functions](#)

## Function syntax

```
LSIsCurrency(string)
```

## See also

[GetLocale](#), [SetLocale](#), [LSCurrencyFormat](#)

## History

ColdFusion MX: Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms; the results might vary depending upon the JVM; for example, Sun JVM 1.4.1 requires euro format the local currency if the current locale's country belongs to the Euro Zone.

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A currency string or a variable that contains one. |

## Usage

For examples of ColdFusion code and output that shows differences between earlier ColdFusion releases and ColdFusion MX in accepting input formats and displaying output, see [LSCurrencyFormat](#).

**Note:** If the locale belongs to a Euro zone country and the currency is a correctly formatted euro value for the locale, this function returns True for all JVMs, including Sun 1.3.1. As a result, with 1.3.1-compliant JVMs, the `LSIsCurrency` function does not ensure that `LSParseCurrency` returns a value. If a currency uses the older country-specific format for Euro Zone locales, the `LSIsCurrency` function returns False for newer JVMs, such as Sun 1.4.1, and True for older JVMs, such as Sun 1.3.1.

**Note:** To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

## Example

```
<h3>LSIsCurrency Example</h3>

<cfif IsDefined("FORM.locale")>
<!-- if locale is defined, set locale to that entry -->
<cfset NewLocale = SetLocale(FORM.locale)>
```

```
<p>Is the value "<cfoutput>#FORM.myValue#</cfoutput>"  
  a proper currency value for <cfoutput>#GetLocale()#</cfoutput>?  
<p>Answer: <cfoutput>#LSIsCurrency(FORM.myValue)#</cfoutput>  
</cfif>  
  
<p><form action = "LSIsCurrency.cfm">  
<p>Select a locale for which you would like to check a currency value:  
<!-- check the current locale for server -->  
<cfset serverLocale = GetLocale()>
```

# LSIsDate

## Description

Determines whether a string is a valid representation of a date/time value in the current locale.

## Returns

True, if the string can be formatted as a date/time value in the current locale; False, otherwise.

## Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#)

## Function syntax

```
LSIsDate(string)
```

## See also

[CreateDateTime](#), [GetLocale](#), [IsNumericDate](#), [LSDateFormat](#), [ParseDateTime](#), [SetLocale](#); “Handling data in ColdFusion MX” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Changed behavior: this function accepts a dash or hyphen character only in the Dutch(Standard) and Portuguese (Standard) locales. If called this way (for example, `LSIsDate("3-1-2002")`) in any other locale, this function returns False. (Earlier releases returned True.)
- Changed behavior: when using the SUN JRE 1.3.1 on an English(UK) locale, this function returns False for a date that has a one-digit month or day (for example, 1/1/01). To work around this, insert a zero in a one-digit month or day (for example, 01/01/01).

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

A date/time object is in the range 100 AD–9999 AD.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

## Example

```
<h3>LSIsDate Example</h3>
<cfif IsDefined("FORM.locale")>
  <!-- if locale is defined, set locale to that entry -->
  <cfset NewLocale = SetLocale(FORM.locale)>
```

```
<p>Is the value "<cfoutput>#FORM.myValue#</cFOUTPUT>" a proper date
value for <cfoutput>#GetLocale()#</cfoutput>?
<p>Answer: <cfoutput>#LSIsDate(FORM.myValue)#</cfoutput>
</cfif>
<p><form action = "LSIsDate.cfm">
<p>Select a locale for which you would like to check a date value:
<!--- check the current locale for server --->
<cfset serverLocale = GetLocale()>
```

# LSIsNumeric

## Description

Determines whether a string is a valid representation of a number in the current locale.

## Returns

True, if the string represents a number the current locale; False, otherwise.

## Category

[Decision functions](#), [International functions](#), [String functions](#)

## Function syntax

```
LSIsNumeric(string)
```

## See also

[GetLocale](#), [SetLocale](#); “Handling data in ColdFusion MX” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

## Example

```
<h3>LSIsNumeric Example</h3>

<cfif IsDefined("FORM.locale")>
<!-- if locale is defined, set locale to that entry -->
<cfset NewLocale = SetLocale(FORM.locale)>

<p>Is the value "<cfoutput>#FORM.myValue#</cfOUTPUT>"
a proper numeric value for <cfoutput>#GetLocale()#</cfoutput>?

<p>Answer: <cfoutput>#LSIsNumeric(FORM.myValue)#</cfoutput>
</cfif>

<p><form action = "LSIsNumeric.cfm">

<p>Select a locale for which to check a numeric value:
...
```

# LSNumberFormat

## Description

Formats a number in a locale-specific format.

## Returns

A formatted number.

- If no mask is specified, it returns the number formatted as an integer
- If no mask is specified, truncates the decimal part; for example, it truncates 34.57 to 35
- If the specified mask cannot correctly mask a number, it returns the number unchanged
- If the parameter value is "" (an empty string), it returns 0.

## Category

[Display and formatting functions](#), [International functions](#)

## Function syntax

```
LSNumberFormat(number [, mask ])
```

## See also

[GetLocale](#), [SetLocale](#); “Handling data in ColdFusion MX” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed behavior: if the specified mask format cannot correctly mask a number, this function returns the number unchanged. (In earlier releases, it truncated the number or threw an error.) (If no mask is specified, ColdFusion MX truncates the decimal part as ColdFusion 5 does. For example, it truncates 1234.567 to 1235.)
- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

## Parameters

| Parameter | Description  |
|-----------|--|
| number    | Number to format   |
| mask      | LSNumberFormat mask characters apply, except: dollar sign, comma, and dot are mapped to their locale-specific equivalents. |

The following table lists the LSNumberFormat mask characters:

| Character | Meaning   |
|-----------|---|
| _         | (Underscore.) Digit placeholder.                                      |
| 9         | Digit placeholder. (Shows decimal places more clearly than _.)        |
| .         | Location of a mandatory decimal point (or locale-appropriate symbol). |

| Character | Meaning  |
|-----------|--|
| 0         | Located to the left or right of a mandatory decimal point. Pads with zeros.  |
| ()        | If number is less than zero, puts parentheses around the mask.   |
| +         | Puts plus sign before positive number; minus sign before negative number.  |
| -         | Puts space before positive number; minus sign before negative number.  |
| ,         | Separates every third decimal place with a comma (or locale-appropriate symbol).   |
| L,C       | Left-justifies or center-justifies number within width of mask column. First character of mask must be L or C. The default value is right-justified. |
| \$        | Puts a dollar sign (or locale-appropriate symbol) before formatted number. First character of mask must be the dollar sign (\$).                     |
| ^         | Separates left and right formatting.   |

**Note:** If you do not specify a sign for the mask, positive and negative numbers do not align in columns. To put a plus sign or space before positive numbers and a minus sign before negative numbers, use the plus or hyphen mask character, respectively.

### Usage

This function uses Java standard locale formatting rules on all platforms.

The position of symbols in format masks determines where the codes take effect. For example, if you put a dollar sign at the far left of a format mask, ColdFusion displays a dollar sign at the left edge of the formatted number. If you separate the dollar sign on the left edge of the format mask by at least one underscore, ColdFusion displays the dollar sign just to the left of the digits in the formatted number.

These examples show how symbols determine formats:

| Number | Mask    | Result    |
|--------|---------|-----------|
| 4.37   | \$____  | "\$ 4.37" |
| 4.37   | _\$____ | " \$4.37" |

The positioning can also show where to put a minus sign for negative numbers:

| Number | Mask    | Result   |
|--------|---------|----------|
| -4.37  | -____   | "- 4.37" |
| -4.37  | _ -____ | " -4.37" |

The positions for a symbol are: far left, near left, near right, and far right. The left and right positions are determined by the side of the decimal point on which the code character is shown. For formats that do not have a fixed number of decimal places, you can use a caret (^) to separate the left fields from the right.

An underscore determines whether the code is placed in the far or near position. Most code characters' effect is determined by the field in which they are located. This example shows how to specify where to put parentheses to display negative numbers:

| Number | Mask   | Result   |
|--------|--------|----------|
| 3.21   | C(_^_) | "(3.21)" |
| 3.21   | C_(^_) | "(3.21)" |
| 3.21   | C(_^)_ | "(3.21)" |
| 3.21   | C_(^)_ | "(3.21)" |

To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

When converting from string to double, to prevent rounding errors, this function adds a rounding factor of 1.5543122344752E-014 to the converted number. For example, without adding the rounding factor, converting the string value 1.275 to double with two digits of precision results in a value of 1.2749999999999999, which would be rounded up to 1.27. By adding the rounding factor, the conversion correctly results in a value of 1.28.

If you round off a double, such as 1.99499999999999999999999999999999, where the last decimal is 10E-14, the rounding factor can cause an incorrect result.

### Example

```
<h3>LSNumberFormat Example</h3>
<p>LSNumberFormat returns a number value using the locale convention.
<!-- loop through a list of locales and show number values -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ", ">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><b><i>#locale#</i></b><br>
    #LSNumberFormat(-1234.5678, "_____")#<br>
    #LSNumberFormat(-1234.5678, "_____.____")#<br>
    #LSNumberFormat(1234.5678, "_____")#<br>
    #LSNumberFormat(1234.5678, "_____.____")#<br>
    #LSNumberFormat(1234.5678, "$_(_____.____)")#<br>
    #LSNumberFormat(-1234.5678, "$_(_____.____)")#<br>
    #LSNumberFormat(1234.5678, "+_____")#<br>
    #LSNumberFormat(1234.5678, "-_____")#<br>
  </cfoutput>
</cfloop>
```

# LSParseCurrency

## Description

Converts a locale-specific currency string into a formatted number. Attempts conversion by comparing the string with each the three supported currency formats (none, local, international) and using the first that matches.

## Returns

A formatted number (string representation of a number) that matches the value of the parameter.

## Category

[International functions](#), [String functions](#)

## Function syntax

```
LSParseCurrency(string)
```

## See also

[LSParseEuroCurrency](#), [LSCurrencyFormat](#), [LSEuroCurrencyFormat](#), [LSIsCurrency](#);  
“Locale-specific content” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

## Parameters

| Parameter | Description   |
|-----------|---|
| string    | A locale-specific string a variable that contains one |

## Usage

This function uses the locale formatting rules of the JVM (specified in the ColdFusion Administrator Java and JVM page) on all platforms. These rules changed between Sun JVM 1.3.1 and JVM 1.4.1:

- JVM 1.3.1 requires that the local and international versions of currencies of countries in the Euro zone be formatted using the older, country-specific designations, such as 100.000,00 DM or DEM100.000,00 for the German (Standard) locale. Use the [LSParseEuroCurrency](#) function to parse euro currencies in these locales with JVM 1.3.1.
- JVM 1.4.1 requires that currencies for Euro zone countries be expressed as euros; for example 100.000,00 € or EUR100.000,00.

**Note:** The [LSIsCurrency](#) function always returns True if the locale is in the Euro currency zone and the currency is expressed in euros, including when using JVM 1.3.1. As a result, with older JVMs, [LSIsCurrency](#) does not ensure that [LSParseCurrency](#) returns a value.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

For a list of the locale-specific formats used to parse the currency, see [LSCurrencyFormat](#).

### Example

```
<h3>LSParseCurrency Example</h3>
<p>LSParseCurrency converts a locale-specific currency string to a number.
  Attempts conversion through each of the three default currency formats.
<!-- loop through a list of locales; show currency values for 123,456 units -
-->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ", ">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><B><I>#locale#</I></B><br>
    Local: #LSCurrencyFormat(123456.78, "local")#<br>
    Parsed local Currency:
    #LSParseCurrency(LSCurrencyFormat(123456,"local"))#<br>
    International: #LSCurrencyFormat(123456.78999, "international")#<br>
    Parsed International Currency:
    #LSParseCurrency(LSCurrencyFormat(123456.78999,"international"))#<br>
    None: #LSCurrencyFormat(123456.78999, "none")#<br>
    Parsed None formatted currency:
    #LSParseCurrency(LSCurrencyFormat(123456.78999,"none"))#<br>
  <hr noshade>
</cfoutput>
</cfloop>
```

# LSParseDateTime

## Description

Converts a string that is a valid date/time representation in the current locale into a date/time object.

## Returns

A date/time object.

## Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#), [String functions](#)

## Function syntax

```
LSParseDateTime(date/time-string)
```

## See also

[LSDateFormat](#), [ParseDateTime](#), [SetLocale](#), [GetLocale](#); “Locales” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed formatting behavior: this function might not parse string formats that worked with earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Changed how the `date/time-string` parameter value is processed: ColdFusion processes the `date/time-string` parameter value time zone information differently than in earlier releases, as described in the Usage section.

## Parameters

| Parameter                     | Description  |
|-------------------------------|--|
| <code>date/time-string</code> | A string a variable that contains one, in a format that is readable in the current locale. |

## Usage

This function can parse any date, time, or date/time combination that conforms to Java standard locale formatting rules for the current locale.

The following table lists some of the date/time values you can pass to this function in the English (US) locale. You can also pass only the date or the time parts of these formats:

| Format                       | Example           |
|------------------------------|-------------------|
| <code>m/dd/yy h:mm:ss</code> | 1/30/02 7:02:33   |
| <code>m/dd/yy h:mm tt</code> | 1/30/02 7:02 AM   |
| <code>m/dd/yyyy h:mm</code>  | 1/30/2002 7:02 AM |

| Format                             | Example                                    |
|------------------------------------|--|
| mmm dd, yyyy h:mm:ss tt            | Jan 30, 2002 7:02:12 AM                    |
| mmmm dd, yyyy h:mm:ss tt zzz       | January 30, 2002 7:02:23 AM PST            |
| ddd, mmm dd, yyyy hh:mm:ss         | Wed, Jan 30, 2002 07:02:12                 |
| dddd, mmmm dd, yyyy h:mm:ss tt zzz | Wednesday, January 30, 2002 7:02:12 AM PST |

Valid dates are in the range 100 AD–9999 AD. Two digit years in the range 00–29 are interpreted as being 2000–2029. Two digit years in the range 30–99 are interpreted as being 1930–1999

This function corrects for differences between the current time zone and any time zone specified in the input parameter.

- If a time zone specified in the `date/time-string` parameter is different from the time zone setting of the computer, ColdFusion adjusts the time value to its equivalent in the computer time zone.
- If a time zone is not specified in the `date/time-string` parameter, ColdFusion does not adjust the time value.

**Note:** This function does not accept POP dates, which include a time zone offset value.

### Example

```
<h3>LSParseDateTime Example - returns a locale-specific date/time object</h3>
<!-- loop through a list of locales and show date values for Now()-->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ", ">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><B><I>#locale#</I></B><br>
  <p>Locale-specific formats:
  <br>#LSDateFormat(Now(), "mmm-dd-yyyy")# #LSTimeFormat(Now())#<br>
  #LSDateFormat(Now(), "mmmm d, yyyy")# #LSTimeFormat(Now())#<br>
  #LSDateFormat(Now(), "mm/dd/yyyy")# #LSTimeFormat(Now())#<br>
  #LSDateFormat(Now(), "d-mmm-yyyy")# #LSTimeFormat(Now())#<br>
  #LSDateFormat(Now(), "ddd, mmmm dd, yyyy")# #LSTimeFormat(Now())#<br>
  #LSDateFormat(Now(), "d/m/yy")# #LSTimeFormat(Now())#<br>
  #LSDateFormat(Now())# #LSTimeFormat(Now())#<br>
  <p>Standard Date/Time:
  #LSParseDateTime("#LSDateFormat(Now())# #LSTimeFormat(Now())#"#)#<br>
  </cfoutput>
</cfloop>
```

# LSParseEuroCurrency

## Description

Formats a locale-specific currency string as a number. Attempts conversion through each of the default currency formats (none, local, international). Ensures correct handling of euro currency for Euro zone countries.

## Returns

A formatted number that matches the value of the string.

## Category

[International functions](#), [String functions](#)

## Function syntax

```
LSParseEuroCurrency(currency-string)
```

## See also

[LSParseCurrency](#), [LSEuroCurrencyFormat](#), [SetLocale](#); “Locale-specific content” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java locale formatting rules on all platforms, except that it uses the rule detailed in the Usage section for countries in the Euro currency zone.

## Parameters

| Parameter       | Description   |
|-----------------|---|
| currency-string | Locale-specific string or a variable that contains one. |

## Usage

This function determines whether the current locale’s country belongs to the Euro Zone, whose members have converted to the euro; if so, the `currency-string` parameter must be formatted in euros on all JVMs, including Sun JVM 1.3.1. If the country is not in the Euro zone, the string must follow the locale formatting rules of the JVM. For examples of valid currency formats in all supported locales, see [LSEuroCurrencyFormat on page 752](#).

For a list of the locale options that ColdFusion supports, and information on setting the default display format of date, time, number, and currency values, see [SetLocale](#).

## Example

```
<h3>LSParseEuroCurrency Example</h3>
<p>Loop through all available locales. Create string representations of the
value
123,456 in the three supported currency formats,
and parse the results back to numbers.<p>
<cfloop list="#Server.Coldfusion.SupportedLocales#" index="locale"
delimiters=",">
  <cfset oldlocale = SetLocale(locale)>
```

```
<cfoutput><p>Current Locale: <b><i>#locale#</i></b><br>
<cfset localCurrency = LSEuroCurrencyFormat(123456, "local")>
  Value in local currency: #localCurrency#<br>
  Parsed using LSParseEuroCurrency:
  #LSParseEuroCurrency(localCurrency)#<br>
<cfset IntlCurrency = LSEuroCurrencyFormat(123456, "international")>
  Value with International currency formatting: #IntlCurrency#<br>
  Parsed using LSParseEuroCurrency:
  #LSParseEuroCurrency(IntlCurrency)#<br>
<cfset Currency = LSEuroCurrencyFormat(123456, "none")>
  Value with no currency formatting: #currency#<br>
  Parsed using LSParseEuroCurrency:
  #LSParseEuroCurrency(Currency)#<br>
  <hr noshade>
</cfoutput>
</cfloop>
```

# LSParseNumber

## Description

Converts a string that is a valid numeric representation in the current locale into a formatted number.

## Returns

A formatted number that matches the value of the string.

## Category

[International functions](#), [String functions](#)

## Function syntax

```
LSParseNumber(string)
```

## See also

[LSParseDateTime](#), [SetLocale](#); “Locales” in Chapter 17, “Developing Globalized Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

This function uses Java standard locale formatting rules on all platforms.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

## Example

```
<h3>LSParseNumber Example</h3>
<p>LSParseNumber converts a locale-specific string to a number.
Returns the number matching the value of string.
<!-- loop through a list of locales and show number values -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ", ">
  <cfset oldlocale = SetLocale(locale)>

  <cfoutput><p><B><I>#locale#</I></B><br>
  #LSNumberFormat(-1234.5678, "_____")#<br>
  #LSNumberFormat(-1234.5678, "_____.____")#<br>
  #LSNumberFormat(1234.5678, "_____")#<br>
  #LSNumberFormat(1234.5678, "_____.____")#<br>
  #LSNumberFormat(1234.5678, "$_(_____.____)")#<br>
  #LSNumberFormat(-1234.5678, "$_(_____.____)")#<br>
```

```
#LSNumberFormat(1234.5678, "+_____." )#<br>
#LSNumberFormat(1234.5678, "-_____." )#<br>
The actual number:
  #LSParseNumber(LSNumberFormat(1234.5678, "_____." ))#<br>
<hr noshade>
</cfoutput>
</cfloop>
```

# LSTimeFormat

## Description

Formats the time part of a date/time string into a string in a locale-specific format.

## Returns

A string representing the time value.

## Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#)

## Function syntax

```
LSTimeFormat(time [, mask ])
```

## See also

[LSParseDateTime](#), [LSDateFormat](#), [TimeFormat](#); “Locales” in Chapter 17, “Developing Globalized Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 6.1: Added the mask character L or l to represent milliseconds.

ColdFusion MX:

- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Added support for the following *mask* parameter options: `short`, `medium`, `long`, and `full`.

## Parameters

---

| Parameter | Description  |
|-----------|--|
| string    | <ul style="list-style-type: none"><li>• A date/time value</li><li>• A string that is convertible to a time value</li></ul> A date/time object is in the range 100 AD-9999 AD.  |
| mask      | <p>Masking characters that determine the format:</p> <ul style="list-style-type: none"><li>• h: Hours; no leading zero for single-digit hours (12-hour clock)</li><li>• hh: Hours; leading zero for single-digit hours. (12-hour clock)</li><li>• H: Hours; no leading zero for single-digit hours (24-hour clock)</li><li>• HH: Hours; leading zero for single-digit hours (24-hour clock)</li><li>• m: Minutes; no leading zero for single-digit minutes</li><li>• mm: Minutes; leading zero for single-digit minutes</li><li>• s: Seconds; no leading zero for single-digit seconds</li><li>• ss: Seconds; leading zero for single-digit seconds</li><li>• l: Milliseconds</li><li>• t: One-character time marker string, such as A or P.</li><li>• tt: Multiple-character time marker string, such as AM or PM</li></ul> <p>The following conform to Java locale-specific time encoding standards. Their exact formats depend on the locale:</p> <ul style="list-style-type: none"><li>• short: includes hours, minutes; may include AM or PM</li><li>• medium: includes hours, minutes; may include AM or PM</li><li>• long: medium plus time zone</li><li>• full: long, may also include an hour designator</li></ul> <p>The default value is short.</p> |

---

## Usage

This function uses Java standard locale formatting rules on all platforms.

When passing date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

To calculate a difference between time zones, use the [GetTimeZoneInfo](#) function.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

If no seconds value is passed to this function, and the mask value is `s`, the default output seconds format is one zero; for example, `lstimeformat(6:39, "h:m:s")` returns `6:39:0`. If the mask value is `ss`, it returns `6:39:00`.

## Example

```
<h3>LSTimeFormat Example</h3>
```

```

# LTrim

## Description

Removes leading spaces from a string.

## Returns

A copy of the string, without leading spaces.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

```
LTrim(string)
```

## See also

[RTrim](#), [ToBase64](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Example

```
<h3>LTrim Example</h3>

<cfif IsDefined("FORM.myText")>
<cfoutput>
<pre>
Your string:"#FORM.myText#"
Your string:"#LTrim(FORM.myText)#"
(left trimmed)
</pre>
</cfoutput>
</cfif>

<form action = "ltrim.cfm">
<p>Type in some text, and it will be modified by LTrim to remove
  leading spaces from the left
<p><input type = "Text" name = "myText" value = "  TEST">

<p><input type = "Submit" name = "">
</form>
```

# Max

## Description

Determines the greater of two numbers.

## Returns

The greater of two numbers.

## Category

[Mathematical functions](#)

## Function syntax

Max(*number1*, *number2*)

## See also

[Min](#)

## Parameters

| Parameter        | Description |
|------------------|-------------|
| number1, number2 | Numbers     |

## Example

```
<h3>Max Example</h3>
<cfif IsDefined("FORM.myNum1")>
  <cfif IsNumeric(FORM.myNum1) and IsNumeric(FORM.myNum2)>
    <p>The maximum of the two numbers is <cfoutput>#Max(FORM.myNum1,
      FORM.myNum2)#</cfoutput>
    <p>The minimum of the two numbers is <cfoutput>#Min(FORM.myNum1,
      FORM.myNum2)#</cfoutput>
  <cfelse>
    <p>Please enter two numbers
  </cfif>
</cfif>

<form action = "max.cfm">
<h3>Enter two numbers, see the maximum and minimum of them</h3>

Number 1 <input type = "Text" name = "MyNum1">
<br>Number 2 <input type = "Text" name = "MyNum2">

<br><input type = "Submit" name = "" value = "See results">
</form>
```

# Mid

## Description

Extracts a substring from a string.

## Returns

A string; the set of characters from *string*, beginning at *start*, of length *count*.

## Category

[String functions](#)

## Function syntax

`Mid(string, start, count)`

## See also

[Left](#), [Len](#), [Right](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A string or a variable that contains one. Must be single-quotation mark or double-quotation mark delimited.                              |
| start     | A positive integer or a variable that contains one. Position at which to start count. Positions start with 1, not 0.                     |
| count     | A positive integer or a variable that contains one. Number of characters to return. (Zero is not valid, but it does not throw an error.) |

## Example

```
<h3>Mid Example</h3>

<cfif IsDefined("Form.myText")>
  <!-- If len returns 0 (zero), then show error message. -->
  <cfif Len(Form.myText)>
    <cfif Len(Form.myText) LTE Form.RemoveChars>
      <cfoutput><p style="color: red; font-weight: bold">Your string
        #Form.myText# only has #Len(Form.myText)# characters. You cannot output
        the #Form.removeChars# middle characters of this string because it is
        not long enough.</p></cfoutput>
    <cfelseif Form.startPos GTE Len(Form.myText)>
      <cfoutput><p style="color: red; font-weight: bold">Your string
        #Form.myText# only has #Len(Form.myText)# characters. You cannot start
        at position #Form.startPos#.</p></cfoutput>
    <cfelse>
      <cfoutput><p>Your original string: <strong>#Form.myText#</strong></p>
      <p>Your changed string, showing only the <strong>#Form.removeChars#
        </strong> middle characters: <strong>#Mid(Form.myText,
        Form.startPos, Form.removeChars)#</strong></p></cfoutput>
    </cfif>
  <cfelse>
    <p style="color: red; font-weight: bold">Please enter a string of more
    than 0 (zero) characters.</p>
  </cfif>
</cfif>
```

```
</cfif>
</cfif>

<form action="#<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
<p>Type in some text<br />
<input type="Text" name="myText"></p>
<p>Enter a starting position (from the beginning of the entered text)<br />
<input name="startPos" type="text" size="1"></p>
<p>How many characters do you want to show?
<select name="RemoveChars">
<option value="1">1
<option value="3" selected>3
<option value="5">5
<option value="7">7
<option value="9">9</select>
<input type="Submit" name="Submit" value="Remove characters"></p>
</form>
```

# Min

## Description

Determines the lesser of two numbers.

## Returns

The lesser of two numbers.

## Category

[Mathematical functions](#)

## Function syntax

`Min(number1, number2)`

## See also

[Max](#)

## Parameters

| Parameter                     | Description |
|-------------------------------|-------------|
| <code>number1, number2</code> | Numbers     |

## Example

```
<h3>Min Example</h3>
<cfif IsDefined("FORM.myNum1")>
  <cfif IsNumeric(FORM.myNum1) and IsNumeric(FORM.myNum2)>
    <p>The maximum of the two numbers is <cfoutput>#Max(FORM.myNum1,
FORM.myNum2)#</cfoutput>
    <p>The minimum of the two numbers is <cfoutput>#Min(FORM.myNum1,
FORM.myNum2)#</cfoutput>
  <cfelse>
    <p>Please enter two numbers
  </cfif>
</cfif>

<form action = "min.cfm">
<h3>Enter two numbers, and see the maximum and minimum of the two numbers</h3>

Number 1 <input type = "Text" name = "MyNum1">
<br>Number 2 <input type = "Text" name = "MyNum2">

<br><input type = "Submit" name = "" value = "See results">
</form>
```

# Minute

## Description

Extracts the minute value from a date/time object.

## Returns

The ordinal value of the minute, in the range 0–59.

## Category

[Date and time functions](#)

## Function syntax

`Minute(date)`

## See also

[DatePart](#), [Hash](#), [Second](#)

## Parameters

| Parameter         | Description  |
|-------------------|--|
| <code>date</code> | • A date/time object, in the range 100 AD–9999 AD. |

## Usage

When passing a date/time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

## Example

```
<h3>Minute Example</h3>
```

```
<cfoutput>
```

```
The time is currently #TimeFormat(Now())#.
```

```
We are in hour #Hour(Now())#, Minute #Minute(Now())#  
and Second #Second(Now())# of the day.
```

```
</cfoutput>
```

# Month

## Description

Extracts the month value from a date/time object.

## Returns

The ordinal value of the month, in the range 1 (January) – 12 (December).

## Category

[Date and time functions](#)

## Function syntax

Month(*date*)

## See also

[DatePart](#), [MonthAsString](#), [Quarter](#)

## Parameters

| Parameter | Description                                    |
|-----------|--|
| date      | Date/time object, in the range 100 AD–9999 AD. |

## Usage

When passing a date/time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or the [Now](#) function as the *date* parameter of this function; for example: `#Month(CreateDate(2001, 3, 3))#`.

## Example

```
<h3>Month Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
<cfoutput>
  <p>Your date, #DateFormat(yourDate)#.
  <br>It is #DayofWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
  <br>This is day #Day(yourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
  <br>We are in week #Week(yourDate)# of #Year(yourDate)#
    (day #DayofYear(yourDate)# of #DaysinYear(yourDate)#). <br>
  <cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year
  </cfif>
</cfoutput>
</cfif>
```

# MonthAsString

## Description

Determines the name of the month that corresponds to *month\_number*.

## Returns

A string; the name of the specified month, in the current locale.

## Category

[Date and time functions](#), [String functions](#)

## Function syntax

```
MonthAsString(month_number)
```

## See also

[DatePart](#), [Month](#), [Quarter](#)

## Parameters

| Parameter    | Description                     |
|--------------|---------------------------------|
| month_number | An integer in the range 1 - 12. |

## Example

```
<h3>MonthAsString Example</h3>

<cfif IsDefined("FORM.year")>
<p>More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>

<cfoutput>
<p>Your date, #DateFormat(yourDate)#.
<br>It is #DayofWeekAsString(DayOfWeek(yourDate))#, day
#DayOfWeek(yourDate)# in the week.
<br>This is day #Day(yourDate)# in the month of
#MonthAsString(Month(yourDate))#, which has
#DaysInMonth(yourDate)# days.
<br>We are in week #Week(yourDate)# of #Year(yourDate)#
(day #DayofYear(yourDate)# of #DaysinYear(yourDate)#). <br>
<cfif IsLeapYear(Year(yourDate))>This is a leap year
<cfelse>This is not a leap year
</cfif>
</cfoutput>
</cfif>
```

# Now

## Description

Gets the current date and time of the computer running the ColdFusion server. The return value can be passed as a parameter to date functions such as [DaysInYear](#) or [FirstDayOfMonth](#).

## Returns

A date/time object; the current date and time of the computer running the ColdFusion server.

## Category

[Date and time functions](#)

## Function syntax

`Now()`

## See also

[CreateDateTime](#), [DatePart](#)

## Example

```
<h3>Now Example</h3>
```

```
<p>Now returns the current date and time as a valid date/time object.
```

```
<p>The current date/time value is <cfoutput>#Now()#</cfoutput>
```

```
<p>You can also represent this as <cfoutput>#DateFormat(Now())#,  
#TimeFormat(Now())#</cfoutput>
```

# NumberFormat

## Description

Creates a custom-formatted number value. Supports the numeric formatting used in the U.S. For international number formatting, see [LSNumberFormat](#).

## Returns

A formatted number value:

- If no mask is specified, returns the value as an integer with a thousands separator.
- If the parameter value is "" (an empty string), returns 0.

## Category

[Display and formatting functions](#)

## Function syntax

```
NumberFormat(number [, mask ])
```

## See also

[DecimalFormat](#), [DollarFormat](#), [IsNumeric](#), [LSNumberFormat](#)

## History

ColdFusion MX: Changed behavior: if the mask format cannot correctly mask a number, this function returns the number unchanged. (It does not truncate the number nor throw an error.) (If no mask is selected, ColdFusion MX rounds the decimal part as ColdFusion 5 does. For example, it rounds 34.567 to 35.)

## Parameters

| Parameter | Description   |
|-----------|---|
| number    | A number.   |
| mask      | A string or a variable that contains one. Set of characters that determine how ColdFusion displays the number |

The following table explains mask characters:

| Mask character | Meaning   |
|----------------|---|
| _ (underscore) | Optional. Digit placeholder.  |
| 9              | Optional. Digit placeholder. (Shows decimal places more clearly than _.)    |
| .              | Location of a mandatory decimal point.                                      |
| 0              | Located to the left or right of a mandatory decimal point. Pads with zeros. |
| ()             | If number is less than zero, puts parentheses around the mask.              |
| +              | Puts plus sign before positive number; minus sign before negative number.   |
| -              | Puts a space before positive number; minus sign before negative number.     |

| Mask character | Meaning  |
|----------------|--|
| ,              | Separates every third decimal place with a comma.  |
| L,C            | Left-justifies or center-justifies number within width of mask column. First character of mask must be L or C. The default value is right-justified. |
| \$             | Puts a dollar sign before formatted number. First character of mask must be the dollar sign (\$).  |
| ^              | Separates left and right formatting.   |

**Note:** If you do not specify a sign for the mask, positive and negative numbers do not align in columns. To put a plus sign or space before positive numbers and a minus sign before negative numbers, use the plus or minus sign, respectively.

## Usage

This function uses Java standard locale formatting rules on all platforms.

The position of symbols in format masks determines where the codes take effect. For example, if you put a dollar sign at the far left of a format mask, ColdFusion displays a dollar sign at the left edge of the formatted number. If you separate the dollar sign on the left edge of the format mask by at least one underscore, ColdFusion displays the dollar sign just to the left of the digits in the formatted number.

These examples show how symbols determine formats:

| Number | Mask    | Result    |
|--------|---------|-----------|
| 4.37   | \$____  | "\$ 4.37" |
| 4.37   | _\$____ | " \$4.37" |

The positioning can also show where to place the minus sign for negative numbers:

| Number | Mask  | Result   |
|--------|-------|----------|
| -4.37  | -____ | "- 4.37" |
| -4.37  | __-__ | " -4.37" |

The positions for a symbol are: far left, near left, near right, and far right. The left and right positions are determined by the side of the decimal point on which the code character is shown. For formats that do not have a fixed number of decimal places, you can use a caret (^) to separate the left fields from the right.

An underscore determines whether the code is placed in the far or near position. Most code characters' effect is determined by the field in which they are located. This example shows how to specify where to put parentheses to display negative numbers:

| Number | Mask   | Result    |
|--------|--------|-----------|
| 3.21   | C(_^_) | "( 3.21)" |
| 3.21   | C_(^_) | " (3.21)" |

# ParagraphFormat

## Description

Replaces characters in a string:

- Single newline characters (CR/LF sequences) with spaces
- Double newline characters with HTML paragraph tags (<p>)

## Returns

A copy of the string, with characters converted.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

```
ParagraphFormat(string)
```

## See also

[StripCR](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

This function is useful for displaying data entered in `textarea` fields.

## Example

```
<h3>ParagraphFormat Example</h3>
<p>Enter text into this textarea, and see it returned as HTML.
<cfif IsDefined("FORM.myTextArea")>
  <p>Your text area, formatted
  <p><cfoutput>#ParagraphFormat(FORM.myTextArea)#</cfoutput>
</cfif>
<!-- use #Chr(10)##Chr(13)# to simulate a line feed/carriage
return combination; i.e, a return --->
<form action = "paragraphformat.cfm">
<textarea name = "MyTextArea" cols = "35" ROWS = 8>
This is sample text and you see how it scrolls
  <cfoutput>#Chr(10)##Chr(13)#</cfoutput>
  From one line
  <cfoutput>#Chr(10)##Chr(13)##Chr(10)##Chr(13)#</cfoutput>
  to the next
</textarea>
<input type = "Submit" name = "Show me the HTML version">
</form>
```

# ParameterExists

## Description

This function is deprecated. Use the `IsDefined` function.

Determines whether a parameter exists. ColdFusion does not evaluate the argument.

## History

ColdFusion MX: Deprecated this function. It might not work, and might cause an error, in later releases.

# ParseDateTime

## Description

Parses a date/time string according to the English (U.S.) locale conventions. (To format a date/time string for other locales, use the [LSParseDateTime](#) function.)

## Returns

A date/time object

## Category

[Date and time functions](#), [Display and formatting functions](#)

## Function syntax

```
ParseDateTime(date/time-string [, pop-conversion ] )
```

## See also

[IsDate](#), [IsNumericDate](#), [SetLocale](#)

## Parameters

| Parameter        | Description   |
|------------------|---|
| date/time string | A string containing a date/time value formatted according to U.S. locale conventions. Can represent a date/time in the range 100 AD-9999 AD. Years 0-29 are interpreted as 2000-2029; years 30-99 are interpreted as 1930-1999.   |
| pop-conversion   | <ul style="list-style-type: none"><li>• pop: specifies that the date/time string is in POP format, which includes the local time of the sender and a time-zone offset from UTC. ColdFusion applies the offset and returns a value with the UTC time.</li><li>• standard: (the default) function does no conversion.</li></ul> |

## Usage

This function is similar to [CreateDateTime](#), but it takes a string instead of enumerated date/time values. These functions are provided primarily to increase the readability of code in compound expressions.

To calculate a difference between time zones, use the [GetTimeZoneInfo](#) function.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

## Example

```
<h3>ParseDateTime Example</h3>
<cfif IsDefined("form.theTestValue")>
  <cfif IsDate(form.theTestValue)>
    <h3>The expression <cfoutput>#DE(form.theTestValue)#</cfoutput> is a valid
    date</h3>
    <p>The parsed date/time is:
      <cfoutput>#ParseDateTime(form.theTestValue)#</cfoutput>
    </p>
  </cfif>
</cfif>
```

```
<h3>The expression <cfoutput>#DE(form.theTestValue)#</cfoutput> is not a
valid date</h3>
</cfif>
</cfif>

<form action="#CGI.ScriptName#" method="POST">
<p>Enter an expression, and discover if it can be evaluated to a date value.
<input type="Text" name="TheTestValue" value="<CFOUTPUT>#DateFormat(Now())#
#TimeFormat(Now())#</CFOUTPUT>">
<input type="Submit" value="Parse the Date" name="">
</form>
```

# Pi

## Description

Gets the mathematical constant  $\pi$ , accurate to 15 digits.

## Returns

The number 3.14159265358979.

## Category

[Mathematical functions](#)

## Function syntax

Pi()

## See also

[ASin](#), [Cos](#), [Sin](#), [Tan](#)

## Example

```
<h3>Pi Example</h3>
<!-- By default, ColdFusion displays only 11 significant digits.
      Use NumberFormat to display all 15. -->
The Pi function Returns the number
<cfoutput>
#NumberFormat(Pi(), "_." <u>                    </u>")#,
</cfoutput> the mathematical constant pi, accurate to 15 digits.
```

# PreserveSingleQuotes

## Description

Prevents ColdFusion from automatically escaping single-quotation mark characters that are contained in a variable. ColdFusion does not evaluate the argument.

## Returns

(None)

## Category

[Other functions](#)

## Function syntax

```
PreserveSingleQuotes(variable)
```

## History

ColdFusion MX: Changed behavior: ColdFusion automatically escapes simple-variable, array-variable, and structure-variable references within a `cfquery` tag body or block. (Earlier releases did not automatically escape array-variable references.)

## Parameters

| Parameter | Description  |
|-----------|--|
| variable  | Variable that contains a string in which to preserve single-quotation marks. |

## Usage

This function is useful in SQL statements to defer evaluation of a variable reference until runtime. This prevents errors that result from the evaluation of a single-quote or apostrophe data character (for example, "Joe's Diner") as a delimiter.

**Example A:** Consider this code:

```
<cfset mystring = "'Newton's Law', 'Fermat's Theorem'">
PreserveSingleQuotes(#mystring#) is
<cfoutput>
  #PreserveSingleQuotes(mystring)#
</cfoutput>
```

The output is as follows:

```
PreserveSingleQuotes(#mystring#) is 'Newton's Law', 'Fermat's Theorem'
```

**Example B:** Consider this code:

```
<cfset list0 = " '1','2', '3' ">
<cfquery sql = "select * from foo where bar in (#list0#)">
```

ColdFusion escapes the single-quote characters in the list as follows:

```
"'1'", "'2'", "'3'"
```

The `cfquery` tag throws an error.

You code this function correctly as follows:

```
<cfquery sql = "select * from foo where bar in
  (#preserveSingleQuotes(list0)#)">
```

This function ensures that ColdFusion evaluates the code as follows:

```
'1', '2', '3'
```

### Example

**PreserveSingleQuotes Example**  
This is a useful function for creating lists of information to return from a query. In this example, we pick the list of Centers in Suisun, San Francisco, and San Diego, using the SQL grammar IN to modify a WHERE clause, rather than looping through the result set after the query is run.

```
<cfset List = "'Suisun', 'San Francisco', 'San Diego'">
<cfquery name = "GetCenters" datasource = "cfdoexamples">
  SELECT Name, Address1, Address2, City, Phone
  FROM Centers
  WHERE City IN (#PreserveSingleQuotes(List)#)
</cfquery>
<p>We found <cfoutput>#GetCenters.RecordCount#</cfoutput> records.
<cfoutput query = "GetCenters">
  <p>#Name#<br>
  #Address1#<br>
  <cfif Address2 is not "">#Address2#
  </cfif>
  #City#<br>
  #Phone#<br>
</cfoutput>
```

# Quarter

## Description

Calculates the quarter of the year in which a date falls.

## Returns

An integer, 1–4.

## Category

[Date and time functions](#)

## Function syntax

`Quarter(date)`

## See also

[DatePart](#), [Month](#)

## Parameters

| Parameter         | Description                                     |
|-------------------|---|
| <code>date</code> | A date/time object in the range 100 AD–9999 AD. |

## Usage

When passing a date/time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

## Example

`<h3>Quarter Example</h3>`

Today, `<cfoutput>#DateFormat(Now())#</cfoutput>`,  
is in Quarter `<cfoutput>#Quarter(Now())#</cfoutput>`.

# QueryAddColumn

## Description

Adds a column to a query and populates its rows with the contents of a one-dimensional array. Pads query columns, if necessary, to ensure that all columns have the same number of rows.

## Returns

The number of the column that was added.

## Category

[Query functions](#)

## Function syntax

```
QueryAddColumn(query, column-name[, datatype], array-name)
```

## See also

[QueryNew](#), [QueryAddRow](#), [QuerySetCell](#); “Managing data types for columns” in Chapter 22, “Using Query of Queries,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `datatype` parameter.

ColdFusion MX: Changed behavior: if a user attempts to add a column whose name is invalid, ColdFusion throws an error. (In earlier releases, ColdFusion permitted the add operation, but the user could not reference the column after adding it.)

## Parameters

| Parameter                | Description  |
|--------------------------|--|
| <code>query</code>       | Name of a query object.  |
| <code>column-name</code> | Name of the new column.  |
| <code>datatype</code>    | (Optional) Column data type. ColdFusion generates an error if data you add to the column is not of this type, or if it cannot convert the data to this type. The following data types are valid: <ul style="list-style-type: none"><li>• Integer: 32-bit integer</li><li>• BigInt: 64-bit integer</li><li>• Double: 64-bit decimal number</li><li>• Decimal: Variable length decimal, as specified by <code>java.math.BigDecimal</code></li><li>• VarChar: String</li><li>• Binary: Byte array</li><li>• Bit: Boolean (1=True, 0=False)</li><li>• Time: Time</li><li>• Data: Date (can include time information)</li></ul> |
| <code>array-name</code>  | Name of an array whose elements populate the new column.   |

## Usage

You can add columns to query objects, such as queries retrieved with the `cfquery` tag or queries created with the `QueryNew` function. You cannot use the `QueryAddColumn` function on a cached query. This function is useful for generating a query object from the arrays of output parameters that Oracle stored procedures can generate.

Macromedia recommends that you use the optional `datatype` parameter. Without this parameter, ColdFusion must try to determine the column's data type when it uses the query object in a query of queries. Determining the data type requires additional processing, and can result in errors if ColdFusion does not guess the type correctly.

## Example

The following example creates a new query object, uses the `QueryAddColumn` function to add three columns to the object, and displays the results. Because two of the arrays that provide the data are shorter than the third, `QueryAddColumn` adds padding to the corresponding columns in the query.

```
<!--- Make a query. --->
<cfset myQuery = QueryNew("")>

<!--- Create an array. --->
<cfset FastFoodArray = ArrayNew(1)>
<cfset FastFoodArray[1] = "French Fries">
<cfset FastFoodArray[2] = "Hot Dogs">
<cfset FastFoodArray[3] = "Fried Clams">
<cfset FastFoodArray[4] = "Thick Shakes">
<!--- Use the array to add a column to the query. --->
<cfset nColumnNumber = QueryAddColumn(myQuery, "FastFood", "VarChar",
    FastFoodArray)>

<!--- Create a second array. --->
<cfset FineCuisineArray = ArrayNew(1)>
<cfset FineCuisineArray[1] = "Lobster">
<cfset FineCuisineArray[2] = "Flambe">
<!--- Use the array to add a second column to the query. --->
<cfset nColumnNumber2 = QueryAddColumn(myQuery, "FineCuisine", "VarChar",
    FineCuisineArray)>

<!--- Create a third array. --->
<cfset HealthFoodArray = ArrayNew(1)>
<cfset HealthFoodArray[1] = "Bean Curd">
<cfset HealthFoodArray[2] = "Yogurt">
<cfset HealthFoodArray[3] = "Tofu">
<!--- Use the array to add a third column to the query. --->
<cfset nColumnNumber3 = QueryAddColumn(myQuery, "HealthFood", "VarChar",
    HealthFoodArray)>

<!--- Display the results. --->
<table cellpadding = "2" cellspacing = "2" border = "0">
<tr>
    <th align = "left">Fast Food</th>
    <th align = "left">Fine Cuisine</th>
```

```
<th align = "left">Health Food</th>
</tr>
<cfoutput query = "myQuery">
<tr>
  <td>#FastFood#</td>
  <td>#FineCuisine#</td>
  <td>#HealthFood#</td>
</tr>
</cfoutput>
</table>
```

# QueryAddRow

## Description

Adds a specified number of empty rows to a query.

## Returns

The number of rows in the query

## Category

[Query functions](#)

## Function syntax

```
QueryAddRow(query [, number ])
```

## See also

[QueryAddColumn](#), [QueryAddRow](#), [QuerySetCell](#), [QueryNew](#); “Creating a record set with a function” in Chapter 22, “Using Query of Queries,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| query     | Name of an executed query.                                  |
| number    | Number of rows to add to the query. The default value is 1. |

## Example

```
<h3>QueryAddRow Example</h3>

<!-- start by making a query -->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
    SELECT Course_ID, Descript
    FROM Courses
</cfquery>
<p>The Query "GetCourses" has <cfoutput>#GetCourses.RecordCount#</cfoutput>
rows.

<cfset CountVar = 0>
<cfloop CONDITION = "CountVar LT 15">
    <cfset temp = QueryAddRow(GetCourses)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Number", 100*CountVar)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Descript",
    "Description of variable #Countvar#")>
</cfloop>

<p>After the QueryAddRow action, the query has
<CFOUTPUT>#GetCourses.RecordCount#</CFOUTPUT>
records.
<CFOUTPUT query="GetCourses">
<PRE>#Course_ID# #Course_Number# #Descript#</pre> </cfoutput>
```

# QueryNew

## Description

Creates an empty query (query object).

## Returns

An empty query with a set of named columns, or an empty query.

## Category

[Query functions](#)

## Function syntax

```
QueryNew(columnlist [, columntypelist])
```

## History

ColdFusion MX 7: Added *columntypelist* parameter.

## See also

[QueryAddColumn](#), [QueryAddRow](#), [QuerySetCell](#); “Managing data types for columns” in Chapter 22, “Using Query of Queries,” *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter             | Description   |
|-----------------------|---|
| <i>columnlist</i>     | Comma-delimited list of column names, or an empty string.   |
| <i>columntypelist</i> | (Optional) Comma-delimited list specifying column data types. ColdFusion generates an error if the data you add to the column is not of this type, or if it cannot convert the data to this type. The following data types are valid: <ul style="list-style-type: none"><li>• Integer: 32-bit integer</li><li>• BigInt: 64-bit integer</li><li>• Double: 64-bit decimal number</li><li>• Decimal: Variable length decimal, as specified by <code>java.math.BigDecimal</code></li><li>• VarChar: String</li><li>• Binary: Byte array</li><li>• Bit: Boolean (1=True, 0=False)</li><li>• Time: Time</li><li>• Date: Date (can include time information)</li></ul> |

## Usage

If you specify an empty string in the *columnlist* parameter, you must use the `QueryAddColumn` function to add columns to the query.

Macromedia recommends that you use the optional *columntypelist* parameter. Without this parameter, ColdFusion must try to determine data types when it uses the query object in a query of queries. Determining data types requires additional processing, and can result in errors if ColdFusion does not guess a type correctly.

## Example

The following example uses the `QueryNew` function to create an empty query with three columns. It populates two rows of the query and displays the contents of the query object and its metadata.

```
<!-- Create a new three-column query, specifying the column data types -->
<cfset myQuery = QueryNew("Name, Time, Advanced", "VarChar, Time, Bit")>

<!-- Make two rows in the query -->
<cfset newRow = QueryAddRow(MyQuery, 2)>

<!-- Set the values of the cells in the query -->
<cfset temp = QuerySetCell(myQuery, "Name", "The Wonderful World of CMFL", 1)>
<cfset temp = QuerySetCell(myQuery, "Time", "9:15 AM", 1)>
<cfset temp = QuerySetCell(myQuery, "Advanced", False, 1)>
<cfset temp = QuerySetCell(myQuery, "Name", "CFCs for Enterprise
    Applications", 2)>
<cfset temp = QuerySetCell(myQuery, "Time", "12:15 PM", 2)>
<cfset temp = QuerySetCell(myQuery, "Advanced", True, 2)>

<h4>The query object contents</h4>
<cfoutput query = "myQuery">
    #Name# #Time# #Advanced#<br>
</cfoutput><br>
<br>
<h4>Using individual query data values</h4>
<cfoutput>
    #MyQuery.name[2]# is at #MyQuery.Time[2]#<br>
</cfoutput><br>
<br>
<h4>The query metadata</h4>
<cfset querymetadata=getMetaData(myQuery)>
<cfdump var="#querymetadata#">
```

# QuerySetCell

## Description

Sets a cell to a value. If no row number is specified, the cell on the last row is set.

## Returns

True, if successful; False, otherwise.

## Category

[Query functions](#)

## Function syntax

```
QuerySetCell(query, column_name, value [, row_number ])
```

## See also

[QueryAddColumn](#), [QueryAddRow](#), [QueryNew](#); “Creating a record set with a function” in Chapter 22, “Using Query of Queries,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter   | Description                                |
|-------------|--|
| query       | Name of an executed query.                 |
| column_name | Name of a column in the query.             |
| value       | Value to set in the cell.                  |
| row_number  | Row number. The default value is last row. |

## Example

```
<!-- This example shows the use of QueryAddRow and QuerySetCell -->

<!-- start by making a query -->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
  SELECT Course_ID, Descript
  FROM Courses
</cfquery>
<p>The Query "GetCourses" has <cfoutput>#GetCourses.RecordCount#</cfoutput>
  rows.

<cfset CountVar = 0>
<cfloop CONDITION = "CountVar LT 15">
  <cfset temp = QueryAddRow(GetCourses)>
  <cfset CountVar = CountVar + 1>
  <cfset Temp = QuerySetCell(GetCourses, "Number", 100*CountVar)>
  <cfset CountVar = CountVar + 1>
  <cfset Temp = QuerySetCell(GetCourses, "Descript",
    "Description of variable #Countvar#")>
</cfloop>

<p>After the QueryAddRow action, the query has
  <CFOUTPUT>#GetCourses.RecordCount#</CFOUTPUT>
  records.
  <CFOUTPUT query="GetCourses">
  <PRE>#Course_ID# #Course_Number# #Descript#</pre> </cfoutput>
```

# QuotedValueList

## Description

Gets the values of each record returned from an executed query. ColdFusion does not evaluate the arguments.

## Returns

A delimited list of the values of each record returned from an executed query. Each value is enclosed in single-quotation marks.

## Category

[Query functions](#), [List functions](#)

## Function syntax

```
QuotedValueList(query.column [, delimiter ])
```

## See also

[ValueList](#)

## Parameters

| Parameter    | Description  |
|--------------|--|
| query.column | Name of an executed query and column. Separate query name and column name with a period. |
| delimiter    | A string or a variable that contains one. Character(s) that separate column data.        |

## Example

```
<!-- use the contents of one query to create another dynamically -->
<cfset List = "BIOL', 'CHEM'">
<!-- first, get the department IDs in our list -->
<cfquery name = "GetDepartments" datasource = "cfdocexamples">
SELECT Dept_ID FROM Departments
WHERE Dept_ID IN (#PreserveSingleQuotes(List)#)
</cfquery>

<!-- now, select the courses for that department based on the
quotedValueList produced from our previous query -->
<cfquery name = "GetCourseList" datasource = "cfdocexamples">
SELECT *
FROM CourseList
WHERE Dept_ID IN ('#GetDepartments.Dept_ID#')
</cfquery>

<!-- now, output the results -->

List the course numbers that are in BIOL and CHEM (uses semicolon (;) as the
delimiter):<br>
<cfoutput>
#QuotedValueList(GetCourseList.CorNumber, ";")#<br>
</cfoutput>
```

# Rand

## Description

Generates a pseudo-random number.

## Returns

A pseudo-random decimal number, in the range 0 – 1.

## Category

[Mathematical functions](#), [Security functions](#)

## Function syntax

```
Rand([algorithm])
```

## History

ColdFusion MX 7: Added the *algorithm* parameter.

## See also

[Randomize](#), [RandRange](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| algorithm | (Optional) The algorithm to use to generate the random number. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>CFMX_COMPAT: the algorithm used in ColdFusion MX (default).</li><li>SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm</li><li>IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm).</li></ul> |

## Usage

Call the [Randomize](#) function before calling this function to seed the random number generator. Seeding the generator ensures that the `Rand` function always generates the same sequence of pseudo-random numbers. This behavior is useful if you must reproduce a pattern consistently.

ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

## Example

The following example uses the SHA1PRNG algorithm to generate a single random number:

```
<h3>Rand Example</h3>
<cfoutput>
  <p>Rand("SHA1PRNG") returned: #Rand("SHA1PRNG")#</p>
  <p><A HREF = "#CGI.SCRIPT_NAME#">Try again</A>
</cfoutput>
```

# Randomize

## Description

Seeds the pseudo-random number generator with an integer number, ensuring repeatable number patterns.

## Returns

A pseudo-random decimal number, in the range 0–1.

## Category

[Mathematical functions](#), [Security functions](#)

## Function syntax

```
Randomize(number[, algorithm])
```

## History

ColdFusion MX 7: Added the *algorithm* parameter.

## See also

[Rand](#), [RandRange](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| number    | Integer number. If the number is not in the range -2,147,483,648 – 2,147,483,647, ColdFusion generates an error.   |
| algorithm | (Optional) The algorithm to use to generate the seed number. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>CFMX_COMPAT: the algorithm used in ColdFusion MX (default).</li><li>SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm.</li><li>IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm).</li></ul> |

## Usage

Call this function before calling [Rand](#) to seed the random number generator. Seeding the generator ensures that the [Rand](#) function always generates the same sequence of pseudo-random numbers. This behavior is useful if you must reproduce a pattern consistently.

ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

## Example

The following example calls the `Randomize` function to seed the random number generator and generates 10 random numbers. To show the effect of the seed, submit the form with the same value multiple times.

```
<h3>Randomize Example</h3>

<!-- Do the following only if the form has been submitted. -->
<cfif IsDefined("Form.myRandomInt")>

  <!-- Make sure submitted value is a number and display its value. -->
  <cfif IsNumeric(FORM.myRandomInt)>
    <cfoutput>
      <b>Seed value is #FORM.myRandomInt#</b><br>
    </cfoutput><br>

    <!-- Call Randomize to seed the random number generator. -->
    <cfset r = Randomize(FORM.myRandomInt, "SHA1PRNG")>

    <cfoutput>
      <b>Random number returned by Randomize(#Form.myRandomInt#,
        "SHA1PRNG"):</b><br>
      #r#<br>
      <br>
      <b>10 random numbers generated using the SHA1PRNG algorithm:</b><br>
      <cfloop index = "i" from = "1" to = "10" step = "1">
        #Rand("SHA1PRNG")#<br>
      </cfloop><br>
    </cfoutput>

  <cfelse>
    <p>Please enter a number.
  </cfif>
</cfif>

<!-- Form to specify the seed value. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
<p>Enter a number to seed the randomizer:
<input type = "Text" name = "MyRandomInt" value="12345">
<p><input type = "Submit" name = "">
</form>
```

# RandRange

## Description

Generates a pseudo-random integer in the range between two specified numbers.

## Returns

A pseudo-random integer.

## Category

[Mathematical functions](#), [Security functions](#)

## Function syntax

```
RandRange(number1, number2[, algorithm])
```

## History

ColdFusion MX 7: Added the *algorithm* parameter.

## See also

[Rand](#), [Randomize](#)

## Parameters

| Parameter                       | Description   |
|---------------------------------|---|
| <i>number1</i> , <i>number2</i> | Integer numbers. If the numbers are not in the range -2,147,483,648 – 2,147,483,647, ColdFusion generates an error.   |
| <i>algorithm</i>                | (Optional) The algorithm to use to generate the random number. ColdFusion MX installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• CFMX_COMPAT: the algorithm used in ColdFusion MX (default).</li><li>• SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm</li><li>• IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm.)</li></ul> |

## Usage

Very large positive or negative values for the *number1* and *number2* parameters might result in poor randomness in the results. To prevent this problem, do not specify numbers outside the range -1,000,000,000 – 1,000,000,000.

ColdFusion MX 7 uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, Macromedia cannot provide technical support for third-party security providers.

## Example

The following example contains a form that requires random number range values, and lets you optionally specify a random number seed value. It uses `cfform` controls and attributes to specify a default range, ensure that the range fields have values, and validate that the field values are in a specified integer range. When you submit the form, it checks whether the seed field has an empty string; if the field has a value, the code uses the number to seed the random number generator. It then generates and displays the random number.

```
<h3>RandRange Example</h3>

<!-- Do the following only if the form has been submitted. -->
<cfif IsDefined("Form.mySeed")>

  <!-- Do the following only if the seed field has a non-empty string. -->
  <cfif Form.mySeed NEQ "">
    <cfoutput>
      <b>Seed value is #FORM.mySeed#</b><br>
    </cfoutput>
    <br>

    <!-- Call Randomize to seed the random number generator. -->
    <cfset r = Randomize(FORM.mySeed, "SHA1PRNG")>
  <cfelse>
    <b>No Seed value submitted</b><br>
  </cfif>

  <!-- Generate and display the random number. -->
  <cfoutput><p><b>
    RandRange returned: #RandRange(FORM.myInt, FORM.myInt2, "SHA1PRNG")#
  </b></p>
</cfif>

<!-- This form uses cfform input validation to check the input range. -->
<cfform action = "#CGI.SCRIPT_NAME#">
<p>Enter the random number Range: From
<cfinput type = "Text" name = "MyInt" value = "1"
  RANGE = "-1000000000,1000000000"
  message = "Please enter a value between -1,000,000,000 and 1,000,000,000"
  validate = "integer" required = "Yes">
To
<cfinput type = "Text" name = "MyInt2" value = "9999"
  RANGE = "-1000000000,1000000000"
  message = "Please enter a value between --1,000,000,000 and 1,000,000,000"
  validate = "integer" required = "Yes"></p>
<p>Enter a number to seed the randomizer:
<cfinput type = "Text" name = "mySeed" RANGE = "-1000000000,1000000000"
  message = "Please enter a value between -1,000,000,000 and 1,000,000,000"
  validate = "integer" required = "No"></p>
<p><input type = "Submit" name = "">
</cfform>
```

# REFind

## Description

Uses a regular expression (RE) to search a string for a pattern. The search is case sensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Chapter 7, “Using Regular Expressions in Functions,” in *ColdFusion MX Developer’s Guide*.

## Returns

Depends on the value of the `returnsubexpressions` parameter:

- If `returnsubexpressions = "False"`:
  - The position in the string where the match begins
  - 0, if the regular expression is not matched in the string
- If `returnsubexpressions = "True"`: a structure that contains two arrays, `len` and `pos`. The array elements are as follows:
  - If the regular expression is found in the string, the first element of the `len` and `pos` arrays contains the length and position, respectively, of the first match of the entire regular expression.  
If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group.
  - If the regular expression is not found in the string, the first element of the `len` and `pos` arrays contains 0.

## Category

[String functions](#)

## Function syntax

```
REFind(reg_expression, string [, start ] [, returnsubexpressions ] )
```

## See also

[Find](#), [FindNoCase](#), [REFindNoCase](#), [REReplace](#), [REReplaceNoCase](#)

## Parameters

| Parameter                   | Description  |
|-----------------------------|--|
| <code>reg_expression</code> | Regular expression for which to search. Case-sensitive.        |
| <code>string</code>         | A string, or a variable that contains one, in which to search. |

| Parameter            | Description  |
|----------------------|--|
| start                | Optional. A positive integer, or a variable that contains one. Position in the string at which to start search. The default value is 1.  |
| returnsubexpressions | Optional. Boolean. Whether to return substrings of <code>reg_expression</code> , in arrays named <code>len</code> and <code>pos</code> : <ul style="list-style-type: none"> <li>• True: if the regular expression is found, the first array element contains the length and position, respectively, of the first match. If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group. If the regular expression is not found, the arrays each contain one element with the value 0.</li> <li>• False: the function returns the position in the string where the match begins. Default.</li> </ul> |

## Usage

This function finds the first occurrence of a regular expression in a string. To find the second and subsequent instances of the expression or of subexpressions in it, you call this function more than once, each time with a different start position. To determine the next start position, use the `returnsubexpressions` parameter, and add the value returned in the first element of the length array to the value in the first element of the position array.

## Example

```
<h3>REFind Example</h3>
<p>This example shows the use of the REFind function with and without the
  <i>returnsubexpressions</i> parameter set to True.
  If you do not use the <i>returnsubexpressions</i> parameter,
  REFind returns the position of the first occurrence of a regular
  expression in a string starting from the specified position.
  Returns 0 if no occurrences are found.</p>

<p>REFind("a+c+", "abcaaccdd"):
<cfoutput>#REFind("a+c+", "abcaaccdd")#</cfoutput></p>
<p>REFind("a+c*", "abcaaccdd"):
<cfoutput>#REFind("a+c*", "abcaaccdd")#</cfoutput></p>
<p>REFind("[[:upper:]]", "abcaacCDD"):
<cfoutput>#REFind("[[:upper:]]", "abcaacCDD")#</cfoutput></p>
<p>REFind("[\?&]rep = ", "report.cfm?rep = 1234&u = 5"):
  <cfoutput>#REFind("[\?&]rep = ", "report.cfm?rep = 1234&u = 5")#
  </cfoutput>
</p>
<!-- Set startPos to one; returnMatchedSubexpressions = TRUE -->
<hr size = "2" color = "#0000A0">
<p>If you use the <i>returnsubexpression</i> parameter, REFind returns the
  position and length of the first occurrence of a regular expression
  in a string starting from the specified position. The position and
  length variables are stored in a structure. To access position and length
  information, use the keys <i>pos</i> and <i>len</i>, respectively.</p>
<cfset teststring = "The cat in the hat hat came back!">
<p>The string in which the function is to search is:
<cfoutput><b>#teststring#</b></cfoutput>.</p>
```

```

<p>The first call to REFind to search this string is:
  <b>REFind("[A-Za-z]+",testString,1,"TRUE")</b></p>
<p>This function returns a structure that contains two arrays: pos and len.</p>
<p>To create this structure you can use a CFSET statement, for example: </p>
<cfset st = REFind("[[:alpha:]]",testString,1,"TRUE")>
</cfset st = REFind("[[:alpha:]]",testString,1,"TRUE")>
<p>
  <cfoutput>
    The number of elements in each array: #ArrayLen(st.pos)#.
  </cfoutput></p>
<p><b>The number of elements in the pos and len arrays is always one
  if you do not use parentheses in the regular expression.</b></p>
<p>The value of st.pos[1] is: <cfoutput>#st.pos[1]#.</cfoutput></p>
<p>The value of st.len[1] is: <cfoutput>#st.len[1]#.</cfoutput></p>
<p>
<cfoutput>
  Substring is <b>[#Mid(testString,st.pos[1],st.len[1])#]</B>
</cfoutput></p>
<hr size = "2" color = "#0000A0">
<p>However, if you use parentheses in the regular expression, the first
  element contains the position and length of the first instance
  of the whole expression. The position and length of the first instance
  of each parenthesized subexpression within is included in additional
  array elements.</p>
<p>For example:
  <cfset st1 = REFind("([[:alpha:]]+)(\1)",testString,1,"TRUE")>
  <cfset st1 = REFind("([[:alpha:]]+)(\1)",testString,1,"TRUE")>
<p>The number of elements in each array is <cfoutput>#ArrayLen(st1.pos)#
  </cfoutput>.</p>
<p>First whole expression match; position is
  <cfoutput>#st1.pos[1]#;
    length is #st1.len[1]#; whole expression match is
    <B>[#Mid(testString,st1.pos[1],st1.len[1])#]</B>
  </cfoutput></p>
<p>Subsequent elements of the arrays provide the position and length of
  the first instance of each parenthesized subexpression therein.</p>
<cfloop index = "i" from = "2" to = "#ArrayLen(st1.pos)#">
  <p><cfoutput>Position is #st1.pos[i]#; Length is #st1.len[i]#;
  Substring is <B>[#Mid(testString,st1.pos[i],st1.len[i])#]
  </B></cfoutput></p>
</cfloop><br>

```

# REFindNoCase

## Description

Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case-insensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Chapter 7, “Using Regular Expressions in Functions,” in *ColdFusion MX Developer’s Guide*.

## Returns

Depends on the value of the `returnsubexpressions` parameter:

- If `returnsubexpressions = "False"`:
  - The position in the string where the match begins
  - 0, if the regular expression is not matched in the string
- If `returnsubexpressions = "True"`: a structure that contains two arrays, `len` and `pos`. The array elements are as follows:
  - If the regular expression is found in the string, the first element of the `len` and `pos` arrays contains the length and position, respectively, of the first match of the entire regular expression.
  - If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group.
  - If the regular expression is not found in the string, the first element of the `len` and `pos` arrays contains 0.

## Category

[String functions](#)

## Function syntax

```
REFindNoCase(reg_expression, string [, start] [, returnsubexpressions] )
```

## See also

[Find](#), [FindNoCase](#), [REFind](#), [REReplace](#), [REReplaceNoCase](#)

## Parameters

| Parameter                   | Description  |
|-----------------------------|--|
| <code>reg_expression</code> | Regular expression for which to search. Case-insensitive. For more information, see Chapter 7, “Using Regular Expressions in Functions,” in <i>ColdFusion MX Developer’s Guide</i> . |
| <code>string</code>         | A string or a variable that contains one. String in which to search.   |

| Parameter            | Description  |
|----------------------|--|
| start                | Optional. A positive integer or a variable that contains one. Position at which to start search. The default value is 1.   |
| returnsubexpressions | Optional. Boolean. Whether to return substrings of <code>reg_expression</code> , in arrays named <code>len</code> and <code>pos</code> : <ul style="list-style-type: none"> <li>• True: if the regular expression is found, the first array element contains the length and position, respectively, of the first match. If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group. If the regular expression is not found, the arrays each contain one element with the value 0.</li> <li>• False: the function returns the position in the string where the match begins. Default.</li> </ul> |

## Usage

This function finds the first occurrence of a regular expression in a string. To find the second and subsequent instances of the expression or of subexpressions in it, you call this function more than once, each time with a different start position. To determine the next start position, use the `returnsubexpressions` parameter, and add the value returned in the first element of the length array to the value in the first element of the position array.

## Example

```
<h3>REFindNoCase Example</h3>
<p>This example demonstrates the use of the REFindNoCase function with and without the <i>returnsubexpressions</i> parameter set to True.</p>
<p>If you do not use the <i>returnsubexpressions</i> parameter, REFindNoCase returns the position of the first occurrence of a regular expression in a string starting from the specified position. Returns 0 if no occurrences are found. </p>
<p>REFindNoCase("a+c+", "abcaaccdd"):
<cfoutput>#REFindNoCase("a+c+", "abcaaccdd")#</cfoutput></p>
<p>REFindNoCase("a+c*", "abcaaccdd"):
<cfoutput>#REFindNoCase("a+c*", "abcaaccdd")#</cfoutput></p>
<p>REFindNoCase("[[:alpha:]]+", "abcaacCDD"):
<cfoutput>#REFindNoCase("[[:alpha:]]+", "abcaacCDD")#</cfoutput></p>
<p>REFindNoCase("[\?&]rep = ", "report.cfm?rep = 1234&u = 5"):
<cfoutput>#REFindNoCase("[\?&]rep = ", "report.cfm?rep = 1234&u = 5")#</cfoutput></p>
<!-- Set startPos to one; returnMatchedSubexpressions = True -->
<hr size = "2" color = "#0000A0">
<p>If you do use the <i>returnsubexpression</i> parameter, REFindNoCase returns the position and length of the first occurrence of a regular expression in a string starting from the specified position. The position and length variables are stored in a structure. To access position and length information, use the keys <i>pos</i> and <i>len</i>, respectively.</p>
<cfset teststring = "The cat in the hat hat came back!">
<p>The string in which the function is to search is:
<cfoutput><b>#teststring#</b></cfoutput>.</p>
```

```

<p>The first call to REFindNoCase to search this string is:
<b>REFindNoCase("[[:alpha:]]+",testString,1,"True")</b></p>
<p>This function returns a structure that contains two arrays: pos and len.</p>
<p>To create this structure you can use a CFSET statement,
  for example:</p>
<lt;CFSET st = REFindNoCase("[[:alpha:]]+",testString,1,"True")&gt;
<cfset st = REFindNoCase("[[:alpha:]]+",testString,1,"True")>
<p>
  <cfoutput>
    The number of elements in each array: #ArrayLen(st.pos)#.
  </cfoutput></p>
<p><b>The number of elements in the pos and len arrays will always be one,
  if you do not use parentheses to denote subexpressions in the regular
  expression.</b></p>
<p>The value of st.pos[1] is: <cfoutput>#st.pos[1]#.</cfoutput></p>
<p>The value of st.len[1] is: <cfoutput>#st.len[1]#.</cfoutput></p>
<p>
  <cfoutput>
    Substring is <b>[#Mid(testString,st.pos[1],st.len[1])#]</B>
  </cfoutput></p>
<hr size = "2" color = "#0000A0">
<p>However, if you use parentheses to denote subexpressions in the regular
  expression, the first element contains the position and length of
  the first instance of the whole expression. The position and length
  of the first instance of each subexpression within will be included
  in additional array elements.</p>
<p>For example:
<lt;CFSET st1 = REFindNoCase("[[:alpha:]]+)[
  ]+(\1)",testString,1,"True")&gt;</p>
<cfset st1 = REFindNoCase("[[:alpha:]]+)[ ]+(\1)",testString,1,"True")>

<p>The number of elements in each array is
<cfoutput>
  #ArrayLen(st1.pos)#
</cfoutput>.</p>

<p>First whole expression match; position is
<cfoutput>
  #st1.pos[1]#; length is #st1.len[1]#;
  whole expression match is <B>[#Mid(testString,st1.pos[1],st1.len[1])#]</B>
</cfoutput></p>

<p>Subsequent elements of the arrays provide the position and length of the
  first instance of each parenthesized subexpression therein.</p>
<cfloop index = "i" from = "2" to = "#ArrayLen(st1.pos)#">
  <p><cfoutput>Position is #st1.pos[i]#; Length is #st1.len[i]#;
  Substring is <B>[#Mid(testString,st1.pos[i],st1.len[i])#]</B>
  </cfoutput></p>
</cfloop><br>

```

# ReleaseComObject

## Description

Releases a COM Object and frees up resources that it used.

## Returns

Nothing.

## Category

[Extensibility functions](#)

## Function syntax

```
ReleaseComObject(objectName)
```

## See also

[CreateObject](#), [cfobject](#)

## History

ColdFusion MX 6.1: Added this function.

## Parameters

| Parameter               | Description   |
|-------------------------|---|
| <code>objectName</code> | Variable name of a COM object that was created using the <a href="#">CreateObject</a> function or <a href="#">cfobject</a> tag. |

## Usage

This function forcefully terminates and releases the specified COM object and all COM objects that it created. Use this function when the object is no longer in use, to quickly free up resources. If the COM object has a method, such as a `quit` method, that terminates the program, call this method before you call the `ReleaseComObject` function.

This function can improve processing efficiency, but is not required for an application to work. If you do not use this function, the Java garbage collection mechanism eventually frees the resources. If you use this function on an object that is in use, the object is prematurely released and your application will get exceptions.

## Example

```
<h3>ReleaseComObject Example</h3>
<cfscript>
obj = CreateObject("Com", "excel.application.9");
//code that uses the object goes here
obj.quit();
ReleaseComObject(obj);
</cfscript>
```

# RemoveChars

## Description

Removes characters from a string.

## Returns

A copy of the string, with *count* characters removed from the specified start position. If no characters are found, returns zero.

## Category

[String functions](#)

## Function syntax

```
RemoveChars(string, start, count)
```

## See also

[Insert](#), [Len](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A string or a variable that contains one. String in which to search.                   |
| start     | A positive integer or a variable that contains one. Position at which to start search. |
| count     | Number of characters to remove.  |

## Example

```
<h3>RemoveChars Example</h3>
Returns a string with <I>count</I> characters removed from the
start position. Returns 0 if no characters are found.

<cfif IsDefined("FORM.myString")>
  <cfif (FORM.numChars + FORM.start) GT Len(FORM.myString)>
    <p>Your string is only <cfoutput>#Len(FORM.myString)#
    </cfoutput> characters long.
    Please enter a longer string, select fewer characters to remove or
    begin earlier in the string.
  </cfif>
  <cfoutput>
    <p>Your original string: #FORM.myString#
    <p>Your modified string: #RemoveChars(FORM.myString,
    FORM.start, FORM.numChars)#
    </cfoutput>
  </cfif>
</cfif>
```

# RepeatString

## Description

Creates a string that contains a specified number of repetitions of the specified string.

## Returns

A string.

## Category

[String functions](#)

## Function syntax

```
RepeatString(string, count)
```

## See also

[CJustify](#), [LJustify](#), [RJustify](#)

## Parameters

| Parameter | Description                               |
|-----------|---|
| string    | A string or a variable that contains one. |
| count     | Number of repeats.                        |

## Example

```
<h3>RepeatString Example</h3>
<p>RepeatString returns a string created from <I>string</I>, repeated
  a specified number of times.
<ul>
  <li>RepeatString("-", 10): <cfoutput>#RepeatString("-", 10)#</cfoutput>
  <li>RepeatString("&lt;br>", 3): <cfoutput>#RepeatString("<br>", 3)#
</cfoutput>
  <li>RepeatString("", 5): <cfoutput>#RepeatString("", 5)#</cfoutput>
  <li>RepeatString("abc", 0): <cfoutput>#RepeatString("abc", 0)#</cfoutput>
  <li>RepeatString("Lorem Ipsum", 2):
    <cfoutput>#RepeatString("Lorem Ipsum", 2)#</cfoutput>
</ul>
```

# Replace

## Description

Replaces occurrences of *substring1* in a string with *substring2*, in a specified scope. The search is case-sensitive.

## Returns

The string, after making replacements.

## Category

[String functions](#)

## Function syntax

```
Replace(string, substring1, substring2 [, scope ])
```

## See also

[Find](#), [REFind](#), [ReplaceNoCase](#), [ReplaceList](#), [REReplace](#)

## Parameters

| Parameter  | Description  |
|------------|--|
| string     | A string or a variable that contains one. String in which to search.   |
| substring1 | A string or a variable that contains one. String for which to search   |
| substring2 | String that replaces <code>substring1</code>   |
| scope      | <ul style="list-style-type: none"><li>• one: replaces the first occurrence (default)</li><li>• all: replaces all occurrences</li></ul> |

## Usage

To remove a string, specify the empty string ("" ) as *substring2*.

You do not need to escape comma characters in strings. For example, the following code deletes the commas from the sentence:

```
replace("The quick brown fox jumped over the lazy cow, dog, and  
cat.", ",", "", "All")
```

## Example

```
<h3>Replace Example</h3>
```

```
<p>The Replace function returns <I>string</I> with <I>substring1</I>  
replaced by <I>substring2</I> in the specified scope. This  
is a case-sensitive search.
```

```
<cfif IsDefined("FORM.MyString")>  
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>  
<p>You wanted to replace the substring <cfoutput>#FORM.MySubString1#  
</cfoutput>  
with the substring <cfoutput>#FORM.MySubString2#</cfoutput>.  
<p>The result: <cfoutput>#Replace(FORM.myString,  
FORM.MySubString1, FORM.mySubString2)#</cfoutput>  
</cfif>
```

# ReplaceList

## Description

Replaces occurrences of the elements from a delimited list in a string with corresponding elements from another delimited list. The search is case-sensitive.

## Returns

A copy of the string, after making replacements.

## Category

[List functions](#), [String functions](#)

## Function syntax

```
ReplaceList(string, list1, list2)
```

## See also

[Find](#), [REFind](#), [Replace](#), [REReplace](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A string, or a variable that contains one, within which to replace substring |
| list1     | Comma-delimited list of substrings for which to search                       |
| list2     | Comma-delimited list of replacement substrings                               |

## Usage

The list of substrings to replace is processed sequentially. If a *list1* element is contained in *list2* elements, recursive replacement might occur. The second example shows this.

## Example

```
<p>The ReplaceList function returns <I>string</I> with  
<I>substringlist1</I> (e.g. "a,b") replaced by <I>substringlist2</I>  
(e.g. "c,d") in the specified scope.  
<cfif IsDefined("FORM.MyString")>  
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>  
<p>You wanted to replace the substring <cfoutput>#FORM.MySubString1#  
</cfoutput>  
with the substring <cfoutput>#FORM.MySubString2#</cfoutput>.  
<p>The result: <cfoutput>#Replacelist(FORM.myString,  
FORM.MySubString1, FORM.mySubString2)#</cfoutput>  
</cfif>  
<form action = "replacelist.cfm" method="post">  
<p>String 1  
<br><input type = "Text" value = "My Test String" name = "MyString">  
<p>SubString 1 (find this list of substrings)  
<br><input type = "Text" value = "Test, String" name = "MySubString1">  
<p>SubString 2 (replace with this list of substrings)  
<br><input type = "Text" value = "Replaced, Sentence" name = "MySubString2">  
<p><input type = "Submit" value = "Replace and display" name = "">  
</form>
```

```
<h3>Replacelist Example Two</h3>
<cfset stringtoreplace = "The quick brown fox jumped over the lazy dog.">
<cfoutput>
  #ReplaceList(stringtoreplace,"dog,brown,fox,black",
  "cow,black,ferret,white")#
</cfoutput>
```

# ReplaceNoCase

## Description

Replaces occurrences of *substring1* with *substring2*, in the specified scope. The search is case-insensitive.

## Returns

A copy of the string, after making replacements.

## Category

[String functions](#)

## Function syntax

```
ReplaceNoCase(string, substring1, substring2 [, scope ])
```

## See also

[Find](#), [REFind](#), [Replace](#), [ReplaceList](#), [REReplace](#)

## Parameters

| Parameter  | Description  |
|------------|--|
| string     | A string (or variable that contains one) within which to replace substring.  |
| substring1 | String (or variable that contains one) to replace, if found.   |
| substring2 | String (or variable that contains one) that replaces <i>substring1</i> .   |
| scope      | <ul style="list-style-type: none"><li>one: replaces the first occurrence (default).</li><li>all: replaces all occurrences.</li></ul> |

## Example

```
<h3>ReplaceNoCase Example</h3>
<p>The ReplaceNoCase function returns <I>string</I> with <I>substring1</I>
  replaced by <I>substring2</I> in the specified scope.
  The search/replace is case-insensitive.

<cfif IsDefined("FORM.MyString")>
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>
<p>You wanted to replace the substring <cfoutput>#FORM.MySubString1#
  </cfoutput>
with the substring <cfoutput>#FORM.MySubString2#</cfoutput>.
<p>The result: <cfoutput>#ReplaceNoCase(FORM.myString,
FORM.MySubString1, FORM.mySubString2)#</cfoutput>
</cfif>
```

# REReplace

## Description

Uses a regular expression (RE) to search a string for a string pattern and replace it with another. The search is case-sensitive.

## Returns

If the *scope* parameter is set to *one*, returns a string with the first occurrence of the regular expression replaced by the value of *substring*.

If the *scope* parameter is set to *all*, returns a string with all occurrences of the regular expression replaced by the value of *substring*.

If the function finds no matches, it returns a copy of the string unchanged.

## Category

[String functions](#)

## Function syntax

```
REReplace(string, reg_expression, substring [, scope ])
```

## See also

[REFind](#), [Replace](#), [ReplaceList](#), [REReplaceNoCase](#)

## History

ColdFusion MX: Added supports for the following special codes in a replacement substring, to control case conversion:

- \u - uppercase the next character
- \l - lowercase the next character
- \U - uppercase until \E
- \L - lowercase until \E
- \E - end \U or \L

For more information on new features, see [REFind](#).

## Parameters

| Parameter             | Description  |
|-----------------------|--|
| <i>string</i>         | A string or a variable that contains one. String within which to search.   |
| <i>reg_expression</i> | Regular expression to replace. The search is case-sensitive.   |
| <i>substring</i>      | A string or a variable that contains one. Replaces <i>reg_expression</i> .   |
| <i>scope</i>          | <ul style="list-style-type: none"><li>• <i>one</i>: replaces the first occurrence (default).</li><li>• <i>all</i>: replaces all occurrences.</li></ul> |

## Usage

For details on using regular expressions, see Chapter 7, “Using Regular Expressions in Functions,” in *ColdFusion MX Developer’s Guide*.

## Example

```
<p>The REReplace function returns <i>string</i> with a regular expression
  replaced
  with <i>substring</i> in the specified scope. Case-sensitive search.
<p>REReplace("CABARET","C|B","G","ALL"):
<cfoutput>#REReplace("CABARET","C|B","G","ALL")#</cfoutput>
<p>REReplace("CABARET","[A-Z]","G","ALL"):
<cfoutput>#REReplace("CABARET","[A-Z]","G","ALL")#</cfoutput>
<p>REReplace("I love jellies","jell(y|ies)","cookies"):
<cfoutput>#REReplace("I love jellies","jell(y|ies)","cookies")#
</cfoutput>
<p>REReplace("I love jelly","jell(y|ies)","cookies"):
<cfoutput>#REReplace("I love jelly","jell(y|ies)","cookies")#</cfoutput>
```

# REReplaceNoCase

## Description

Uses a regular expression to search a string for a string pattern and replace it with another. The search is case-insensitive.

## Returns

- If `scope = "one"`: returns a string with the first occurrence of the regular expression replaced by the value of *substring*.
- If `scope = "all"`: returns a string with all occurrences of the regular expression replaced by the value of *substring*.
- If the function finds no matches: returns a copy of the string, unchanged.

## Category

[String functions](#)

## Function syntax

```
REReplaceNoCase(string, reg_expression, substring [, scope ])
```

## See also

[REFind](#), [REFindNoCase](#), [Replace](#), [ReplaceList](#)

## History

ColdFusion MX: Changed behavior: this function inserts the following special characters in regular expression replacement strings, to control case conversion: `\u`, `\U`, `\l`, `\L`, and `\E`. If any of these strings is present in a ColdFusion 5 application, you must insert a backslash before it (for example, change `"\u"` to `"\\u"`).

## Parameters

| Parameter                   | Description   |
|-----------------------------|---|
| <code>string</code>         | A string or a variable that contains one.   |
| <code>reg_expression</code> | Regular expression to replace. For more information, see Chapter 7, "Using Regular Expressions in Functions," in <i>ColdFusion MX Developer's Guide</i> .   |
| <code>substring</code>      | A string or a variable that contains one. Replaces <code>reg_expression</code> .  |
| <code>scope</code>          | <ul style="list-style-type: none"><li>• <code>one</code>: replaces the first occurrence of the regular expression. Default.</li><li>• <code>all</code>: replaces all occurrences of the regular expression.</li></ul> |

## Usage

For details on using regular expressions, see Chapter 7, "Using Regular Expressions in Functions," in *ColdFusion MX Developer's Guide*.

## Example

```
<p>The REReplaceNoCase function returns <i>string</i> with a regular expression replaced with <i>substring</i> in the specified scope. This is a case-insensitive search.  
<p>REReplaceNoCase("cabaret", "C|B", "G", "ALL");
```

```
<cfoutput>#REReplaceNoCase("cabaret","C|B","G","ALL")#</cfoutput>
<p>REReplaceNoCase("cabaret","[A-Z]","G","ALL"):
<cfoutput>#REReplaceNoCase("cabaret","[A-Z]","G","ALL")#</cfoutput>
<p>REReplaceNoCase("I LOVE JELLIES","jell(y|ies)","cookies"):
<cfoutput>#REReplaceNoCase("I LOVE JELLIES","jell(y|ies)","cookies")#
</cfoutput>
<p>REReplaceNoCase("I LOVE JELLY","jell(y|ies)","cookies"):
<cfoutput>#REReplaceNoCase("I LOVE JELLY","jell(y|ies)","cookies")#
</cfoutput>
```

# Reverse

## Description

Reverses the order of items, such as the characters in a string, the digits in a number, or the elements in an array.

## Returns

A copy of *string*, with the characters in reverse order.

## Category

[String functions](#)

## Function syntax

`Reverse(string)`

## See also

[Left](#), [Mid](#), [Right](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

You can call this function on a number with code such as the following:

```
<cfoutput>reverse(6*2) equals #reverse(6*2)#</cfoutput>
```

This code outputs the following:

```
reverse(6*2) equals 21
```

## Example

```
<h3>Reverse Example</h3>
```

```
<p>Reverse returns your string with the positions of the characters reversed.
```

```
<cfif IsDefined("FORM.myString")>
```

```
  <cfif FORM.myString is not "">
```

```
    <p>Reverse returned:
```

```
    <cfoutput>#Reverse(FORM.myString)#</cfoutput>
```

```
  <cfelse>
```

```
    <p>Please enter a string to be reversed.
```

```
  </cfif>
```

```
</cfif>
```

```
<form action = "reverse.cfm">
```

```
<p>Enter a string to be reversed:
```

```
<input type = "Text" name = "MyString">
```

```
<p><input type = "Submit" name = "">
```

```
</form>
```

# Right

## Description

Gets a specified number of characters from a string, beginning at the right.

Returns the specified number of characters from the end (or *right* side) of the specified string.

## Returns

- If the length of the string is greater than or equal to *count*, the rightmost *count* characters of the string
- If *count* is greater than the length of the string, the whole string
- If *count* is greater than 1, and the string is empty, an empty string

## Category

[String functions](#)

## Function syntax

`Right(string, count)`

## See also

[Left](#), [Mid](#), [Reverse](#)

## Parameters

| Parameter | Description   |
|-----------|---|
| string    | A string or a variable that contains one.                             |
| count     | A positive integer that specifies the number of characters to return. |

## Example

```
<!-- Simple Right Example-->
<cfoutput>
#Right("See the quick red fox jump over the fence", 9)#
<br>
#Right("ColdFusion", 6)#
</cfoutput>

<!-- Right Example using form input -->
<h3>Right Example</h3>
<cfif IsDefined("Form.MyText")>
<!-- If len returns 0 (zero), then show error message. -->
  <cfif Len(FORM.myText)
    <cfif Len(FORM.myText) LTE FORM.RemoveChars>
      <cfoutput><p style="color: red; font-weight: bold">Your string
#FORM.myText# only has #Len(FORM.myText)# characters. You cannot output
the #FORM.removeChars# rightmost characters of this string because it
is not long enough.</p></cfoutput>
    <cfelse>
      <cfoutput><p>Your original string: <strong>#FORM.myText#</strong>
<p>Your changed string, showing only the <strong>#FORM.removeChars#
</strong> rightmost characters:
<strong>#right(Form.myText, FORM.removeChars)#</strong></p>
    </cfoutput>
  </cfif>
</cfif>
```

```
        </cfoutput>
    </cfif>
    <cfelse>
        <p style="color: red; font-weight: bold">Please enter a string of more
            than 0 (zero) characters.</p>
    </cfif>
</cfif>

<form action="<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
<p>Type in some text<br />
<input type="Text" name="myText"></p>
<p>How many characters from the right do you want to show?
<select name="RemoveChars">
<option value="1">1
<option value="3" selected>3
<option value="5">5
<option value="7">7
<option value="9">9</select>
<input type="Submit" name="Submit" value="Remove characters"></p>
</form>
```

# RJustify

## Description

Right justifies characters of a string.

## Returns

A copy of a string, right-justified in the specified field length.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

`RJustify(string, length)`

## See also

[CJustify](#), [LJustify](#)

## Parameters

---

| Parameter | Description   |
|-----------|---|
| string    | A string enclosed in quotation marks, or a variable that contains one.                          |
| length    | A positive integer or a variable that contains one. Length of field in which to justify string. |

---

## Example

```
<!-- This example shows how to use RJustify --->
<cfparam name = "jstring" default = "">

<cfif IsDefined("FORM.justifyString")>
  <cfset jstring = rjustify(FORM.justifyString, 35)>
</cfif>
<html>
<head>
<title>RJustify Example</title>
</head>
<body>
<h3>RJustify Function</h3>
<p>Enter a string. It will be right justified within the sample field

<form action = "rjustify.cfm">
<p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>"
  size = 35 name = "justifyString">

<p><input type = "Submit" name = ""> <input type = "reset">
</form>
```

# Round

## Description

Rounds a number to the closest integer that is larger than the input parameter.

## Returns

An integer.

## Category

[Mathematical functions](#)

## Function syntax

`Round(number)`

## See also

[Ceiling](#), [Fix](#), [Int](#)

## Parameters

| Parameter | Description     |
|-----------|-----------------|
| number    | Number to round |

## Usage

Use this function to round a number. This function rounds numbers that end with .5 up to the nearest integer. It rounds 3.5 to 4 and -3.5 to -3.

## Example

```
<h3>Round Example</h3>
<p>This function rounds a number to the closest integer.
<ul>
  <li>Round(7.49) : <cfoutput>#Round(7.49)#</cfoutput>
  <li>Round(7.5) : <cfoutput>#Round(7.5)#</cfoutput>
  <li>Round(-10.775) : <cfoutput>#Round(-10.775)#</cfoutput>
  <li>Round(-35.5) : <cfoutput>#Round(-35.5)#</cfoutput>
  <li>Round(35.5) : <cfoutput>#Round(35.5)#</cfoutput>
  <li>Round(1.2345*100)/100 : <cfoutput>#Round(1.2345*100)/100#</cfoutput>
</ul>
```

# RTrim

## Description

Removes spaces from the end of a string.

## Returns

A copy of *string*, after removing trailing spaces.

## Category

[String functions](#)

## Function syntax

RTrim(*string*)

## See also

[LTrim](#), [Trim](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Example

```
<h3>RTrim Example</h3>

<cfif IsDefined("FORM.myText")>
<cfoutput>
<pre>
Your string:"#FORM.myText#"
Your string:"#RTrim(FORM.myText)#"
(right trimmed)
</pre>
</cfoutput>
</cfif>

<form action = "Rtrim.cfm" method="post">
<p>Enter some text. It will be modified by Rtrim to remove spaces from the
right.
<p><input type = "Text" name = "myText" value = "TEST" ">

<p><input type = "Submit" name = "">
</form>
```

## Second

### Description

Extracts the ordinal for the second from a date/time object.

### Returns

An integer in the range 0–59.

### Category

[Date and time functions](#)

### Function syntax

`Second(date)`

### See also

[DatePart](#), [Hash](#), [Minute](#)

### Parameters

| Parameter | Description        |
|-----------|--------------------|
| date      | A date/time object |

### Usage

When passing a date/time object as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

### Example

```
<!-- This example shows the use of Hour, Minute, and Second -->
<h3>Second Example</h3>
<cfoutput>
The time is currently #TimeFormat(Now())#.
We are in hour #Hour(Now())#, Minute #Minute(Now())#
and Second #Second(Now())# of the day.
</cfoutput>
```

# SendGatewayMessage

## Description

Sends an outgoing message through a ColdFusion MX event gateway.

## Returns

String. The value returned depends on the gateway type.

## Category

[Extensibility functions](#)

## Function syntax

```
SendGatewayMessage(gatewayID, data)
```

## See also

[GetGatewayHelper](#); “[IM gateway message sending commands](#)”, “[SMS Gateway CFEvent structure and commands](#)”, “[CFML event gateway SendGatewayMessage data parameter](#)”, and “[Sending a message using the SendGatewayMessage function](#)” in Chapter 42, “[Using Event Gateways](#),” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description  |
|-----------|--|
| gatewayID | Identifier of the gateway to send the message. Must be the Gateway ID of one of the ColdFusion event gateway instances configured on the ColdFusion MX Administrator Event Gateways section’s Gateways page.       |
| data      | A ColdFusion structure. The contents of the structure depend on the event gateway type, but typically include a MESSAGE field that contains the message to send and a field that contains the destination address. |

## Usage

The `SendGatewayMessage` function calls the specified gateway’s `outgoingMessage` method. The value returned by the function depends on the gateway type. The following table describes the return values for standard ColdFusion MX gateway types:

| Gateway type      | Return values   |
|-------------------|---|
| Asynchronous CFML | If the message was queued for delivery to the CFC, returns True; False, otherwise.                                    |
| Lotus SameTime    | If the message or command was successful, returns OK.<br>If an error occurred, returns a string indicating the cause. |

| Gateway type | Return values   |
|--------------|---|
| SMS          | <p>If the gateway is in asynchronous mode, returns the empty string immediately.</p> <p>If the gateway is in synchronous mode, the function waits for the gateway to return a response. If the message was successfully sent to the short message service center (SMSC), returns the message ID from the SMSC. If an error occurred, returns a string indicating the cause.</p> |
| XMPP         | <p>If the message or command was successful, returns OK</p> <p>If an error occurred, returns a string indicating the cause.</p>   |

### Example

The following example uses an instance of the CFML gateway to log messages asynchronously to a file. To use this example, you must configure an instance of the CFML gateway with the name “Asynch Logger” in the ColdFusion MX Administrator. This gateway instance must use a CFC that takes the message and logs it. For sample CFC code, see “Using the CFML event gateway for asynchronous CFCs” in Chapter 42, “Using Event Gateways,” in *ColdFusion MX Developer’s Guide*.

```

Sending an event to the CFML event gateway that is registered in the
ColdFusion MX Administrator as Asynch Logger.<br>
<cfscript>
    status = false;
    props = structNew();
    props.message = "Replace me with a variable with data to log";
    status = SendGatewayMessage("Asynch Logger", props);
    if (status IS True) WriteOutput('Event Message "#props.message#" has been
    sent.');
```

# SetEncoding

## Description

Sets the character encoding (character set) of Form and URL scope variable values; used when the character encoding of the input to a form, or the character encoding of a URL, is not in UTF-8 encoding.

## Returns

None

## Category

[International functions](#), [System functions](#)

## Function syntax

```
SetEncoding(scope_name,charset)
```

## See also

[GetEncoding](#), [cfcontent](#), [cfprocessingdirective](#), [URLDecode](#), [URLEncodedFormat](#);  
“Locales” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter  | Description   |
|------------|---|
| scope_name | <ul style="list-style-type: none"><li>• url</li><li>• form</li></ul>  |
| charset    | The character encoding in which text in the scope variables is encoded. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> |

## Usage

Use this function when the character encoding of the input to a form or the character encoding of a URL is not in UTF-8 encoding. For example, Traditional Chinese characters are often in Big5 encoding. This function resets URL and Form variables, so you should call it before using these variables (typically, in the Application.cfm page or Application.cfc file). Calling this function first also avoids interpreting the characters of the variables incorrectly.

For more information on character encoding, see the following web pages:

- [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html) provides general information on character encoding and the web, and has several useful links.
- [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets) is a complete list of character sets names used on the Internet, maintained by the Internet Assigned Numbers Authority.
- [java.sun.com/j2se/1.4.1/docs/guide/intl/encoding.doc.html](http://java.sun.com/j2se/1.4.1/docs/guide/intl/encoding.doc.html) lists the character encoding that Java 1.4.1, and therefore the default ColdFusion configuration, can interpret. If you use a JVM that does not conform to the Sun Java 2 Platform, Standard Edition, v 1.4.1, the supported locales may differ. The list uses Java internal names, not the IANA character encoding names that you normally use in the `SetEncoding` `charset` parameter and other ColdFusion attributes and parameters. Java automatically converts standard IANA names to its internal names as needed.

## Example

```
<!-- This example sends and interprets the contents of two fields as
      big5 encoded text. Note that the form fields are received as URL variables
      because the form uses the GET method. -->
<cfcontent type="text/html; charset=big5">
<form action='#cgi.script_name#' method='get'>
<input name='xxx' type='text'>
<input name='yyy' type='text'>
<input type="Submit" value="Submit">
</form>

<cfif IsDefined("URL.xxx")>
<cfscript>
  SetEncoding("url", "big5");
  WriteOutput("URL.XXX is " & URL.xxx & "<br>");
  WriteOutput("URL.YYY is " & URL.yyy & "<br>");
  theEncoding = GetEncoding("URL");
  WriteOutput("The URL variables were decoded using '" &
  theEncoding & "' encoding.");
</cfscript>
</cfif>
```

# SetLocale

## Description

Sets the country/language locale for ColdFusion processing and the page returned to the client. The locale value determines the default format of date, time, number, and currency values, according to language and regional conventions.

## Returns

The locale value prior to setting the new locale, as a string.

## Category

[International functions](#), [System functions](#)

## Function syntax

```
SetLocale(new_locale)
```

## See also

[GetHttpTimeString](#), [GetLocale](#), [GetLocaleDisplayName](#); “Locales” in Chapter 17, “Developing Globalized Applications” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added support for all locales supported by the ColdFusion MX Java runtime.

ColdFusion MX:

- Changed formatting behavior: this function might return a different value than in earlier releases. This function uses Java standard locale determination and formatting rules on all platforms.
- Deprecated the Spanish (Mexican) locale option. It might not work, and it might cause an error, in later releases.
- Changed the Spanish (Modern) option: it now sets the locale to Spanish (Standard).

## Parameters

| Parameter               | Description                                       |
|-------------------------|---|
| <code>new_locale</code> | The name of a locale; for example, "English (US)" |

## Usage

You can specify any locale name that is listed in the `Server.Coldfusion.SupportedLocales` variable. This variable is a comma-delimited list of all locale names supported by the JVM, plus the locale names that were required by ColdFusion MX prior to ColdFusion MX 7.

The following locale names were used in ColdFusion releases through ColdFusion MX 6.1, and continue to be supported. If you use any of these values in the `SetLocale` function, the `GetLocale` function returns the name you set, not the corresponding Java locale name.

|                     |                   |                    |
|---------------------|-------------------|--------------------|
| Chinese (China)     | French (Belgian)  | Korean             |
| Chinese (Hong Kong) | French (Canadian) | Norwegian (Bokmal) |

---

|                       |                    |                        |
|-----------------------|--------------------|------------------------|
| Chinese (Taiwan)      | French (Standard)  | Norwegian (Nynorsk)    |
| Dutch (Belgian)       | French (Swiss)     | Portuguese (Brazilian) |
| Dutch (Standard)      | German (Austrian)  | Portuguese (Standard)  |
| English (Australian)  | German (Standard)  | Spanish (Modern)       |
| English (Canadian)    | German (Swiss)     | Spanish (Standard)     |
| English (New Zealand) | Italian (Standard) | Swedish                |
| English (UK)          | Italian (Swiss)    |                        |
| English (US)          | Japanese           |                        |

---

ColdFusion determines the locale value as follows:

- By default, ColdFusion uses the JVM locale, and the default JVM locale is the operating system locale. You can set JVM locale value explicitly in ColdFusion MX in the ColdFusion Administrator Java and JVM Settings page JVM Arguments field; for example: `-Duser.language=de -Duser.region=DE`.
- A locale set using the `SetLocale` function persists for the current request or until it is reset by another `SetLocale` function in the request.
- If a request has multiple `SetLocale` functions, the current locale setting affects how locale-sensitive ColdFusion tags and functions, such as the functions that start with LS format data. The last `SetLocale` function that ColdFusion processes before sending a response to the requestor (typically the client browser) determines the value of the response `Content-Language` HTTP header. The browser that requested the page displays the response according to the rules for the language specified by the `Content-Language` header.
- ColdFusion ignores any `SetLocale` functions that follow a `cfflush` tag.

Because this function returns the previous locale setting, you can save the original locale value. You can restore the original locale by calling `SetLocale` again with the saved variable. For example, the following line saves the original locale in a Session variable:

```
<cfset Session.oldlocale = SetLocale(newLocale)>
```

The variable `server.ColdFusion.SupportedLocales` is initialized at startup with a comma-delimited list of the locales that ColdFusion and the operating system support. If you call `SetLocale` with a locale that is not in the list, the call generates an error.

**Note:** ColdFusion uses the Spanish (Standard) formats for Spanish (Modern) and Spanish (Standard).

### Example

```
<h3>SetLocale Example</h3>
<p>SetLocale sets the locale to the specified new locale for the current session.
<p>A locale encapsulates the set of attributes that govern the display and formatting of date, time, number, and currency values.
<p>The locale for this system is <cfoutput>#GetLocale()#</cfoutput>
<p><cfoutput><I>the old locale was #SetLocale("English (UK)")#</I>
<p>The locale is now #GetLocale()#</cfoutput>
```

# SetProfileString

## Description

Sets the value of a profile entry in an initialization file.

## Returns

An empty string, upon successful execution; otherwise, an error message.

## Category

[System functions](#)

## Function syntax

```
SetProfileString(iniPath, section, entry, value)
```

## See also

[GetProfileSections](#), [GetProfileString](#), [SetProfileString](#)

## Parameters

| Parameter            | Description  |
|----------------------|--|
| <code>iniPath</code> | Absolute path of initialization file                               |
| <code>section</code> | Section of the initialization file in which the entry is to be set |
| <code>entry</code>   | Name of the entry to set   |
| <code>value</code>   | Value to which to set the entry                                    |

## Example

```
<h3>SetProfileString Example</h3>
This example uses SetProfileString to set the timeout value in an
initialization file. Enter the full path of your initialization
file, specify the timeout value, and submit the form.
<!-- This section checks whether the form was submitted. If so, this
section sets the initialization path and timeout value to the
path and timeout value specified in the form -->
<cfif Isdefined("Form.Submit")>

    <cfset IniPath = FORM.iniPath>
    <cfset Section = "boot loader">
    <cfset MyTimeout = FORM.MyTimeout>
    <cfset timeout = GetProfileString(IniPath, Section, "timeout")>

    <cfif timeout Is Not MyTimeout>
    <cfif MyTimeout Greater Than 0>
        <hr size = "2" color = "#0000A0">
        <p>Setting the timeout value to <cfoutput>#MyTimeout#</cfoutput>
        </p>
        <cfset code = SetProfileString(IniPath,
            Section, "timeout", MyTimeout)>
        <p>Value returned from SetProfileString:
            <cfoutput>#code#</cfoutput></p>
    <cfelse>
```

```

        <hr size = "2" color = "red">
        <p>Timeout value should be greater than zero in order to
        provide time for user response.</p>
        <hr size = "2" color = "red">
    </cfif>
</cfelse>
    <p>The timeout value in your initialization file is already
    <cfoutput>#MyTimeout#</cfoutput>.</p>
</cfif>
<cfset timeout = GetProfileString(IniPath, Section, "timeout")>
<cfset default = GetProfileString(IniPath, Section, "default")>

<h4>Boot Loader</h4>
<p>Timeout is set to: <cfoutput>#timeout#</cfoutput>.</p>
<p>Default directory is: <cfoutput>#default#</cfoutput>.</p>

</cfif>

<form action = "setprofilestring.cfm">
<hr size = "2" color = "#0000A0">
<table cellspacing = "2" cellpadding = "2" border = "0">
<tr>
    <td>Full Path of Init File</td>
    <td><input type = "Text" name = "IniPath"
        value = "C:\myboot.ini"></td>
</tr>
<tr>
    <td>Timeout</td>
    <td><input type = "Text" name = "MyTimeout" value = "30"></td>
</tr>
<tr>
    <td><input type = "Submit" name = "Submit" value = "Submit"></td>
    <td></td>
</tr>
</table>
</form>

```

# SetVariable

## Description

This function is no longer required in well-formed ColdFusion pages.

Sets a variable in the `name` parameter to the value of the `value` parameter.

## Returns

The new value of the variable.

## Category

[Dynamic evaluation functions](#)

## Function syntax

```
SetVariable(name, value)
```

## See also

[DE](#), [Evaluate](#), [IIf](#)

## Parameters

| Parameter          | Description                                 |
|--------------------|---|
| <code>name</code>  | Variable name                               |
| <code>value</code> | A string, the name of a string, or a number |

## Usage

You can use direct assignment statements in place of this function to set values of dynamically named variables. To do so, put the dynamically named variable in quotation marks and number signs (#); for example:

```
<cfset DynamicVar2 = "ABD">  
<cfset "#DynamicVar2#" = "Test Value2">
```

Also, the following lines are equivalent:

```
<cfset "myVar#i#" = myVal>  
SetVariable("myVar" & i, myVal)
```

For more information, see Chapter 4, “Using Expressions and Number Signs,” in *ColdFusion MX Developer’s Guide*.

## Example

```
<h3>SetVariable Example</h3>  
  
<cfif IsDefined("FORM.myVariable")>  
<!-- strip out url, client., cgi., session., caller. -->  
<!-- This example only lets you set form variables -->  
<cfset myName = ReplaceList(FORM.myVariable,  
    "url,client,cgi,session,caller", "FORM,FORM,FORM,FORM,FORM")>  
  
<cfset temp = SetVariable(myName, FORM.myValue)>  
<cfset varName = myName>
```

```
<cfset varNameValue = Evaluate(myName)>
<cfoutput>
  <p>Your variable, #varName#
  <p>The value of #varName# is #varNameValue#
</cfoutput>
</cfif>
```

# Sgn

## Description

Determines the sign of a number.

## Returns

- 1, if *number* is positive.
- 0, if *number* is 0.
- -1, if *number* is negative.

## Category

[Mathematical functions](#)

## Function syntax

Sgn(*number*)

## See also

[Abs](#)

## Parameters

| Parameter | Description |
|-----------|-------------|
| number    | A number    |

## Example

```
<h3>Sgn Example</h3>
```

```
<p>Sgn determines the sign of a number. Returns 1 if number is positive;  
0 if number is 0; -1 if number is negative.
```

```
<p>Sgn(14): <cfoutput>#Sgn(14)#</cfoutput>
```

```
<p>Sgn(21-21): <cfoutput>#Sgn(21-21)#</cfoutput>
```

```
<p>Sgn(-0.007): <cfoutput>#Sgn(-0.007)#</cfoutput>
```

# Sin

## Description

Calculates the sine of an angle that is entered in radians.

## Returns

A number; the sine of the angle.

## Category

[Mathematical functions](#)

## Function syntax

`Sin(number)`

## See also

[ASin](#), [Cos](#), [ACos](#), [Tan](#), [Atn](#), [Pi](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| number    | Angle, in radians for which to calculate the sine. |

## Usage

The range of the result is -1 to 1.

To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

**Note:** Because the function uses floating point arithmetic, it returns a very small number (such as 6.12323399574E-017) for angles that should produce 0. To test for a 0 value, check whether the value is less than 0.000000000001.

## Example

```
<h3>Sin Example</h3>
<!-- Calculate sine if form has been submitted -->
<cfif IsDefined("FORM.sinNum")>
<!-- Make sure input is a number -->
  <cfif IsNumeric("#FORM.sinNum#")>
<!-- Convert degrees to radians, call the Sin function. -->
  <cfset sinValue=#Sin((Form.sinNum * PI()) / 180)#>
<!-- 0.0000000000001 is the function's precision limit.
  If absolute value of returned sine value is
  less, set result to 0 -->
  <cfif Abs(sinValue) LT 0.000000000001>
    <cfset sinValue=0>
  </cfif>
  <cfoutput>
    Sin(#FORM.sinNum#) = #sinValue#<br><br>
  </cfoutput>
</cfif>
<!-- If input is not a number, show an error message -->
<h4>You must enter a numeric angle in degrees.</h4>
```

# SpanExcluding

## Description

Gets characters from a string, from the beginning to a character that is in a specified set of characters. The search is case-sensitive.

## Returns

A string; characters from *string*, from the beginning to a character that is in *set*.

## Category

[String functions](#)

## Function syntax

```
SpanExcluding(string, set)
```

## See also

[GetToken](#), [SpanIncluding](#); “Caching parts of ColdFusion pages” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| string    | A string or a variable that contains one                                      |
| set       | A string or a variable that contains one. Must contain one or more characters |

## Example

```
<h3>SpanExcluding Example</h3>

<cfif IsDefined("FORM.myString")>
<p>Your string was <cfoutput>#FORM.myString#</cfoutput>
<p>Your set of characters was <cfoutput>#FORM.mySet#</cfoutput>
<p>Your string up until one of the characters in the set is:
<cfoutput>#SpanExcluding(FORM.myString, FORM.mySet)#</cfoutput>
</cfif>

<p>Returns all characters from string from beginning to a character
  from the set of characters. The search is case-sensitive.

<form method = post action = "spanexcluding.cfm">
<p>Enter a string:
<br><input type = "Text" name = "myString" value = "Hey, you!">
<p>And a set of characters:
<br><input type = "Text" name = "mySet" value = "Ey">
<br><input type = "Submit" name = "">
</form>
```

# SpanIncluding

## Description

Gets characters from a string, from the beginning to a character that is not in a specified set of characters. The search is case-sensitive.

## Returns

A string; characters from *string*, from the beginning to a character that is not in *set*.

## Category

[String functions](#)

## Function syntax

```
SpanIncluding(string, set)
```

## See also

[GetToken](#), [SpanExcluding](#); “Caching parts of ColdFusion pages” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | A string or a variable that contains the search string.  |
| set       | A string or a variable that contains a set of characters. Must contain one or more characters. |

## Example

```
<h3>SpanIncluding Example</h3>
<cfif IsDefined("FORM.myString")>
<p>Your string was <cfoutput>#FORM.myString#</cfoutput>
<p>Your set of characters was <cfoutput>#FORM.mySet#</cfoutput>
<p>Your string, until the characters in the set have been found, is:
<cfoutput>#SpanIncluding(FORM.myString, FORM.mySet)#</cfoutput>
</cfif>
```

<p>Returns characters of a string, from beginning to a character that is not in set. The search is case-sensitive.

```
<form action = "spanincluding.cfm" method="post">
<p>Enter a string:
<br><input type = "Text" name = "myString" value = "Hey, you!">
<p>And a set of characters:
<br><input type = "Text" name = "mySet" value = "ey,H">
<br><input type = "Submit" name = "">
</form>
```

# Sqr

## Description

Calculates the square root of a number.

## Returns

Number; square root of *number*.

## Category

[Mathematical functions](#)

## Function syntax

`Sqr(number)`

## See also

[Abs](#)

## Parameters

---

| Parameter | Description  |
|-----------|--|
| number    | A positive integer or a variable that contains one. Number whose square root to get. |

---

## Usage

The value in `number` must be greater than or equal to 0.

## Example

```
<h3>Sqr Example</h3>
```

```
<p>Returns the square root of a positive number.
```

```
<p>Sqr(2): <cfoutput>#Sqr(2)#</cfoutput>
```

```
<p>Sqr(Abs(-144)): <cfoutput>#Sqr(Abs(-144))#</cfoutput>
```

```
<p>Sqr(25^2): <cfoutput>#Sqr(25^2)#</cfoutput>
```

# StripCR

## Description

Deletes return characters from a string.

## Returns

A copy of *string*, after removing return characters.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

StripCR(*string*)

## See also

[ParagraphFormat](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

Useful for preformatted (between `<pre>` and `</pre>` tags) HTML display of data entered in textarea fields.

## Example

```
<h3>StripCR Example</h3>

<p>Function StripCR is useful for preformatted HTML display of data
(PRE) entered in textarea fields.
<cfif isdefined("Form.myTextArea")>

<pre>
<cfoutput>#StripCR(Form.myTextArea)#</cfoutput>
</pre>
</cfif>
<!-- use #Chr(10)##Chr(13)# to simulate line feed/carriage return combination
--->
<form action = "stripcr.cfm">
<textarea name = "MyTextArea" cols = "35" rows = 8>
This is sample text and you see how it scrolls
<cfoutput>#Chr(10)##Chr(13)#</cfoutput>
From one line
<cfoutput>#Chr(10)##Chr(13)##Chr(10)##Chr(13)#</cfoutput>
to the next
</textarea>
<input type = "Submit" name = "Show me the HTML version">
</form>
```

# StructAppend

## Description

Appends one structure to another.

## Returns

True, upon successful completion; False, otherwise.

## Category

[Structure functions](#)

## Function syntax

```
StructAppend(struct1, struct2, overwriteFlag)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter     | Description   |
|---------------|---|
| struct1       | Structure to which struct2 is appended.   |
| struct2       | Structure that contains the data to append to struct1   |
| overwriteFlag | <ul style="list-style-type: none"><li>• True or "Yes": values in struct2 overwrite corresponding values in struct1. Default.</li><li>• False or "No": values in struct2 do not overwrite corresponding values in struct1.</li></ul> |

## Usage

This function appends the fields and values of struct2 to struct1; struct2 is not modified. If struct1 already contains a field of struct2, overwriteFlag determines whether the value in struct2 overwrites it.

A structure’s keys are unordered.

## Example

```
<html>
<body>
<!-- Create a Name structure -->
<cfset nameCLK=StructNew()>
<cfset nameCLK.first="Chris">
<cfset nameCLK.middle="Lloyd">
<cfset nameCLK.last="Gilson">
<!-- Create an address struct -->
<cfset addrCLK=StructNew()>
<cfset addrCLK.street="17 Gigantic Rd">
```

```

<cfset addrCLK.city="Watertown">
<cfset addrCLK.state="MA">
<cfset addrCLK.zip="02472">
<!--- Create a Person structure --->
<cfset personCLK=StructNew()>
<cfset personCLK.name=#nameCLK#>
<cfset personCLK.addr=#addrCLK#>
<!--- Display the contents of the person struct before the Append --->
<p>
The person struct <b>before</b> the Append call:<br>
<cfloop collection=#personCLK# item="myItem">
<cfoutput>
#myItem#<br>
</cfoutput>
</cfloop>
<!--- Merge the address struct into the top-level person struct --->
<cfset bSuccess = StructAppend( personCLK, addrCLK )>

<!--- Display the contents of the person struct, after the Append --->
<p>
The person struct <b>after</b> the Append call:<br>
<cfloop collection=#personCLK# item="myItem">
  <cfoutput>
    #myItem#<br>
  </cfoutput>
</cfloop>

```

# StructClear

## Description

Removes all data from a structure.

## Returns

True, on successful execution; False, otherwise.

## Category

[Structure functions](#)

## Function syntax

```
StructClear(structure)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description        |
|-----------|--------------------|
| structure | Structure to clear |

## Usage

Do not call this function on a session variable. For more information, see TechNote 14143, “*ColdFusion 4.5 and the StructClear(Session) function*,” at [www.coldfusion.com/Support/KnowledgeBase/SearchForm.cfm](http://www.coldfusion.com/Support/KnowledgeBase/SearchForm.cfm). (The article applies to ColdFusion 4.5, 5.x, and ColdFusion MX.)

## Example

```
<!-- Shows StructClear function. Calls cf_addemployee custom tag which
      uses the addemployee.cfm file. -->
<body>
<h1>Add New Employees</h1>
<!-- Establish params for first time through -->
<cfparam name = "Form.firstname" default = "">
<cfparam name = "Form.lastname" default = "">
<cfparam name = "Form.email" default = "">
<cfparam name = "Form.phone" default = "">
<cfparam name = "Form.department" default = "">
<cfif form.firstname eq "">
  <p>Please fill out the form.
<cfelse>
<cfoutput>
  <cfscript>
    employee = StructNew();
    StructInsert(employee, "firstname", Form.firstname);
```

```
    StructInsert(employee, "lastname", Form.lastname);
    StructInsert(employee, "email", Form.email);
    StructInsert(employee, "phone", Form.phone);
    StructInsert(employee, "department", Form.department);
</cfscript>
</cfoutput>
<!-- Call the custom tag that adds employees -->
<cf_addemployee empinfo = "#employee#">
<cfscript>StructClear(employee);</cfscript>
</cfif>
```

# StructCopy

## Description

Copies a structure. Copies top-level keys, values, and arrays in the structure by value; copies nested structures by reference.

## Returns

A copy of a structure, with the same keys and values; if *structure* does not exist, throws an exception.

## Category

[Structure functions](#)

## Function syntax

```
StructCopy(structure)
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description       |
|-----------|-------------------|
| structure | Structure to copy |

## Usage

The following code shows how this function copies a structure that contains a string field, a number field, and a two-dimensional array at the top level:

```
<cfoutput>
  <cfset assignedCopy = StructNew()>
  <cfset assignedCopy.string = #struct.string#>
  <cfset assignedCopy.number = #struct.number#>
  <cfset assignedCopy.array = ArrayNew(2)>
  <cfset assignedCopy.array[1][1] = #struct.array[1][1]#>
  <cfset assignedCopy.array[1][2] = #struct.array[1][2]#>
</cfoutput>
```

The following code shows how `StructCopy` copies a nested structure:

```
<cfoutput>
  <cfset assignedCopy.nestedStruct = struct.nestedStruct>
</cfoutput>
```

To copy a structure entirely by value, use [Duplicate on page 577](#).

The following table shows how variables are assigned:

| Variable type   | Assigned by |
|---|-------------|
| structure.any_simple_value<br>Boolean<br>Binary<br>Base64 | Value       |
| structure.array   | Value       |
| structure.nested_structure                                | Reference   |
| structure.object  | Reference   |
| structure.query   | Reference   |

### Example

```
<!-- This code shows assignment by-value and by-reference. -->
// This script creates a structure that StructCopy copies by value. <br>
<cfscript>
  // Create elements.
  s = StructNew();
  s.array = ArrayNew(2);

  // Assign simple values to original top-level structure fields.
  s.number = 99;
  s.string = "hello tommy";

  // Assign values to original top-level array.
  s.array[1][1] = "one one";
  s.array[1][2] = "one two";
</cfscript>

<!-- Output original structure -->
<hr>
<b>Original Values</b><br>
<cfoutput>
  // Simple values <br>
  s.number = #s.number#<br>
  s.string = #s.string#<br>
  // Array value <br>
  s.array[1][1] = #s.array[1][1]#<br>
  s.array[1][2] = #s.array[1][2]#<br>
</cfoutput>

// Copy this structure to a new structure. <br>
<cfset copied = StructCopy(s)>

<cfscript>
// Change the values of the original structure. <br>
  s.number = 100;
  s.string = "hello tommy (modified)";
  s.array[1][1] = "one one (modified)";
  s.array[1][2] = "one two (modified)";
</cfscript>
```

```

<hr>
<b>Modified Original Values</b><br>
<cfoutput>
  // Simple values <br>
  s.number = #s.number#<br>
  s.string = #s.string#<br>
  // Array value <br>
  s.array[1][1] = #s.array[1][1]#<br>
  s.array[1][2] = #s.array[1][2]#<br>
</cfoutput>
<hr>
<b>Copied structure values should be the same as the original.</b><br>
<cfoutput>
  // Simple values <br>
  copied.number = #copied.number#<br>
  copied.string = #copied.string#<br>
  // Array value <br>
  copied.array[1][1] = #copied.array[1][1]#<br>
  copied.array[1][2] = #copied.array[1][2]#<br>
</cfoutput>

// This script creates a structure that StructCopy copies by reference.
<cfscript>
  // Create elements.
  s = StructNew();
  s.nested = StructNew();
  s.nested.array = ArrayNew(2);
  // Assign simple values to nested structure fields.
  s.nested.number = 99;
  s.nested.string = "hello tommy";
  // Assign values to nested array.
  s.nested.array[1][1] = "one one";
  s.nested.array[1][2] = "one two";
</cfscript>

<!-- Output original structure --->
<hr>
<b>Original Values</b><br>
<cfoutput>
  // Simple values <br>
  s.nested.number = #s.nested.number#<br>
  s.nested.string = #s.nested.string#<br>

  // Array values <br>
  s.nested.array[1][1] = #s.nested.array[1][1]#<br>
  s.nested.array[1][2] = #s.nested.array[1][2]#<br>
</cfoutput>

// Use StructCopy to copy this structure to a new structure. <br>
<cfset copied = StructCopy(s)>
// Use Duplicate to clone this structure to a new structure. <br>
<cfset duplicated = Duplicate(s)>

<cfscript>
  // Change the values of the original structure.

```

```

    s.nested.number = 100;
    s.nested.string = "hello tommy (modified)";
    s.nested.array[1][1] = "one one (modified)";
    s.nested.array[1][2] = "one two (modified)";
</cfscript>
<hr>
<b>Modified Original Values</b><br>
<cfoutput>
    // Simple values <br>
    s.nested.number = #s.nested.number#<br>
    s.nested.string = #s.nested.string#<br>

    // Array value <br>
    s.nested.array[1][1] = #s.nested.array[1][1]#<br>
    s.nested.array[1][2] = #s.nested.array[1][2]#<br>
</cfoutput>

<hr>
<b>Copied structure values should reflect changes to original.</b><br>
<cfoutput>
    // Simple values <br>
    copied.nested.number = #copied.nested.number#<br>
    copied.nested.string = #copied.nested.string#<br>
    // Array values <br>
    copied.nested.array[1][1] = #copied.nested.array[1][1]#<br>
    copied.nested.array[1][2] = #copied.nested.array[1][2]#<br>
</cfoutput>

<hr>
<b>Duplicated structure values should remain unchanged.</b><br>
<cfoutput>
    // Simple values <br>
    duplicated.nested.number = #duplicated.nested.number#<br>
    duplicated.nested.string = #duplicated.nested.string#<br>
    // Array value <br>
    duplicated.nested.array[1][1] = #duplicated.nested.array[1][1]#<br>
    duplicated.nested.array[1][2] = #duplicated.nested.array[1][2]#<br>
</cfoutput>

```

# StructCount

## Description

Counts the keys in a structure.

## Returns

A number; if *structure* does not exist, throws an exception.

## Category

[Structure functions](#)

## Function syntax

```
StructCount(structure)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description         |
|-----------|---------------------|
| structure | Structure to access |

## Example

```
<!-- This view-only example shows use of StructCount. -->
<p>This file is similar to addemployee.cfm, which is called by
  StructNew, StructClear, and StructDelete. To test, copy
  StructCount function to appropriate place in addemployee.cfm.
<!--
<cfswitch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
      <cfoutput>Error. No employee data was passed.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelse>
      <cfquery name = "AddEmployee" datasource = "cfdocexamples">
        INSERT INTO Employees
          (FirstName, LastName, Email, Phone, Department)
        VALUES
          <cfoutput>
            (
              '#StructFind(attributes.EMPINFO, "firstname")#' ,
              '#StructFind(attributes.EMPINFO, "lastname")#' ,
              '#StructFind(attributes.EMPINFO, "email")#' ,
              '#StructFind(attributes.EMPINFO, "phone")#' ,
              '#StructFind(attributes.EMPINFO, "department")#'
            )
          </cfoutput>
```

```
</cfquery>
</cfif>
<cfoutput><hr>Employee Add Complete
  <p>#StructCount(attributes.EMPINFO)# columns added.</cfoutput>
</cfcase>
</cfswitch> --->
```

# StructDelete

## Description

Removes an element from a structure.

## Returns

Boolean value. The value depends on the `indicateNotExisting` parameter value.

## Category

[Structure functions](#)

## Function syntax

```
StructDelete(structure, key [, indicateNotExisting ])
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter           | Description   |
|---------------------|---|
| structure           | Structure or a variable that contains one. Contains element to remove.  |
| key                 | Element to remove.  |
| indicateNotExisting | <ul style="list-style-type: none"><li>• True: returns Yes if <i>key</i> exists; No if it does not.</li><li>• False: returns Yes regardless of whether <i>key</i> exists. Default.</li></ul> |

## Example

```
<h3>StructDelete Function</h3>
<!-- Delete the surrounding comments to make this page work
<p>This example uses the StructInsert and StructDelete functions.
<!-- Establish params for first time through -->
<cfparam name = "firstname" default = "Mary">
<cfparam name = "lastname" default = "Sante">
<cfparam name = "email" default = "msante@allaire.com">
<cfparam name = "phone" default = "777-777-7777">
<cfparam name = "department" default = "Documentation">

<cfif IsDefined("FORM.Delete")>
  <cfoutput>
    Field to be deleted: #form.field#
  </cfoutput>
<p>
<CFScript>
  employee = StructNew();
  StructInsert(employee, "firstname", firstname);
  StructInsert(employee, "lastname", lastname);
  StructInsert(employee, "email", email);
```

# StructFind

## Description

Determines the value associated with a key in a structure.

## Returns

The value associated with a key in a structure; if *structure* does not exist, throws an exception.

## Category

[Structure functions](#)

## Function syntax

```
StructFind(structure, key)
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                                 |
|-----------|---|
| structure | Structure that contains the value to return |
| key       | Key whose value to return                   |

## Usage

A structure’s keys are unordered.

## Example

```
<!--- This view-only example shows the use of StructFind. --->
<p>This file is identical to addemployee.cfm, which is called by StructNew,
  StructClear, and StructDelete. It adds employees. Employee information
  is passed through the employee structure (EMPINFO attribute). In UNIX,
  you must also add the Emp_ID.
<!---
<cfswitch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
      <cfoutput>Error. No employee data was passed.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelse>
      <cfquery name = "AddEmployee" datasource = "cfdocexamples">
        INSERT INTO Employees (FirstName, LastName, Email, Phone, Department)
        VALUES
        <cfoutput>
          (
            '#StructFind(attributes.EMPINFO, "firstname")#' ,
            '#StructFind(attributes.EMPINFO, "lastname")#' ,
            '#StructFind(attributes.EMPINFO, "email")#' ,
            '#StructFind(attributes.EMPINFO, "phone")#' ,
            '#StructFind(attributes.EMPINFO, "department")#' )
          </cfoutput>
```

```
</cfquery>
</cfif>
<cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch> --->
```

# StructFindKey

## Description

Searches recursively through a substructure of nested arrays, structures, and other elements, for structures whose values match the search key in the *value* parameter.

## Returns

An array that contains structures with values that match *value*.

## Category

[Structure functions](#)

## Function syntax

```
StructFindKey(top, value, scope)
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter          | Description   |
|--------------------|---|
| <code>top</code>   | ColdFusion object (structure or array) from which to start search. This parameter requires an object, not a name of an object.                                |
| <code>value</code> | String or a variable that contains one for which to search.   |
| <code>scope</code> | <ul style="list-style-type: none"><li>• <code>one</code>: returns one matching key. Default.</li><li>• <code>all</code>: returns all matching keys.</li></ul> |

## Usage

Returns an array that includes one structure for each of the specified values it finds. The fields of each of these structures are:

- `Value`: value held in the found key
- `Path`: string that can be used to reach the found key
- `Owner`: parent object that contains the found key

A structure’s keys are unordered.

## Example

```
<cfset aResults = StructFindKey( #request#, "bass" )>
```

# StructFindValue

## Description

Searches recursively through a substructure of nested arrays, structures, and other elements for structures with values that match the search key in the `value` parameter.

## Returns

An array that contains structures with values that match the search key *value*. If none are found, returns an array of size 0.

## Category

[Structure functions](#)

## Function syntax

```
StructFindValue( top, value [, scope])
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| top       | ColdFusion object (a structure or an array) from which to start search. This parameter requires an object, not a name of an object.                    |
| value     | String or a variable that contains one for which to search. The type must be a simple object. Arrays and structures are not supported.                 |
| scope     | <ul style="list-style-type: none"><li>• one: function returns one matching key (default).</li><li>• all: function returns all matching keys.</li></ul> |

## Usage

The fields of each structure in the returned array are:

- Key: name of the key in which the value was found
- Path: string which could be used to reach the found key
- Owner: parent object that contains the found key

A structure’s keys are unordered.

## Example

```
<cfset aResults = StructFindValue( #request#, "235" )>
```

# StructGet

## Description

Gets a structure(s) from a specified path.

## Returns

An alias to the variable in the *pathDesired* parameter. If necessary, StructGet creates structures or arrays to make *pathDesired* a valid variable "path."

## Category

[Structure functions](#)

## Function syntax

```
StructGet(pathDesired)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed behavior: this function can be used on XML objects.
- Changed behavior: if there is no structure or array present in *pathDesired*, this function creates structures or arrays to make *pathDesired* a valid variable "path."

## Parameters

| Parameter   | Description  |
|-------------|--|
| pathDesired | Pathname of variable that contains structure or array from which ColdFusion retrieves structure. |

## Usage

You can inadvertently create invalid structures using this function. For example, if array notation is used to expand an existing array, the specified new element is created, regardless of the type currently held in the array.

## Example

```
<!-- GetStruct() test -->
<cfset test = StructGet( "dog.myscope.test" )>
<cfset test.foo = 1>
<cfif NOT IsDefined("dog")>
    Dog is not defined<br>
</cfif>
<cfif NOT IsDefined("dog.myscope")>
    Dog.Myscope is not defined<br>
</cfif>
<cfif NOT Isdefined("dog.myscope.test")>
    Dog.Myscope.Test is not defined<br>
</cfif>
```

```
<cfif NOT Isdefined("dog.myscope.test.foo")>
  Dog.Myscope.Test.Foo is not defined<br>
</cfif>
<cfoutput>
  #dog.myscope.test.foo#<br>
</cfoutput>
<cfset test = StructGet( "request.myscope[1].test" )>
<cfset test.foo = 2>
<cfoutput>
  #request.myscope[1].test.foo#<br>
</cfoutput>
<cfset test = StructGet( "request.myscope[1].test[2]" )>
<cfset test.foo = 3>
<cfoutput>
  #request.myscope[1].test[2].foo#<br>
</cfoutput>
```

# StructInsert

## Description

Inserts a key-value pair into a structure.

## Returns

True, upon successful completion. If `structure` does not exist, or if `key` exists and `allowoverwrite = "False"`, ColdFusion throws an exception.

## Category

[Structure functions](#)

## Function syntax

```
StructInsert(structure, key, value [, allowoverwrite ])
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter                   | Description   |
|-----------------------------|---|
| <code>structure</code>      | Structure to contain the new key-value pair.  |
| <code>key</code>            | Key that contains the inserted value.   |
| <code>value</code>          | Value to add.   |
| <code>allowoverwrite</code> | Optional. Whether to allow overwriting a key. The default value is <code>False</code> . |

## Usage

A structure’s keys are unordered.

## Example

```
<h1>Add New Employees</h1>
<!-- Establish params for first time through -->
<cfparam name = "FORM.firstname" default = "">
<cfparam name = "FORM.lastname" default = "">
<cfparam name = "FORM.email" default = "">
<cfparam name = "FORM.phone" default = "">
<cfparam name = "FORM.department" default = "">

<cfif FORM.firstname EQ "">
  <p>Please fill out the form.
<cfelse>
  <cfoutput>
    <CFScript>
      employee = StructNew();
      StructInsert(employee, "firstname", FORM.firstname);

  <input type = "submit" value = "OK">
</form>

```

# StructIsEmpty

## Description

Determines whether a structure contains data.

## Returns

True, if *structure* is empty; if *structure* does not exist, ColdFusion throws an exception.

## Category

[Decision functions](#), [Structure functions](#)

## Function syntax

```
StructIsEmpty(structure)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description       |
|-----------|-------------------|
| structure | Structure to test |

## Example

```
<!-- This example illustrates use of StructIsEmpty. -->
<p>This file is identical to addemployee.cfm, which is called by StructNew,
  StructClear, and StructDelete. It adds employees. Employee information
  is passed through employee structure (EMPINFO attribute). In UNIX, you
  must also add the Emp_ID.
<switch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
      <cfoutput>Error. No employee data was passed.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelse>
      <!-- Add the employee; In UNIX, you must also add the Emp_ID -->
      <cfquery name = "AddEmployee" datasource = "cfdocexamples">
        INSERT INTO Employees
          (FirstName, LastName, Email, Phone, Department)
        VALUES
          <cfoutput>
            (
              '#StructFind(attributes.EMPINFO, "firstname")#' ,
              '#StructFind(attributes.EMPINFO, "lastname")#' ,
              '#StructFind(attributes.EMPINFO, "email")#' ,
              '#StructFind(attributes.EMPINFO, "phone")#' ,
              '#StructFind(attributes.EMPINFO, "department")#'
            )
          </cfoutput>
      </cfquery>
```

```
        </cfoutput>
    </cfquery>
</cfif>
    <cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch>
```

# StructKeyArray

## Description

Finds the keys in a ColdFusion structure.

## Returns

An array of keys; if *structure* does not exist, ColdFusion throws an exception.

## Category

[Structure functions](#)

## Function syntax

```
StructKeyArray(structure)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                                    |
|-----------|--|
| structure | Structure from which to extract a list of keys |

## Usage

A structure’s keys are unordered.

## Example

```
<!-- Shows StructKeyArray function to copy keys from a structure to an array.
     Uses StructNew to create structure and fills its fields with the
     information the user enters in the form fields. --->
<h3>StructKeyArray Example</h3>
<h3>Extracting the Keys from the Employee Structure</h3>
<!-- Create structure. Check whether Submit was pressed. If so, define fields
     in employee structure with user entries on form. ----->
<cfset employee = StructNew()>
<cfif Isdefined("Form.Submit")>
    <cfif Form.Submit is "OK">
        <cfset employee.firstname = FORM.firstname>
        <cfset employee.lastname = FORM.lastname>
        <cfset employee.email = FORM.email>
        <cfset employee.phone = FORM.phone>
        <cfset employee.company = FORM.company>
    <cfelseif Form.Submit is "Clear">
        <cfset rc = StructClear(employee)>
    </cfif>
</cfif>
<p> This example uses the StructNew function to create a structure called
     "employee" that supplies employee info. Its fields are filled by
     the form. After you enter employee information in structure, the
     example uses StructKeyArray function to copy all of the keys from
     the structure into an array. </p>
```

```

<hr size = "2" color = "#0000A0">
<form action = "structkeyarray.cfm">
<table cellpadding = "2" cellspacing = "2" border = "0">
  <tr>
    <td>First Name:</td>
    <td><input name = "firstname" type = "text"
      value = "" hspace = "30" maxlength = "30"></td>
  </tr>
  <tr>
    <td>Last Name:</td>
    <td><input name = "lastname" type = "text"
      value = "" hspace = "30" maxlength = "30"></td>
  </tr>
  <tr>
    <td>EMail</td>
    <td><input name = "email" type = "text"
      value = "" hspace = "30" maxlength = "30"></td>
  </tr>
  <tr>
    <td>Phone:</td>
    <td><input name = "phone" type = "text"
      value = "" hspace = "20" maxlength = "20"></td>
  </tr>
  <tr>
    <td>Company:</td>
    <td><input name = "company" type = "text"
      value = "" hspace = "30" maxlength = "30"></td>
  </tr>
  <tr>
    <td><input type = "submit" name = "submit"
      value = "OK"></td>
  </tr>
  <td><b>After you submit the FORM, scroll down to see the array.</b>
</td>
</tr>
</table>
</form>
<cfif NOT StructIsEmpty(employee)>
  <hr size = "2" color = "#0000A0">
  <cfset keysToStruct = StructKeyArray(employee)>
  <cfloop index = "i" from = "1" to = "#ArrayLen(keysToStruct)#">
    <p><cfoutput>Key#i# is #keysToStruct[i]#</cfoutput></p>
    <p><cfoutput>Value#i# is #employee[keysToStruct[i]]#</cfoutput>
  </p>
  </cfloop>
</cfif>

```

# StructKeyExists

## Description

Determines whether a specific key is present in a structure.

## Returns

True, if *key* is in *structure*; if *structure* does not exist, ColdFusion throws an exception.

## Category

[Decision functions](#), [Structure functions](#)

## Function syntax

```
StructKeyExists(structure, "key")
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description               |
|-----------|---------------------------|
| structure | Name of structure to test |
| key       | Key to test               |

## Usage

This function can sometimes be used in place of the `IsDefined` function, when working with the URL and Form scopes, which are structures. The following pieces of code are equivalent:

```
cfif IsDefined("Form.JediMaster")>
<cfif StructKeyExists(Form,"JediMaster")>
```

A structure’s keys are unordered.

## Example

```
<!--- This example shows the use of StructKeyExists. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew,
StructClear, and StructDelete. To test, copy the &LT;CFELSEif&GT;
statement to the appropriate place in addemployee.cfm. It is a custom tag
to add employees. Employee information is passed through the employee
structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.
```

```
<cfswitch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
      <cfoutput>Error. No employee data was passed.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelseif NOT StructKeyExists(attributes.EMPINFO, "department")>
      <cfscript>StructUpdate(attributes.EMPINFO, "department",
        "Unassigned");
      </cfscript>
    <cfexit method = "ExitTag">
  <cfelse>
```

# StructKeyList

## Description

Extracts keys from a ColdFusion structure.

## Returns

A list of keys; if *structure* does not exist, ColdFusion throws an exception.

## Category

[Structure functions](#)

## Function syntax

```
StructKeyList(structure [, delimiter])
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| structure | Structure from which to extract a list of keys.                              |
| delimiter | Optional. Character that separates keys in list. The default value is comma. |

## Usage

A structure’s keys are unordered.

## Example

```
<!-- This example shows how to use StructKeyList to list the keys
in a structure. It uses StructNew function to create structure
and fills it with information user enters in form fields. --->
<!-- This section creates structure and checks whether Submit has been
pressed.
If so, code defines fields in the employee structure with what the
user entered in the form. --->
<cfset employee = StructNew()>
<cfif Isdefined("Form.Submit")>
  <cfif Form.Submit is "OK">
    <cfset employee.firstname = FORM.firstname>
    <cfset employee.lastname = FORM.lastname>
    <cfset employee.email = FORM.email>
    <cfset employee.phone = FORM.phone>
    <cfset employee.company = FORM.company>
  <cfelseif Form.Submit is "Clear">
    <cfset rc = StructClear(employee)>
  </cfif>
</cfif>
<html>
<head>
  <title>StructKeyList Function</title>
</head>
```

```

<body>
<h3>StructKeyList Function</h3>
<h3>Listing the Keys in the Employees Structure</h3>
<p>This example uses StructNew function to create structure "employee" that
supplies employee information. The fields are filled with the
contents of the following form.</p>
<p>After you enter employee information into structure, example uses
<b>StructKeyList</b> function to list keys in structure.</p>
<p>This code does not show how to insert information into a database.
See cfquery for more information about database insertion.

  <cfset keysToStr = StructKeyList(employee,"<li>")>
  <p>Here are the keys to the structure:</p>
  <ul>
    <li><cfoutput>#keysToStr#</cfoutput>
  </ul>
  <p>If fields are correct, we can process new employee information.
  If they are not correct, consider rewriting application.</p>
</cfif>

```

# StructNew

## Description

Creates a structure.

## Returns

A structure.

## Category

[Structure functions](#)

## Function syntax

```
StructNew()
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

None

## Example

```
<!-- Shows StructNew. Calls CF_ADDEMPLOYEE, which uses the |
      addemployee.cfm file to add employee record to database. -->
<h1>Add New Employees</h1>
<cfparam name = "FORM.firstname" default = "">
<cfparam name = "FORM.lastname" default = "">
<cfparam name = "FORM.email" default = "">
<cfparam name = "FORM.phone" default = "">
<cfparam name = "FORM.department" default = "">
<cfif FORM.firstname EQ "">
  <p>Please fill out the form.
<cfelse>
  <cfoutput>
  <cfscript>
    employee = StructNew();
    StructInsert(employee, "firstname", FORM.firstname);
    StructInsert(employee, "lastname", FORM.lastname);
    StructInsert(employee, "email", FORM.email);
    StructInsert(employee, "phone", FORM.phone);
    StructInsert(employee, "department", FORM.department);
  </cfscript>
  <p>First name is #StructFind(employee, "firstname")#
  <p>Last name is #StructFind(employee, "lastname")#
  <p>EMail is #StructFind(employee, "email")#
  <p>Phone is #StructFind(employee, "phone")#
  <p>Department is #StructFind(employee, "department")#
  </cfoutput>
<!-- Call the custom tag that adds employees -->
<CF_ADDEMPLOYEE EMPINFO = "#employee#">
</cfif>
```

# StructSort

## Description

Returns a sorted array of the top level keys in a structure. Sorts using alphabetic or numeric sorting, and can sort based on the values of any structure element.

## Returns

An array of top-level key names (strings), sorted by the value of the specified subelement.

## Category

[Structure functions](#)

## Function syntax

```
StructSort(base, sortType, sortOrder, pathToSubElement)
```

## See also

[Structure functions](#); “Structure functions” in Chapter 5, “Using Arrays and Structures,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter        | Description  |
|------------------|--|
| base             | A ColdFusion struct with one field (an associative array).   |
| sortType         | <ul style="list-style-type: none"><li>• numeric</li><li>• text: case-sensitive (all lowercase letters precede the first uppercase letter). Default.</li><li>• textnocase</li></ul>                       |
| sortOrder        | <ul style="list-style-type: none"><li>• asc: ascending (a to z) sort order. Default.</li><li>• desc: descending (z to a) sort order</li></ul>  |
| pathToSubElement | String or a variable that contains one.<br>Path to apply to each top-level key, to reach element value by which to sort.<br>The default value is nothing (top-level entries sorted by their own values). |

## Usage

The `pathToSubElement` string does not support array notation, and only supports substructures of structures.

This function does not sort or change the structure.

## Example

```
<cfscript>
    salaries = StructNew() ;
    employees = StructNew() ;
    departments = StructNew() ;
    for ( i=1; i lt 6; i=i+1 )
    {
        salary = 120000 - i*10000 ;
        salaries["employee#i#"] = salary ;
    }

```

```

        employee = StructNew() ;
        employee["salary"] = salary ;
        // employee.salary = salary ;
        employees["employee#i#"] = employee ;

        departments["department#i#"] = StructNew() ;
        departments["department#i#"].boss = employee ;
    }
</cfscript>

<cfoutput>
<p>list of employees based on the salary (text search): <br>
1) #ArrayToList( StructSort( salaries ) )#<br>
2) #ArrayToList( StructSort( salaries, "text", "ASC" ) )#<br>
3) #ArrayToList( StructSort( salaries, "textnocase", "ASC" ) )#<br>
4) #ArrayToList( StructSort( salaries, "text", "DESC" ) )#<br>
<p>list of employees based on the salary (numeric search): <br>
5) #ArrayToList( StructSort( salaries, "numeric", "ASC" ) )#<br>
6) #ArrayToList( StructSort( salaries, "numeric", "DESC" ) )#<br>
<p>list of employees based on the salary (subfield search): <br>
7) #ArrayToList( StructSort( employees, "numeric", "DESC", "salary" ) )#<br>
8) #ArrayToList( StructSort( employees, "text", "ASC", "salary" ) )#<br>
<p>list of departments based on the salary (sub-sub-field search): <br>
9) #ArrayToList( StructSort( departments, "text", "ASC", "boss.salary" )
) )#<br>
</cfoutput>

<!-- add an invalid element and test that it throws an error -->
<p><p>
<cfset employees[ "employee4" ] = StructNew()>
<cftry>
    <cfset temp = StructSort( employees, "text", "ASC", "salary" )>
    <cfoutput>We have a problem - this was supposed to throw an exception!<br>
</cfoutput>
</cfcatch type="any">
    <cfoutput>
        ERROR: <b>This error was expected!</b><br>
        #cfcatch.message# - #cfcatch.detail#<br>
    </cfoutput>
</cfcatch>
</cftry>

```

# StructUpdate

## Description

Updates a key with a value.

## Returns

True, on successful execution; if the structure does not exist, ColdFusion throws an error.

## Category

[Structure functions](#)

## Function syntax

```
StructUpdate(structure, key, value)
```

## See also

[Structure functions](#); “Modifying a ColdFusion XML object” in Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| structure | Structure to update               |
| key       | Key, the value of which to update |
| value     | New value                         |

## Example

```
<!-- This example shows the use of StructUpdate. -->
<p>This file is similar to addemployee.cfm, which is called by StructNew,
StructClear, and StructDelete. To test this file, copy the
<LT;CFELSEIF&GT; statement to the appropriate place in
addemployee.cfm. It is an example of a custom tag used to add
employees. Employee information is passed through the employee
structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.

<cfswitch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
      <cfoutput>Error. No employee data was passed.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelseif StructFind(attributes.EMPINFO, "department") EQ "">
      <cfscript>
        StructUpdate(attributes.EMPINFO, "department", "Unassigned");
      </cfscript>
      <cfexit method = "ExitTag">
    <cfelse>
```

# Tan

## Description

Calculates the tangent of an angle that is entered in radians.

## Returns

A number; the tangent of an angle.

## Category

[Mathematical functions](#)

## Function syntax

`Tan(number)`

## See also

[Atn](#), [Cos](#), [ACos](#), [Sin](#), [ASin](#), [Pi](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| number    | Angle, in radians, for which to calculate the tangent. |

## Usage

To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

**Note:** Because the function uses floating point arithmetic, it can return a very small number (such as 6.12323399574E-017) for angles that should produce 0 and can return a very large number (such as 1.63312393532E+016) for infinity or not a number. To test for a 0 value, check whether the value is less than 0.0000000000001. To test for an infinite value, check whether the value is more than 1E15.

## Example

```
<h3>Tan Example</h3>
<!-- Calculate tangent if form has been submitted -->
<cfif IsDefined("FORM.tanNum")>
<!-- Make sure input is a number -->
  <cfif IsNumeric("#FORM.tanNum#")>
<!-- Convert degrees to radians, call the Tan function. -->
  <cfset tanValue=#Tan((Form.tanNum * PI()) / 180)#>
<!-- 0.0000000000001 is the function's precision limit.
  If absolute value of returned value is
  less, set result to 0 -->
  <cfif Abs(tanValue) LT 0.0000000000001>
    <cfset tanValue=0>
  </cfif>
  <cfoutput>
    Tan(#FORM.tanNum#) = #tanValue#<br><br>
  </cfoutput>
<cfelse>
<!-- If input is not a number, show an error message -->
  <h4>You must enter a numeric angle in degrees.</h4>
```

# TimeFormat

## Description

Formats a time value using U.S. English time formatting conventions.

## Returns

A custom-formatted time value. If no mask is specified, returns a time value using the `hh:mm tt` format. For international time formatting, see [LSTimeFormat](#).

## Category

[Date and time functions](#), [Display and formatting functions](#)

## Function syntax

```
TimeFormat(time [, mask ])
```

## See also

[CreateTime](#), [Now](#), [ParseDateTime](#), [LSTimeFormat](#), [DateFormat](#)

## History

ColdFusion MX 6.1: Added the mask character L or l to represent milliseconds.

ColdFusion MX:

- Changed the way extra characters are processed: this function processes extra characters within the `mask` value differently than in earlier releases, as follows:
    - ColdFusion 5 and earlier: the function returns the time format and an apostrophe-delimited list of the extra characters. For example, `TimeFormat(Now(), "hh:mm:ss dog")` returns `8:17:23 d'o'g`.
    - ColdFusion MX: the function returns the time format and the extra characters. For example, for the call above, it returns `8:17:23 dog`.
- If the extra characters are single-quoted (for example, `hh:mm:ss 'dog'`), ColdFusion 5 and ColdFusion MX return the time format and the extra characters: `8:17:23 dog`.
- Added support for the following `mask` parameter options: `short`, `medium`, `long`, and `full`.

## Parameters

| Parameter | Description   |
|-----------|---|
| time      | A date/time value or string to convert  |
| mask      | Masking characters that determine the format: <ul style="list-style-type: none"><li>• h: hours; no leading zero for single-digit hours (12-hour clock)</li><li>• hh: hours; leading zero for single-digit hours (12-hour clock)</li><li>• H: hours; no leading zero for single-digit hours (24-hour clock)</li><li>• HH: hours; leading zero for single-digit hours (24-hour clock)</li><li>• m: minutes; no leading zero for single-digit minutes</li><li>• mm: minutes; a leading zero for single-digit minutes</li><li>• s: seconds; no leading zero for single-digit seconds</li><li>• ss: seconds; leading zero for single-digit seconds</li><li>• l or L: milliseconds. l gives 3 digits. L gives 2 digits.</li><li>• t: one-character time marker string, such as A or P</li><li>• tt: multiple-character time marker string, such as AM or PM</li><li>• short: equivalent to h:mm tt</li><li>• medium: equivalent to h:mm:ss tt</li><li>• long: medium followed by three-letter time zone; as in, 2:34:55 PM EST</li><li>• full: same as long</li></ul> |

## Usage

When passing a date/time value as a string, you must enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

Database query results for date and time values can vary in sequence and formatting unless you use functions to format the results. To ensure that dates and times display with appropriate formatting, and that users of your ColdFusion application are not confused by dates and times displayed, Macromedia recommends that you use the `DateFormat` and `TimeFormat` functions to format date and time values from queries. For more information and examples, see TechNote 22183, “*ColdFusion Server (5 and 4.5.x) with Oracle: Formatting Date and Time Query Results*,” at [www.coldfusion.com/Support/KnowledgeBase/SearchForm.cfm](http://www.coldfusion.com/Support/KnowledgeBase/SearchForm.cfm).

## Example

```
<cfset todayDate = #Now()#>
<body>
<h3>TimeFormat Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using Timeformat, we can display the value in different ways:
<cfoutput>
<ul>
<li>#TimeFormat(todayDate)#
<li>#TimeFormat(todayDate, "hh:mm:ss")#
<li>#TimeFormat(todayDate, "hh:mm:ssT")#
<li>#TimeFormat(todayDate, "hh:mm:ssTT")#
<li>#TimeFormat(todayDate, "HH:mm:ss")#
</ul>
</cfoutput>
<p>To generate a standard ISO 8601 W3C Date and Time string like
1997-07-16T19:20, concatenate a DateFormat function, the character T, and a
```

TimeFormat function.

For example: `dateformat(now(), "yyy-mm-dd">#T#TimeFormat(now(), "HH:mm:ss")`

produces:</p>

```
<cfoutput>#dateformat(now(), "yyy-mm-dd">#T#TimeFormat(now(), "HH:mm:ss")#</
```

```
cfoutput>
```

```
</body>
```

# ToBase64

## Description

Calculates the Base64 representation of a string or binary object. The Base64 format uses printable characters, allowing binary data to be sent in forms and e-mail, and stored in a database or file.

## Returns

The Base64 representation of a string or binary object.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

```
ToBase64(string or binary_object[, encoding])
```

## See also

- [BinaryEncode](#) for conversion of binary data to base64
- [cffile](#) for information about loading and reading binary data
- [cfwddx](#) for information about serializing and deserializing binary data
- [IsBinary](#) and [ToBinary](#) for checking for binary data and converting a Base64 object to binary format

## History

ColdFusion MX: Added the *encoding* parameter.

## Parameters

---

| Parameter               | Description  |
|-------------------------|--|
| string or binary_object | A string, the name of a string, or a binary object.  |
| encoding                | <p>For a string, defines how characters are represented in a byte array. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>. The default value is the encoding of the page on which the function is called. See <a href="#">cfcontent</a>. For a binary object, this parameter is ignored.</p> |

---

## Usage

Macromedia recommends that you use the [BinaryEncode](#) function to convert binary data to Base64-encoded data in all new applications.

```
<h3>ToBase64 Example</h3>
<!-- Initialize data. ---->
<cfset charData = "">
<!-- Create string of ASCII characters (32-255); concatenate them --->
<cfloop index = "data" from = "32" to = "255">
  <cfset ch = chr(data)>
  <cfset charData = charData & ch>
</cfloop>
<p>
The following string is the concatenation of all characters (32 to 255)
  from the ASCII table.<br>
<cfoutput>#charData#</cfoutput>
</p>
<!-- Create a Base64 representation of this string. ---->
<cfset data64 = toBase64(charData)>

<!----- Convert string to binary. ----->
<cfset binaryData = toBinary(data64)>
<!--- Convert binary back to Base64. ---->
<cfset another64 = toBase64(binaryData)>
<!--- Compare another64 with data64 to ensure that they are equal. ---->
<cfif another64 eq data64>
  <h3>Base64 representations are identical.</h3>
<cfelse>
  <h3>Conversion error.</h3>
</cfif>
```

# ToBinary

## Description

Calculates the binary representation of Base64-encoded data.

## Returns

The binary representation of Base64-encoded data.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

ToBinary(*string\_in\_Base64* or *binary\_value*)

## See also

- [BinaryDecode](#) for conversion of binary-encoded data, including Base64, to binary data
- [cffile](#) for information about loading and reading binary data
- [cfwddx](#) for information about serializing and deserializing binary data
- [IsBinary](#) and [ToBase64](#) for checking format and converting to Base64
- [Len](#) for determining the length of a binary object
- “Binary data type and binary encoding” in Chapter 3, “Using ColdFusion Variables,” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter        | Description                                     |
|------------------|---|
| string_in_Base64 | A string in Base64 format to convert to binary. |

## Usage

Macromedia recommends that you use the [BinaryDecode](#) function to convert Base64 encoded data to binary data in all new applications.

If you pass a binary value to this function, it returns the input value.

## Example

```
<h3>ToBinary Example</h3>
<!--- Initialize data. ---->
<cfset charData = "">
<!--- Create a string of ASCII characters (32-255); concatenate them. ---->
<cfloop index = "data" from = "32" to = "255">
  <cfset ch = chr(data)>
  <cfset charData = charData & ch>
</cfloop>
<p>The following string is the concatenation of all characters (32 to 255)
  from the ASCII table.<br>
<cfoutput>#charData#</cfoutput></p>
<!--- Create a Base64 representation of this string. ---->
<cfset data64 = toBase64(charData)>
```

```
<!-- Convert string to binary. ---->
<cfset binaryData = toBinary(data64)>
<!-- Convert binary back to Base64. --->
<cfset another64 = toBase64(binaryData)>
<!-- Compare another64 with data64 to ensure that they are equal. ---->
<cfif another64 eq data64>
  <h3>Base64 representation of binary data is identical to the Base64
  representation of string data.</h3>
<cfelse>
  <h3>Conversion error.</h3>
</cfif>
```

# ToScript

## Description

Creates a JavaScript or ActionScript expression that assigns the value of a ColdFusion variable to a JavaScript or ActionScript variable. This function can convert ColdFusion strings, numbers, arrays, structures, and queries to JavaScript or ActionScript syntax that defines equivalent variables and values.

## Returns

A string that contains a JavaScript or ActionScript variable definition corresponding to the specified ColdFusion variable value.

## Category

[Conversion functions](#), [Extensibility functions](#)

## Function syntax

```
ToScript(cfvar, javascriptvar, outputformat, ASFormat)
```

## See also

[cfwddx](#); Chapter 9, “WDDX JavaScript Objects,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter            | Description  |
|----------------------|--|
| <i>cfvar</i>         | A ColdFusion variable. This can contain one of the following: <ul style="list-style-type: none"><li>• String</li><li>• Number</li><li>• Array</li><li>• Structure</li><li>• Query</li></ul>  |
| <i>javascriptvar</i> | A string that specifies the name of the JavaScript variable that the <code>ToScript</code> function creates.   |
| <i>outputformat</i>  | Optional. A Boolean value that determines whether to create WDDX (JavaScript) or ActionScript style output for structures and queries: <ul style="list-style-type: none"><li>• True: creates WDDX-style output (default).</li><li>• False: creates ActionScript-style output.</li></ul>  |
| <i>ASFormat</i>      | Optional. A Boolean value that specifies whether to use ActionScript shortcuts in the script: <ul style="list-style-type: none"><li>• True: creates new Objects and Arrays with ActionScript shortcuts: [] for New Array(), and {} for New Object. Using ActionScript shortcuts allows you to pass ActionScript into <code>cfform</code> attributes without triggering ActionScript validation.</li><li>• False: does not use ActionScript shortcuts to create new Objects and new Arrays when generating the script. Instead, generates New Object() and New Array() in the script (default).</li></ul> |

## Usage

To use a ColdFusion variable in JavaScript or ActionScript, the `ToScript` function must be in a `cfoutput` region and be surrounded by number signs (`#`). For example, the following code uses the `ToScript` function to convert a ColdFusion variable to a JavaScript variable:

```
<cfset thisString="hello world">
<script type="text/javascript" language="JavaScript">
  <cfoutput>
    var #toScript(thisString, "jsVar")#;
  </cfoutput>
</script>
```

When ColdFusion runs this code, it sends the following to the client:

```
<script type="text/javascript" language="JavaScript">
  var jsVar = "hello world";
</script>
```

An HTML script tag must enclose the JavaScript code. The `cfoutput` tag does not need to be inside the script block; it can also surround the block.

WDDX-style output generates JavaScript code that creates a `WDDXRecordset` object, where the key of each record set entry is a column name, and the value of the recordlist entry is an array of the corresponding query column entries, as follows:

```
WDDXQuery = new WddxRecordset();
col0 = new Array();
col0[0] = "John";
col0[1] = "John";
WDDXQuery["firstname"] = col0;
col0 = null;
col1 = new Array();
col1[0] = "Lund";
col1[1] = "Allen";
WDDXQuery["lastname"] = col1;
col1 = null;
```

To use WDDX-style output, you must first load the `cf_webroot/CFIDE/scripts/wddx.js` script, which defines JavaScript WDDX objects, as in the following line:

```
<script type="text/javascript" src="/CFIDE/scripts/wddx.js script"> </script>
```

For more information on WDDX in JavaScript, see [Chapter 9, “WDDX JavaScript Objects,” on page 1091](#).

ActionScript-style output generates code that creates an array of objects, where the array is indexed by row number, and the objects consist of column name - column value pairs, as follows:

```
ActionScriptQuery = new Array();
ActionScriptQuery[0] = new Object();
ActionScriptQuery[0]['firstname'] = "John";
ActionScriptQuery[0]['lastname'] = "Lund";
ActionScriptQuery[1] = new Object();
ActionScriptQuery[1]['firstname'] = "John";
ActionScriptQuery[1]['lastname'] = "Allen";
```

An `ActionScript`-style array does not require you to include the `wddx.js` file, and creates a variable that you can use in `ActionScript` on a Flash format form, for example, in an `onChange` attribute.

If the `outputformat` parameter is `False`, setting `ASFormat` to `True` causes `ToScript` to use the `ActionScript` shortcut `[]` in place of `New Array()` and the shortcut `{}` in place of `New Object()`. Using these shortcuts allows you to pass `ActionScript` into `cfform` attributes without triggering `ActionScript` validation. If `ASFormat` is `False`, `ToScript` generates `New Array()` and `New Object()` in the script.

### Example

The following example shows the results of converting a `ColdFusion` string, array, and query object to `JavaScript` variables. It also uses the string and array in `JavaScript` code.

```
<h2>ToScript</h2>

<h3>Converting a string variable</h3>
<cfset thisString = "This is a string">
<cfoutput>
  <b>The thisString variable in ColdFusion</b><br>
  #thisString#<br>
  <br>
  <strong>The output of ToScript(thisString, "jsVar")</strong><br>
  #ToScript(thisString, "jsVar")#<br>
  <br>
  <strong>In a JavaScript script, convert thisString Variable to JavaScript
  and output the resulting variable:</strong><br>
  <script type="text/javascript" language="JavaScript">
    var #ToScript(thisString, "jsVar")#;
    document.write("jsVar in JavaScript is: " + jsVar);
  </script>
</cfoutput>

<h3>Converting an array</h3>
<!-- Create and populate a one-dimensional array -->
<cfset myArray=ArrayNew(1)>
<cfloop index="i" from="1" to="4">
  <cfset myArray[i]="This is array element" & i>
</cfloop>

<cfoutput>
<b>The ColdFusion myArray Array</b><br>
<!-- Write the contents of the myArray variable in ColdFusion -->
  <cfloop index="i" from="1" to="#arrayLen(myArray)#">
    myArray[#i#]: #myArray[i]#<br>
  </cfloop>
  <br>
  <strong>The output of ToScript(myArray, "jsArray")</strong><br>
  #toScript(myArray, "jsArray")#<br>
  <br>
  <strong>In JavaScript, convert myArray to a JavaScript variable and write
  it's contents</strong><br>
  <script type="text/javascript" language="JavaScript">
    var #ToScript(myArray, "jsArray")#;
    for (i in jsArray)
```

```

        {
            document.write("myArray[" + i + "]: " + jsArray[i] + "<br>");
        }
    </script>
<br>
<h3>Converting a query</h3>
This section converts the following query object to both WDDX format
and ActionScript type Javascript objects.<br>

<!-- Query a database -->
<cfquery name="thisQuery" datasource="cfdocexamples">
    SELECT FirstName,LastName
    FROM employee
    WHERE FirstName = 'John'
</cfquery>
<br>
The Query in ColdFusion
<cftable query="thisQuery" headerlines="1" colheaders>
    <cfcol align="left" width="9" header="<b>FirstName</b>" text="#FirstName#">
    <cfcol align="left" width="9" header="<b>LastName</b>" text="#LastName#">
</cftable>

<strong>JavaScript generated by ToScript(thisQuery, "WDDXQuery"):</strong><br>
    #toScript(thisQuery, "WDDXQuery")#;<br>
<br>
<strong>JavaScript generated by ToScript(thisQuery, "ActionScriptQuery",
    False):</strong><br>
    #toScript(thisQuery, "ActionScriptQuery", False)#<br>
<br>
<!-- Convert to both WDDX format and ActionScript format -->
<script type="text/javascript" language="JavaScript">
    #ToScript(thisQuery, "WDDXQuery")#;
    #ToScript(thisQuery, "ActionScriptQuery", False)#;
</script>
<!-- For brevity, this example does not use JavaScript query variables -->
</cfoutput>

```

# ToString

## Description

Converts a value to a string.

## Returns

A string.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

```
ToString(value[, encoding])
```

## See also

[ToBase64](#), [ToBinary](#), [CharsetEncode](#); Chapter 35, “Using XML and WDDX,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX:

- Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (ColdFusion 5 and earlier releases supported ASCII values 1–255.)
- Added the *encoding* parameter.
- Added ability to convert an XML document object to a string.

## Parameters

---

| Parameter | Description  |
|-----------|--|
| value     | Value to convert to a string; can be a simple value such as an integer, a binary object, or an XML document object.  |
| encoding  | The character encoding (character set) of the string. Optional for binary data, Generates an error if used for a simple value or XML document object. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> . The default value is the encoding of the page on which the function is called. See <a href="#">cfcontent</a> . |

---

## Usage

This function can convert simple values and binary values that do not contain Byte zero. If this function cannot convert a value, it throws an exception. This function can also convert an XML document object to a string XML representation.

Macromedia recommends that you use the [CharsetEncode](#) function to convert binary data to a string.

## Example

```
<h3>ToString Example</h3>
<!--- Initialize data. ----->
<cfset charData = "">
<!--- Create string of ASCII characters (32-255) and concatenate them. ---->
<cfloop index = "data" from = "32" to = "255">
  <cfset ch = chr(data)>
  <cfset charData = charData & ch>
</cfloop>
<p>The following string is the concatenation of characters (32 to 255)
  from the ASCII table.<br>
<cfoutput>#charData#</cfoutput></p>

<!--- Create a Base64 representation of this string. ---->
<cfset data64 = toBase64(#charData#)>
<p>
The following string is the Base64 representation of the string.<br>
<cfoutput>#data64#</cfoutput></p>
<!--- Create a binary representation of Base64 data. --->
```

```
<cfset dataBinary = toBinary(data64)>

<!--- Create the string representation of the binary data. ---->
<cfset dataString = ToString(dataBinary)>
<p>The following is the string representation of the binary data.<br>
<cfoutput>#dataString#</cfoutput></p>
```

# Trim

## Description

Removes leading and trailing spaces from a string.

## Returns

A copy of *string*, after removing leading and trailing spaces.

## Category

[String functions](#)

## Function syntax

`Trim(string)`

## See also

[LTrim](#), [RTrim](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Example

```
<h3>Trim Example</h3>
<cfif IsDefined("FORM.myText")>
  <cfoutput>
    <pre>
      Your string:"#FORM.myText#"
      Your string:"#Trim(FORM.myText)#"
      (trimmed on both sides)
    </pre>
  </cfoutput>
</cfif>
<form method = "post" action = "trim.cfm">
<p>Type in some text, and it will be modified by trim to remove leading
  spaces from the left and right
<p><input type = "Text" name = "myText" value = "  TEST  ">
<p><input type = "Submit" name = "">
</form>
```

# UCase

## Description

Converts the alphabetic characters in a string to uppercase.

## Returns

A copy of a string, converted to uppercase.

## Category

[String functions](#)

## Function syntax

`UCase(string)`

## See also

[LCase](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Example

```
<h3>UCase Example</h3>

<cfif IsDefined("FORM.sampleText")>
  <cfif FORM.sampleText is not "">
    <p>Your text, <cfoutput>#FORM.sampleText#</cfoutput>,
    returned in uppercase is <cfoutput>#UCase(FORM.sampleText)#</cfoutput>.
  <cfelse>
    <p>Please enter some text.
  </cfif>
</cfif>

<form action = "ucase.cfm">
<p>Enter your sample text, and press "submit" to see the text returned in
  uppercase:
<p><input type = "Text" name = "SampleText" value = "sample">

<input type = "Submit" name = "" value = "submit">
</form>
```

# URLDecode

## Description

Decodes a URL-encoded string.

## Returns

A copy of a string, decoded.

## Category

[Conversion functions](#), [Other functions](#), [String functions](#)

## Function syntax

```
URLDecode(urlEncodedString[, charset])
```

## See also

[URLEncodedFormat](#); “Tags and functions for globalizing” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

ColdFusion MX 6.1: Changed the default charset: the default charset is the character encoding of the URL scope.

ColdFusion MX:

- Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (Earlier releases supported ASCII values.)
- Added the `charset` parameter.

## Parameters

| Parameter                     | Description  |
|-------------------------------|--|
| <code>urlEncodedString</code> | URL-encoded string or a variable that contains one.  |
| <code>charset</code>          | <p>The character encoding in which the URL is encoded. Optional. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• <code>utf-8</code></li><li>• <code>iso-8859-1</code></li><li>• <code>windows-1252</code></li><li>• <code>us-ascii</code></li><li>• <code>shift_jis</code></li><li>• <code>iso-2022-jp</code></li><li>• <code>euc-jp</code></li><li>• <code>euc-kr</code></li><li>• <code>big5</code></li><li>• <code>euc-cn</code></li><li>• <code>utf-16</code></li></ul> <p>For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>. The default value is the character encoding of the URL scope. See <a href="#">SetEncoding</a>.</p> |

## Usage

URL encoding formats some characters with a percent sign and the two-character hexadecimal representation of the character. For example, a character whose code is 129 is encoded as %81. A space is encoded with a plus sign.

Query strings in HTTP are always URL-encoded.

## Example

This example creates, encodes, and decodes a string that contains ASCII character codes:

```
<cfscript>
  // Build string
  s = "";
  for (c = 1; c lte 256; c = c + 1)
  {
    s = s & chr(c);
  }
  // Encode string and display result
  enc = URLEncodedFormat(s);
  WriteOutput("Encoded string is: '#enc#'.<br>");
  // Decode and compare result with original
  dec = URLDecode(enc);
  if (dec neq s)
  {
    WriteOutput("Decoded is not the same as encoded.");
  }
  else
  {
    WriteOutput("All's quiet on the Western front.");
  }
</cfscript>
```

# URLEncodedFormat

## Description

Generates a URL-encoded string. For example, it replaces spaces with %20, and non-alphanumeric characters with equivalent hexadecimal escape sequences. Passes arbitrary strings within a URL (ColdFusion automatically decodes URL parameters that are passed to a page).

## Returns

A copy of a string, URL-encoded.

## Category

[Conversion functions](#), [Other functions](#), [String functions](#)

## Function syntax

```
URLEncodedFormat(string [, charset ])
```

## See also

[URLDecode](#); “Tags and functions for globalizing” in Chapter 17, “Developing Globalized Applications,” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 6.1: Changed the default encoding to be the response character encoding.

ColdFusion MX: Added the `charset` parameter.

## Parameters

---

| Parameter | Description   |
|-----------|---|
| string    | A string or a variable that contains one  |
| charset   | The character encoding in which the string is encoded. Optional.<br>The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> .<br>The default value is the character encoding of the response. See <a href="#">cfcontent</a> . |

---

## Usage

URL encoding formats some characters with a percent sign and the two-character hexadecimal representation of the character. For example, a character whose code is 129 is encoded as %81. A space is encoded with a plus sign.

Query strings in HTTP are always URL-encoded.

## Example

```
<h3>URLEncodedFormat Example</h3>
<cfif IsDefined("url.myExample")>
  <p>The url variable url.myExample was passed from the previous link ...
  its value is:
  <br><b>"<cfoutput>#url.myExample#</cfoutput>"</b>
</cfif>
<p>This function returns a URL encoded string.
<cfset s = "My url-encoded string has special characters & other stuff">
<p> <A HREF = "urlencodedformat.cfm?myExample=<cfoutput>#URLEncodedFormat(s)#
</cfoutput>">Click me</A>
```

# URLSessionFormat

## Description

Depending on whether a client computer accepts cookies, this function does the following:

- If the client does not accept cookies: automatically appends all required client identification information to a URL
- If the client accepts cookies: does not append information

This function automatically determines which identifiers are required, and sends only the required information. It provides a more secure and robust method for supporting client identification than manually encoding the information in each URL, because it sends only required information, when it is required, and it is easier to code.

## Returns

A URL; if cookies are disabled for the browser, client and session data are appended.

## Category

[Other functions](#); Chapter 15, “Maintaining client identity,” in Chapter 15, “Using Persistent Data and Locking,” in *ColdFusion MX Developer’s Guide*

## Function syntax

```
URLSessionFormat(request_URL)
```

## Parameters

| Parameter                | Description              |
|--------------------------|--------------------------|
| <code>request_URL</code> | URL of a ColdFusion page |

## Usage

In the following example, the `cfform` tag posts a request to another page and sends the client identification, if required. If cookie support is detected, the function returns the following:

```
myactionpage.cfm
```

If the detected cookie is not turned on, or cookie support cannot be reliably detected, the function return value is as follows:

```
myactionpage.cfm?jsessionid=xxxx;cfid=xxxx&cftoken=xxxxxxxx
```

## Example

```
<cfform
  method="Post"
  action="#URLSessionFormat("MyActionPage.cfm")#">
</cfform>
```

# Val

## Description

Converts numeric characters that occur at the beginning of a string to a number.

## Returns

A number. If conversion fails, returns zero.

## Category

[Conversion functions](#), [String functions](#)

## Function syntax

`Val(string)`

## See also

[IsNumeric](#)

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

This function works as follows:

- If `TestValue = "234A56?7"`, `Val(TestValue)` returns `234`.
- If `TestValue = "234'5678'9?"`, `Val(TestValue)` returns `234`.
- If `TestValue = "BG234"`, `Val(TestValue)` returns the value `0`, (not an error).
- If `TestValue = "0"`, `Val(TestValue)` returns the value `0`, (not an error).

## Example

```
<h3>Val Example</h3>
<cfif IsDefined("FORM.theTestValue")>
  <cfif Val(FORM.theTestValue) is not 0>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput>
    can be converted to a number:
    <cfoutput>#Val(FORM.theTestValue)#</cfoutput></h3>
  <cfelse>
    <h3>The beginning of the string <cfoutput>#DE(FORM.theTestValue)#
    </cfoutput> cannot be converted to a number</h3>
  </cfif>
</cfif>
<form action = "val.cfm">
<p>Enter a string, and determine whether its beginning can be evaluated
to a numeric value.
<p>
<input type = "Text"
  name = "TheTestValue"
  value = "123Boy">
<input type = "Submit"
```

```
    value = "Is the beginning numeric?"  
    name = "">  
</form>
```

# ValueList

## Description

Inserts a delimiter between each value in an executed query. ColdFusion does not evaluate the arguments.

## Returns

A delimited list of the values of each record returned from an executed query.

## Category

[List functions](#), [Query functions](#)

## Function syntax

```
ValueList(query.column [, delimiter ])
```

## See also

[QuotedValueList](#)

## Parameters

| Parameter    | Description  |
|--------------|--|
| query.column | Name of an executed query and column. Separate query name and column name with a period. |
| delimiter    | A delimiter character to separate column data items. The default value is comma (,).     |

## Example

```
<h3>ValueList Example</h3>

<!-- use the contents of a query to create another dynamically -->
<cfquery name = "GetDepartments" datasource = "cfdocexamples">
SELECT Dept_ID FROM Departments
WHERE Dept_ID IN ('BIOL')
</cfquery>

<cfquery name = "GetCourseList" datasource = "cfdocexamples">
SELECT *
FROM CourseList
WHERE Dept_ID IN ('#GetDepartments.Dept_ID#')
</cfquery>

Value list of all BIOL Course ID's using (--) as the delimiter:<br>
<cfoutput>
#ValueList(GetCourseList.Course_ID,"--")#<br>
</cfoutput>

Value list of all BIOL Course Numbers using (;) as the delimiter:<br>
<cfoutput>
#ValueList(GetCourseList.CorNumber,";")#<br>
</cfoutput>
```

# Week

## Description

From a date/time object, determines the week number within the year.

## Returns

An integer in the range 1–53; the ordinal of the week, within the year.

## Category

[Date and time functions](#)

## Function syntax

`Week(date)`

## See also

[DatePart](#)

## Parameters

| Parameter         | Description                                     |
|-------------------|---|
| <code>date</code> | A date/time object in the range 100 AD–9999 AD. |

## Usage

When passing `date` as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date.

## Example

```
<h3>Week Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
<cfoutput>
  <p>Your date, #DateFormat(yourDate)#.
  <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
  <br>This is day #Day(YourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
  <br>We are in week #Week(yourDate)# of #Year(yourDate)# (day
    #DayOfYear(yourDate)# of #DaysInYear(yourDate)#). <br>
  <cfif IsLeapYear(Year(yourDate))>This is a leap year
  <cfelse>This is not a leap year
  </cfif>
</cfoutput>
</cfif>
```

# Wrap

## Description

Wraps text so that each line has a specified maximum number of characters.

## Returns

String containing the wrapped text.

## Category

[String functions](#)

## Function syntax

```
Wrap(string, limit[, strip])
```

## See also

[cfmail](#)

## History

ColdFusion MX 6.1: Added this function

## Parameters

| Parameter | Description  |
|-----------|--|
| string    | String or variable that contains one. The text to wrap.  |
| limit     | Positive integer maximum number of characters to allow on a line.  |
| strip     | Boolean specifying whether to remove all existing newline and carriage return characters in the input string with spaces before wrapping the text. The default value is False. |

## Usage

Inserts line break at the location of the first white space character (such as a space, tab, or new line) before the specified limit on a line. If a line has no whitespace characters before the limit, inserts a line break at the limit. Uses the operating-system specific line break: newline for UNIX, carriage return and newline on Windows.

If you specify the `strip` parameter, all existing line breaks are removed, so any paragraph formatting is lost.

Use this function to limit the length of text lines, such as text to be included in a mail message. The `cfmail` and `cfmailpart` tag `wraptext` attributes use this function

## Example

```
<h3>Wrap Example</h3>
<cfset inputText="This is an example of a text message that we want to wrap. It
 is rather long and needs to be broken into shorter lines.">
<cfoutput>#Wrap(inputText, 59)#</cfoutput>
```

# WriteOutput

## Description

Appends text to the page-output stream.

This function writes to the page-output stream regardless of conditions established by the [cfsetting](#) tag.

## Category

[Other functions](#), [System functions](#)

## Function syntax

```
WriteOutput(string)
```

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

Within the `cfquery` and `cfmail` tags, this function does not output to the current page; it writes to the current SQL statement or mail text. Do not use `WriteOutput` within `cfquery` and `cfmail`.

Although you can call this function anywhere within a page, it is most useful inside a `cfscript` block.

## Example

```
...
<cfscript>
    employee = StructNew();
    StructInsert(employee, "firstname", FORM.firstname);
    StructInsert(employee, "lastname", FORM.lastname);
    StructInsert(employee, "email", FORM.email);
    StructInsert(employee, "phone", FORM.phone);
    StructInsert(employee, "department", FORM.department);
    WriteOutput("About to add " & FORM.firstname & " " & FORM.lastname);
</cfscript>
```

# XmlChildPos

## Description

Gets the position of a child element within an XML document object.

## Returns

The position, in an XmlChildren array, of the *N*th child that has the specified name.

## Category

[XML functions](#)

## Function syntax

```
XmlChildPos(elem, childName, N)
```

## See also

[IsXmlElement](#), [XmlElementNew](#), [XmlSearch](#), [XmlTransform](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter              | Description   |
|------------------------|---|
| <code>elem</code>      | XML element within which to search.   |
| <code>childName</code> | XML child element for which to search. Must be an immediate child of the <code>elem</code> parameter. |
| <code>N</code>         | Index of XMLchild element for which to search.  |

## Usage

You can use the returned index in the `ArrayInsertAt` and `ArrayDeleteAt` functions to change XML document objects. If the specified child is not found, the function returns -1.

## Example

The following example searches XML document element, `xmlobject.employee.name[1]`, for its second `Status` element child and uses the position in an `ArrayDeleteAt` function to remove the element:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
<employee>
  <!-- A list of employees -->
  <name EmpType="Regular">
    <first>Almanzo</first>
    <last>Wilder</last>
    <Status>Medical Absence</Status>
    <Status>Extended Leave</Status>
  </name>
  <name EmpType="Contract">
```

```
        <first>Laura</first>
        <last>Ingalls</last>
    </name>
</employee>
</cfxml>

<!-- Find the second Status child of the first employee.name element -->
<cfscript>
elempos=XMLChildPos(xmlobject.employee.name[1], "Status", 2);
ArrayDeleteAt(xmlobject.employee.name[1].XmlChildren, elempos);
</cfscript>

<!-- Dump the resulting document object to confirm the deletion -->
<cfdump var="#xmlobject#">
```

# XmlElemNew

## Description

Creates an XML document object element.

## Returns

An XML document object element.

## Category

[XML functions](#)

## Function syntax

```
XmlElemNew(xmlObj [, namespace], childName)
```

## See also

[cfxml](#), [IsXmlElem](#), [XmlChildPos](#), [XmlFormat](#), [XmlNew](#), [XmlParse](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `namespace` parameter.

ColdFusion MX: Added this function.

## Parameters

| Parameter              | Description   |
|------------------------|---|
| <code>xmlObj</code>    | Name of the XML document object in which you are creating the element |
| <code>namespace</code> | (Optional) URI of the namespace to which this element belongs         |
| <code>childName</code> | Name of the element to create   |

## Usage

The function’s return variable specifies the location of the new element in the document object. It must specify a valid location in the document object identified by the `xmlObj` parameter. The following statements show this use:

```
MyDoc.MyRoot.XmlChildren[2] = XmlElemNew(MyDoc,"childNode");  
ArrayAppend(MyDoc.MyRoot.XmlChildren, XmlElemNew(MyDoc,"childNode"));
```

If you do not specify a namespace URI and use a namespace prefix in the `childName` parameter, ColdFusion checks to see if a namespace URI has already been specified for the prefix, and if so, uses that namespace.

## Example

The following example creates and displays a ColdFusion document object:

```
<cfscript>  
MyDoc = XmlNew();  
MyDoc.xmlRoot = XmlElemNew(MyDoc,"MyRoot");  
if (testVar IS TRUE)  
    MyDoc.MyRoot.XmlText = "The value of testVar is True.";
```

```
else
  MyDoc.MyRoot.XmlText = "The value of testVar is False.";
for (i = 1; i LTE 4; i = i + 1)
{
  MyDoc.MyRoot.XmlChildren[i] = XmlElemNew(MyDoc,"childNode");
  MyDoc.MyRoot.XmlChildren[i].XmlText = "This is Child node " & i & ".";
}
</cfscript>
<cfdump var=#MyDoc#>
```

# XmlFormat

## Description

Escapes special XML characters in a string so that the string can be used as text in XML.

## Returns

A copy of the *string* parameter that is safe to use as text in XML.

## Category

[String functions](#), [XML functions](#)

## Function syntax

```
XmlFormat(string)
```

## See also

[cfxml](#), [XmlNew](#), [XmlParse](#), [XmlValidate](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter | Description                              |
|-----------|--|
| string    | A string or a variable that contains one |

## Usage

This function escapes characters as follows:

| Text character                              | Escaped representation  |
|---|---|
| Greater than symbol (>)                     | &gt;  |
| Less than symbol (<)                        | &lt;  |
| Single-quotation mark (')                   | &apos;  |
| Double-quotation mark (")                   | &quot;  |
| Ampersand symbol (&)                        | &amp;   |
| Carriage return (but not line feed)         | Removed from the text.  |
| High ASCII characters in the range 128-255. | Replaced by unicode escape sequence; for example, É (capital E with an Acute symbol) is replaced by &#xc9;. |

## Example

The following example shows how `XmlFormat` escapes special XML characters. Use the View Source command in the browser to see the results. ColdFusion interprets the `'` in the second text string as representing a single-quotation mark in text before it applies the `XmlFormat` function.

```
<?xml version = "1.0"?>  
<cfoutput>
```

```
<someXML>
  <someElement someAttribute="#XmlFormat("'a quoted value'")#">
    #XmlFormat("Body of element with <, >, "" and & goes here.")#
  </someElement>
</someXML>
</cfoutput>
```

# XmlGetNodeType

## Description

Determines the type of an XML document object node.

## Returns

A string identifying the XML node type. The following values are valid:

---

|                             |                        |
|-----------------------------|------------------------|
| ATTRIBUTE_NODE              | CDATA_SECTION_NODE     |
| COMMENT_NODE                | DOCUMENT_FRAGMENT_NODE |
| DOCUMENT_NODE               | DOCUMENT_TYPE_NODE     |
| ELEMENT_NODE                | ENTITY_NODE            |
| ENTITY_REFERENCE_NODE       | NOTATION_NODE          |
| PROCESSING_INSTRUCTION_NODE | TEXT_NODE              |

---

If the argument is not a document object node, the function generates an error.

## Category

[XML functions](#)

## Function syntax

```
XmlGetNodeType(xmlNode)
```

## See also

[IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlChildPos](#), [XmlValidate](#);  
Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

---

| Parameter            | Description            |
|----------------------|------------------------|
| <code>xmlNode</code> | An XML DOM object node |

---

## Usage

The `XmlGetNodeType` function can determine the types of the nodes returned by the `XmlSearch` function, or the types of the entries in an element’s `XmlNodes` array.

## Example

The following example checks the node types of various parts of an XML document object:

```
<!-- Create an XML document object -->
<cfxml variable="xmlObject">
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>

```

```

<items>
  <item id="43">
    <!-- This item is coded to show several node types -->
    <![CDATA["Our Best" hammer & chisel set!!!]]> Imported from France
    <quantity>1</quantity>
    <unitprice>15.95</unitprice>
  </item>
</items>
</order>
</cfxml>

<!-- Display the node types --->
<cfoutput>
  <h3>Node Types</h3>
  xmlobject: #XMLGetNodeType(xmlobject)#<br>
  xmlobject.order: #XMLGetNodeType(xmlobject.order)#<br>
  <br>
  Now check the types of all the nodes in the xmlobject.order.items.item
  element's XmlNode array.<br>
  Note the many apparently empty Text nodes generated by whitespace characters
  in the XML text source.<br><br>
  <cfset descnodes=xmlobject.order.items.item.XmlNodes>
  <cfloop from="1" to="#ArrayLen(descnodes)#" index="i">
    #i# Node type is: #XMLGetNodeType(descnodes[i])#<br>
    #i# Node name is: #descnodes[i].XmlName#<br>
    <cfif (descnodes[#i#].XmlValue NEQ "")>
      #i# Node value is: #descnodes[i].XmlValue#<br>
    </cfif>
  <br>
</cfloop>
</cfoutput>

```

# XmlNew

## Description

Creates an XML document object.

## Returns

An empty XML document object.

## Category

[XML functions](#)

## Function syntax

```
XmlNew([caseSensitive])
```

## See also

[cfxml](#), [IsXmlDoc](#), [ToString](#), [XmlFormat](#), [XmlParse](#), [XmlValidate](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX: Added this function.

## Parameters

| Parameter     | Description  |
|---------------|--|
| caseSensitive | Determines how ColdFusion processes the case of XML document object component identifiers: <ul style="list-style-type: none"><li>• True: maintains case</li><li>• False: ColdFusion ignores case. Default.</li></ul> |

## Usage

An XML document object is represented in ColdFusion as a structure.

The *caseSensitive* parameter value determines whether identifiers whose characters are of varying case, but are otherwise the same, refer to different components; for example:

- If True, the element or attribute names “name” and “NAME” refer to different elements or attributes.
- If False, these names refer to the same elements or attributes.

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";  
MyDoc.xmlRoot.XmlAttributes.Version = "12b";  
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

To convert an XML document object into a string, use the [ToString](#) function.

## Example

The following example creates and displays a ColdFusion document object:

```
<cfset testVar = True>
<cfscript>
    MyDoc = XmlNew();
    MyDoc.xmlRoot = XmlElemNew(MyDoc,"MyRoot");
    if (testVar IS TRUE)
        MyDoc.MyRoot.XmlText = "The value of testVar is True.";
    else
        MyDoc.MyRoot.XmlText = "The value of testVar is False.";
    for (i = 1; i LTE 4; i = i + 1){
        MyDoc.MyRoot.XmlChildren[i] = XmlElemNew(MyDoc,"childNode");
        MyDoc.MyRoot.XmlChildren[i].XmlText = "This is Child node " & i & ".";
    }
</cfscript>
<cfdump var=#MyDoc#>
```

# XmlParse

## Description

Converts XML text into an XML document object.

## Returns

An XML document object.

## Category

[Conversion functions](#), [XML functions](#)

## Function syntax

```
XmlParse(xmlText [, caseSensitive ], validator)
```

## See also

[cfxml](#), [IsXML](#), [ToString](#), [XmlFormat](#), [XmlNew](#), [XmlSearch](#), [XmlTransform](#), [XmlValidate](#);  
Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7:

- Added the `validator` parameter.
- Added support for filenames and URLs in the `xmlText` parameter.
- Added support for relative URLs and path names.

ColdFusion MX: Added this function.

## Parameters

| Parameter                  | Description   |
|----------------------------|---|
| <code>xmlText</code>       | Any of the following: <ul style="list-style-type: none"><li>• A string containing XML text.</li><li>• The name of an XML file.</li><li>• The URL of an XML file; valid protocol identifiers include <code>http</code>, <code>https</code>, <code>ftp</code>, and <code>file</code>.</li></ul>   |
| <code>caseSensitive</code> | <ul style="list-style-type: none"><li>• Yes: maintains the case of document elements and attributes.</li><li>• No: Default</li></ul>  |
| <code>validator</code>     | Any of the following: <ul style="list-style-type: none"><li>• The name of a Document Type Definition (DTD) or XML Schema file.</li><li>• The URL of a DTD or Schema file; valid protocol identifiers include <code>http</code>, <code>https</code>, <code>ftp</code>, and <code>file</code>.</li><li>• A string representation of a DTD or Schema.</li><li>• An empty string; in this case, the XML file must contain an embedded DTD or Schema identifier, which is used to validate the document.</li></ul> |

## Usage

If you specify a relative URL or path name in a parameter, ColdFusion uses the directory (or, for URLs, the logical directory) that contains the current ColdFusion page as the path root.

The *caseSensitive* parameter value determines whether identifiers whose characters are of varying case, but are otherwise the same, refer to different components; for example:

- If true, the element or attribute names “name” and “NAME” refer to different elements or attributes.
- If false, these names refer to the same elements or attributes.

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";
MyDoc.xmlRoot.XmlAttributes.Version = "12b";
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

The optional *validator* parameter specifies a DTD or Schema to use to validate the document. If the parser encounters a validation error, ColdFusion generates an error and stops parsing the document. You must specify a *validator* parameter to make the `XmlParse` function validate your document. If you do not specify a *validator* parameter, and the XML file specifies a DTD or Schema, ColdFusion ignores the DTD or Schema. If you specify a *validator* parameter, you must also specify a *caseSensitive* parameter.

If you do not specify a *validator* parameter, the *xmlText* parameter can specify a well-formed XML fragment, and does not have to specify a complete document.

**Note:** To convert an XML document object back into a string, use the `ToString` function.

## Example

The following example has three parts: an XML file, a DTD file, and a CFML page that parses the XML file and uses the DTD for validation. The CFML file displays the returned XML document object. To show the results of invalid XML, modify the `bmenuD.xml`.

**Note:** The DTD used in the following example represents the same XML structure as the Schema used in the `XmlValidate` example.

The `custorder.xml` file is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE order SYSTEM "C:\CFusionMX7\wwwroot\examples\custorder.dtd">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter&apos;s Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36&quot; Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
```

```

        <name>Standard paint thinner</name>
        <quantity>3</quantity>
        <unitprice>8.95</unitprice>
    </item>
</items>
</order>

```

The `custorder.dtd` file is as follows:

```

<!ELEMENT order (customer, items)>
<!ATTLIST order
    id CDATA #REQUIRED>
<!ELEMENT customer EMPTY>
<!ATTLIST customer
    firstname CDATA #REQUIRED
    lastname CDATA #REQUIRED
    accountNum CDATA #REQUIRED>
<!ELEMENT items (item+)>
<!ELEMENT item (name, quantity, unitprice)>
<!ATTLIST item
    id CDATA #REQUIRED>
<!ELEMENT name (#PCDATA)>
<!ELEMENT quantity (#PCDATA)>
<!ELEMENT unitprice (#PCDATA)>

```

The CFML file is as follows. It uses a filename for the XML file and a URL for the DTD. Note that the XML and URL paths must be absolute.

```

<cfset
myDoc=XMLParse("C:\CFusionMX7\wwwroot\examples\custorder.xml",
false, "http://localhost:8500/examples/custorder.dtd">
Dump of myDoc XML document object<br>
<cfdump var="#myDoc#">

```

# XmlSearch

## Description

Uses an XPath language expression to search an XML document object.

## Returns

An array of XML object nodes that match the search criteria.

## Category

[XML functions](#)

## Function syntax

```
XmlSearch(xmlDoc, xpathString)
```

## See also

[cfxml](#), [IsXML](#), [XmlChildPos](#), [XmlParse](#), [XmlTransform](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added support for attribute searches.

ColdFusion MX: Added this function.

## Parameters

| Parameter   | Description         |
|-------------|---------------------|
| xmlDoc      | XML document object |
| xpathString | XPath expression    |

## Usage

The `XmlSearch` function does not support complete XPath syntax. It only supports XPath expressions that return one or more XML nodes and attribute searches. XPath expressions that return any other type of value, such as a string, number, or Boolean, generate errors.

XPath is specified by the World Wide Web Consortium (W3C). For detailed information on XPath, including XPath expression syntax, see the W3C website at [www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

## Example

The following example extracts the elements named *last*, which contain employee last names, from an XML file, and displays the names.

The `employeesimple.xml` file contains the following XML:

```
<?xml version="1.0" encoding="UTF-8"?>
<employee>
<!-- A list of employees -->
  <name EmpType="Regular">
    <first>Almanzo</first>
    <last>Wilder</last>
  </name>
```

```
<name EmpType="Contract">
  <first>Laura</first>
  <last>Ingalls</last>
</name>
</employee>
```

The CFML file contains the following lines:

```
<cfscript>
  myxmldoc = XmlParse("C:\CFusionMX7\wwwroot\examples\employeesimple.xml");
  selectedElements = XmlSearch(myxmldoc, "/employee/name/last");
  for (i = 1; i LTE ArrayLen(selectedElements); i = i + 1)
    writeoutput(selectedElements[i].XmlText & "<br>");
</cfscript>
```

# XmlTransform

## Description

Applies an Extensible Stylesheet Language Transformation (XSLT) to XML. The XML can be in string format or an XML document object.

## Returns

A string containing the results of applying the XSLT to the XML.

## Category

[Conversion functions](#), [XML functions](#)

## Function syntax

```
XmlTransform(xml, xsl[, parameters])
```

## See also

[cfxml](#), [XmlFormat](#), [XmlNew](#), [XmlParse](#), [XmlSearch](#), [XmlValidate](#); Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added the `parameters` parameter and the ability to use a file for the XSL.

ColdFusion MX: Added this function.

## Parameters

| Parameter  | Description   |
|------------|---|
| xml        | An XML document in string format, or an XML document object   |
| xsl        | XSLT transformation to apply; can be any of the following:<br>Any of the following: <ul style="list-style-type: none"><li>• A string containing XSL text.</li><li>• The name of an XSLT file. Relative paths start at the directory containing the current CFML page.</li><li>• The URL of an XSLT file; valid protocol identifiers include http, https, ftp, and file. Relative paths start at the directory containing the current CFML page.</li></ul> |
| parameters | A structure containing XSL template parameter name-value pairs to use in transforming the document. The XSL transform defined in the <code>xslString</code> parameter uses these parameter values in processing the XML.  |

## Usage

An XSLT converts an XML document to another format or representation by applying an Extensible Stylesheet Language (XSL) stylesheet to it. XSL, including XSLT syntax is specified by the World Wide Web Consortium (W3C). For detailed information on XSL and XSLT, see the W3C website at [www.w3.org/Style/XSL/](http://www.w3.org/Style/XSL/).

If the XSLT code contains include statements with relative paths, ColdFusion resolves them relative to the location of the XSLT file, or for an XSL string, the location of the current ColdFusion page.

### Example

The following example converts an XML document that represents a customer order into an HTML document with the customer name and a table with the order items and quantities:

The `custorder.xml` file that represents a customer order has the following lines:

```
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter's Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>
```

The `custorder.xsd` XSLT file that transforms the XML to HTML that displays the customer's name, and the items and quantities ordered has the following lines:

```
<?xml version="1.0"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/
  Transform">
<xsl:output method="html" doctype-public="-//W3C//DTD HTML 4.0 Transitional//
  EN" />
<xsl:template match="/">
  <html>
    <body>
      <table border="2" bgcolor="yellow">
        <tr>
          <th>Name</th>
          <th>Price</th>
        </tr>
        <xsl:for-each select="breakfast_menu/food">
          <tr>
            <td>
              <xsl:value-of select="name"/>
            </td>
            <td>
              <xsl:value-of select="price"/>
            </td>
          </tr>
        </xsl:for-each>
      </table>
    </body>
  </html>
</template>
```

```
        </td>
      </tr>
    </xsl:for-each>
  </table>
</body>
</html>
</xsl:template>
</xsl:stylesheet>
```

**The CFML file has the following lines:**

```
<cffile action="read" file="C:\CFusionMX7\wwwroot\examples\custorder.xml"
  variable="xmltrans">
<cfset xmldoc = XmlParse("C:\CFusionMX7\wwwroot\examples\custorder.xml")>
<cfoutput>#XmlTransform(xmldoc, xmltrans)#</cfoutput>
```

# XmlValidate

## Description

Uses a Document Type Definition (DTD) or XML Schema to validate an XML text document or an XML document object.

## Returns

The following validation structure:

| Field       | Description  |
|-------------|--|
| Errors      | An array containing any validator error messages. These messages indicate that the document does not conform to the DTD or Schema (is not valid).        |
| FatalErrors | An array containing any validator fatal error messages. Fatal errors indicate that the document contains XML formatting errors (is not well-formed XML). |
| Status      | A Boolean value: <ul style="list-style-type: none"><li>• True if the document is valid.</li><li>• False if the validation check failed.</li></ul>        |
| Warning     | An array containing any validator warnings. A well-formed and valid document can produce warning messages.   |

Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*

## History

ColdFusion MX 7: Added this function.

## Parameters

| Parameter | Description  |
|-----------|--|
| xmlDoc    | Any of the following: <ul style="list-style-type: none"><li>• A string containing an XML document.</li><li>• The name of an XML file.</li><li>• The URL of an XML file; valid protocol identifiers include http, https, ftp, and file.</li><li>• An XML document object, such as one generated by the <a href="#">XmlParse</a> function.</li></ul> |
| validator | Any of the following: <ul style="list-style-type: none"><li>• A string containing a DTD or Schema.</li><li>• The name of a DTD or Schema file.</li><li>• The URL of a DTD or Schema file; valid protocol identifiers include http, https, ftp, and file.</li></ul>   |

## Usage

If you specify a relative URL or filename in a parameter, ColdFusion uses the directory (or, for URLs, the virtual directory) that contains the current ColdFusion page as the path root.

The *validator* parameter specifies a DTD or Schema to use to validate the document. If you omit the parameter, the XML document must contain one of the following:

- A `!DOCTYPE` tag to specify the DTD or its location
- An `xsi:schemaLocation` or `xsi:noNamespaceSchemaLocation` tag to specify the Schema location

If you use a *validator* parameter and the XML document specifies a DTD or Schema, the `XmlValidate` function uses the *validator* parameter, and ignores the specification in the XML document.

If you do not use a *validator* parameter, and the XML document does not specify a DTD or Schema, the function returns a structure with an error message in the Errors field.

This function attempts to process the complete XML document, and reports all errors found during the processing. As a result, the returned structure can have a combination of Warning, Error, and FatalError fields, and each field can contain multiple error messages.

## Example

The following example has three parts: an XML file, an XSD Schema file, and a CFML page that parses the XML file and uses the Schema for validation. The CFML file displays the value of the returned structure's Status field and displays the returned structure. To show the results of invalid XML, modify the `custorder.xml` file.

**Note:** The Schema used in the following example represents the same XML structure as the DTD used in the `XmlParse` example.

The `custorder.xml` file is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<order xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="http://localhost:8500/something.xsd"
  id="4323251" >
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter's Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>
```

```

    </item>
  </items>
</order>

```

The `custorder.xsd` file is as follows:

```

<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  elementFormDefault="qualified">
  <xs:element name="customer">
    <xs:complexType>
      <xs:attribute name="firstname" type="xs:string" use="required"/>
      <xs:attribute name="lastname" type="xs:string" use="required"/>
      <xs:attribute name="accountNum" type="xs:string" use="required"/>
    </xs:complexType>
  </xs:element>
  <xs:element name="name" type="xs:string"/>
  <xs:element name="quantity" type="xs:string"/>
  <xs:element name="unitprice" type="xs:string"/>
  <xs:element name="item">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="name"/>
        <xs:element ref="quantity"/>
        <xs:element ref="unitprice"/>
      </xs:sequence>
      <xs:attribute name="id" type="xs:integer" use="required">
    </xs:attribute>
    </xs:complexType>
  </xs:element>
  <xs:element name="items">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="item" maxOccurs="unbounded"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="order">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="customer"/>
        <xs:element ref="items"/>
      </xs:sequence>
      <xs:attribute name="id" type="xs:string" use="required"/>
    </xs:complexType>
  </xs:element>
</xs:schema>

```

The CFML file is as follows. It uses a filename for the XML file and a URL for the Schema. The XML and URL paths must be absolute.

```

<cfset
myResults=XMLValidate("C:\CFusionMX7\wwwroot\examples\custorder.xml",
"http://localhost:8500/examples/custorder.xsd")>
<cfoutput>

```

```
Did custorder.xml validate against custorder.xsd? #results.status#<br><br>
</cfoutput>
Dump of myResults structure returned by XMLValidate<br>
<cfdump var="#myResults#">

# Year

## Description

From a date/time object, gets the year value.

## Returns

The year value of *date*.

## Category

[Date and time functions](#)

## Function syntax

`Year(date)`

## See also

[DatePart](#), [IsLeapYear](#)

## Parameters

---

| Parameter         | Description                                     |
|-------------------|---|
| <code>date</code> | A date/time object in the range 100 AD-9999 AD. |

---

## Usage

When passing a date as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date.

## Example

```
<h3>Year Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year,FORM.month,FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
    day #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(yourDate)#
    in the month of #MonthAsString(Month(yourDate))#,
    which has #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(YourDate)#
    (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#). <br>
    <cfif IsLeapYear(Year(yourDate))>
      This is a leap year
    <cfelse>This is not a leap year
    </cfif>
  </cfoutput>
</cfif>
```

# YesNoFormat

## Description

Evaluates a number or Boolean value.

## Returns

Yes, for a nonzero value; No for zero, false, and no Boolean values, and an empty string ("").

## Category

[Decision functions](#), [Display and formatting functions](#)

## Function syntax

```
YesNoFormat(value)
```

## See also

[IsBinary](#), [IsNumeric](#)

## Parameters

| Parameter | Description               |
|-----------|---------------------------|
| value     | A number or Boolean value |

## Example

```
<h3>YesNoFormat Example</h3>
```

```
<p>The YesNoFormat function returns non-zero values as "Yes"; zero, false and no Boolean values, and empty strings ("") as "No".
```

```
<cfoutput>
```

```
<ul>
```

```
<li>YesNoFormat(1):#YesNoFormat(1)#
```

```
<li>YesNoFormat(0):#YesNoFormat(0)#
```

```
<li>YesNoFormat("1123"):#YesNoFormat("1123")#
```

```
<li>YesNoFormat("No"):#YesNoFormat("No")#
```

```
<li>YesNoFormat(True):#YesNoFormat(True)#
```

```
</ul>
```

```
</cfoutput>
```

# CHAPTER 4

## ColdFusion MX Flash Form Style Reference

This chapter describes the styles that you can specify in Macromedia ColdFusion MX 7 forms tags when you display the form or form element in Flash format.

### Contents

|   |     |
|---|-----|
| Styles valid for all controls . . . . .   | 934 |
| Styles for cfform. . . . .  | 936 |
| Styles for cfformgroup with horizontal or vertical type attributes. . . . .                     | 936 |
| Styles for box-style cfformgroup elements . . . . .   | 937 |
| Styles for cfformgroup with accordion type attribute . . . . .                                  | 938 |
| Styles for cfformgroup with tabnavigator type attribute . . . . .                               | 939 |
| Styles for cfformitem with hrule or vrule type attributes. . . . .                              | 939 |
| Styles for cfinput with radioButton, checkbox, button, image, or submit type attributes . . . . | 940 |
| Styles for cftextarea tag and cfinput with text, password, or hidden type attributes. . . . .   | 941 |
| Styles for cfselect with size attribute value of 1 . . . . .                                    | 941 |
| Styles for cfselect with size attribute value greater than 1 . . . . .                          | 942 |
| Styles for cfcalendar tag and cfinput with dateField type attribute . . . . .                   | 942 |
| Styles for the cfgrid tag. . . . .  | 943 |
| Styles for the cftree tag. . . . .  | 943 |

**Note:** The column labeled **Inh** indicates whether a style is inherited by child controls, such as the form controls in a vbox.

## Styles valid for all controls

The following styles are valid for all ColdFusion Flash format form tags except for `cfformitem` tags with the following `type` attributes, which do not take `style` attributes:

- `html`
- `space`
- `text`

These styles do not cause errors when used in all other tags. **However, many styles do not have any effect when used in some tags.**

| Style                                | Inh | Description  |
|--------------------------------------|-----|--|
| <code>backgroundAlpha</code>         | N   | Alpha (transparency) level of the SWF file or image defined by <code>backgroundImage</code> . Valid values range from 0 (transparent) to 100 (opaque). The default value is 100.   |
| <code>backgroundColor</code>         | Y   | Format: color; background color of the control. Has no effect if specified in a <code>cfform</code> control tag, which uses the <code>background-color</code> style to control the color. Also ignored by <code>cfinput</code> tags of type <code>button</code> , <code>img</code> , <code>submit</code> , <code>radiobutton</code> , and <code>checkbox</code> , because they are completely filled with the button face or other graphics. |
| <code>backgroundDisabledColor</code> | Y   | Format: color; background color of components when disabled. The default value is <code>##EFEFEEF</code> (light gray).   |
| <code>backgroundSize</code>          | N   | Scales the image specified by <code>backgroundImage</code> to different percentage sizes. By default, the value is <code>auto</code> , which maintains the original size of the image. A value of <code>100%</code> stretches the image to fit the entire screen. You must include the percent sign with the value.  |
| <code>barColor</code>                | Y   | Format: color; color of the outer bar.   |
| <code>borderCapColor</code>          | Y   | Format: color; outside left and outside right color for skins.   |
| <code>borderColor</code>             | Y   | Format: color; black section of a three-dimensional border or the color section of a two-dimensional border.   |
| <code>borderSides</code>             | N   | Bounding box sides. Only used when <code>borderStyle="solid"</code> . Space-delimited string containing the sides of the border to show. Order is not important. The default value is <code>"left top right bottom"</code> .   |
| <code>borderStyle</code>             | Y   | Bounding box style. The possible values are: <ul style="list-style-type: none"><li>• <code>inset</code> (default)</li><li>• <code>none</code></li><li>• <code>outset</code></li><li>• <code>solid</code></li></ul>   |
| <code>borderThickness</code>         | N   | Bounding box thickness. Only used when <code>borderStyle="solid"</code> . The default value is 1.  |
| <code>color</code>                   | Y   | Format: color; text color of a component's label.  |
| <code>cornerRadius</code>            | N   | Radius of component corners. The default value is 0.   |
| <code>disabledColor</code>           | Y   | Format: color; color of the component if it is disabled.   |

| Style              | Inh | Description  |
|--------------------|-----|--|
| dropShadow         | N   | Format: Boolean; controls the visibility of the component's drop shadow. The default value is false. This style must be used with borderStyle="solid". For drop shadows to appear on containers, set backgroundColor or backgroundImage. Otherwise, since the default background of a container is transparent, the shadow appears behind the container. |
| errorColor         | Y   | Format: color; color of the error text.  |
| fillColors         | N   | Format: color; colors used to tint the background of the control. Pass the same color for both values for "flat" looking control. The default value is ##E6EEEE,##FFFFFF.  |
| fontFamily         | Y   | Comma-separated list of fonts to use, in descending order of desirability. You can use any font family name. If you specify a generic font name, it is converted to an appropriate device font. Flash can only use fonts that are installed on the client system.  |
| fontSize           | Y   | Format: length; size of the text.  |
| fontStyle          | Y   | Determines whether the text is italic. Recognized values are normal and italic. The default value is normal.   |
| fontWeight         | Y   | Determines whether the text is bold. Recognized values are normal and bold. The default value is normal.   |
| highlightColor     | Y   | Format: color; color of the control when it is in focus.   |
| horizontalGap      | N   | Format: length; number of pixels between children in the horizontal direction.   |
| leading            | N   | Additional vertical space between lines of text. The default value is no leading.  |
| marginLeft         | N   | Format: length; number of pixels between the container's left border and its content area.   |
| marginRight        | N   | Format: length; number of pixels between the container's right border and its content area.  |
| scrollTrackColor   | Y   | Format: color; scroll track for a scroll bar. The default value is ##EFFFFF (light gray).  |
| selectedFillColors | N   | Format: colors; two colors used to tint the background of the control when in its selected state. Pass the same color for both values for "flat" looking control. The default value is undefined, which means the colors will be derived from themeColor.  |
| textAlign          | Y   | Aligns text in a container. Recognized values are left, right, and center. The default value is right.   |
| textDecoration     | N   | Determines whether the text is underlined or not. Recognized values are none and underline. The default value is none.   |
| textIndent         | Y   | Format: length; offset of first line of text from the left side of the container. The default value is 0.  |

| Style       | Inh | Description  |
|-------------|-----|--|
| themeColor  | Y   | Format: color; background color of a component. The possible values are: <ul style="list-style-type: none"> <li>• haloGreen</li> <li>• haloBlue</li> <li>• haloOrange</li> <li>• haloSilver</li> </ul> |
| verticalGap | N   | Format: length; number of pixels between children in the vertical direction.   |

## Styles for cfform

The following styles apply to the `cfform` tag:

| Style            | Inh | Description   |
|------------------|-----|---|
| background-color |     | Format: color; background color of the form.  |
| indicatorGap     | Y   | Format: length; number of pixels between the label and child components. The default value is 14.                     |
| labelWidth       | Y   | Format: length; width of the form labels. The default value is the length of the longest label in the form.           |
| marginBottom     | N   | Format: length; number of pixels between the container's bottom border and its content area. The default value is 16. |
| marginTop        | N   | Format: length; number of pixels between the container's top border and its content area. The default value is 16.    |
| verticalGap      | N   | Format: length; number of pixels between children in the vertical direction. The default value is 8.                  |

## Styles for cfformgroup with horizontal or vertical type attributes

The following styles apply to the `cfformgroup` tag with type attributes `horizontal` or `vertical`:

| Style           | Inh | Description  |
|-----------------|-----|--|
| horizontalAlign | N   | Horizontal alignment of children. Possible values are left, center, and right. The default value is left.            |
| horizontalGap   | N   | Format: length; number of pixels between children in the horizontal direction. The default value is 6.               |
| indicatorGap    | Y   | Format: length; number of pixels between the label and child components. The default value is 14.                    |
| labelWidth      | Y   | Format: length; width of the form labels. The default value is the length of the longest label in the form.          |
| marginBottom    | N   | Format: length; number of pixels between the container's bottom border and its content area. The default value is 0. |

| Style       | Inh | Description   |
|-------------|-----|---|
| marginTop   | N   | Format: length; number of pixels between the container's top border and its content area. The default value is 0. |
| verticalGap | N   | Format: length; number of pixels between children in the vertical direction. The default value is 6.              |

## Styles for box-style cfformgroup elements

The following styles apply to the `cfformgroup` tag with the following `type` attributes. Some types have additional attributes, which are listed in the following sections.

- `hbox`
- `vbox`
- `hdividedbox`
- `vdividedbox`
- `panel`
- `tile`
- `page`

| Style           | Inh | Description   |
|-----------------|-----|---|
| horizontalAlign | N   | Horizontal alignment of children in the container. The default value is left. Possible values are left, center, and right.      |
| horizontalGap   | N   | Format: length; number of pixels between children in the horizontal direction. The default value is 8 (6 for a tile container). |
| marginBottom    | N   | Format: length; number of pixels between the container's bottom border and its content area. The default value is 0.            |
| marginTop       | N   | Format: length; number of pixels between the container's top border and its content area. The default value is 0.               |
| verticalAlign   | N   | Vertical alignment of children in the container. The default value is top. Possible values are top, middle, and bottom.         |
| verticalGap     | N   | Format: length; number of pixels between children in the vertical direction. The default value is 8 (6 for a tile container).   |

### Styles specific to cfformgroup with hdividedbox or vdividedbox type attributes

The following additional styles apply to the `cfformgroup` tag with `type="hdividedbox"`, or `type="vdividedbox"`:

| Style             | Inh | Description   |
|-------------------|-----|---|
| dividerAffordance | N   | Format: length; width ( <code>hdividedbox</code> ) or height ( <code>vdividedbox</code> ) in pixels of the area of the divider that the user can select with the mouse pointer. The default value is 6. |

| Style            | Inh | Description  |
|------------------|-----|--|
| dividerColor     | Y   | Format: color; color of the dividers in their up state. The default value is ##AAAAAA. |
| dividerThickness | N   | Format: length; thickness in pixels of the dividers. The default value is 4.           |

### Styles specific to cfformgroup with panel type attribute

The following additional styles apply to the `cfformgroup` tag with `type="panel"`:

| Style            | Inh | Description   |
|------------------|-----|---|
| cornerRadius     | N   | Format: length; radius of corners of the window frame. The default value is 8.  |
| dropShadow       | N   | Boolean value specifying whether the panel has a drop shadow. The default value is true.  |
| footerColors     | Y   | Format: color; comma-delimited list of two colors used to draw the footer (ControlBar) background. The first color is the top color. The second color is the bottom color. The default value is ##F4F5F7, ##E1E5EB.   |
| headerColors     | Y   | Format: color; comma-delimited list of two colors used to draw the header. The first color is the top color. The second color is the bottom color. The default value is ##E1E5EB, ##F4F5F7.   |
| headerHeight     | N   | Format: length; height of the header. The default value is 28.  |
| panelBorderStyle | N   | Border style for the bottom two corners of the container. The top two corners are always round. Possible values are <code>default</code> , which configures the container to have square corners, and <code>roundCorners</code> , which defines rounded corners. To configure the top corners to be square, set <code>cornerRadius</code> to 0. The default value is <code>default</code> . |
| shadowDirection  | N   | Direction of drop shadow. Possible values are "left", "center", and "right". The default value is "center".   |
| shadowDistance   | N   | Distance of drop shadow. Negative values move shadow above the panel. The default value is 2.   |

### Styles for cfformgroup with accordion type attribute

The following styles apply to the `cfformgroup` tag with `type="accordion"`:

| Style        | Inh | Description   |
|--------------|-----|---|
| headerHeight | N   | Format: length; height of the accordion container buttons, in pixels. The default value is 22.                        |
| marginBottom | N   | Format: length; number of pixels between the container's bottom border and its content area. The default value is -1. |
| marginTop    | N   | Format: length; number of pixels between the container's top border and its content area. The default value is -1.    |

| Style        | Inh | Description   |
|--------------|-----|---|
| openDuration | N   | Format: time; duration, in milliseconds, of the transition from one child panel to another. The default value is 250. |
| verticalGap  | N   | Format: length; number of pixels between children in the vertical direction. The default value is -1.                 |

## Styles for cfformgroup with tabnavigator type attribute

The following styles apply to the `cfformgroup` tag with the `type="tabnavigator"`:

| Style           | Inh | Description   |
|-----------------|-----|---|
| horizontalAlign | N   | Horizontal alignment of children. The default value is left. Possible values are left, center, and right. Because the preferred width of each tab in the tab navigator container is the size of the label text, you must use the <code>tabWidth</code> style to increase the width of the tab to a size larger than its preferred width to see different alignments.  |
| horizontalGap   | N   | Format: length; number of pixels between children in the horizontal direction. The default value is 6.  |
| tabHeight       | N   | Format: length; default tab height, in pixels. The default value is 22.   |
| tabWidth        | N   | Format: length; width of the tabs, in pixels. If undefined, the default tab widths are automatically calculated from the label text. If the width of the container is smaller than the width of the label text, the labels are truncated. If a tab label is truncated, Flash displays a tooltip with the full label text when a user moves the mouse pointer over the tab. If you specify an explicit tab width, labels do not automatically shrink to fit if they do not fit in the available space. |

## Styles for cfformitem with hrule or vrule type attributes

The following styles apply to the `formitem` tag with `type="hrule"` or `type="vrule"`:

| Style | Inh | Description  |
|-------|-----|--|
| color | Y   | Format: color; color of the line. according to the following rules: <ul style="list-style-type: none"> <li>• If <code>strokeWidth</code> is 1, the color of the entire line.</li> <li>• If <code>strokeWidth</code> is 2 (default), the color of the top line.</li> <li>• If <code>strokeWidth</code> is greater than 2, the color of the top and left edges of the rectangle.</li> </ul> The default value is <code>##C4CCCC</code> . |

| Style       | Inh | Description  |
|-------------|-----|--|
| shadowColor | Y   | Format: color; shadow color of the line, as follows: <ul style="list-style-type: none"> <li>If <code>strokeWidth</code> is 1, does nothing.</li> <li>If <code>strokeWidth</code> is 2 (default), the color of the bottom line.</li> <li>If <code>strokeWidth</code> is greater than 2, the color of the bottom and right edges of the rectangle.</li> </ul> The default value is <code>##D4DOC8</code> .               |
| strokeWidth | Y   | Thickness of the rule in pixels, as follows: <ul style="list-style-type: none"> <li>If <code>strokeWidth</code> is 1, the rule is a 1-pixel-wide line.</li> <li>If <code>strokeWidth</code> is 2 (default), the rule is two adjacent 1-pixel-wide horizontal lines.</li> <li>If <code>strokeWidth</code> is greater than 2, the rule is a hollow rectangle with 1-pixel-wide edges.</li> </ul> The default value is 2. |

## Styles for `cfinput` with `radioButton`, `checkbox`, `button`, `image`, or `submit` attributes

The following styles apply `cfinput` tags with the following `type` attribute values:

- `button`
- `checkbox`
- `image`
- `radiobutton`
- `submit`

In some cases, a style applies only to the subset of these input types, as specified in the description.

| Style                         | Inh | Description   |
|-------------------------------|-----|---|
| borderThickness               | N   | Thickness of border "ring". A value of 0 means no border. Any value greater than 2 creates a glowing "ring" around the button. The default value is 3.  |
| cornerRadius                  | N   | Radius of corners. The default value is 5.  |
| horizontalGap                 | N   | Gap between the label and the image in an <code>img</code> input when <code>labelPlacement</code> = "left" or "right". The default value is 2.  |
| repeatDelay                   | N   | Format: time; number of milliseconds to wait after the first <code>buttonDown</code> event before repeating <code>buttonDown</code> events at the <code>repeatInterval</code> . The default value is 500. |
| repeatInterval                | N   | Format: time; number of milliseconds between <code>buttonDown</code> events if you press and hold a button. The default value is 35.  |
| symbolBackgroundColor         | Y   | Format: color; background color of check boxes and radio buttons. The default value is <code>##FFFFFF</code> (white).   |
| symbolBackgroundDisabledColor | Y   | Format: color; background color of check boxes and radio buttons when disabled. The default value is <code>##EFEEEE</code> (light gray).  |

| Style                                 | Inh | Description   |
|---------------------------------------|-----|---|
| symbolBackgroundColor<br>PressedColor | Y   | Format: color; background color of check boxes and radio buttons when pressed. The default value is #FFFFFF (white).                            |
| symbolColor                           | Y   | Format: color; the check mark of a check box or the dot of a radio button. The default value is #000000 (black).                                |
| symbolDisabledColor                   | Y   | Format: color; check mark or radio button dot color if the control is disabled. The default value is #848384 (dark gray).                       |
| texRollOverColor                      | Y   | Format: color; text color of the label as you move the mouse pointer over the control. The default value is #2B333C.                            |
| textSelectColor                       | Y   | Format: color; text color of the label as you select the control. The default value is #000000.   |
| verticalGap                           | N   | Gap between the label and the image in an <code>img</code> input when <code>labelPlacement = "top" or "bottom"</code> . The default value is 2. |

## Styles for `cftextarea` tag and `cfinput` with `text`, `password`, or `hidden` type attributes

The following style applies to the following tags and tag-attribute combinations:

- `textarea`
- `cfinput type="hidden"`
- `cfinput type="password"`
- `cfinput type="text"`

| Style         | Inh | Description                                     |
|---------------|-----|---|
| disabledColor | Y   | Format: color; disabled color of the Text Area. |

## Styles for `cfselect` with `size` attribute value of 1

The following styles apply to the `cfselect` tag when the `size` attribute is 1; that is, if the control displays one option at a time, with a drop-down list (also known as a combobox):

| Style                | Inh | Description  |
|----------------------|-----|--|
| alternatingRowColors | Y   | Format: comma delimited list of colors for rows in an alternating pattern. Value can be a list of two or more colors. Use only if you do not specify a <code>backgroundColor</code> style. |
| closeDuration        | N   | Time to close the drop-down list, in milliseconds. The default value is 250.   |
| openDuration         | N   | Time to close the drop-down list, in milliseconds. The default value is 250.   |
| rollOverColor        | Y   | Format: color; color of the background when the user rolls over an item. The default value is #0EFFD6.   |
| selectionColor       | Y   | Format: color; color of the background when the user selects an item. The default value is #ODFFC1.  |

## Styles for cfselect with size attribute value greater than 1

The following styles apply to the `cfselect` tag when the `size` attribute is greater than 1; that is, if the control is a list box that displays two or more options at a time:

| Style                             | Inh | Description  |
|-----------------------------------|-----|--|
| <code>alternatingRowColors</code> | Y   | Type: comma-delimited list of colors for rows in an alternating pattern. Value can be a list of two or more colors.                      |
| <code>marginBottom</code>         | N   | Format: length; number of pixels between the bottom of the row and the bottom of the text in the row. The default value is 0.            |
| <code>marginTop</code>            | N   | Format: length; number of pixels between the top of the row and the top of the text in the row. The default value is 0.                  |
| <code>rollOverColor</code>        | Y   | Format: color; color of the background when the user moves the mouse pointer over the link. The default value is <code>##0EFFD6</code> . |
| <code>selectionColor</code>       | Y   | Format: color; color of the background when the user selects the link. The default value is <code>##0DFFC1</code> .                      |
| <code>selectionDuration</code>    | N   | The duration of the selection animation, in milliseconds. The default value is 250. Set to 0 to disable animation.                       |
| <code>textRollOverColor</code>    | Y   | Format: color; text color when the user moves the mouse pointer over the selection. The default value is <code>##02B33C</code> .         |
| <code>textSelectedColor</code>    | Y   | Format: color; text color when selected. The default value is <code>##005F33</code> .  |

## Styles for cfcalendar tag and cfinput with dateField type attribute

The following styles apply to the `cfcalendar` tag and `dateField` type of the `cfinput` tag:

| Style                       | Inh | Description  |
|-----------------------------|-----|--|
| <code>headerColors</code>   | Y   | Format: color; colors of the band at the top of the DateChooser control. Specify two values, separated by a comma. For a solid band, use the same color for both values. The default value is <code>##E6EEEE,##FFFFFF</code> . |
| <code>rollOverColor</code>  | Y   | Format: color; color of the background when the user moves the mouse pointer over the DateField. The default value is <code>##E3FFD6</code> .  |
| <code>selectionColor</code> | Y   | Format: color; color of the background when the user selects the DateField. The default value is <code>##CDFFC1</code> .   |
| <code>todayColor</code>     | Y   | Format: color; color of today's date. The default value is <code>##2B333C</code> .   |

## Styles for the cfgrid tag

The following styles apply to the `cfgrid` tag:

| Style                        | Inh | Description  |
|------------------------------|-----|--|
| <code>horizontalAlign</code> | N   | Horizontal alignment of children in the container. The default value is left. Possible values are left, center, and right. |
| <code>horizontalGap</code>   | N   | Number of pixels between children in the horizontal direction. The default value is 8.                                     |
| <code>marginBottom</code>    | N   | Number of pixels between the container's bottom border and its content area. The default value is 0.                       |
| <code>marginTop</code>       | N   | Number of pixels between the container's top border and its content area. The default value is 0.                          |
| <code>verticalAlign</code>   | N   | Vertical alignment of children in the container. The default value is top. Possible values are top, middle, and bottom.    |
| <code>verticalGap</code>     | N   | Number of pixels between children in the vertical direction. The default value is 8.                                       |

## Styles for the cftree tag

The following styles apply to the `cftree` tag:

| Style                             | Inh | Description  |
|-----------------------------------|-----|--|
| <code>alternatingRowColors</code> | Y   | Type: Array; colors for rows in an alternating pattern. Value can be an Array of two or more colors.                                     |
| <code>depthColors</code>          | Y   | Type: Array; array of colors used in the Tree control, in descending order.  |
| <code>indentation</code>          | N   | Indentation for each tree level, in pixels. The default value is 8.  |
| <code>openDuration</code>         | N   | Format: time; length of an open or close transition, in milliseconds. The default value is 250.  |
| <code>rollOverColor</code>        | Y   | Format: color; color of the background when the user moves the mouse pointer over the link. The default value is <code>##E3FFD6</code> . |
| <code>selectionColor</code>       | Y   | Format: color; color of the background when the user selects the link. The default value is <code>##CDFFC1</code> .                      |
| <code>selectionDuration</code>    | N   | The duration of the selection animation, in milliseconds. The default value is 250. Set to 0 to disable animation.                       |
| <code>textRollOverColor</code>    | Y   | Format: color; color of the text when the user moves the mouse pointer over the entry. The default value is <code>##02B33C</code> .      |
| <code>textSelectedColor</code>    | Y   | Format: color; color of the text when the user selects the entry. The default value is <code>##005F33</code> .                           |

# CHAPTER 5

## Application.CFC Reference

This chapter describes the methods that you implement in `Application.cfc` to handle Macromedia ColdFusion MX 7 application events. It also describes the variables that you set in the CFC to configure application characteristics.

### Contents

|   |     |
|---|-----|
| <a href="#">Application variables</a> ..... | 945 |
| <a href="#">Method summary</a> .....        | 946 |
| <a href="#">Method descriptions</a> .....   | 948 |

**Note:** Although Windows is case-insensitive, Macromedia recommends that you always start the `Application.cfc` filename with an uppercase A. Both `application.cfc` and `Application.cfc` are reserved words.

**Note:** If your application has an `Application.cfc`, and an `Application.cfm` or `onRequestend.cfm` page, ColdFusion MX ignores the CFM pages.

### Application variables

The `This` scope for the `Application.cfc` contains several built-in variables which correspond to the attributes that you set in the `cfapplication` tag. You set the values of these variables in the CFC initialization code, before you define the CFC methods. You can access the variables in any method.

The following table briefly describes the variables that you can set to control the application behavior. For more details, see the `cfapplication` tag.

| Variable                        | Default             | Description  |
|---------------------------------|---------------------|--|
| <code>name</code>               | no name             | The application name. If you do not set this variable, or set it to the empty string, your CFC applies to the unnamed application scope, which is the ColdFusion MX J2EE servlet context. For more information on unnamed scopes see “Sharing data between ColdFusion pages and JSP pages or servlets” in <i>ColdFusion MX Developer’s Guide</i> . |
| <code>applicationTimeout</code> | Administrator value | Life span, as a real number of days, of the application, including all Application scope variables. Use the CFML <code>CreateTimeSpan</code> function to generate this variable’s value.   |
| <code>clientManagement</code>   | Administrator value | Whether the application supports Client scope variables.   |
| <code>clientStorage</code>      | Administrator value | Where Client variables are stored; can be cookie, registry, or the name of a data source.  |
| <code>loginStorage</code>       | cookie              | Whether to store login information in the Cookie scope or the Session scope.   |
| <code>sessionManagement</code>  | no                  | Whether the application supports Session scope variables.  |
| <code>sessionTimeout</code>     | Administrator value | Life span, as a real number of days, of the user session, including all Session variables. Use the CFML <code>CreateTimeSpan</code> function to generate this variable’s value.  |
| <code>setClientCookies</code>   | True                | Whether to send CFID and CFTOKEN cookies to the client browser.  |
| <code>setDomainCookies</code>   | False               | Whether to set CFID and CFTOKEN cookies for a domain (not just a host).  |
| <code>scriptProtect</code>      | Administrator value | Whether to protect variables from cross-site scripting attacks.  |

## Method summary

The following table briefly describes the application event methods that you can implement in `Application.CFC`:

| Method name                     | Method runs when   |
|---------------------------------|--|
| <code>onApplicationEnd</code>   | The application ends: the application times out, or the server is stopped  |
| <code>onApplicationStart</code> | The application first starts: the first request for a page is processed or the first CFC method is invoked by an event gateway instance, or a web services or Macromedia Flash Remoting CFC. |
| <code>onError</code>            | An exception occurs that is not caught by a try/catch block.   |
| <code>onRequest</code>          | The <code>onRequestStart</code> method finishes. (This method can filter request contents.)  |
| <code>onRequestEnd</code>       | All pages in the request have been processed:  |

---

| <b>Method name</b>          | <b>Method runs when</b> |
|-----------------------------|-------------------------|
| <code>onRequestStart</code> | A request starts        |
| <code>onSessionEnd</code>   | A session ends          |
| <code>onSessionStart</code> | A session starts        |

---

All parameters to these methods are positional. You can use any names for these parameters.

When a request executes, ColdFusion MX runs the CFC methods in the following order:

1. `onApplicationStart` (if not run before for this application)
2. `onSessionStart` (if not run before for this session)
3. `onRequestStart`
4. `onRequest`
5. `onRequestEnd`

The `onApplicationEnd`, `onSessionEnd`, and `onError` CFCs are triggered by specific events.

# onApplicationEnd

## Description

Runs when an application times out or the server is shutting down.

## Syntax

```
<cffunction name="onApplicationEnd" returnType="void">  
  <cfargument name="ApplicationScope" required=true/>  
  ...  
</cffunction>
```

## See also

[onApplicationStart](#), [Method summary](#), “Managing the application with Application.cfc” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in *ColdFusion MX Developer’s Guide*

## Parameters

ColdFusion MX passes the following parameters to the method:

| Parameters              | Description            |
|-------------------------|------------------------|
| <i>ApplicationScope</i> | The application scope. |

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

Use this method for any clean-up activities that your application requires when it shuts down, such as saving data in memory to a database, or to log the application end to a file. You cannot use this method to display data on a user page, because it is not associated with a request. The application ends, even if this method throws an exception.

If you call this method explicitly, ColdFusion does not end the application; it does execute the method code, but does not lock the Application scope while the method executes.

You must use the *ApplicationScope* parameter to access the application scope; you cannot reference the scope directly; for example, use `Arguments.ApplicationScope.myVariable`, not `Application.myVariable`. This method can access the Server scope directly, but it does not have access to Session or Request scopes.

**Note:** The application times out only if it is inactive for the time-out period. Sessions do not end, and the `onSessionEnd` method is not called when an application ends. For more information, see [onSessionEnd](#).

## Example

```
<cffunction name="onApplicationEnd">  
  <cfargument name="ApplicationScope" required=true/>  
  <cflog file="#This.Name#" type="Information"  
    text="Application #Arguments.ApplicationScope.applicationname# Ended" >  
</cffunction>
```

# onApplicationStart

## Description

Runs when ColdFusion MX receives the first request for a page in the application.

## Syntax

```
<cffunction name="onApplicationStart" returnType="boolean">
    ...
    <cfreturn Boolean>
</cffunction>
```

## See also

[onApplicationEnd, Method summary](#), “Managing the application with Application.cfc” in Chapter 13, “Designing and Optimizing a ColdFusion Application,” in Chapter 5, “Application.CFC Reference,” in *ColdFusion MX Developer’s Guide*

## Returns

A Boolean value: True if the application startup code ran successfully; False, otherwise. You do not need to explicitly return a True value if you omit the `cffunction` tag `returntype` attribute.

## Usage

Use this method for application initialization code; for example, use it to set Application scope variables, to determine whether a required data source or other resource is available, or to log the application start. You do not have to lock the Application scope if you set Application variables in this method, and you can reference Application scope variables as you normally do; for example, as `Application.myVariable`.

This method can access the requested page’s Variables scope only if the `Application.cfc` file includes an `onRequest` method that calls the page.

If you call this method explicitly, ColdFusion does not start the application; it does execute the method code, but does not lock the Application scope while the method executes.

If this method throws an uncaught exception or returns `False`, the application does not start and ColdFusion MX does not process any pages in the application. In this case, ColdFusion will run the `onApplicationStart` method the next time a user requests a page in the application.

## Example

The following example tests for the availability of a database. If the database is not available it reports and logs the error, and does not start the application; if it is available, the method initializes two Application scope variables.

```
<cffunction name="onApplicationStart">
    <cftry>
        <!--- Test whether the DB is accessible by selecting some data. --->
        <cfquery name="testDB" dataSource="cfdocexamples" maxrows="2">
            SELECT Emp_ID FROM employee
        </cfquery>
        <!--- If we get a database error, report an error to the user, log the
            error information, and do not start the application. --->
    <cfcatch type="database">
```

```
<cfoutput>
  This application encountered an error<br>
  Please contact support.
</cfoutput>
<cflog file="#This.Name#" type="error"
  text="cfdoexamples DB not available. message: #cfcatch.message#
Detail: #cfcatch.detail# Native Error: #cfcatch.NativeErrorCode#" >
  <cfreturn False>
</cfcatch>
</cftry>
<cflog file="#This.Name#" type="Information" text="Application Started">
<!--- You do not have to lock code in the onApplicationStart method that sets
  Application scope variables. --->
<cfscript>
  Application.availableResources=0;
  Application.counter1=1;
</cfscript>
<cfreturn True>
</cffunction>
```

# onError

## Description

Runs when an uncaught exception occurs in the application.

## Syntax

```
<cffunction name="onError" returnType="void">
  <cfargument name="Exception" required=true/>
  <cfargument name="EventName" type="String" required=true/>
  ...
</cffunction>
```

## See also

[Method summary](#), “Handling errors in Application.cfc” in *ColdFusion MX Developer’s Guide*

## Parameters

ColdFusion MX passes the following parameters to the method:

| Parameter        | Description  |
|------------------|--|
| <i>Exception</i> | The ColdFusion MX Exception object. For information on the structure of this object, see the description of the <code>cfcatch</code> variable in the <code>cfcatch</code> description.         |
| <i>EventName</i> | The name of the event handler that generated the exception. If the error occurs during request processing and you do not implement an <code>onRequest</code> method, this is the empty string. |

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

Use this method to handle errors in an application-specific manner. This method overrides any error handlers that you set in the ColdFusion MX Administrator or in `cferror` tags. It does not override try/catch blocks.

Whether the `onError` method can display output depends on where the error takes place, as follows:

- The `onError` method can display a message to the user if an error occurs during an `onApplicationStart`, `onSessionStart`, `onRequestStart`, `onRequest`, or `onRequestEnd` event method, or while processing a request.
- The `onError` method cannot display output to the user if the error occurs during an `onApplicationEnd` or `onSessionEnd` event method, because there is no available page context; however, it can log an error message.

If the `onError` event handler is triggered by a scope-specific event method, such as `onSessionStart`, the error prevents further processing at the level of that scope and any lower scopes. An `onError` event triggered by an `onSessionStart` method, for example, prevents further processing in the session, but not in the application.

If an exception occurs while processing the `onError` method, or if the `onError` method uses a `cfthrow` tag, the ColdFusion MX standard error handling mechanisms handle the exception. These mechanisms include: any error handlers specified by `cferror` tags in the `Application.cfc` initialization code, the site-wide error handler specified in the ColdFusion MX Administrator, and ColdFusion MX default error page. Therefore, you can use the `onError` method as a filter to handle selected errors, and use other ColdFusion error-handling techniques for the remaining errors.

### Example

```
<cffunction name="onError">
  <cfargument name="Exception" required=true/>
  <cfargument type="String" name="EventName" required=true/>
  <!--- Log all errors. --->
  <cflog file="#This.Name#" type="error"
    text="Event Name: #Arguments.Eventname#" >
  <cflog file="#This.Name#" type="error"
    text="Message: #Arguments.Exception.message#">
  <cflog file="#This.Name#" type="error"
    text="Root Cause Message: #Arguments.Exception.rootcause.message#">
  <!--- Display an error message if there is a page context. --->
  <cfif NOT (Arguments.EventName IS "onSessionEnd") OR
    (Arguments.EventName IS "onApplicationEnd")>
    <cfoutput>
      <h2>An unexpected error occurred.</h2>
      <p>Please provide the following information to technical support:</p>
      <p>Error Event: #Arguments.EventName#</p>
      <p>Error details:<br>
      <cfdump var=#Arguments.Exception#></p>
    </cfoutput>
  </cfif>
</cffunction>
```

# onRequest

## Description

Runs when a request starts, after the `onRequestStart` event handler. If you implement this method, it **must** explicitly call the requested page to process it.

## Syntax

```
<cffunction name="onRequest" returnType="void">
  <cfargument name="targetPage" type="String" required=true/>
  ...
  <cfinclude template="#Arguments.targetPage#">
  ...
</cffunction>
```

## See also

[onRequestStart](#), [onRequestEnd](#), [Method summary](#), “Managing requests in Application.cfc” in *ColdFusion MX Developer’s Guide*

## Parameters

ColdFusion MX passes the following parameters to the method:

| Parameter               | Description                                   |
|-------------------------|---|
| <code>targetPage</code> | Path from the web root to the requested page. |

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

This event handler provides an optional request filter mechanism for CFML page requests (that is, `.cfm` pages requested using a browser). Use it to intercept requests to target pages and override the default behavior of running the requested pages. The following rules specify where and how you use the `onRequest` method.

- Implement this method only if the following are true:
  - The directory, and any subdirectories affected by this `Application.cfc` contain CFM files and do not contain any CFC files that are intended to be accessed as web services, using Flash Remoting, or using an event gateway.
  - You want to intercept the request and process it in a special way.
- If you do not implement this method, ColdFusion automatically calls the target page (or the CFC for a web service, Flash Remoting, or event gateway event).
- If you implement this method, it **must** explicitly call the target page, normally by using a `cfinclude` tag.
- Do **not** implement the `onRequest` method in any `Application.cfc` file that affects `.cfc` files that implement web services, process Flash Remoting or event gateway requests; ColdFusion MX will not execute the requests if you implement this method.

- Code in this method that precedes the call to the target page can perform the same functions as the `onRequestStart` method, and shares the `Variables` scope with the target page.
- Code in this method that follows the call to the target page can perform the same functions as the `onRequestEnd` method, and shares the `Variables` scope with the target page.
- If you implement this method, you can also implement the `onRequestStart` and `onRequestEnd` methods.

You can use this method to do preprocessing that is required for all requests. Typical uses include filtering and modifying request page contents (such as removing extraneous white space), or creating a switching mechanism that determines the exact page to display based on available parameters.

### Example

```
<cffunction name="onRequest">
  <cfargument name="targetPage" type="String" required=true/>
  <cfset var content="">
  <cfsavecontent variable="content">
    <cfinclude template="#Arguments.targetPage#">
  </cfsavecontent>
  <cfoutput>
    #replace(content, "report", "MyCompany Quarterly Report", "all")#
  </cfoutput>
</cffunction>
```

# onRequestEnd

## Description

Runs at the end of a request, after all other CFML code.

## Syntax

```
<cffunction name="onRequestEnd" returnType="void">
  <cfargument type="String" name="targetPage" required=true/>
  ...
</cffunction>
```

## See also

[onRequestStart](#), [onRequest](#), [Method summary](#), “Managing requests in Application.cfc” in *ColdFusion MX Developer’s Guide*

## Parameters

ColdFusion MX passes the following parameters to the method:

| Parameter         | Description                                   |
|-------------------|---|
| <i>targetPage</i> | Path from the web root to the requested page. |

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

This method has the same purpose as the `onRequestEnd.cfm` page. (You cannot use an `onRequestEnd.cfm` page if you have an `Application.cfc` file for your application.) This method runs before the request terminates; therefore, it can access the page context, and can generate output.

This method can be useful for gathering performance metrics, or for displaying dynamic footer information.

This method can access the requested page’s Variables scope only if the `Application.cfc` file includes an `onRequest` method that calls the page. You can use Request scope variables to share data with the requested page, even if the `Application.cfc` file does not have an `onRequest` method.

If you call this method explicitly, ColdFusion does not end the request, but does execute the method code.

## Example

The following example displays one of two footer pages depending on whether the user has logged in:

The `onRequestEnd` method in `Application.cfc` contains the following code:

```
<cffunction name="onRequestEnd">
  <cfargument type="String" name="targetPage" required=true/>
  <cfset theAuthuser=getauthuser()>
  <cfif theAuthUser NEQ "">
```

```
    <cfinclude template="authuserfooter.cfm">
  <cfelse>
    <cfinclude template="noauthuserfooter.cfm">
  </cfif>
</cffunction>
```

A very simple `authuserfooter.cfm` page consists of the following code:

```
<cfoutput>
  <h3>Thank you for shopping at our store, #theAuthUser#!</h3>
</cfoutput>
```

A very simple `noauthuserfooter.cfm` page consists of the following code:

```
<cfoutput>
  <h3>Remember, only registered users get all our benefits!</h3>
</cfoutput>
```

To test this example, implement code for logging in a user, or try the example with and without the following line in the `onRequestStart Application.cfc` method:

```
<cfloginuser name="Robert Smith" password="secret" roles="customer">
```

# onRequestStart

## Description

Runs when a request starts.

## Syntax

```
<cffunction name="onRequestStart" returnType="boolean">
  <cfargument type="String" name="targetPage" required=true/>
  ...
  <cfreturn Boolean>
</cffunction>
```

## See also

[onRequest](#), [onRequestEnd](#), [Method summary](#), “Managing requests in Application.cfc” in *ColdFusion MX Developer’s Guide*

## Parameters

ColdFusion MX passes the following parameters to the method:

| Parameters        | Description                                   |
|-------------------|---|
| <i>targetPage</i> | Path from the web root to the requested page. |

## Returns

A Boolean value. Return `False` to prevent ColdFusion from processing the request. You do not need to explicitly return a `True` value if you omit the `cffunction tag` `returntype` attribute.

## Usage

This method runs at the beginning of the request. It is useful for user authorization (login handling), and for request-specific variable initialization, such as gathering performance statistics.

If this method throws an exception (for example, if it uses the `cfthrow` tag), ColdFusion handles the error and does not process the request further.

If you call this method explicitly, ColdFusion does not start a request, but does execute the method code.

This method can access the requested page’s Variables scope only if the `Application.cfc` file includes an `onRequest` method that calls the page. You can use Request scope variables to share data with the requested page even if `Application.cfc` does not have an `onRequest` method.

## Example

This example uses the authentication code generated by the ColdFusion MX Dreamweaver Login wizard to ensure that the user is logged in. For Beta 2, the wizard generates code that is appropriate for `Application.cfm` only. To use this code with the `Application.CFC`, delete the generated `Application.CFM`

```
<cffunction name="onRequestStart">
  <cfargument name="requestname" required=true/>
  <!--- Authentication code, generated by the Dreamweaver Login wizard.
  <cfinclude template="mm_wizard_application_include.cfm">
```

```
<!-- Regular maintenance is done late at night. During those hours, tell
people to come back later, and do not process the request further. -->
<cfscript>
    if ((Hour(now()) gt 1) and (Hour(now()) lt 3)) {
        WriteOutput("The system is undergoing periodic maintenance.
Please return after 3:00 AM Eastern time.");
        return false;
    } else {
        this.start=now();
        return true;
    }
</cfscript>
</cffunction>
```

# onSessionEnd

## Description

Runs when a session ends.

## Syntax

```
<cffunction name="onSessionEnd" returnType="void">
  <cfargument name="SessionScope" required=True/>
  <cfargument name="ApplicationScope" required=False/>
  ...
</cffunction>
```

## See also

[onSessionStart](#), [Method summary](#), “Managing sessions in Application.cfc” in *ColdFusion MX Developer’s Guide*

## Parameters

ColdFusion MX passes the following parameters to the method:

| Parameter               | Description            |
|-------------------------|------------------------|
| <i>SessionScope</i>     | The Session scope      |
| <i>ApplicationScope</i> | The Application scope; |

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

Use this method for any clean-up activities when the session ends. A session ends when the session is inactive for the session time-out period or, if using J2EE sessions, the user closes the browser. You can, for example, save session-related data, such as shopping cart contents or whether the user has not completed an order, in a database, or do any other required processing based on the user’s status. You might also want to log the end of the session, or other session related information, to a file for diagnostic use.

If you call this method explicitly, ColdFusion does not end the session; it does execute the method code, but does not lock the Session.

You cannot use this method to display data on a user page, because it is not associated with a request.

You can access shared scope variables as follows:

- You must use the *SessionScope* parameter to access the Session scope. You cannot reference the Session scope directly; for example, use `Arguments.SessionScope.myVariable`, not `Session.myVariable`.

- You must use the *ApplicationScope* parameter to access the Application scope. You cannot reference the Application scope directly; for example, use `Arguments.ApplicationScope.myVariable`, not `Application.myVariable`. Use a named lock when you reference variables in the Application scope, as shown in the example.
- You can access the Server scope directly; for example, `Server.myVariable`.
- You cannot access the Request scope.

Sessions do not end, and the `onSessionEnd` method is not called when an application ends. The `onSessionEnd` does not execute if there is no active application, however.

### Example

The following method decrements an Application scope session count variable and logs the session length.

```
<cffunction name="onSessionEnd">
  <cfargument name = "SessionScope" required=true/>
  <cfargument name = "AppScope" required=true/>
  <cfset var sessionLength = TimeFormat(Now() - SessionScope.started,
    "H:mm:ss")>
  <cflock name="AppLock" timeout="5" type="Exclusive">
    <cfset Arguments.AppScope.sessions = Arguments.AppScope.sessions - 1>
  </cflock>
  <cflog file="#This.Name#" type="Information"
    text="Session #Arguments.SessionScope.sessionid# ended. Length:
    #sessionLength# Active sessions: #Arguments.AppScope.sessions#">
</cffunction>
```

# onSessionStart

## Description

Runs when a session starts.

## Syntax

```
<cffunction name="onSessionStart" returnType="void">  
    ...  
</cffunction>
```

## See also

[onSessionEnd](#), [Method summary](#), “Managing sessions in Application.cfc” in *ColdFusion MX Developer’s Guide*

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

This method is useful for initializing Session scope data, such as a shopping cart, or setting session-specific Application scope variables, such as for tracking the number of active sessions. You never need to lock the Session scope to set its variables using this method.

If you call this method explicitly, ColdFusion does not start a session; it does execute the method code, but does not lock the Session scope.

This method can access the requested page’s Variables scope only if the Application.cfc file includes an `onRequest` method that calls the page.

## Example

The following `onSessionStart` example initializes some Session scope variables and increments and Application scope counter of active sessions.

```
<cffunction name="onSessionStart">  
    <cfscript>  
        Session.started = now();  
        Session.shoppingCart = StructNew();  
        Session.shoppingCart.items = 0;  
    </cfscript>  
    <cflock scope="Application" timeout="5" type="Exclusive">  
        <cfset Application.sessions = Application.sessions + 1>  
    </cflock>  
</cffunction>
```

# CHAPTER 6

## ColdFusion MX Event Gateway Reference

This chapter describes the Java interfaces available for building Macromedia ColdFusion MX 7 custom CFXs in Java.

### Contents

|  |      |
|--|------|
| Gateway development interfaces and classes . . . . .           | 963  |
| CFML CFEvent structure . . . . .                               | 1004 |
| IM gateway methods and commands . . . . .                      | 1004 |
| SMS Gateway CFEvent structure and commands . . . . .           | 1042 |
| CFML event gateway SendGatewayMessage data parameter . . . . . | 1052 |

**Note:** The following CFML functions also apply to gateway application development:  
[GetGatewayHelper](#), [SendGatewayMessage](#).

### Gateway development interfaces and classes

The ColdFusion MX event gateway system is defined in the `coldfusion.eventgateway` package. Gateway developers implement two interfaces and use several classes, as follows:

- [Gateway interface](#)
- [GatewayHelper interface](#)
- [GatewayServices class](#)
- [CFEvent class](#)
- [Logger class](#)

## Gateway interface

`coldfusion.eventgateway.Gateway`

Interface for implementing ColdFusion MX event gateways.

A class that implements this interface defines a ColdFusion MX event gateway type that you can use in ColdFusion MX applications. The class must implement the following methods:

---

| Signature  | Description   |
|--|---|
| <code>GatewayName([String id[, String configFile]])</code>                     | The gateway constructor.  |
| <code>String getGatewayID()</code>   | Returns the gateway ID.   |
| <code>GatewayHelper getHelper()</code>   | Returns an instance of the <code>GatewayHelper</code> class for this gateway type. instance, or null if the gateway does not have a <code>GatewayHelper</code> class. |
| <code>int getStatus()</code>   | Gets the event gateway status.  |
| <code>String outgoingMessage(coldfusion.eventgateway.CFEvent cfmessage)</code> | Handles a message sent by ColdFusion and processes it to send to a message receiver.  |
| <code>void restart()</code>  | Restarts a running event gateway.   |
| <code>void setCFCListeners(String[] listeners)</code>                          | Identifies the CFCs that listen for incoming messages from the event gateway.   |
| <code>void setGatewayID(String id)</code>                                      | Sets the gateway ID that uniquely identifies the Gateway instance.  |
| <code>void start()</code>  | Starts the event gateway.   |
| <code>void stop()</code>   | Stops the event gateway.  |

---

# Constructor

## Description

Instantiates a gateway.

## Category

Event Gateway Development

## Syntax

```
public void gatewayName()  
public void gatewayName(String id)  
public void gatewayName(String id, String configFile)
```

## See also

[setGatewayID](#), “Class constructor” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter  | Description  |
|------------|--|
| id         | The identifier for the gateway instance              |
| configFile | The absolute path to the gateway configuration file. |

## Usage

If your gateway requires a configuration file, use the constructor with two parameters. Otherwise, you can use either the default constructor or the single parameter version; ColdFusion always uses the `setGatewayID` method to set the ID.

## Example

The following example shows the two argument constructor implemented in the ColdFusion MX `SocketGateway` class:

```
public SocketGateway(String id, String configpath) {  
    propsFilePath=configpath;  
    try {  
        FileInputStream propsFile = new FileInputStream(propsFilePath);  
        properties.load(propsFile);  
        propsFile.close();  
        this.loadProperties();  
    }  
    catch (FileNotFoundException f) {  
        // do nothing. use default value for port.  
    }  
    catch (IOException e) {  
        e.printStackTrace();  
    }  
    gatewayID = id;  
    gatewayService = GatewayServices.getGatewayServices();  
}
```

# getGatewayID

## Description

Returns the gateway ID that identifies the Gateway instance.

## Category

Event Gateway Development

## Syntax

```
public String getGatewayID()
```

## See also

[setGatewayID](#), “Providing Gateway class service and information routines” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Usage

This method returns a string value that is set by the `setGatewayID` method.

## Example

The following example is the ColdFusion MX SocketGateway class `getGatewayID` method:

```
public String getGatewayID()
{
    return gatewayID;
}
```

# getHelper

## Description

Returns an instance of the gatewayHelper class, if any for the gateway type.

## Category

Event Gateway Development

## Syntax

```
public GatewayHelper getHelper()
```

## See also

[GatewayHelper interface](#); “Providing Gateway class service and information routines” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

A coldfusion.eventgateway.GatewayHelper class instance, or null if the gateway does not have a GatewayHelper class.

## Usage

ColdFusion calls this method when a ColdFusion MX application calls the CFML `GetGatewayHelper` function. The application then uses the gatewayHelper object methods to call gateway-specific utility methods, such as instant message buddy management methods.

## Example

The following example is the ColdFusion MX SocketGateway class `getHelper` method:

```
public GatewayHelper getHelper()
{
    // SocketHelper class implements the GatewayHelper interface
    return new SocketHelper();
}
```

# getStatus

## Description

Returns the gateway status.

## Category

Event Gateway Development

## Syntax

```
public int getStatus()
```

## See also

“Providing Gateway class service and information routines” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

An integer status value. The Gateway interface defines the following status constants:

- STARTING
- RUNNING
- STOPPING
- STOPPED
- FAILED

## Example

The following example is the ColdFusion MX SocketGateway class `getStatus` method:

```
public int getStatus()  
{  
    return status;  
}
```

# outgoingMessage

## Description

Sends a message from ColdFusion to a message receiver.

## Category

Event Gateway Development

## Syntax

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent message)
```

## See also

“Responding to a ColdFusion function or listener CFC” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

---

| Parameter | Description   |
|-----------|---|
| message   | A coldfusion.eventgateway.CFEvent instance containing the message to be sent. |

---

## Returns

A gateway-specific string, such as a message ID or a status indicator.

## Usage

This method handles a message sent by ColdFusion MX and processes it as needed by the gateway type to send a message to the (usually external) message receiver. ColdFusion MX calls this method when the listener method of a listener CFC returns a message or when a ColdFusion application calls the `SendGatewayMessage` function. ColdFusion MX passes the String returned by this method back as the return value of a CFML `SendGatewayMessage` function.

## Example

The following example is the ColdFusion MX `SocketGateway` class `outgoingMessage` method:

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null && message != null)
    {
        SocketServerThread st =
            ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID()));
        if(st != null)
            st.writeOutput(message);
        else
        {
            log.error("Cannot send outgoing message. OriginatorID '" +
                cfmsg.getOriginatorID() + "' is not a valid socket id.");
        }
    }
}
```

```

        retcode="failed";
    }
}
else if (data.get("OriginatorID") != null && message != null)
{
    SocketServerThread st =
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID")));
    if(st != null)
        st.writeOutput(message);
    else
    {
        log.error("Cannot send outgoing message. OriginatorID '" +
            data.get("OriginatorID") + "' is not a valid socket id.");
        retcode="failed";
    }
}
else
{
    log.error("Cannot send outgoing message. OriginatorID/MESSAGE is not
        available.");
    retcode="failed";
}
return retcode;
}

```

# restart

## Description

Stops a gateway if it is running and starts it up.

## Category

Event Gateway Development

## Syntax

```
public void restart()
```

## See also

[start](#), [stop](#)

## Usage

In most cases, you implement this method as a call to the stop method followed by a start method, but you may be able to optimize the restart method based on the type of gateway.

## Example

The following example is the ColdFusion MX SocketGateway class restart method:

```
public void restart()
{
    stop();
    start();
}
```

# setCFListeners

## Description

Sets the array of listener CFCs that the gateway sends messages to.

## Category

Event Gateway Development

## Syntax

```
public void setCFListeners(String[] listeners)
```

## See also

[Constructor](#), [getGatewayID](#), [setCFPath](#), “Providing Gateway class service and information routines” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| listeners | Array of absolute file paths to CFCs to which the gateway forwards messages when it gets events. |

## Usage

When ColdFusion MX starts a gateway instance, it calls this method with the names in the instance’s listener list in the ColdFusion MX Administrator. ColdFusion MX can also call this method if the ColdFusion MX Administrator listener list changes while the gateway is running.

## Example

The following example is the ColdFusion MX SocketGateway class `setCFListeners` method:

```
public void setCFListeners(String[] listeners)
{
    ArrayList aListeners = new ArrayList();
    for(int i = 0; i<listeners.length; i++)
    {
        aListeners.add(listeners[i]);
    }
    // Try not to pull the rug out from underneath a running message
    synchronized (cfListeners)
    {
        cfListeners = aListeners;
    }
}
```

# setGatewayID

## Description

Sets the gateway ID that uniquely identifies the Gateway instance.

## Category

Event Gateway Development

## Syntax

```
public void setGatewayID(String id)
```

## See also

[Constructor](#), [getGatewayID](#), “Providing Gateway class service and information routines” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                               |
|-----------|---|
| id        | The identifier for this gateway instance. |

## Usage

This method sets a string value that is returned by the `getGatewayID` method. ColdFusion MX calls this method to set the gateway ID with the value specified in the gateway instance configuration in the ColdFusion MX Administrator before it starts the event gateway, even if the Gateway constructor also sets the ID.

## Example

The following example is the ColdFusion MX SocketGateway class `setGatewayID` method:

```
public void setGatewayID(String id)
{
    gatewayID = id;
}
```

# start

## Description

starts a gateway running.

## Category

Event Gateway Development

## Syntax

```
public void start()
```

## See also

[restart](#), [stop](#), “The start method” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Usage

Start a gateway by performing any required initialization. This method starts any listener thread or threads that monitor the gateway’s event source. The ColdFusion MX Administrator calls this function when it starts a gateway instance.

This method should update the status information that is returned by the `getStatus` method to indicate when the gateway is starting and when the gateway is running.

The ColdFusion MX Administrator Gateway Types page lets you specify a time-out for the gateway startup, and whether to kill the gateway on startup time-out. If you enable the kill option and the `start` method does not return in the time-out period, ColdFusion MX will kill the thread that called this function.

## Example

The following example is the ColdFusion MX `SocketGateway` class `restart` method:

```
public void start()
{
    status = STARTING;
    listening=true;
    // Start up event generator thread
    Runnable r = new Runnable()
    {
        public void run()
        {
            socketServer();
        }
    };
    Thread t = new Thread(r);
    t.start();
    status = RUNNING;
}
```

# stop

## Description

Stops a gateway if it is running.

## Category

Event Gateway Development

## Syntax

```
public void stop()
```

## See also

[restart](#), [start](#), “The stop method” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Usage

Stops a gateway by performing any required clean-up operations. This method stops any listener thread or threads that monitor the gateway’s event source and releases any other resources. The ColdFusion MX Administrator calls this function when it stops a gateway instance.

This method should update the status information that is returned by the `getStatus` method to indicate when the gateway is stopping and when the gateway is stopped.

## Example

The following example is the ColdFusion MX `SocketGateway` class `stop` method:

```
public void stop()
{
    status = STOPPING;
    listening=false;
    Enumeration e = socketRegistry.elements();
    while (e.hasMoreElements()) {
        try
        {
            ((SocketServerThread)e.nextElement()).socket.close();
        }
        catch (IOException e1) {
            e1.printStackTrace();
        }
    }
    if (serverSocket != null) {
        try
        {
            serverSocket.close();
        }
        catch (IOException e1) {
        }
        serverSocket = null;
    }
    status = STOPPED;
}
```

## GatewayHelper interface

`coldfusion.eventgateway.GatewayHelper`

ColdFusion MX includes a `coldfusion.eventgateway.GatewayHelper` Java marker interface, with no methods. Implement this interface to define a class that provides gateway-specific utility methods to the ColdFusion application or listener CFC. For example, an instant messaging event gateway might use a helper class to provide buddy list management methods to the application. The Gateway class must implement a `getHelper` method that returns the helper class, or null if you do not implement the interface.

For information on GatewayHelper classes, see [“GatewayHelper class” on page 1092](#).

## GatewayServices class

`coldfusion.eventgateway.GatewayServices`

The Gateway class uses the `coldfusion.eventgateway.GatewayServices` class to interact with the ColdFusion event gateway services. This class has the following methods:

---

| Signature   | Description  |
|---|--|
| <code>GatewayServices</code> <code>getGatewayServices()</code>                          | Static method that returns the <code>GatewayServices</code> object.                                |
| <code>boolean</code> <code>addEvent(CFEvent msg)</code>                                 | Sends a <code>CFEvent</code> instance to ColdFusion for dispatching to a listener CFC.             |
| <code>coldfusion.eventgateway.Logger</code><br><code>getLogger([String logfile])</code> | Returns a ColdFusion logger object that the event gateway can use to log information in a file.    |
| <code>int</code> <code>getMaxQueueSize()</code>   | Returns the maximum size of the ColdFusion event queue, as set in the ColdFusion MX Administrator. |
| <code>int</code> <code>getMaxQueueSize()</code>   | Returns the current size of the ColdFusion event queue that handles all messages for all gateways. |

---

# getGatewayServices

## Description

Static method that returns the GatewayServices object. Gateway code can call this method at any time, if required.

## Category

Event Gateway Development

## Syntax

```
GatewayServices getGatewayServices()
```

## See also

“GatewayServices class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The GatewayServices object.

## Usage

Gateway constructors can call this method to get a convenient reference to the GatewayServices class and its methods.

## Example

The following Socket gateway constructor code sets the GatewayServices variable:

```
public SocketGateway(String id)
{
    gatewayID = id;
    gatewayService = GatewayServices.getGatewayServices();
}
```

Calls to GatewayServices methods, such as the following, use the returned value.

```
boolean sent = gatewayService.addEvent(event);
```

# addEvent

## Description

Sends a CFEvent instance to ColdFusion for dispatching to a listener CFC.

## Category

Event Gateway Development

## Syntax

```
boolean addEvent(CFEvent msg)
```

## See also

[getMaxQueueSize](#), [getMaxQueueSize](#), “Responding to incoming messages” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| msg       | The CFEvent object containing the message to be queued for delivery to the listener CFC. |

## Returns

True if the event was added to the gateway services queue for delivery, false, otherwise. Therefore, a true response does not indicate that the message was delivered.

## Usage

The event gateway must use this method to send incoming messages to the application for processing.

## Example

The following example from the ColdFusion MX SocketGateway code sends an event to all listener CFCs:

```
for (int i = 0; i < listeners.length; i++) {
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCfcMethod(cfcEntryPoint);
    event.setCfcTimeOut(10);
    if (path != null)
        event.setCfcPath(path);
    boolean sent = gatewayService.addEvent(event);
    if (!sent)
        log.error("SocketGateway(" + gatewayID + ") Unable to put message on
            event queue. Message not sent from " + gatewayID + ", thread " +
            theKey + ". Message was " + theInput);
}
```

# getLogger

## Description

Returns a ColdFusion Logger object that the event gateway can use to log information in a file.

## Category

Event Gateway Development

## Syntax

```
coldfusion.eventgateway.Logger getLogger([String logfile])
```

## See also

[Logger class](#), “Logging events and using log files” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| logfile   | The name, without an extension, of a log file in the ColdFusion MX logs directory. ColdFusion MX automatically appends a .log extension to the name. If the file does not exist, ColdFusion MX creates it when it logs the first message. By default, ColdFusion logs to the eventgateway.log file. |

## Returns

A ColdFusion MX logger object to use in

## Usage

The Logger class has five methods: `debug`, `info`, `warn`, `error`, and `fatal`, that correspond to the severity level that is set in the log message. Each method takes a message string, a Throwable class object, or both.

If you pass a Throwable object to these methods, ColdFusion MX writes the exception information in the `exceptions.log` file.

## Example

The ColdFusion MX example `DirectoryWatcherGateway` includes the following line in the constructor to get a logger object:

```
// We create our own log file, which will be named "watcher.log"
logger = gatewayService.getLogger("watcher");
```

The following code, from the start of the routine that loads information from the configuration file, uses this object to log the initialization.

```
// Load the properties file to get our settings
protected void loadconfig() throws ServiceRuntimeException
{
    // load config
    logger.info("DirectoryWatcher (" + gatewayID + ") Initializing
        DirectoryWatcher gateway with configuration file " + config);
    .
    .
    .
}
```

# getMaxQueueSize

## Description

Returns the maximum size of the ColdFusion event queue, as set in the ColdFusion MX Administrator.

## Category

Event Gateway Development

## Syntax

```
int getMaxQueueSize()
```

## See also

[addEvent](#), [getQueueSize](#)

## Returns

The integer maximum number of messages that the gateway services queue can hold.

## Usage

If the queue length reaches this value, the `addEvent` method will not add its message to the processing queue. You can use this method and the `getQueueSize` method to control the rate of event queuing and to help diagnose any throughput problems in your gateways.

## Example

The following example logs the queue size, maximum queue size, and other information if a `gatewayService.addEvent` method fails to queue a message for delivery to a listener CFC. (It uses an internal method to construct the error message string.)

```
boolean sent = gatewayService.addEvent(cfmsg);
if (!sent)
{
    logger.error(RB.getString(this, "IMGateway.cantAddToQueue",
        gatewayType, gatewayID, ((path != null) ? path : "default"),
        Integer.toString(gatewayService.getQueueSize()),
        Integer.toString(gatewayService.getMaxQueueSize())));
}
```

# getQueueSize

## Description

Returns the current size of the ColdFusion event queue that handles all messages for all gateways.

## Category

Event Gateway Development

## Syntax

```
int getQueueSize()
```

## See also

[addEvent](#), [getMaxQueueSize](#)

## Returns

The integer number of messages in the gateway message queue that are waiting to be delivered to CFCs.

## Usage

You can use this method and the `getMaxQueueSize` method to control the rate of event queuing and to help diagnose any throughput problems in your gateways.

## Example

The following example logs the queue size, maximum queue size, and other information if a `gatewayService.addEvent` method fails to queue a message for delivery to a listener CFC. (It uses an internal method to construct the error message string.)

```
boolean sent = gatewayService.addEvent(cfmsg);
if (!sent)
{
    logger.error(RB.getString(this, "IMGateway.cantAddToQueue",
        gatewayType, gatewayID, ((path != null) ? path : "default"),
        Integer.toString(gatewayService.getQueueSize()),
        Integer.toString(gatewayService.getMaxQueueSize())));
}
```

## CFEvent class

`coldfusion.gateway.CFEvent`

The Gateway class sends and receives `CFEvent` instances to communicate with the ColdFusion listener CFC or application. The `CFEvent` instances correspond to [CFML CFEvent structures](#) that ColdFusion application listener CFC methods receive and contain the message structures that ColdFusion application code sends to the gateway.

- The Gateway notifies ColdFusion of a message by sending a `CFEvent` instance in `GatewayServices.addEvent` method.
- The Gateway receives a `CFEvent` instance when ColdFusion calls the gateway's `outgoingMessage` method.

The `CFEvent` Class extends the `java.util.Hashtable` class and has the following methods:

| Methods   | Description  |
|---|--|
| <code>CFEvent(String gatewayID)</code>  | <code>CFEvent</code> constructor.  |
| <code>String getGatewayID()</code>  | Returns the gateway ID (set in the <code>CFEvent</code> constructor).  |
| <code>void setCFCMethod(String method)</code><br><code>String getCFCMethod()</code>   | Sets or gets the name of the CFC method that receives an incoming message.   |
| <code>void setCFPath(String path)</code><br><code>String getCFPath()</code>           | Sets or gets the path to the application listener CFC that processes the event.  |
| <code>void setCFTimeout(String seconds)</code><br><code>String getCFTimeout()</code>  | Sets or gets the time-out, in seconds, for the listener CFC to process the event request.                              |
| <code>void setData(Map data)</code><br><code>Map getData()</code>                     | Sets or gets the event data structure, which contains the message contents and any other gateway-specific information. |
| <code>void setGatewayType(String type)</code><br><code>String getGatewayType()</code> | Sets or gets the event gateway type identifier, such as SMS.   |
| <code>void setOriginatorID(String id)</code><br><code>String getOriginatorID()</code> | Sets or gets the gateway- or protocol-specific Identity of the originator of a message.                                |

# CFEvent

## Description

CFEvent constructor.

## Category

Event Gateway Development

## Syntax

```
CFEvent(String gatewayID)
```

## See also

[getGatewayID](#), [“CFML CFEvent structure” on page 1004](#), [“CFEvent class” in Chapter 45](#), [“Creating Custom Event Gateways” in \*ColdFusion MX Developer’s Guide\*](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| gatewayID | The ID of the gateway. This parameter indicates the source of the message and must be the value that is passed in the Gateway constructor or set using the Gateway <code>setGatewayID</code> method. |

## Usage

This method creates a container for an event gateway message that you send to ColdFusion MX gateway services in a `gatewayServices.addEvent` method for delivery to a CFC listener method.

## Example

The following example, based on code for the ColdFusion asynchronous CFML gateway, sends a message to that the gateway has received to a CFC:

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    // Get the data
    Map data = cfmsg.getData();
    boolean status = true;
    if (data != null)
    {
        // create an event
        CFEvent event = new coldfusion.eventgateway.CFEvent(gatewayID);
        //set the event field values
        event.setGatewayType("CFMLGateway");
        event.setOriginatorID("CFMLGateway");
        event.setData(data);
        // send it to the event service
        status = gatewayService.addEvent(event);
    }
    return new Boolean(status).ToString();
}
```

# getCFCMethod

## Description

Gets the name of the CFC method that processes the message.

## Category

Event Gateway Development

## Syntax

```
String getCFCMethod()
```

## See also

[getCFCPath](#), [getCFCTimeout](#), [setCFCMethod](#), “CFML CFEvent structure” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

For incoming messages, the name of the method that gateway services will call in the listener CFC, as set by the [setCFCMethod](#) method. If [setCFCMethod](#) has not been called, returns null, and not `onIncomingMessge`, which ColdFusion gateway services uses by default. Outgoing messages that are returned by a CFC in response to an incoming message also have the CFC method name in this field if the gateway set the field on the incoming message.

## Usage

Most event gateways do not need to use this method. This method could be useful if a gateway sends messages to multiple CFC Methods and must determine which method is responding.

# getCFPath

## Description

Gets the path to the listener CFC that processes this message.

## Category

Event Gateway Development

## Syntax

```
String getCFPath()
```

## See also

[getCFMethod](#), [getCFTimeout](#), [setCFPath](#), “CFML CFEvent structure” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

An absolute path to the application listener CFC that will process the event, as set by the [setCFPath](#) method. If the [setCFPath](#) method has not been called, returns null, not the path specified in the ColdFusion Administrator and used by default by gateway services. Outgoing messages that are returned by a CFC in response to an incoming message also have the CFC method name in this field if the gateway set the field on the incoming message.

## Usage

Most event gateways do not need to use this method. This method could be useful if a gateway sends messages to multiple CFCs and must determine which CFC is responding.

# getCFCTimeout

## Description

Gets the time-out, in seconds, for the listener CFC to process the event request.

## Category

Event Gateway Development

## Syntax

```
String getCFCTimeout()
```

## See also

[getCFMethod](#), [getCFPath](#), [setCFCTimeout](#), “CFML CFEvent structure” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The listener CFC time-out, in seconds, as set by the [setCFCTimeout](#) method, or null.

## Usage

Most gateways do not need to use this function.

When ColdFusion calls a listener CFC method to process the event, and the CFC does not process the event in the specified time-out period, ColdFusion terminates the request and logs an error in application.log file. By default ColdFusion uses the Timeout Request value set on the Server Settings page in the ColdFusion MX Administrator.

# getData

## Description

Returns the data Map that contains the message contents and other gateway-specific information.

## Category

Event Gateway Development

## Syntax

```
Map getData()
```

## See also

[setData](#), “[CFML CFEvent structure](#)” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The event data structure, or null. This structure includes the message contents being passed by the gateway and any other gateway-specific information.

## Usage

The contents of the data Map depends on the event gateway type. Typical fields include the message contents, originator ID, destination ID, and if a gateway (such as the ColdFusion MX SMS gateway) supports multiple commands, the command.

**Note:** The returned Map object has case-insensitive keys.

## Example

The following `outgoingMessage` method from the `SocketGateway` example gateway gets the message contents from the `CFEvent` data field of an outgoing message. If the `CFEvent` object does not include an `OriginatorID` field, it also tries to get the originator ID from the data field.

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null)
        ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID())).
            writeOutput(message);
    else if (data.get("OriginatorID") != null)
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID"))).
            writeOutput(message);
    else {
        System.out.println("cannot send outgoing message. OriginatorID is not
            available.");
        retcode="failed";
    }
    return retcode;
}
```

# getGatewayID

## Description

Returns the gateway ID field of the CFEvent object.

## Category

Event Gateway Development

## Syntax

```
String getGatewayID(CFEvent event)
```

## See also

[CFEvent](#), [“CFML CFEvent structure” on page 1004](#), “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The gateway ID of the CFEvent object, or null.

## Usage

Most gateways do not need to use this method. The gateway ID is set in the CFEvent constructor and normally corresponds to the gateway that is handling the event.

# getGatewayType

## Description

Returns the gateway type field of the CFEvent object.

## Category

Event Gateway Development

## Syntax

```
String getGatewayType()
```

## See also

[setGatewayType](#), “[CFML CFEvent structure](#)” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The gateway type of the CFEvent object, or null.

## Usage

Most gateways do not need to use this method.

# getOriginatorID

## Description

Identifies the originator of an incoming message. Some gateway types also use this field for the destination of an outgoing message.

## Category

Event Gateway Development

## Syntax

```
String getOriginatorID()
```

## See also

[setOriginatorID](#), “[CFML CFEvent structure](#)” on page 1004, “[CFEvent class](#)” in Chapter 45, “[Creating Custom Event Gateways](#)” in *ColdFusion MX Developer’s Guide*

## Returns

The protocol-specific identifier of the message originator, or null.

## Example

The `outgoingMessage` method of the `SocketGateway` example gateway uses the `getOriginatorID` method to determine the destination of an outgoing message. This way, a listener CFC that sends a response back to the originator does not have to explicitly set a destination in the return variable. If the field is empty, (as it is in messages sent by the `CFML SendGatewayMessage` function) the gateway tries to get the destination from the `CFEvent` data field.

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null)
        ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID())).
            writeOutput(message);
    else if (data.get("OriginatorID") != null)
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID"))).
            writeOutput(message);
    else
    {
        System.out.println("cannot send outgoing message. OriginatorID is not
            available.");
        retcode="failed";
    }
    return retcode;
}
```

# setCFCMethod

## Description

Sets the name of the CFC method that will processes an incoming message.

## Category

Event Gateway Development

## Syntax

```
void setCFCMethod(String method)
```

## See also

[getCFCMethod](#), [setCFCPath](#), [setCFCTimeout](#), “CFML CFEvent structure” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| method    | The method in the listener CFC that ColdFusion will call to process this event. If you do not use this method in your gateway, ColdFusion invokes the <code>onIncomingMessage</code> method. |

## Usage

Gateways that use a single CFC listener method do not need to use this method if the listener CFC method is named `onIncomingMessage`. For the sake of consistency, Macromedia recommends that any event gateway with a single listener not override this default.

A gateway, such as the ColdFusion MX XMPP gateway, that uses different listener methods for different message types uses this method to identify the destination method.

## Example

The following example code comes from the ColdFusion XMPP gateway incoming message handler. It creates a CFEvent object and sets the method that will handle tests based on the message type.

```
CFEvent cfmsg = new CFEvent(gatewayID);
cfmsg.setOriginatorID(sender);
cfmsg.setGatewayType(gatewayType);
if(messageType == IMessage.IM)
{
    // default for normal messages
    cfmsg.setCfcMethod(onIncomingMessageFunction);
}
//if the message is an authorization request
else if(messageType == IMessage.AUTH_REQUEST)
{
    cfmsg.setCfcMethod(onAddBuddyRequestFunction);
    message = "Requesting authorization to add '" + recipient + "' to '"
+ sender + "' buddy list and view '" + recipient + "' presence.";
} // Code snipped here for brevity.
```

# setCFPath

## Description

Specifies the listener CFC that will process this event.

## Category

Event Gateway Development

## Syntax

```
void setCFPath(String path)
```

## See also

[getCFPath](#), [setCFMethod](#), [setCFTimeout](#), “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| path      | An absolute path to the application listener CFC that will process the event. If you do not call this method in your gateway, ColdFusion uses the first path configured for the event gateway instance on the Event Gateways page in the ColdFusion MX Administrator. |

## Usage

By default, ColdFusion delivers messages to the CFC in the first path configured for the event gateway instance on the Event Gateways page in the ColdFusion MX Administrator.

If your application supports multiple listener CFCs, use this method to set each listener CFC and then call the `gatewayService.addEvent` method to send the event to the CFC.

## Example

The following example code is based on the Socket gateway `processInput` method that takes input from the socket and sends it to the CFC listener methods. The `listeners` variable contains an array of listener CFCs and is set by the gateway’s `setCFListeners` method, which ColdFusion calls when it starts the gateway.

```
for (int i = 0; i < listeners.length; i++)
{
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCFMethod(cfcEntryPoint);
    event.setCFTimeout(10);
    if (path != null)
        event.setCFPath(path);boolean sent = gatewayService.addEvent(event);
}
```

# setCFCTimeout

## Description

Sets the time-out, in seconds, during which the listener CFC must process the event request and return before ColdFusion gateway services terminates the request.

## Category

Event Gateway Development

## Syntax

```
void setCFCTimeout(String timeout)
```

## See also

[getCFCTimeout](#), [setCFMethod](#), [setCFPath](#), “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| timeout   | The CFC time-out period, in seconds. |

## Usage

When ColdFusion calls a listener CFC method to process the event, and the CFC does not return in the specified time-out period, ColdFusion terminates the request and logs an error in the application.log file.

If you do not use this method, ColdFusion uses the Timeout Request value set on the Server Settings page in the ColdFusion MX Administrator.

Use this method if your messages require a longer or shorter time-out period than standard ColdFusion MX HTML requests.

## Example

The following example code is based on the Socket gateway processInput method that takes input from the socket and sends it to the CFC listener methods. It sets the CFC time-out to 10 seconds.

```
for (int i = 0; i < listeners.length; i++)
{
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCfcMethod(cfcEntryPoint);
    event.setCfcTimeOut(10);
    if (path != null)
        event.setCfcPath(path);
    boolean sent = gatewayService.addEvent(event);
}
```

# setData

## Description

Adds the gateway-specific data, including any message contents, as a Java Map to the CFEvent object

## Category

Event Gateway Development

## Syntax

```
void setData(Map data)
```

## See also

[getData](#), [“CFML CFEvent structure” on page 1004](#), [“CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in \*ColdFusion MX Developer’s Guide\*](#)

## Parameters

| Parameter | Description  |
|-----------|--|
| data      | The incoming message and any additional gateway-specific event data. |

## Usage

The number of fields and their contents depend on the event gateway type. The Map keys must be strings.

Because Coldfusion is not case sensitive, it converts the Map passed in the setData method to a case insensitive Map. As a result, do not create entries in the data with names that differ only in case.

## Example

The following code shows the routine from the example JMS gateway that handles incoming messages. It puts the JMS message ID and contents in a data HashMap, and uses it in the setData method:

```
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + "' to queue.");
    } else {
        log.error("Failed to add message '" + msgID + "' to queue.");
    }
}
```

# setGatewayType

## Description

Identifies the type of event gateway.

## Category

Event Gateway Development

## Syntax

```
void setGatewayType(String gatewayType)
```

## See also

## Parameters

| Parameter   | Description                |
|-------------|----------------------------|
| gatewayType | A gateway type identifier. |

[getGatewayType](#), “CFML CFEvent structure” on page 1004, “CFEvent class” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Usage

For the sake of consistency, use the same name in this method and in the Type Name field when you add the event gateway type in the ColdFusion MX Administrator. Gateway application CFCs that handle multiple gateway types, such as those in an instant messaging application that handles multiple instant messaging providers, could use this field to determine the protocol type and any gateway type-specific actions.

## Example

The following code shows the routine from the example JMS gateway that handles incoming messages. It sets the gateway type to JMS:

```
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + "' to queue.");
    } else {
        log.error("Failed to add message '" + msgID + "' to queue.");
    }
}
```

# setOriginatorID

## Description

Identifies the originator of an incoming message.

## Category

Event Gateway Development

## Syntax

```
void setOriginatorID(String originatorID)
```

## See also

[getOriginatorID](#), “[CFML CFEvent structure](#)” on page 1004, “CFEvent class” in Chapter 45, “[Creating Custom Event Gateways](#)” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter    | Description  |
|--------------|--|
| originatorID | The gateway or protocol-specific ID of the message originator. |

## Example

The following code shows the routine from the example JMS gateway that handles incoming messages. It sets the originator ID to the name of the JMS topic that the gateway handles:

```
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + "' to queue.");
    } else {
        log.error("Failed to add message '" + msgID + "' to queue.");
    }
}
```

## Logger class

`coldfusion.eventgateway.Logger`

**Note:** This class is in the `coldfusion.log` package, not the `coldfusion.eventgateway` package, which contains all other event gateway-related interfaces and classes.

The `Logger` class logs messages to a file in the ColdFusion logs directory. (You set this directory on the ColdFusion MX Administrator Logging Settings page.) The

`coldfusion.eventgateway.GatewayServices.getLogger()` method returns an instance of the `Logger` class. The `Logger` class has the following methods:

| Signature          | Description                                      |
|--------------------|--|
| <code>debug</code> | Writes a debugging message to the log file.      |
| <code>error</code> | Writes an error message to the log file.         |
| <code>fatal</code> | Writes a fatal error to the log file.            |
| <code>info</code>  | Writes an informational message to the log file. |
| <code>warn</code>  | Writes a warning message to the log file.        |

# debug

## Description

Writes a log entry with a debugging severity to the ColdFusion MX logger. The entry includes the severity, thread ID, date, time, and a text message.

## Category

Event Gateway Development

## Syntax

```
debug(String message)
debug(Throwable th)
debug(String message, Throwable th)
```

## See also

[error](#), [fatal](#), [info](#), [warn](#), [getLogger](#), “Logging events and using log files” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| message   | The message to include in the log entry.   |
| th        | A throwable object, normally an exception. ColdFusion MX logs the exception information in the exception.log file in the ColdFusion MX logs directory. |

## Usage

Use this method to send a debugging message to the ColdFusion MX logging subsystem.

By default, ColdFusion does **not** write debugging messages to the log file. To have debug messages appear in the log file, change the priority entry in *cf\_root*\lib\neo-logging.xml (in the server configuration) or *cf\_root*\WEB-INF\cfusion\lib\neo-logging.xml (in the J2EE configuration). Change the following entry:

```
<var name='priority'>
  <string>information</string>
</var>
```

to the following:

```
<var name='priority'>
  <string>debug</string>
</var>
```

With debug priority, ColdFusion MX writes messages with a severity of “debug” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

## Example

The ColdFusion MX instant messaging gateways use the following line to log information about incoming administrative messages or errors only when debugging priority is on.

```
// code to process incoming administrative messages or errors
logger.debug(gatewayType + "Gateway (" + gatewayID + ") admin message: " +
  msg.getMessage());
```

## error

### Description

Writes a log entry with an error severity to the ColdFusion MX logger. The entry includes the severity, thread ID, date, time, and a text message.

### Category

Event Gateway Development

### Syntax

```
error(String message)
error(Throwable th)
error(String message, Throwable th)
```

### See also

[debug](#), [fatal](#), [info](#), [warn](#), [getLogger](#), “Logging events and using log files” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

### Parameters

| Parameter | Description  |
|-----------|--|
| message   | The message to include in the log entry.   |
| th        | A throwable object, normally an exception. ColdFusion MX logs the exception information in the exception.log file in the ColdFusion MX logs directory. |

### Usage

Use this method to send an error message to the ColdFusion MX logging subsystem. ColdFusion MX will write a messages with a severity of “error” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

### Example

The ColdFusion MX example `SocketGateway` class includes the following code in the `outgoingMessage` method. It writes an error message if the message’s originator ID does not correspond to an open socket.

```
SocketServerThread st =
    ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID()));
if(st != null)
    st.writeOutput(message);
else {
    log.error("Cannot send outgoing message. OriginatorID '" +
        cfmsg.getOriginatorID() + "' is not a valid socket id.");
    retcode="failed";
}
```

# fatal

## Description

Writes a log entry with a fatal severity to the ColdFusion MX logger. The entry includes the severity, thread ID, date, time, and a text message.

## Category

Event Gateway Development

## Syntax

```
fatal(String message)
fatal(Throwable th)
fatal(String message, Throwable th)
```

## See also

[debug](#), [error](#), [info](#), [warn](#), [getLogger](#), “Logging events and using log files” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| message   | The message to include in the log entry.   |
| th        | A throwable object, normally an exception. ColdFusion MX logs the exception information in the exception.log file in the ColdFusion MX logs directory. |

## Usage

Use this method to send a fatal error message to the ColdFusion MX logging subsystem. ColdFusion MX will write a messages with a severity of “fatal” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

# info

## Description

Writes a log entry with an information severity to the ColdFusion MX logger. The entry includes the severity, thread ID, date, time, and a text message.

## Category

Event Gateway Development

## Syntax

```
info(String message)
info(Throwable th)
info(String message, Throwable th)
```

## See also

[debug](#), [error](#), [fatal](#), [warn](#), [getLogger](#), “Logging events and using log files” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| message   | The message to include in the log entry.   |
| th        | A throwable object, normally an exception. ColdFusion MX logs the exception information in the exception.log file in the ColdFusion MX logs directory. Not normally used with this method. |

## Usage

Use this method to send an informational message to the ColdFusion MX logging subsystem. ColdFusion MX will write a messages with a severity of “information” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

ColdFusion normally logs all information severity messages, so you should not use this severity for debugging messages or for events that happen frequently.

## Example

The ColdFusion MX example `DirectoryWatcherGateway` class includes the following line at the top of its `loadconfig` method that loads the gateway’s configuration file. It writes a message including the gateway ID and configuration file.

```
logger.info("DirectoryWatcher (" + gatewayID + ") Initializing
DirectoryWatcher gateway with configuration file " + config);
```

# warn

## Description

Writes a log entry with a warning severity to the ColdFusion MX logger. The entry includes the severity, thread ID, date, time, and a text message.

## Category

Event Gateway Development

## Syntax

```
warn(String message)
warn(Throwable th)
warn(String message, Throwable th)
```

## See also

[debug](#), [error](#), [fatal](#), [info](#), [getLogger](#), “Logging events and using log files” in Chapter 45, “Creating Custom Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| message   | The message to include in the log entry.   |
| th        | A throwable object, normally an exception. ColdFusion MX logs the exception information in the exception.log file in the ColdFusion MX logs directory. |

## Usage

Use this method to send a warning message to the ColdFusion MX logging subsystem. ColdFusion MX will write a messages with a severity of “warning” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

## Example

The ColdFusion MX example `SocketWatcherGateway` class includes the following code in its constructor to load a configuration file. If it cannot load the file, it converts the exception information to a string and logs a warning that includes the gateway ID, and the exception information. It also passes the exception to the `warn` method

```
propsFilePath=configpath;
try {
    FileInputStream propsFile = new FileInputStream(propsFilePath);
    properties.load(propsFile);
    propsFile.close();
    this.loadProperties();
}
catch (IOException e) {
    // do nothing. use default value for port.
    log.warn("SocketGateway(" + gatewayID + ") Unable to read configuration file
        " + propsFilePath + ": " + e.toString() + ". Using default port.", e);
}
```

## CFML CFEvent structure

The CFML listener CFC methods receive messages in the form of a CFEvent structure that corresponds to the [CFEvent class](#) that gateway developers use. This structure has the following fields. Some of the fields might not be used by all gateways. All fields contain text or numeric values except the Data field, which contains a structure.

---

| Field        | Description   |
|--------------|---|
| GatewayID    | The event gateway that sent the event or will handle the outgoing message. The value is the ID of an event gateway instance configured on the ColdFusion MX Administrator Gateways page. If the application calls the <a href="#">SendGatewayMessage</a> function to respond to the event gateway, it uses this ID as the function's first parameter. |
| Data         | A structure containing the event data, including the message. The Data structure contents depend on the event gateway type. This field corresponds to the <a href="#">SendGatewayMessage</a> function's second parameter.   |
| OriginatorID | The originator of the message. The value depends on the protocol or event gateway type. Some event gateways might require this value in response messages to identify the destination of the response. Identifies the sender of the message.  |
| GatewayType  | The type of event gateway, such as SMS. An application that can process messages from multiple event gateway types can use this field. This value is the gateway type name that is specified by the event Gateway class. It is not necessarily the same as the gateway type name in the ColdFusion MX Administrator.                                  |
| CFPath       | The location of the listener CFC. The listener CFC does not need to use this field.   |
| CFMethod     | The listener method that ColdFusion invokes to process the event. The listener CFC does not need to use this field.   |
| CFTimeout    | The time-out, in seconds, for the listener CFC to process the event request. The listener CFC does not need to use this field.  |

---

## IM gateway methods and commands

The XMPP and IBM Sametime gateways implement CFC methods to receive messages, use the gatewayHelper object methods to manage the gateway, and use outgoing message commands to send messages. The following sections describe these methods and commands:

- [IM Gateway CFC incoming message methods](#)
- [IM gateway message sending commands](#)
- [IM Gateway GatewayHelper class methods](#)

## IM Gateway CFC incoming message methods

You write the following CFC methods to handle incoming messages from an XMPP or Lotus Sametime instant messaging gateway.

**Note:** The method names assume a default gateway configuration. ColdFusion lets you change the method names and disable event types in the gateway configuration file.

---

| <b>Method</b>                      | <b>Message type</b>  |
|------------------------------------|--|
| <a href="#">onAddBuddyRequest</a>  | Requests from other IM users to add the gateway ID as their buddy  |
| <a href="#">onAddBuddyResponse</a> | Responses from others to requests from your gateway to add them to your buddy lists. Also used by buddies to ask to be removed from your list. |
| <a href="#">onBuddyStatus</a>      | Online status information messages   |
| <a href="#">onIMServerMessage</a>  | Error and administrative messages from the IM server   |
| <a href="#">onIncomingMessage</a>  | Instant messages   |

---

# onAddBuddyRequest

## Description

Handles incoming requests for users to add the gateway user name as one of their buddies.

## Syntax

```
onAddBuddyRequest(CFEvent)
```

## See also

[onIncomingMessage](#), [onAddBuddyResponse](#), [onBuddyStatus](#), [onIMServerMessage](#)

## Parameters

The method must take one parameter, a CFEvent structure with the following fields:

| Field          | Description  |
|----------------|--|
| gatewayType    | Gateway type, either XMPP or SAMETIME  |
| gatewayID      | The ID of the gateway instance, as configured in ColdFusion MX Administrator |
| originatorID   | The IM ID of the message originator  |
| cfcMethod      | This CFC method; by default, onAddBuddyRequest.                              |
| data.MESSAGE   | The message that was sent with the request                                   |
| data.SENDER    | The sender's ID; identical to the originatorID field value                   |
| data.RECIPIENT | The recipient's ID, as specified in the gateway's configuration file         |
| data.TIMESTAMP | The date and time when the message was sent                                  |

## Returns

The function can optionally return a value to send a response message. The return structure must contain the following fields:

| Field   | Description   |
|---------|---|
| command | One of the following: <ul style="list-style-type: none"><li>• <code>accept</code> Accept the request to add you as a buddy. ColdFusion adds the user to the permit list of users that can get status information.</li><li>• <code>decline</code> Deny request to add you as a buddy. ColdFusion adds the user to the deny list of users that can get status information.</li><li>• <code>noact</code> Take no action. ColdFusion does not respond to the requestor.</li></ul> |
| buddyID | ID to which to send the message. Normally, the value of the CFEvent.data.SENDER field. Not used with the <code>noact</code> command.  |
| reason  | A text message describing the reason for the action. Not used with the <code>noact</code> command.  |

## Example

The following example searches for the requested buddy's name in a data source and, if it finds a unique entry, adds the buddy and updates the buddy's status information in an Application scope buddyStatus structure. If it doesn't find the name, it declines the buddy. If there are multiple entries for the buddy name in the database, it tells the gateway not to respond. It logs all actions.

```
<cffunction name="onAddBuddyRequest">
  <cfargument name="CFEvent" type="struct" required="YES">
  <cfquery name="buddysearch" datasource="cfdoexamples">
    select IM_ID
    from Employees
    where IM_ID = '#CFEvent.Data.SENDER#'
  </cfquery>
  <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
    <cfscript>
      // If the name is in the DB once, accept; if it is missing, decline.
      // If it is in the DB multiple times, take no action.
      if (buddysearch.RecordCount IS 0) {
        action="decline";
        reason="Invalid ID";
      }
      else if (buddysearch.RecordCount IS 1) {
        action="accept";
        reason="Valid ID";
        //Add the buddy to the buddy status structure only if accepted.
        if (NOT StructKeyExists(Application,
          "buddyStatus")) {
          Application.buddyStatus=StructNew();
        }
        if (NOT StructKeyExists(Application.buddyStatus,
          CFEvent.Data.SENDER)) {
          Application.buddyStatus[#CFEvent.Data.SENDER#]=StructNew();
        }
        Application.buddyStatus[#CFEvent.Data.SENDER#].status=
          "Accepted Buddy Request";
        Application.buddyStatus[#CFEvent.Data.SENDER#].timeStamp=
          CFEvent.Data.TIMESTAMP;
        Application.buddyStatus[#CFEvent.Data.SENDER#].message=
          CFEvent.Data.MESSAGE;
      }
      else {
        action="noact";
      }
    </cfscript>
  </cflock>
  <!-- Log the request and decision information. -->
  <cflog file="#CFEvent.GatewayID#Status"
    text="onAddBuddyRequest; SENDER: #CFEvent.Data.SENDER# MESSAGE:
    #CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP# ACTION: #action#">
  <!-- Return the action decision. -->
  <cfset retValue = structNew()>
  <cfset retValue.command = action>
  <cfset retValue.BuddyID = CFEvent.DATA.SENDER>
```

```
<cfset retValue.Reason = reason>  
<cfreturn retValue>  
</cffunction>
```

# onAddBuddyResponse

## Description

Handles incoming responses from other users to requests from the gateway to be added to their buddy lists. Also receives requests from buddies to have you remove them from your buddy list.

## Syntax

```
onAddBuddyResponse(CFEvent)
```

## See also

[onIncomingMessage](#), [onAddBuddyRequest](#), [onBuddyStatus](#), [onIMServerMessage](#)

## Parameters

The method must take one parameter, a CFEvent structure with the following fields:

| Field          | Description  |
|----------------|--|
| gatewayType    | Gateway type, either XMPP or SAMETIME.   |
| gatewayID      | The ID of the gateway instance, as configured in ColdFusion MX Administrator.  |
| originatorID   | The IM ID of the message originator.   |
| cfcMethod      | This CFC method; by default, onAddBuddyResponse.   |
| data.MESSAGE   | One of the following: <ul style="list-style-type: none"><li>• accept The request was accepted.</li><li>• decline The request was declined, or the buddy is asking you to remove them from your list.</li></ul> |
| data.SENDER    | The sender's ID; identical to the originatorID.  |
| data.RECIPIENT | The recipient's ID, as specified in the gateway's configuration file.  |
| data.TIMESTAMP | The date and time when the message was sent.   |

## Returns

The function does not return a value.

## Example

The following example adds the buddy's status to the Application scope buddyStatus structure if the message sender accepted an add buddy request. It logs all responses.

```
<cffunction name="onAddBuddyResponse">
  <cfargument name="CFEvent" type="struct" required="YES">
  <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
    <cfscript>
      //Do the following only if the buddy accepted the request.
      if (NOT StructKeyExists(Application, "buddyStatus")) {
        Application.buddyStatus=StructNew();
      }
      if (#CFEVENT.Data.MESSAGE# IS "accept") {
        //Create a new entry in the buddyStatus record for the buddy.
        if (NOT StructKeyExists(Application.buddyStatus,
          CFEVENT.Data.SENDER)) {
```

```

        Application.buddyStatus[#CFEvent.Data.SENDER#]=StructNew();
    }
    //Set the buddy status information to indicate buddy was added.
    Application.buddyStatus[#CFEvent.Data.SENDER#].status=
        "Buddy accepted us";
    Application.buddyStatus[#CFEvent.Data.SENDER#].timeStamp=
        CFEvent.Data.TIMESTAMP;
    Application.buddyStatus[#CFEvent.Data.SENDER#].message=
        CFEvent.Data.MESSAGE;
    }
</cfscript>
</cflock>
<!-- Log the information for all responses. --->
<cflog file="#CFEvent.GatewayID#Status"
    text="onAddBuddyResponse; BUDDY: #CFEvent.Data.SENDER# RESPONSE:
#CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP#">
</cffunction>

```

# onBuddyStatus

## Description

Handles incoming messages indicating online status (presence) changes of users on the gateway's buddy list.

## Syntax

```
onBuddyStatus(CFEvent)
```

## See also

[onIncomingMessage](#), [onAddBuddyRequest](#), [onAddBuddyResponse](#), [onIMServerMessage](#)

## Parameters

The method must take one parameter, a CFEvent structure with the following fields:

| Field                  | Description  |
|------------------------|--|
| gatewayType            | Gateway type, either XMPP or SAMETIME.   |
| gatewayID              | The ID of the Gateway instance, as configured in ColdFusion MX Administrator.  |
| originatorID           | The IM ID (buddy name) of the message originator.  |
| cfcMethod              | This CFC method; by default, onIMServerMessage.  |
| data.BUDDYNAME         | The sender's buddy name, or ID; identical to the originatorID.   |
| data.BUDDYNICK<br>NAME | The buddy's display name or nickname.  |
| data.BUDDYSTATUS       | The buddy's status; one of the following: <ul style="list-style-type: none"><li>• ONLINE</li><li>• OFFLINE</li><li>• AWAY</li><li>• DO NOT DISTURB</li></ul> XMPP only <ul style="list-style-type: none"><li>• NOT AVAILABLE</li><li>• FREE TO CHAT</li></ul> Sametime only <ul style="list-style-type: none"><li>• IDLE</li></ul> Use the IMGatewayHelper getCustomAwayMessage method to get any custom message that the buddy sent when changing status. |
| data.BUDDYGROUP        | The group that the buddy belongs to.   |
| data.RECIPIENT         | The recipient's ID, as specified in the gateway's configuration file.  |
| data.TIMESTAMP         | The date and time when the message was sent.   |

**Note:** You configure the buddy's nickname and group when you use the gatewayHelper object addBuddy method to add a buddy.

## Returns

The function does not return a value.

## Example

The following example keeps an Application scope structure up-to-date with a buddy's status. It also uses the gatewayhelper object getBuddyStatus method to get the buddy's custom away message, if any.

```
<cffunction name="onBuddyStatus">
  <cfargument name="CFEvent" type="struct" required="YES">
  <!--- Get the gatewayhelper object and to get the info for this buddy. --->
  <!--- This is used to get the buddy's custom away message. --->
  <cfset helper = getGatewayHelper("MYIM")>
  <cfset mybuddyinfo=helper.getBuddyInfo(CFEvent.Data.BUDDYNAME)>

  <cflog file="#CFEvent.GatewayID#Status" type="Information"
    text="in OnbuddyStatus, sender is #CFEvent.OriginatorID#">
  <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
    <cfscript>
      // Create the status structures if they don't exist.
      if (NOT StructKeyExists(Application, "buddyStatus")) {
        Application.buddyStatus=StructNew();
      }
      if (NOT StructKeyExists(Application.buddyStatus,
        CFEvent.Data.BUDDYNAME)) {
        Application.buddyStatus[#CFEvent.Data.BUDDYNAME#]=StructNew();
      }
      // Save the buddy status, timestamp, and custom away message
      Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status=
        CFEvent.Data.BUDDYSTATUS;
      Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timeStamp=
        CFEvent.Data.TIMESTAMP;
      // The following assumes that the buddy is in only one group.
      Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].customAway=
        mybuddyinfo[1].BUDDYCUSTOMAWAYMESSAGE;
    </cfscript>
  </cflock>
  <!--- log the info, for debugging purposes only --->
  <cfset temp=Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status>
  <cflog file="#CFEvent.GatewayID#Status" type="Information" text=
    "Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status is #temp#">
  <cfset temp=Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timeStamp>
  <cflog file="#CFEvent.GatewayID#Status" type="Information" text=
    "Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timestamp is #temp#">
  <cflog file="#CFEvent.GatewayID#Status" type="Information" text=
    "Buddy Custom Away Message is mybuddyinfo[1].BUDDYCUSTOMAWAYMESSAGE#">
</cffunction>
```

# onIMServerMessage

## Description

Handles incoming error and status messages from the IM server.

## Syntax

```
onIMServerMessage(CFEvent)
```

## See also

[onIncomingMessage](#), [onAddBuddyRequest](#), [onAddBuddyResponse](#), [onBuddyStatus](#)

## Parameters

This method must take one parameter, a CFEvent structure with the following fields:

| Field          | Description  |
|----------------|--|
| gatewayType    | Gateway type, either XMPP or SAMETIME  |
| gatewayID      | The ID of the gateway instance, as configured in ColdFusion MX Administrator |
| originatorID   | The IM ID (buddy name) of the message originator                             |
| cfcMethod      | This CFC method; by default, onIMServerMessage                               |
| data.MESSAGE   | The message sent by the server   |
| data.SENDER    | The sender's ID; identical to the originatorID                               |
| data.RECIPIENT | The recipient's ID, as specified in the gateway's configuration file         |
| data.TIMESTAMP | The date and time when the message was sent                                  |

## Example

The following example logs the sender, message, and a timestamp when an IM server sends an error or status message:

```
<cffunction name="onIMServerMessage">
  <!--- This function just logs the message. --->
  <cfargument name="CFEvent" type="struct" required="YES">
  <cflog file="#CFEvent.GatewayID#Status"
    text="onIMServerMessage; SENDER: #CFEvent.OriginatorID# MESSAGE:
#CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP#">
</cffunction>
```

# onIncomingMessage

## Description

Handles incoming instant messages from other users. Optionally returns a response to the message sender.

## Syntax

```
onIncomingMessage(CFEvent)
```

## See also

[onAddBuddyRequest](#), [onAddBuddyResponse](#), [onBuddyStatus](#), [onIMServerMessage](#), “Handling incoming messages” and “Sample IM message handling application” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

The method must take one parameter, a CFEvent structure with the following fields:

| Field          | Description  |
|----------------|--|
| gatewayType    | Gateway type, either XMPP or SAMETIME.                                       |
| gatewayID      | The ID of the Gateway instance as configured in ColdFusion MX Administrator. |
| originatorID   | The IM ID of the message originator.   |
| cfcMethod      | This CFC method; by default, onIncomingMessage.                              |
| data.MESSAGE   | The message that was received.   |
| data.SENDER    | The sender’s ID; identical to the originatorID                               |
| data.RECIPIENT | The recipient’s ID, as specified in the gateway’s configuration file         |
| data.TIMESTAMP | The date and time when the message was sent                                  |

## Returns

The function can optionally return a value to send a response message. The return structure must contain the following fields:

| Field   | Description  |
|---------|--|
| command | Normally omitted. You can also specify submit.   |
| buddyID | ID to which to send the message. Normally, the value of the input parameter’s Data.SENDER field. |
| message | The message contents.  |

## Example

The following example shows a simple onIncomingMessage method that echoes a message back to the sender.

```
<cffunction name="onIncomingMessage">  
  <cfargument name="CFEvent" type="struct" required="YES">  
  <cfset input_mesg = CFEvent.data.MESSAGE>
```

```
<cfset retVal = structNew()>
<cfset retVal.command = "submit">
<cfset retVal.buddyID = CFEvent.originatorID>
<cfset retVal.message = "Message Received:" & input_mesg>
<cfreturn retVal>
</cffunction>
```

## IM gateway message sending commands

You use the `SendGatewayMessage` CFML function or the return value of a CFC listener method to send outgoing messages. The ColdFusion MX 7 IM gateway accepts the following outgoing message commands:

| Command | Description   |
|---------|---|
| submit  | (Default) Sends a normal message to another IM user.  |
| accept  | Accepts an add buddy request. Adds the buddy to the list of IDs that get your presence information and sends an acceptance message to the buddy ID.             |
| decline | Declines an add buddy request and sends a rejection message to the buddy ID.  |
| noact   | Tells the gateway to take no action. The gateway logs a message that indicates that it took no action, and contains the gateway type, gateway ID, and buddy ID. |

The message structure that you return in the gateway listener CFC function or use as the second parameter in the CFML `SendGatewayMessage` function can have the following fields. The table lists the fields and the commands in which they are used, and describes the field's use.

| Field   | Commands           | Description   |
|---------|--------------------|---|
| buddyID | All                | The destination user ID   |
| command | All                | The command; defaults to submit if omitted  |
| message | submit             | A text message to send to the destination user  |
| reason  | accept,<br>decline | A text description of the reason for the action or other message to send to the add buddy requestor |

In typical use, a ColdFusion application uses the `accept`, `decline`, and `noact` commands in the return value of the `onAddBuddyRequest` method, and uses the `submit` command (or `no` command, because `submit` is the default command) in `SendGatewayMessage` CFML functions and the return value of the `onIncomingMessage` CFC method.

## IM Gateway GatewayHelper class methods

The GatewayHelper class returned by the CFML `GetGatewayHelper` function includes the following methods:

---

|                                   |                              |                                       |                            |
|-----------------------------------|------------------------------|---------------------------------------|----------------------------|
| <code>addBuddy</code>             | <code>getDenyList</code>     | <code>getStatusAsString</code>        | <code>removeDeny</code>    |
| <code>addDeny</code>              | <code>getName</code>         | <code>getStatusTimeStamp</code>       | <code>removePermit</code>  |
| <code>addPermit</code>            | <code>getNickName</code>     | <code>isOnline</code>                 | <code>setNickName</code>   |
| <code>getBuddyInfo</code>         | <code>getPermitList</code>   | <code>numberOfMessagesReceived</code> | <code>setPermitMode</code> |
| <code>getBuddyList</code>         | <code>getPermitMode</code>   | <code>numberOfMessagesSent</code>     | <code>setStatus</code>     |
| <code>getCustomAwayMessage</code> | <code>getProtocolName</code> | <code>removeBuddy</code>              |                            |

---

# addBuddy

## Description

Adds a buddy to the buddy list for the gateway user ID and asks to have the IM server send messages with the buddy's online presence state to the gateway.

## Syntax

```
Boolean = addBuddy(name, nickname, group)
```

## See also

[getBuddyInfo](#), [getBuddyList](#), [removeBuddy](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| name      | The unique instant messaging user name for the person about whom you want to receive periodic status messages.   |
| nickname  | The nickname that the application can use to refer to the user.  |
| group     | The name of the group you wish to add the user to in your Buddy List. If the group specified does not exist, it will be created. If the group parameter is the empty string, the gateway uses the General group. |

## Returns

True if the ID was added to the gateway's buddy list; False, otherwise.

## Usage

This method adds the buddy to the buddy list for the gateway's ID and sends a subscription request (to automatically get presence information about the buddy's online status) to the remote buddy. It does not wait for a response from the buddy, so it returns True (and the gateway adds the buddy to the list) even if the buddy denies the subscription request. Use the listener CFC [onAddBuddyResponse](#) method to monitor the buddy's response. If the CFEvent.data.MESSAGE field value is decline, the listener method can call the gatewayHelper object `removeBuddy` method to remove the buddy from the buddy list.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# addDeny

## Description

Tells the IM server to add the specified user to the deny list for the gateway's user ID. If the gateway's permit mode value is DENY\_SOME, the specified user cannot receive messages on the gateway's presence state.

## Syntax

```
Boolean = addDeny(name, nickname, group)
```

## See also

[addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer's Guide*

## Parameters

| Parameter | Description  |
|-----------|--|
| name      | The unique instant messaging user name for the person about whom you want to deny access to status messages.   |
| nickname  | The nickname that the application can use to refer to the user. Can be the empty string.   |
| group     | The name of the group that you want to add the user to in your buddy list. If the group specified does not exist, it is created. If the group parameter is the empty string, the gateway uses the General group. |

## Returns

True if the ID was added to the deny list; False, otherwise.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns False.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# addPermit

## Description

Tells the IM server to add the specified user to the permit list for the gateway's user ID. If the gateway's permit mode is PERMIT\_SOME, the specified user receive messages on the gateway's presence state.

## Syntax

```
Boolean = addPermit(name, nickname, group)
```

## See also

[addDeny](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | The unique instant messaging user name for the person about whom you want to deny access to status messages.  |
| nickname  | The nickname that the application can use to refer to the user. Can be the empty string.  |
| group     | The name of the group you want to add the user to in your Buddy List. If the group specified does not exist, it is created. If the group parameter is the empty string, the gateway uses the General group. |

## Returns

True if the ID was added to the permit list; false, otherwise.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns False.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# getBuddyInfo

## Description

Gets information about the specified user from the buddy list, deny list, and permit list.

## Syntax

```
array = getBuddyInfo(name)
```

## See also

[addBuddy](#), [getBuddyList](#), [removeBuddy](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | The unique instant messaging user name for the person about whom you want to get information. |

## Returns

An array of structures, with one structure for each information record found. The method finds one record for each group that the user belongs to in each of the lists (buddy, permit, deny) that contains the specified name. Each structure has the following fields. Some fields might not be meaningful for some IM protocols. If there is no information for a field, it is blank.

| Field           | Description  |
|-----------------|--|
| BUDDYNAME       | The user’s unique ID.  |
| BUDDYGROUP      | The group to which the user belongs.   |
| BUDDYNICKNAME   | The nickname that you have assigned to the user.   |
| BUDDYPROTOCOL   | The instant messaging protocol. JABBER (for XMPP) or SAMETIME, or an empty string (if the server did not return a value).  |
| BUDDYSTATUS     | The user’s presence state, can be any of the following: <ul style="list-style-type: none"><li>• ONLINE</li><li>• OFFLINE</li><li>• AWAY</li><li>• DND (displays as DO NOT DISTURB)</li></ul> XMPP only <ul style="list-style-type: none"><li>• NA (displays as NOT AVAILABLE)</li><li>• FREE_TO_CHAT (displays as FREE TO CHAT)</li></ul> Sametime only <ul style="list-style-type: none"><li>• IDLE</li></ul> |
| BUDDYSIGNONTIME | The date and time when the user signed onto the IM server. Empty if the user is not currently signed on. Always an empty string for XMPP and Sametime.   |
| BUDDYSTATUSTIME | The date and time when the user’s status most recently changed.  |

| Field                      | Description   |
|----------------------------|---|
| BUDDYCUSTOM<br>AWAYMESSAGE | The custom away message that the user has set to explain the current status, if any.  |
| BUDDYOWNER                 | A string representing the client and protocol associated with this ID, in the format <i>client@protocol</i> .   |
| BUDDYLISTTYPE              | The type of list that this buddy record is in; one of the following: <ul style="list-style-type: none"> <li>• BUDDY_LIST The list of users whose presence status information the gateway can receive.</li> <li>• DENY_LIST The list of users who cannot get presence information about the gateway ID.</li> <li>• PERMIT_LIST The list of users who can send presence information messages to the gateway ID.</li> <li>• REVERSE_LIST The list of users who do not allow messages to us.</li> </ul> |
| BUDDYIDLETIME              | If the buddy status is IDLE, how long the buddy has been idle. Always 0 for XMPP or SameTime.   |
| BUDDYISMOBILE              | True or False, indicating whether the user is on a mobile device. Always False for XMPP or SameTime.  |
| BUDDYWARNING<br>PERCENT    | The user's warning percentage value. Always 0 for XMPP or SameTime.   |

### Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods. For an example of using this method to get the buddy custom away message, see [onBuddyStatus](#).

# getBuddyList

## Description

Gets the buddy list for the gateway's user ID.

## Syntax

```
array = getBuddyList()
```

## See also

[addBuddy](#), [getBuddyInfo](#), [removeBuddy](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Returns

An array of IDs (buddy names) of the users on the gateway's buddy list, a list of instant messaging IDs that this gateway normally communicates with.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# getCustomAwayMessage

## Description

Returns the gateway's custom away message if it has been set by the gatewayHelper object `setStatus` method.

## Syntax

```
string = getCustomAwayMessage()
```

## See also

[getStatusAsString](#), [getStatusTimeStamp](#), [isOnline](#), [setStatus](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer's Guide*

## Returns

The gateway's custom away message if it has been set by the GatewayHelper object `setStatus` method.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

## getDenyList

### Description

Returns the list of users that the IM server has been told not to send state information about the gateway, if the permit mode is set to DENY\_SOME.

### Syntax

```
array = getDenyList()
```

### See also

[addDeny](#), [addPermit](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer’s Guide*

### Returns

An array of IDs (buddy names) of the users on the gateway’s deny list, the list of IDs to which the IM server does not send presence status information.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns False.

### Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# getName

## Description

Returns the gateway's user name.

## Syntax

```
string = getName()
```

## See also

[getProtocolName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), [setNickName](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer's Guide*

## Returns

The gateway's user name, as specified in gateway configuration file.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# getNickName

## Description

Returns the gateway's nickname (display name), if it has been set using the gatewayHelper object `setNickName` method.

## Syntax

```
string = getNickName()
```

## See also

[getName](#), [getProtocolName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), [setNickName](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer's Guide*

## Returns

The gateway's nickname, if any; empty string, otherwise.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# getPermitList

## Description

Returns the list of users that the IM server has been told to send state information about the gateway.

## Syntax

```
array = getPermitList()
```

## See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” of *ColdFusion MX Developer’s Guide*

## Returns

An array of IDs (buddy names) of the users on the gateway’s permit list, the list of IDs to which the IM server sends presence status information if the permit mode is set to PERMIT\_SOME.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns False.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# getPermitMode

## Description

Gets the gateway's permit mode from the IM server. The permit mode determines whether all users can get the gateway's online state information, or whether the server uses a permit list or a deny list to control which users get state information.

## Syntax

```
string = getPermitMode()
```

## See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Returns

The gateway's permit mode; one of the following values:

| Mode        | Description  |
|-------------|--|
| PERMIT_ALL  | (Default) Permits all users to be aware of the gateway's online presence and state.              |
| PERMIT_SOME | Permits only users in the permit list to be aware of the gateway's online presence and state.    |
| DENY_SOME   | Prevents the users in the deny list from being aware of the gateway's online presence and state. |

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns PERMIT\_ALL.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# getProtocolName

## Description

Gets the name of the gateway's instant messaging protocol.

## Syntax

```
string = getProtocolName()
```

## See also

[getName](#), [getNickName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), [setNickName](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Returns

The gateway's protocol, as determined by the gateway type; one of the following values:

- JABBER (for XMPP)
- SAMETIME

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# getStatusAsString

## Description

Gets the online status of the gateway as a text string.

## Syntax

```
string = getStatusAsString()
```

## See also

[getCustomAwayMessage](#), [getStatusTimeStamp](#), [isOnline](#), [setStatus](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The gateway’s online status; one of the following:

- ONLINE
- OFFLINE
- AWAY
- DO NOT DISTURB

### XMPP only

- NOT AVAILABLE
- FREE TO CHAT

### Sametime only

- IDLE

## Usage

The DO NOT DISTURB, NOT AVAILABLE, and FREE TO CHAT strings differ from the status values that you use in the [setStatus](#) method, which does not allow spaces in the status names.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# getStatusTimeStamp

## Description

Gets the date and time that the gateway changed its online status.

## Syntax

```
date-time object = getStatusTimeStamp()
```

## See also

[getCustomAwayMessage](#), [getStatusAsString](#), [isOnline](#), [setStatus](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The date and time that the gateway changed its online status, normally by calling the `setStatus gatewayHelper` object method.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# isOnline

## Description

Determines whether the gateway is connected to the instant messaging server.

## Syntax

```
Boolean = isOnline()
```

## See also

[getCustomAwayMessage](#), [getStatusAsString](#), [getStatusTimeStamp](#), [setStatus](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

True, if the gateway is connected to the IM server; False, otherwise.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# numberOfMessagesReceived

## Description

Gets the number of messages received by the gateway since it was started.

## Syntax

```
integer = numberOfMessagesReceived()
```

## See also

[getName](#), [getNickName](#), [getProtocolName](#), [numberOfMessagesSent](#), [setNickName](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*

## Returns

The number of messages received by the gateway since it was started.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# numberOfMessagesSent

## Description

Gets the number of messages sent by the gateway since it was started.

## Syntax

```
integer = numberOfMessagesSent()
```

## See also

[getName](#), [getNickName](#), [getProtocolName](#), [numberOfMessagesReceived](#), [setNickName](#),  
“Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways”  
in *ColdFusion MX Developer’s Guide*

## Returns

The number of messages sent by the gateway since it was started.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

# removeBuddy

## Description

Removes an ID from a group in the buddy list for the gateway and tells the IM server not to send the gateway messages with the buddy's online presence state.

## Syntax

```
Boolean = removeBuddy(name, group)
```

## See also

[addBuddy](#), [getBuddyInfo](#), [getBuddyList](#), [removeDeny](#), [removePermit](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

---

| Parameter | Description   |
|-----------|---|
| name      | The unique instant messaging user name for the person to remove from the buddy list.  |
| group     | The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group. |

---

## Returns

True if the ID was removed from the group; False, otherwise.

## Usage

If the user is in multiple groups in your buddy list, you remove the buddy separately from each group. The IM server does not stop sending status updates until you remove the name from all groups.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# removeDeny

## Description

Removes an ID from a group in the deny list for the gateway. If the gateway's permit mode is DENY\_SOME, the specified user can receive messages on the gateway's presence state.

## Syntax

```
Boolean = removeDeny(name, group)
```

## See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeBuddy](#), [removePermit](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | The unique instant messaging user name for the person to remove from the deny list.   |
| group     | The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group. |

## Returns

True if the ID was removed from the group; False, otherwise.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns False.

## Usage

If the user is in multiple groups in your deny list, you remove the user separately from each group. The IM server enables sending status updates if you remove the name any group.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# removePermit

## Description

Removes an ID from a group in the permit list for the gateway. If the gateway's permit mode is PERMIT\_SOME, the specified user cannot receive messages on the gateway's presence state.

## Syntax

```
Boolean = removePermit(name, group)
```

## See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeBuddy](#), [removeDeny](#), [setPermitMode](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | The unique instant messaging user name for the person to remove from the permit list.   |
| group     | The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group. |

## Returns

True if the ID was removed from the group; False, otherwise.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function always returns False.

## Usage

If the user is in multiple groups in your permit list, you remove the user separately from each group. However, the IM server stops sending status updates when you remove the user from the first group.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# setNickName

## Description

Sets the gateway's nickname (display name).

## Syntax

```
Boolean = setNickName(name)
```

## See also

[getName](#), [getNickName](#), [getProtocolName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

| Parameter | Description   |
|-----------|---|
| name      | The display name that you want to associate with this gateway. This name is not guaranteed to be unique for the protocol. |

## Returns

True if the nickname got set; false, otherwise.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# setPermitMode

## Description

Sets the gateway's permit mode on the IM server. The permit mode determines whether all users can get the gateway's online state information, or whether the server uses a permit list or a deny list to control which users get state information.

## Syntax

```
Boolean = setPermitMode(permitMode)
```

## See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*

## Parameters

| Parameter  | Description   |
|------------|---|
| permitMode | The permission mode, one of the following: <ul style="list-style-type: none"><li>PERMIT_ALL Permits all users to be aware of the gateway's online presence and state. This is the default mode if you do not call this function.</li><li>PERMIT_SOME Permits only users in the permit list to be aware of the gateway's online presence and state.</li><li>DENY_SOME Prevents all users in the deny list from being aware of the gateway's online presence and state.</li></ul> |

## Returns

True if the permit mode was set; False otherwise.

**Note:** XMPP permission management is included in the XMPP 1.0 draft specification, but several XMPP servers that were available at the time of the ColdFusion MX 7 release do not support permission management. If the server does not support permission management, this function returns False to all values except PERMIT\_ALL.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer's Guide*, which uses all GatewayHelper class methods.

# setStatus

## Description

Sets the online presence status of the gateway, including any custom away message.

## Syntax

```
Boolean = setStatus(status, customAwayMsg)
```

## See also

[getCustomAwayMessage](#), [getStatusAsString](#), [getStatusTimeStamp](#), [isOnline](#), “Using the GatewayHelper object” in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*

## Parameters

| Parameter     | Description  |
|---------------|--|
| status        | The gateway’s online presence status; one of the following: <ul style="list-style-type: none"><li>• ONLINE</li><li>• AWAY</li><li>• DND (Do Not Disturb)</li></ul> XMPP only <ul style="list-style-type: none"><li>• NA (Not Available)</li><li>• FREE_TO_CHAT</li></ul> Sametime only: <ul style="list-style-type: none"><li>• IDLE</li></ul> |
| customAwayMsg | A text string containing a custom message for the status. Can be the empty string if you do not need a custom away message.  |

## Returns

True, if the operation was successful; False, otherwise. Passing an invalid status for the protocol causes this method to return False.

## Usage

Do not use the `setStatus` method to go offline. Although the method accepts a parameter of `OFFLINE`, the gateway immediately resets itself to be online. To set the gateway offline, stop the gateway instance in the ColdFusion MX Administrator, or use the `stopGatewayInstance` method in the `CFIDE.adminapi.eventgateway` CFC.

## Example

See “GatewayHelper example”, in Chapter 43, “Using the Instant Messaging Event Gateways” in *ColdFusion MX Developer’s Guide*, which uses all GatewayHelper class methods.

## SMS Gateway CFEvent structure and commands

This section describes the detailed contents of the following structures that you use in the SMS Gateway listener CFCs and CFML `SendGatewayMessage` functions:

- [SMS Gateway incoming message CFEvent structure](#)
- [SMS gateway message sending commands](#)

## SMS Gateway incoming message CFEvent structure

The SMS gateway puts the following information in a CFEvent instance that it sends to the CFC listener method:

| Field                   | Value  |
|-------------------------|--|
| OriginatorID            | Contents of the PDU <code>source_addr</code> field, the address of the device that sent the message.   |
| CfcMethod               | Listener CFC method name. Value of the configuration file <code>cfc-method</code> entry, or <code>onIncomingMessage</code> if the configuration file does not have this entry.   |
| Data.MESSAGE            | Contents of the <code>short_message</code> field of the PDU.   |
| Data.sourceAddress      | The address of the device that sent this message.  |
| Data.destAddress        | The address to which the message was sent; an address in the range specified by the gateway configuration file <code>address-range</code> setting.   |
| Data.esmClass           | Contents of the PDU <code>esm_class</code> field. Identifies the message type. A number in the range 0-255 representing a Byte value, where bits 2-5 (0-indexed) indicate the message type, and therefore the contents of the <code>data.MESSAGE</code> field, as follows. (Reserved values are omitted.)<br><code>xx0000xx</code> Normal message<br><code>xx0001xx</code> SMSC delivery receipt<br><code>xx0010xx</code> SME Delivery Acknowledgement<br><code>xx0100xx</code> SME Manual/User Acknowledgement<br><code>xx0110xx</code> Conversation abort (Korean CDMA only)<br><code>xx1000xx</code> Intermediate Delivery Notification<br>For more information on this field, see the SMPP specification.  |
| Data.protocol           | Contents of the PDU <code>protocol_id</code> field. Meaningful for messages sent from GSM networks only. For more information, see the GSM 03.40 specification.  |
| Data.priority           | Contents of the PDU <code>priority_flag</code> field. A message priority level set by the originating SME, in the range 0-3; 0 is the lowest priority and 3 is the highest priority. The specific priority level meaning depends on the originating network. For more details, see the SMPP specification.   |
| Data.registeredDelivery | Contents of the PDU <code>registered_delivery</code> field, indicating the type of delivery receipt or acknowledgement that the sender requested. A number in the range 0-32, representing the sum of the following values:<br>0 No SMS delivery receipt requested <i>or</i><br>1 SMSC delivery receipt requested on delivery success or failure <i>or</i><br>2 SMSC delivery receipt requested on delivery failure only<br>Plus<br>0 No SME acknowledgement requested <i>or</i><br>4 SME Delivery Acknowledgement requested <i>or</i><br>8 SME Manual/User Acknowledgement requested <i>or</i><br>12 Both Delivery and Manual/User Acknowledgements requested<br>Plus<br>0 No Intermediate notification requested <i>or</i><br>16 Intermediate notification requested |

| Field              | Value   |
|--------------------|---|
| Data.DataCoding    | <p>Contents of the PDU data_coding field. Indicates the character set or the noncharacter data type of the message contents, as follows:</p> <p>00000000 SMSC Default Alphabet</p> <p>00000001 IA5 (CCITT T.50)/ASCII (ANSI X3.4)</p> <p>00000010 Octet unspecified (8-bit binary)</p> <p>00000011 Latin 1 (ISO-8859-1)</p> <p>00000100 Octet unspecified (8-bit binary)</p> <p>00000101 JIS (X 0208-1990)</p> <p>00000110 Cyrillic (ISO-8859-5)</p> <p>00000111 Latin/Hebrew (ISO-8859-8)</p> <p>00001000 UCS2 (ISO/IEC-10646)</p> <p>00001001 Pictogram Encoding</p> <p>00001010 ISO-2022-JP (Music Codes)</p> <p>00001101 Extended Kanji JIS(X 0212-1990)</p> <p>00001110 KS C 5601</p> <p>11xxxxxx GSM control use only; see the GSM 03.38 specification</p> <p>For more details, see the SMPP specification.</p> |
| data.messageLength | The length of the short_message field.  |
| GatewayType        | Always SMS.   |

For more information on the meanings of some of these fields and how to handle incoming SMS messages an SMS gateway listener CFC method, see “Handling incoming messages” in Chapter 44, “Using the SMS Event Gateway” in *ColdFusion MX Developer’s Guide*.

## SMS gateway message sending commands

ColdFusion applications that use gateways of the Short Message Service (SMS) type can send the following commands to the event gateway in an outgoing message:

- [submit command](#)
- [submitMulti command](#)
- [data command](#)

## submit command

To send a message to a single destination address in an SMPP SUBMIT\_SM PDU, the structure that you used in the *Data* parameter of a `SendGatewayMessage` function or the return variable of the CFC listener method has the following fields. For more information about these fields, see the documentation for the SUBMIT\_MULTIPLE PDU in the SMPP3.4 specification, which you can download from the SMS Forum at [www.smsforum.net/](http://www.smsforum.net/).

### Required fields

| Field                                | Contents  |
|--------------------------------------|---|
| command                              | If present, the value must be <code>submit</code> . If you omit this field, the event gateway sends a submit message.   |
| shortMessage<br>or<br>messagePayload | The message contents. You must specify one of these fields, but not both. The SMPP specification imposes a maximum size of 254 bytes on the shortMessage field, and some carriers might limit its size further. The messagePayload field can contain up to 64K bytes; it must start with 0x0424, followed by two bytes specifying the payload length, followed by the message contents. |
| destAddress                          | Required. The address to which to send the message.   |
| sourceAddress                        | The address of this application. You can omit this field; the configuration file specifies the application address.   |

### Optional fields

You can set default values for the following optional fields in the SMS event gateway configuration file. For information on the default values, see “Configuring an SMS event gateway” in Chapter 44, “Using the SMS Event Gateway” in *ColdFusion MX Developer’s Guide*.

|                 |                 |             |
|-----------------|-----------------|-------------|
| destAddress_npi | destAddress_ton | serviceType |
|-----------------|-----------------|-------------|

The following optional fields do not have default values:

|                    |                     |                      |                      |
|--------------------|---------------------|----------------------|----------------------|
| alertOnMsgDelivery | EsmClass            | priorityFlag         | smDefaultMsgId       |
| callbackNum        | ItsReplyType        | PrivacyIndicator     | SmsSignal            |
| callbackNumAtag    | ItsSessionInfo      | protocolId           | SourceAddrSubunit    |
| callbackNumPresInd | LanguageIndicator   | registeredDelivery   | SourcePort           |
| dataCoding         | MoreMsgsToSend      | replacedPresent      | SourceSubaddress     |
| DestAddrSubunit    | MsMsgWaitFacilities | SarMsgRefNum         | UserMessageReference |
| DestinationPort    | MsValidity          | SarSegmentSeqnum     | UserResponseCode     |
| DestSubaddress     | NumberOfMessages    | SarTotalSegments     | UssdServiceOp        |
| DisplayTime        | PayloadType         | scheduleDeliveryTime | validityPeriod       |

## Example

The following example `onIncomingMessage` method of a listener CFC uses the `submit` command to echo incoming SMS messages to the message originator:

```
<cffunction name="onIncomingMessage" output="no">
  <cfargument name="CFEvent" type="struct" required="yes">
  <!--- Create a return structure that contains the message. --->
  <cfset retValue = structNew()>
  <cfset retValue.command = "submit">
  <cfset retValue.destAddress = arguments.CFEvent.originatorid>
  <cfset retValue.shortMessage = "Echo: " & CFEvent.Data.MESSAGE>
  <!--- Send the message back. --->
  <cfreturn retValue>
</cffunction>
```

## submitMulti command

To send a single text message to multiple recipients using an SMPP SUBMIT\_MULTI PDU, the *Data* parameter of a `SendGatewayMessage` function or the return variable of the CFC listener method usually has the following fields. For more information about these fields, see the documentation for the SUBMIT\_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at [www.smsforum.net/](http://www.smsforum.net/).

### Required fields

| Field                                | Contents  |
|--------------------------------------|---|
| command                              | Must be <code>submitMulti</code> .  |
| shortMessage<br>or<br>messagePayload | The message contents. You must specify one of these fields, but not both. The SMPP specification imposes a maximum size of 254 bytes on the shortMessage field, and some carriers might limit its size further. The messagePayload field can contain up to 64K bytes; it must start with 0x0424, followed by two bytes specifying the payload length, followed by the message contents. |
| destAddress                          | A ColdFusion array of destination addresses (required). You cannot specify individual TON and NPI values for these addresses; all must conform to a single setting.   |
| sourceAddress                        | The address of this application. You can omit this field; the configuration file specifies the application address.   |

### Optional fields

The following optional fields can have default values set in the SMS event gateway configuration file. For information on the default values see “Configuring an SMS event gateway” in Chapter 44, “Using the SMS Event Gateway” in *ColdFusion MX Developer’s Guide*.

| destAddress_npi | destAddress_ton | serviceType |
|-----------------|-----------------|-------------|
|-----------------|-----------------|-------------|

The following optional fields do not have default values:

|                    |                     |                      |                      |
|--------------------|---------------------|----------------------|----------------------|
| alertOnMsgDelivery | DisplayTime         | protocolId           | SmsSignal            |
| callbackNum        | EsmClass            | registeredDelivery   | SourceAddrSubunit    |
| callbackNumAtag    | LanguageIndicator   | replacelfPresent     | SourcePort           |
| callbackNumPresInd | MsMsgWaitFacilities | SarMsgRefNum         | SourceSubaddress     |
| dataCoding         | MsValidity          | SarSegmentSeqnum     | UserMessageReference |
| DestAddrSubunit    | PayloadType         | SarTotalSegments     | validityPeriod       |
| DestinationPort    | priorityFlag        | scheduleDeliveryTime |                      |
| DestSubaddress     | PrivacyIndicator    | smDefaultMsgId       |                      |

## Example

The following example `onIncomingMessage` method sends a response that echoes an incoming message to the originator address, and sends a copy of the response to a second address:

```
<cffunction name="onIncomingMessage" output="no">
  <cfargument name="CFEvent" type="struct" required="yes">
    <!--- Get the message. --->
    <cfset data=cfevent.DATA>
    <cfset message="#data.message#">
    <!--- Create the return structure. --->
    <cfset retValue = structNew()>
    <cfset retValue.command = "submitmulti">
    <cfset retValue.destAddresses=arraynew(1)>
    <!--- One destination is incoming message originator;
         get the address from CFEvent originator ID. --->
    <cfset retValue.destAddresses[1] = arguments.CFEvent.originatorid>
    <cfset retValue.destAddresses[2] = "12345">
    <cfset retValue.shortMessage = "echo: " & message>
  <cfreturn retValue>
</cffunction>
```

## data command

To send binary data to a single destination address in an SMPP DATA\_SM PDU, the *Data* parameter of a `SendGatewayMessage` function or the return variable of the CFC listener method must have the following fields. For more information about these fields, see the documentation for the SUBMIT\_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at [www.smsforum.net/](http://www.smsforum.net/).

### Required fields

| Field          | Contents  |
|----------------|---|
| command        | Must be <code>data</code> .   |
| messagePayload | The message data. To convert data to binary format, use the <code>ColdFusion MX ToBinary</code> function.           |
| destAddress    | The address to which to send the message.   |
| sourceAddress  | The address of this application. You can omit this field; the configuration file specifies the application address. |

### Optional fields

The following optional fields can have default values set in the SMS event gateway configuration file. For information on the default values see “Configuring an SMS event gateway” in Chapter 44, “Using the SMS Event Gateway” in *ColdFusion MX Developer’s Guide*.

| destAddress_npi | destAddress_ton | serviceType |
|-----------------|-----------------|-------------|
|-----------------|-----------------|-------------|

The following optional fields do not have default values:

|                    |                     |                    |                      |
|--------------------|---------------------|--------------------|----------------------|
| alertOnMsgDelivery | DestTelematicsId    | NetworkErrorCode   | SetDpf               |
| callbackNum        | DisplayTime         | NumberOfMessages   | SmsSignal            |
| callbackNumAtag    | EsmClass            | PayloadType        | SourceAddrSubunit    |
| callbackNumPresInd | ItsReplyType        | PrivacyIndicator   | SourceBearerType     |
| dataCoding         | ItsSessionInfo      | QosTimeToLive      | SourceNetworkType    |
| DestAddrSubunit    | LanguageIndicator   | ReceiptedMessgeld  | SourcePort           |
| DestBearerType     | MessageState        | registeredDelivery | SourceSubaddress     |
| DestNetworkType    | MoreMsgsToSend      | SarMsgRefNum       | SourceTelematicsId   |
| DestinationPort    | MsMsgWaitFacilities | SarSegmentSeqnum   | UserMessageReference |
| DestSubaddress     | MsValidity          | SarTotalSegments   | UserResponseCode     |

## Example

The following example `onIncomingMessage` method converts an incoming message to binary data, and sends the binary version of the message back to the originator address:

```
<cffunction name="onIncomingMessage" output="no">
  <cfargument name="CFEvent" type="struct" required="yes">
    <!--- Get the message --->
    <cfset data=CFEvent.DATA>
    <cfset message="#data.message#">
    <!--- Create the return structure --->
    <cfset retValue = structNew()>
    <cfset retValue.command = "data">
    <!--- Sending to incoming message originator; get value from CFEvent. --->
    <cfset retValue.destAddress = arguments.CFEvent.originatorid>
    <cfset retValue.messagePayload = tobinary(tobase64("echo: " & message))>
    <cfreturn retValue>
  </cfargument>
</cffunction>
```

## CFML event gateway `SendGatewayMessage` data parameter

The ColdFusion CFML gateway type enables you to invoke CFC methods asynchronously. The structure that you use in the `SendGatewayMessage` function *data* parameter can include two types of fields:

- Any number of fields can contain arbitrary contents for use in by the CFC.
- Several optional fields can configure how the gateway delivers the information to the CFC.

The CFML gateway looks for the following optional fields, and, if they exist, uses them to determine how it delivers the message. Do not use these field names for data that you send to your CFC method.

| Field                     | Use   |
|---------------------------|---|
| <code>cfcpath</code>      | Overrides the CFC path specified in the ColdFusion MX Administrator. This field lets you use a single gateway configuration in the ColdFusion MX Administrator multiple CFCs. This field sets the CFEvent object <code>CFCPath</code> variable.   |
| <code>method</code>       | Specifies the name of the method to invoke in the CFC. The default method is <code>onIncomingMessage</code> . This field lets you use a single gateway configuration in the ColdFusion MX Administrator for a CFC that has several methods. This field sets the CFEvent object <code>CFCMethod</code> variable.   |
| <code>originatorID</code> | Sets the <code>originatorID</code> field of the CFEvent object that ColdFusion MX delivers to the CFC. The default value is <code>CFMLGateway</code> .  |
| <code>timeout</code>      | Sets the time-out, in seconds, during which the listener CFC must process the event request and return before ColdFusion gateway services terminates the request. The default value is the <code>Timeout</code> Request value set on the <code>Server Settings</code> page in the ColdFusion MX Administrator. Set this value if a request might validly take longer to process than the default time-out; for example, if the request involves a very long processing time. This field sets the CFEvent object <code>CFCTimeout</code> variable. |

### Example

The following example consists of a CFML page that sends a message to a `logevent` method in the file `logger.CFC`. The CFML page specifies the CFC and method to call, and sets the `OriginatorID`.

```
<h3>Sending an event using a generic CFML event gateway and specifying the CFC
and method.</h3>
<cfscript>
    status = False;
    props = structNew();
    props.cfcpath="C:\CFusionMX7\gateway\cfc\MyCFCs\logger.cfc";
    props.method="logEvent";
    props.OriginatorID=CGI.SCRIPT_NAME;
    props.Message="Replace me with a variable with data to log";
    props.file="GenericCFCtest";
    props.type="warning";
    status = SendGatewayMessage("DefaultCFC", props);
    if (status IS True)
        WriteOutput('Event Message "#props.Message#" has been sent.');
```

The CFC method uses the OriginatorID and the message, file, and type fields of the CFEvent parameter's data field to specify the log file and message.

```
<cfcomponent>
  <cffunction name="logEvent" output="no">
    <cfargument name="CFEvent" type="struct" required="yes">
      <cfscript>
        if (NOT IsDefined("CFEvent.Data.file")) {
          CFEvent.Data.file="defaultEventLog"; }
        if (NOT IsDefined("CFEvent.Data.type")) {
          CFEvent.Data.type="information"; }
      </cfscript>
      <cflog text="Message from #CFEvent.originatorID#: #CFEvent.Data.message#"
        file="#CFEvent.data.file#" type="#CFEvent.Data.type#" >
    </cffunction>
  </cfcomponent>
```

# CHAPTER 7

## ColdFusion C++ CFX Reference

This chapter describes the Macromedia ColdFusion MX 7 CFXAPI classes and methods.

### C++ class overview

The following table lists the CFXAPI classes and methods:

| Class               | Methods  |
|---------------------|--|
| CCFXException class | CCFXException::GetError<br>CCFXException::GetDiagnostics   |
| CCFXQuery class     | CCFXQuery::AddRow<br>CCFXQuery::GetColumns<br>CCFXQuery::GetData<br>CCFXQuery::GetName<br>CCFXQuery::GetRowCount<br>CCFXQuery::SetData |

| Class                            | Methods   |
|----------------------------------|---|
| <code>CCFXRequest class</code>   | <a href="#">CCFXRequest::AddQuery</a><br><a href="#">CCFXRequest::AttributeExists</a><br><a href="#">CCFXRequest::CreateStringSet</a><br><a href="#">CCFXRequest::Debug</a><br><a href="#">CCFXRequest::GetAttribute</a><br><a href="#">CCFXRequest::GetAttributeList</a><br><a href="#">CCFXRequest::GetCustomData</a><br><a href="#">CCFXRequest::GetQuery</a><br><a href="#">CCFXRequest::ReThrowException</a><br><a href="#">CCFXRequest::SetCustomData</a><br><a href="#">CCFXRequest::SetVariable</a><br><a href="#">CCFXRequest::ThrowException</a><br><a href="#">CCFXRequest::Write</a><br><a href="#">CCFXRequest::WriteDebug</a> |
| <code>CCFXStringSet class</code> | <a href="#">CCFXStringSet::AddString</a><br><a href="#">CCFXStringSet::GetCount</a><br><a href="#">CCFXStringSet::GetIndexForString</a><br><a href="#">CCFXStringSet::GetString</a>   |

## Deprecated class methods

The following CFXAPI classes and methods are deprecated. They do not work, and might cause an error, in later releases.

| Class             | Deprecated member                      | Deprecated as of this ColdFusion release |
|-------------------|--|--|
| CCFXQuery Class   | <code>CCFXQuery::SetQueryString</code> | ColdFusion MX                            |
|                   | <code>CCFXQuery::SetTotalTime</code>   | ColdFusion MX                            |
| CCFXRequest Class | <code>CCFXRequest::GetSetting</code>   | ColdFusion MX                            |

## CCFXException class

An abstract class that represents an exception thrown during processing of a ColdFusion Extension (CFX) procedure.

Exceptions of this type can be thrown by [CCFXRequest class](#), [CCFXQuery class](#), and [CCFXStringSet class](#). Your ColdFusion Extension code must be written to handle exceptions of this type. For more information, see [CCFXRequest::ThrowException](#) and [CCFXRequest::ReThrowException](#).

### Class methods

|  |  |
|--|--|
| <code>virtual LPCSTR GetError()</code>       | The <a href="#">CCFXException::GetError</a> function returns a general error message.          |
| <code>virtual LPCSTR GetDiagnostics()</code> | The <a href="#">CCFXException::GetDiagnostics</a> function returns detailed error information. |

## CCFXException::GetError

### Description

Provides basic user output for exceptions that occur during processing.

## CCFXException::GetDiagnostics

### Description

Provides detailed user output for exception that occur during processing.

### Example

This code block shows how GetError and GetDiagnostics work with ThrowException and ReThrowException.

```
// Write output back to the user here...
pRequest->Write( "Hello from CFX_F002!" );
pRequest->ThrowException("User Error", "You goof'd...");

// Output optional debug info
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Debug info..." );
}

// Catch ColdFusion exceptions & re-raise them
catch( CCFXException* e )
{
    // This is how you would pull the error information
    LPCTSTR strError = e->GetError();
    LPCTSTR strDiagnostic = e->GetDiagnostics();

    pRequest->ReThrowException( e );
}

// Catch ALL other exceptions and throw them as
// ColdFusion exceptions (DO NOT REMOVE! --
// this prevents the server from crashing in
// case of an unexpected exception)
catch( ... )
{
    pRequest->ThrowException(
        "Error occurred in tag CFX_F002",
        "Unexpected error occurred while processing tag." );
}
```

## CCFXQuery class

An abstract class that represents a query used or created by a ColdFusion Extension (CFX). Queries contain one or more columns of data that extend over a varying number of rows.

### Class methods

---

|   |  |
|---|--|
| <code>virtual int AddRow()</code>   | <code>CCFXQuery::AddRow</code> adds a row to a query.  |
| <code>virtual CCFXStringSet* GetColumns</code>                              | <code>CCFXQuery::GetColumns</code> retrieves a list of a query's column names.               |
| <code>virtual LPCSTR GetData( int iRow, int iColumn )</code>                | <code>CCFXQuery::GetData</code> retrieves a data element from a row and column of a query.   |
| <code>virtual LPCSTR GetName()</code>                                       | <code>CCFXQuery::GetName</code> retrieves the name of a query.                               |
| <code>virtual int GetRowCount()</code>                                      | <code>CCFXQuery::GetRowCount</code> retrieves the number of rows in a query.                 |
| <code>virtual void SetData( int iRow, int iColumn, LPCSTR lpszData )</code> | <code>CCFXQuery::SetData</code> sets a data element within a row and column of a query.      |
| <code>virtual void SetQueryString( LPCSTR lpszQuery )</code>                | This function is deprecated. It might not work, and might cause an error, in later releases. |
| <code>virtual void SetTotalTime( DWORD dwMilliseconds )</code>              | This function is deprecated. It might not work, and might cause an error, in later releases. |

---

### CCFXQuery::AddRow

#### Syntax

```
int CCFXQuery::AddRow(void)
```

#### Description

Add a row to the query. Call this function to append a row to a query.

#### Returns

Returns the index of the row that was appended to a query.

## Example

The following example shows the addition of two rows to a three-column ('City', 'State', and 'Zip') query:

```
// First row
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iCity, "Minneapolis" ) ;
pQuery->SetData( iRow, iState, "MN" ) ;
pQuery->SetData( iRow, iZip, "55345" ) ;

// Second row
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iCity, "St. Paul" ) ;
pQuery->SetData( iRow, iState, "MN" ) ;
pQuery->SetData( iRow, iZip, "55105" ) ;
```

## CCFXQuery::GetColumns

### Syntax

```
CCFXStringSet* CCFXQuery::GetColumns(void)
```

### Description

Retrieves a list of the column names contained in a query.

### Returns

Returns an object of [CCFXStringSet](#) class that contains a list of the columns in the query. ColdFusion automatically frees the memory that is allocated for the returned string set, after the request is completed.

### Example

The following example gets the list of columns, then iterates over the list, writing each column name back to the user:

```
// Get the list of columns from the query
CCFXStringSet* pColumns = pQuery->GetColumns() ;
int nNumColumns = pColumns->GetCount() ;

// Print the list of columns to the user
pRequest->Write( "Columns in query: " ) ;
for( int i=1; i<=nNumColumns; i++ )
{
    pRequest->Write( pColumns->GetString( i ) ) ;
    pRequest->Write( " " ) ;
}
```

## CCFXQuery::GetData

### Syntax

```
LPCSTR CCFXQuery::GetData(int iRow, int iColumn)
```

### Description

Gets a data element from a row and column of a query. Row and column indexes begin with 1. You can determine the number of rows in a query by calling `CCFXQuery::GetRowCount`. You can determine the number of columns in a query by retrieving the list of columns using `CCFXQuery::GetColumns`, and then calling `CCFXStringSet::GetCount` on the returned string set.

### Returns

Returns the value of the requested data element.

### Parameters

| Parameter | Description                            |
|-----------|--|
| iRow      | Row to retrieve data from (1-based)    |
| iColumn   | Column to retrieve data from (1-based) |

### Example

The following example iterates over the elements of a query and writes the data in the query back to the user in a simple, space-delimited format:

```
int iRow, iCol ;
int nNumCols = pQuery->GetColumns()->GetCount() ;
int nNumRows = pQuery->GetRowCount() ;
for ( iRow=1; iRow<=nNumRows; iRow++ )
{
    for ( iCol=1; iCol<=nNumCols; iCol++ )
    {
        pRequest->Write( pQuery->GetData( iRow, iCol ) ) ;
        pRequest->Write( " " ) ;
    }
    pRequest->Write( "<BR>" ) ;
}
```

## CCFXQuery::GetName

### Syntax

```
LPCSTR CCFXQuery::GetName(void)
```

### Description

Returns the name of a query.

## Example

The following example retrieves the name of a query and writes it back to the user:

```
CCFXQuery* pQuery = pRequest->GetQuery() ;
pRequest->Write( "The query name is: " ) ;
pRequest->Write( pQuery->GetName() ) ;
```

## CCFXQuery::GetRowCount

### Syntax

```
int CCFXQuery::GetRowCount(void)
```

### Description

Returns the number of rows contained in a query.

### Example

The following example retrieves the number of rows in a query and writes it back to the user:

```
CCFXQuery* pQuery = pRequest->GetQuery() ;
char buffOutput[256] ;
wsprintf( buffOutput,
"The number of rows in the query is %ld.",
pQuery->GetRowCount() ) ;
pRequest->Write( buffOutput ) ;
```

## CCFXQuery::SetData

### Syntax

```
void CCFXQuery::SetData(int iRow, int iColumn, LPCSTR lpszData)
```

### Description

Sets a data element within a row and column of a query. Row and column indexes begin with 1. Before calling `SetData` for a given row, call `CCFXQuery::AddRow` and use the return value as the row index for your call to `SetData`.

### Parameters

| Parameter | Description                             |
|-----------|---|
| iRow      | Row of data element to set (1-based)    |
| iColumn   | Column of data element to set (1-based) |
| lpszData  | New value for data element              |

## Example

The following example shows the addition of two rows to a three-column ('City', 'State', and 'Zip') query:

```
// First row
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iCity, iRow, "Minneapolis" ) ;
pQuery->SetData( iState, iRow, "MN" ) ;
pQuery->SetData( iZip, iRow, "55345" ) ;

// Second row
iRow = pQuery->AddRow() ;
pQuery->SetData( iCity, iRow, "St. Paul" ) ;
pQuery->SetData( iState, iRow, "MN" ) ;
pQuery->SetData( iZip, iRow, "55105" ) ;
```

## CCFXRequest class

Abstract class that represents a request made to a ColdFusion Extension (CFX). An instance of this class is passed to the main function of your extension DLL. The class provides interfaces that can be used by the custom extension for the following actions:

- Reading and writing variables
- Returning output
- Creating and using queries
- Throwing exceptions

## Class methods

---

|   |  |
|---|--|
| <code>virtual BOOL AttributeExists<br/>( LPCSTR lpszName )</code> | <code>CCFXRequest::AttributeExists</code> checks whether the attribute was passed to the tag.                                      |
| <code>virtual LPCSTR GetAttribute<br/>( LPCSTR lpszName )</code>  | <code>CCFXRequest::GetAttribute</code> gets the value of the passed attribute.   |
| <code>virtual CCFXStringSet* GetAttributeList()</code>            | <code>CCFXRequest::GetAttributeList</code> gets an array of attribute names passed to the tag.                                     |
| <code>virtual CCFXQuery* GetQuery()</code>                        | <code>CCFXRequest::GetQuery</code> gets the query that was passed to the tag.  |
| <code>virtual LPCSTR GetSetting( LPCSTR lpszSettingName )</code>  | <code>CCFXRequest::GetSetting</code><br>This method is deprecated. It might not work, and might cause an error, in later releases. |
| <code>virtual void Write( LPCSTR lpszOutput )</code>              | <code>CCFXRequest::Write</code> writes text output back to the user.   |

---

---

|  |   |
|--|---|
| <code>virtual void SetVariable( LPCSTR lpszName, LPCSTR lpszValue )</code>           | <a href="#">CCFXRequest::SetVariable</a> sets a variable in the template that contains this tag.          |
| <code>virtual CCFXQuery* AddQuery( LPCSTR lpszName, CCFXStringSet* pColumns )</code> | <a href="#">CCFXRequest::AddQuery</a> adds a query to the template that contains this tag.                |
| <code>virtual BOOL Debug()</code>  | <a href="#">CCFXRequest::Debug</a> checks whether the tag contains the <code>Debug</code> attribute.      |
| <code>virtual void WriteDebug( LPCSTR lpszOutput )</code>                            | <a href="#">CCFXRequest::WriteDebug</a> writes text output into the debug stream.                         |
| <code>virtual CCFXStringSet* CreateStringSet()</code>                                | <a href="#">CCFXRequest::CreateStringSet</a> allocates and returns a <code>CCFXStringSet</code> instance. |
| <code>virtual void ThrowException( LPCSTR lpszError, LPCSTR lpszDiagnostics )</code> | <a href="#">CCFXRequest::ThrowException</a> throws an exception and ends processing of this request.      |
| <code>virtual void RethrowException ( CCFXException* e )</code>                      | <a href="#">CCFXRequest::RethrowException</a> re-throws an exception that has been caught.                |
| <code>virtual void SetCustomData( LPVOID lpvData )</code>                            | <a href="#">CCFXRequest::SetCustomData</a> sets custom (tag specific) data to carry with a request.       |
| <code>virtual LPVOID GetCustomData()</code>  | <a href="#">CCFXRequest::GetCustomData</a> gets custom (tag specific) data for a request.                 |

---

## CCFXRequest::AddQuery

### Syntax

```
CCFXQuery* CCFXRequest::AddQuery(LPCSTR lpszName,
    CCFXStringSet* pColumns)
```

### Description

Adds a query to the calling template. The query can be accessed by CFML tags (for example, `CFOUTPUT` or `CFTABLE`) within the template. After calling `AddQuery`, the query is empty (it has 0 rows). To populate the query with data, call the [CCFXQuery::AddRow](#) and [CCFXQuery::SetData](#) functions.

### Returns

Returns a pointer to the query that was added to the template (an object of class `CCFXQuery`). The memory allocated for the returned query is freed automatically by ColdFusion after the request is completed.

### Parameters

---

| Parameter             | Description   |
|-----------------------|---|
| <code>lpszName</code> | Name of query to add to the template (must be unique) |
| <code>pColumns</code> | List of column names to be used in the query          |

---

## Example

The following example adds a query named 'People' to the calling template. The query has two columns ('FirstName' and 'LastName') and two rows:

```
// Create a string set and add the column names to it
CCFXStringSet* pColumns = pRequest->CreateStringSet() ;
int iFirstName = pColumns->AddString( "FirstName" ) ;
int iLastName = pColumns->AddString( "LastName" ) ;

// Create a query that contains these columns
CCFXQuery* pQuery = pRequest->AddQuery( "People", pColumns ) ;

// Add data to the query
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iFirstName, "John" ) ;
pQuery->SetData( iRow, iLastName, "Smith" ) ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iFirstName, "Jane" ) ;
pQuery->SetData( iRow, iLastName, "Doe" ) ;
```

## CCFXRequest::AttributeExists

### Syntax

```
BOOL CCFXRequest::AttributeExists(LPCSTR lpszName)
```

### Description

Checks whether the parameter was passed to the tag. Returns True if the parameter is available; False, otherwise.

### Parameters

| Parameter | Description                                       |
|-----------|---|
| lpszName  | Name of the parameter to check (case insensitive) |

### Example

The following example checks whether the user passed an attribute named DESTINATION to the tag, and throws an exception if the attribute was not passed:

```
if ( pRequest->AttributeExists("DESTINATION")==FALSE )
{
    pRequest->ThrowException(
        "Missing DESTINATION parameter",
        "You must pass a DESTINATION parameter in "
        "order for this tag to work correctly." );
}
```

## CCFXRequest::CreateStringSet

### Syntax

```
CCFXStringSet* CCFXRequest::CreateStringSet(void)
```

### Description

Allocates and returns an instance. Always use this function to create string sets, as opposed to directly using the `new` operator.

### Returns

Returns an object of [CCFXStringSet](#) class. The memory allocated for the returned string set is freed automatically by ColdFusion after the request is completed

### Example

The following example creates a string set and adds three strings to it:

```
CCFXStringSet* pColors = pRequest->CreateStringSet() ;
pColors->AddString( "Red" ) ;
pColors->AddString( "Green" ) ;
pColors->AddString( "Blue" ) ;
```

## CCFXRequest::Debug

### Syntax

```
BOOL CCFXRequest::Debug(void)
```

### Description

Checks whether the tag contains the `Debug` attribute. Use this function to determine whether to write debug information for a request. For more information, see [CCFXRequest::WriteDebug](#).

### Returns

Returns `True` if the tag contains the `Debug` attribute; `False`, otherwise.

### Example

The following example checks whether the `Debug` attribute is present, and if it is, it writes a brief debug message:

```
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Top secret debug info" ) ;
}
```

## CCFXRequest::GetAttribute

### Syntax

```
LPCSTR CCFXRequest::GetAttribute(LPCSTR lpszName)
```

### Description

Retrieves the value of the passed attribute. Returns an empty string if the attribute does not exist. (To test whether an attribute was passed to the tag, use [CCFXRequest::AttributeExists](#).)

## Returns

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, an empty string is returned.

## Parameters

---

| Parameter | Description  |
|-----------|--|
| lpszName  | Name of the attribute to retrieve (case insensitive) |

---

## Example

The following example retrieves an attribute named `DESTINATION` and writes its value back to the user:

```
LPCSTR lpszDestination = pRequest->GetAttribute("DESTINATION") ;
pRequest->Write( "The destination is: " ) ;
pRequest->Write( lpszDestination ) ;
```

## CCFXRequest::GetAttributeList

### Syntax

```
CCFXStringSet* CCFXRequest::GetAttributeList(void)
```

### Description

Gets an array of attribute names passed to the tag. To get the value of one attribute, use [CCFXRequest::GetAttribute](#).

### Returns

Returns an object of class [CCFXStringSet](#) class that contains a list of attributes passed to the tag. The memory allocated for the returned string set is freed automatically by ColdFusion after the request is completed.

### Example

The following example gets the list of attributes and iterates over the list, writing each attribute and its value back to the user.

```
LPCSTR lpszName, lpszValue ;
CCFXStringSet* pAttribs = pRequest->GetAttributeList() ;
int nNumAttribs = pAttribs->GetCount() ;

for( int i=1; i<=nNumAttribs; i++ )
{
    lpszName = pAttribs->GetString( i ) ;
    lpszValue = pRequest->GetAttribute( lpszName ) ;
    pRequest->Write( lpszName ) ;
    pRequest->Write( " = " ) ;
    pRequest->Write( lpszValue ) ;
    pRequest->Write( "<BR>" ) ;
}
```

## CCFXRequest::GetCustomData

### Syntax

```
LPVOID CCFXRequest::GetCustomData(void)
```

### Description

Gets the custom (tag specific) data for the request. This method is typically used from within subroutines of a tag implementation to extract tag data from a request.

### Returns

Returns a pointer to the custom data, or NULL if no custom data has been set during this request using [CCFXRequest::SetCustomData](#).

### Example

The following example retrieves a pointer to a request specific data structure of hypothetical type MYTAGDATA:

```
void DoSomeGruntWork( CCFXRequest* pRequest )
{
    MYTAGDATA* pTagData =
        (MYTAGDATA*)pRequest->GetCustomData() ;

    ... remainder of procedure ...
}
```

## CCFXRequest::GetQuery

### Syntax

```
CCFXQuery* CCFXRequest::GetQuery(void)
```

### Description

Retrieves a query that was passed to a tag. To pass a query to a custom tag, you use the `QUERY` attribute. This attribute should be set to the name of a query (created using the `cfquery` tag or another custom tag). The `QUERY` attribute is optional and should be used only by tags that process an existing data set.

### Returns

Returns an object of the [CCFXQuery](#) class that represents the query passed to the tag. If no query was passed to the tag, NULL is returned. The memory allocated for the returned query is freed automatically by ColdFusion after the request is completed.

## Example

The following example retrieves the query that was passed to the tag. If no query was passed, an exception is thrown:

```
CCFXQuery* pQuery = pRequest->GetQuery() ;
if ( pQuery == NULL )
{
    pRequest->ThrowException(
        "Missing QUERY parameter",
        "You must pass a QUERY parameter in "
        "order for this tag to work correctly." ) ;
}
```

## CCFXRequest::ReThrowException

### Syntax

```
void CCFXRequest::ReThrowException(CCFXException* e)
```

### Description

Re-throws an exception that has been caught within an extension procedure. This function is used to avoid having C++ exceptions that are thrown by DLL extension code propagate back into ColdFusion. Catch ALL C++ exceptions that occur in extension code, and either re-throw them (if they are of the [CCFXException](#) class) or create and throw a new exception pointer using [CCFXRequest::ThrowException](#).

### Parameters

---

| Parameter | Description                          |
|-----------|--------------------------------------|
| e         | A CCFXException that has been caught |

---

### Example

The following code demonstrates how to handle exceptions in ColdFusion Extension DLL procedures:

```
try
{
    ...Code that could throw an exception...
}
catch( CCFXException* e )
{
    ...Do appropriate resource cleanup here...
    // Re-throw the exception
    pRequest->ReThrowException( e ) ;
}
catch( ... )
{
    // Something nasty happened

    pRequest->ThrowException(
        "Unexpected error occurred in CFX tag", "" ) ;
}
```

## CCFXRequest::SetCustomData

### Syntax

```
void CCFXRequest::SetCustomData(LPVOID lpvData)
```

### Description

Sets custom (tag specific) data to carry with the request. Use this function to store request specific data to pass to procedures within your custom tag implementation.

### Parameters

| Parameter      | Description            |
|----------------|------------------------|
| <i>lpvData</i> | Pointer to custom data |

### Example

The following example creates a request-specific data structure of hypothetical type MYTAGDATA and stores a pointer to the structure in the request for future use:

```
void ProcessTagRequest( CCFXRequest* pRequest )
{
    try
    {
        MYTAGDATA tagData ;
        pRequest->SetCustomData( (LPVOID)&tagData ) ;

        ... remainder of procedure ...
    }
}
```

## CCFXRequest::SetVariable

### Syntax

```
void CCFXRequest::SetVariable(LPCSTR lpzName, LPCSTR lpzValue)
```

### Description

Sets a variable in the calling template. If the variable name already exists in the template, its value is replaced. If it does not exist, a variable is created. The values of variables created using `SetVariable` can be accessed in the same manner as other template variables (for example, `#MessageSent#`).

### Parameters

| Parameter       | Description       |
|-----------------|-------------------|
| <i>lpzName</i>  | Name of variable  |
| <i>lpzValue</i> | Value of variable |

## Example

The following example sets the value of a variable named 'MessageSent' based on the success of an operation performed by the custom tag:

```
BOOL bMessageSent;
...attempt to send the message...
if ( bMessageSent == TRUE )
{
    pRequest->SetVariable( "MessageSent", "Yes" );
}
else
{
    pRequest->SetVariable( "MessageSent", "No" );
}
```

## CCFXRequest::ThrowException

### Syntax

```
void CCFXRequest::ThrowException(LPCSTR lpszError,
    LPCSTR lpszDiagnostics)
```

### Description

Throws an exception and ends processing of a request. Call this function when you encounter an error that does not allow you to continue processing the request. This function is almost always combined with the [CCFXRequest::ReThrowException](#) to protect against resource leaks in extension code.

### Parameters

| Parameter              | Description                  |
|------------------------|------------------------------|
| <i>lpszError</i>       | Short identifier for error   |
| <i>lpszDiagnostics</i> | Error diagnostic information |

### Example

The following example throws an exception indicating that an unexpected error occurred while processing a request:

```
char buffError[512] ;
wsprintf( buffError,
    "Unexpected Windows NT error number %ld "
    "occurred while processing request.", GetLastError() );

pRequest->ThrowException( "Error occurred", buffError );
```

## CCFXRequest::Write

### Syntax

```
void CCFXRequest::Write(LPCSTR lpszOutput)
```

### Description

Writes text output back to the user.

### Parameters

| Parameter  | Description    |
|------------|----------------|
| lpszOutput | Text to output |

### Example

The following example creates a buffer to hold an output string, fills the buffer with data, and writes the output back to the user:

```
CHAR buffOutput[1024] ;  
wsprintf( buffOutput, "The destination is: %s",  
    pRequest->GetAttribute("DESTINATION") ) ;  
pRequest->Write( buffOutput ) ;
```

## CCFXRequest::WriteDebug

### Syntax

```
void CCFXRequest::WriteDebug(LPCSTR lpszOutput)
```

### Description

Writes text output into the debug stream. The text is only displayed to the end-user if the tag contains the `Debug` attribute. (For more information, see [CCFXRequest::Debug](#).)

### Parameters

| Parameter  | Description    |
|------------|----------------|
| lpszOutput | Text to output |

### Example

The following example checks whether the `Debug` attribute is present; if so, it writes a brief debug message:

```
if ( pRequest->Debug() )  
{  
    pRequest->WriteDebug( "Top secret debug info" ) ;  
}
```

## CCFXStringSet class

Abstract class that represents a set of ordered strings. Strings can be added to a set and can be retrieved by a numeric index (index values for strings are 1-based). To create a string set, use [CCFXRequest::CreateStringSet](#).

### Class methods

---

|  |   |
|--|---|
| <code>virtual int AddString( LPCSTR lpszString )</code>              | <a href="#">CCFXStringSet::AddString</a> adds a string to the end of a list.            |
| <code>virtual int GetCount()</code>                                  | <a href="#">CCFXStringSet::GetCount</a> gets the number of strings contained in a list. |
| <code>virtual LPCSTR GetString( int iIndex )</code>                  | <a href="#">CCFXStringSet::GetString</a> gets the string located at the passed index.   |
| <code>virtual int GetIndexForString<br/>( LPCSTR lpszString )</code> | <a href="#">CCFXStringSet::GetIndexForString</a> gets the index for the passed string.  |

---

### CCFXStringSet::AddString

#### Syntax

```
int CCFXStringSet::AddString(LPCSTR lpszString)
```

#### Description

Adds a string to the end of the list.

#### Returns

The index of the string that was added.

#### Parameters

---

| Parameter               | Description               |
|-------------------------|---------------------------|
| <code>lpszString</code> | String to add to the list |

---

#### Example

The following example demonstrates adding three strings to a string set and saving the indexes of the items that are added:

```
CCFXStringSet* pSet = pRequest->CreateStringSet() ;  
int iRed = pSet->AddString( "Red" ) ;  
int iGreen = pSet->AddString( "Green" ) ;  
int iBlue = pSet->AddString( "Blue" ) ;
```

### CCFXStringSet::GetCount

#### Syntax

```
int CCFXStringSet::GetCount(void)
```

## Description

Gets the number of strings in a string set. The value can be used with `CCFXStringSet::GetString` to iterate over the strings in the set (recall that the index values for strings in the list begin at 1).

## Returns

Returns the number of strings contained in the string set.

## Example

The following example demonstrates using `GetCount` with `CCFXStringSet::GetString` to iterate over a string set and write the contents of the list back to the user:

```
int nNumItems = pStringSet->GetCount();
for ( int i=1; i<=nNumItems; i++ )
{
    pRequest->Write( pStringSet->GetString( i ) );
    pRequest->Write( "<BR>" );
}
```

## CCFXStringSet::GetIndexForString

### Syntax

```
int CCFXStringSet::GetIndexForString(LPCSTR lpszString)
```

### Description

Searches for a passed string. The search is case-insensitive.

### Returns

If the string is found, its index within the string set is returned. If it is not found, the constant `CFX_STRING_NOT_FOUND` is returned.

### Parameters

| Parameter               | Description          |
|-------------------------|----------------------|
| <code>lpszString</code> | String to search for |

### Example

The following example demonstrates a search for a string and throwing an exception if it is not found:

```
CCFXStringSet* pAttribs = pRequest->GetAttributeList();

int iDestination =
    pAttribs->GetIndexForString("DESTINATION");
if ( iDestination == CFX_STRING_NOT_FOUND )
{
    pRequest->ThrowException(
        "DESTINATION attribute not found."
        "The DESTINATION attribute is required "
        "by this tag." );
}
```

## CCFXStringSet::GetString

### Syntax

```
LPCSTR CCFXStringSet::GetString(int iIndex)
```

### Description

Retrieves the string located at the passed index (index values are 1-based).

### Returns

Returns the string located at the passed index.

### Parameters

| Parameter           | Description                 |
|---------------------|-----------------------------|
| <code>iIndex</code> | Index of string to retrieve |

### Example

The following example demonstrates `GetString` with `CCFXStringSet::GetCount` to iterate over a string set and write the contents of a list back to the user:

```
int nNumItems = pStringSet->GetCount() ;
for ( int i=1; i<=nNumItems; i++ )
{
    pRequest->Write( pStringSet->GetString( i ) ) ;
    pRequest->Write( "<BR>" ) ;
}
```

# CHAPTER 8

## ColdFusion Java CFX Reference

This chapter describes the Java interfaces available for building Macromedia ColdFusion MX 7 custom CFXs in Java.

### Contents

|                                       |      |
|---------------------------------------|------|
| Class libraries overview . . . . .    | 1075 |
| Custom tag interface . . . . .        | 1076 |
| Query interface . . . . .             | 1077 |
| Request interface . . . . .           | 1082 |
| Response interface . . . . .          | 1087 |
| Debugging classes reference . . . . . | 1090 |

### Class libraries overview

The following Java interfaces are available for building ColdFusion custom CFXs in Java:

| Interface            | Methods   |
|----------------------|---|
| Custom tag interface | <code>processRequest</code>   |
| Query interface      | <code>addRow</code><br><code>getColumnIndex</code><br><code>getColumns</code><br><code>getData</code><br><code>getName</code><br><code>getRowCount</code><br><code>setData</code> |

| Interface          | Methods   |
|--------------------|---|
| Request interface  | <a href="#">attributeExists</a><br><a href="#">debug</a><br><a href="#">getAttribute</a><br><a href="#">getAttributeList</a><br><a href="#">getIntAttribute</a><br><a href="#">getQuery</a><br><a href="#">getSetting</a> |
| Response interface | <a href="#">addQuery</a><br><a href="#">setVariable</a><br><a href="#">write</a><br><a href="#">writeDebug</a>  |

## Custom tag interface

```
public abstract interface CustomTag
```

Interface for implementing custom tags.

Classes that implement this interface can be specified in the `CLASS` attribute of the Java CFX tag. For example, in a class *MyCustomTag*, which implements this interface, the following CFML code calls the `MyCustomTag.processRequest` method:

```
<CFX_MyCustomTag>
```

Other attributes can be passed to the Java CFX tag. Their values are available using the Request object passed to the `processRequest` method.

## Methods

| Returns | Syntax  | Description  |
|---------|---|--|
| void    | <code>processRequest(Request request, Response response)</code> | Processes a request originating from the CFX_mycustomtag tag |

## processRequest

### Description

Processes a request originating from the Java CFX tag.

### Category

[Custom tag interface](#)

### Syntax

```
public void processRequest(Request request, Response response)
```

### Throws

Exception If an unexpected error occurs while processing the request.

## Parameters

| Parameter | Description  |
|-----------|--|
| request   | Parameters (attributes, query, and so on.) for this request                          |
| response  | Interface for generating response to request (output, variables, queries, and so on) |

## Query interface

```
public abstract interface Query
```

Interface to a query used or created by a custom tag. A query contains tabular data organized by named columns and rows.

## Methods

| Returns  | Method   | Description  |
|----------|--|--|
| int      | <a href="#">addRow()</a>                                 | Adds a row to the query                              |
| int      | <a href="#">getColumnIndex(String name)</a>              | Gets the index of a column given its name            |
| String[] | <a href="#">getColumns()</a>                             | Gets a list of the column names in a query           |
| String   | <a href="#">getData(int iRow, int iCol)</a>              | Gets a data element from a row and column of a query |
| String   | <a href="#">getName()</a>                                | Gets the name of a query                             |
| int      | <a href="#">getRowCount()</a>                            | Gets the number of rows in a query                   |
| void     | <a href="#">setData(int iRow, int iCol, String data)</a> | Sets a data element in a row and column of a query   |

## addRow

### Description

Adds a row to a query. Call this method to append a row to a query.

Returns the index of the row that was appended to the query.

### Category

[Query interface](#)

### Syntax

```
public int addRow()
```

### See also

[setData](#), [getData](#)

### Example

The following example demonstrates the addition of two rows to a query that has three columns, *City*, *State*, and *Zip*:

```
// Define column indexes
```

```

int iCity = 1, iState = 2, iZip = 3 ;

// First row
int iRow = query.addRow() ;
query.setData( iRow, iCity, "Minneapolis" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55345" ) ;
// Second row
iRow = query.addRow() ;
query.setData( iRow, iCity, "St. Paul" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55105" ) ;

```

## getColumnIndex

### Description

Returns the index of the column, or 0 if no such column exists.

### Category

[Query interface](#)

### Syntax

```
public int getColumnIndex(String name)
```

### See also

[getColumns](#), [getData](#)

### Parameters

| Parameter | Description   |
|-----------|---|
| name      | Name of column to get index of (lookup is case-insensitive) |

### Example

The following example retrieves the index of the EMAIL column and uses it to output a list of the addresses contained in the column:

```

// Get the index of the EMAIL column
int iEMail = query.getColumnIndex( "EMAIL" ) ;

// Iterate over the query and output list of addresses
int nRows = query.getRowCount() ;
for( int iRow = 1; iRow <= nRows; iRow++ )
{
    response.write( query.getData( iRow, iEMail ) + "<BR>" ) ;
}

```

## getColumns

### Description

Returns an array of strings containing the names of the columns in the query.

### Category

[Query interface](#)

### Syntax

```
public String[] getColumns()
```

### Example

The following example retrieves the array of columns, then iterates over the list, writing each column name back to the user:

```
// Get the list of columns from the query
String[] columns = query.getColumns() ;
int numRows = columns.length ;

// Print the list of columns to the user
response.write( "Columns in query: " ) ;
for( int i=0; i<numRows; i++ )
{
    response.write( columns[i] + " " ) ;
}
```

## getData

### Description

Retrieves a data element from a row and column of a query. Row and column indexes begin with 1. You can find the number of rows in a query by calling `getRowCount`. You can find the number of columns in a query by calling `getColumns`.

Returns the value of the requested data element.

### Category

[Query interface](#)

### Syntax

```
public String getData(int iRow, int iCol)
```

### Throws

`IndexOutOfBoundsException` If an invalid index is passed to the method.

### See also

[setData](#), [addRow](#)

## Parameters

---

| Parameter | Description                            |
|-----------|--|
| iRow      | Row to retrieve data from (1-based)    |
| iCol      | Column to retrieve data from (1-based) |

---

## Example

The following example iterates over the rows of a query and writes the data back to the user in a simple, space-delimited format:

```
int iRow, iCol ;
int nNumCols = query.getColumns().length ;
int nNumRows = query.getRowCount() ;
for ( iRow = 1; iRow <= nNumRows; iRow++ )
{
    for ( iCol = 1; iCol <= nNumCols; iCol++ )
    {
        response.write( query.getData( iRow, iCol ) + " " ) ;
    }
    response.write( "<BR>" ) ;
}
```

## getName

### Description

Returns the name of a query.

### Category

[Query interface](#)

### Syntax

```
public String getName()
```

### Example

The following example retrieves the name of a query and writes it back to the user:

```
Query query = request.getQuery() ;
response.write( "The query name is: " + query.getName() ) ;
```

## getRowCount

### Description

Retrieves the number of rows in a query.

Returns the number of rows contained in a query.

### Category

[Query interface](#)

### Syntax

```
public int getRowCount()
```

## Example

The following example retrieves the number of rows in a query and writes it back to the user:

```
Query query = request.getQuery() ;
int rows = query.getRowCount() ;
response.write( "The number of rows in the query is "
+ Integer.toString(rows) ) ;
```

## setData

### Description

Sets a data element in a row and column of a query. Row and column indexes begin with 1.

Before calling `setData` for a given row, call `addRow` and use the return value as the row index for your call to `setData`.

### Category

[Query interface](#)

### Syntax

```
public void setData(int iRow, int iCol, String data)
```

### Throws

`IndexOutOfBoundsException` If an invalid index is passed to the method.

### See also

[getData](#), [addRow](#)

### Parameters

| Parameter         | Description                             |
|-------------------|---|
| <code>iRow</code> | Row of data element to set (1-based)    |
| <code>iCol</code> | Column of data element to set (1-based) |
| <code>data</code> | New value for data element              |

### Example

The following example demonstrates the addition of two rows to a query that has three columns, *City*, *State*, and *Zip*:

```
// Define column indexes
int iCity = 1, iState = 2, iZip = 3 ;

// First row
int iRow = query.addRow() ;
query.setData( iRow, iCity, "Minneapolis" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55345" ) ;

// Second row
iRow = query.addRow() ;
```

```

query.setData( iRow, iCity, "St. Paul" );
query.setData( iRow, iState, "MN" );
query.setData( iRow, iZip, "55105" );

```

## Request interface

```
public abstract interface Request
```

Interface to a request made to a CustomTag. The interface includes methods for retrieving attributes passed to the tag (including queries) and reading global tag settings.

### Methods

| Returns  | Syntax   | Description   |
|----------|--|---|
| boolean  | <code>attributeExists(String name)</code>          | Checks whether the attribute was passed to this tag.  |
| boolean  | <code>debug()</code>                               | Checks whether the tag contains the <code>debug</code> attribute.   |
| String   | <code>getAttribute(String name)</code>             | Retrieves the value of the passed attribute.  |
| String[] | <code>getAttributeList()</code>                    | Retrieves a list of attributes passed to the tag.   |
| int      | <code>getIntAttribute(String name)</code>          | Retrieves the value of the passed attribute as an integer.  |
| int      | <code>getIntAttribute(String name, int def)</code> | Retrieves the value of the passed attribute as an integer (returns default if the attribute does not exist or is not a valid number). |
| Query    | <code>getQuery()</code>                            | Retrieves the query that was passed to this tag.  |

### attributeExists

#### Description

Checks whether the attribute was passed to this tag.

Returns True if the attribute is available; otherwise returns False.

#### Category

[Request interface](#)

#### Syntax

```
public boolean attributeExists(String name)
```

#### See also

[getAttribute](#), [getAttributeList](#)

#### Parameters

| Parameter | Description                                       |
|-----------|---|
| name      | Name of the attribute to check (case-insensitive) |

## Example

The following example checks whether the user passed an attribute named `DESTINATION` to the tag; if not, it throws an exception:

```
if ( ! request.attributeExists("DESTINATION") )
{
    throw new Exception(
        "Missing DESTINATION parameter",
        "You must pass a DESTINATION parameter in "
        "order for this tag to work correctly." );
};
```

## debug

### Description

Checks whether the tag contains the `debug` attribute. Use this method to determine whether to write debug information for this request. For more information, see [writeDebug](#).

Returns `True` if the tag contains the `debug` attribute; `False`, otherwise.

### Category

[Request interface](#)

### Syntax

```
public boolean debug()
```

### See also

[writeDebug](#)

### Example

The following example checks whether the `debug` attribute is present, and if so, it writes a brief debug message:

```
if ( request.debug() )
{
    response.writeDebug( "debug info" );
}
```

## getAttribute

### Description

Retrieves the value of a passed attribute. Returns an empty string if the attribute does not exist (use `attributeExists` to test whether an attribute was passed to the tag). Use `getAttribute(String,String)` to return a default value rather than an empty string.

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, an empty string is returned.

### Category

[Request interface](#)

## Syntax

```
public String getAttribute(String name)
```

## See also

[attributeExists](#), [getAttributeList](#), [getIntAttribute](#), [getAttribute](#)

## Parameters

---

| Parameter | Description                                  |
|-----------|--|
| name      | The attribute to retrieve (case-insensitive) |

---

## Example

The following example retrieves an attribute named `DESTINATION` and writes its value back to the user:

```
String strDestination = request.getAttribute("DESTINATION") ;
response.write( "The destination is: " + strDestination ) ;
```

## getAttributeList

### Description

Retrieves a list of attributes passed to the tag. To retrieve the value of one attribute, use the `getAttribute` method.

Returns an array of strings containing the names of the attributes passed to the tag.

### Category

[Request interface](#)

### Syntax

```
public String[] getAttributeList()
```

### See also

[attributeExists](#), [getAttributeList](#)

### Example

The following example retrieves the list of attributes, then iterates over the list, writing each attribute and its value back to the user:

```
String[] attribs = request.getAttributeList() ;
int nNumAttribs = attribs.length ;

for( int i = 0; i < nNumAttribs; i++ )
{
    String strName = attribs[i] ;
    String strValue = request.getAttribute( strName ) ;
    response.write( strName + "=" + strValue + "<BR>" ) ;
}
```

## getIntAttribute

### Description

Retrieves the value of the passed attribute as an integer. Returns -1 if the attribute does not exist. Use `attributeExists` to test whether an attribute was passed to the tag. Use `getIntAttribute(String,int)` to return a default value rather than throwing an exception or returning -1.

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, -1 is returned.

### Category

[Request interface](#)

### Syntax

```
public int getIntAttribute(String name)
```

### Throws

`NumberFormatException` If the attribute is not a valid number.

### See also

[attributeExists](#), [getAttributeList](#), [getIntAttribute](#)

### Parameters

| Parameter | Description                                  |
|-----------|--|
| name      | The attribute to retrieve (case-insensitive) |

### Example

The following example retrieves an attribute named `PORT` and writes its value back to the user:

```
int nPort = request.getIntAttribute("PORT");
if ( nPort != -1 )
    response.write( "The port is: " + String.valueOf(nPort) );
```

## getQuery

### Description

Retrieves the query that was passed to this tag.

To pass a query to a custom tag, you use the query attribute. It should be set to the name of a query (created using the `cfquery` tag). The query attribute is optional and should be used only by tags that process an existing dataset.

Returns the Query that was passed to the tag. If no query was passed, returns null.

### Category

[Request interface](#)

## Syntax

```
public Query getQuery()
```

## Example

The following example retrieves a query that was passed to a tag. If no query was passed, an exception is thrown:

```
Query query = request.getQuery() ;
if ( query == null )
{
    throw new Exception(
        "Missing QUERY parameter. " +
        "You must pass a QUERY parameter in "
        "order for this tag to work correctly." ) ;
}
```

## getSetting

### Description

Retrieves the value of a global custom tag setting. Custom tag settings are stored in the CustomTags section of the ColdFusion Registry key.

Returns the value of the custom tag setting. If no setting of that name exists, an empty string is returned.

### Category

[Request interface](#)

### Syntax

```
public String getSetting(String name)
```

### Parameters

| Parameter | Description  |
|-----------|--|
| name      | The name of the setting to retrieve (case-insensitive) |

### Usage

All custom tags implemented in Java share a registry key for storing settings. To avoid name conflicts, preface the names of settings with the name of your custom tag class. For example, the code below retrieves the value of a setting named *VerifyAddress* for a custom tag class named *MyCustomTag*:

```
String strVerify = request.getSetting("MyCustomTag.VerifyAddress") ;
if ( Boolean.valueOf(strVerify) )
{
    // Do address verification...
}
```

# Response interface

```
public abstract interface Response
```

Interface to response generated from a custom tag. This interface includes methods for writing output, generating queries, and setting variables in the calling page.

## Methods

| Returns | Syntax   | Description                               |
|---------|--|---|
| Query   | <code>addQuery(String name, String[] columns)</code> | Adds a query to the calling template.     |
| void    | <code>setVariable(String name, String value)</code>  | Sets a variable in the calling template.  |
| void    | <code>write(String output)</code>                    | Outputs text back to the user.            |
| void    | <code>writeDebug(String output)</code>               | Writes text output into the debug stream. |

## addQuery

### Description

Adds a query to the calling template. The query can be accessed by CFML tags in the template. After calling `addQuery`, the query is empty (it has 0 rows). To populate the query with data, call the Query methods `addRow` and `setData`.

Returns the Query that was added to the template.

### Category

[Response interface](#)

### Syntax

```
public Query addQuery(String name, String[] columns)
```

### Throws

`IllegalArgumentException` If the name parameter is not a valid CFML variable name.

### See also

[addRow](#), [setData](#)

### Parameters

| Parameter | Description                                  |
|-----------|--|
| name      | The name of the query to add to the template |
| columns   | The column names to use in the query         |

### Example

The following example adds a query named *People* to the calling template. The query has two columns (*FirstName* and *LastName*) and two rows:

```
// Create string array with column names (also track columns indexes)
String[] columns = { "FirstName", "LastName" } ;
```

```

int iFirstName = 1, iLastName = 2 ;

// Create a query which contains these columns
Query query = response.addQuery( "People", columns ) ;

// Add data to the query
int iRow = query.addRow() ;
query.setData( iRow, iFirstName, "John" ) ;
query.setData( iRow, iLastName, "Smith" ) ;
iRow = query.addRow() ;
query.setData( iRow, iFirstName, "Jane" ) ;
query.setData( iRow, iLastName, "Doe" ) ;

```

## setVariable

### Description

Sets a variable in the calling template. If the variable name specified exists in the template, its value is replaced. If it does not exist, a new variable is created.

### Category

[Response interface](#)

### Syntax

```
public void setVariable(String name, String value)
```

### Throws

`IllegalArgumentException` If the name parameter is not a valid CFML variable name.

### Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| name      | The name of the variable to set  |
| value     | The value to set the variable to |

### Example

For example, this code sets the value of a variable named *MessageSent* based on the success of an operation performed by the custom tag:

```

boolean bMessageSent ;

...attempt to send the message...

if ( bMessageSent == true )
{
    response.setVariable( "MessageSent", "Yes" ) ;
}
else
{
    response.setVariable( "MessageSent", "No" ) ;
}

```

## write

### Description

Outputs text back to the user.

### Category

[Response interface](#)

### Syntax

```
public void write(String output)
```

### Parameters

| Parameter | Description    |
|-----------|----------------|
| output    | Text to output |

### Example

The following example outputs the value of the `DESTINATION` attribute:

```
response.write( "DESTINATION = " +  
    request.getAttribute("DESTINATION") );
```

## writeDebug

### Description

Writes text output into the debug stream. This text is displayed to the end-user only if the tag contains the `debug` attribute (check for this attribute using the `Request.debug` method).

### Category

[Response interface](#)

### Syntax

```
public void writeDebug(String output)
```

### See also

[debug](#)

### Parameters

| Parameter | Description        |
|-----------|--------------------|
| output    | The text to output |

### Example

The following example checks whether the `debug` attribute is present; if so, it writes a brief debug message:

```
if ( request.debug() )  
{  
    response.writeDebug( "debug info" );  
}
```

## Debugging classes reference

The constructors and methods supported by the `DebugRequest`, `DebugResponse`, and `DebugQuery` classes are as follows. These classes also support the other methods of the `Request`, `Response`, and `Query` interfaces, respectively.

### DebugRequest

```
// initialize a debug request with attributes
public DebugRequest( Hashtable attributes ) ;

// initialize a debug request with attributes and a query
public DebugRequest( Hashtable attributes, Query query ) ;

// initialize a debug request with attributes, a query, and settings
public DebugRequest( Hashtable attributes, Query query,
                    Hashtable settings ) ;
```

### DebugResponse

```
// initialize a debug response
public DebugResponse() ;

// print the results of processing
public void printResults() ;
```

### DebugQuery

```
// initialize a query with name and columns
public DebugQuery( String name, String[] columns )
    throws IllegalArgumentException ;

// initialize a query with name, columns, and data
public DebugQuery( String name, String[] columns, String[][] data )
    throws IllegalArgumentException ;
```

# CHAPTER 9

## WDDX JavaScript Objects

This chapter provides information about JavaScript objects and functions used to WDDX in a Macromedia ColdFusion MX 7 application.

### Contents

|                                  |      |
|----------------------------------|------|
| JavaScript object overview ..... | 1091 |
| WddxSerializer object .....      | 1092 |
| WddxRecordset object .....       | 1095 |

### JavaScript object overview

These are the JavaScript objects and functions:

| Class                 | Functions  |
|-----------------------|--|
| WddxSerializer object | serialize<br>serializeVariable<br>serializeValue<br>write                    |
| WddxRecordset object  | addColumn<br>addRows<br>getField<br>getRowCount<br>setField<br>wddxSerialize |

WDDX JavaScript objects are defined in the wddx.js file; this file is installed in the CFIDE/scripts directory.

To use these objects, you must put a JavaScript tag before the code that refers to the objects; for example:

```
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"></script>
```

# WddxSerializer object

The WddxSerializer object includes functions that serialize any JavaScript data structure. For more information on using this object, see “Using WDDX” in Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*.

## Functions

The only function that developers typically call is `serialize`.

| Function syntax                                  | Description   |
|--|---|
| <code>object.serialize(rootobj)</code>           | Creates a WDDX packet for a passed WddxRecordset instance.  |
| <code>object.serializeVariable(name, obj)</code> | Serializes a property of a structure. If an object is not a string, number, array, Boolean, or a date, WddxSerializer treats it as a structure. |
| <code>object.serializeValue(obj)</code>          | Recursively serializes eligible data in a passed instance.  |
| <code>object.write(str)</code>                   | Appends data to the serialized data stream.   |

## serialize

### Description

Creates a WDDX packet for a passed WddxRecordset instance.

### Syntax

```
object.serialize( rootobj )
```

### Parameters

| Parameter | Description                                |
|-----------|--|
| object    | Instance name of the WddxSerializer object |
| rootobj   | JavaScript data structure to serialize     |

### Return value

Returns a serialized WDDX packet as a string if the function succeeds, or a null value if an error occurs.

### Usage

Call this function to serialize the data in a WddxRecordset instance.

### Example

This example shows a JavaScript function that you can call to serialize a WddxRecordset instance. It copies serialized data to a form field for display:

```
function serializeData(data, formField)
{
    wddxSerializer = new WddxSerializer();
    wddxPacket = wddxSerializer.serialize(data);
```

```

    if (wddxPacket != null)
    {
        formField.value = wddxPacket;
    }
    else
    {
        alert("Couldn't serialize data");
    }
}

```

## serializeVariable

### Description

Serializes a property of a structure. If an object is not a string, number, array, Boolean, or date, WddxSerializer treats it as a structure.

### Syntax

```
object.serializeVariable( name, obj )
```

### Parameters

| Parameter | Description                              |
|-----------|--|
| object    | Instance name of a WddxSerializer object |
| name      | Property to serialize                    |
| obj       | Instance name of the value to serialize  |

### Return value

Returns a Boolean True if serialization was successful; False, otherwise.

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serializeValue` function:

```

...
// Some generic object; treat it as a structure
this.write("<struct>");
for (prop in obj)
{
    bSuccess = this.serializeVariable(prop, obj[prop]);
    if (! bSuccess)
    {
        break;
    }
}
this.write("</struct>");
...

```

## serializeValue

### Description

Recursively serializes eligible data in a passed instance. Eligible data includes:

- String
- Number
- Boolean
- Date
- Array
- Recordset
- Any JavaScript object

This function serializes null values as empty strings.

### Syntax

```
object.serializeValue( obj )
```

### Parameters

| Parameter | Description  |
|-----------|--|
| object    | Instance name of the WddxSerializer object             |
| obj       | Instance name of the WddxRecordset object to serialize |

### Return value

Returns a Boolean True if *obj* was serialized successfully; False, otherwise.

### Usage

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serialize` function:

```
...
this.wddxPacket = "";
this.write("<wddxPacket version='1.0'><header/><data>");
bSuccess = this.serializeValue(rootObj);
this.write("</data></wddxPacket>");
if (bSuccess)
{
    return this.wddxPacket;
}
else
{
    return null;
}
...
```

## write

### Description

Appends data to a serialized data stream.

### Syntax

```
object.write( str )
```

### Parameters

| Parameter | Description                                       |
|-----------|---|
| object    | Instance name of the WddxSerializer object        |
| str       | String to be copied to the serialized data stream |

### Return value

Returns an updated serialized data stream as a String.

### Usage

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serializeValue` function:

```
...
else if (typeof(obj) == "number")
{
    // Number value
    this.write("<number>" + obj + "</number>");
}
else if (typeof(obj) == "boolean")
{
    // Boolean value
    this.write("<boolean value='" + obj + "'/>");
}
...
```

## WddxRecordset object

Includes functions that you call as needed when constructing a WDDX record set. For more information on using this object, see “Using WDDX” in Chapter 35, “Using XML and WDDX” in *ColdFusion MX Developer’s Guide*.

## Functions

| Function syntax                         | Description  |
|---|--|
| <code>object.addColumn(name)</code>     | Adds a column to all rows in a WddxRecordset instance. |
| <code>object.addRows(n)</code>          | Adds rows to all columns in a WddxRecordset instance.  |
| <code>object.dump(escapeStrings)</code> | Displays WddxRecordset object data.                    |

| Function syntax                               | Description   |
|---|---|
| <code>object.getField(row, col)</code>        | Returns the element in a row/column position.             |
| <code>object.getRowCount()</code>             | Indicates the number of rows in a WddxRecordset instance. |
| <code>object.setField(row, col, value)</code> | Sets the element in a row/column position.                |
| <code>object.wddxSerialize(serializer)</code> | Serializes a record set.                                  |

## Returns

HTML table of the WddxRecordset object data.

## Usage

Convenient for debugging and testing record sets. The boolean parameter `escapeStrings` determines whether `<>&` characters in string values are escaped as `&lt;&gt;&amp;` in HTML.

## Example

```
<!-- Create a simple query -->
<cfquery name = "q" datasource = "cfdocexamples">
SELECT Message_Id, Thread_id, Username, Posted
FROM messages
</cfquery>
<!-- Load the wddx.js file, which includes the dump function -->
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"></script>
<script>
// Use WDDX to move from CFML data to JS
<cfwddx action="cfml2js" input="#q#" topLevelVariable="qj">
// Dump the record set
document.write(qj.dump(true));
</script>
```

## addColumn

### Description

Adds a column to all rows in a WddxRecordset instance.

### Syntax

```
object.addColumn( name )
```

### Parameters

| Parameter           | Description                               |
|---------------------|---|
| <code>object</code> | Instance name of the WddxRecordset object |
| <code>name</code>   | Name of the column to add                 |

### Return value

None.

## Usage

Adds a column to every row of the WDDX record set. Initially the new column's values are set to NULL.

## Example

This example calls the `addColumn` function:

```
// Create a new record set
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```

## addRows

### Description

Adds rows to all columns in a `WddxRecordset` instance.

### Syntax

```
object.addRows( n )
```

### Parameters

| Parameter           | Description  |
|---------------------|--|
| <code>object</code> | Instance name of the <code>WddxRecordset</code> object |
| <code>n</code>      | Integer; number of rows to add                         |

### Return value

None.

### Usage

This function adds the specified number of rows to every column of a WDDX record set. Initially, the row/column values are set to NULL.

## Example

This example calls the `addRows` function:

```
// Create a new record set
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");
```

```
// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```

## getField

### Description

Returns the element in the specified row/column position.

### Syntax

```
object.getField( row, col )
```

### Parameters

| Parameter | Description  |
|-----------|--|
| object    | Instance name of the WddxRecordset object              |
| row       | Integer; zero-based row number of the value to return  |
| col       | Integer or string; column of the value to be returned. |

### Return value

Returns the value in the specified row/column position.

### Usage

Call this function to access a value in a WDDX record set.

### Example

This example calls the `getField` function (the variable `r` is a reference to a `WddxRecordset` instance):

```
for (row = 0; row < nRows; ++row)
{
  o += "<tr>";
  for (i = 0; i < colNames.length; ++i)
  {
    o += "<td>" + r.getField(row, colNames[i]) + "</td>";
  }
  o += "</tr>";
}
```

## getRowCount

### Description

Indicates the number of rows in a `WddxRecordset` instance.

### Syntax

```
object.getRowCount( )
```

## Parameters

---

| Parameter | Description                             |
|-----------|---|
| object    | Instance name of a WddxRecordset object |

---

## Return value

Integer. Returns the number of rows in the WddxRecordset instance.

## Usage

Call this function before a looping construct to determine the number of rows in a record set.

## Example

This example calls the `getRowCount` function:

```
function dumpWddxRecordset(r)
{
  // Get row count
  nRows = r.getRowCount();
  ...
  for (row = 0; row < nRows; ++row)
  ...
}
```

## setField

### Description

Sets the element in the specified row/column position.

### Syntax

```
object.setField( row, col, value )
```

## Parameters

---

| Parameter | Description   |
|-----------|---|
| object    | Instance name of a WddxRecordset object                     |
| row       | Integer; row that contains the element to set               |
| col       | Integer or string; the column containing the element to set |
| value     | Value to set  |

---

## Return value

None.

## Usage

Call this function to set a value in a WddxRecordset instance.

## Example

This example calls the `setField` function:

```
// Create a new recordset
rs = new WddxRecordset();
```

```

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);

```

## wddxSerialize

### Description

Serializes a record set.

### Syntax

```
object.wddxSerialize( serializer )
```

### Parameters

| Parameter  | Description                               |
|------------|---|
| object     | Instance name of the WddxRecordset object |
| serializer | WddxSerializer instance                   |

### Return value

Returns a Boolean True if serialization was successful; False, otherwise.

### Usage

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serializeValue` function:

```

...
else if (typeof(obj) == "object")
{
if (obj == null)
{
// Null values become empty strings
this.write("<string></string>");
}
else if (typeof(obj.wddxSerialize) == "function")
{
// Object knows how to serialize itself
bSuccess = obj.wddxSerialize(this);
}
}
...

```

# CHAPTER 10

## ColdFusion ActionScript Functions

This chapter explains the syntax and usage of the two Macromedia ColdFusion MX 7 server-side ActionScript functions, `CF.query` and `CF.http`.

### Contents

|                                |      |
|--------------------------------|------|
| <a href="#">CF.query</a> ..... | 1102 |
| <a href="#">CF.http</a> .....  | 1104 |

# CF.query

## Description

Performs queries against ColdFusion data sources.

## Return value

Returns a RecordSet object.

## Syntax

```
CF.query
({
    datasource:"data source name",
    sql:"SQL stmts",
    username:"username",
    password:"password",
    maxrows:number,
    timeout:milliseconds
})
```

## Arguments

| Arguments  | Req/Opt  | Description  |
|------------|----------|--|
| datasource | Required | Name of the data source from which the query retrieves data.   |
| sql        | Required | SQL statement.   |
| username   | Optional | Username. Overrides the username specified in the data source setup.   |
| password   | Optional | Password. Overrides the password specified in the data source setup.   |
| maxrows    | Optional | Maximum number of rows to return in the record set.  |
| timeout    | Optional | Maximum number of seconds for the query to execute before returning an error indicating that the query has timed out. Can only be used in named arguments. |

## Usage

You can code the `CF.query` function using named or positional arguments. You can invoke all supported arguments using the named argument style, as follows:

```
CF.query({datasource:"datasource", sql:"sql stmt",
    username:"username", password:"password", maxrows:"maxrows",
    timeout:"timeout"});
```

**Note:** The named argument style uses curly braces `{}` to surround the function arguments.

Positional argument style, which is a shorthand coding style, does not support all arguments. Use the following syntax to code the `CF.query` function using positional arguments:

```
CF.query(datasource, sql);
CF.query(datasource, sql, maxrows);
CF.query(datasource, sql, username, password);
CF.query(datasource, sql, username, password, maxrows);
```

**Note:** Do not use curly braces `{}` with positional arguments.

You can manipulate the record set returned by the `CF.query` function using methods in the `RecordSet` ActionScript class. The following are some of the methods available in the `RecordSet` class:

- `RecordSet.getColumnNames`
- `RecordSet.getLength`
- `RecordSet.getItemAt`
- `RecordSet.getItemID`
- `RecordSet.sortItemsBy`
- `RecordSet.getNumberAvailable`
- `RecordSet.filter`
- `RecordSet.sort`

For more information on using server-side ActionScript, see Chapter 34, “Using Server-Side ActionScript” in *ColdFusion MX Developer’s Guide*. For more detailed information about the `RecordSet` ActionScript class, see *Using Flash Remoting*.

### Example

```
// Define a function to do a basic query
// Note use of positional arguments
function basicQuery()
{
    result = CF.query("myquery", "cust_data", "SELECT * from tblParks");
    return result;
}

// Example function declaration using named arguments
function basicQuery()
{
    result = CF.query({datasource:"cust_data", sql:"SELECT * from tblParks"});
    return result;
}

// Example of the CF.query function using maxrows argument
function basicQueryWithMaxRows()
{
    result = CF.query("cust_data", "SELECT * from tblParks", 25);
    return result;
}

// Example of the CF.query function with username and password
function basicQueryWithUser()
{
    result = CF.query("cust_data", "SELECT * from tblParks",
        "wsburroughs", "migraine1");
    return result;
}
```

# CF.http

## Description

Executes HTTP POST and GET operations on files. (POST operations upload MIME file types to a server, or post cookie, formfield, URL, file, or CGI variables directly to a server.)

## Return value

Returns an object containing properties that you reference to access data.

## Syntax

```
CF.http
({
    method:"get or post",
    url:"URL",
    username:"username",
    password:"password",
    resolveurl:"yes or no",
    params:arrayvar,
    path:"path",
    file:"filename"
})
```

## Arguments

| Arguments | Req/Opt  | Description  |
|-----------|----------|--|
| method    | Required | One of two arguments: <ul style="list-style-type: none"><li>• get: downloads a text or binary file or creates a query from the contents of a text file.</li><li>• post: sends information to the server page or CGI program for processing. Requires the <code>params</code> argument.</li></ul> |
| url       | Required | The absolute URL of the host name or IP address of the server on which the file resides. The URL must include the protocol (http or https) and host name.  |
| username  | Optional | When required by a server, a username.   |
| password  | Optional | When required by a server, a password.   |

| Arguments  | Req/Opt  | Description   |
|------------|----------|---|
| resolveurl | Optional | <p>For <code>Get</code> and <code>Post</code> methods.</p> <ul style="list-style-type: none"> <li>• Yes or No. Default is No.</li> </ul> <p>For <code>GET</code> and <code>POST</code> operations, if Yes, the page reference that is returned into the <code>Filecontent</code> property has its internal URLs fully resolved, including port number, so that links remain intact. The following HTML tags, which can contain links, are resolved:</p> <ul style="list-style-type: none"> <li>- <code>img src</code></li> <li>- <code>a href</code></li> <li>- <code>form action</code></li> <li>- <code>applet code</code></li> <li>- <code>script src</code></li> <li>- <code>embed src</code></li> <li>- <code>embed pluginspace</code></li> <li>- <code>body background</code></li> <li>- <code>frame src</code></li> <li>- <code>bgsound src</code></li> <li>- <code>object data</code></li> <li>- <code>object classid</code></li> <li>- <code>object codebase</code></li> <li>- <code>object usemap</code></li> </ul> |
| params     | Optional | <p>HTTP parameters passed as an array of objects. Supports the following parameter types:</p> <ul style="list-style-type: none"> <li>• name</li> <li>• type</li> <li>• value</li> </ul> <p><code>CF.http</code> params are passed as an array of objects. The <code>params</code> argument is required for <code>POST</code> operations.</p>  |
| path       | Optional | The path to the directory in which to store files. When using the <code>path</code> argument, the <code>file</code> argument is required.   |
| file       | Optional | Name of the file that is accessed. For <code>GET</code> operations, defaults to the name specified in the <code>url</code> argument. Enter path information in the <code>path</code> argument. This argument is required if you are using the <code>path</code> argument.   |

## Usage

You can write the `CF.http` function using named arguments or positional arguments. You can invoke all supported arguments using the named argument style, as follows:

```
CF.http({method:"method", url:"URL", username:"username", password:"password",
  resolveurl:"yes or no", params:arrayvar,
  path:"path", file:"filename"});
```

**Note:** The named argument style uses curly braces `{}` to surround the function arguments.

Positional arguments let you use a shorthand coding style. However, not all arguments are supported for the positional argument style. Use the following syntax to code the `CF.http` function using positional arguments:

```
CF.http(url);
CF.http(method, url);
```

```
CF.http(method, url, username, password);
CF.http(method, url, params, username, password);
```

**Note:** Do not use curly braces {} with positional arguments.

The following parameters can only be passed as an array of objects in the `params` argument in the `CF.http` function:

| Parameter | Description   |
|-----------|---|
| name      | The variable name for data that is passed   |
| type      | The transaction type: <ul style="list-style-type: none"><li>• URL</li><li>• FormField</li><li>• Cookie</li><li>• CGI</li><li>• File</li></ul> |
| value     | Value of URL, FormField, Cookie, File, or CGI variables that are passed   |

The `CF.http` function returns data as a set of object properties, as described in the following table:

| Property    | Description  |
|-------------|--|
| Text        | A Boolean value that indicates whether the specified URL location contains text data.  |
| Charset     | The charset used by the document specified in the URL.<br>HTTP servers normally provide this information, or the charset is specified in the charset parameter of the Content-Type header field of the HTTP protocol. For example, the following HTTP header announces that the character encoding is EUC-JP:<br>Content-Type: text/html; charset=EUC-JP                               |
| Header      | Raw response header. For example, <code>macromedia.com</code> returns the following header:<br>HTTP/1.1 200 OK<br>Date: Mon, 04 Mar 2002 17:27:44 GMT<br>Server: Apache/1.3.22 (Unix) mod_perl/1.26<br>Set-Cookie: MM_cookie=207.22.48.162.4731015262864476;<br>path=/; expires=Wed, 03-Mar-04 17:27:44 GMT;<br>domain=.macromedia.com<br>Connection: close<br>Content-Type: text/html |
| Filecontent | File contents, for text and MIME files.  |
| Mimetype    | MIME type. Examples of MIME types include <code>text/html</code> , <code>image/png</code> , <code>image/gif</code> , <code>video/mpeg</code> , <code>text/css</code> , and <code>audio/basic</code> .  |

| Property       | Description  |
|----------------|--|
| responseHeader | Response header. If there is only one header key, its value can be accessed as simple type. If there are multiple header keys, the values are put in an array in a responseHeader structure.                           |
| Statuscode     | HTTP error code and associated error string. Common HTTP status codes returned in the response header include:<br>400: Bad Request<br>401: Unauthorized<br>403: Forbidden<br>404: Not Found<br>405: Method Not Allowed |

You access these attributes using the `get` function:

```
function basicGet()
{
    url = "http://localhost:8100/";

    // Invoke with just the url. This is an HTTP GET.
    result = CF.http(url);
    return result.get("Filecontent");
}
```

**Note:** For more information on using server-side ActionScript, see Chapter 34, “Using Server-Side ActionScript” in *ColdFusion MX Developer’s Guide*.

### Example

The following examples show a number of the ways to use the `CF.http` function:

```
function postWithNamedArgs()
{
    // Set up the array of Post parameters.
    params = new Array();
    params[1] = {name:"arg1", type:"FormField", value:"value1"};
    params[2] = {name:"arg2", type:"URL", value:"value2"};
    params[3] = {name:"arg3", type:"CGI", value:"value3"};

    url = "http://localhost:8100/";

    path = application.getContext("/").getRealPath("/");
    file = "foo.txt";

    result = CF.http({method:"post", url:url, username:"karl", password:"salsa",
    resolveurl:true, params:params, path:path, file:file});

    if (result)
        return result.get("Statuscode");
    return null;
}

// Example of a basic HTTP GET operation
// Shows that HTTP GET is the default
function basicGet()
```

```

{
    url = "http://localhost:8100/";

    // Invoke with just the url. This is an HTTP GET.
    result = CF.http(url);
    return result.get("Filecontent");
}

// Example showing simple array created to pass params arguments
function postWithParams()
{
    // Set up the array of Post parameters. These are just like cfhttpparam tags.
    params = new Array();
    params[1] = {name:"arg2", type:"URL", value:"value2"};

    url = "http://localhost:8100/";

    // Invoke with the method, url, and params
    result = CF.http("post", url, params);
    return result.get("Filecontent");
}

// Example with username and params arguments
function postWithParamsAndUser()
{
    // Set up the array of Post parameters. These are just like cfhttpparam tags.
    params = new Array();
    params[1] = {name:"arg2", type:"URL", value:"value2"};

    url = "http://localhost:8100/";

    // Invoke with the method, url, params, username, and password
    result = CF.http("post", url, params, "karl", "salsa");
    return result.get("Filecontent");
}

```
