

# Adobe Fireworks CS4 Troubleshooting

## **Legal notices**

For legal notices, see [http://help.adobe.com/en\\_US/legalnotices/index.html](http://help.adobe.com/en_US/legalnotices/index.html).

## **A note to our customers**

Adobe provides this searchable PDF of archived technical support documents as a service to our customers who own and continue to enjoy older, unsupported versions of our software products. The information in these documents is not updated, and will become increasingly less accurate as hardware, browsers, and operating systems continue to evolve. Please be aware that these archived documents reflect historical issues and solutions for products that are no longer supported. Adobe does not warrant that the information in this document is accurate.

# Welcome window in Fireworks is partially off the screen and cannot be closed

## Issue

After launching Fireworks 4, the [Welcome window](#) appears partially off the screen with the Close Window button not visible. (The Welcome window can also be activated by choosing Help > Welcome.) Because the Close Window button is not visible, the window cannot be closed and now covers the Fireworks workspace.

## Reason

The Welcome window can appear too-large on the screen if the monitor is set to a low resolution, such as 640 x 480 pixels.

## Solution

Three methods exist to close this window, including:

### Using the Alt+F4 function keys

The Fireworks Welcome window is a standard system element which can be removed by first pressing and holding the Alt key and then pressing the F4 function key (Alt+F4). This keyboard shortcut will close any currently active window (unless Function keys have been disabled on the system or some other configuration setting has disabled the key combination). For this key combination to work, first make sure that the Welcome window is currently the active window by clicking on it.

### Changing the monitor resolution

- 1 Right-click on an empty place on the Desktop.
- 2 Select Properties in the context menu. The Display Properties dialog box will appear.
- 3 Click the Settings tab and locate the Screen Area slider.
- 4 Move the slider to the right to increase screen resolution to at least 1024 x 768 pixels.

Once the screen resolution is set to 1024 x 768 pixels or higher, the Fireworks 4 Welcome window will not appear with its title bar and close box on your monitor until you delete the Fireworks 4 Preferences.txt file. Once this is done, the Welcome window will appear on the screen with its title bar and close box. Click the close box to close the window.

## Disabling the Welcome window in the Fireworks 4 Preferences.txt file

- 1 Close Fireworks, if it is currently open.
- 2 Choose Start > Programs > Accessories > Notepad to launch Windows Notepad.
- 3 In Notepad, choose File > Open and navigate to the Fireworks 4 directory which normally would be located at: C:\Program Files\Macromedia\Fireworks 4
- 4 Open the file named Fireworks 4 Preferences.txt found in the Fireworks 4 folder.
- 5 Locate the following line in the preferences file (use Notepad's Edit > Find command, if necessary): DisplayWelcomeMovie) (true)
- 6 Change "true" to "false".
- 7 Save the file.
- 8 Exit Notepad and launch Fireworks 4. The Welcome window will now not appear unless the user chooses Help > Welcome in Fireworks 4.

## Using Photoshop layer masks in Fireworks 3

**Accessing a layer mask from Adobe Photoshop** Layer masks in Photoshop do not appear as masks in Fireworks 3 layers. Instead the masked objects appear in the Fireworks 3 PNG file as an image with a transparent background. Beginning with Fireworks 4, however, the masks are retained from Photoshop files.

This TechNote, then, is useful for Fireworks 3 users who would like to use a Photoshop file containing masks. The instructions show users how to use a layer mask from a Photoshop document as a mask in Fireworks. Such a layer mask can be edited when selected. This TechNote is also useful for all Fireworks users wishing to follow the [Fireworks steps](#) to composite masked images in all versions of Fireworks.

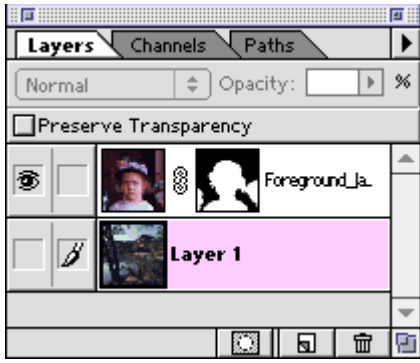

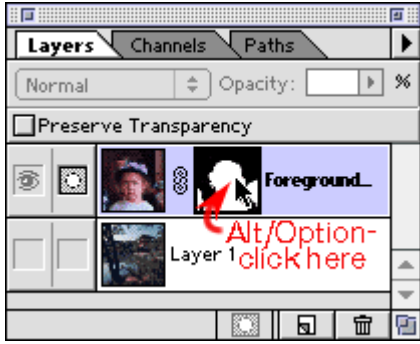

**Note:** This workaround is for Fireworks 3 users. Layer masks in Photoshop files that are opened or imported into Fireworks 4 or MX will be retained as bitmap masks.

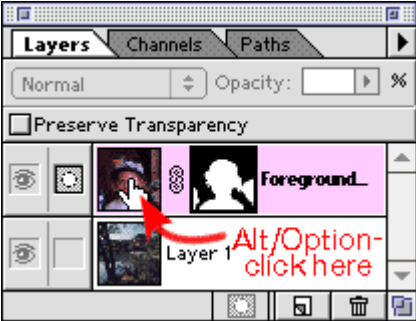

**Strategies** There are two ways to approach the task:

▶	A user can copy and paste a mask to a new layer from within a Photoshop file if a selection path is not needed for modification. See the <a href="#">first set of Photoshop instructions</a> for step-by-step instructions.
▶	If you wish to change a selection, you have the option of either using a previously saved selection or creating a selection from the mask. The instructions below will show how to add a modification, such as a feathered edge, to the selection. You will also learn how to recreate the layer mask as an image on a new separate layer. Refer to the <a href="#">second set of Photoshop instructions</a> for step-by-step instructions.

Once the layer mask is separated out to its own layer, import the file into Fireworks and use the mask object to mask any other object in the document.

**Photoshop tasks** Preparing a Photoshop file with a layer mask (without a selection path):

1	<p>Open the Photoshop file containing the layer mask and turn off the visibility of any other layers. If more than one layer has a layer mask applied, you will need to perform this operation multiple times (once for each individual layer mask). Make sure that only one layer is visible at this time.</p>
	
2	<p>Press Alt (Windows) or Option (Macintosh) and click the thumbnail for the layer mask. This will make the mask itself visible rather than the artwork on the layer.</p>
	
3	<p>Press Ctrl + A (Windows) or Command + A (Macintosh) or choose Select &gt; All to select all of the mask image. Press Ctrl + C (Windows) or Command + C (Macintosh) to copy the mask.</p>

	
<p>4</p>	<p>Press Alt (Windows) or Option (Macintosh) and click the thumbnail for the artwork on the masked layer to restore the artwork for that layer. This will make the artwork visible in the document window rather than the mask. Press Ctrl + D (Windows) or Command + D (Macintosh) to deselect all.</p>
	

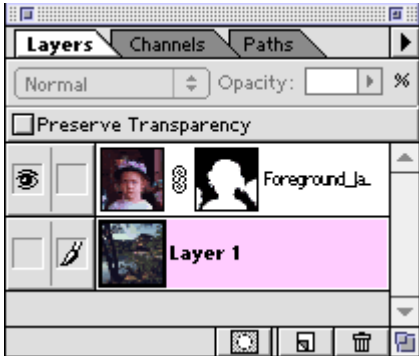

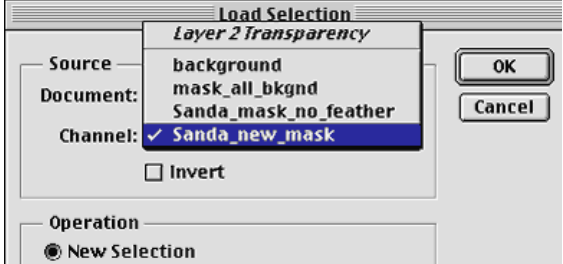

5	<p>Press Ctrl + V (Windows) or Command + V (Macintosh) to paste the mask image from the clipboard into the document. This will create a new layer with the mask on it.</p> <p><b>Note:</b>A Fireworks mask contains two colors. The black areas will cause the image being masked to appear opaque. The white areas will cause the image being masked to appear transparent. In Fireworks MX these colors are reversed, i.e. black areas will cause pixels to appear transparent and white objects will cause pixels to be opaque.</p>
	
6	<p>To remove the mask from the layer, drag the thumbnail of the layer mask to the layer palette's trash icon. Select Discard in the alert window that appears.</p>

	
7	<p>The layers palette will now appear with the mask on the first layer and the unmasked layer below it. Repeat steps 1 through 6 for any other layers with masks that you wish to use in Fireworks. Choose File &gt; Save As. Name and save the file as a Photoshop file format.</p> <p>When the Photoshop document is opened or imported into Fireworks, the grayscale images on their own layer may be used with images in other layers as masks. Simply use the Mask Group command.</p>
	

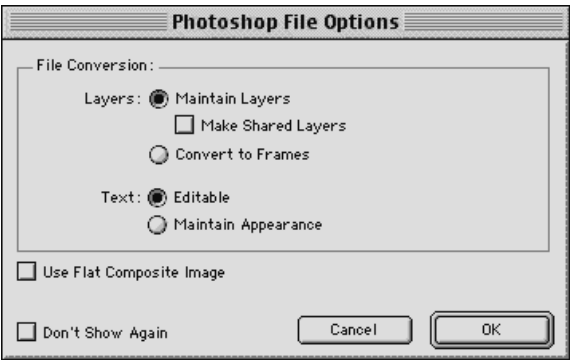

[Proceed to the Fireworks portion of this TechNote.](#)

**Preparing a Photoshop file with a layer mask (with a selection path):**

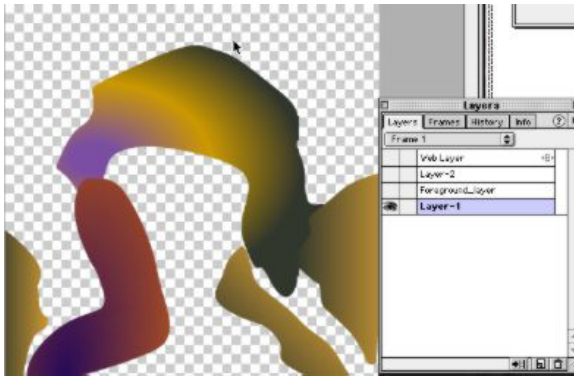

1	<p>Open the Photoshop file containing the layer mask. Notice that the black areas of the mask are the background. These areas mask out to reveal the graphic in Layer 1 with the Foreground_layer image on top.</p>
	
2	<p>Choose Select &gt; Load Selection. Choose the selection that was used to generate the mask. If the selection was not saved, do the following: Open the Channels panel. Hide all channels except the mask. Select the Magic Wand. Set the tolerance for the wand to 12. Click on the black area to select all of the mask (use shift-click if noncontiguous areas exist).</p> <p><b>Note:</b> If you want to reverse the mask in Fireworks, you can choose Select &gt; Inverse. If you want to feather the selection you can choose Select &gt; Feather, then set a pixel distance for the selection's feather.</p>
	
3	<p>Click the triangle at the top right of the Layers palette to display the palette menu. Choose New Layer and fill the selection with black. The image on the new layer will be an exact duplicate of the layer mask but it will be a grayscale image on the new layer. If you inverted the selection it will be a reverse of the layer mask.</p> <p><b>Note:</b> In Fireworks 3 and 4 masks, black areas cause the image being masked to appear opaque. White areas cause the image being masked to appear transparent. This is reversed in Fireworks MX masks.</p>

	
	<p><b>Tip:</b> You can also save your selection as a clipping path in Photoshop. Open the Paths panel in Photoshop. While the selection is still marquee'd, click the Options arrow at the top right of the Paths panel and select New Path from the pop-up menu. Name the path and click OK in the New Path dialog box. With the path highlighted in the Paths panel, click the Options arrow again and choose Make Work Path. Set the tolerance to .5 and click OK in the Make Work Path dialog box. Double-click the work path and give it a name in the Save Path dialog. Click the Options arrow one more time and choose Clipping Path. Select the path from the pop-up in the Clipping Path dialog box and set the flatness to 3 device pixels. Click OK to save your settings. Choose File &gt; Export &gt; Paths to Illustrator to create a vector shape which may be imported into Fireworks and used as a mask or for other purposes. The vector shape is always editable but if pixel level accuracy is needed in your mask, a bitmap selection may work better.</p>
4	Choose File > Save As. Name and save your file as the Photoshop file format.

**Fireworks tasks** To use the layer mask in Fireworks, do the following:

1	In Fireworks, open the Photoshop file containing the layer mask. Use the default settings as illustrated in the image below.
	
2	Because the mask has been converted to a layer in Photoshop, it will also appear in the same layer in Fireworks. Notice that all of the layers are intact. The Layer that had the layer mask on it appears as an image with a transparent background. In this example, the selection was feathered so the foreground image has a glow around it. The canvas color is showing through the feathered area.
	

3	<p>In this image, the layer mask was left intact and the duplicate mask was feathered to produce a mask for the background image. Masking the background image with a feathered image will produce transparency at the intersection of the images, allowing the canvas to show through. If desired, a background layer with colored fills can be added to give a variety of colors to the glow, adding interesting lighting effects.</p> <p>Select the mask image and the background image and choose Modify &gt; Mask Group to create the masked background with its feathered edge.</p>
	
4	<p>In the layers panel, click the Options arrow and select New Layer... Name the layer. Move the new layer to the bottom of the layer stack. Draw vector paths containing gradients using colors from the foreground and background images. (The eyedropper in the Gradient Fill Editor's swatch pop-up should be used to select colors from the image). In this selection the flowers on the hat, the green in the background and a yellow color were chosen to get a glow in some areas and a shadow in others.</p>

	
5	<p>Because the vector shapes are behind the areas that are feathered and semi-transparent, they show through the feather only slightly giving the image a glow in some places, a shadow in others. This adds depth to the image. Also, the Mask Group in Fireworks allows you the option of ungrouping the mask. You can then apply it to any other image you wish to import.</p>
	

## Uninstall Fireworks 8 | Mac OS X

You can uninstall Macromedia Fireworks 8 from Mac OS X using one of the two methods listed below.

### Use the installer

When uninstalling Fireworks, be sure to select the correct location for the Fireworks application folder in the installation program. It necessary to select the correct location to locate and remove the necessary files. Do the following:

- 1 If Fireworks is running, choose File > Quit
- 2 Launch the Fireworks 8 Installer.
- 3 When prompted to select a Destination, click the Select Folder button. Navigate to the location on your hard drive where the Fireworks application folder is installed. Click Choose.
- 4 On the next Install screen, select the Uninstall option from the pop-up menu at the top of the dialog box. Click the Uninstall button to begin the uninstallation process.

### Uninstall manually

To manually uninstall Fireworks 8 from your computer, delete the following folders:

**Note:** Confirm that Fireworks is not running before proceeding.

- Fireworks 8 application folder - The location of this folder varies if installed to a location other than the default location of the Applications folder.
- Fireworks support files - Delete the Fireworks 8 folder from the following path: [hard\_drive]: Users: [user\_name]: Library: Application Support: Macromedia:
- Fireworks preferences: Delete the Fireworks 8 folder from the following path: [hard\_drive]: Users: [user\_name]: Library: Preferences: Macromedia:

**Note:** Delete the folder located in the Users folders for each user account that has run Fireworks 8.

## Unexpected results exporting CSS for multiple pages or multiple states in Fireworks (Windows)

### Fireworks version

CS4

### Issue

When you try to export CSS for multiple pages or multiple states in Adobe Fireworks you may experience unexpected results, including (but not limited to) an error message such as, "Individual slice exception[1,1]"

## Solution

Limit CSS export to the current page and the current state. Exporting multiple pages and multiple states is not supported.

# Text tool in Fireworks CS3 displays "?" instead of Russian or Greek on Mac OS

## Issue

When you type cyrillic (for example, Russian, Greek) using the Text tool in Adobe Fireworks CS3, question marks are displayed instead of the desired characters. This happens regardless of whether you have set the operating system interface to English or to Russian/Greek.

## Solution

### Upgrade to Fireworks CS4.

- To purchase an upgrade from Adobe, visit the Adobe Store at <http://store.adobe.com/>, click the link for your region, click Software, and then click the link for the product you want to purchase.
- To locate an authorized reseller, visit the Adobe website at [www.adobe.com/store/customerregistration/other\\_places.jhtml](http://www.adobe.com/store/customerregistration/other_places.jhtml).

## Supported file formats

This document provides an overview of the supported file formats in Fireworks. For more information about how to use different file formats in Fireworks, see the Fireworks online Help.

### Supported file formats for new files

New documents in Fireworks are saved as Portable Network Graphic (PNG) documents, the native file format for Fireworks.

### Supported file formats for opening, importing, and saving

- Fireworks PNG
- Flattened PNG
- GIF
- animated GIF
- JPEG
- BMP

- WBMP
- SWF
- AI (Illustrator 8)
- PSD
- PICT (Mac OS only)
- TIFF

#### Supported file formats for exporting

- Adobe PDF
- HTML and images
- images only (based on original file type)
- FXG (CS5)
- MXML (CS5)
- EPS (Open only) (CS5)
- Dreamweaver library (lbi)
- CSS and Images (htm)
- Director (htm)
- Animations (animated GIF files, Flash SWF files or Fireworks PNG, states or layers as multiple files)

For more information on the export options of Fireworks, see the section "Optimizing and Exporting" in the online Help.

## How to show a "don't show again" dialog again

When you first install Fireworks, it will often show dialogs with specific advice or tips.

The following are some examples of these dialogs:

▶	How to reduce preview time in the Export Preview dialog
▶	Warning when converting a vector shape to filtered pixels
▶	Warning when changing text in a single button state

Most of these dialogs have a small "Don't show again" checkbox within them, so you can stop seeing them if you wish. Fireworks gives you necessary information once, and then gets out of your way as you learn the program.

There may be an occasion when you will want to see one of these dialogs again. This TechNote describes how you can get these dialogs to come back after you've checked the "Don't show again" option.

**To see the dialog box again do the following:**

1	Quit Fireworks.
2	Delete the Fireworks Preferences file. On Windows this file is found in your Fireworks 3 folder, and on Macintosh this file is found in your System-level Preferences folder.
3	Restart Fireworks. You will see all dialogs again, including registration reminders.

**Note:** Be sure to shut down Fireworks before removing the preferences file. Many programs read their preferences at startup, modify them during operation, and write them to disk when closing. If you delete the preferences while Fireworks is running, then it will just write a fresh copy of the old preferences when you shut it down.

## When you scale down an ellipse, the elliptical shape changes (Fireworks)

### Issue

When you scale down an ellipse so that the guides cross over, the elliptical shape changes in Adobe Fireworks.

### Fireworks Version

CS4, CS5

### Reason

The ellipse is a path and scaling up or down will scale the points within it. Restriction is placed on the guides such that they don't cross each other while scaling down, this is one measure to avoid the overlap, but if the points between the 2 guides are not in a straight line they are bound to overlap.

### Solution

Place the guides in such a way that path points don't overlap.

## Quick tips for Fireworks

Here are some fast and friendly tips for Fireworks users, courtesy of Macromedia Technical Support. To get these daily, check out our Quick Access Bar .

▶	To tween a live effect, apply the effect to the first instance, clone or duplicate and then change the effect settings to the second instance.
▶	To edit images in Fireworks 2 or 3, just select the desired bitmap editing tool and start using the tool. Fireworks will intelligently change to image edit mode.
▶	In Fireworks, everything is editable all of the time. Try creating some text, applying multiple effects, then change the text: It's easy with Fireworks!
▶	Use the button editor to quickly create a button in Fireworks. Clone or duplicate the button to create multiple instances of the button for a nav bar.
▶	Use FreeHand clip art from the Clipart Viewer in Fireworks. Drag and drop the art from the viewer into a Fireworks open document window.
▶	Copy and Paste charts from Excel 97 (Windows) or Excel 98 (Macintosh) to Fireworks. In Windows, use Chart Location on new sheet.
▶	To use PowerPoint images in Fireworks (Windows) save the slide as a PNG, GIF, or JPEG and import into Fireworks.
▶	To use PowerPoint Clipart in Fireworks (Macintosh) choose File > Import.
▶	To ensure all text formatting changes apply to all characters (Macintosh), use the Text Menu instead of the Text Editor.
▶	The PICT format version of a Kodak Photo CD image can be imported or opened directly in Fireworks (Macintosh).
▶	To use FreeHand created charts in Fireworks copy and paste the charts into Fireworks.
▶	To use Photoshop compatible plug-ins in Fireworks go to File > Preferences, select Folders from the pop-up menu click Photoshop and the ellipsis button. Navigate to the plug-ins folder and click select. Restart the Fireworks application.
▶	Moving your FreeHand artwork into Fireworks couldn't be easier. Fireworks can open existing FreeHand 7 and 8 files and lists options for a simple conversion.
▶	For help with adding Fireworks generated HTML into other HTML applications open the Fireworks HTML file in a text editing software. Read the comments.
▶	To easily resize an object to an exact percentage select Modify > Transform > numeric transformation. Type in the desired percentage.
▶	To easily update an edited image on each frame use symbols and instances. Select the object, choose Insert > Convert to Symbol. Clone or duplicate the instance on the canvas. Any change to the symbol is reflected in the all instances of the symbol across all frames.
▶	To edit objects across multiple frames turn on Onion Skinning in the Frames panel and choose Show all Frames and Multi-Frame Editing.
▶	To add or change a color to selected text, use the fill color. Use tweening with changing position, a transformation (Scale, Rotation, or Perspective), and opacity to create a variety of simple animation effects.

▶	Fireworks PNG files can be imported into Flash 4. No need to export as a different format!
▶	To edit a gradient select the Paint Bucket and use the set of handles.
▶	Use the Paint Bucket set of handles to rotate and change direction of a pattern or texture.
▶	Use the Batch command to automatically convert a folder of files to another Fireworks supported format or to the same format with different settings.
▶	To make a Hotspot that is exactly the same shape as an object in Fireworks 3, select the object and then choose Insert > Hotspot.
▶	Fireworks can open FreeHand files containing blends destined for animation and place each step on a separate frame, making quick work of an animated GIF.
▶	Check out the Fireworks online forums at <a href="https://www.adobe.com/support/forums/">https://www.adobe.com/support/forums/</a>
▶	To restrict an edit to objects on only one layer such as deleting unwanted slices, choose Single Layer Editing from the Layer panel's Options pop-up.
▶	To get Photoshop layer masks into Fireworks, in Photoshop Alt/Option-click on the mask and copy it. Click on the trash icon in the layers panel to delete the mask and then create a new layer and paste. Save the document. Now the mask can be used in Fireworks via the Modify > Mask Group command.
▶	Use the Matte color selector in the Export Preview dialog to quickly set a background color to be designated as the transparent color for transparent GIFs.
▶	Keep checking our Web site at <a href="http://www.macromedia.com/support/fireworks">www.macromedia.com/support/fireworks</a> for the latest in tutorials and news on how people are utilizing Fireworks.
▶	In Fireworks 3, you can save steps in the History panel as commands that you can use later in other documents.
▶	Go to the Extensibility section of the Fireworks Support Site to download JavaScript commands that you can use in Fireworks.

## Where are the opacity slider and blend modes in Fireworks 4?

### Issue

In Fireworks 3 (and previous versions), the opacity slider and the blend modes pop-up list used to create object interactivity are located on the Object panel. These features are no longer on the Object panel in Fireworks 4. Where are they located in Fireworks 4?

## Solution

In Fireworks 4, the opacity slider and blend modes pop-up list are located toward the top of the layers panel.

## How to make small text characters look cleaner

### Issue

Many users wish to export GIFs and JPEGs that contain text elements that are smaller than 14 points. Most screen rendered text that is smaller than 14 points will either display pixelated or will be too "muddy" to read. Is there a way to make screen rendered text that is smaller than 14 points look better?

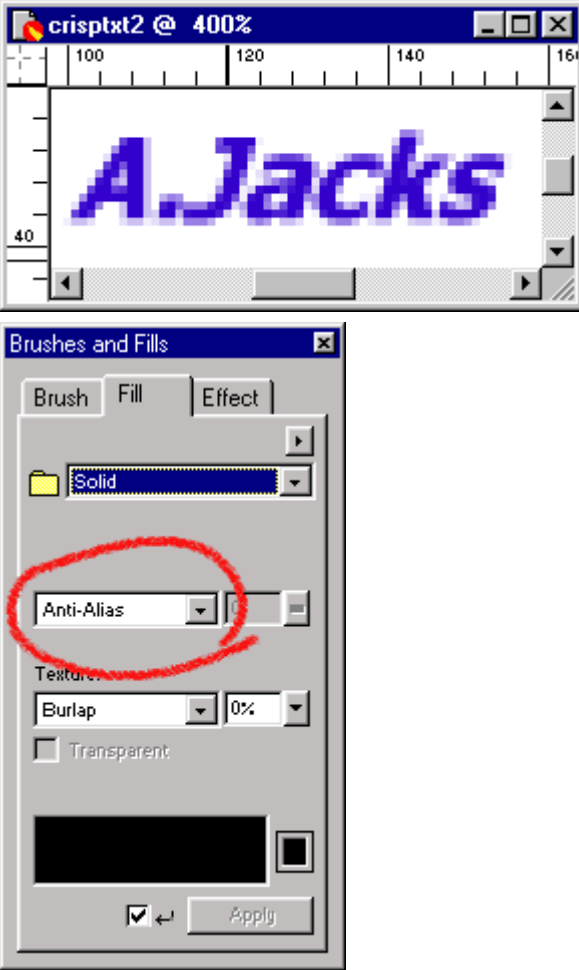

### Reason

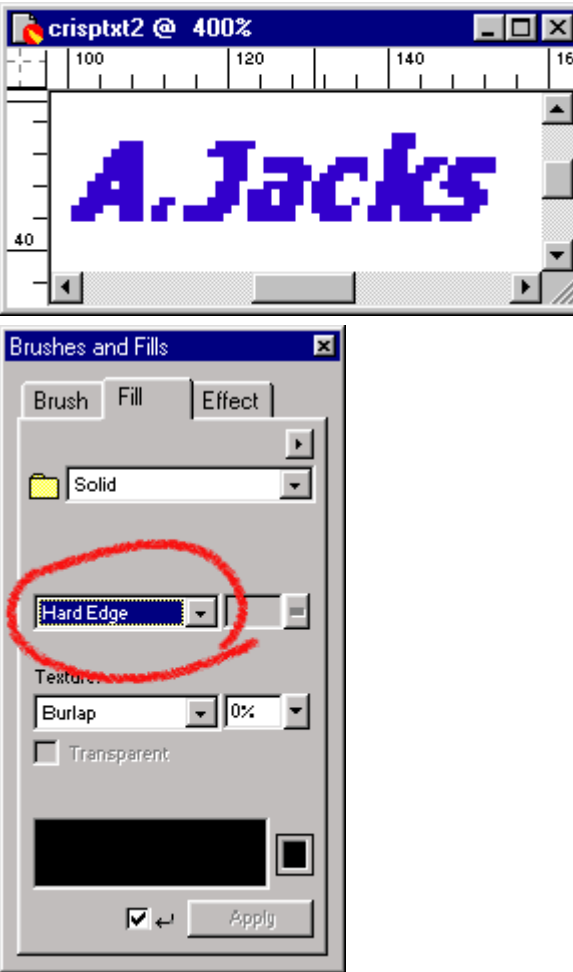

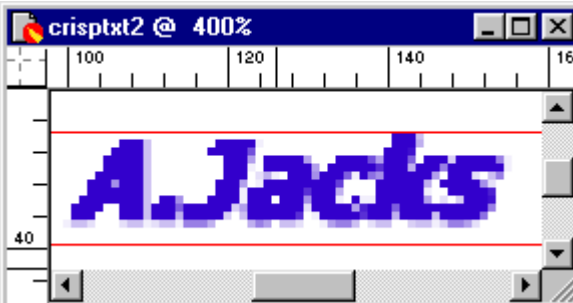

There are two ways to render fonts in bitmap images: 1. anti-aliased and 2. with hard edges. When fonts are rendered in Fireworks, the default setting is as anti-aliased, setting the text fill to "Hard Edge" in the Fill panel will allow text to be displayed without anti-aliasing. Sometimes an in-between setting is desired and this can be accomplished in Fireworks.

### Solution

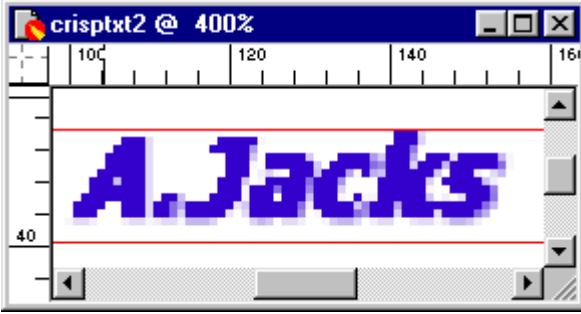

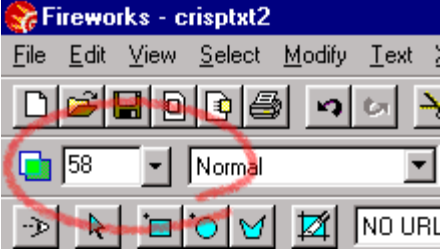

In Fireworks text fills can be manipulated in the fill inspector as well as opacity in the Opacity Toolbar (Fireworks 1) or the Object panel (Fireworks 2). By overlaying text with a hard edge with the same text anti-aliased and using the Opacity slider to make further adjustments, a satisfactory appearance can be created.

**To solve the problem do the following:**

1	<p>Type your text in the Fireworks Text editor and set the font size. This text is 14 point. Anti-aliasing is on by default.</p> <p><b>Note:</b>Text under 14 points in size is usually unreadable in GIF images. If you need to use text smaller than 12 points, consider using HTML text and place it in a layer overlapping the image if needed.</p>
	 <p>The image shows two screenshots from the Fireworks software. The top screenshot is a window titled 'crisptxt2 @ 400%' showing the text 'A.Jacks' in a blue, pixelated font. The bottom screenshot is the 'Brushes and Fills' panel, which has tabs for 'Brush', 'Fill', and 'Effect'. The 'Fill' tab is selected, and the 'Solid' fill is chosen. The 'Anti-Alias' dropdown menu is circled in red. Other options include 'Texture' (Burlap, 0%), 'Transparent', and an 'Apply' button.</p>
2	<p>Clone the text object and set the fill edge to Hard Edge in the Fills panel.</p>

	 <p>The screenshot shows a window titled 'crisptxt2 @ 400%' with a ruler at the top. The main area displays the text 'A. Jacks' in a blue, pixelated font. Below the window is a 'Brushes and Fills' panel with tabs for 'Brush', 'Fill', and 'Effect'. The 'Brush' tab is active, showing a 'Solid' folder and a 'Hard Edge' brush selected and circled in red. Other options include 'Texture' (Burlap, 0%), 'Transparent' (unchecked), and an 'Apply' button.</p>
3	The combination of the two text objects should result in a better overall rendering
	 <p>This screenshot shows the same 'crisptxt2 @ 400%' window. The text 'A. Jacks' is now centered between two horizontal red lines, which likely represent a bounding box or alignment guides for the text object.</p>

4	The Opacity of the Anti-aliased text and the hard edge text can be manipulated to achieve a good balance of the two.
	
	 <p><b>Note:</b>The Opacity setting in Fireworks 2 may be found in the Object panel.</p>

**Note:**Some fonts are specifically meant to look good at small sizes on the web, hence they are called web fonts. They may be found on [Microsoft's web site](#), but beware that they are not good for high quality print material.

## How to make Fireworks 4 buttons work in Fireworks 3

### Issue

Multi-state buttons created in Fireworks 4 do not work in Fireworks 3.

### Reason

In Fireworks 4, button symbols are placed on unshared layers; in Fireworks 3 they are placed on shared layers. Multi-state button symbols located on a non-shared layer in Fireworks 3 will not display the changes between the states. Consequently, when Fireworks 3 opens a Fireworks 4 PNG file containing multi-state buttons, the buttons are placed on a non-shared layer and they will not display the changes across the states.

### Solution

If the multi-state buttons are not contained within a symbol, you can open the button or buttons in the Button Editor in Fireworks 3 to cause them to work again. Part 1 below outlines the steps for causing these multi-state Fireworks 4 buttons to work properly in Fireworks 3.

If, however, the Fireworks 4 buttons are contained within a symbol (as in the case of a nav bar symbol), additional steps will be necessary to make the buttons within the symbol function properly in Fireworks 3.

### **Part 1: Making Fireworks 4 buttons work in Fireworks 3**

- 1 Create a multi-state button in Fireworks 4 or open a Fireworks 4 PNG file which already has a multi-state button.
- 2 Add one frame for each button state after the Up state using the New/Duplicate Frame button at the bottom of the Frames panel. (In other words, the Frames panel should have at least as many frames as there are states in your button.)
- 3 Save the PNG file as a new Fireworks 4 file.
- 4 Open the new Fireworks 4 file in Fireworks 3.
- 5 Double-click the instance of the button on the canvas. If you are in a Preview Mode (such as Preview, 2-up or 4-up) click the Original tab to display the PNG document. Double-clicking the button instance will open the button in the Button Editor.
- 6 Choose the Over tab.
- 7 Close the Button Editor. This will cause the button to move to a new shared layer in Fireworks 3.
- 8 Follow steps 5 through 7 for any other multi-state buttons on the canvas.
- 9 Save the PNG file as a new Fireworks 3 file (with a different name). Do not overwrite the Fireworks 4 file since you may need to use it later.

### **Part 2: Making Fireworks 4 buttons within a nav bar symbol work in Fireworks 3**

- 1 Open a Fireworks 4 PNG file which has a symbol which contains multi-state buttons. For convenience, this symbol will be referred to as a nav bar symbol in the following steps.
- 2 Add one frame for each button state after the Up state using the New/Duplicate Frame button at the bottom of the Frames panel. (In other words, the Frames panel should have at least as many frames as there are states in your buttons.)
- 3 Save the PNG file as a new Fireworks 4 file.
- 4 Open the new Fireworks 4 file in Fireworks 3.
- 5 Choose Window > Library if the Library is not already open. Access the Button Editor by clicking on the button in the Library”launching the Button Editor from within the Symbol Editor will not make the buttons work in Fireworks 3.
- 6 Double-click one of the nav bar symbol's buttons in the Library to launch the Button Editor. If you first get the the Symbol Properties dialog box for the button instead, then click Edit to launch the Button Editor.
- 7 Choose the Over tab.
- 8 Close the Button Editor. This will cause the button to move to a new shared layer in Fireworks 3.
- 9 Follow steps 6 through 8 for each of the other buttons contained within the nav bar symbol.
- 10 Double-click the nav bar symbol in the Library or double-click the instance of the nav bar symbol on the canvas. This will launch the Symbol Editor.
- 11 Delete each of the buttons currently inside the nav bar symbol.
- 12 Drag each of the nav bar symbol buttons from the Library back into the Symbol Editor, placing them in the same position as they occupied in Fireworks 4.
- 13 Close the Symbol Editor.

**14** Save the PNG file as a new Fireworks 3 file (with a different name). Do not overwrite the Fireworks 4 file since you may need to use it later.

## Additional Information

For more details about Fireworks buttons, see [Using the Button Editor \(TechNote 14302\)](#). [Building a Nav Bar in Fireworks 3 \(TechNote 14306\)](#) describes the process of creating a nav bar symbol.

# Limitations of importing and exporting PSD files in Fireworks

## What's covered

- [PSD import and export improvements](#)
- [Known limitations of PSD import and export](#)

Owing to enhancements in Fireworks, many elements of the original PSD file are retained when importing and exporting as a PSD file.

## PSD import and export improvements

The improved support for PSD import and export allows you to import and export the following elements in a PSD file:

- Layer affects
- Layer groups
- Transparency
- Text
- Slices
- Smart objects
- Vector shapes
- Guides
- Gradients

## Known limitations of PSD import and export

### Importing

- Text objects with transformations applied revert to default fonts if the original font used to create an object is not found on the system.
- Photoshop adjustment layers are not preserved when imported.
- PSD files are not a valid file type when creating a slideshow.
- Text on a path does not retain its original position.
- Reopening a PSD exported from Fireworks could move the layers up or down in the stack when reimported.
- Editable clipping mask
- Editable adjustment layers

## Exporting

- Fireworks groups are exported as flattened layers. Blend affects applied to the group can be lost during the flattening process.
- Images with gradient fills or pattern are exported with a random fill or pattern. There are currently no PSD Live Effects that allow you to apply these features to images during export.
- Strokes are not preserved.
- Blend modes don't always retain exact appearance.
- Symbols are flattened as bitmaps.

# Limitations of importing and exporting AI files in Adobe Fireworks

## What's covered

- [Import issues](#)
- [Export issues](#)

There are some known issues when you try to import or export Adobe Illustrator files with Adobe Fireworks.

## Fireworks Version

CS4, CS5

### Import issues

- Symbol libraries from Adobe Illustrator are not maintained. **Workaround:** Recreate the Document Library in Adobe Fireworks.
- Some effects applied to objects in an Illustrator file are lost. **Note:** This can occur because the effect is not supported in Adobe Fireworks. Rasterizing the effect will remove edit ability but maintain the appearance. **Workaround:**
  - 1 In Adobe Illustrator, use the Selection tool to select objects that are not imported correctly into Adobe Fireworks.
  - 2 Choose Object > Rasterize.
  - 3 Choose a desired setting for the objects in the Rasterize dialog box and click OK.
  - 4 Re-save the file and import into Fireworks.
- A second path is placed outside of the canvas when importing an AI file on a Japanese operating system. **Workaround:** After placing the AI file, select the second path and delete it.
- AI elements are imported as a group when the file contains double-byte characters. Ungrouping the text will place each character in a separate text element. **Workaround:** Copy each text element and add it to a common Text Block.

### Export issues

- Indents and indent spacing are lost when exporting to the Adobe Illustrator format if the file contains double-byte characters. **Workaround:**
  - 1 In Adobe Fireworks, select the double-byte text block and choose Text > Convert to Paths.
  - 2 Choose File > Save As and select Illustrator <version number> from the Save As drop down list.
  - 3 Open the saved AI file in Illustrator.

- Text Blocks are converted to plug symbols when exporting to the AI format if the file contains double-byte characters. **Workaround:**
  - 1 In Adobe Fireworks, select the double-byte text block and choose Text > Convert to Paths.
  - 2 Choose File > Save As and select Illustrator <version number> from the Save As drop-down.
  - 3 Open the saved AI file in Illustrator.
- Vertical double-byte text is converted to horizontal text when exporting as an Adobe Illustrator 8 format. **Workaround:**
  - 1 In Adobe Fireworks, select the double-byte text block and choose Text > Convert to Paths.
  - 2 Choose File > Save As and select Illustrator <version number> from the Save As drop-down.
  - 3 Open the saved AI file in Illustrator.
- Some effects applied to objects in Fireworks are lost when exporting to the Illustrator 8 format. **Note:** The font is rasterized on export in the PDF format. **Workaround:**
  - 1 Using Adobe Fireworks, choose File > Export.
  - 2 Select Adobe PDF and click Export.
  - 3 Open the saved PDF document in Illustrator.
- Fonts are converted to Adobe Illustrator default font if the original file was exported from Adobe Fireworks in the AI format. **Note:** The font is rasterized on export in the PDF format. **Workaround:**
  - 1 Using Adobe Fireworks, choose File > Export.
  - 2 Select Adobe PDF and click Export.
  - 3 Open the saved PDF document in Illustrator.

## Limitations of the Adobe Fireworks CS4 trial version

### What's covered

- [Access the Adobe Fireworks CS4 trial](#)
- [Adobe Fireworks CS4 trial limitations](#)

We attempt to provide our customers with the most robust trial products possible for a limited period. We providing you access to the full scope of our product before purchasing to ensure it meets your requirements.

### Access the Adobe Fireworks CS4 trial

We have enabled multiple methods of obtaining a Adobe Fireworks CS4 trial. Please use one of the following methods:

- Download the trial for any of our products from the [Adobe Product Downloads](#) page by selecting a product and clicking Download A Free Trial link.
- Use the retail or volume licensing installation media to install a trial. **Important:** Customers can supply their installation media (without their serial number) to other customers for trial purposes. During the installation process you are offered and opportunity to install as a trial or to provide a serial number.

### Adobe Fireworks CS4 trial limitations

The Adobe Fireworks CS4 trial is a fully functional product until the end of the trial period. We have not imposed any limitations on the functionality of the Adobe Fireworks CS4 product during the trial period. The trial period lasts for 30 days from the first launch of the product. After the trial period has expired you must enter a valid serial number to continue using the product. There is no way to extend the length of the trial on a machine or to reset the trial period.

## Intermittent crash or hang in Adobe Fireworks CS4

### Issue

When clicking certain elements in Adobe Fireworks CS4 a crash or hang occurs intermittently. The following elements are known to cause this behavior:

- Layer
- Object
- Color picker

### Solution

#### Apply the Adobe Fireworks CS4 10.0.3 update.

- 1 Download the Adobe Fireworks CS4 update by clicking Help > Updates.
  - If you are unable to apply the update via the updater, please download the update.
    - a Exit Adobe Fireworks CS4.
    - b From the Adobe product updates, select Fireworks from the Product drop-down, click Go.
    - c Download and install the Fireworks CS4 10.0.3 update.
- 2 Launch Fireworks CS4.

## After installing the English version, Fireworks 8 launches in a different language

### Issue

After installing the English version of Macromedia Studio 8 or Fireworks 8, Fireworks launches in a different language, such as Japanese.

## Reason

Fireworks 8 is a multilingual single application that senses the language of the operating system when being launched and will run in the matching language.

## Solution

Review [Switching languages in Fireworks 8](#) (TechNote b6a0f908) for details about switching the language that Fireworks is running, or download and install the [Switching Language extension](#) from the Fireworks Exchange.

Public\_Document

# General file and code troubleshooting

This TechNote provides a standard process for troubleshooting images and HTML files that originated in Fireworks. The overall intent of this TechNote is not to provide answers to specific issues, but to help users understand where their code has gone wrong. If you are troubleshooting pages that contain Pop-up menus look at [Troubleshooting Pop-up Menus from Fireworks](#) (TechNote 18538).

## Getting started

To troubleshoot the outcome of a Fireworks export, a user will need access to the following things:

- **The original Fireworks PNG file from which the files were exported.** Most troubleshooting begins by opening the source file, the PNG file created in Fireworks. This is not the HTML file exported and published on the Internet. Rather, it is the original file created in Fireworks. Although the code will not be read here, this is the place to check the settings that mandate how the code is exported from Fireworks.
- **The HTML and images exported from Fireworks.**

**Note:** New to Fireworks MX, if a PNG file cannot be located, a new one can be generated in Fireworks MX by using the Reconstitute Table feature in the File menu. This feature will create a new PNG file out of HTML code that contains a table. This feature will not recreate the editable text and vectors that were available to you in the original PNG file, so it is important to save and keep your original Fireworks source PNG files. See the tutorial [Creating Macromedia Fireworks MX documents from HTML](#) for more information on this new feature.

## Identify the issue

When troubleshooting any problem, it is important to isolate the problem. The following questions will help you identify the parameters of the issue:

- **What is the problem?** Does the problem impair performance or appearance? Does it act differently than you would expect?
- **Where am I seeing the problem?** Identify whether the issue is present in the browser or in Fireworks. If in the browser, does it appear in all browsers or in only one?
- **When does the problem occur?** Does the issue occur when you are in Fireworks and are previewing? Does it happen only when previewing in the browser from within Dreamweaver? Does it only occur after you've exported the HTML and have merely opened it in the browser? Determine exactly the point at which you observed the problem so you can eliminate the need to repeat steps in the future.
- **How did I get here?** This is one of the hardest questions to answer, especially if you are a creative type and have performed many steps and undos to get to your current preview or export operation. If you can identify the steps leading up to the observed problem, you will most likely be able to identify the cause of the problem.

Once you have answered the questions above, try using those answers to describe the problem you are going to troubleshoot. The following paragraph is an example of the result of the above questions:

"In Internet Explorer, when viewing my exported HTML file, some of my exported images appear distorted in their table cells, others are from other slice areas. This happened after I opened the HTML Setup and changed my file naming settings for slices and then exported to a folder where I already had some images saved."

### Common user errors

[Incorrect HTML style exported](#) [Copying and pasting code incorrectly](#) [Slice options not setup correctly](#) [Non standard filenames](#)

### After you export: other areas to consider

[Attaching CSS tags inappropriately](#) , or placing the CSS tags incorrectly in a table created in Fireworks can cause tables to look broken. [Exporting to a location in your site and maintaining document relative links](#) [Verifying that site definitions are viable.](#)

### Start with the PNG file

Before you export your file you should always preview it in a browser by choosing File > Preview in Browser. Doing this creates a temporary HTML file on your system, the location of which will vary by operating system and version. Since Fireworks is not site aware, any document relative or scite root relative URL links will not work properly until you have exported the file to the correct site directory. The image and rollover links will work however. If anything does not display correctly, focus your attention on this section of this TechNote for suggestions.

**Check the slices, hotspots and buttons in the PNG file** If your file uses a button, a slice or a hotspot, then you will end up with at least one HTML file and at least one exported image file. Each slice or button will be a separate image, and will generate a separate table cell in the resulting HTML table.

- Make sure slices do not overlap each other or overlap buttons on the Fireworks canvas. Overlapping slices will increase the number of exported images and may prevent your behaviors from working. See [Overview of slices and slice issues](#) (TechNote 15903) for more information.
- Hotspots that have behaviors attached to them must be on top of any slices that share the same canvas space or their behaviors will not work. Check the Web Layer's layer stack to see if you have any problems of this kind, and reorder the hotspots to the top if necessary.
- If your file has any HTML slices, preview in a browser before exporting and adjust the contents of such slices so that they don't break your table apart. Content in HTML slices might cause the Fireworks HTML table to be expanded in such a way as to leave gaps between the images. Remember that Fireworks does not display the contents of an HTML text slice, so previewing in a browser is the most dependable way of judging how the contents of that slice will act.

**Check the HTML Setup for the PNG file if you are exporting HTML** The HTML Setup dialog box is available by choosing File > HTML Setup.

- HTML tables can be exported using spacers or nesting to maintain table size and shape. If your table acts unpredictably in the browser, you may want to choose to use either spacers or nesting. Sometimes no form of table control is needed, and if your table is too complex, Fireworks will automatically space the table with spacers.

**Note:** If you export using the Nested Tables- No Spacers option and your slice arrangement causes the tables to nest more than 8 deep, Fireworks will default to using a 1-Pixel Transparent Spacer setting for your table.

- File naming selections in the Document Specific tab of the HTML Setup can cause exported images to overwrite each other. See [How to use HTML Setup in Fireworks](#) (TechNote 16182). Also verify here that the appropriate HTML style is used (Dreamweaver for Dreamweaver HTML, FrontPage for FrontPage HTML, etc.).

**Check the export settings for the PNG file** When done with your file, you will have to export to get your finished files. The PNG file you save is the always-editable Fireworks source file, but the exported files are what will actually be used in the browser.

- Check the optimize settings of the document and of each slice to make sure the appropriate options were exported. See [Exporting and saving files](#) (Fireworks Article). Bear in mind that TIFF, PICT and BMP files will not display in browsers, and PNG files have only limited support in some browsers.
- If your file has slices, make sure you choose to export HTML and images, and verify that you are choosing to export slices. See [Overview of slices and slice issues](#) (TechNote 15903).
- Until fully familiar with Fireworks HTML code and how it works, we **strongly** recommend exporting to the same folder as the final HTML page that you intend to insert Fireworks objects into. There is path information in the various JavaScript portion of the file that Dreamweaver or other HTML editors will NOT update when it is inserted into an HTML page, and problems can occur because of an incorrect path.

**Note:** Because Fireworks is not "site aware" it exports HTML that will contain document relative paths to any images it exports. If site root relative paths are desired, changes will have to be made in the HTML to reflect that style. This TechNote does not address issues specific to using site root relative paths.

- Browsers and servers can be very picky about file and path names. Never use space characters or any high ASCII characters in the path of file names. Some servers do not recognize uppercase characters, and though you are testing locally, now is the right time make sure this is not an issue. Look at [Server issues](#) (TechNote 14832).

**Note:** Since slice names are used to create the file names for images, you are prevented in Fireworks from naming a slice in a way that will cause problems.

[Top](#)

#### **Continue with the HTML file:**

After you export your Fireworks HTML, it's a good idea to check it out and see what you've got. Open your browser and then choose File > Open to open a dialog that allows you to browse your hard drive and locate the exported Fireworks HTML. Select the file and click Open and then click OK. Test all the JavaScript actions, view the animations and check the status bar to see if links and status bar messages are working properly. Also check your Alt tags. If you don't see any problems, then Fireworks has done it's job. Try opening the HTML file in your HTML editor. Test in the browser from there.

- Most HTML editors do not change the code of HTML files opened in that application. There could be some reason such as site definition settings that could cause problems. Rebuild the site cache, or create a new site, if problems arise.
- If you are exporting to a Dreamweaver site, See [Inserting a Fireworks table into Dreamweaver](#) (TechNote 15687).
- If you are using FrontPage see [Exporting and inserting Fireworks HTML into FrontPage](#) (TechNote 16633).
- Look for any JavaScript functions that may be duplicated on your page. Netscape generally ignores any behaviors whose functions that are duplicated.
- Once you have inserted the Fireworks HTML into a Dreamweaver file, in the course of working with your file, you might inadvertently place a CSS tag inside the Fireworks table. Look at the CSS code, where is the CSS tag in reference to the table tag? If the CSS tag is inside of the <td>tag and viewed in some versions of Netscape spaces can be added by the browser that may break-apart or dislocate cells.
- If you get a JavaScript error when you insert into your page, look for any misplaced tags, such as META tags which should be in the <head> of the document.

[Top](#)

#### **Additional information**

Look at the [Fireworks Support Center](#) and the [Developer and Design Center](#) for current updates and issues.

## Fireworks Online Forums

Before posting to an online forum, please consult your Macromedia Fireworks documentation, search Macromedia's site for keywords, and scan the Fireworks [TechNotes](#) . Please also search the forum for answers before posting a question.

Macromedia forum posts are archived daily by [groups.google.com](http://groups.google.com). Searching for the word fireworks, followed by a keyword specific to your search, will usually provide multiple threads to answer many questions based on the keyword topic.

Read the information in the [List of online forums](#) if you haven't already.

If you are new to using the online forums, please read the [Using Macromedia online forums](#) document.

### Macromedia Online Forums

The Macromedia Forums can be accessed with a [web browser](#) or a [newsreader](#) . For access to the forums with a browser refer to [Macromedia Online Forums](#) , and for newsreader access refer to [Welcome to the Macromedia Online Forums \(News interface\)](#) .

Viewing the forums with a web browser or a newsreader is mostly a personal choice of which interface you prefer, however, many users find a text-only newsreader to be faster. Postings are the same for the web-based and newsreader-based forums, it is only the visual display of the postings that is different.

### Web-based forums

- [Macromedia Online Forums Web Forum Listing](#)
- Macromedia Fireworks web forum: [General Discussion](#) - For users of the web design tool, Fireworks. This group hosts discussions of installation, troubleshooting, and general usage.
- Macromedia Fireworks web forum: [Exchange Extensions](#) - For advanced developers and those who wish to learn how to extend Fireworks with JavaScript, Flash commands, customized HTML and JavaScript output and plug-ins for live effects.
- [International online forums](#)

### Newsreader-based forums (requires a newsreader)

- [Macromedia Online Forums Newsreader Listing](#)
- Macromedia Fireworks newsreader forum: [General Discussion](#) - For users of the web design tool, Fireworks. This group hosts discussions of installation, troubleshooting, and general usage.

## Fireworks JavaScript preloads explained

**How image preloading works in Fireworks HTML code** When HTML code that contains Rollover, Swap Image or Toggle Group behaviors is exported from Fireworks, the JavaScript will include a preload function. This function will download images to the browser's local cache folder so they can be quickly called by these behaviors. Depending on the HTML style selected by the user, Fireworks will generate preload JavaScript that is compatible with the various HTML editors it supports. Careful examination of the HTML code reveals where the preload functions are located and where there may be a call to run the preload function later in the code. It is important that the user be aware that not only the preload function, but also the call that initializes the function are both important for preloads to work.

**What to look for in the code** Every preload must be performed by a JavaScript action in the HTML called a **FUNCTION**. Functions contain the actual commands that tell the browser what to do when that particular function is called by an **EVENT**. Below are some examples of the JavaScript from Fireworks generated Generic, Dreamweaver 2, GoLive and FrontPage HTML.

### Generic HTML- <head> tag:

```
if (document.images){
  preload_r1_c1_F1 = new Image(108,36); preload_r1_c1_F1.src = "preload_r1_c1.gif";
  preload_r1_c1_F2 = new Image(108,36); preload_r1_c1_F2.src = "preload_r1_c1_F2.gif";
  preload_r1_c1_F3 = new Image(108,36); preload_r1_c1_F3.src = "preload_r1_c1_F3.gif";
  preload_r1_c1_F4 = new Image(108,36); preload_r1_c1_F4.src = "preload_r1_c1_F4.gif";
  preload_r3_c1_F1 = new Image(108,36); preload_r3_c1_F1.src = "preload_r3_c1.gif";
  preload_r3_c1_F2 = new Image(108,36); preload_r3_c1_F2.src = "preload_r3_c1_F2.gif";
  preload_r3_c1_F3 = new Image(108,36); preload_r3_c1_F3.src = "preload_r3_c1_F3.gif";
  preload_r3_c1_F4 = new Image(108,36); preload_r3_c1_F4.src = "preload_r3_c1_F4.gif";
  preload_r5_c1_F1 = new Image(108,36); preload_r5_c1_F1.src = "preload_r5_c1.gif";
  preload_r5_c1_F2 = new Image(108,36); preload_r5_c1_F2.src = "preload_r5_c1_F2.gif";
  preload_r5_c1_F3 = new Image(108,36); preload_r5_c1_F3.src = "preload_r5_c1_F3.gif";
  preload_r5_c1_F4 = new Image(108,36); preload_r5_c1_F4.src = "preload_r5_c1_F4.gif";
  preload_r7_c1_F1 = new Image(108,36); preload_r7_c1_F1.src = "preload_r7_c1.gif";
  preload_r7_c1_F2 = new Image(108,36); preload_r7_c1_F2.src = "preload_r7_c1_F2.gif";
  preload_r7_c1_F3 = new Image(108,36); preload_r7_c1_F3.src = "preload_r7_c1_F3.gif";
  preload_r7_c1_F4 = new Image(108,36); preload_r7_c1_F4.src = "preload_r7_c1_F4.gif";
}
```

The "if (document.images)" statement queries the browser to see if it understands the preload function (document.images) and then tells the browser to download the images on the page. The list of images to preload that follow are called an **ARRAY**. All images in the document as well as those used in rollovers will be listed in the array. In the above example there are sixteen images. Notice that a variable is declared to be a new Image with an x,y pixel size, then the source (.src) is set to be the corresponding image file.

### Dreamweaver 2 HTML- <head> tag:

```
function MM_preloadImages() {
  if (document.images) {
    var imgFiles = MM_preloadImages.arguments;
    if (document.preloadArray == null) {
      document.preloadArray = new Array();
    }
    var i = document.preloadArray.length;
    with (document) {
      for (var j = 0; j < imgFiles.length; j++) {
        if (imgFiles[j].charAt(0) != "#") {
          document.preloadArray[i] = new Image();
          document.preloadArray[i++].src = imgFiles[j];
        }
      }
    }
  }
}
}
```

In this case, the function `MM_preloadImages` is declared so that it can be called upon later in the HTML file. The variable for the image files (`imgFiles`) is set to `MM_preloadImages.arguments` which calls up the array which will be found later in the HTML file. This function is an example of modular code that can be used in conjunction with a separate call to run the function and the array as well.

Below is an example of the call (`onLoad="MM_preloadImages`) to the function and the array that tells the function which files to preload--<body> tag:

```
<body onLoad="MM_preloadImages ('images/preload_r1_c1_F2.gif', '#931560371110');
MM_preloadImages('images/preload_r1_c1_F4.gif',
'images/preload_r1_c1_F4.gif', '#931560371111');
MM_preloadImages('images/preload_r3_c1_F2.gif', '#931560371112');
MM_preloadImages('images/preload_r3_c1_F4.gif',
'images/preload_r3_c1_F4.gif', '#931560371113');
MM_preloadImages('images/preload_r5_c1_F2.gif', '#931560371114');
MM_preloadImages('images/preload_r5_c1_F4.gif',
'images/preload_r5_c1_F4.gif', '#931560371115');
MM_preloadImages('images/preload_r7_c1_F2.gif', '#931560371116');
MM_preloadImages('images/preload_r7_c1_F4.gif',
'images/preload_r7_c1_F4.gif', '#931560371117');
InitGrp('FwSimpleGroup');">
```

**Note:**The above code should appear all on one line with no breaks. Line breaks have been included to aid readability.

#### GoLive HTML:

```
function CSILoad(im, ar) {
  if (document.images) {
    CSIm[im] = new Object();
    for (var i = 0; i < 3; i++) {
      if (ar[i] != "") {
        CSIm[im][i] = new Image();
        CSIm[im][i].src = ar[i];
      }
    }
  } else {
    CSIm[im][i] = 0;
  }
  CSIm[im][3] = ar[3];
}
}
```

The function here is named "CSILoad" and the array is found at the beginning and at then end of the JavaScript section:

```
function CSScriptInit() {
CSILoad('preload_r1_c1',new Array(/*URL*/'images/preload_r1_c1.gif',
/*URL*/'images/preload_r1_c1_f2.gif', /*URL*/'images/preload_r1_c1_f3.gif',''));
CSILoad('preload_r3_c1',new Array(/*URL*/'images/preload_r3_c1.gif',
/*URL*/'images/preload_r3_c1_f2.gif', /*URL*/'images/preload_r3_c1_f3.gif',''));
CSILoad('preload_r5_c1',new Array(/*URL*/'images/preload_r5_c1.gif',
/*URL*/'images/preload_r5_c1_f2.gif', /*URL*/'images/preload_r5_c1_f3.gif',''));
CSILoad('preload_r7_c1',new Array(/*URL*/'images/preload_r7_c1.gif',
/*URL*/'images/preload_r7_c1_f2.gif', /*URL*/'images/preload_r7_c1_f3.gif',''));
CSAction(new Array('65683020'));
CSAction(new Array('65683022'));
CSAction(new Array('65683024'));
CSAction(new Array('65683026'));
}
```

and later in the file:

```
CSImages=new Array(); function CSPreloadImage(action) { if (document.images) {
CSImages[CSImages.length] = new Image(); CSImages[CSImages.length - 1].src = action[1];
} } CSAct['65683020'] = new Array(CSPreloadImage,/*URL*/ 'images/preload_r1_c1_f3.gif');
CSAct['65683022'] = new Array(CSPreloadImage,/*URL*/ 'images/preload_r3_c1_f3.gif');
CSAct['65683024'] = new Array(CSPreloadImage,/*URL*/ 'images/preload_r5_c1_f3.gif');
CSAct['65683026'] = new Array(CSPreloadImage,/*URL*/ 'images/preload_r7_c1_f3.gif'); // --
></script>
</csscriptdict>
<csactions><csaction name="65683020" outputclass="Preload Image"
val0="images/preload_r1_c1_f3.gif"><csaction name="65683022" outputclass="Preload Image"
val0="images/preload_r3_c1_f3.gif"><csaction name="65683024" outputclass="Preload Image"
val0="images/preload_r5_c1_f3.gif"><csaction name="65683026" outputclass="Preload Image"
val0="images/preload_r7_c1_f3.gif"></csactions><csactionitem
name="65683020"></csactionitem><csactionitem name="65683022"></csactionitem><csactionitem
name="65683024"></csactionitem><csactionitem name="65683026"></csactionitem></head><body >
```

**Note:**Line breaks have been included to aid readability.

**Note:**All of the above code was copied from the <head> tag with the exception of the last line containing the onload call to the function. The "onload" calls the function "CSScriptInit" to begin the preloading.

**FrontPage HTML- <head> tag:**

```

if (document.images) {
  preload_r1_c1_F1 = new Image(108,36); preload_r1_c1_F1.src = "images/preload_r1_c1.gif";
  preload_r1_c1_F2 = new Image(108,36); preload_r1_c1_F2.src = "images/preload_r1_c1_F2.gif";
  preload_r1_c1_F3 = new Image(108,36); preload_r1_c1_F3.src = "images/preload_r1_c1_F3.gif";
  preload_r1_c1_F4 = new Image(108,36); preload_r1_c1_F4.src = "images/preload_r1_c1_F4.gif";
  preload_r3_c1_F1 = new Image(108,36); preload_r3_c1_F1.src = "images/preload_r3_c1.gif";
  preload_r3_c1_F2 = new Image(108,36); preload_r3_c1_F2.src = "images/preload_r3_c1_F2.gif";
  preload_r3_c1_F3 = new Image(108,36); preload_r3_c1_F3.src = "images/preload_r3_c1_F3.gif";
  preload_r3_c1_F4 = new Image(108,36); preload_r3_c1_F4.src = "images/preload_r3_c1_F4.gif";
  preload_r5_c1_F1 = new Image(108,36); preload_r5_c1_F1.src = "images/preload_r5_c1.gif";
  preload_r5_c1_F2 = new Image(108,36); preload_r5_c1_F2.src = "images/preload_r5_c1_F2.gif";
  preload_r5_c1_F3 = new Image(108,36); preload_r5_c1_F3.src = "images/preload_r5_c1_F3.gif";
  preload_r5_c1_F4 = new Image(108,36); preload_r5_c1_F4.src = "images/preload_r5_c1_F4.gif";
  preload_r7_c1_F1 = new Image(108,36); preload_r7_c1_F1.src = "images/preload_r7_c1.gif";
  preload_r7_c1_F2 = new Image(108,36); preload_r7_c1_F2.src = "images/preload_r7_c1_F2.gif";
  preload_r7_c1_F3 = new Image(108,36); preload_r7_c1_F3.src = "images/preload_r7_c1_F3.gif";
  preload_r7_c1_F4 = new Image(108,36); preload_r7_c1_F4.src = "images/preload_r7_c1_F4.gif";
}

```

As in the generic HTML, the "if (document.images)" statement queries the browser to see if it understands the preload function (document.images) and then tells the browser to download the images on the page.

**Copying the code** Whenever copying JavaScript code and preload arrays to a different HTML document, carefully examine the code and make sure that no necessary preloads are missing. Notice that the Dreamweaver 2 call to the function and the array are both found in the <body> tag proper, and the GoLive code has the onload call to the function in the <body> tag.

For more information on copying and pasting Fireworks HTML code, see [Need help when copying JavaScript from Fireworks to other applications?](#) (TechNote 13205).

## Fireworks generated HTML code with FrontPage

### Issue

When copying and pasting the HTML code from Fireworks directly into FrontPage 98, the code gets altered and links to image files are lost.

### Reason

FrontPage uses HTML code validation that inserts <Bot> tags into the body which can significantly change the Fireworks code. This can cause broken links to image files among other problems. In order for any HTML file to link to images that appear on the page, the HTML file must remain in the same relative location to the images. Using the Insert > FrontPage Component to bring Fireworks HTML is recommended.

**Solution** To get Fireworks HTML into FrontPage use the following steps:

1	Export from Fireworks as FrontPage HTML being sure that you export your images into the WWWROOT directory structure.
2	Open the HTML file in Notepad.
3	Open FrontPage and Open a new or existing HTML file.

4	In Notepad, copy the JavaScript and table from within the tag as marked. See <a href="#">Need help when copying JavaScript from Fireworks to other applications?</a> (TechNote 13205) for more information on this issue.
5	In FrontPage's Normal tab, choose Insert > FrontPage Component and choose Insert HTML.
6	A window comes up with a blank field. Paste into this field. Notice the "HTML Markup to insert (will not be checked for correctness) -this means FrontPage won't alter this code!
7	Click OK.
8	Go to the Preview tab and preview the inserted code/images/rollovers. <b>Note:</b> FrontPage has converted the comments into HTML text and it will be necessary to delete them.
9	Go back to the HTML window and delete all of the unnecessary comments.
10	Now in the HTML window select the JavaScript functions beginning with the preload array and cut them.
11	Scroll up to the <head> tag and click after the<title> and before the </head> and paste.FrontPage now accepts the JavaScript without any complaints.
12	Go to the Preview tab and preview your work.
13	SAVE the document.

**Note:**Many users report being able to successfully open Fireworks generated HTML in FrontPage and then continue editing. FrontPage 98 allows only one document to be open at a time, which prohibits performing copy and paste routines. FrontPage 2000 allows users to have more than one HTML document open at a time, facilitating the copy and paste routine. With the advent of Fireworks 3, users may choose to copy the HTML code that fireworks exports directly to the clipboard by choosing "Copy to Clipboard" in the Export dialog's HTML settings Location field. Check the [exciting new features in Fireworks 3](#) and [upgrade to Fireworks 3](#) to gain this added feature.

## Fireworks document fails to display in the 2-up and 4-up preview windows

### Issue

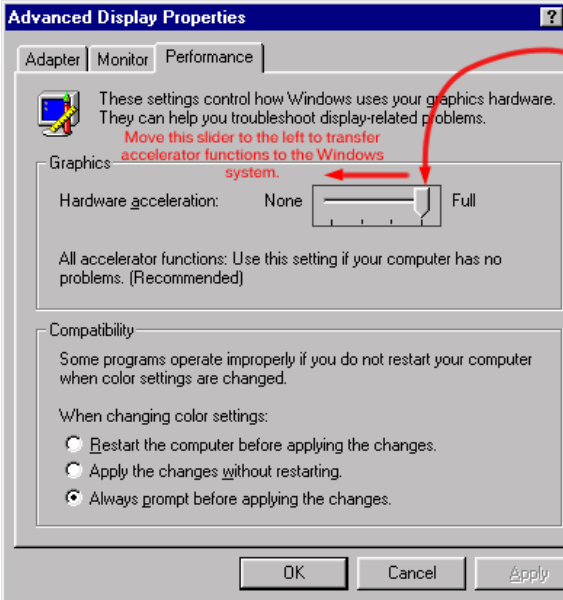

When the 2-up or 4-up window is opened in Fireworks 3, the document display area appears empty. Additionally, switching export settings in the Optimize panel can also cause the display to go blank.

### Reason

The 2-up and 4-up windows in Fireworks 3 are taxing the display hardware acceleration and at some point the display driver fails to render the document.

## Solution

To see the display in the 2-up or 4-up window do the following:

1	<p>Reduce the Hardware Acceleration setting.</p> <p>This is found in the Windows Control Panel System Properties under the Performance tab.</p> <p>Click the "Graphics..." button to access this control.</p> <p>Alternatively on many systems the control can be accessed through the Display Properties in the Settings tab.</p>
2	<p>Click the "Advanced..." or "Change..." button and then click the Performance tab to get to the Hardware Acceleration slider.</p>
3	<p>Move the slider down one notch and then restart your computer to activate the new setting.</p>  <p><b>Note:</b>The Hardware Acceleration slider transfers functions that are normally performed on the Display Adapter (video card) when acceleration is set to Full to the Windows operating system as the slider is moved to the right.</p>
4	<p>Then test Fireworks' 2-up and 4-up windows to see if the problem persists.</p> <p>If the preview is still blank, choose the next lowest setting in the Hardware Acceleration slider, restart and test Fireworks. Continue this process until the preview displays correctly.</p>

# Fireworks CS6 known issues and bugs

## Adobe Fireworks CS6 known issues and bugs

Welcome to Adobe Fireworks CS6. This document contains known issues and troubleshooting tips not covered in the Fireworks documentation. See Adobe Support for late-breaking information and known issues for all Creative Suite 6 applications.

- If you want to copy objects from Adobe Illustrator to Fireworks, change the color format from CMYK to RGB. Fireworks supports only the RGB color format.
- If you have installed CS4, CS5, or CS6 and then uninstalled CS4 and CS5, you get the following error when you start Fireworks CS6: "Your user privileges do not allow Fireworks to update your registry" warning message.' Discard the message by clicking OK.
- On Mac OS, the Fill color preview does not display the opacity. The Opacity field is provided as a text box instead of a slider.
- On Windows, if your user profile has non-default TEMP folder paths, when using the Photoshop Live Filter feature, you receive the following errors:
  - Internal error occurred
  - Could not render database
  - Could not complete your request. An error occurred. As a workaround, reset the TEMP folder to the default location.
  - 1 Right-click My Computer and select Properties.
  - 2 Select Advanced > Environment Variables.
  - 3 Ensure that the TEMP and TMP variables are pointing to the following directories: TEMP = %USERPROFILE%\Appdata\Local\Temp TMP = %USERPROFILE%\Appdata\LocalTemp
- The Image Preview window is not displayed completely by default on Netbooks with 1024 x 600 resolution.
- Fireworks CS6 provides new symbols for various categories, such as Wireframe, Icons, jQuery Bootstrap, and Gesture. Names of the folders that contain the symbols are localized. However, the symbol names are not localized.

## GB18030 support for Windows XP

To support the display of all characters of the Chinese standard GB18030 on Windows XP systems, Adobe recommends the installation of the Microsoft GB18030 Support Package. This support package updates an XP system with, among other things, fonts and input-method-editors (IMEs) to correctly support GB18030. The support package is available as a download from the Microsoft website. (#BG061690)

## Chinese Language-specific issues

On Windows XP (Simplified Chinese), because the application's default Chinese font is SimSun, 4-byte GB18030 characters aren't displayed correctly. As a workaround, use the two scripts provided with Fireworks CS6 installer (SetNewUIFont and ClearNewUIFont) for GB18030 standard support. These two scripts are installed at the following location: [drive:]/Program Files/Adobe/Adobe Fireworks CS6/Simplified Chinese/.

To set the user interface font to enable 4-byte GB18030 characters, do the following:

- 1 Make sure that Adobe Fireworks CS6 is not currently running.
- 2 Double-click SetNewUIFont.reg to set the user interface font for Fireworks.
- 3 Launch Fireworks again. The user interface is enabled to view 4-byte GB18030 characters in all dialogs managed by Fireworks.

To revert the user interface font to original settings, do the following:

- 1 Make sure that Adobe Fireworks CS6 is not currently running.
- 2 Double-click ClearNewUIFont.reg to clear the new user interface font for Fireworks.
- 3 Launch Fireworks again. The user interface is reset to Fireworks standard user interface font.

**Note:** Restart Windows after running these scripts.

- Fireworks CS6 does not display 4-byte characters in the document tab's title on Windows XP. As a workaround, name the titles with ASCII or 2-byte Chinese characters.
- On Windows XP and Vista, some 2-byte and all 4-byte characters aren't correctly pasted to Illustrator when you use the Copy Path Outlines feature in Fireworks.
- On Windows XP and Vista, some 2-byte and all 4-byte characters sometimes don't display correctly in the Create Slideshow dialog when entered from the keyboard.
- On Windows XP, some 2-byte and all 4-byte characters sometimes don't display correctly in the HTML Slice on the canvas.

## Fireworks CS5 known issues and bugs

### Adobe Fireworks CS5 known issues and bugs

Welcome to Adobe Fireworks CS5. This document contains known issues and troubleshooting tips not covered in the Fireworks documentation.

You need to have AIR 2 runtime installed to be able to install the AIR package files created using the AIR extension for Fireworks CS5.

The first launch of Extension Manager should be with administrator privileges on Microsoft Vista and Microsoft Windows 7 (if UAC is enabled). You will get an error dialog if this is not done.

To access the template feature of Fireworks CS5 on Microsoft Vista or Microsoft Windows 7, you need to launch FW with administrator privileges.

The Image Preview window is not displayed completely by default on netbooks with 1024x600 resolution.

Please refer to [Adobe Support](#) for late-breaking information and known issues for all Creative Suite 5 applications.

**GB18030 support for Windows XP**

In order to support the display of all characters of the Chinese standard GB18030 on Windows XP systems, Adobe recommends the installation of the Microsoft GB18030 Support Package. This support package will update an XP system with, among other things, fonts and input-method-editors (IMEs) to correctly support GB18030. The support package is available as a download from the Microsoft website. (#BG061690)

### Chinese Language-specific issues

On Windows XP (Simplified Chinese), because the application's default Chinese font is SimSun, 4-byte GB18030 characters aren't displayed correctly. As a workaround, use the two scripts provided with Fireworks CS4 installer (SetNewUIFont and ClearNewUIFont) for GB18030 standard support. These two scripts are installed at the following location: [drive:]\Program Files\Adobe\Adobe Fireworks CS4\Simplified Chinese\.

To set the UI font to enable 4-byte GB18030 characters:

- 1 Make sure that Adobe Fireworks CS4 is not currently running.
- 2 Double click the "SetNewUIFont.reg" to set the UI font for Fireworks.
- 3 Launch Fireworks again, the UI should be enabled to view 4-byte GB18030 characters in all dialogs managed by Fireworks.

To revert the UI font to original settings:

- 1 Make sure that Adobe Fireworks CS4 is not currently running.
- 2 Double-click the "ClearNewUIFont.reg" to clear the new UI font for Fireworks.
- 3 Launch Fireworks again, the UI should be reset to Fireworks standard UI font.

Note: You must restart Windows after running these scripts.

- Fireworks CS4 does not display 4-byte characters in the document tab's title on Windows XP. As a workaround, name the titles with ASCII or 2-byte Chinese characters.
- On Windows XP and Windows Vista, some 2-byte and all 4-byte characters might not be correctly pasted to Illustrator when you use the Copy Path Outlines feature in Fireworks.
- On Windows XP and Windows Vista, some 2-byte and all 4-byte characters might not be displayed correctly in the Create Slideshow dialog when they are typed in from the keyboard.
- On Windows XP, some 2-byte and all 4-byte characters might not be displayed correctly in the HTML Slice on the canvas.

## Adobe Fireworks CS4 hangs when working with text (Mac OS)

### Issue

When running under Mac OS X 10.6 (Snow Leopard), Adobe Fireworks CS4 hangs when working with text (for example, when selecting the text tool or manipulating text fields) or when running an extension or custom panel that is internally modifying text objects.

## Solution

- 1 Quit all the applications that are running.
- 2 In the Finder, go to /Applications/Adobe Fireworks CS4/Required/
- 3 Rename the file GlobalResources (for example, rename file to GlobalResources\_original).
- 4 Download the GlobalResources.txt Fix file and remove the .txt extension so that it is called GlobalResources  
[GlobalResources.txt](#)
- 5 Place this file in the folder that you located in Step 2.
- 6 Restart Fireworks.

## Additional information

This solution is only intended to fix issues with Fireworks hanging when working with text in Mac OS X 10.6. To troubleshoot general freezes and system errors, see "Troubleshoot system errors or freezes in Fireworks CS4 on Mac OS" (TechNote [kb405840](#)).

# Fireworks crashes on launch. An error report is generated.

## Issue

Fireworks crashes on launch. An error report is generated.

## Details

You installed Fireworks on a machine that has Dreamweaver CS4 or an earlier version (CS3, MX2004, or Dreamweaver 8) installed.

## Reason

Dreamweaver adds entries to the Windows registry when creating sites. When you launch Fireworks, Fireworks reads these registry entries. If the registry entries are corrupted, Fireworks fails to start.

## Solution

**Warning:** This workaround will erase the site definitions in Dreamweaver. You must back up your sites in Dreamweaver before making changes described in this workaround.

### Step 1: Back up sites in Dreamweaver.

- 1 Select Site > Manage Sites.
- 2 In the Manage Sites dialog box, select the sites you want to back up, and click Export.**Note:** Hold down Shift key and select multiple sites.
- 3 In the Export Site dialog box, enter a name for the site definition file (\*.STE) and click Save. Each site is backed as a separate STE file.

### Step 2: Back up Windows registry entries for Dreamweaver.

To ensure that the changes you make to the registry entries does not cause any other issues, back up the Windows registry entries for Dreamweaver. See <http://support.microsoft.com/kb/322756> for detailed instructions for backing up your Windows registry.

### Step 3: Edit Windows registry entries for Dreamweaver.

Use the registry editor available in your Windows OS to edit the registries.

- 1 Click Start > Run and type regedit. The Windows Registry Editor opens.
- 2 Go to the following registry entries, according to the Dreamweaver version:
  - **Dreamweaver CS4:**HKEY\_CURRENT\_USER\\Software\\Adobe\\Common\\10
  - **Dreamweaver CS3:**HKEY\_CURRENT\_USER\\Software\\Adobe\\Common\\9
  - **Dreamweaver 8:**HKEY\_CURRENT\_USER\\Software\\Macromedia\\Common\\8
  - **Dreamweaver MX2004:**HKEY\_CURRENT\_USER\\Software\\Macromedia\\Common\\2004
- 3 Inside the registry path of your Dreamweaver installation, go to "Site\\-Summary" and look for the key **Number of Sites**. Set its value as 0.
- 4 Launch Fireworks.

### Step 4: Restore the site definitions in Dreamweaver.

After you have made the registry changes, when you launch Dreamweaver, your earlier site definitions do not appear in the managed sites list.

To isolate the sites that caused the launch failure for Fireworks, you should import the site definitions you backed up earlier in batches. If you have a large number of sites managed in Dreamweaver, say, 50 sites, you can import sites in batches of 10 and then launch Fireworks to check if the sites added back to Dreamweaver caused the problem. If Fireworks fails to start, it means that one of the sites that you imported into Dreamweaver was corrupted. You can then delete the sites that you imported last time, and then reconfigure the corrupted sites.

- 1 Select Site > Manage Sites.
- 2 In the Manage Sites dialog box, click Import.
- 3 In the Import Site dialog box, select the site definition files (STE) you want to import, and click Open.**Note:** Hold down Ctrl key to select multiple sites.

### Step 5: Verify imported sites.

You should import the sites either one at a time (if you have only a few sites managed) or in batches (if you have a large number of sites) so that you can isolate the corrupted site.

- 1 Import the sites in batches as described in Step 4: Restore the site definitions in Dreamweaver
- 2 After each import operation, launch Fireworks. Check if Fireworks launches normally.
  - If Fireworks launches normally, it means that all the sites imported are not corrupted. Proceed to import the next batch of sites into Dreamweaver.
  - If Fireworks fails to launch, it means that one or more of the sites you imported is corrupted. Reconfigure the sites that you imported last, and then proceed to import the remaining sites.
- 3 Repeat the steps 1 and 2 to import and verify the remaining sites.

## Additional Information

Fireworks does not have a direct dependency on Dreamweaver registry entries, therefore you can make Fireworks ignore these registry entries by making the registry entry that contains the number of Dreamweaver sites to read zero. When you launch Fireworks, Fireworks determines that there are no Dreamweaver sites to read, ignoring the corrupted registry entries.

# Fireworks 8 Frequently Asked Questions

## Issue

- [What's new in Fireworks 8?](#)
- [What does Fireworks do?](#)
- [What file formats can Fireworks Import and Export?](#)
- [How do I switch languages in Fireworks 8?](#)
- [How can I convert my pop-up menus to the new CSS based pop-up menus?](#)
- [Does Fireworks 8 work with Photoshop?](#)

## What's new in Fireworks 8?

### Optimization

- **Image editing panel** - Access commonly used image editing tools, filters, and menu commands in a central location.
- **More import file formats** - Fireworks 8 now supports import of QuickTime Image, MacPaint, SGI, and JPEG 2000 file formats. (A QuickTime plug-in is required to use this feature on Windows).
- **Batch processing workflow optimized** - Streamlined file renaming, the ability to check file dimensions when scaling during a batch process, and the addition of a status bar and log file, are just a few of the workflow optimizations.

### Integrated workflow

- **CSS (Cascading Style Sheet) pop-up menus** - Get clean and easily customizable code that integrates well into sites built in Dreamweaver. Fireworks 8 uses CSS (Cascading Style Sheet) format to create interactive pop-up menus.
- **Vector compatibility** - Preserve vector attributes (fills, strokes, filters and blend modes) when moving objects from Fireworks to Flash.
- **New slicing option** - Insert polygon slices when a selected object is a polygon path.
- **Recognize ActionScript color values** - Ensure color consistency. Fireworks recognizes ActionScript color values when copied from Flash and pasted into Fireworks color value fields.
- **Use the "Save as" command to save bitmaps into different file types** - Choose formats such as gif, jpg, tiff, in the "Save As" dialog box.

- **Evolved open, save, and export logic** - The logic used to determine the default folders in the open, save, save as, save a copy, and export dialog boxes is enhanced, reducing the amount of navigation required.
- **Less intrusive grids** - Like Flash, grids now use a dotted line and a lighter default grid color.

### Create Without Complexity

- **26 new blend modes** - 26 new choices to alter the look of your colors and objects, such as Overlay, Color Burn and Hard Light.
- **Add shadow** - Add a shadow to paths and text objects.
- **Solid shadow** - A new live filter that stamps the object it is applied to several times.
- **Mobile interface components** - Mock up mobile interfaces quickly with Halo Lite bitmap interface components.
- **Sample buttons, animations, themes, and bullets** - Get started quickly with cool new assets like buttons, animations, themes, and bullets.
- **AutoShape properties panel** - This new panel is used to modify AutoShape properties such as the star, arrow, or smart polygon AutoShapes.
- **Live marquee and convert selections** (marquee to path and path to marquee) - Turn active selections into editable vector paths and the reverse. Get instant feedback on filters and settings applied to selections.
- **Autoname text** - Layers are automatically named by the text you type into them.
- **Special characters panel** - Use this new panel to insert special characters directly into text blocks.
- **Reshape text on a path** - Path points can now be edited when text is attached.

### Workflow Improvements

- **Recent fonts and optimization** - Recently used fonts now appear at the top of font menus. Optimization now defaults to the last settings used.
- **Save multiple selections** - Save, restore, name, and delete multiple marquee selections within PNG files.
- **Select objects that share an edge in the layers panel** - Shift-click to select objects that share an edge or boundary in the layers panel.
- **Autosave preferences** - Fireworks 8 preferences are automatically saved more frequently.
- **Group consecutive nudges** - Consecutive nudges are treated as one move.
- **Improved tablet support** - Tablet support is improved for path scrubber tools and stroke pressure sensitivity.
- **Lock objects** - Lock on a per-object basis in the layers panel.

### What does Fireworks do?

Fireworks 8 is the best solution for creating and optimizing web images with precise control in an intuitive, customizable environment. The industry-leading optimization tools in Fireworks enable users to strike the balance between maximum image quality and minimum compression size. Fireworks integrates seamlessly with Dreamweaver and Flash for ideal conditions to create and optimize images without losing information or time with roundtrip editing. Use visual tools to create professional quality web graphics and animations, such as rollovers and pop-ups, without programming skills.

### What file formats can Fireworks Import and Export?

Fireworks imports:

- AI

- BMP
- Fireworks PNG
- FreeHand FH7-11
- GIF
- Illustrator 8
- JPEG
- JPEG 2000\*
- MacPaint\*
- Photoshop PSD
- PICT (Macintosh only)
- PNG
- QuickTime Image\*
- SGI\*
- TGA
- TIFF

**Fireworks exports:**

- BMP 8, 24 bit
- CSS layers
- GIF and animated GIF
- HTML
- Illustrator 7 (.ai)
- JPEG
- Macromedia Flash (.swf)
- Photoshop PSD (.psd)
- PICT 8, 24 bit
- PNG 8, 24, 32 bit
- TIFF 8, 24, 32 bit
- WBMP

\*QuickTime plug-in required

**How do I switch languages in Fireworks 8?**

Fireworks 8 is a multilingual installer/application that allows the application to sense which OS your system is running and install and runs in that language. For more information about switching languages see [Switching Languages in Fireworks 8](#) (TechNote b6a0f908).

**How can I convert my pop-up menus to the new CSS based pop-up menus?**

With the addition of CSS based pop-up menus in Fireworks 8 you may want to convert your existing menus to CSS. For information on how to do this see [Converting previous version pop-up menus to the new CSS menus](#) (TechNote 6131eb27).

## Does Fireworks 8 work with Photoshop?

Fireworks provides excellent support for importing native Photoshop (PSD) files, with options for retaining many aspects of the imported files, including layers, masks, and editable text. Bring Photoshop images into Fireworks for further editing and web optimization without losing the ability to export the images back into Photoshop.

## Fireworks 3 Eye Candy filters in Fireworks 4

### Issue

Opening a Fireworks 3 file using the Fireworks 3 Eye Candy effect such as "Cut Out" or "Motion Trail" in Fireworks 4 will not render or display the effects.

### Reason

Fireworks 4 includes a limited version of Eye Candy 4000 with the option to purchase the full version from Alien Skin Software. Fireworks 3 shipped with Eye Candy 3.1 LE which included different plug-ins than those that are included in the new version.

### Solution

Move the Fireworks 3 Eye Candy plug-in into the Configuration/Xtras folder under the Fireworks 4 folder to allow Fireworks 4 to access the earlier Eye Candy options and open the Fireworks 3 file with the Live Effect intact.

- 1 Quit Fireworks. Browse to the Macromedia Fireworks 3 folder and locate the following files in the Settings > Xtras folder.
- 2 Copy the files circled above and paste them into the Macromedia Fireworks 4/Configuration/Xtras folder on your hard drive.
- 3 Launch Fireworks 4 and open the document that contains the effect.

## Fireworks 3 crashes after the splash screen appears

### Issue

When launching Fireworks 3, the splash screen appears and a message on it says "Initializing VM". It then goes away without launching the program.

## Reason

Fireworks is trying to set up its own scratch disk (virtual memory) and something in your system's configuration is not allowing the process to work.

## Solution

Check the system's configuration to see what is causing the problem and make the necessary changes to allow Fireworks 3 to set up its scratch disk.

The following is a list of things to check for and change if needed:

▶	<p>The Temp directory is not found by Fireworks. On some systems the Set Temp line in the Autoexec.bat file could be pointing to any of a number of locations, even to a network drive. On Windows NT configurations, the administrator may have set the temp to be a restricted area. In a normal configuration on Windows 95 and NT, the Temp directory should be at the root level of the hard drive. On Windows 98 and 2000, the Temp directory should normally be in the Windows directory. Variations on this configuration can cause vm initialization errors</p> <p><b>Note:</b> A Temp directory containing a lot of files is an invitation to many hazards. It's a good idea to keep your temp directory clear at all times.</p>
▶	<p>Fireworks also looks at your first two hard drives to determine where to set up the scratch disk. If one of those drives is not working properly or is not properly formatted for Windows operating systems, then the initialize vm will fail. Also make sure you have plenty of free space on these drives. You can edit a preference in the Fireworks 3 Preferences.TXT file at these two lines:</p> <p>(PrimaryScratchDisk) (c:) (SecondaryScratchDisk) (d:)</p> <p>Once Fireworks is running, set the primary and secondary scratch disks by choosing File &gt; Preferences, clicking the Folders tab and setting the primary and secondary scratch disks) The default should be C: and D:. You can use Windows Notepad or any text editor to set these manually before launching. If you do not have a D: drive, Fireworks will detect this and set the preferences to C:</p>
▶	<p>If the Preferences file is damaged, it can be deleted. Then try to launch Fireworks. A damaged Preferences file can be caused by installing Fireworks with virus detection software running or if the Temp directory was full when Fireworks was installed. Other parts of the program could be damaged as well.</p>
▶	<p>Another possible cause of Fireworks freezing on the "Initializing VM" splash screen is the presence of a virtual hard drive that is created by McAfee VirusScan. If McAfee VirusScan is present on the system, a tool that comes with it named Safe &amp; Sound creates a virtual disk that Fireworks cannot access. For more info on this and how to disable the virtual disk see File is Locked error when launching Fireworks 3 (TechNote 14729).</p>

## How to feather an object

## Issue

After applying a feather effect nothing happens.

## Reason

You must press the delete key to remove the excess selection after feathering in order to see the desired effect.

## Solution

1	Enter image edit mode. Objects must be converted to images to perform the following steps. If your object is not an image, choose <b>Modify &gt; Image Object (Fireworks 1)</b> or <b>Modify &gt; Merge Images</b> to convert a vector object to an image.
2	With a selection tool such as the marquee, lasso, or magic wand, select pixels within the image that will have a feathered edge.
3	Choose <b>Select &gt; Feather (Fireworks 1)</b> <b>Edit &gt; Feather (Fireworks 2 and 3)</b> and type a value to set the feather radius.
4	Click OK.
5	Now delete the excess portion of the pixels in the selection for a feather effect.  <b>Note:</b> Choose <b>Select &gt; Inverse (Fireworks 1)</b> or <b>Edit &gt; Select Inverse (Fireworks 2 and 3)</b> before deleting the excess portion, to achieve a different feather effect.
	See examples below.

### To create an opaque feathered selection:

1	Enter image edit mode. (Objects must be converted to images first)
2	Double-click the Marquee or Lasso tools to view the Tool Options panel.
3	Select Feather from the Tool Options pop-up and type a value to set the feather radius.
4	With a selection tool such as the marquee, lasso, or magic wand, select pixels within the image.
5	Choose the paint bucket tool and add color within the selection.
	See examples below.

# Feathered selections and transparent gradients in Fireworks 3

## Introduction

I am trying to create a feathered selection in Fireworks that fades to a transparent background. What is the best way to do this?

I am trying to create a gradient fill that goes from a color to transparent, much like the gradient options "foreground to transparent" or "background to transparent" that can be created in Photoshop. How is this done in Fireworks?

### Discussion

Fireworks allows the user to create a vector shape that can be used as an image mask for any object or objects that are to be grouped with the mask. This is useful for creating gradients that have transparent features that are going to be composited with other objects in Fireworks. When using objects as masks in Fireworks it is important to remember that black pixels in the mask will make the masked objects opaque and white pixels in the mask will make the masked objects transparent. This is because the mask works as an Alpha when the Modify > Mask Group > Mask to Image command is used.

In order to preserve the Alpha channel on export, use the PNG32 format and set the Matte color to Transparent in the Optimize panel. This will allow other image editing programs to open the file with the Alpha channel intact.

**Note:** When opening a PNG containing an Alpha channel in Photoshop, use the Magic Wand tool to select the dark area containing the transparency and then delete the selected area to return to the correct display of the image.

- [Using a mask to feather an image selection.](#)
- [Using a mask to create a transparent gradient.](#)

### Using a mask to feather an image selection

A common practice used in image editing programs is to use a pixel selection tool to select an area of pixels, set the feather distance and then either copy and paste to a new layer or invert the selection and delete. There's a better way to do this in Fireworks 3 and it maintains editability of both the selection and the image selected.

#### To use a mask to create a feathered selection:

- 1 Open the image you want to make a feathered selection from and Exit Image Edit mode by clicking the Stop button in the status bar of the main Fireworks window. You may also import an image -importing an image will bring it in as an object in Fireworks.
- 2 Choose the ellipse tool from the Rectangle tool flyout group. Any vector shape may be used as a mask for the object.
- 3 Click and drag with the ellipse tool to draw an ellipse. Press the Alt (Windows)/Option (Macintosh) key to draw from the center out. Press the Shift key to constrain the ellipse to a circle.
- 4 Fill the ellipse with a solid black fill and set the edge to Feather. Enter a distance for the feather. You may want to experiment with gradient fills to get a softer effect. See the image in step 2 above. It was created by placing a rectangular gradient over the toolbox image and masking the image.
- 5 Shift-click on the image behind the fill to add it to the selection (the object panel should read "Object (two objects)" and choose Modify > Mask Group > Mask to Image.
- 6 The results should look like this:

The advantage of this method lies in the editability of the path, the feather and the image inside the path are retained. No other image editing software can boast this kind of flexibility.

### Using a mask to create a transparent Gradient

Since the white pixels of the mask will cause the masked image to have transparent pixels, it's easy to create a transparent gradient using the Mask to Image command.

#### To create a gradient with transparency:

- 1 Draw an object and apply a gradient fill to it using the Fill panel's fill options.
- 2 Clone the object.
- 3 Click and hold the Pointer tool to reveal the Pointer tool group flyout. Choose the Select Behind tool. You can also press the "v" key to toggle from the Pointer tool to the Select Behind tool and back.
- 4 Hold down the Shift key and notice that the outline of the object will turn red when you run the mouse over it. Click when you see the red highlight to add the original object to the selection. The Object panel will read "Object (2 Objects)".
- 5 Choose Modify > Mask Group > Mask to Image.
- 6 The results should look like this:

## How to export animations in sliced images

### Introduction

How can Fireworks be used to export sliced tables that contain animated GIFs in some of the cells?

Here are the steps for exporting an image that contains slices with an animated GIF:

- 1 Create the file in Fireworks creating frames for the animation or open an existing animated GIF.
- 2 Choose File > Export and click the Animation tab. Set the desired Animation controls for your final file.**Note:** This is the only place where you will be able to access these controls.
- 3 Click Save and Close or click on the "+" button by the Saved Settings pop-up to save the settings for future use.
- 4 Use the Slice tool to slice up the entire image.

- 5 For each slice object in Object Properties (Fireworks 1) or the Object panel (Fireworks 2) set the Link to "No URL (noHREF)". Slice type is Image (Fireworks 1).
- 6 For each slice to be animated, in the Slice Export settings choose Custom and then click the ellipsis (...) button. Set the Export settings to Animated GIF. (Notice you can set the Animated GIF but cannot access the Animation controls.) Click Save and Close. If the settings were saved in step 3 (above), then the saved settings can be selected in the Object panel.
- 7 Choose Export Slices and export!

**Note:** Animated symbols may be used in Fireworks 3 to create animated areas in sliced images. See [How to create an animated symbol and insert it into a Fireworks document](#) for more information on this.

## **Error : " Your user privileges do not allow Fireworks to update your registry..." when launching Fireworks CS4 on Windows**

### **Issue**

Fireworks CS4 doesn't launch and displays the error:

### **Details**

Although Fireworks has been installed on a system by an Administrator, Fireworks can still be launched on the same system by a Standard or a Restricted user; assuming that the Standard or Restricted user is operating with the user's default settings. If however, the settings for either user are modified after Fireworks has been installed, the modifications may restrict access to certain areas on the system or to certain folders and files. Because Fireworks must have access to certain areas of the hard drive to write temporary files, the new access restrictions can cause Fireworks to fail to launch.

### **Solution**

In Windows Explorer navigate to the Fireworks.exe file, by default it is located here: C:\Program Files\Adobe\Adobe Fireworks CS4.

Right-click on it, select Run As and choose an administrator account. Click ok.

## Error "An internal error occurred" | Startup | Fireworks CS4 | Windows

### Issue

When you start Fireworks CS4 on Windows, you receive the following error:

"An internal error occurred."

### Solution

Delete the Fireworks CS4 Panel Prefs.xmlfile and restart Fireworks.

- (Windows XP): \\Documents and Settings\[username]\Application Data\Adobe\Fireworks CS4\[language]\
- (Windows Vista and Windows 7): \\Users\[username]\AppData\Roaming\Adobe\Fireworks CS4\[language]\

## Error "File is not found" when creating an AIR package in Fireworks (Windows)

### Fireworks Version

CS4, CS5

### Issue

When creating an Adobe AIR package in Adobe Fireworks, the error message "File is not found" is displayed.

### Solution

Install JRE (Java Runtime Environment) 1.4 or higher.

For more information, see the Java website at [www.java.com/en/download/manual.jsp](http://www.java.com/en/download/manual.jsp).

### Additional Information

This information can also be found in the Fireworks ReadMe file.

## Error "Could not launch...internal error..." when launching Fireworks CS4

## Issue

When you try to start Fireworks CS4, you receive the error, "Could not launch Fireworks. An internal error occurred."

## Solutions

Do one or more of the following:

**Solution 1: Validate fonts (Mac OS).** Close Fireworks. Delete the user preferences folder: /[user name]/Library/Preferences/Adobe Fireworks CS4. Double-click Font Book in the Applications folder. Choose Edit > Select All. Right-click (or Ctrl-click) and choose Validate Fonts. Remove all fonts that showed a problem, or remove duplicates. Launch Fireworks.

### **Solution 2: Isolate damaged fonts. (Windows and Mac OS)**

- 1 Close Fireworks.
- 2 Move installed fonts from the Fonts folder to a temporary folder on your desktop. Do not move any variants of Arial, Times New Roman, Garamond, Georgia, Kozuka, Minion Pro, Myriad Pro, Verdana and Tahoma.

**On Mac OS:** Move fonts from /[user name]/Library/Fonts/ to a temporary folder on the desktop.

**On Windows:** Move fonts from C:\Windows\Fonts\ to a temporary folder on the desktop.

- 3 Launch Fireworks. If Fireworks launches normally, close Fireworks. Install the fonts you moved to the temporary folder back into the Fonts folder in batches of 30 fonts or so. Installing in small batches helps you isolate the fonts that cause Fireworks launch issues.
- 4 Each time you move a batch of fonts back to the Fonts folder, launch Fireworks. If Fireworks launches successfully, close Fireworks again and repeat steps 2 and 3.
- 5 If Fireworks doesn't launch after you move a batch of fonts, do the following:
  - a Remove the last batch of fonts you moved back into the temporary folder.
  - b Move a smaller batch of about ten fonts to the Fonts folder.
  - c Launch Fireworks.
- 6 Repeat the steps to isolate the fonts that prevent Fireworks from launching normally.

## Additional information

Fireworks doesn't launch when it encounters damaged fonts. Fonts can become damaged when modified with font editing applications. For example, if you used a font editing application such as CrossFont to convert a Mac OS font Helvetica.dfont to a TrueType font, such fonts in your system could be reported as damaged. Similarly, if any fonts have duplicate PostScript names, Fireworks doesn't launch.

## Why do sliced images from Fireworks have broken icons inside Dreamweaver?

**Introductory note:** The issue addressed in this TechNote pertains mainly to Macromedia Fireworks 1 and 2. The Export process in Fireworks, as well as Macromedia Dreamweaver's ability to keep track of links in its site management feature, has improved in later product versions. In [Additional information](#) below you'll find links to resources for similar information for later product versions.

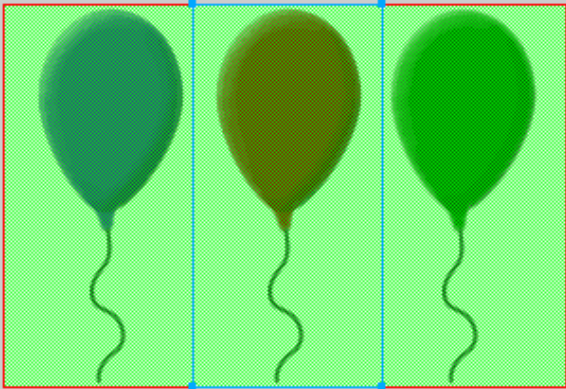

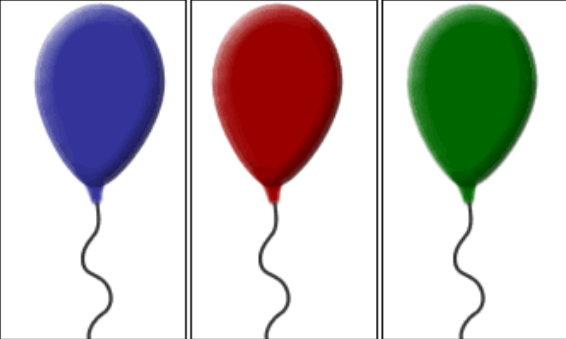

**Fireworks to Dreamweaver integration** When exporting sliced graphics from Fireworks, you also have the option to generate an HTML page that contains the table information necessary to make all of the slices display as one integrated graphic. The Slice tool separates each slice into an individual image, and each image is placed into its corresponding table cell, similar to pieces in a puzzle. Understanding what pieces Fireworks creates with the Slice tool, and how the pieces fit together, will assist you in integrate the resulting files into your Web page.

**How does the slice tool work?** The slice tool draws regions within the graphic, which will be exported as separate image files (slices) from Fireworks. Fireworks combines the separate image files back together by creating a table that inserts one of the images in each of the table's cells. The table tags reside in the HTML page that is created when the files are exported. The table is generated automatically by Fireworks (when you choose an HTML style in the Export dialog box).

**Why do table cells contain broken icons rather than images after a copy and paste of the table tags?** In the Export dialog box (choose File > Export, then click the "Next" button in the Export Preview dialog box) there are two different elements that are being saved. The top of the dialog box allows you to browse to indicate where the image slices (the separate GIF or JPEG files) should be saved. The HTML location indicates where the HTML page will be saved. Make sure that this location contains the HTML page that the source code will ultimately be pasted into. The two pages must reside in the same directory before copying the table information; if they are in different folders, the paths will be broken and the images won't show up when you preview the page in a browser.

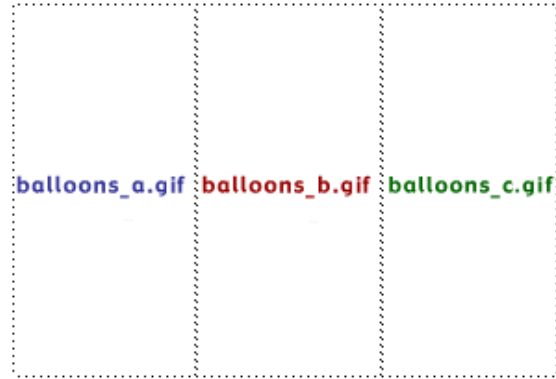

**To illustrate the process, see the steps below:**

1	This is how an image looks before using the slice tool:
	

2	<p>This is how the image looks after the slice tool has been used to designate the slice areas:</p>  <p>The image shows three balloons (blue, red, and green) on a green background. Two vertical blue lines are drawn between the balloons, and a red border surrounds the entire image, indicating the slice areas.</p>
3	<p>When exporting the files from Fireworks, the resulting slices will be individual files:</p>  <p>The image shows three individual balloon slices, each in its own frame. The first is blue, the second is red, and the third is green.</p> <p><b>balloons_a.gif balloons_d.gif balloons_f.gif</b></p>

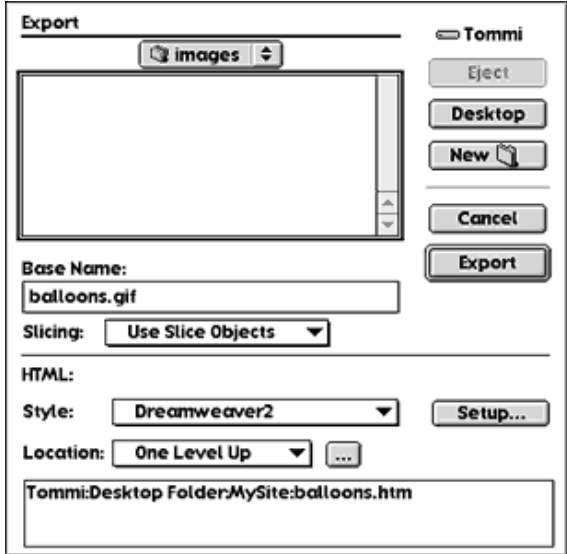

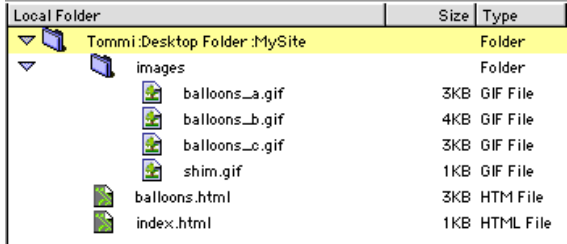

4

Fireworks will also create a table, which will have the table cell information necessary to fit all the separate slices back into their proper location:

If you look at the source code, you'll notice that the table was created with more than three table cells. Fireworks automatically creates transparent GIFs (called Shims) that fill in the extra empty table cells that are created in order to make the table perfectly square, and to allow the table to display correctly in every browser configuration. The default export setting inserts the Shim slices in the extra top row and right column of table cells to ensure that the content you've designed doesn't get distorted in the browser. The default setting is recommended in order to get the most reliable table renderings in all browser configurations. To change this default, open the Document Properties by choosing File > Document Properties or by clicking Setup in the Export dialog box to access the slice options. Click the Table Shims pop-up menu to select either "No Shims," "Shims from Image", or "Transparent Image"(the default).

5	<p>Along with the information in the table formatting, each table cell also contains the path to find the corresponding slice, so that the image will appear in the cell.</p> <p>This is an example of the lines of code in the table:</p> <pre>&lt;table &gt;&lt;tr&gt;&lt;!--spacing row, 1 height. --&gt;&lt;td&gt;&lt;img name="FwShim_Col_0" href="/support/fireworks/ts/documents/images/shim.gif" &gt;&lt;/td&gt;&lt;td&gt;&lt;img name="FwShim_Col_1" href="/support/fireworks/ts/documents/images/shim.gif" &gt;&lt;/td&gt;&lt;td&gt;&lt;img name="FwShim_Col_2" href="/support/fireworks/ts/documents/images/shim.gif" &gt;&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;!--row 1 --&gt;&lt;td&gt;&lt;img href="/support/fireworks/ts/documents/images/balloons_a.gif" name=balloons_a" &gt;&lt;/td&gt;&lt;td&gt;&lt;img href="/support/fireworks/ts/documents/images/balloons_b.gif" name=balloons_b" &gt;&lt;/td&gt;&lt;td&gt;&lt;img href="/support/fireworks/ts/documents/images/balloons_c.gif" name=balloons_c" &gt;&lt;/td&gt;&lt;td&gt;&lt;img name="FwShim_Row_0" href="/support/fireworks/ts/documents/images/shim.gif" &gt;&lt;/td&gt;&lt;/tr&gt;&lt;/table&gt;</pre> <p>In the example above, the three image slices are linked by a path highlighted in the matching color of the balloons. The paths in gray refer to the transparent Shims that Fireworks created. The path that links a slice to each cell is document relative to the HTML page that Fireworks creates. The paths in the code above indicate that the HTML page balloons.html lives a folder one level up from the folder called images. The path points the HTML page to look in a folder called images, where all the GIF files live. As long as the relationship is maintained between the slices and the HTML page, the links will be correct. If the HTML page is moved to a different folder, or if the slices are moved from the images folder, the paths will be broken and the images will not appear in the table cells.</p>
---	---

6	<p>When exporting the files from Fireworks, it is critical that the HTML page created by Fireworks is exported into the same folder as the HTML page you will be pasting the table information into. In the example below, the local root folder is named MySite. Inside the MySite folder is the index.html page and a folder called images. Since the source code from the HTML page that Fireworks creates will be copied into the index.html page, the Export dialog box should be configured so that the slices will be saved in the images folder and the HTML page will be saved one level up, in the MySite folder.</p> 
7	<p>As long as both HTML files live in the same folder, the paths will not be broken, and the table cells will show up with the image slices inside. The page that the code is copied into from Fireworks will use the same path, because it is in the same location as the page that Fireworks created. After exporting the slices and HTML page from Fireworks, the site structure looks like this:</p>  <p>The two HTML files, balloons.html and index.html are both located in the same folder. When the HTML source is copied from the balloons.html file into the index.html page, the paths will be correct, and the images will appear in the table cells.</p>

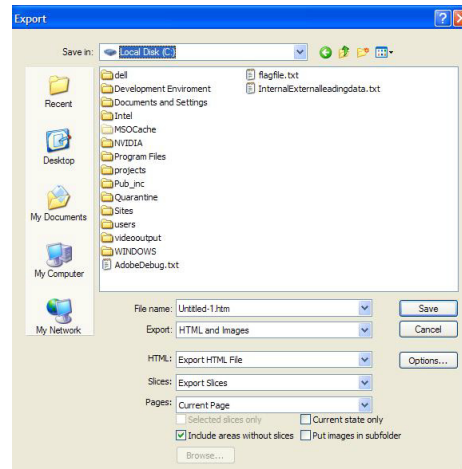

**Additional information** Below you'll find more updated information about exporting from Fireworks and inserting HTML code into Dreamweaver:

▶	The <a href="#">Export</a> section of the Fireworks Support Site.
▶	The <a href="#">Fireworks and Dreamweaver Integration</a> section of the Dreamweaver Support Site.
▶	To upgrade your current version of Dreamweaver and Fireworks, visit the <a href="#">Macromedia On-line store</a> .

## Differences in single-state export between Fireworks CS4 and CS5

### What's covered

Fireworks CS4    Fireworks CS5

### Fireworks CS4

When you export multiple states with Current State Only deselected, the first state isn't appended with "\_s1," regardless of settings in the HTML Setup dialog box. (The Current State Only option is in the Export dialog box.) For example, when you edit State 3 and export it without exporting all the other states, the exported slice overwrites State 1.

#### Example:

Export a file named XYZ with three states. Fireworks creates files XYZ, XYZ\_f2, and XYZ\_f3, corresponding to the states after export. The first state isn't appended with f1. If you modify State 3, and export it with Current State Only deselected, a file with the name XYZ is created. The XYZ file contains changes to State 3, and overwrites the previously created XYZ file (corresponding to State 1). The XYZ\_f3 file is unchanged.

To retain the naming convention for State 3, and avoid overwriting the State 1 file, do the following:

- 1 Before you export, rename the XYZ file to XYZ\_f1.
- 2 Export State 3. A file with the name XYZ is created.
- 3 Delete the existing XYZ\_f3 file, or rename it.
- 4 Rename the XYZ file to XYZ\_f3.

### Fireworks CS5

When you export multiple states with Current State Only deselected, the first state is appended with "\_s1" (or the convention defined in the HTML Setup dialog). For example, when you edit State 3 and export it without exporting all the other states, a file named XYZ is created. The XYZ\_s3 file is unchanged after export, and all changes made to State 3 are reflected in the XYZ file. Unlike CS4, the file corresponding to State 1 is not overwritten.

#### Example:

Export a file named XYZ with three states. Fireworks creates files XYZ\_s1, XYZ\_s2, and XYZ\_s3 corresponding to the states after export. If you modify State 3 and export it with Current State Only deselected, then a file with the name XYZ is created. The XYZ file contains changes to State 3. The XYZ\_s3 file is unchanged.

To retain the naming convention for State 3, do the following:

- 1 Export the state (for example, State 3), that you have modified. A file with the name XYZ is created.
- 2 Rename the XYZ file to XYZ\_s3.

## How to create a fade-in/fade-out animation in Fireworks 4

**A little history on Fireworks animation** Fireworks users have produced fast-loading animated GIFs in Fireworks since the early days of the product. There have been many changes to the User Interface (UI) since Fireworks 1, when the Opacity and URLs toolbars graced the screen horizontally. Several years ago, a Lynda Weiman seminar inspired a TechNote on the ever-popular fade-in/fade-on animation technique. This TechNote has been updated with each new version of Fireworks [see [How to animate a text fade in and out](#) (TechNote 13728)]. Since Fireworks 4 can now boast of a time-saving animation symbol creator, a brand new TechNote for the fade-in/fade-out technique is in order.

**Animation symbols** Below is an overview of the options on the Animate dialog box. These options allow for most kinds of animation, including movement, direction, scale, opacity and rotation. With this automated feature, you can quickly create basic animated symbols. Further, multiple animated symbols can exist on one canvas. More complicated animations, however, will still have to be made with tweening or with frame-by-frame alteration of the image.

### The Animate dialog box in Fireworks 4

#### Animation functions available on the Animate dialog box

▶	<b>Frames:</b> This option allows you to designate the number of frames that you want in your animation. A new Fireworks document starts on Frame 1 and this frame is included in this number. In this example, if 5 is selected, there will be 5 frames total.
▶	<b>Move:</b> This option allows you to designate the distance the object will move from its point of origin in a straight line. Animation along curved or other path shapes is not available under this option.
▶	<b>Direction:</b> This allows the user to set an angle in which the object will move from its point of origin in a straight line. When the option arrow is selected, rotate the dial so the indicator points in the direction of the animation.

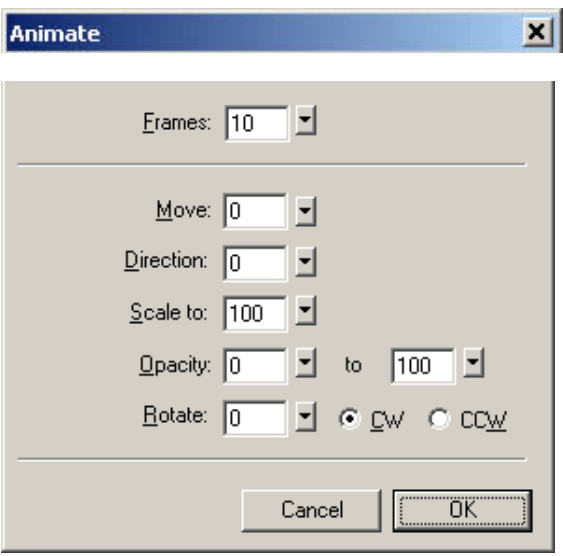

▶	<p><b>Scale to:</b> This setting tells the animation symbol to change scale incrementally to the specified percentage in this field over the specified number of frames as designated in the Frames text box at the top of the dialog box. If an object is going to scale to 200% over 5 frames, the second frame's image will be 125%, the third, 150%, the fourth 175% and the fifth 200%. The percent increments will vary depending on how many frames are selected in the Frames text box.</p>
	<p><b>Opacity:</b> This allows the user to specify a transparency percentage for the selected Animation symbol to appear as in the initial frame and incrementally changes the opacity setting over the specified number of frames in the Frames text box to the transparency percentage designated in the "to" field. If an object is going to fade from 0% to 100% (opaque) over a 5 frame animation, the transparency of each successive image would be as follows: frame 2 would display the symbol at 25% transparency, frame 3 at 50%, frame 4 at 75% and frame 5 at 100%. The percent increments will vary depending on how many frames are selected in the Frames text box.</p>
▶	<p><b>Rotate:</b> This allows the user to specify the range in degrees of the rotation as well as the direction, Clockwise (CW) or Counter Clockwise (CCW). Rotating objects will move in a circular motion, but can be transformed to create interesting effects.</p>

**Text fade-ins and outs** Text that fades in and out continues to be a popular animation on Web sites. Usually such text has an image map link and invites the viewer to click on it to navigate to another page or site. This TechNote provides the steps you should use to create a text fade-in/fade-out animation in Fireworks 4.

### Section 1: Creating a text fade-in

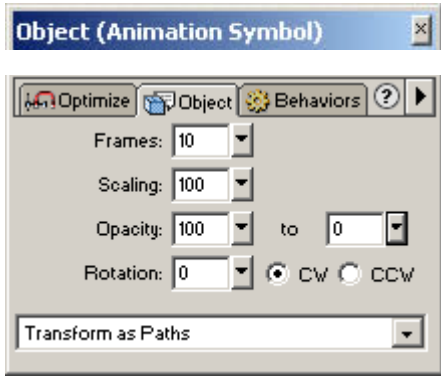

1	Choose Window > Optimize to open the Optimize panel.
2	In the Export File Format pop-up menu, select Animated GIF.
3	Choose Window > Frames to open the Frames panel. Click Frame 1.
4	Click the Text tool in the tools panel. Then click on the canvas. The Text Editor will appear on the screen.
5	Type your first text item. Make other text and formatting selections on the Text Editor as needed.
6	Click OK to close the Text Editor.
7	With the text object on your canvas still selected, choose Command > Document > Center in Document to place the object in the center of the canvas.
8	With the text object still selected, choose Modify > Animate > Animate Selection to open the Animate dialog box.
9	Set the appropriate values in the various text boxes in the Animate dialog box (see below). Generally a change in opacity of 10% between increments will give a smooth transition, so a 0% to 100% transition will appear smooth over 10 frames.

	
10	Click OK.
11	The message box in will appear, asking if you want to create additional frames for the animation. (This message appears if Fireworks has to extend the animation past the last frame of your document. You have the option of not showing this message again.)
12	Click OK to create the additional frames.
13	The symbol will now appear on the canvas. Since you set your animated symbol to start at 0% opacity, it will appear transparent in Frame 1.

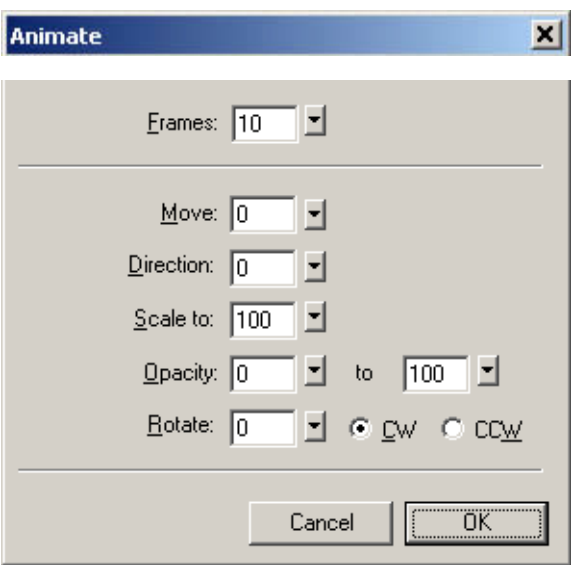

## Section 2: Creating a text fade-out

1	Now that you've made an animation symbol that fades in, you can add a symbol instance that fades out. Open the Frames panel and click the last frame.
2	Click the Add Frames button at the bottom of the Frames panel. This will add an additional frame on the Frames panel.
3	Choose Window > Library to open the Library panel.
4	On the Library panel find the animation symbol that is in Frames 1 through 10. Drag the symbol from the Library panel to the center of the canvas.
5	With the symbol selected, choose Command > Document > Center in Document to place the object in the center of the canvas.

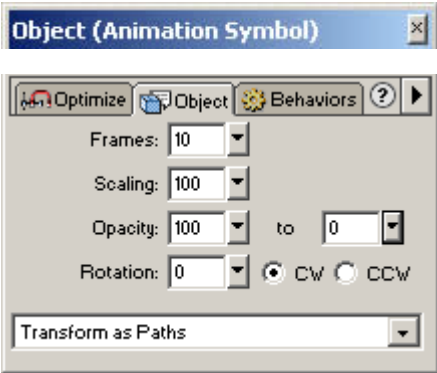

6	With the symbol selected, open the Object panel and set the animation settings to fade the symbol out over 10 frames, just as you did for the first instance of the symbol to make it fade in.
	
7	Test the first part of the animation by clicking the Play button at the bottom of the Canvas window.

### Section 3: Creating a second text fade-in

1	Now that you know how to make animation symbols fade in or out, you can add additional fading in/out animations to further accent your design. This third animation will alternate with the second symbol instance.
2	Open the Frames panel and click the Frame on which the first animation ends.
3	Click the Text tool and then on the canvas.
4	Type your alternate text item. Make other text and formatting selections on the Text Editor as needed.
5	Click OK to close the Text Editor.
6	With the text object still selected, choose Commands > Document > Center in Document to center the text on the canvas.
7	While the text object is still selected, choose Modify > Animate > Animate Selection to activate the Animate dialog box.
8	Set the animation options in the Animate dialog box that appears. In this case, the settings will be the same as the first text fade-in.

	
9	Click OK.
10	If you receive the message box asking if you want Fireworks to create additional frames for your animation, Click OK to accept.

**Section 4: Creating the second text fade-out** To finish this technique, you'll only need to add one more symbol instance that fades out. The steps will be similar to the steps in Section 2 above, as follows:

1	Click on the last frame.
2	On the Library panel, locate the second animated symbol.
3	Drag the second animation symbol from the Library panel to the center of the canvas.
4	With the symbol instance selected, choose Commands > Document > Center in Document .
5	With the symbol instance selected, set the animation settings on the Object panel.
	
6	After receiving the message box asking if you want Fireworks to create additional frames for your animation, Click OK.

Choose File > Export to export the animated GIF (make sure the Export file format has been set to Animated GIF on the Optimize panel).

The results should look like this:

## Changing the location of a Pop-up Menu exported from Fireworks

**Issue** When previewing in a browser, a Pop-up Menu exported from Fireworks 4 and inserted into an HTML document does not appear in the expected location. The availability of a new extension on the Dreamweaver Exchange allows more stable alignment of pop-up menus in Dreamweaver. See Note below.

**Reasons** There are several reasons why a Pop-up Menu might display in an unexpected location on the previewing browser page, including:

▶	<b>Changed location of triggering device</b> The location of the triggering device (a hot spot, linked image or button) for a Pop-up Menu on the Dreamweaver page is not the same location that the triggering device occupied on the canvas in Fireworks.
▶	<b>Browser margins</b> Page margins have not been set to "0" in Dreamweaver.
▶	<b>Shifting location of triggering device</b> The triggering device is not absolutely positioned in Dreamweaver.

An explanation of each reason and a corresponding solution are offered below.

**Reason 1: absolute positioning relative to the top left corner of the Web page** When Fireworks exports a file containing Pop-up Menus, it creates a JavaScript file (fw\_menu.js) which generates CSS layers. The JavaScript code assigns an absolute location to each Pop-up Menu CSS layer. This is intentional so that the Pop-up Menus and sub-menus will always appear in the same absolute location in relation to each other. However, this causes the Pop-up Menus to be in the wrong location if the devices triggering these Pop-up Menus are placed in positions on the page which are different than their positions on the canvas in Fireworks.

**Changing location illustration** The following is a simple example which illustrates how changing the location of a triggering device between the Fireworks canvas and the Dreamweaver page "dislocates" a Pop-up Menu.

**The Fireworks canvas** A developer creates a single button on the canvas in Fireworks. The button is placed in the upper right hand corner of the canvas. The developer positions the Pop-up Menu on the canvas so that it overlays the button only slightly on the button's lower right-hand corner. View Example 1 to see how this button and the Pop-up Menu are positioned relative to each other and the upper left hand corner of the Fireworks canvas.

**Different positioning on the Dreamweaver page** The developer inserts the Fireworks HTML (Insert > Interactive Images > Fireworks HTML) for the button and JavaScript into a table in Dreamweaver. However, the button is positioned to the right and down by a 100 pixels in both directions. Although the position of the button relative to the upper left-hand corner of the page has changed from Fireworks to Dreamweaver, the position of the Pop-up Menu (which are housed in CSS Layers) has not. See Example 2 for an example of how this button appears in Dreamweaver, as well as how the button and the Pop-up Menu display in a browser. For comparison purposes, consider Example 3 which demonstrates that if the button is located in Dreamweaver in the same position it occupied on the canvas in Fireworks, the Pop-up Menu displays as expected.

**Solution 1: resetting the positioning of a Pop-up Menu in the HTML Code** The position of a Pop-up Menu on the Dreamweaver page can be modified by changing its X,Y coordinates in the HTML code. The X,Y coordinates are relative to the top left corner of the page. These coordinates are absolute;the Pop-up Menu will not move even if other items on the page do move (as with page resizing). The image below shows the X,Y coordinates for a button created in Fireworks, as well as the resulting HTML code for these coordinates in Dreamweaver:

Modifying the HTML will involve finding the current X,Y coordinates of your Pop-up Menu and then changing the coordinates to appear in a location closer to the triggering device or nearer to the location anticipated in Fireworks.

#### Changing a Pop-up Menu's location in the Dreamweaver HTML code

1	Select the image which triggers the Pop-up Menu.
2	Open the Code inspector in Dreamweaver. The code relating to the image will be highlighted.
3	In the highlighted code, find the following text:  "window.FW_showMenu(window.fw_menu_#,#,#)"

4	The last two numbers correspond to the absolute X,Y location of the Pop-up Menu from the top left corner of the page. (The X,Y coordinates of the Pop-up menu in the example above is 100,10.)
5	Change those numbers to reflect the desired absolute location.
6	<p>Users of Internet Explorer 5.0 for Macintosh (only) must take an extra step to change the location of their Pop-up Menus:</p> <p>Once the X,Y location has been changed in the onMouseOver call above, the following tag which appears just above the Fireworks 4 table must be moved to the first line under the &lt;body&gt; tag in the HTML file:</p> <pre>&lt;Script Language="JavaScript1.2"&gt;fwLoadMenus();&lt;/script&gt;</pre> <p><b>Note:</b> The above script is the call to the "fwLoadMenus()" JavaScript function, which is located in head tag of the document. The "fwLoadMenus()" function controls the Pop-up Menus. A call to a JavaScript function basically triggers the JavaScript activity in the browser. In Internet Explorer 5.0 for the Macintosh the actual placement of the call influences how the browser calculates the X,Y coordinates. If the call is placed directly below the body tag (rather than just above the Fireworks table) the X,Y coordinates will relate to the upper left-hand corner of the browser window. Moving this code is not necessary for any browser other than Internet Explorer 5.0 for the Macintosh.</p>

#### Approximating the location where a Pop-up should display

1	Open the page in Dreamweaver with the Pop-up Menu(s).
2	If you are not in Design View, choose View > Design.
3	If the rulers are not already displayed on the page, choose View > Rulers > Show. Also, pixels should be your mode of measurement (View > Rulers > Pixels). If the origin is not 0,0, choose View > Rulers > Reset Origin.
4	Notice that as you move your cursor around the Dreamweaver page, small dotted lines appear in the rulers. These dotted lines indicate the cursor's current X,Y coordinates. The dotted line in the top ruler shows the X coordinate; the dotted line in the ruler on the left side indicates the Y coordinate.
5	Place your cursor in the position that you would like the Pop-up Menu to appear on the Dreamweaver page. Note the location of the dotted line in the top ruler for the X coordinate, as well as the location of the dotted line in the left ruler for the Y coordinate. Write down your intended X,Y coordinates.
6	Follow the above steps to change the location of the Pop-up Menu in the Dreamweaver HTML. You may need to again change the X,Y coordinates by a few pixels to get the exact absolute location you want.

**Note:** The Fireworks Insert Pop-up Menu command automatically writes the Dreamweaver Add/Remove Netscape Resize Fix command to the external JavaScript code to prevent problems with browser resizing in Netscape 4.x. It will not be necessary to add this command once the Fireworks HTML table has been inserted into Dreamweaver, even if you inserted the Fireworks HTML into a layer.

**Reason 2: browser margins** If the Fireworks HTML table has been inserted into another HTML document, the page margins of the document may be artificially holding the table away from the top left corner. The Pop-up Menus will then seem to be positioned slightly above and to the left of the triggering devices.

**Solution 2: resetting page margins** Set the page margins to "0" in Dreamweaver.

**Reason 3: triggering device location shifts on Web page** Because a Pop-up Menu is absolutely positioned relative to the top left corner of the page, the triggering device will also have to be absolutely positioned. In other words, the triggering device cannot be located or aligned such that its position will change if the browser window resizes.

**Solution 3: stabilizing the location of the triggering devices** Use Left or Default alignment for a Pop-up Menu's triggering device (and any table or layer in which the triggering device is embedded). Generally, placing a Fireworks HTML table with Pop-up Menus inside a Center-aligned table will not allow the Pop-up Menus to consistently appear as expected.

**Note:** aspects of the Pop-up Menu feature in Fireworks were improved in the [Fireworks 4.0.2 Updater](#). See [Fireworks 4 and 4.0.2 release notes](#) for specific information about the updater.

## How to change the location of submenus in a Fireworks Pop-up Menu

### Positioning submenus in Fireworks 4

Many users have asked how they can control the position of submenus that are generated using the Fireworks 4 Pop-up Menu feature. The code that controls the horizontal and vertical position of the submenus relative to their main menu items is found in the fw\_menu.js file. This TechNote will explain how you can change the position of your submenus using the code provided. In Fireworks MX, submenus can be positioned using the Position tab of the Pop-up Menu Editor. See [Fireworks MX Pop-Up Menu](#) (Fireworks Article) for more information on Pop-up Menus in Fireworks MX.

This TechNote assumes that you already know how to create Pop-up Menus in Fireworks 4 and that you know how to export Fireworks HTML and Images to a defined Dreamweaver site directory structure. You can learn how to create Pop-up Menus by choosing Help > Lessons and clicking on Lesson 5 in the Flash movie that appears: "Creating a Pop-up Menu" to learn how to create Pop-up Menus. For information on how to Optimize and Export your files, see articles in the [Optimizing](#) and [Exporting](#) area of the Fireworks support site. Also you should be somewhat familiar with JavaScript, and should be able to edit the code in the fw\_menu.js file with confidence.

This TechNote will explain:

- How to set the horizontal positioning of the submenus globally.
- How to set the vertical positioning of the submenus globally.
- How to set individual horizontal positioning for submenus.

### Changing submenu horizontal position globally

The submenu positioning in the fw\_menu.js is determined by three lines in the code. In each case, the change you make should be identical. The following table gives details on these three lines of code and shows how they should be changed. To do this you can open the fw\_menu.js that was exported to your site directly alongside the Fireworks HTML in Code view in Dreamweaver 4.

**Note:** The code in the fw\_menu.js shown in this TechNote is generated from Fireworks 4.0.2 in its original form. Make sure you have downloaded and installed the [Fireworks 4.0.2 updater](#) before exporting your HTML and images from Fireworks. If you have made other third party recommended changes, your line numbers may be different.

**To change the horizontal position of submenus, follow these steps:**

- 1 Open the fw\_menu.js file that Fireworks exported alongside the Fireworks HTML file in Dreamweaver and choose View > Code if Code View is not enabled. You should also be able to see the line numbers. If not, choose View > Code View Options > Line Numbers. It may also help to turn on Word Wrap, Syntax Coloring and Auto Indent as well. Scroll down in the code to line 652 and locate the following line of code:

Notice the "-5" at the end of that line? That means the submenu should overlap its parent menu by 5 pixels. So if you wanted increase the overlap, change the -5 to something smaller like -10. That would cause an overlap of 10 pixels. If didn't want to overlap at all, you would add a positive number. For example, changing the -5 to +5 would cause the submenu to be positioned 5 pixels to the right of the parent menu's right side. Change this number to the desired pixel setting.

- 2 Because the Pop-up Menu code is designed to work in several different browsers, there are two other locations where you must set the distance from the right side of the main menu. Scroll down in the code to line 668 and locate the following code:

Again, change the "-5" at the end of this line of code to the desired pixel setting to cause the submenu to appear the desired number of pixels from the right side of the main menu.

- 3 The third location where you must change the horizontal position of the submenu is shown below. It is only 3 lines further down on line 671.

Here also, you will need to change the "-5" at the end of the line to the same number you entered for the two submenu positions in lines 652 and 668. Once you have set this number in all three lines, Save the fw\_menu.js file. The next time you view the HTML in a browser, you will see that the submenus appear at exactly the location you specified in the three lines of the fw\_menu.js code.

**Changing the vertical position globally**

As with the horizontal position, the vertical position of the submenus is set in three lines of the fw\_menu.js file. The following table gives details on these three lines of code and shows how they should be changed. Again you must open the fw\_menu.js that was exported to your site directly alongside the Fireworks HTML in Code view in Dreamweaver 4.

**To change the vertical position of submenus follow these steps:**

- 1 Again, as in step 1 in the instructions for horizontal positioning of the submenus, you must open the fw\_menu.js in Dreamweaver in Code View. Scroll down to line 647 and locate the following code:

Notice that the last item in the line is divided by the number "3". The default location for submenus is set to 1/3 the height of the menu item as set in the `fwLoadMenus` function in the `<script>` area of the HTML code. By either changing the number 3 to a different number, or by replacing the entire `l.Menu.menuItemHeight/3` to a different numerical value, positive or negative, the vertical position of the submenus can be adjusted.

**2** Scroll down to line 667 and locate the following code:

Again the value is expressed as the `MenuItemHeight` divided by "3". You can either set the value of the denominator in this fraction or you can replace the entire `l.Menu.menuItemHeight/3` with the desired value, including negative numbers.

**3** Scroll to line 670 which is the last line where the vertical position must be set:

Again the value is expressed as the `MenuItemHeight` divided by "3". You can either set the value of the denominator in this fraction or you can replace the entire `l.Menu.menuItemHeight/3` with the desired value, including negative numbers. All values should be set in whole numbers since they are measured in pixels.

### Changing the horizontal position for individual menus

**1** In the `fw_menu.js` file, append the string `" + (childMenu.Menu.horzOffset || 0)"` to the default endings to lines 649, 652, 668 and 670 as shown below:

**Note:** Notice the "+" must be included before `(childMenu.Menu.horzOffset...)`. Make sure you correctly enter the entire string!

**2** The Fireworks JavaScript code also sets a container for the menus and submenus to appear in as indicated by the property `"Menu.container"`, which in turn has a property called `"clip"`. The Menu container is an invisible box that the Pop-up Menus and submenus are set to appear in and the clip delimits the size and location of this container. This container only affects Netscape 4.x code, so if you want to make submenus that are positioned to the left of the main menu appear in Netscape 4.x you'll need to add the following two lines of code after line 652 in the `fw_menu.js` file: `if( l.Menu.container.clip.left > childMenu.left ) { l.Menu.container.clip.left = childMenu.left;`

**3** In the submenu sections of the `fwLoadMenus` function, for each submenu you wish to control the horizontal position, define `horzOffset`. See lines 14 and 20 in the example below. Positive values shift the submenu to the right, and negative values shift the submenu to the left. If you don't define `horzOffset` for a submenu, it simply goes to the default location.

**4** Save and close the `fw_menu.js` and the HTML file. Test your HTML in a browser. To see this code working, see [Example 1](#).

## Additional Information

The following TechNotes discuss various aspects of Pop-up Menus and ways you can customize or use them in your HTML:

## Button text does not update correctly

**Issue** Button text does not update correctly.

**Reason** The addition of the Button Editor in Fireworks 3 with the copy up and update text functions, along with the ability to update the text via the Object panel presents several problems when the user creates multiple text objects in the Button Editor.

For example, if the button has multiple text blocks in any or all of the tabs, and the user updates the text in the Object panel when the button is selected, which text block gets updated? This TechNote explains how Fireworks determines this and discusses ways to work around this issue. Other text issues as related to buttons are discussed and tips for improving button production are included.

Unlike text on the canvas, text in a button and any instances of it on the canvas are dynamically linked. This is what allows the user to easily update button text using the Object panel. Because the Button Editor and the Symbol Editor behave exactly like the canvas, it is possible to create multiple text objects on a button and its various states which can present problems under the circumstances in this list.

**The following problems that may occur using text in the Button Editor:**

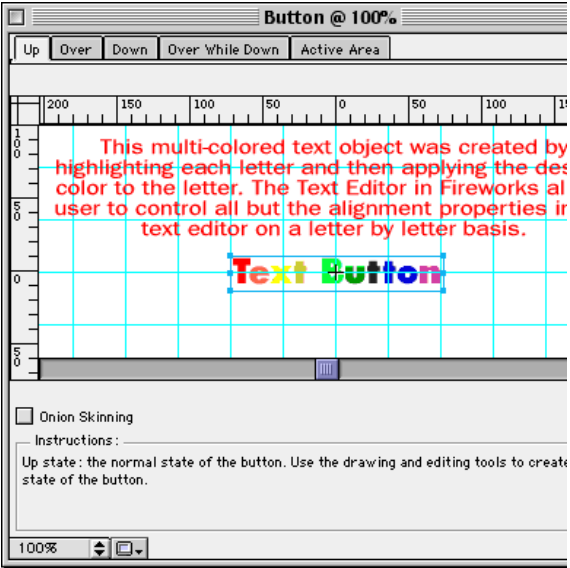

▶	Non-updating features.
▶	Multiple text objects in the button editor.

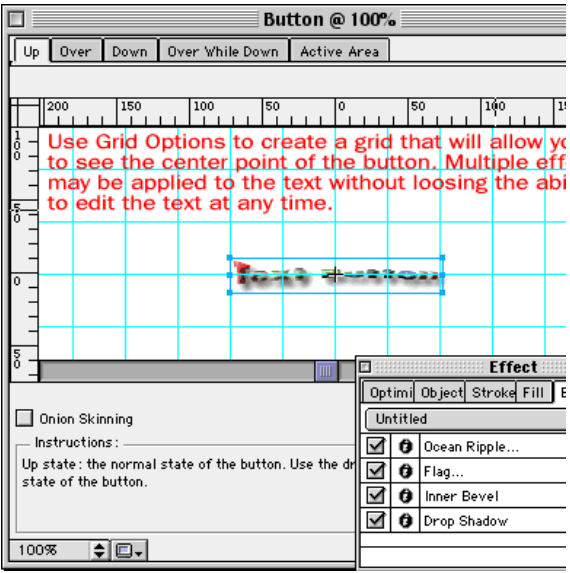

**Non-updating features** In Fireworks 3, only alphanumeric characters that are entered into the text string are updatable. Font, Font size, color, style, kerning, leading, alignment, character width, baseline shift, anti-aliasing and auto-kerning are not affected when updating text in buttons.

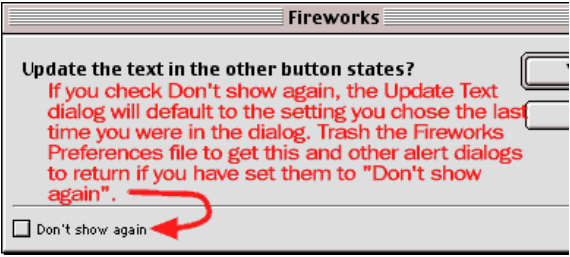

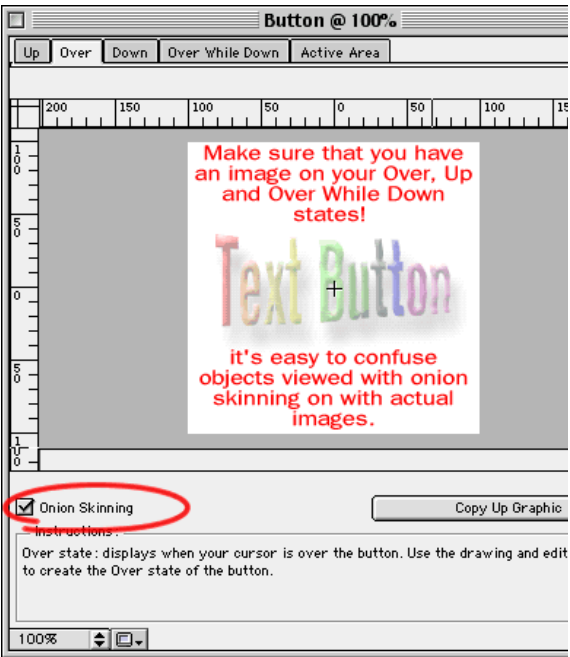

**Note:** This behavior is consistent both when text is changed in the text editor and when text is updated in the Object panel when the button is selected.

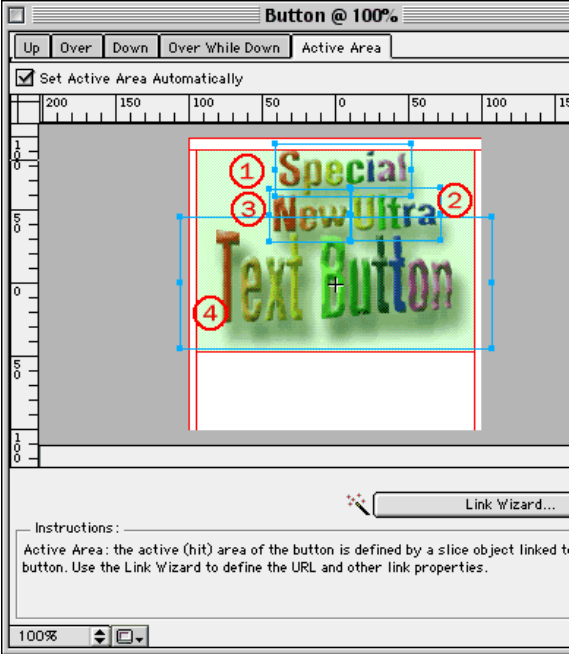

**Multiple text objects in the Button Editor** In Fireworks 3 users can place many text objects in the Button Editor. Because of the linking of the text between the various states in the Button Editor as well as the ability to update the text from the Object panel, problems may arise that can be easily avoided with a little foresight.

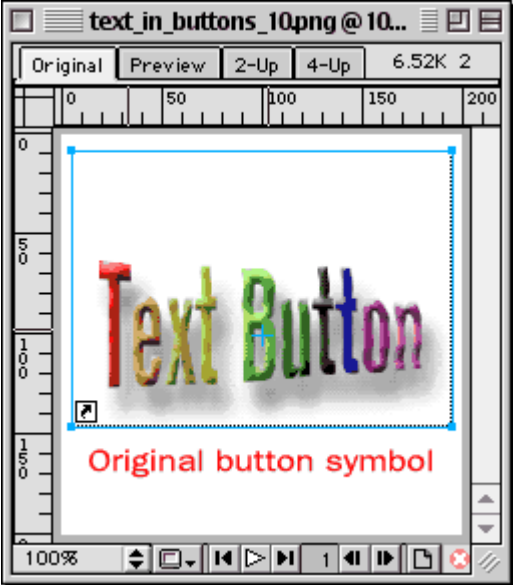

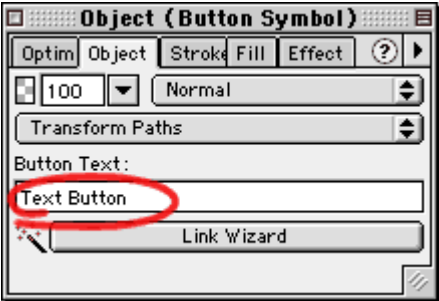

**Solution**The following steps and illustrations show what can happen (1- 12) and in step 13 how to avoid such problems:

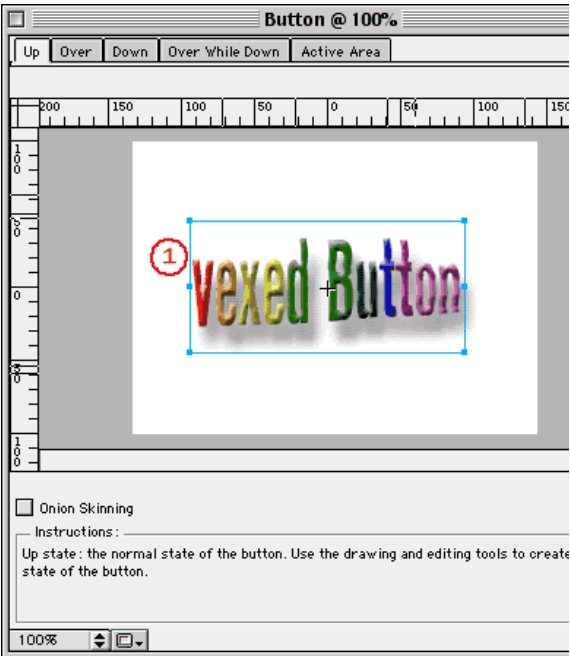

1	<p>Choose Insert &gt; Button or click a text object and select Insert &gt; Convert to Symbol. Check the radio "Button" in next dialog window. Text can also be imported into the Button Editor or choose Insert &gt; Libraries &gt; Other to choose a text button from another document from your system.</p>
	
2	<p>Effects can be added to the text just as an effect can be applied to any object on the canvas.</p>

	
3	<p>Click the Over state tab and then click the "Copy Up Graphic" button. Double-click the text to bring up the Text Editor and change the text.</p>
	
4	<p>The Update text dialog appears asking if you wish to update the text in the other button states.</p>

	 <p><b>Update the text in the other button states?</b> If you check Don't show again, the Update Text dialog will default to the setting you chose the last time you were in the dialog. Trash the Fireworks Preferences file to get this and other alert dialogs to return if you have set them to "Don't show again".</p> <p><input type="checkbox"/> Don't show again</p> <p><b>Note:</b>When you click on the "Don't show again" checkbox, the selection you choose will be kept for future text updates. To restore the dialog to show whenever text is updated, delete the Fireworks Preferences file and relaunch the program.</p>
5	Use onion skinning to see the relative position of the buttons between the various states. Don't confuse an object on another tab as being on the current tab because onion skinning is turned on.
	 <p><b>Button @ 100%</b></p> <p>Up Over Down Over While Down Active Area</p> <p>Make sure that you have an image on your Over, Up and Over While Down states!</p> <p>Text Button</p> <p>it's easy to confuse objects viewed with onion skinning on with actual images.</p> <p><input checked="" type="checkbox"/> Onion Skinning</p> <p>Copy Up Graphic</p> <p>Instructions:</p> <p>Over state: displays when your cursor is over the button. Use the drawing and edit to create the Over state of the button.</p> <p>100%</p>

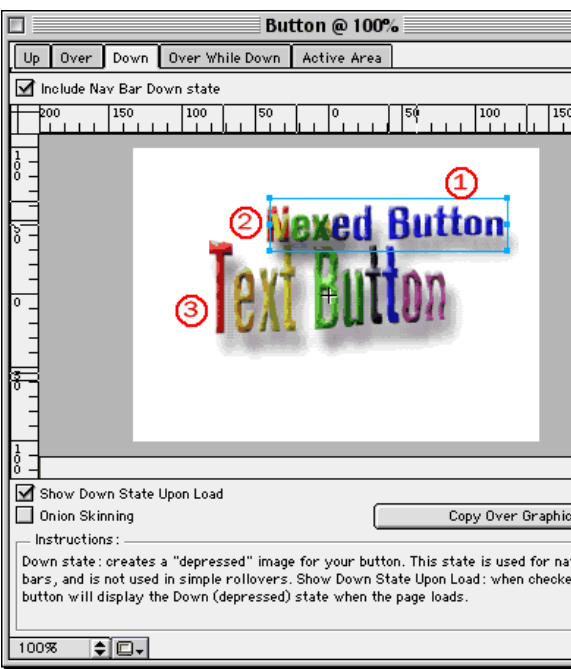

6	<p>Repeat the Copy Up, Over and Down Graphic operation and add a new text object to each subsequent state of the button. Notice that the last added text is the top object in the button state just as layers may contain multiple objects that appear in a front to back order. The text to the right in this button has the word "Special" as the top object then "Ultra" as the second object, "New" as the third and "Text Button" as the bottom item.</p>
	 <p>The screenshot shows a software interface for creating a button. The title bar reads 'Button @ 100%'. Below the title bar are tabs for 'Up', 'Over', 'Down', 'Over While Down', and 'Active Area'. A checkbox labeled 'Set Active Area Automatically' is checked. A horizontal ruler is visible above the main workspace, with markings at 200, 150, 100, 50, 0, 50, and 100. The main workspace contains a button graphic with a light green background and a red border. The text 'Special', 'New Ultra', and 'Text Button' is displayed on the button. Red circles with numbers 1, 2, 3, and 4 are placed around the text objects to indicate their order or position. Below the workspace is a 'Link Wizard...' button. The 'Instructions:' section contains the text: 'Active Area: the active (hit) area of the button is defined by a slice object linked to button. Use the Link Wizard to define the URL and other link properties.' At the bottom of the interface, there is a zoom level indicator set to '100%'.</p> <p><b>Note:</b>When working with a button that will be exported as part of a Nav Bar, the Link Wizard may be disregarded in the creation of the initial button. This gives you the flexibility of setting specific button properties later in the Object panel.</p>
7	<p>Once the button is created it will appear on the canvas and in the Library panel.</p>

	
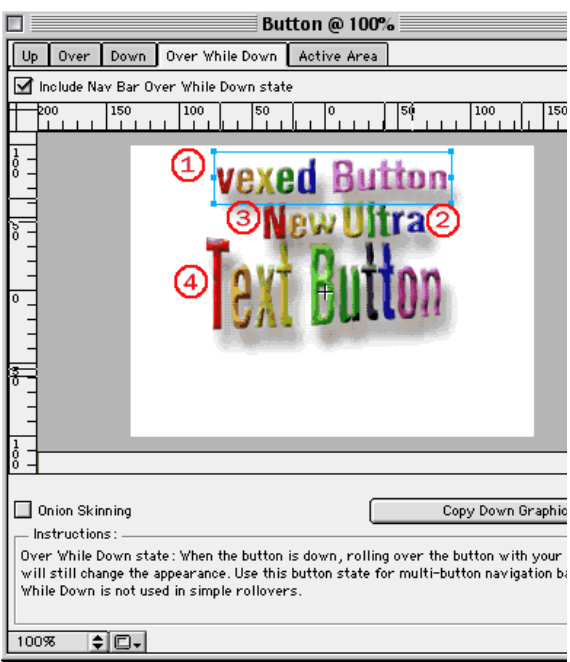

8	<p>With the button selected on the canvas, bring up the Object panel Command+I (Macintosh) or Control+I (Windows) and notice that the Button text field will display the topmost text that appears in the Up state of the Button Editor.</p>
	
9	<p>Enter some new text in the Button Text field. Notice that the new text appears on the Over state of the button.</p>

	 <p>Button @ 100%</p> <p>Up Over Down Over While Down Active Area</p> <p>200 150 100 50 0 50 100 150</p> <p>1 0 0</p> <p>1 0 0</p> <p>0</p> <p>0</p> <p>1 0 0</p> <p><input type="checkbox"/> Onion Skinning</p> <p>Instructions:</p> <p>Up state: the normal state of the button. Use the drawing and editing tools to create state of the button.</p> <p>100%</p>
10	When the Over state is viewed, notice that the text in the topmost object of the layer stack gets altered, not the original text that logically would be linked to the text in the Up state.

	
11	<p>When the Down state is viewed, notice that the text in the topmost object of the layer stack gets altered, not the original text that logically would be linked to the text in the Over state.</p>

	 <p>The screenshot shows a software interface for creating buttons. The title bar reads "Button @ 100%". Below the title bar are tabs for "Up", "Over", "Down", "Over While Down", and "Active Area". A checkbox labeled "Include Nav Bar Down state" is checked. A horizontal scale bar is visible below the tabs. The main preview area shows two buttons: "Nexed Button" and "Text Button". The "Nexed Button" is highlighted with a blue border and a red circle "1". The "Text Button" is highlighted with a red circle "3". A red circle "2" is also present near the "Nexed Button". Below the preview window, there are checkboxes for "Show Down State Upon Load" (checked) and "Onion Skinning" (unchecked). A "Copy Over Graphic" button is also visible. Instructions explain the "Down state" and "Show Down State Upon Load" options. The zoom level is set to 100%.</p>
12	<p>When the Over While Down state is viewed, notice that the text in the topmost object of the layer stack gets altered, not the original text that logically would be linked to the text in the Down state.</p>

	
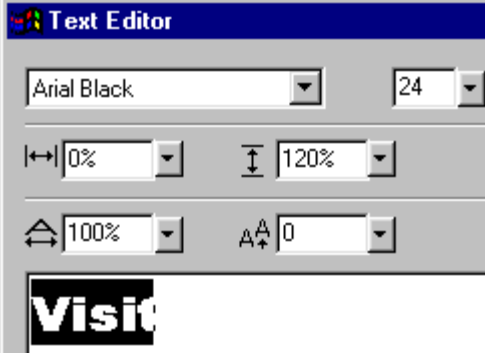

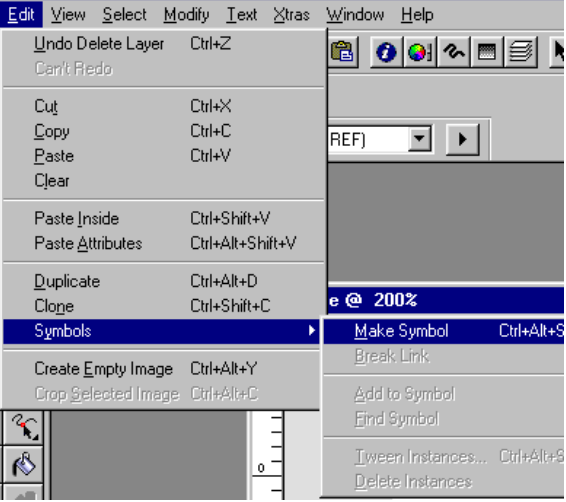

13	<p>To avoid this problem, click the text object to be changed in the Over, Down and Over While Down states and choose <b>Modify &gt; Arrange &gt; Bring to Front</b> before exiting the Button Editor. Then when the button is changed either by using the Object panel or by using the Button Editor, the correct text will be altered.</p>

	
14	This animation shows the various states of the button with the text altered after moving the objects to the front.
	

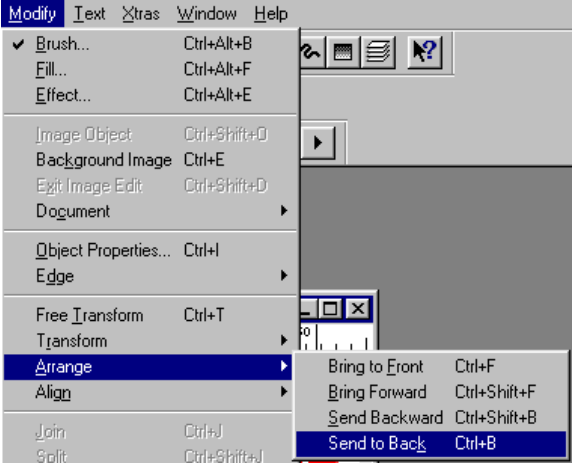

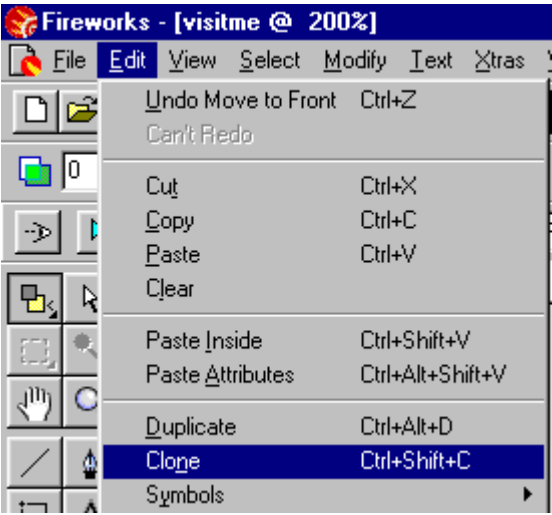

## How to animate a text fade in and out

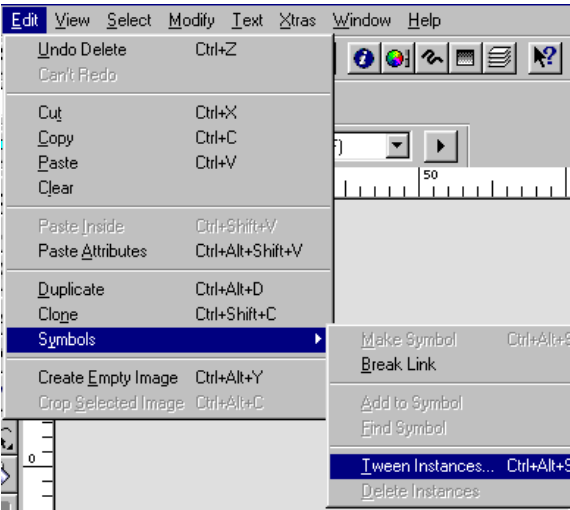

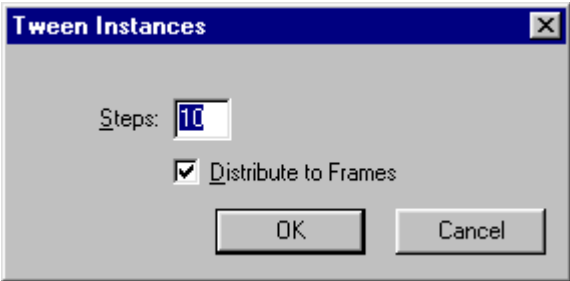

**Issue** This question came up in a Fireworks 1 seminar that Lynda Weinman held here at Macromedia. The user wanted to use symbols and tweening in Fireworks to create a text object that changed opacity from 0% to 100% over a series of frames and then reversed the animation with another text object, going from 100% to 0% opacity. The example below shows the desired results:

**Here's how it's done:** Open a new Fireworks Document and follow the steps below:

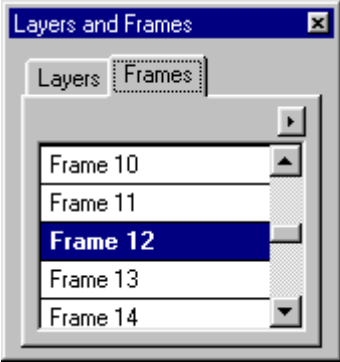

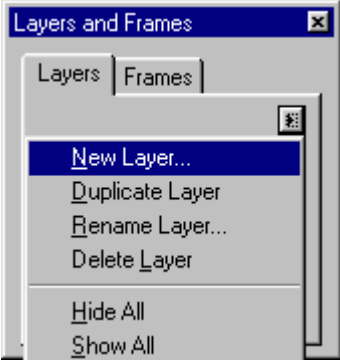

1	<p>In a new Fireworks document, type the first text object. Use the Swatches panel to set the color and any other attributes.</p> <p>In Fireworks 2 and 3, use either the Fill swatch at the bottom of the toolbox or set the fill color in the Fill panel.</p>
	
2	<p>With the text object selected, Choose Edit &gt; Symbols &gt; Make Symbol.</p> <p>In Fireworks 2 the Symbol, Tween Instances and Symbol Options can be found under the Insert Menu. Choose Insert &gt; Symbol.</p> <p>In Fireworks 3, choose Insert &gt; Convert to Symbol. Notice that the Symbol is saved in the Library panel. Only instances appear on the canvas in Fireworks 3. Tweening and other Symbol Options are under the Modify menu.</p>
	

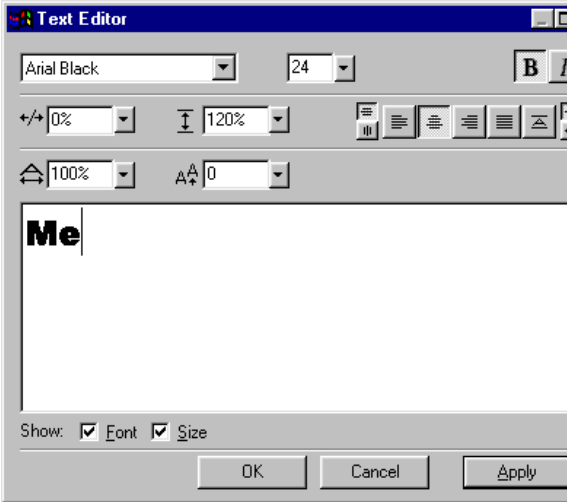

3	<p>Clone the Symbol to create an Instance. Note that a symbol has a little plus (+) sign in the lower left corner of its bounding box. An instance has a "shortcut arrow" in the lower left of its bounding box. The clone command is under the Edit menu. Choose Edit &gt; Clone or press Control+Shift+C (Windows) or Command+Shift+C (Macintosh).</p> <p>As previously noted, Symbols do not appear on the canvas in Fireworks 3. Instances only will be used for tweening in Fireworks 3.</p>
	 <p>The top screenshot shows a canvas window titled 'visitme @ 200%' with a grid. A red 'Visit' symbol is centered on the canvas. A small square with a plus sign (+) is in the bottom-left corner of the symbol's bounding box. The bottom screenshot shows the same canvas with a dashed bounding box around the 'Visit' text. A red arrow points to a small square with a shortcut arrow (a square with a diagonal arrow) in the bottom-left corner of the dashed box.</p>
4	<p>Set the opacity of the instance to 0%. In Fireworks 1 this is done in the Opacity Toolbar. In Fireworks 2 and 3 it is found in the Object panel.</p>
	 <p>The screenshot shows the 'Fireworks - Un' window with the Object panel open. The opacity slider is visible, with a value of 0. The slider is a vertical bar with a horizontal line indicating the current opacity level.</p>

5	<p>Choose Modify &gt; Arrange &gt; Send to Back or press Control+B (Windows) or Command+B (Macintosh) to send the instance directly behind the symbol. Animation in Fireworks is done in back to front order. When objects are distributed to frames, the backmost object will appear in Frame 1 and the frontmost object will appear in the last frame. All other objects will appear in back to front order in the corresponding sequence of frames.</p>
	 <p>The screenshot shows the 'Modify' menu in Fireworks. The 'Arrange' option is selected, and its submenu is open, showing 'Send to Back' (Ctrl+B) as the selected option. Other options in the 'Arrange' submenu include 'Bring to Front' (Ctrl+F), 'Bring Forward' (Ctrl+Shift+F), and 'Send Backward' (Ctrl+Shift+B).</p>
6	<p>Clone the instance. The cloned instance will appear between the instance and the symbol (the original instance in Fireworks 3). Move the second instance to the front by choosing Modify &gt; Arrange &gt; Bring to Front or press Control+F (Windows) or Command+F (Macintosh).</p>
	 <p>The screenshot shows the 'Edit' menu in Fireworks. The 'Clone' option is selected, which has the keyboard shortcut Ctrl+Shift+C. Other options in the menu include 'Duplicate' (Ctrl+Alt+D), 'Paste Attributes' (Ctrl+Alt+Shift+V), 'Paste Inside' (Ctrl+Shift+V), 'Clear', 'Copy' (Ctrl+C), 'Paste' (Ctrl+V), 'Cut' (Ctrl+X), and 'Undo Move to Front' (Ctrl+Z).</p>
7	<ul style="list-style-type: none"> <li>• In Fireworks 1 choose Edit &gt; Symbols &gt; Tween Instances....</li> <li>• In Fireworks 2 choose Insert &gt; Tween Instances....</li> <li>• In Fireworks 3 choose Modify &gt; Symbol &gt; Tween Instances....</li> </ul>

	
8	<p>Set the number of steps desired between each of the instances and symbol and check "Distribute to Frames".</p> <p><b>Note:</b> the number of instances does not include the symbols and instances that have already been placed on the canvas. The number of frames created will equal the number of steps entered in this dialog plus the number of instances and symbols on the canvas.</p>
	
9	<p>Open the Frames panel and move to the Frame where the symbol appears (in Fireworks 3 this will be the frame where the instance's opacity reaches 100%. In this case it will be frame 12.</p>

	
10	Open the Layers panel and add a new layer. Use layers to keep animations separate and distinct. Lock the layer containing the first part of the animation to avoid confusion.
	
11	Select the text tool and click on the canvas to enter the second text object to animate.

	 <p>Text Editor</p> <p>Arial Black 24 B</p> <p>+/- 0% I 120%</p> <p>100% A 0</p> <p>Me</p> <p>Show: <input checked="" type="checkbox"/> Font <input checked="" type="checkbox"/> Size</p> <p>OK Cancel Apply</p>
12	Repeat steps 2 through 8 for the second text object. Export the file as an Animated GIF with the desired settings.
