Using This Guide

This guide is intended for users of MediaCentral | UX with the Media | Distribute feature. This guide describes the installation and configuration procedures for Media Distribute, such as installing the Media Distribute software and configuring system accounts.

For information on using the publishing features of Media Distribute, see the *Media | Distribute User's Guide* or the MediaCentral | UX Help. For administrative information for MediaCentral | UX, see the *Avid MediaCentral | UX Administration Guide*.

1 Installation for Media | Distribute

The supported configuration for Media Distribute requires you to install Media Distribute on your MediaCentral | UX server, which is part of your MediaCentral configuration. For installation information, see the *Avid MediaCentral Platform Services Installation and Configuration Guide*.

Before you install Media Distribute, you must install and configure your MediaCentral server. If you plan to process video or to use a content management system (CMS) account profile, you must also install the Interplay Web Services. See “Installing Software for Interplay Web Services” in the *Interplay | Production Software Installation and Configuration Guide*.

The Media Distribute installation procedures assume you have installed Avid MediaCentral Platform Services (MCS). You must extract the Media Distribute installation package from `Media_Distribute_[version]/Build[xx]_Linux.tar.gz`. You run the installation file itself from a shell script called `install.sh`. This installs the plug-in needed for MediaCentral UX to access the Media Distribute functionality, as well as the `avid-mpd` service which provides the functionality for Media Distribute workflows.

The procedures for installing Media Distribute depend on whether you install the application components in a cluster environment or on a single MediaCentral server.

- If you deploy MCS and components on a master node and one or more non-master nodes in a cluster configuration, see “[Installing and Upgrading Media | Distribute in a Cluster Environment](#)” on page 10.
- If you deploy all MCS and components on a single server, see “[Installing and Upgrading Media | Distribute on a Single Server](#)” on page 20.

If necessary for security considerations, you can configure Media Distribute to communicate with the Internet through a proxy server. For more information, see “[Modifying Media | Distribute to Work with a Proxy Server](#)” on page 24.

The following installed components are necessary for the current version of Media Distribute:

- Avid MediaCentral Platform Services v2.4.x (if you work with a cluster configuration, you need to ensure that all nodes in the cluster function properly)
- iNEWS 3.4.3 or later (for MCS configurations with iNEWS)
- Avid ISIS v4.7.4 driver (v4.7.6 with MCS v2.4.1)

- Red Hat Enterprise Linux (RHEL) v6.5
- Avid Interplay Web Services
- MediaCentral Distribution Service

You also need to ensure that the following are available for Media Distribute:

- Interplay Media Services Engine
- Interplay Transfer engine
- At least one installed transcode provider
- STP encoder
- Internet connection for publishing to social media sites

Installing and Upgrading Media | Distribute in a Cluster Environment

The procedures in this section assume you have already installed and configured your MediaCentral Platform Services on your clustered servers. For more information on configuring a MediaCentral cluster environment, see the *Avid MediaCentral Platform Services Installation and Configuration Guide*. To configure Media Distribute, you require the following:

- RHEL and MediaCentral software components are installed on all servers in the cluster.
- All servers are set up and configured correctly for the cluster.
- Failover processes work correctly.

Installing Media Distribute entails the following steps:

- Copying the Media Distribute installation files to a USB drive.
- Identifying the master and non-master nodes in your configuration, and identifying the virtual cluster IP address (see [“Identifying the Master and Non-Master Nodes” on page 11](#) and [“Identifying the Virtual Cluster IP” on page 11](#)).
- Installing Media Distribute on the master and all non-master nodes in your cluster configuration.
- Setting up the Media Distribute database on the master node of the cluster. You must install Media Distribute on all nodes, but you only configure the database once.
- Modifying the MCS configuration file to change the host address to the virtual cluster IP of the cluster.

After you have installed and configured Media Distribute on your master and non-master nodes, you need to restart some MediaCentral Platform and Media Distribute services.

If you need to remove Media Distribute, see [“Removing Media | Distribute” on page 26](#).

For installation procedures, see the following topics:

- [“Installing and Upgrading Media | Distribute” on page 13](#)
- [“Configuring Media | Distribute on the Master Node” on page 16](#)
- [“Configuring the Media | Distribute Installation on Non-Master Nodes” on page 18](#)

The Media Distribute software installation package file (Media_Distribute_*[version]*/Build/*[xx]*_Linux.tar.gz) is available to Avid Support representatives only and can be downloaded from the Avid Gold Build repository.

To prepare and mount a USB drive for Media Distribute installation:

1. On a Windows system, format a USB drive as a FAT32 volume.
2. Get the Media Distribute installation package file (Media_Distribute_*[version]*/Build/*[xx]*_Linux.tar.gz) from your Avid representative.
3. Copy the compressed installation file to the USB drive.
4. Remove the USB device from the Windows system.

Identifying the Master and Non-Master Nodes

You can use the cluster resource monitoring command, `crm`, to verify which server functions as the master node and which as the non-master nodes.

To identify the master and non-master nodes, do the following:

- ▶ Log in to any node in the cluster as root and open the cluster resource monitoring utility by typing the following: `crm resource status`

The status of all cluster-related services on all nodes displays in the terminal window.

The master and non-master nodes are indicated as the Master/Slave Set — for example:

```
Master/Slave Set: ms_drbd_postgres [drbd_postgres]
Masters: [ morpheus-hp1 ]
Slaves: [ morpheus-hp2 ]
```

Identifying the Virtual Cluster IP

Some configuration files used in the configuration of your Media Distribute installation require the virtual cluster IP. This is required for the correct configuration of the Media Distribute service in a cluster installation.

To identify the virtual cluster IP:

- Log in to the master node of the cluster and type the following command: **ifconfig**

The following is an example of the output of a typical network interface configuration:

```
eth0      Link encap:Ethernet  HWaddr 00:26:55:E6:83:E1
          inet addr:172.24.18.163  Bcast:172.24.18.255  Mask:255.255.255.0
          inet6 addr: fe80::226:55ff:fee6:83e1/64 Scope:Link
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:4321802 errors:0 dropped:0 overruns:0 frame:0
          TX packets:3628475 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:1374391088 (1.2 GiB)  TX bytes:1086706641 (1.0 GiB)

eth0:c10  Link encap:Ethernet  HWaddr 00:26:55:E6:83:E1
          inet addr:172.24.18.61  Bcast:172.24.18.189  Mask:255.255.255.255
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          Interrupt:38 Memory:fbde0000-fbe00000

lo        Link encap:Local Loopback
          inet addr:127.0.0.1  Mask:255.0.0.0
          inet6 addr: ::1/128 Scope:Host
          UP LOOPBACK RUNNING  MTU:16436  Metric:1
          RX packets:7331022 errors:0 dropped:0 overruns:0 frame:0
          TX packets:7331022 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:8040287442 (7.4 GiB)  TX bytes:8040287442 (7.4 GiB)
```

The virtual cluster IP is the IP assigned to the 'eth0:c10' network adapter. In this example, the virtual cluster IP is 172.24.18.61.

Installing and Upgrading Media | Distribute

If you install Media Distribute in a cluster environment, you must install it first on the master node of the cluster since the database service runs on this node. The installation includes creating a database for the Media Distribute service. This can only be done on the node with the running PostgreSQL service. After you install the application on the master node, you must install Media Distribute on all non-master nodes.

The procedure for upgrading Media Distribute is similar to the one you used initially to install Media Distribute. The upgrade procedure overwrites some configuration files. You can restore these files by using the backup configuration files already in your configuration once the upgrade completes.

When you upgrade your version of Media Distribute, all system and user settings are saved. You do not need to create new settings, but if the newer version includes new features, you might need to modify your settings to activate the features. For a list of new features, see the [ReadMe](#) documentation that came with your version of MediaCentral UX. For information on setting up account profiles, see “[Configuring System Accounts for Media | Distribute](#)” on page 64.

The Media Distribute installation, upgrade, and configuration disconnects all users logged in to MediaCentral UX when it restarts some services. Ensure that all users save their sessions and log off during the installation or upgrade procedures.

To install or upgrade Media Distribute:

1. Insert the Media Distribute installation USB drive into the server.
2. Verify the name of the device by typing the following command: `dmesg`

Linux information relating to hardware appears on the screen.

Information for the USB device appears near the end of the output, near the list of SCSI devices. The name of the USB device is found inside square brackets (e.g., `sdc`). This is the name you use to mount the device.

3. Create a mount point for the USB device by typing the following: `mkdir /media/usb`
4. Mount the USB key at the mount point you just created:

```
mount -t vfat /dev/sdc<?> /media/usb
```

The name of the USB device (`sdc`, in this case) takes a 1 (one) in the mount command. This simply indicates a partition exists on the USB device. Formatting the USB device in Windows created the partition.

The USB device is now mounted and available for use.

5. Verify the USB key has been mounted: `df -h`

Information displays about all mounted file systems and devices, including information about the USB device, similar to the following:

File system	Size	Used	Avail	Use %	Mounted on
/dev/sdc1	7.5 G	4.5 G	3.0 G	61 %	/media/usb

6. Unpack the Media Distribute installation file by typing the following command:

```
tar -xzf /media/usb/Media_Distribute_[version]Build_[xx]_Linux.tar.gz
```

The compressed file extracts to a subfolder within the target directory called `Media_Distribute_[version]_Build_[xx]_Linux`.

7. Navigate to the installation directory:

```
cd Media_Distribute_[version]_Build_[xx]_Linux
```

8. Run the installation script:

```
./install.sh
```

For master node installations, a default user in the PostgreSQL database is created with a user name of `mpduser` and a password of `resudpm`. The necessary database tables and schema in PostgreSQL database are also created.

9. Follow the prompts to install Media Distribute.

During installation on non-master nodes, you might see a message; “Not running a database PG on localhost. Please enter IP of database server.” If you see this message, press Enter. You do not need to provide an IP address for your database server when installing Media Distribute on a non-master node.

10. Type the following to open the MediaCentral Configurator, and then ensure that the Media Distribute plug-in is enabled within the Configurator:

```
/opt/avid/avid-interplay-central/configurator
```

When the MediaCentral Configurator completes, a dialog box opens.

11. Press Enter to select No.

The Configurator closes.

12. To restart the MediaCentral service, type the following command:

```
crm resource restart AvidIPC
```

When you restart the services, all users currently logged on to MediaCentral UX are logged out. Restarting the services might take up to a minute.

13. (Master node only) To verify the version of Media Distribute installed on a master node, type the following command:

```
/usr/share/apache-servicemix/bin/mpd_version
```

The command returns the installed versions of ServiceMix and Media Distribute. For example:

```
ServiceMix   Version: 4.5.1
MPD          Version: 2.3.0.20150122_114231
MPD UI       Version: 2.3.0.20150122_114231
```

14. (Master node only) To verify the ServiceMix installation on a master node, do the following:

- a. Type the following

```
ssh Administrator@localhost -p 8101
```

- b. Type **yes** to continue connecting to the host, and then type the default password **avid**.

- c. Type **list**, and press Enter.

All account endpoints display as “Active” and the Social Media Integration route displays as “Started.”

```
root@burl-cat-ics1:~
[ 238] [Active   ] [      ] [      ] [ 80] Polopoly Camel Component (

Administrator@root>
```

If not all endpoints are active or if the Social Media Integration route is not started, ServiceMix might not have completed restarting. You can wait a moment and then retry these steps.

- d. To quit ServiceMix, type `logout`.
15. To remove the installation files and unmount the USB drive, do the following:
- a. Type `cd /` to ensure you are not currently on the USB key by changing to the root directory.
 - b. Type the following:

```
rm -rf [target_directory]
umount /media/usb
```
 - c. Remove the USB drive from the server.

Configuring Media | Distribute on the Master Node

After you install Media Distribute, you must edit several configuration and property files and restart services on the master cluster node before you can use Media Distribute. For Media Distribute upgrades, you need to move the existing configuration files.

Once you configure Media Distribute on the master and non-master nodes, you must perform a failover operation to restart the PostgreSQL service and validate the mpduser configuration. For more information, see [“Restarting PostgreSQL Service and Verifying the Cluster Installation” on page 20](#).

To configure PostgreSQL to allow remote hosts access to the Media Distribute database:

1. Using Linux commands, navigate to the directory containing the PostgreSQL database configuration file:

```
cd /mnt/drbd/postgres_data
```
2. Using the Linux text editor, `vi`, open the `pg_hba.conf` file for editing:

```
vi pg_hba.conf
```
3. Type `G` to go to the last line of the file, and then Type `i` (lower case “i”) to enter insert mode.
4. Add the following to the last line:

```
host      mpd      mpduser      0.0.0.0/0      trust
```
5. Press the Escape key to return to command mode, then type `:wq` and press Return to write and quit the text editor.

To configure the User Management Service (UMS) properties file (new installation only):

1. Using Linux commands, navigate to the directory containing the UMS properties file:

```
cd /usr/share/apache-servicemix/config
```
2. Using the Linux text editor, `vi`, open the `application.properties` file for editing:

```
vi application.properties
```

3. Navigate using the arrow keys to the next line:
`com.avid.mpd.uls.host.retriever=application.properties`
4. If the line is commented with a # character, type **i** (lower case “i”) to enter insert mode, Place the cursor over the # character and type **x** to delete the character and uncomment the line.
5. Navigate using the arrow keys to the line containing the parameter for
`com.avid.osgi.uls.host`
6. Type a valid UMS REST address.
 The default value is `https://localhost:10443/ws/rest`. Use the virtual cluster IP address as the host for this configuration file — for example, type
`https://123.45.67.89:10443/ws/rest`
7. Press the Escape key to return to command mode, then type **:wq** and press Return to write and quit the text editor.

To configure PostgreSQL to allow remote hosts access to the Media Distribute database (new installation only):

1. Navigate to the directory containing the Media Distribute database configuration file:
`cd /etc/apache-servicemix`
2. Using the Linux text editor, vi, open the `avid-mpd-wrapper.conf` file for editing:
`vi avid-mpd-wrapper.conf`
3. Locate the following line, and then navigate using the arrow keys and place the cursor on top of the # (comment indicator):
`# set.default.DB_HOST=hostname or IP`
4. Type **i** (lower case “i”) to enter insert mode, and then use the arrow keys and backspace to erase the # (comment indicator).
5. Delete the `hostname or IP` value at the end of the line, and then replace it by typing the virtual cluster IP address — for example, `set.default.DB_HOST=123.45.67.89`
6. Press the Escape key to return to command mode, then type **:wq** and press Return to write and quit the text editor.

To modify the MCS configuration file (new installation only):

1. Using Linux commands, navigate to the directory containing the MediaCentral configuration file: `/etc/apache-servicemix`.
2. Using the Linux text editor, vi, open the
`com.avid.acs.bus.broker.rabbitmq.RabbitMqBusAccessFactory.cfg` file for editing:
`vi com.avid.acs.bus.broker.rabbitmq.RabbitMqBusAccessFactory.cfg`
3. Navigate using the arrow keys to the line containing the parameter for `brokerConnectURL`.

4. Type `i` (lower case “i”) to enter insert mode, and then type a valid URL for the MediaCentral connection.

The default value is `amqp://localhost/acs`. Use the virtual cluster IP address as the host for this configuration file — for example, `amqp://123.45.67.89/acs`

5. Press the Escape key to return to command mode, then type `:wq` and press Return to write and quit the text editor.
6. To restart the Media Distribute service, type the following command:

```
service avid-mpd clean-restart
```

To restore and move the Servicemix configuration files (upgraded systems only):

- ▶ For Media Distribute upgrades, restore the Servicemix configuration files by doing the following:

- a. Type the following to navigate to the Servicemix directory:

```
cd /etc/apache-servicemix/
```

- b. Type the following commands to restore the backup configuration files:

```
mv avid-mpd-wrapper.conf.rpmsave avid-mpd-wrapper.conf
```

```
mv
```

```
com.avid.acs.bus.broker.rabbitmq.RabbitMQBusAccessFactory.cfg.rpmsav
```

```
e com.avid.acs.bus.broker.rabbitmq.RabbitMQBusAccessFactory.cfg
```

Configuring the Media | Distribute Installation on Non-Master Nodes

After you install or upgrade Media Distribute (see [“Installing and Upgrading Media | Distribute” on page 13](#)), you must edit several configuration and property files and restart services on all non-master nodes in your cluster before you can use Media Distribute. Since the edited configuration and property files are identical to the ones you edited on the master node, you can copy those files to the non-master nodes.

To copy the edited Media Distribute files from the master to the non-master nodes:

1. Log in to your non-master node server using the root account.
2. Open a Linux terminal window, and then type the following commands:

```
scp root@[hostname]:/etc/apache-servicemix/avid-mpd-wrapper.conf
/etc/apache-servicemix/
```

```
scp root@[hostname]:/etc/apache-servicemix/
com.avid.acs.bus.broker.rabbitmq.RabbitMQBusAccessFactory.cfg
/etc/apache-servicemix/
```

```
scp root@[hostname]:/usr/share/apache-servicemix/config/
application.properties /usr/share/apache-servicemix/config/
```

[hostname] is the host name of your master node.

The terminal window displays the following message:

```
The authenticity of host '[hostname (IP address)]' can't be established.
RSA key fingerprint is [fingerprint alphanumerical id].
Are you sure you want to continue connecting (yes/no)?
```

3. Type **yes**.

The terminal window displays the following message:

```
Warning: Permanently added '[hostname, IP address]' (RSA) to the list of
known hosts.
```

4. If prompted for a password, type the password for your root user account.

The edited files are copied to the non-master node.

5. To restart the Media Distribute service, type the following command:

```
service avid-mpd clean-restart
```

To verify the ServiceMix installation, do the following:

1. Type the following

```
ssh Administrator@localhost -p 8101
```

2. Type **yes** to continue connecting to the host, and then type the default password **avid**.

3. Type **list**, and press Enter.

All account endpoints display as “Active” and the Social Media Integration route displays as “Started.”

```
root@burl-cat-ics1:~
[ 238] [Active] [ ] [ ] [ 80] Polopoly Camel Component (
2.2.0.20150323_095428)

Administrator@root>
```

4. To quit ServiceMix, type **logout**.

Restarting PostgreSQL Service and Verifying the Cluster Installation

Before you verify your Media Distribute installation on the master and non-master nodes, you need to perform a failover of the servers. This restarts the PostgreSQL service and validates the mpduser. It also tests your new installation and verifies that both Media Distribute and MediaCentral Platform Services are running properly.

To perform a failover and verify your installation:

1. Open a terminal window and log in to any non-master node in the cluster as root and check the cluster resource status by typing the following: `crm_mon -f`

The status of all cluster-related services on all nodes displays in the terminal window. The Migration summary also displays at the bottom of the screen, which can be useful to view errors and fail counts per node.

2. On the master node, type the following, and then press Enter: `crm node standby [master node]`
3. Monitor the cluster information displayed on the slave node as it updates its information.

As the slave node becomes the master node, it takes ownership of the PostgreSQL database. This process takes several seconds to complete.

4. When the updated cluster is stable, type the following and press Enter: `crm node online [master node]`

The node on standby resumes the master node status.

Installing and Upgrading Media | Distribute on a Single Server

The Media Distribute software installation package file (Media_Distribute_*[version]*_Build_*[xx]*_Linux.tar.gz) is available to Avid Support representatives only and can be downloaded from the Avid Gold Build repository.

To prepare and mount a USB drive for Media Distribute installation:

1. On a Windows system, format a USB drive as a FAT32 volume.
2. Get the Media Distribute installation package file (Media_Distribute_*[version]*_Build_*[xx]*_Linux.tar.gz) from your Avid representative.
3. Copy the compressed installation file to the USB drive.
4. Remove the USB device from the Windows system.

Installing and Upgrading Media | Distribute on a Server

You can install or upgrade Media Distribute on a single server. The installation includes creating a database for the Media Distribute service.

The procedure for upgrading Media Distribute is similar to the one you used initially to install Media Distribute. If you need to remove Media Distribute, see [“Removing Media | Distribute”](#) on page 26.

When you upgrade your version of Media Distribute, all system and user settings are saved. You do not need to create new settings, but if the newer version includes new features, you might need to modify your settings to activate the features. For a list of new features, see the ReadMe documentation that came with your version of MediaCentral UX. For information on setting up account profiles, see [“Configuring System Accounts for Media | Distribute”](#) on page 64.

The Media Distribute installation and configuration disconnects all users logged in to MediaCentral UX when it restarts some services. Ensure that all users save their sessions and log off during the installation or upgrade procedures.

To install or upgrade Media Distribute:

1. Insert the Media Distribute installation USB drive into the master node server.
2. Verify the name of the device by typing the following command: `dmesg`

Linux information relating to hardware appears on the screen.

Information for the USB device appears near the end of the output, near the list of SCSI devices. The name of the USB device is found inside square brackets (e.g., `sdc`). This is the name you use to mount the device.

3. Create a mount point for the USB device by typing the following: `mkdir /media/usb`
4. Mount the USB key at the mount point you just created:

```
mount -t vfat /dev/sdc<?> /media/usb
```

The name of the USB device (`sdc`, in this case) takes a 1 (one) in the mount command. This simply indicates a partition exists on the USB device. Formatting the USB device in Windows created the partition.

The USB device is now mounted and available for use.

5. Verify the USB key has been mounted: `df -h`

Information displays about all mounted file systems and devices, including information about the USB device, similar to the following:

File system	Size	Used	Avail	Use %	Mounted on
/dev/sdc1	7.5 G	4.5 G	3.0 G	61 %	/media/usb

6. Unpack the Media Distribute installation file by typing the following command:

```
tar -xzf /media/usb/Media_Distribute_[version]Build[xx]_Linux.tar.gz
```

The compressed file extracts to a subfolder within the target directory called `Media_Distribute_[version]_Build_[xx]_Linux`.

7. Navigate to the installation directory:

```
cd Media_Distribute_[version]_Build_[xx]_Linux
```

8. Run the installation script:

```
./install.sh
```

A default user in the PostgreSQL database is created with a user name of `mpduser` and a password of `resudpm`. The necessary database tables and schema in PostgreSQL database are also created.

9. Follow the prompts to install Media Distribute.
10. To verify the package has been installed, type the following:

```
/usr/share/apache-servicemix/bin/mpd_version
```

The output should include the following lines:

```
apache-servicemix.noarch 0:4.5.1-avid.el6.5
avid-mpd-[Version].[Build]-avid.el6.1.noarch.rpm
avid-media-central-mpd-[Version].[Build]-avid.el6.1.noarch.rpm
```

11. Type the following to open the MediaCentral Configurator, and then ensure that the Media Distribute plug-in is enabled within the Configurator:

```
/opt/avid/avid-interplay-central/configurator
```

When you exit MediaCentral Configurator, you are asked to restart the MediaCentral services. When you restart the services, all users currently logged on to MediaCentral UX are logged out.

12. To verify the ServiceMix installation, do the following:

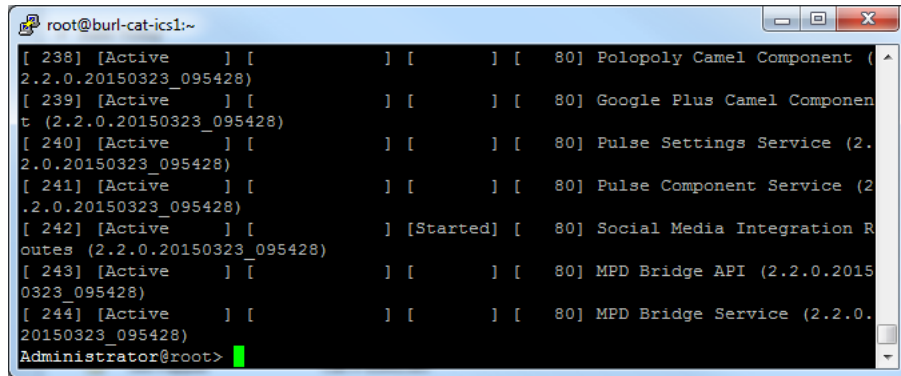

a. Type the following

```
ssh Administrator@localhost -p 8101
```

b. Type **yes** to continue connecting to the host, and then type the default password **avid**.

c. Type **list**, and press Enter.

If the ServiceMix installation is successful, all account endpoints display as “Active” and the Social Media Integration route displays as “Started.”

```
root@burl-cat-ics1:~
[ 238] [Active] [ ] [ ] [ ] [ 80] Polopoly Camel Component (
2.2.0.20150323_095428)

[ 244] [Active] [ ] [ ] [ ] [ 80] MPD Bridge Service (2.2.0.
20150323_095428)
Administrator@root>
```

d. To quit ServiceMix, type **logout**.

13. To unmount the USB drive, do the following:

a. Type **cd /** to ensure you are not currently on the USB key by changing to the root directory.

b. Type the following:

```
rm -rf [target_directory]
```

```
umount /media/usb
```

c. Remove the USB drive from the server.

Modifying Media | Distribute to Work with a Proxy Server

Media Distribute installations include an instance of ServiceMix that requires external connectivity to the Internet — for example, to post packages to Facebook or Twitter. Both Media Distribute and ServiceMix reside on the MediaCentral server connected to your internal network. This might create potential security issues for certain customers. For secure deployment considerations, you can configure Media Distribute to communicate with the Internet through a proxy server.

Using a proxy server — such as a Squid server or any other proxy server running on another machine in the network — allows you to restrict the ports that ServiceMix uses and the specific Internet sites with which it communicates. This solution involves configuration changes only and does not require changes to the existing Media Distribute installation process. After installing Media Distribute, you need to modify the Service Mix configuration file to include the proxy settings to ensure that all requests and responses go through the proxy server. When you restart Media Distribute services, any ServiceMix communication is forwarded to the proxy server.

When you have configured Media Distribute to use a proxy server, you must configure the proxy server with the following information:

- IP addresses of all ServiceMix instances, so that only data originating from Media Distribute are allowed to the proxy server
- Social media targets for the destination domains — for example, api.twitter.com

See the documentation that came with your proxy server installation for more information on how to configure it for proxy operation.

The following procedure describes how to modify the ServiceMix properties file. It assumes you have set up and configured a proxy server.

To modify the ServiceMix configuration file for using Media Distribute with a proxy server:

1. Navigate to the directory containing the Media Distribute database configuration file:

```
cd /etc/apache-servicemix
```

2. Using the Linux text editor, vi, open the avid-mpd-wrapper.conf file for editing:

```
vi avid-mpd-wrapper.conf
```

3. Locate the section called Proxy configuration, and then type **i** (lower case “i”) to enter insert mode.

4. Locate the following lines, type `i` (lower case “i”) to enter insert mode, and then use the arrow keys and backspace to erase the `#` (comment indicator) on all lines except those for setting the proxy user name and proxy password (these are optional parameters):

```
#wrapper.java.additional.n=-Dhttp.proxySet=true
#wrapper.java.additional.n=-Dhttp.proxyHost=<the proxy host>
#wrapper.java.additional.n=-Dhttp.proxyPort=<the proxy port>
#wrapper.java.additional.n=-Dhttp.proxyUser=<the proxy username>
#wrapper.java.additional.n=-Dhttp.proxyPassword=<the proxy password>
#wrapper.java.additional.n=-Dhttps.proxySet=true
#wrapper.java.additional.n=-Dhttps.proxyHost=<the proxy host>
#wrapper.java.additional.n=-Dhttps.proxyPort=<the proxy port>
#wrapper.java.additional.n=-Dhttps.proxyUser=<the proxy username>
#wrapper.java.additional.n=-Dhttps.proxyPassword=<the proxy password>
```

5. Delete the numeral variable (`.n`) and number the lines for which you have removed the comment indicator.
6. Delete the `<proxy host>` or `<proxy port>` variable and then replace it by typing the IP address of your proxy server or by typing the port configured by your proxy server for both the HTTP and HTTPS settings.

Typically the proxy port is 3128.

The modified configuration should look like the following example:

```
wrapper.java.additional.1=-Dhttp.proxySet=true
wrapper.java.additional.2=-Dhttp.proxyHost=12.345.67.89
wrapper.java.additional.3=-Dhttp.proxyPort=3128
#wrapper.java.additional.n=-Dhttp.proxyUser=<the proxy username>
#wrapper.java.additional.n=-Dhttp.proxyPassword=<the proxy password>
wrapper.java.additional.4=-Dhttps.proxySet=true
wrapper.java.additional.5=-Dhttps.proxyHost=12.345.67.89
wrapper.java.additional.6=-Dhttps.proxyPort=3128
#wrapper.java.additional.n=-Dhttps.proxyUser=<the proxy username>
#wrapper.java.additional.n=-Dhttps.proxyPassword=<the proxy password>
```

7. Press the Escape key to return to command mode, then type `:wq` and press Return to write and quit the text editor.

- To restart the MediaCentral service, type the following command:

```
service avid-mpd restart
```

Removing Media | Distribute

If you want to remove Media Distribute, you can use the procedure described in this section. If you need to reinstall Media Distribute, see [“Installing and Upgrading Media | Distribute in a Cluster Environment” on page 10](#) or [“Installing and Upgrading Media | Distribute on a Single Server” on page 20](#).

To remove Media Distribute on the master node:

- To check the correct version and build numbers for your installation, type the following:

```
/usr/share/apache-servicemix/bin/mpd_version
```

The output should include the following lines:

```
apache-servicemix.noarch 0:4.5.1-avid.el6.5
avid-mpd-[Version].[Build]-avid.el6.1.noarch.rpm
avid-media-central-mpd-[Version].[Build]-avid.el6.1.noarch.rpm
```

- Remove the Media Distribute by typing the following commands:

```
rpm -e avid-media-central-mpd-[Version].[Build]-avid.el6.1.noarch.rpm
rpm -e avid-mpd-[Version].[Build]-avid.el6.1.noarch.rpm
```

You can copy the lines from the output in the previous step and paste them after the `rpm -e` command.

- To restart the MediaCentral services, type the following commands:

- ▶ For cluster configurations: `crm resource restart AvidIPC`
- ▶ For single-node systems: `service avid-interplay-central restart`

When you remove Media Distribute, the Media Distribute Producer role remains in MediaCentral UX.

2 Configuration for Media | Distribute

Before you use Avid Media Distribute to publish your content to multiple channels and devices, you need to configure MediaCentral | UX for each platform or service you want to use for publishing. This allows you to link your media packages and iNEWS stories with distribution to the Web and to social media outlets and helping you to automate file preparation and transcoding.

Before you configure your system accounts, you need to need to configure MediaCentral UX for Media Distribute. For more information, see the following topics:

- [“Assigning Media | Distribute Roles” on page 28](#)
- [“Configuring the Transcode Route” on page 36](#)

You can then configure your system and user accounts for Media Distribute:

- [“Configuring System Accounts for Media | Distribute” on page 64](#)
- [“Configuring User Profiles for Media | Distribute” on page 127](#)

Once you have configured your platforms and services, users can log in to MediaCentral UX and start working with the application. For more information on using MediaCentral UX, see the *Avid MediaCentral UX User’s Guide*.

Verifying Your Media | Distribute Installation

Before you start to configure Media Distribute, you can test your installation to verify that all Media Distribute components are functioning correctly.

To verify your Media Distribute installation:

1. Sign in to MediaCentral UX as an administrator.
2. Click the Layout selector and select Media Distribute.

If Media Distribute has installed correctly, the following panes display in the Media Distribute layout:

- Social Message
- Web Story
- Packages

Assigning Media | Distribute Roles

Media Distribute provides two basic roles for publishing to multiple platforms and managing the layouts and permissions associated with them. Before you assign roles, you need to set up an administrative account for Media Distribute. Once this administrative account appears in the System Settings, the necessary roles are available for Media Distribute.

If your MediaCentral configuration includes iNEWS, you need to assign an Advance License to the two Media Distribute roles before you assign these roles to users. For Interplay Production configurations, you can use the default Basic License type for these roles.

For more information about licenses and roles, see the *Avid MediaCentral / UX Administration Guide*.

When you have set up an administrative account and assigned the appropriate license type, you can then assign either the Advance Journalist or the Media Distribute Producer role to Media Distribute users. Only Media Distribute Producers have access to the review and approval features in the Packages pane.

You can assign roles in two ways:

- In the Role Details pane
- In the User or Group Details pane.

If you are upgrading from Media Distribute v1.8 to v2.x, you need to add the Media Distribute layout to the Advance Journalist role and to modify the legacy Interplay Pulse Producer role.

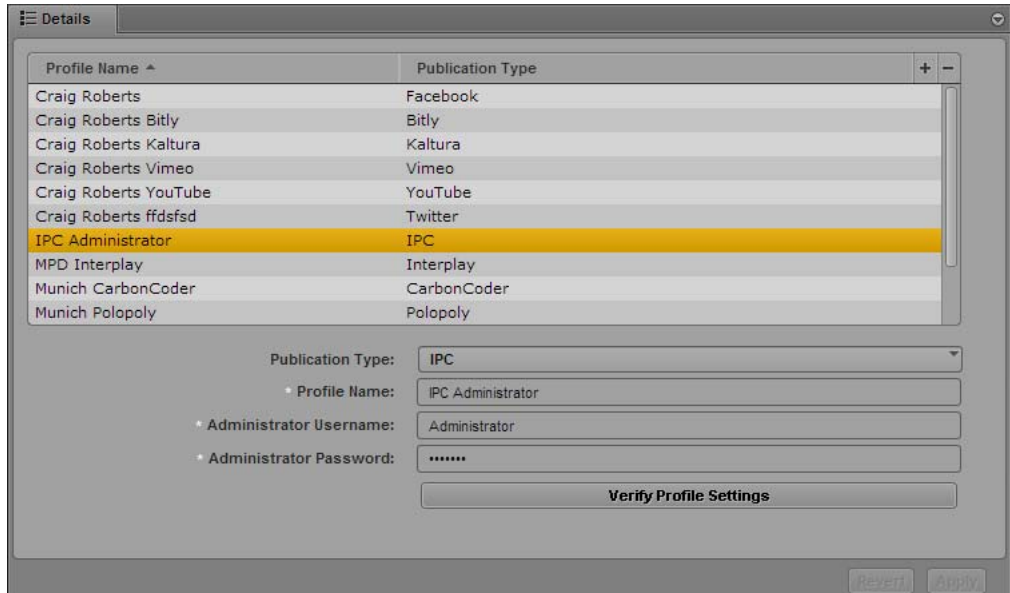

To set up an administrative account for Media Distribute:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select IPC.
5. Click the + (plus) button in the Details section.
6. Specify the required settings:
 - Profile Name (type a descriptive name for your administrative profile)
 - Administrative Username
 - Administrative Password
7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

The setting, “Transform iNEWS stories to lower case,” applies only to Media Distribute accounts that publish packages containing iNEWS stories. The option does not affect this setting.

8. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

To assign an Advance License to the Media Distribute roles in the Role Details pane (iNEWS configurations only):

1. Select Users from the Layout selector.
2. In the Roles pane, double-click either Advance Journalist or Media Distribute Producer to assign to a user or group.

Information about the role is displayed in the Details pane.

3. In the Details pane, select Advance License as the License Type for the following roles:
 - Advance Journalist
 - Media Distribute Producer

4. Click Apply to save your changes or click Revert to cancel your changes.

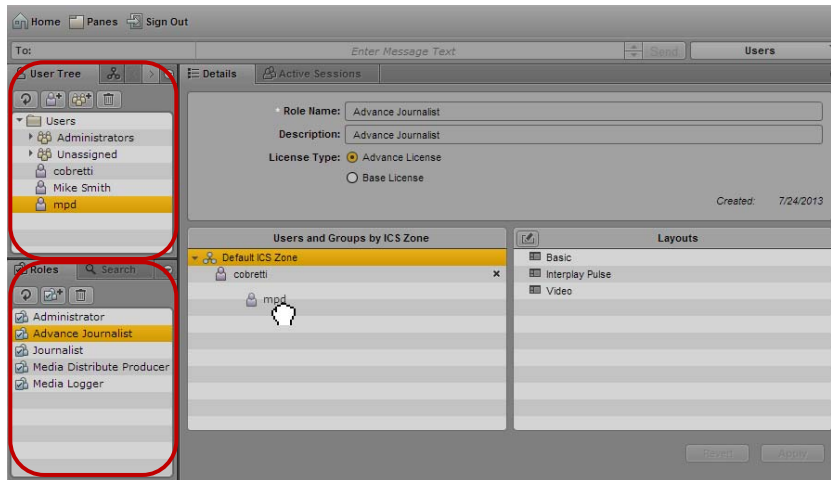

To assign a Media Distribute role to a user in the Role Details pane:

1. Select Users from the Layout selector.
2. In the Roles pane, double-click either Advance Journalist or Media Distribute Producer to assign to a user or group.

Information about the role is displayed in the Details pane.

3. Click the User Tree pane.

4. Select the user or group to which you want to assign the role and drag it to the Users and Groups by MediaCentral Zone section of the Details pane.

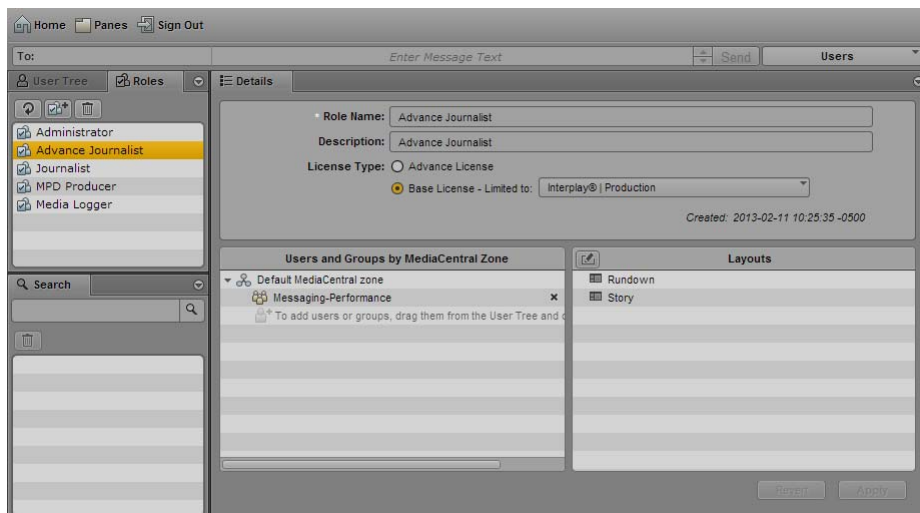

MediaCentral UX User Settings, with the User Tree and Roles panes.

5. Click Apply to save your changes or click Revert to cancel your changes.

To assign the Media Distribute layout and create the Media Distribute Producer role (for MediaCentral UX upgrade installations only):

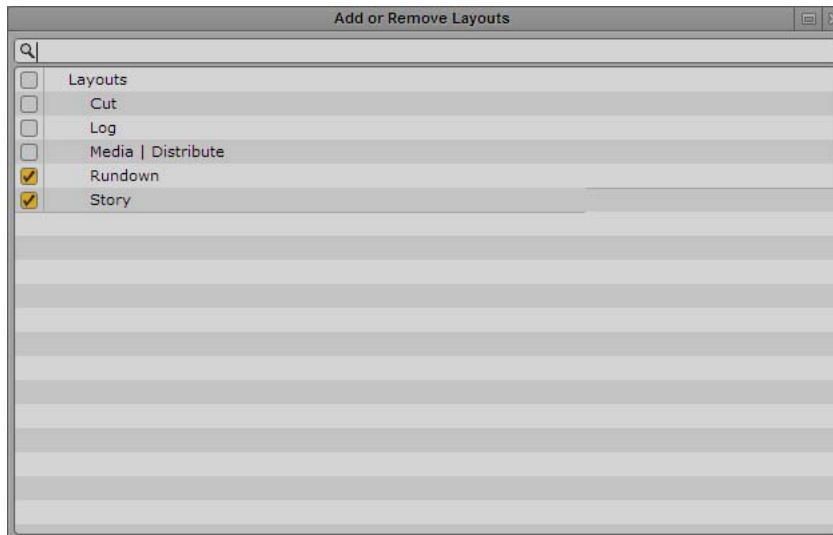

1. Select Users from the Layout selector.
2. In the Roles pane, double-click Advance Journalist.

Information about the role is displayed in the Details pane.

3. In the Layouts pane, click the edit button.

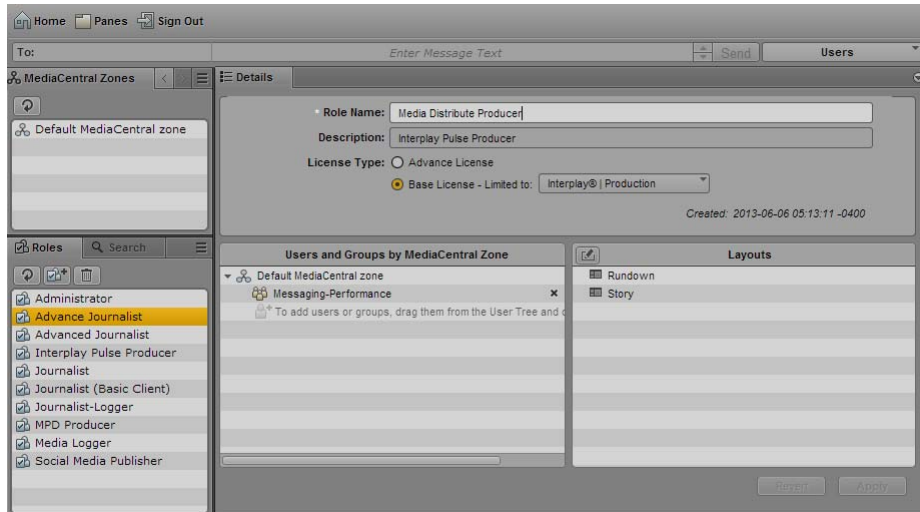

The Add or Remove Layouts dialog box opens.

4. Select Media | Distribute, and then click the Close button.
5. Click Apply to save your changes or click Revert to cancel your changes.
6. In the Roles pane, double-click Interplay Pulse Producer.
Information about the role is displayed in the Details pane.

7. Modify the role name in the Role Name text box by typing the following:

Media Distribute Producer

8. Modify the description in the Description text box by typing the following:

Media Distribute Producer

9. In the Layouts pane, click the edit button.
The Add or Remove Layouts dialog box opens.
10. Select Media | Distribute, and then click the Close button.
11. Click Apply to save your changes or click Revert to cancel your changes.

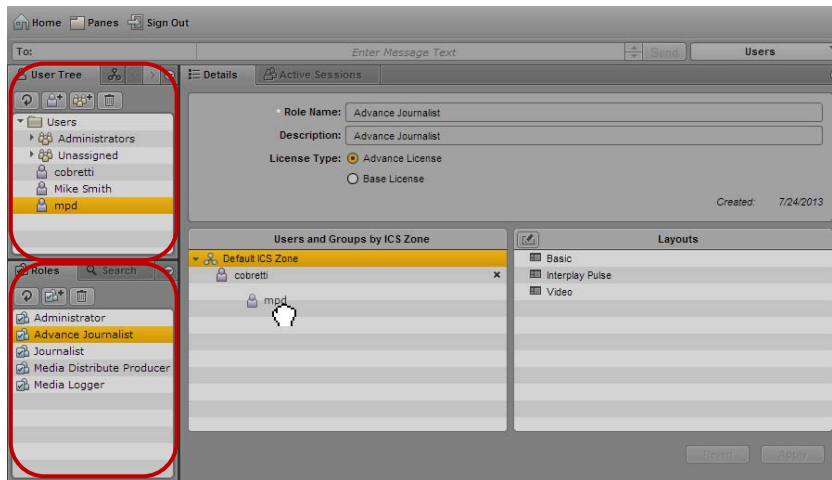

To assign a role in the User or Group Details pane (iNEWS configuration only):

1. Select Users from the Layout selector.
2. In the Roles pane, double-click either Advance Journalist or Media Distribute Producer to assign to a user or group.

Information about the role is displayed in the Details pane.

3. Click the User Tree pane.

4. Select the user or group to which you want to assign the role and drag it to the Users and Groups by MediaCentral Zone section of the Details pane.

MediaCentral UX User Settings, with the User Tree and Roles panes.

5. Click Apply to save your changes or click Revert to cancel your changes.

MediaCentral | UX Security for Media | Distribute

A MediaCentral client requires user login credentials in order to gain access to the underlying functionality. All data transfer to and from the MediaCentral client (user credentials, session information, user configuration settings, media images and files, text, and machine instructions) are transported in a secure manner to the MediaCentral server using HTTPS protocol.

MediaCentral clients that connect through the public Internet require a virtual private network (VPN) access to the server network. All connections pass through the VPN router/firewall through identified ports. Once the data has passed into the “house network” it is secured using the customer’s existing network security infrastructure.

For Media Distribute, ports are used for outgoing HTTP traffic and pass through a network firewall. In some cases, a platform or a system account might require a separate port for outgoing FTP data. Media Distribute does not require any ports for incoming data.

Do not enable a firewall on the servers in your Media Distribute configuration.

The following tables list the ports used by MediaCentral UX and Media Distribute that should be allowed through the VPN and network firewalls.

VPN Firewall Port Settings

Component	Port	Usage
MediaCentral UX Web application	80	MediaCentral Platform Playback Services (MCPS) HTTP calls
	443	MediaCentral HTTPS calls
	843	Loading the Flash Player for playback
	26000	Inbound MCPS data
	5000	Serving outbound JPEG images to the Flash player
	21	Outgoing FTP data
 <i>Communication over port 21 is only required for XML transfer to generic CMS or OVP endpoints or for media transfers to the WorldNow CMS system and is not required as part of any installation that uses standard Media Distribute third-party connectors.</i>		
MediaCentral UX mobile applications	80	MCPS HTTP calls
	443	MediaCentral HTTPS calls

Network Firewall Port Settings

Component	Port	Usage
MediaCentral UX (these ports are used for outbound communication with configured endpoints such as Facebook, Twitter, or YouTube)	80	MediaCentral Platform Playback Services (MCPS) HTTP calls
	443	MediaCentral HTTPS calls

Outbound ACLs should be used to allow packets from the MediaCentral Platform Services (MCS) server to the MediaCentral client over “established” TCP sessions only.

Note that the Interplay Web service and MediaCentral UX application services operate on the same server, so there are no proxies or firewalls between these components. Access to the MediaCentral database is also direct, with no database firewall protection required.

Only MediaCentral UX Administrators can access and modify the system data stored within the user management database (user credentials, user settings, and system attributes).

For more information on MediaCentral security, see the *Avid MediaCentral / UX Security Architecture and Analysis*.

Configuring the Transcode Route

Media Distribute delivers video to the configured online video platforms using the following workflow. An understanding of this workflow might help to complete the Send to Playback settings.

- The user publishes a bundle to endpoints that include video assets — for example, YouTube and Vimeo. The source videos are stored in Interplay Production.
- To start the publishing process, Media Distribute sends the source video to the MediaCentral Distribution server in a send-to-playback operation.
- The Interplay Production media files are mixed down to MXF-wrapped OP1a media. In the Packages pane, Media Distribute monitors the process as the status displays as “mixing down.”

You can send only sequences for mixdown and transfer to an FTP location.

- The Transfer Manager moves the MXF file to the FTP location specified in the Mixing Down FTP Path in the Send to Playback system settings — see [“Send to Playback Configuration for Media | Distribute”](#) on page 45.

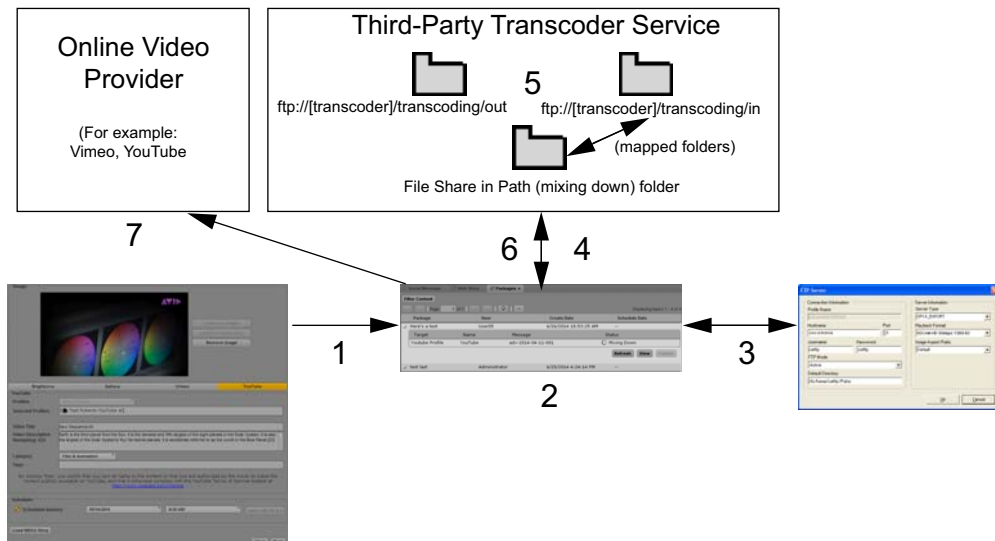

This location is independent of the transcoder. The system supports multiple transcode configurations which you can assign to various endpoints. By not delivering the video directly to a transcode watch folder, the transcode route is built in a manner that allows for support of multiple transcode endpoints.

- The Media Distribute orchestration engine monitors the FTP location. Once the MXF media arrives at the FTP location, Media Distribute delivers it to the appropriate transcoder /in folder, based on the configuration for your transcoder service (`ftp://<transcoder>/transcoding/in`).

- Media Distribute submits the transcoding job to the transcoder:
 - The File Share in Path value (`\\<transcoder_hostname>\avid\transcoding/in`) should be configured and mapped to the FTP “in” path (`ftp://<transcoder>/transcoding/in`). The file share folder must have the appropriate read/write permissions set. For more information, see [“Configuring the Video Transcoding Host” on page 40.](#)
 - The transcoder workflow should be configured to provide output to the `ftp://<transcoder>/transcoding/out` folder.
- After transcoding, the Media Distribute orchestration engine obtains the transcoded video file from the transcoder “out” folder and delivers it to the designed online video provider (OVP) endpoint for publication.

In order to enable this workflow, you must configure the Send to Playback system settings to provide the necessary information.

The following illustration outlines the overall workflow for publishing video using Media Distribute. Note that some details depend on the specific configuration of your transcoder service — for example, Telestream Vantage or Harmonic ProMedia Carbon transcoder.

- 1 A user creates a media package with video and clicks Post to send it for review and approval. When a producer approves the package, it is sent for publication.
- 2 The sequence, with the source files stored in the Interplay Production database, is mixed down to MXF-wrapped OP1a media. In the Packages pane, the status displays as “mixing down.”

-
- 3 Media Distribute uses the MediaCentral Distribution Service to monitor the send-to-playback status. When the sequence is mixed down, the Transfer Manager profile, configured in Interplay Transfer, allows Interplay Transfer to move the MXF file to the Mixing Down FTP Host location.
 - 4 Interplay Transfer moves the media to the Mixing Down FTP Path folder. This folder, specified in the STP profile, matches the configuration the Transfer Manager profile. The folder is configured as a shared folder.
 - 5 Media Distribute monitors the shared folder, and when the media has been transferred, Media Distribute copies the MXF file from the Mixing Down FTP folder to the transcoding/in FTP folder on the transcoder service system. The shared folder is mapped to the transcoding/in FTP folder on the transcoder server. It is transcoded and moved to the transcoding/out folder.
 - 6 Media Distribute downloads the transcoded media from the transcoder service.
 - 7 Media Distribute publishes the video package to the specified online video provider.
-

To transcode and publish video with Media Distribute, you need to provide the following configuration:

- Configuration requires that the following servers are available: Avid MediaCentral Distribution Service, Interplay Production Services, Interplay Transfer, and MediaCentral Platform Services.
- You must configure the Send to Playback settings to provide mixdown output to an FTP server. For more information, see “Configuring for Send to Playback” in the *Avid MediaCentral | UX Administration Guide*.
- You must configure each transcoding host — for example, Vantage and Carbon Coder. See “Configuring the Video Transcoding Host” on page 40.
- You also need to configure an STP profile in the System Settings > Media Distribute section. See “Send to Playback Configuration for Media | Distribute” on page 45.
- You must configure the Media Distribute system accounts as described in “Configuring System Accounts for Media | Distribute” on page 64.

If your iNEWS stories use uppercase characters, you can select the option to transform iNEWS stories to lowercase. This changes all text to lowercase characters when you load an iNEWS story in the Media Distribute layout.

Configuring MediaCentral | UX for Media | Distribute

To use MediaCentral UX to publish your packages, you must configure several parameters so MediaCentral UX uses the correct server, workgroup, and credentials for your project.

You can create only one Media Distribute configuration for each Media Distribute installation.

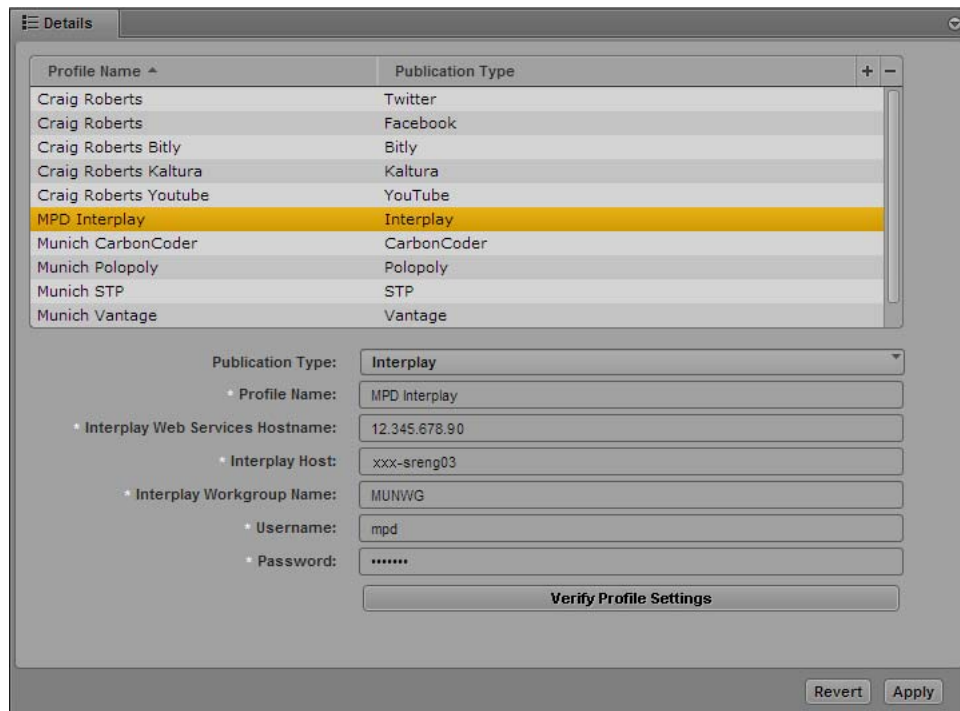

To configure MediaCentral UX:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Interplay.
5. Click the + (plus) button in the Details section.

An Interplay profile named “New Profile” is created in the Details section.

6. Specify the required settings:
 - Profile Name (type a descriptive name for your profile)
 - Interplay Web Services Hostname
 - Interplay Host
 - Interplay Workgroup Name

- Username
 - Password
7. Click Verify Profile Settings to validate the profile settings.
If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.
 8. Click Apply to save the profile.
The profile displays in the Details section with the new information.
If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring the Video Transcoding Host

You must configure Windows network share folder structure and folders before using a third-party transcoder such as Telestream Vantage® to transcode video for your media package. You also need a File Transfer Protocol (FTP) service running on your transcode server. For the FTP process to work, each media file function must be mapped to specified folders. The following table describes the required structure of the Windows network share folder and FTP folders on a Vantage host server:

Windows Network Share	FTP Folder
avid	ftp://<Vantage_hostname>/transcoding/in
	ftp://<Vantage_hostname>/transcoding/out
	ftp://<Vantage_hostname>/transcoding/mixdown

The Windows network folder for incoming media must be accessible and mapped to the FTP folder (for the transcoded media). This FTP structure is required for retrieving MXF files from Send to Playback and for providing the transcoded output for Media Distribute workflows.

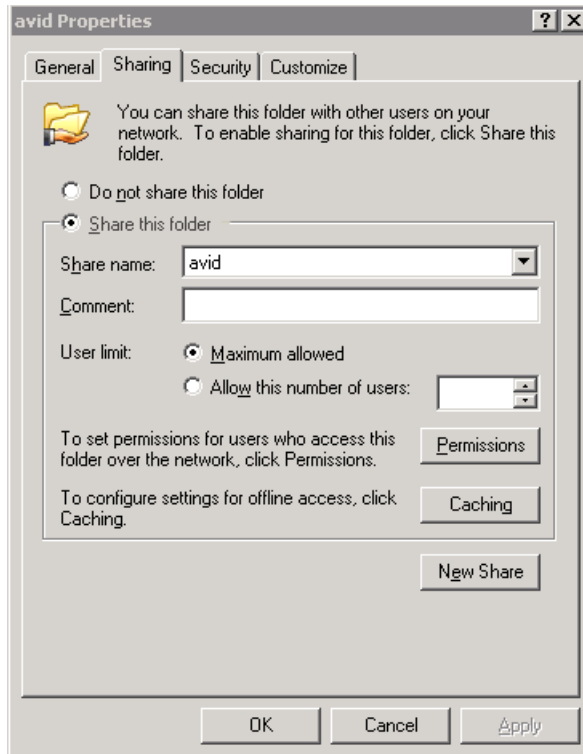

You also need to set the Interplay Transfer Manager options in the Send to Playback configuration for Media Distribute. For information on configuring Send to Playback, see “[Send to Playback Configuration for Media | Distribute](#)” on page 45.

To configure your FTP service, you need to install an FTP server application. The procedure in this section uses the open source FTP server application called FileZilla Server. You can download the software from the following Web site: <https://filezilla-project.org/>.

To set up Windows network share:

1. On your transcoding server, create the following folder if it does not exist already:
<transcoder_hostname>\<drive:>\avid\transcoding\in
2. Right-click the <transcoder_hostname>\<drive:>\avid folder and select Sharing and Security.

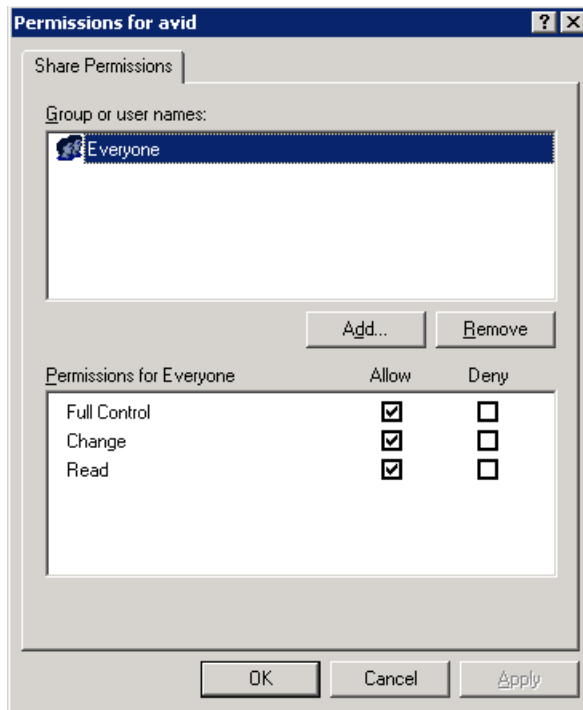

The avid Properties dialog box opens.

3. Click the Sharing tab, and then select the Share this folder option.

4. Click Permissions.

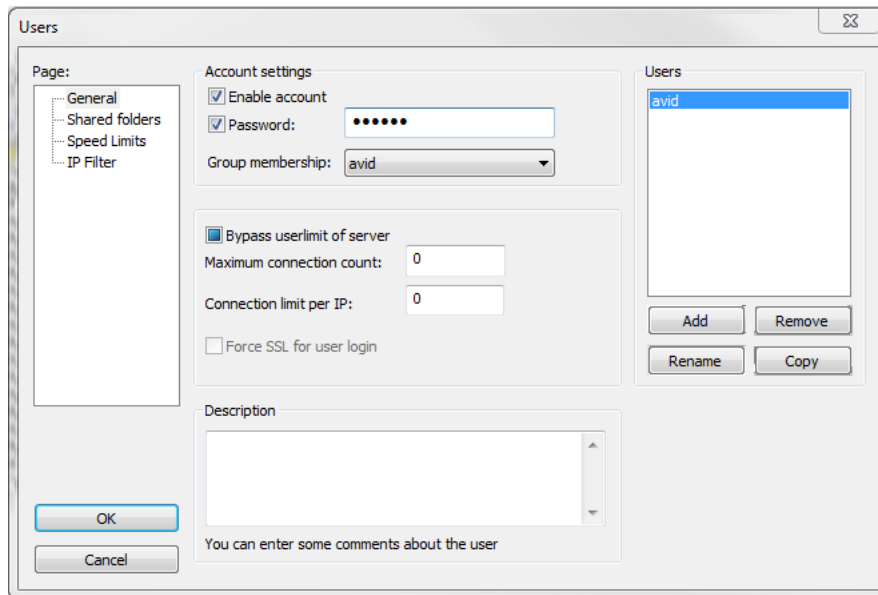

The Permissions dialog box opens.

5. Select Everyone, and then select Allow for all permissions in the Permissions for Everyone list.
6. Click OK to return to the avid Properties dialog box, and then click OK.
7. Open FileZilla Server, and log in to your server.

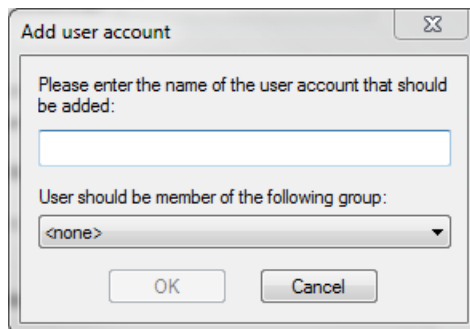

8. Select Edit > Users.

The Users dialog box opens.

9. Click Add.

The Add User Account dialog box opens.

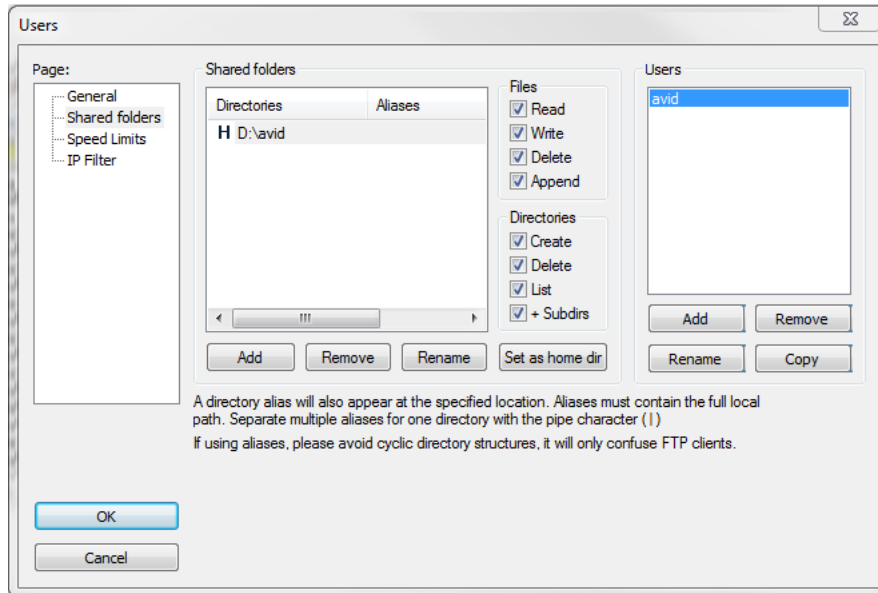

10. In the text box, type **avid**, and then click OK.

11. In the Users dialog box, select the following options:

- Enable account
- Password, and type a password for the user account
- Bypass userlimit of server

12. In the Page list, select Shared folders.
13. In the Shared folders area, click Add, and then navigate to the `<drive:>\avid` folder, and then click OK.

The folder is added to the Shared folders list.

14. Select the following options for Files and Directories:

- Read
- Write
- Delete
- Append
- Create
- Delete
- List
- +Subdirs

15. Click OK.

Send to Playback Configuration for Media | Distribute

The MediaCentral UX administrator needs to specify Send to Playback configuration information before you can use publish using Media Distribute. The Transfer Manager Destination Profile must be the same as the profile name specified in the Interplay Transfer settings. The FTP host name, user name, and password also reflect the same settings in Interplay Transfer.

The send-to-playback operation uses the credentials of the MediaCentral UX workgroup user specified in the Interplay profile and not the currently logged in user, so the user must have read/write privileges for the Interplay database used for sending media assets to the FTP host (see “[Configuring MediaCentral | UX for Media | Distribute](#)” on page 38). For information on setting up MediaCentral UX users and roles, see “Managing Users and Groups” in the *Avid MediaCentral | UX Administration Guide*.

You can create only one Send to Playback configuration for each Media Distribute installation.

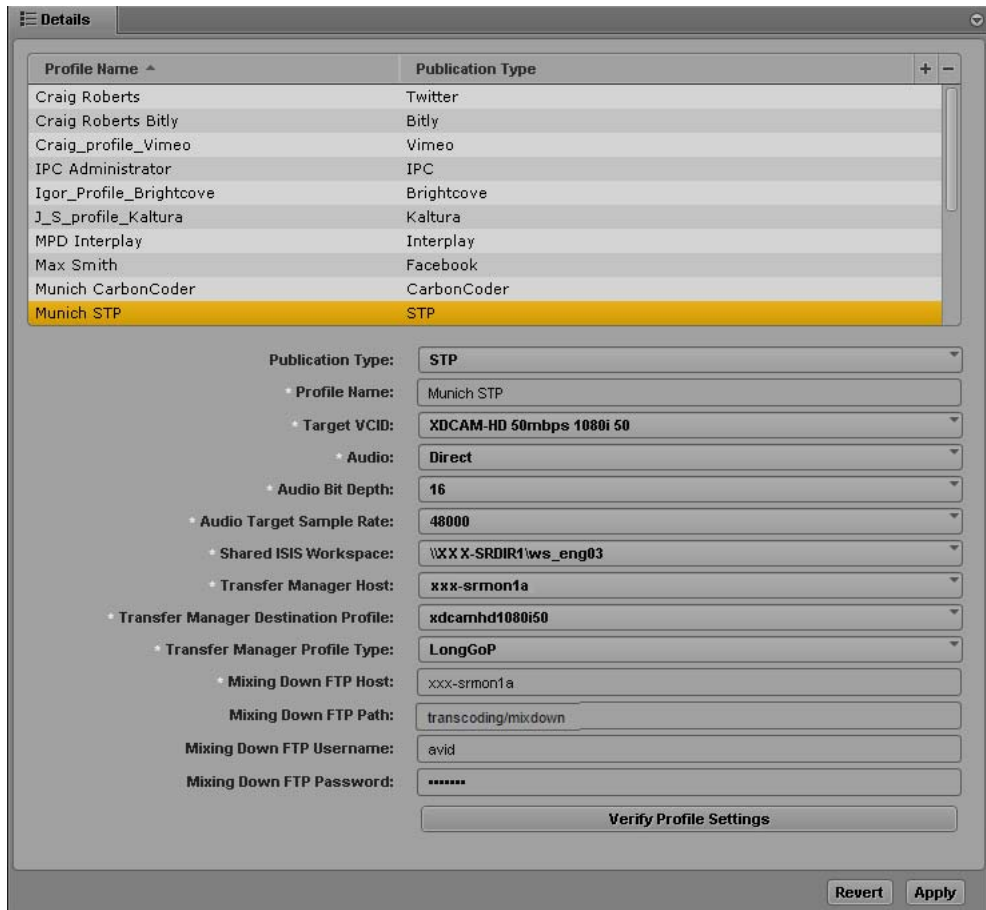

To configure Send to Playback publish settings:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select STP.

5. Click the + (plus) button in the Details section.

An STP profile named “New Profile” is created in the Details section.

6. Specify the required settings:

- Profile Name: use the same name used for the FTP server profile configured in the Interplay Transfer Configuration tool. For more information, see “Configuring an FTP Server Profile” in the *Interplay / Transfer Setup and User’s Guide*.
- Target VCID: Select a VCID from the list of supported resolutions.

- Audio: Options are Direct, Stereo, or Mono. When you use Direct to send a export a clip for Send to Playback, the channel order reflects the channel order used when you captured the audio. For example, if your source audio is 5:1 multichannel audio, you should select Direct to preserve the channel mappings.
- Audio Bit Depth: Options are 16 and 24.
- Audio Target Sample Rate: Options are 32000, 44100, 48000, and 96000.
- Shared ISIS Workspace — The STP service requires this ISIS workspace to store video prior to delivery to the transcode service. Select a valid shared ISIS workspace from the menu to be used as a temporary location for storing media.

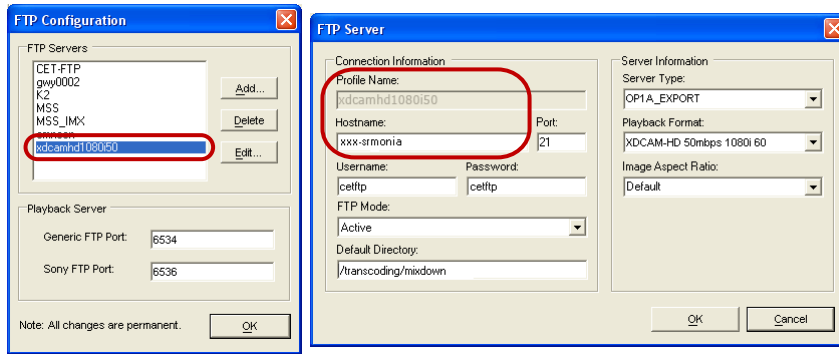

The user specified in this profile must have read/write privileges for the shared ISIS workspace.

- Transfer Manager Host — select a Transfer Manager host from the menu. You can use the values from your Transfer Manager configuration. For more information, see the *Interplay | Transfer Setup and User's Guide*.
- Transfer Manager Destination Profile — Select an existing destination profile from the menu.
- TransferManager Profile Type — Select a profile from the following options:

Profile Type	Description
IFrame	For send-to-playback operations using I-frame media. The source media clips must match the target VCID format. The output file uses an OP1a format.
IFrameAMS	For send-to-playback operations using I-frame media and sent to an Avid AirSpeed server. The source media clips must match the target VCID format. The output file uses an OP Atom format.
LongGoP	For send-to-playback operations using Long GOP media. Since the send-top-playback encoding creates a new media clip, the source media clips do not need to match the target VCID format. The output file uses an OP1a format.
LongGoPAMS	For send-to-playback operations using Long GOP media and sent to an Avid AirSpeed server. Since the send-top-playback encoding creates a new media clip, the source media clips do not need to match the target VCID format. The output file uses an OP Atom format.

- Mixing Down FTP Host — Type the FTP host name. The FTP host name must be the same as the FTP server name associated with the destination profile and specified in the FTP configuration in Interplay Transfer. For more information on FTP configuration in Interplay Transfer, see *Interplay | Transfer Setup and User's Guide*.

In the sample profile setting above, the Transfer Manager Destination Profile is listed as **xdcamhd1080i50** and the Mixing Down FTP Host is **xxx-srmonia**. This corresponds to the following components of the Interplay Transfer FTP configuration:

- Mixing Down FTP Path — Type the path to the FTP destination where MXF output is staged for transcode. This should be the same as the destination directory specified in the FTP configuration in Interplay Transfer. In the example here, the Mixing Down FTP Path is /transcoding/mixdown.

Do not set the Mixing Down FTP Path to the same delivery folders used by your third-party transcoding application — for example, the FTP Transcode/in Path in your Vantage profile. The FTP location must be independent of the transcoder path.

- Mixing Down FTP Username — Type the user name for your FTP service credentials.
- Mixing Down FTP Password — Type the password for your FTP service credentials.

You cannot use either an at sign (@) or a colon (:) in your password. You can substitute %40 (@) or %3a (:) instead.

7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

8. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a Telestream Vantage Profile

Before you can use the Telestream Vantage video transcoding service with Media Distribute, you must install Telestream Vantage on your system and then configure the Vantage settings in MediaCentral UX.

Before you set up your Vantage workflow, you must configure your video host transcoding. For more information, see “[Configuring the Video Transcoding Host](#)” on page 40.

The following procedures assume you have created a Vantage account. For more information, see <http://www.telestream.net/vantage/>.

You must select your Telestream Vantage video transcoding service profile when you set up your system accounts — for example, your YouTube or Vimeo account — for publishing your media packages. Depending on your configuration, you might need to configure your system accounts before configuring MediaCentral UX for your Vantage account. For more information, see “[Configuring System Accounts for Media | Distribute](#)” on page 64.

To install and configure Telestream Vantage:

1. Install Vantage on your Windows system.
2. Use the Vantage Management Console to configure your Vantage license.
3. Configure your Vantage workflow, and then edit your Flip tasks to set the output folder to the \\<hostname>\avid\transcoding\out folder you created when you set up your video host transcoding. A typical Vantage workflow usually includes at least a Receive and a Flip task. See your Vantage documentation for more information on creating and configuring workflows.
4. Make sure that you select H.264 as the Encoder and .mp4 as the Extension in your Flip tasks.

You cannot change the output file name by adding file name prefixes or suffixes. This causes the publish job to fail.

5. Type the following URL in a browser address bar to obtain your Vantage workflow ID:
<http://<hostname>:8676/DomainRest/GetWorkflows>.
 A Web page displays your Vantage workflow ID.
6. Save your workflow ID.

To configure MediaCentral UX for your Vantage account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

Profile Name	Publication Type
Bitly	Bitly
Craig.X.Roberts	Facebook
CraigVIm	Vimeo
IPC	IPC
Interplay	Interplay
STP	STP
TwitterTest	Twitter
VantTrans	Vantage
WnTest	WorldNow

Publication Type: **Vantage**
 • Profile Name: VantTrans
 • Workflow ID: d120ef86-d036-4625-9349-572ff13c4673
 • Host Name: 172.22.206.110
 FTP Hostname:
 • FTP User Name: avid
 • FTP Password:
 • FTP Transcode/In Path: transcoding/in
 • FTP Transcode/Out Path: transcoding/out
 • File Share In Path: \\xxx-srmon1a\avid

Verify Profile Settings

4. Click the Publication Type menu and select Vantage.
 5. Click the + (plus) button in the Details section.
- A Vantage profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the configuration on your Vantage system:
 - Profile Name (type a descriptive name for your profile)
 - Workflow ID (from your Vantage workflow configuration)
 - Host Name (your Vantage hostname — for example, vantage-host)
 - FTP Hostname (optional — if you use different servers for your FTP transcode in/out location and for your File Share path, you can specify a different FTP server. If the transcode in/out and File Share are on the same server, you can leave this setting blank.)
 - FTP User Name (from your video host transcoding configuration)
 - FTP Password (from your video host transcoding configuration)
 - FTP Transcode/In Path (for incoming files, from your video host transcoding configuration. You can use a subpath expression — for example, transcoding\in.)
 - FTP Transcode/Out Path (for outgoing files, from your video host transcoding configuration. You can use a subpath expression — for example, transcoding\out.)
 - File Share In Path (from your video host transcoding configuration — see [“Configuring the Video Transcoding Host”](#) on page 40. You must use the path to the Network Share path for this setting — for example, \\my_vantage\avid.)

7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

8. (Optional) If your iNEWS stories use uppercase characters, you can select the option to transform iNEWS stories to lowercase. This changes all text to lowercase characters when you load an iNEWS story in the Media Distribute layout.
9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Validating the Vantage Transcode Route Configuration

When you have configured video transcoding for your Vantage video host system as well as the Telestream Vantage profile, you can validate the configuration by publishing a test media package to make sure all components work successfully. For information on configuring video transcoding and the Vantage profile, see “[Configuring the Video Transcoding Host](#)” on page 40 and “[Configuring a Telestream Vantage Profile](#)” on page 49.

To publish a media package, you first need to set up and configure at least one system account. For more information, see “[Configuring System Accounts for Media / Distribute](#)” on page 64.

The validation procedure includes monitoring the progress of the transcode procedure in the following applications:

- the ServiceMix log in your MediaCentral server
- the Job Status tab of the Vantage Workflow Designer
- the Vantage server Avid transcode folders
- the Media Distribute layout in MediaCentral UX

To validate the Vantage transcode configuration:

1. Log in to the MediaCentral server, either locally or using a terminal emulator application such as PuTTY, and type the following in a terminal window:
 - a. To open the ServiceMix application, type the following command:

```
ssh Administrator@localhost -p 8101
```
 - b. Type **yes** to continue connecting to the host, and then type the default password **avid**. The ServiceMix interface displays in the terminal window.
 - c. To move to the end of the log, type **log:tail**, and press Enter.

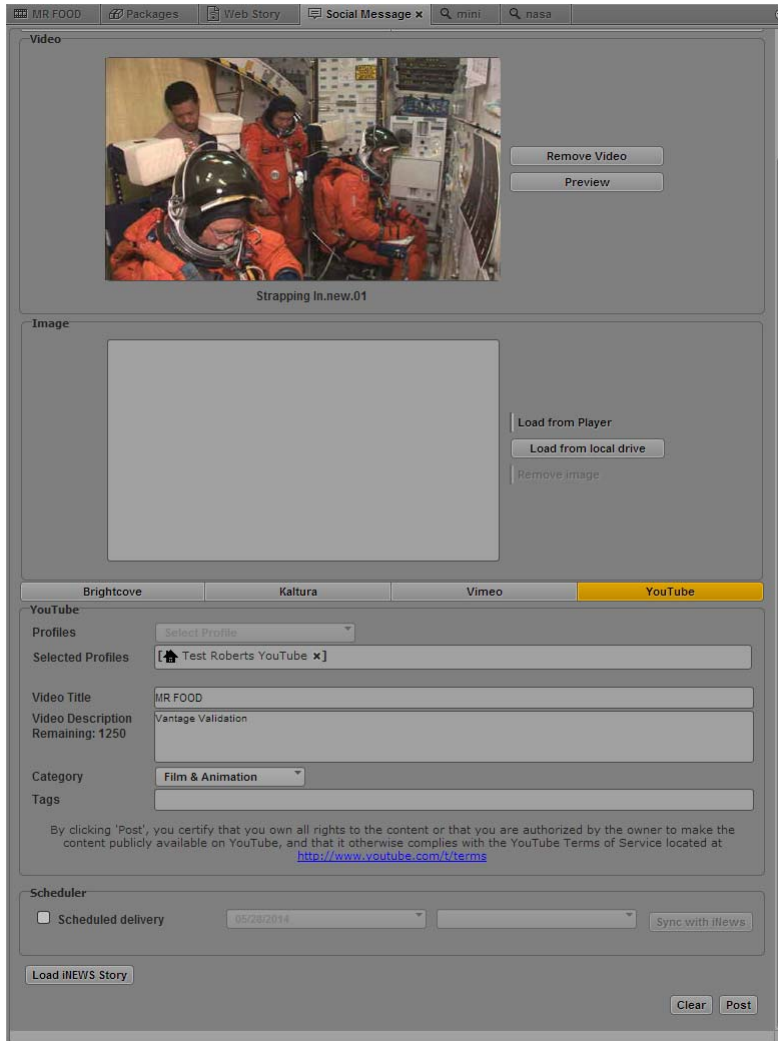

2. On your Vantage server, do the following:
 - a. Open Vantage Workflow Designer, and then select File > Job Status.
 - b. In a file browser, navigate to `<drive>:/avid/transcoding` so you can see the following folders:
 - `<drive>:/avid/transcoding/in`
 - `<drive>:/avid/transcoding/out`

3. Sign in to MediaCentral UX, and then click the Layout selector and select Media Distribute. The Media Distribute layout opens.
4. Click the Social Message pane. The Social Message pane opens.
5. Add some text in the Message text box. Changes you make in the Message text box apply globally to all social media targets you select. You can also modify the story text for individual targets in the text boxes for those targets.
6. Select a social media target — for example, YouTube.
7. Click the Profiles menu, and select the Vantage transcoding service profile.
8. Double-click a video asset in the Asset pane or drag the video asset to the Media viewer. The video asset displays in the Media pane. You can select a master clip, a subclip, or a sequence.

9. Click Attach Video.

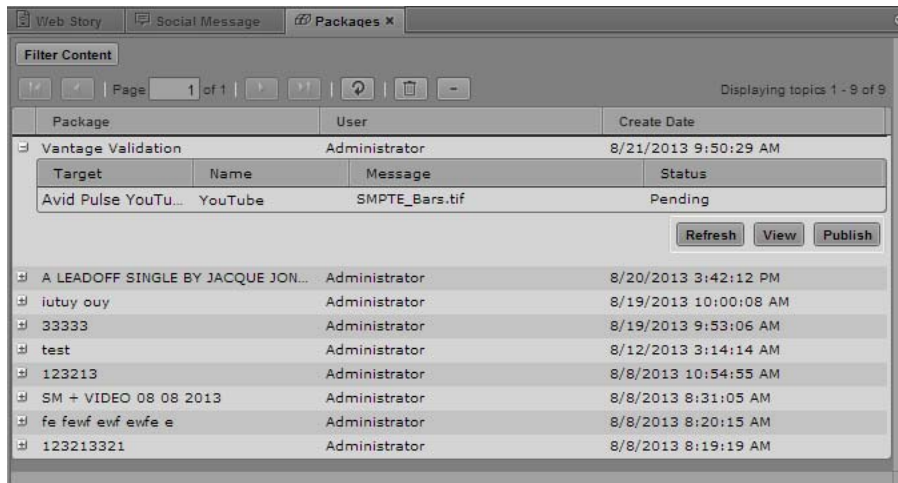

The video displays in the Video area of the Social Media pane.

10. Click Post, and then click Yes.

- Click the Packages pane, and then click the Refresh button.

The Packages pane displays the media package status as Pending.

- Click Publish.

The Packages pane displays the media package status as Mixing Down. When the mixdown process completes, the status displays as Mixing Down Finished.

- In the ServiceMix console displaying in the MediaCentral server terminal window, check the log for the following entries:

- Transcoded MediaItem is found transcodedMediaItemId=<ID number>
- Starting to copy MXF <media object ID> to transcoder machine FTP <Vantage_hostname>

```

| 216 - route-smi - 1.0.9 | 1 items for transcoding
2013-08-07 09:07:20,438 | INFO | read #15 - Split | mediaItemProcessin

age]

```

When the media package is published, the ServiceMix log displays the transcoded media item as released.

- In the file browser on the Vantage server, check the `<drive>:/avid/transcoding/in` folder for the MXF media file to be transcoded.

When the media package is published, the transcoded media item is deleted from the transcoding/in and transcoding/out folders.

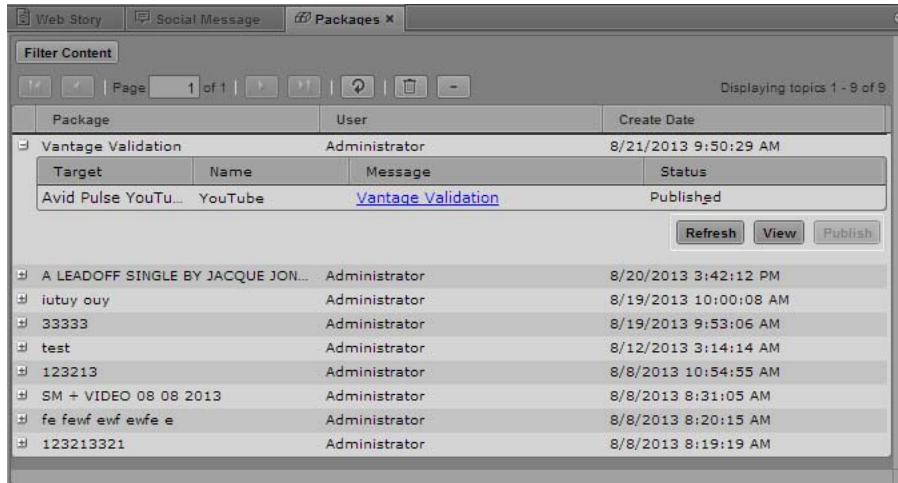

- In the Job Status tab of the Vantage Workflow Designer, check the status of the transcode job.

- When the Job Status tab reports the transcode process as completed, check the `<drive>:/avid/transcoding/out` folder in the file browser for the transcoded MXF media file.

17. In the MediaCentral UX Packages pane, check the status of the media package.

When the publish procedure completes, the status displays as Published and the link to video included in the package appears in blue. Clicking the link opens a browser and displays the video on the Web page for the selected online platform.

Configuring the Harmonic ProMedia Carbon Transcoder

Before you can use the Harmonic ProMedia™ Carbon transcoder with Media Distribute, you must install ProMedia Carbon on your system and then configure the CarbonCoder settings in MediaCentral UX.

Before you set up your Carbon system, you must configure your video host transcoding. For more information, see [“Configuring the Video Transcoding Host”](#) on page 40.

The following procedures assume you have created a ProMedia Carbon account. For more information, see <http://www.harmonicinc.com/product/promedia-carbon>.

To install and configure ProMedia Carbon:

1. Install Harmonic ProMedia Carbon on your Windows system.
2. Start ProMedia Carbon.
3. In Carbon, create a new profile by doing the following:
 - a. In the Target tab, add a new target and select a target preset.
 - b. In the Target Parameters window, modify the Destination Base Name to %s and the Destination Path to \\hostname\avid\transcoding\out.
 - c. Click Save Profile, and name the new profile Avid MPD.

4. Locate the profile ID by using one of the following:

- ▶ The Preset Editor in Carbon Admin
- ▶ ListProfiles.exe in the Carbon SDK

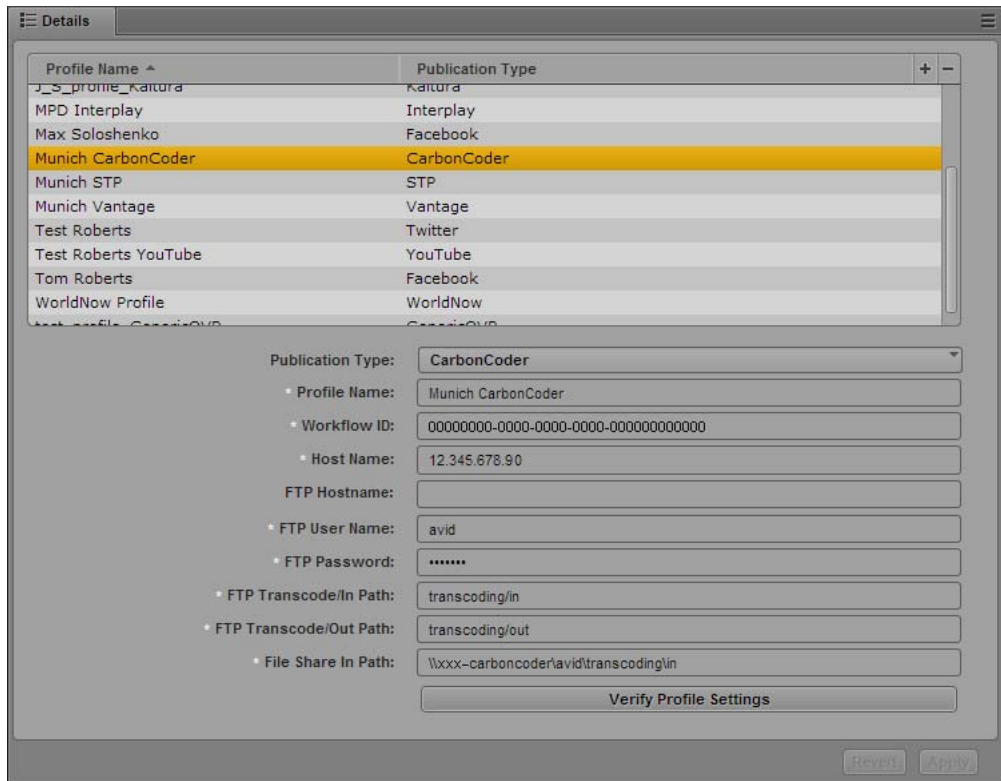

To configure MediaCentral UX for your ProMedia Carbon account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select CarbonCoder.
5. Click the + (plus) button in the Details section.

A CarbonCoder profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the using the parameter fields from ProMedia Carbon:
 - Profile Name (type a descriptive name for your profile)
 - Workflow ID (from your CarbonCoder profile)
 - Host Name (your CarbonCoder hostname — for example, carboncoder-host)
 - FTP Hostname (optional — if you use different servers for your FTP transcode in/out location and for your File Share path, you can specify a different FTP server. If the transcode in/out and File Share are on the same server, you can leave this setting blank.)
 - FTP User Name (from your video host transcoding configuration)
 - FTP Password (from your video host transcoding configuration)
 - FTP Transcode/In Path (for incoming files, from your video host transcoding configuration)
 - FTP Transcode/Out Path (for outgoing files, from your video host transcoding configuration)
 - File Share In Path (from your video host transcoding configuration — see “[Configuring the Video Transcoding Host](#)” on page 40)
7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.
8. (Optional) If your iNEWS stories use uppercase characters, you can select the option to transform iNEWS stories to lowercase. This changes all text to lowercase characters when you load an iNEWS story in the Media Distribute layout.
9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a RadiantGrid Profile

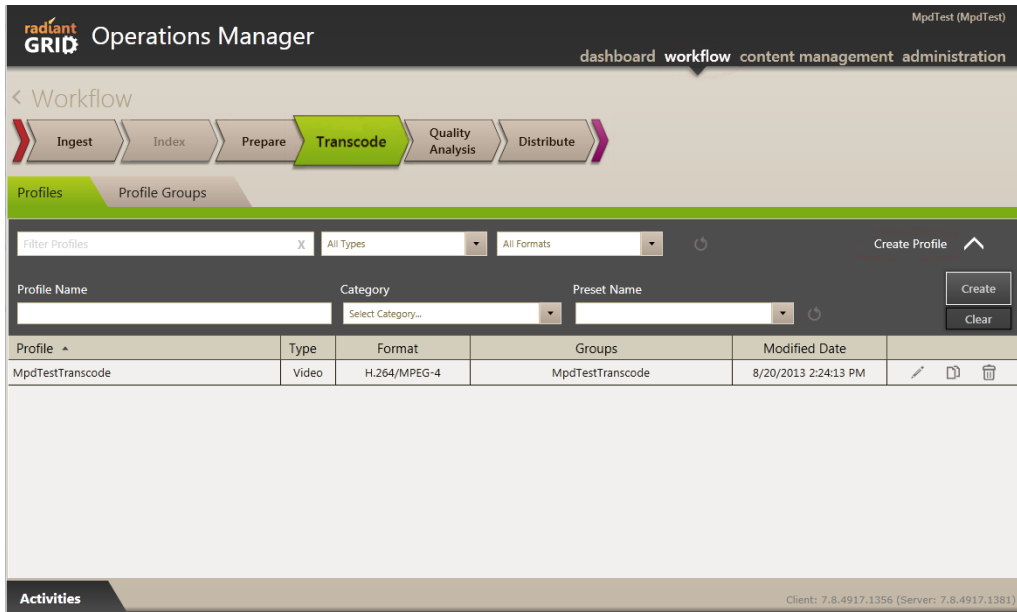

In order to use the RadiantGrid™ transcoding engine with Media Distribute, you need to install and configure the RadiantGrid software on a supported server. See your RadiantGrid representative for more information.

The following procedures assume you have created a RadiantGrid account and password. For more information, see <http://www.wohler.com/RgProduct.aspx>.

Once you have your RadiantGrid profile credentials, you need to create new transcode profile. This profile must transcode media from the MXF format to the H.264 (.mp4) format. The following procedure does not describe all of the options required for creating the profile using the RadiantGrid application.

To set up a RadiantGrid profile for use with Media Distribute:

1. Open your browser and log in to your RadiantGrid account.
2. Create a new Transcode profile. For details on creating a RadiantGrid transcoding profile, see your RadiantGrid documentation.

3. (Optional) Configure a workflow template.

If you create a new transcode profile, you might be able to skip this step. However, if you use an existing transcode profile, you might need to reconfigure your workflow template.

Name	Modified Date	
MpdTest	8/9/2013 3:37:20 PM	

4. Configure an FTP service. For information on configuring the FTP service, see [“Configuring the Video Transcoding Host”](#) on page 40.

To configure MediaCentral UX for your RadiantGrid account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

Profile Name ^	Publication Type	+ -
Munich Vantage	Vantage	
New Profile	RadiantGrid	
Polopoly	Polopoly	
Test Brightcove Profile	Brightcove	
Test Roberts	Twitter	
Test Roberts YouTube	YouTube	
Tom Roberts	Facebook	
test_profile_GenericCMS	GenericCMS	
test_profile_GenericOVP	GenericOVP	
test_profile_InternetBroadcasting	InternetBroadcasting	

Publication Type: RadiantGrid
Profile Name: PulseTest
RadiantGrid User Name: xxxxxxxx
RadiantGrid Password: *****
Transcoding Profile Name: MpdTestTranscode
Host Name: radiant-host
FTP Hostname:
FTP User Name: avid
FTP Password: *****
FTP Transcode/In Path: transcoding/in
FTP Transcode/Out Path: transcoding/out
File Share In Path: \\xxx-radiant\avid\transcoding\in
File Share Out Path: \\xxx-radiant\avid\transcoding\out

Verify Profile Settings

Revert Apply

4. Click the Publication Type menu and select RadiantGrid.

5. Click the + (plus) button in the Details section.

A RadiantGrid profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the configuration on your RadiantGrid system and your FTP configuration:

- Profile Name (type a descriptive name for your profile)
- RadiantGrid User Name (from your RadiantGrid configuration)
- RadiantGrid Password (from your RadiantGrid configuration)
- Transcoding Profile Name (the profile name is listed on the Workflow > Transcode Web page of your RadiantGrid configuration)

- Host Name (your RadiantGrid server hostname — for example, radiant-host)
 - FTP Hostname (optional — if you use different servers for your FTP transcode in/out location and for your File Share path, you can specify a different FTP server. If the transcode in/out and File Share are on the same server, you can leave this setting blank.)
 - FTP User Name (from your video host transcoding configuration)
 - FTP Password (from your video host transcoding configuration)
 - FTP Transcode/In Path (for incoming files, from your video host transcoding configuration)
 - FTP Transcode/Out Path (for outgoing files, from your video host transcoding configuration)
 - File Share In Path (from your video host transcoding configuration)
 - File Share Out Path (from your video host transcoding configuration)
7. Click Verify Profile Settings to validate the profile settings.
- If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.
8. (Optional) If your iNEWS stories use uppercase characters, you can select the option to transform iNEWS stories to lowercase. This changes all text to lowercase characters when you load an iNEWS story in the Media Distribute layout.
9. Click Apply to save the profile.
- The profile displays in the Details section with the new information.
- If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

3 Configuring System Accounts for Media | Distribute

You can set up multiple accounts in the System Settings layout for the services you want to use for publishing to multiple platforms. For information on the supported system accounts, see the following topics:

- [“Configuring the Bitly Link-Shortening Service” on page 65](#)
- [“Configuring a Twitter Publication Account” on page 66](#)
- [“Configuring a Facebook Publication Account” on page 72](#)
- [“Configuring a Facebook Page Publication Account” on page 78](#)
- [“Configuring a Vimeo Publication Account” on page 85](#)
- [“Configuring a YouTube Publication Account” on page 88](#)
- [“Configuring a YouTube v3 Publication Account” on page 93](#)
- [“Configuring a Brightcove Account” on page 97](#)
- [“Configuring a Kaltura Account” on page 100](#)
- [“Configuring an Ooyala Account” on page 102](#)
- [“Configuring an Atex Polopoly Web CMS Account” on page 105](#)
- [“Configuring a WorldNow Web CMS Profile” on page 107](#)
- [“Configuring thePlatform Profile” on page 113](#)
- [“Configuring a WordPress CMS Profile” on page 115](#)
- [“Configuring an InternetBroadcasting CMS Profile” on page 117](#)
- [“Configuring a Generic CMS Profile” on page 119](#)
- [“Configuring a Generic OVP Profile” on page 124](#)

If your iNEWS stories use uppercase characters, you can select the option in the Media Distribute > General section of the System Settings to transform iNEWS stories to lowercase. This changes all text to lowercase characters when you load an iNEWS story in the Media Distribute layout.

Configuring the Bitly Link-Shortening Service

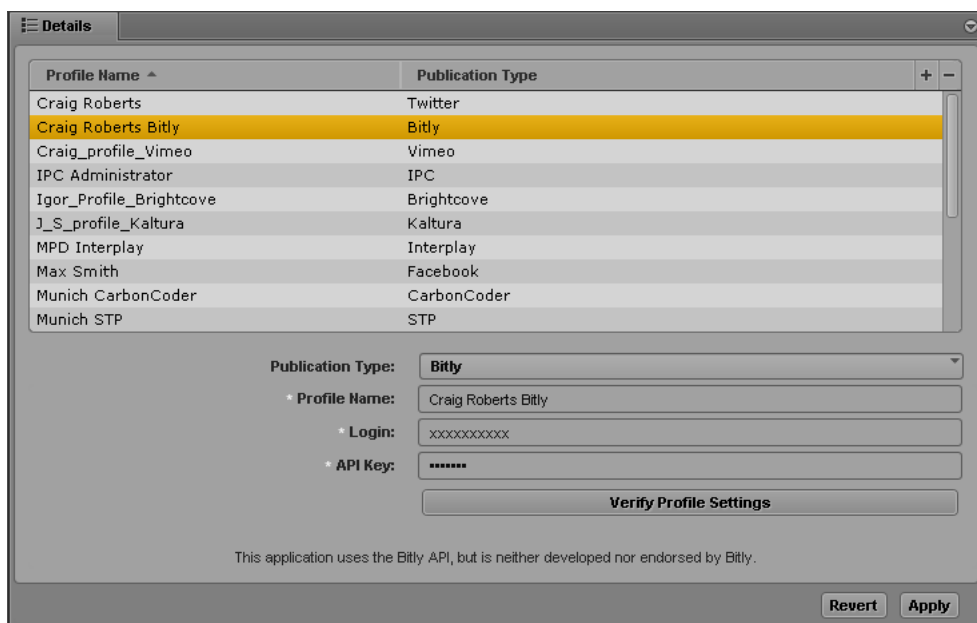

You can configure the Bitly™ URL shortening service using MediaCentral UX settings. Using a link shortening service is optional, but it can aid in ensuring that URLs do not exceed character limits on some social media postings.

The following procedures assume you have created a Bitly account at <https://bitly.com/> and you have generated a Bitly API key at <http://dev.bitly.com/>.

To configure Bitly for Media Distribute:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.
The System Settings layout opens.
3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Bitly.
5. Click the + (plus) button in the Details section.

A Bitly profile named “New Profile” is created in the Details section.

6. Specify the required settings:
 - Profile Name (type a descriptive name for your profile)
 - Login
 - API Key
7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

The setting, “Transform iNEWS stories to lower case,” applies only to Media Distribute accounts that publish packages containing iNEWS stories. The option does not affect this setting.

8. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a Twitter Publication Account

Before you can publish a package to Twitter from MediaCentral UX using Media Distribute, you must first set up a Twitter account to which you want to publish, and you must configure a Twitter publication account.

This section describes configuring corporate or group house accounts. When you publish to these accounts, your packages require review and approval. For information on configuring a personal account, see “[Configuring a User Profile for a Personal Twitter Account](#)” on page 128.

The following procedures assume you have created a Twitter account at <https://twitter.com>.

The user interface for Twitter might change without notice. The procedure below outlines the general steps to create the elements needed to configure Media Distribute. For more information on creating a Twitter application, see your Twitter account documentation.

To set up a Twitter application account for MediaCentral UX multi-platform delivery:

1. Log on to your Twitter account and navigate to the My Applications Web page at <https://dev.twitter.com/apps>.
2. Click Create New App.

The Create an application Web page opens.

Home → My applications

Create an application

Application Details

Name: *

Your application name. This is used to attribute the source of a tweet and in user-facing authorization screens. 32 characters max.

Description: *

Your application description, which will be shown in user-facing authorization screens. Between 10 and 200 characters max.

Website: *

Your application's publicly accessible home page, where users can go to download, make use of, or find out more information about your application. This fully-qualified URL is used in the source attribution for tweets created by your application and will be shown in user-facing authorization screens. (If you don't have a URL yet, just put a placeholder here but remember to change it later.)

Callback URL:

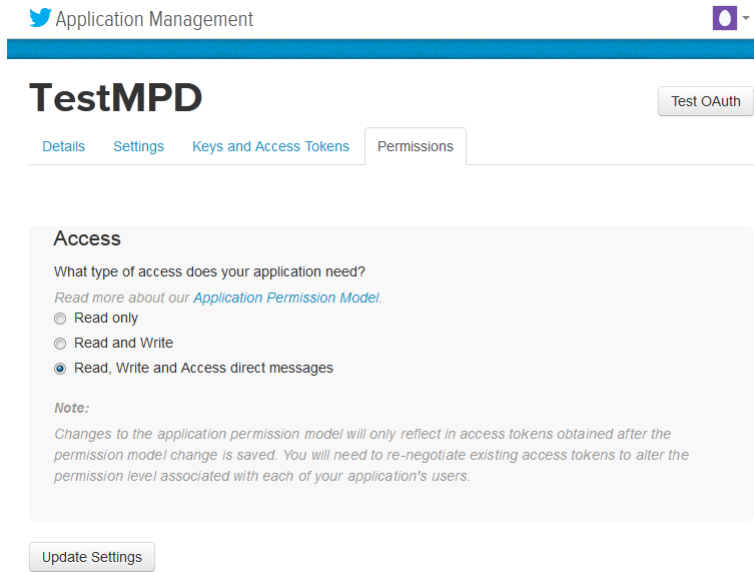

Where should we return after successfully authenticating? For [@Anywhere applications](#), only the domain specified in the callback will be used. [@Auth 1.0s](#) applications should explicitly specify their `oauth_callback` URL on the request token step, regardless of the value given here. To restrict your application from using callbacks, leave this field blank.

3. Type your information for the required fields, which might include the following:
 - Name
 - Description
 - Website (the public URL for your Twitter application, where users can download your application or get more information about it; use a placeholder URL if you do not have an application URL yet)
4. In the Developer Agreement section, read the rules agreement and select Yes, I agree.
5. If required, type the security text.
6. Click Create your Twitter application.

Your Twitter application opens in the Application Management page.

7. Click the Permissions tab.

The Permissions tab opens.

The screenshot shows the Twitter Application Management interface for an application named 'TestMPD'. At the top, there is a header with the Twitter logo and 'Application Management' on the left, and a profile picture icon on the right. Below the header, the application name 'TestMPD' is displayed in large font, with a 'Test OAuth' button to its right. A navigation bar contains four tabs: 'Details', 'Settings', 'Keys and Access Tokens', and 'Permissions', with 'Permissions' being the active tab. The main content area is titled 'Access' and contains the following text: 'What type of access does your application need?' followed by a link 'Read more about our Application Permission Model'. Below this are three radio button options: 'Read only', 'Read and Write', and 'Read, Write and Access direct messages', with the third option selected. A 'Note:' section follows, containing a paragraph of text: 'Changes to the application permission model will only reflect in access tokens obtained after the permission model change is saved. You will need to re-negotiate existing access tokens to alter the permission level associated with each of your application's users.' At the bottom of the 'Access' section is an 'Update Settings' button.

8. In the Access area, select Read, Write and Access direct messages, and then click Update this Twitter application's settings.

Your settings are saved.

9. Click the Keys and Access Tokens tab.

The Keys and Access Tokens tab opens.

Application Management

TestMPD

Test OAuth

Token Actions

Regenerate My Access Token and Token Secret Revoke Token Access

10. In the Application Settings area, click Create Consumer Key and Secret.

If you already created an access token, the button in this area is labeled “Recreate Consumer Key and Secret.”

11. In the Your Access Token area, click Create My Access Token and Token Secret.

If you already created an access token, the button in this area is labeled “Recreate My Access Token and Token Secret.”

12. Save the following parameter fields so you can enter them in the appropriate location in the MediaCentral UX settings:

- Consumer key
- Consumer secret
- Access token
- Access token secret

To configure MediaCentral UX for your Twitter application:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

8. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

You can add multiple Twitter profiles.

Configuring a Facebook Publication Account

Before you can publish a package to Facebook from MediaCentral UX using Media Distribute, you must first set up a Facebook profile account to which you want to publish, and you must configure a Facebook publication account in MediaCentral UX. You also need to set permissions for your Facebook application so it can post to your Facebook account.

This section describes configuring corporate or group house accounts. When you publish to these accounts, your packages require review and approval. For information on configuring a personal account, see “[Configuring a User Profile for a Personal Facebook Account](#)” on [page 130](#).

Before you attempt to publish your package to Facebook, Avid recommends that you test your account privileges.

The following procedures assume you have created a Facebook account at <https://www.facebook.com>.

The user interface for Facebook developers might change without notice. The procedure below provides general guidelines to create the elements needed to configure Media Distribute. For more information on creating a Facebook application, downloading and installing any necessary SDK applications, see [Facebook support documentation](#).

To set up a Facebook application account for MediaCentral UX multi-platform delivery:

1. Log on to your Facebook account, and then go to the Facebook developers Web page at <https://developers.facebook.com>.
2. If you have not registered as a Facebook developer, do the following:
 - a. Click Apps and select Register as a Developer.
The Register as a Facebook Developer dialog box opens.
 - b. Follow the prompts to register as a Facebook developer.
3. Click Apps, and select Create New App.

If you previously created an app for Facebook, select My Apps > Add a New App.

The Create New App dialog box opens.

4. Select a platform for your app — for example, Android.
5. Type a name for your application in the App Name text box, and then click Create New Facebook App ID.
The Create New App ID dialog box opens.
6. Select the appropriate options and then click Create App ID.
7. Click Skip Quick Start.

The Facebook app Dashboard opens.

8. Click Settings.

9. Click Add Platform, and then select Website.

The Settings dialog box opens.

The screenshot shows the Facebook Developers interface for configuring an app. The 'Basic' tab is active, displaying the following fields:

- App ID:** 123456789012345
- App Secret:** Masked with dots, with a 'Show' button.
- Display Name:** DocTestMPD
- App Domains:** (Empty field)
- Namespace:** (Empty field)
- Contact Email:** johnsmith@mymail.com
- Website Section:**
 - Site URL:** http://localhost
 - Mobile Site URL:** URL of your mobile site

At the bottom of the settings panel, there are three buttons: 'Delete App' (red), 'Discard', and 'Save Changes' (blue).

10. In the Website area, type a site URL.

If you do not have a site URL, you can type `http://localhost`. You can modify the URL later.

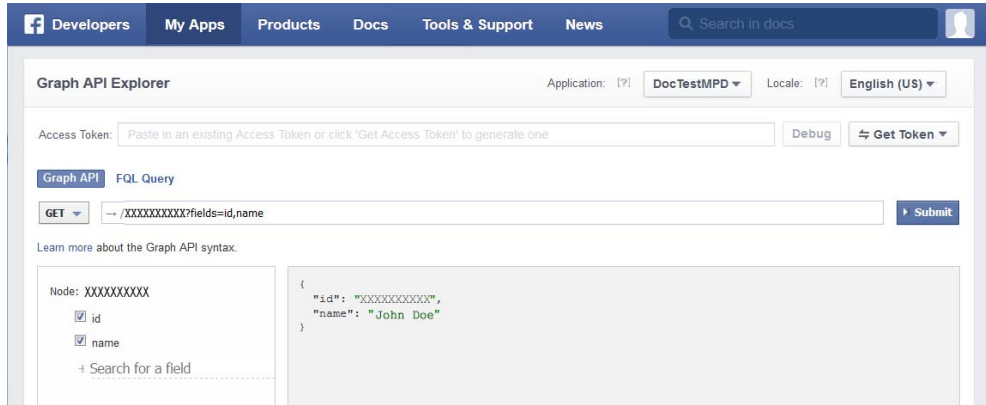

11. Click Save Changes.

12. Save the following parameter fields so you can enter them in the appropriate location in the MediaCentral UX settings:

- App ID
- App Secret

To set Facebook permissions for your Media Distribute application:

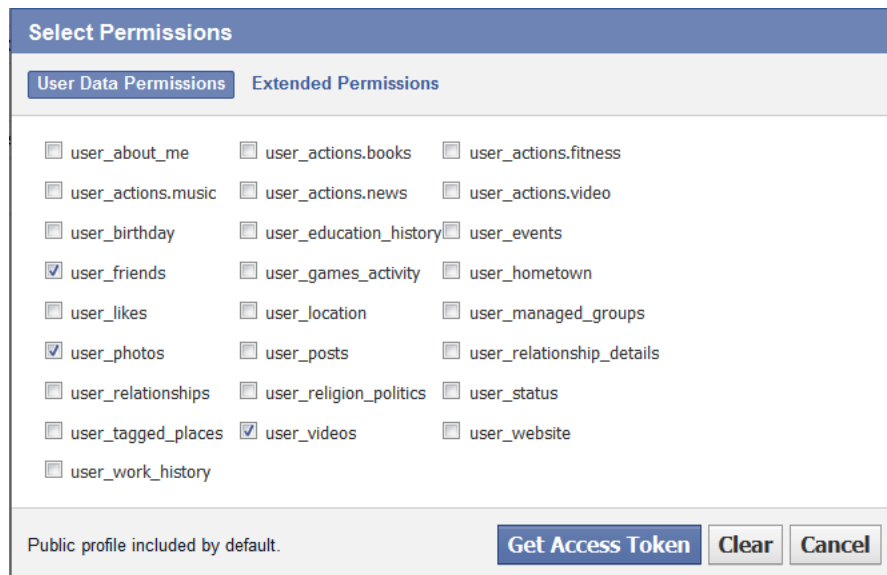

1. Log on to your Facebook developers account, and click Tools > Graph API Explorer. The Graph API Explorer Web page displays.

2. Click the Application menu and select your Facebook application.
3. Click the Get Token menu, and then select Get Access Token.

The Select Permissions dialog box opens.

4. Click the User Data Permissions tab, and then select the user_friends, user_photos, and user_videos options.

- Click the Extended Permissions tab, and then select the `publish_actions` and the `manage_pages` options.

Select Permissions

User Data Permissions **Extended Permissions**

ads_management ads_read email
 manage_pages publish_actions publish_pages
 read_custom_friendlists read_insights read_page_mailboxes
 rsvp_event

Public profile included by default.

Get Access Token Clear Cancel

- Click Get Access Token.

The Web page generates a new access token and sets the necessary permissions for your application.

This token remains valid for only one hour.

- Save your access token so you can enter it in the appropriate location in the MediaCentral UX setting.

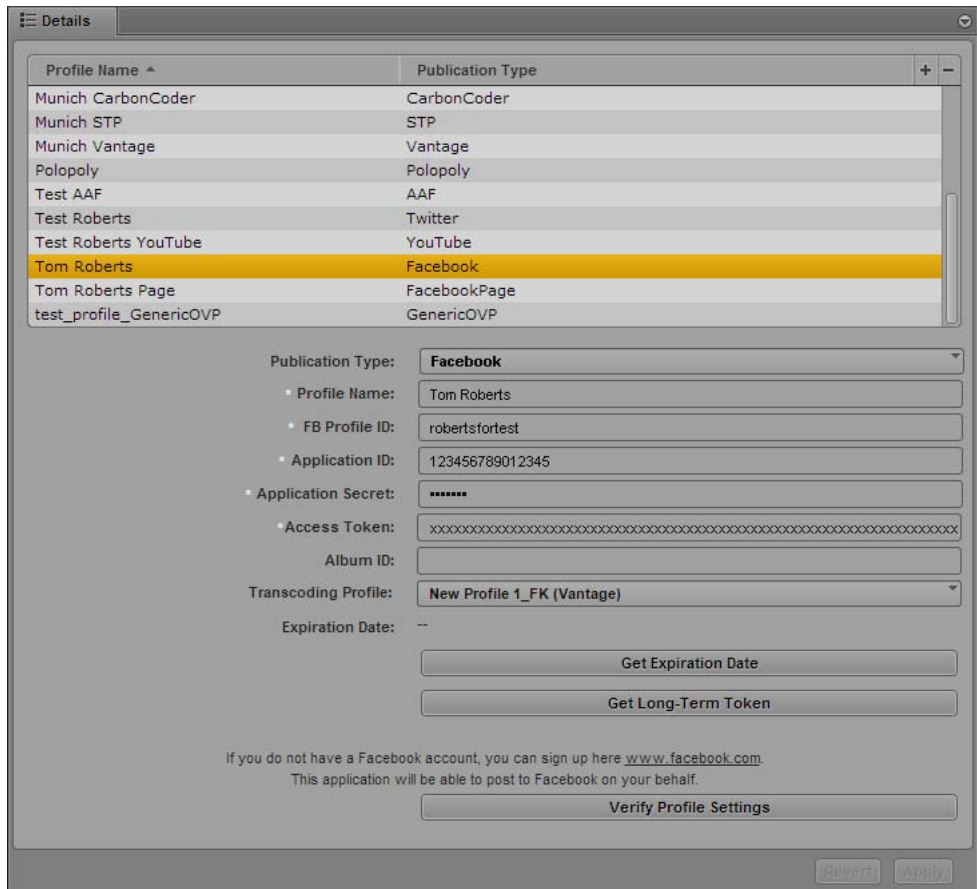

To configure MediaCentral UX for your Facebook application:

- Sign in to MediaCentral UX as an administrator.
- Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Facebook.

5. Click the + (plus) button in the Details section.

A Facebook profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the parameter fields you copied from your Facebook Apps Web page:

- Profile Name (type a descriptive name for your profile — for example, *[MyCompany]* Facebook News))
- FB Profile ID
- Application ID

- Application Secret
- Access Token
- (Optional) Album ID

You can specify the name of a Facebook album if you want to publish images directly to an album that you have created for your Facebook account.

7. (Optional) Click Transcoding Profile and select one of the available profiles.

You cannot publish video directly to Facebook unless you specify a transcoding profile.

8. (Optional) Click Get Expiration Date.

Media Distribute checks the expiration date of your access token and updates the entry in the Expiration Date field. This shows you how much time is left on your Facebook access token.

9. (Optional) Click Get Long-Term Token.

Media Distribute converts your access token, which often remains valid for a couple of hours, to a long-lived token. For more information on short-lived and long-lived tokens and their expiration periods, see your Facebook developer documentation.

10. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

11. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

You can add multiple Facebook profiles.

Configuring a Facebook Page Publication Account

You can publish packages to a corporate Facebook Page account from MediaCentral UX using Media Distribute. Once you set up a Page account on Facebook, you then can configure a Facebook Page publication account.

Facebook Pages allow businesses to connect with customers and users. Facebook Page accounts allow official representatives of a business or organization to create and contribute to Pages. For more information on Facebook Pages, see Facebook Pages support information at www.facebook.com/help.

You do not need to configure a Facebook publication account in Media Distribute in order to publish to your Facebook Page, but you do need to have a Facebook account to set up a Facebook Page. For information on configuring a Facebook publication account, see “[Configuring a Facebook Publication Account](#)” on page 72.

Before you attempt to publish your package to a Facebook Page, Avid recommends that you test your account privileges.

The following procedures assume you have created a Facebook account and created a Facebook Page at <https://www.facebook.com/pages/create>.

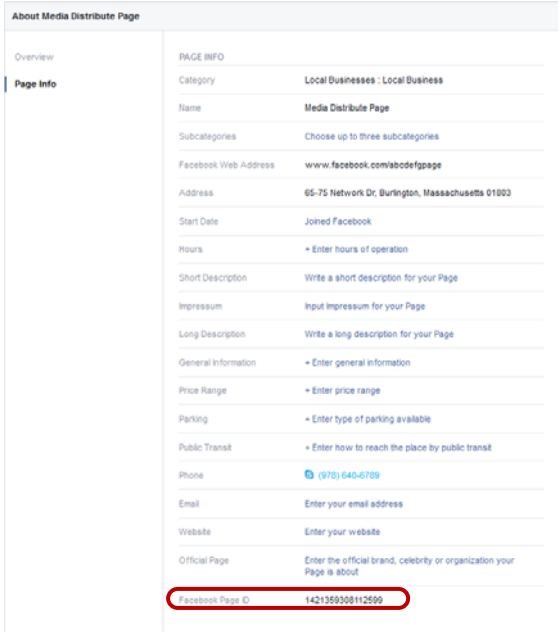

The user interface for Facebook developers might change without notice. The procedure below provides general guidelines to create the elements needed to configure Media Distribute. For more information on creating a Facebook application, see Facebook support documentation.

To set up a Facebook Page for MediaCentral UX multi-platform delivery:

1. Log on to your Facebook account, click the Edit Account button, and select Manage Pages.
The Pages page opens.
2. Click your Page in the Pages list.
Your Facebook Page opens.

3. Click About, and then select Page Info.

Your Facebook Page displays the page information.

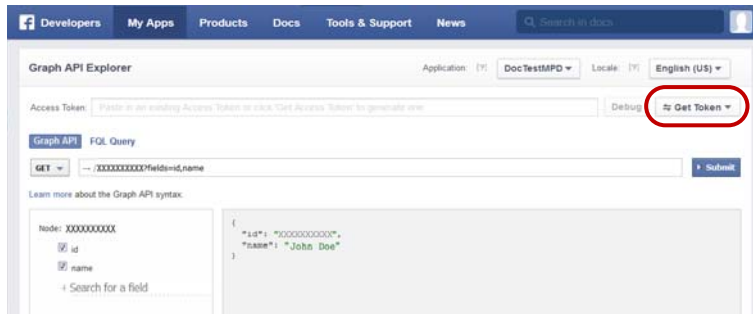

4. Save your Facebook Page ID so you can enter it in the appropriate location in the MediaCentral UX setting.

To set Facebook Page permissions for your Media Distribute application:

1. Log on to your Facebook developers account, and click Tools & Support > Graph API Explorer.
2. Click the Application menu and select the Facebook application associated with your Facebook Page.

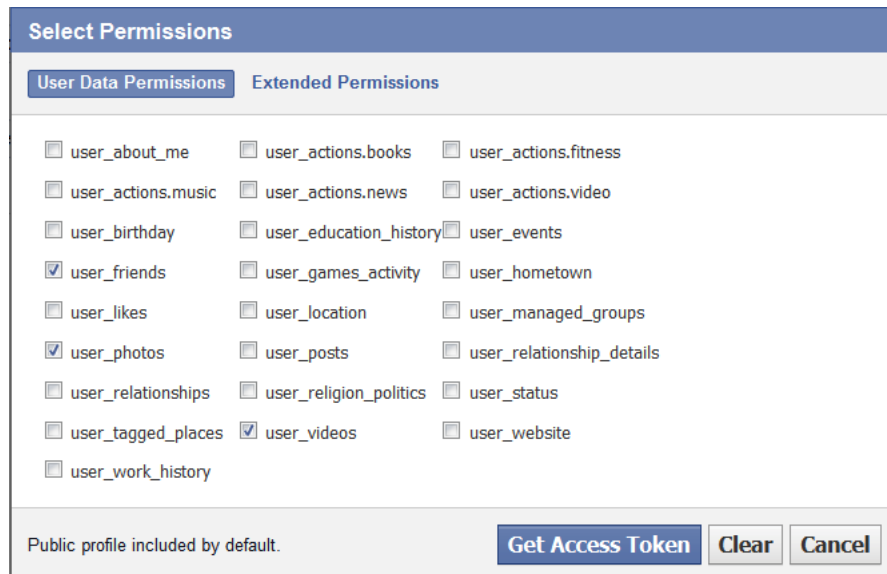

The Graph API Explorer Web page displays.

3. Click the Get Token menu, and then select Get Access Token.

The Select Permissions dialog box opens.

4. Click the User Data Permissions tab, and then select the user_friends, the user_photos, and user_videos options.

5. Click the Extended Permissions tab, and then select the publish_actions, the manage_pages, and the read_stream options.

Select Permissions

User Data Permissions **Extended Permissions**

ads_management ads_read email

manage_pages publish_actions publish_pages

read_custom_friendlists read_insights read_page_mailboxes

rsvp_event

Public profile included by default.

Get Access Token Clear Cancel

6. Click Get Access Token.

The Web page generates a new access token and sets the necessary permissions for your application.

This token remains valid for only one hour.

7. Save your access token so you can enter it in the appropriate location in the MediaCentral UX setting.
8. Click Debug.

The Access Token Debugger page opens and displays information about your access token.

Access Token Info	
App ID	111111111111111111 Test
User ID	1000000000000000 - Craig Roberts
Issued	Unknown
Expires	1395046000 (in about an hour)
Valid	True
Origin	Web
Scopes	basic_info, manage_pages, public_profile, publish_actions, publish_stream, read_stream, share_item, user_friends

9. Save your App ID and User ID so you can enter them in the appropriate locations in the MediaCentral UX setting.

10. Select Apps > [your Facebook app].

The Dashboard for your app opens.

11. Click Show to display your App Secret.
12. Save your App Secret so you can enter it in the appropriate locations in the MediaCentral UX setting.

To configure MediaCentral UX for your Facebook Page:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

- Application ID — from your Facebook app settings
- Application Secret — from your Facebook app settings
- Access Token — from your Facebook app settings
- (Optional) Album ID

You can specify the name of a Facebook album if you want to publish images directly to an album that you have created for your Facebook account.

7. (Optional) Click Get Expiration Date.

Media Distribute checks the expiration date of your access token and updates the entry in the Expiration Date field. This shows you how much time is left on your Facebook access token.

8. (Optional) Click Get Long-Term Token.

Media Distribute converts your access token, which often remains valid for a couple of hours, to a long-lived token. For more information on short-lived and long-lived tokens and their expiration periods, see your Facebook developer documentation.

9. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

10. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

You can add multiple Facebook page profiles.

Configuring a Vimeo Publication Account

Before you can publish a package to Vimeo from MediaCentral UX using Media Distribute, you must first set up a Vimeo account to which you want to publish, and you must configure a Vimeo publication account.

Media Distribute works with both the Advanced API and the standard API used by Vimeo applications. For both, you need to check the OAuth tab in the My Apps Web page for the required parameters used in configuring your Vimeo account. Media Distribute does not use OAuth2 authentication.

The following procedures assume you have created a Vimeo account at <https://vimeo.com/>.

The user interface for Vimeo might change without notice. The procedure below outlines the general steps to create the elements needed to configure Media Distribute. For more information on creating a Vimeo application, see your Vimeo account documentation.

To set up a Vimeo application account for MediaCentral UX multi-platform delivery:

1. Log on to your Vimeo account, and then go to the Vimeo My Apps Web page at <https://developer.vimeo.com/apps>.
2. Click “Create a new app.”

The Create an new App Web page opens.

3. Type your information in the required text fields:
 - App Name
 - App Description
 - App URL (the public URL for your Vimeo application, where users can download your application or get more information about it; use a placeholder URL if you do not have an application URL yet)
4. Accept the Vimeo API License Agreement (<https://developer.vimeo.com/guidelines/terms>) and the Vimeo Terms of Service (<https://vimeo.com/terms>), and then click Create app.

The My API Apps Web page opens.

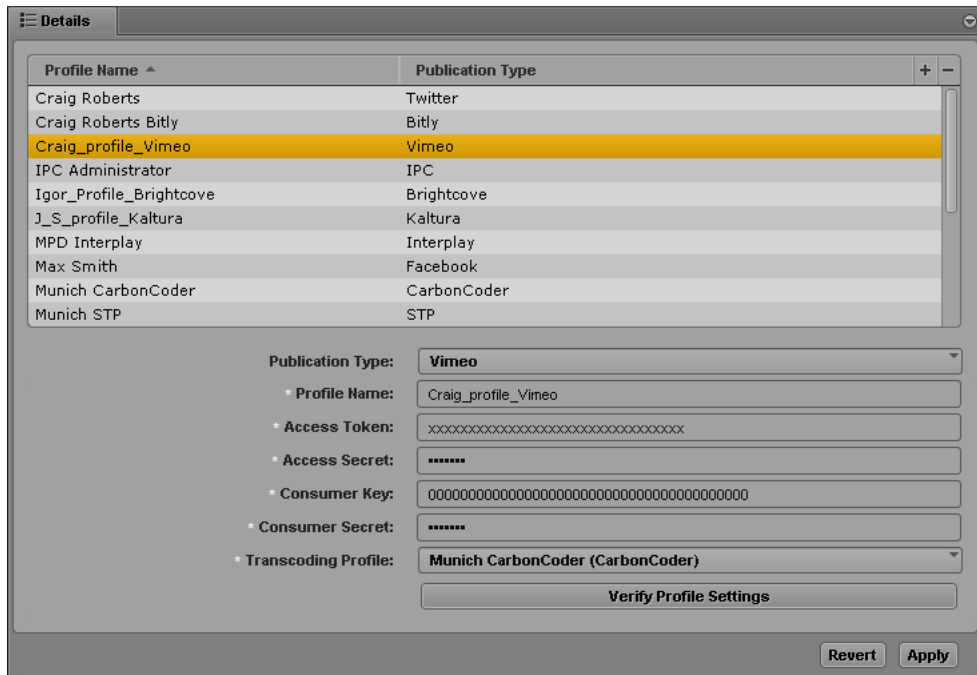

5. Click the OAuth tab, and save the following parameter fields so you can enter them in the appropriate location in the MediaCentral UX settings:
 - Client ID (Also known as Consumer Key or API Key)
 - Client Secret (Also known as Consumer Secret or API Secret)
 - Access token
 - Access token secret

By default, Vimeo assigns Read, Write, and Delete permissions for your application.

To configure MediaCentral UX for your Vimeo application:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.
The System Settings layout opens.
3. In the Settings pane select Media Distribute > Profiles.
The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Vimeo.

5. Click the + (plus) button in the Details section.

A Vimeo profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the parameter fields you copied from your Vimeo My Advanced API Apps Web page:

- Profile Name (type a descriptive name for your profile)
- Access Token
- Access Secret
- Consumer Key
- Consumer Secret

7. Click Transcoding Profile and select one of the available profiles.

8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a YouTube Publication Account

Before you can publish a package to YouTube from MediaCentral UX using Media Distribute, you must first set up a Google account to manage the publication of your media package to YouTube, and you must configure a YouTube publication account in MediaCentral UX.

The following procedures assume you have created a Google account at <https://accounts.google.com/>.

Google has switched the authorization standard used by YouTube applications to OAuth 2.0. If you use a YouTube application created before April 2015 to publish videos to the Web, you can follow the procedures in this section. If you want to use OAuth 2.0 credentials or if you want to create a new YouTube application, see “[Configuring a YouTube v3 Publication Account](#)” on [page 93](#).

The user interface for YouTube and Google accounts might change without notice. The procedure below outlines the general steps to create the elements needed to configure Media Distribute. For more information on creating and managing a YouTube application, see your Google developer account documentation.

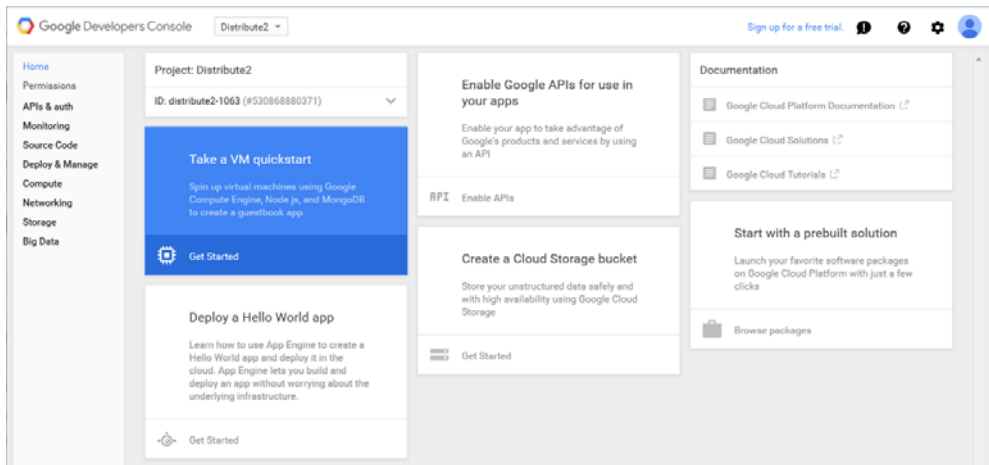

You need to provide the following information to configure your YouTube account for Media Distribute:

- Your Google developer account user name and password.
- Your Google project name.
- The server API key.

To create a YouTube application for MediaCentral UX:

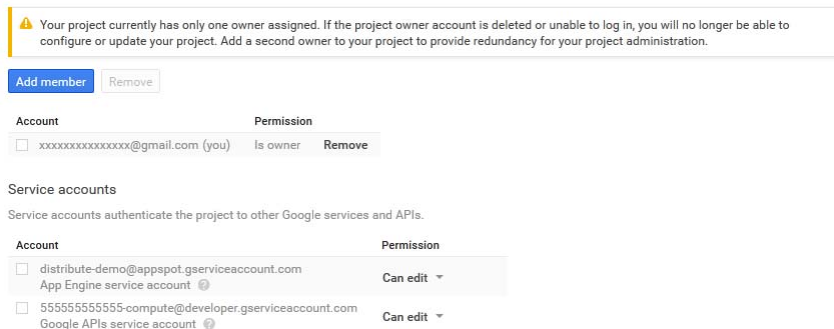

1. Log on to your Google account, and then go to the Google Developers Console Web page at <https://console.developers.google.com/project>.
2. Click the name of your existing project.

The Project Dashboard for your project opens.

3. In the navigation panel for your project, click Permissions.

The Permissions page opens.

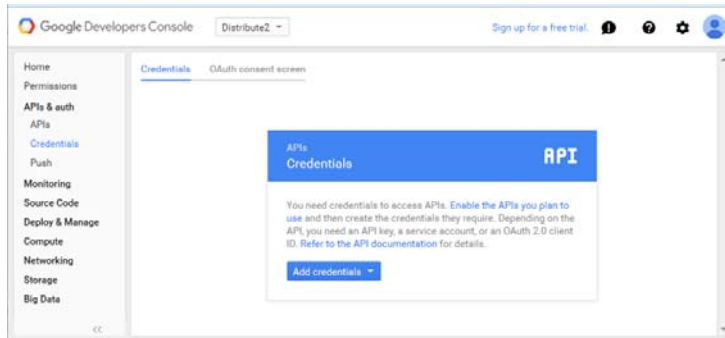

4. Select the user you want to administer the project and the account for your application and select the appropriate permissions:
 - Is Owner — by default, the user who creates the project is the owner. You can add other owners who can change the project settings and manage project members.
 - Can edit — these users can modify the project settings.
 - Can view — these users can read any project settings or information about the project.

You can add users clicking the Add Member button.

5. In the APIs & auth section, click Credentials.

The Credentials page opens.

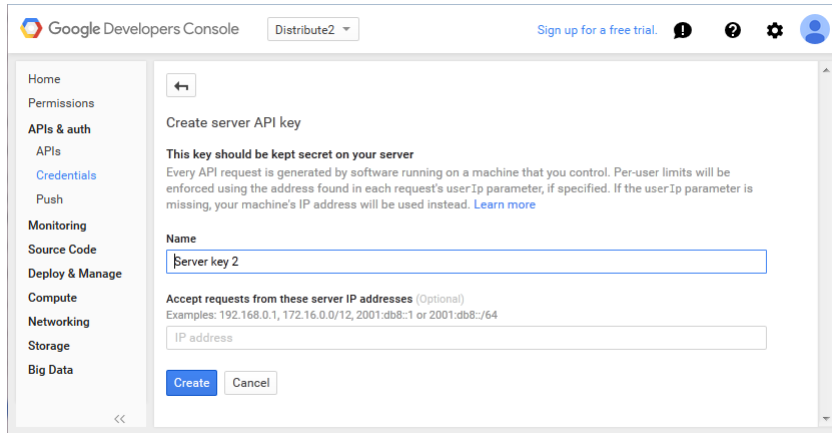

6. Click Add credentials, and then select API key.

The Create a new key dialog box opens.

7. Click Server key in the Create a new key dialog box.

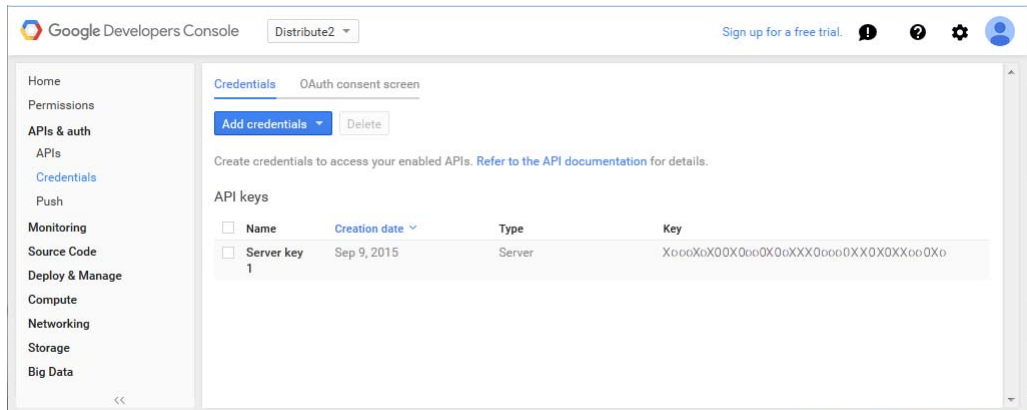

The Create server API key dialog box opens.

8. (Option) In the Accept Requests from These Server IP Addresses text box, type the name of the server used for your Media Distribute applications. This allows you to restrict your API key so that requests are only allowed from your servers' source IP addresses

9. Click Create.

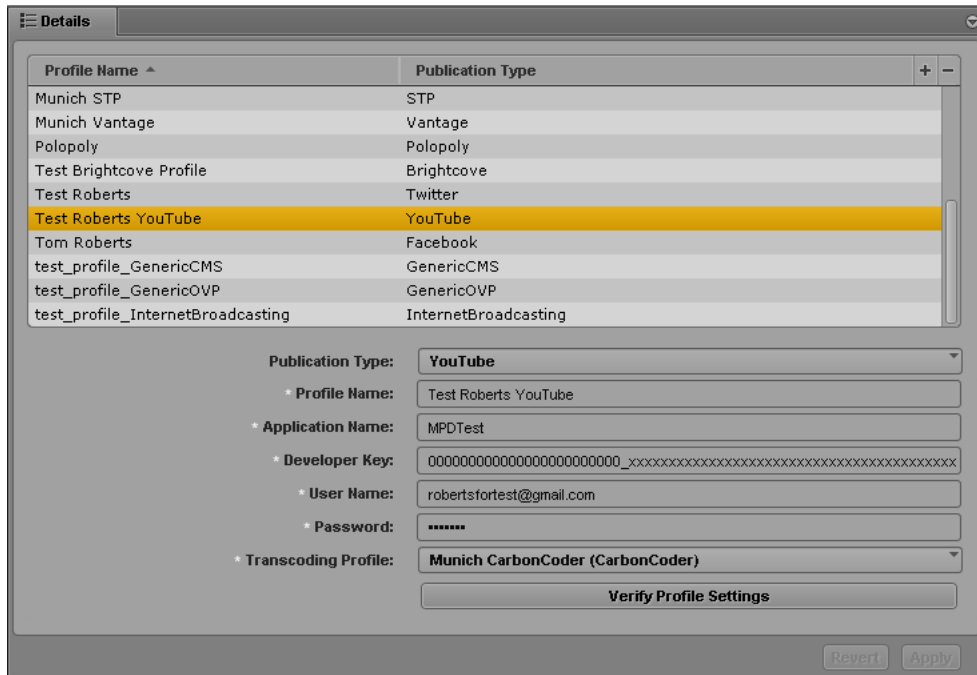

A new API key is created and displays in the Credentials page.

10. If you have never used this account to upload a video, do the following to create a YouTube channel:
 - a. In your browser, navigate to https://www.youtube.com/my_videos.
 - b. Create a new channel. For information creating a new YouTube channel, see the YouTube online help.

To configure MediaCentral UX for your YouTube application:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.
The System Settings layout opens.
3. In the Settings pane select Media Distribute > Profiles.
The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select YouTube.
5. Click the + (plus) button in the Details section.
A YouTube profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the parameter fields you copied from your YouTube Product Dashboard Web page as well as your YouTube credentials:
 - Profile Name (type a descriptive name for your profile)
 - Application Name (from your Google Developer Console project)
 - Developer Key (the API key from your Google Developer Console project)
 - User Name
 - Password
7. Click Transcoding Profile and select one of the available profiles.
8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

Due to security settings on Google accounts, you might receive an error indicating an incorrect user name or password, even if your account credentials are correct. You can sign in to your Google account and change the Sign-in and Security settings to enable access to the account for less secure apps. For more information, see the Google Accounts Help.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a YouTube v3 Publication Account

Before you can publish a package to YouTube from MediaCentral UX using Media Distribute, you must first set up a Google account to manage the publication of your media package to YouTube, and you must configure a YouTube v3 publication account in MediaCentral UX.

The following procedures assume you have created a Google account at <https://accounts.google.com/>.

The user interface for Google accounts might change without notice. The procedure below outlines the general steps to create the elements needed to configure Media Distribute. For more information on creating and managing a Google or YouTube application, see your Google developer account documentation.

If you use a YouTube profile created before April 2015, you can follow the procedures described in “[Configuring a YouTube Publication Account](#)” on page 88. For new profiles, you can use the Avid Media Distribute Integration application to generate the necessary access token and refresh token. MediaCentral UX also supplies the following default parameter values when it creates a new YouTube v3 profile so it can use the Avid application:

- Client Id
- Client Secret
- Scopes
- Redirect URI

To use the Avid Media Distribute Integration application to generate default values for your YouTube v3 account, you must be logged in to the Google account you use for publishing videos from Media Distribute.

If you want to create your own YouTube application, you can replace the profile parameter values with those copied from your YouTube application. You need to generate the Client ID and Client Secret from the OAuth 2.0 credentials in the Credentials Web page in the APIs and auth section of your application in the Google Developers Console. You also need to supply the values for the Scopes and Redirect URI parameters. For more information, see the Google Developers documentation.

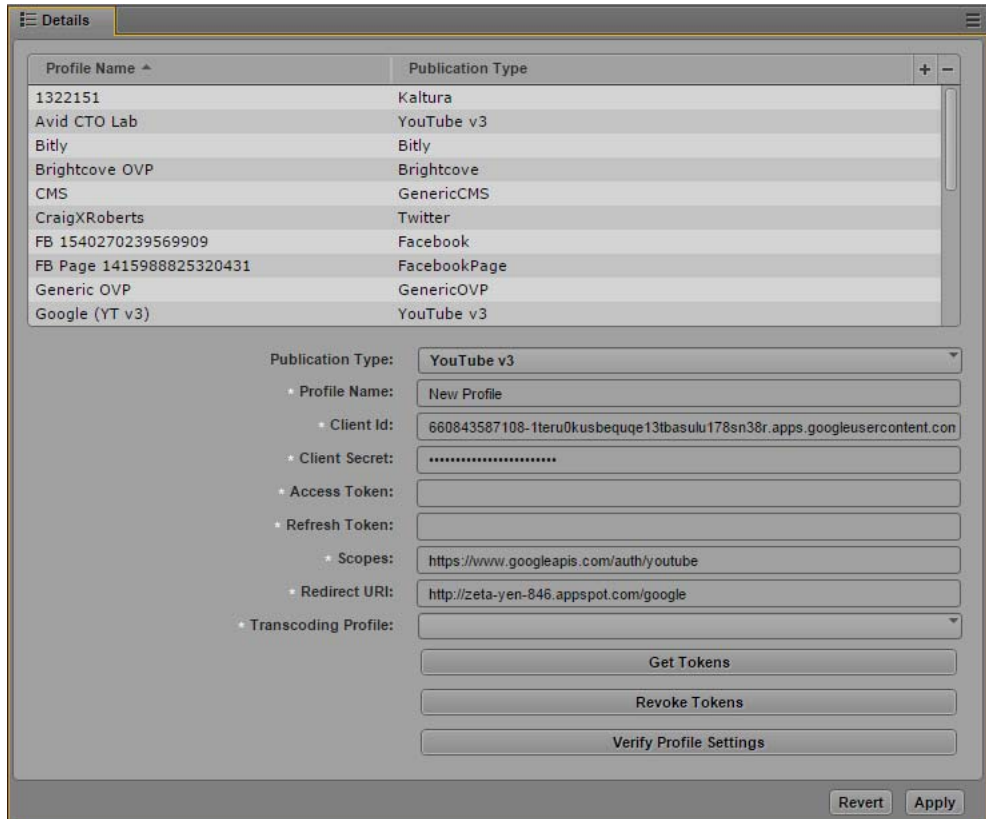

To configure MediaCentral UX for your YouTube v3 account:

1. Log on to your Google account at <https://accounts.google.com/>.
2. Sign in to MediaCentral UX as an administrator.
3. Select System Settings from the Layout selector.

The System Settings layout opens.

4. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

5. Click the Publication Type menu and select YouTube v3.

6. Click the + (plus) button in the Details section.

A YouTube v3 profile named “New Profile” is created in the Details section, and the following parameter fields are automatically filled by default:

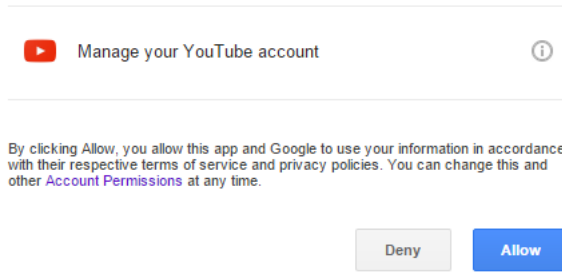

- Client ID
- Client Secret
- Scopes
- Redirect URI

7. Specify a Profile Name by typing a descriptive name for your profile.

8. Click Get Tokens.

The Avid Media Distribute Integration application opens a Web page asking permission to manage your YouTube account. This allows the application to generate the necessary access tokens so you can publish videos to your YouTube account.

▼ Avid Media | Distribute Integration would like to:

If you already received the access and refresh tokens, clicking Get Tokens does not supply you with new tokens. You need to click Revoke Tokens, and then click Get Tokens.

9. Click Allow.

The Avid Media Distribute Integration application generates the access tokens and displays them on the application Web page.

Please copy and paste Access Token and Refresh Token into Distribute Youtube v3 profile:

Access Token: ya29.9QXX

Refresh Token: 1/XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

If you see 'null' instead of Refresh Token it means you've already obtained it. To get a new one please press 'Revoke Token' and then do 'Get Token' again.

10. Copy the Access Token value to the parameter field for Access Token in your MediaCentral YouTube v3 profile.
11. Copy the Refresh Token value to the parameter field for Refresh Token in your MediaCentral YouTube v3 profile.
12. Click Transcoding Profile and select one of the available profiles.

13. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

14. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a Brightcove Account

Before you can publish a package to Brightcove from MediaCentral UX using Media Distribute, you must first set up a Brightcove account to which you want to publish, and you must configure the Brightcove Media API settings for your account.

The following procedures assume you have created a Brightcove account at <http://www.brightcove.com/en/>.

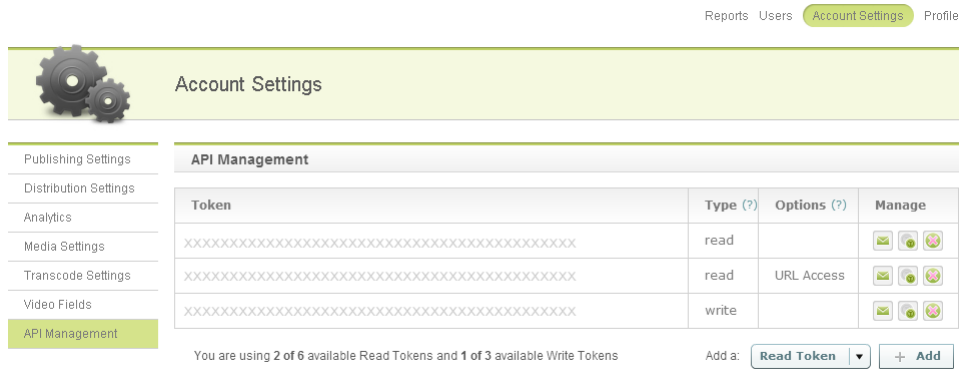

You must have a paid Brightcove account to use the Brightcove Video Cloud Media API to publish packages from MediaCentral UX to the Brightcove service.

The Media Distribute settings for Brightcove allow you to select some rendition options when you publish to your Brightcove account. A rendition is a copy of your video transcoded to a specific bit rate and resolution. If your video is supported for transcoding, you can use Media Distribute to create multiple renditions as specified in your transcoding profile. If you use a video with the H.264 format, you can also retain this format as a rendition when you create multiple renditions.

To set up a Brightcove account for MediaCentral UX multi-platform delivery:

1. Log on to your Brightcove account, and click the Account Settings tab.
The Account Settings Web page opens.
2. In the navigation panel on the left, click API Management.
The API Management Web page opens.

3. To create tokens, do the following:
 - a. Click the Add a: menu and select Read Token with URL Access, and then click Add.
 - b. Click the Add a: menu and select Write Token, and then click Add.

The tokens appear in the Token list.
4. Save the following parameter fields from the API Management Web page so you can enter them in the appropriate location in the MediaCentral UX settings:
 - Read Token with URL Access
 - Write Token

To configure MediaCentral UX for your Brightcove account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.
The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Brightcove.
5. Click the + (plus) button in the Details section.

A Brightcove profile named “New Profile” is created in the Details section.
6. Specify the required settings, using the parameter fields you copied from your Brightcove API Management Web page:
 - Profile Name (type a descriptive name for your profile)
 - Read Token
 - Write Token
7. Click Transcoding Profile and select one of the available profiles.
8. (Optional) If you want to create multiple transcoded versions of your media as specified in your transcoding profile, select Create multiple renditions.
9. (Optional) If you want to keep a copy of your video at the source H.264 rendition in addition to any other renditions created, select Preserve source rendition. This option is selected by default.

10. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

11. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a Kaltura Account

Before you can publish a package to Kaltura from MediaCentral UX using Media Distribute, you must first set up a Kaltura account to which you want to publish, and you must configure the Kaltura Media API settings for your account.

The following procedures assume you have created a Kaltura account at <http://corp.kaltura.com/>.

To set up a Kaltura account for MediaCentral UX multi-platform delivery:

1. Log on to your Kaltura account at <http://corp.kaltura.com/>, and click the Settings tab.

The Account Settings Web page opens.

2. Click Integration Settings tab.

The Integration Settings Web page opens.

The screenshot displays the Kaltura Account Settings interface. It is divided into several sections:

- Account Info:** Lists Partner ID (1392391), Sub Partner ID (139239100), Administrator Secret (3a0c85d1559211a988b56b1081a0e3a2), and User Secret (8d9597aaa6bbfed9d3cac0676709b4c0). There is a link for Advanced Settings.
- Entitlement Settings:** Contains explanatory text and a table for application settings.
- Notifications:** Includes a toggle for "Do you want to receive server notifications?" (set to No) and a field for "Enter Notification URL".
- Notification Actions Table:** A table with columns for Notification Name, Sent by Client, and Sent by Server.

Notification Name	Sent by Client	Sent by Server
Add Entry	<input type="checkbox"/>	<input type="checkbox"/>
Update Entry Permissions	<input type="checkbox"/>	<input type="checkbox"/>
Delete Entry	<input type="checkbox"/>	<input type="checkbox"/>
Block Entry	<input type="checkbox"/>	<input type="checkbox"/>
Add User	<input type="checkbox"/>	<input type="checkbox"/>
Update Entry Thumbnail	<input type="checkbox"/>	<input type="checkbox"/>
Update Entry Moderation	<input type="checkbox"/>	<input type="checkbox"/>

At the bottom of the Entitlement Settings section, there is a table:

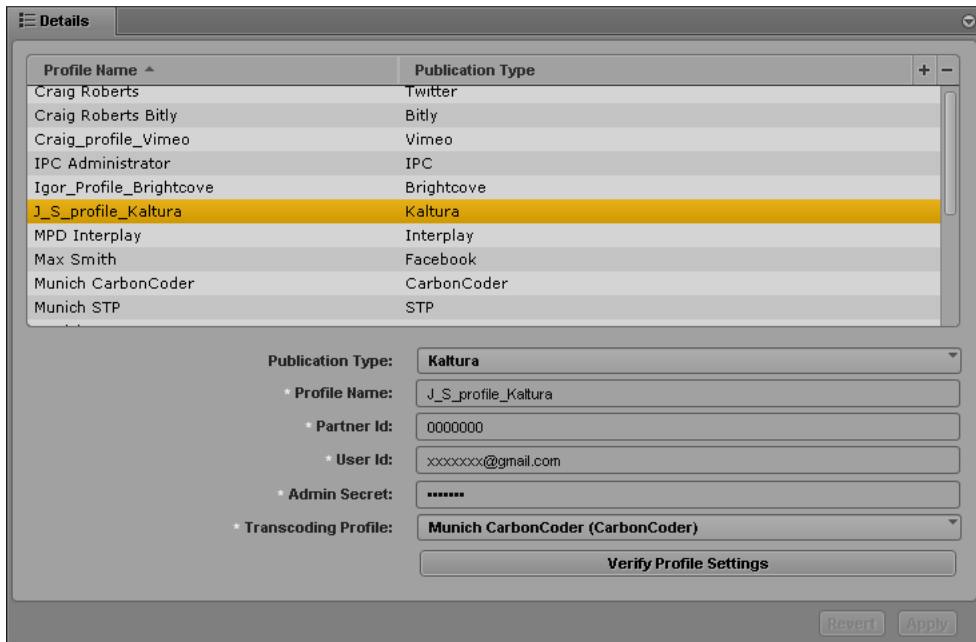

Application	Privacy Context Labels	Actions
MediaSpace	MediaSpace	Change Remove

Below this table are links for "+ Add Entitlements to Categories" and "API Default: Entitlement Enforcemen". A "Save Changes" button is located at the bottom right of the page.

3. Save the following parameter fields from the Integration Settings Web page so you can enter them in the appropriate location in the MediaCentral UX settings:
 - Partner ID
 - Administration Secret

To configure MediaCentral UX for your Kaltura account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.
The System Settings layout opens.
3. In the Settings pane select Media Distribute > Profiles.
The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Kaltura.
5. Click the + (plus) button in the Details section.
A Kaltura profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the parameter fields you copied from your Kaltura API Management Web page:
 - Profile Name (type a descriptive name for your profile)
 - Partner ID
 - User ID (your login credential)
 - Admin Secret
7. Click Transcoding Profile and select one of the available profiles.
8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.
9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring an Ooyala Account

Before you can publish a package to Ooyala from MediaCentral UX using Media Distribute, you must first set up an Ooyala account to which you want to publish, and you must check the Backlot API settings for your account.

The following procedures assume you have created an Ooyala account at <https://backlot.ooyala.com/backlot/web>.

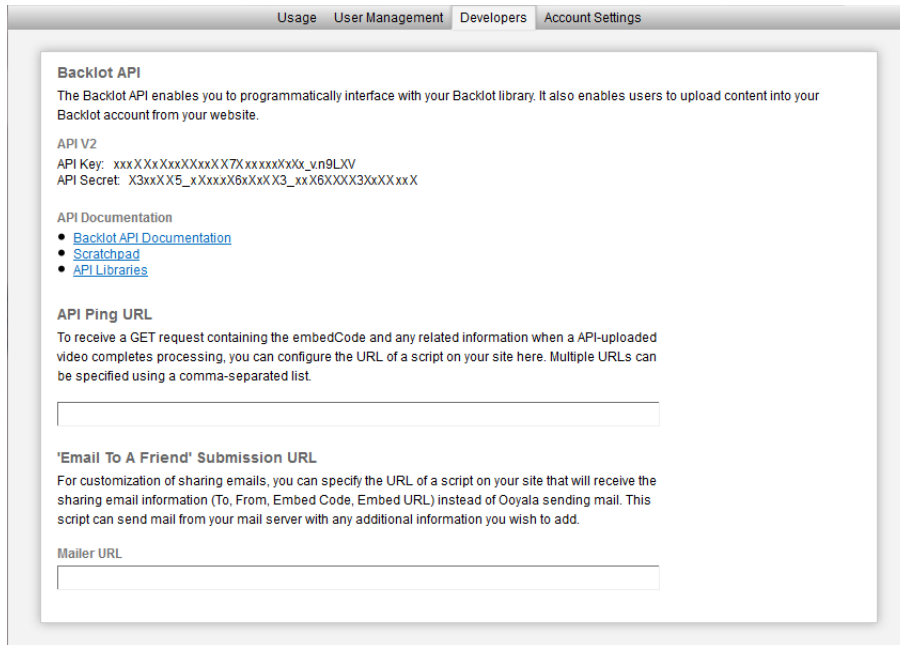

To set up an Ooyala account for MediaCentral UX multi-platform delivery:

1. Log on to your Ooyala Backlot account.

The Ooyala Backlot Web page opens.

2. Click the Account tab, and then click the Developers tab.

The Backlot API Web page opens.

3. Save the following parameter fields from the Backlot API Web page so you can enter them in the appropriate location in the MediaCentral UX settings:

- API Key
- API Secret

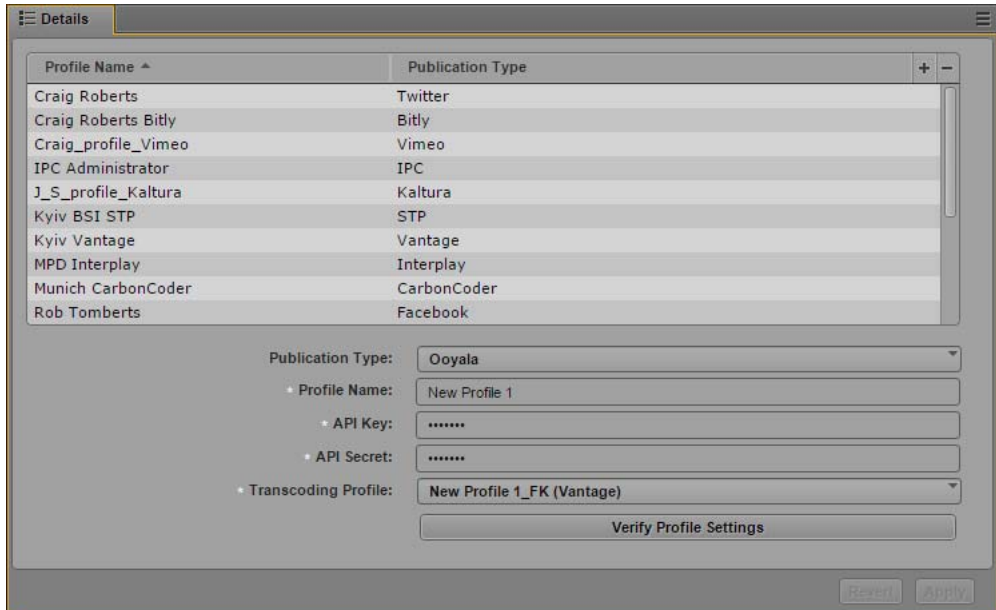

To configure MediaCentral UX for your Ooyala account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select Ooyala.
5. Click the + (plus) button in the Details section.
An Ooyala profile named “New Profile” is created in the Details section.
6. Specify the required settings, using the parameter fields you copied from your Ooyala Backlot API Web page:
 - Profile Name (type a descriptive name for your profile)
 - API Key
 - API Secret
7. Click Transcoding Profile and select one of the available profiles.
8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring an Atex Polopoly Web CMS Account

Before you can publish a package to Polopoly from MediaCentral UX using Media Distribute, you must first have a Polopoly account with Atex and set up a Polopoly environment.

You can create multiple Polopoly profiles in the System Settings layout, but you can only configure one Web CMS account at a time — for example, you can configure MediaCentral UX either for Polopoly or for WorldNow, but not for both.

The following procedures assume you have already created the necessary Polopoly environment. See your Polopoly documentation for more information.

To configure your Polopoly server for MediaCentral UX multi-platform delivery:

1. Log on to your Polopoly server using one of the following set of credentials.
 - Log in as `root` with the your root password.
 - Log in as `centos` with your centos password.

SSH is turned off by default.
2. To make the Polopoly user interface accessible through the server firewall, type to following to open a port: `iptables -I INPUT 1 -i eth0 -p tcp --dport 8080 -j ACCEPT`
3. If the Polopoly services are not running, do the following:
 - a. Type `su` and press Return.
 - b. At the prompt, type the password you used to log in to the server.
 - c. Start the MySQL database by typing the following: `cd /usr/local/mysql/support-files./mysql.server start`
 - d. Navigate to the Jboss directory by typing `cd /opt/jboss` and then start Jboss by typing the following: `bin/run.sh -b 0.0.0.0 &`
 - e. Navigate to the Tomcat directory by typing `cd /opt/tomcat` and then start Tomcat by typing the following: `bin/startup.sh`

To configure MediaCentral UX for your Polopoly account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

The screenshot shows the 'Details' pane in MediaCentral UX. At the top, there is a table with two columns: 'Profile Name' and 'Publication Type'. The 'Polopoly' profile is highlighted in yellow. Below the table, there are several configuration fields for the selected profile:

Profile Name	Publication Type
Munich STP	STP
Munich Vantage	Vantage
Polopoly	Polopoly
Test Brightcove Profile	Brightcove
Test Roberts	Twitter
Test Roberts YouTube	YouTube
Tom Roberts	Facebook
test_profile_GenericCMS	GenericCMS
test_profile_GenericOVP	GenericOVP
test_profile_InternetBroadcasting	InternetBroadcasting

Below the table, the configuration fields are as follows:

- Publication Type:** Polopoly (dropdown menu)
- * Profile Name:** Polopoly (text field)
- * Server:** http://12.345.678.90:8080 (text field)
- * User Name:** sysadmin (text field)
- * Password:** ***** (password field)
- * Service Address:** polopoly (text field)
- * External ID:** Avid.d (text field)
- * OVP Profile:** Test Roberts YouTube (YouTube) (dropdown menu)

At the bottom of the pane, there is a 'Verify Profile Settings' button, and at the very bottom, 'Revert' and 'Apply' buttons.

4. Click the Publication Type menu and select Polopoly.
5. Click the + (plus) button in the Details section.
A Polopoly profile named “New Profile” is created in the Details section.
6. Specify the required settings for the following parameter fields:
 - Profile Name (type a descriptive name for your profile)
 - Server (the name of your Polopoly host — for example, http://localhost :80080)
 - User Name (your Polopoly login name)
 - Password (your Polopoly login password)

- Service Address (the address of the Polopoly REST service — for example, polopoly)
 - External ID (from your Polopoly account settings)
7. Click OVP Profile and select one of the available profiles. OVP profiles are created when you configure your online video provider settings — for example, when you set up MediaCentral UX for your Vimeo or YouTube account. For more information, see [“Configuring a Vimeo Publication Account” on page 85](#) or [“Configuring a YouTube Publication Account” on page 88](#).
 8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.
 9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a WorldNow Web CMS Profile

Before you can publish a package to the WorldNow platform from MediaCentral UX using Media Distribute, you must first have a WorldNow account and set up a WorldNow environment.

The following procedures assume you have already created the necessary WorldNow environment. Your WorldNow account provides you with the following information needed to complete your MediaCentral UX configuration:

- Account user name
- Account password
- Affiliate number
- Producer host
- Ingest FTP host
- Ingest FTP path
- Ingest FTP user name
- Ingest FTP password

The following notes apply to using WorldNow with MediaCentral UX:

- Once you have configured MediaCentral UX for your WorldNow CMS, the fields available to you in the Web Story pane change to reflect the options and metadata provided by WorldNow.
- You can create multiple WorldNow profiles in the System Settings layout, but you can only configure one Web CMS account at a time — for example, you can configure MediaCentral UX either for WorldNow or for Atex Polopoly, but not for both.
- You can set the default values for some options used when you publish to a WorldNow account so you do not have to set them in the Web Story pane each time you create a story. Some values display as automatically selected options and some control the size and placement of graphics when you attach images to your story. These options correspond to those available in your WorldNow CMS.

See your WorldNow documentation for more information, or see the WorldNow Web site at www.worldnow.com.

A limitation in the current version of Media Distribute might cause an `SSLHandshakeException` error to occur and prevent posting video to WorldNow. This is caused by a problem where the client and server cannot negotiate the desired level of security. To work around this problem, you can disable SSL validation for HTTPS connections.

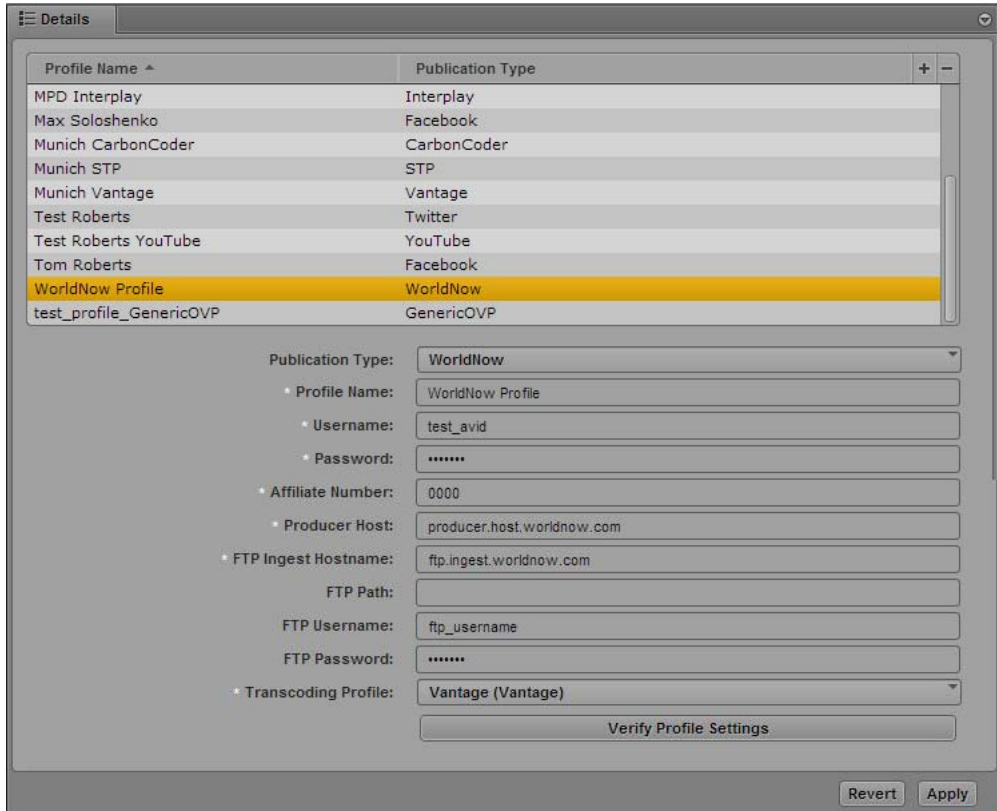

To configure MediaCentral UX for your WorldNow account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select WorldNow.

5. Click the + (plus) button in the Details section.

A WorldNow profile named “New Profile” is created in the Details section.

6. Specify the required settings for the following parameter fields:

- Profile Name (type a descriptive name for your profile)
- Username (your WorldNow login name)
- Password (your WorldNow login password)
- Affiliate Number (from your WorldNow account information)
- Producer Host (from your WorldNow account information)
- FTP Ingest Hostname (from your WorldNow account information)

- FTP Path (optional) — if your ingest FTP location is configured to use a directory other than the root folder, you can specify a different FTP directory or subdirectory. If the transcode in/out has not changed, you can leave this setting blank.
 - FTP Username (from your WorldNow account information)
 - FTP Password (from your WorldNow account information)
7. Click Transcoding Profile and select one of the available profiles.
 8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

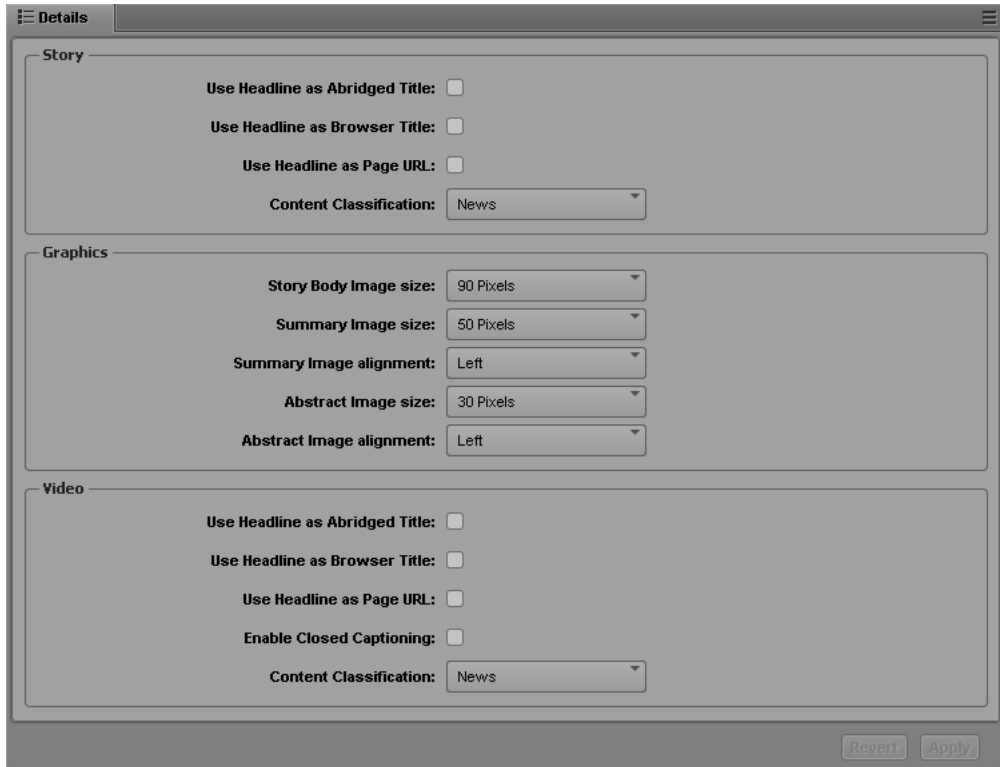

To set default values in MediaCentral UX for your WorldNow account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > WorldNow.

The Settings pane displays the WorldNow settings.

4. Select the WorldNow options that you want to use as default values in the Web Story pane.

- Story options can be set to use your Story Headline in some additional areas for your Web story. You can also select a default classification for your story from the Content Classification menu.
 - Use Headline as Abridged Title
 - Use Headline as Browser Title
 - Use Headline as Page URL
 - Content Classification
- Graphics options control the default size (in pixels) and alignment of images in your Web story.
 - Story Body Image Size
 - Summary Image Size

- Summary Image Alignment
 - Abstract Image Size
 - Abstract Image Alignment
 - Video options can be set to use your Headline in some additional areas for your Web story. You can also enable closed captions for your story and select a default classification from the Content Classification menu.
 - Use Headline as Abridged Title
 - Use Headline as Browser Title
 - Use Headline as Page URL
 - Enable Closed Captioning
 - Content Classification
5. Click Apply to save the settings.

The WorldNow options display in the Details section with the new information.

If you are editing your WorldNow settings, click Revert to return to the original settings.

To disable SSL validation:

1. In a terminal window on the master cluster node, type the following to stop ServiceMix:

```
service avid-mpd stop
```
2. Navigate to the directory containing the Media Distribute database configuration file:

```
cd /etc/apache-servicemix
```
3. Using the Linux text editor, vi, open the avid-mpd-wrapper.conf file for editing:

```
vi avid-mpd-wrapper.conf
```
4. Locate the following line in the JVM Parameters section, and then edit the SSL validation to true:

```
# wrapper.java.additional.<NUMBER>=-Dmpd.ssl.trust.all=true
```
5. Press the Escape key to return to command mode, then type `:wq` and press Return to write and quit the text editor.
6. To restart the Media Distribute service, type the following command:

```
service avid-mpd restart
```

Configuring thePlatform Profile

Before you can publish a package to thePlatform® video CMS from MediaCentral UX using Media Distribute, you must first have an account for thePlatform and set up an administrative role.

The following procedures assume you have already created the necessary thePlatform environment. Your thePlatform account provides you with the following information needed to complete your MediaCentral UX configuration:

- Account user name
- Account password

Once you have configured MediaCentral UX for your thePlatform account, you can use the fields available to you in a separate thePlatform pane that reflect the options and metadata provided by thePlatform.

See your thePlatform documentation for more information, or see thePlatform Technical Resource Center at help.theplatform.com.

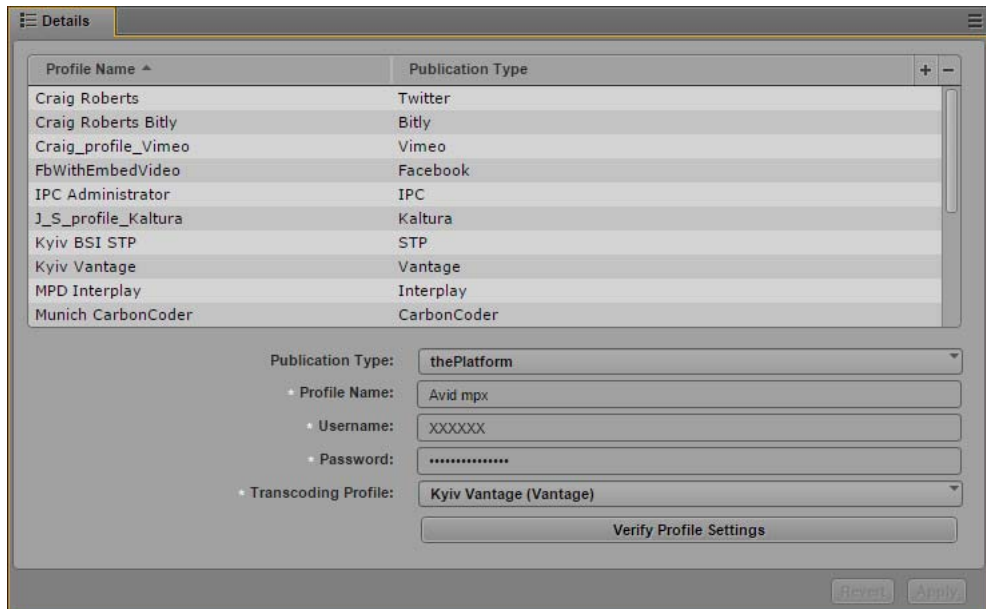

To configure MediaCentral UX for your thePlatform account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select thePlatform.
5. Click the + (plus) button in the Details section.
A new thePlatform profile named “New Profile” is created in the Details section.
6. Specify the required settings for the following parameter fields:
 - Profile Name (type a descriptive name for your profile)
 - Username (your thePlatform login name)
 - Password (your thePlatform login password)
7. Click Transcoding Profile and select one of the available profiles.
8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a WordPress CMS Profile

Before you can publish a package to the WordPress® platform from MediaCentral UX using Media Distribute, you must first set up your WordPress CMS and have a WordPress administrative account.

The following procedures assume you have already created the necessary WordPress CMS environment. Your WordPress installation provides you with the following information needed to complete your MediaCentral UX configuration:

- Blog ID — Media Distribute uses a default blog ID of “1.” If your WordPress configuration uses multiple blog sites, you might need to assign a different blog ID.
- Administrator account user name
- Administrator account password
- Your WordPress host’s API URL — The default XML-RPC API is “[http://\[your_WordPress_IP\]/xmlrpc.php](http://[your_WordPress_IP]/xmlrpc.php). You can disable or reconfigure this URL if needed.

WordPress allows you to configure your site in many ways and the default Media Distribute settings might not be appropriate for your corporate needs. See your WordPress administrator or the WordPress documentation for more information on customizing your account details, or see the WordPress Web site at wordpress.org.

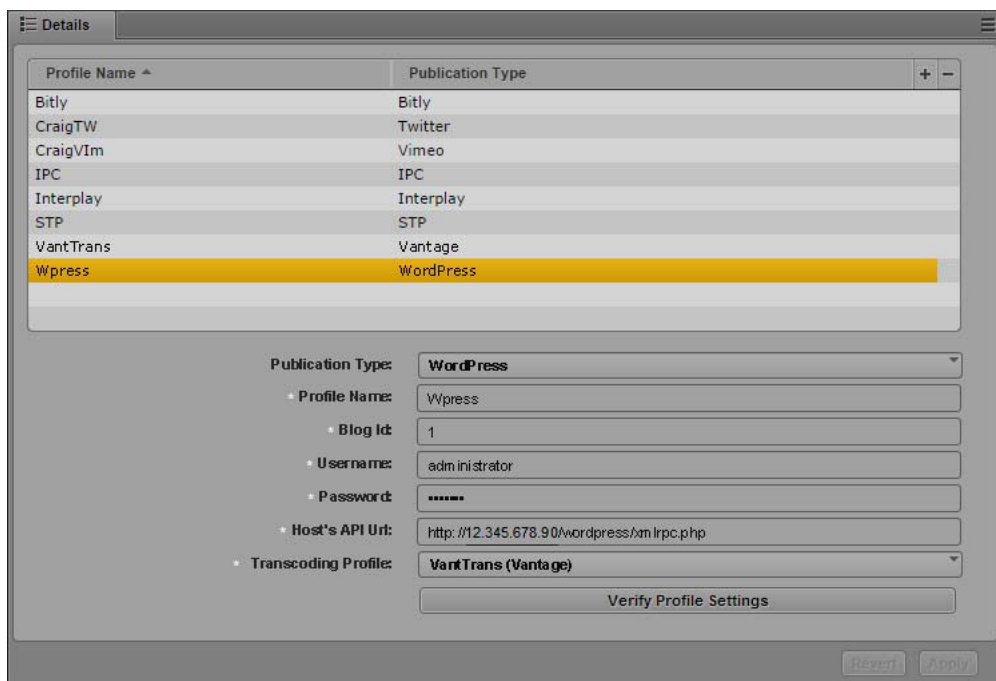

To configure MediaCentral UX for your WordPress account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select WordPress.

5. Click the + (plus) button in the Details section.

A WordPress profile named “New Profile” is created in the Details section.

6. Specify the required settings for the following parameter fields:

- Profile Name (type a descriptive name for your profile)
- Blog ID (from your WordPress configuration information — the default blog ID is “1”)
- Username (your WordPress administrator login name)
- Password (your WordPress administrator login password)
- Host’s API URL (from your WordPress configuration information — usually this is your WordPress URL followed by /xmlrpc.php)

7. Click Transcoding Profile and select one of the available profiles.

8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring an InternetBroadcasting CMS Profile

Before you can publish a package to the InternetBroadcasting Digital Publishing Platform from MediaCentral UX using Media Distribute, you must first set up your InternetBroadcasting CMS and have an InternetBroadcasting administrative account.

The following procedures assume you have already created the necessary InternetBroadcasting CMS environment. Your InternetBroadcasting installation provides you with the following information needed to complete your MediaCentral UX configuration:

- User name and password — You need InternetBroadcasting account credentials to publish a media package to the CMS.
- API Key — Use the contribution API key provided by your InternetBroadcasting account.
- Content Path — Media Distribute uses this path to the InternetBroadcasting CMS to upload the content of your package.
- Category Path — If you use InternetBroadcasting categories, Media Distribute can retrieve the categories located at this path on the InternetBroadcasting server.

For more information, see your InternetBroadcasting CMS administrator.

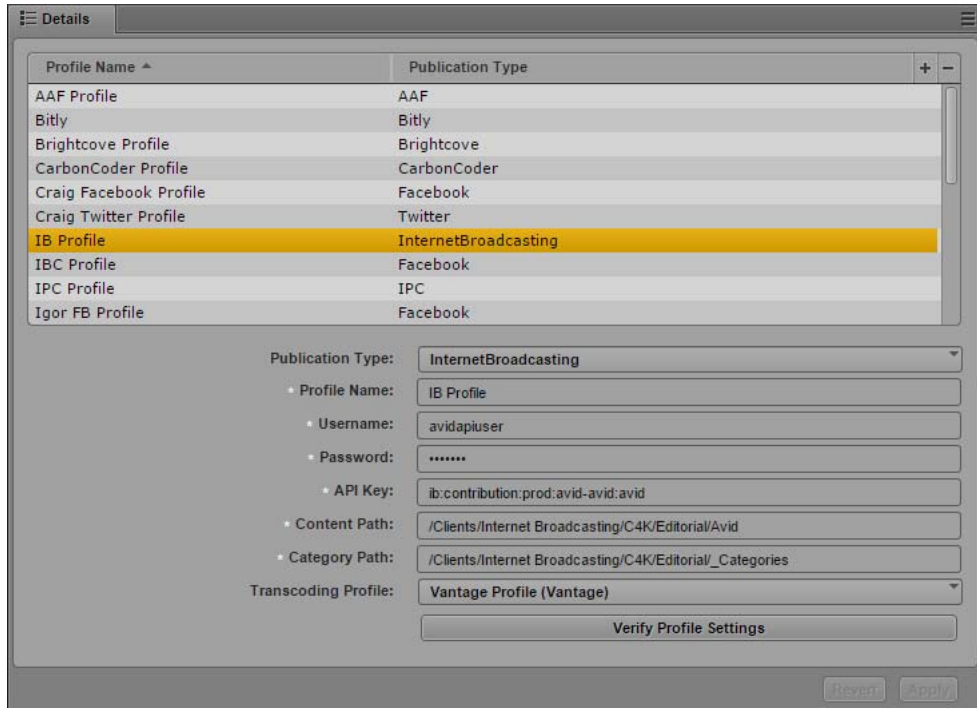

To configure MediaCentral UX for your InternetBroadcasting account:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select InternetBroadcasting.

5. Click the + (plus) button in the Details section.

A InternetBroadcasting profile named “New Profile” is created in the Details section.

6. Specify the required settings for the following parameter fields:

- Profile Name (type a descriptive name for your profile)
- Username (your InternetBroadcasting administrator login name)
- Password (your InternetBroadcasting administrator login password)
- API Key (from your InternetBroadcasting configuration information)
- Content Path (the path to the location in the InternetBroadcasting Library where the uploaded media is placed)
- Category Path (the path to the location in the InternetBroadcasting Library where the Categories are stored)

7. Click Transcoding Profile and select one of the available profiles.

8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a Generic CMS Profile

The Generic CMS profile allows you to integrate a third-party, unsupported CMS with Media Distribute. Depending on how you configure your Generic CMS profile, you can deliver media files to your FTP location using one of two methods:

- If you select Archive in the settings, the profile creates a compressed (ZIP) file containing an XML file with profile information and metadata, as well as an image file (PNG) and a video file (MP4) if images and video are included in the media package. Media Distribute then delivers the file to your FTP location.

You must select a transcoding profile in order to create the MP4 video file.

- If you want to deliver images and video to separate FTP locations, you can specify settings to send images and video to different servers or to different folders on your FTP server. An XML file also is delivered to the principal FTP host indicated in the profile settings. If you do not specify separate image and video FTP locations, all files are delivered to the principal FTP location.

If you load an image from the Media pane, the profile retrieves image and video metadata and stores it with the image. You can view the metadata in the Metadata pane. If you load an image from a local disk, only basic metadata is included with the information sent to your FTP site.

You need to develop a proxy target that can receive the files from the FTP location listed in the profile and then deliver them to a CMS using proper API.

The Generic CMS profile should be used only by Avid personnel. See your Avid professional services representative for more information.

To configure MediaCentral UX for a Generic CMS profile:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

Profile Name ^	Publication Type	+ -
Craig Roberts Bitly	Bitly	
Craig_Roberts	Twitter

Image FTP Host:

Image FTP Path:

Image FTP Login:

Image FTP Password:

Video FTP Host:

Video FTP Path:

Video FTP Login:

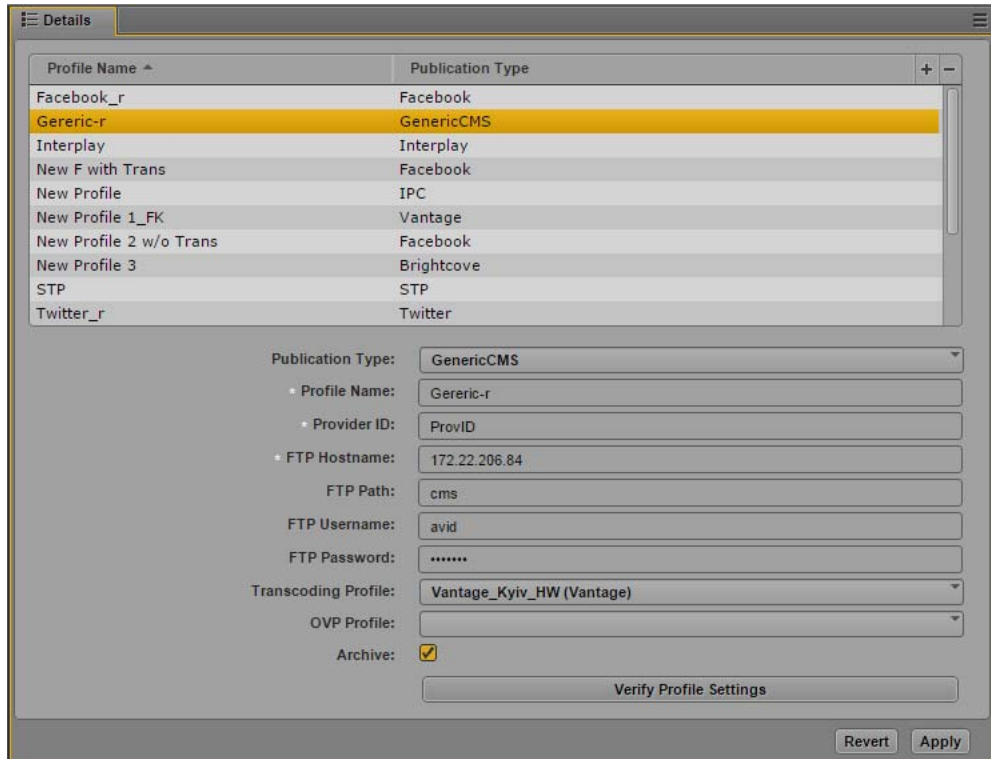

Video FTP Password:

4. Click the Publication Type menu and select GenericCMS.

5. Click the + (plus) button in the Details section.
A Generic CMS profile named “New Profile” is created in the Details section.
6. Specify the required settings, using the configuration on your CMS and FTP configuration:
 - Profile Name (type a descriptive name for your profile)
 - Provider ID (The provider ID identifies your CMS and is included in the XML file created by the profile. If your CMS does not require a specific provider ID, you can type any name in this field.)
 - FTP Hostname (your CMS server hostname)
 - FTP Path (for incoming files, from your video host transcoding configuration)
 - FTP Username (from your video host transcoding configuration)
 - FTP Password (from your video host transcoding configuration)
7. (Optional) Click Transcoding Profile and select one of the available profiles. Transcoding profiles are created when you configure your transcoding host — for example, when you set up MediaCentral UX for the Telestream Vantage video transcoder. For more information, see [“Configuring the Transcode Route” on page 36](#).
8. (Optional) Click OVP Profile and select one of the available profiles. OVP profiles are created when you configure your online video provider settings — for example, when you set up MediaCentral UX for your Vimeo or YouTube account. For more information, see [“Configuring a Vimeo Publication Account” on page 85](#) or [“Configuring a YouTube Publication Account” on page 88](#).

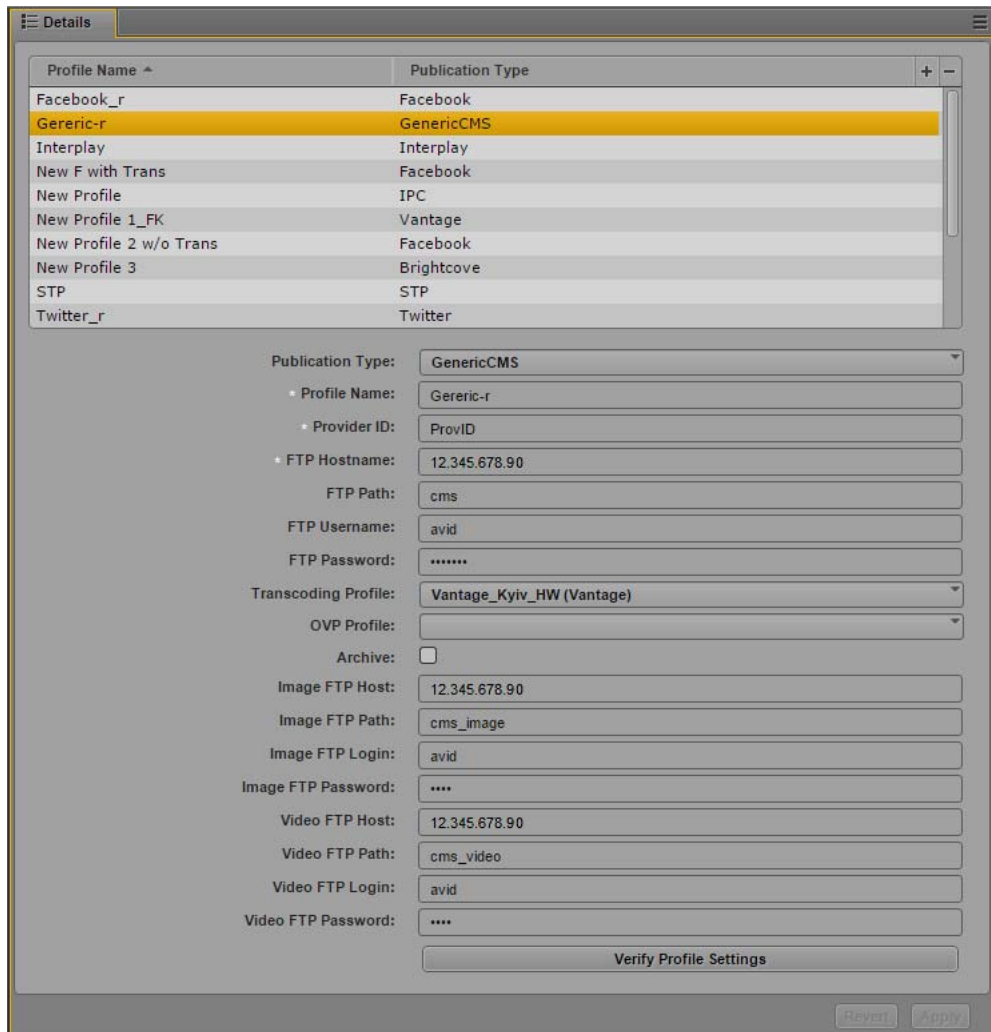

9. Do one of the following:

- ▶ If you want to send image and video metadata to the FTP host in a single compressed ZIP file, select Archive.

- ▶ If you want to deliver the image and video, along with the image and video metadata, to separate FTP sites, specify the following optional settings:
 - Image FTP Host (the FTP server hostname for delivery of image files and metadata)
 - Image FTP Path (the path on your FTP server that you want to use for delivery of image files and metadata)
 - Image FTP Login (the account name used to log in to your FTP server)
 - Image FTP Password (the password for your FTP server account)
 - Video FTP Host (the FTP server hostname for delivery of video files and metadata)
 - Video FTP Path (the path on your FTP server that you want to use for delivery of video files and metadata)

- Video FTP Login (the account name used to log in to your FTP server)
- Video FTP Password (the password for your FTP server account)

10. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

11. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

Configuring a Generic OVP Profile

The Generic OVP profile allows you to post to a third-party, unsupported online video provider (OVP) using Media Distribute. If you select an OVP profile and a transcode profile, Media Distribute transcodes your media to the MP4 format and publishes the media to the specified OVP site. The MP4 media file is contained in a compressed (ZIP) file which also contains an XML file with a link to the uploaded video. You can select both options to send your media to both an FTP and an OVP location.

The Generic OVP profile should be used only by Avid personnel. See your Avid professional services representative for more information.

To configure MediaCentral UX for a Generic OVP profile:

1. Sign in to MediaCentral UX as an administrator.
2. Select System Settings from the Layout selector.

The System Settings layout opens.

3. In the Settings pane select Media Distribute > Profiles.

The Settings pane displays the settings in that group.

4. Click the Publication Type menu and select GenericOVP.

5. Click the + (plus) button in the Details section.

A Generic OVP profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the configuration on your FTP configuration:

- Profile Name (type a descriptive name for your profile)
- FTP Hostname (your FTP server hostname)
- FTP Path (for incoming files, from your video host transcoding configuration)
- FTP Username (from your video host transcoding configuration)
- FTP Password (from your video host transcoding configuration)

7. Click Transcoding Profile and select one of the available profiles.

8. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

9. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

4

Configuring User Profiles for Media | Distribute

Once your MediaCentral UX administrator had configured your system profiles, you can set up your user profiles to include your personal accounts for services such as Twitter and Facebook. User roles allow you to publish your packages automatically and without the requirement of review and approval.

For examples of creating user profiles, see the following topics:

- [“Configuring a User Profile for a Personal Twitter Account” on page 128](#)
- [“Configuring a User Profile for a Personal Facebook Account” on page 130](#)

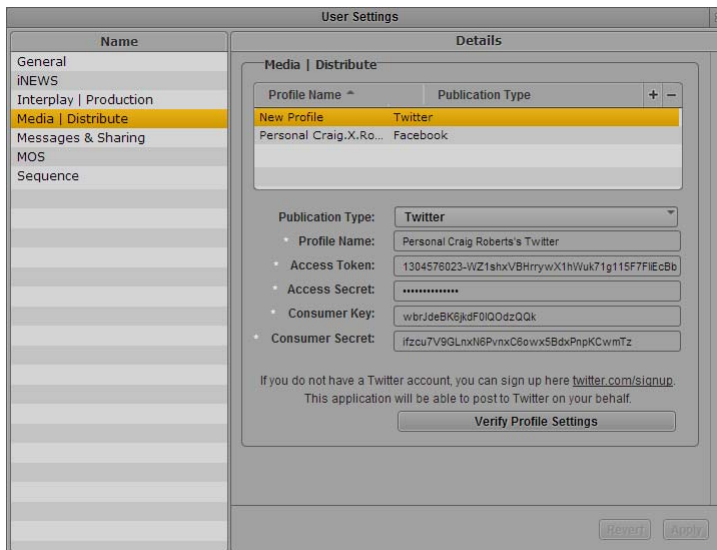

Configuring a User Profile for a Personal Twitter Account

The following procedures assume you have created a Twitter account at <https://twitter.com>.

To set up a user profile for Twitter:

1. Sign in to MediaCentral UX.
2. Select Home > User Settings.

The User Settings dialog box opens.

3. In the Name pane, select Media Distribute.
4. Click the Publication Type menu and select Twitter.
5. Click the + (plus) button in the Details section.

A Twitter profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the parameter fields from your Twitter application Web page or from your Twitter profile in the MediaCentral UX System Settings layout (see [“Configuring a Twitter Publication Account”](#) on page 66):
 - Profile Name (type a descriptive name for your profile)
 - Access Token
 - Access Secret

- Consumer Key
- Consumer Secret

7. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

8. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

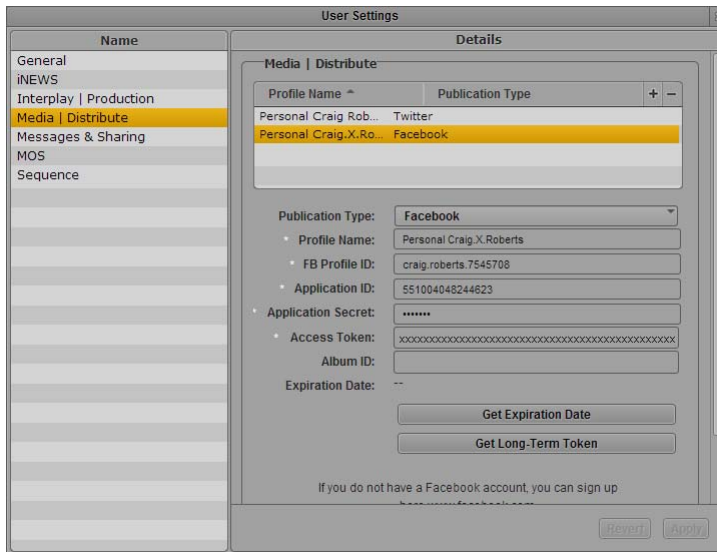

Configuring a User Profile for a Personal Facebook Account

The following procedures assume you have created a Facebook account at <https://www.facebook.com>. User roles allow you to publish your packages automatically and without the requirement of review and approval.

To set up a user profile for Facebook:

1. Sign in to MediaCentral UX.
2. Select Home > User Settings.

The User Settings dialog box opens.

3. In the Name pane, select Media Distribute.
4. Click the Publication Type menu and select Facebook.
5. Click the + (plus) button in the Details section.

A Facebook profile named “New Profile” is created in the Details section.

6. Specify the required settings, using the parameter fields from your Facebook Apps Web page or from your Facebook profile in the MediaCentral UX System Settings layout (see [“Configuring a Facebook Publication Account” on page 72](#)).
 - Profile Name (type a descriptive name for your profile)
 - FB Profile ID

- Application ID
- Application Secret
- Application Secret
- Access Token
- (Optional) Album ID

You can specify the name of a Facebook album if you want to publish images directly to an album that you have created for your Facebook account.

7. (Optional) Click Get Expiration Date.

Media Distribute checks the expiration date of your access token and updates the entry in the Expiration Date field. This shows you how much time is left on your Facebook access token.

8. (Optional) Click Get Long-Term Token.

Media Distribute converts your access token, which often remains valid for a couple of hours, to a long-lived token. For more information on short-lived and long-lived tokens and their expiration periods, see your Facebook developer documentation.

9. Click Verify Profile Settings to validate the profile settings.

If your profile is valid, a message displays: “Profile configurations is valid.” If any settings are incorrect, a message displays and indicates which fields are incorrect. All invalid settings names change to red.

10. Click Apply to save the profile.

The profile displays in the Details section with the new information.

If you are editing a profile, click Revert to return to the original settings. If you want to delete a profile, select the profile and click the minus (-) button in the Details section.

B Working with Media | Distribute Logs

Media Distribute provides you with logging capabilities to help you troubleshoot problems with your installation. Working with the Media Distribute debug logging level can give you more information to resolve issues.

Enabling the debug logging level increases the amount of logging information saved to the system. You can configure Media Distribute logging to adjust the maximum size of the log files or the maximum number of files saved on the system.

By default, Media Distribute sets the logging level to INFO.

When you change the logging level, the changes are applied immediately to your system, and you do not need to restart any Media Distribute services.

To enable the debug logging level:

1. Open a terminal window and log in as root to the server where you installed Media Distribute.

2. Navigate to the directory containing the logging configuration file:

```
cd /usr/share/apache-servicemix/etc
```

3. Using the Linux text editor, vi, open the org.ops4j.pax.logging.cfg file for editing:

```
vi org.ops4j.pax.logging.cfg
```

4. Locate the following line, and then navigate using the arrow keys to the INFO parameter:

```
log4j.rootLogger=INFO, out, osgi:VmLogAppender
```

5. Type i (lower case “i”) to enter insert mode, and then use the arrow keys and backspace to erase INFO and replace it with DEBUG.

```
log4j.rootLogger=DEBUG, out, osgi:VmLogAppender
```

To disable the debug logging level, replace DEBUG with INFO.

6. Press the Escape key to return to command mode, then type `:wq` and press Return to write and quit the text editor.

The change is applied immediately. You do not need to restart any Media Distribute services.

To change the default log file size:

1. Open a terminal window and log in as root to the server where you installed Media Distribute.
2. Navigate to the directory containing the logging configuration file:

```
cd /usr/share/apache-servicemix/etc
```
3. Using the Linux text editor, vi, open the org.ops4j.pax.logging.cfg file for editing:

```
vi org.ops4j.pax.logging.cfg
```
4. Locate the following line, and then navigate using the arrow keys to the 10MB parameter:

```
log4j.appender.out.maxFileSize=10MB
```
5. Type **i** (lower case “i”) to enter insert mode, and then use the arrow keys and backspace to erase 10MB and replace it with the appropriate maximum file size.
6. Press the Escape key to return to command mode, then type **:wq** and press Return to write and quit the text editor.

The change is applied immediately. You do not need to restart any Media Distribute services.

To change the number of log files saved by the system:

1. Open a terminal window and log in as root to the server where you installed Media Distribute.
2. Navigate to the directory containing the logging configuration file:

```
cd /usr/share/apache-servicemix/etc
```
3. Using the Linux text editor, vi, open the org.ops4j.pax.logging.cfg file for editing:

```
vi org.ops4j.pax.logging.cfg
```
4. Locate the following line, and then navigate using the arrow keys to the 100 parameter:

```
log4j.appender.out.maxBackupIndex=100
```
5. Type **i** (lower case “i”) to enter insert mode, and then use the arrow keys and backspace to erase 100 and replace it with the maximum number of files to be saved on the system.
6. Press the Escape key to return to command mode, then type **:wq** and press Return to write and quit the text editor.

The change is applied immediately. You do not need to restart any Media Distribute services.

C Modifying the Transcoder Monitoring Interval

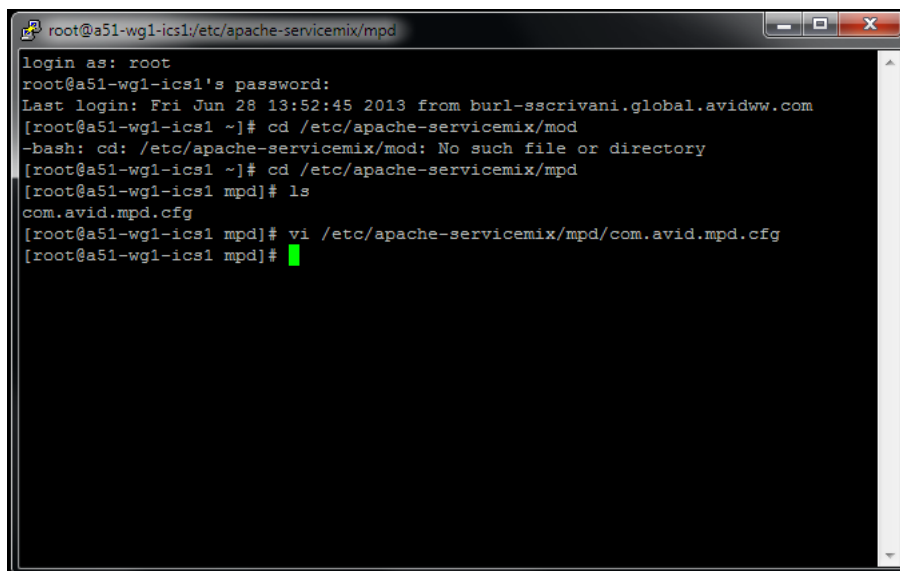

Media Distribute uses a default monitoring interval of one minute (60000 ms) for transcode services (Mixing Down, Mixed Down, and Transcoding). These various transcode processes display in the status window within the Media Distribute Packages pane for each specific package that requires video transcoding.

After successful configuration and operation of an Media Distribute instance, you can change these default monitoring intervals by editing an Media Distribute configuration file.

To modify the transcoder monitoring interval:

1. Open a session on the Media Distribute server.
2. Using Linux commands, navigate to the directory containing the Media Distribute configuration file: `/etc/apache-servicemix/mpd/com.avid.mpd.cfg`.
3. Using the Linux text editor, `vi`, open the `com.avid.mpd.cfg` file for editing:

```
vi com.avid.mpd.cfg
```

```
root@a51-wg1-ics1/etc/apache-servicemix/mpd
login as: root
root@a51-wg1-ics1's password:
Last login: Fri Jun 28 13:52:45 2013 from burl-sscrivani.global.avidww.com
[root@a51-wg1-ics1 ~]# cd /etc/apache-servicemix/mod
-bash: cd: /etc/apache-servicemix/mod: No such file or directory
[root@a51-wg1-ics1 ~]# cd /etc/apache-servicemix/mpd
[root@a51-wg1-ics1 mpd]# ls
com.avid.mpd.cfg
[root@a51-wg1-ics1 mpd]# vi /etc/apache-servicemix/mpd/com.avid.mpd.cfg
[root@a51-wg1-ics1 mpd]# █
```

D Modifying the Settings for Interlaced Graphics

When you attach an image to your media package by clicking the Load from Player button, Media Distribute takes the image from the frame selected in the Media pane. If your video uses an interlaced format, this can cause the attached image to display interlacing effects which can degrade the quality of the image. You can set Media Distribute to deinterlace the graphics file it receives from the Media viewer by editing the transcoding configuration file.

To change the settings for interlaced graphics:

1. Open a terminal window and log in as root to the server where you installed Media Distribute.

2. Navigate to the directory containing the transcoding configuration file:

```
cd /usr/share/apache-servicemix/etc/mpd
```

3. Using the Linux text editor, vi, open the transcoding.cfg file for editing:

```
vi transcoding.cfg
```

4. Locate the following line, and then navigate using the arrow keys to the deinterlacing parameter:

```
image.processing.deinterlacing={true,false}
```

5. Type **i** (lower case “i”) to enter insert mode, and then use the arrow keys and backspace to erase the bracketed options (including the brackets) and then type **true**.

```
image.processing.deinterlacing=true
```

6. Press the Escape key to return to command mode, then type **:wq** and press Return to write and quit the text editor.

7. Restart the Media Distribute services on the server or on all cluster nodes by typing the following:

```
service avid-mpd clean-restart
```
