

MiVue 792 WiFi Pro Software Update (VXR78.67.5288.BE1WD.01)

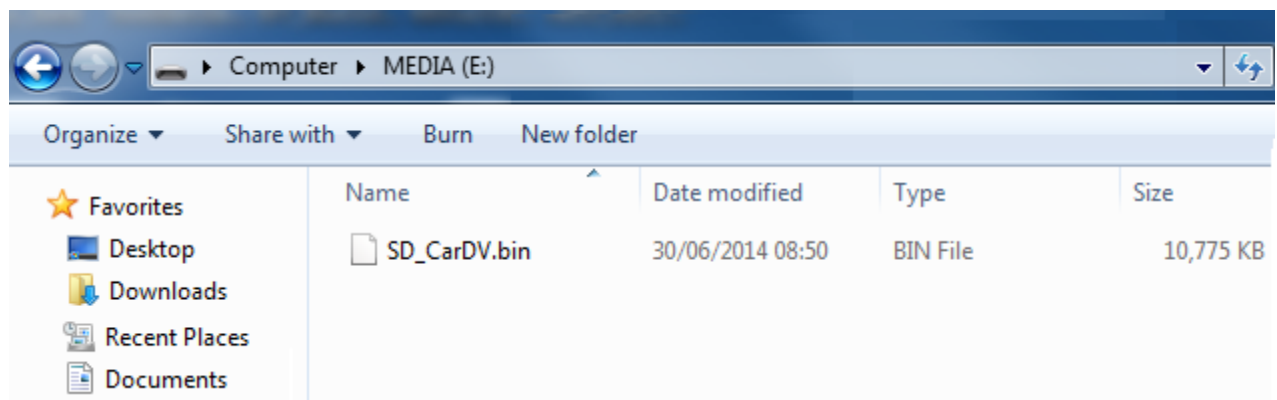

This update (VXR78.67.5288.BE1WD.01) includes the following:

» MiVue A30 connection improved

Before you begin: Please ensure your device has a full battery and that it has a constant charge during the update process. The SD card used for the update needs to be formatted through a PC before starting the update.

Save any previous video recordings you have on the Micro SD card to your computer.

1. Insert your Micro SD card into a card reader/adaptor and connect to your PC. Delete any files and folders off the Micro SD card (format) so that it's blank.
2. Copy & paste the .bin file onto the blank Micro SD card.

3. Insert the Micro SD card into your device, switch on and select **Yes** to accept the firmware update. Please note, this can take several minutes to complete.
4. The firmware update will now install and once finished, the device will switch off automatically. Remove the SD card and switch the device on. Please format the SD card using a card reader/adaptor before re-

inserting the SD card into your device and using this to record your next journey.

Please note: Installing the latest firmware will reset the Safety Cameras to the factory default version. We do advise installing the latest safety camera update after this software update has successfully installed on your MiVue.
