1 Foreword

1.1 Notes on the documentation

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with applicable national standards.

It is essential that the documentation and the following notes and explanations are followed when installing and commissioning the components.

It is the duty of the technical personnel to use the documentation published at the respective time of each installation and commissioning.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without prior announcement. No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

Trademarks

Beckhoff[®], TwinCAT[®], EtherCAT[®], EtherCAT G[®], EtherCAT G10[®], EtherCAT P[®], Safety over EtherCAT[®], TwinSAFE[®], XFC[®], XTS[®] and XPlanar[®] are registered trademarks of and licensed by Beckhoff Automation GmbH.

Other designations used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owners.

Patent Pending

The EtherCAT Technology is covered, including but not limited to the following patent applications and patents:

EP1590927, EP1789857, EP1456722, EP2137893, DE102015105702 with corresponding applications or registrations in various other countries.

Ether**CAT**

EtherCAT[®] is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany

Copyright

© Beckhoff Automation GmbH & Co. KG, Germany.

The reproduction, distribution and utilization of this document as well as the communication of its contents to others without express authorization are prohibited.

Offenders will be held liable for the payment of damages. All rights reserved in the event of the grant of a patent, utility model or design.

1.2 Safety instructions

Safety regulations

Please note the following safety instructions and explanations! Product-specific safety instructions can be found on following pages or in the areas mounting, wiring, commissioning etc.

Exclusion of liability

All the components are supplied in particular hardware and software configurations appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

Personnel qualification

This description is only intended for trained specialists in control, automation and drive engineering who are familiar with the applicable national standards.

Description of symbols

In this documentation the following symbols are used with an accompanying safety instruction or note. The safety instructions must be read carefully and followed without fail!

▲ DANGER

Serious risk of injury!

Failure to follow the safety instructions associated with this symbol directly endangers the life and health of persons.

A WARNING

Risk of injury!

Failure to follow the safety instructions associated with this symbol endangers the life and health of persons.

Personal injuries!

Failure to follow the safety instructions associated with this symbol can lead to injuries to persons.

NOTE

Damage to the environment or devices

Failure to follow the instructions associated with this symbol can lead to damage to the environment or equipment.

Tip or pointer

This symbol indicates information that contributes to better understanding.

2 Overview

This chapter is all about TwinCAT 3 implementation in C/C++. The most important chapters are:

- Start from scratch Which platforms are supported? Additional installations to implement TwinCAT 3 C++ modules? Find all answers in <u>Requirements [> 20]</u> and <u>Preparation [> 22]</u>. Limitations are documented <u>here</u> [> 166].
- Quick start [) 60]

This is a "less than five minutes sample" to create a simple incrementing counter in C++ being executed cyclically. Counter value will be monitored and overwritten, debugging capabilities will be presented etc.

• <u>MODULES [▶ 37]</u>

Modularization the basic philosophy of TwinCAT 3. Especially for C++ Modules it is required to understand the module concept of TwinCAT 3. Minimum is to read one article about the architecture of TwinCAT modules.

• <u>Wizards [</u>• <u>99</u>]

Documentation of visual components of the TwinCAT C++ environment. This includes on the one hand tools for creating projects and on the other hand tools for editing module and configuring instances of modules.

• Programming Reference [• 156]

This chapter contains detailed information for programming in TwinCAT C++. For Example Interfaces as well as other TwinCAT provided functions for ADS communication and helper methods are located here.

- The How to ...? [▶ 233] Chapter contains useful hints while working with TwinCAT C++.
- Samples

Some Interfaces and their usage is best described by working code, which is provided as download including source code and solution.

3 Introduction

The method of emulating classic automation devices such as programmable logic controllers (PLC) and numerical controllers (NC) as software on powerful standard hardware has been the state of the art for many years and is now practiced by many manufacturers.

There are many benefits, but the most important is without doubt the fact that the software is mostly hardware-independent. This means, firstly, that the performance of the hardware can be specially adapted to the application and, secondly, that you can automatically benefit from its further development.

This particularly applies to PC hardware, whose performance is still increasingly at a dramatically fast rate. The relative independence from a supplier that results from this separation of software and hardware is also very important for the user.

Since the PLC and Motion Control – and possibly other automation components – remain independent logic function blocks with this method, there are only a few changes in the application architecture in comparison with classic automation technology.

The PLC determines the machine's logical processes and transfers the implementation of certain axis functions to the Motion Control. On account of the improved performance of the controllers and the possibility to use higher-level programming languages (IEC 61131-3), even complex machines can be automated in this way.

Modularization

In order to master the complexity of modern machines and at the same time to reduce the necessary engineering expenditure, many machine manufacturers have begun to modularize their machines. Individual functions, assemblies or machine units are thereby regarded as modules, which are as independent as possible and are embedded into the overall system via uniform interfaces.

Ideally a machine is then structured hierarchically, whereby the lowest modules represent the simplest, continually reusable basic elements. Joined together they form increasingly complex machine units, up to the highest level where the entire machine is created. Different approaches are followed when it comes to the control system aspects of machine modularization. These can be roughly divided into a decentralized and a centralized approach.

In the local approach, each machine module is given its own controller, which determines the PLC functions and possibly also the motion functions of the module.

The individual modules can be put into operation and maintained separately from one another and scaled relatively independently. The necessary interactions between the controllers are coordinated via communication networks (fieldbuses or Ethernet) and standardized via appropriate profiles.

The central approach concentrates all control functions of all modules in the common controller and uses only very little pre-processing intelligence in the local I/O devices. The interactions can occur much more directly within the central control unit, as the communication paths become much shorter. Dead times do not occur and use of the control hardware is much more balanced, which reduces overall costs.

However, the central method also has the disadvantage that the necessary modularization of the control software is not automatically specified. At the same time, the possibility of being able to access any information from other parts of the program in the central controller obstructs the module formation and the reusability of this control software in other applications. Since no communication channel exists between the control units, an appropriate profile formation and standardization of the control units frequently fall by the wayside.

The best of both worlds

The ideal controller for modular machines uses elements from decentralized and centralized control architecture. A central, powerful computer platform of the most general kind possible serves 'as always' as the control hardware.

The benefits of centralized control technology:

- low overall costs
- available

- fast, modular fieldbus system (keyword: EtherCAT)
- and the possibility to access all information in the system without loss of communication

are decisive arguments.

The above-mentioned benefits of a decentralized approach can be implemented in the centralized control system by means of suitable modularization of the control software.

Instead of allowing a large, complex PLC program and an NC with many axes to run, many small 'controllers' can co-exist in a common runtime on the same hardware with relative independence from one another. The individual control modules are self-contained and make their functions available to the environment via standard interfaces, or they use corresponding functions of other modules or the runtime.

A significant profile is created through the definition of these interfaces and the standardization of the corresponding parameters and process data. Since the individual modules are implemented in a runtime, direct calls of other modules are also possible – once again via corresponding standard interfaces. In this way the modularization can take place within sensible limits without communication losses occurring.

During the development or commissioning of individual machine modules, the associated control modules can be created and tested on any control hardware with the appropriate runtime. Missing connections to other modules can be emulated during this phase. On the complete machine they are then instanced together on the central runtime, which only needs to be dimensioned such that the resource requirements of all instanced modules (memory, tasks and computing power) are fulfilled.

TwinCAT 3 Run-Time

The TwinCAT runtime offers a software environment in which TwinCAT modules are loaded, implemented and managed. It offers additional basic functions so that the system resources can be used (memory, tasks, fieldbus and hardware access etc.). The individual modules do not have to be created using the same compiler and can therefore be independent of one another and can originate from different manufacturers.

A series of system modules is automatically loaded at the start of the runtime, so that their properties are available to other modules. However, access to the properties of the system modules takes place in the same way as access to the properties of normal modules, so that it is unimportant to the modules whether the respective property is made available by a system module or a normal module.

In contrast to the PLC, where customer code is executed within a runtime environment, TwinCAT C++ modules are not within such a hosted environment. As a consequence TwinCAT C++ modules are executed as Kernel Modules (.sys) – thus they are built with the kernel mode libraries.

3.1 From conventional user mode programming to realtime programming in TwinCAT

This article describes the conceptual differences between standard user mode programming in a programming language such as C++, C# or Java, and real-time programming in TwinCAT.

The article particularly focuses on real-time programming with TwinCAT C++, because this is where previous knowledge with C++ programming comes to the fore and the sequence characteristics of the TwinCAT real-time system have to be taken into account.

With conventional user mode programming, e.g. in C#, a program is created, which is then executed by an operating system.

The program is started by the operating system and can run independently, i.e. it has full control over its own execution, including aspects such as threading and memory management. In order to enable multitasking, the operating system interrupts such a program at any time and for any period. The program does not register such an interruption. The operating system must ensure that such interruptions remain unnoticed by the user. The data exchange between the program and its environment is event-driven, i.e. non-deterministic and often blocking.

The behavior is not adequate for execution under real-time conditions, because the application itself must be able to rely on the available resources in order to be able to ensure real-time characteristics (response guarantees).

The basic idea of PLC is therefore adopted for TwinCAT C++: The TwinCAT real-time system manages the real-time tasks, handles the scheduling and cyclically calls an entry point in the program code. The program execution must be completed within the available cycle length and return the control. The TwinCAT system makes the data from the I/O area available in the process images, so that consistent access can be guaranteed. This means that the program code itself cannot use mechanisms such as threading.

TE1000

Concurrency

With conventional programming in user mode, concurrency is controlled by the program. This is where threads are started, which communicate with each other. All these mechanisms require resources, which have to be allocated and enabled, which can compromise the real-time capability. The communication between the threads is event-based, so that a calling thread has no control over the processing time in the called thread.

In TwinCAT, tasks are used for calling modules, which therefore represents concurrency. Tasks are assigned to a core; they have cycle times and priorities, with the result that a higher-priority task can interrupt a lower-priority task. If several cores are used, tasks are executed concurrently in practice.

Modules can communicate with each other, so that data consistency has to be ensured in concurrency mode.

Data exchange across task boundaries is enabled through mapping, for example. When direct data access via methods is used, it must be protected through Critical sections, for example.

Startup/shutdown behavior

The TwinCAT C++ code is executed in the so-called "Windows kernel context" and the "TwinCAT real-time context", not as a user mode application.

During startup/shutdown of the modules, code for (de)initialization is initially executed in the Windows kernel context; only the last phase and the cyclic calls are executed in the TwinCAT real-time context.

Details are described in the "Module state machine [\blacktriangleright <u>44</u>]" section.

Memory management

TwinCAT has its own memory management, which can also be used in the real-time context. This memory is obtained from what is referred to as the "non-paged pool", which is provided by the operating system. In this memory the TcCOM modules are instantiated with their memory requirement.

In addition, the so-called "router memory" is provided by TwinCAT in this memory area, from which the TcCOM modules can allocate memory dynamically in the real-time-context (e.g. with the New operator).

If possible, memory should generally be allocated in advance, not in the cyclic code. During each allocation a check is required to verify that the memory is actually available. For allocations in the cyclic code, the execution therefore depends on the memory availability.

4 Requirements

Overview of minimum requirements

The implementation and debugging of TwinCAT 3 C++ modules requires:

The following must be installed on the engineering PC:

- Microsoft Visual Studio 2010 (with Service Pack 1), 2012, 2013 or 2015 Professional, Premium or Ultimate
 - When installing Visual Studio 2019 or 2017, the **Desktop development with C++** option must be manually selected, as this option is not selected with the automatic installation:

Installing — Visua	al Studio Professional 2019 — 16.7.0			
Workloads	Individual components	Language packs	Installation locations	
Editing, e	development debugging, interêctive development and ior Python.	I source	Node.js development Build scalable network applications using Node.js, an asynchronous event-driven JavaScript runtime.	
Desktop & Mobile	e (5)			
Build WF	sktop development >F, Windows Forms, and console applicat al Basic, and F# with .NET Core and .NET.	-	Desktop development with C++ Build modern C++ apps for Windows using tools of your choice, including MSVC, Clang, CMake, or MSBuild.	
Workloads	ual Studio Professional 2017 — 15.6.6 Individual components	Language packs		
Windows (3)				
Create a	al Windows Platform development pplications for the Universal Windows Pl VB, JavaScript, or optionally C++.	latform	.NET desktop development Build WPF, Windows Forms, and console applications using C#, Visual Basic, and F#.	
Build Wi	o development with C++ indows desktop applications using the M olset, ATL, or MFC.	licrosoft		

 When installing Visual Studio 2015, the Visual C++ development option must be manually selected, as this option is not selected with the automatic installation:

Features	Languages		
Select featu	res		
Vis	ual Studio 2015 Upda	te 1 (New)	
🔺 🔳 Pr	oramming Language	s	
Þ 🗸	Visual C++		
	Visual F#		

- TwinCAT 3 installation (XAE engineering)
- XaeShell is sufficient for the integration and use of existing binary C++ modules in a TwinCAT 3 PLC environment (Visual Studio is not required.)

On the runtime PC:

- IPC or Embedded CX PC with Microsoft operating system (Windows 7 / 10).
- Microsoft Visual Studio does not have to be installed.
- TwinCAT 3 installation (XAR runtime)

Limitations on the runtime PC

- TwinCAT 3.0 only supports 32-bit operating systems as target platform (runtime PC).
 TC3.0 can be used as engineering platform on x64 PCs. The program can be transferred to a 32bit (x86) remote PC over the network and executed there.
- TwinCAT 3.1 also supports x64-bit operating systems as target platform (runtime PC). To do this, the drivers must be signed as documented under <u>Driver signing [▶ 25]</u>.
- The runtime PC must be either a Windows 7 or Windows 10 system.

Also see about this

■ "Microsoft Windows Driver Kit (WDK)" installation (only <= Build 4022) [▶ 22]</p>

5 **Preparation - only once**

A PC for the engineering of TwinCAT C++ modules must be prepared. You only have to carry out these steps once:

- Install the Microsoft Windows Driver Kit (WDK) [▶ 22].
- Configure the TwinCAT <u>Basis [▶ 24]</u> as well as the <u>configuration and platform [▶ 25]</u> toolbar.
- On x64 PCs, sign modules so that they can be run; see <u>Documentation for the setup of a test signing</u>
 [<u>25</u>].
- If the operating system of the target system requires enhanced validation for drivers, for example, through a SecureBoot, carry out a <u>corresponding signing [▶ 31]</u> with Microsoft.

5.1 "Microsoft Windows Driver Kit (WDK)" installation (only <= Build 4022)

NOTE

WDK installation only up to TwinCAT 3.1 Build 4022

The installation of the WDK described here is only necessary up to TwinCAT 3.1. Build 4022. From Build 4024.0, either the WDK must be uninstalled or the previously set system variable WINDDK7 must be renamed so that TwinCAT ignores the WDK.

Installation of WDK 7 for TwinCAT 3.1. 4022 and earlier

The installation is only necessary for the TwinCAT 3 engineering environment in order to be able to create and edit C++ modules. The WDK installation is not required on the target system (XAR).

1. Download the Windows Driver Kit 7.1 from the Microsoft Download Center <u>https://www.microsoft.com/</u> <u>en-us/download/details.aspx?id=11800</u>

Windows Driver Kit Version 7.1.0

Important! Selectir	ng a language below will d	lynamically change the complete p	page content to that language.	
Language:	English		Download	

The Windows Driver Kit (WDK) Version 7.1.0 is an update to the WDK 7.0.0 release and contains the tools, code samples, documentation, compilers, headers and libraries with which software developers create drivers for Windows 7, Windows Vista, Windows XP, Windows Server 2008 R2, Windows Server 2008, and Windows Server 2003.

- 2. Following the download, either burn a CD of the downloaded ISO image or use a virtual (software-based) CD drive.
- 3. Start KitSetup.exe of the ISO image that has been downloaded or burnt on CD (on Windows 7 PCs, start the installation with **Run As Administrator...**).

- BECKHOFF
- Select the option Build Environment none of the other components are required by TwinCAT 3 and click on OK to continue.

5.2 Visual Studio - TwinCAT XAE Base toolbar

Efficient engineering through TwinCAT XAE base toolbar

TwinCAT 3 integrates its own toolbar in the Visual Studio menu for better efficiency. It assists you in the creation of C++ projects. This toolbar is automatically added to the Visual Studio menu by the TwinCAT 3 setup. If you wish to add it manually, however, do the following:

1. Open the View menu and select Toolbars\TwinCAT XAE Base

 \Rightarrow The selected toolbar appears below the menu.

5.3 Prepare Visual Studio - Configuration and Platform toolbar

Add the toolbar "Solution Configuration and Solution Platform"

With the **Configuration and Platform** toolbar you can specify the target platform for the creation of your project. This toolbar is automatically added to the Visual Studio menu by the TwinCAT 3 setup. If you wish to add it manually, however, do the following:

- 1. Open the View menu and select Toolbars\Customize.
- 2. Navigate to the Commands tab.
- 3. Activate the Toolbar option field and then select the Standard toolbar from the list.
- 4. Click on Add Command...
- 5. Select the Build category, select the Solution Configurations command and then click on OK.
- 6. Repeat the last step for the Solution Platforms command.
- 7. Click on Close.
- ⇒ The two commands now appear below the menu bar.

5.4 Driver signing

TwinCAT C++ modules must be signed with a certificate so that they can be executed.

The signature ensures that only C++ software whose origin can be traced is executed on productive systems.

For test purposes, certificates that cannot be verified can be used for signing. However, this is only possible if the operating system is in test mode so that these certificates are not used on productive systems.

Engineering requires no signing

Only the execution requires certificates - the engineering does not.

There are two ways to load modules, different certificates are used for signing:

- Operating system: The C++ modules are loaded as normal kernel drivers and must therefore also have a signature.
 - With TwinCAT 3.1. 4022 or earlier, only this procedure is available.
 - Windows 7 (Embedded) x86 (32bit) does not require signing.
- TwinCAT: The C++ modules are loaded by the TwinCAT runtime system and must be signed with a TwinCAT user certificate.
 - With TwinCAT 3.1. 4024 and higher, this method is also available.
 - This procedure is required to perform new functions such as <u>versioned C++ projects</u> [▶ <u>49</u>] and thus also the <u>C++ Online Change</u> [▶ <u>164</u>].

Since a published module should be executable on various PCs, signing is always necessary for publishing.

Organizational separation of development and production software

Beckhoff recommends working organizationally with (at least) two certificates.

- 1. A certificate which is not countersigned, thus the test mode is needed for the development process. This certificate can also be issued individually by each developer.
- 2. Only the software that has passed the corresponding final tests is signed by a countersigned certificate. This software can thus also be installed on machines and delivered.

Such a separation of development and operation ensures that only tested software runs on productive systems.

5.4.1 Operating system

For the implementation of TwinCAT 3 C++ modules on x64 platforms, the driver (*.sys file) must be signed with a certificate if it is to be loaded by the operating system.

The signature, which is automatically executed during the TwinCAT 3 build process, is used by 64-bit Windows operating systems for the authentication of the drivers.

A certificate is required to sign a driver. <u>This Microsoft documentation</u> describes the process and background knowledge for obtaining a test and release certificate that is accepted by 64-bit Windows operating systems.

To use such a certificate in TwinCAT 3, configure the step after compiling your x64 build target as documented in "Creating a test certificate for test mode [≥ 27]".

Test certificates

For testing purposes, self-signed test certificates can be created and used without technical limitations.

The following tutorials describe how to activate this option. To create drivers with real certificates for production machines, this option must be disabled.

- Creating a test certificate for test mode [> 27]
- Delete (test) certificates [29]

5.4.1.1 Test signing

Overview

Implementing TwinCAT 3 C++ modules for x64 platforms requires signing the driver with a certificate.

This article describes how to create and install a test certificate for testing a C++ driver.

Note the procedure when creating test certificates

Developers may have a wide range of tools for creating certificates. Please follow this description exactly, in order to activate the test certificate mechanism.

The following commands must be executed from a command line that has been opened in either way:

- Visual Studio 2010 / 2012 prompt with administrator rights. (Via: All Programs -> Microsoft Visual Studio 2010/2012 -> Visual Studio Tools -> Visual Studio Command Prompt, then right-click Run as administrator)
- Developer Command Prompt of Visual Studio 2017 / 2019 with administrator rights. (Via: All Programs -> Visual Studio 2017 -> Visual Studio Command Prompt for VS 2017/2019, then rightclick on Run as administrator)
- Only if the WINDDK has been installed: Normal prompt (Start->Command Prompt) with administrator rights, then change to directory %WINDDK7%\bin\x86\, which contains the corresponding tools.
- 1. On XAE:

in the engineering system enter the following command in the Visual Studio 2010 / 2012 prompt with administrator rights (see note above):

makecert -r -pe -ss PrivateCertStore -n CN=MyTestSigningCert
MyTestSigningCert.cer

(If you do not have access rights to the PrivateCertStore, you can use a different location. This must also be used in the PostBuild event, as described <u>here. [▶ 30]</u>)

- ⇒ This is followed by creation of a self-signed certificate, which is stored in the file "MyTestSigningCert.cer" and in the Windows Certificate Store.
- ⇒ Check the result with mmc (**Use File->Add/Remove Snap-in->Certificates**):

2. On XAE:

configure the certificate so that it is recognized by TwinCAT XAE on the engineering system. Set the environment variable TWINCATTESTCERTIFICATE to "MyTestSigningCert" in the engineering system or edit the post build event of Debug|TwinCAT RT (x64) and Release|TwinCAT RT (x64). The name of the variable is NOT the name of the certificate file, but the CN name (in this case MyTestSigningCert).

Note From TwinCAT 3.1 4024.0, the configuration of the certificate to be used is carried out under Tc Sign in the project properties. To use signing via the operating system, as described here, please pay attention to the project settings:

Untitled1 Property Pages

Configuration:	Release		 ✓ Platform: 	Active(TwinCAT RT (x64))
Configurati	ion Properties	~	Enable signing		
General			SHA1 signing		Yes
Debugging VC++ Directories Tc SDK Tc Extract Version			SHA256 signing		No
			TwinCAT signing		No
		~	TwinCAT Certificat	e (Same for all configur	ations)
			TwinCAT Certificate	Name	
Tc Publ			TwinCAT Certificate	Password	
Tc Sign			Verbose Output		No

 On XAR (and XAE, if local test) activate the test mode so that Windows can accept the self-signed certificates. This can be done on both engineering systems (XAE) and runtime systems (XAR).

- 4. Execute the following using the "Run as administrator" option: bcdedit /set testsigning yes and restart the target system.
 - ⇒ If test signing mode is enabled, this is displayed at the bottom right of the desktop. The PC now accepts all signed drivers for execution.

- 5. You may have to switch off "SecureBoot" for this, which can be done in the bios.
- 6. Test whether a configuration with a TwinCAT module implemented in a TwinCAT C++ driver can be enabled and started on the target system.

⇒ Compilation of the x64 driver generates the following output:

Output

5.4.1.3 Customer Certificates

Configuration Certificate
 From TwinCAT 3.1 4024.0, the configuration

From TwinCAT 3.1 4024.0, the configuration of the certificate to be used is carried out under <u>Tc</u> <u>Sign [\blacktriangleright 161]</u> in the project properties.

If the TwinCAT C++ class wizard is used, the project is prepared for x64 targets using the test certificate procedure described above.

This test signing system can be used for the entire engineering and test process.

BECKHOFE

If you want to create an infrastructure and sign the kernel drivers with official "Microsoft trusted" certificates, the post-build events of the project properties provide the entry point.

Untitled1 Property Pages			? X
Configuration: Active(Release	e) 🔻 Platform:	Active(TwinCAT RT (x64))	 Configuration Manager
 Common Properties Configuration Properties General Debugging VC++ Directories C/C++ Linker Manifest Tool Resources MIDL XML Document General Browse Information Build Events Pre-Build Event Post-Build Event 	Command Line Description Use In Build Command Line "\$(WINDDK7)\bin\x86\signton	"\$(WINDDK7)\bin\x86\sign Yes	tool" sign /v /s PrivateCertStore /n S(T) වාන RTIFICATE) "S(TargetPath)"
▷ Custom Build Step	Specifies a command li	ne for the post-build event tool to run.	Macros>> OK Cancel
< III			OK Cancel Apply

The customer can simply replace the value of the environment variable **TWINCATTESTCERTIFICATE** or determine another certificate to be used.

The customer can also change the whole signing process with the signing tool.

In this case a CrossSigning is necessary for the Windows drivers. The parameter for the signtool is "/ac". The certificate provider provides the necessary information. Microsoft provides an overview <u>here.</u>

5.4.1.4 SecureBoot: Driver signing

Systems may require enhanced validation of the Windows drivers. This is usually the case with systems with enabled <u>SecureBoot</u>.

In this case, the TwinCAT C++ drivers must also be signed by the "Attestation Signing" established by Microsoft in the same way as all other drivers that the operating system is to load. The procedure for this is documented in <u>MSDN</u>.

For development purposes, the development process can be simplified on corresponding test systems by deactivating SecureBoot.

5.4.2 TwinCAT

Versioned C++ projects are stored as binary in a TMX file (TwinCAT Module Executeable).

For the implementation of TwinCAT 3 C++ modules, this compiled, executable TMX file must be signed with a TwinCAT user certificate if it is to be loaded by the TwinCAT Runtime.

For signing a TMX file, a <u>TwinCAT user certificate is required [>32]</u>, which is configured accordingly in the project for signing.

NOTE

Signing on 32bit and 64bit systems

In contrast to the operating system signature, TwinCAT signing is intended for both 32bit and 64bit systems. Thus, the test mode is assumed for a test signature also on 32-bit systems.

Note In contrast to the operating system signature, TwinCAT signing is intended for both 32bit and 64bit systems. Thus, the test mode is assumed for a test signature also on 32-bit systems.

Test signing

Just as with the option of loading drivers through the operating system, TwinCAT also provides the test mode of the operating system for loading.

As soon as the <u>TwinCAT user certificate has been countersigned by Beckhoff [> 34]</u>, the test mode can be dispensed with accordingly.

5.4.2.1 Test signing

The test signature for TwinCAT can be carried out with the same TwinCAT user certificate as for the actual delivery (see <u>Driver signing [▶ 26]</u>).

1. For test operation, e.g. during software development, the creation of a TwinCAT user certificate, as described <u>here</u>, is sufficient. Make sure that you select the purpose "Sign TwinCAT C++ executable (*.tmx)". For this the Crypto version 2 is required, a message appears.

Name	Unique	Status	Issue (UTC)	Expire (UTC)	Permissions	
[Create OEM Cer	tificate			×	
	OEM Name:			SI	tart	
- OEM Certificate				Ca	ncel	
Create New	Unique Name (do	omain or e-mail address):

OEM Authority	Sign TwinCA	T C++ executable (*.tmx)				
Sign License						
Create Templ	L	Microsoft Visual Stud	dia.			×
Create New L	Crypto Version:	IVIICIOSOTE VISUAI SEUG	OIC			
Reissue Exist			which is supported	Г C++ executable signin d by TwinCAT 3.1.4024 а		

- On XAR (and XAE, if local test) activate the test mode so that Windows can accept the self-signed certificates. This can be done on both engineering systems (XAE) and runtime systems (XAR).
- 3. Execute the following using the "Run as administrator" option: bcdedit /set testsigning yes and restart the target system.
 - ⇒ If test signing mode is enabled, this is displayed at the bottom right of the desktop. The PC now accepts all signed drivers for execution.

- 4. You may have to switch off "SecureBoot" for this, which can be done in the bios.
- 5. During the initial activation (Activate Configuration) with a TwinCAT user certificate, the target system will determine that the certificate is not trusted and the activation process will be aborted:

Error List

<u> </u>	27.08.2019 17:32:42 782 ms 'TCOM \$ ver' (10): Import 'C\TwinCAT\3.1\Target\OenCertificate\test.domain_db006e5e-e160-0177-d83e-2f0ddaf4aefe.reg' to add OEM to trusted list

A local user with administrator rights can trust the certificate through simple running via the created REG file.

This process only enables modules with a signature from the trusted TwinCAT user certificates to run.

6. Following this process you can use the TwinCAT user certificate for signing with the test mode of the operating system.

This is configured in the project properties [\blacktriangleright 161].

Use the <u>TcSignTool [\blacktriangleright 57]</u> to avoid storing the password of the TwinCAT user certificate in the project, where it would also end up in version management, for example.

If you have this TwinCAT user certificate countersigned by Beckhoff, you can also use it for delivery without TestMode.

5.4.2.2 Signing for delivery

If you create TwinCAT driver software for delivery, you should use a countersigned TwinCAT user certificate. With a countersigned TwinCAT user certificate, the test mode is no longer required.

6 Modules

The TwinCAT module concept is one of the core elements for the modularization of modern machines. This chapter describes the modular concept and working with modules.

The modular concept applies to all TwinCAT modules, not just C++ modules, although most details only relate to the engineering of C++ modules.

6.1 The TwinCAT Component Object Model (TcCOM) concept

The TwinCAT Component Object Model defines the characteristics and the behavior of the modules. The model derived from the "Component Object Model" COM from Microsoft Windows describes the way in which various independently developed and compiled software components can co-operate with one another. To make that possible, a precisely defined mode of behavior and the observation of interfaces of the module must be defined, so that they can interact. Such an interface is also ideal for facilitating interaction between modules from different manufacturers, for example.

To some degree TcCOM is based on COM (Component Object Model of the Microsoft Windows world), although only a subset of COM is used. In comparison with COM, however, TcCOM contains additional definitions that go beyond COM, for example the state machine module.

Overview and application of TcCOM modules

This introductory overview is intended to make the individual topics easier to understand.

One or several TcCOM modules are consolidated in a driver. This driver is created by TwinCAT Engineering using the MSVC compiler. The modules and interfaces are described in a TMC (TwinCAT Module Class) file. The drivers and their TMC file can now be exchanged and combined between the engineering systems.

Instances of these modules are now created using the engineering facility. They are associated with a TMI file. The instances can be parameterized and linked with each other and with other modules to form the IO. A corresponding configuration is transferred to the target system, where it is executed.

Corresponding modules are started, which register with the TwinCAT ObjectServer. The TwinCAT XAR also provides the process images. Modules can query the TwinCAT ObjectServer for a reference to another object with regard to a particular interface. If such a reference is available, the interface methods can be called on the module instance.

The following sections substantiate the individual topics.

ID Management

Different types of ID are used for the interaction of the modules with each other and also within the modules. TcCOM uses GUIDs (128 bit) and 32 bit long integers.

TcCOM uses

- GUIDs for: ModulIDs, ClassIDs and InterfaceIDs.
- 32 bit long integers are used for: ParameterIDs, ObjectIDs, ContextIDs, CategoryID.

Interfaces

An important component of COM, and therefore of TcCOM too, is interfaces.

Interfaces define a set of methods that are combined in order to perform a certain task. An interface is referenced with a unique ID (InterfaceID), which must never be modified as long as the interface does not change. This ID enables modules to determine whether they can cooperate with other modules. At the same time the development process can take place independently, if the interfaces are clearly defined. Modifications of interfaces therefore lead to different IDs. The TcCOM concept is designed such that InterfaceIDs can superpose other (older) InterfaceIDs ("Hides" in the TMC description / TMC editor). In this way, both versions of the interface are available, while on the other hand it is always clear which is the latest InterfaceID. The same concept also exists for the data types.

TcCOM itself already defines a whole series of interfaces that are prescribed in some cases (e.g. ITComObject), but are optional in most. Many interfaces only make sense in certain application areas. Other interfaces are so general that they can often be re-used. Provision is made for customer-defined interfaces, so that two third-party modules can interact with each other, for example.

- All interfaces are derived from the basic interface ItcUnknown which, like the corresponding interface of COM, provides the basic services for querying other interfaces of the module (TcQueryInterface) and for controlling the lifetime of the module (TcAddRef and TcRelease).
- The ITComObject interface, which must be implemented by each module, contains methods for accessing the name, ObjectID, ObjectID of the parent, parameters and state machine of the module.

Several general interfaces are used by many modules:

- ITcCyclic is implemented by modules, which are called cyclically ("CycleUpdate"). The module can register via the ITcCyclicCaller interface of a TwinCAT task to obtain cyclic calls.
- The ITcADI interface can be used to access data areas of a module.
- ITcWatchSource is implemented by default; it facilitates ADS device notifications and other features.
- The ITcTask interface, which is implemented by the tasks of the real-time system, provides information about the cycle time, the priority and other task information.
- The ITComObjectServer interface is implemented by the ObjectServer and referenced by all modules.

A whole series of general interfaces has already been defined. General interfaces have the advantage that their use supports the exchange and recycling of modules. User-defined interfaces should only be defined if no suitable general interfaces are available.

Class Factories

"Class Factories" are used for creating modules in C++. All modules contained in a driver have a common Class Factory. The Class Factory registers once with the ObjectServer and offers its services for the development of certain module classes. The module classes are identified by the unique ClassID of the module. When the ObjectServer requests a new module (based on the initialization data of the configurator or through other modules at runtime), the module selects the right Class Factory based on the ClassID and triggers creation of the module via its ITcClassFactory interface.

Module service life

Similar to COM, the service life of a module is determined via a reference counter (RefCounter). The reference counter is incremented whenever a module interface is queried. The counter is decremented when the interface is released. An interface is also queried when a module logs into the ObjectServer (the ITComObject interface), so that the reference counter is at least 1. The counter is decremented on logout.

BECKHOFF

When the counter reaches 0, the module deletes itself automatically, usually after logout from the ObjectServer. If another module already maintains a reference (has an interface pointer), the module continues to exist, and the interface pointer remains valid, until this pointer is released.

6.1.1 TwinCAT module properties

A TcCOM module has a number of formally defined, prescribed and optional properties. The properties are sufficiently formalized to enable interchangeable application. Each module has a module description, which describes the module properties. They are used for configuring the modules and their relationships with each other.

If a module is instantiated in the TwinCAT runtime, it registers itself with a central system instance, the ObjectServer. This makes it reachable and parameterizable for other modules and also for general tools. Modules can be compiled independently and can therefore also be developed, tested and updated independently. Modules can be very simple, e.g. they may only contain a basic function such as low-pass filter. Or they may be very complex internally and contain the whole control system for a machine subassembly.

There are a great many applications for modules; all tasks of an automation system can be specified in modules. Accordingly, no distinction is made between modules, which primarily represent the basic functions of an automation system, such as real-time tasks, fieldbus drivers or a PLC runtime system, and user- or application-specific algorithms for controlling a machine unit.

The diagram below shows a common TwinCAT module with his main properties. The dark blue blocks define prescribed properties, the light blue blocks optional properties.

Module description

Each TcCOM module has some general description parameters. These include a ClassID, which unambiguously references the module class. It is instantiated by the corresponding ClassFactory. Each module instance has an ObjectID, which is unique in the TwinCAT runtime. In addition there is a parent ObjectID, which refers to a possible logical parent.

The description, state machine and parameters of the module described below can be reached via the ITComObject interface (see "Interfaces").

Class description files (*.tmc)

The module classes are described in class description files (TwinCAT Module Class; *.tmc).

These files are used by developers to describe the module properties and interfaces, so that others can use and embed the module. In addition to general information (vendor data, module class ID etc.), optional module properties are described.

- · Supported categories
- · Implemented interfaces
- Data areas with corresponding symbols
- Parameter
- · Interface pointers
- Data pointers, which can be set

The system configurator uses the class description files mainly as a basis for the integration of a module instance in the configuration, for specifying the parameters and for configuring the links with other modules.

They also include the description of all data types in the modules, which are then adopted by the configurator in its general data type system. In this way, all interfaces of the TMC descriptions present in the system can be used by all modules.

More complex configurations involving several modules can also be described in the class description files, which are preconfigured and linked for a specific application. Accordingly, a module for a complex machine unit, which internally consists of a number of submodules, can be defined and preconfigured as an entity during the development phase.

Instance description files (*.tmi)

An instance of a certain module is described in the instance description file (TwinCAT Module Instance; *.tmi). The instance descriptions are based on a similar format, although in contrast to the class description files they already contain concrete specifications for the parameters, interface pointers etc. for the special module instance within a project.

The instance description files are created by TwinCAT Engineering (XAE), when an instance of a class description is created for a specific project. They are mainly used for the exchange of data between all tools involved in the configuration. However, the instance descriptions can also be used cross-project, for example if a specially parameterized module is to be used again in a new project.

State machine

Each module contains a state machine, which describes the initialization state of the module and the means with which this state can be modified from outside. The state machine describes the states, which occur during starting and stopping of the module. This relates to module creation, parameterization and production in conjunction with the other modules.

Application-specific states (e.g. of the fieldbus or driver) can be described in their own state machines. The state machine of the TcCOM modules defines the states INIT, PREOP, SAFEOP and OP. Although the state designations are the same as under EtherCAT fieldbus, the actual states differ. When the TcCOM module implements a fieldbus driver for EtherCAT, it has two state machines (module and fieldbus state machine), which are passed through sequentially. The module state machine must have reached the operating state (OP) before the fieldbus state machine can start.

The state machine is <u>described [▶ 44]</u> in detail separately.

Parameter

Modules can have parameters, which can be read or written during initialization or later at runtime (OP state). Each parameter is designated by a parameter ID. The uniqueness of the parameter ID can be global, limited global or module-specific. Further details can be found in the "ID Management" section. In addition to the parameter ID, the parameter contains the current data; the data type depends on the parameter and is defined unambiguously for the respective parameter ID.

Interfaces

BECKHOFF

Interfaces consist of a defined set of methods (functions), which offer modules through which they can be contacted by other modules. Interfaces are characterized by a unique ID, as described above. A module must support at least the ITComObject interface and may in addition contain as many interfaces as required. An interface reference can be queried by calling the method "TcQueryInterface" with specification of the corresponding interface ID.

Interface pointers

	Interface Pointers

Interface pointers behave like the counterpart of interfaces. If a module wants to use an interface of another module, it must have an interface pointer of the corresponding interface type and ensure that it points to the other module. The methods of the other module can then be used.

Interface pointers are usually set on startup of the state machine. During the transition from INIT to PREOP (IP), the module receives the object ID of the other modules with the corresponding interface; during the transition from PREOP to SAFEOP (PS) or SAFEOP to OP (SO), the instance of the other modules is searched with the ObjectServer, and the corresponding interface is set with the Method Query interface. During the state transition in the opposite direction, i.e. from SAFEOP to PREOP (SP) or OP to SAFEOP (OS), the interface must be enabled again.

Data areas

Modules can contain data areas, which can be used by the environment (e.g. by other modules or the IO area of TwinCAT). These data areas can contain any data. They are often used for process image data (inputs and outputs). The structure of the data areas is defined in the device description of the module. If a module has data areas, which it wants to make accessible for other modules, it implements the ITcADI interface to enable access to the data. Data areas can contain symbol information, which describes the structure of the respective data area in more detail.

Data area pointer

If a module wants to access the data area of other modules, it can contain data area pointers. These are normally set during initialization of the state machine to data areas or data area sections of other modules. The access is directly to the memory area, so that corresponding protection mechanisms for competing access operations have to be implemented, if necessary. In many cases it is preferable to use a corresponding interface.

Context

The context should be regarded as real-time task context. Context is required for the configuration of the modules, for example. Simple modules usually operate in a single time context, which therefore requires no detailed specification. Other modules may partly be active in several contexts (e.g. an EtherCAT master can support several independent real-time tasks, or a control loop can process control loops of the layer below in another cycle time). If a module has more than one time-dependent context, this must be specified the in the module description.

BECKHOFF

Categories

Modules can offer categories by implementing the interface ITComObjectCategory. Categories are enumerated by the ObjectServer, and objects, which use this to associated themselves with categories, can be queried by the ObjectServer (ITComObjectEnumPtr).

ADS

Each module that is entered in the ObjectServer can be reached via ADS. The ObjectServer uses the ITComObject interface of the modules in order to read or write parameters or to access the state machine, for example. In addition, a dedicated ADS port can be implemented, through which dedicated ADS commands can be received.

System module

In addition, the TwinCAT runtime provides a number of system modules, which make the basic runtime services available for other modules. These system modules have a fixed, constant ObjectID, through which the other modules can access it. An example for such a system module is the real-time system, which makes the basic real-time system services, i.e. generation of real-time tasks, available via the ITcRTime interface. The ADS router is also implemented as a system module, so that other modules can register their ADS port here.

Creation of modules

Modules can be created both in C++ and in IEC 61131-3. The object-oriented extensions of the TwinCAT PLC are used for this purpose. Modules from both worlds can interact via interfaces in the same way as pure C++ modules. The object-oriented extension makes the same interfaces available as in C++.

The PLC modules also register via the ObjectServer and can therefore be reached through it. PLC modules vary in terms of complexity. It makes no difference whether only a small filter module is generated or a complete PLC program is packed into a module. Due to the automation, each PLC program is a module within the meaning of TwinCAT modules. Each conventional PLC program is automatically packed into a module and registers itself with the ObjectServer and one or several task modules. Access to the process data of a PLC module (e.g. mapping with regard to a fieldbus driver) is also controlled via the defined data areas and ITcADI.

This behavior remains transparent and invisible for PLC programmers, as long as they decide to explicitly define parts of the PLC program as TwinCAT modules, so that they can be used with suitable flexibility.

6.1.2 TwinCAT module state machine

In addition to the states (INIT, PREOP, SAFEOP and OP), there are corresponding state transitions, within which general or module-specific actions have to be executed or can be executed. The design of the state machine is very simple. In any case, there are only transitions to the next or previous step,

resulting in the following state transitions: INIT to PREOP (IP), PREOP to SAFEOP (PS) and SAFEOP to OP (SO). In the opposite direction there are the following state transitions: OP to SAFEOP (OS), SAFEOP to PREOP (SP) and PREOP to INIT (PI). Up to and including the SAFEOP state, all states and state transitions take place within the non-real-time context. Only the transition from SAFEOP to OP, the OP state and the transition from OP to SAFEOP take place in the real-time context. This differentiation is relevant when resources are allocated or activated, or when modules register or deregister with other modules.

State: INIT

The INIT state is only a virtual state. Immediately after creation of a module, the module changes from INIT to PREOP, i.e. the IP state transition is executed. The instantiation and the IP state transition always take place together, so that the module never remains in INIT state. Only when the module is removed does it remain in INIT state for a short time.

Transition: INIT to PREOP (IP)

During the IP state transition, the module registers with the ObjectServer with its unique ObjectID. The initialization parameters, which are also allocated during object creation, are transferred to the module. During this transition the module cannot establish connections to other modules, because it is not clear whether the other modules already exist and are registered with the ObjectServer. When the module requires system resources (e.g. memory), these can be allocated during the state transition. All allocated resources have to be released again during the transition from PREOP to INIT (PI).

State: PREOP

In PREOP state, module creation is complete and the module is usually fully parameterized, even if further parameters may be added during the transition from PREOP to SAFEOP. The module is registered in the ObjectServer, although no connections with other modules have been created yet.

Transition: PREOP to SAFEOP (PS)

In this state transition the module can establish connections with other modules. To this end it has usually received, among other things, ObjectIDs of other modules with the initialization data, which are now converted to actual connections with these modules via the ObjectServer.

The transition can generally be triggered by the system according to the configurator, or by another module (e.g. the parent module). During this state transition further parameters can be transferred. For example, the parent module can transfer its own parameters to the child module.

State: SAFEOP

The module is still in the non-real-time context and is waiting to be switched to OP state by the system or by other modules.

Transition: SAFEOP to OP (SO)

The state transition from SAFEOP to OP, the state OP, and the transition from OP to SAFEOP take place in the real-time context. System resources may no longer be allocated. On the other hand, resources can now be requested by other modules, and modules can register with other modules, e.g. in order to obtain a cyclic call during tasks.

This transition should not be used for long-running tasks. For example, file operations should be executed during the PS transition.

State: OP

In OP state the module starts working and is fully active in the meaning of the TwinCAT system.

Transition: OP to SAFEOP (OS)

This state transition takes place in the real-time context. All actions from the SO transition are reversed, and all resources requested during the SO transition are released again.

Transition: SAFEOP to PREOP (SP)

All actions from the PS transition are reversed, and all resources requested during the PS transition are released again.

Transition: PREOP to INIT (PI)

All actions from the IP transition are reversed, and all resources requested during the IP transition are released again. The module signs off from the ObjectServer and usually deletes itself (see "Service life").

6.2 Module-to-module communication

TcCOM modules can communicate with one another. This article is intended to provide an overview of the various options. There are four methods of module-to-module communication:

- IO Mapping (linking of input/output symbols)
- IO Data Pointer
- · Method calls via interface
- ADS

These four methods will now be described.

IO Mapping (linking of input/output symbols)

The inputs and outputs of TcCOM modules can be linked by IO Mapping in the same way as the links to physical symbols in the fieldbus level. To do this, <u>data areas are created in the TMC editor [} 134</u>] that describe the corresponding inputs/outputs. These are then linked in the TwinCAT solution.

Through mapping, the data are provided or accepted at the task beginning (inputs) or task end (outputs) respectively. The data consistency is ensured by synchronous or asynchronous mapping.

The implementing language (PLC, C++, Matlab) is unimportant.

The following sample shows the realization:

Sample12: Module communication: IO mapping used [306]

IO Data Pointer

Direct memory access is also possible within a task via the Data Area Pointers, which are created in the TMC Editor.

If several callers of a task or callers from other tasks occur, the user must ensure the data consistency through appropriate mechanisms. Data pointers are available for C++ and Matlab.

The following sample shows the realization:

Sample10: Module communication: Use of data pointers [277]

Method calls via interfaces

As already described, TcCOM modules can offer interfaces that are also defined in the TMC editor. If a module implements them (<u>"Implemented Interfaces" in the TMC editor [>126]</u>), it offers appropriate methods. A calling module will then have an "Interface Pointer" to this module in order to call the methods.

These are blocking calls, meaning that the caller blocks until the called methods come back and the return values of the methods can thus be directly used. If several callers of a task or callers from other tasks occur, the user must ensure the data consistency through appropriate mechanisms.

The following samples show the realization:

Sample11: Module communication: PLC module calls a method of a C-module [278]

Sample11a: Module communication: C-module cites a method in the C-module [306]

Further samples exist for the communication with the PLC [> 324].

ADS

As the internal communication of the TwinCAT system in general, ADS can also be used to communicate between modules. Communication in this case is acyclic, event-controlled communication.

At the same time ADS can also be used to collect or provide data from the UserMode and communicate with other controllers (i.e. via the network). ADS can also be used to ensure data-consistent communication, e.g. between tasks/cores/CPUs. In this case TcCOM modules can be both clients (requesters) and servers (providers). The implementing language (PLC, C++, Matlab) is unimportant.

The following samples show the realization:

Sample03: C++ as ADS server [> 258]

Sample06: UI-C#-ADS client uploads the symbols from the module [268]

Sample07: reception of ADS notifications [273]

Sample08: provision of ADS-RPC [> 274]

7 Modules - Handling

TcCOM modules are implemented and loaded after a build.

This section describes the handling of modules when they are exchanged between systems.

A distinction must be made between the two C++ project types:

- <u>C++ projects [) 49]</u> that create a sys file to load them by the operating system.
- <u>Versioned C++ projects</u> [▶ <u>49</u>] that create a tmx file to load them with the <u>TwinCAT Loader</u> [▶ <u>53</u>] (from TwinCAT 3.1 Build 4024).

Beckhoff recommends using <u>versioned C++ projects [\blacktriangleright 49]</u> as standard. The advantages they offer include the following:

- <u>Driver signature [) 31]</u> via OEM certificates that can be obtained from Beckhoff.
- <u>Versioned storage [> 53]</u> of the binaries.
- <u>Online Change capability [> 164]</u>, if required.

Also see about this

- Export to TwinCAT 3.1 4022.xx [▶ 50]
- Import up to TwinCAT 3.1 4022.xx [▶ 51]

7.1 Versioned C++ Projects

From TwinCAT 3.1 Build 4024.0

The functionality described here is available from TwinCAT 3.1. 4024.0.

Versioned TwinCAT C++ projects result in an architecture-dependent TMX file during building and are loaded via the <u>TwinCAT Loader [\blacktriangleright 53]</u>. They must be signed by a TwinCAT user certificate.

If a C++ project was created using the template "Versioned C++ Project", the binary files are stored by a publish in the TwinCAT repository under *C:\TwinCAT\3.x\Repository* at a vendor- and version-specific location.

From here required modules are transferred to the target system under C:\TwinCAT\3.1\Boot\Repository, if they are needed.

This can be either at the time of activation (**Activate Configuration**) or at the time of the <u>Online Change</u> $[\blacktriangleright 164]$.

Additionally, it is possible to create an archive for the transfer between engineering systems of the binary version of this project, which is configured by the <u>project properties</u> [**>** 160].

7.2 Non-versioned C++ projects

TwinCAT C++ drivers (.sys files) are loaded via the Windows operating system. These are kernel-mode drivers which are subject to the normal requirements of the operating system with regard to loading.

If a C++ project has been created using the TwinCAT Driver Project template, the binary files are stored in the TwinCAT folder under C:\TwinCAT\3.x\CustomConfig\Modules by a publish.

From here the driver is transferred to the target system under C:\TwinCAT\3.x\Driver if it is needed.

Additionally, it is possible to create an archive for the transfer of the binary version of this project, which is configured by the project properties [\blacktriangleright 160].

Up to TwinCAT 3.1 4022.xx

Before Release 4024.0, the handling of the export and import functionality was somewhat different, which is documented on the subpages.

7.2.1 Export to TwinCAT 3.1 4022.xx

This article describes how to export a TwinCAT 3 driver that can run on any other TwinCAT PC.

The following steps have to be carried out

- 1. Implement a TwinCAT 3 C++ project on an engineering PC equipped with a Visual Studio version, see quick start sample <u>Create a TwinCAT 3 project</u> [▶ <u>60</u>]. Implement the TwinCAT modules as described, compile and test the modules contained in the project before export.
- 2. Since the result should be able to be used on any machine, TwinCAT generates a 32-bit and a 64-bit version.

Since x64 drivers must be signed, a certificate must be installed on the machine that exports the module. See <u>x64: Driver signing [\blacktriangleright 25]</u>, how to generate and install a certificate.

(This step can be omitted on an engineering or 32-bit system)

- 3. To export a TC 3 C++ project, right-click on the module project in the solution tree and select **TwinCAT Publish Modules**.
 - ⇒ The project is then compiled (rebuild) the successful export is displayed in the **Build** output window.

Please note the successful message at the end:

Output

The binary files and the TMC module description are exported to the TempContr folder under *C:* *TwinCAT*\3.x\CustomConfig\Modules.

BECKHOFF

4. For the import, simply copy the TempContr folder to any other TwinCAT 3 machine.

7.2.2 Import up to TwinCAT 3.1 4022.xx

This article describes how a TC3-C++ driver can be imported and integrated into a PC/IPC controller with TwinCAT 3 XAE (without full version of Visual Studio).

The binary TC3-C++ driver was previously implemented and <u>exported [> 50]</u> on another PC.

The following steps have to be carried out

1. Copy the TC3-C++ driver on the second IPC with TwinCAT XAE without the full version of Visual Studio into the destination folder ..*TwinCAT\3.x\CustomConfig\Modules*. The *TestDriver.zip* archive is unpacked in this sample.

- 5. Create a new task.
- 6. Go to the **context** of the module instance and link the C++ module instance with the previously added **Task 1**.
- 7. Activate the configuration.

7.3 Starting Modules

TwinCAT C++ modules can be started in two ways:

- Operating system: The operating system starts the TwinCAT module as a normal driver.
 - ∘ On x64bit-PCs the operating system requires a signature, see <u>Driver signing [▶ 25]</u>.

- <u>TwinCAT Loader: [) 53]</u> The TwinCAT Loader starts the TwinCAT module.
 - The TwinCAT Loader requires <u>a signature [> 25]</u> with TwinCAT user certificate.
 - This option is mandatory for <u>encrypted modules [> 55]</u>.
 - The TwinCAT Loader is required for the <u>versioned C++ projects</u> [) 99].

Via System -> TcCOM Modules -> Class Factories tab you can see whether the TwinCAT Loader or the operating system is used:

B Driver signing [▶ 26]

7.4 TwinCAT Loader

From TwinCAT 3.1 Build 4024.0

The functionality described here is available from TwinCAT 3.1. 4024.0.

TwinCAT 3 has an integrated function for loading modules.

Modules loaded with the TwinCAT Loader

- must be signed: <u>Test signing</u> [▶ 53]
- **can** be encrypted: <u>Encrypting Modules</u> [▶ <u>55]</u>, for which the TwinCAT software Protection must be configured with a user DB.

7.4.1 Test signing

The test signature for TwinCAT can be carried out with the same TwinCAT user certificate as for the actual delivery (see <u>Driver signing [} 26]</u>).

1. For test operation, e.g. during software development, the creation of a TwinCAT user certificate, as described <u>here</u>, is sufficient. Make sure that you select the purpose "Sign TwinCAT C++ executable (*.tmx)". For this the Crypto version 2 is required, a message appears.

ertificates	Database	Users	Groups	Object	Protection	Rights

								Ye	25	No	7

- On XAR (and XAE, if local test) activate the test mode so that Windows can accept the self-signed certificates. This can be done on both engineering systems (XAE) and runtime systems (XAR).
- 3. Execute the following using the "Run as administrator" option: bcdedit /set testsigning yes and restart the target system.

⇒ If test signing mode is enabled, this is displayed at the bottom right of the desktop. The PC now accepts all signed drivers for execution.

- 4. You may have to switch off "SecureBoot" for this, which can be done in the bios.
- 5. During the initial activation (Activate Configuration) with a TwinCAT user certificate, the target system will determine that the certificate is not trusted and the activation process will be aborted:

A local user with administrator rights can trust the certificate through simple running via the created REG file.

This process only enables modules with a signature from the trusted TwinCAT user certificates to run.

6. Following this process you can use the TwinCAT user certificate for signing with the test mode of the operating system.

This is configured in the project properties [▶ 161].

Use the <u>TcSignTool</u> [\blacktriangleright <u>57</u>] to avoid storing the password of the TwinCAT user certificate in the project, where it would also end up in version management, for example.

If you have this TwinCAT user certificate countersigned by Beckhoff, you can also use it for delivery without TestMode.

7.4.2 Encrypting Modules

TwinCAT C++ modules loaded via the TwinCAT Loader (TMX files) can be encrypted, i.e. a key protects the content of the driver against manipulation and reverse engineering at file level.

No debugging

Encrypted modules cannot be searched for errors. Encrypted modules are not displayed in the debugger.

Module encryption is enabled as follows:

- $\checkmark\,$ The TwinCAT software protection must be configured.
- ✓ A TwinCAT user certificate with Sign UserDB rights is required.
- 1. In the system tree, select the Solution User DB Key as the Boot File Encryption Key.

TwinCAT Project2 😔 🗙 Module1.cpp Module1.h	 Solution Explorer

- 3. To start, an encrypted module must be loaded with the TwinCAT Loader (not the operating system).
- ⇒ For non-versioned drivers: The drivers are encrypted during transfer to the _deployment directory of the project.
- ⇒ For versioned TMX: The drivers are stored unencrypted in XAE and encrypted when they are activated on the target system.
- ⇒ If the function is used with versioned C++ projects, the TMX files are stored in the <u>repository</u> [▶ <u>49</u>] as usual.

TwinCAT C++ modules can be started in two ways:

- Operating system: The operating system starts the TwinCAT module as a normal driver.
 - On x64bit-PCs the operating system requires a signature, see <u>Driver signing [▶ 25]</u>.
- <u>TwinCAT Loader: [) 53]</u> The TwinCAT Loader starts the TwinCAT module.
 - The TwinCAT Loader requires <u>a signature [> 25]</u> with TwinCAT user certificate.
 - This option is mandatory for <u>encrypted modules [> 55]</u>.

• The TwinCAT Loader is required for the versioned C++ projects [▶ 99].

Via System -> TcCOM Modules -> Class Factories tab you can see whether the TwinCAT Loader or the operating system is used:

B Driver signing [▶ 26]

7.4.3 Return Codes

Loading a module with the TwinCAT Loader can fail for various reasons.

Here is a list of the return codes:

Hex	Dec	Description
0xC1	193	File is corrupted; PE file checksum error
0x241	577	Signature error: TwinCAT user certificate does not match the file hash
0x4FB	1275	Signature error: File not signed
0x1772	6002	File is encrypted, but cannot be decoded with known keys.

7.4.4 TcSignTool - Storage of the certificate password outside the project

The TcSignTool can be used to store a password for a TwinCAT user certificate in the registry. Thus, the password is not needed in the projects, where the passwords would end up unintentionally in version control systems.

The TcSignTool is a command line program located in the path C:\TwinCAT\3.x\sdk\Bin\.

The storage of the password is carried out with the following parameters:

tcsigntool grant /f "C:\TwinCAT\3.1\CustomConfig\Certificates\MyCertificate.tccert" /p MyPassword

The password is deleted with the following parameters:

tcsigntool grant /f "C:\TwinCAT\3.1\CustomConfig\Certificates\MyCertificate.tccert" /r

The unencrypted password is stored under HKEY CURRENT USER\SOFTWARE\Beckhoff\TcSignTool\

8 TwinCAT C++ development

Overview of the development environment

The layout of Visual Studio is flexible and adaptable, so that only a brief overview of a common configuration can be provided here. The user is free to configure windows and arrangements as required.

- In the TwinCAT solution, a TwinCAT C++ project can be created by right-clicking on the C++ icon. This project contains the sources ("Untitled Project") of perhaps several <u>modules [▶ 35]</u>, and module instances ("Untitled1_Obj1 (CModule1)") can be created. The module instances have inputs/outputs, which can be linked in the usual way ("Link"). There are <u>further options [▶ 46]</u> for module interaction.
- The Visual Studio editor for Visual C++ is used for programming. Note in particular the drop-down boxes for fast navigation within a file. In the lower section the result of the compile process is output. The user can switch to TwinCAT messages (cf. <u>Module messages for the Engineering (logging / trac-ing) [▶ 229]</u>).

The usual features such as breakpoints (cf. <u>Debugging [▶ 91]</u>) can be used in the editors.

3. The freely configurable toolbar usually contains the toolbar for TwinCAT XAE Base. Activate Configuration, RUN, CONFIG, Choose Target System (in this case <Local>) and several other buttons provide fast access to frequently used functions. The TwinCAT Debugger is the button for establishing a connection to the target system with regard to C++ modules (the PLC uses an independent debugger). Like in other C++ programs, and in contrast to PLC, in TwinCAT C++ a distinction has to be made between "Release" and "Debug". In a build process for "Release", the code is optimized to such an extent that a debugger may no longer reliably reach the breakpoints, and incorrect data may be displayed.

Procedure

This section describes the processes for programming, compiling and starting a TwinCAT C++ project.

It provides a general overview of the engineering process for TwinCAT C++ projects with reference to the corresponding detailed documentation. The quick start guide describes the individual common steps.

1. Type declaration and module type:

The <u>TwinCAT Module Class Editor (TMC) [\blacktriangleright 103] and TMC code generator is used for the definition of data types and interfaces, and also for the modules that use these.</u>

The TMC code generator generates source code based on the processed TMC file and prepares data types / interfaces for use in other projects (like PLC).

Editing and starting the code generator can take place as often as you like – the code generation pays attention to programmed user code and saves it.

2. Programming

The familiar Visual Studio C++ programming environment is used for the development and <u>debugging</u> [<u>91</u>] of the user-defined code within the code template.

3. Instantiating modules [▶ 35]

The program describes a class, which is instantiated as objects. The <u>TwinCAT Module Instance</u> <u>Configurator [▶ 146]</u> is used for configuring the instance. General configuration elements are: assign task, download symbol information for runtime (TwinCAT Module Instance (TMI) file) or define parameter/interface pointer.

4. Mapping of variables

The input and output variables of an object can be linked with variables of other objects or PLC projects, using the standard TwinCAT System Manager.

5. Building

During the building (compilation and linking) of the TwinCAT C++ project, all components are compiled for the selected platform. The platform is determined automatically when the target system is selected.

- 6. Publishing (see Export to TwinCAT 3.1 4022.xx [▶ 50] / Import up to TwinCAT 3.1 4022.xx [▶ 51]) During publishing of a module, the drivers for all platforms are created, and the module is prepared for distribution. The created directory can be distributed without the need to transfer the source code. Only binary code with the interface description is transferred.
- 7. Signature (see Driver signing [> 25])

The TwinCAT drivers must be signed for x64 run times, since 64-bit Windows versions require that kernel modules are signed. Therefore, this applies both to the x64 creation and to the <u>publication of modules [\blacktriangleright 233]</u>, because these modules contain the x64 binary codes (if not deactivated). The signature process can be <u>user-defined [\blacktriangleright 30]</u>.

8. Activation

The TwinCAT C++ driver can be activated like any other TwinCAT project via **Activate Configuration**. The dialog then requests to switch TwinCAT to RUN mode.

<u>Debugging [> 91]</u> in real-time (which is familiar from IEC61131-based systems) and the setting of (conditional) breakpoints is possible for TwinCAT C++ modules.

⇒ The module runs under real-time conditions.

9 Quick Start

This quick start shows how you can familiarize yourself with the TwinCAT C++ module engineering in a short time. Each step in the creation of a module that runs in a real-time context is described in detail.

Three different scenarios are discussed:

- TwinCAT driver projects, which were common up to 4022. These modules are loaded by the operating system and are unversioned in binary form.
- TwinCAT versioned C++ projects, which are recommended for new projects from 4024.0 or higher. Modules based on such project are loaded by TwinCAT and stored versioned in binary form.
 - We illustrate how to switch between the different versions via Online Change, using versioned C++ projects as a basis.

Before the quick start, please pay attention to the <u>preparation - just once!</u> Prepare the respective driver signing.

9.1 Create TwinCAT 3 project

Start the TwinCAT Engineering Environment (XAE)

Microsoft Visual Studio can be started via the TwinCAT SysTray icon.

The Visual Studio versions recognized during the installation and supported by TwinCAT are thereby offered. Alternatively, Visual Studio can also be started via the Start menu.

TwinCAT 3 C++ - Build Project

Carry out the following steps to create a TwinCAT C++ project:

1. Select New TwinCAT Project ... via the Start page.

- 2. Alternatively, create a project by clicking on: File -> New -> Project.
 - ⇒ All existing project templates are displayed.
- 3. Select **TwinCAT XAE Project** and optionally enter a suitable project name.
- 4. Click on **OK**. From now on you cannot select or change the name of the directory. Retain the default settings (selected option **Create directory for solution**).

New Project	New Project					
▷ Recent		.NET Framework 4.5	- Sort by: Default	- # E	Search Installed Templates (Ctrl+E)

<u>N</u> ame:	TwinCAT Project	1				
Location:	C:\tmp\			•	Browse	
Solution name: TwinCAT Project		1			Create directory for solution Add to source control	
					OK Cancel	

⇒ The Visual Studio Solution Explorer then displays the TwinCAT 3 project.

9.2 Create TwinCAT 3 C++ project

After creating a TwinCAT 3 project, open the C++ node and carry out the following steps:

1. Right-click C++ and choose Add New Item....

If the green C++ symbol is not listed, this means that either a target device is selected that doesn't support TwinCAT C++ or the TwinCAT solution is currently open in a version of Visual Studio that is not C++-capable (cf. Requirements [> 20]).

⇒ The "<u>TwinCAT C++ Project Wizard [▶ 99]</u>" is shown and all existing project templates are listed.

- 2. Select one of the quick start options:
 - TwinCAT driver project: These modules are loaded by the operating system and are subject to its signing requirements as described here [> 26]. Driver projects were used routinely up to TwinCAT 3 4022. For 4024 or higher they should only be used if there is an extension in an existing environment, for example. With these modules no Online Change is possible.

The quick start instructions for this project type continue here [63].

TwinCAT Versioned Project: These modules are loaded by TwinCAT and are subject to the <u>signing</u> requirements [> 31] described for this purpose. There is a versioned storage of the compilations, between which - if desired - can be switched as online change.
 The quick start instructions for this project type continue here [> 78]

The quick start instructions for this project type continue <u>here [\blacktriangleright 78]</u>.

- The TwinCAT Static Library Project is not explained as part of the quick start. <u>Sample25: Static Library</u> [▶<u>317]</u>
- 3. Confirm with OK or double-click.
- \Rightarrow The C++ project has been created and the TwinCAT module wizard starts up.

Also see about this

■ TwinCAT Module Class Wizard [▶ 100]

9.3 TwinCAT 3 Driver

The following sections describe the handling of a TwinCAT 3 Driver Project. They guide you through code generation, modification and activation of the configuration on a target system.

9.3.1 Creating a TwinCAT 3 C++ module in the TwinCAT Driver Project

Once a TwinCAT 3 C++ project has been created, the <u>TwinCAT module wizard [> 100]</u> starts automatically in order to create a module.

1. In this case, select **TwinCAT Module Class with Cyclic I/O** and click on **OK**. A name is not necessary and also cannot be entered here.

2. Enter a unique name in the **TwinCAT Class Wizard** dialog box or continue with the **Object1** suggestion.

⇒ A TwinCAT 3 C++ project with a driver will then be created on the basis of the selected template:

Also see about this

- Requirements [> 20]
- TwinCAT C++ Project Wizard [▶ 99]
- Sample25: Static Library [▶ 317]

9.3.2 Implement TwinCAT 3 C++ project

This article describes how the sample project can be changed.

The implementation begins after creating a TwinCAT C++ project and opening *MyClass>.cpp* (*Module1.cpp* in this sample).

BECKHOFF

1. The <*MyClass*>::*CycleUpdate()* method is cyclically called – this is the point where the cyclic logic is to be positioned. The entire cyclic code is inserted at this point. The dropdown menus at the top of the editor can be used for navigation.

2. In this case a counter is incremented by the value of the "Value" variable in the input image (m_Inputs). Replace a line in order to increment the counter without dependence on the value of the input image. Replace this line m counter+=m Inputs.Value;

```
m_counter+=m_inputs.value
with this one
m_counter++;
```

3. Save the modifications.

9.3.3 Create TwinCAT 3 C++ Module instance

An instance of the module must be created in order to execute it. Several instances of a module can exist.

After creating a TwinCAT C++ module, open the C++ Configuration node and follow these steps to create an instance.

1. Right-click on the C++ module (in this case "Untitled1") and select Add New Item....

- ⇒ All existing C++ modules are listed.
- 2. Select a C++ module. You can use the default name or alternatively enter a new instance name and confirm with **OK** (in this sample the default name was selected).

Insert TcCc	m Object			
Search:	Name: Untitle	ed1_Obj2 (CModule1)		ОК
Туре:	E ₩ C++ Module Vendor ₩ C++ Modules ₩ CModule1 [Module]		C Multiple:	ancel

⇒ The new instance "Untitled1_Obj2 (CModule1)" becomes part of the TwinCAT 3 solution: the new node is located precisely under the TwinCAT 3 C++ source "Untitled1 Project".

The module already provides a simple I/O interface with 3 variables in each case:

- · Input area: Value, Status, Data
- Output area: Value, Control, Data

The description of these interfaces corresponds in two places:

"<Classname>Services.h" (in this sample "Untitled1Services.h")

BECKHOFF

• "TwinCAT Module Configuration".tmc file (in this sample "Untitled1.tmc")

9.3.4 Create a TwinCAT task and apply it to the module instance

This page describes the linking of a module instance to a task, so that the cyclic interface of the module is called by the TwinCAT real-time system.

This configuration step only has to be carried out once. No new task needs to be configured for subsequent creations/new compilations of the C++ module in the same project.

Creating a TwinCAT 3 task

1. Open System, right-click on Tasks and select Add New Item....

Enter a unique name for the task (or retain the default name).
 In this sample the I/O image interface is provided by a C++ module instance, so that no image is necessary at the task for triggering the execution of the C++ module instance.

⇒ The new task with the name "Task 1" has been created.

 The task can now be configured; double-click on the task to do this. The most important parameters are Auto start and Priority: Auto start must be activated in order to automatically start a task that is to be cyclically executed. The Cycle ticks define the timing of the clock in relation to the basic clock (see real-time settings).

BECKHOFF

⇒ On completion of this step the Interface Pointer is configured as a CyclicCaller. The configuration is now complete!

9.3.5 Compiling/building a TwinCAT 3 C++ project

This article describes how an already implemented C++ module class is created (compiled).

1. Select the target platform according to which the compilation should be carried out. TwinCAT checks this setting when selecting a target system and changes it if necessary after a prompt. The project is also deactivated if an unsupported target platform is selected.

2. Right-click on the TwinCAT 3 C++ project and select **Build** or **Rebuild**.

⇒ The compiler output window must look like this if the code has been correctly written (i.e. no syntax errors):

```
1>Untitled3.vcxproj -> C:\TwinCAT\3.1\SDK\\_products\TwinCAT RT (x64)\Release\Untitled3.sys
1>Signing output with Windbws certificate 'MyTestSigningCert'
1>Done Adding Additional Store
1>Successfully signed: C:\TwinCAT\3.1\SDK\\_products\TwinCAT RT (x64)\Release\Untitled3.sys
1>
1>Done building project "Untitled3.vcxproj".
========= Rebuild All: 1 succeeded, 0 failed, 0 skipped =========
```

- 3. Verify that it was successful, indicated by "Successfully signed". If this message does not appear, check the <u>operating system driver signing [▶ 26]</u> setting.
- ⇒ Following successful compilation/creation, the new TwinCAT C++ module is provided for the specific target platform in the "_Deployment\" subfolder of the project directory.

9.3.6 TwinCAT 3 enable C++ debugger

To prevent all dependencies from being loaded for <u>debugging [\triangleright 91]</u>, this function is switched off by default and must be activated once before the activation of the configuration.

- 1. Select **C++ Debugger** on the C++ node of the Solution tab.
- 2. Select Enable C++ Debugger.

3. Switch Enable C++ Debugger on.

9.3.7 Activating a TwinCAT 3 project

Once a TwinCAT C++ project has been created, compiled and made available, the configuration must be activated:

1. Click on the symbol **Activate Configuration** – all required files for the TwinCAT project are transferred to the target system:

2. In the next step, confirm the activation of the new configuration. The previous old configuration will be overwritten.

3. If you have no license on the target system, you will be offered the option to create a 7-day trial license. This can be repeated any number of times.

4. TwinCAT 3 automatically asks whether the mode should be switched to Run mode.

- ⇒ In the case of **OK**, the TwinCAT 3 project switches to Run mode. In the case of **Cancel**, TwinCAT 3 remains in **Config mode**.
- After switching to Run mode, the TwinCAT System Service symbol at the bottom in Visual Studio lights up green.

9.3.8 Debug TwinCAT 3 C++ project

This article describes the debugging of the TwinCAT 3 C++ example project.

Attachment to the C++ runtime

After switching on the C++ debugging in the TwinCAT project and activating the complete project, the TwinCAT Engineering (XAE) can now be used to connect to the target system for debugging.

1. A) Click on the **Attach...** button familiar from Visual Studio in order to connect to the TwinCAT debugger on the target system:

B) Alternatively, select **Debug -> Attach to process...** in the Visual Studio environment:

TwinCAT Project1 - Microsoft Visual Studio (Administrator)

Monitoring C++ module member variables (without breakpoints)

The normal Visual Studio debugging mechanism is available – setting of breakpoints, step execution, etc. Their usage depends on the process to be monitored:

If TwinCAT runs on a real machine with axis movements, the user will probably not wish to set any breakpoints just for monitoring variables. On reaching a breakpoint the execution of a task would be stopped and, depending on the configuration, the axis would immediately come to a halt or, perhaps even worse, would continue to move in an uncontrolled fashion – a very unfavorable situation.

TwinCAT 3 therefore offers the option to monitor process variables without setting breakpoints:

1. Select Debug -> Windows -> TwinCAT Live Watch

FILE EDIT VIEW PROJECT BUILD	DEB	UG TWINCAT	PLC	TEAM	TOOLS	TEST	SO	OPE	ADS	ANALYZE	WINDOW	HEL
G • O 👸 • 🛅 • 🚔 💾 🧩 🐰		Windows				•	•	Break	points		Ctrl+Alt+B	L

Setting breakpoints

The setting of breakpoints in the conventional way is also possible.

A WARNING

Damage to plants and personal injuries due to unexpected behavior of the machine / plant

Breakpoints change the behavior of the machine or plant. Depending on the machine being controlled, the machine or workpieces may be damaged or the health and life of people may be endangered.

Make sure that the changed behavior of the controlled system does not cause any damage and be sure to note the plant documentation.

Detaching the debugger from the process

Click on Debug ->	Detach All.

9.4 TwinCAT 3 Versioned Project

The following sections describe the handling of a TwinCAT 3 Versioned C++ Project. They guide you through code generation, modification and activation of the configuration on a target system. The Online Change can optionally be included in the code and executed.

9.4.1 Create TwinCAT 3 C++ project

Once a TwinCAT 3 C++ project has been created, the <u>TwinCAT module wizard [▶ 100]</u> starts automatically in order to create a module.

At this point a decision is made as to whether the module should be prepared for an Online Change.

1.

- If Online Change is required, select TwinCAT Module Class Online Changeable and click OK.
- If Online Change is not required, select TwinCAT Module with Cyclic IO

2. A name is not necessary and also cannot be entered here.

		? ×
Sort by: Default		Search (Ctrl+E)
TwinCAT Module Class	TwinCAT C++ Module	Type: TwinCAT C++ Module Creates a new TwinCAT module class
TwinCAT Module Class with ADS port	TwinCAT C++ Module	which is online changeable. It requires a TwinCAT C++ Project with version.
TwinCAT Module Class with Cyclic Caller	TwinCAT C++ Module	
TwinCAT Module Class with Cyclic IO	TwinCAT C++ Module	
TwinCAT Module Class with Data Pointer	TwinCAT C++ Module

9.4.2 TwinCAT 3 C++ Configure project

- ✓ You have got a created TwinCAT C++ project.
- 1. Right-click the project to open the properties.
- 2. Activate TwinCAT Signing.
- 3. If you have not yet created a TwinCAT user certificate, follow the instructions and observe to select the **Sign TwinCAT C++ executeables**.
- Enter the file name of the TwinCAT user certificate and the password. (Note that this is stored unencrypted in the solution and is therefore also loaded on servers via version control, for example. If necessary use the <u>TcSignTool</u> [▶ <u>57</u>].)

9.4.3 Implement TwinCAT 3 C++ project

This article describes how the sample project can be changed.

The implementation begins after creating a TwinCAT C++ project and opening <MyClass>.cpp (Module1.cpp in this sample).

1. The <MyClass>::CycleUpdate() method is cyclically called – this is the point where the cyclic logic is to be positioned. At this point, add the entire cyclic code. Use the drop-down menu at the top of the editor for navigation.

2. In this case a counter is incremented by the value of the Value variable in the input image (m_Inputs). Replace a line in order to increment the counter without dependence on the value of the input image. Replace this line

```
m_counter+=m_Inputs.Value;
with this line
m_counter++;
```

- 3. Save the modifications.
- 4. If you have prepared the module for Online Change, please note that version 0.0.0.1 has been implemented here, as you can see in the TMC editor.

Solution Explorer	- ₽ ×	Untitled1.tmc [TMC Editor] 🐵 🗡 Mod	Jule1.cpp Module1.h 🗸

9.4.4 Publish TwinCAT 3 C++ project in version 0.0.0.1

Once a TwinCAT C++ project has been created, compiled and made available, the configuration must be activated.

1. Click on the symbol **Activate Configuration** – all required files for the TwinCAT project are transferred to the target system:

⇒ The module is published in version 0.0.0.1 with the incremental counter on the engineering device.

9.4.5 Implement and publish TwinCAT 3 C++ project version 0.0.0.2

These steps are only necessary if you have previously prepared the module for Online Change.

This article describes how to change the sample project to create a version 0.0.0.2. This can later be exchanged on the target system via Online Change

In <MyClass>.cpp (in this sample Module1.cpp) the implementation can be changed.

- Replace a line to decrement the counter instead of incrementing it. Replace this line m_counter++;
- 2. with this
 m_counter--;
- 3. Save the modifications.

4. Start the Code Generator to take over any possible changes.

5. Parameterize version 0.0.0.2 in the TMC Editor.

Solution Explorer		Untitled1.tmc [TMC Editor] 👳 🗙 Mod	odule1.cpp Module1.h
◎ ◎ ☆ 🛱 -] で - ≒ ฮ 🗿 👂 🗕		S 🤸 💽 🔩

Search Solution Explorer (Ctrl+;) Solution 'TwinCAT OCDemoProject' (1 project) Solution 'TwinCAT OCDemoProject Solution 'TwinCAT	• م		Edit the basic information about the TMC file.
D Untitled1.rc			
*+ Untitled1ClassFactory.cpp			
TMC Files			
b TwinCAT OS Files		•	I

6. Publish this version as well:

 \Rightarrow There are two versions of a module, which can be exchanged during runtime.

9.4.6 Create TwinCAT 3 C++ Module instance

An instance of the module must be created in order to execute it. Several instances of a module can exist.

After creating a TwinCAT C++ module, open the **C++ Configuration** node and follow these steps to create an instance.

1. Right-click on the C++ module (in this case "Untitled1") and select Add New Item....

- ⇒ All existing C++ modules are listed.
- 2. Select a C++ module. You can use the default name or alternatively enter a new instance name and confirm with **OK** (in this sample the default name was selected).

Insert TcCo	om Object	
Search:	Name: Untitled1_Obj2 (CModule1)	ОК
Туре:	EIII C++ Module Vendor EIII C++ Modules IIII CModule1 [Module]	Cancel Multiple: 1

⇒ The new instance "Untitled1_Obj2 (CModule1)" becomes part of the TwinCAT 3 solution: the new node is located precisely under the TwinCAT 3 C++ source "Untitled1 Project".

The module already provides a simple I/O interface with 3 variables in each case:

- · Input area: Value, Status, Data
- Output area: Value, Control, Data

The description of these interfaces corresponds in two places:

- BECKHOFF
 - "<Classname>Services.h" (in this sample "Untitled1Services.h")

• "TwinCAT Module Configuration".tmc file (in this sample "Untitled1.tmc")

9.4.7 Activating a TwinCAT 3 project

Once a TwinCAT C++ project has been created, compiled and made available, the configuration must be activated:

1. Click on the symbol **Activate Configuration** – all required files for the TwinCAT project are transferred to the target system:

2. In the next step, confirm the activation of the new configuration. The previous old configuration will be overwritten.

TwinCAT	KAE	
?	Activate Configuration (Old Configurations will be	overwritten!)
	ОК	Cancel

- 3. If you have no license on the target system, you will be offered the option to create a 7-day trial license. This can be repeated any number of times.
- 4. TwinCAT 3 automatically asks whether the mode should be switched to Run mode.

⇒ In the case of **OK**, the TwinCAT 3 project switches to Run mode. In the case of **Cancel**, TwinCAT 3 remains in **Config mode**.

- BECKHOFF
- 5. For test operation, e.g. during software development, the creation of a TwinCAT user certificate, as described <u>here</u>, is sufficient. Make sure that you select the purpose "Sign TwinCAT C++ executable (*.tmx)". For this the Crypto version 2 is required, a message appears.

ertificates	Database	Users	Groups	Object Pr	otection	Rights				
Name		Uniq	ue		Status	Issue	(UTC)	Expire (UTC)	Permissions

Reiss	sue Exist			?		2 which		T C++ executable signir d by TwinCAT 3.1.4024 ;		
								Yes	No	

⇒ After switching to Run mode, the TwinCAT System Service symbol at the bottom in Visual Studio lights up green.

9.4.8 TwinCAT 3 C++ Implement project Online Change

These steps are only necessary if you have previously prepared the module for Online Change.

- ✓ Running TwinCAT C++ project as described above.
- 1. Switch to the **TcCOM Objects** overview of the **SYSTEM** area and there to the **Online Changeable Objects** tab.

- 3. In the column **Online Version** the currently running version is preselected and marked with the extension (Current).
- 4. Set a different version.
- 5. Activate this change by right-clicking and Apply changed online object versions on the target.

⇒ The version change was made on the target

Activating a TwinCAT 3 project [87]

10 Debugging

TwinCAT C++ offers various mechanisms for debugging TwinCAT C++ modules running under real-time conditions.

Most of them correspond to the mechanisms that are familiar from the normal C++ development environment. The world of automation requires additional, slightly different debugging mechanisms, which are documented here.

In addition, we provide an overview of Visual Studio tools that can be used in TwinCAT 3. These were extended, so that data from the target system are displayed.

Debugging must be enabled.

This is configured via the C++ node of the solution:

1. Double-click on the C++ node and switch to the C++ Debugger tab to access the checkbox.

 For all debugging in TwinCAT C++, connect the TwinCAT Engineering with the runtime system (XAR) via the TwinCAT Debugger button.

	FILE	EDIT	VIEW	PROJECT	BUILD	DEBUG	TWINCAT	PLC	TEAM	SQL	TOOLS	TEST	SCOPE	
							9 - C -	🕨 Twi	nCAT Deb	ougger	-		~ D),
3	š 🔥	#	2 🔍	6	a <loo< td=""><td>cal></td><td>•</td><td>₽ ³</td><td></td><td></td><td></td><td></td><td>• E %</td><td></td></loo<>	cal>	•	₽ ³					• E %	

Breakpoints and step-by-step execution

In most cases when debugging a C++ program, breakpoints are set and the code is then executed step by step while observing the variables, pointers, etc.

In the context of the Visual Studio debugging environment, TwinCAT offers options to run real-time-executed code step by step. To set a breakpoint, you can navigate through the code and click on the gray column on the left adjacent to the code or use the hotkey (normally F9).

WARNING

Damage to plants and personal injuries due to unexpected behavior of the machine / plant

Breakpoints change the behavior of the machine or plant. Depending on the machine being controlled, the machine or workpieces may be damaged or the health and life of people may be endangered.

Make sure that the changed behavior of the controlled system does not cause any damage and be sure to note the plant documentation.

On reaching the breakpoint (indicated by an arrow), the execution of the code is stopped.

The code is executed step by step by pressing **Step Over** (Debug menu, toolbar or hotkey F10). The familiar Visual Studio functions **Step in** (F11) and **Step out** (Shift + F11) are also available.

Conditional breakpoints

A more advanced technology allows the setting of conditional breakpoints – the execution of code is only stopped at a breakpoint if a condition is fulfilled.

TwinCAT offers the implementation of a conditional breakpoint as part of the Visual Studio Integration. To set a condition, first set a normal breakpoint and then right-click on the red dot in the breakpoint column.

Select **Condition...** to open the condition window:

Breakpoint Condition	8 🕅
When the breakpoint location is reached, the expression is evaluat is hit only if the expression is true or has changed.	ted and the breakpoint
Condition:	
m_counter <= 10000	
Is true	
Has changed	
ОК	Cancel

Details of the conditions and how they are to be formulated can be found <u>here [> 94]</u>.

Live Watch

When engineering and developing machines, it is not always advisable to stop the system at a breakpoint because this will affect the behavior.

The TwinCAT PLC projects offer an online view and handling of the variables in the RUN state, without having to interrupt the real-time.

TwinCAT C++ projects offer a similar behavior for C++ code via the **Live Watch** window.

The Live Watch window can be opened via **Debug->Windows->TwinCAT Live Watch**. To open the window, first establish a connection with the real-time system (press the **TwinCAT Debugger** button), whereupon Visual Studio switches to the debug view, otherwise no data can be provided.

TwinCAT Live Watch		▼ □ ×
Arranged by Object ID	Search	٩
M_parentObjld > m_objName > m_spSrv > m_eTcomState > m_ePendState > m_accessCnt > m_Trace m_TraceLevelMax > m_Parameter Value Status Data		
Name	Value	Туре
(Oid:01010010).m_counter		unsigned int
(*((Oid:01010010).m_pInputs)).Value	0123	unsigned long
2 Items 1 changed		

The TwinCAT Live Watch window is divided into two areas.

In the upper area all member variables can be explored. By double-clicking on it they are added to the lower area, where the current value is then displayed.

You can edit these values by clicking on the value in the **Value** field. The new value is highlighted in red. To write the value, press the symbol in the upper left corner (1).

Using the import and export symbols under (2), the selected member variables can be saved and later restored.

10.1 Details of Conditional Breakpoints

TwinCAT C++ provides conditional breakpoints. Details of the formulation of these conditions can be found here.

Breakpoint Condition	8 23
When the breakpoint location is reached, the is hit only if the expression is true or has characteristic or ha	ne expression is evaluated and the breakpoint anged.
Condition:	
m_counter <= 10000	
Is true	
Has changed	
	OK Cancel

Unlike the Visual Studio C++ conditional breakpoints, the TwinCAT conditions are compiled and subsequently transferred to the target system so that they can be used during short cycle times.

▲ WARNING

Damage to plants and personal injuries due to unexpected behavior of the machine / plant

Breakpoints change the behavior of the machine or plant. Depending on the machine being controlled, the machine or workpieces may be damaged or the health and life of people may be endangered.

Make sure that the changed behavior of the controlled system does not cause any damage and be sure to note the plant documentation.

The option buttons offer two options that are described separately.

Option: Is true

Conditions are defined with the help of logical terms, comparable to conjunctive normal forms. They are formed from a combination of maxterms connected by "&&".

(Maxterm1 && Maxterm2 && ... && MaxtermN)

wherein each Maxterm represents a combination of || associated conditions:

(condition1 ||condition2 || ... || conditionN)

Possible comparison operators: ==, !=, <=, >=, <, >

Observe the Live Watch window for the determination of the available variables. All listed variables can be used for the formulation of conditions. This includes TMC-defined symbols as well as local member variables.

Samples:

```
m_counter == 123 && hr != 0
m_counter == 123 || m_counter2 == 321 && hr == 0
m_counter == 123
```

Further comments:

- Monitoring module instances: The OID of the object is stored in m_objId, so the monitoring of the OID can look like this m_objId == 0x01010010
- Monitoring of tasks: A special variable #taskId is provided to access the OID of the calling task. E.g. #taskID == 0x02010010

Option: Has changed

The option "Has changed" is simple to understand: By providing variable names, the value will be monitored and execution will be held, if the value has changed from the cycle before.

Samples:

```
m_counter
```

```
m counter && m counter2
```

10.2 Visual Studio tools

Visual Studio makes the usual development and debugging tools available for C++ developers. TwinCAT 3 extends these Visual Studio tools, so that debugging of C++ code that runs on a target system is also possible in TwinCAT 3 Engineering with the Visual Studio tools.

The corresponding advanced tools are briefly described here. If the corresponding windows are not visible in Visual Studio, they can be added via the menu item **Debug** ->**Windows**. The menu is context-dependent, i.e. many of the windows described here only become configurable once a debugger is linked to a target system.

Call stack

The Call Stack is displayed by the Call Stack tool window when a breakpoint has been reached.

Ca	II Stack
	Name
0	Untitled1.sys!CModule1::Add(unsigned long a, unsigned long b, unsigned long* res) Line 227
	Untitled1.sys!CModule1::CycleUpdate(ITcTask* ipTask, ITcUnknown* ipCaller, unsignedint64 context) Line 179
	TcRtsObjects.sys!CADT::ExecTask() Line 602
	TcRtsObjects.sys!CTask::CycleTask() Line 1127
	TcRtsObjects.sys!CTask::TaskEntryPoint() Line 570
	0xfffff8800a4a1574()

Autos / Locals and Watch

The corresponding variables and values are displayed in the **Autos** / **Locals** window when a breakpoint is reached. Changes are shown in RED.

11 Wizards

For ease of entrance in engineering the TwinCAT C++ system provides Wizards.

- The <u>TwinCAT Project Wizard [> 99]</u> creates a TwinCAT C++ project. For Driver projects, the TwinCAT Class Wizard will be started afterwards.
- The <u>TwinCAT Module Class Wizard [▶ 100]</u> is automatically started during creation of a C++ module. This wizard provides different "ready to use" projects as entry points for own development.
- The <u>TwinCAT Module Class Editor</u> [▶ 103] (TMC) is a graphical editor for defining the data structures, parameters, data areas, interfaces and pointers. It generates a TMC file, which will be used by the TMC Code generator.
- From the defined Classes instances will be generated and could be configured via the <u>TwinCAT</u> <u>Module Instance Configurator [▶ 146]</u>

11.1 TwinCAT C++ Project Wizard

After the creation of a TwinCAT project you can add a C++ project with the help of the TwinCAT C++ Project Wizard:

1. Right click on the C++ icon and select Add new Item... to start the C++ project wizard.

TwinCAT offers three C++ projects:

- Driver Project: Projects containing one or more executable modules

- Versioned C++ Projects: Projects that involve revision control. So you obtain the opportunity to switch

between versions at runtime.

- Static library: Projects with C++ functions that are used by (different) TwinCAT C++ drivers.

Add New Item - Twi	inCAT Project4						?	×

- 2. Select one of the project templates and specify a name and location.
 - ⇒ The TwinCAT C++ project is created
- \Rightarrow In the case of a driver, the <u>TwinCAT C++ class wizard [] 100]</u> is started.

11.2 TwinCAT Module Class Wizard

TwinCAT 3 offers various class templates that can be used to create TcCOM object classes:

- TwinCAT Module Class
- TwinCAT Module Class with ADS port
- TwinCAT Module Class with cyclic caller
- TwinCAT Module Class with cyclic input/output
- TwinCAT Module Class with data pointer
- TwinCAT Module Class for real-time context
- TwinCAT Module Class with Online Changeable capability

TwinCAT Modules Class

Creates a new TwinCAT module class.

This is a template generates a basic core module. It has no cyclic caller and no data area, instead it's good as a start point for implementing services called on demand from a caller.

For example when creating a C++ method that will be called from a PLC module or another C++ module.

See <u>Sample11</u> [▶ 278]

TwinCAT Module Class with ADS port

This template offers the C++ module as well as the functionality of an ADS server and ADS clients.

• ADS server:

Can run as a single instance of this template of the C++ module and can be preconfigured with a specific ADS port number (e.g. 25023).

Enables several instances of this template, whereby each C++ module is assigned its own unique ADS port number by TwinCAT 3 (e.g. 25023, 25024, 25025, ...).

The ADS messages can be analyzed and processed thanks to the implementation of the C++ module. ADS handling for accessing input/output data areas does not have to be implemented using its own ADS Message Handling.

 ADS Client: This template provides sample codes to initiate an ADS call by sending an ADS message to an ADS partner.

Since the modules behave like ADS clients or ADS servers that communicate with each other via ADS messages, the two modules (Caller=Client and Called=Server) can run in the same or different real-time contexts on the same or different CPU cores.

Because ADS can work across networks, the two modules can also run on different machines in the network.

See Sample03 [258], ADS Communication [208]

TwinCAT Module Class with cyclic caller

Enables the cyclic call of a C++ program which is cut off from the outside world.

Not often used, a module class with cyclic caller and cyclic I/O is preferred.

TwinCAT Module Class with cyclic input/output

Creates a new TwinCAT module class, which implements the cyclically calling interface and has an input and output data area.

The input and output data areas can be linked with other input/output images or with physical I/O terminals.

Important:

The C++ module has its own logical input/output data storage area. The data areas of the module can be configured with the System Manager.

If the module is mapped with a cyclic interface, copies of the input and output data areas exist in both modules (the caller and the called). In this way, the module can run under a different real-time context and even on another CPU core in relation to another module.

TwinCAT will continuously copy the data between the modules.

See Quick start, sample 01 [▶ 257].

TwinCAT Module Class with data pointer

Just like the TwinCAT Module Class with Cyclic IO, this template also generates a new TwinCAT module class that implements a calling interface with an input and output data area for linking with other logic input/ output images or with physical I/O terminals.

In addition, this template provides data pointers that can be used to access data areas from other modules via pointers.

Important:

Unlike in the case of the cyclic I/O data area, where the data is copied cyclically between modules, in the case of the use of C++ data pointers there is only a single data area and this belongs to the destination module. When writing from another C++ module to the destination module via the data pointer mechanism, this will immediately affect the data area of the destination module. (Not necessarily towards the end of a cycle).

If the module is executed at runtime, the call occurs immediately, blocking the original process (it is a pointer...). Therefore, both modules (the caller and the called one) must be in the same real-time context and on the same CPU core.

The data pointer is configured in the <u>TwinCAT Module Instance Configurator [146]</u>.

See <u>sample10</u> [▶ 277]

TwinCAT Module Class for real-time context

This template creates a module, which can be instantiated in the real-time context.

As described <u>here [\blacktriangleright 44]</u>, the other modules have transitions for startup and shutdown in a non-real-time context. In some cases modules have to be started when a real-time is already running, so that all transitions are executed in the real-time context. This is a corresponding template.

The modules with this (modified) state machine can also be used for instantiation directly on startup of TC. In this case the transitions are executed like for a normal module.

The <u>TcCOM 03 sample [\blacktriangleright 338]</u> illustrates the application of such a module.

TwinCAT Module Class with Online Change capability

This option can only be used if the module is added to a Versioned C++ Project.

This template creates a module that is capable of online change. Due to the revision control of the project, these modules become exchangeable at runtime - it is therefore possible to exchange modules from different versions at runtime.

The procedure for this Online Change is described <u>here [> 164]</u>.

The module itself otherwise corresponds to a module with cyclic input/output.

11.3 TwinCAT Module Class Editor (TMC)

The TwinCAT Module Class editor (TMC editor) is used for defining the class information for a module. It includes data type definitions and their application, provided and implemented interfaces, and data areas and data pointers.

To put it briefly: everything that is visible from outside must be defined with this editor.

The basic idea is:

- 1. The TMC Editor can be used to modify the module description file (TMC file). This contains all information that is accessible in the TwinCAT system itself. These are for example symbols, implemented interfaces and parameters.
- 2. The TwinCAT Code Generator, which can also be called from the TMC Editor, is used to generate all the required C++ code, i.e. header and cpp files.

Start the TMC editor

Open the editor by double-clicking on the TMC file of a module. The graphical editor opens:

Solution Explorer	- ₽ ×	Untitled1.tmc [TMC Editor] 😐 🗙	
© ⊃ 🖆 '⊙ - ฮ 🖻 🗡 🗕		S 🔸 🕑 🔩

Functionalities of the TMC editor:

- Create/delete/edit symbols in the data areas, e.g. the logical input or output process images of a module.
- · Create/delete/edit user-defined data type definitions.
- Create/delete/edit symbols in the parameter list of a module.

User Help

The TMC editor offers user support for the definition of data types and C++ modules.

For example, in the event of problems (alignment, invalid standard definitions, ...) within the TMC, the user is guided to the relevant location via red flags within the TMC tree:

▲ 🚛 TMC ▲ 🛟 Data Types	Let the properties of the Sub Item.		
DataType1 Interface2			
A Se Methods	General properties		
Method1	Name SubItem2		
Modules CModule1

	Value Enum String		
	Value		
	Min		
	Max		
	IVIdX		
	Optional properties		
	[-+]↓ ↑ · · · · · ·		
	Name Value Description		

The user can nevertheless edit the TMCs directly, since they are XML files and can therefore be created and edited by the user.

Tools

The upper section of the TMC editor contains symbols for the required operations.

- Updating of the higher-level data types.
- Switching the <u>User Help [> 103]</u> on/off.
- Start the TwinCAT TMC Code Generator:

The editor will store the entered information in the TMC file. The TwinCAT TMC Code Generator converts this TMC description to source code, which is also available in the context menu of the TwinCAT C++ project.

User interface

- <u>TMC [> 106]</u>: Here you can edit the C++ module vendor's basic information and add an image.
- <u>Data types [107]</u>: Data types are added, removed, or re-ordered here.
- <u>Modules [) 124]</u>: Shows the modules of the driver.
- Implemented Interfaces [126]: Shows the implemented interfaces of the module.
- <u>Parameters [127]</u>: Parameters are added, removed, or re-ordered here.
 - <u>TraceLevelMax [} 133]</u>: Parameter that controls the quantity of logged messages; predefined for (almost) every module.
- <u>Data Areas [] 134]</u>: Data areas are added, removed, or re-ordered here.
- <u>Data Pointers [) 141]</u>: Data pointers are added, removed, or re-ordered here.
- Interface Pointers [) 143]: Interface pointers are added, removed, or re-ordered here.
- <u>Deployment [> 144]</u>: Determines the files that are provided.

11.3.2 Basic Information

Basic information on the TMC file can be found here:

Untitled1.tmc [TMC Editor] 😐 🗙 Mod	dule1.cpp Module1.h
S 🔸 🕑 🔍	
 ▲ Translations ▷ A Translations ▷ Data Types ▲ Modules ▲ Module1 ⊖ Implemented Interfaces ▷ ■ Parameters ▷ □ Data Areas ■ Data Pointers ∹ Interface Pointers ⑦ Event Classes ■ Deployment 	Edit the basic information about the TMC file.

Information about the provider

Name: This is the name of the provider.

Choose Image: A 16 x 16 pixel bitmap icon is entered here.

Reset image: Resets the module image to the standard value.

Versioned Classfactory

Name: Displays all class factories referenced from the TMC file. The class factory that implements the C++ project must be set. Typically this is the name of the project. Used only for versioned C++ projects; otherwise "not set" appears here.

Version: The current version, consisting of four digits, each separated by a ".". At least one digit must not be 0.

Optional features

Generated by: This field indicates who created the file and who will maintain it. Please note that changes are no longer possible in the TMC Editor when filling out this field (deactivates all editing procedures).

Comment: Optionally, you can enter a comment here.

11.3.3 Data Types

The user can define data types via the TwinCAT Module Class (TMC) editor.

These data types can be type definitions, structures, areas, enumerations or interfaces, e.g. methods and their signatures.

The TwinCAT Engineering system (XAE) publishes these data types in relation to all other nested projects of the TwinCAT project, so that they can also be used in PLC projects, for example (as described <u>here [▶ 278]</u>).

NOTE

Name conflict

A name collision can occur if the driver is used in combination with a PLC module.

• Do not use any of the keywords that are reserved for the PLC as names.

This chapter describes how to use the capabilities of the TMC editor for defining data types.

11.3.3.1 Overview

T	Move the selected element one place downwards.
t	Move the selected element one place upwards.
-	Search for unused types.
8 Byte 🝷	Select byte alignment.
	Align selected data type (alignment). This function loops through all used data types (recursion). Is this is not desired, a step-by-step approach can be adopted, by using the function within the data types.
	Reset data format of the selected data type.
	Сору
2	Paste

Data type properties

Name: user-defined name of the data type.

GUID: unique ID of the data type.

Specification: specification of the data type.

Size: size of the data type, if expressly specified.

Size X64: different size of the data type for the x64 platform.

11.3.3.2 Add / modify / delete data types

Data types used by TwinCAT C++ modules can be added, edited and deleted with the help of the TwinCAT Module Class (TMC) editor.

This article describes:

- <u>Step 1: Create a new data type [▶ 108]</u> in the TMC file.
- <u>Step 2: Start the TwinCAT TMC Code Generator</u> [▶ <u>111</u>] in order to generate C++ code on the basis of a module description in the TMC file.
- <u>Using [) 124]</u> the data types.

Step 1: Generate a new type

1. After starting the TMC Editor, select the **Data Types** node.

- 2. Extend the list of data types and interfaces by a new data type by clicking on the + button Add a new data area.
 - \Rightarrow A new **data type** is then listed as a new entry:

3. Select the generated "Data Type1" in order to obtain details of the new data type.

Untitled1.tmc [TMC Editor]* 🛛 😕 🗙		•

	Name Value Description	
		-

- 8. Give the other sub-elements a new name and select a suitable data type.
- 9. Save the changes you have made in the TMC file.

Step 2: Start the TwinCAT TMC Code Generator to generate code for the module description.

10. Right-click on your project file and select **TwinCAT TMC Code Generator** to generate the source code for your data type:

⇒ You can see the data type declaration in the module header file "Untitled1Services.h"

⇒ If you add a further data type or a further sub-element, run the TwinCAT TMC Code Generator again.

11.3.3.3 Add / modify / delete Interfaces

Interfaces of a TwinCAT module can be added, edited and deleted with the help of the TwinCAT Module Class (TMC) editor.

This article describes:

- <u>Step 1: Create a new interface [> 112]</u> in the TMC file.
- <u>Step 2: [] 112]Add methods [] 112]</u> to the interface in the TMC file.
- <u>Step 3: Use the interface [▶ 114]</u> by adding it to the "Implemented Interfaces" of the module.
- <u>Step 4: Start the TwinCAT TMC [> 116]</u> Code Generator to generate code for the module description.
- Optional change of the interface [> 116].

Step 1: generate a new interface

- 1. After starting the TMC Editor, select the **Data Types** node.
- 2. Click on Add a new interface to extend the list of interfaces by a new interface.
 - ⇒ A new entry **IInterface1** is then listed:

Untitled1.tmc [TMC Editor]* ↔ ×		*
C 🕺		
TMC TMC Data Types Interface1	Add, remove and reorder Data Types.

///<AutoGeneratedContent id="DataTypes">
#if !defined(_TC_TYPE_41D4A207_3A09_4316_9D89_0DD1881AB8C4_INCLUDED_)
#define _TC_TYPE_41D4A207_3A09_4316_9D89_0DD1881AB8C4_INCLUDED_
enum A_ASampleEnum : SHORT {
    One,
    Two,
    Three
};
#endif // !defined(_TC_TYPE_41D4A207_3A09_4316_9D89_0DD1881AB8C4_INCLUDED_)
```

You may wish to manually append the namespace name to the enumeration element as a prefix:

```
#if !defined(_TC_TYPE_C26FED5F_AC13_4FD3_AC6F_B658CB5604E0_INCLUDED_)
#define _TC_TYPE_C26FED5F_AC13_4FD3_AC6F_B658CB5604E0_INCLUDED_
enum B_BSampleEnum : SHORT {
    B_one,
    B_two,
    B_three
    };
    #endif // !defined( TC TYPE C26FED5F AC13 4FD3 AC6F B658CB5604E0 INCLUDED )
```

GUID: unique ID of the data type.

Specification: specification of the data type.

- Alias: generate an alias of a standard data type (e.g. INT).
- <u>Array [] 121]</u>: create a user-defined array.
- <u>Enumeration [] 122]</u>: create a user-defined enumeration.
- <u>Struct [] 122]</u>: generate a user-defined structure.
- Interface [123]: generate a new interface.

Select data type

Select: Select data type – it can be a basic TwinCAT data type or a user-defined data type. Data types equivalent to the PLC data types are defined (like TIME, LTIME, etc.). See Data Types of the PLC for further information.

Description: Define the type as pointer, reference or value by means of the appropriate selection.

- Normal type
- Pointer
- Pointer to pointer
- Pointer to pointer to pointer
- a reference

Type information

- Namespace: Defined for selected data type.
- GUID: Unique ID of the selected data type.

Optional data type settings

Size [Bits]: Size in bits (white fields) and in "Byte.Bit" notation (grey fields). A different size can be defined for the x64 platform.

C/C++ Name: name used in the generated C++ code. The TMC code generator will not generate the declaration, so that user-defined code can be provided for this data type. Beyond that a different name can be defined for x64.

Unit: a unit of the variable.

Comment: comment that is visible, for example, in the instance configurator.

Hide sub items: If the data type has sub-elements, the System Manager will not allow the sub-elements to be accessed. This should be used, for example, in the case of larger arrays.

Persistent (even if unused): Persistent type in the global type system (cf. System->Type System->Data Types).

Optional Defaults

Depending on data type the default could be defined.

Optional Properties

A table of name, value and description for annotating the data type. This information is provided within the TMC and also TMI files. TwinCAT functions as well as customer programs can use these properties.

Datatype Hides

Listed GUIDs refer to data types which are hidden by this data type. Normally, GUIDs of previous versions of this data type are inserted here automatically on each change.

11.3.3.5 Specification

This section describes the Specification of data types.

Edit the	e properties of the Data Type.	*
General proper	rties	
Name Namespace GUID Specification	stSensorData (2bco2b2c b400 4278 a098-cab003abfe1e) Alias	
Choose data ty Select Description	Array Enumeration Struct Interface	

11.3.3.5.1 Array

Array: create a user-defined array.

۵	efine the dime	ensions of	the array	
				
	Dimension	LBound	Elements	
	0	0	1	

A new dialog is shown for adding (+) or removing (-) array elements.

Dimension: Dimension of the array.

LBound: Left limit of the array (default value = 0).

Elements: Quantity of elements.

Dynamic arrays for parameters and data pointers

Define the dim	ensions of	the array				
+ -						
Dimension	LBound	Elements	Min	Max	Max is unbounded	
0	0	8	1	32		

In the case of <u>parameters [127]</u> and <u>data pointers [141]</u>, TwinCAT 3 supports arrays with a dynamic size.

Min: Minimum size of the array.

Max: Maximum size of the array.

Max is unbounded: indicates that there is no upper limit for the array size.

11.3.3.5.2 Enum

Enumeration: create a user-defined enumeration.

D	efine the	e entries	of the e	num	eration
	-		-		
	÷	-	1 1	1	
	Text	Enum	Comm	ent	
	red	0			
	blue	1			
	green	2			

A new dialog is shown for adding (+) or removing (-) an element. Edit the order with the help of the arrows.

Enum: Suitable integer value.

Comment: Optional comment.

11.3.3.5.3 Struct

Struct: Creating a user-defined structure.

Select the **Sub Items** node or click on the **Edit Struct** button to switch to this table:

Name: The name of the method.

RPC enable: enablement of remote procedure calls from outside this method.

Include Return Value: enablement of the forwarding of the return value of the method.

The fields correspond to those of the Data type properties [> 118].

Defining the method parameters

- Name:
- Type: Known from the Data type properties [> 118].
- Description: Known from the Data type properties [> 118].
- Default Value: Default value of this parameter; only numbers are allowed.
- RPC direction: As in the case of PLC function blocks, each parameter can either be IN, OUT or INOUT. Over and above that, it can be defined as NONE so that this parameter is ignored in the case of remote procedure calls (RPC).

11.3.4 Modules

 CModule1 Implemented Interfaces Parameters Data Areas Inputs Symbols Outputs Data Pointers Interface Pointers CyclicCaller Deployment 	Name Class ID (CLSID) Class Factory Image Init Sequence Instantiable in I Define the contexts ID 1 Optional properties		Auto generate on save
	Name Value D	escription	

General properties

Name: Name of the module.

Class ID: Unique module ID.

Auto generate on save: Enables TwinCAT to generate the ClassID via the module parameters during saving. If the ClassID changes during import of the binary modules, the corresponding ClassIDs have to be adjusted. Thus, TwinCAT can detect the interface change.

Choose Image: Add a 16x16 pixel bitmap symbol.

Reset image: Reset the module image to the default value.

Init sequence: Start the state machine. The selection options with 'late' in the name are internal. (See <u>Object [> 147]</u> of the instance configurator for further information.)

Instantiable in RT Context: Indicates whether this module can be instantiated under real-time context; see <u>TwinCAT Module Class Wizard [> 100]</u>

Defining the contexts of the module

You can add (+) or remove (-) contexts for the module. Edit the order with the help of the arrows. The context ID must be an integer other than 0.

Optional Properties

A table of name, value and description for annotating the module. This information is provided within the TMC and also TMI files. TwinCAT functions as well as customer programs can use these properties.

11.3.4.1 Implemented Interfaces

Implemented Interfaces: View and edit the implemented interfaces of the module.

11.3.4.2 Parameters

A TcCOM module instance is defined through various parameters.

TwinCAT supports three types of Parameter IDs (PTCID) in the section <u>Configuring the parameter ID</u> [\blacktriangleright 132].

- "User defined" (default value for new parameters): A unique parameter ID is generated, which can be used in the user code or in the instance configuration for specifying the parameter.
- "Predefined...": Special PTCIDs provided by the TwinCAT 3 system (e.g. TcTraceLevel).
- "Context-based...": Automatically assign values of the <u>configured context [▶ 148]</u> to this parameter. The selected property is applied to the PTCPID. It overwrites the defined standard parameters and the instance configuration parameter (parameter (Init)).

The parameters and their configuration are described in more detail below.

Parameters: Shows the implemented parameters of the module.

Add, remove and reorder Parameters.	
🕂 🗕 🖡 8 Byte - 🛃 🎛	
Name Parameter ID Specification Size Size X64 Context Disable Code Generation	
TraceLevelMax #x03002103 Alias 1	
Parameter #x00000001 Struct 1	
	Image: State of the state o

Name: Name of the interface.

Parameter ID: Unique ID of the parameter.

Specification: Data type of the parameter.

Size: Size of the parameter. Other sizes are possible for x64.

Context: Context ID of the parameter.

Disable Code Generation: Enable/disable the code generation.

11.3.4.2.1 Add / modify / delete parameters

The properties and functionalities of a TwinCAT class can be added, edited and deleted with the aid of the TwinCAT Module Class (TMC) Editor.

This article describes:

- <u>Step 1: Create a new parameter [} 128]</u> in the TMC file.
- <u>Step 2: Start the TwinCAT TMC Code Generator</u> [▶ <u>129</u>] to generate code for the module description in the TMC file.
- Step 3: Observe the transitions of the state machine [> 130]

Step 1: Create new parameters

- 1. After starting the TMC Editor, select the target **Parameters**.
- 2. Extend the list of parameters by a new parameter by clicking on the + button Add a new parameter.
 - \Rightarrow A new "Parameter" is then listed as a new entry:

⊿ 🌄 Modules ⊿ 🔂 CModule1	Add, remove and reorder Parameters.	
Parameters	Name Parameter ID Specification Size Size X64 Context Disable Code Generation	
	Tracel evelMax #x03002103 Alias 1

- **Namespace:** user-defined namespace of the data type.
- GUID: unique ID of the data type.

Enter a unique ID Value: Enter a unique ID value, see Parameter [127].

Constant Name: source code name of the parameter ID.

Optional parameter settings

Size [Bits]: Calculated size in bits (white fields) and in "Byte.Bit" notation (grey fields). A special size configuration is provided for x64.

Unit: a unit of the variable.

Comment: Comment that is visible, for example, in the instance configurator.

Context ID: Context used when accessing parameters by ADS.

Create Symbol: Default setting for ADS icon creation.

Disable Code Generation: Enable/disable the code generation.

Hide parameter: Switches between showing/hiding parameters in the System Manager view.

Hide sub items: If the data type has sub-elements, the System Manager will not allow the sub-elements to be accessed. This should be used, for example, in the case of larger arrays.

Online parameter: Define as online parameter.

Read-only: Switch to read-only access for System Manager.

Optional Properties

A table of name, value and description for annotating the parameter. This information is provided within the TMC and also TMI files. TwinCAT functions as well as customer programs can use these properties.

11.3.4.2.3 TraceLevelMax

TraceLevelMax: Parameter which defines the trace level. This is a predefined parameter provided by most TwinCAT module templates (except for the empty TwinCAT module template).

Settings for this parameter should not be changed.

See <u>Module messages for the Engineering (logging / tracing)</u> [▶ 229]

	Align the selected data type
	Reset the data format of the selected area

NOTE

Recursion when setting an alignment

When setting the alignment of a data area, this will be taken as the basis for all of its elements (symbols and also their sub-elements). User-defined alignment will be overwritten.

Number: Number of the data area.

Type: Defines the purpose and location of the data area.

Name: Name of the data area.

Size: Size of the parameter; other sizes are possible for x64.

Context: Displays the context ID.

Disable Code Generation: Enable/disable the code generation.

11.3.4.3.1 Add / modify / delete data areas and variables

The properties and functionalities of a TwinCAT class can be added, edited and deleted with the aid of the TwinCAT Module Class (TMC) Editor.

This article describes:

- Creation of a new data area in the TMC file.
- <u>Creating [) 140]</u> new variables in a data area.

- For example, edit the name or data type [140] of variables existing in the TMC file.
- Delete existing variables [141] from the TMC file.

Creating a new data area

- 1. After starting the TMC Editor, select the **Data Areas** node of the module.
- 2. Click on the + button, thus creating a new data area.

✓ United TMC	-	Add, remove and	I reorder D	ata Areas.		
CModule1	-+-	👃 🕇 🛛 8 Byte	- 📕 🖶			
- Implemented Interfaces	Number	Area Type	Name	Size Size X64	Context	xt Disable Code Generation
🖌 🛄 Data Areas	0	Input-Destination	Inputs		1	
b Inputs	1	Output-Source	Outputs		1	
Dutputs	3	Standard	DataArea3		1	
 ▶ ■ DataArea3 ▶ ■ Data Pointers ▶ ≤ Interface Pointers ■ Encloyment 						

3. In order to obtain the properties of the data area, double-click on the table or on the node.

⊿ TMC	_

DataArea3	Name DataArea3
Interface Pointers	Optional data area settings
Peployment	Size [Bytes] x64 specific
	Comment
	Context ID 1 •

4. Rename the data area.

Creating a new variable

- 5. Select the sub-node **Symbols** of the data area.
- 6. Extend this data area by a new variable by clicking on the + button. A new entry "Symbol4" is then listed.

Editing the name or data type of existing variables

7. Select the sub-node **Symbol4** or double-click on the row. The variable properties are shown.

8. Enter a new name, e.g. "bEnableJob" and change the type to BOOL.

General properties

Number: Number of the data area.

Type: Defines the purpose and location of the data area. The following are available:

Linkable data areas in the System Manager:

- Input-Source
- Input-Destination
- Output-Source
- Output-Destination
- Retain-Source (for use with NOV-RAM memory, see <u>appendix [> 348]</u>)
- Retain-Destination (for internal use)

Further data areas:

- Standard (visible but not linkable in the System Manager)
- Internal (for internal module symbols, which can be reached via ADS but are not visible in the System Manager)

- MArea (for internal use)
- Not specified (same as standard)

Name: Name of the data area.

Optional parameter settings

Size [Bytes]: Size in bytes. A special size configuration is provided for x64.

Comment: Optional comment that is visible, for example, in the instance configurator.

Context ID: Context ID of all symbols of this data area; used for the determination of the mapping.

Data type name: If specified, a data type with the specified name is created in the type system.

Create Symbol: Default setting for ADS icon creation.

Disable Code Generation: Enable/disable the code generation.

Optional Defaults

Depending on data type the default could be defined.

Optional Properties

A table of name, value and description for annotating the data area. This information is provided within the TMC and also TMI files. TwinCAT functions as well as customer programs can use these properties.

11.3.4.3.3 Symbol Properties

	Moves the selected element up one position
I	

This dialog enables configuration of the source and target file, which are transferred to the target system for the respective platforms.

Define the files, which should be deployed.

Source File: Path to the source files.

Destination file: Path to the binary files.

Rename Destination: Destination file will be renamed before the new file is transferred. Since this is required for Windows 10, it is done implicitly.

The individual entries can be expanded and collapsed by the + or – respectively at the beginning.

Evaluate: Puts the calculated value into the text field for verification.

Insert: Adds the variable name selected in the dropdown list.

Add or remove specific file entries

Remove symbol file entries: Removes the entries for the provision of symbol files (PDB).

Remove all entries: Removes all entries.

Reset to default: Sets the standard entries.

Add default file entries: Adds the entries for the selected platform.

Remove file entries: Removes the entries for the selected platform.

Source and target paths for the allocation may contain virtual environment variables, which are resolved by the TwinCAT XAE / XAR system.

The following table shows the list of these supported virtual environment variables.

Virtual environment variable	Registry entry (REG_SZ) under key	Default value
	\HKLM\Software\Beckhoff\TwinCAT3	
%TC_INSTALLPATH%	InstallDir	C:\TwinCAT\3.x \

11.4 TwinCAT Module Instance Configurator

The TwinCAT 3 Modules Class (TMC) editor described above defines drivers at class level. These are instantiated and have to be configured via the TwinCAT 3 instance configurator.

The configuration applies to the context (including the task calling the module), parameters and pointers.

Instances of C++ classes are created by right-clicking on the C++ project folder; see quick start. This chapter describes the configuration of these instances in detail.

Double-click on the generated instance to open the configuration dialog with several windows.

11.4.1 Object

Solution Explorer 🗾 🔻 🕂 🗙	TWINCAT	Samplec	:PPProject 🕂	× Module	et.cpp	Module1.h

Specifying the startup behavior of several TcCOM instances

TcCOM instances can refer to each other - e.g. for the purpose of interaction via data or interface pointers. To determine the startup behavior, the **Init Sequence** specifies states to be "held" by each TcCOM instance for all other modules.

The name of an Init Sequence consists of the short name of the TcCOM state machine. If the short name of a state (I, P, S, O) is included in the name of the Init Sequence, the modules will wait in this state, until all other modules have reached at least this state. In the next transition the module can refer to all other module instances, in order to be in this state as a minimum.

If, for example, a module has the Init Sequence "PS", the IP transitions of all other modules are executed, so that all modules are in "Preop" state.

This is followed by the PS transition of the module, and the module can rely on the fact that the other modules are in "Preop" state.

• **Copy TMI to target:** Generating the TMI (TwinCAT Module Instance) file and transferring it to the target.

11.4.2 Context

winCAT SampleC	PPProject 👳 🗙 M	odule1.cpp Module1.h							
Object Context	Parameter (Init) Data	Area Interfaces Interface Pointer							
Context:		1	•						
Depend On:		Manual Config	•

1	1	Outputs	OutputSrc	12		3 Symbols		
		Value	UDINT	4.0 (Offs: 0.0)				
		Control	UDINT	4.0 (Offs: 4.0)				
		Data	UDINT	4.0 (Offs: 8.0)				

List of all data areas and their variables (as defined in TMC).

The CS (CreateSymbol) checkbox creates the ADS Symbols for each parameter, thus the variable is accessible from outside

11.4.5 Interfaces

oject Context Parameter (Init) Data Area Interfaces Interface Pointer		
ID	Name	
00000012-0000-0000-E000-00000000064	ITComObject	
03000010-0000-0000-E000-00000000064	ITcCyclic	
03000012-0000-0000-E000-00000000064	ITcADI	
03000018-0000-0000-E000-00000000064	ITcWatchSource	

List of all implemented interfaces (as defined in TMC)

11.4.6 Interface Pointer

ect Context Pa	rameter (Init) Data Area Interfaces	Interface Pointer			
PTCID	Name	OTCID	Object Name	ID	Туре
0x03002060	CvclicCaller	02010010	▼ Task 1	0300001E-0000-0000	ITcCvclicCaller

List of all Interface Pointers (as defined in TMC).

Special ParameterIDs (PTCID) are used to set values automatically. These are configured via the TMCEditor's parameter dialogue as described <u>here [\blacktriangleright 127]</u>.

The OTCID column defines the pointer to the instance, which should be used.

11.4.7 Data Pointer

		Dete D	-list an			
ct Context Par	ameter (Init) Data Area Interfac	es Interface Pointer Data P	binter			
T CID		07.070			011	
TCID	Name	OTCID	Object Name	Area No	Offset	Size

List of all Data Pointers (as defined in TMC).

Special ParameterIDs (PTCID) are used to set values automatically. These are configured via the TMCEditor's parameter dialogue as described <u>here [\blacktriangleright 127]</u>.

The OTCID column defines the pointer to the instance, which should be used.

11.5 Customer-specific project templates

TwinCAT 3 is embedded in Visual Studio and thus also uses the project management provided. TwinCAT 3 C++ projects are "nested projects" in the TwinCAT project folder (TwinCAT Solution).

This section of the documentation describes how customers can realize their own project templates.

11.5.1 Overview

When a TwinCAT C/C++ project is created, the TwinCAT C++ Project Wizard is started first. The latter generates a framework for a TwinCAT driver. The purpose of this framework is to register a TwinCAT driver in the system. The actual function of the driver is implemented in TwinCAT modules.

The TwinCAT Class Wizard is automatically started on creating a new driver project in order to add the first TwinCAT driver module. The different modules are generated by the same TwinCAT Class Wizard, but the specific design of the module is realized using templates.

▲ Installed	Sort by:	Default 🚽 🏢 📃		Search Installed Templates (Ctrl+E)
TwinCAT C++ Module	5/C+\$	TwinCAT Module Class	TwinCAT C++ Module	Type: TwinCAT C++ Module
Online	SC+*	TwinCAT Module Class with ADS port	TwinCAT C++ Module	Creates a new TwinCAT module class.
	∽ _{C+} €	TwinCAT Module Class with Cyclic Caller	TwinCAT C++ Module	
	%	TwinCAT Module Class with Cyclic IO	TwinCAT C++ Module	
	SC+*	TwinCAT Module Class with Data Pointer	TwinCAT C++ Module	
	SC+*	TwinCAT Module Class for RT Context	TwinCAT C++ Module	
Name:				
Location: C:\User	s\Henningm\Desk	top\tmp\TwinCAT Project2\TwinCAT Project2	\Untitled4\	Browse

11.5.2 Files involved

Virtually all relevant information is contained in the directory C:\TwinCAT\3.x\Components\Base \CppTemplate:

Class
Driver
Templates

The TwinCAT C++ Project Wizard calls the TwinCAT Module Class Wizard if a Driver Project is to be created.

Directory: Driver and Class

The respective project types are defined in the Driver (for TwinCAT C++ Project Wizard) and Class directory (for the TwinCAT Module Class Wizard), each project type encompassing 3 files:

😻 TcDriverWizard.ico	10.06.2015 11:14	Icon	267 KB
TcDriverWizard.vsdir	10.06.2015 11:14	VSDIR File	1 KB
🔤 TcDriverWizard.vsz	10.06.2015 11:14	Visual Studio Wiza	1 KB
😪 TcStaticLibraryWizard.ico	10.06.2015 11:14	Icon	267 KB
TcStaticLibraryWizard.vsdir	10.06.2015 11:14	VSDIR File	1 KB
🚈 TcStaticLibraryWizard.vsz	10.06.2015 11:14	Visual Studio Wiza	1 KB

The *.vsdir* file provides information that is used when the respective assistant wizard is started. This is essentially a name, a brief description and a file name of the type *.vsz* containing details for this project type. The general description in the MSDN can be found here: <u>https://msdn.microsoft.com/de-de/library/</u><u>Aa291929%28v=VS.71%29.aspx</u>.

The *.vsz* file referenced in the *.vsdir* file provides information that is needed by the wizard. The most important information here is the wizard that is to be started and a list of parameters. Both wizards have a *.xml* file as a parameter that describes the transformations of, for example, source files from the template to the specific project. These are located together with the templates for the source code, etc. in the *Templates* directory.

If a driver is to be created, the TwinCAT C++ Project Wizard starts the TwinCAT Module Class Wizard via the **TriggerAddModule** parameter.

The general description in the MSDN can be found here: <u>https://msdn.microsoft.com/de-de/library/</u><u>Aa291929%28v=VS.71%29.aspx</u>.

The *.ico* file merely provides an icon.

Directory: Templates

Both the templates for the source code and the *.xml* file named in the *.vsz* file for the TwinCAT Module Class Wizard are located in corresponding subdirectories in the *Templates* directory.

This *.xml* file describes the procedure for getting from the template to a real project.

11.5.3 Transformations

Transformation description (XML file)

The configuration file describes (in XML) the transformation of the template files into the project folder. In the normal case these will be *.cpp / .h* and possibly project files; however, all types of files can be handled.

The root node is a <ProjectFileGeneratorConfig> element. The useProjectInterface="true" attribute can be set directly at this node. It sets the processing procedure in the Visual Studio mode to generate projects (as opposed to TC-C++ modules).

Several <FileDescription> elements, each of which describes the transformation of a file, follow here. After these elements there is a possibility to define symbols that are available for the transformation in a <Symbols> element.

Transformation of the template files

A <FileDescription> element is structured as follows:

```
<FileDescription openFile="true">
<SourceFile>FileInTemplatesDirectory.cpp</SourceFile>
<TargetFile>[!output SYMBOLNAME].cpp</TargetFile>
<Filter>Source Files</Filter>
</FileDescription>
```

- The source file from the templates directory is specified as the <SourceFile>.
- The destination file in the Project directory is specified as the <TargetFile>. A symbol is normally used by means of the [!output...] command.
- The attribute "copyOnly" can be used to specify whether the file should be transformed, i.e. whether the transformations described in the source file are executed. Otherwise the file is merely copied.
- The "openFile" attribute can be used to specify whether the file is to be opened after creation of the project in Visual Studio.
- Filter: a filter is created in the project.
 To do this the useProjectInterface="true" attribute must be set at the <ProjectFileGeneratorConfig>.

Transformation instructions

Commands that describe the transformations themselves are used in the template files.

The following commands are available:

• [!output SYMBOLNAME]

This command replaces the command by the value of the symbol. A number of predefined symbols are available.

• [!if SYMBOLNAME], [!else] and [!endif] describe a possibility to integrate corresponding text only in certain situations during the transformation.

Symbol names

Symbol names can be provided for the transformation instructions in 3 ways. These are used by the commands described above in order to carry out replacements.

1. A number of predefined symbols directly in the configuration file:

```
A list of <Symbols> is provided in the XML file. Symbols can be defined here: <Symbols>
<Symbol>
<Name>CustomerSymbol</Name>
<Value>CustomerString</Value>
</Symbol>
```

```
</Symbols>
```

- 3. Important symbols are provided by the system itself

Symbol Name (Projects)	Description		
PROJECT_NAME	The project name from the Visual Studio dialog.		
PROJECT_NAME_UPPERCASE	The project name in upper case letters.		
WIN32_WINNT	0x0400		
DRVID	Driver ID in the format: 0x03010000		
PLATFORM_TOOLSET	Toolset version, e.g. v100		
PLATFORM_TOOLSET_ELEMENT	Toolset version as an XML element, e.g. <platformtoolset>v100<!--<br-->PlatformToolset></platformtoolset>		
NEW_GUID_REGISTRY_FORMAT	Creates a new GUID in the format: {48583F97-206A-4C7C-9EF2-D5C8A31F7BDC}		
Symbol Name (Classes)	Description		
PROJECT_NAME	The project name from the Visual Studio dialog.		
HEADER_FILE_NAME	Entered by the user in the wizard dialog.		
SOURCE_FILE_NAME	Entered by the user in the wizard dialog.		
CLASS_NAME	Entered by the user in the wizard dialog.		
CLASS_SHORT_NAME	Entered by the user in the wizard dialog.		
CLASS_ID	A new GUID created by the wizard.		
GROUP_NAME	C++		
TMC_FILE_NAME	Used to identify the TMC file.		
NEW_GUID_REGISTRY_FORMAT	Creates a new GUID in the format: {48583F97-206A-4C7C-9EF2-D5C8A31F7BDC}		

11.5.4 Notes on handling

Template in customer-specific directory

Templates can also be stored outside of the usual TwinCAT directory.

1. In the registry, expand the search path (in this case V12.0, i.e. for VS 2013) in which the node /2 is created:

Registry Key: HKEY_CURRENT_USER\Software\Microsoft\VisualStudio\12.0_Config

```
\label{eq:projects} B9B2C4C6-072A-4B72-83C1-77FD2DEE35AB} AddItemTemplates \\ TemplateDirs \\ 3d3e7b23-b958-4a99-bfee-d0d953c182d4 \\ \\
```

📸 Registry Editor File Edit View Favorites Help				
 IBEF792BE-AA5F-4e3c-8C82-674BF9C0715B) IBBE792BE-AA5F-4e3c-8C82-674BF9C0715B) IBBE704C6-072A-4872-83C1-77FD2DEE35AB) IAdditem TemplateDirs IAdditem TemplateDirs<	Name (Default) SortPriority TemplatesDir	Type REG_SZ REG_DWORD REG_SZ	Data CustomerTemplates 0x0000065 (101) C:\CustomerDirectory\Class	
< III +	•		III	
Computer\HKEY_CURRENT_USER\Software\Microsoft\VisualStudio\12.0_Config\Projects\B9B2C4C6-072A-4872-83C1-77FD2DEE3SAB}\AddItemTemplate\TemplateDirs\(3d3e7b23-b958-4a99-bfee-d0d953c182d4})\/2				

- 2. Increase the SortPriority.
- 3. Recommendation: in the directory, create a subdirectory called Class, which is entered in the registry, and a subdirectory called Templates in order to separate the *.vsz / .vsdir / .ico* files from the templates.
- 4. Adapt the paths within the files.
- ⇒ As a result, a dedicated order exists for the templates:

Add New Item - Untitled7		
▲ Installed	Sort by: Default	
TwinCAT C++ Module CustomerTemplates	Customer Module Class with Cyclic IO	CustomerTemplates
▶ Online		

This directory or directory structure can, for example, now be versioned in the version management system and is also not affected by TwinCAT installations/updates.

Quick start

A general entry to the wizard environment in the MSDN is the entry point: <u>https://msdn.microsoft.com/de-de/library/7k3w6w59%28v=VS.120%29.aspx</u>.

This describes how a template is used for creating a customer-specific module with the TwinCAT C++ Module Wizard.

1. Take an existing module template as the copying template In C:\TwinCAT\3.x\Components\Base\CppTemplate\Templates

퉬 CustomerModuleCyclicIO	20.08.2015 10:29	File folder
📗 TcDriverWizard	21.07.2015 13:02	File folder
TcModuleAdsPort	21.07.2015 13:02	File folder
TcModuleCyclicCaller	21.07.2015 13:02	File folder
TcModuleCyclicIO	21.07.2015 13:02	File folder
퉬 TcModuleDataPointer	21.07.2015 13:02	File folder
퉬 TcModuleEmpty	21.07.2015 13:02	File folder
퉬 TcModuleRT	21.07.2015 13:02	File folder
TcStaticLibrary	21.07.2015 13:02	File folder

2. Rename the .xml file within the folder

CustomerModuleCyclicIOConfig.xml	10.06.2015 11:14	XML Document	1 KB
🚰 TcModuleCyclicIO.cpp	10.06.2015 11:14	C++ Source	7 KB
h TcModuleCyclicIO.h	10.06.2015 11:14	C/C++ Header	2 KB
TcModuleCyclicIO.tmc	10.06.2015 11:14	TMC File	5 KB

3. Copy the corresponding files .ico / .vsdir / .vsz also in the Class/

CustomerModuleCyclicIOWizard.ico	10.06.2015 11:14	Icon	265 KB
CustomerModuleCyclicIOWizard.vsdir	20.08.2015 10:35	VSDIR File	1 KB
CustomerModuleCyclicIOWizard.vsz	10.06.2015 11:14	Visual Studio Wiza	1 KB
TcModuleAdsPortWizard.ico	10.06.2015 11:14	Icon	265 KB
TcModuleAdsPortWizard.vsdir	10.06.2015 11:14	VSDIR File	1 KB
🚈 TcModuleAdsPortWizard.vsz	10.06.2015 11:14	Visual Studio Wiza	1 KB
TcModuleCyclicCallerWizard.ico	10.06.2015 11:14	Icon	265 KB

- 4. Now reference the copied .vsz file in the .vsdir file and adapt the description.
- 5. Enter the .xml file created in step 2 in the .vsz file.
- 6. You can now make changes to the source files in the *Template/CustomerModuleCyclicIO*/ directory. The *.xml* takes care of replacements when creating a project from this template.
- ⇒ The TwinCAT Module Class Wizard now displays the new project for selection:

Add New Item - Untitled1		8
▲ Installed	Sort by: Default	Search Installed Templates (Ctrl+E)
TwinCAT C++ Module	TwinCAT Module Class TwinCAT C++ Module	Type: TwinCAT C++ Module
v Online	Year TwinCAT Module Class with ADS port TwinCAT C++ Module	
	TwinCAT Module Class with Cyclic Caller TwinCAT C++ Modul	e
	Customer Module Class with Cyclic IO TwinCAT C++ Module	e
	TwinCAT Module Class with Cyclic IO TwinCAT C++ Modul	e
	TwinCAT Module Class with Data Pointer TwinCAT C++ Module	2
	TwinCAT Module Class for RT Context TwinCAT C++ Module	2

If the vsxproj, for example, are also to be provided in a changed form, it is recommended to adapt a copy of the TwinCAT C++ Project Wizard.

If necessary, the use of settings in *.props* files should also be considered so that settings can also be changed in existing projects created from a template – e.g. as a result of the *.props* files being updated by a version management system.

Alternative creation on the basis of an existing project

A viable way here is to create a finished project and transform it into a template afterwards.

- 1. Copy the cleaned project into the *Templates*\ folder.
- 2. Create a transformation description (XML file).
- 3. Prepare the source files and the project file by means of the replacements described.
- 4. Provide the .ico / .vsdir / .vsz files.

12 Programming Reference

TwinCAT offers a wide range of basic functions. They all can be very useful for TwinCAT C++ programmers and are documented here.

There is a wide range of C++ samples, which contain the valuable information on the handling of the modules and interfaces.

TwinCAT C++ project

A TwinCAT C++ project has some parameters that can be opened by double-clicking on the TwinCAT C++ project (project name here "Untitled1").

TwinCAT Project4	₽ X			
Project Settings				
Project Name:	Untitled1	ld:	1	
Project Path:	Untitled1			
Project Type:	C++ Project			
Project Guid:	{9F4F6F39-D708-46F5-ABD3-55367E7A5732}			
Encryption:	No boot project encryption (default)			\sim
3				
Comment:				
Compiler Define	8			
Manual:				

Renaming is not possible at this stage (see <u>Renaming TwinCAT C++ projects [> 237]</u>)

The encryption of the binary module can be set here, a more detailed description of the requirements can be found <u>here [\blacktriangleright 55]</u>.

The option whether the sources should be included can be set here for the two archive types, which are transferred to the target system or sent by email.

Accordingly, empty archives are created on deselection.

12.1 TwinCAT C++ Project properties

From TwinCAT 3.1 Build 4024.0

The functionality described here is available from TwinCAT 3.1. 4024.0.

Different settings can be made in the project properties for a TwinCAT C++ project.

The project properties are opened by right-clicking on the C++ project -> **Properties**.

Tc SDK	~	Windows Driver Kit	
Tc Extract Version		Build with WDK	No
Tc Publish		WinDDK7 folder	
Tc Sign			
▷ C/C++			
▷ Linker			

Settings for the TwinCAT SDK

Common

• **TwinCAT SDK folder**: File folder that provides the TwinCAT SDK and shows the value of the environment variable TWINCATSDK.

Intrinsics

• Use intrinsics from platform toolset: the intrinsics should be used.

Windows Driver Kit

If an environment variable WINDDK7 is set, this option prevents the use of the WDK for a specific project.

- Build with WDK: Whether the WDK should be used.
- WinDDK7 folder: Displays the value of the WINDDK7 environment variable.

12.1.2 Tc Extract Version

Configuration Properties	✓ Extract Version	
General	Resource Input File	<pre>\$(ProjectDir)\$(ProjectName).rc</pre>
Debugging	Product Version Input File	<pre>\$(ProjectDir)\$(ProjectName).tmc</pre>
VC++ Directories	File Version Input File	<pre>\$(ProjectDir)\$(ProjectName).tmc</pre>
Tc SDK	Header Output File	\$(IntDir)\\$(ProjectName)Version.h
Tc Extract Version		
Tc Publish		
Tc Sign		
▷ C/C++		
Linker		

Version information from the project is provided in a header file and used for the build process.

If the *.rc* file contains version information, the header file is generated from it. With versioned C++ projects, the version information is read from the TMC file and the macros from the generated header file are used in the *.rc* file.

Extract Version

- Resource Input File: The .rc file to consider.
- Product Version Input File: TMC file containing the product version for versioned projects.
- File Version Input File: TMC file, which contains the file version for versioned projects.
- Header-Output File: Header File in which the information is provided.

12.1.3 Tc Publish

 Configuration Properties 	General Settings (Same for all configurations)	
General	form(s) TwinCAT RT (x86);TwinCA	RT (x64)
Debugging	figuration(s) \$(Configuration)

Tc Extract Version	lish as Versioned Library Depends on TMC/TML D	cription
Tc Publish	allation Settings (Same for all configurations)	
Tc Sign	hive	
▷ C/C++	lish Installation Root Folder Default	
Linker	cial Settings (Same for all configurations)	
 Manifest Tool Resources 	litional Files	
 MIDL 	t publish command	

Information about publishing modules.

General Settings

- Platform(s): Which platforms should be built in a Publish?
- Configuration(s): Selection whether to build debug / release.
- **Include Debug Information:** For which configurations should the debug symbols (PDBs) be provided in the repository?
- **TMC / TML source file(s):** TMC / TML files from the project that represent the starting point for the Publish process.
- Publish as Versioned Library: Should the publishing take place in the repository [) 49]?

Installation Settings

- Archive: File path for an archive. Extensions *.zip* (for a ZIP archive) and *.exe* (for a self-extracting ZIP archive) are allowed. Both contain the content for a repository (versioned C++ projects) or CustomConfig/Modules (non-versioned C++ drivers) on another engineering system.
- Publish Installation Root Folder: No installation is performed on the local system with "None". The files are only available under *TWINCATSDK/_products/TcPublish*. An archive can be created to manually transfer these files to another system and install them there.
 If "Default" is selected, an installation into the repository (versioned C++ projects) or CustomConfig/ Modules (non-versioned C++ drivers) is performed on the local system.

Special Settings

- Additional Files: Adding additional files to the Publish process, which are stored in the "deploy" subdirectory during installation.
- Post publish command: Execute a command after the publish, e.g. to clean up.

12.1.4 Tc Sign

Configuration Properties	~	Enable signing		
General		SHA1 signing	No	
Debugging		SHA256 signing	No	
VC++ Directories		TwinCAT signing	Yes	
Tc SDK	~	TwinCAT Certificate (Same for all co	nfigurations)	
Tc Extract Version		TwinCAT Certificate Name	204 C	
Tc Publish		TwinCAT Certificate Password		\sim
Tc Sign		Verbose Output	No	
▷ C/C++	~	Windows SHA1 Certificate (Same for	or all configurations)	
▷ Linker		Certificate Store Name	PrivateCertStore	
Manifest Tool		Certificate Name	\$(TWINCATTESTCERTIFICATE)	
Resources		Certificate ID		
 MIDL XML Document Generator 		Timestamp Server URL		
b Browse Information		CA Cross Signing Certificate Path

Custom Build Step	~	Windows SHA256 Certificate (Same	for all configurations)	
Code Analysis		Certificate Store Name		
		Certificate Name		
		Certificate ID		
		Timestamp Server URL		
		CA Cross Signing Certificate Path		
		Verbose Output	No	
		-		

<u>TwinCAT modules must be signed [\blacktriangleright 25]</u>, which can be configured here.

Enable Signing

- **SHA1 signing:** Should an operating system signature, which is necessary for the operating system, be carried out?
- **SHA256 signing:** Should an operating system signature, which is necessary for the operating system, be carried out?
- **TwinCAT signing:** Should a TwinCAT user certificate be used for signing? This is necessary for the <u>TwinCAT Loader [▶ 53]</u>.

TwinCAT Certificates

These parameters are used for all configurations such as debug and release.

• **TwinCAT Certificate Name:** Name of the certificate file (directory: *C:\TwinCAT\3.x\CustomConfig* *Certificates*). Alternatively, the environment variable TcSignTwinCatCertName can be set to the name of the certificate file.

- TwinCAT Certificate Password: Password that protects the TwinCAT user certificate (stored in plain text, leave blank if necessary). The <u>TcSignTool [>57]</u> can be used to not store the password of the TwinCAT user certificate in the project, where it would also end up in version management, for example.
- Verbose Output: Should extended information be output during the signature?

Windows Certificate (SHA1)

- Certificate Store Name: Name of the certificate store in the certificate manager of the operating system.
- Certificate Name: Name of the certificate in the certificate store.
- Certificate ID: ID of the certificate.
- **Timestamp Server URL:** URL of the timestamp server for use during the signature. This is provided by various CAs.
- CA Cross Signing Certificate Path: Path to cross signing certificate. Microsoft provides an overview <u>here.</u>
- Verbose Output: Should extended information be output during the signature?

Windows Certificate (SHA256)

- Certificate Store Name: Name of the certificate store in the certificate manager of the operating system.
- Certificate Name: Name of the certificate in the certificate store.
- Certificate ID: ID of the certificate.
- Timestamp Server URL: URL of the timestamp server for use during signature, provided by the CA.
- CA Cross Signing Certificate Path: Path to cross signing certificate. Microsoft provides an overview. <u>here.</u>
- Verbose Output: Should extended information be output during the signature?

12.2 File Description

During the development of TwinCAT C++ modules, files in the file system can be handled directly. This is of interest, either to understand how the system works or for specific use cases such as manual file transfer, etc.

Here is a list of files related to C++ modules.

File	Description	Further Information
Engineering / XAE		
*.sln	Visual Studio Solution file, hosts TwinCAT and non-TwinCAT projects	
*.tsproj	TwinCAT project, collection of all nested TwinCAT projects, such as TwinCAT C++ or TwinCAT PLC project	
_Config/	_Config/ Folder contains further configuration files (*.xti) that belong to the TwinCAT project.	
_Deployment/	Folder for compiled TwinCAT C++ drivers	
*.tmc	TwinCAT Module Class file (XML-based)	See <u>TwinCAT Module</u> <u>Class Editor (TMC) [▶ 103]</u>
*.rc	Resource file	See <u>Setting version/</u> vendor information [▶ 236]
.vcxproj.	Visual Studio C++ project files	
*ClassFactory.cpp/.h	Class Factory for this TwinCAT driver	
*Ctrl.cpp/.h	Upload and remove drivers for TwinCAT UM platform	
*Driver.cpp/.h	Upload and remove drivers for TwinCAT RT platform	
*Interfaces.cpp/.h	Declaration of the TwinCAT COM interface classes	
*W32.cpp./.def/.idl		
*.cpp/.h	One C++/Header file per TwinCAT module in the driver. Insert user code here.	
Resource.h	Required by *.rc file	
TcPch.cpp/.h	Used for creating precompiled headers	
%TC_INSTALLPATH% \Repository\ <vendor> \<prjname>\<version> \<platform>*.tmx</platform></version></prjname></vendor>	Compiled driver that is loaded via the TcLoader. C:\TwinCAT\3.x\Repository\C++ Module Vendor\Untitled1\0.0.0.1\TwinCAT RT * \Unititled1.tmx	See <u>Versioned C++</u> <u>Projects [▶ 49]</u>
%TC_INSTALLPATH% \CustomConfig\Modules*	Published TwinCAT driver package normally C:\TwinCAT\3.x\CustomConfig \Modules*	See <u>Export to TwinCAT</u> 3.1 4022.xx [▶ <u>50]</u>
Runtime / XAR		
%TC_BOOTPRJPATH%	Current configuration setup	
\CurrentConfig*	usually C:\TwinCAT\3.x\Boot

12.2.1 Compilation procedure

The procedure that initiates a Build or Rebuild on a TwinCAT C++ project in the TwinCAT Engineering XAE is described here. This is to be taken into account, for example, if company-specific environments and building processes are to be integrated.

The configurations that are built in the case of a Build or Rebuild depend on the current selection in Visual Studio:

Release	-	TwinCAT	RT (x64)	Ŧ
Debug Release			-21)	Ð
Configuration Manager				

The correct target architecture (in this case TwinCAT RT (x64)) is set appropriately by selecting the target system.

The **Configuration Manager** allows the dedicated setting of the build configuration.

When selecting **Build** or **Rebuild** (and thus also **Activate Configuration**), the following steps are performed:

- 1. The sources are located in the respective project directory.
- 2. The compilations are generated according to the specific architecture in C:\TwinCAT\3.1\sdk_products\

e.g. in C:\TwinCAT\3.1\sdk_products\TwinCAT RT (x64)\Debug\<ProjectName>

3. The link process then places the **.sys/.pdb** file also architecture-specific in *C:\TwinCAT\3.1\sdk_prod-ucts*.

e.g. in C:\TwinCAT\3.1\sdk_products\TwinCAT RT (x64)\Debug\

- 4. A copy of the .*sys/.pdb* is placed in the _Deployment/ subdirectory of the project directory, e.g. in *Project Directory/_Deployment/TwinCAT RT (x64)*\
- 5. Pressing the **Activate Configuration** button leads to *.sys/.pdb* being transferred from _Deployment/ of the project directory to the target system (if applicable it is a local copy).

12.3 Online Change

From TwinCAT 3.1 Build 4024.0

The functionality described here is available from TwinCAT 3.1. 4024.0.

TwinCAT 3.1 supports the exchange of C++ modules at runtime, i.e. without interrupting the real-time program.

For this purpose, different versions of a TwinCAT Executable (TMX) are stored on the target system, as already described <u>here [\blacktriangleright 49].</u>

For all module instances from a TMX, a switchover between the versions can be initiated by the engineering.

The procedure is roughly sketched:

- ✓ Online Change capable module in TMX
- 1. TwinCAT instantiates the new module. The old module is still called cyclically by the task.
- TwinCAT calls ITcOnlineChange::PrepareOnlineChange() of the new module. This call can access the old module and accept data that does not change due to the cyclic calls of the module - for example parameter values.
- 3. TwinCAT calls ITcOnlineChange::PerformOnlineChange() of the new module. This call can access the old module and take over data which have changed cyclically before. This call is executed if no cyclic call is made by a task. The old module is **not** called again by the task, but the new module is called. The PerformOnlineChange() method should use as little computing time as possible so that this switchover can take place from one task cycle to the other.
- TwinCAT
 Task

 Old
 New

 Module
 PrepareOnlineChange()

 CycleUpdate()
 PerformOnlineChange()

 CycleUpdate()
 PerformOnlineChange()
- 4. After completion, the task will call the new module cyclically.

The Online Change can be carried out through this dialog in engineering.

When dealing with the Online Change, there are therefore some aspects to consider:

- The project must provide a revision control.
- The DataAreas for these modules are kept outside the TcCOM module and made available to the modules. This means that they do not need to consider the data or the mapping of the symbols in the DataAreas.
- The DataAreas of the module must not change.
- References to internal data structures must not be passed on. Access must always take place via interfaces that are retrieved via the TcQueryInterface, since these references are updated during an Online Change.

After a restart, TwinCAT will start the driver in the initial version of the modules.

12.4 Limitations

<u>TwinCAT 3 C++ modules [} 35]</u> are executed in Windows kernel mode. Developers must therefore be aware of some limitations:

- Win32 API [166] is not available in kernel mode
- Windows kernel mode API must not be used directly. TwinCAT SDK provides functions, which are supported.
- User mode libraries (DLL) cannot be used. (see <u>Third Party Libraries [▶ 249]</u>)
- The memory capacity for dynamic allocation in a real-time context is limited by the router memory (this can be configured during engineering), see <u>Memory Allocation [▶ 167]</u>.
- · A subset of the C++ runtime library functions (CRT) is supported
- C++ exceptions are not supported.
- Runtime Type Information (<u>RTTI [▶ 167]</u>) is not supported.
- Subset of STL is supported (see <u>STL / Containers [▶ 228]</u>)
- Support for functions from math.h through TwinCAT implementation (see <u>Mathematical Functions</u> [<u>225]</u>)

TwinCAT functions as replacement for Win32 API functions

The original Win32 API is not available in Windows kernel mode. For this reason a list of the common functions of the Win32 API and their equivalents for TwinCAT is provided here:

Win32API	TwinCAT functionality	
WinSock	TF6311 TCP/UDP real-time	
Message boxes	Tracing [▶ 229]	
File I/O	See Interface ITcFileAccess [▶ 176], Interface ITcFileAccessAsync [▶ 184] and Sample19: Synchronous File Access [▶ 310], Sample20: FileIO- Write [▶ 311], Sample20a: FileIO-Cyclic Read / Write [▶ 311]	
Synchronization	See <u>Sample11a: Module communication: C module</u> calls a method of another C module [> 306]	
Visual C CRT	See RtlR0.h	

RTTI dynamic_cast function in TwinCAT

TwinCAT has no support for dynamic_cast<>.

Instead, it may be possible to use the TCOM strategy. Define an ICustom interface, which is derived from ITcUnknown and contains the methods, which are called from a derived class. The base class CMyBase is derived from ITcUnknown and implements this interface. The class CMyDerived is derived from CMyBase and from ICustom. It overwrites the TcQueryInterface method, which can then be used instead of dynamic cast.

TcQueryInterface can also be used to display the IsType() function through evaluation of the return value.

See Interface ITcUnknown [▶ 205].

12.5 Memory Allocation

Generally we recommend reserving memory with the aid of member variables of the module class. This is done automatically for data areas defined in the TMC editor.

It is also possible to allocate and release memory dynamically.

- Operator new / delete
- TcMemAllocate / TcMemFree

This memory allocation can be used in the <u>transitions [} 44]</u> or in the OP state of the state machine.

If the memory allocation is made in a non-real-time context, the memory is allocated in the non-paged pool of the operating system (blue in the diagram). In the TwinCAT real-time context, the memory is allocated in the router memory (red in the diagram).

The memory can also be released in the transitions or the OP state; we recommend to always release the memory in the "symmetric" transition, e.g. allocation in PS, release in SP.

Memory allocation between Windows and real-time context in conjunction with static variables

If global instances are used,

- a maximum of 32 global instances may exist in total,
- and memory allocated in the real-time context must be released in the OS transition, for example, so that this does not happen via the destructor.

This code includes three examples of global instances:

```
class MyClassA
{
  public:
    MyClassA() {}
    ~MyClassA() {}
    private:
        int v;
}
MyClassA A;
class MyClassB
{
        static MyClassA Value;
};
MyClassA& GetInstance()
{
        static MyClassA a;
        return a;
}
```

12.6 Multi-task data access synchronization

When the same data is accessed by multiple tasks, the tasks may access the same data simultaneously, depending on the task/real-time configuration. If the data is written by at least one of the tasks, the data may have an inconsistent state during or after a change. To prevent this, all concurrent accesses must be synchronized so that only one task at a time can access the shared data.

If the same data is accessed by several tasks and the data is written for at least one of these accesses, all read and write accesses must be synchronized. This applies irrespective of whether the tasks run on one or more CPU cores.

A WARNING

Inconsistencies and other risks due to unsecured data access

If concurrent accesses are not synchronized, there is a risk of inconsistent or invalid data records. Depending on how the data is used in the further course of the program, this can result in incorrect program behavior, undesired axis movement or even sudden program standstill. Depending on the controlled system, damage to equipment and workpieces may occur, or people's health and lives may be endangered.

General synchronization options between the TcCOM modules are described <u>here [> 46]</u>. The following mechanisms were described:

- Data exchange via the process image (IO mapping). During this process, the cycle transition, and thus TwinCAT, ensures data synchronicity between the sources and targets.
- Method calls via interfaces in which CriticalSections can be used.
- ADS, which transfers data in the form of a transport medium and thus ensures synchronicity of the data.
- Common data area to be protected by a CriticalSection.

Ideally, however, you should try to avoid the need for synchronization. Otherwise, the simplest way is usually the exchange via the process image, which copies the data between the cycles from the output process images to the input process images and thus ensures a consistent state.

If this is not sufficient and data has to be accessed from different contexts, one of the following options can be used.

It is important to differentiate between the task contexts that are to access the data. In the TwinCAT Runtime, a distinction is made between the Windows kernel mode thread contexts (Windows context for short) and the TwinCAT real-time task contexts (RT context). During initialization of TwinCAT modules, the IP, PS, SP and PI transitions are executed in the Windows context. The SO and OS transitions are executed in the RT context.

The SDK offers appropriate synchronization options for such scenarios. Nevertheless, the TcCOM modules should be designed such that they are independent of each other, at least in the Windows context, and thus do not require synchronization. The transitions in the RT context can use CriticalSections if required.

For the CriticalSection and semaphores it applies that in case of a lock the task waits for the release. In the meantime the core is released for other tasks. With CriticalSections the active task inherits the priority of the waiting task ("Priority Inheritance").

CriticalSections

Instances of CriticalSections are created through TwinCAT real-time. This instance can be initialized in the Windows context as well as in the RT context. The CriticalSection instance can only be used in the RT context.

TwinCAT real-time uses "priority inheritance" to prevent a task with lower priority from indirectly blocking a task with high priority.

CCriticalSectionInstance

The CCriticalSectionInstance class provides the interface to handle Critical Sections and has the required memory. To create a Critical Section the class requires the object ID of the TwinCAT real-time instance, which is available via OID_TCRTIME_CTRL, as well as a reference to the TwinCAT object server via a pointer to ITComObjectServer.

Methods:

- CCriticalSectionInstance(OTCID oid=0, ITComObjectServer* ipSrv=NULL); The default constructor that initializes the object ID of the Critical Section Provider. If the pointer is given to the object server, the Critical Section is also initialized.
- ~CCriticalSectionInstance();
 The destructor deletes the Critical Section instance.

- void SetOidCriticalSection(OTCID oid); Sets the Critical Section Provider, which is given by TwinCAT real-time and whose object ID is available via OID_TCRTIME_CTRL.
- bool HasOidCriticalSection(); Returns TRUE if the object ID is set to a value other than 0, otherwise FALSE. The object ID is not checked to verify whether it belongs to a Critical Section Provider.
- bool IsInitializedCriticalSection(); Returns TRUE if the Critical Section was successfully initialized.
- HRESULT CreateCriticalSection(ITComObjectServer* ipSrv); Once the Critical Section is initialized, it is deleted and a new Critical Section is initialized. Returns S_OK if successful. Error cases are indicated by the return of error codes:

ADS_E_INVALIDPARM	Invalid Critical Section Provider
ADS_E_NOINTERFACE	The object ID is set to a reference that is not a Critical Section Provider, i.e. ITcRTime is not implemented.
E_FAIL	Internal error from the Critical Section Provider.

- HRESULT CreateCriticalSection(OTCID oid, ITComObjectServer* ipSrv); Initializes the Critical Section. DeleteCriticalSection() must be called if this method is used again. Return values as in CreateCriticalSection(ITComObjectServer* ipSrv);
- HRESULT DeleteCriticalSection(); Critical Section is deleted. Always returns S_OK.
- HRESULT EnterCriticalSection(); blocked until the Critical Section is released.
- HRESULT LeaveCriticalSection(); Leaves the Critical Section and thus releases it again.
 Returns MAKE RTOS HRESULT(OS CS ERR) if the caller is not the owner.

EnterCriticalSection() and LeaveCriticalSection() must be called in the RT context, otherwise the following return value is returned:

ADS_E_INVALIDCONTEXT	Return value if Critical Section is entered outside the RT context. The
	Critical Section is not entered.

If these methods are used without initializing the Critical Section, S_OK is returned without further action. All other methods can be used in the RT context as well as in the Windows context.

CriticalSections allow nested calls and require an associated LeaveCriticalSection() call for each EnterCriticalSection() call. The Critical Section is released when the last LeaveCriticalSection() is called.

Sample:

The <u>sample [\blacktriangleright 306]</u> shows how to use a CriticalSection to prevent simultaneous access to a date via an interface method call.

Critical Section Concurrent

The CCriticalSectionInstanceConcurrent class allows concurrent access. This can be used if several tasks have read access to the data to be protected, but all other accesses must be prevented in the case of write access.

Methods:

- CCriticalSectionInstanceConcurrent(UINT concurrent, OTCID oid=0, ITComObjectServer* ipSrv=NULL); The parameter "concurrent" defines the number of tasks that can simultaneously enter the Critical Section via CsEnterCriticalSectionConcurrent(). If "concurrent" is 1, the Critical Section Concurrent variant works like a Critical Section. The value 0 is not allowed. It would prevent the Critical Section from being initialized.
- The value of is not allowed. It would prevent the Childar Section from being initialized.
- ~CCriticalSectionInstanceConcurrent(); The destructor implicitly deletes the Critical Section
- void SetOidCriticalSection(OTCID oid); Sets the Critical Section Provider, which is given by TwinCAT real-time and whose object ID is available via OID_TCRTIME_CTRL.
- bool HasOidCriticalSection(); Returns TRUE if the object ID is set to a value other than 0, otherwise FALSE. The object ID is not checked to verify whether it belongs to a Critical Section Provider.

- bool IsInitializedCriticalSection(); Returns TRUE if the Critical Section was successfully initialized.
- HRESULT CreateCriticalSection(ITComObjectServer* ipSrv); Once the Critical Section is initialized, it
 is deleted and a new Critical Section is initialized. Returns S_OK if successful. Error cases are
 indicated by the return of error codes:

ADS_E_INVALIDPARM	Invalid Critical Section Provider
ADS_E_NOINTERFACE	The object ID is set to a reference that is not a Critical Section Provider, i.e. ITcRTime is not implemented.
E_FAIL	Internal error from the Critical Section Provider.

- HRESULT CreateCriticalSection(OTCID oid, ITComObjectServer* ipSrv); Initializes the Critical Section. DeleteCriticalSection() must be called if this method is used again. Return values as in CreateCriticalSection(ITComObjectServer* ipSrv);
- HRESULT DeleteCriticalSection(); Critical Section is deleted. Always returns S_OK.
- HRESULT EnterCriticalSection(); Blocked until the Critical Section is released and can be accessed exclusively.
- HRESULT LeaveCriticalSection(); Leaves the Critical Section and thus releases it again. Returns MAKE_RTOS_HRESULT(OS_CS_ERR) if the caller is not the owner.
- HRESULT EnterCriticalSectionConcurrent(); Enters the Critical Section in parallel with other tasks. The number of parallel accesses is defined by the parameter "concurrent" in the constructor. When this maximum number is reached, the call is blocked until one of the parallel accesses has ended.

EnterCriticalSection(), EnterCriticalSectionConcurrent() and LeaveCriticalSection() must be called in the RT context, otherwise the following return value is returned:

ADS_E_INVALIDCONTEXT	Return value if Critical Section is entered outside the RT context. The
	Critical Section is not entered.

If these methods are used without initializing the Critical Section, S_OK is returned without further action. All other methods can be used in the RT context as well as in the Windows context.

Semaphores

Semaphores are used to synchronize access to limited resources. They can also be used to implement a notification event. Semaphores are provided by the TwinCAT real-time through the CSemaphoreInstance class.

CSemaphoreInstance

The CSemaphoreInstance class provides the interface for handling semaphores. To create a semaphore, the instance requires the object ID of the TwinCAT real-time instance, which is available via OID_TCRTIME_CTRL, as well as a reference to the TwinCAT object server via a pointer to ITComObjectServer.

Methods:

- HRESULT SemCreate(WORD nCntInit, OTCID oid, ITComObjectServer* ipSrv); Creates the semaphores with nCntInit as initial value of the available resources. Returns S_OK if successful and E_FAIL if the semaphore cannot be generated.
- HRESULT SemDelete(); SemDelete() deletes the semaphore. Returns S_OK.
- HRESULT SemPost() SemPost() increases the number of available resources. If a task is waiting for the semaphores, the task with the highest priority is released, i.e. it can continue its execution. Returns S_OK if successful. Possible error codes:

MAKE_RTOS_HRESULT(51)

Semaphore overflow. For example, if the internal memory is insufficient.

 HRESULT SemPend(OSTICKS nTimeout); Reduces the number of available resources; if no resources are available, the task is blocked at this point.
 SemPend() waits for a semaphore until it is available. A timeout can be specified in OSTICKS and is therefore processor dependent. The ITcRTime interface in can be used to calculate it. In the sample TcSemaphoreSample a method TimeoutMsToTicks was used for this purpose. Special values for nTimeout:

	Method immediately returns S_OK if the semaphore is available. Method returns a timeout if no resource is available.
RTIME_ENDLESSWAIT (0)	Method waits indefinitely for availability of the semaphores

The method returns S_OK if the semaphore was successfully obtained; otherwise:

MAKE_RTOS_HRESULT(10)	Indicates a timeout. If nTimeout is set as RTIME_NOWAIT, this
	semaphore is not available.

Sample:

Sample24: Semaphores [> 316]

12.7 Interfaces

Several interfaces are available for the interaction of the modules developed by the user with the TwinCAT 3 system. These are described (at API level) in detail on these pages.

Name	Description
ITcUnknown [▶ 205]	ITcUnknown defines the reference count as well as the querying of a reference to a more specific interface.
ITComObject [190]	The ITComObject interface is implemented by every TwinCAT module.
ITcCyclic [▶ 173]	The interface is implemented by TwinCAT modules that are called once per task cycle.
ITcCyclicCaller [▶ 174]	Interface for logging the ItcCyclic interface of a module onto and off from a TwinCAT task.
ITcFileAccess [176]	Interface for accessing the file system
ITcFileAccessAsync [] 184]	Asynchronous access to file operations.
ITcPostCyclic [▶ 196]	The interface is implemented by TwinCAT modules that are called once per task cycle following the output update.
ITcPostCyclicCaller [▶ 197]	Interface for logging the ITcPostCyclic interface of a module onto and off from a TwinCAT task.
ITcloCyclic [▶ 186]	This interface is implemented by TwinCAT modules that are called during the input update and output update within a task cycle.
ITcloCyclicCaller [▶ 187]	Interface for logging the ITcloCyclic interface of a module onto and off from a TwinCAT task.
ITcRTimeTask [199]	Query of extended TwinCAT task information.
ITcTask [200]	Query of the timestamp and task-specific information of a TwinCAT task.
ITcTaskNotification [▶_204]	Executes a callback if the cycle time was exceeded during the previous cycle.

TwinCAT SDK

TwinCAT SDK contains a number of functions, which can be found in C:\TwinCAT\3.x\sdk\Include.

- The TcCOM framework is provided here (in particular TcInterfaces.h and TcServices.h).
- Tasks and data area access is provided via TcloInterfaces.h.
- SDK functions are the <u>mathematical functions [> 225]</u>.
- Subset of <u>STL [▶ 228]</u>.
- TwinCAT runtime <u>RtIR0.h [) 207</u>]
- Methods for <u>ADS communication [▶ 208]</u>

· Classes / functions with names beginning with "Os" must not be used in a real-time context.

12.7.1 Return values

ITc interfaces methods generally return an HRESULT.

The following return values can be returned in the case of ITc interfaces.

Name	HRESULT
S_OK	0x0000 0000
S_FALSE	0x0000 0001
E_NOTIMPL	0x8000 4001
E_NOINTERFACE	0x8000 4002
E_POINTER	0x8000 4003
E_ABORT	0x8000 4004
E_FAIL	0x8000 4005
E_UNEXPECTED	0x8000 FFFF
E_ACCESSDENIED	0x8007 0005
E_HANDLE	0x8007 0006
E_OUTOFMEMORY	0x8007 000E
E_INVALIDARG	0x8007 0057

In addition, there is a possibility for <u>ADS Return Codes</u> to be returned as HRESULT. These are also available as macros in the SDK, where they are known, for example, as ADS_E_BUSY for the ADS Error Code ADSERR_DEVICE_BUSY.

12.7.2 Interface ITcCyclic

Interface ITcCyclic Interface is implemented by TwinCAT modules which should be called once per task cycle.

Syntax

```
TCOM_DECL_INTERFACE("03000010-0000-e000-000000000064", ITcCyclic)
struct__declspec(novtable) ITcCyclic : public ITcUnknown
```

Required include: TcIoInterfaces.h

Methods

Name	Description
CycleUpdate [173]	Is called once per task cycle if the interface is logged on to a cyclic caller.

Comments

The ITcCyclic interface is implemented by TwinCAT modules. This interface is passed to the ITcCyclicCaller::AddModule() method when a module logs on to a task, usually as the last initialization step in the transition from SafeOP to OP. After login, the CycleUpdate() method of the module instance is called.

12.7.2.1 Method ITcCyclic:CyclicUpdate

The CyclicUpdate method is normally called by a TwinCAT Task after the interface has been logged in.

Syntax

HRESULT TCOMAPI CycleUpdate(ITcTask* ipTask, ITcUnknown* ipCaller, ULONG_PTR context)

Parameters

ipTask: (type: ITcTask) refers to the current task context.

ipCaller: (type: ITcUnknown) refers to the calling instance.

Context: (type: ULONG_PTR) context contains the value which has been passed to method ITcCyclicCaller::AddModule()

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

At present, the return value is ignored by the TwinCAT tasks.

Description

Within a task cycle the method CycleUpdate() is called after InputUpdate() has been for all registered module instances. Therefore, this method should be used to implement cyclic processing.

12.7.3 Interface ITcCyclicCaller

Interface for logging the ItcCyclic interface of a module onto and off from a TwinCAT task.

Syntax

```
TCOM_DECL_INTERFACE("0300001E-0000-0000-0000-00000000064", ITcCyclicCaller)
struct declspec(novtable) ITcCyclicCaller : public ITcUnknown
```

Required include: TcIoInterfaces.h

Methods

Name	Description
AddModule [▶_174]	Login module that implements the ITcCyclic interface.
The second secon	Log off the previously logged in ITcCyclic interface of a module.

Comments

The ITcCyclicCaller interface is implemented by TwinCAT tasks. A module uses this interface to login its ITcCyclic interface to a task, usually as the last initialization step in the SafeOP to OP transition. After login, the CycleUpdate() method of the module instance is called. The interface is also used to log off the module so that it is no longer called by the task.

12.7.3.1 Method ITcCyclicCaller:AddModule

Reports the ITcCyclic interface of a module to a cyclic caller, e.g. a TwinCAT task.

Syntax

```
virtual HRESULT TCOMAPI
AddModule(STcCyclicEntry* pEntry, ITcCyclic* ipMod, ULONG_PTR
context=0, ULONG sortOrder=0)=0;
```

Parameter

pEntry: (type: STcCyclicEntry) [in] pointer to a list item that is inserted into the internal list of the cyclic caller; see also <u>description [> 175]</u>.

ipMod: (type: ITcCyclic) [in] interface pointer used by the cyclic caller.

context: (type: ULONG_PTR) [optional] a context value that is transferred to the ITcCyclic::CyclicUpdate() method with each call.

sortOrder: (type: ULONG) [optional] the sorting order can be used for controlling the order of execution if various module instances are executed by the same cyclic caller.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [▶ 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [▶ 343]</u>.

The error ADSERR_DEVICE_INVALIDSTATE is returned if the cyclic caller, i.e. the TwinCAT task is not in the OP state.

Description

A TwinCAT module class normally uses a Smart Pointer to refer to the cyclic caller type ITcCyclicCallerPtr. The object ID of the task is stored in this Smart Pointer and a reference to the task can be obtained via the TwinCAT object server. In addition, the Smart Pointer class already contains a list item. Therefore the Smart Pointer can be used as the first parameter for the AddModule method.

The following sample code shows the login of the ITcCyclicCaller interface.

```
RESULT hr =
S_OK;
if ( m_spCyclicCaller.HasOID() ) {
    if ( SUCCEEDED_DBG(hr =
        m_spSrv->TcQuerySmartObjectInterface(m_spCyclicCaller)) )
    {
        if ( FAILED(hr =
        m_spCyclicCaller->AddModule(m_spCyclicCaller,
        THIS_CAST(ITcCyclic))) ) {
            m_spCyclicCaller = NULL;
        }
}
```

12.7.3.2 Method ITcCyclicCaller:RemoveModule

Unregister a module instance from being called by a cyclic caller.

Syntax

```
virtual HRESULT TCOMAPI
RemoveModule(STcCyclicEntry* pEntry)=0;
```

Parameters

pEntry: (type: STcCyclicEntry) refers to the list entry which should be removed from the internal list of the cyclic caller.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

The method returns E_FAIL if the entry is not in the internal list.

Description

Similar to the method AddModule() the smart pointer for the cyclic caller is used as list entry when the module instance should be removed from cyclic caller.

Declaration and usage of smart pointer:

ITcCyclicCallerInfoPtr m_spCyclicCaller;

```
if (
m_spCyclicCaller ) {
m_spCyclicCaller->RemoveModule(m_spCyclicCaller);
}
m_spCyclicCaller = NULL;
```

12.7.4 Interface ITcFileAccess

Interface to access file system from TwinCAT C++ modules

Syntax

```
TCOM_DECL_INTERFACE("742A7429-DA6D-4C1D-80D8-398D8C1F1747", ITcFileAccess) ____declspec(novtable)
ITcFileAccess: public ITcUnknown
```

Required include: TcFileAccessInterfaces.h

🔹 Methods

Name	Description
FileOpen [▶ 177]	Opens a file.
FileClose [▶ 178]	Closes a file.
FileRead [▶ 178]	Reads from a file.
FileWrite [▶ 179]	Writes to a file.
FileSeek [▶ 179]	Sets position in a file.
<u>FileTell [▶ 180]</u>	Queries position in a file.
FileRename [▶ 180]	Renames a file.
FileDelete [▶ 180]	Deletes a file.
FileGetStatus [181]	Gets the status of a file.
FileFindFirst [▶ 182]	Searches for a file, first iteration.
FileFindNext [▶ 182]	Searches for a file, next iteration.
FileFindClose [183]	Closes a file search.
<u>MkDir [▶ 183]</u>	Creates a directory.
<u>RmDir [▶ 184]</u>	Deletes a directory.

Remarks

The ITcFileAccess interface used to access files from file systems. Since the provided methods are blocking this should not be used in CycleUpdate() / realtime context. The derived interface ITcFileAccessAsync [184] adds a Check() Method, which could be used instead.

Please have a look at <u>Sample20a: FileIO-Cyclic Read / Write [> 311]</u>.

The interface is implemented by module class CID_TcFileAccess.

12.7.4.1 Method ITcFileAccess:FileOpen

Opens a file.

Syntax

```
virtual HRESULT TCOMAPI FileOpen(PCCH szFileName, TcFileAccessMode AccessMode, PTcFileHandle
phFile);
```

Parameter

szFileName: (type: PCCH) [in] the name of the file to be opened.

AccessMode: (type: TcFileAccessMode) [in] method of accessing the file; see TcFileAccessServices.h.

phFile: (type: TcFileHandle) [out] returned file handle.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

The method returns a handle to access the file, which name is defined in szFileName.

AccessModes could be used as following:

```
typedef enum TcFileAccessMode
amRead = 0x0000001,
amWrite = 0x0000002,
amAppend = 0x0000004,
amPlus = 0x0000008,
amBinary = 0x0000010,
amReadBinary = 0x00000011,
amWriteBinary = 0x0000012,
amText = 0x0000020,
amReadText = 0x0000021,
amWriteText = 0x00000022,
amEnsureDirectory = 0x00000040,
amReadBinaryED = 0x0000051,
amWriteBinaryED = 0x00000052,
amReadTextED = 0x00000061,
amWriteTextED = 0x0000062,
amEncryption = 0x0000080,
amReadBinEnc = 0 \times 00000091,
amWriteBinEnc = 0x00000092,
amReadBinEncED = 0x00000d1,
amWriteBinEncED = 0x00000d2,
} TcFileAccessMode, *PTcFileAccessMode;
```

ADS Return Codes [343]

12.7.4.2 Method ITcFileAccess:FileClose

Closes a file.

Syntax

virtual HRESULT TCOMAPI FileClose(PTcFileHandle phFile);

Parameter

phFile: (type: TcFileHandle) [out] returned file handle.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

The method closes a file defined by the phFile.

Also see about this

ADS Return Codes [▶ 343]

12.7.4.3 Method ITcFileAccess:FileRead

Read data from a file.

Syntax

```
virtual HRESULT TCOMAPI
FileRead(TcFileHandle hFile, PVOID pData, UINT cbData, PUINT pcbRead);
```

Parameter

hFile: (type: TcFileHandle) [in] refers to the previously opened file.

pData: (type: PVOID) [out] storage location of the data to be read.

cbData: (type: PVOID) [in] maximum size of the data to be read (size of the memory behind pData).

pcbRead: (type: PUINT) [out] size of the data that was read.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method retrieves data from a file defined by the file handle. Data will be stored in pData while pcbRead provides length of given data.

Also see about this

ADS Return Codes [▶ 343]

12.7.4.4 Method ITcFileAccess:FileWrite

Write data to a file.

Syntax

```
virtual HRESULT TCOMAPI
FileWrite(TcFileHandle hFile, PCVOID pData, UINT cbData, PUINT pcbWrite);
```

Parameter

hFile: (type: TcFileHandle) [in] refers to the previously opened file.

pData: (type: PVOID) [in] storage location of the data to be written.

cbData: (type: PVOID) [in] size of the data to be written (size of the memory behind pData).

pcbRead: (type: PUINT) [out] size of the written data.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method writes data to a file defined by the file handle. Data will be read from pData while pcbRead provides length of data.

Also see about this

ADS Return Codes [▶ 343]

12.7.4.5 Method ITcFileAccess:FileSeek

Sets position in file.

Syntax

virtual HRESULT TCOMAPI FileSeek(TcFileHandle hFile, UINT uiPos);

Parameter

hFile: (type: TcFileHandle) [in] refers to the previously opened file.

uiPos: (type: UINT) [in] position at which setting is to take place.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method sets the position within the file for further actions

Also see about this

ADS Return Codes [▶ 343]

12.7.4.6 Method ITcFileAccess:FileTell

Retrieves position in file.

Syntax

virtual HRESULT TCOMAPI FileTell(TcFileHandle hFile, PUINT puiPos);

Parameter

hFile: (type: TcFileHandle) [in] refers to the previously opened file.

puiPos: (type: PUINT) [out] storage location of the position to be returned.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method retrieves the position within the file, which is currently set.

Also see about this

ADS Return Codes [> 343]

12.7.4.7 Method ITcFileAccess:FileRename

Renames a file.

Syntax

virtual HRESULT TCOMAPI FileRename(PCCH szOldName, PCCH szNewName);

Parameter

szOldName: (type: PCCH) [in] the file name to be changed.

szNewName: (type: PCCH) [in] the new file name.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method renames a file from an old name to a new name.

Also see about this

ADS Return Codes [343]

12.7.4.8 Method ITcFileAccess:FileDelete

Deletes a file.

BECKHOFF

Syntax

virtual HRESULT TCOMAPI FileDelete(PCCH szFileName);

Parameter

szFileName: (type: PCCH) [in] name of the file to be deleted.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method deletes a file from the file system.

Also see about this

ADS Return Codes [▶ 343]

12.7.4.9 Method ITcFileAccess:FileGetStatus

Retrieves status of a file.

Syntax

virtual HRESULT TCOMAPI FileGetStatus(PCCH szFileName, PTcFileStatus pFileStatus));

Parameter

szFileName: (type: PCCH) [in] the name of the file in question.

pFileStatus: (type: PTcFileStatus) [out] the state of the file, cf. TcFileAccessServices.h .

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method retrieves Status information of a given file name.

This includes the following information:

```
typedef struct TcFileStatus
{
 union
 {
 ULONGLONG ulFileSize;
 struct
 {
 ULONG ulFileSizeLow;
 ULONG ulFileSizeHigh;
 };
 };
 ULONGLONG ulCreateTime;
 ULONGLONG ulModifiedTime;
 ULONGLONG ulReadTime;
 DWORD dwAttribute;
 DWORD wReserved0;
 } TcFileStatus, *PTcFileStatus;
}
```

Also see about this

ADS Return Codes [▶ 343]

12.7.4.10 Method ITcFileAccess:FileFindFirst

Capability to step through files of a directory.

Syntax

```
virtual HRESULT TCOMAPI FileFindFirst (PCCH szFileName, PTcFileFindData pFileFindData ,
PTcFileFindHandle phFileFind);
```

Parameter

szFileName: (type: PCCH) [in] directory or path and name of the file sought. The file name can contain placeholders such as asterisk (*) or question mark (?).

pFileFindData: (type: PTcFileFindData) [out] the description of the first file, cf. TcFileAccessServices.h

phFileFind: (type: PTcFileFindHandle) [out] handle for searching further with FileFindNext.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [▶ 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [▶ 343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method starts with finding files in a defined directory. The Method provides access to PTcFileFindData of the first found file, which contains the following information:

```
typedef struct TcFileFindData
{
  TcFileHandle hFile;
  DWORD dwFileAttributes;
  ULONGLONG ui64CreationTime;
  ULONGLONG ui64LastAccessTime;
  ULONGLONG ui64LastWriteTime;
  DWORD dwFileSizeHigh;
  DWORD dwFileSizeLow;
  DWORD dwReserved1;
  DWORD dwReserved2;
  CHAR cFileName[260];
  CHAR cAlternateFileName[14];
  WORD wReserved0;
  } TcFileFindData, *PTcFileFindData;
}
```

Also see about this

ADS Return Codes [▶ 343]

12.7.4.11 Method ITcFileAccess:FileFindNext

Step further on through files of a directory.

Syntax

virtual HRESULT TCOMAPI FileFindNext (TcFileFindHandle hFileFind, PTcFileFindData pFileFindData);

Parameters

hFileFind: (type: PTcFileFindHandle) [in] handle to search further on with FileFindNext.

pFileFindData: (type: PTcFileFindData) [out] the description of the next file. Compare *TcFileAccessServices.h.*

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [> 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [> 343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method finds next file in a directory. The Method provides access to PTcFileFindData of the found file, which contains the following information:

```
typedef struct TcFileFindData {
    TcFileHandle hFile;
    DWORD dwFileAttributes;
    ULONGLONG ui64CreationTime;
    ULONGLONG ui64LastAccessTime;
    ULONGLONG ui64LastWriteTime;
    DWORD dwFileSizeHigh;
    DWORD dwFileSizeLow;
    DWORD dwReserved1;
    DWORD dwReserved2;
    CHAR cFileName[260];
    CHAR cAlternateFileName[14];
    WORD wReserved0;
    } TcFileFindData, *PTcFileFindData;
}
```

Also see about this

ADS Return Codes [> 343]

12.7.4.12 Method ITcFileAccess:FileFindClose

Close finding files of a directory.

Syntax

virtual HRESULT TCOMAPI FileFindClose (TcFileFindHandle hFileFind);

Parameter

hFileFind: (type: PTcFileFindHandle) [in] handle to exit the search.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method closes finding of files in a directory.

Also see about this

ADS Return Codes [▶ 343]

12.7.4.13 Method ITcFileAccess:MkDir

Create a directory on the filesystem.

Syntax

virtual HRESULT TCOMAPI MkDir(PCCH szDir);

Parameter

szDir: (type: PCCH) [in] directory to be created.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method creates a directory as defined by the szDir parameter.

Also see about this

ADS Return Codes [> 343]

12.7.4.14 Method ITcFileAccess:RmDir

Delete a directory from the filesystem.

Syntax

```
virtual HRESULT TCOMAPI RmDir(PCCH szDir);
```

Parameter

szDir: (type: PCCH) [in] directory to be deleted.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [] 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [] 343]</u>.

A particularly interesting error code is ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.

Description

This method deletes a directory as defined by the szDir parameter.

Also see about this

ADS Return Codes [▶ 343]

12.7.5 Interface ITcFileAccessAsync

Asynchronous access to file operations. This interface extends ITcFileAccess [176].

Syntax

```
TCOM_DECL_INTERFACE("C04AC244-C126-466E-982E-93EC571F2277", ITcFileAccessAsync) struct
declspec(novtable) ITcFileAccessAsync: public ITcFileAccess
```

```
Required include: TcFileAccessInterfaces.h
```

🔹 Methods

Name	Description
<u>C [▶ 185]</u> heck	Query the state of the file operation.

Interface parameters

Name	Description		
PID_TcFileAccessAsyncSegmentSize	Size of the segments transferred to system service.		
PID_TcFileAccessAsyncTimeoutMs	Sets the timeout in [ms].		
PID_TcFileAccessAsyncNetId(Str)	NetId of the system service to be contacted.		

Comments

Interface can be obtained from module instance with class ID CID_TcFileAccessAsync. When using the asynchronous interface, the interface methods inherited from the synchronous variant return ADS_E_PENDING if a query has been successfully submitted but not yet completed. If the call is received while the previous request was still being processed, the error code ADS_E_BUSY is returned.

Description of the module parameters:

- PID_TcFileAccessAsyncAdsProvider: Object ID of a task that provides the ADS interface.
- PID_TcFileAccessAsyncNetId / PID_TcFileAccessAsyncNetIdStr: AmsNetId of the system service used for file access. The "Str" variant takes the AmsNetId as string. Please use one.
- PID_TcFileAccessAsyncTimeoutMs: Timeout for file access.
- PID_TcFileAccessAsyncSegmentSize: The read and write access to file is fragmented with this segment size.

See Sample20a: FileIO-Cyclic Read / Write [311].

12.7.5.1 Method ITcFileAccessAsync::Check()

Query the state of the file operation.

Syntax

virtual HRESULT TCOMAPI Check();

Parameters

none

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Particularly interesting error codes are

- ADSERR_DEVICE_TIMEOUT if the timeout (5 seconds) has elapsed.
- ADSERR_DEVICE_PENDING if the file operation is not completed.

Description

This operation checks the state of the previously called file operation.

Also see about this

ADS Return Codes [343]

12.7.6 Interface ITcloCyclic

Interface is implemented by TwinCAT modules which should be called on input update and on output update within a task cycle.

Syntax

```
TCOM_DECL_INTERFACE("03000011-0000-0000-0000000000064", ITcIoCyclic)
struct __declspec(novtable) ITcIoCyclic : public ITcUnknown
```

Required include: TcIoInterfaces.h

Methods

Name	Description
	Is called at the beginning of a task cycle if the interface is logged on to a cyclic I/O caller.
	Is called at the end of a task cycle if the interface is logged on to a cyclic I/O caller.

Comments

ITcloCyclic can be used to implement a TwinCAT module that acts as a fieldbus driver or I/O filter module.

This interface is passed to the ITcloCyclicCaller::AddloDriver method when a module logs on to a task, usually as the last initialization step at the transition from SafeOP to OP. After login, the methods InputUpdate() and OutputUpdate() of the module instance are called once per task cycle.

12.7.6.1 Method ITcloCyclic:InputUpdate

The InputUpdate method is normally called by a TwinCAT task after the interface has been logged in.

Syntax

```
virtual HRESULT TCOMAPI InputUpdate(ITcTask* ipTask,
ITcUnknown* ipCaller, DWORD dwStateIn, ULONG_PTR context = 0)=0;
```

Parameter

ipTask: (type: ITcTask*) refers to the current task context.

ipCaller: (type: ITcUnknown) refers to the calling instance.

dwStateIn: (type: DWORD) future extensions reserved; at present this value is always 0. **context:** (type: ULONG_PTR) context contains the value that was transferred to the method ITcCyclicCaller::AddIoDriver().

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

In a task cycle the method InputUpdate() is first called for all registered module instances. Therefore this method must be used for updating the data areas of the type Input-Source of the module.

12.7.6.2 Method ITcloCyclic:OutputUpdate

The OutputUpdate method is normally called by a TwinCAT task after the interface has been logged in.

Syntax

```
virtual HRESULT TCOMAPI OutputUpdate(ITcTask* ipTask, ITcUnknown* ipCaller,
PDWORD pdwStateOut = NULL, ULONG_PTR context = 0)=0;
```

Parameters

ipTask: (type: ITcTask) refers to the current task context.

ipCaller: (type: ITcUnknown) refers to the calling instance.

pdwStateOut: (type: DWORD) [out] reserved for future extensions, currently returned value is ignored. **context:** (type: ULONG_PTR) context contains the value which has been passed to method ITcCyclicCaller::AddloDriver()

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

In a task cycle the method OutputUpdate() is called for all registered module instances. Therefore this method must be used for updating the data areas of the type Output-Destination of the module.

12.7.7 Interface ITcloCyclicCaller

Interface for logging the ITcloCyclic interface of a module onto and off from a TwinCAT task.

Syntax

```
TCOM_DECL_INTERFACE("0300001F-0000-0000-e000-00000000064", ITcIoCyclicCaller)
struct__declspec(novtable) ITcIoCyclicCaller : public ITcUnknown
```

Required include: TcIoInterfaces.h

Methods

Name	Description
AddIoDriver [▶ 187]	Login module that implements the ITcloCyclic interface.
	Log off the previously logged in ITcloCyclic interface of a module.

Comments

The ITcloCyclicCaller interface is implemented by TwinCAT tasks. A module uses this interface to login its ITcloCyclic interface to a task, usually as the last initialization step in the SafeOP to OP transition. After login, the CycleUpdate() method of the module instance is called. The interface is also used to log off the module so that it is no longer called by the task.

12.7.7.1 Method ITcloCyclicCaller:AddloDriver

Reports the ITcloCyclic interface of a module to a cyclic I/O caller, e.g. a TwinCAT task.

Syntax

```
virtual HRESULT TCOMAPI AddIoDriver(STcIoCyclicEntry*
pEntry, ITcIoCyclic* ipDrv, ULONG_PTR context=0, ULONG sortOrder=0)=0;
```

Parameter

pEntry: (type: STcloCyclicEntry) pointer to a list item that is inserted into the internal list of the cyclic I/O caller; see also <u>description [} 175]</u>.

ipDrv: (type: ITcloCyclic) [in] interface pointer used by the cyclic I/O caller.

context: (type: ULONG_PTR) [optional] a context value that is transferred to the ITcloCyclic::InputUpdate() and ITcloCyclic::OutputUpdate methods with each call.

sortOrder: (type: ULONG) [optional] the sorting order can be used for controlling the order of execution if various module instances are executed by the same cyclic caller.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

A TwinCAT module class normally uses a Smart Pointer to refer to the cyclic I/O caller of type ITcloCyclicCallerPtr. The object ID of the cyclic I/O caller is stored in this Smart Pointer and a reference can be obtained via the TwinCAT object server. In addition, the Smart Pointer class already contains a list item. Therefore the Smart Pointer can be used as the first parameter for the AddloDriver method.

The following code sample illustrates the login of the ITcloCyclicCaller interface.

12.7.7.2 Method ITcloCyclicCaller:RemoveloDriver

Unregister a module instance from being called by a cyclic I/O caller.

Syntax

```
virtual HRESULT TCOMAPI
RemoveIoDriver(STCIoCyclicEntry* pEntry)=0;
```

Parameters

pEntry: (type: STcIoCyclicEntry) refers to the list entry which should be removed from the internal list of the cyclic I/O caller.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

The method returns E_FAIL if the entry is not in the internal list.

Description

Comparable with the AddIoDriver() method, the smart pointer is used for the cyclic I/O caller as a list item if the module instance is to be removed from the cyclic I/O caller.

Declaration and use of the smart pointer:

```
ITcIoCyclicCallerInfoPtr
m_spIoCyclicCaller;
if ( m_spIoCyclicCaller )
{
    m_spIoCyclicCaller > RemoveIoDriver(m_spIoCyclicCaller);
}
m_spCyclicCaller = NULL;
```

12.7.8 ITComOnlineChange interface

The ITComOnlineChange interface is used to perform Online Changes of modules.

Syntax

```
TCOM_DECL_INTERFACE ("D28A8CD2-5477-4B75-AF0F-998841AF9E44", ITComOnlineChange)
```

🔹 Methods

Name	Description			
PrepareOnlineChange [189]	This method is called to prepare the Online Change.			
PerformOnlineChange [> 190]	This method is called to perform the Online Change.			

Comments

The implementation of this interface is necessary for a module to be capable of Online Change. Furthermore such a module must be created in a versioned C++ project.

- <u>Here [▶ 164]</u> is a general description of the procedure.
- This procedure can be followed for existing modules: <u>Online Change [> 164]</u>.

Also see about this

- TwinCAT Module Class Wizard [▶ 102]
- TwinCAT C++ Project Wizard [▶ 99]

12.7.8.1 Method ITComOnlineChange:PrepareOnlineChange

This method is called to prepare the Online Change.

The method is called by TwinCAT to execute the OnlineChange. It runs asynchronously in the background, which must be taken into account when accessing the existing object. The preparation should include all operations that can already be performed.

Syntax

virtual HRESULT TCOMAPI PrepareOnlineChange(ITComObject* ipOldObj, TmcInstData* pOldInfo) = 0;

Parameter

ipOldObj: (Type: ITComObject*) Reference to the existing object to be exchanged.

pOldInfo: (type: TmcInstData*) reference to information of the existing object.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [▶ 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [▶ 343]</u>.

Description

Via ipOldObj, the data of the existing object is made available for transfer so that it can be applied.

For example:

```
ULONG nData = sizeof(m_Parameter);
PVOID pData = &m_Parameter;
ipOldObj->TcGetObjPara(PID_Module1Parameter, nData, pData);
```

12.7.8.2 Method ITComOnlineChange:PerformOnlineChange

This method is called to perform the Online Change.

The method is called by TwinCAT to execute the OnlineChange. It is called blocking. It should therefore only take a short time.

Syntax

virtual HRESULT TCOMAPI PerformOnlineChange(ITComObject* ipOldObj, TmcInstData* pOldInfo) = 0;

Parameter

ipOldObj: (Type: ITComObject*) Reference to the existing object to be exchanged.

pOldInfo: (type: TmcInstData*) reference to information of the existing object.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

Via ipOldObj, the data of the existing object is made available for transfer so that it can be applied.

For example:

```
ULONG nData = sizeof(m_Parameter);
PVOID pData = &m_Parameter;
ipOldObj->TcGetObjPara(PID_Module1Parameter, nData, pData);
```

12.7.9 Interface ITComObject

The ITComObject interface is implemented by every TwinCAT module. It makes basic functionalities available.

Syntax

```
TCOM_DECL_INTERFACE("00000012-0000-0000-e000-00000000064", ITComObject)
struct__declspec(novtable) ITComObject: public ITcUnknown
```

BECKHOFF

🔹 Methods

Name	Description
TcGetObjectId(OTCID& objId) [▶_191]	Saves the object ID using the given OTCID reference.
TcSetObjectId [191]	Sets the object ID of the object to the given OTCID.
TcGetObjectName [192]	Saves the object names in the buffer with the given length.
TcSetObjectName [192]	Sets the object name of the object to given CHAR*.
TcSetObjState [193]	Initializes a transition to a predefined state.
TcGetObjState [193]	Queries the current state of the object.
<u>TcGetObjPara [▶ 193]</u>	Queries an object parameter identified with its PTCID.
TcSetObjPara [▶ 194]	Sets an object parameter identified with its PTCID.
TcGetParentObjld [194]	Saves the parent object ID with the help of the given OTCID reference.
TcSetParentObject [195]	Sets the parent object ID to the given OTCID.

Comments

The ITComObject interface is implemented by every TwinCAT module. It makes functionalities available regarding the state machine and Information from/to the TwinCAT system.

12.7.9.1 Method ITcComObject:TcGetObjectId(OTCID& objId)

The method saves the object ID with the help of the given OTCID reference.

Syntax

HRESULT TcGetObjectId(OTCID& objId)

Parameter

objld: (type: OTCID&) reference to OTCID value.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The method stores Object ID using given OTCID reference.

12.7.9.2 Method ITcComObject:TcSetObjectId

The method TcSetObjectId sets object's object ID to the given OTCID.

Syntax

HRESULT TcSetObjectId(OTCID objId)

Parameters

objld: (type: OTCID) The OTCID, which should be set.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

At present, the return value is ignored by the TwinCAT tasks.

Description

Indicates the success of the ID change.

12.7.9.3 Method ITcComObject:TcGetObjectName

The method TcGetObjectName stores the Object name into buffer with given length.

Syntax

HRESULT TcGetObjectName(CHAR* objName, ULONG nameLen);

Parameters

objName: (type: CHAR*) the name, which should be set.

nameLen: (type: ULONG) the maximum length to write.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The method TcGetObjectName stores the Object name into buffer with given length.

12.7.9.4 Method ITcComObject:TcSetObjectName

The method TcSetObjectName sets objects's Object Name to the given CHAR*.

Syntax

HRESULT TcSetObjectName(CHAR* objName)

Parameter

objName: (type: CHAR*) the name of the object to be set.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The method TcSetObjectName sets objects's Object Name to the given CHAR*.

12.7.9.5 Method ITcComObject:TcSetObjState

The method TcSetObjState initializes a transition to given state.

Syntax

HRESULT TcSetObjState(TCOM_STATE state, ITComObjectServer* ipSrv, PTComInitDataHdr pInitData);

Parameter

state: (type: TCOM_STATE) displays the new state.

ipSrv: (type: ITComObjectServer*) ObjServer that handles the object.

pInitData: (type: PTComInitDataHdr) points to a list of parameters (optional), see macro IMPLEMENT_ITCOMOBJECT_EVALUATE_INITDATA as an example of how the list can be iterated.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The method TcSetObjState initializes a transition to given state.

12.7.9.6 Method ITcComObject:TcGetObjState

The method TcGetObjState retrieves the current state of the object.

Syntax

```
HRESULT TcGetObjState(TCOM_STATE* pState)
```

Parameter

pState: (type: TCOM_STATE*) pointer to the state.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The TcGetObjState method queries the current state of the object.

12.7.9.7 Method ITcComObject:TcGetObjPara

The method TcGetObjPara retrieves a object parameter identified by its PTCID.

Syntax

HRESULT TcGetObjPara(PTCID pid, ULONG& nData, PVOID& pData, PTCGP pgp=0)

Parameter

pid: (type: PTCID) parameter ID of the object parameter.

nData: (type: ULONG&) max. length of the data.

pData: (type: PVOID&) pointer to the data.

pgp: (type: PTCGP) reserved for future extension, NULL forwarded.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [▶ 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [▶ 343]</u>.

Description

The method TcGetObjPara retrieves a object parameter identified by its PTCID.

12.7.9.8 Method ITcComObject:TcSetObjPara

The method TcSetObjPara sets a object parameter identified by its PTCID.

Syntax

```
HRESULT TcSetObjPara(PTCID pid, ULONG nData, PVOID pData, PTCGP pgp=0)
```

Parameter

pid: (type: PTCID) parameter ID of the object parameter.

nData: (type: ULONG) max. length of the data.

pData: (type: PVOID) pointer to the data.

pgp: (type: PTCGP) reserved for future extension, NULL forwarded.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The method TcSetObjPara sets a object parameter identified by its PTCID.

12.7.9.9 Method ITcComObject:TcGetParentObjId

The method TcGetParentObjId stores Parent Object ID using given OTCID reference.

Syntax

HRESULT TcGetParentObjId(OTCID& objId)

Parameter

objld: (type: OTCID&) reference to OTCID value.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

The method TcGetParentObjId stores Parent Object ID using given OTCID reference.

12.7.9.10 Method ITcComObject:TcSetParentObjld

The method TcSetParentObjId sets Parent Object ID using given OTCID reference.

Syntax

```
HRESULT TcSetParentObjId( OTCID objId )
```

Parameter

objld: (type: OTCID) reference to OTCID value.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

At present, the return value is ignored by the TwinCAT tasks.

Description

The method TcSetParentObjId sets Parent Object ID using given OTCID reference.

12.7.10 ITComObject interface (C++ convenience)

The ITComObject interface is implemented by every TwinCAT module. It makes basic functionalities available.

TwinCAT C++ provides additional functions, which are not directly defined through the interface.

Syntax

Required include: TcInterfaces.h

Methods

Name	Description
OTCID TcGetObjectId [> 196]	Queries the object ID.
<u>TcTryToReleaseOpState [▶ 196]</u>	Releases resources; must be implemented.

Comments

Further methods exist, which are not itemized here.

This functionality is provided as standard by the module wizards.

12.7.10.1 TcGetObjectId method

The method queries the object ID.

Syntax

OTCID TcGetObjectId(void)

Parameters

Return Value

OTCID: Returns the OTCID of the object.

Description

The method TcGetObjectId retrieves the Object ID of the object.

12.7.10.2 TcTryToReleaseOpState method

The method TcTryToReleaseOpState releases resources, e.g. data pointers, in order to prepare for exiting the OP state.

Syntax

```
BOOL TcTryToReleaseOpState(void)
```

Parameters

Return value

TRUE or FALSE is returned.

Description

The method TcTryToReleaseOpState releases resources, e.g. data pointers, in order to prepare for exiting the OP state. Must be implemented in order to cancel possible mutual dependencies of module instances. See <u>Sample 10 [> 277]</u>.

12.7.11 Interface ITcPostCyclic

Interface is implemented by TwinCAT modules which should be called once per task cycle after the output update (comparable to Attribute TcCallAfterOutputUpdate of the PLC).

Syntax

```
TCOM_DECL_INTERFACE("03000025-0000-0000-000000000064", ITcPostCyclic)
struct__declspec(novtable) ITcPostCyclic : public ITcUnknown
```

Required include: TcIoInterfaces.h

Methods

Name	Description
	Is called once per task cycle after the output update if the interface has been logged on to a cyclic caller.

Comments

The ITcPostCyclic interface is implemented by TwinCAT modules. This interface is passed to the ITcCyclicCaller::AddPostModule() method when a module logs itself on to a task, usually as the last initialization step at the transition from SafeOP to OP. After login, the PostCycleUpdate() method of the module instance is called.

12.7.11.1 Method ITcPostCyclic:PostCyclicUpdate

The PostCyclicUpdate method normally called by a TwinCAT Task after the output update, after the interface has been logged in.

Syntax

HRESULT TCOMAPI PostCycleUpdate(ITcTask* ipTask, ITcUnknown* ipCaller, ULONG_PTR context)

Parameters

ipTask: (type: ITcTask) refers to the current task context.

ipCaller: (type: ITcUnknown) refers to the calling instance.

Context: (type: ULONG_PTR) context contains the value which has been passed to method ITcPostCyclicCaller::AddPostModule()

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

At present, the return value is ignored by the TwinCAT tasks.

Description

Within a task cycle the method PostCycleUpdate() is called after OutputUpdate() has been for all registered module instances. Therefore, this method should be used to implement such cyclic processing.

12.7.12 Interface ITcPostCyclicCaller

Interface for logging the ITcPostCyclic interface of a module onto and off from a TwinCAT task.

Syntax

TCOM_DECL_INTERFACE("03000026-0000-0000-e000-00000000064", ITcCyclicCaller)
struct__declspec(novtable) ITcPostCyclicCaller : public ITcUnknown Ca

Required include: TcIoInterfaces.h

Methods

Name	Description
AddPostModule [198]	Login module that implements the ITcPostCyclic interface.
	Log off the previously logged in ITcPostCyclic interface of a module.

Comments

The ITcPostCyclicCaller interface is implemented by TwinCAT tasks. A module uses this interface to login its ITcPostCyclic interface to a task, usually as the last initialization step in the SafeOP to OP transition. After login, the PostCycleUpdate() method of the module instance is called. The interface is also used to log off the module so that it is no longer called by the task.

12.7.12.1 Method ITcPostCyclicCaller:AddPostModule

Reports the ITcPostCyclic interface of a module to a cyclic caller, e.g. a TwinCAT task.

Syntax

```
virtual HRESULT TCOMAPI
AddPostModule(STcPostCyclicEntry* pEntry, ITcPostCyclic* ipMod, ULONG_PTR
context=0, ULONG sortOrder=0)=0;
```

Parameter

pEntry: (type: STcPostCyclicEntry) [in] pointer to a list item that is inserted into the internal list of the cyclic caller; see also <u>description [198]</u>.

ipMod: (type: ITcPostCyclic) [in] interface pointer used by the cyclic caller.

context: (type: ULONG_PTR) [optional] a context value that is transferred to the ITcPostCyclic::PostCyclicUpdate() method with each call.

sortOrder: (type: ULONG) [optional] the sorting order can be used for controlling the order of execution if various module instances are executed by the same cyclic caller.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

The error ADSERR_DEVICE_INVALIDSTATE is returned if the cyclic caller, i.e. the TwinCAT task is not in the OP state.

Description

A TwinCAT module class uses a Smart Pointer to refer to the cyclic caller of type ITcPostCyclicCallerPtr. The object ID of the task is stored in this Smart Pointer and a reference to the task can be obtained via the TwinCAT object server. In addition, the Smart Pointer class already contains a list item. Therefore the Smart Pointer can be used as the first parameter for the AddPostModule method.

The following code sample illustrates the login of the ITcPostCyclicCaller interface.

```
RESULT hr =
S_OK;
if ( m_spPostCyclicCaller.HasOID() ) {
    if ( SUCCEEDED_DBG(hr =
    m_spSrv->TcQuerySmartObjectInterface(m_spPostCyclicCaller)) )
    {
        if ( FAILED(hr =
        m_spPostCyclicCaller->AddPostModule(m_spPostCyclicCaller,
        THIS_CAST(ITcPostCyclic)) ) {
            m_spPostCyclicCaller = NULL;
        }
    }
}
```

12.7.12.2 Method ITcPostCyclicCaller:RemovePostModule

Unregister a module instance from being called by a cyclic caller.

Syntax

```
virtual HRESULT TCOMAPI
RemovePostModule(STcPostCyclicEntry* pEntry)=0;
```

Parameters

pEntry: (type: STcPostCyclicEntry) refers to the list entry which should be removed from the internal list of the cyclic caller.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

The method returns E_FAIL if the entry is not in the internal list.

Description

Similar to the method AddPostModule() the smart pointer for the cyclic caller is used as list entry when the module instance should be removed from cyclic caller.

Declaration and usage of smart pointer:

ITcPostCyclicCallerInfoPtr m_spPostCyclicCaller;

```
if (
m_spPostCyclicCaller ) {
m_spPostCyclicCaller->RemovePostModule(m_spPostCyclicCaller);
}
```

```
m_spPostCyclicCaller = NULL;
```

12.7.13 Interface ITcRTimeTask

Retrieve extended TwinCAT task Information.

Syntax

```
TCOM_DECL_INTERFACE("02000003-0000-0000-e000-00000000064", ITcRTimeTask)
struct declspec(novtable) ITcRTimeTask : public ITcTask
```

Required include: TcRtInterfaces.h

🔹 Methods

Name	Description
GetCpuAccount [200]	Query of the CPU account of a TwinCAT Task.

Remarks

Retrieving and using TwinCAT task Information could be done by this interface.

Please have a look at <u>Sample30: Timing Measurement [) 320]</u>

12.7.13.1 Method ITcRTimeTask::GetCpuAccount()

Query of the CPU account of a TwinCAT Task.

Syntax

```
virtual HRESULT TCOMAPI GetCpuAccount(PULONG pAccount)=0;
```

Parameters

pAccount: (type: PULONG) [out] TwinCAT task CPU account is stored in this parameter.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

E_POINTER if the parameter pAccount = NULL.

Description

The GetCpuAccount() method can be used to query the current computing time used for the task.

Code snippet showing the use of GetCpuAccount(), e.g. within an ITcCyclic::CycleUpdate() method:

```
// CPU account in 100 ns interval
ITcRTimeTaskPtr spRTimeTask = ipTask;
ULONG nCpuAccountForComputeSomething = 0;
if (spRTimeTask != NULL)
{
ULONG nStart = 0;
hr = FAILED(hr) ? hr : spRTimeTask->GetCpuAccount(&nStart);
ComputeSomething();
ULONG nStop = 0;
hr = FAILED(hr) ? hr : spRTimeTask->GetCpuAccount(&nStop);
nCpuAccountForComputeSomething = nStop - nStart;
}
```

12.7.14 Interface ITcTask

Query of the timestamp and task-specific information of a TwinCAT task.

Syntax

```
TCOM_DECL_INTERFACE("02000002-0000-0000-e000-00000000064", ITcTask)
struct declspec(novtable) ITcTask : public ITcUnknown
```

Required include: TcRtInterfaces.h

🔹 Methods

Name	Description
GetCycleCounter [203]	Query number of task cycles since task start.
<u>GetCycleTime [▶ 203]</u>	Query of task cycle time in nanoseconds, i.e. time between "begin of task" and next "begin of task".
GetPriority [201]	Querying the task priority.
GetCurrentSysTime [202]	Querying the time when the task cycle starts at intervals of 100 nanoseconds since January 1, 1601 (UTC).
<u>GetCurrentDcTime [▶ 202]</u>	Querying the distributed clock time when the task cycle starts in nanoseconds since January 1, 2000.
<u>GetCurPentiumTime</u> [▶ <u>203]</u>	Querying the time when the method is called at intervals of 100 nanoseconds since January 1, 1601 (UTC).

Comments

With the ITcTask interface the time can be measured in real-time context.

Reference	Function (ITcTask)	Unit	Zerotime	read time stamps at		
				3	4	6
Distributed Clock master	GetCurrentSysTime	100ns	01.01.1601	1	1	1
(EtherCAT, Sercos,)	GetCurrentDcTime	1ns	01.01.2000	1	1	1
Processor Clock	GetCurPentiumTime	100ns	01.01.1601	3	4	6

12.7.14.1 Method ITcTask:GetPriority

Querying the task priority.

Syntax

```
virtual HRESULT TCOMAPI GetPriority(PULONG
pPriority)=0;
```

Parameter

pPriority: (Type: PULONG) [out] Priority value of the task is stored in this parameter.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [▶ 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [▶ 343]</u>.

E_POINTER if the parameter pPriority = NULL.

Description

<u>Sample30: Timing Measurement [} 320]</u> shows usage of this method.

12.7.14.2 Method ITcTask:GetCurrentSysTime

Retrieve time at task cycle start in 100 nanoseconds intervals since 1. January 1601 (UTC)

Syntax

```
virtual HRESULT TCOMAPI GetCurrentSysTime(PLONGLONG
pSysTime)=0;
```

Parameters

pSysTime: (type: PLONGLONG) [out] current system time at task cycle start is stored in this parameter.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

E_POINTER if the parameter pSysTime = NULL.

Description

<u>Sample30: Timing Measurement [} 320]</u> shows usage of this method.

12.7.14.3 Method ITcTask:GetCurrentDcTime

Retrieve distributed clock time at task cycle start in nanoseconds since 1. January 2000

Syntax

```
virtual HRESULT TCOMAPI GetCurrentDcTime(PLONGLONG
pDcTime)=0;
```

Parameters

pDcTime: (type: PLONGLONG) [out] distributed clock time at task cycle start is stored in this parameter.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [> 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [> 343]</u>.

E_POINTER if the parameter pDcTime = NULL.

Description

<u>Sample30: Timing Measurement [▶ 320]</u> shows usage of this method.

12.7.14.4 Method ITcTask:GetCurPentiumTime

Retrieve time at method call in 100 nanoseconds intervals since 1. January 1601 (UTC)

Syntax

```
virtual HRESULT TCOMAPI GetCurPentiumTime(PLONGLONG
pCurTime)=0;
```

Parameter

pCurTime: (Type: PLONGLONG) [out] This parameter stores the current time (UTC) in 100 nanosecond intervals since January 1, 1601.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

E_POINTER if the parameter pCurTime = NULL.

Description

Sample30: Timing Measurement [320] shows usage of this method.

12.7.14.5 Method ITcTask:GetCycleCounter

Retrieve number of task cycles since task start.

Syntax

```
virtual HRESULT TCOMAPI GetCycleCounter(PULONGLONG
pCnt)=0;
```

Parameter

pCnt: (type: PULONGLONG) [out] the number of task cycles since the task was started is stored in this parameter.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

E_POINTER if the parameter pCnt = NULL.

Description

<u>Sample30: Timing Measurement [] 320]</u> shows usage of this method.

12.7.14.6 Method ITcTask:GetCycleTime

Query of task cycle time in nanoseconds, i.e. time between "begin of task" and next "begin of task".

Syntax

```
virtual HRESULT TCOMAPI GetCycleTime(PULONG
pCycleTimeNS)=0;
```

Parameters

pCycleTimeNS: (type: PULONG) [out] the configured task cycle time in nanoseconds is stored in this parameter.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

E_POINTER if the parameter pCnt = NULL.

Description

Sample30: Timing Measurement [320] shows usage of this method.

12.7.15 Interface ITcTaskNotification

Executes a callback if the cycle time was exceeded during the previous cycle. This interface provides comparable functions such as PLC PlcTaskSystemInfo->CycleTimeExceeded.

Syntax

```
TCOM_DECL_INTERFACE("9CDE7C78-32A0-4375-827E-924B31021FCD", ITcTaskNotification) struct
__declspec(novtable) ITcTaskNotification: public ITcUnknown
```

Required include: TcRtInterfaces.h

Methods

Name	Description
NotifyCycleTimeExceeded	Called if the cycle time was exceeded.

Comments

Note that the callback does not take place during the calculations, but at the end of the cycle. Therefore, this method does not offer any mechanism for immediately stopping the calculations.

12.7.15.1 Method ITcTaskNotification::NotifyCycleTimeExceeded()

Gets called if cycle time was exceeded beforehand

Syntax

virtual HRESULT TCOMAPI NotifyCycleTimeExceeded ();

Parameters

ipTask: (type: ITcTask) refers to the current task context.

context: (type: ULONG_PTR) context

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [1343]</u>.

Description

Gets called if cycle time was exceeded beforehand. So not immediately on exceeded time, but afterwards.

12.7.16 Interface ITcUnknown

ITcUnknown defines the reference counting as well as querying a reference to a more specific interface.

Syntax

TCOM DECL INTERFACE("00000001-0000-0000-e000-00000000064", ITcUnknown)

Declared in: TcInterfaces.h

Required include: -

Methods

Name	Description
TcAddRef [) 205]	Increments the reference counter.
TcQueryInterface [> 205]	Query of the reference to an implemented interface via the IID.
TcRelease [206]	Decrements the reference counter.

Remarks

Every TcCOM interface is directly or indirectly derived from ITcUnknown. As a consequence every TcCOM module class implements ITcUnknown, because it is derived from ITComObject.

The default implementation for ITcUnknown will delete the object if its last reference is released. Therefore an interface pointer must not be dereferenced after TcRelease() has been called.

12.7.16.1 Method ITcUnknown:TcAddRef

This method increments the reference counter.

Syntax

ULONG TcAddRef()

Return Value

Resulting reference count value.

Description

Increments the reference counter and returns the new value..

12.7.16.2 Method ITcUnknown:TcQueryInterface

Query of an interface pointer with regard to an interface that is given by interface ID (IID).

Syntax

HRESULT TcQueryInterface(RITCID iid, PPVOID pipItf)

iid: (Type: RITCID) Interface IID.

pipItf: (PPVOID Type) pointer to interface pointer. Is set when the requested interface type is available from the corresponding instance.

Return value

If successful, S_OK ("0") or another positive value will be returned, cf. <u>Return values [▶ 173]</u>. Extended messages refer in particular to the column HRESULT in <u>ADS Return Codes [▶ 343]</u>.

If the demanded interface is not available, the method returns ADSERR_DEVICE_NOINTERFACE.

Description

Query reference to an implemented interface by the IID. It is recommended to use smart pointers to initialize and hold interface pointers.

Variant 1:

```
HRESULT GetTraceLevel(ITcUnkown* ip, TcTraceLevel& tl)
{
HRESULT hr = S_OK;
if (ip != NULL)
{
ITComObjectPtr spObj;
hr = ip->TcQueryInterface(spObj.GetIID(), &spObj);
if (SUCCEEDED(hr))
{
hr = spObj->TcGetObjPara(PID_TcTraceLevel, &tl, sizeof(tl));
}
return hr;
}
```

The interface id associated with the smart pointer can be used as parameter in TcQueryInterface. The operator "&" will return pointer to internal interface pointer member of the smart pointer. Variant 1 assumes that interface pointer is initialized if TcQueryInterface indicates success. If scope is left the destructor of the smart pointer spObj releases the reference.

Variant 2:

```
HRESULT GetTraceLevel(ITcUnkown* ip, TcTraceLevel& tl)
{
HRESULT hr = S_OK;
ITComObjectPtr spObj = ip;
if (spObj != NULL)
{
spObj->TcGetObjParam(PID_TcTraceLevel, &tl);
}
else
{
hr = ADS_E_NOINTERFACE;
}
return hr;
}
```

When assigning interface pointer ip to smart pointer spObj method TcQueryInterface is implicitly called with IID_ITComObject on the instance ip refers to. This results in shorter code, however it loses the original return code of TcQueryInterface.

12.7.16.3 Method ITcUnknown:TcRelease

This method decrements the reference counter.

Syntax

ULONG TcRelease()

Return Value

Resulting reference count value.

Description

Decrements the reference counter and returns the new value.

If reference counter gets zero, object deletes itself.

12.8 Runtime Library (RtlR0.h)

TwinCAT has its own implementation of the runtime library. These functions are declared in RtIR0.h, a part of TwinCAT SDK.

Methods provided

Name	Description
abs	Calculates the absolute value.
atof	Converts a string (char *buf) into a double.
BitScanForward	Searches for a set bit (1) from LSB to MSB.
BitScanReverse	Searches for a set bit (1) from MSB to LSB.
labs	Calculates the absolute value.
memcmp	Compares two buffers.
тетсру	Copies one buffer into another.
memcpy_byte	Copies one buffer into another (bytewise).
memset	Sets the bytes of a buffer to a value.
qsort	QuickSort for sorting a list.
snprintf	Writes formatted data into a character string.
sprintf	Writes formatted data into a character string.
sscanf	Reads data from a character string after specification of a format.
strcat	Appends one character string to another.
strchr	Searches for a character in a character string.
strcmp	Compares two character strings.
strcpy	Copies a character string.
strlen	Determines the length of a character string.
strncat	Appends one character string to another.
strncmp	Compares two character strings.
strncpy	Copies a character string.
strstr	Searches for a character string within a character string.
strtol	Converts a character string into an integer.
strtoul	Converts a character string into an unsigned integer.
swscanf	Reads data from a character string after specification of a format.
tolower	Converts a letter into a lower-case letter.
toupper	Converts a letter into an upper-case letter.
vsnprintf	Writes formatted data into a character string ('\0' scheduling).
vsprintf	Writes formatted data into a character string.

Comments

All functions are based on the C++ runtime library.

12.9 ADS Communication

ADS based on client-server principle. An ADS query calls the corresponding indication methods on the server side. The ADS response calls the corresponding confirmation method on the client side.

In this section both the outgoing and incoming ADS communication is described for TwinCAT 3 C++ modules.

ADS instruction set	Description
AdsReadDeviceInfo [208]	The general device information can be read with this command.
AdsRead [> 210]	ADS read command for retrieving data from an ADS device.
AdsWrite [212]	ADS write command for transferring data to an ADS device.
AdsReadState [216]	ADS command to query the state of an ADS device.
AdsWriteControl [218]	ADS control command to change the state of an ADS device.
AdsAddDeviceNotification [220]	Observe variable. The client is informed in case of an event.
AdsDelDeviceNotification [222]	Removes the variable that was previously linked.
AdsDeviceNotification [224]	Used to transfer the device notification event.
AdsReadWrite [> 214]	ADS read/write command. Data is transmitted to an ADS device (write) and its response data read with one call.

The ADS Return Codes [343] apply to the entire ADS communication.

As an introduction, look at <u>Sample07: Receiving ADS Notifications [) 273]</u>.

12.9.1 AdsReadDeviceInfo

12.9.1.1 AdsReadDeviceInfoReq

The method AdsDeviceInfoReq enables the transfer of an ADS DeviceInfo command for reading the identification and version number of an ADS server. AdsReadDeviceInfoCon is called on receipt of the response.

Syntax

int AdsReadDeviceInfoReq(AmsAddr& rAddr, ULONG invokeId);

Parameters

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command, which is sent. The Invokeld is specified from the source device and serves to identify the commands.

Return value

Type: int

Error code - see <u>AdsStatuscodes [} 343]</u>.

12.9.1.2 AdsReadDeviceInfoInd

The method AdsDeviceInfoInd indicates an ADS DeviceInfo command for reading the identification and version number of an ADS server. The <u>AdsReadDeviceInfoRes</u> [209] must be called afterwards.

Syntax

void AdsReadDeviceInfoInd(AmsAddr& rAddr, ULONG invokeId);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

Return Value

void

12.9.1.3 AdsReadDeviceInfoRes

The method AdsReadDeviceInfoRes sends an ADS Read Device Info. <u>AdsReadDeviceInfoCon [> 210]</u> forms the counterpart and is subsequently called.

Syntax

int AdsReadDeviceInfoRes(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, CHAR name[ADS_FIXEDNAMESIZE], AdsVersion version);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [343].

name: (type: char[ADS_FIXEDNAMESIZE]) [in] contains the name of the device.

version: (type: AdsVersion) [in] structure of build (int), revision (byte) and version (byte) of the device.

Return value

Type: int

Error code - see <u>AdsStatuscodes [} 343]</u>.

12.9.1.4 AdsReadDeviceInfoCon

The method AdsReadDeviceInfoCon permits to receive an ADS read device info confirmation. The receiving module has to provide this method. The <u>AdsReadDeviceInfoReq</u> [> 208] is the counterpart and need to be called beforehand.

Syntax

```
void AdsReadDeviceInfoCon( AmsAddr& rAddr, ULONG invokeId, ULONG nResult,
CHAR name[ADS_FIXEDNAMESIZE], AdsVersion version );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see <u>AdsStatuscodes [> 343]</u>.

name: (type: char[ADS_FIXEDNAMESIZE]) [in] contains the name of the device.

version: (type: AdsVersion) [in] structure of build (int), revision (byte) and version (byte) of the device.

Return Value

void

12.9.2 AdsRead

12.9.2.1 AdsReadReq

The method AdsReadReq enables the sending of an ADS read command for the data transmission from an ADS device.

<u>AdsReadCon [▶ 212]</u> is called on receipt of the response.

Syntax

```
int AdsReadReq( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, ULONG
cbLength );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbLength: (type: ULONG) [in] contains the length in bytes of the data to be read (pData).

Return value

Type: int

Error code - see <u>AdsStatuscodes</u> [▶ <u>343</u>].

12.9.2.2 AdsReadInd

The method AdsReadInd permits to receive an ADS read request. The <u>AdsReadRes</u> [> <u>211</u>] needs to be called for sending the result.

Syntax

```
void AdsReadInd( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, ULONG
cbLength );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbLength: (type: ULONG) [in] contains the length in bytes of the data to be read (pData).

Return value

Type: int

ADS Return Code - see <u>AdsStatuscodes [} 343</u>].

12.9.2.3 AdsReadRes

The method AdsReadRes enables the sending of an ADS read response. <u>AdsReadCon [\triangleright 212]</u> forms the counterpart and is subsequently called.

Syntax

int AdsReadRes(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, ULONG cbLength, PVOID pData);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS read command; see AdsStatuscodes [343].

cbLength: (type: ULONG) [in] contains the length in bytes of the data that was read (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the data are located.

Return value

Type: int

ADS Return Code - see <u>AdsStatuscodes</u> [▶ <u>343</u>].

12.9.2.4 AdsReadCon

The method AdsReadCon enables the reception of an ADS read confirmation. The receiving module must provide this method.

The counterpart <u>AdsReadReq</u> [▶ <u>210</u>] must have been called beforehand.

Syntax

void AdsReadCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, ULONG cbLength, PVOID pData);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS read command; see <u>AdsStatuscodes [> 343]</u>.

cbLength: (type: ULONG) [in] contains the length in bytes of the data that was read (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the data are located.

Return Value

void

12.9.3 AdsWrite

12.9.3.1 AdsWriteReq

The method AdsWriteReq enables the sending of an ADS write command for transferring data to an ADS device.

AdsWriteCon [214] is called on receipt of the response.

Syntax

```
int AdsWriteReq( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, ULONG
cbLength, PVOID pData );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbLength: (type: ULONG) [in] contains the length in bytes of the data to be written (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the written data are located.

Return value

Type: int

Error code - see <u>AdsStatuscodes [} 343]</u>.

12.9.3.2 AdsWriteInd

The method AdsWriteInd indicates an ADS write command, for the transfer of data to an ADS device. The <u>AdsWriteRes</u> [▶ 213] has to be called for confirming the operation.

Syntax

```
void AdsWriteInd( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, ULONG
cbLength, PVOID pData );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbLength: (type: ULONG) [in] contains the length in bytes of the data to be written (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the written data are located.

Return value

void

Error code - see <u>AdsStatuscodes</u> [▶ <u>343</u>].

12.9.3.3 AdsWriteRes

The method AdsWriteRes sends an ADS write response. <u>AdsWriteCon [> 214]</u> forms the counterpart and is subsequently called.

Syntax

int AdsWriteRes(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see <u>AdsStatuscodes [> 343]</u>.

Return Value

Type: int

ADS Return Code - see <u>AdsStatuscodes [> 343]</u>.

12.9.3.4 AdsWriteCon

The method AdsWriteCon enables the reception of an ADS write confirmation. The receiving module must provide this method.

AdsWriteReq [212] forms the counterpart and must have been called beforehand.

Syntax

void AdsWriteCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [> 343].

Return Value

void

12.9.4 AdsReadWrite

12.9.4.1 AdsReadWriteReq

The method AdsReadWriteReq permits to send an ADS readwrite command, for the transfer of data to and from an ADS device. The <u>AdsReadWriteCon</u> [▶ <u>216</u>] will be called on arrival of the answer.

Syntax

```
int AdsReadWriteReq( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, ULONG
cbReadLength, ULONG cbWriteLength, PVOID pData );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbReadLength: (type: ULONG) [in] contains the length in bytes of the data to be read (pData).

cbWriteLength: (type: ULONG) [in] contains the length in bytes of the data to be written (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the written data are located.

Return value

Type: int

Error code, see <u>AdsStatuscodes [} 343]</u>.

12.9.4.2 AdsReadWriteInd

The method AdsReadWriteInd indicates an ADS readwrite command, for the transfer of data to and from an ADS device. The <u>AdsReadWriteRes</u> [▶ <u>217</u>] needs to be called for sending the result.

Syntax

void AdsReadWriteInd(AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, ULONG cbReadLength, ULONG cbWriteLength, PVOID pData);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbReadLength: (type: ULONG) [in] contains the length in bytes of the data to be read (pData).

cbWriteLength: (type: ULONG) [in] contains the length in bytes of the data to be written (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the written data are located.

Return Value

void

12.9.4.3 AdsReadWriteRes

The method AdsReadWriteRes permits to receive an ADS read write confirmation. The <u>AdsReadWriteCon</u> [$\underbrace{1216}$] is the counterpart and will be called afterwards.

Syntax

```
int AdsReadWriteRes( AmsAddr& rAddr, ULONG invokeId, ULONG nResult, ULONG cbLength, PVOID
pData );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [343].

cbLength: (type: ULONG) [in] contains the length in bytes of the data that was read (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the data are located.

Return value

Type: int

ADS Return Code - see <u>AdsStatuscodes [} 343]</u>.

12.9.4.4 AdsReadWriteCon

The method AdsReadWriteCon enables the reception of an ADS read/write confirmation. The receiving module must provide this method.

AdsReadWriteReq [214] forms the counterpart and must be called beforehand.

Syntax

void AdsReadWriteCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, ULONG cbLength, PVOID pData);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [> 343].

cbLength: (type: ULONG) [in] contains the length in bytes of the data that was read (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the data are located.

Return Value

void

12.9.5 AdsReadState

12.9.5.1 AdsReadStateReq

The method AdsReadStateReq permits to send an ADS read state command for reading the ADS status and the device status from an ADS server. The <u>AdsReadStateCon [\triangleright 218]</u> will be called on arrival of the answer.

Syntax

```
int AdsReadStateReq(AmsAddr& rAddr, ULONG invokeId);
```

Parameters

rAddr: (type: AmsAddr) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command, which is sent. The Invokeld is specified from the source device and serves to identify the commands.

Return value

Type: int

```
Error code - see AdsStatuscodes [ 343].
```

12.9.5.2 AdsReadStateInd

The method AdsReadStateInd indicates an ADS read state command for reading the ADS status and the device status from an ADS device. The <u>AdsReadStateRes</u> [\blacktriangleright <u>217</u>] needs to be called for sending the result.

Syntax

void AdsReadStateInd(AmsAddr& rAddr, ULONG invokeId);

Parameters

rAddr: (type: AmsAddr) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command, which is sent. The Invokeld is specified from the source device and serves to identify the commands.

Return Value

void

12.9.5.3 AdsReadStateRes

The method AdsWriteRes enables the sending of an ADS status read response. <u>AdsReadStateCon [> 218]</u> forms the counterpart and is subsequently called.

Syntax

int AdsReadStateRes(AmsAddr&rAddr, ULONG invokeId, ULONG nResult, USHORT adsState, USHORT deviceState);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [> 343].

adsState: (type: USHORT) [in] contains the ADS state of the device.

deviceState: (type: USHORT) [in] contains the device status of the device.

Return value

Type: int

Error code - see AdsStatuscodes [> 343].

12.9.5.4 AdsReadStateCon

The method AdsWriteCon enables the reception of an ADS state read confirmation. The receiving module must provide this method.

AdsReadStateReq [216] forms the counterpart and must be called beforehand.

Syntax

void AdsReadStateCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, USHORT adsState, USHORT deviceState);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see <u>AdsStatuscodes [> 343]</u>.

adsState: (type: USHORT) [in] contains the ADS state of the device.

deviceState: (type: USHORT) [in] contains the device status of the device.

Return Value

void

12.9.6 AdsWriteControl

12.9.6.1 AdsWriteControlReq

The method AdsWriteControlReq permits to send an ADS write control command for changing the ADS status and the device status of an ADS server. The <u>AdsWriteControlCon [> 220]</u> will be called on arrival of the answer.

Syntax

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

adsState: (Type: USHORT) [in] new ADS state (see enum nAdsState in Ads.h).

deviceState: (Type: USHORT) [in] new device state.

cbLength: (type: ULONG) [in] contains the length in bytes of the data (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the written data are located.

Return value

Type: int

Error code - see <u>AdsStatuscodes [} 343]</u>.

12.9.6.2 AdsWriteControlInd

The method AdsWriteControlInd permits to send an ADS write control command for changing the ADS status and the device status of an ADS device. The <u>AdsWriteControlRes</u> [> <u>219</u>] has to be called for confirming the operation.

Syntax

void AdsWriteControlInd(AmsAddr& rAddr, ULONG invokeId, USHORT adsState, USHORT deviceState, ULONG cbLength, PVOID pDeviceData);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

adsState: (Type: USHORT) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

deviceState: (Type: USHORT) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

cbLength: (type: ULONG) [in] contains the length in bytes of the data (pData).

pData: (type: PVOID) [in] pointer to the data buffer in which the written data are located.

Return Value

void

12.9.6.3 AdsWriteControlRes

The method AdsWriteControlRes permits to send an ADS write control response. The <u>AdsWriteControlCon</u> [<u>> 220]</u> is the counterpart and will be called afterwards.

Syntax

int AdsWriteControlRes(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [> 343].

Return value

Type: int

ADS Return Code - see <u>AdsStatuscodes [} 343]</u>.

12.9.6.4 AdsWriteControlCon

The method AdsWriteCon enables the reception of an ADS write control confirmation. The receiving module must provide this method.

AdsWriteControlReq [218] forms the counterpart and must be called beforehand.

Syntax

void AdsWriteControlCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes [> 343].

Return Value

void

12.9.7 AdsAddDeviceNotification

12.9.7.1 AdsAddDeviceNotificationReq

The method AdsAddDeviceNotificationReq permits to send an ADS add device notification command, for adding a device notification to an ADS device. The <u>AdsAddDeviceNotificationCon [} 222</u>] will be called on arrival of the answer.

Syntax

```
int AdsAddDeviceNotificationReq( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG
indexOffset,
    AdsNotificationAttrib noteAttrib);
```

Parameters

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command, which is sent. The Invokeld is specified from the source device and serves to identify the commands.

indexGroup: (type: ULONG) [in] contains the index group number (32 bit, unsigned) of the requested ADS service.

indexOffset: (type: ULONG) [in] contains the index offset number (32 bit, unsigned) of the requested ADS service.

noteAttrib: (type: AdsNotificationAttrib) [in] contains specification of the notification parameters (cbLength, TransMode, MaxDelay)

Return value

Type: int

Error code - see AdsStatuscodes [343].

12.9.7.2 AdsAddDeviceNotificationInd

The method AdsAddDeviceNotificationInd should enable sending <u>AdsDeviceNotification [\blacktriangleright 224]</u>. The <u>AdsAddDeviceNotificationRes</u> [\blacktriangleright 221] has to be called for confirming the operation.

Syntax

```
void AdsAddDeviceNotificationInd( AmsAddr& rAddr, ULONG invokeId, ULONG indexGroup, ULONG indexOffset, AdsNotificationAttrib noteAttrib );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

indexGroup: (Type: ULONG) [in] contains the index group number (32-bit, unsigned) of the requested ADS service.

indexOffset: (Type: ULONG) [in] contains the index offset number (32-bit, unsigned) of the requested ADS service.

noteAttrib: (type: AdsNotificationAttrib) [in] contains the specification of the notification parameters (cbLength, TransMode, MaxDelay).

Return Value

void

12.9.7.3 AdsAddDeviceNotificationRes

The method AdsAddDeviceNotificationRes permits to send an ADS add device notification response. The <u>AdsAddDeviceNotificationCon</u> [222] is the counterpart and will be called afterwards.

Syntax

void AdsAddDeviceNotificationCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, ULONG handle);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes

Handle: (type: ULONG) [in] handle to generated device notification.

Return Value

void

12.9.7.4 AdsAddDeviceNotificationCon

The method AdsAddDeviceNotificationCon confirms an ADS device addition notification request. AdsAddDeviceNotificationReq [\blacktriangleright 220] forms the counterpart and must be called beforehand.

Syntax

void AdsAddDeviceNotificationCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult, ULONG handle);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see AdsStatuscodes.

Handle: (type: ULONG) [in] handle to generated device notification.

Return Value

void

12.9.8 AdsDelDeviceNotification

12.9.8.1 AdsDelDeviceNotificationReq

The method AdsDelDeviceNotificationReq permits to send an ADS delete device notification command, for removing a device notification from an ADS device. The <u>AdsDelDeviceNotificationCon</u> [> 223] will be called on arrival of the answer.

Syntax

int AdsDelDeviceNotificationReq(AmsAddr& rAddr, ULONG invokeId, ULONG hNotification);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

hNotification: (type: ULONG) [in] contains the handle of the notification to be removed.

Return value

Type: int

Error code - see <u>AdsStatuscodes</u> [▶ <u>343</u>].

12.9.8.2 AdsDelDeviceNotificationInd

The method AdsAddDeviceNotificationCon permits to receive an ADS delete device notification confirmation. The receiving module has to provide this method. The <u>AdsDelDeviceNotificationRes</u> [▶ 223] has to be called for confirming the operation.

Syntax

void AdsDelDeviceNotificationCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see <u>AdsStatuscodes [> 343]</u>.

Return Value

void

12.9.8.3 AdsDelDeviceNotificationRes

The method AdsAddDeviceNotificationRes permits to receive an ADS delete device notification. The <u>AdsDelDeviceNotificationCon [\blacktriangleright 223]</u> is the counterpart and will be called afterwards.

Syntax

int AdsDelDeviceNotificationRes(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

nResult: (type: ULONG) [in] contains the result of the ADS command; see <u>AdsStatuscodes [) 343</u>].

Return value

Int

Returns the result of the ADS command, see <u>AdsStatuscodes [} 343</u>].

12.9.8.4 AdsDelDeviceNotificationCon

The method AdsAddDeviceNotificationCon enables the reception of an ADS device deletion notification confirmation. The receiving module must provide this method. <u>AdsDelDeviceNotificationReq</u> [> 222] forms the counterpart and must be called beforehand.

Syntax

void AdsDelDeviceNotificationCon(AmsAddr& rAddr, ULONG invokeId, ULONG nResult);

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the transmitted command; the Invokeld is specified by the source device and serves to identify the commands.

nResult: (type: ULONG) [in] contains the result of the ADS write command; see <u>AdsStatuscodes [> 343]</u>.

Return Value

void

12.9.9 AdsDeviceNotification

12.9.9.1 AdsDeviceNotificationReq

The method AdsAddDeviceNotificationReq permits to send an ADS device notification, to inform an ADS device. The <u>AdsDeviceNotificationInd [\triangleright 224]</u> will be called on the counterpart.

Syntax

```
int AdsDeviceNotificationReq( AmsAddr& rAddr, ULONG invokeId, ULONG cbLength,
AdsNotificationStream notifications[] );
```

Parameters

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command, which is sent. The Invokeld is specified from the source device and serves to identify the commands.

nResult: (type: ULONG) [in] contains result of the device notification indication.

notifications[]: (type: AdsNotificationStream) [in] contains information of the device notification(s).

Return value

Type: int

ADS Return Code - see <u>AdsStatuscodes</u> [▶ <u>343</u>].

12.9.9.2 AdsDeviceNotificationInd

The method AdsDeviceNotificationInd enables receiving of information from an ADS device notification display. The receiving module must provide this method. There is no acknowledgment of receipt. <u>AdsDeviceNotificationCon [\blacktriangleright 225] must be called by <u>AdsDeviceNotificationReq [\blacktriangleright 224] to check the transfer.</u></u>

Syntax

```
void AdsDeviceNotificationInd( AmsAddr& rAddr, ULONG invokeId, ULONG cbLength,
AdsNotificationStream* pNotifications );
```

Parameter

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the responding ADS server.

invokeld: (type: ULONG) [in] handle of the command that is sent. The Invokeld is specified by the source device and is used for the identification of the commands.

cbLength: (type: ULONG) [in] contains the length of pNotifications.

pNotifications: (type: AdsNotificationStream*) [in] pointer to the notifications. This array consists of AdsStampHeader with notification handle and data via AdsNotificationSample.

Return Value

void

12.9.9.3 AdsDeviceNotificationCon

The sender can use the method AdsAddDeviceNotificationCon to check the transfer of an ADS device notification.

AdsDeviceNotificationReq [224] must be called first.

Syntax

```
void AdsDeviceNotificationCon( AmsAddr& rAddr, ULONG invokeId, ULONG nResult );
```

Parameters

rAddr: (type: AmsAddr&) [in] structure with NetId and port number of the ADS server.

invokeld: (type: ULONG) [in] handle of the command, which is sent. The Invokeld is specified from the source device and serves to identify the commands.

nResult: (type: ULONG) [in] contains result of the device notification indication

Return Value

void

12.10 Mathematical Functions

TwinCAT has its own mathematical functions implemented, because the math.h implementation provided by Microsoft is not real-time capable.

These functions are declared in TcMath.h, which is part of TwinCAT SDK. For x64 the operations are executed via SSE; on x86 systems the FPU is used.

•

TwinCAT 3.1 4018 or earlier

TwinCAT 3.1 4018 provides an fpu87.h with the same methods. This continues to exist and redirects to TcMath.h.

Methods provided

Name	Description	
sqr_	Calculates the square.	
sqrt_	Calculates the square root.	
sin_	Calculates the sine.	
cos_	Calculates the cosine.	
tan_	Calculates the tangent.	
atan_	Calculates the angle whose tangent is the specified value.	
atan2_	Calculates the angle whose tangent is the quotient of two specified values.	
asin_	Calculates the angle whose sine is the specified value.	
acos_	Calculates the angle whose cosine is the specified value.	
exp_	Calculates e to the specified power.	
log_	Calculates the logarithm of a specified value.	
log10_	Calculates the base 10 logarithm of a specified value.	
fabs_	Calculates the absolute value.	
fmod_	Calculates the remainder.	
ceil_	Calculates the smallest integer that is greater than or equal to the specified number.	
floor_	Calculates the largest integer that is smaller than or equal to the specified number.	
pow_	Calculates a specified number to the specified power.	
sincos_	Calculates the sine and cosine of x.	
fmodabs_	Calculates the absolute value that meets the Euclidean definition of the mod operation.	
round_	Calculates a value and rounds to the nearest integer.	
round_digits_	Calculates a rounded value with a specified number of decimal places.	
coubic_	Calculates the cubic value.	
ldexp_	Calculates a real number (double) from mantissa and exponent.	
ldexpf_	Calculates a real number (float) from mantissa and exponent.	
sinh_	Calculates the hyperbolic sine of the specified angle.	
cosh_	Calculates the hyperbolic cosine of the specified angle.	
tanh_	Calculates the hyperbolic tangent of the specified angle.	
finite_	Determines whether the specified value is finite.	
isnan_	Determines whether the specified value is not a number (NAN).	
rands_	Calculates a pseudo random number between 0 and 32767. The parameter holdrand is set randomly and changed with every call.	

Comments

The functions have the extension "_" (underscore), which identifies them as TwinCAT implementation. Most are analog math.h, designed by Microsoft, only for the data type double.

See also

MSDN documentation of analog math.h functions.

BECKHOFF

12.11 Time Functions

TwinCAT provides functions for time conversion, they are declared in TcTimeConversion.h, which is part of TwinCAT SDK.

Methods provided

Name	Description
TcDayOfWeek(WORD day, WORD month, WORD year)	Determines the day of the week. Input: day (030) and month (112) Return: 0 is Sunday, 6 is Saturday
TclsLeapYear	Determines whether the given year is a leap year.
TcDaysInYear	Determines the number of days in a given year.
TcDaysInMonth	Determines the number of days in a given month.
TcSystemTimeToFileTime(const SYSTEMTIME* lpSystemTime, FILETIME *lpFileTime);	Converts the given system time into a file time.
TcFileTimeToSystemTime(const FILETIME *IpFileTime, SYSTEMTIME* lpSystemTime);	Converts the given file time into a system time.
TcSystemTimeToFileTime(const SYSTEMTIME* lpSystemTime, ULONGLONG& ul64FileTime);	Converts the given system time into a file time (ULONGLONG format).
TcFileTimeToSystemTime(const ULONGLONG& ul64FileTime, SYSTEMTIME* lpSystemTime);	Converts the given file time (ULONGLONG format) into a system time.
TclsISO8601TimeFormat(PCCH sDT)	Checks whether a PCCH follows the time format ISO8601.
TcDecodeDateTime(PCCH sDT)	Converts a ULONG as DateTime from the PCCH into ISO8601 format.
TcDecodeDcTime(PCCH sDT)	Converts a LONGLONG as DcTime from the PCCH into ISO8601 format.
TcDecodeFileTime(PCCH sFT)	Converts a LONGLONG as FileTime from the PCCH into ISO8601 format.
TcEncodeDateTime(ULONG value, PCHAR p, UINT len)	Converts a string (p, len) into ISO8601 format on the basis of the ULONG value in DateTime format.
	Minimum length for p is 24 bytes.
TcEncodeDcTime(LONGLONG value, PCHAR p, UINT len)	Converts a string (p, len) into ISO8601 format on the basis of the LONGLONG in DcTime format.
	Minimum length for p is 32 bytes.
TcEncodeFileTime(LONGLONG value, PCHAR p, UINT len)	Converts a string (p, len) into ISO8601 format on the basis of the LONGLONG in FileTime format.
	Minimum length for p is 32 bytes.
TcDcTimeToFileTime(LONGLONG dcTime)	Converts a LONGLONG as FileTime from the LONGLONG into DcTime.
TcFileTimeToDcTime(LONGLONG fileTime);	Converts a LONGLONG as DcTime from the LONGLONG into FileTime.
TcDcTimeToDateTime(LONGLONG dcTime)	Converts a ULONG as DateTime from the LONGLONG into DcTime.
TcDateTimeToDcTime(ULONG dateTime)	Converts a ULONG as DcTime from the LONGLONG into DateTime.
TcFileTimeToDateTime(LONGLONG fileTime)	Converts a ULONG as DateTime from the LONGLONG into FileTime.
TcDateTimeToFileTime(ULONG dateTime)	Converts a LONGLONG as FileTime from the ULONG into DateTime.

 Further information on different time sources is described here: <u>https://infosys.beckhoff.com/content/1031/ethercatsystem/2469114379.html</u>

12.12 STL / Containers

TwinCAT 3 C++ supports STL with regard to

- List
- Map
- Set
- Stack
- String
- Vector
- WString
- Algorithms (such as binary_search)
 - See c:\TwinCAT\3.x\Sdk\Include\StI\StI\algorithm for a specific list of supported algorithms.

```
Restrictions
```

- Class templates do not exist for all data types.
 - Some header files should not be used directly.

More detailed documentation on memory management, which uses STL, can be found here [167].

12.13 Error messages - understanding

In TwinCAT you receive very detailed information about errors that occur.

For instance, this error message means:

- · The error occurred during the transition from SAFE OP to OP.
- The affected object is "Untitled1_Obj1" (CModule1).
- The error code 1821 / 0x71d indicates that the object ID is invalid.

Therefore, you should examine the method "SetObjStateSP()", which is responsible for this transition, in more detail. In the case of the generated standard code, you can see that the addition of the module takes place there.

The reason for this error is that no task has been assigned to this module, so the module cannot have a task in which it is executed.

Version: 1.13

12.14 Module messages for the Engineering (logging / tracing)

Overview

TwinCAT 3 C++ offers the option of sending messages from a C++ module to the TwinCAT 3 Engineering as tracing or logging.

Syntax

The syntax for recording messages is as follows:

m_Trace.Log(TLEVEL, FNMACRO"A message", ...);

With these properties:

• TLEVEL categorizes a message into one of five levels. The recording of the higher level always includes the recording of the lower levels: i.e. a message classified on level "tlWarning" will occur with level "tlAlways", "tlError" and "tlWarning" - it will NOT record the "tlInfo" and "tlVerbose" messages.

Level 0	tlAlways
Level 1	tlError
Level 2	tlWarning
Level 3	tlInfo
Level 4	tlVerbose

- FNMACRO can be used to place the function name before the message to be printed
 - FENTERA: Used when entering a function; prints the function name followed by ">>>".
 - $\circ~$ FNAMEA: Used within a function; prints the function name.
 - FLEAVEA: Used when exiting a function; prints the function name followed by "<<<".
- The &q format specifier is used to output pointers and other variables of platform-specific size.

Sample

```
HRESULT CModule1::CycleUpdate(ITcTask* ipTask, ITcUnknown* ipCaller, ULONG PTR context)
   HRESULT hr = S OK;
    // Sample to showcase trace logs
   ULONGLONG cnt = 0;
   if (SUCCEEDED(ipTask->GetCycleCounter(&cnt)))
    {
       if (cnt%500 == 0)
           m Trace.Log(tlAlways, FENTERA "Level tlAlways: cycle= %llu", cnt);
       if (cnt%510 == 0)
           m Trace.Log(tlError, FENTERA "Level tlError: cycle=%llu", cnt);
       if (cnt%520 == 0)
           m Trace.Log(tlWarning, FENTERA "Level tlWarning: cycle=%lld", cnt);
       if (cnt%530 == 0)
           m Trace.Log(tlInfo, FENTERA "Level tlInfo: cycle=%llu", cnt);
       if (cnt%540 == 0)
            m Trace.Log(tlVerbose, FENTERA "Level tlVerbose: cycle=%llu", cnt);
   }
   // TODO: Replace the sample with your cyclic code
   m counter++;
   m Outputs.Value = m counter;
   return hr;
```

Use tracking level

The tracking level can be preconfigured at the level of the module instance.

- 1. Navigate to the instance of the module in the solution tree.
- 2. Select the Parameters (Init) tab on the right.
- 3. Make sure that you activate Show Hidden Parameters.
- 4. Select the tracking level.

5. To test everything, select the highest level tlVerbose.

Alternatively, you can change the tracking level at runtime by going to the instance, selecting a level at **Value** for TraceLevelMax parameters, right-clicking in front of the first column, and selecting **Online Write**.

Т	winCAT Project1 🕫 × Module1.cpp Module1.h						
	Object Context Parameter (Init) Data Area Interfaces Interface Pointer						
	Γ	PTCID	Name	Value	C	Unit	Туре
			TraceLevelMax	tlInfo 🗾	\Box		TcTraceLevel
	-	Online Read	ter		Γ		
		Online Write		0			UDINT
			.data2	0			UDINT
			.data3	0.0			LREAL

Filter message categories

Visual Studio Error List allows you to filter entries by category. The three categories **Errors**, **Warnings** and **Messages** can be enabled or disabled independently by simply switching the keys.

In this screenshot only warnings are enabled - errors and messages are disabled:

Error List
🔻 👻 42 Errors 🔥 41 Warnings 🚺 145 Messages 🛛 Clear
Description 🔺

13 How to...?

This is a collection of frequently ask questions about common paradigms of coding as well as handling of TwinCAT C++ modules.

13.1 Using the Automation Interface

The Automation Interface can be used for C++ projects.

This includes <u>creating projects [\triangleright 99]</u> and using the wizard for <u>creating module classes [\triangleright 100]</u>. In addition, the project properties can be set and the TMC Code Generator and the publishing of modules called. The corresponding <u>documentation [\triangleright 350]</u> is part of the Automation Interface.

Irrespective of the programming language, <u>access to and creation and handling of TcCOM modules [} 354]</u> may be relevant.

From there, common System Manager tasks such as linking of variables can be executed.

13.2 Windows 10 as target system up to TwinCAT 3.1 Build 4022.2

For Windows 10 target systems the transferred files cannot be overwritten; they have to be renamed first.

Up to TwinCAT 3.1 Build 4022.2, the **Rename Destination** option must be enabled for this purpose in the <u>TMC Editor deployment [\blacktriangleright 144]</u>. In later versions this is done implicitly when the target system uses Windows 10 as operating system.

13.3 Publishing of modules

The section Export to TwinCAT 3.1 4022.xx [\blacktriangleright 50] describes how TwinCAT modules are published so that they can be transferred to any TwinCAT system and imported [\blacktriangleright 51].

The engineering system (XAE) does not necessarily have to be on the same platform type as the executing system. To this end, TwinCAT creates all versions of the module in the course of the publication.

Certain use cases require an adaptation of the publication of the modules:

- When working in a pure 32-bit (x86) environment, the x64 settings can be skipped so that no certificates are required.
- The User Mode (UM) settings can be skipped if they are not used.

Migration

If a build is not contained in the published module, the corresponding platform cannot be used as an executing system.

Add the corresponding target platforms in the provision [144] of the TMC Editor or remove them.

The following provision configuration, for example, only makes the TwinCAT RT (x86) build available:

PublishDriverMod.tmc [TMC Editor] 🙁	<				•
C 😽					
TMC Data Types Modules CModule1		deployment of th			Â

a rabistibilitetiviou.anc	01/03/2014 12/22	TWICTTIC			

13.4 Publishing modules on the command line

By means of the following call, the module publishing process in the TwinCAT Engineering (XAE) can also be initiated from the command line:

msbuild CppProject.vcxproj /t:TcPublishModule /p:TcPublishDestinationBaseFolder=c:\temp

The CppProject.vcxproj parameter must be adapted according to the existing project file.

The TcPublishDestinationBaseFolder parameter is optional here. If it is not specified, the normal storage location will be used (C:\TwinCAT\3.x\CustomConfig\Modules).

13.5 Clone

The runtime data can be transferred from one machine to another by means of a file copy if both originate from the same platform and are connected with equivalent hardware equipment.

The following steps describe a simple procedure to transfer a binary configuration from one machine, "source", to another, "destination".

- ✓ Empty the folder *C:\TwinCAT\3.x\Boot* on the source machine.
- 1. Create (or enable) the module on the source machine.
- 2. Transfer the folder C:\TwinCAT\3.x\Boot from the source to the destination.
- 3. Transfer the driver itself from C:\TwinCAT\3.x\Driver\AutoInstall\MYDRIVER.sys.
- 4. Optionally transfer MYDRIVER.pdb as well.
- 5. If drivers are new on a machine: TwinCAT must carry out a registration once. To do this, switch TwinCAT to RUN mode using SysTray (right-click->System->Start/Restart). The following call can alternatively be used (replace "%1" by the driver name): sc create %1 binPath= c:\TwinCAT\3.1\Driver\AutoInstall\%1.sys type= kernel start= auto group= "file system" DisplayName= %1 error= normal
- \Rightarrow You can now start the target machine.

Handling licenses

Note that licenses cannot be transferred in this manner. Please use pre-installed licenses, volume licenses or other mechanisms for providing licenses.

13.6 Access Variables via ADS

Variables of C++ modules can be reached via ADS if the variables are marked in the TMC Editor as "Create Symbol":

The name of the variable for access by ADS is derived from the name of the instance.

For the TraceLevelMax parameter it could be:

```
Untitled1_Obj1 (CModule1).TraceLevelMax
```

13.7 TcCallAfterOutputUpdate for C++ modules

Comparable with the PLC attribute TcCallAfterOutputUpdate, C++ modules can be called following the output update.

The ITcPostCyclic [▶ 196] interface is used in the same way as the ITcCyclic [▶ 173] interface.

13.8 Order determination of the execution in a task

Different module instances can be assigned to a task, so the user needs a mechanism to determine the order of execution in the task.

It is configured under **Sort Order** in the <u>context [] 148]</u> of the <u>TwinCAT Module Instance Configurator [] 146]</u>.

Object Context Parameter (Init) Data Area Ir	iterfaces Interface Pointer						
Context:	1 🔹						
Depend On:	Manual Config 🗸 🗸						
Need Call From Sync Mapping							
Data Areas:	nterfaces:						
Ø 'Inputs' 1 'Outputs'							
Data Pointer:	nterface Pointer:						
Result:							
ID Task	Name	Priority	Cycle Time (µs)	Task Port	Symbol Port	Sort Order	
1 02010010	Task 1	1	1000000	350	350	150	-

See <u>Sample26</u>: Order of execution in a task [▶ <u>318</u>], how this is to be implemented.

13.9 Setting version/vendor information

Windows offers a mechanism to query vendor and version resources that are defined in the course of a .rc file for the compilation time.

These are accessible, for example, via the **Details** tab of each properties file.

VersionVendorIn	fo.sys Properties
eneral Digital Sig	natures Security Details Previous Versions
Property	Value
Description -	
File description	Version VendorInfo TwinCAT C++ Driver
Туре	System file
File version	1.2.3.4
Product name	Beckhoff Customer Project
Product version	1.0.0.0
Copyright	TODO: Add legal copyright

	ProductVersion	1.0.0.0

13.10 Renaming TwinCAT C++ projects

The automated renaming of TwinCAT C++ projects is not possible.

At this point instructions will be given on manually renaming a project.

In summary, one can say that the C++ project will be renamed together with the corresponding files.

- ✓ A project, "OldProject", exists and is to be renamed "NewProject".
- 1. If TcCOM instances exist in the project and are to be retained along with their links, first move them by drag & drop out of the project into **System->TcCOM Objects**.
- 2. Remove the old project from the TwinCAT Solution using **Remove**.

▲ 🐜 C++	
OldProject	Microsoft Visual Studio
OldProject Project	
External Dependencies	Change Remove to service 'OldProject' and all its contents from 'Twin CAT Device \$12'
🔺 🚛 Header Files	Choose Remove to remove 'OldProject' and all its contents from 'TwinCAT Project13'.
Module1.h	Choose Delete to permanently delete 'OldProject' and all its contents.
Module2.h	
OldProjectClassFactory.h	Remove Date Cancel
OldProjectInterfaces.h	
OldProjectServices.h	

3. Compilations of the "OldProject" can be deleted. To do this, delete the corresponding .sys/.pdb files in " Deployment".

Any existing .aps file can also be deleted.

- 4. Rename the C++ project directory and the project files (.vcxproj, .vcxproj.filters). If version management is in use, this renaming must be carried out via the version management system.
- 5. If a .vcvproj.user file exists, check the contents; this is where user settings are stored. Also rename this file if necessary.
- 6. Open the TwinCAT Solution. Re-link the renamed project to the C++ node using Add existing Item: navigate to the renamed subdirectory and select the .vcxproj file there.
- 7. Rename the ClassFactory, services and interfaces as well as header/source code files to the new project name. In addition, rename the TMC file and the corresponding files in the project folders "TwinCAT RT Files" and "TwinCAT UM Files".

This renaming should also be mapped in the version management system; if the version management system is not integrated in Visual Studio, this step must also be carried out in the version management system. Replace all occurrences in the source code (case-sensitive):

"OLDPROJECT" becomes "NEWPROJECT" and "OldProject" becomes "NewProject". Use the **Find and Replace** dialog in Visual Studio for this; note that the "NewProject Project" in the Solution Explorer has to be selected.

⊿ % ₆₊ C++

⇒

NOTE

Incorrect source code

The simple renaming of all occurrences of the character string may result in incorrect source code, for example if the project name is used within a method name.

• If such occurrences are possible, carry out the renaming individually (Replace instead of Replace All).

How to build the project:

1. A) If instances from the project should exist, update them. To do this, right-click on the instance, select TTMI/TMC File->Reload TMI/TMC File... and select the renamed new TMC file.

ProjectRea	Now	Obit (CMadulat)	/// <th>enera</th> <th>tedContent></th>	enera	tedContent>
I/O	Ë	Add New Item	Ins		
Tevices	* ם	Add Existing Item	Shift+Alt+A	TTO	COMOBJECT SETSTATE();
🍟 Mappings	×	Remove	Del	Ľ'`	should be compared by the comp
	ŋ	Сору	Ctrl+C		ModuleToCaller(); ModuleFromCaller();
	ж	Cut	Ctrl+X		
	â	Paste	Ctrl+V	ng	_
		Paste with Links		m_	Trace;
		TMI/TMC File	•		Reload TMI/TMC File
	•	Disable			Export TMI File
		Change Id			Export TMC File
	_		ITcCvcl		<pre>illerInfoPtr m spCvclicCaller:</pre>

B) Alternatively, carry this out via **System->TcCOM Objects** and the **Project Objects** tab by rightclicking on the OTCID.

- 2. Move System->TcCOM into the project.
- 3. Clean up the target system(s). Delete the files "OldProject.sys/.pdb" in C:\TwinCAT\3.x\Driver\AutoInstall.
- 4. Test the project.

13.11 Delete Module

A TwinCAT C++ module can be deleted from a C++ project with the help of the TMC Editor.

- 1. Right-click on the module (in this case CModule2)
- 2. Select Delete.

CModule2 General properties Add new data area Add new data pointer Add new interface pointer CModule2 be65338d-f349-4 Add new parameter Add new parameter Delete	 TMC Data Types Modules Module1 	Shows the properties of the
Add new data area Add new data pointer Add new interface pointer Add new parameter Delete		General properties
	Add new Add new Add new Add new	data area data pointer interface pointer parameter CModule2 be65338d-f349-4 Choose ima

3. Confirm the deletion via TMC.

TMC Edito	pr	3
?	Delete TwinCAT module class 'Module2' from TMC file? Implementation files 'Module2.h' and 'Module2.cpp' remain in the project.	
	Yes No	

 Note that the .cpp and .h files are retained – delete them manually if necessary. Delete other components concerned (e.g. header files, structures). See Compiler error messages for more information.

13.12 Add revision control and Online Change subsequently

An existing project with C++ TcCOM modules can be subsequently extended by the Online Change property.

This is a manual process.

The changeover takes place in several steps:

- <u>Convert C++ project to a versioned C++ project [> 240]</u>.
- Make C++ module class Online Change capable [▶ 243].

These steps are described on the subpages. However, it may be useful to create a new project yourself and transfer the corresponding differences. Thus, the respective context is visible.

13.12.1 C++ Project -> Revision control

These instructions describe how to add subsequently a revision control to a TwinCAT C++ project.

The code to be changed is stored in **bold** in the source code.

- ✓ C++ project. For the sample "Untitled1" is used as C++ project name. In addition, an empty, new project with a versioned C++ project is to be created. This serves as a copy template.
- 1. Open the file *Untitled1.vcxproj* in an editor.
- 2. Make the following addition:

```
<PropertyGroup Label="Globals">
<ProjectGuid>{...}</ProjectGuid>
<RootNamespace>Untitled1</RootNamespace>
<Keyword>Win32Proj</Keyword>
<AutomaticRetargetPlatformVersion>true</AutomaticRetargetPlatformVersion>
</PropertyGroup>
<PropertyGroup Label="TcGeneral">
<TcGeneralUseTmx>true</TcGeneralUseTmx>
</PropertyGroup>
<Import Project="$(VCTargetsPath)\Microsoft.Cpp.Default.props" />
```

- 3. Transfer the *Untitled1.rc* and *Untitled1W32.rc* files from the **new** project to the project to be migrated, overwriting the *Untitled1.rc* file.
- 4. Open the project.
- 5. Under TwinCAT UM Files -> Context menu / Add Existing Items select the file Unititled1W32.rc and add it to the project.

6. This file only needs to be built for TwinCAT UM platforms, so it should otherwise be excluded for the build process. This is done via right-click and properties:

ntitled1W32.rc	Property Pages			? >
Configuration:	All Configurations	V Platform:	ultiple Platforms	✓ Configuration Manager
 ✓ Configurati General ▷ Resource 	i i i i i i i i i i i i i i i i i i i	 ✓ General Excluded From Build Content Item Type 	Yes Resource compiler	
			Multiple Platforms Selected Platforms TwinCAT UM (x86) TwinCAT UM (x64) TwinCAT RT (x64) TwinCAT RT (x86)	? ×

- 7. Open the TMC Editor.
- 8. Set the name of the class factory and the version to "0.0.0.1".

▲ 📲 TMC Module Classes	The second secon
▶ 本 Translations	Edit the basic information about the TMC file.
👂 🌮 Data Types	
 Modules Module1 Implemented Interfaces Parameters DataAreas 	Vendor Information Name C++ Module Vendor Image Choose image Reset image
 Contexts SortOrders Libraryld ModuleClsId TraceLevelMax Parameter Data Areas Data Pointers Interface Pointers Event Classes Deployment 	Versioned Classfactory Name Untitled1 Version 0.0.0.1 Optional properties

9. Under Deployment, delete all entries.

10. Change in header *Modul1.h* DECLARE_IPERSIST_LIB():

```
public:
   DECLARE IUNKNOWN()
   DECLARE_IPERSIST_LIB()
   DECLARE ITCOMOBJECT_LOCKOP()
11. Add Modul1.cpp to the source code:
   #pragma hdrstop
   #include "Module1.h"
   #include "Untitled1Version.h"
   #ifdef _DEBUG
12. Add Modul1.cpp to the source code:
   END INTERFACE MAP()
   IMPLEMENT_IPERSIST_LIB(CModule1, VID_Untitled1,
   CID_Untitled1CModule1)
   IMPLEMENT_ITCOMOBJECT(CModule1)
   IMPLEMENT ITCOMOBJECT SETSTATE LOCKOP2 (CModule1)
13. Call the code generator.
    4 % C++
                                                                 13
          ‰ Untitled1
                                                                 14
```

14. Change in the file Untitled1Classfactory.cpp:

```
CUntitledlClassFactory::CUntitledlClassFactory() : CObjClassFactory()
{
  TcDbgUnitSetImageName(TCDBG_UNIT_IMAGE_NAME_TMX(SRVNAME_UNTITLED1));
  #if defined(TCDBG_UNIT_VERSION)
  TCDbgUnitSetVersion(TCDBG_UNIT_VERSION(Untitled1));
  #endif //defined(TCDBG_UNIT_VERSION)
}
```

15. Change the signing in the project properties in the tab <u>Tc Sign [▶ 161]</u>. To do this, switch **SHA1 signing** off and **TwinCAT signing** on; provide TwinCAT user certificate and password at the same time.

Configuration Properties	×	Enable signing		
General		SHA1 signing	No	
Debugging		SHA256 signing	No	
VC++ Directories		TwinCAT signing	Yes	
Tc SDK	~	TwinCAT Certificate (Same for all co	onfigurations)	
Tc Extract Version		TwinCAT Certificate Name	.tccert	
Tc Publish		TwinCAT Certificate Password	52	
Tc Sign		Verbose Output	No	
▷ C/C++	~	Windows SHA1 Certificate (Same for	or all configurations)	
▷ Linker		Certificate Store Name	PrivateCertStore	
 Manifest Tool Resources 		Certificate Name	\$(TWINCATTESTCERTIFICATE)	
 MIDL 		Certificate ID		
XML Document Generator		Timestamp Server URL		
Browse Information		CA Cross Signing Certificate Path

Custom Build Step	~	Windows SHA256 Certificate (Same	e for all configurations)	
Code Analysis		Certificate Store Name		
,,		Certificate Name		
		Certificate ID		
		Timestamp Server URL		
		CA Cross Signing Certificate Path		
		Verbose Output	No	

- 16. Trigger the **Rebuild** of the project.
- \Rightarrow The result is a C++ project that supports revision control.

If a module is to be made Online Change capable, this can be achieved by the following instructions [243].

13.12.2 C++ Module -> OnlineChange

These instructions describe how to subsequently make a module OnlineChange-capable in a versioned TwinCAT C++ project.

- ✓ Versioned C++ project with C++ module, which is not yet Online Change capable. For this sample, a module "Module1" is assumed. In addition, an empty, new project can be created with an Online Change-capable module, from which the changes can be more easily adopted.
- 1. Open the project and the TMC Editor.
- 2. Set the Auto generate on save option for the module so that the ClassID is changed automatically.

Untitled1.tmc [TMC Editor] 😐 🗙 Mod	dule1.cpp Mo	dule1.h

P Deployment	Parameter	#x00000001	Struct		1		
	Counter	#x00000002	Alias		1		

6. Start the code generation.

7. Some changes must be made in the header of the module "Module1.h". First, delete the declarations of the interfaces that are no longer required and the corresponding maps in two places.

```
class CModule1
: public ITComObject
, publicITcADI
, publicITcWatchSource
///<AutoGeneratedContent id="InheritanceList">
, public ITcCyclic
///</AutoGeneratedContent>
{
public:
DECLARE_IUNKNOWN()
DECLARE_ITCMOBJECT_LOCKOP()
DECLARE_ITCOMOBJECT_LOCKOP()
DECLARE_ITCMATCHSOURCE()
DECLARE_ITCWATCHSOURCE()
DECLARE_OBJPARAWATCH_MAP()
```

8. Create a new member variable in the header:

///</AutoGeneratedContent>
ITcADIPtr m_spADI;
// TODO: Custom variable

9. Some changes need to be made to the source code of the module "Module1.cpp". First, delete the implementations of the interfaces that are no longer required in two places.

```
BEGIN_INTERFACE_MAP(CModule1)
INTERFACE_ENTRY_ITCOMOBJECT()
INTERFACE_ENTRY(IID_ITcADI, ITcADI)
INTERFACE_ENTRY(IID_ITcWatchSource, ITcWatchSource)
///<AutoGeneratedContent id="InterfaceMap">
INTERFACE_ENTRY(IID_ITcCyclic, ITcCyclic)
///<AutoGeneratedContent>
END_INTERFACE_MAP()
IMPLEMENT_ITCOMOBJECT(CModule1)
IMPLEMENT_ITCADI(CModule1)
IMPLEMENT_ITCADI(CModule1)
IMPLEMENT_ITCWATCHSOURCE(CModule1)
```

10. Delete the implementation of the maps belonging to the deleted interfaces:

```
BEGIN SETOBJPARA MAP(CModule1)
SETOBJPARA DATAAREA MAP()
///<AutoGeneratedContent id="SetObjectParameterMap">
SETOBJPARA_VALUE(PID_TcTraceLevel, m_TraceLevelMax)
SETOBJPARA VALUE (PID Module1Parameter, m Parameter)
SETOBJPARA ITFPTR(PID Ctx TaskOid, m spCyclicCaller)
///</AutoGeneratedContent>
END SETOBJPARA MAP()
// Get parameters of CModule1
BEGIN GETOBJPARA MAP(CModule1)
GETOBJPARA_DATAAREA_MAP()
///<AutoGeneratedContent id="GetObjectParameterMap">
GETOBJPARA VALUE(PID TcTraceLevel, m TraceLevelMax)
GETOBJPARA VALUE (PID Module1Parameter, m Parameter)
GETOBJPARA ITFPTR(PID_Ctx_TaskOid, m_spCyclicCaller)
///</AutoGeneratedContent>
END GETOBJPARA MAP()
// Get watch entries of CModule1
BEGIN_OBJPARAWATCH_MAP(CModule1)
OBJPARAWATCH_DATAAREA_MAP()
///<AutoGeneratedContent id="ObjectParameterWatchMap">
///</AutoGeneratedContent>
END_OBJPARAWATCH_MAP()
```

```
// Get data area members of CModule1
BEGIN_OBJDATAAREA_MAP(CModule1)
///<AutoGeneratedContent id="ObjectDataAreaMap">
OBJDATAAREA_VALUE(ADI_Module1Inputs, m_Inputs)
OBJDATAAREA_VALUE(ADI_Module1Outputs, m_Outputs)
///</AutoGeneratedContent>
END_OBJDATAAREA_MAP()
```

11. The m_spAPI pointer must be obtained in the transition P->S in the state machine:

```
HRESULT CModule1::SetObjStatePS(PTComInitDataHdr pInitData)
```

```
{
m_Trace.Log(tlVerbose, FENTERA);
HRESULT hr = S_OK;
IMPLEMENT_ITCOMOBJECT_EVALUATE_INITDATA(pInitData);
// query TcCOM object server for ITcADI interface with own object id,
// which retrieves a reference to the TMC module instance handler
m_spADI.SetOID(m_objId);
hr = FAILED(hr) ? hr : m_spSrv->TcQuerySmartObjectInterface(m_spADI);
// TODO: Add initialization code
```

12. Add the following in the state machine in the transition S->O, the calls to AddModuleToCaller or RemoveModuleFromCaller are omitted.

```
HRESULT hr = S_OK;
// Retrieve pointer to data areas via ITcADI interface from TMC module handler
///<AutoGeneratedContent id="DataAreaPointerInitialization">
///<AutoGeneratedContent>
/// TODO: Add any additional initialization
// Cleanup if transition failed at some stage
if ( FAILED(hr) )
{
    SetObjStateOS();
```

13. Add the following in the state machine in the transition O->S, the call RemoveModuleFromCaller is omitted:

```
HRESULT hr = S_OK;
// Release pointer to data areas via ITcADI interface from TMC module handler
///<AutoGeneratedContent id="DataAreaPointerRelease">
///</AutoGeneratedContent id="DataAreaPointerRelease">
///</AutoGeneratedContent>
// TODO: Add any additional deinitialization
```

- 14. The AddModuleToCaller and RemoveModuleFromCaller methods are not required and can be deleted.
- 15. Change the accesses to the DataAreas:

```
HRESULT CModule1::CycleUpdate(ITcTask* ipTask, ITcUnknown* ipCaller, ULONG_PTR context)
{
    HRESULT hr = S_OK;
    // TODO: Replace the sample with your cyclic code
    m_Counter+=m_pInputs->Value;
    m_pOutputs->Value=m_Counter;
    return hr;
}
```

16. Implement the ITcOnlineChange. The functions are created by the previous code generation, but must not return NOTIMPL.

```
///<AutoGeneratedContent id="ImplementationOf_ITComOnlineChange">
```

```
// PrepareOnlineChange is called after this instance has been set to PREOP in non RT context.
// Parameter ipOldObj refers to the currently active instance which is still in OP.
// Retrieve parameter values that are not changed during OP via ipOldObj here.
11
// Parameter pOldInfo refers to instance data which includes the libraryId and
// the module class id. This information can be used to implement switch from one
// specific version to another.
HRESULT CModule1::PrepareOnlineChange(ITComObject* ipOldObj, TmcInstData* pOldInfo)
HRESULT hr = S OK;
ULONG nData = sizeof(m_Parameter);
PVOID pData = &m Parameter;
ipOldObj->TcGetObjPara(PID Module1Parameter, nData, pData);
return hr;
// PerformOnlineChange is called after this instance has been set to SAFEOP in RT context.
// Parameter ipOldObj refers to old instance which is now in SAFEOP.
// Allows to retrieve data after the last cyclic update of the old instance and
```

```
// before the first cyclic update of this instance.
HRESULT CModule1::PerformOnlineChange(ITComObject* ipOldObj, TmcInstData* pOldInfo)
{
HRESULT hr = S_OK;
ULONG nData = sizeof(m_Counter);
PVOID pData = &m_Counter;
ipOldObj->TcGetObjPara(PID_Module1Counter, nData, pData);
return hr;
}
///</AutoGeneratedContent>
```

17. Start the TMC Code Generator again to generate the code for the initialization of the data area pointers.

13.13 Initialization of TMC-member variables

All member variables of a TcCOM module must be initialized. The TMC Code Generator supports this with:

///<AutoGeneratedContent id="MemberInitialization">

The TMC Code Generator replaces this with:

```
///<AutoGeneratedContent id="MemberInitialization">
m_TraceLevelMax = tlAlways;
memset(&m_Parameter, 0, sizeof(m_Parameter));
memset(&m_Inputs, 0, sizeof(m_Inputs));
memset(&m_Outputs, 0, sizeof(m_Outputs));
///</AutoGeneratedContent>
```

The projects generated with the TwinCAT C++ Wizard prior to TwinCAT 3.1 Build 4018 do not use this property, but can easily be adapted by inserting this line in the corresponding code (e.g. Constructor):

///<AutoGeneratedContent id="MemberInitialization">

13.14 Using PLC strings as method parameters

To transfer a character string from PLC to C++ as a method parameter, use a pointer with length information when declaring the method in TMC:

- +	• ↓ ↑	
Name	Туре	Description
nStr	UDINT	Normal Type 🔹
pStr	SINT	Is Pointer 💌

Such a method can be called by means of implementing a method within the wrapper function block.

	1	METHOD SetString : HRESULT
-	2	VAR_INPUT
	3	<pre>sSent : STRING(80);</pre>
	4	END_VAR
	-	
•		
•	1	IF (ipStateMachine <> 0) THEN
•	1	<pre>IF (ipStateMachine <> 0) THEN SetString := ipStateMachine.SetString(SIZEOF(sSent),ADR(sSent));</pre>
-	1 2 3	

The reason is the different handling of method parameters in the two worlds:

- PLC: Uses the call by value for STRING(nn) data types.
- TwinCAT C++ (TMC): Uses the call by reference.

13.15 Third Party Libraries

C/C++ code existing in Kernel mode cannot be linked with or execute libraries from third parties that were developed for execution in User mode. There is therefore no possibility to use any DLL directly in TwinCAT C++ modules.

The connection of the TwinCAT 3 real-time environment can be realized via ADS communication instead. You can implement a User-mode application that makes use of the third-party library that provides TwinCAT functions via ADS.

This action of an ADS component in User mode can take place both as a client (i.e. the DLL transmits data to the TwinCAT real-time if necessary) and as a server (i.e. the TwinCAT real-time fetches data from the User mode if necessary).

Such an ADS component in User mode can also be used in the same way from the PLC. In addition, ADS can communicate beyond device limits.

The following samples illustrate the use of ADS in C++ modules:

Sample03: C++ as ADS server [> 258]

Sample07: Receiving ADS Notifications [273]

Sample08: provision of ADS-RPC [> 274]

13.16 Linking via TMC editor (TcLinkTo)

Similar to the PLC, in TwinCAT C++ a link to the hardware, for example, can be predefined at the time of encoding.

This is done in the TMC editor at the symbol to be linked. A property **TcLinkTo** with the value of the target is specified. The screenshot below illustrates this:

Solution Explorer	Untitled1.tmc [TMC Editor] + × Modu	le1.cpp Module1.h

Note that such an instruction applies to all instances of the module:

14 Troubleshooting

This is a list of pitfalls and glitches within the handling of TwinCAT C++ modules.

14.1 Build - "The target ... does not exist in the project"

In particular when transferring a TwinCAT solution from one machine to another, Visual Studio may display error messages to the effect that not all targets (such as Build, Rebuild, Clean) exist in the project.

🔀 1	error MSB4057: The target "Rebuild" does not exist in the project.
<mark>/</mark> 2	23.02.2015 08:39:08 279 ms 'TCatSysManager' (33728): Project 'Measurement' build for
	platform 'TwinCAT RT (x86)' failed.

Check the configuration of the "platform toolset" of the C++ project. It may need to be reconfigured if solutions migrate from one Visual Studio version to another:

Measurement Property Pages 8								
Configuration: Active(Debug)	Platform: Active(TwinCAT R)	T (x86)) Configuration Manager						
Common Properties	▲ General							
Configuration Properties	Output Directory	\$(SolutionDir)\$(Configuration)\						
General	Intermediate Directory	\$(Configuration)\						
	Target Name							
	Target Extension							
	Extensions to Delete on Clean							
	Build Log File	\$(IntDir)\\$(MSBuildProjectName).log						
	Platform Toolset	v120						
	Enable Managed Incremental Build							
	Project Defaults							
	Configuration Type	Application (.exe)						

14.2 Debug - "Unable to attach"

If this error message appears when starting the debugger in order to debug a TwinCAT C++ project, then a configuration step is missing:

In this case, navigate to **System -> Real-Time**, select the **C++ Debugger** tab and activate the option **Enable C++ Debugger**.

14.3 Activation – "invalid object id" (1821/0x71d)

If the ADS Return Code 1821 / 0x71d is reported during the course of the start, check the context of the module instance as described in <u>Quick start [\blacktriangleright 69]</u>.

14.4 Error message - VS2010 and LNK1123/COFF

During the compilation of a TwinCAT C++ module, the error message

```
LINK : fatal error LNK1123: failure during conversion to COFF: file invalid or corrupt
```

indicates that a Visual Studio 2010 is being used, but without Service Pack 1, which is <u>required [> 20]</u> for TwinCAT C++ modules.

Download the installation program for the service pack from Microsoft.

14.5 Using C++ classes in TwinCAT C++ module

When adding (non-TwinCAT) C++ classes using the Visual Studio context menu **Add->Class...**, the compiler/linker reports:

Error 4 error C1010: unexpected end of file while looking for precompiled header. Did you forget to add '#include ""' to your source?

Insert the following lines at the start of your generated class file:

#include "TcPch.h"
#pragma hdrstop

14.6 Using afxres.h

In some templates afxres.h is included, which in some systems is not provided.

This header file can be replaced by winres.h.

15 C++-samples

Numerous samples are available - further samples follow.

This picture provides an overview in graphical form and places the emphasis on the interaction possibilities of a C++ module.

Beyond that, this is a table with brief descriptions of the samples.

Number	Title	Description
01	Sample01: Cyclic with IO module [▶ 257]	This article describes the implementation of a TC3 C++ module that uses an IO module mapped with physical IO. This sample describes the quick start for the purpose of creating a C++ module that increments a counter on each cycle and assigns the counter to the logical output "Value" in the data area. The data area can be assigned to the physical IO or another logical input or another module instance.
02	Sample02: Cyclic with IO task [258]	Describes the flexibility of C++ code when working with IOs that are configured at the task. Thanks to this approach, a finally compiled C++ module can affect various IOs connected with the IO task much more flexibly. One application could be to check cyclic analog input channels, where the number of input channels can differ from one project to another.
03	Sample03: ADS Server Client [▶ 258]	Describes the design and implementation of one's own ADS interface in a C++ module. The sample contains two parts:
		ADS Server implemented in TC3 C++ with user- specific ADS interface
		 ADS Client UI implemented in C#, which transmits user-specific ADS messages to the ADS server.
05	Sample05: CoE access via ADS [267]	Shows how CoE registers of EtherCAT devices can be accessed over ADS.
06	Sample06: ADS C# client uploads ADS symbols [▶ 268]	Shows how symbols in an ADS server can be accessed via the ADS interface. C# ADS client connects to a module implemented in PLC/C++/Matlab. Upload the available symbol information and read/write subscription for process values.
07	Sample07: Receiving ADS Notifications [] 273]	Describes the implementation of a TC3 C++ module that receives ADS notifications regarding data changes on other modules.
08	Sample08: provision of ADS-RPC [> 274]	Describes the implementation of methods that can be called by ADS via the task.
10	Sample10: Module communication: Use of data pointers [▶ 277]	Describes the interaction between two C++ modules with a direct data pointer. The two modules must be implemented on the same CPU core in the same real- time context.
11	Sample11: Module communication:	This sample contains two parts
	PLC module calls a method of a C- module [▶ 278]	• A C++ module which functions as a state machine that provides an interface with methods for starting/ stopping and also for setting/maintaining the state machine.
		 Second PLC module for interacting with the first module by calling methods from the C++ module.
11a	Sample11a: Module communication: C-module cites a method in the C-	This sample contains two classes in one driver (can also be done between two drivers)
	module [• 306]	 One module that provides a calculation method. Access is protected through a Critical section.
		• A second module that acts as the caller in order to use the methods in the other module.
12	Sample12: Module communication: IO mapping used [▶_306]	 Describes how two modules can interact with each other via mapping of symbols from the data area of different modules. The two modules can be executed on the same or different CPU cores.

13	Sample13: Module communication: C- module calls PLC methods [▶ 307]	Describes how a TwinCAT C++ module calls a PLC function block using TcCOM interface methods.
19	Sample19: Synchronous File Access [▶ 310]	Describes how the File IO function can be used in a synchronized manner with C++ modules. The sample writes process values in a file. The writing of the file is triggered by a deterministic cycle - the execution of File IO is decoupled (asynchronous), i.e.: the deterministic cycle continues to run and is not hindered by writing to the file. The status of the routine for decoupled writing to the file can be checked.
20	Sample20: FileIO-Write [▶_311]	Describes how the File IO function can be used with C++ modules. The sample writes process values in a file. The writing of the file is triggered by a deterministic cycle - the execution of File IO is decoupled (asynchronous), i.e.: the deterministic cycle continues to run and is not hindered by writing to the file. The status of the routine for decoupled writing to the file can be checked.
20a	Sample20a: FileIO-Cyclic Read / Write [▶ <u>311]</u>	A more extensive sample than S20 and S19. It describes the cyclic read and/or write access to files from a TC3 C+ + module.
22	Sample22: Automation Device Driver (ADD): Access DPRAM [▶_312]	Describes how the TwinCAT Automation Device Driver (ADD) is to be written for access to the DPRAM.
23	Sample23: Structured Exception Handling (SEH) [▶_314]	Describes the use of Structured Exception Handling (SEH) based on five variants.
24	Sample24: Semaphores [] 316]	Describes the use of semaphores.
25	Sample25: Static Library [> 317]	Describes how to use the TC3 C++ static library contained in another TC3 C++ module.
26	Sample26: Order of execution in a task [▶ 318]	Describes the determination of the task execution order, if a task is assigned to more than one module.
30	Sample30: Timing Measurement [▶ 320]	Describes the measurement of the TC3 C++ cycle or execution time.
31	Sample31: Functionblock TON in TwinCAT3 C++ [▶_321]	Describes the implementation of a behavior in C++, which is comparable to a TON function block of PLC / 61131.
37	Sample37: Archive data [> 323]	Describes the loading and saving of the state of an object during the initialization and de-initialization.
TcCOM	TcCOM samples [> 324]	Several samples are provided to illustrate the module communication between PLC and C++.

15.1 Sample01: Cyclic module with IO

This article describes how to implement a TC3 C++ module which is using the module IO mapped to physical IO

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project**
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Activate the configuration by clicking on \mathbf{k} .

 \Rightarrow The sample is ready for operation.

Description

This sample describes the quick start for the purpose of creating a C++ module that increments a counter on each cycle and assigns the counter to the logical output Value in the data area.

The data area can be assigned to the physical IO or another logical input or another module instance.

The sample is described step by step here in the short instructions.

15.2 Sample02: Cyclic C++ logic, which uses IO from the IO Task

This article describes the implementation of a TC3 C++ module that uses an image of an IO Task.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Source code, which is not automatically generated by the wizard, is identified with a start flag "//sample code" and end flag "//sample code end".

In this way you can search for these strings in the files, in order to get an idea of the details.

Description

This sample describes the flexibility of C++ code when working with IOs configured at the task. This approach enables a compiled C++ module to respond more flexibly, if a different number of IOs are linked to the IO task. One application option would be cyclic testing of analog input channels with a different number of channels, depending on the project.

The sample contains

- the C++ module TcIoTaskImageAccessDrv with a module instance TcIoTaskIMageAccessDrv_Obj1
- A "Task1" with an image, 10 input variables (Var1..Var10) and 10 output variables (Var11..Var20).
- They are linked: The instance is called by the task and uses the image of Task1.

The C++ code accesses the values via a data image, which is initialized during the transition from SAFEOP to OP (SO).

In the cyclically executed method CycleUpdate the value of each input variable is checked by calling the helper method CheckValue. If it is less than 0, the corresponding output variable is set to 1, if it is greater than 0, it is set to 2, if it is 0, the output is set to 3.

After activation of the configuration you can access the variables via the Solution Explorer and set them. Double-click on the Task1 image of system for an overview. The input variables can be opened and then set with the **Online** tab.

15.3 Sample03: C++ as ADS server

This article describes:

 The creation of a TC3 C++ module that acts as an ADS server. The server provides an ADS interface for starting / stopping / resetting a counter variable in the C++ module. The counter is available as a module output and can be assigned to an output terminal (analog or a number of digital IOs). How the TC3 ADS server function written in C++ is to be implemented. [▶ 259]

• The creation of a C# ADS client to interact with the C++ ADS server. The client provides a UI for connection locally or via a network to an ADS server with the ADS interface to be counted. The UI enables the starting / stopping / reading / overwriting and resetting of the counter.

Sample code: ADS Client UI written in C# [▶ 263].

Understanding the sample

Options for the automatic determination of an ADS port are used in the sample. The disadvantage of this is that the client has to be configured at each start in order to access the correct ADS port.

Alternatively, the ADS port can be hard-coded in the module as shown below. Disadvantage here: The C++ module cannot be instanced more than once as it is not possible to share an ADS port.

HKESULI CAASCOMMUNICATIONMODULE::	setubjstaters	(PICOMINITUATAHOR pinituata)

15.3.1 Sample03: TC3 ADS Server written in C++

This article describes how to create a TC3-C++ module acting as a ADS-server. The server will provide an ADS interface to start / stop / reset an counter variable insight the C++ module.

Download

Here you can access the source code for this sample:

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on $\stackrel{\text{\tiny III}}{=}$.
- \Rightarrow The sample is ready for operation.

Description

This sample contains a C++ module that acts as an ADS server. The server grants access to a counter that can be started, stopped and read.

The header file of the module defines the counter variable m_bCount, and the corresponding .cpp file initializes the value in the constructor and implements the logic in the CycleUpdate method.

The AdsReadWriteInd method in the .cpp file analyzes the incoming messages and returns the return values. A define in the header file is added for a further added message type.

Details such as the definition of the ADS message types are described in the following cookbook, where you can compile the sample manually.

Cookbook

This is a step by step description about the creation of the C++ module.

1. Create a new TwinCAT 3 project solution

Follow the steps for creating a new TwinCAT 3 project [60].

2. Create a C++ project with ADS port

Follow the steps for the creation of a new TwinCAT 3 C++ project.

Select TwinCAT Module Class with ADS port in the Class templates dialog.

3. Add the sample logic to the project

1. Open the header file <MyClass>.h (in this sample Module1.h) and add the counter m_bCount to the protected area as a new member variable:

```
class CModule1
    : public ITComObject
    , public ITcCyclic
    , . . .
{
public:
    DECLARE IUNKNOWN()
    . . . .
protected:
    DECLARE ITCOMOBJECT SETSTATE();
///<AutoGeneratedContent id="Members">
    ITcCyclicCallerInfoPtr m spCyclicCaller;
    . . . . .
///</AutoGeneratedContent>
    ULONG m ReadByOidAndPid;
    BOOL m_bCount;
};
```

Open the class file <MyClass>.cpp (in this sample Module1.cpp) and initialize the new values in the constructor:

```
CModule1::CModule1()
.....
{
    memset(&m_Counter, 0, sizeof(m_Counter));
    memset(&m_Inputs, 0, sizeof(m_Inputs));
    memset(&m_Outputs, 0, sizeof(m_Outputs));
    m_bCount = FALSE; // by default the counter should not increment
    m_Counter = 0; // we also initialize this existing counter
}
```

 \Rightarrow The sample code has been added.

3.a. Add the sample logic to the ADS server interface.

Usually, the ADS server receives an ADS message, which contains two parameters (indexGroup and indexOffset) and perhaps further data pData.

Designing an ADS interface

Our counter is to be started, stopped, reset, overwritten with a value or send a value to the ADS client on request:

indexGroup	indexOffset	Description
0x01	0x01	m_bCount = TRUE, counter is incremented.
0x01	0x02	Counter value is transferred to ADS client.
0x02	0x01	m_bCount = FALSE, counter is no longer incremented.
0x02	0x02	Reset counter.
0x03	0x01	Overwrite counter with value transferred by ADS client.

These parameters are defined in modules1Ads.h – change the source code to add a new command for IG_RESET.

```
#include "TcDef.h"
enum ModulelIndexGroups : ULONG
{
    ModulelIndexGroup1 = 0x00000001,
    ModulelIndexGroup2 = 0x00000002, // add command
    IG_OVERWRITE = 0x00000003 // and new command
};
enum ModulelIndexOffsets : ULONG
{
    ModulelIndexOffset1 = 0x00000001,
    ModulelIndexOffset2 = 0x0000002
};
```

Change the source code in your <MyClass>::AdsReadWriteInd() method (in this case in Module1.cpp).

```
{
case Module1IndexGroup1:
    switch(indexOffset)
    case Module1IndexOffset1:
        // TODO: add custom code here
        m bCount = TRUE; // receivedIG=1 IO=1, start counter
        AdsReadWriteRes(rAddr, invokeId, ADSERR_NOERR, 0,NULL);
        break;
    case Module1IndexOffset2:
        // TODO: add custom code here
        // map counter to data pointer
    pData = &m_Counter; // received IG=1 IO=2, provide
AdsReadWriteRes(rAddr, invokeId, ADSERR_NOERR, 4, pData);
                                  // received IG=1 IO=2, provide counter value via ADS
//comment this: AdsReadWriteRes(rAddr, invokeId,ADSERR NOERR, 0, NULL);
     break;
    break;
case Module1IndexGroup2:
    switch(indexOffset)
    case Module1IndexOffset1:
     // TODO: add custom code here
    // Stop incrementing counter
    m bCount = FALSE;
    // map counter to data pointer
    pData = &m Counter;
     AdsReadWriteRes(rAddr, invokeId, ADSERR NOERR, 4,pData);
     break;
case Module1IndexOffset2:
```

switch(indexGroup)

```
// TODO: add custom code here
   // Reset counter
   m Counter = 0;
    // map counter to data pointer
   pData = &m Counter;
    AdsReadWriteRes(rAddr, invokeId, ADSERR NOERR, 4, pData);
    break;
break;
case IG OVERWRITE:
   switch(indexOffset)
    case Module1IndexOffset1:
    . .
     // TODO: add custom code here
                                     // override counter with value provided by ADS-client
    unsigned long *pCounter = (unsigned long*) pData;
    m Counter = *pCounter;
     AdsReadWriteRes(rAddr, invokeId, ADSERR_NOERR, 4, pData);
     break;
break;
break;
default:
     _super::AdsReadWriteInd(rAddr, invokeId, indexGroup,indexOffset, cbReadLength, cbWriteLength,
pData;
    break;
```

3.b. Add sample logic to the cyclic part

The method <MyClass>::CycleUpdate() is cyclically called - this is the place to modify the logic.

```
// TODO: Replace the sample with your cyclic code
m_Counter+=m_Inputs.Value; // replace this line
m_Outputs.Value=m_Counter;
```

In this case the counter **mCounter** is incremented if the boolean variable **m_bCount** is true.

Insert this If-Case to your cyclic method

```
HRESULT CModule1::CycleUpdate(ITcTask* ipTask,
ITcUnknown* ipCaller, ULONG context)
{
HRESULT hr = S_OK;
// handle pending ADS indications and confirmations
CheckOrders();
....
// TODO: Replace the sample with your cyclic code
if (m_bCount) // new part
{
    m_Counter++;
}
m_Outputs.Value=m_Counter;
}
```

4. Execute server sample

- 1. Run the <u>TwinCAT TMC Code Generator</u> [> <u>71</u>] in order to provide the inputs/outputs for the module.
- 2. Save the project.
- 3. <u>Compile [▶ 71]</u> the project.
- 4. Create a module instance.
- 5. Create a cyclic task and configure the C++ module for the execution in this context.
- 6. Scan the hardware IO and assign the symbol Value of outputs to certain output terminals (this is optional).
- 7. <u>Activate [87]</u> the TwinCAT project.
- \Rightarrow The sample is ready for operation.

5. Determine the ADS port of the module instance

Generally the ADS port may be

- pre-numbered, so that the same port is always used for this module instance.
- kept customizable, in order to offer several module instances the option to have their own ADS port assigned on startup of the TwinCAT system.

In this sample the default setting (keep flexible) is selected. First of all you have to determine the ADS port that was assigned to the module that has just been activated.

- 1. Navigate to the module instance.
- 2. Select the Parameter Online tab.
 - ⇒ 0x8235 or decimal 33333 is assigned to the ADS port (this may be different in your sample). If more and more instances are created, each instance is allocated its own unique AdsPort.
 - ⇒ The counter is still at "0" because the ADS message to start the incrementation has not been sent.

 \Rightarrow The server part is completed - continue with <u>ADS client sends the ADS messages [\blacktriangleright 263].</u>

Also see about this

- Create TwinCAT 3 C++ Module instance [> 67]
- Create a TwinCAT task and apply it to the module instance [69]

15.3.2 Sample03: ADS client UI in C#

This article describes the ADS client, which sends ADS messages to the previously described ADS server.

The implementation of the ADS server depends neither on the language (C++ / C# / PLC / \dots) nor on the TwinCAT version (TwinCAT 2 or TwinCAT 3).

Download

Here you can access the source code for this sample.

- ✓ This code requires .NET Framework 3.5 or higher!
- 1. Unpack the downloaded ZIP file.
- 2. Open the sln file contained in it with Visual Studio.

- 3. Create the sample on your local machine (right-click on the project and click on Build).
- 4. Start the program with a right-click on **Project**, **Debug->Start new instance**.

Description

This client performs two tasks:

- Testing the ADS-server, which was described before.
- Providing sample code for implementing a ADS-client

Using the client

Selecting a communication partner

Enter both ADS parameters in order to specify your ADS communication partner:

- NetID: 127.0.0.1.1.1 (for ADS partner also linked with local ADS Message Router) Enter another NetID, if you want to communicate with an ADS partner connected to another ADS router via the network.
 First you have to create an ADS route between your device and the remote device.
- AdsPort

Enter the AdsServerPort of your communication partner.

Do not confuse the ADS server port (which has explicitly implemented your own message handler) with the regular ADS port for the purpose of access to symbols (this is provided automatically, without the need for user intervention).

Find the assigned AdsPort [> 259], in this sample the AdsPort was 0x8235 (dec 33333).

Create link with communication partner

Click on **Connect** to call the method TcAdsClient.Connect for the purpose of creating a link with the configured port.

NetID:	127.0.0.1.1.1
Port:	
Connect]
Start	
Read	1
	1
Stop	

ADS messages are sent to the ADS server with the help of the **Start** / **Read** / **Stop** / **Overwrite** / **Reset** buttons.

The specific indexGroup / indexOffset commands were already <u>designed in the ADS interface of the ADS</u> <u>server [> 259]</u>.

The result of clicking on the command buttons can also be seen in the module instance in the **Parameters** (online) tab.

ject	Context	Parameter (Init)	Parameter (Online)	Data Area	Interfaces	Interface Poin	iter

    lbOutput.Items.Add("Counter reset Value = " + BitConverter.ToInt32(dataBuffer, 0));
}
catch (Exception err)
{
    MessageBox.Show(err.Message);
}
```

15.4 Sample05: C++ CoE access via ADS

This article describes how to implement a TC3 C++ modules which can access the CoE (CANopen over EtherCAT) register of a EtherCAT terminal.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Note the actions listed on this page under **Configuration**.
- 6. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

This sample describes access to an EtherCAT Terminal, which reads the manufacturer ID and specifies the baud rate for serial communication.

This sample describes the quick start for the purpose of creating a C++ module that increments a counter on each cycle and assigns the counter to the logical output Value in the data area.

Configuration

1. Activate the EtherCAT address of the terminal concerned and assign it.

General	EtherCAT	Process Data	Startup	CoE - Online	EL60xx	Online

15.5 Sample06: UI-C#-ADS client uploading the symbolic from module

This article describes the implementation of an ADS client to

 connect to an ADS server that provides a process image (data area); the connection can be established locally or remotely via a network,

- · upload symbol information,
- read / write data synchronously,
- subscribe to symbols, in order to obtain values on change as callback.

Download

Access the source code for this client sample:

- ✓ This code requires .NET Framework 3.5 or higher!
- 1. Unpack the downloaded ZIP file.
- 2. Open the sln file contained in it with Visual Studio.
- 3. Create the sample on your local machine (right-click on the project and click on "Build").
- 4. Start the program with a right-click on **Project**, **Debug->Start new instance**.

The client sample should be used with example 03 "C++ as ADS server".

Open <u>Sample 03</u> [▶ 259] before you begin with this client-side sample!

Description

The possibilities of the ADS are described on the basis of this sample.

The details of the implementation are described in Form1.cs, which is included in the download. The connection via ADS with the target system is established in the btnLoad_Click method, which is called on clicking on the **Load Symbols** button. From there you can explore the different GUI functions.

Background information:

For this ADS client it is irrelevant whether the ADS server is based on TwinCAT 2 or TwinCAT 3. It also doesn't matter if the server is a C++ module, a PLC module or an IO task without any logic.

The ADS client UI

On starting of the sample the user interface (UI) is displayed.

Symbols	Current Symbol

Selecting a communication partner

After starting the client, enter the two ADS parameters, in order to determine your ADS communication partner.

· NetID:

127.0.0.1.1.1 (for ADS partner also linked with local ADS message router). Enter another NetID, if you want to communicate with an ADS partner connected to another ADS router via the network. First you have to create an ADS route between your device and the remote device.

- AdsPort
 - Enter the AdsPort of your communication partner: 350 (in this sample).

Do not confuse the ADS server port with the regular ADS port.

Do not confuse the ADS server port (which was explicitly implemented in sample 03 for providing your own message handler) with the regular ADS port for the purpose of access to symbols (this is provided automatically, without the need for user intervention):

The regular ADS port is required to access symbols. You can find the AdsPort for the IO task of your instance or the module instance yourself (since the module is executed in the context of the IO task).

Navigate to IO task Task1 and note the value of the port: 350.

Solution Explorer 🔹 🖣 🗙	TwinCAT Project

Enabled symbols for access available via ADS

Individual symbols or whole data areas can be provided for access via ADS, or they can be deliberately not provided.

Navigate to the Data Area tab of your instance and activate/deactivate the C/S column.

In this sample all symbols are marked and therefore available for ADS access.

After making the changes, click on **Activate configuration**.

Solution 'AdsCommunicationSample' (1 projec	Object	Context	Parameter (Init)	Parameter (Online)	Data Area	Interfaces	Interfa	ace Pointer

Load symbols

Once the NetID and the ADS port have been set up, click on the **Load Symbols** button to make a connection with the target system and load the symbols.

All available symbols are then visible. You can then:

• Write a new value:

select a symbol in the left-hand tree, e.g. Counter.

enter a new value in the edit box **Value** on the right-hand side and click on **Write using WriteSymbol**. The new value is written to the ADS server.

After writing a new value with **Write using WriteSymbol**, the C# application is assigned a callback with the new value.

• Subscribe in order to obtain callback when the value changes: select a symbol in the left-hand tree, e.g. **Counter**. click on **Watch Current Symbol**.

15.6 Sample07: Receiving ADS Notifications

This article describes how to implement a TC3 C++ module which receives ADS Notifications about data changes on other modules.

Since all other ADS communication has to be implemented in a similar way, this sample is the general entry point to initialize ads communication from TwinCAT C++ modules.

Download

Here you can access the source code for this sample:

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

This sample describes the reception of ADS notifications in a TwinCAT C++ module.

The solution contains 2 modules for this purpose.

• A C++ module, which registers for querying ADS notifications of a variable.

- For a simple understanding: A PLC program that provides a variable MAIN.PlcVar. If its value changes, an ADS notification is sent to the C++ module.
- The C++ module utilizes the message recording options. For a better understanding of the code, simply start the sample and note the output / error log when you change the value Main.PlcVar of the PLC module.

The address is prepared during the module transition PREOP->SAFEOP (SetObjStatePS). The CycleUpdate method contains a simple state machine, which sends the required ADS command. Corresponding methods show the receipts.

The inherited and overloaded method AdsDeviceNotificationInd is called when a notification is received.

During shutdown, ADS messages are sent during transition for the purpose of logoff (SetObjStateOS), and the module waits for receipts of confirmation until a timeout occurs.

Start of the module development

ĺ

Creating a TwinCAT C++ module with the aid of the ADS port wizard. This sets up everything you need for establishing an ADS communication. Simply use and overwrite the required ADS methods of ADS.h, as shown in the sample.

ADS Communication [208]

15.7 Sample08: provision of ADS-RPC

This article describes the implementation of methods that can be called by ADS via the task.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The download contains 2 projects:

- The TwinCAT project, which contains a C++ module. This offers some methods that can be called by ADS.
- Also included is a Visual C++ project that calls the methods from the User mode as a client.

Four methods with different signatures are provided and called. These are organized in two interfaces, so that the composition of the ADS symbol names of the methods becomes clear.

Understanding the sample

The sample consists of the TwinCAT C++ module, which offers the RPC methods and a C++ sample program that calls them.

TwinCAT C++ module

The TwinCAT C++ project contains a module and an instance of the module with the name "foobar".

RPC methods are normal methods that are described by interfaces in the TMC editor and are additionally enabled by an **RPC enable** checkbox. The options are described in greater detail in the <u>Description of the TMC Editor</u> [▶ 103].

In this module two interfaces are described and implemented, as can be seen in the TMC Editor:

The methods, four in all, have different signatures of call and return values.

Their ADS symbol name is formed according to the pattern: ModuleInstance.Interface#MethodName Particularly important in the implementing module is the ContextId, which defines the context for the execution.

As can be seen in the C++ code itself, the methods are generated by the code generator and implemented like normal methods of a TcCOM module.

```
Module1.cpp 🗢 🔀 Untitled1.tmc [TMC Editor]
  Untitled1
                                     → CModule1
                                                                            ///<AutoGeneratedContent id="ImplementationOf IRpcTest">
   HRESULT CModule1::CallInWHResult(LONG in)
     {
        HRESULT hr = S_OK;
        return hr;
    }
   HRESULT CModule1::CallIn(LONG in)
     {
        HRESULT hr = S_OK;
        return hr;
    }
     ///</AutoGeneratedContent>
     ///<AutoGeneratedContent id="ImplementationOf_IRpcTest2">
   HRESULT CModule1::AddWOHResult(LONG a, LONG b, LONG& sum)
    {
            HRESULT hr = S OK;
            sum = a+b;
            m_Trace.Log(tlAlways, FNAMEA "got called with %d %d -> %d", a, b, sum);
            return hr;
    }
   □ HRESULT CModule1::AddWHResult(LONG a, LONG b, LONG& sum)
     {
        HRESULT hr = S_OK;
        sum = a + b;
        m_Trace.Log(tlAlways, FNAMEA "got called with %d %d -> HRESULT %d ", a, b, sum);
        return hr;
    }
     ///</AutoGeneratedContent>
```

If the type information of the methods is to be available on the target system, the TMI file of the module can be transferred to the target system.

Solution Explorer 🔹	ų×.	TwinCAT Project1 👎 🔾	× SampleRPC.cpp	Untitled1.tmc [TMC Editor]*	Module1.cpp

```

15.8 Sample10: module communication: Using data pointer

This article describes the implementation of two TC3 C++ modules, which communicate via a data pointer.

Download

Here you can access the source code for this sample:

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project**
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

This communication is based on a "split" data area: Provided by a module and accessible from another module via pointers.

It is not possible that two different data pointers are linked with the same entry in an output or input data area; without this limitation there could be synchronization problems. For this reason a ModuleDataProvider module consolidates input and output in a standard data area, which is not subject to this restriction.

All in all, this sample includes the following modules:

- ModuleDataProvider provides a data area, which can be accessed by the other modules. The data area contains 4 bits (2 for input, 2 for output) and 2 integers (1 for input, 1 for output).
- ModuleDataInOut provides "normal" input variables, which are written to the data area of the ModuleDataProvider, and output variables, which are read from the data area.

This instance of the CModuleDataInOut class serve as a simulation for real IO.

- ModuleDataAccessA accesses the data area of ModuleDataProvider and cyclically processes Bit1 / BitOut1 and the integer.
- ModuleDataAccessB accesses the data area of ModuleDataProvider and cyclically processes Bit2 / BitOut2 and the integer.

The user of the sample triggers ModuleDataInOut by setting the variables ValueIn / Bit1 / Bit2:

- When setting the input Bit1, the output Switch1 will be set accordingly.
- When setting the input Bit2, the output Switch2 will be set accordingly.
- When the input ValueIn is set, the output ValueOut is incremented twice in each cycle.

All modules are configured such that they have the same task context, which is necessary since access via pointers offers no synchronization mechanism. The order of execution corresponds to the order specified on the context configuration tab. This value is passed on as parameter SortOrder and stored in the smart pointer of the cyclic caller (m_spCyclicCaller), which also contains the object ID of the cyclic caller.

Understanding the sample

The module ModuleDataInOut has input and output variables. They are linked with the corresponding variables of the data provider.

The module ModuleDataProvider provides an input and output data array and implements the ITcloCylic interface. The method InputUpdate copies data from the input variables to the DataIn symbol of the standard data area Data, and the method OutputUpdate copies data from the DataOut symbol to the output variables.

The modules ModuleDataAccessA and ModuleDataAccessB contain pointers to data areas of the data provider via links. These pointers are initialized during the transition from SAFEOP to OP. ModuleDataAccessA cyclically sets BitOut1 according to Bit1. ModuleDataAccessB accordingly, with BitOut2 / Bit2. Both increment ValueOut through multiplication of the internal counter with the value ValueIn.

It is important that all modules are executed in the same context, since there is no synchronization mechanism via data pointers. The order of execution is defined by the **Sort Order** on the **Context** tab of the respective module. This is provided as parameter **SortOrder** in the SmartPointer (m_SpCyclicCaller), which also includes the ObjectID.

15.9 Sample11: module communication: PLC module invokes method of C-module

This article describes the implementation:

- of a C++ module [> 279] that provides methods for controlling a state machine.
 Follow this step-by-step introduction with regard to the implementation of a C++ module that provides an interface to the state machine.
- of a PLC module [> 294] for calling the function of the C++ module. The fact that no hard-coded link exists between the PLC and the C++ module is a great advantage. Instead, the called C++ instance can be configured in the system manager. Follow this step-by-step introduction with regard to the implementation of a PLC project that calls methods from a C++ module.

Download

Get the source code for this sample:

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.

 \Rightarrow The sample is ready for operation.

15.9.1 TwinCAT 3 C++ module providing methods

This article describes the creation of a TwinCAT 3 C++ module that provides an interface with several methods that can be called by a PLC and also by other C++ modules.

The idea is to create a simple state machine in C++ that can be started and stopped from the outside by other modules, but which also allows the setting or reading of the particular state of the C++ state machine.

Two further articles use the result from this C++ state machine.

- Calling the function from the PLC logic [278] i.e. affecting the C++ code from the PLC.
- <u>Calling the function from the C++ logic [) 306]</u> i.e. interaction between two C++ modules.

This article describes:

- Step 1: create a new TwinCAT 3 project [> 279].
- Step 2: <u>create a new TwinCAT 3 C++ driver [▶ 280]</u>.
- Step 3: create a new TwinCAT 3 interface.
- Step 4: <u>add methods to the interface [▶ 283]</u>.
- Step 5: add a new interface to the module.
- Step 6: start the TwinCAT TMC Code Generator to generate code for the module class description
 [> 288].
- Step 7: implement the member variables and the constructor.
- Step 8: implement methods.
- Step 9: implement cyclic update.
- Step 10: <u>compile code [▶ 291]</u>
- Step 11: create an instance of the C++ module.
- Step 12: done. Check the results.

Step 1: create a new TwinCAT 3 project

First of all, create a TwinCAT project as usual.

New Project					8 X
▷ Recent		.NET Framework 4.5	* Sort by: Default	· # E	Search Installed Templates (Ctrl+E)
 Installed Templates Visual Basic Visual C# Visual C++ Visual F# SQL Server EtherCAT AP Pi Other Project T TwinCAT Meas TwinCAT Project Samples 	ypes urement	TwinCAT X	'AE Project (XML format)	TwinCAT Project	Type: TwinCAT Project TwinCAT XAE SystemManager Configuration
Name:	TwinCAT Project1				P
Location:	C:\temp\			T	Browse
Solution name:	TwinCAT Project1				 Create directory for solution Add to source control
					OK Cancel

Step 2: create a new TwinCAT 3 C++ driver

1. Right-click on C++ and Add New Item...

2. Select the template TwinCAT Driver Project and enter a driver name, "StateMachineDrv" in this sample. Click on **Add** to continue.

Add New Item - Tw	vinCAT Project1						8 23
▲ Installed		Sort by:	Default	• II 🗄			Search Installed Templates (Ctrl+E)
TwinCAT C++	Driver	S/C++	TwinCAT Driver Project			TwinCAT C++ Driver	Type: TwinCAT C++ Driver Creates a TwinCAT driver project.
v Online		S/C++	TwinCAT Static Library Pr	oject		TwinCAT C++ Driver	creates a rwines r unverproject.
					_		
					se		
Name:	StateMachineDr	/					
Location:	C:\temp\TwinCA	AT Projec	t1\TwinCAT Project1\			•	Browse
							Add Cancel

- 3. Select a template to be used for this new driver. In this sample "TwinCAT Module Class with Cyclic IO" is selected, since the internal counter of the state machine is available for assigning to the IO.
- 4. Click on **Add** to continue.

TwinCAT C++ Module

5. Specify a name for the new class in the C++ driver "StateMachineDrv". The names of the module class and the header and source files are derived from the specified "Short Name".

6. Click on **OK** to continue.

TwinCAT Class Wizard	
	winCAT Class Wizard
Short name	StateMachineModule
Class name	CStateMachineModule
Header file name	StateMachineModule.h
Source file name	StateMachineModule.cpp
	Cancel OK

⇒ The wizard then creates a C++ project, which can be compiled error-free.

Step 3: create a new TwinCAT 3 interface

NOTE

Name conflict

A name collision can occur if the driver is used in combination with a PLC module. Do not use any of the keywords that are reserved for the PLC as names.

1. Start the TMC editor by double-clicking on **StateMachineDrv.tmc**.

- 2. Select **Data Types** within the TMC editor.
- 3. Add a new interface by clicking on Add a new interface
 - ⇒ A new entry **IInterface1** is then listed.
- 4. Open **Interface1** by double-clicking in order to change the properties of the interface.
- 5. Enter a meaningful name in this sample "IStateMachine".

 \Rightarrow The interface has been created.

Step 4: add methods to the interface

1. Click on **Edit Methods...** to get a list of the methods of this interface: Click on the + button to create a new default method, Method1.

2. Replace the default name Method1 by a more meaningful name, in this sample "Start".

▲ Image: TMC ▲ Data Types ▲ → IStateMachine	M Edit the properties of the method.

	Select HRESULT Description Normal Type • Type Information • Name HRESULT Namespace • Guid {18071995-0000-0000-0000-00000000019} Resolve Type						
	Define the parameters of the method						
	4 − ↓ ↑						
	Name Type State INT	Description Default Value					

- \Rightarrow The new parameter, Parameter1, is generated by default as **Normal Type INT**.
- 6. Click on the name "Parameter1" and change the name in the edit box to "State".
- 7. After Start, Stop and SetState have been defined, define a further method.
- 8. Rename it "GetState".
- 9. Add a parameter and name it "pState" (which is conceived to become a pointer later on).
- 10. Change Normal Type to Is Pointer.

 ▲ TMC ▲ Data Types ▲ → IStateMachine 	M Edit the properties of the method.

Data Areas	HRESULT	SetState	
Data Pointers	HRESULT	GetState	
⊳ <u> </u> Interface Pointers Poployment			

Step 5: add a new interface to the module

- 1. Select the module that is to be extended by the new interface in this case select the destination **Modules->CStateMachineModule**.
- 2. Extend the list of implemented interfaces by a new interface with **Add a new interface to the module** by clicking on the **+** button.

3. All available interfaces are listed - select the new interface IStateMachine and end with OK.

Name	Guid	Specification
IStateMachine (local)	{9ff4c3fe-4a6b-4a97-8f97-1e5b15cb1bb5}	Interface
ITcAppServices	{08500102-0000-0000-e000-00000000064}	Interface

Show hidden data ty	pes	OK Cancel

⇒ The new interface IStateMachine is part of the module description.

Step 6: Start the TwinCAT TMC Code Generator

1. In order to generate the C/C++ code on the basis of this module, right-click in the C/C++ project and then select the **TwinCAT TMC Code Generator**.

 ⇒ The module StateMachineModule.cpp now contains the new interfaces CModule1: Start() CModule1: Stop() CModule1: SetState(SHORT State) CModule1: GetState(SHORT* pState).

Step 7: implementation of the member variables and the constructor

Add the member variables to the header file StateMachineModule.h.

Solution Explorer	StateMachineModule.h 🗢 🗙
C O 🟠 To - 🗊 🗈 🔸 🔎 🔂	(Global Scope)
Search Solution Explorer (Ctrl+ü)	<pre>HRESULT AddModuleToCaller();</pre>
 Solution 'TwinCAT Project PLC calling C-Me TwinCAT Project PLC calling C-Method SYSTEM MOTION PLC PLC-calling-statemachine SAFETY C++ 	<pre>VOID RemoveModuleFromCaller(); ///<autogeneratedcontent id="Members"> TcTraceLevel m_TraceLevelMax; StateMachineModuleParameter m_Parameter; StateMachineModuleInputs m_Inputs; StateMachineModuleOutputs m_Outputs; ITcCyclicCallerInfoPtr m_spCyclicCaller; ///</autogeneratedcontent></pre>
 StateMachineDrv StateMachineDrv Project StateMachineDrv Project Statemal Dependencies Header Files Resource.h StateMachineDrvClassF StateMachineDrvInterfa StateMachineDrvService StateMachineModule.h 	<pre>// Tracing CTcTrace m_Trace; // TODO: Custom variable UINT m_counter; BOOL m_bRun; SHORT m_State; };</pre>
⊡ StateMachineWoddle.n	100 % - 4

Step 8: implementation of methods

Implement the code for the four methods in the StateMachineModule.cpp:

```
///<AutoGeneratedContent id="ImplementationOf IStateMachine">

HRESULT CModule1::Start()

 {
     HRESULT hr = S_OK;
     m bRun = TRUE;
     return hr;
 }
□ HRESULT CModule1::Stop()
 {
     HRESULT hr = S OK;
     m bRun = FALSE;
     return hr;
 }
□ HRESULT CModule1::SetState(SHORT State)
 {
     HRESULT hr = S_OK;
     m State = State;
     return hr;
 }
HRESULT CModule1::GetState(SHORT* pState)
 {
     HRESULT hr = S OK;
     *pState = m State;
     return hr;
 }
 ///</AutoGeneratedContent>
```

Step 9: implementation of a cyclic update

The C++ module instance is cyclically called, even if the internal state machine is in Stop mode.

- If the state machine is not to be executed, the m_bRun Flag signals that the code execution of the internal state machine is to be quit.
- If the state is "1" the counter must be incremented.
- If the state is "2" the counter must be decremented.
- The resulting counter value is assigned to Value, which is a member variable of the logical output of the data area. This can be assigned to the physical IO level or to other data areas of other modules at a later time.

Step 10: compilation of code

1. Following the implementation of all interfaces, compile the code by right-clicking on the state machine and selecting **Build**.

2. Repeat the compilation and optimize your code until the result looks like this:

⇒

Output			
Show output from:	Build	- 🛛 🖓 🛛 🖧 🛼 🗐 😨	
1> Touching "C	:\TwinCAT3\SDK_products\	<pre>winCAT RT (x86)\Debug\StateMachineDrv\St</pre>	ateMachineDrv.lastbuildstate".

15.9.2 Calling methods offered by another module via PLC

This article describes how a PLC can call a method that is provided by another module; in this case: the previously defined C++ module.

- Step 1: check the available interfaces.
- Step 2: create a new PLC project.
- Step 3: <u>add a new FB state machine [▶ 295]</u>(which acts as the proxy that calls the C++ module methods).
- Step 4: clean up the function block interface.
- Step 5: add the FB methods "FB init" and "exit". [> 299]
- Step 6: implement the FB methods.
- Step 7: call the FB state machine in the PLC. [> 303]
- Step 8: compile the PLC code.
- Step 9: link the PLC FB with the C++ instance.
- Step 10: observe the execution of both modules, PLC and C++.

Step 1: check available interfaces

Option 1:

- 1. Navigate to the C++ module instance.
- 2. Select the Interfaces tab.
- ⇒ The IStateMachine interface is in the list with its specific IID (Interface ID).

Option 2:

- 1. Navigate to System.
- 2. Select the Interfaces tab.

⇒ The IStateMachine interface is in the list with its specific IID (Interface ID).

Step 2: creating a new PLC project

A standard PLC project called "PLC-calling state machine" is created.

- 1. Right-click on the PLC node.
- 2. Select Standard PLC Project.
- 3. Adapt the name.

Solution Explorer			g C-Method 😐 🗙 StateMach	ineModule.cpp	StateMachineModule.h

3. Define a new FB to be created, which will later act as a proxy for calling C++ classes: Enter the name of the new FB: "FB_StateMachine".

4. Select Function Block, then Implements and then click on the ... button.

BECKHOFF

Create a new POU (Program Organization Unit)
Name
ivanc.
FB_StateMachine
Type:
© <u>P</u> rogram
Function <u>B</u> lock
E <u>x</u> tends:
☑ Implements:
Method implementation language:
Structured Text (ST)
© <u>F</u> unction
Return type:
Implementation language:
Structured Text (ST)
Open Cancel

5. Select the interface either via the **Text Search** tab or the **Categories** tab by deselecting **Structured View**.

nterfaces	Name	Type	Origin	
	⊶ IStateMachine	INTERFACE		
	- IICADI	INTERFALE		
	∽ ITcAppServices	INTERFACE		
	∽ ITcAppServices2	INTERFACE		
	᠃ ITcBaseClassFactory	INTERFACE		
	→ ITcCyclic	INTERFACE		
	→ ITcCyclicCaller	INTERFACE		
	᠃ ITcEthernetAdapter	INTERFACE		
	→ ITcFileAccess	INTERFACE		
	∽ ITcIoCyclic	INTERFACE

	→ ITcNcDcConvert2	INTERFACE		
	→ ITcNcTrafo	INTERFACE		

6. Select IStateMachine and click on OK.

- \Rightarrow The IStateMachine interface is then listed as the interface to be implemented.
- 7. Select Structured Text (ST) as Method implementation language.
- 8. Select Structured Text (ST) as implementation language.
- 9. End this dialog with **Open**.

Add POU	×					
Create a new PC	DU (Program Organization Unit)					
Name:						
FB_StateMachine						
Type:						
Program						
Function Block						
Extends:						
☑ Implements:	IStateMachine					
Method implement	Method implementation language:					
Structured Text (S	T) 🔻					
© Function						
Return type:						
Implementation language	2:					
Structured Text (ST)	•					
	Open Cancel					

⇒ You have successfully added the FB.

Step 4: Customizing the function block interface

As a result of creating an FB that implements the IStateMachine interface, the wizard will create an FB with corresponding methods.

The FB_StateMachine makes 4 methods available:

- GetState
- SetState
- Start
- Stop
- 1. Delete Implements IStateMachine. Since the function block should act as proxy, it does not implement the interface itself. Therefore, it can be deleted.
- 2. Delete the methods TcAddRef, TcQueryInterface and TcRelease. They are not required for a proxy function block.

⇒ The result is:

Step 5: add FB methods FB_init (Constructor) and FB_exit (Destructor)

1. Right-click on FB_StateMachine in the tree and select Add / Method...

2. Add the methods FB_exit and FB_init - both with Structured Text (ST) as the implementation language. They are available as predefined name.

Add Method
문화 Create a new method
Name:
METH
FB_exit FB_init FB_reinit
Implementation language:
Structured Text (ST)
Access specifier:
Open Cancel

3. Exit the dialog in each case by clicking on **Open**.

 \Rightarrow In the end, all required methods are available:

Step 6: implement FB methods

Now all methods have to be filled with code.

NOTE

Missing attributes lead to unexpected behavior

Attribute statements in brackets represent code to be added.

More precise information on the attributes is given in the PLC documentation.

1. Implement the variable declarations of the FB_Statemachine. The FB itself does not require cyclically executable code.

2. Implement the variable declarations and the code area of the method FB_exit.

3. Implement the variable declarations and the code area of the method FB_init.

4. Implement the variable declaration and the code area of the method GetState (the generated pragmas can be deleted as they are not required for a proxy FB).

5. Implement the variable declaration and the code area of the method SetState (the generated pragmas can be deleted as they are not required for a proxy FB).

6. Implement the variable declaration and the code area of the method Start (the generated pragmas can be deleted as they are not required for a proxy FB).

FB_StateMachine.Start + × FB_StateMachine.SetState* FB_StateMachine.GetState* 1 METHOD Start : HRESULT 2 IF (ipStateMachine <> 0) THEN 1 2 Start:= ipStateMachine.Start(); 3 END IF

7. Implement the variable declaration and the code area of the method Stop (the generated pragmas can be deleted as they are not required for a proxy FB).

⇒ The implementation of the FB_StateMachine, which acts as the proxy for calling the C++ module instance, is completed.

Step 7: call FB in the PLC

The FB_StateMachine is now called in the POU MAIN.

This simple sample acts as follows:

- Cyclic incrementation of a PLC counter nCounter
- If nCounter = 500, the C++ StateMachine is started with the state "1" in order to increment its internal C ++ counter. Then read the state of C++ using GetState().
- If nCounter = 1000, the C++ state machine is set to the state "2" in order to decrement its internal C++ counter. Then read the state of C++ using GetState().
- If nCounter = 1500, the C++ StateMachine is stopped. The PLC nCounter is also set to "0", so that everything starts again from the beginning.

```
MAIN 😐 🗙 TwinCAT Project PLC calling C-Method
                                                   FB_StateMachine.GetState
          PROGRAM MAIN
     1
     2
          VAR
=
     3
              nCounter
                               : INT;
     4
              nCurrentState : INT;
     5
              fbStateMachine : FB StateMachine;
     6
          END VAR
     7
     1
          nCounter := nCounter +1;
     2
     з
          IF nCounter = 500 THEN
-
              fbStateMachine.SetState(1);
     4
     5
              fbStateMachine.GetState(ADR(nCurrentState));
     6
              fbStateMachine.Start();
     7
          END IF
     8
     9
          IF nCounter = 1000 THEN
-
    10
              fbStateMachine.SetState(2);
    11
              fbStateMachine.GetState (ADR (nCurrentState));
    12
          END IF
    13
    14
          IF nCounter = 1500 THEN
15
              fbStateMachine.Stop();
    16
              nCounter := 0;
    17
          END IF
```

Step 8: compile PLC code

1. Right-click on the PLC project and click on **Build**.

⇒ The compilation result shows "1 succeeded - 0 failed".

```
      Output

      Show output from:
      Build
      Build</th
```

Step 9: link PLC FB with C++ instance

The benefits of all previous steps now become apparent:

The PLC FB FB_StateMachine can be configured with regard to linking with every instance of the C++ module StateMachine. This is a very flexible and powerful method of connecting PLC and C++ modules on the machine with each other.

- 1. Navigate to the instance of the PLC module in the left-hand tree and select the **Symbol Initialization** tab on the right-hand side.
 - ⇒ All instances of FB_StateMachine are listed; in this sample we have only defined one FB instance in POU MAIN.

2. Select the drop-down field **Value** and then the C++ module instance that is to be linked to the FB instance.

 \Rightarrow PLC and C++ module are connected to each other.

Step 10: observe the execution of the two modules, PLC and C++

Following the activation of the TwinCAT configuration and the downloading and starting of the PLC code, the execution of the two codes, PLC and C++, is simple to observe:

- 1. After the Login and Start of the PLC project, the editor is already in online mode (left-hand side see following illustration).
- 2. In order to be able to access online variables of the C++ module, <u>activate the C++ debugging [▶ 72]</u> and follow the steps in the quick start in order to start the debugging (right-hand side of the following illustration).

15.10 Sample11a: Module communication: C module calls a method of another C module

This article describes how TC3 C++ modules could communicate via method calls. The method protects the data with a critical section thus the access could be initiated from different contexts / tasks.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The project contains three modules:

- The instance of the CModuleDataProvider class hosts the data and protects against access via the Retrieve and Store methods through a Critical Section.
- The instance of the module class CModuleDataRead reads the data from the DataProvider by calling the Retrieve method.
- The instance of the module class CModuleDataWrite writes the data from the DataProvider by calling the Store method.

The read/write instances are configured for access to the DataProvider instance, which can be seen in the **Interface Pointer** menu on the instance configuration.

The context (task), in which the instances are to be executed, can also be configured there. In this sample two tasks are used, TaskRead and TaskWrite.

The DataWriteCounterModul parameters of CModuleDataWrite and DataReadCounterModulo (CModuleDataRead) enable the moment to be determined, at which the module instances initiate the access.

CriticalSections are described in the SDK in TcRtInterfaces.h and are therefore intended for the real-time context.

15.11 Sample12: module communication: Using IO mapping

This article describes how two TC3 C++ modules could communicate via the usual IO mapping of TwinCAT 3: Two instances are linked via IO mapping and access the variable value periodically.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.

- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Activate the configuration by clicking on \mathbf{k} .
- \Rightarrow The sample is ready for operation.

Description

Both instances are realized by means of a module class ModuleInToOut: The class cyclically copies its input data area Value to its output data area Value.

The Front instance acts as front end for the user. An input Value is transferred to the output Value via the method cycleupdate(). This output value of Front is assigned (linked) to the input "value" of the Back instance.

The Back instance copies the input Value to its output Value, which can be monitored by the user (see the following quick start steps to start debugging: <u>Debugging a TwinCAT 3 C++ project</u> [▶ 74])

Ultimately, the user can define the input value of the Front instance and observe the output value of Back.

15.12 Sample13: Module communication: C-module calls PLC methods

This article describes how a TwinCAT C++ module calls a methods of a PLC function block via the TcCOM interface.

Download

System requirements: TwinCAT 3.1 Build 4020

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

This sample provides for communication from a C++ module to a function block of a PLC by means of method call. To this end a TcCOM interface is defined that is offered by the PLC and used by the C++ module.

The PLC page as a provider in the process corresponds to the corresponding project of the <u>TcCOM Sample</u> <u>01</u> [\blacktriangleright _324], where an PLC is considered after PLC communication. Here a Caller is now provided in C++, which uses the same interface.

The PLC page adopted by <u>TcCOM Sample 01 [> 324]</u>. The function block registered there as TcCOM module offers the object ID allocated to it as an output variable.

It is the C++ module's task to make the offered interface of this function block accessible.

✓ A C++ project with a Cycle IO module is assumed.

1. In the TMC editor, create an interface pointer of the type I_Calculation with the name Calculationn). Later access occurs via this.

CppCaller.tmc [TMC Editor] 🛛 😕 🗙								
S 🔸 🕥								
 TMC Module Classes Data Types Modules Kon CCppCallerModule 	-C Edit the properties of the Interface Pointer.							
= CoppealerModule = Implemented Interfaces	General properties							
 Parameters Data Areas Data Pointers 	Name Calculation							
▲ ☐ Interface Pointers	Choose interface type							
CyclicCaller Calculation Deployment	Select I_Calculation (local)							
	Namespace							
	Guid {4d0c9030-560a-45f3-897b-05120422b093}							
	Configure the parameter ID User defined •							
	Unique ID Value #x00000002 Generate ID							
	Constant Name PID_CppCallerModuleCalculation							
	Optional interface pointer settings							
	Comment							
	Context ID 1 -							
	Disable code generation							

2. The Data Area Inputs have already been created by the module wizard with the type Input-Destination. Here in the TMC editor you create an input of the type OTCID with the name oidProvider, via which the Object ID will be linked from the PLC later.

CppCaller.tmc [TMC Editor] 👒 🗙	
C 🗚 📀	
 TMC Module Classes Data Types Modules 	Edit the properties of the Symbol.
CCppCallerModule CppCallerModule	General properties

	Guid {18071995-0000-0000-0000000000000000000000000

3. All other symbols are irrelevant for the sample and can be deleted.

⇒ The TMC-Code-Generator prepares the code accordingly. In the header of the module some variables are created in order to carry out the methods calls later.

 ▲ See C++ ▲ CppCaller ▲ CppCaller Project ▶ Sec CppCaller Project ▶ Sec CppCaller Project ▶ Sec CppCaller Project ▶ CppCallerClassFactory.h ▶ CppCallerInterfaces.h ▶ CppCallerModule.h 	CppCallerModuleInputs m_Inputs; ITcCyclicCallerInfoPtr m_spCyclicCaller; I_CalculationPtr m_spCalculation; /// // TODO: Custom variable SHORT m_a; SHORT m_resAdd; SHORT m_resSub;
CppCallerServices.h Resource.h TCPch.h References	<pre>};</pre>

In the actual code of the module in CycleUpdate() the interface pointer is set using the object ID transmitted from the PLC. It is important that this happens in the CycleUpdate() and thus in real-time context, since the PLC must first provide the function block. When this has taken place once, the methods can be called.

In addition, as can be seen above, the interface pointer is cleared when the program shuts down. This happens in the SetObjStateOS method.

- 4. Now build the C++ project.
- 5. Create an instance of the module.

6. Connect the input of the C++ module to the output of the PLC.

⇒ The project can be started. When the PLC is running, the OID is made known through the mapping to the C++ instance. Once this has occurred, the method can be called.

15.13 Sample19: Synchronous File Access

This article describes how to implement a TC3 C++ module which accesses files on the hard disk within the startup of a module, thus within the real-time environment.

Download

Get the source code for this sample

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project**
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

The whole source code, which is not automatically generated by the wizard, is identified with the comment start flag "//sample code" and the comment end flag "//sample code end". In this way you can search for these strings in the files, in order to get an idea of the details.

Description

This sample describes file access via the TwinCAT interface ITCFileAccess. The access is synchronous and can be used for reading a configuration during startup of a module, for example.

The sample contains a C++ module, TcFileTestDrv, with an instance of this module, TcFileTestDrv_Obj1. In this sample the file access takes place during the transition PREOP to SAFEOP, i.e. in the SetObjStatePS() method.

Helper methods encapsulate file handling.

First, general file information and a directory list is printed to the log window of TwinCAT 3. Then, a file *%TC_TARGETPATH%DefaultConfig.xml* (normally *C:\TwinCAT\3.x\Target\DefaultConfig.xml*) is copied to %TC_TARGETPATH%DefaultConfig.xml.bak.

For access to the log entries, see the **Error List** tab in the TwinCAT 3 output window. The amount of information can be set by changing the variable TraceLevelMax in the instance TcFileTestDrv_obj1 in **Parameter (Init)** tab.

15.14 Sample20: FileIO-Write

This article describes the implementation of TC3 C++ modules, which write (process) values to a file.

The writing of the file is triggered by a deterministic cycle - the execution of File IO is decoupled (asynchronous), i.e.: the deterministic cycle continues to run and is not hindered by writing to the file.

Download

Here you can access the source code for this sample

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project**
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample includes an instance of TcAsyncWritingModule, which writes data to the file AsyncTest.txt in directory BOOTPRJPATH (usually C:\TwinCAT\3.x\Boot).

TcAsyncBufferWritingModule has two buffers (m_Buffer1, m_Buffer2), which are alternately filled with current data. The member variable m_pBufferFill points to the buffer that is currently to be filled. Once a buffer is filled, the member variable m_pBufferWrite is set such that it points to the full buffer.

These data are written to a file with the aid of TcFsmFileWriter.

Note that the file has no human-readable content, such as ASCII characters; in this sample, but binary data are written to the file.

15.15 Sample20a: FileIO-Cyclic Read / Write

This article is a more comprehensive sample than S20 and S19. It demonstrates cyclic read and/or write access to files from a TC3-C++ module.

Download

Here you can access the source code for this sample

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample describes how to access files for reading and/or writing using the CycleUpdate method, i.e. in a cyclic manner.

This sample contains the following projects and module instances.

- A static library (TcAsyncFileIo) offers the file access. The code for the file access can be shared, therefore this code is located in a static library that is used by the driver projects.
- A driver (TcAsyncBufferReadingDrv) provides two instances:
 - ReadingModule: uses the static library to read the AsyncTest.txt file.
 - WriteDetectModule: Detects write operations and initiates read operations.
- A driver (TcAsyncBufferWritingDrv) provides one instance:
 - WriteModule: uses the static library to write to the AsyncTest.txt file.

On starting the sample, the writing module begins to write data to the file located in the boot project path (normally C:*TwinCAT\3.x\Boot\AsyncTest.txt*). The input variable bDisableWriting can be used to prevent writing.

The objects are connected to one another: once the writing is complete, the WritingModule triggers the DetectModule of TcAsyncBufferReadingDrv. As a result of this, the ReadingModule initiates a reading procedure.

Observe the nBytesWritten / nBytesRead output variables of the WritingModule / ReadingModule. Over and above that, protocol messages are generated at verbose level. As before, these can be configured with the help of the TraceLevelMax parameter of the module.

- A driver (TcAsyncFileFindDrv) provides one instance
 - FileFindModule: list the files of a directory with the help of the static library.

Initiate the action with the help of the input variable bExecute. The FilePath parameter contains the directory whose files are to be listed (default value: *c*: *TwinCAT*\3. 1\Boot*).

Observe the sequence tracking (verbose protocol level) with regard to the list of files found.

Understanding the sample

The project TcAsyncFileIO contains various classes in a static library. This library is used by driver projects for reading and writing.

Each class is intended for a file access operation such as Open / Read / Write / List / Close / Since execution takes place in a cyclic real-time context, each operation has a status, and the class encapsulates this state machine.

As an entry point for understanding the file access, begin with the classes TcFsmFileReader and TcFsmFileWriter.

If too many history tracking messages occur, which hamper understanding of the sample, you can disable modules!

15.16 Sample22: Automation Device Driver (ADD): Access DPRAM

This article describes how to implement a TC3 C++ driver which acts as a TwinCAT Automation Device Driver (ADD) accessing the DPRAM.

Download

Here you can access the source code for this sample.

NOTE

Configurations details

Read the configurations details below prior to the activation.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Note the actions listed on this page under **Configuration**.
- 6. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

This sample is intended to switch the Link Detect bit of the network adapter (i.e. of an CX5010) cyclically on and off.

The C++ module is connected to the NOV/DP-RAM device via the PciDeviceAdi interface pointer of the C++ module.

Configuration

To make the sample work, the hardware addresses must be configured to match your own hardware. Check the PCI configuration:

15.17 Sample23: Structured Exception Handling (SEH)

This article describes the use of Structured Exception Handling (SEH) on the basis of five variants.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project

- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛 .
- \Rightarrow The sample is ready for operation.

Description

The sample contains five variants that demonstrate the use of SEH in TwinCAT C++:

- 1. Exception in the case of a NULL-pointer access
- 2. Exception in the case of a NULL-pointer access with a filter
- 3. Exception with Finally
- 4. A customer-specific structured exception
- 5. Exception with Continue block

F

All of these variants can be selected via a drop-down box at the instance of the C++:

Solution Explorer 🛛 🝷 🕂 🗙	TwinCA	AT SEHProject \times	SEHModule.cpp

Understanding the sample

BECKHOFF

The selection in the drop-down box is an enumeration that is used in the CycleUpdate() of the module for selecting a case (switch case). As a result the variants can be considered independently of one another here:

- Exception in the case of a NULL-pointer access Here, a PBYTE is created as NULL and used afterwards, which leads to an exception. This is intercepted by the TcTry{} block and an output generated.
- Exception in the case of a NULL-pointer access with a filter This variant also accesses a NULL-pointer, but in TcExcept{} it uses a method, FilterException(), that is also defined in the module. Reactions take place to different exceptions within the method; in this case a message is merely output.
- Exception with Finally
 A NULL-pointer access takes place once again here, but this time a TcFinally{} block is executed in
 every case.

- 4. A customer-specific structured exception By means of TcRaiseException() an exception is generated that is intercepted and processed by the FilterException() method. Since this is an exception defined in the module, the FilterException() method additionally outputs a further (specific) message.
- 5. Exception with Continue block Here too, a NULL-pointer access takes place once again with TcExcept{}; however, this time the exception is forwarded after handling in the FilterException() method so that the further TcExcept{} also handles the exception.

15.18 Sample24: Semaphores

This article describes the use of semaphores.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project ...**.
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Note the actions listed on this page under Configuration.
- 6. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample contains a "LargeObjPool", which contains two "LargeObj" for processing by the "LargeObjProcessors".

The "LargeObjProcessors" are controlled by different tasks with different priorities that run on different CPU cores. In the info data area they count how often processing could be carried out ("Info->ProcessedObjCount") and how often no object was available for processing within the delay time ("Info->TakeObjFailedCount").

Understanding the sample

The LargeObjPool is initialized in the PS transition by the InitPool() method with two LargeObj (defined by the parameter "ObjCount"). The pool essentially offers two methods, which are used by the "LargeObjProcessors":

- TakeObj () returns a LargeObj if one is available. Based on a semaphore, the system waits until a timeout occurs to see if an object is made available. The objects themselves are stored in a map. Access to the map is protected by a CriticalSection.
- ReturnObj () provides a processed object to the pool for further processing.

In its CycleUpdate() LargeObjProcessor uses TakeObj() from the pool to obtain a LargeObj for processing. If this is successful, processing is simulated via the help function ConsumeTime() before the LargeObj is returned to the pool via ReturnObj.

Processing of all LargeObj must be complete before the system can be shut down. This is achieved by the LargeObjPool informing the TwinCAT system via TcTryLockOpState() and TcReleaseOpState() that an object is being processed. As long as the stored counter is not 0, the TcCOM object "Pool" is reset and only shut down later by the Op->SafeOp transition.

15.19 Sample25: Static Library

This article describes the implementation and use of a module of a static TC3 C++ library.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample contains two projects – the DriverUsingStaticLib project uses the static content of the StaticLib project.

StaticLib:

On the one hand, StaticLib offers the function ComputeSomething in the StaticFunction.h/.cpp. On the other hand an interface ISampleInterface is defined (see TMCEditor) and implemented in the MultiplicationClass.

DriverUsingStaticLib:

In the CycleUpdate method of the ModuleUsingStaticLib, both the class and the function of StaticLib is used.

Understanding the sample

Follow the steps below to create and use a static library.

Manual recompilation

Note that Visual Studio does not automatically recompile the static library during driver development. Do that manually.

- ✓ During development of a C++ project use the TwinCAT Static Library Project template for creating a static library.
- ✓ For the following steps use the Edit dialog of VisualStudio, so that afterwards %(AdditionalIncludeDirectories) or %(AdditionalDependencies) is used.

1. In the driver add the directory of the static library to the compiler under Additional Include Directories.

DriverUsingStaticLib Property Pages		8			
Configuration: Active(Debug)	Platform: Active(TwinCAT RT (x86))	Configuration Manager			
Common Properties	Additional Include Directories	\$(ProjectDir)\StaticLib;%(AdditionalIncludeDirectories)			
Configuration Properties	Resolve #using References				
General	Debug Information Format	Program Database for Edit And Continue (/ZI)			
Debugging	Common Language RunTime Support				
VC++ Directories	Suppress Startup Banner	Yes (/nologo)			
⊿ C/C++	Warning Level	Level3 (/W3)			
General	Treat Warnings As Errors	No (/WX-)			
Optimization	Multi-processor Compilation	Yes (/MP)			
Preprocessor	Use Unicode For Assembler Listing				
Code Generation					
Language Precompiled Heade					
Output Files					
Browse Information					
Advanced					
Command Line					

2. Add this as an additional dependency for the linker in the driver, which uses the static library. Open the project properties of the driver and add the static library:

Untitled1 Property Pages		8 8
Configuration: Active(Release)	Platform: Active(TwinCAT	RT (x64)) Configuration Manager
▷ Common Properties ▲	Additional Dependencies	StaticProject.lib;%(AdditionalDependencies)
Configuration Properties	Ignore All Default Libraries	Yes (/NODEFAULTLIB)
General	Ignore Specific Default Libraries	
Debugging	Module Definition File	
VC++ Directories	Add Module to Assembly	
⊳ C/C++	Embed Managed Resource File	
⊿ Linker	Force Symbol References	
General	Delay Loaded Dlls	
Input	Assembly Link Resource	
Manifest File		
Debugging		
System		
Optimization		
Embedded IDL		

15.20 Sample26: Order of execution in a task

This article describes the determination of the task execution order if more than one module is assigned to a task.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample contains the SortOrder module, which is instanced twice. The sort order determines the execution order, which can be configured via the <u>TwinCAT Module Instance Configurator [} 146</u>].

For example, the CycleUpdate method tracks the object name and ID along with the sort order of this module. On the console window you can see the order of execution:

i) 32 05.09.2014 13:01:14 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder1' (0x01010010) w/ SortOrder150
i) 33 05.09.2014 13:01:14 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder2' (0x01010020) w/ SortOrder170
i) 34 05.09.2014 13:01:15 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder1' (0x01010010) w/ SortOrder150
i) 35 05.09.2014 13:01:15 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder1' (0x01010020) w/ SortOrder170
i) 36 05.09.2014 13:01:16 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder2' (0x01010020) w/ SortOrder170
i) 36 05.09.2014 13:01:16 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder1' (0x01010010) w/ SortOrder150
i) 37 05.09.2014 13:01:16 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder2' (0x01010020) w/ SortOrder150
i) 37 05.09.2014 13:01:16 343 ms | 'TCOM Server' (10): CSortOrderModule::CycleUpdate() I am 'SortOrder2' (0x01010020) w/ SortOrder150

In the sample, one instance is configured with Sort Order 150 and one with 170, while both instances are assigned to a task.

Understanding the sample

- ✓ A TcCOM C++ module with cyclic IO.
- 1. The module requires a context-based parameter Sort order of task, which will automatically select PID_Ctx_TaskSortOrder as name.

Note that the parameter must be an alias (specification) of data type UDINT:

▲ ♥ TMC ● Data Types ▲ Modules Modules	Edit the properties of the parameter.
CSortOrderModule	General properties
Parameters TraceLevelMax TaskSortOrderContext1Parameter Data Areas	Name TaskSortOrderContext1Parameter Specification Alias
⊿ 🛄 Inputs ⊳ 🔁 Symbols	Choose data type
 ▷ real Outputs □ Data Pointers □ Interface Pointers □ Deployment 	Select UDINT
	Configure the parameter ID Context based
	Select the property which should be taken from the given context Select the context I Value #x030020B0 Constant Name PID_Ctx_TaskSortOrder

- 2. Start the TMC Code Generator in order to obtain the standard implementation.
- 3. Since the code is modified in the next step, disable the code generation for this parameter now.

•,,	ptional parameter settings
→ 9 Implemented Interfaces → Parameters → TaskSortOrderContext1Parameter → Data Areas → Symbols → → Outputs → Data Protect	Size [Bits] x64 specific Comment x64 specific Context ID 1 Create symbol Create symbol Ø Disable code generation nue parameter Hide sub items Online parameter

4. Make sure you accept the changes before restarting the TMC Code Generator:

Take a look at the CPP module (SortOrderModule.cpp in the sample). The instance of the smart pointer of the cyclic caller includes information data, including a field for the sorting order. The parameter value is stored in this field.

5. In this sample the object name, ID and sort order are tracked cyclically:

```
// TODO: Add your cyclic code here
    m_counter+=m_Inputs.Value;
    m_Outputs.Value=m_counter;
    m_Trace.Log(tlAlways, FNAMEA "I am '%s' (0x%08x) w/ SortOrder %d ", this->TcGetObjectName(),
this->TcGetObjectId() , m spCyclicCaller.GetInfo()->sortOrder); //ADDED
```

- 6. The sorting order can also be transferred as the fourth parameter of the method ITcCyclicCaller::AddModule(), which is used in CModuleA::AddModuleToCaller().
- 7. Allocate a task with a **long cycle interval** (e.g. 1000 ms) to the instances of this module, in order to limit the tracking messages sent to the TwinCAT Engineering system.
- 8. Assign a different sorting order to each instance via the <u>TwinCAT Module Instance Configurator [146]</u>:

Object Context Parameter (Init) Data Are	a Interfaces Interface Pointer							
Context:	1	•						
Depend On:	Manual Config	•						
Need Call From Sync Mapping								
Data Areas:	Interfaces:							
0 'Inputs'								
V 1 'Outputs'								
Data Pointer:	Interface Pointer:							
Result:	J L							
ID Task	Name		Priority	Cycle Time (µs)	Task Port	Symbol Port	Sort Order	
1 02010010	▼ Task 1		1	1000000	350	350	150	-

15.21 Sample30: Timing Measurement

This article describes how to implement a TC3 C++ module which contains time measurement functionalities.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

This sample exclusively deals with time measurement such as

- Querying the task cycle time in nanoseconds
- · Querying the task priority
- Querying the time when the task cycle starts at intervals of 100 nanoseconds since January 1, 1601 (UTC)
- Querying the distributed clock time when the task cycle starts in nanoseconds since January 1, 2000
- Querying the time when the method is called at intervals of 100 nanoseconds since January 1, 1601 (UTC)

ITcTask interface [> 200]

15.22 Sample31: Functionblock TON in TwinCAT3 C++

This article describes the implementation of a behavior in C++, which is comparable with a TON function block of PLC / IEC-61131-3.

Source

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on Open Project
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Activate the configuration by clicking on 🔛 .
- \Rightarrow The sample is ready for operation.

Description

The behavior of this module is comparable with a module that was created with the Cyclic IO wizard. m_input.Value is added to m_Output.Value. As opposed to the Cyclic IO module, this module only adds m_input.Value to m_Output.Value if the defined time interval (1000 ms) has elapsed.

This is achieved with the help of a CTON class, which is comparable with the TON function block of PLC / 61131.

Understanding the sample

The C++ class CTON (TON.h/.cpp) provides the behavior of a TON function block of PLC / 61131. The Update() method is comparable with the rump of the function block, which has to be called regularly.

The Update() method contains two "in" parameters:

- IN1: Starts the timer switch on a rising edge and resets the timer switch on a falling edge.
- · PT: Describes the time to wait before Q is set.

And two "out" parameters:

- Q: TRUE if PT exhibited a rising edge seconds after IN.
- ET: Designates the elapsed time.

Beyond that, ITcTask must be provided to query the time base.

ITcTask interface [200]

15.23 Sample35: Access Ethernet

This article describes the implementation of TC3 C++ modules that communicate directly via an Ethernet card. The sample code queries a hardware address (MAC) from a communication partner by means of the cyclic transmission and reception of ARP packets.

The sample illustrates the direct access to the Ethernet card. The TF6311 TCP/UDP RT function provides access to Ethernet cards on the basis of TCP and UDP, so that an implementation of a network stack is not necessary on the basis of this sample.

Download

Here you can access the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project ...**.
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. Build->Build Solution).
- 5. Note the actions listed on this page under **Configuration**.
- 6. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample contains an instance of the TcEthernetSample module, which sends and received ARP packets for the purpose of determining the remote hardware address (MAC).

The CycleUpdate method implements a rudimentary state machine for sending ARP packets and waiting for a response with a timeout.

The sample uses two Ethernet components from TwinCAT:

- An ITcEthernetAdapter (instance name in the sample is m_spEthernetAdapter) represents an RT Ethernet adapter. It enables access to the adapter parameters such as hardware MAC address, link speed and link errors. It can be used to send Ethernet frames and enables a module instance to register itself as an ItcloEthProtocol via the registerProtocol method.
- 2. The **ITclOoEthProtocol** is extended by the sampling module, which ensures that a notification takes place via the **ITcEthernetAdapter** in case of Ethernet events.

Configuration

The downloaded TwinCAT project must be configured for execution in a network environment. Please carry out the following steps:

 $\checkmark\,$ This sample demands the use of the TwinCAT driver by the Ethernet card.

1. Start TcRteInstall.exe either from the XAE via the menu **TwinCAT->Show Realtime Ethernet** compatible devices... or from the hard disk on the XAR systems.

rnet Adapters	Update Lis
Installed and ready to use devices Local Area Connection 2 - TwinCAT-Intel PCI Ethernet Adapter (Gigabit)	Install
Compatible devices	Bind
🔮 Incompatible devices	Unbind
P Disabled devices	Enable
	Disable

- 2. You may have to install and activate the driver with the help of the buttons.
- 3. TwinCAT must know which Ethernet card is to be used. Open the project in **XAE** and click on **Select I**/ **O / Devices / Device 1 (RT-Ethernet Adapter)**.
- 4. Click on the Adapter tab and select the adapter with Search.
- TcEthernetSample_Obj1 must be configured. Open the instance window and set the following values: Parameter (Init): SenderIpAddress (IP of the network adapter configured in step 2) Parameter (Init): TargetIpAddress (IP of target host) Interface pointer: EthernetAdapter must point to I/O / Devices / Device 1 (RT-Ethernet Adapter).

15.24 Sample37: Archive data

The sample TcCOM object archive describes restoration and saving of an object state during initialization and deinitialization.

TwinCAT supports retain data

TwinCAT also supports retain data, in order to utilize the NOVRAM of a device to make data persistent.

Download

Get the source code for this sample.

- 1. Unpack the downloaded ZIP file.
- 2. Open the zip file that it contains in TwinCAT 3 by clicking on **Open Project**
- 3. Select your target system.
- 4. Build the sample on your local machine (e.g. **Build->Build Solution**).
- 5. Activate the configuration by clicking on 🔛.
- \Rightarrow The sample is ready for operation.

Description

The sample TcCOM object archive describes restoration and saving of an object state during initialization and deinitialization. The state of the sample class CmoduleArchive corresponds to the value of the counter CModuleArchive::m_counter.

During the transition from PREOP to SAFEOP, i.e. when calling the method CModuleArchive::SetObjStatePS(), the object archive server (ITComObjArchiveServer) is used to create an object archive for reading, which is accessed via the interface ITComArchiveOp. This interface provides overloads from operator>>() in order to read them in the archive.

During the transition from SAFEOP to PREOP, i.e. when calling the method CModuleArchive::SetObjStateSP(), the TCOM object archive server is used to create an object archive for writing, which is accessed via the interface ITComArchiveOp. This interface provides overloads from operator<<() in order to write them in the archive.

The interface used here was not developed for the <u>real-time context</u> [\blacktriangleright <u>44</u>], therefore the interface can only be used in the non-real-time context.

15.25 TcCOM samples

Modules can communicate between PLC and C++. The description therefore covers handling of C++ modules on the PLC side and handling of the PLC on the C++ side. The TcCOM samples for communication with the PLC are shown here.

The <u>TcCOM_Sample01 sample [\blacktriangleright 324]</u> shows how TcCOM communication can take place between two PLCs. In the process functionalities from one PLC are directly called up from the other PLC.

The <u>TcCOM_Sample02 sample [> 334]</u> shows how a PLC application can use functionalities of an existing instance of a TwinCAT C++ class. In this way separate algorithms written C++ (or Matlab) can be used easily in the PLC.

Although in the event of the use of an existing TwinCAT C++ driver the TwinCAT C++ license is required on the target system, a C++ development environment is not necessary on the target system or on the development computer.

The <u>TcCOM Sample03 sample [> 338]</u> shows how a PLC application uses functionalities of a TwinCAT C++ class by generating an instance of C++ class at the same time. In comparison to the previous sample this can offer increased flexibility.

15.25.1 TcCOM_Sample01_PicToPic

This sample describes a TcCOM communication between two PLCs.

Functionalities provided by a function block in the first PLC (also called "provider" in the sample), are called from the second PLC (also called "caller" in the sample). To this end it is not necessary for the function block or its program code to be copied. Instead the program works directly with the object instance in the first PLC.

Both PLCs must be in a TwinCAT runtime. In this connection a function block offers its methods system-wide via a globally defined interface and represents itself a TcCOM object. As is the case with every TcCOM object, such a function block is also listed at runtime in the **TcCOM Objects** node.

The procedure is explained in the following sub-chapters:

- Creating an FB in the first PLC that provides its functionality globally [325]
- Creating an FB in the second PLC that, as a simple proxy, also offers this functionality there [330]
- Execution of the sample project [) 332]

Downloading the sample: https://infosys.beckhoff.com/content/1033/TC3_C/Resources/ zip/9007201597787659.zip

Race Conditions in the case of Multi-Tasking (Multi-Threading) use

The function block that provides its functionality globally is instantiated in the first PLC. It can be used there like any function block. In addition, if it is used from a different PLC (or, for example, from a C++ module), make sure that the methods offered are thread-safe, as the various calls could take place simultaneously from different task contexts or mutually interrupt one another, depending on the system configuration. In this case the methods must not access member variables of the function block or global variables of the first PLC. If this should be absolutely necessary, prevent simultaneous access. Observe the function TestAndSet() from the Tc2_System library.

System requirements

TwinCAT version	Hardware	Libraries to be integrated
TwinCAT 3.1, Build 4020	x86, x64, ARM	Tc3_Module

15.25.1.1 Creating an FB which provides its functionality globally in the first PLC

 Create a PLC and prepare a new function block (FB) (here: FB_Calculation). Derive the function block from the TcBaseModuleRegistered class, so that an instance of this function block is not only available in the same PLC, but can also be reached from a second. Note: as an alternative you can also modify an FB in an existing PLC.

Program	
Function Block	
Extends:	TcBaseModuleRegistered
Implements:	
Access specifier:	
	v
Method implement	
Structured Text (S	si) •

- 2. The function block must offer its functionality by means of methods. These are defined in a global interface, whose type is system-wide and known regardless of programming language. To create a global interface, open the Context menu in the "Interface" tab of System Properties and choose the option "New".
 - ⇒ The TMC Editor opens, which provides you with support in creating a global interface.

3. Specify the name (here: I_Calculation) and append the desired methods. The interface is automatically derived from ITcUnknown, in order to fulfill the TwinCAT TcCOM module concept.

C 🗚 🕖				
TMC Data Types Calculation	—• Edit the properties of the Data Type.

	Name Type		Description	Defaul
	nin1 INT		Normal Type 🔻	
	nln2 INT		Normal Type 🔹	
	nRes INT		Is Reference 👻	
			•	

6. Now implement the I_Calculation interface in the FB_Calculation function block and append the c+ +_compatible attribute.

```
4 {attribute 'c++_compatible'}
5 FUNCTION_BLOCK FB_Calculation EXTENDS TcBaseModuleRegistered IMPLEMENTS I_Calculation
6
7 VAR
8 END_VAR
9
```

7. Choose the "Implement interfaces..." option in the Context menu of the function block in order to obtain the methods belonging to this interface.

8. Delete the two methods TcAddRef() and TcRelease() because the existing implementation of the base class should be used.

 Create the FB_reinit() method for the FB_Calculation function block and call the basic implementation. This ensures that the FB_reinit() method of the base class will run during the online change. This is imperative.

- 10. Implement the TcQueryInterface() method of the Interface ITcUnknown [▶ 205]. Via this method it is possible for other TwinCAT components to obtain an interface pointer to an instance of this function block and thus actuate method calls. The call for TcQueryInterface is successful if the function block or its base class provides the interface queried by means of iid (Interface ID). For this case the handed over interface pointer is allocated the address to the function block type-changed and the reference counter is incremented by means of TcAddRef().
- 11. Fill the two methods Addition() and Subtraction() with the corresponding code to produce the functionality: nRes := nIn1 + nIn2 and nRes := nIn1 nIn2
- 12. Add one or more instances of this function block in the MAIN program block or in a global variable list.
 - \Rightarrow The implementation in the first PLC is complete.

⇒ After compiling the PLC, the object ID of the TcCOM object which represents the instance of FB_Calculation is available as an outlet in the in the process image.

15.25.1.2 Creating an FB which likewise offers this functionality there as a simple proxy in the second PLC,

- 1. Create a PLC and append a new function block there.
 - ⇒ This proxy function block should provide the functionality which was programmed in the first PLC. It does this via an interface pointer of the type of the global interface I_Calculation.

2. In the declaration part of the function block declare as an output an interface pointer to the global interface which later provides the functionality outward.

 In addition create the object ID and the interface ID as local member variables. While the interface ID is already available via a global list, the object ID is assigned via a link in the process image.

4. Implement the PLC proxy function block. First add the GetInterfacePointer() method to the function block. The interface pointer is fetched to the specified interface of the specified TcCOM object with the help of the FW_ObjMgr_GetObjectInstance() function. This will only be executed if the object ID is valid and the interface pointer has not already been allocated. The object itself increments a reference counter.

FB_C	alculat	ionProxy.GetInterfacePointer 🖷 🕂 🗙
	1	METHOD GetInterfacePointer : HRESULT
	2	VAR
	3	END_VAR
	4	
8	1	IF nObjID <> 0 THEN
	2	IF (ip = 0) THEN // only get interface pointer if it is not already existing
	3	GetInterfacePointer := FW ObjMgr GetObjectInstance(oid:=nObjID, iid:=iid, pipUnk:=ADR(ip));
	4	ELSE
	5	GetInterfacePointer := E_HRESULTAdsErr.EXISTS;
	6	END_IF
	7	ELSE
	8	GetInterfacePointer := E_HRESULTAdsErr.INVALIDOBJID;
	9	END_IF
	10	

5. It is imperative to release the used reference again. To this end call the FW_SafeRelease() function in the FB_exit destructor of the function block.

FB_C	alculat	tionProxy.FB_exit 🛍 🕂 🔀 FB_CalculationProxy.GetInterfacePointer 🕯 👘
	1 2 3 4 5	<pre>{attribute 'hide'} METHOD FB_exit : BOOL VAR_INPUT bInCopyCode : BOOL; // if TRUE, the exit method is a END_VAR</pre>
	1 2 3	<pre>IF NOT bInCopyCode THEN // if not online change FW_SafeRelease(ADR(ip)); END_IF</pre>

- \Rightarrow This completes the implementation of the Proxy function block.
- Instantiate the Proxy function block FB_CalculationProxy in the application and call its method GetInterfacePointer() to get a valid interface pointer. An instance of the proxy block is declared in the application to call the methods provided via the

interface. The calls themselves take all place over the interface pointer defined as output of the function block. As is typical for pointers a prior null check must be made. Then the methods can be called directly, also via Intellisense.

MAI	N* ⊰	
	1	PROGRAM MAIN
	2	VAR
	з	fbCalc : FB_CalculationProxy;
	4	hrCalc : HRESULT;
	5	a : INT := 10;

	8	nDiff : INT; // a - b
	9	END_VAR
	10	
-	1	IF fbCalc.ip = 0 THEN
	2	<pre>hrCalc := fbCalc.GetInterfacePointer();</pre>
	з	END_IF
	4	IF fbCalc.ip <> 0 THEN
	5	<pre>hrCalc := fbCalc.ip.Addition(a,b,nSum);</pre>
	6	<pre>hrCalc := fbCalc.ip.Subtraction(a,b,nDiff);</pre>
	7	END IF
	8	

 \Rightarrow The sample is ready for testing.

Order irrelevant

The sequence in which the two PLCs start later is irrelevant in this implementation.

15.25.1.3 Execution of the sample project

- 1. Select the destination system and compile the project.
- 2. Enable the TwinCAT configuration and execute a log-in and start both PLCs.
 - ⇒ In the online view of the PLC application "Provider" the generated object ID of the C++ object can be seen in the PLC function block FB_Calculation. The project node "TcCOM Objects" keeps the generated object with its object ID and the selected name in its list.

15.25.2 TcCOM_Sample02_PlcToCpp

This example describes a TcCOM communication between PLC and C++. In this connection a PLC application uses functionalities of an existing instance of a TwinCAT C++ class. In this way own algorithms written in C++ can be used easily in the PLC.

Although in the event of the use of an existing TwinCAT C++ driver the TwinCAT C++ license is required on the destination system, a C++ development environment is not necessary on the destination system or on the development computer.

An already built C++ driver provides one or more classes whose interfaces are deposited in the TMC description file and thus are known in the PLC.

The procedure is explained in the following sub-chapters:

- 1. Instantiating a TwinCAT++ class as a TwinCAT TcCOM Object [334]
- 2. Creating an FB in the PLC, which as a simple wrapper offers the functionality of the C++ object [335]
- 3. Execution of the sample project [> 337]

Downloading the sample: https://infosys.beckhoff.com/content/1033/TC3_C/Resources/zip/2343048971.zip

System requirements

TwinCAT version	Hardware	Libraries to be Integrated
TwinCAT 3.1, Build 4020	x86, x64	Tc3_Module

15.25.2.1 Instantiating a TwinCAT++ class as a TwinCAT TcCOM Object

The TwinCAT C++ driver must be available on the target system. TwinCAT offers a deployment for this purpose, so that the components only have to be stored properly on the development computer.

The existing TwinCAT C++ driver as well as its TMC description file(s) are available as a driver archive. This archive (IncrementerCpp.zip) is unpacked in the following folder: *C:\TwinCAT\3.1\CustomConfig\Modules\IncrementerCpp*

The TwinCAT Deployment copies the file(s) later in the following folder upon the activation of a configuration in the target system:

C:\TwinCAT\3.1\Driver\AutoInstall\

- 1. Open a TwinCAT project or create a new project.
- 2. Add an instance of Class ClncrementModule in the solution under the node TcCOM Objects.

4	 SYSTEM iii License real-Time reasks 	Insert TcCc	om Object				
4	 Routes TcCOM Objects MOTION PLC PLC_CallingCppObj PLC_CallingCppObj Project PLC_CallingCppObj Instance 	Search: Type:	P Beckhoff Automa C++ Module Venu C++ Modules E C+- Modules	dor	Object1 (CIncrementModule)	Multiple:	OK Cancel
4	 SAFETY C++ I/O Devices 						t Instance Reload

In the <u>documentation for TwinCAT C++</u> [\blacktriangleright <u>11</u>] there is a detailed explanation on how C++ drivers for TwinCAT are created.

To create the above-mentioned driver archive, **Publish TwinCAT Modules** is selected from the C+ + project context as the last step in the creation of a driver.

15.25.2.2 Creating an FB in the PLC that, as a simple proxy, offers the functionality of the C++ object

 Create a PLC and append a new function block there. This Proxy function block should provide the functionality that was programmed in C++. It is able to do this via an interface pointer that was defined from the C++ class and is known in the PLC due to the TMC description file.

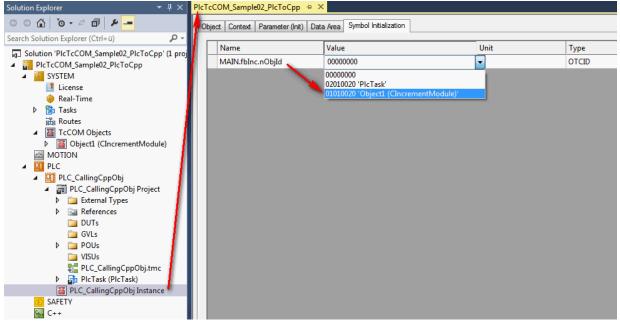

- 2. In the declaration part of the function block declare as an output an interface pointer to the interface which later provides the functionality outward.
- 3. Create the object ID and the interface ID as local member variables. While the interface ID is already available via a global list, the object ID is allocated via the TwinCAT symbol initialization. The TcInitSymbol attribute ensures that the variable appears in a list for external symbol initialization. The object ID of the created C++ object should be allocated.

FB_I	ncrem	entProxy 🛍 👍 🗙
	1	FUNCTION_BLOCK FB_IncrementProxy
	2	VAR_OUTPUT
	3	<pre>ip : IIncrement;</pre>
	4	END_VAR
	5	
	6	VAR
	7	{attribute 'TcInitSymbol'}
	8	{attribute 'displaymode':='hex'}
	9	nObjId : OTCID; // Instance configured to be retrieved
	10	<pre>iid : IID := TC_GLOBAL_IID_LIST.IID_IIncrement;</pre>
	11	hrInit : HRESULT;
	12	END_VAR
	13	
	1	

The object ID is displayed upon selection of the object under the TcCOM Objects node. Provided the TcInitSymbol attribute was used, the list of symbol initializations is located in the node of the PLC instance in the Symbol Initialization tab.

4. Here, assign an existing object ID to the symbol name of the variable by drop-down. This value is assigned when the PLC is downloaded so it can be defined prior to the PLC run-time. New symbol initializations or changes are accordingly entered with a new download of the PLC.

As an alternative, the passing of the object ID could also be implemented by means of process image linking as implemented in the first sample (<u>TcCOM_Sample01_PlcToPlc [}_324]</u>).

5. Implement the PLC Proxy function block. First the FB_init constructor method is added to the function block. For the case that it is no longer an OnlineChange but rather the initialization of the function block, the interface pointer to the specified

interface of the specified TcCOM object is obtained with the help of the function FW_ObjMgr_GetObjectInstance(). In this connection the object itself increments a reference counter.

6. It is imperative to release the used reference again. To this end call the FW_SafeRelease() function in the FB_exit destructor of the function block.

- ⇒ This completes the implementation of the Proxy function block.
- 7. Declare an instance of the Proxy function block to call the methods provided via the interface in the application.

The calls themselves take all place over the interface pointer defined as output of the function block. As is typical for pointers a prior null check must be made. Then the methods can be called directly, also via Intellisense.

MAIN	\ * -¤	×
	1	PROGRAM MAIN
-	2	VAR
	3	<pre>fbInc : FB_IncrementProxy;</pre>
	4	nValue : UDINT;
	5	END_VAR
	6	
-	1	IF fbInc.ip <> 0 THEN
	2	<pre>fbInc.ip.doIncrement(4, ADR(nValue));</pre>
	3	END_IF
	4	

 \Rightarrow The sample is ready for testing.

15.25.2.3 Execution of the sample project

- 1. Select the destination system and compile the project.
- 2. Enable the TwinCAT configuration and execute a log-in as well as starting the PLC.

⇒ In the online view of the PLC application the assigned object ID of the C++ object in the PLC Proxy function block can be seen. The interface pointer has a valid value and the method will be executed.

15.25.3 TcCOM_Sample03_PlcCreatesCpp

Just like Sample02, this sample describes a TcCOM communication between PLC and C++. To this end a PLC application uses functionalities of a TwinCAT C++ class. The required instances of this C++ class will be created by the PLC itself in this sample. In this way own algorithms written in C++ can be used easily in the PLC.

Although in the event of the use of an existing TwinCAT C++ driver the TwinCAT C++ license is required on the destination system, a C++ development environment is not necessary on the destination system or on the development computer.

An already built C++ driver provides one or more classes whose interfaces are deposited in the TMC description file and thus are known in the PLC.

The procedure is explained in the following sub-chapters:

- 1. Provision of a TwinCAT C++ driver and its classes [339]
- 2. Creating an FB in the PLC that creates the C++ object and offers its functionality [340]
- 3. Execution of the sample project [> 342]

Downloading the sample: https://infosys.beckhoff.com/content/1033/TC3_C/Resources/zip/2343051531.zip

System requirements

TwinCAT version	Hardware	Libraries to be integrated
TwinCAT 3.1, Build 4020	x86, x64	Tc3_Module

15.25.3.1 Provision of a TwinCAT C++ driver and its classes

The TwinCAT C++ driver must be available on the target system. TwinCAT offers a deployment for this purpose, so that the components only have to be stored properly on the development computer.

The existing TwinCAT C++ driver as well as its TMC description file(s) are available as a driver archive. This archive (IncrementerCpp.zip) is unpacked in the following folder: $C:TwinCAT \setminus 3.1 \setminus CustomConfig \setminus Modules \setminus IncrementerCpp \setminus$

The TwinCAT Deployment copies the file(s) later in the following folder upon the activation of a configuration in the target system:

C:\TwinCAT\3.1\Driver\AutoInstall\

- 1. Open a TwinCAT project or create a new project.
- 2. Select the required C++ driver in the solution under the **TcCOM Objects** node in the **Class Factories** tab.
- ⇒ This ensures that the driver is loaded on the target system when TwinCAT starts up. In addition this selection provides for the described deployment.

Creation of the C++ driver

In the <u>documentation for TwinCAT C++ [\blacktriangleright 11]</u> there is a detailed explanation on how C++ drivers for TwinCAT are created.

For Sample03 it is important to note that TwinCAT C++ drivers whose classes are supposed to be dynamically instantiated must be defined as "TwinCAT Module Class for RT Context". The C++ Wizard offers a special template for this purpose.

In addition this sample uses a TwinCAT C++ class which manages without TcCOM initialization data and without TcCOM parameters.

15.25.3.2 Creating an FB in the PLC that creates the C++ object and offers its functionality

 Create a PLC and append a new function block there. This Proxy function block should provide the functionality that was programmed in C++. It manages this via an interface pointer that was defined by C++ and is known in the PLC due to the TMC description file.

PLC CreatingCppObj Instance

2. In the declaration part of the function block declare as an output an interface pointer to the interface (IIncrement) which later provides the functionality outward.

3. Create class ID and the interface ID as member variables.

While the interface ID is already available via a global list, the class IDs, provided they are not yet supposed to be known, are determined by other means. When you open the TMC description file of the associated C++ driver you will find the corresponding GUID there.

4. Add the FB_init constructor method to the PLC Proxy function block.

For the case, that it is not an online change but rather the initialization of the function block, a new TcCOM object (Class instance of the specified class) is created and the interface pointer to the specified interface is obtained. In the process the used FW_ObjMgr_CreateAndInitInstance() function is also given the name and the destination state of the TcCOM object. These two parameters are declared here as input parameters of the FB_init method, whereby they are to be specified in the instantiation of the Proxy function block. The TwinCAT C++ class to be instantiated manages without TcCOM initialization data

and without TcCOM parameters.

In the case of this function call the object itself increments a reference counter.

FB_I	ncrem	entProxyDynInstance.FB_init 🕘 🗙		
	1	METHOD FB_init : BOOL		
	2	VAR_INPUT		
	3	bInitRetains : BOOL; // if TRUE, the retain	n variables	are initialized (warm start / cold start)
	4	bInCopyCode : BOOL; // if TRUE, the instan	nce afterwar	ds gets moved into the copy code (online change)
	5			
	6	sObjName : STRING; // object name to h	be set for t	his instance (optional)
	7	<pre>eObjState : TCOM_STATE; // target object st</pre>	tate (usuall	y TCOM_STATE.TCOM_STATE_OP)
	8	END_VAR		
	1	IF NOT bInCopyCode THEN // if not online change	9	
	2	objName := sObjName;		
	3	hrInit := FW_ObjMgr_CreateAndInitInstance(clsId	:= classId,
	4		iid	:= iid,
	5		pipUnk	:= ADR(ip),
	6		objId	:= OTCID_CreateNewId,
	7		parentId	:= TwinCAT_SystemInfoVarListAppInfo.ObjId, //
	8		name	:= sObjName,
	9		state	:= eObjState,
	10		pInitData	:= 0);
	11	END_IF		
	12			

 It is imperative to release the used reference again and to delete the object, provided it is no longer being used. To this end call the FW_ObjMgr_DeleteInstance() function in the FB_exit destructor of the function block.

 \Rightarrow This completes the implementation of the Proxy function block.

6. Declare an instance of the Proxy function block to call the methods provided via the interface in the application. The calls themselves take all place over the interface pointer defined as output of the function block. As is typical for pointers a prior null check must be made. Then the methods can be called directly, also via Intellisense.

 \Rightarrow The sample is ready for testing.

15.25.3.3 Execution of the sample project

- 1. Select the target system and compile the project.
- 2. Enable the TwinCAT configuration and execute a log-in as well as starting the PLC.
- ⇒ In the online view of the PLC application the desired TcCOM object name in the PLC Proxy function block can be seen. The project node TcCOM Objects keeps the generated object with the generated ID and the desired name in his list. The interface pointer has a valid value and the method will be executed.

16 Appendix

- The <u>ADS Return Codes [] 343]</u> are important across TwinCAT 3, particularly if <u>ADS communication</u>
 [] 208] itself is implemented.
- The <u>Retain data [▶ 348]</u> (in NOVRAM memory) can be used in a similar way from the PLC and also C+ +.
- In addition to the <u>TcCOM Module [▶ 35]</u> concept, the TwinCAT 3 <u>type system</u> is an important basis for understanding.
- The following pages originate from the documentation for the Automation Interface. When using the Automation Interface please refer to the dedicated documentation.
 - Creating and handling C++ projects and modules [▶ 350]
 - Creating and handling TcCOM modules [▶ 354]

16.1 ADS Return Codes

Grouping of error codes: 0x000 [> 343]..., 0x500 [> 344]..., 0x700 [> 345]..., 0x1000 [> 347]...

Global error codes

Hex	Dec	HRESULT	Name	Description
0x0	0	0x9811 0000	ERR_NOERROR	No error.
0x1	1	0x9811 0001	ERR_INTERNAL	Internal error.
0x2	2	0x9811 0002	ERR_NORTIME	No real-time.
0x3	3	0x9811 0003	ERR_ALLOCLOCKEDMEM	Allocation locked – memory error.
0x4	4	0x9811 0004	ERR_INSERTMAILBOX	Mailbox full – the ADS message could not be sent. Reducing the number of ADS messages per cycle will help.
0x5	5	0x9811 0005	ERR_WRONGRECEIVEHMSG	Wrong HMSG.
0x6	6	0x9811 0006	ERR_TARGETPORTNOTFOUND	Target port not found – ADS server is not started or is not reachable.
0x7	7	0x9811 0007	ERR_TARGETMACHINENOTFOUND	Target computer not found – AMS route was not found.
0x8	8	0x9811 0008	ERR_UNKNOWNCMDID	Unknown command ID.
0x9	9	0x9811 0009	ERR_BADTASKID	Invalid task ID.
0xA	10	0x9811 000A	ERR_NOIO	No IO.
0xB	11	0x9811 000B	ERR_UNKNOWNAMSCMD	Unknown AMS command.

0x16	22	0x9811 0016	ERR_AMSSYNC_AMSERROR	AMS Sync error.
0x17	23	0x9811 0017	ERR_AMSSYNC_NOINDEXINMAP	No index map for AMS Sync available.
0x18	24	0x9811 0018	ERR_INVALIDAMSPORT	Invalid AMS port.
0x19	25	0x9811 0019	ERR_NOMEMORY	No memory.
0x1A	26	0x9811 001A	ERR_TCPSEND	TCP send error.
0x1B	27	0x9811 001B	ERR_HOSTUNREACHABLE	Host unreachable.
0x1C	28	0x9811 001C	ERR_INVALIDAMSFRAGMENT	Invalid AMS fragment.
0x1D	29	0x9811 001D	ERR_TLSSEND	TLS send error – secure ADS connection failed.
0x1E	30	0x9811 001E	ERR_ACCESSDENIED	Access denied – secure ADS access denied.

Router error codes

Hex	Dec	HRESULT	Name	Description
0x500	1280	0x9811 0500	ROUTERERR_NOLOCKEDMEMORY	Locked memory cannot be allocated.
0x501	1281	0x9811 0501	ROUTERERR_RESIZEMEMORY	The router memory size could not be changed.
0x502	1282	0x9811 0502	ROUTERERR_MAILBOXFULL	The mailbox has reached the maximum number of possible messages.
0x503	1283	0x9811 0503	ROUTERERR_DEBUGBOXFULL	The Debug mailbox has reached the maximum number of possible messages.
0x504	1284	0x9811 0504	ROUTERERR_UNKNOWNPORTTYPE	The port type is unknown.
0x505	1285	0x9811 0505	ROUTERERR_NOTINITIALIZED	The router is not initialized.
0x506	1286	0x9811 0506	ROUTERERR_PORTALREADYINUSE	The port number is already assigned.
0x507	1287	0x9811 0507	ROUTERERR_NOTREGISTERED	The port is not registered.
0x508	1288	0x9811 0508	ROUTERERR_NOMOREQUEUES	The maximum number of ports has been reached.
0x509	1289	0x9811 0509	ROUTERERR_INVALIDPORT	The port is invalid.
0x50A	1290	0x9811 050A	ROUTERERR_NOTACTIVATED	The router is not active.
0x50B	1291	0x9811 050B	ROUTERERR_FRAGMENTBOXFULL	The mailbox has reached the maximum number for fragmented messages.
0x50C	1292	0x9811 050C	ROUTERERR_FRAGMENTTIMEOUT	A fragment timeout has occurred.
0x50D	1293	0x9811 050D	ROUTERERR_TOBEREMOVED	The port is removed.

General ADS error codes

Hex	Dec	HRESULT	Name	Description
0x700	1792	0x9811 0700	ADSERR_DEVICE_ERROR	General device error.
0x701	1793	0x9811 0701	ADSERR_DEVICE_SRVNOTSUPP	Service is not supported by the server.
0x702	1794	0x9811 0702	ADSERR_DEVICE_INVALIDGRP	Invalid index group.
0x703	1795	0x9811 0703	ADSERR_DEVICE_INVALIDOFFSET	Invalid index offset.
0x704	1796	0x9811 0704	ADSERR DEVICE INVALIDACCESS	Reading or writing not permitted.
0x705	1797	0x9811 0705	ADSERR DEVICE INVALIDSIZE	Parameter size not correct.
0x706	1798	0x9811 0706	ADSERR DEVICE INVALIDDATA	Invalid data values.
0x707	1799	0x9811 0707	ADSERR DEVICE NOTREADY	Device is not ready to operate.
0x708	1800	0x9811 0708	ADSERR DEVICE BUSY	Device is busy.
0x709	1801	0x9811 0709	ADSERR_DEVICE_INVALIDCONTEXT	Invalid operating system context. This can result from use of ADS function blocks in different tasks. It may be possible to resolve this through multitasking synchronization in the PLC.
0x70A	1802	0x9811 070A	ADSERR_DEVICE_NOMEMORY	Insufficient memory.
0x70B	1803	0x9811 070B	ADSERR_DEVICE_INVALIDPARM	Invalid parameter values.
0x70C	1804	0x9811 070C	ADSERR_DEVICE_NOTFOUND	Not found (files,).
0x70D	1805	0x9811 070D	ADSERR_DEVICE_SYNTAX	Syntax error in file or command.
0x70E	1806	0x9811 070E	ADSERR_DEVICE_INCOMPATIBLE	Objects do not match.
0x70F	1807	0x9811 070F	ADSERR_DEVICE_EXISTS	Object already exists.
0x710	1808	0x9811 0710	ADSERR_DEVICE_SYMBOLNOTFOUND	Symbol not found.
0x711	1809	0x9811 0711	ADSERR_DEVICE_SYMBOLVERSIONIN- VALID	Invalid symbol version. This can occur due to an on- line change. Create a new handle.
0x712	1810	0x9811 0712	ADSERR_DEVICE_INVALIDSTATE	Device (server) is in invalid state.
0x713	1811	0x9811 0713	ADSERR_DEVICE_TRANSMODENOTSUPP	AdsTransMode not supported.
0x714	1812	0x9811 0714	ADSERR_DEVICE_NOTIFYHNDINVALID	Notification handle is invalid.
0x715	1813	0x9811 0715	ADSERR_DEVICE_CLIENTUNKNOWN	Notification client not registered.
0x716	1814	0x9811 0716	ADSERR_DEVICE_NOMOREHDLS	No further notification handle available.
0x717	1815	0x9811 0717	ADSERR_DEVICE_INVALIDWATCHSIZE	Notification size too large.
0x718	1816	0x9811 0718	ADSERR_DEVICE_NOTINIT	Device not initialized.
0x719	1817	0x9811 0719	ADSERR_DEVICE_TIMEOUT	Device has a timeout.
0x71A	1818	0x9811 071A	ADSERR_DEVICE_NOINTERFACE	Interface query failed.
0x71B	1819	0x9811 071B	ADSERR_DEVICE_INVALIDINTERFACE	Wrong interface requested.
0x71C	1820	0x9811 071C	ADSERR_DEVICE_INVALIDCLSID	Class ID is invalid.
0x71D	1821	0x9811 071D	ADSERR_DEVICE_INVALIDOBJID	Object ID is invalid.
0x71E	1822	0x9811 071E	ADSERR_DEVICE_PENDING	Request pending.

0x1004	4100	0x9811 1004	RTERR_PRIOEXISTS	The request task priority is already assigned.
0x1005	4101	0x9811 1005	RTERR_NOMORETCB	No free TCB (Task Control Block) available. The maximum number of TCBs is 64.
0x1006	4102	0x9811 1006	RTERR_NOMORESEMAS	No free semaphores available. The maximum num- ber of semaphores is 64.
0x1007	4103	0x9811 1007	RTERR_NOMOREQUEUES	No free space available in the queue. The maximum number of positions in the queue is 64.
0x100D	4109	0x9811 100D	RTERR_EXTIRQALREADYDEF	An external synchronization interrupt is already applied.
0x100E	4110	0x9811 100E	RTERR_EXTIRQNOTDEF	No external sync interrupt applied.
0x100F	4111	0x9811 100F	RTERR_EXTIRQINSTALLFAILED	Application of the external synchronization interrupt has failed.
0x1010	4112	0x9811 1010	RTERR_IRQLNOTLESSOREQUAL	Call of a service function in the wrong context
0x1017	4119	0x9811 1017	RTERR_VMXNOTSUPPORTED	Intel VT-x extension is not supported.
0x1018	4120	0x9811 1018	RTERR_VMXDISABLED	Intel VT-x extension is not enabled in the BIOS.
0x1019	4121	0x9811 1019	RTERR_VMXCONTROLSMISSING	Missing function in Intel VT-x extension.
0x101A	4122	0x9811 101A	RTERR_VMXENABLEFAILS	Activation of Intel VT-x fails.

TCP Winsock error codes

Hex	Dec	Name	Description		
0x274C	10060	WSAETIMEDOUT	A connection timeout has occurred - error while establishing the connection, because the remote terminal did not respond properly after a certain period of time, or the established connection could not be maintained because the connected host did not respond.		
0x274D	10061	WSAECONNREFUSED	Connection refused - no connection could be established because the target computer has explicitly rejected it. This error usually results from an attempt to connect to a service that is inactive on the external host, that is, a service for which no server application is running.		
0x2751	10065	WSAEHOSTUNREACH	No route to host - a socket operation referred to an unavailable host.		
	More Winsock error codes: Win32 error codes				

16.2 Retain data

This section describes the option to make data available even after an ordered or spontaneous system restart. The NOV-RAM of a device is used for this purpose. The EL6080 cannot be used for these retain data, because the corresponding data must first be transferred, which leads to corresponding runtimes. The following section describes the retain handler, which stores data and makes them available again, and the application of the different TwinCAT 3 programming languages.

Configuring a retain device

1. The retain data are stored and made available by a retain handler, which is part of the NOV-DP-RAM device in the IO section of the TwinCAT solution. Create a NOV-RAM DP Device in the IO area of the

∡ 🗾 I/O
▲ [⊕] _E Devices
🔺 🌾 Device 1 (NOV-DP-RAM)
🚔 Image
💾 Inputs
Outputs

Solution.

2. Create one or more Retain Handler below this device.

Storage location: NOVRAM

3. Configure the NOV-DP RAM device. In the **Generic NOV-DP-RAM Device** tab, use **Search...** to define the area to be used.

General Generic NOV-E	OP-RAM Device	DPRAM (Online)		
PCI				
Vendor ID (hex):	15EC		Search	
Device ID (hex):	5000			
BaseAddr (0-5):	evice Found At			
Bus/Slot (Addr):	0xF0100000 Slot 0 (0xF000	0000)		ОК
🔿 🔘 RAM (e.g. ISA				Cancel
Address				O Unused
				© All
Size:				
Export/Import Data				
Auto Init linked				Help
			Import)

4. An additional retain directory for the symbols is created in the TwinCAT boot directory.

Using the retain handler with a PLC project

In a PLC project the variables are either created in a VAR RETAIN section or identified with the attribute TcRetain.

```
PROGRAM MAIN
VAR RETAIN
1: UINT;
k: UINT;
END_VAR
VAR
{attribute `TcRetain':='1'}
m: UINT;
x: UINT;
END_VAR
```

Corresponding symbols are created after a "Build". The assignment to the retain handler of the NOV-DP-RAM device is done in column **Retain Hdl**.

MAIN.I											
MAIN.k											
MAIN.m											
CALLEDY .											

If self-defined data types (DUTs) are used as retain, the data types must be available in the TwinCAT type system. You can either use the option **Convert to Global Type** or you can create structures directly as STRUCT RETAIN. However, the Retain Handler then handles all occurrences of the structure. Retain data cannot be used for POUs (function blocks) as a whole. However, individual elements of a POU can be used.

Using the retain handler with a C++ module

In a C++ module a data area of type Retain Source is created, which contains the corresponding symbols.

At the instances of the C++ module, a retain handler of the NOV-DP-RAM device to be used for this data area is defined in column **Retain Hdl**.

Conclusions

When a retain handler is selected as target in the respective project, the symbols under retain handler and a mapping are created automatically after a "Build".

16.3 Creating and handling C++ projects and modules

This chapter explains in-depth how to create, access and handle TwinCAT C++ projects. The following list shows all chapters in this article:

- General information about C++ projects
- Creating new C++ projects
- · Creating new module within a C++ project
- Opening existing C++ projects
- Creating module instances
- Calling TMC Code Generator
- Calling Publish Modules command
- Setting C++ Project Properties

· Building project

General information about C++ projects

C++ projects are specified by their so-called project template, which are used by the "TwinCAT C++ Project Wizard". Inside a project multiple modules could be defined by module templates, which are used by the "TwinCAT Class Wizard".

TwinCAT-defined templates are documented in the <u>Section C++ / Wizards [99]</u>.

The customer could define own templates, which is documented at <u>the corresponding sub-section if C++</u> <u>Section / Wizards [> 150]</u>.

Creating C++ projects

To create a new C++ project via Automation Interface, you need to navigate to the C++ node and then execute the CreateChild() method with the corresponding template file as a parameter.

Code snippet (C#):

```
ITcSmTreeItem cpp = systemManager.LookupTreeItem("TIXC");
ITcSmTreeItem cppProject = cpp.CreateChild("NewCppProject", 0, "", pathToTemplateFile);
```

Code snippet (Powershell):

```
$cpp = $systemManager.LookupTreeItem("TIXC")
$newProject = $cpp.CreateChild("NewCppProject", 0, "", $pathToTemplateFile)
```

For instantiating a driver project please use "TcDriverWizard" as pathToTemplateFile.

Creating new module within a C++ project

Within a C++ project usually a TwinCAT Module Wizard is used to let the wizard create a module by a template.

Code snippet (C#):

ITcSmTreeItem cppModule = cppProject.CreateChild("NewModule", 1, "", pathToTemplateFile);

Code snippet (Powershell):

```
$cppModule = $cppProject.CreateChild("NewModule", 0, "", $pathToTemplateFile);
```

As example for instantiating a Cyclic IO module project please use "TcModuleCyclicCallerWizard" as pathToTemplateFile.

Opening existing C++ projects

To open an existing C++-Project via Automation Interface, you need to navigate to the C++ node and then execute the CreateChild() method with the path to the corresponding C++ project file as a parameter.

You can use three different values as SubType:

- 0: Copy project to solution directory
- 1: Move project to solution directory
- 2: Use original project location (specify "" as NameOfProject parameter)

Basically, these values represent the functionalities (Yes, No, Cancel) from the following MessageBox in TwinCAT XAE:

Microsoft V	/isual Studio	X
2	Project path not under current solution. Copy project to solution directory (YES) Move project to solution directory (NO) Use original project location (CANCEL)	
	Yes No Cance	2

In place of the template file you need to use the path to the C++ project (to its vcxproj file) that needs to be added. As an alternative, you can also use a C++ project archive (tczip file).

Code snippet (C#):

```
ITcSmTreeItem cpp = systemManager.LookupTreeItem("TIXC");
ITcSmTreeItem newProject = cpp.CreateChild("NameOfProject", 1, "", pathToProjectOrTczipFile);
```

Code snippet (Powershell):

```
$cpp = $systemManager.LookupTreeItem("TIXC")
$newProject = $cpp.CreateChild("NameOfProject", 1, "", $pathToProjectOrTczipFile)
```

Please note that C++ projects can't be renamed, thus the original project name needs to be specified. (cmp. Renaming TwinCAT C++ projects [\triangleright 237])

Creating module instances

TcCOM Modules could be created at the System -> TcCOM Modules node. Please <u>see documentation there</u> [▶ <u>354</u>].

The same procedure could also be applied to the C++ project node to add TcCOM instances at that place (\$newProject at the code on top of this page.).

Calling TMC Code Generator

TMC Code generator could be called to generate C++ code after changes at the TMC file of the C++ project.

Code snippet (C#):

```
string startTmcCodeGenerator = @"<?xml version=""1.0"" encoding=""UTF-16""?>
<TreeItem>
<CppProjectDef>
<Methods>
<StartTmcCodeGenerator>
<Active>true</Active>
</StartTmcCodeGenerator>
</Methods>
</CppProjectDef>
</TreeItem>";
cppProject.ConsumeXml(startTmcCodeGenerator);
```

Code snippet (Powershell):

```
$startTmcCodeGenerator = @"<?xml version=""1.0"" encoding=""UTF-16""?>
<TreeItem>
<CppProjectDef>
<Methods>
<StartTmcCodeGenerator>
<Active>true</Active>
</StartTmcCodeGenerator>
</Methods>
```

</CppProjectDef> </TreeItem>" \$cppProject.ConsumeXml(\$startTmcCodeGenerator)

Calling Publish Modules command

Publishing includes building the project for all platforms. The compiled module will be provided for Export like described in the <u>Module-Handling section of C++ [\triangleright 50].</u>

Code snippet (C#):

string publishModules = @"<?xml version=""1.0"" encoding=""UTF-16""?>
<TreeItem>
<CppProjectDef>
<Methods>
<PublishModules>
<Active>true</Active>
</PublishModules>
</PublishModules>
</Methods>
</CppProjectDef>
</TreeItem>";
cppProject.ConsumeXml(publishModules);

Code snippet (Powershell):

```
$publishModules = @"<?xml version=""1.0"" encoding=""UTF-16""?>
<TreeItem>
<CppProjectDef>
<Methods>
<PublishModules>
<Active>true</Active>
</PublishModules>
</Methods>
</CppProjectDef>
</TreeItem>"
$cppProject.ConsumeXml($publishModules)
```

Setting C++ Project Properties

C++ projects provide different options for the build and deployment process. These are settable by the Automation Interface.

Code snippet (C#):

```
string projProps = @"<?xml version=""1.0"" encoding=""UTF-16""?>
<TreeItem>
<CppProjectDef>
<BootProjectEncryption>Target</BootProjectEncryption>
<TargetArchiveSettings>
<SaveProjectSources>false</SaveProjectSources>
</TargetArchiveSettings>
<SaveProjectSources>false</SaveProjectSources>
</FileArchiveSettings>
</CppProjectDef>
</TreeItem>";
cppProject.ConsumeXml(projProps);
```

Code snippet (Powershell):

```
$projProps = @"<?xml version=""1.0"" encoding=""UTF-16""?>
<TreeItem>
<CppProjectDef>
<BootProjectEncryption>Target</BootProjectEncryption>
<TargetArchiveSettings>
</TargetArchiveSettings>
<FileArchiveSettings>
<SaveProjectSources>false</SaveProjectSources>
</FileArchiveSettings>
</CppProjectDef>
</TreeItem>"
$cppProject.ConsumeXml($projProps)
```

For the BootProjectEncryption the values "None" and "Target" are valid. Both other settings are "false" and "true" values.

Building project

To build the project or solution you can use the corresponding classes and methods of the Visual Studio API, which are documented here.

16.4 Creating and handling TcCOM modules

This chapter explains how to add existing TcCOM modules to a TwinCAT configuration and parameterize them. The following topics will be briefly covered in this chapter:

- Acquiring a reference to "TcCOM Objects" node
- · Adding existing TcCOM modules
- Iterating through added TcCOM modules
- · Setting CreateSymbol flag for parameters
- · Setting CreateSymbol flag for Data Areas
- Setting Context (Tasks)
- Linking variables

Acquiring a reference to "TcCOM Objects" node

In a TwinCAT configuration, the "TcCOM Objects" node is located under "SYSTEM^TcCOM Objects". Therefore you can acquire a reference to this node by using the method ITcSysManager::LookupTreeItem() in the following way:

Code Snippet (C#):

ITcSmTreeItem tcComObjects = systemManager.LookupTreeItem("TIRC^TcCOM Objects");

Code Snippet (Powershell):

\$tcComObjects = \$systemManager.LookupTreeItem("TIRC^TcCOM Objects")

The code above assumes that there is already a systemManager objects present in your AI code.

Adding existing TcCOM modules

To add existing TcCOM modules to your TwinCAT configuration, these modules need to be detectable by TwinCAT. This can be achieved by either of the following ways:

- Copying TcCOM modules to folder %TWINCAT3.XDIR"\CustomConfig\Modules\
- Editing %TWINCAT3.XDIR"\Config\lo\TcModuleFolders.xml to add a path to a folder of your choice and place the modules within that folder

Both ways will be sufficient to make the TcCOM modules detectable by TwinCAT.

A TcCOM module is being identified by its GUID or name:

 This GUID can be used to add a TcCOM module to a TwinCAT configuration via the ITcSmTreeItem::CreateChild() method. The GUID can be determined in TwinCAT XAE via the properties page of a TcCOM module.

Object	Context	Parameter	lnit)	Parameter (Online)	Data Area	Interfaces	Block Diagram				
Object Id:		Ox	0x01010020		Сор	Copy TMI to Target					
Object	Object Name:			(TempContr)							
Type Name:			TempContr								
GUID:	GUID:			8F5FDCFF-EE4B-4EE5-80B1-25EB23BD1B45							
Class I	Class Id:			8F5FDCFF-EE4B-4EE5-80B1-25EB23BD1B45							
Class Factory:			TempContr								
Parent Id:			0x0000000								
Init Sequence:			PSO 🔻								

Alternatively, you can also determine the GUID via the TMC file of the TcCOM module.

```
<TcModuleClass>

<Modules>

<Module GUID="{8f5fdcff-ee4b-4ee5-80b1-25eb23bd1b45}">

...

</Module>

</Modules>

</TcModuleClass>
```

Let's assume that we already own a TcCOM module that is registered in and detectable by TwinCAT. We now would like to add this TcCOM module, which has the GUID {8F5FDCFF-EE4B-4EE5-80B1-25EB23BD1B45} to our TwinCAT configuration. This can be done by the following way:

Code Snippet (C#):

```
Dictionary<string,Guid> tcomModuleTable = new Dictionary<string,Guid>();
tcomModuleTable.Add("TempContr",Guid.Parse("{8f5fdcff-ee4b-4ee5-80b1-25eb23bd1b45}"));
ITcSmTreeItem tempController = tcComObjects.CreateChild("Test", 0, "",
tcomModuleTable["TempContr"]);
```

Code Snippet (Powershell):

```
$tcomModuleTable = @""
$tcomModuleTable.Add("TempContr", "{8f5fdcff-ee4b-4ee5-80b1-25eb23bd1b45}")
$tempController = $tcComObjects.CreateChild("Test", 0, "", $tcomModuleTable["TempContr"])
```

Please note that the vInfo parameter of the method ItcSmTreeItem::CreateChild() contains the GUID of the TcCOM module which is used to identify the module in the list of all registered TcCOM modules in that system.

 This name can be used to add a TcCOM module to a TwinCAT configuration via the ITcSmTreeItem::CreateChild() method. The name can be determined in TwinCAT XAE via the TMC Editor.

NewCppProject.tmc [TMC Editor] 😕 🗙	NewModule.cpp	NewModule.h	TwinCAT Project11

□○ Implemented Interfaces ▶ ■ Parameters	Name	NewModule		
🕨 🛄 Data Areas	Class ID (CLSID)	6ba04cba-3baf-4453-b5	e0-d481bc9edc7e	Auto generate on save
Data Pointers ♦ ≒ Interface Pointers	Class Factory	NewCppProject]
 Event Classes Deployment 	Image	Choose image	Reset image	

• This can be done by the following way:

Code Snippet (C#):

ITcSmTreeItem tempController = tcComObjects.CreateChild("Test", 1, "", "NewModule");

Code Snippet (Powershell):

\$tempController = \$tcComObjects.CreateChild("Test", 0, "", "NewModule")

Iterating through added TcCOM modules

To iterate through all added TcCOM module instances, you may use the ITcModuleManager2 interface. The following code snippet demonstrates how to use this interface.

Code Snippet (C#):

```
ITcModuleManager2 moduleManager = (ITcModuleManager2)systemManager.GetModuleManager();
foreach (ITcModuleManager2 moduleInstance in moduleManager)
{
   string moduleType = moduleInstance.ModuleTypeName;
   string instanceName = moduleInstance.ModuleInstanceName;
   Guid classId = moduleInstance.ClassID;
   uint objId = moduleInstance.oid;
   uint parentObjId = moduleInstance.ParentOID;
}
```

Code Snippet (Powershell):

```
$moduleManager = $systemManager.GetModuleManager()
ForEach( $moduleInstance in $moduleManager )
{
   $moduleType = $moduleInstance.ModuleTypeName
   $instanceName = $moduleInstance.ModuleInstanceName
   $classId = $moduleInstance.ClassID
   $objId = $moduleInstance.oid
   $parentObjId = $moduleInstance.ParentOID
}
```

Please note that every module object can also be interpreted as an ITcSmTreeItem, therefore the following type cast would be valid:

Code Snippet (C#):

ITcSmTreeItem treeItem = moduleInstance As ITcSmTreeItem;

Please note: Powershell uses dynamic data types by default.

Setting CreateSymbol flag for parameters

The CreateSymbol (CS) flag for parameters of a TcCOM module can be set via its XML description. The following code snippet demonstrates how to activate the CS flag for the Parameter "CallBy".

Code Snippet (C#):

```
bool activateCS = true;
// First step: Read all Parameters of TcCOM module instance
string tempControllerXml = tempController.ProduceXml();
XmlDocument tempControllerDoc = new XmlDocument();
tempControllerDoc.LoadXml(tempControllerXml);
XmlNode sourceParameters = tempControllerDoc.SelectSingleNode("TreeItem/TcModuleInstance/Module/
Parameters");
// Second step: Build target XML (for later ConsumeXml())
XmlDocument targetDoc = new XmlDocument();
XmlElement treeItemElement = targetDoc.CreateElement("TreeItem");
XmlElement moduleInstanceElement = targetDoc.CreateElement("TcModuleInstance");
XmlElement moduleElement = targetDoc.CreateElement("Module");
XmlElement parametersElement = (XmlElement) targetDoc.ImportNode(sourceParameters, true);
moduleElement.AppendChild(parametersElement);
moduleInstanceElement.AppendChild(moduleElement);
treeItemElement.AppendChild(moduleInstanceElement);
targetDoc.AppendChild(treeItemElement);
// Third step: Look for specific parameter (in this case "CallBy") and read its CreateSymbol
attribute
XmlNode destModule = targetDoc.SelectSingleNode("TreeItem/TcModuleInstance/Module ");
XmlNode callByParameter = destParameters.SelectSingleNode("Parameters/Parameter[Name='CallBy']");
XmlAttribute createSymbol = callByParameter.Attributes["CreateSymbol"];
```

```
createSymbol.Value = "true";
```

// Fifth step: Write prepared XML to configuration via ConsumeXml()
string targetXml = targetDoc.OuterXml;
tempController.ConsumeXml(targetXml);

Code Snippet (Powershell):

```
$tempControllerXml = [Xml]$tempController.ProduceXml()
$sourceParameters = $tempControllerXml.TreeItem.TcModuleInstance.Module.Parameters
```

[System.XML.XmlDocument] \$targetDoc = New-Object System.XML.XmlDocument [System.XML.XmlElement] \$treeItemElement = \$targetDoc.CreateElement("TreeItem") [System.XML.XmlElement] \$moduleInstanceElement = \$targetDoc.CreateElement("TcModuleInstance") [System.XML.XmlElement] \$moduleElement = \$targetDoc.CreateElement("Module") [System.XML.XmlElement] \$parametersElement = \$targetDoc.ImportNode(\$sourceParameters, \$true) \$moduleElement.AppendChild(\$parametersElement) \$moduleInstanceElement.AppendChild(\$moduleElement) \$treeItemElement.AppendChild(\$moduleInstanceElement) \$targetDoc.AppendChild(\$treeItemElement) \$destModule = \$targetDoc.TreeItem.TcModuleInstance.Module \$callByParameter = \$destmodule.SelectSingleNode("Parameters/Parameter[Name='CallBy']")

```
$callByParameter.CreateSymbol = "true"
```

\$targetXml = \$targetDoc.OuterXml
\$tempController.ConsumeXml(\$targetXml)

Setting CreateSymbol flag for Data Areas

The CreateSymbol (CS) flag for Data Areas of a TcCOM module can be set via its XML description. The following code snippet demonstrates how to activate the CS flag for the Data Area "Input". Please note that the procedure is pretty much the same as for parameters.

Code Snippet (C#):

```
bool activateCS = true;
// First step: Read all Data Areas of a TcCOM module instance
string tempControllerXml = tempController.ProduceXml();
XmlDocument tempControllerDoc = new XmlDocument();
tempControllerDoc.LoadXml(tempControllerXml);
XmlNode sourceDataAreas = tempControllerDoc.SelectSingleNode("TreeItem/TcModuleInstance/Module/
DataAreas");
// Second step: Build target XML (for later ConsumeXml())
XmlDocument targetDoc = new XmlDocument();
XmlElement treeItem = targetDoc.CreateElement("TreeItem");
XmlElement moduleInstance = targetDoc.CreateElement("TcModuleInstance");
XmlElement module = targetDoc.CreateElement("Module");
XmlElement dataAreas = (XmlElement)
targetDoc.ImportNode(sourceDataAreas, true);
module.AppendChild(dataAreas);
moduleInstance.AppendChild(module);
treeItem.AppendChild(moduleInstance);
targetDoc.AppendChild(treeItem);
// Third step: Look for specific Data Area (in this case "Input") and read its CreateSymbol
attribute
XmlElement dataArea = (XmlElement)targetDoc.SelectSingleNode("TreeItem/TcModuleInstance/Module/
DataAreas/DataArea[ContextId='0' and Name='Input']");
XmlNode dataAreaNo = dataArea.SelectSingleNode("AreaNo");
XmlAttribute createSymbol = dataAreaNoNode.Attributes["CreateSymbols"];
// Fourth step: Set CreateSymbol attribute to true if it exists. If not, create attribute and set
its value
if (createSymbol != null)
string oldValue = createSymbol.Value;
else
createSymbol = targetDoc.CreateAttribute("CreateSymbols");
dataAreaNo.Attributes.Append(createSymbol);
createSymbol.Value = XmlConvert.ToString(activateCS);
// Fifth step: Write prepared XML to configuration via ConsumeXml()
string targetXml = targetDoc.OuterXml;
tempController.ConsumeXml(targetXml);
```

Code Snippet (Powershell):

```
$tempControllerXml = [Xml]$tempController.ProduceXml()
$sourceDataAreas = $tempControllerXml.TreeItem.TcModuleInstance.Module.DataAreas
[System.XML.XmlDocument] $targetDoc = New-Object System.XML.XmlDocument
[System.XML.XmlElement] $treeItem = $targetDoc.CreateElement("TreeItem")
[System.XML.XmlElement] $moduleInstance = $targetDoc.CreateElement("TcModuleInstance")
[System.XML.XmlElement] $module = $targetDoc.CreateElement("Module")
[System.XML.XmlElement] $dataAreas = $targetDoc.ImportNode($sourceDataAreas, $true)
$module.AppendChild($dataAreas)
$moduleInstance.AppendChild($module)
$treeItem.AppendChild($moduleInstance)
$targetDoc.AppendChild($treeItem)
$destModule = $targetDoc.TreeItem.TcModuleInstance.Module
[System.XML.XmlElement] $dataArea = $destModule.SelectSingleNode("DataAreas/DataArea[ContextId='0"
and Name='Input']")
$dataAreaNo = $dataArea.SelectSingleNode("AreaNo")
$dataAreaNo.CreateSymbols = "true"
// Fifth step: Write prepared XML to configuration via ConsumeXml()
$targetXml = $targetDoc.OuterXml
$tempController.ConsumeXml($targetXml)
```

Setting Context (Tasks)

Every TcCOM module instance needs to be run in a specific context (task). This can be done via the ITcModuleInstance2::SetModuleContext() method. This method awaits two parameters: ContextId and TaskObjectId. Both are equivalent to the corresponding parameters in TwinCAT XAE:

Object Context Parameter (Init) Parameter (Online) Data Area Interfaces Block Diagra	im					
Context:	0						
Depend On:	Manual Config 🗸 🗸						
Need Call From Sync Mapping							
Data Areas:	Interfaces:						
☑ 0 'Input' ☑ 1 'Output' ☑ 21 'BlockIO' ☑ 22 'ContState'							
Data Pointer:	Interface Pointer:						
Result:							
ID Task Nam	e	Priority	Cycle Tim	Task Port	Symbol Port	Sort Order	-
0 02010010 🔽 Addit	ionalTask1	1	10000	350	350	0	-

Please note that the TaskObjectId is shown in hex in TwinCAT XAE.

Code Snippet (C#):

```
ITcModuleInstance2 tempControllerMi = (ITcModuleInstance2) tempController;
tempControllerMi.SetModuleContext(0, 33619984);
```

You can determine the TaskObjectId via the XML description of the corresponding task, for example:

Code Snippet (C#):

```
ITcSmTreeItem someTask = systemManager.LookupTreeItem("TIRT^SomeTask");
string someTaskXml = someTask.ProduceXml();
XmlDocument someTaskDoc = new XmlDocument();
someTaskDoc.LoadXml(someTaskXml);
XmlNode taskObjectIdNode = someTaskDoc.SelectSingleNode("TreeItem/ObjectId");
string taskObjectIdStr = taskObjectId.InnerText;
uint taskObjectId = uint.Parse(taskObjectIdStr, NumberStyles.HexNumber);
```

Linking variables

Linking variables of a TcCOM module instance to PLC/IO or other TcCOM modules can be done by using regular Automation Interface mechanisms, e.g. ITcSysManager::LinkVariables().
