CNC MELD/S60/60S Series

PLC PROGRAMMING MANUAL (LADDER SECTION)

MELDASMAGIC is a registered trademark of Mitsubishi Electric Corporation.
Other company and product names that appear in this manual are trademarks or registered trademarks of the respective company.

## Introduction

These specifications are the programming manual used when creating the sequence program with the onboard PLC development tool or PLC development software.
The PLC (Programmable Logic Controller) is largely divided into the basic commands, function commands and exclusive commands, and ample command types are available. The commands can be used according to the purpose and application such as the PLC support function used when supporting the user PLCs.

This Instruction Manual does not explain the operation procedures for programming the sequence program with onboard or PLC development software. Refer to the related material listed below for details.

## 1. System Configuration

### 1.1 System Configuration for PLC Development

(1) M64 Series

The system configuration for PLC development is shown below.
Communication terminal

Note) Refer to the "PLC Onboard Instruction Manual" for development using the communication terminal (onboard development), and the "PLC Program Development Manual (Personal Computer Section)" for development using the personal computer.

## (2) MELDASMAGIC 64 Series

Note) Refer to the "PLC Onboard Instruction Manual (BNP-B2130)" for development using the onboard PLC development tool, and the "PLC Programming Manual (Personal Computer Section) (BN-B2132)" for development using the PLC development software.

### 1.2 User PLC (Ladder) Development Procedure

The procedure for creating the user PLC, used to control the control target (machine) built into the control unit, is shown below.

## 2. PLC Processing Program

### 2.1 PLC Processing Program Level and Operation

Table 2.1-1 explains the contents of users PLC processing level and Fig. 2.1-1 shows the timing chart.
Table 2.1-1 PLC processing level

| Program name | Description (frequency, level, etc.) |
| :--- | :--- |
| High-speed processing <br> program | This program starts periodically with a time interval of 7.1 ms. <br> This program has the highest level as a program that starts periodically. <br> It is used in signal processing where high speed processing is required. <br> Processing time of this program shall not exceed 0.5ms. <br> Application example: <br> Position count control of turret and ATC magazine |
| Main processing <br> program (ladder) | This program runs constantly. When one ladder has been executed from <br> the head to END, the cycle starts again at the head. |

(Note 1) The section from the END command to the next scan is done immediately as shown with the $X$ section. Note that the min. scan time will be 14.2 msec .

Fig. 2.1-1 PLC processing program operation timing chart

### 2.2 User Memory Area Configuration

The user memory area approximate configuration and size are shown below.

|  | Control information | $\qquad$ Control table indicating the user PLC configuration (The table is automatically generated.) <1280 bytes> |
| :---: | :---: | :---: |
| P251 | High speed processing program | High-speed processing program <br> The program does not need to be a high speed processing program. |
| P252 | Main processing program | - PLC main process <br> <16 Kbyte together with high speed process> |
|  | Message data | $\qquad$ Message data for alarm messages, PLC switches, etc. <32 Kbyte-main process-high speed process-control information> |

Max. 32 Kbyte from control information to messages.

## 3. Input/Output Signals

### 3.1 Input/Output Signal Types and Processing

The input/output signals handled in user PLC are as follows:
(1) Input/output from/to controller
(2) Input/output from/to operation board (Note 1)
(3) Input/output from/to machine

The user PLC does not directly input or output these signals from or to hardware or controller; it inputs or outputs the signals from or to input/output image memory. For the reading and writing with the hardware or controller, the controller will perform the input/output according to the level of the main process or high speed process.

(Note 1) The operation board here refers to when the remote I/O is installed on the communication terminal. (This cannot be used with the MELDASMAGIC 64 Series.)

Fig. 3.1-1 Concept of input/output processing

Fig. 3.1-2 Input/output processing conforming to program level

Table 3.1-1 lists whether or not high speed input/output, interrupt input and initial processing can be performed.

Table 3.1-1 Whether or not high speed input/output, interrupt input and initial can be performed

|  | High speed input <br> specification | High speed output <br> specification |
| :--- | :---: | :---: |
| Input signal from control unit | x | x |
| Output signal to control unit | x | x |
| Input signal from machine | O (2-byte units) | x |
| Output signal to machine | x | O (2-byte units) |
| Input signal from operation <br> board (Cannot be used with the <br> MELDASMAGIC 64 Series) | x | x |
| Output signal to operation board <br> (Cannot be used with the <br> MELDASMAGIC 64 Series) | x | x |
| Input signal from MELSEC <br> when connected to MELSEC <br> (Cannot be used with the <br> MELDASMAGIC 64 Series) | x | x |
| Output signal to MELSEC when <br> connected to MELSEC <br> (Cannot be used with the <br> MELDASMAGIC 64 Series) |  |  |

$\bigcirc$ : Possible $\quad x$ : Not possible
The operation board in Table 3.1-1 is applied when control is performed by operation board input/output card that can be added as NC option.

### 3.2 Handling of Input Signals Designated for High Speed Input

The input/output signals used in user PLC are input/output for each program level as shown in Fig. 3.1-2.
In high speed processing, input/output signal for which high speed input or output designation (parameter) is made is input or output each time the high speed processing program runs. In main processing, signals other than interrupt input signals or high speed input/output designation are input/output.
When high speed input designation signal is used in main processing, the input signal may change within one scan because high speed processing whose level is higher than main processing interrupts. Input signal which must not change within one scan should be saved in temporary memory $(M)$, etc., at the head of main processing and the temporary memory should be used in the main program, for example.

Input image memory

The hatched area is high speed input designation part. Whenever the high speed processing program runs, data is reset in the hatched area. Thus, the signal in the hatched area may change in main processing (A) and (B) because the high speed process re-reads the input signal in the hatched area.

### 3.3 High Speed Input/output Designation Method

High speed input/output is designated by setting the corresponding bit of the bit selection parameter as shown below.
(1) High speed input designation

|  | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Bit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit selection parameter <br> \#6457 | $\begin{gathered} x 70 \\ \times 7 \mathrm{~F} \end{gathered}$ | $S_{\times 6 F}^{x 6}$ | $S_{\times 5 F}^{x 5}$ | $\begin{gathered} \mathrm{X} 40 \\ S_{4} \mathrm{~F} \end{gathered}$ | $\begin{gathered} x 30 \\ \times 3 F \end{gathered}$ | $\int_{x}^{x 20}$ | $\int_{x 1 F}^{10}$ | $\begin{array}{r} \times 00 \\ \times 0 F \end{array}$ | These bits correspond to the low-order byte (bits 0~7) of file register R2928. |
| \# 6458 | $\int_{X F F}^{X F}$ | $S_{X E F}^{X E}$ | $\int_{X D F}^{X D}$ | $S_{X C F}^{X C}$ | $\int_{X B F}^{X B}$ | $\int_{X A F}^{X A}$ | $\int_{x}^{x} 90$ | $S_{x 85}^{x}$ | These bits correspond to the high-order byte (bits 8~F) of file register R2928. |

(2) High speed output designation

|  | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | - Bit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit selection parameter $\# 6461$ | $\int_{Y 7 F}^{Y}$ | $\int_{Y 6 F}^{Y 60}$ | $S_{Y 5 F}^{Y 5}$ | $\int_{Y 4 F}^{Y 40}$ | $S_{Y 3 F}^{Y}$ | $S_{Y 2 F}^{Y}$ | $\int_{Y 1 F}^{Y}$ | $S_{Y O F}^{Y 00}$ | These bits correspond to the low-order byte (bits $0 \sim 7$ ) of file register R2930. |
|  |  |  |  |  |  |  |  |  |  |
| \#6462 | $S_{Y F F}^{Y F}$ | $\int_{Y E F}^{Y E O}$ | $S_{Y D F}^{Y D}$ | $S_{Y C F}^{Y C 0}$ | $S_{Y B F}^{Y B}$ | $\begin{gathered} \text { YA } 0 \\ S_{\text {YAF }} \end{gathered}$ | $\begin{gathered} Y 90 \\ S_{9 F} \end{gathered}$ | $\int_{Y 8 F}^{Y 80}$ | These bits correspond to the high-order byte (bits $8 \sim F$ ) of file register R2930. |

As listed above, one bit corresponds to two bytes (16 points).
Input or output in which 1 is set in the table is not performed at the main processing program level.
Although the number of bits set to 1 is not limited, set only necessary ones from viewpoint of overhead.
High speed input/output designation corresponds to the bit selection parameter and can be set in the parameter. However, it is recommended to set in a sequence program to prevent a parameter setting error, etc.
Example: -[MOV H3 R2928]-.... To designate X00~X0F, X10~X1F

### 3.4 Limits for Using High Speed Processing Program

### 3.4.1 Separation of Main Processing and High Speed Processing Bit Operation Areas

(1) Bit operation area

When using high speed processing, the bit operation range such as the temporary memory is separated from the main process.
(Method 1) When using the same $M$ or $G$ code, the bit operation area for high speed processing and the bit operation area for main processing are separated by 64 points or more and used.

For example, the following is used M0 to M4735 for main processing M4800 to M5120 for high speed processingSeparate by 64 points or more (M4736 to M4799 are not used)
(Method 2) $M$ is used for the main processing temporary memory and $G$ is used for the high speed processing temporary memory.
(Note 1) The output devices handled with high speed processing must be limited to $M$ or $G, Y, D$ and $R$.
(Note 2) These limits apply not only to the OUT command, but also to the PLF, PLS, SET, RST and MOV command, etc., outputs. The devices apply to all devices including M, G, F, E, T and Q .
(Note 3) Bit device G cannot be used for ladder program development using GPP.

## (Example)

## (2) Data area

Even with commands that handle data (numerical values) during the MOV command, etc., the bit area must be separated by 64 points or more and the data register (D) and file register (R) separated by four registers or more.

Example) Use D0 to D896 for main processing Use D900 to D1023 for high speed processing- Separate by four registers or more

### 3.4.2 Separation of Remote I/O Output

When handling high speed output during the high speed process, the main processing output and high speed processing output cannot be used together in the same remote I/O unit (32 points in channel No. setting rotary switch). A separate 32 points for high speed processing output or a 16-point remote I/O unit will be required.
MOV commands, etc., that extend over differing remote I/O units must not be enforced during either main processing or high speed processing. If these must be enforced, the channel No. setting rotary switch for the output unit used in the main processing and the output unit used for the high speed processing must be raised 1 or more.

(Usage example 1) Avoid interference with the main process by assigning 7 (last channel) for the channel No. rotary switch for high speed processing output. For example, use YE0 to YFF (for 32-point DO-L) or YE0 to YEF (for 16-point DO-R) as the high speed processing output.
(Refer to <Usage examples 1-1, 1-2 and 1-3> below.)
(Usage example 2) Assign Y0 to Y1F (32-point) for high speed processing, and use Y20 and following for the main process. (Refer to <Usage example 2> below.)
(Usage example 3) Assign the device after the device used for main processing for the high speed process.
For example, if the devices up to Y2D are used for the main process, use Y40 to Y5F (channel No. setting rotary switch No.: 2) for the high speed process.
(Refer to <Usage example 3> below.)
Relation of channel No. setting switch and device No.
(1) is the setting No. of the channel No. setting rotary switch

<Usage example 1-1>
(Devices are YEO and following)
<Usage example 2>

Usage examples $1-2$ show the assignment for the 16-point unit as the No. of high speed output points is relatively low.

<Usage example 3>

This is an outline drawing looking at the remote VO unit from the front, in which the shaded portion is for high speed output.

## 4. Parameters

## 4. Parameters

### 4.1 PLC Constants

The parameters that can be used in user PLC include PLC constants set in the data type. Set up data is stored in a file register and is backed up. In contrast, if data is stored in the file register corresponding to PLC constant by using sequence program MOV instruction, etc., it is backed up. However, display remains unchanged. Display another screen once and then select the screen again.
48 PLC constants are set (the setting range is $\pm 8$ digits). (Signed 4-byte binary data)
The correspondence between the PLC constants and file registers is listed below. The setting and display screens are also shown.

| \# | Corresponding file registers |  | \# | Corresponding file registers |  | \# | Corresponding file registers |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | High order | Low order |  | High order | Low order |  | High order | Low order |
| 6301 | R2801 | R2800 | 6321 | R2841 | R2840 | 6341 | R2881 | R2880 |
| 6302 | R2803 | R2802 | 6322 | R2843 | R2842 | 6342 | R2883 | R2882 |

## PLC constant screen

### 4.2 Bit Selection Parameters

The parameters that can be used in user PLC include bit selection parameters set in the bit type. Set up data is stored in a file register and is backed up.
For use in bit operation in a sequence program, the file register contents are transferred to temporary memory ( $\mathrm{M}, \mathrm{G}$ ) using the MOV command. In contrast, if data is stored in the file register corresponding to bit selection by using the MOV command etc., it is backed up. However, display remains unchanged. Once display another screen and again select screen.
The corresponding between the bit selection parameters and file registers is listed below. The setting and display screens are also shown.

| \# | Corresponding file register | \# | Corresponding file register | \# | Corresponding file register | \# | Corresponding file register |

| C | $\begin{aligned} & \text { \#6477 } \\ & \text { R2938L } \end{aligned}$ |  |  |  |  |  |  |  |  |
| D | $\begin{aligned} & \# 6478 \\ & \text { R2938H } \\ & \hline \end{aligned}$ |  |  |  |  |  |  |  |  |
| E | $\begin{aligned} & \text { \#6479 } \\ & \text { R2939L } \\ & \hline \end{aligned}$ |  |  |  |  |  |  |  |  |
| F | $\begin{aligned} & \text { \#6480 } \\ & \text { R2939H } \\ & \hline \end{aligned}$ |  |  |  |  |  |  |  |  |

(Note 1) The bits marked - are used by the system. Be sure to set to 0 .
(Note 2) Parameters \#6481~\#6496 are not used. They are for debugging at MITSUBISHI.
(Note 3) For the parameter meanings, refer to the PLC Onboard Manual.
(Note 4) These cannot be used with the MELDASMAGIC 64 Series.

## 5. Explanation of Devices

### 5.1 Devices and Device Numbers

The devices are address symbols to identify signals handled in PLC. The device numbers are serial numbers assigned to the devices. The device numbers of devices $\mathrm{X}, \mathrm{Y}, \mathrm{U}, \mathrm{W}$, and H are represented in hexadecimal notation. The device numbers of other devices are represented in decimal notation.

### 5.2 Device List

| Device | Device No. | Unit | Details |
| :---: | :---: | :---: | :---: |
| X* | X0~X4BF (1216 points) | 1 bit | Input signal to PLC. Machine input, etc. |
| $\mathrm{Y}^{*}$ | Y0~Y53F (1344 points) | 1 bit | Output signal from PLC. Machine output, etc. |
| U* | U0~U178 (384 points) | 1 bit | Input signal to PLC for second system. Signal for No. 2 system. |
| W* | W0~W1FF (512 points) | 1 bit | Output signal from PLC for second system. Signal for No. 2 system. |
| M | M0~M5119 (5120 points) | 1 bit | Temporary memory |
| G | G0~G3071 (3072 points) | 1 bit | Temporary memory |
| F | F0~F127 (128 points) | 1 bit | Temporary memory, alarm message interface |
| L | L0~L255 (256 points) | 1 bit | Latch relay (backup memory) |
| E* | E0~E127 (128 points) | 1 bit | Special relay |
| T | T0~T15 (16 points) | 1 bit or 16 bits | 10ms unit timer |
|  | T16~T95 (80 points) | 1 bit or 16 bits | 100ms unit timer |
|  | T96~T103 (8 points) | 1 bit or 16 bits | 100ms unit integrating timer |
| Q | Q0~Q39 (40 points) | 1 bit or 16 bits | 10 ms unit timer (fixed) |
|  | Q40~Q135 (96 points) | 1 bit or 16 bits | 100ms unit timer (fixed) |
|  | Q136~Q151 (16 points) | 1 bit or 16 bits | 100ms unit integrating timer (fixed) |
| C | C0~C23 (24 points) | 1 bit or 16 bits | Counter |
| B | B0~B103 (104 points) | 1 bit or 16 bits | Counter (Fixed counter) |
| D | D0~D1023 (1024 points) | 16 bits or 32 bits | Data register for arithmetic operation |
| R* | R0~R8191 (8192 points) | 16 bits or 32 bits | File register. R500 to R549 and R1900 to R2799 are released to the user for interface between the PLC and controller. R1900 to R2799 are backed up by the battery. |
| A | A0, A1 (2 points) | 16 bits or 32 bits | Accumulator |
| Z | - (1 point) | 16 bits | Index of D or R address ( $\pm \mathrm{n}$ ) |
| V | - (1 point) | 16 bits | Index of D or R address ( $\pm \mathrm{n}$ ) |
| N | N0~N7 (8 points) | - | Master control nesting level |
| $\mathrm{P}^{*}$ | P0~P255 (256 points) | - | Label for conditional jump and subroutine call commands |
| K | K-32768~K32767 | - | Decimal constant for 16-bit command |
|  | $\begin{array}{r} \text { K-2147483648~ } \\ \text { K2147483647 } \end{array}$ | - | Decimal constant for 32-bit command |
| H | H0~HFFFF | - | Hexadecimal constant for 16-bit command |
|  | H0~HFFFFFFFF | - | Hexadecimal constant for 32-bit command |

(Note 1) The applications of the devices having a* in the device column are separately determined. Do not use the undefined device Nos., even if they are open.
(Note 2) Devices I, J and S are available besides the above devices, but must not be used.

### 5.3 Detailed Explanation of Devices

The devices used with the PLC are described below.

### 5.3.1 Input/output X, Y, U, W

Input/output $\mathrm{X}, \mathrm{Y}, \mathrm{U}$ and W are a window for executing communication with the PLC and external device or controller.

## Input $\mathrm{X}, \mathrm{U}$

(1) This issued commands or data from an external device such as a push-button, changeover switch, limit switch or digital switch to the PLC.
(2) Assuming that there is a hypothetical relay Xn built-in the PLC per input point, the program uses the a contact and $b$ contact of that Xn .
(3) There is no limit to the No. of a contacts and b contacts of the input Xn that can be used in the program.

(4) The input No. is expressed with a hexadecimal.

## Output Y, W

(1) This outputs the results of the program control to the solenoid, magnetic switch, signal lamp or digital indicator, etc.
(2) The output ( Y ) can be retrieved with the equivalent of 1 a contact.
(3) There is no limit to the No. of a contacts and b contacts of the output Yn that can be used in the program.

(4) The output No. is expressed with a hexadecimal.

### 5.3.2 Internal Relays M, G and F, Latch Relay L

The internal relay and latch relay are auxiliary relays in the PLC that cannot directly output to an external source.

## Internal relays M and G

(1) These relays are cleared when the power is turned OFF.
(2) There is no limit to the No. of a contacts and b contacts of the input relays that can be used in the program.
(3) The internal relay No. is expressed with a decimal.

## Internal relay F

Internal relay F is an interface for the alarm message display.
Use the bit selection parameter to determine whether to use this relay for the alarm message interface. The target will be F0 to F127. This internal relay can be used in the same manner as the internal relay M when not used as the alarm message interface.

## Latch relay L

(1) The original state is held even when the power is turned OFF.
(2) There is no limit to the No. of a contacts and b contacts of the latch relay that can be used in the program.
(3) The latch No. is expressed with a decimal.

### 5.3.3 Special Relays E

The special relays are relays having fixed applications such as the carrier flag for operation results and the display request signal to the CRT setting and display unit. Even the relays of E0 to E127 that are not currently used must not be used as temporary memory.

## Special relays E

(1) These relays are cleared when the power is turned OFF.
(2) There is no limit to the No. of a contacts and $b$ contacts of the special relays that can be used in the program.
(3) The special relay No. is expressed with a decimal.

### 5.3.4 Timer T, Q

(1) The 100 ms timer, 10 ms timer and 100 ms timer cumulative timer are available for this count-up type timer.

## 100ms Timer T, Q

(1) When the input conditions are set, the count starts. When the set value is counted, that timer contact will turn ON.
(2) If the input conditions are turned OFF, the 100 ms timer count value will be set to 0 , and the contact will turn OFF.

(3) The value is set with a decimal, and can be designated from 1 to 32767 ( 0.1 to 3276.7 sec.). The data register ( D ) data can also be used as the setting value. File register ( R ) cannot be used.

## 10ms Timer T, Q

(1) When the input conditions are set, the count starts. When the set value is counted, that timer contact will turn ON.
(2) If the input conditions are turned OFF, the 10 ms timer count value will be set to 0 , and the contact will turn OFF.

(3) The value is set with a decimal, and can be designated from 1 to 32767 ( 0.01 to 327.67 sec .). The data register ( D ) data can also be used as the setting value. File register ( R ) cannot be used.

## 100ms Cumulative timer T, Q

(1) When the input conditions are set, the count starts. When the set value is counted, that timer contact will turn ON.
(2) Even the input conditions are turned OFF, the 100 ms cumulative timer current value (count value) will be held, and the contact state will not change.
(3) The 100 ms cumulative timer count value will be set to 0 and the contact will turn OFF when the RST command is executed.

(4) The value is set with a decimal, and can be designated from 1 to 32767 ( 0.1 to 3267.7 sec.). The data register (D) data can also be used as the setting value. File register (R) cannot be used.
(5) When the bit selection parameter is set, the 100 ms cumulative timer current value (count value) will be held even when the power is turned OFF.
(2) Setting of timer setting value from CRT setting and display unit The timer setting value can be set with the CRT setting and display unit using device T. (Variable timer)
Whether the setting value (Kn) programmed with the sequence program or the setting value set from the CRT setting and display unit is valid is selected with the bit selection parameters. The changeover is made in a group for T0 to T103. Even when set from the CRT setting and display unit, the setting value ( Kn ) program will be required in the sequence program. However, the Kn value will be ignored. When the data register (D) is used for the setting value, the data register (D) details will be used as the setting value regardless of the parameter.

Note) The setting value for device $Q$ of the timer $T, Q$ cannot be set from the CRT setting and display unit.

### 5.3.5 Counter C, B

(1) The counter counts up and detects the rising edge of the input conditions. Thus, the count will not take place when the input conditions are ON.

## Counter C, B

(1) The value is set with a decimal, and can be designated from 1 to 32767. The data register (D) data can also be used as the setting value. File register ( $R$ ) cannot be used.
(2) The counter count value will not be cleared even if the input conditions turn OFF. The counter count value must be cleared with the RST command.
(3) When the bit selection parameter is set, the counter current value (count value) will be held even when the power is turned OFF.
(2) Setting of counter setting value from CRT setting and display unit

The counter setting value can be set with the CRT setting and display unit using device C. (Variable counter)
Whether the setting value $(\mathrm{Kn})$ programmed with the sequence program or the setting value set from the CRT setting and display unit is valid is selected with the bit selection parameters. The changeover is made in a group for C0 to C23. Even when set from the CRT setting and display unit, the setting value (Kn) program will be required in the sequence program. However, the Kn value will be ignored. When the data register (D) is used for the setting value, the data register (D) details will be used as the setting value regardless of the parameter.

Note) The setting value for device B of counter C, B cannot be set from the CRT setting and display unit.

### 5.3.6 Data Register D

(1) The data register is the memory that stores the data in the PLC.
(2) The data register has a 1-point 16-bit configuration, and can be read and written in 16-bit units. To handle 32-bit data, two points must be used. The data register No. designated with the 32-bit command will be the low-order 16-bit, and the designated data register No. +1 will be the high-order 16-bit.
(Example) Use of the DMOV command is shown below.

(3) The data that is stored once in the sequence program is held until other data is stored.
(4) The data stored in the data register is cleared when the power is turned OFF.
(5) Values that can be stored: Decimal -32768 to 32767 \} For 16-bit command (Using Dn)

Hexadecimal 0 to FFFF
Decimal -2147483648 to 2147483647 For 32-bit command Hexadecimal 0 to FFFFFFFF
(6) Data registers D0 to D1023 are all user release data registers.

### 5.3.7 File Register $R$

(1) As with the data registers, the file registers are memories used to store data. However, there are some that have fixed applications, and those that are released.
(2) The file register has a 1-point 16-bit configuration, and can be read and written in 16-bit units. To handle 32-bit data, two points must be used. The file register No. designated with the 32-bit command will be the low-order 16 -bit, and the designated file register No. +1 will be the high-order 16-bit.
(Example) Use of the DMOV command is shown below.

(3) The data that is stored once in the sequence program is held until other data is stored.
(4) The data stored in the file registers R500 to R549 and R1900 to R2799 and the user release registers R1900 to R2799 is not cleared when the power is turned OFF.
The other file registers have fixed applications such as interface of the PLC and controller, parameter interface, etc.
(5) Values that can be stored: Decimal -32768 to 32767 \} For 16-bit command (Using Rn)

Hexadecimal 0 to FFFF
Decimal -2147483648 to 2147483647 For 32-bit command
(Using Rn+1, Rn)
Hexadecimal 0 to FFFFFFFF

### 5.3.8 Accumulator $A$

(1) The accumulator is a data register that stores the results of the function command operation and the function commands where the operation results are stored are as follow.

```
Commands
SER, SUM, ROR, DROR, RCR, DRCR, ROL, DROL, RCL, DRCL
```

(2) When using commands other than those above, the accumulator can be used in the sequence program with the equivalent registers as the data registers.
(3) The accumulator has a 1-point 16-bit configuration, and can be read and written in 16-bit units.
(4) The accumulator has two points (A0, A1). With the 32-bit command, A0 will be the low-order 16 -bit, and A1 will be the high-order 16-bit. Thus, A1 cannot be designated with a 32 -bit command.
(5) The data stored in the accumulator is cleared when the power is turned OFF.
(6) Values that can be stored: Decimal - 32768 to 32767 \} For 16-bit command (Using A1 or A0)

Hexadecimal 0 to FFFF
Decimal -2147483648 to 2147483647 \} For 32-bit command
Hexadecimal 0 to FFFFFFFF (Using A1 or A0)

### 5.3.9 Index Registers $\mathbf{Z}$ and $V$

(1) Z and V index registers are available.
(2) The index registers are used as ornaments for the device (T, C, D, R).

(3) The index register has a 1-point 16-bit configuration, and can be read and written in 16-bit units.
(4) The data stored in the index register is cleared when the power is turned OFF.
(5) Values that can be stored: Decimal -32768 to 32767

Hexadecimal 0 to FFFF
Note) The CRT display of the index registers Z and V is as shown below.

### 5.3.10 Nesting N

(1) This indicates the master control nesting structure.
(2) The master control nesting ( N ) is used in order from smallest number.

(1) The conditions for each master control to turn ON are as follow.

| MC N0 M15 | ON when condition A is ON |
| :---: | :---: |
| MC N2 M16 | ON when conditions $A, B$ are ON |
| MC N2 M17 | ON when conditions $A, B, C$ are ON |

(2) The timer and counter when the master control is OFF is as follows.
. 100ms timer, 10 ms timer: The count value is set to 0 .

- 100 ms cumulative timer : The current count value is retained.
- Counter: The current counter value is retained.
- OUT command: All turn OFF.

### 5.3.11 Pointer $P$

(1) The pointer indicates the branch command (CJ, CALL) jump destination. The pointer No. assigned at the jump destination head is called the label.
(2) Pointers P0 to P159, P251, P252 and P255 are user release pointers.
(3) P255 always indicates END.
(P255 can be used as a device such as a CJ command, but cannot be used as a label. This cannot be used for the CALL command device.)

(4) The special usages of the pointers other than P255 are shown below.

P251: Label for starting PLC high speed processing program.
P252: Label for starting PLC main (ladder) processing program.
This can be omitted when there is only a PLC main (ladder) processing program.
P 128 to P159: Label for page return when printing out ladder diagram.
P128 to P159 are the head label of the return page. These can also be used as the normal CJ and CALL commands.
(Note 1) P251 and P252 cannot be used as CJ or CALL command devices.
(Note 2) Do not create a program in which the $P^{* *}$ in the PLC high speed processing program is jumped to from the PLC main processing program.
(Note 3) The $\mathrm{P}^{* *}$ used as a CJ or CALL command device must also be programmed as a label.
The PLC will not operate correctly if Notes 1 to 3 are not observed.

### 5.3.12 Decimal Constant K

(1) The decimal constant can be used in the following ways.

1) Timer counter setting value: Designate in the range of 1 to 32767.
2) Pointer No.: 0 to 159
3) Bit device digit designation: 1 to 8
4) Basic command, function command, exclusive command value setting

- 16-bit command: -32768 to 32767
- 32-bit command: -2147483648 to 2147483647
(2) The decimal constant is stored in the BIN value (binary) in the PLC.

### 5.3.13 Hexadecimal Constant H

(1) The hexadecimal constant is used to designate the basic command, function command and exclusive command values.

- 16-bit command: 0 to FFFF
- 32-bit command: 0 to FFFFFFFF

## 6. Explanation of Commands

### 6.1 Command List

### 6.1.1 Basic Commands

| Class | Process unit | Command sign | Symbol | Process details | No. of steps | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Basic command | Bit | L D | $1+$ | Start of logic operation (A contact operation start) | 1 | 39 |
|  |  | LDI |  | Start of logic denial operation (B contact operation start) | 1 | 39 |
|  |  | AND | $\longrightarrow$ | Logical AND <br> (A contact serial connection) | 1 | 41 |
|  |  |  | AK | Logical AND denial <br> (B contact serial connection) | 1 | 41 |
|  |  | $\bigcirc \mathrm{O}$ |  | Logical OR <br> (A contact parallel connection) | 1 | 43 |
|  |  | ORI | HK | Logical OR denial <br> (B contact parallel connection) | 1 | 43 |
|  |  | ANB |  | AND between logical blocks (Serial connection between blocks) | 1 | 45 |
|  |  | ORB |  | OR between logical blocks (Parallel connection between blocks) | 1 | 47 |
|  |  | OUT | $\longrightarrow \longrightarrow$ | Device output | 1~2 | 49 |
|  |  | SET | $\longrightarrow$ [SET | Device set | 2 | 55 |
|  |  | RST | [RST: | Device reset | 2 | 57 |
|  |  | M C | [MC. | Master control start | 3 | 59 |
|  |  | MCR | $\underline{M}$ | Master control release | 2 | 59 |
|  |  | PLS | $\longrightarrow[\dddot{P L S}$ | Generate one cycle worth of pulses at rising edge of input signal | 2 | 61 |
|  |  | PLF | $[$ PGF | Generate one cycle worth of pulses at falling edge of input signal | 2 | 61 |
|  |  | SFT | $[\ddot{\mathrm{SF}} \mathrm{F}$ | Device 1-bit shift | 2 | 63 |
|  |  | MPS | $\text { xif }+11$ | Registration of logical operation | 1 | 65 |
|  |  | MRD |  | Read of operation results registered in MPS | 1 | 65 |
|  |  | MPP | MPP | Reading and resetting of operation results registered in MPS | 1 | 65 |
|  |  | DEFR | DEFR | Generate one cycle worth of pulses to oper-ation results at rising edge of input signal | 1 | 67 |

### 6.1.2 Function Commands

(1) Comparison commands

| Class | Process unit | Command sign | Symbol | Process details | $\begin{gathered} \text { No. } \\ \text { of } \\ \text { steps } \end{gathered}$ | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| = | 16-bit | LD = |  | Continuity state when (S1) = (S2) <br> Non-continuity state when (S1) $=/(\mathrm{S} 2)$ | 3 | 70 |
|  |  | AND = |  |  | 3 | 70 |
|  |  | $\mathrm{OR}=$ | $L[\cdots$ |  | 3 | 70 |
|  | 32-bit | LDD $=$ | 1 [D=S | Continuity state when (S1+1, S1)=(S2+1, S2) Non-continuity state when $(\mathrm{S} 1+1, \mathrm{~S} 1) \neq(\mathrm{S} 2+1, \mathrm{~S} 2)$ | 3~4 | 72 |
|  |  | ANDD= | $[\mathrm{D}=\mathrm{Sl}$ [ S 2$]$ |  | 3~4 | 72 |
|  |  | ORD = | $L[0]$ |  | 3~4 | 72 |
| > | 16-bit | LD > |  | Continuity state when (S1) > (S2) <br> Non-continuity state when (S1) <= (S2) | 3 | 74 |
|  |  | AND > | [ -3.10 |  | 3 | 74 |
|  |  | OR > | [->>1 |  | 3 | 74 |
|  | 32-bit | LDD > | $\downarrow[0]>$ Sl | Continuity state when (S1+1, S1) > (S2+1, S2) Non-continuity state when $(\mathrm{S} 1+1, \mathrm{~S} 1)<=(\mathrm{S} 2+1, \mathrm{~S} 2)$ | 3~4 | 76 |
|  |  | ANDD> |  |  | 3~4 | 76 |
|  |  | ORD > | $L[0]$ |  | 3~4 | 76 |
| < | 16-bit | LD $<$ |  | Continuity state when (S1) < (S2) <br> Non-continuity state when (S1) >= (S2) | 3 | 78 |
|  |  | AND < |  |  | 3 | 78 |
|  |  | OR < |  |  | 3 | 78 |
|  | 32-bit | LDD < | $\downarrow[0<010.102]$ | Continuity state when (S1+1, S1) < (S2+1, S2) Non-continuity state when $(\mathrm{S} 1+1, \mathrm{~S} 1)>=(\mathrm{S} 2+1, \mathrm{~S} 2)$ | 3~4 | 80 |
|  |  | ANDD< | $[0<\mathrm{D}<\mathrm{Si}: \mathrm{S} 2]$ |  | 3~4 | 80 |
|  |  | ORD < | L[00<< |  | 3~4 | 80 |

(2) Arithmetic operation commands

| Class | Process unit | Command sign | Symbol | Process details | $\begin{gathered} \text { No. } \\ \text { of } \\ \text { steps } \end{gathered}$ | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| + | 16-bit | $+$ |  | $(\mathrm{S} 1)+(\mathrm{S} 2) \rightarrow(\mathrm{D})$ | 4 | 82 |
|  | 32-bit | D+ |  | $(\mathrm{S} 1+1, \mathrm{~S} 1)+(\mathrm{S} 2+1, \mathrm{~S} 2) \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 4~5 | 84 |
| - | 16-bit | - |  | $(\mathrm{S} 1)-(\mathrm{S} 2) \rightarrow(\mathrm{D})$ | 4 | 86 |
|  | 32-bit | D- |  | $(\mathrm{S} 1+1, \mathrm{~S} 1)-(\mathrm{S} 2+1, \mathrm{~S} 2) \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 4~5 | 88 |
| * | 16-bit | * |  | $(\mathrm{S} 1) \times(\mathrm{S} 2) \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 4 | 90 |
|  | 32-bit | D* |  | $\begin{aligned} & (\mathrm{S} 1+1, \mathrm{~S} 1) \times(\mathrm{S} 2+1, \mathrm{~S} 2) \\ & \rightarrow(\mathrm{D}+3, \mathrm{D}+2, \mathrm{D}+1, \mathrm{D}) \end{aligned}$ | 4~5 | 92 |
| 1 | 16-bit | 1 |  | $(\mathrm{S} 1) \fallingdotseq(\mathrm{S} 2) \rightarrow(\mathrm{D})$ <br> Quotient (D) Remainder (D+1) | 4 | 94 |
|  | 32-bit | D/ |  | $\begin{aligned} & (\mathrm{S} 1+1, \mathrm{~S} 1) \fallingdotseq(\mathrm{S} 2+1, \mathrm{~S} 2) \rightarrow \\ & \text { Quotient }(\mathrm{D}+1, \mathrm{D}) \text { Remainder }(\mathrm{D}+3, \mathrm{D}+2) \end{aligned}$ | 4~5 | 96 |
| +1 | 16-bit | INC |  | $(\mathrm{D})+1 \rightarrow(\mathrm{D})$ | 2 | 98 |
|  | 32-bit | DINC |  | $(\mathrm{D}+1, \mathrm{D})+1 \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 2 | 100 |
| -1 | 16-bit | DEC |  | $(\mathrm{D})-1 \rightarrow(\mathrm{D})$ | 2 | 102 |
|  | 32-bit | DDEC |  | $(D+1, D)-1 \rightarrow(D+1, D)$ | 2 | 104 |

(3) BCD $\leftrightarrow$ BIN conversion commands

| Class | Process unit | Command sign | Symbol | Process details | No. of step | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| BCD | 16-bit | BCD |  |  | 3 | 106 |
|  | 32-bit | DBCD |  |  | 3 | 108 |
| BIN | 16-bit | BIN |  |  | 3 | 110 |
|  | 32-bit | DBIN | $[\text { DBIN:S }$ | $\underset{\text { BCD (0~99999999) }}{\substack{\text { (\$1+1, S1) }}} \underset{(D+1, D)}{\text { BIN }}$ | 3 | 112 |

(4) Data transmission commands

| Class | Process unit | Command sign | Symbol | Process details | No. of step | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 而isas sion | 16-bit | MOV | - MOV: | $(\mathrm{S}) \rightarrow(\mathrm{D})$ | 3 | 114 |
|  | 32-bit | DMOV | $[$ [DMOV: | $(\mathrm{S}+1, \mathrm{~S}) \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 3~4 | 116 |
| Con-version | 16-bit | XCH |  | $(\mathrm{D} 1) \leftrightarrow(\mathrm{D} 2)$ | 3 | 118 |
|  | 32-bit | DXCH |  | $(\mathrm{D} 1+1, \mathrm{D} 1) \leftrightarrow(\mathrm{D} 2+1, \mathrm{D} 2)$ | 3 | 120 |
| Batch trans- <br> mis-si <br> on | 16-bit | BMOV | [BMOV: S: | (S) <br> (D) | 4 | 122 |
| Batch transmission of same data | 16-bit | FMOV | [MOV:S........................... |  | 4 | 124 |

(5) Program branch commands

| Class | Process unit | Command sign | Symbol | Process details | $\begin{gathered} \text { No. } \\ \text { of } \\ \text { step } \end{gathered}$ | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Jump | - | CJ |  | Jump to $\mathrm{P}^{* *}$ after input conditions are set | 2 | 126 |
| Pro-gr am end | - | FEND | [-FEND....] | End process during sequence program | 1 | 128 |
| Sub-r ou-tin e call | - | CALL | [CALLO...... | Execute $P^{* *}$ sub-routine program after input conditions are set | 2 | 130 |
| Re-tur <br> n | - | RET | - [........ $\ldots$ | Return to main program from subroutine program | 1 | 130 |

(6) Logical operation commands

| Class | Process unit | Command sign | Symbol | Process details | No. of step | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Logical AND | 16-bit | WAND |  | $(\mathrm{S} 1)^{\wedge}(\mathrm{S} 2) \rightarrow(\mathrm{D})$ | 4 | 132 |
|  | 32-bit | DAND | [ANDOS | $(\mathrm{D}+1, \mathrm{D})^{\wedge}(\mathrm{S}+1, S) \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 3~4 | 134 |
| Logical <br> OR | 16-bit | WOR | -[WOR S1: ST D D $]\}$ | $(\mathrm{S} 1) \mathrm{V}(\mathrm{S} 2) \rightarrow$ (D) | 4 | 136 |
|  | 32-bit | DOR | $\underline{[O O R: S: D]}$ | $(\mathrm{D}+1, \mathrm{D}) \vee(\mathrm{S}+1, S) \rightarrow(\mathrm{D}+1, \mathrm{D})$ | 3~4 | 138 |
| Exclu-si ve OR | 16-bit | WXOR | [WXOR:S1:S2:D] | $(\mathrm{S} 1) \mathrm{V}-(\mathrm{S} 2) \rightarrow$ (D) | 4 | 140 |
|  | 32-bit | DXOR | [DXOROM: D] | $(D+1, D)(S+1, S) \rightarrow(D+1, D)$ | 3~4 | 142 |
| Com-ple ment of 2 | 16-bit | NEG | [NEG: | $(\mathrm{D})+1 \rightarrow$ (D) | 2 | 144 |

(7) Rotation commands

| Class | Process unit | Command sign | Symbol | Process details | $\begin{aligned} & \text { No. } \\ & \text { of } \\ & \text { step } \end{aligned}$ | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Right rotation | 16-bit | $\square$ | $[\text { ROR: }$ |  | 2 | 146 |
|  |  |  | $\left[\begin{array}{llll} \mathrm{RCR} & \cdots \\ \hdashline \cdots & \mathrm{n} \end{array}\right]$ |  | 2 | 148 |
|  | 32-bit | DROR | $[\text { DROR: } n]$ |  | 2 | 150 |
|  |  | DRCR | $\left[\begin{array}{ll} {[R C R} \\ \end{array}\right]$ |  | 2 | 152 |
| Left rotation | 16-bit |  | $[R O L \ldots \ldots n]$ |  | 2 | 154 |
|  |  | $\square$ | $\left[\begin{array}{lllll} \mathrm{RCL} & \vdots & \ldots \end{array}\right]$ |  | 2 | 156 |
|  | 32-bit | DROL |  |  | 2 | 158 |
|  |  | DRCL | $\left[\begin{array}{lll} 0 R C L & n \\ \hdashline \cdots \end{array}\right]$ |  | 2 | 160 |
| Right shift | 16-bit | SFR |  |  | 3 | 162 |
|  | Devic とenit | DSFR | $[D G F R: \ldots \square \cdot n]$ |  | 3 | 164 |
| Left shift | 16-bit | $\square$ | $\left[\begin{array}{lll} {[S F L} \\ M & D \end{array}\right]$ |  | 3 | 166 |
|  | Devic とenit | DSFL | $-\left[\begin{array}{lll} O W F L & D & \vdots \\ \end{array}\right]$ |  | 3 | 168 |

(8) Data processing commands

| Class | Process unit | Command sign | Symbol | Process details | No. of step | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Search | 16-bit | SER | $\underline{-1}$ |  | 4 | 170 |
| Number of bits set to 1 | 16-bit | SUM | $[\text { SUM: : ........ }]$ |  | 2 | 172 |
| Decode | 2 n -bit | DECO |  |  | 4 | 174 |
|  | 16-bit | SEG | $[$ [EG: |  | 3 | 176 |
| Average value | 16-bit | AVE | -[AVE:S | 16-bit data average value $\frac{1}{n} \sum_{i=1}^{a} \quad(S+i) \rightarrow(D)$ | 4 | 178 |

(9) Other function commands

| Class | $\begin{aligned} & \hline \text { Pro- } \\ & \text { cess } \\ & \text { unit } \end{aligned}$ | Command sign | Symbol | Process details | $\begin{gathered} \hline \text { No. } \\ \text { of } \\ \text { step } \end{gathered}$ | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Carry flag set | - | STC | $[\ldots . . . . . .$. | Carry flag contact (E12) is turned on. | 1 | 180 |
| Carry flag reset | - | CLC | $[\ldots \mathrm{CLC} \ldots]\}$ | Carry flag contact (E12) is turned off. | 1 | 180 |
| BIT | 1-bit | LDBIT | $p$ [BIT S1 M | Bit test (a contact operation start handling) | 3 | 182 |
|  |  | ANDBIT |  | Bit test (a contact series connection handling) | 3 | 182 |
|  |  | ORBIT | [BIT:SI................ | Bit test (a contact parallel connection handling) | 3 | 182 |
|  |  | LDBII |  | Bit test (b contact operation start handling) | 3 | 184 |
|  |  | ANDBII | [BII Sl Sl ] n ] $]$ | Bit test (b contact series connection handling) | 3 | 184 |
|  |  | ORBII |  | Bit test (b contact parallel connection handling) | 3 | 184 |

### 6.1.3 Exclusive commands

| Class | Process unit | Command sign | Symbol | Process details | $\begin{gathered} \hline \text { No. } \\ \text { of } \\ \text { step } \end{gathered}$ | Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ATC | - | ATC | $-[A T C: K n: R n: R m]$ | K1: Tool number search | 4 | 194 |
|  |  |  |  | K2: Tool number AND search |  | 195 |
|  |  |  |  | K3: Tool change |  | 196 |
|  |  |  |  | K4: Random position tool change |  | 197 |
|  |  |  |  | K5: Forward rotation of pointer |  | 198 |
|  |  |  |  | K6: Reverse rotation of pointer |  | 198 |
|  |  |  |  | K7: Normal rotation of tool table |  | 199 |
|  |  |  |  | K8: Reverse rotation of tool table |  | 199 |
|  |  |  |  | K9: Tool data read |  | 200 |
|  |  |  |  | K10: Tool data write |  | 201 |
|  |  |  |  | K11: Automatic write of tool data |  | 202 |
| ROT | - |  |  | K 1 : Rotary body index | 4 | 207 |
|  |  |  | [ROT:Kn Rn:Rm] | K3: Ring counter |  | 210 |
| TSRH | - | TSRH |  | Spare tool selection in tool life management | 3 | 211 |
| DDB | - | DDBA <br> (Asynchro- <br> nous) | [DDBA: Rn | Data designated after $R n$ is read/written. | 2 | 222 |
|  |  | DDBS <br> (Synchro- <br> nous) | $\text { [DUBS:C....... }]$ | Data designated after $R n$ is read/written. | 2 | 225 |

### 6.2 Command Formats

### 6.2.1 How to Read the Command Table

The basic command and function command explanations are as follow.

## Example) Explanation of D+ command

D+ ... BIN 32-bit addition $\leftarrow$ The command sign is indicated.

The No. of steps of the D+ command is indicated. $4 / 5$ steps indicate that for the 32-bit command, two steps are required for the constant. In the example for the D+ com-mand, if S2 is the word device and step 4 is the constant, the No. of steps will

The commands that can use an $\qquad$ index $(Z, V)$ are circled.

The D+ command circuit display format is indicated.

The functions, execution conditions and program examples of each command are explained on the following pages.

### 6.2.2 No. of Steps

The basic No. of steps in the sequence command includes step 1 to step 5.
Main examples of each step are shown below.

| Basic No. of steps | Command (mnemonic) | Circuit display |
| :---: | :---: | :---: |
| Step 1 | LD, ANI, ANB, ORB, STC, CLC, FEND, RET, ${ }^{* *}$ |  |
| Step 2 | INC, DEC, SET, RST, OUT T, CJ, CALL, DDB |  |
| Step 3 | MOV, =, BCD, XCH |  |
| Step 4 | DMOV, +, -, ATC |  |
| Step 5 | D+, D-, D*, D/ |  |

As shown above, the command code, source and destination in basic No. of steps for the command are equivalent to one step each. Only the 32-bit command constant K or H uses two steps.
(Note) If the constant value in the DMOV or D* command, etc., is small, a display in which there is a space equivalent to one step will occur between the source (S) and destination (D) or between the source (S2) and destination (D). (Section marked with * in diagram.

### 6.2.3 END Command

When programming a sequence program with a circuit mode, the END command is automatically created.

### 6.2.4 Index Ornament

(1) The index ornament is used to add an index $(Z, V)$ to a device, add the details of the directly designated device No. and index register, and designate the device No.
(2) The index ( $Z, V$ ) can be set between -32768 to 32767 with a sign added.
(3) The index ornament is used only for the MOV command. (It cannot be used for DMOV.)
(4) The usable command format is shown below.

1) Transmission of data to $Z, V$

(Note 1) After circuit conversion, the display will change to $Z 0$ and V0. However, this must be input as " Z " and " V ".
2) Possible device combinations of MOV command with index ornament

|  | S (source) | D (destination) | Program example |
| :--- | :--- | :--- | :--- |
| MOV | Constant <br> Kn or Hn | (Word device) $\cdot$ Z <br> Example) D0Z, R500V | MOV K100 D0Z |
|  | Word device <br> Example) D0, R1900 | (Word device) $\cdot$ Z <br> Example) D0Z, R500V | MOV D0 D100V |
|  | (Word device) $\cdot$ Z <br> Example) D0Z, D1V | (Word device) $\cdot$ Z <br> Example) D0V, D1Z | MOV D0Z D20Z |
|  | (Word device) $\cdot$ Z <br> Example) D0Z, D1V | Bit designation <br> Example) K2Y20 | MOV D0Z K2M10 |
|  | Bit designation <br> Example) K2M00 | (Word device) $\cdot$ Z <br> Example) D0Z, R1900V | MOV K2M10 D0Z |

(Note 2) The word device refers to T, C, D, R, A0 and A1.
(Note 3) The CRT display of the circuit with index ornament is as shown below.

### 6.2.5 Digit Designation

A digit may need to be designated for the bit device ( $\mathrm{X}, \mathrm{Y}, \mathrm{M}, \mathrm{L}, \mathrm{E}, \mathrm{F}$ ) when using the function command. How many points of 4 -point unit bit devices are to be used with the 16 -bit or 32 -bit command is selected with this digit designation.
Use device K when designating the digit. The designation range is as shown below. A random bit device can be set for the bit device.
(a) 16-bit command: K1 to 4 (4 to 16 points)
(Example) Setting range with digit designation of X0 to F 16-bit data

(b) 32-bit command: K 1 to 8 (4 to 32 points)
(Example) Setting range with digit designation of $\mathrm{X0}$ to 1F 32-bit data.

(1) When a digit is designated on the source (S) side, the values that can be handled as source data will be as shown below.

Table of digit designations and values that can be handled

|  | For 16-bit command | For 32-bit command |
| :--- | :---: | :---: |
| K1 (4 points $)$ | $0 \sim 15$ | $0 \sim 15$ |
| K2 (8 points $)$ | $0 \sim 255$ | $0 \sim 255$ |
| K3 (12 points $)$ | $0 \sim 4095$ | $0 \sim 4095$ |
| K4 (16 points $)$ | $-32768 \sim 32767$ | $0 \sim 65535$ |
| K5 (20 points) | - | $0 \sim 1048575$ |
| K6 (24 points $)$ | - | $0 \sim 167772165$ |
| K7 $(28$ points $)$ | - | $0 \sim 268435455$ |
| K8 (32 points $)$ | - | $-2147483648 \sim 2147483647$ |

| Program example | Process |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| For 16-bit command |  |  |  |  |  |  |  |  |  |  |
| For 32-bit command |  |  |  |  |  |  |  |  |  |  |

(2) When a digit is designated on the destination (D) side, the No. of points designated by the digit will be the target of the destination side.

| Circuit side | Process |
| :---: | :---: |
| When source data ( S ) is a value |  |
| When source ( S ) data is a bit device |  |
| When source ( S ) data is a word device |  |

(Note) The CRT display of the circuit having a digit designation will be as follows.

## 7. Basic Commands

These commands are the basis for the sequence programs. The sequence program cannot be created without these commands.
The circuit can be created (programmed) with the same image as creating a circuit by combining the actual relay $A$ contacts and $B$ contacts as done conventionally.

O LD, LDI ... Operation start

| Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit desig-nation nation | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit device |  |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-sta } \\ \text { nt } \end{gathered}$ |  |  | Pointer | Level |  |  |  |  |
| X | Y | M |  | L | E | F | F | T | c | D | R | A0 | A1 | Z | V | K |  | H | P | N |  |  |  |  |
| $\bigcirc$ | $\bigcirc$ | 0 | O | $\bigcirc$ | O | 0 | O | O | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |  |  | 1 |  |  |

## Function

LD is the a contact operation start command and LDI is the b contact operation start command. The ON/OFF information of the designated device is read in as the operation results.

## Execution conditions

This is executed per scan regardless of the device ON/OFF setting.

## Program example

(1) Program used at head of circuit block.

(2) Program used at head of circuit block connected with ANB.

(3) Program used at head of circuit block connected with ORB.

○ AND, ANI ... Serial connection of contact

$\square$

## Function

AND is the a contact serial connection command, and ANI is the b contact serial connection command. The ON/OFF information of the designated device is read in, and the AND operation with the operation results up to that point is executed. The result is the operation result.

## Execution conditions

This is executed per scan regardless of the operation results before the AND, ANI commands.

## Program example

(1) Program used after LD, LDI, AND or ANI, etc.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X3 |  |  |  |
| 1 | AND | M6 |  |  |  |
| 2 | LDI | X4 |  |  |  |
| 3 | ANI | M7 |  |  |  |
| 4 | ORB |  |  |  |  |
| 5 | ANI | M9 |  |  |  |
| 6 | OUT | Y33 |  |  |  |
| 7 | LD | X5 |  |  |  |
| 8 | LD | M8 |  |  |  |
| 9 | OR | M9 |  |  |  |
| 10 | ANB |  |  |  |  |
| 11 | ANI | M11 |  |  |  |
| 12 | OUT | Y34 |  |  |  |
|  |  |  |  |  |  |

(2) Program used to connect contact in parallel with coil.

○ OR, ORI ... Parallel connection of one contact

## Function

OR is the one a contact parallel connection command, and ORI is the one b contact parallel connection operation command. The ON/OFF information of the designated device is read in, and the OR operation with the operation results up to that point is executed. The result is the operation result.

## Execution conditions

This is executed per scan regardless of the operation results before the OR, ORI commands.

## Program example

(1) Program used at head of circuit block.

## Coding

(2) Program used in circuit.

O ANB ... Serial connection of circuit block

## Function

(1) AND operation of the $A$ block and $B$ block is executed, and the operation results are obtained.
(2) The ANB symbol is a connection symbol instead of a contact symbol.
(3) When consecutively writing ANB, a max. of 7 commands (8 blocks) can be written. The PC cannot execute a correct operation if 8 or more commands are written consecutively.

## Program example

Program that serially connects continuous circuit blocks.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | ---: | ---: |
| 0 | LD | X0 |  |  |  |
| 1 | OR | X1 |  |  |  |
| 2 | LD | X2 |  |  |  |
| 3 | OR | X3 |  |  |  |
| 4 | ANB |  |  |  |  |
| 5 | LD | X4 |  |  |  |
| 6 | OR | X5 |  |  |  |
| 7 | ANB |  |  |  |  |
| 8 | LD | X6 |  |  |  |
| 9 | OR | X7 |  |  |  |
| 10 | ANB |  |  |  |  |
| 11 | LD | X8 |  |  |  |
| 12 | OR | X9 |  |  |  |
| 13 | ANB |  |  |  |  |
| 14 | OUT | M7 |  |  |  |
|  |  |  |  |  |  |

O ORB ... Parallel connection of blocks

| Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digitdesignation | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit device |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-sta } \\ \text { nt } \end{gathered}$ |  |  | Pointer | Level |  |  |  |  |
| X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | v | K |  | H | P | N |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 |  |  |

## Function

(1) OR operation of the $A$ block and $B$ block is executed, and the operation results are obtained.
(2) ORB connects circuit blocks with two or more contacts in parallel. Use OR or ORI to connect circuit blocks with only one contact in parallel.

Y10
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | AND | X1 |  |  |  |
| 2 | LD | X2 |  |  |  |
| 3 | AND | X3 |  |  |  |
| 4 | ORB |  |  |  |  |
| 5 | ORI | X4 |  |  |  |
| 6 | OUT | Y10 |  |  |  |
|  |  |  |  |  |  |

(3) The ORB symbol is a connection symbol instead of a contact symbol.
(4) When consecutively writing ORB, a max. of 7 commands ( 8 blocks) can be written. The PC cannot execute a correct operation if 8 or more commands are written consecutively.

## Program example

Program that connects continuous circuit blocks in parallel.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :---: | :---: |

| 11 | OUT | M7 |  |  |  |
|  |  |  |  |  |  |

O OUT (Y, M, G, L, E, F) ... Output (Y, M, G, L, E, F)

## Function

The operation results before the OUT command are output to the designated device.

| Operation <br> results | OUT command |  |  |
| :---: | :---: | :---: | :---: |
|  | Coil | Contact |  |
|  |  | a contact | b contact |
| OFF | OFF | Non-continuity | Continuity |
| ON | ON | Continuity | Non-continuity |

## Execution condition

This is executed per scan regardless of the operation results before the OUT command.

## Program example

(1) Program output to output unit.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :---: | :---: |
| 0 | LD | X5 |  |  |  |
| 1 | OUT | Y33 |  |  |  |
| 2 | LD | X6 |  |  |  |
| 3 | OUT | Y34 |  |  |  |
| 4 | OUT | Y35 |  |  |  |
|  |  |  |  |  |  |

(2) Program that turns internal relay or latch relay ON/OFF.

O OUT T, Q ... Timer output

|  |  |  |  |  |  |  |  |  |  | sa | dev | ice |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-st } \\ \text { ant } \end{gathered}$ |  | Pointer | Level |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | v | K | H | P | N |  |  |  |  |
| Device |  |  |  |  |  |  | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Setting value |  |  |  |  |  |  |  |  | O |  |  |  |  |  |  | O |  |  |  |  | 2 |  |  |

## Function

(1) When the operation results before the OUT command are ON, the timer coil will turn ON and count to the set value. When the time is counted up (count value ${ }^{3}$ set value), the contacts will change as shown below.

| a contact | Continuity |
| :---: | :---: |
| b contact | Non-continuity |

(2) If the operation results before the OUT command turn ON to OFF, the following will occur.

| Timer type | Timer coil | Timer current value | Before time up |  | After time up |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | a contact | b contact | a contact | b contact |
| 100 ms timer | OFF | 0 |  | Continuity | Continuity | Non-conti nuity |
| 10 ms timer |  |  | Non-conti nuity |  |  |  |
| 100ms cumulative timer | OFF | Hold current value | Non-conti nuity | Continuity | Continuity | Non-conti nuity |

(3) The state of the cumulative timer contact after time up will not change until the RST command is executed.

## Execution condition

This is executed per scan regardless of the operation results before the OUT command.

## Program example

(1) Program to turn ON Y 10 and Y 14 ten seconds after X 0 turns ON .

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X0 |  |  |  |  |
| 1 | OUT | T1 | K100 |  |  |  |
| 3 | LD | T1 |  |  |  |  |
| 4 | OUT | Y10 |  |  |  |  |
| 5 | OUT | Y14 |  |  |  |  |
|  |  |  |  |  |  |  |

(2) Program to use X10 to 1F BCD data as timer setting value.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | BIN | K4X10 | D10 |  |  |
| 4 | LD | X2 |  |  |  |
| 5 | OUT | T2 | D10 |  |  |
| 7 | LD | T2 |  |  |  |
| 8 | OUT | Y15 |  |  |  |
|  |  |  |  |  |  |

O OUT C, B ... Counter output

## Function

(1) If the operation results before the OUT command change from OFF to ON, the current value (count value) will be incremented by one. When the value is counted up (current value ${ }^{3}$ setting value), the contacts will change as shown below.

| a contact | Continuity |
| :---: | :---: |
| b contact | Non-continuity |

(2) The value will not be counted when the operation results are ON . (A pulse change is not required to input the count.)
(3) If the operation results change from OFF to ON after the current value $>=$ setting value is established, the contact state will remain the same and the current value will not be counted up.

## Execution condition

This is executed per scan regardless of the operation results before the OUT command.

## Program example

(1) Program to turn Y 30 ON when X 0 turns ON ten times, and to turn Y 30 OFF when X 1 turns ON .

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | OUT | C10 | K10 |  |  |
| 3 | LD | C10 |  |  |  |
| 4 | OUT | Y30 |  |  |  |
| 5 | LD | X1 |  |  |  |
| 6 | RST | C10 |  |  |  |
|  |  |  |  |  |  |

(2) Program to set C 10 setting value to 10 when X 0 turns ON , and to 20 when X 1 turns ON .

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | MOV | K10 | D0 |  |  |
| 4 | LD | X1 |  |  |  |
| 5 | MOV | K20 | D0 |  |  |
| 8 | LD | X3 |  |  |  |
| 9 | OUT | C10 | D0 |  |  |
| 11 | LD | C10 |  |  |  |
| 12 | OUT | Y30 |  |  |  |
|  |  |  |  |  |  |

O SET ... Device setting (ON)

## Function

(1) The designated device turns ON when the SET input turns ON.
(2) The device turned ON remains ON even if the SET input turns OFF. The device can be turned OFF with the RST command.

(3) If the SET input is OFF, the state of the device will not change.

## Execution condition

The execution conditions for the SET command are as shown below.

## Program example

(1) Program to set $\mathrm{Y} 8 \mathrm{~B}(\mathrm{ON})$ when X 8 turns ON , and reset Y 8 B (OFF) when X 9 turns ON .

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X9 |  |  |  |
| 1 | RST | Y8B |  |  |  |
| 3 | LD | X8 |  |  |  |
| 4 | SET | Y8B |  |  |  |
|  |  |  |  |  |  |

Operation of SET and RST commands

ORST ... Device resetting

## Function

(1) The designated device will change as explained below when the RST input turns ON.

| Device | Status |
| :--- | :--- |
| Y, M, E, F, L <br> W, J, S, G | The coil and contact are turned OFF. |
| T, C, Q, B | O is set for the current value, and the coil and <br> contact are turned OFF. |
|  |  |

(2) If the RST input is OFF, the state of the device will not change.

## Execution condition

The execution conditions for the RST command are as shown below.

## Program example

(1) Program to reset 100 ms cumulative timer and counter.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X4 |  |  |  |
| 1 | OUT | T96 | K18000 |  |  |
| 3 | LD | T96 |  |  |  |
| 4 | OUT | C23 | K16 |  |  |
| 6 | RST | T96 |  |  |  |
| 8 | LD | C23 |  |  |  |
| 9 | OUT | Y55 |  |  |  |
| 10 | LD | X5 |  |  |  |
| 11 | RST | C23 |  |  |  |
|  |  |  |  |  |  |

OMC, MCR ... Master control set/reset

## Function

## MC

(1) If the MC ON/OFF command is ON when the master control starts, the operation results between MC and MCR will remain the same.
(2) If the MC ON/OFF command is OFF, the operation results between MC and MCR will be as follows.

| $\mathbf{1 0 0} \mathbf{m s}, \mathbf{1 0 m s}$ <br> timer | 100ms cumulative timer counter | OUT <br> Command | SET/RST | SFT |
| :--- | :--- | :--- | :--- | :--- |
| Count value is set <br> to 0 | Current count value is held | All become <br> OFF | The state is <br> retained |  |

(3) Up to eight ( N 0 to 7 ) nests can be used. When using nests, the MC will use the nesting ( N ) from the smallest No., and MCR will use from the largest No.
(4) The program between the MC command and MCR command will be scanned regardless of the MC command ON/OFF state.
(5) By changing the destination D device, the MC command can be used as often as necessary in one scan.
(6) When the MC command is ON, the coil for the device designated for the destination will turn ON.

## MCR

(1) This is the master control cancel command, and indicates the end of the master control range.
(2) The designated nesting ( N ) No. and following nests will be canceled.

## Program example

(1) Program to turn MC ON when X 9 is ON and turn MC OFF when OFF.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X9 |  |  |  |
| 1 | MC | N0 | M98 |  |  |
| 4 | LD | X10 |  |  |  |
| 5 | OUT | Y30 |  |  |  |
| 6 | LD | X11 |  |  |  |
| 7 | OUT | Y31 |  |  |  |
| 8 | LD | X12 |  |  |  |
| 9 | OUT | Y32 |  |  |  |
| 10 | LD | X13 |  |  |  |
| 11 | OUT | Y33 |  |  |  |
| 12 | MCR | N0 |  |  |  |
|  |  |  |  |  |  |

O PLS, PLF ... Pulse (1 scan ON)

## Function

## PLS

(1) The designated device is turned ON for one scan when the PLS command changes from OFF to ON and is turned OFF in all other cases.

(2) Even if the sequence program is changed from RUN to STOP and then RUN after the PLS command is executed, the PLS command will not be executed. If the PLS command is ON when the power is turned ON, the PLS command will be executed.

## PLF

(1) The designated device is turned ON for one scan when the PLF command changes from ON to OFF and is turned OFF in all other cases.

(2) Even if the sequence program RUN switch is changed from RUN to STOP and then RUN after the PLF command is executed, the PLF command will not be executed.

## Program example

(1) Program to execute PLS command when X9 turns ON.
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X9 |  |  |  |
| 1 | PLS | M9 |  |  |  |
|  |  |  |  |  |  |

(2) Program to execute PLF command when X9 turns OFF.

Coding

O SFT ... Device shift

(STT input

## Function

(1) The device that designates the ON/OFF state of the device that is one number smaller than the device designated with D (destination) is shifted, and the device that is one number smaller is turned OFF.
(2) Turn the head device to be shifted ON with the SET command.
(3) When using SFT in succession, program from the largest device No.

Operation of shift command

## Program example

(1) Program to shift $Y 57$ to $5 B$ when $X 8$ turns $O N$.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X8 |  |  |  |
| 1 | SFT | Y5B |  |  |  |
| 3 | SFT | Y5A |  |  |  |
| 5 | SFT | Y59 |  |  |  |
| 7 | SFT | Y58 |  |  |  |
| 9 | LD | X7 |  |  |  |
| 10 | PLS | M8 |  |  |  |
| 12 | LD | M8 |  |  |  |
| 13 | SET | Y57 |  |  |  |
|  |  |  |  |  |  |

○ MPS, MRD, MPP ... Registering, reading and clearing of operation results

## Function

MPS
(1) The operation results (ON/OFF) just before the MPS command are registered.
(2) The MPS command can be used consecutively up to four times. If the MPP command is used in between, the No. of MPS usages will be decremented by one.

## MRD

(1) The operation results registered with the MPS command are read, and the operation is continued from the next step using those operation results.

## MPP

(1) The operation results registered with the MPS command are read, and the operation is continued from the next step using those operation results.
(2) The operation results registered with the MPS command are cleared.

## Point

(1) The circuits when MPS, MRD and MPP are used and not used are as follow.

## Program example

(1) Program using MPS, MRD and MPP.

(1)
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |

|  |  |  |  |  |  |

DEFR ... Pulses in regard to operation results

## Function

The operation results are turned ON for one scan when the DEFR command is turned from OFF to ON, and are turned OFF for all other cases.

## Execution conditions

This is executed per scan regardless of the operation results to the DEFR command.

## Program example

(1) Program to turn YO ON for one scan when X 9 turns ON .

## Coding

(2) Program to execute MOVE command once when X9 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X9 |  |  |  |
| 1 | DEFR | M0 |  |  |  |
| 2 | MOV | K0 | D10 |  |  |
| 5 |  |  |  |  |  |

## 8. Function Commands

Recent sequence programs that require more advanced control cannot provide sufficient control only with basic commands and thus need four-rule operation and comparison, etc.
Many function commands have been prepared for this. There are approx. 76 types of function commands.
Each command is explained in the following section.

OLD=, AND=, OR= .... Comparison of 16-bit data (=)

| , | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{array}{r} \text { Digit } \\ \text { desia } \end{array}$nation | $\begin{array}{\|l\|l\|} \hline \text { No. of } \\ \text { steps } \end{array}$ | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | $\left\|\begin{array}{c} \text { Con-st } \\ \text { ant } \end{array}\right\|$ |  | $\begin{gathered} \text { Pointer } \\ \hline \mathbf{P} \end{gathered}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathrm{N} \\ \hline \end{array}$ |  |  |  |  |
|  | x | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | v | K | H |  |  |  |  |  |  |
| S1 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  | $\bigcirc$ | O |  |  |  | 3 |  |  |
| S2 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | O | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  | $\bigcirc$ | 3 |  |  |

## Function

(1) 16-bit comparison operation is executed with a contact handling.
(2) The comparison operation results will be as follow.

| Conditions | Comparison operation results |
| :---: | :--- |
| S1=S2 | Continuity state |
| S1 $\neq \mathrm{S} 2$ | Non-continuity state |

## Execution conditions

The execution conditions for $\mathrm{LD}=$, $\mathrm{AND}=$ and $\mathrm{OR}=$ are as follow.

| Command | Execution conditions |
| :--- | :--- |
| LD $=$ | Executed per scan |
| AND $=$ | Executed only when previous <br> contact command is ON |
| OR= | Executed per scan |

## Program example

(1) Program to compare the X 0 to F data and D3 data.

(2) Program to compare the BCD value 100 and D3 data.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M3 |  |  |  |
| 1 | AND $=$ | H100 | D3 |  |  |
| 4 | OUT | Y33 |  |  |  |
| 5 |  |  |  |  |  |

(3) Program to compare the BIN value 100 and D3 data.

(4) Program to compare the D0 and D3 data.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |

## Function

(1) 32-bit comparison operation is executed with a contact handling.
(2) The comparison operation results will be as follow.

| Conditions | Comparison operation results |
| :---: | :--- |
| S1=S2 | Continuity state |
| S1 $1=$ S2 | Non-continuity state |

## Execution conditions

The execution conditions for LDD=, ANDD= and ORD= are as follow.

| Command | Execution conditions |
| :--- | :--- |
| LDD $=$ | Executed per scan |
| ANDD $=$ | Executed only when previous <br> contact command is ON |
| ORD $=$ | Executed per scan |

## Program example

(1) Program to compare the X 0 to 1 F data, D 3 and D 4 data.

(2) Program to compare the BCD value 18000, D3 and D4 data.

|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H |  |  |  |  |  |  |
| S1 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | O | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |
| S2 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  | $\bigcirc$ | $\bigcirc$ |  |  |  | 4 |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | O | 0 | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |

## Function

(1) The device designated with S1 and the device designated with S2 are subtracted, and the subtracted results are stored in the device designated with $D$.

(2) -32768 to 32767 (BIN 16-bit) can be designated in S1 and S2.
(3) The positive/negative of the data in S1, S2 and D is determined with the highest-order bit (B15).

| B15 | Judgment of <br> positive/negative |
| :---: | :---: |
| 0 | Positive |
| 1 | Negative |

(4) The carry flag will not turn ON if the 0 bit underflows.
$\qquad$

## Execution conditions

The execution conditions for - are as shown below.

## Program example

(1) Program to subtract the BIN data from D3 to D10 and output to D20.

| Coding |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | $\xrightarrow[(\mathrm{ON})]{\text { MO }}$ | D3 | D1 | D20] | $\begin{gathered} \begin{array}{c} \text { No. of } \\ \text { steps } \end{array} \\ \hline 0 \end{gathered}$ | Command LD | Device |  |  |  |
|  |  |  |  |  |  |  | M0 |  |  |  |
|  |  |  |  |  | 1 | - | D3 | D10 | D20 |  |
|  |  |  |  |  | 5 |  |  |  |  |  |

(2) Program to BCD output the difference of the timer T3 setting value and current value to D20.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X3 |  |  |  |
| 1 | OUT | T3 | K18000 |  |  |
| 3 | LD | M0 |  |  |  |
| 4 | MOV | K18000 | D2 |  |  |
| 7 | - | D2 | T3 | D3 |  |
| 11 | BCD | D3 | D20 |  |  |
| 14 |  |  |  |  |  |

## OD- ... BIN 32-bit subtraction

|  |  |  |  |  |  |  |  |  |  | ab | ice |  |  |  |  |  |  | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \\ \hline \end{array}$ | $\left\|\begin{array}{c} \text { Digit } \\ \text { desig- } \\ \text { deation } \end{array}\right\|$ | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-st } \\ \text { ant } \end{gathered}$ |  | $\begin{array}{\|c} \hline \text { Pointer } \\ \hline \mathbf{P} \end{array}$ |  |  |  |  |  |

| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | O | 0 | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |  |

Setting data

| S1 | Subtraction data or head No. of <br> device where subtraction data is <br> stored. |
| :--- | :--- |
| S2 | Subtraction data or head No. of <br> device where subtraction data is <br> stored. |
| D | No. of device to store subtraction <br> results |

## Function

(1) The device designated with S1 and the device designated with S2 are subtracted, and the subtracted results are stored in the device designated with $D$.

(2) -2147483648 to 2147483647 (BIN 32-bit) can be designated in S 1 and S2.
(3) The positive/negative of the data in $S$ and $D$ is determined with the highest-order bit (B31).

| B31 | Judgment of <br> positive/negative |
| :---: | :---: |
| 0 | Positive |
| 1 | Negative |

(4) The carry flag will not turn ON if the 0 bit underflows.

## Execution conditions

The execution conditions for D - are as shown below.

## Program example

(1) Program to subtract the D0, 1 data from the D10, 11 data when X1 turns ON, and output the results to D99, 100. Program to subtract the D0, 1 data from D10, 11 data when X2 turns ON, and output the results to D97, 98 .

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X1 |  |  |  |  |
| 1 | D- | D10 | D0 | D99 |  |  |
| 5 | LD | X2 |  |  |  |  |
| 6 | D- | D10 | D0 | D97 |  |  |
| 10 |  |  |  |  |  |  |

$\qquad$

○ * ... BIN 16-bit multiplication

Setting data

| S1 | Multiplication data or No. of device <br> where multiplication data is stored. |
| :---: | :--- |
| S2 | Multiplication data or No. of device <br> where multiplication data is stored. |
| D | Head No. of device to store <br> multiplication results |

## Function

(1) The BIN data designated with S1 and the BIN data designated with S2 are multiplied, and the multiplication results are stored in the device designated with $D$.

(2) -32768 to 32767 (BIN 16-bit) can be designated in S1 and S2.
(3) The positive/negative of the data in $S 1, S 2$ and $D$ is determined with the highest-order bit (B15, $D$ is B31).

| B15/B31 | Judgment of <br> positive/negative |
| :---: | :---: |
| 0 | Positive |
| 1 | Negative |

$\square$

## Execution conditions

The execution conditions for * are as shown below.

## Program example

(1) Program to multiply the D0 data and BIN 5678 when X 5 turns ON and output the results to D3, 4.

(2) Program to multiple the D0 BIN data and D10 BIN data, and output the results to D20.

## ○ ${ }^{*}$... BIN 32-bit multiplication

## Function

(1) The BIN data designated with S1 and the BIN data designated with S2 are multiplied, and the multiplication results are stored in the device designated with $D$.

(2) -2147483648 to 2147483647 (BIN 32-bit) can be designated in S1 and S2.
(3) The positive/negative of the data in $\mathrm{S} 1, \mathrm{~S} 2$ and D is determined with the highest-order bit (B31, D is $B 63$ ).

| B31/B63 | Judgment of <br> positive/negative |
| :---: | :---: |
| 0 | Positive |
| 1 | Negative |

## Execution conditions

The execution conditions for $D^{*}$ are as shown below.

## Program example

(1) Program to multiply the D7, 8 BIN data and D18, 19 BIN data when X 5 turns ON, and output the results to D1 to 4 .

(2) Program to multiply the D20 BIN data and D10 BIN data when X0 turns ON, and output the high-order 16-bit to Y30 to 4F.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X0 |  |  |  |  |
| 1 | D* $^{*}$ | D20 | D10 | D0 |  |  |
| 5 | DMOV | D3 | K8Y30 |  |  |  |
| 8 |  |  |  |  |  |  |

## O / ... BIN 16-bit division

Setting data

| S1 | Division data or No. of device where <br> division data is stored. |
| :--- | :--- |
| S2 | Division data or No. of device where <br> division data is stored. |
| D | Head No. of device to store division <br> results |

## Function

(1) The BIN data designated with S1 and the BIN data designated with S2 are divided, and the division results are stored in the device designated with $D$.

(2) -32768 to 32767 (BIN 16-bit) can be designated in S1 and S2.
(3) The positive/negative of the data in S1, S2 and D is determined with the highest-order bit (B15).

| B15 | Judgment of <br> positive/negative |
| :---: | :---: |
| 0 | Positive |
| 1 | Negative |

(4) For the word device, the operation results will be stored as quotient and redundant using the 32-bit.

Quotient ... Stored in low-order 16-bit.
Redundant... Stored in high-order 16-bit.
(5) The S1 and S2 data will not change even after operation is executed.
1

## Execution conditions

The execution conditions for / are as shown below.

## Program example

(1) Program to divide the D10 data by 3.14 when X 3 turns ON , and output the value (quotient) to D5.
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X3 |  |  |  |  |
| 1 | $*$ | D10 | K100 | D0 |  |  |
| 5 | $/$ | D0 | K314 | D5 |  |  |
| 9 |  |  |  |  |  |  |

## Point

The source and destination sides of the above program are as follow.

OD/ ... BIN 32-bit division

Setting data

| S1 | Division data or head No. of device <br> where division data is stored. |
| :--- | :--- |
| S2 | Division data or head No. of device <br> where division data is stored. |
| D | Head No. of device to store division <br> results |

## Function

(1) The BIN data designated with S1 and the BIN data designated with S2 are divided, and the division results are stored in the device designated with D .

(2) -2147483648 to 2147483647 (BIN 32-bit) can be designated in S 1 and S 2 .
(3) The positive/negative of the data in S and D is determined with the highest-order bit (B31).

| B31 | Judgment of <br> positive/negative |
| :---: | :---: |
| 0 | Positive |
| 1 | Negative |

(4) For the word device, the operation results will be stored as quotient and redundant using the 64-bit.
Quotient ... Stored in low-order 32-bit.
Redundant... Stored in high-order 32-bit.
(5) The S1 and S2 data will not change even after operation is executed.

## Execution conditions

The execution conditions for $\mathrm{D} /$ are as shown below.

## Program example

(1) Program to multiply the D10 data by 3.14 when X 3 turns ON , and output the results to Y 30 to 3 F .

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X3 |  |  |  |  |
| 1 | ${ }^{*}$ | D10 | K314 | D0 |  |  |
| 5 | D | D0 | K100 | D2 |  |  |
| 10 | MOV | D2 | K4Y30 |  |  |  |
|  |  |  |  |  |  |  |

O INC ... (16-bit BIN data) +1

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digitdesig nation | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-st } \\ \text { ant } \end{gathered}$ |  | $\frac{\text { Pointer }}{} \frac{\mathbf{P}}{}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \\ \hline \end{array}$ |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D |  | R | A0 | A1 | z | v | K | H |  |  |  |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | O |  | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 2 |  |  |

## Function

(1) The device (16-bit data) designated with $D$ is incremented by one.

(2) If INC is executed when the details of the device designated with $D$ are $32767,-32768$ will be stored in the device designated with D.

## Execution conditions

The execution conditions for the INC command are as shown below.

## Program example

(1) Example of addition counter program

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X7 |  |  |  |

| 7 | LD | M5 |  |  |  |
| 8 | ANI | M38 |  |  |  |
| 9 | INC | D8 |  |  |  |
| 11 | LD= | K100 | D8 |  |  |
| 14 | OUT | M38 |  |  |  |
| 15 |  |  |  |  |  |

O DINC ... (32-bit BIN data) +1

## Function

(1) The device (32-bit data) designated with $D$ is incremented by one.

(2) If DINC is executed when the details of the device designated with $D$ are 2147483647 , -2147483648 will be stored in the device designated with $D$.

## Execution conditions

The execution conditions for the DINC command are as shown below.

## Program example

(1) Program to increment the DO, 1 data by one when MO turns ON.

(2) Program to increment X 10 to 27 data by one when M0 turns ON , and to store the results in D3, 4 .

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M0 |  |  |  |
| 1 | DMOV | K6X10 | D3 |  |  |
| 4 | DINC | D3 |  |  |  |
|  |  |  |  |  |  |

○ DEC ... (16-bit BIN data) -1

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit desig nation | No. of steps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | $\frac{\text { Pointer }}{\mathbf{P}}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathrm{N} \\ \hline \end{array}$ |  |  |  |  |

| D | $\left.\begin{array}{l}\text { Head No. of device to be }\end{array}\right]$ |
| :--- | :--- |
| DDECed |  | DDECed (-1)

## Function

(1) The device (32-bit data) designated with $D$ is decremented by one.

(2) If DDEC is executed when the details of the device designated with D are $0,-1$ will be stored in the device designated with $D$.

## Execution conditions

The execution conditions for the DDEC command are as shown below.

## Program example

(1) Program to decrement the DO, 1 data by one when MO turns ON.
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M0 |  |  |  |
| 1 | DDEC | D0 |  |  |  |
| $4(3)$ |  |  |  |  |  |

(2) Program to decrement X10 to 27 data by one when M0 turns ON , and to store the results in D3, 4.

OBCD ... BIN $\rightarrow$ BCD conversion (16-bit)

## Function

The BIN data (0 to 9999) of the device designated with S is BCD converted and transmitted to the device designated with $D$.

(Note 1) If the device BIN data designated by $S$ is not within 0 to 9999 , it will not be converted correctly.

## Execution conditions

The execution conditions for $B C D$ are as follow.
ON

## Program example

(1) Program to output C 4 current value from Y 20 to 2 F to BCD display.

| $\begin{gathered} \text { M0 } \\ \text { (ON) } \end{gathered}$ | $\left.\begin{array}{c\|c\|c}{[B C D} & C_{4} & D_{4} \\ \\ {[M O V} & D_{4} & K 4] O\end{array}\right]$ |  | No. of steps | Command | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 0 | LD | M0 |  |  |  |
|  |  |  | 1 | BCD | C4 | D4 |  |  |
|  |  |  | 4 | MOV | D4 | K4Y20 |  |  |

O DBCD $\ldots$ BIN $\rightarrow$ BCD conversion (32-bit)

## Function

The BIN data (0 to 99999999) of the device designated with S is BCD converted and transmitted to the device designated with D.

(Note 1) If the device BIN data designated by S is not within 0 to 99999999 , it will not be converted correctly.

## Execution conditions

The execution conditions for DBCD are as follow.

## Program example

(1) Program to output the current timer value of which the setting value exceeds 9999 to Y1C to 2F.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X3 |  |  |  |
| 1 | OUT | T5 | K18000 |  |  |
| 3 | LD | M0 |  |  |  |
| 4 | DBCD | T5 | D15 |  |  |
| 7 | DMOV | D15 | K5Y1C |  |  |

$\bigcirc$ BIN $\ldots$ BCD $\rightarrow$ BIN conversion (16-bit)

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |  |

## Function

The BCD data (0 to 9999) of the device designated with S is BIN converted and transmitted to the device designated with $D$.

D side BIN 9999

(Note 1) If the device digit data designated by $S$ is not within 0 to 9 , it will not be converted correctly.

## Execution conditions

The execution conditions for BIN are as follow.

## Program example

(1) Program to BIN convert the X 10 to 1B BCD data when X 8 turns $O n$, and store in D 8 .

O DBIN $\ldots$ BCD $\rightarrow$ BIN conversion (32-bit)

Setting data

| $S$ | BCD data or head No. of <br> device where BCD data is <br> stored |
| :--- | :--- |
| $D$ | Head No. of device to store <br> BIN data |

## Function

The BCD data (0 to 99999999) of the device designated with S is BIN converted and transmitted to the device designated with D.

(Note 1) If the device digit data designated by $S$ is not within 0 to 9 , it will not be converted correctly.

## Execution conditions

The execution conditions for DBIN are as follow.

## Program example

(1) Program to BIN convert the X 10 to 23 BCD data when X 0 turns ON , and to store in D14, 15.

| 0 |  | Coding |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  | 1 | DBIN | K5X10 | D14 |  |  |
|  |  | 4 |  |  |  |  |  |

(2) Program to BIN convert the D0, 1 data when X0 turns ON, and store in D18, 19.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | DBIN | D0 | D18 |  |  |
| 4 |  |  |  |  |  |

O MOV ... 16-bit data transmission

$\Delta$ : MOV from a bit device (word device) to Z or V is not possible.
$Z$ and $V$ cannot be independently placed on the source side, but can be used on the source side as ornaments for D and R .
Refer to "6.2.4 Index Ornaments" for details.
(Note 1) MOV to device $X$ can be programmed, but this is a command for testing by Mitsubishi. Do not use it.

## Function

The 16-bit data of the device designated with $S$ is transmitted to the device designated with $D$.

## Execution conditions

The execution conditions for MOV are as shown below.

## Program example

(1) Program to store input X 0 to $B$ data in D8.
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M0 |  |  |  |
| 1 | MOV | K3X0 | D8 |  |  |
| 4 |  |  |  |  |  |

(2) Program to store 155 in D8 as binary value when X 8 turns ON .

(3) Program to store 155 in D93 as BCD value in when XB turns ON .
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XB |  |  |  |
| 1 | MOV | H155 | D93 |  |  |
| 4 |  |  |  |  |  |

(4) Program to store 155 in D894 as hexadecimal (HEX) when X13 turns ON.

O DMOV ... 32-bit data transmission

(Note 1) DMOV from a bit device to a bit device is not possible.
(Note 2) DMOV to device X can be programmed, but this is a command for testing by Mitsubishi. Do not use it.

Setting data

| S | Transmission source data or <br> head No. of device where <br> data is stored |
| :---: | :--- |
| D | Head No. of transmission <br> destination device. |

## Function

The 32-bit data of the device designated with $S$ is transmitted to the device designated with $D$.

## Execution conditions

The execution conditions for DMOV are as shown below.

## Program example

(1) Program to store A0, A1 data in D0, D1.

| Coding |
| :--- |
| $(O N)$ |

(2) Program to store $\mathrm{X0}$ to 1F data in D0, D1.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M0 |  |  |  |
| 1 | DMOV | K8X0 | D0 |  |  |
|  |  |  |  |  |  |

O XCH ... 16-bit data exchange

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{array}{r} \text { Digit } \\ \text { desia } \end{array}$nation | $\begin{array}{\|l\|l\|} \hline \text { No. of } \\ \text { steps } \end{array}$ | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  | Con-s |  |  | $\begin{array}{\|c} \hline \text { Pointer } \\ \hline \mathbf{P} \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathrm{N} \\ \hline \end{array}$ |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | v | K | H |  |  |  |  |  |  |
| D1 |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 3 |  |  |
| D2 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  | $\bigcirc$ | 3 |  |  |

Setting data

| D1 | No. of device where data to <br> be exchanged is stored. |
| :--- | :--- |
| D2 |  |

## Function

The D1 and D2 16-bit data are exchanged.

## Execution conditions

The execution conditions for the XCH command are as shown below.

## Program example

(1) Program to exchange T0 current value with D0 details when M8 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M8 |  |  |  |
| 1 | XCH | T0 | D0 |  |  |
|  |  |  |  |  |  |

(2) Program to exchange D0 details with M16 to M31 data when M10 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M10 |  |  |  |
| 1 | XCH | K4M16 | D0 |  |  |
|  |  |  |  |  |  |

(3) Program to exchange D0 details with R9 details when M0 turns ON.

| Coding |
| :---: |
| (Pulse coding) |

O DXCH ... 32-bit data exchange

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | $\frac{\text { Pointer }}{} \mathbf{P}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathrm{N} \\ \hline \end{array}$ |  |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H |  |  |  |  |  |  |  |
| D1 |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  | 3 |  |  |  |
| D2 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  | 3 |  |  |  |

## Function

The D1 and D2 32-bit data are exchanged.

## Execution conditions

The execution conditions for the DXCH command are as shown below.

## Program example

(1) Program to exchange T0 and T1 current values with D0, 1 details when M8 turns ON.

| Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. of steps | Command | Device |  |  |  |
|  | 0 | LD | M8 |  |  |  |
|  | 1 | DXCH | T0 | D0 |  |  |
|  |  |  |  |  |  |  |

(2) Program to exchange D0, 1 details with M16 to M47 data when M10 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X10 |  |  |  |
| 1 | DXCH | K8M16 | D0 |  |  |
|  |  |  |  |  |  |

(3) Program to exchange D0, 1 details with R9, 10 details when M0 turns ON.

○ BMOV ... Block transmission of 16-bit data

## Function

The details of n points from the device designated with S are batch transmitted to the n point designated with $D$.

## Execution conditions

The execution conditions of the BMOV command are as shown below.

## Program example

(1) Program to transmit the current values of T33 to 48 to D908 to 923.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | M90 |  |  |  |  |
| 1 | BMOV | T33 | D908 | H10 |  |  |
|  |  |  |  |  |  |  |

Block transmission with BMOV command

○ FMOV ... Batch transmission of same 16-bit data

## Function

The details of the device designated with $S$ are transmitted to the $n$ point designated with $D$.

## Execution conditions

The execution conditions of the FMOV command are as shown below.

## Program example

(1) Program to reset (clear) D8 to 23 when XA turns ON.

Resetting of data registers with FMOV command

| Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left[\begin{array}{ccc} \mathrm{FMOV}: \ldots 0 \text { K } 8 & 110 \end{array}\right]$ | No. of steps | Com mand | Device |  |  |  |
|  | 0 | LD | XA |  |  |  |
|  | 1 | FMOV | K0 | D8 | H10 |  |
|  | 5 |  |  |  |  |  |

## O CJ ... Conditional jump

| $\backslash$ |  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-st } \\ \text { ant } \end{gathered}$ |  | Pointer |  | $\begin{array}{\|c\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \end{array}$ |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H |  |  |  |  |  |  |  |
| P |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 2 |  |  |

## Function

## CJ

(1) The program of the designated pointer No. is executed when the jump command turns ON .
(2) The program of the next step is executed when the jump command is OFF.

## Point

(1) After the timer coil is turned ON, if the timer that is turning the coil ON with the CJ command is jumped, the timer count will continue.
(2) The scan time will be shortened if jumping is done after the CJ command.
(3) The CJ command can be used to jump to a smaller step.

(4) The devices skipped with CJ will not change.

(5) Label $\left(P^{* *}\right)$ possesses one step.

○ FEND ... Program end

## Function

The sequence program is ended.

## Program example

Program when using CJ command

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | OUT | Y20 |  |  |  |
| 2 | LD | XB |  |  |  |
| 3 | CJ | P23 |  |  |  |
| 5 | LD | X13 |  |  |  |
| 6 | OUT | Y30 |  |  |  |
| 7 | LD | X14 |  |  |  |
| 8 | OUT | Y31 |  |  |  |
| 9 | FEND |  |  |  |  |
| 10 | P23 |  |  |  |  |
| 11 | LD | X1 |  |  |  |
| 12 | OUT | Y22 |  |  |  |
| 13 |  |  |  |  |  |

O CALL, RET ... Call/return of sub-routine program

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| , | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | Pointer | Level |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H | P | N |  |  |  |  |
| $\mathbf{P}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\bigcirc$ |  |  | 2 |  |  |

## Function

CALL
(1) The sub-routine program designated with the point ( $\mathrm{P}^{* *}$ ) is executed.

## RET

(1) The end of the sub-routine program is indicated.
(2) When the RET command is executed, the sequence program in the step after the CALL command will be executed.

## Execution conditions

The execution conditions of the CALL command are as shown below.

## Program example

Program to execute sub-routine program when X 1 changes from OFF to ON.

O WAND ... Logical AND of 16-bit data

|  |  |  |  |  |  |  |  |  |  | ab |  |  |  |  |  |  |  | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \\ \hline \end{array}$ | Digitdesig nation | $\begin{aligned} & \text { No. of } \\ & \text { steps } \end{aligned}$ | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | $\begin{gathered} \text { Con-st } \\ \text { ant } \end{gathered}$ |  | $\begin{array}{\|c} \hline \text { Pointer } \\ \hline \mathbf{P} \end{array}$ |  |  |  |  |  |
|  | $\mathbf{x}$ | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | v | K | H |  |  |  |  |  |  |
| S1 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |
| S2 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  | O | $\bigcirc$ |  |  | $\bigcirc$ | 4 |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | O | 0 | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |

## Function

(1) Logical AND is executed for each bit of the 16-bit data in the device designated with S1 and the device designated with S 2 , and the results are stored in the device designated with D .

(2) Above the bit device digit designation is operated as 0 .
(Refer to program example (2) on the next page.)

## Execution conditions

The execution conditions for WAND are as follow.

## Program example

(1) Program that executes logical AND of the D10 data and D20 data when XA turns ON, and stores the results in D33.

(2) Program that executes logical AND of the X10 to 1B data and D33 data when XA turns ON, and outputs the results to D50.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XA |  |  |  |
| 1 | WAND | K3X10 | D33 | D50 |  |
|  |  |  |  |  |  |

| X1B -10 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 1 |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| D33 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  | 1 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | - | 1 | 0 | 0 | 1 |
|  | $\qquad$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| D50 | 0 | 0 | - | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |

O DAND ... Logical AND of 32-bit data

## Function

(1) Logical AND is executed for each bit of the 32-bit data in the device designated with D and the device designated in S , and the results are stored in the device designated with D .

(2) Above the bit device digit designation is operated as 0 .
(Refer to program example (1) on the next page.)

## Execution conditions

The execution conditions for the DAND command are as follow.

## Program example

(1) Program that executes logical AND of the X 30 to 47 24-bit data and D99, 100 data when X 8 turns ON, and transmit the results to M80 to 103.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X3 |  |  |  |
| 1 | DAND | K6X30 | D99 |  |  |
| 10 | DMOV | D99 | K6M80 |  |  |
|  |  |  |  |  |  |

(2) Program that executes logical AND of the D0, 1 32-bit data and R108, 109 when M16 turns ON, and outputs the results to Y100 to 11F.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M16 |  |  |  |
| 1 | DAND | D0 | R108 |  |  |
| 4 | DMOV | R108 | K8Y100 |  |  |
|  |  |  |  |  |  |

O WOR ... Logical OR of 16-bit data

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\begin{gathered} \text { Digit } \\ \text { desig- } \\ \text { nation } \end{gathered}$ | $\begin{aligned} & \text { No. of } \\ & \text { steps } \end{aligned}$ | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | $\left.\begin{gathered} \text { Con-st } \\ \text { ant } \end{gathered} \right\rvert\,$ |  | $\begin{array}{\|c} \hline \text { Pointer } \\ \hline \mathbf{P} \end{array}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \\ \hline \end{array}$ |  |  |  |  |
|  | x | Y | M | L | E | F | T | c | D | R | A0 | A1 | Z | V | K | H |  |  |  |  |  |  |
| S1 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |
| S2 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | 0 | $\bigcirc$ | $\bigcirc$ |  |  | O | $\bigcirc$ |  |  | $\bigcirc$ | 4 |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |

## Function

Logical OR is executed for each bit of the 16 -bit data in the device designated with S 1 and the device designated with S 2 , and the results are stored in the device designated with D .

## Execution conditions

The execution conditions for WOR are as follow.

## Program example

(1) Program that executes logical OR of the D10 data and D20 data when XA turns ON, and stores the results in D33.

(2) Program that executes logical OR of the X10 to 1B data and D33 data when XA turns ON, and outputs the results in D100.

O DOR ... Logical OR of 32-bit data

Setting data

| S | Data to be logical ORed or <br> head No. of device where <br> data is stored. |
| :---: | :--- |

## Function

Logical OR is executed for each bit of the 32-bit data in the device designated with $D$ and the device designated with S , and the results are stored in the device designated with D .

## Execution conditions

The execution conditions for DOR are as follow.

## Program example

(1) Program that executes logical OR of the X0 to 1F 32-bit data and the FOFF hexadecimal when XB turns ON , and stores the results in R66, 67.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XB |  |  |  |
| 1 | DMOV | HFOFF | R66 |  |  |
| 5 | DOR | X8X0 | R66 |  |  |
|  |  |  |  |  |  |

(2) Program that executes logical OR of the M64 to 87 24-bit data and X20 to 37 24-bit data when M8 turns ON, and stores the results in D23, 24.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M8 |  |  |  |
| 1 | DMOV | K6X20 | D23 |  |  |
| 4 | DOR | K6M64 | D23 |  |  |
|  |  |  |  |  |  |

O WXOR ... Exclusive OR of 16-bit data

Setting data

| S1 | Data to be exclusive ORed <br> or No. of device where data <br> is stored. |
| :--- | :--- |
| D | No. of device to store <br> exclusive OR results. |

## Function

Exclusive OR is executed for each bit of the 16-bit data designated with S1 and designated with S2, and the results are stored in the device designated with $D$.

## Execution conditions

The execution conditions for WXOR are as follow.

## Program example

(1) Program that executes exclusive OR of the D10 data and D20 data when XA turns ON, and stores the results in D33.

(2) Program that executes exclusive OR of the X10 to 1B data and D33 data when XA turns ON, and outputs the results to D100.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XA |  |  |  |
| 1 | WXOR | K3X10 | D33 | D100 |  |
|  |  |  |  |  |  |

O DXOR ... Exclusive OR of 32-bit data

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| , | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | Pointer | Level |  |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H | P | N |  |  |  |  |  |
| S | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  | $\bigcirc$ | $\bigcirc$ |  |  |  | $3 / 4$ |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |  |  |

Setting data

| $S$ | Data to be exclusive ORed <br> or head No. of device where |
| :---: | :--- |
|  |  |
| D | data is stored. |

## Function

Exclusive $O R$ is executed for each bit of the 32-bit data designated with $D$ and designated with $S$, and the results are stored in the device designated with $D$.

## Execution conditions

The execution conditions for DXOR are as follow.

## Program example

(1) Program that compares the X20 to 3F 32-bit data and the D9, 10 data when X 6 turns ON , and stores the differing No. of bits in D16.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X6 |  |  |  |
| 1 | DXOR | K8X20 | D9 |  |  |
| 4 | SUM | D9 |  |  |  |
| 6 | MOV | A0 | D16 |  |  |
|  |  |  |  |  |  |

## O NEG ... Complement of 2 (BIN 16-bit data)

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit nation | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | $\left\|\begin{array}{c} \text { Con-st } \\ \text { ant } \end{array}\right\|$ |  | Pointer <br> P | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \\ \hline \end{array}$ |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H |  |  |  |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 2 |  |  |

## Function

(1) The 16 -bit data of the device designated with D is reversed and incremented by one, and then stored in the device designated with D .

(2) This is used to use a negative BIN value as an absolute value.

## Execution conditions

The execution conditions for NEG are as follow.

## Program example

(1) Program to calculate D10 - D20 when XA turns ON and obtain an absolute value when the results are negative.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XA |  |  |  |
| 1 | AND | D10 | D20 |  |  |
| 4 | OUT | M3 |  |  |  |
| 5 | LD | XA |  |  |  |
| 6 | - | D10 | D20 | D10 |  |
| 10 | AND | M3 |  |  |  |
| 11 | NEG | D10 |  |  |  |
| 13 |  |  |  |  |  |

O ROR ... Right rotation of A0 data

## Function

The AO data excluding the carry flag is rotated to the right n bits.

## Execution conditions

The execution conditions for the ROR command are as shown below.

## Program example

Program to rotate the AO details 3 bits to the right when MO turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M0 |  |  |  |
| 1 | ROR | K3 |  |  |  |
| 3 |  |  |  |  |  |

Right rotation of data using ROR command

O RCR ... Right rotation of A0 data

## Function

The A0 data including the carry flag is rotated to the right n bits.

- The carry flag must be set to 1 or 0 before executing RCR.

## Execution conditions

The execution conditions for the RCR command are as shown below.

## Program example

Program to rotate the AO details 3 bits to the right when MO turns ON.

Right rotation of data using RCR command

○ DROR ... Right rotation of A0, 1 data

## Function

The A0, 1 data excluding the carry flag is rotated to the right n bits.

## Execution conditions

The execution conditions for the DROR command are as shown below.

## Program example

Program to rotate the A0, 1 details 3 bits to the right when M0 turns ON.
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XA |  |  |  |
| 1 | DMOV | K1 | A0 |  |  |
| 5 | LD | M0 |  |  |  |
| 6 | DROR | K3 |  |  |  |
| 8 |  |  |  |  |  |

Right rotation of data using DROR command

ODRCR ... Right rotation of A0, 1 data

## Function

The A0, 1 data including the carry flag is rotated to the right n bits.

. The carry flag must be set to 1 or 0 before executing DRCR.

## Execution conditions

The execution conditions for the DRCR command are as shown below.

## Program example

Program to rotate the A0, 1 details 3 bits to the right when M0 turns ON.

Right rotation of data using DRCR command

OROL ... Left rotation of A0 data

## Function

The A0 data excluding the carry flag is rotated to the left n bits.

- The carry flag must be set to 1 or 0 after executing ROL.

## Execution conditions

The execution conditions for the ROL command are as shown below.

## Program example

Program to rotate the AO details 3 bits to the left when MO turns ON.

## Coding

Left rotation of data using ROL command

O RCL ... Left rotation of A0 data

## Function

The A 0 data including the carry flag is rotated to the left n bits.

- The carry flag must be set to 1 or 0 before executing RCL.

## Execution conditions

The execution conditions for the RCL command are as shown below.

## Program example

Program to rotate the AO details 3 bits to the left when MO turns ON.

Left rotation of data using RCL command

○ DROL ... Left rotation of A0, 1 data

## Function

The A0, 1 data excluding the carry flag is rotated to the left n bits.

## Execution conditions

The execution conditions for the DROL command are as shown below.

## Program example

Program to rotate the A0, 1 details 3 bits to the left when MO turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XA |  |  |  |
| 1 | DMOV | H80000000 | AO |  |  |
| 5 | LD | M0 |  |  |  |
| 6 | DROL | K3 |  |  |  |
| 8 |  |  |  |  |  |

Left rotation of data using DROL command

O DRCL ... Left rotation of A0, 1 data

## Function

The A0, 1 data including the carry flag is rotated to the left n bits.

- The carry flag must be set to 1 or 0 before executing DRCL.

## Execution conditions

The execution conditions for the DRCL command are as shown below.

## Program example

Program to rotate the A0, 1 details 3 bits to the left when M0 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | XA |  |  |  |
| 1 | DMOV | H80000000 | AO |  |  |
| 5 | LD | M0 |  |  |  |
| 6 | DRCL | K3 |  |  |  |
| 8 |  |  |  |  |  |

Left rotation of data using DRCL command

## O SFR ... Right shift of 16-bit data

| , | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| , | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | Pointer | Level |  |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H | P | N |  |  |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 3 |  |  |  |
| n |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\bigcirc$ |  |  |  |  |  |  |  |

## Function

(1) The 16 -bit data of the device designated with D is shifted n bits to the right.

(2) n bits from the highest order are set to 0 .
(3) The T, C shift will be a current value (attribute value or count value) shift. (Shifting with the setting value is not possible.)

## Execution conditions

The execution conditions for SFR are as shown below.

## Program example

Program that shifts the details of D8 5 bits to the right when M10 turns ON.

## Coding

Right shift of data with SFR command (word device)

O DSFR ... Right shift of word device in batch

## Function

(1) $n$ points starting at the head of the device designated with $D$ are shifted one point to the right.

(2) The highest order device is set to 0 .
(3) The T, C shift will be a current value (attribute value or count value) shift. (Shifting with the setting value is not possible.)

## Execution conditions

The execution conditions of DSFR are as shown below.

## Program example

(1) Program to shift the details of D668 to 689 to the right when M10 turns ON.

| Coding |
| :---: |
| (Pulse coding) |

Right shift of data with DSFR command
(2) Program to shift the details of R6 to 9 to the right when M6 turns ON.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M6 |  |  |  |
| 1 | DSFR | R6 | K4 |  |  |
|  |  |  |  |  |  |

Right shift of data with DSFR command

○ SFL ... Left shift of 16-bit data

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit desig nation | No. of steps | Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| , | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | Pointer | Level |  |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H | P | N |  |  |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 3 |  |  |  |
| n |  |  |  |  |  |  |  |  |  |  |  |  |  |  | O | , |  |  |  |  |  |  |  |

## Function

(1) The 16-bit data of the device designated with $D$ is shifted $n$ bits to the left.
(2) $n$ bits from the lowest order are set to 0 .

(3) The T, C shift will be a current value (attribute value or count value) shift. (Shifting with the setting value is not possible.)

## Execution conditions

The execution conditions for SFL are as shown below.

## Program example

(1) Program that shifts the details of D8 5 bits to the left when M10 turns ON.

Left shift of data with SFL command (word device)

O DSFL ... Left shift of word device in batch

## Function

(1) $n$ points starting at the head of the device designated with $D$ are shifted one point to the left.

(2) The lowest order device is set to 0 .
(3) The T, C shift will be a current value (attribute value or count value) shift. (Shifting with the setting value is not possible.)

## Execution conditions

The execution conditions of DSFL are as shown below.

## Program example

(1) Program to shift the details of D683 to 689 to the left when M10 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M10 |  |  |  |
| 1 | DSFL | D683 | K7 |  |  |
|  |  |  |  |  |  |

Left shift of data with DSFL command
(2) Program to shift the details of R6 to 9 to the left when M6 turns ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M6 |  |  |  |
| 1 | DSFL | R6 | K4 |  |  |
|  |  |  |  |  |  |

Left shift of data with DSFL command

## 〇 SER ... Search of 16-bit data

Setting data

| S1 | No. of device where <br> search data is stored |
| :--- | :--- |
| S2 | Head No. of device <br> to be searched |
| $n$ | No. of devices to be <br> searched |

## Function

(1) Using the 16-bit data of the device designated with S 1 as the keyword, the n points from the 16-0bit data of the device designated with S2 are searched.
(2) The number of data items matching the keyword is stored in A1. The relative position of the device containing the first matched data counted from S 2 is stored in A0.
(3) When $n$ is a negative value, it is interpreted as 0 .
(4) No process is executed when $n=0$.

## Execution conditions

The execution conditions for SER are as shown below.

Search command

## Program example

Program to compare the data in D883 to D887 with 123 when XB turns ON.

## Coding

Search of data using SER command

O SUM ... Count of No. of 16 -bit data items set to 1

|  | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit nation | No. ofsteps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  |  | $\left\|\begin{array}{c} \text { Con-st } \\ \text { ant } \end{array}\right\|$ |  | $\begin{array}{\|c} \hline \text { Pointer } \\ \hline \mathbf{P} \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathbf{N} \\ \hline \end{array}$ |  |  |  |  |
|  | X | Y | M | L | E | F | T | c | D | R | AO | A1 | 1 | z | V | K | H |  |  |  |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  | 2 |  |  |

## Function

The total No. of bits in the 16 -bit data of the device designated with $S$ that are set to 1 is stored in $A 0$.

## Execution conditions

The execution conditions for SUM are as shown below.

## Program example

Program to obtain the No. of D10 data bits that are set to ON (1) when XB turns ON.

Counting with SUM command

O DECO ... $8 \rightarrow \mathbf{2 5 6}$ bit decoding

## Function

(1) The low-order $n$ bits of the device designated with $S$ are decoded, and the results are stored in the $2^{n}$ bit from the device designated with $D$.
(2) 1 to 8 can be designated for $n$.
(3) No process is executed when $n=0$, and the details of the device designated with $D$ will not change.
(4) The word device is handled as 16 bits.

## Execution conditions

The execution conditions for DECO are as shown below.

## Program example

(1) Program to decode the three bits 0 to 2 of R20, and turn the bits corresponding in D100 ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X0 |  |  |  |  |
| 1 | DECO | R20 | D100 | K3 |  |  |
| 5 |  |  |  |  |  |  |

(Note 1) The D100 bit 0 turns ON when the R20 B0 to B2 is 0 .
(Note 2) The D100 details remain the same even if X0 turns OFF.
(2) Program to decode the eight bits 0 to 7 of R20, and turn the bits corresponding in D100 to D115 ( $2^{8}=256$ bits) ON.

## Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | LD | X0 |  |  |  |  |
| 1 | DECO | R20 | D100 | K8 |  |  |
| 5 |  |  |  |  |  |  |

B15 B14813B12B11810 B9 B8 B7 B6 65 B4 B3 B2 B1 B0
R20

Interpreted as 0
When bit 0 to 7 data is binary and 33 .

○ SEG ... Decoding to 7-segment display data

| , | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit desig-nation | No. of steps | Index |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| , | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | Pointer | Level |  |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H | P | N |  |  |  |  |  |
| S |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 3 |  |  |  |
| D |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  |  |  |  |  |

Setting data

| $S$ | Decode data or No. of <br> device where decode data is <br> stored |
| :---: | :--- |
| D | No. of device to store <br> decoding results. |

## Function

(1) The 0 to F data designated with the low-order 4-bit in S is decoded in the 7 -segment display data and stored in D.

(2) Refer to the following page for the 7-segment display.

## Execution conditions

The execution conditions for SEG are as follow.

7-segment decode table

| S |  | Configuration of 7-segment | D |  |  |  |  |  |  |  | Display data |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Hexadecimal | Bit pattern |  | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |  |
| 0 | 0000 |  | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 1 | 0001 |  | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| 2 | 0010 |  | 0 | 1 | 0 | 1 | 1 | 0 | 1 | 1 | $\bigcirc$ |

| 5 | 0101 |  | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 1 | 5 |
| 6 | 0110 |  | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 5 |
| 7 | 0111 |  | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 7 |
| 8 | 1000 |  | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | $\square$ |
| 9 | 1001 |  | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | $\square$ |
| A | 1010 |  | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | П |
| B | 1011 |  | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | b |
| C | 1100 |  | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | L |
| D | 1101 |  | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 0 | $\square$ |
| E | 1110 |  | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | $E$ |
| F | 1111 |  | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | $F$ |

Lowest-order bit of word device

## Program example

Program to convert D7 data into 7-segment display data when X0 turns ON, and output to D8.
$0 \downarrow \quad \begin{aligned} x 0 \\ \\ 0\end{aligned}$ SEG
D7 D8

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | X0 |  |  |  |
| 1 | SEG | D7 | D8 |  |  |
|  |  |  |  |  |  |

O AVE ... Calculation of average value

Setting data

| Setting data |  |
| :---: | :--- |
| S | Head No. of device <br> where data to be <br> averaged is stored |
| D | Device No. of output <br> destination |
| $n$ | No. of averages |

## Function

The details of the n point devices from the device designated with S are averaged, and the results are output to the device designated with D.

## AVE

## Execution conditions

The execution conditions for AVE are as shown below.

## Program example

(1) Program to average the details of D882 to D888 when XB turns ON, and to output the results to D0.

| Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| of | No. of steps | Command | Device |  |  |  |
|  | 0 | LD | XB |  |  |  |
|  | 1 | AVE | D882 | D0 | K7 |  |
|  |  |  |  |  |  | , |

Averaging of data with AVE command
(Note) Fractional values are omitted.

O STC, CLC ... Setting/resetting of carry flag

## Function

STC
(1) The carry flag contact (E12) is set (ON).

CLC
(2) The carry flag contact (E12) is reset (OFF).

## Execution conditions

The execution conditions for STC and CLC are as shown below.

## Program example

Program to add the X0 to F data and D0 data when M0 turns ON and to turn the carry flag (E12) ON if the results exceed 9999. If the results are 9999 or less, the carry flag is turned OFF.

Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M0 |  |  |  |
| 1 | + | K4X0 | D0 | D1 |  |
| 5 | LD> | K4X0 | D1 |  |  |
| 8 | OR> | D0 | D1 |  |  |
| 11 | OUT | M1 |  |  |  |
| 12 | LD | M1 |  |  |  |
| 13 | STC |  |  |  |  |
| 14 | LD1 | M1 |  |  |  |
| 15 | CLC |  |  |  |  |
| 16 |  |  |  |  |  |

O LDBIT, ANDBIT, ORBIT ... Bit test of a contact handling

## Function

(1) A bit test of the 16 -bit device is executed with a contact handling.
(2) The bit test results are as shown below.

| Condition | Bit test results |
| :--- | :--- |
| When test bit is 1 | Continuity |
| When test bit is 0 | Non-continuity |

## Execution conditions

The execution conditions for LDBIT, ANDBIT and ORBIT are as shown below.

| Condition | Execution conditions |
| :--- | :--- |
| LDBIT | Executed per scan |
| ANDBIT | Executed only when previous <br> contact command is ON |
| ORBIT | Executed per scan |

## Program example

(1) Program to test bit 3 of D10.

| Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. of steps | Command | Device |  |  |  |
|  | 0 | LDBIT | D10 | K3 |  |  |
|  | 3 | OUT | Y33 |  |  |  |
|  | 4 |  |  |  |  |  |

(2) Program to test bit 15 of D10.

| Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. of steps | Command | Device |  |  |  |
|  | 0 | LD | M3 |  |  |  |
|  | 1 | ANDBIT | D10 | K15 |  |  |
|  | 4 | OUT | Y33 |  |  |  |
|  | 5 |  |  |  |  |  |

(3) Program to test bit 15 of D10.
Coding

| No. of <br> steps | Com- <br> mand | Device |  |  |  |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 0 | LD | M3 |  |  |  |
| 1 | LDBIT | D10 | HF |  |  |
| 4 | OR | M8 |  |  |  |
| 5 | ANB |  |  |  |  |
| 6 | OUT | Y33 |  |  |  |
| 7 |  |  |  |  |  |

(4) Program to test bit 10 of D10.

| Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. of steps | Command | Device |  |  |  |
| $\because$ | 0 | LD | M3 |  |  |  |
| - | 1 | AND | M8 |  |  |  |
|  | 2 | ORBIT | D10 | K10 |  |  |
|  | 5 | OUT | Y33 |  |  |  |
|  | 6 |  |  |  |  |  |

O LDBII, ANDBII, ORBII ... Bit test of b contact handling

| , | Usable device |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Digit designation | No. of steps | Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Bit device |  |  |  |  |  | Word (16-bit) device |  |  |  |  |  |  |  | Con-st ant |  | $\frac{\text { Pointer }}{P}$ | $\begin{array}{\|c\|} \hline \text { Level } \\ \hline \mathrm{N} \\ \hline \end{array}$ |  |  |  |  |
|  | X | Y | M | L | E | F | T | C | D | R | A0 | A1 | Z | V | K | H |  |  |  |  |  |  |
| S1 |  |  |  |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  |  |  |  |  |  | 3 |  |  |
| n |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\bigcirc$ |  |  |  | 3 |  |  |

## Function

(1) A bit test of the 16-bit device is executed with $b$ contact handling.
(2) The bit test results are as shown below.

| Condition | Bit test results |
| :--- | :--- |
| When test bit is 0 | Continuity |
| When test bit is 1 | Non-continuity |

## Execution conditions

The execution conditions for LDBII, ANDBII and ORBII are as shown below.

| Condition | Execution conditions |
| :--- | :--- |
| LDBII | Executed per scan |
| ANDBII | Executed only when previous <br> contact command is ON |
| ORBII | Executed per scan |

## Program example

(1) Program to test bit 3 of D10.

(2) Program to test bit 15 of D10.

(3) Program to test bit 15 of D10.

| $0$ | Coding |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | No. of steps | Command | Device |  |  |  |
|  | M8 | 0 | LD | M3 |  |  |  |
|  |  | 1 | LDBII | D10 | HF |  |  |
|  |  | 4 | OR | M8 |  |  |  |
|  |  | 5 | ANB |  |  |  |  |
|  |  | 6 | OUT | Y33 |  |  |  |
|  |  | 7 |  |  |  |  |  |

(4) Program to test bit 10 of D10.

## 9. Exclusive Commands

## 9. Exclusive Commands

Although the basic and functional commands are not used only for specific purposes, some commands may be efficient if command applications such as data transfer between under PLC and controller and controller display screen are limited.
Then, the M300 series provides a number of exclusive commands which are explained below.
Examples of exclusive commands:

- ATC dedicated command (ATC)
- Rotary body control command (ROT)
- Tool life management exclusive command (TSRH)
- DDB (direct data bus) ..... asynchronous
- External search
synchronous

### 9.1 ATC Exclusive Command

### 9.1.1 Outline of ATC Control

The ATC (Automatic Tool Change) can be controlled in the following two ways:

## (1) Mechanical random control

With the information of magazine position from the machine, and T command, the control system determines the direction of magazine rotation, number of steps required, etc. for index of the magazine, according to the given command.
Each tool and magazine tool pot (socket) have a one-on-one corresponding relation.
Usually, the "intermediate pot" that supports the transfer of the tool is provided between the spindle and the magazine.
This control is possible by not using ATC command, but ROT command only.
(2) Memory random control

With the information of magazine rotation, or magazine position from the machine, the control system refers to tool No. stored in the memory. For index of the magazine, the direction of magazine rotation and number of steps are determined by the given T command and tool No. stored in the memory.
Each tool and magazine tool pot (socket) does not always have a one-on-one corresponding relation.
Usually, the "intermediate pot" is not provided.

### 9.1.2 ATC Operation

The motions related to ATC operation can be largely divided into the following four motions:
(1) Index of magazine ..... (ATC-K1, K2, K5, K6, K7, K8)
(2) Tool change (arm, or the like is used) ..... (ATC-K3, K4)
(3) Transfer of tool to intermediate pot or arm ..... (Normal function commands such as MOV, XCH are used.)
(4) Others ..... (ATC-K9, K10, K11)

### 9.1.3 Explanation of Terminology

## (1) Pointer

This points out the position where the magazine is indexed. When a tool table in which tool No. are previously recorded is used, the tool table does not rotate with rotation of the magazine and the pointer serves as "ring counter" for control of magazine position.

## (2) Fixed pointer

This is the type with tool pots numbered and the relationship between tool pot and tool No. is fixed if the magazine is rotated. When the tool table is rotated, fixed pointer does not functionally differ from "floating pointer".
(3) Floating pointer

This is the type with numbered fixed position on magazine and the relationship between magazine No. and tool No. changes when the magazine rotates.

Relationship between pot No. and tool No. does not change.

### 9.1.4 Relationship between Tool Registration Screen and Magazines

When the floating pointer system or tool table rotation system is selected on the tool registration screen, correspondence display between the magazines and tools changes each time the magazine rotates; when the fixed pointer system is selected, it does not change.

## 9. Exclusive Commands

### 9.1.5 Use of ATC and ROT Commands

The use order of the ATC and ROT commands during the T command or tool change command is shown below:

The relationship between the tool number search command and rotary body indexing command when the tool table rotation system or floating pointer system is used is explained below.

## 9. Exclusive Commands

(1) Index tool number 8 in the situation shown above
(a) In the tool table rotation system, the tool number search command outputs 3.
(b) In the floating pointer system, the tool number search command outputs 7.
(2) The tool number search command output result is used by the rotary body indexing command to find the rotation direction, the number of steps, etc.
(a) In the tool table rotation system, rotation direction CW and number of steps 3 are found from the relationship between current value 0 (pointer 0 ) and tool number search output result 3.
(b) In the floating pointer system, rotation direction CW and number of steps 3 are found from the relationship between current value 4 (pointer 4) and tool number search output result 7, as in (a) above.

In the fixed pointer system, the pointer is fixed to 0 and the ring counter of 0 to $\mathrm{n}-1$ ( n is the number of magazines) separate from the pointer is controlled. The counter value is used as the current position.

### 9.1.6 Basic Format of ATC Exclusive Command

### 9.1.7 Command List

| Command |  |  |  | Description |
| :--- | :--- | :--- | :--- | :--- |
| ATC | K1 | Rn | Rm | Tool No. search |
| ATC | K2 | Rn | Rm | Tool No. logical product search |
| ATC | K3 | Rn | Rm | Tool change |
| ATC | K4 | Rn | Rm | Random position tool change |
| ATC | K5 | Rn | Rm | Pointer "FWD" rotation |
| ATC | K6 | Rn | Rm | Pointer "REV" rotation |
| ATC | K7 | Rn | Rm | Tool table "FWD" rotation |
| ATC | K8 | Rn | Rm | Tool table "REV" rotation |
| ATC | K9 | Rn | Rm | Tool data read |
| ATC | K10 | Rn | Rm | Tool data write |
| ATC | K11 | Rn | Rm | Automatic tool data write |
|  |  |  |  |  |

### 9.1.8 Control Data Buffer Contents

|  | Command | Rn | Rn+1 | Rn+2 |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Tool No. search | No. of register to store <br> search data | No. of register to which <br> data output | - |
| 2 | Tool No. logical product <br> search | No. of register to store <br> search data | No. of register to which <br> data output | Mask data position R <br> No. |
| 3 | Tool change <br> (Ex.: Spindle $\rightarrow$ Index <br> position) | No. of register to <br> specify the position of <br> tool change | - | - |
| 4 | Random position tool <br> change | No. of register to <br> specify the position of <br> tool change | No. of register to <br> specify the tool to be <br> changed | - |
| 5 | Pointer "FWD" rotation | - | - | - |
| 6 | Pointer "REV" rotation | - | - | - |
| 7 | Tool table "FWD" <br> rotation | - | - |  |
| 8 | Tool table "REV" <br> rotation | - | - |  |
| 9 | Tool data read | Magazine position (to <br> be read) R No. | No. of register to which <br> data output | - |
| 10 | Tool data write | Magazine position (to <br> be written) R No. | Written data position R <br> No. | - |
| 11 | Automatic tool data <br> write | Initial data storage R <br> No. | - |  |

### 9.1.9 File Register (R Register) Assignment and Parameters

(1) File registers for ATC control

The file registers used with the ATC are as shown below.

|  | Corresponding file (R) register |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

(Note 1) A maximum of 80 tools per magazine can be used.
(Note 2) The tool registration screen has been prepared only for the No. 1 magazine.

## (2) Control parameter contents

For details on the control parameters, refer to 9.1.12 Examples of Tool Registration Screen.

### 9.1.10 Details of Each Command

(1) Tool No. search

This command is used to search for tool No. stored in the tool data table.
When the command tool No. is found, number of searched data and its location are output. If two or more tool No. are found, the location of tool No. nearest to the pointer is output.

R540
(2) Tool No. logical product (AND) search

Tool number AND search is the same as the tool number search command (ATC K1) in function: search data and in-magazine tool number and AND data are ANDed together for a search.

(Note 1) Pointer and location are counted up, like 0, 1, $2 \ldots 9$, in the tool data table, starting from the tool data table head.
(Note 2) When pointer is not used, R2965 should be set to "zero".
Ex.) $-\mathrm{MOV} \mathrm{KO} \mathrm{K} 2965]$
(3) Tool change

When a spindle tool and a magazine index tool are exchanged by the ATC arm, etc., the contents in the memory ( R register) must be updated correspondingly.

(Note 1) When pointer is not used, R2965 should be set to "zero".
Ex.) $-\left[\begin{array}{lllll}M O V & \mathrm{~K} & \mathrm{R} 2965\end{array}\right]$

## (4) Random position tool change

In tool change, a spindle tool is usually exchanged with a magazine index tool. It may often occur, however, that tool change must be performed at a station other than the usual tool change position (tool change at auxiliary tool change position, for example). This command is used in such cases.

## (5) Pointer "FWD" rotation

In the ATC control with floating pointer, pointer count is controlled so that it coincides with the actually indexed magazine position when the magazine rotates in "FWD" direction for index.

When a magazine with 10 tools is used, the control sequence is as follows:
$0,1,2,3 \ldots \ldots .9,0,1,2, \ldots \ldots . .8,9,0,1 \ldots$
(Note 1) When this command is executed, the relationship between magazine No. and tool No., appearing on the tool entry display, changes accordingly.
(6) Pointer "REV" rotation

In the ATC control with floating pointer, pointer count is controlled so that it coincides with actually indexed magazine position when the magazine rotates in "REV" direction for index.

When a magazine with 10 tools is used, for example, the control sequence is as follows:
2, 1, 0, 9, 8 ........ 2, 1, 0, 9, $8 \ldots \ldots . .1,0,9,8 \ldots$
(Note 1) When this command is executed, the relationship between magazine No. and tool No., appearing on the tool entry display, changes accordingly.

## 9. Exclusive Commands

## (7) Tool table "FWD" rotation

The tool table rotates in "FWD" direction in accordance with the magazine rotation.

(Note 1) In this control mode, pointer always indicates "0" (tool table head).
(Note 2) When this command is executed, the relationship between magazine No. and tool No., appearing on the tool entry display, changes accordingly.
(8) Tool table "REV" rotation

The tool table rotates in "REV" direction in accordance with the magazine rotation.

(Note 1) In this control mode, pointer always indicates "0" (tool table head).
(Note 2) When this command is executed, the relationship between magazine No. and tool No., appearing on the tool entry display, changes accordingly.
(9) Tool data read

This command is used to call a specific tool No. in the magazine.

(10) Tool data write

Instead of setting tool No. through the CRT console, the tool No. is entered to each magazine No. set through PLC program.

## 9. Exclusive Commands

(11) Automatic tool data write

All tool Nos. are written (entered) in batch. This command is used for initialization, etc. The data are written one after another for each tool, starting from the default value.

## 9. Exclusive Commands

### 9.1.11 Precautions for Using ATC Exclusive Instructions

(1) When tool data is rewritten by ATC or other than ATC command, tool registration screen display is not updated. The following processing is required:

- Turn on special relay E64 by using the SET command.

## Program example)

- E64 processing is not required for ATC commands ATC K5, K6 (forward rotation, reverse rotation of pointer), ATC K7, K8 (forward rotation, reverse rotation of tool table).
E64 is set through the use of the user PLC and reset by controller.
(2) Method of tool registration prohibiting during magazine rotation If tool data is set on the tool registration screen during magazine rotation, data may be set in erroneous position. To prevent this error, a signal called special relay E71 is provided.
- Turn on E71 during magazine rotation.

## Program example)

- Setting of AUX data (R2998) is valid while E71 is being ON.

### 9.1.12 Examples of Tool Registration Screen

Tool registration screen examples are given below.
For operation, refer to the Operation Manual.

## (1) Comment display part

Comment in the comment display part is prepared by the user who uses the comment display function described in the PLC Development Manual (Personal Computer Section) and PLC Onboard Instruction Manual.
(2) Spindle tool, standby tool display part

The number of display items can be changed according to the control parameter value.
Control parameter (R2950)

00: Only spindle tool is displayed.
01: Spindle tool and standby 1 are displayed.
02: Spindle tool and standby 1 and 2 are displayed.
03: Spindle tool and standby 1~3 are displayed.
04: Spindle tool and standby 1~4 are displayed.
Q5 or more: No spindle tool or standby tool is displayed.
$\llcorner$ Hexadecimal expression
(3) Magazine tool number display part

The number of displayed magazine tools and the magazine number start value can be changed according to the number-of-magazine parameter and control parameter values.

1) Number of magazines

Number-of-magazine parameter (R2960): The value can be set in the range of 0 to 80 .
(Note) If 0 is set, the magazine number is not displayed. However, the magazine number and magazine tool number guide part is displayed.
2) Magazine number start value

Control parameter (R2950)

Example) Magazine number display when the number of magazines is 12.

| $M G$ TOOL-D | MG TOOL-D |
| :---: | :---: |
| 1 | $S$ |
| 2 | 11 |
| $S$ | 12 |

The magazine number starts at 1.

| MG TOOL-D | MG TOOL-D |
| :--- | :--- |
| 0 | $S$ |
| 1 | 10 |
| $S$ | 11 |

The magazine number starts at 0.

### 9.1.13 Display of Spindle Tool and Standby Tool

The tool mounted on the spindle or the tool to be mounted next on the spindle (standby tool) and tool No. in the magazine are set and displayed on the tool registration screen. However, the spindle and standby tool Nos. can also be displayed on the position display screen and tool length measurement screen that are often used. With this, the changes in the magazine pot and spindle tool No. according to the tool selection command or tool change command can be confirmed.
(1) Position display screen for 9 -inch CRT

## (2) Display tool selection parameter

A maximum of four standby tools can be displayed on the tool registration screen. The No. of the standby tool and the title to be displayed on the current value screen and tool length measurement screen, etc., are selected.

R2953

### 9.2 Rot Commands

Rot commands are prepared as functions such as rotary body target position, rotation direction and ring counter. The commands can be used to determine the direction of rotation and number of steps with the data resulting from ATC exclusive command tool No. search processing.

### 9.2.1 Command List

| Command |  |  |  | Description |
| :--- | :--- | :--- | :--- | :--- |
| ROT | K1 | Rn | Rm | Rotary body indexing |
| ROT | K3 | Rn | Rm | Ring counter |

## (1) Rotary body indexing

Direction of rotation and number of steps of ATC magazine (or turret) are determined automatically.

(Note) CW or CCW output is controlled so that it takes a short circuit regardless of parameter specification.
Number of rotary body indexing cycles designating $R$ number
Control buffer data position
designating R number

Rp (parameter) contents

0: Rotary body 1-km

0 : Direction of rotation is determined for shorter reach.
1: Direction of rotation is not determined for shorter reach.

0, 0: (Step No. +1 ) is counted.
0,1 : Step No. is counted.
1, 0: (Step No. -1) is counted.
(Note 1) The Index command is executed after setting $R$ numbers to Rn to $\mathrm{Rn}+3$ and writing data in the file registers (Rs) each corresponding to the R numbers. However, data setting to the parameter $(R p)$ is done once before execution of the Index command; this is to prevent the error code from being cleared.
(Note 2) The error code stored in bit F of the parameter ( Rp ) is cleared when the Index command activating signal (ACT) goes off.

## 9. Exclusive Commands

## 1) Example of rotary body index by ROT K1 instruction

Conditions: (i) The number of rotary body index cycles is 6.
(ii) The target position is specified by a T command.
(Note) Normally the target position must be a binary, but in this example, the number of rotary body index cycles is 1 to 6 , and there is no difference between the binary and BCD. Thus, the direct T command output file register $\mathrm{R} 36(B, C, D)$ is used.

In the example of ladder circuit shown below, the rotation direction is determined by the T command and current position data given by the machine, and the rotary body is rotated in that direction until the target position reaches the current position. When indexing is completed, the auxiliary command completion signal is turned on.

## 9. Exclusive Commands

(Note 1) Either M202 or M203 can be used for a stop signal.
(Note 2) The devices ( $\mathrm{X}, \mathrm{Y}$, and R ) are used in this example for no special purpose. Use any device within the available range.
(Note 3) If a number from 1 to 6 has not been specified for current position data (R512) before the ROT command is activated, an error results.
(Note 4) The control parameters (R510) are specified as follows:

1) Magazine $1 \sim \mathrm{~km}$
2) Take a short cut.
3) Calculate the number of steps.
(Note 5) The T command (R36) is output with a BCD code. In this example, the number of rotary body index cycles is 1 to 6 , and there is no difference between the binary and BCD. Thus, the contents of R36 are used as they are.
The target position and current value (R36 and R512 in this example), which are the data to be compared in the ROT K1 command must be binaries. (In actual use, the contents of R36 are binary converted.)

## (2) Ring counter (Up/down counter)

This command is used to control position of rotary body (or turret).

The ring counter is a binary counter; it is used as an up/down counter of 0 to $\mathrm{Km}-1$ or 1 to Km according to the parameter rotary body command.
$\underline{R p}$ (parameter) contents

(Note 1) The ring counter command is executed after setting $R$ numbers to $R n$ to $R n+1$ and specifying data for the parameter.
(Note 2) The error code ( Mm ) of the ring counter command and the error code in bit F of the parameter ( Rp ) are cleared when the activating signal (ACT) goes off. The activating signal (ACT) of the ring counter command is generally pulsed. This makes it hard for the interface diagnostic and ladder monitor programs to detect an error signal. For debugging, therefore, an error hold circuit is provided after the ring count command to ease error detection.

## 9. Exclusive Commands

### 9.3 Tool Life Management Exclusive Command

(When BASE SPEC parameter \#1037 cmdtype is set to 1 or 2.)
The following command is provided only for tool life management. (It is used for the machining centers.)

1. Spare tool selection ... TSRH

### 9.3.1 Tool Life Management System

(1) Tool life management I (When BASE SPEC parameter \#1096 T-Ltyp is set to 1.)

The use time or use count of the spindle tool specified from user PLC (R3720, R3721) is integrated and the tool use state is monitored. Tool data corresponding to the spindle tool is also output. (R3724~R3735)
(2) Tool life management II (When BASE SPEC parameter \#1096 T-Ltyp is set to 2.)

Tool life management II is provided by adding the spare tool selection function to tool life management I. Spare tool is selected among group by the spare tool selection command executed by user PLC during tool command, etc., and the tool data of the spare tool is output. Tool data corresponding to the spindle tool specified from user PLC is output (R3724~R3735) and tool offset corresponding to the spindle tool is made.

### 9.3.2 Tool Command System

One of the following two can be selected by using a parameter for command tool number (Rm contents) input to the spare tool selection command in tool life management II:
(1) Group number command system (When BASE SPEC parameter \#1104 T-Com2 is set to 0 .) The command tool number (Rm contents) input to the spare tool selection command is handled as group number. Spare tool is selected among the tools corresponding to the group number in tool data.
(2) Tool number command system (When BASE SPEC parameter \#1104 T-Com2 is set to 1.) The command tool number (Rm contents) input to the spare tool selection command is handled as a tool number. The group number containing the command tool number is found and spare tool is selected among the group.

### 9.3.3 Spare Tool Selection System

One of the following two can be selected by using a parameter for the spare tool selection system of the spare tool selection command in tool life management II:
(1) Selection in tool registration order (When BASE SPEC parameter \#1105 T-Sel2 is set to 0 .) Spare tool is selected among the used tools of a single group in the registration number order. If used tools do not exist, spare tool is selected among unused tools in the registration number order. If none of used and unused tools exist, spare tool is selected among normal life tools and abnormal tools (the former is assigned higher priority) in the registration number order.
(2) Life equality selection (When BASE SPEC parameter \#1105 T-Sel2 is set to 1.)

Tool whose remaining life is the longest is selected among the used and unused tools of a single group. If more than one tool has the same remaining life, it is selected in the registration number order. If none of used and unused tools exist, spare tool is selected among normal life tools and abnormal tools (the former is assigned higher priority) in the registration number order.

### 9.3.4 Interface

(1) User PLC $\rightarrow$ Controller

| Device name | Signal name | Explanation |
| :---: | :--- | :--- |
| Y29A | Auxiliary function locking <br> signal | While this signal is input, tool life management is <br> not made. |
| Y2C8 | Tool error 1 signal | This signal indicates tool error state 1. When <br> controller inputs the signal it changes the status in <br> spindle tool data to 3. (Unused tools or used tools <br> are changed to toll error state 1.) |
| Y2C9 | Tool error 2 signal | This signal indicates tool error state 2. When <br> controller inputs the signal, it changes the status in <br> spindle tool data to 4. (Unused tools or used tools <br> are changed to toll error state 2.) |
| Y2CA | Usage data counter validity <br> signal | If this signal is not input, the usage data is not <br> counted. |
| Y2CB | Tool life management input <br> signal | If this signal is input to controller and the tool life <br> management output signal is output to PLC, tool <br> life management is made. |

(2) Controller $\longrightarrow$ User PLC

| Device name | Signal name | Explanation |
| :--- | :--- | :--- |
| X20B | Tool life management output <br> signal | The controller outputs this signal to PLC while the <br> tool life management function is selected. (When <br> BASE SPEC parameter \#1103 T-Life is set to 1.) |

## 9. Exclusive Commands

### 9.3.5 User PLC Processing When the Tool Life Management Function Is Selected

A PLC processing example when tool change is made by the T command is given below:

## (1) Procedure when tool command is executed

(1) Tool life management I

1) When tool command ( $T$ command) is given, the controller outputs $T$ code data and start signal (TF). Note) The T code data (BCD) is binary converted and then used.
2) The user PLC checks the tool command. If life management is required, the user PLC executes the spare tool selection command.
3) The spare tool selection command outputs the tool data of the tool corresponding to the specified tool number.
4) The user PLC decides whether or not the tool can be used according to the status in the output tool data, and selects command tool or performs alarm processing.
(Note) If -1 is set in the group number in the output tool data, the tool data is invalid. At the time, the specified tool number is output to the tool number in the output tool data as it is.
(2) Tool life management II
5) When tool command ( $T$ command) is given, the controller outputs $T$ code data and start signal (TF). Note) The T code data (BCD) is binary converted and then used.
6) The user PLC checks the tool command. If life management is required, the user PLC executes the spare tool selection command.
7) The spare tool selection command selects the spare tool corresponding to the specified number (group number, tool number) and outputs the tool data of the spare tool.
8) The user PLC decides whether or not the tool can be used according to the status in the output tool data, and selects command tool or performs alarm processing.
(Note) If -1 is set in the group number in the output tool data, the tool data is invalid. At the time, the specified tool number is output to the tool number in the output tool data as it is.

## (2) Procedure when spindle tool is changed

1) When spindle tool is changed during the spindle tool change command (M06), etc., the user PLC specifies the tool number of the spindle tool (R3720~R3721).
The controller outputs the spindle tool data corresponding to the tool number of the spindle tool every user PLC main cycle (R3724~R3735).
2) The controller integrates the use time or use count of the spindle tool based on the spindle tool data in the tool data file.
In tool life management II, it also executes tool offset corresponding to the spindle tool.
(Note) If - 1 is set in the group number in the output spindle tool data, the spindle tool data is invalid. At the time, the specified tool number (R3720~R3721) is output to the tool number in the output spindle tool data as it is. The controller does not integrate the usage time or usage count of the spindle tool or make tool offset.
<When tool command is executed>

## 9. Exclusive Commands

<When tool is changed>
When tool is changed, the spindle tool number is set in R3720, R3721. (User PLC)

(3) Tool data flow

## 9. Exclusive Commands

## (4) Tool data

The tool data is tool management data such as the group number, tool number, and tool status. The details are given below:

| Tool data name | Explanation | Data range |
| :---: | :---: | :---: |
| Group number | Number to manage tools of the same type (form and dimensions) in a group. The tools assigned the same group number are assumed to be spare tools. | 1-99999999 |
| Tool number | Number unique to each tool actually output during tool command execution | 1-99999999 |
| Tool data flag | Parameter of use data count system, length compensation system, radius compensation system, etc. |  |
| Tool status | The tool state is indicated. | $0-\mathrm{FF}$ (H) |
| Auxiliary data | Reserved data | 0-65535 |
| Tool life data | Life time or life count for each tool. (If 0 is set, infinity is assumed to be specified.) | $\begin{aligned} & 0-4000 \text { (minutes) } \\ & \text { 0-9999 (times) } \end{aligned}$ |
| Tool use data | Use time or use count for each tool. | $\begin{array}{\|l\|} \hline \text { 0-4000 (minutes) } \\ \text { 0-9999 (times) } \end{array}$ |
| Tool length compensation data | Length compensation data set in any format of compensation number, direct offset amount, and addition offset amount. | Compensation numbers $1-400$ <br> Direct offset amount $\pm 99999.999$ <br> Addition offset amount $\pm 99999.999$ |
| Tool radius compensation data | Radius compensation data set in any format of compensation number, direct offset amount, and addition offset amount. | Compensation numbers $1-400$ <br> Direct offset amount $\pm 99999.999$ <br> Addition offset amount $\pm 99999.999$ |

(5) Tool data flag and tool status

The tool data flag and tool status contents are shown below:

1) Correspondence with tool life management data screen

2) Tool data flag

Bits 0~7 of file register Rn (such as R3728)

| bit | Explanation |  |
| :---: | :---: | :---: |
| bit 0 | Length compensation data format (spare tool compensation system) | 0: Compensation number <br> 1: Addition offset <br> 2: Direct offset amount |
| bit 1 |  |  |
| bit 2 | Radius compensation data format (spare tool compensation system) | 0 : Compensation number <br> 1: Addition offset <br> 2: Direct offset amount |
| bit 3 |  |  |
| bit 4 | Usage data count system | 0 : Usage time (minutes) <br> 1: Number of times tool has been mounted <br> 2: Number of cutting times |
| bit 5 |  |  |
| bit 6 |  |  |
| bit 7 |  |  |

## 1) Spare tool compensation system

Tool compensation corresponding to the spindle tool can be made in tool life management II.
One of the following three types of length and compensation can be selected by setting tool data:
a) Compensation umber system ( 0 is set on the tool data registration screen.)

Compensation data in tool data is handled as the compensation number. It is replaced with the compensation number given in a work program and compensation is executed.
b) Addition compensation system (1 is set on the tool data registration screen.)

Compensation data in tool data is handled as addition offset amount. It is added to the offset amount indicated by the compensation number given in a work program and compensation is executed.
c) Direct compensation system (2 is set on the tool data registration screen.)

Compensation data in tool data is handled as direct offset amount. It is replaced with the offset amount indicated by the compensation number given in a work program and compensation is executed.

## 2) Usage data count system

a) Usage time count

For usage data, the execution time of cutting feed (such as G01, G02, or G03) is counted in 3.75 -s units. However, the life data and usage data are displayed in minute units on the tool data registration screen.
b) Number of times tool has been mounted is counted

When tool is used as spindle tool in tool change, etc., usage data is counted. However, if cutting feed (G01, G02, or G03) is not executed after tool is used as spindle tool, usage data is not counted.
c) Number of cutting times is counted

Usage data is counted when a change is made from rapid traverse feed (such as G00) command to cutting feed (such as G01, G02, or G03) command as shown below. However rapid traverse or cutting feed command with no movement becomes invalid.
Even if a command other than the rapid traverse command appears between cutting feed commands, usage data is not counted.
(T0)

Assuming that the current spindle tool is TO, the TO use data is counted in (1) and (2).

## Caution:

When none of the tool life management input signal and use data count validity signal are input or during machine lock, auxiliary function lock, dry run, or single block, usage data is not counted.

- The usage data is not counted when the life data is 0 .
- Life management is executed even in the MDI operation mode.
- The usage data is not counted even when the status is 2 or more (normal life, error tool 1 , error tool 2).

3) Tool status ..... Bits 8~F of file register Rn (such as R3728)

| bit | Explanation |
| :---: | :---: |
| bit 8 | Tool status (numeric data $0 \sim 4$ ) <br> 0 0: Unused tool <br> 1: Used tool <br> 2: Normal life tool <br> 3: Tool error 1 tool <br> 4: Tool error 2 tool |
| bit 9 |  |
| bit A |  |
| bit B |  |
| bit C | (Reserved) |
| bit D |  |
| bit E |  |
| bit F |  |

## 4) Tool status contents

When the tool status number is 0 or $1, \mathrm{NC}$ assumes the tool to be available.

| Tool status <br> number | $\quad$ Explanation |
| :---: | :--- |
| 0 | Indicates unused tool. <br> Normally, this state is set when tool is replaced with a new tool. |
| 1 | Indicates used tool. <br> When actual cutting is started, this state is set. |
| 2 | Indicates normal life tool. <br> When use data exceeds life data, this state is set. |
| 3 | Indicates tool error 1 tool. <br> When controller inputs the tool error 1 signal, this state is set. |
| 4 | Indicates tool error 2 tool. <br> When controller inputs the tool error 2 signal, this state is set. |

### 9.3.6 Examples of Tool Life Management Screen

Tool life management screen examples are given below.
For operation, refer to the Operation Manual.

Tool life management screen example on 9-inch CRT setting and display unit

### 9.4 DDB (Direct Data Bus) ... Asynchronous DDB

The DDB function is used for PLC to directly read/write various pieces of data that controller has. PLC can read specified data into buffer or write specified data into controller by storing necessary information for read/write and calling the DDB function. Generally, data is read or written for each data piece; data concerning the control axes is processed in batch as many as the specified number of axes.

### 9.4.1 Basic Format of Command

(Note 1) File registers (Rn) and data registers (Dn) to which the user is accessible can be used as the asynchronous DDB control data buffer. The file registers ( $R$ ) to which the user is accessible are R500 through R549 (not backed up) and R1900 through R2799 (backed up).

### 9.4.2 Basic Format of Control Data

(Note) If only the 3rd axis is designated for example, the section for the 3rd axis will be read/write data.
(1) Control signals (Rn), (Dn)

(2) Large section number (Rn+1), (Dn+1)

Specify the large section number of the data to be read/written in binary form.
(3) Sub-section number (Rn+2, Rn+3), (Dn+2, $\mathrm{Dn}+3$ )
(LOW) (HIGH) (LOW) (HIGH)
Specify the sub-section number of the data to be read/written in binary form.
(4) Data size (Rn+4), (Dn+4)

Specify the size of the data to be read/written in binary form.
1: One byte
2: Two bytes
4: Four bytes
If any value other than 1,2 , or 4 is specified, the invalid data size alarm will occur.
(5) Read/write specifications axis (Rn+5), (Dn+5)

Specify the axis to read or write data for each axis classified by major classification numbers.

If axis specification is not made or exceeds the maximum control axis when axis data is read or written, the invalid axis number alarm will occur.
(6) Read/write data (Rn+6, Rn+7), (Dn+6, Dn+7)
(LOW) (HIGH) (LOW) (HIGH)
When data is read, the controller outputs data specified by PLC. When data is written, PLC sets the data to be written.

4-byte data

L $\quad\left(D_{n}+6\right)$

The effective portion of data varies depending on the data size. (Hatched portion) When read is specified the sign of 1-byte or 2-byte is extended to four bytes.

The main data that can be referenced by using the DDB function is listed below.

| Specification <br> item | Contents | Read | Write | Remarks |
| :--- | :--- | :---: | :---: | :---: |
| Asynchronous | Current position in work coordinate, machine coordinate <br> system, length, radius offset amount <br> Parameters <br> $\left[\begin{array}{l}\text { Maximum rotation speed of spindle, second, third, } \\ \text { and fourth reference position coordinates, } \\ \text { stroke stored limit, coordinate system offset, etc. }\end{array}\right.$ | $\bigcirc$ | - |  |
|  | User macro variables <br> Modal data of G code, etc. <br> Controller alarm number <br> Compensation function <br> [lxternal work coordinate system input, <br> external tool compensation input | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| Synchronous | External search <br> PLC axis control, etc. | - | - | - |

## Caution:

The DDBA command is issued after setting necessary data such as control signal and large and sub-classification numbers to the buffer ( Rn or Dn ). A read or write of the control signal is specified only once before execution of the DDBA command to prevent error codes stored in high-order bits by the CNC from being erased.

### 9.5 External Search

### 9.5.1 Function

When PLC specifies the program number, sequence number, and block number of a work program for the controller, the external search function searches memory or tape for the program number, sequence number, and block number.

### 9.5.2 Interface

PLC sets data except the status.

| $\mathrm{R} \mathrm{n}+0$ | Two bytes | Command |
| :---: | :---: | :---: |
| 1 | Two bytes | Status |
| 2 |  | Program No. |
| 3 | Four bytes |  |
| 4 |  | Sequence No. |
| 5 | Four bytes |  |
| 6 |  | Block No. |
| 7 | Four bytes |  |
| 8 | Two bytes | System specification |

(Note 1) File register (Rn) that can be used by the user is used for the control data buffer. Data register (Dn) cannot be used.

## (1) Command

Search mode
$\left\{\begin{array}{l}0: \text { Memory search }\end{array}\right.$
\{ 1: Tape search
PLC axis control
Set all to 0 .
(Note 2) System designation is used for 2-system specifications.

(Note) Unassigned bits will be used for later function extension. Use only bits shown here.

## 9. Exclusive Commands

## (2) Status

The search state is indicated.
The status is set by the controller and is used by PLC for completion check, etc.

The status is cleared by the controller when the search start instruction execution condition is off.
(3) Program number

Specify the program number to be searched in binary form in the range of 1 to 99999999 (eight digits).
Specify 0 to search for the sequence number of the current program selected.
If a number other than 0~99999999 is specified, a data specification error will occur.
(4) Sequence number

Specify the sequence number to be searched in binary form in the range of 1 to 99999 (five digits).
Specify 0 to search for the head of the specified program number.
If a number other than 0~99999 is specified, a data specification error will occur.
(5) Block number

Specify the block number to be searched in binary form in the range of 0 to 99 (two digits).
If a number other than 0~99 is specified, a data specified error will occur.

| Program No. | Sequence No. | Search |
| :--- | :--- | :--- |
| Specified | Specified | Memory or tape is searched for the specified sequence <br> number of the specified program. |
| Specified | Not specified $(=0)$ | Memory or tape is searched for the top of the specified <br> program. |
| Not specified $(=0)$ | Specified | Memory or tape is searched for the specified sequence <br> number of the current program selected. |
| Not specified $(=0)$ | Not specified $(=0)$ | Error (no specification) |

## (6) System specification

Specify the system to be searched. If no system specification is made, only the first system is searched.

### 9.5.3 Search Start Instruction

After interface data between the controller and PLC is prepared, search is started by using the following instruction:

### 9.5.4 Timing Charts and Error Causes

(1) Normal completion

(2) Search error completion

<Error cause>

- The specified program number or sequence number is not found.
- In tape search, tape or VO device does not exist.
- In tape search, an VO error occurred.
- The NC operation state is not reset state Any other search-impossible state.
(3) Search error completion (Data specification error)

### 9.5.5 Sequence Program Example

RST: Reset signal (reset button, output during reset, etc.)

## 10. PLC Help Function

To help the user PLC, an exclusive interface is provided between the user PLC and controller or PLC basic. The function and interface are explained below.

PLC help function examples:

- Alarm message display
- Operator message display
- PLC switches
- Key operation by user PLC
- Load meter display
- External machine coordinate system compensation
- User PLC version display

### 10.1 Alarm Message Display

The contents of an alarm that occurred during sequence (user PLC) processing can be displayed on the CRT setting and display unit.
Up to four alarm messages can be displayed at a time on the alarm diagnosis screen. The maximum length of a message is 32 characters.

### 10.1.1 Interface

The alarm message display interface is available in the two types: F type in which temporary memory $F$ is used for message display request and $R$ type in which file register ( $R$ ) is used for message display request. Either type is selected by using a parameter.

## (1) F type interface

This interface applies to 128 points of temporary memory F0~F127.
If temporary memory F is used as the alarm interface, do not use it for another purpose.

The highest priority is assigned to the F0 signal. The message corresponding to Fn set to 1 is fetched from the message table and displayed in order starting at F0. If no messages are prepared or Fm greater than the number of prepared messages is set to 1, the message "USER PC ERROR m" is displayed.
(2) $R$ type interface

This interface applies to file registers R158~R161. The numeric value (binary) contained in each of the $R$ registers indicates the position of the message to be displayed in the message table.
The message is cleared by setting the R register to 0 .

The messages are displayed starting at the message corresponding to R158 from top to bottom.
Since message display is cleared by setting the $R$ register to 0 , number 0 in the table message cannot be used in the R mode.
If greater value than the number of prepared messages, $m$ is set in the $R$ register, the message "USER PC ERROR m" is displayed.
(3) Alarm classification display

Classification number can be displayed following the message to be displayed regardless of the F or R type. (Dn1~Dn4 in the figure)
For example, one typical alarm message is prepared and classification number can be used to indicate the alarm source or cause.

Example) When spindle alarm occurs, the message "SPINDLE ALARM" is displayed and the alarm source or cause is indicated by the classification number.

For the classification number, the contents of each data register specified in alarm message preparation are displayed. Data register D0 cannot be specified.
(Note 1) The display of the classification number by cause is updated when an alarm message display changes. It is not updated if only the contents of the specified data register (Dn1 to Dn4) change. If the contents of the specified data register are 0, no classification numbers are displayed.

Display example of 9-inch CRT setting and display unit

### 10.1.2 Message Creation

Create messages by using PLC development software.
Set the length of a message and the number of messages to be prepared, then enter message data through the keyboard.
The maximum length of an alarm message is 32 characters (even numbers).
A maximum of 256 alarm messages can be prepared. However, the number of alarm messages may be limited depending on the available memory capacity. For details, refer to the PLC Development Manual (Personal Computer Section).

### 10.1.3 F or R Type Selection Parameter

Set the parameter on the machine manufacturer parameter bit selection screen.

(Reference) \#6450 corresponds to the high-order byte of file register R2924.

### 10.2 Operator Message Display

When a condition to inform the operator of a message occurs, an operator message can be displayed independently of an alarm message.
A maximum of 60 characters can be displayed for the operator message on the alarm diagnosis screen. One operator message can be displayed at a time.

### 10.2.1 Interface

An operator message is displayed by setting the number of the operator message table to be displayed in file register R162. It is cleared by setting R162 to 0 . Thus, number 0 of the operator message table cannot be displayed.

As with alarm messages, the contents of the data register specified for the class number display in operator message preparation are also displayed.
(Note 1) The class number display is updated when the contents of file register R162 change. It is not updated if only the contents of the specified data register (Dn) change.
To change the class number display only, the contents of R162 must be cleared to 0 . If the contents of the specified data register are 0 , no class numbers are displayed.

### 10.2.2 Operator Message Preparation

Create messages by using PLC development software.
On M-FAS, set the length of a message and the number of messages to be prepared, then prepare message data.
The maximum length of an operator message is 60 characters (even numbers). A maximum of 256 operator messages can be prepared. However, the number of operator messages may be limited depending on the available memory capacity. For details, refer to the PLC Development Manual (Personal Computer Section).

### 10.2.3 Operator Message Display Validity Parameter

The parameter is set on the machine manufacturer parameter bit selection screen.

(Reference) \#6450 corresponds to the high-order byte of file register R2924.

### 10.3 PLC Switches

Similar function to machine operation switches can be provided by using the controller CRT setting and display unit. The number of switch points is 32 . The switch names can be given as desired.

### 10.3.1 Explanation of CRT Screen

The CRT screen is explained below.

## PARAMETER SCREEN PLC SWITCH (MENU)

### 10.3.2 Explanation of Operation

To turn on or off a switch, set the number of the switch to be turned on or off in the parentheses of setting part \# ( ) and press the $\begin{gathered}\text { NPUT } \\ \text { CALC }\end{gathered}$ key.
Depending on the state of the switch, its input device $X$ is turned on (off) and accordingly the switch mark indicates the on (off) state.

The switch can be turned off (on) the same way.
Special relay E can reverse the switch on/off states. When special relay E is activated, the on/off state of the corresponding switch and device X is reversed.
To display the switch validity state, etc., the switch name can be highlighted. To do this, turn on or off output device $Y$ corresponding to the switch name.
The corresponding table of the switch numbers, input device X , output device Y , and special relay E is listed below:

| Switch No. | Corresponding device |  |  | Switch No. | Corresponding device |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | X | Y | E |  | E | Y | E |
| \#1 | X140 | Y160 | E80 | \#17 | X150 | Y170 | E96 |
| \#2 | X141 | Y161 | E81 | \#18 | X151 | Y171 | E97 |
| \#3 | X142 | Y162 | E82 | \#19 | X152 | Y172 | E98 |
| \#4 | X143 | Y163 | E83 | \#20 | X153 | Y173 | E99 |
| \#5 | X144 | Y164 | E84 | \#21 | X154 | Y174 | E100 |
| \#6 | X145 | Y165 | E85 | \#22 | X155 | Y175 | E101 |
| \#7 | X146 | Y166 | E86 | \#23 | X156 | Y176 | E102 |
| \#8 | X147 | Y167 | E87 | \#24 | X157 | Y177 | E103 |
| \#9 | X148 | Y168 | E88 | \#25 | X158 | Y178 | E104 |
| \#10 | X149 | Y169 | E89 | \#26 | X159 | Y179 | E105 |
| \#11 | X14A | Y16A | E90 | \#27 | X15A | Y17A | E106 |
| \#12 | X14B | Y16B | E91 | \#28 | X15B | Y17B | E107 |
| \#13 | X14C | Y16C | E92 | \#29 | X15C | Y17C | E108 |
| \#14 | X14D | Y16D | E93 | \#30 | X15D | Y17D | E109 |
| \#15 | X14E | Y16E | E94 | \#31 | X15E | Y17E | E110 |
| \#16 | X14F | Y16F | E95 | \#32 | X15F | Y17F | E111 |

(Note 1) Input device $X$ also holds the state if power is turned off.

O The table below shows the message displayed during operation on the PLC switch screen.

| No. | Message | Explanation | Remedy |
| :---: | :--- | :--- | :--- |
| E01 | SETTING <br> ERROR | A number outside the allowable <br> setting range from 1 to 32 is <br> specified in \# ( ). | Specify a valid number within the <br> range. |

### 10.3.3 Signal Processing

- When setting is done on the PLC switch screen, the input device $X$ corresponding to the specified switch number is turned on or off to switch over the switch state.
- When special relay $E$ is turned on from the user PLC, its corresponding input device $X$ and the switch state are reversed. Special relay E is reset immediately after the CNC reverses the input device $X$ and the switch state. It is turned on by one pulse (scan) only also in the user PLC. In either case, when output device $Y$ is set to on based on the input device $X$ state, the corresponding switch name is highlighted.

The following shows an example of operation of special relay E from the user PLC.
(1) Two-point switch
(Example) When two opposite switches, chip conveyer manual and chip conveyer automatic, are provided;

1) When switch 15 ( $X 14 E$ ) is on and switch 16 (X14F) is off, Y16E and M1 turn on. [Initial state]
2) When switch 16 (X14F) turns on while being in state 1), Y16E turns off, E94 turns on, and M1 turns off.
3) Turning E94 on reverses X14E (to off).
4) When $X 14 E$ is off and $X 14 F$ is on, E94 turns off and Y16F and M2 turn on.
5) When switch 15 (X14E) turns on while being in state 4 ), Y16F turns off, E95 turns on, and M2 turns off.
6) Turning E95 on reverses X14F (to off).
7) When $X 14 F$ is off and $X 14 E$ is on, E95 turns off and Y16E and M1 turn on again.

## (2) Three-point switch

(Example) When three opposite switches 17, 18, and 19 are provided;

## (3) External switch and PLC switch

(Example 1) When an external optional stop switch (X14) is provided;

Under sequence control in the above example, the switch marks on the PLC switch screen can be operated from both external and PLC switches.
(Example 2) When an external switch (XC) that inhibits a PLC switch handle interrupt is provided;

Under sequence control in the above example, when the external switch (XC) is on, the PLC switch for a handle interrupt cannot be turned on.

### 10.3.4 Switch Name Preparation

Prepare PLC switch names by using PLC development software.
Alphanumeric, kana, katakana, and Kanji characters can be used for the switch name. For details, refer to the PLC Development Manual (Personal Computer Section).

### 10.4 Key Operation by User PLC

(This cannot be used with the MELDASMAGIC 64 Series.)
The same operation as if the operator performed key operation can be performed by operating key data by user PLC.

### 10.4.1 Key Data Flow

1) Key data is set in file registers R16 and R112 at the top of the user PLC main.
2) The user PLC refers to the key data and performs necessary processing.
3) The user PLC sets the key data matching the operation board being used in R112.
4) After user PLC main processing is performed, controller performs valid key data processing according to the R16 and R112 contents.

### 10.4.2 Key Operations That Can Be Performed

1) When a key is pressed, it is ignored.

- The R16 contents are judged and NULL ( 00 H ) code is set in R112.

2) When R16 is NULL, that is, key operation is not performed, user PLC performs key operation conforming to the operator.

- Key data matching the target operation is set in R112.

### 10.4.3 Key Data Processing Timing

Key data is processed at the timing shown below.
Set data in R112 only when it is necessary. Normal key operation by the operator is made impossible.

R112

## Example)

### 10.4.4 Layout of Keys on Communication Terminal

There are two types of layouts for the keys on the communication terminal used with this controller as shown below.
The layouts of the alphabetic keys differ.
(1) Key layout for communication terminal CT100 (This also applies to the separated type FCUA-CR10+KB10)

## (2) Key layout for communication terminal CT120

(Note 1) When inputting an alphabet or symbol on the lower right of the alphabet or symbol keys, press SHIFT, and then press the corresponding key.
(Example) When SHIFT $\begin{aligned} & O \\ & A\end{aligned}$ are pressed, " A " will be input.

### 10.4.5 List of Key Codes

(1) For communication terminal CT100, KB10 (M series)

| Key symbol | Code <br> (HEX) | Key symbol | Code <br> (HEX) | Key symbol | Code <br> (HEX) | Key symbol | Code <br> (HEX) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MONITOR | 80 | ¢ ( $\mathbf{4}_{4}$ ) | OB(F8) | - ${ }^{+}$) | 2D(2B) | O (A) | 4F(41) |
| TOOL/PARAM | 81 | $\downarrow$ ( ${ }^{\boldsymbol{V}}$ ) | 0A(F7) | -(, ) | 2E(2C) | N (B) | 4E(42) |
| EDIT/MDI | 83 | $\leftarrow\left({ }^{\leftarrow}\right.$ | 08 (F5) | EOB (]) | 3B (5D) | G (C) | 47 (43) |
| DIAGN IN/OUT | 85 | $\rightarrow\left({ }^{+}\right)$ | 09(F6) | = (\#) | 3D(23) | X (U) | 58(55) |

### 10.5 Load Meter Display

The load meter can be displayed by setting a value in the designated file register ( $R$ ) with the ladder program. The spindle load, $Z$ axis load, etc. characters and scale are created with comments in the PLC development software message function.
10.5.1 Interface

| :--- | :--- | :---: | :---: |
| Load meter 1 | Numerical display | R 152 | R 352 |
|  | Bar graph display | R 153 | R 353 |
| Load meter 2 | Numerical display | R 154 | R 354 |
|  | Bar graph display | R 155 | R 355 |

(Note 1) Use $\$ 1$ for models not having a system.

Display example of 9 -inch CRT setting and display unit
(Note: This screen consists of 80 characters wide $\times 18$ lines long.)

### 10.6 External Machine Coordinate System Compensation

External machine coordinate system compensation is executed by setting compensation data (absolute amount) in the PLC file register (R) for each axis.
Thus, the compensation timing is when PLC rewrites file register ( R ) compensation data. Necessary condition, timing, etc., are set by user PLC.
The interface between user PLC and CNC is shown below.

| File register |  | Contents | File register |  | Contents |
| :---: | :---: | :---: | :---: | :---: | :---: |
| R560 | \$1 | Compensation data for the first axis | R568 | \$2 | Compensation data for the first axis |
| R561 | \$1 | Compensation data for the second axis | R569 | \$2 | Compensation data for the second axis |
| R562 | \$1 | Compensation data for the third axis | R570 |  | - |
| R563 | \$1 | Compensation data for the fourth axis | R571 |  | - |
| R564 |  | - | R572 |  | - |
| R565 |  | - | R573 |  | - |
| R566 |  | - | R574 |  | - |
| R567 |  | - | R575 |  | - |

(Note 1) Use $\$ 1$ for models not having a system.

Data in file registers R560~R575 is not backed up. If it must be backed up, use back-up file registers (R1900~R2799).
(Note 1) The maximum delay to compensation is (one user PLC scan +15 ms ). However, smoothing time constant and servo follow delay are not contained.

### 10.7 User PLC Version Display

The user PLC version can be displayed together with the controller software version on the DIAGN/IN/OUT $\rightarrow$ menu changeover $\rightarrow$ configuration (menu) screen of the setting and display unit (communication terminal).

PLC
B N D -- $\qquad$ W $\qquad$ -$0 \triangle$$\triangle$ : Use an alphabetic character. O: Use a numeral.

Version code (Initial version is $A O$ )A to $\mathbf{Z}$ when major revisions are made (Do not use I or O)
O: 0 to 9 when minor revisions are made
$\triangle$ : Update A to Z when auxiliary
revisions are made
(Do not use l or O)

- Use 3 digits for the system. (Random)

Use 3 digits for the system. (Random)
(Note) The user PLC must be controlled by the user.

### 10.7.1 Interface

Data corresponding to the characters to be displayed on the corresponding file register (R) is set.
(1) To display a 2-digit version code

Program example)

(2) To display a 3-digit version code

Program example)

## 11. PLC Axis Control

### 11.1 Outline

This function allows an independent axis to be controlled with commands from the PLC, separately from the NC control axis.

### 11.2 Specifications

### 11.2.1 Basic Specifications

| Item | Details |
| :---: | :---: |
| No. of control axes | Max. 2 axes |
| Simultaneous control axes | The PLC control axis is controlled independently of the NC control axis. Simultaneous start of multiple PLC axes is possible. |
| Command unit | $\begin{array}{ll}\text { Min. command unit } & 0.001 \mathrm{~mm} \text { ( } 0.0001 \text { inch }) \\ & 0.0001 \mathrm{~mm}(0.00001 \text { inch })\end{array}$ <br> (Same command unit as the NC control axis.) |
| Feedrate | (Min. command unit 0.001 mm ) <br> Rapid traverse 0 to $240000 \mathrm{~mm} / \mathrm{min}$. ( 0 to $24000 \mathrm{inch} / \mathrm{min}$.) <br> Cutting feed 0 to $240000 \mathrm{~mm} / \mathrm{min}$. ( 0 to $24000 \mathrm{inch} / \mathrm{min}$.) <br> (Min. command unit 0.0001 mm ) <br> Rapid traverse 0 to $24000 \mathrm{~mm} / \mathrm{min}$. ( 0 to $2400 \mathrm{inch} / \mathrm{min}$.) <br> Cutting feed 0 to $24000 \mathrm{~mm} / \mathrm{min}$. ( 0 to $2400 \mathrm{inch} / \mathrm{min}$.) |
| Movement commands | Incremental value commands from the current position. Absolute value commands of the machine coordinate system. $0 \sim \pm 99999999 \text { (0.001mm/0.0001inch) }$ |
| Operation modes | $\left.\begin{array}{l}\text { Rapid traverse, cutting feed } \\ \text { Jog feed }(+),(-) \\ \text { Reference point return feed }(+),(-) \\ \text { Handle feed }\end{array}\right\}$ Linear acceleration/linear deceleration <br> ( |
| Acceleration/ deceleration | Rapid traverse, Jog feed <br> Reference point return feed $\begin{aligned} & \text { Cutting feed } \\ & \text { Handle feed \} }\} \text { Exponential function acceleration/ } \end{aligned}$ |
| Backlash compensation | Provided |
| Stroke end | Not provided |
| Soft limit | Provided |
| Rotation axis commands | Provided <br> Absolute value commands … Rotation amount within one rotation. (Rotates the remainder divided by $360^{\circ}$.) <br> Incremental commands . . . . . . Rotates the commanded rotation amount. |
| Inch/mm changeover | Not provided Command to match the feedback unit. |
| Position detector | Encoder (absolute position detection also possible) |

## 11. PLC Axis Control

### 11.2.2 Other Restrictions

(1) There is no mirror image, external deceleration or machine lock function.
(2) Rapid feed override, cutting override and dry run control are not possible.
(3) Automatic operation start, automatic operation stop, reset and interlock NC controls are invalid for PLC control axes.
The same control can be realized using an interface dedicated for PLC control axes.
(4) There is no dedicated emergency switch. The emergency stop is valid in the same manner as the NC control axis.

### 11.3 PLC Interface

The interface between the PLC and NC is carried out by setting the control information data in the R-register ${ }^{(\text {*Note } 1)}$ with the PLC, and calling the DDBS function.

### 11.3.1 DDBS Function Command

When ACT is set to 1 , the PLC axis control process is carried out with the control information data contents. Thus, ACT should be set to 1 during PLC axis control.
Setting ACT to 0 causes a reset status.
(Note 1) The following R-registers can be used. R500 to R549 (No battery backup) R1900 to R2799 (Battery backup)

### 11.3.2 Control Information Data

Set the control information data in the R-register before calling the DDBS function command. The following is a list of control information data.

A max. of 2 axes can be controlled by the PLC. Each axis should have its own control information data.

### 11.3.3 Control Information Data Details

### 11.3.3.1 Commands

Commands consist of main commands and sub-commands.

\[

\]

Main commands: The types of DBBS main commands are as follows.
1: Search
2: PLC axis control
Sub-commands: The PLC axis control sub-command is as follows.
0 : Movement data output and control signal output
(Note 1) "Input" and "output" are the input/output looking from the PLC side.

### 11.3.3.2 Status

The status is set by the NC to indicate the execution status of this function command and the status of the axis being controlled.

| bit 0: busy | Command processing |
| :--- | :--- |
| 1: den | Axis movement completed |
| 2: move | Axis moving |
| 3: SA | Servo ready |
| 4: svon | Servo ON |
| 5: ZP | Reference point reached |
| 6: |  |
| 7: WAIT | Axis movement wait |

| bit 8: oper | Option error |
| :--- | :--- |
| 9: |  |
| A: |  |
| B: |  |
| C: |  |
| D: |  |
| E: ALM2 | Axis in control alarm |
| F: ALM1 | Control information data |
|  |  |

bit 0: busy Command processing
This turns ON when the command is being processed.
The next command is not received while this bit is ON. The next command to be issued is received while this bit is OFF.
bit 1: den Axis movement completed
This bit turns ON when the initialization and commanded movement are completed. This bit stays OFF during movement, even when an interlock is applied. This bit turns ON at reset or servo OFF, or when ACT $=0$.
bit 2: move Axis moving
This bit turns ON when the machine is moving, and turns OFF when the machine is stopped.
bit 3: SA Servo ready
This bit turns ON when the servo is ready. It turns OFF during emergency stops and servo alarms.
bit 4: svon Servo ON
This bit turns OFF when a servo OFF signal is output. It also turns OFF during emergency stops and servo alarms.
Machine movement is possible when this signal is ON.
bit5: ZP Reference point reached
This bit turns ON when the reference point is reached after completion of a reference point return.
It turns OFF when the machine moves.
bit7: WAIT Axis movement wait
This bit turns ON in the buffering mode when the axis movement of the previous block has been completed, and the machine is in a WAIT 5 status. It turns OFF when the previous block movement is completed and the movement of the next block begins.

## 11. PLC Axis Control

bit 8: oper Option error
This bit turns ON when an attempt is made to execute PLC axis control when there is no PLC axis control option.
bit E: ALM2 Axis in control alarm
This bit turns ON when an alarm occurs (such as a servo alarm) during execution of axis control. Axis control cannot be executed while this bit is ON.
After the cause of the alarm has been removed, turn the bit OFF by outputting a reset signal, setting ACT to 0 , or turning the power OFF then ON again.
(Note) When alarms occur during axis control, the same alarms appear in the CRT screen as for NC control axes. Set the PLC 1st axis to "1", and the PLC 2nd axis to "2".

Example: When a servo alarm occurs for the PLC 1st axis
S03 Servo alarm $52 t_{\text {PLC axis }}$
bit F: ALM:1 Control information data designation alarm
This bit turns ON when the designated details of the control information data are illegal. Thus, the PLC axis control process is not executed. Turn the bit OFF by correcting the data, outputting a reset signal, or setting ACT to 0 .

## Timing chart

(1) For rapid traverse and cutting feed mode

(2) For jog feed mode

(Note) The axis moves by jog feed only during start ON.

## (3) For reference point return feed mode

## (3-1) Dog-type reference point return

(Note 1) The axis moves by reference point return feed only during start ON. Turn the start OFF after confirming that the reference point has been reached.
(Note 2) The first reference point return after the power is turned ON is always dog-type. All returns after that are high-speed reference point returns.

## (3-2) High-speed reference point return

(4) For handle feed mode

(Note) Handle feed is possible only during start ON.
(5) When the interlock signal is $\mathrm{ON}(=1)$

(6) When the reset signal is $\mathrm{ON}(=1)$

(7) When the servo OFF signal is $\mathbf{O N}(=1)$

(8) When the ACT signal is OFF ( $=0$ )

### 11.3.3.3 Alarm No.

The alarm Nos. of status ALM1 and ALM2 are set.

The details of each alarm No. are shown below.
(1) ALM1 (Control information data designation alarm)

| Alarm No. | Details |
| :---: | :--- |
| 01 | Control signal illegal <br> (A signal other than a registered control signal has been commanded.) |
| 02 | Axis No. illegal |
| 03 | Operation mode illegal (0 to 6) |
| 04 | Movement data range exceeded -99999999 to +99999999 |
| 05 | Zero point return not complete <br> (absolute value command not possible) |
| 06 |  |
| 10 |  |
| 12 |  |
| . |  |
| 10 |  |

(2) ALM2 (Axis in control alarm)

| Alarm No. | Details |
| :---: | :--- |
| 0 | Servo alarm (Alarm No. is displayed in the PLC axis monitor screen. <br> Refer to the Drive Unit Maintenance Manual for details.) |
| 1 | Z-phase not passed |
| 2 | Soft limit ( + ) |
| 3 | Soft limit ( - ) |

### 11.3.3.4 Control Signals (PLC axis control information data)

Control signals such as start, interlock, reset, axis removal and axis removal 2 are designated for the PLC axis.

bit 0: Start
1: Interlock
2: Reset
3: Servo OFF
4: Axis removal
5: Axis removal 2
6:
7:
bit 8 : Absolute value command
9:
A:
B:
C:
D:
E:
F:
bit 0: Start
Starting begins at the at the rising edge (OFF -> ON) of the start signal, based on the control information data.
The axis does not move during interlock, servo OFF, axis removal and axis removal 2. Movement starts after interlock, servo OFF, axis removal and axis removal 2 are canceled. Start is invalid during resetting.
bit 1: Interlock
The moving PLC axis executes a deceleration stop when the interlock signal turns ON. The stopped PLC axis will resume movement when the interlock signal turns OFF (is canceled).
bit 2: Reset
The PLC axis is reset when the reset signal turns ON. Moving PLC axes will execute a deceleration stop. Commands and controls are invalid during resetting.
If the reset signal turns ON during an alarm occurrence, the alarm will be cleared.

## bit 3: Servo OFF

The PLC axis will execute a deceleration stop and its servo will turn OFF when the servo OFF signal turns ON. Whether the PLC axis movement is compensated during servo OFF can be selected in the basic specification parameter "\#1064 svof".
A servo ON status will result when the power is turned ON.
bit4: Axis removal
The axis will execute a deceleration stop, and a servo OFF status will result, when the axis removal signal turns ON. A servo ON status will result and the stopped PLC axis will resume movement when the axis removal signal turns OFF (is canceled).
Axis removal is validated when either this signal or machining parameter and axis parameter "\#8201 Axis Removal" is validated.
The zero point return will become incomplete when the axis is removed. Therefore, a dog-type reference point return must be completed again when starting with an absolute value command.

## 11. PLC Axis Control

bit 5: Axis removal 2
The axis will execute a deceleration stop, and a servo OFF/ready OFF status will result, when the axis removal 2 signal turns ON. A servo ON/ready ON status will result for the stopped PLC axis when the axis removal 2 signal turns OFF (is canceled).
A restart must be executed to start the movement again.
Position control cannot be carried out while the axis removal 2 signal is ON. However, position detection is possible so the position will not be lost.
bit 8: Absolute value command
Turn this bit ON when the movement data is commanded in absolute values. When this bit is OFF, the commands will be processed as incremental value commands.

### 11.3.3.5 Axis Designation

The axis No. of the PLC axis is designated.

$$
\mathrm{R}_{\mathrm{n}}+4 \quad \text { Axis designation }
$$

0: 1st axis
1: 2nd axis

### 11.3.3.6 Operation Mode

The operation mode for the PLC axis is designated.

$$
\begin{array}{cl}
\mathrm{R}_{\mathrm{n}}+5 & \text { Operation mode } \\
& \\
& \text { 0: Rapid traverse (G0) } \\
\text { 1: Cutting feed (G1) } \\
\text { 2: Jog feed (+) } \\
\text { 3: Jog feed (-) } \\
\text { 4: Reference point return (+) } \\
\text { 5: Reference point return (-) } \\
\text { 6: Handle feed }
\end{array}
$$

The axis movement will not be affected by changing the operation mode, even while the axis is moving. The new operation mode is validated at the next start.

### 11.3.3.7 Feedrate

When the operation mode is cutting feed or jog feed ( $\mathrm{Rn}+5=1$ to 3 ), the PLC axis feedrate is designated with a binary code.

(Note 1) The feedrate designated in the parameters is used for the rapid traverse mode and reference point return mode.
(Note 2) The feedrate can be changed during axis movement. In that case, change using a direct feedrate data $(R n+6,7)$ is possible.

### 11.3.3.8 Movement Data

When the operation mode is rapid traverse or cutting feed, the movement data is designated with a binary code.

(Note 1) The movement data is classified as follows by the absolute value command flag (bit 8) of the command signal.

Absolute value command flag $=0$ : Incremental value from the current position Absolute value command flag = 1: Absolute value of the machine coordinate system
(Note 2) If the movement amount is changed during axis movement, the new movement amount will be validated at the next start.

### 11.3.3.9 Machine Position

The machine position output to the machine system is expressed. The machine position becomes the rfp (reference point) when the reference point is reached.

### 11.3.3.10 Remaining Distance

The remaining distance of the movement data output to the machine system is expressed.
$R_{n}+12 \quad$ Remaining distance (input unit)

### 11.3.4 Reference Point Return near Point Detection

Set the near point dog signal of the PLC axis reference point return for the following devices in the PLC.

| Device No. |  | Signal name |  |
| :---: | :---: | :---: | :---: |
| Y2E0 | *PCD1 | PLC axis | Reference point return <br> near point detection 1 |
| Y2E1 | *PCD2 | PLC axis | Reference point return <br> near point detection 2 |
| Y2E2 |  |  |  |
| Y2E3 |  |  |  |
| Y2E4 |  |  |  |
| Y2E5 |  |  |  |
| Y2E6 |  |  |  |
| Y2E7 |  |  |  |

(Note) The responsiveness when the dog signal is set in PLC middle-speed processing is worse than when set in PLC high-speed processing.

### 11.3.5 Handle Feed Axis Selection

The axis is designated for the following devices when handle feed is carried out with a PLC axis.

| Device No. |  | Signal name |
| :--- | :--- | :--- |
| Y2E0 |  |  |
| Y2E1 |  |  |
| Y2E2 |  |  |
| Y2E3 |  |  |
| Y2E4 | HS1P | 1st handle PLC axis valid |
| Y2E5 | HS2P | 2nd handle PLC axis valid |
| Y2E6 |  |  |
| Y2E7 |  |  |

When Y2E4 and Y2E5 are ON, each handle is PLC axis dedicated and not valid for NC axes. Y248 to Y24F and Y250 to Y257 are used for the axis selection of each handle.
(Note) 1. The handle feed magnification is also used for NC control axes.

## 12. Appendix

### 12.1 Example of Faulty Circuit

Wrong configurations of circuits are shown below. Correct the circuitry, if any.
(1) Circuit containing OR
