TwinCAT 3 Motion

Functional description

TF5200 | TC3 CNC
Online tool compensation

Version   1.0
Date   19.02.2020

BECKHOFF

Notes on the documentation

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with the applicable national standards.
It is essential that the documentation and the following notes and explanations are followed when installing and commissioning the components.
It is the duty of the technical personnel to use the documentation published at the respective time of each installation and commissioning.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.
We reserve the right to revise and change the documentation at any time and without prior announcement.
No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

Trademarks

Beckhoff®, TwinCAT®, EtherCAT®, EtherCAT G®, EtherCAT G10®, EtherCAT P®, Safety over EtherCAT®, TwinSAFE®, XFC®, XTS® and XPlanar® are registered trademarks of and licensed by Beckhoff Automation GmbH.
Other designations used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owners.

Patent Pending

The EtherCAT technology is patent protected, in particular by the following applications and patents:
EP1590927, EP1789857, EP1456722, EP2137893, DE102015105702
with corresponding applications or registrations in various other countries.

General and safety instructions

Icons used and their meanings

This documentation uses the following icons next to the safety instruction and the associated text. Please read the (safety) instructions carefully and comply with them at all times.

Icons in explanatory text

➢ Indicates an action.

⇨ Indicates an action statement.

⚠ **DANGER**

Acute danger to life!

If you fail to comply with the safety instruction next to this icon, there is immediate danger to human life and health.

⚠ **CAUTION**

Personal injury and damage to machines!

If you fail to comply with the safety instruction next to this icon, it may result in personal injury or damage to machines.

NOTICE

Restriction or error

This icon describes restrictions or warns of errors.

Tips and other notes

i This icon indicates information to assist in general understanding or to provide additional information.

General example

Example that clarifies the text.

NC programming example

Programming example (complete NC program or program sequence) of the described function or NC command.

Specific version information

i Optional or restricted function. The availability of this function depends on the configuration and the scope of the version.

Version 1.0 Online tool compensation
TF5200 | TC3 CNC

Table of contents

List of figures

1   Overview

Task

With certain processes such as grinding, the length or the radius of the tool must be continuously corrected to compensate for wear.

Wear compensation depends on the path covered.

Characteristics

Wear compensation can only be enabled with tool type 2 (grinding tool). If a different tool type is used, error message P-ERR-21391 is output.

Wear compensation can be used for 4 processing types and 3 different modes.

Parametrisation

Wear compensation is activated and deactivated from the NC program. The wear constant can be parameterised both from the NC program and using preset parameters in the tool list P-TOOL-00030. Further parameters in this context are described in the chapter Parameter [▶ 32].

Programming

The following NC command is provided to program online tool compensation in the NC program. Parameterisation can be programmed in advance or in combination with **#OTC ON**.

For further details on the above command, see the section Programming [▶ 9].

Links to other documents

For the sake of clarity, links to other documents and parameters are abbreviated, e.g. [PROG] for the Programming Manual or P-AXIS-00001 for an axis parameter.

For technical reasons, these links only function in the Online Help (HMTL5, CHM) but not in pdf files since pdfs do not support cross-linking.

2   Description

Task

With certain processes such as grinding, the length or the radius of the tool must be continuously corrected to compensate for wear.

Wear compensation depends on the path covered. In addition, compensation can be influenced by the PLC.

Wear compensation is activated and deactivated from the NC program. The wear constant can be parameterised both from the NC program and using preset parameters in the tool list P-TOOL-00030.

Rapid traversing blocks have no wear.

It is assumed that the entire width of the lateral surface of the grinding disc is in contact.
Fig. 1: Grinding a contour

Tool type

Wear compensation can only be enabled with tool type 2 (grinding tool). If a different tool type is used, error message P-ERR-21391 is output.

Processing types

Online wear compensation can be used for 4 processing types and 3 different modes.

1. Radius compensation (only in combination with active TRC) for processing contours in the plane (2.5 D)
2. Length compensation for processing surfaces (surface grinding, 2.5 D)
3. Compensation in tool direction for any orientation (5-axis)
4. Compensation in direction of surface normal (5-axis)

Modes

1. Continuous (dependent on motion path traversed)
2. Discrete (discrete wear compensation via PLC)
3. Automatic, combination of discrete and continuous

Discrete additive wear values which are assigned by the PLC are adjusted over several cycles.

2.1   Programming

The following NC command is provided to program online tool compensation in the NC program. Parametrisation can be programmed in advance or in combination with #OTC ON:

> **#OTC ON | OFF [[RADIUS | LENGTH | TOOL_DIR | SURF_NORM_DIR DISC | CONT | AUTO WEAR_CONST**<*expr*> **| WEAR_CONST_TOOL ACC_WEIGHT**<*expr*> **]]**

RADIUS	Radius compensation processing type
LENGTH	Length compensation processing type (**default**)
TOOL_DIR	Compensation in tool direction (5-axis) processing type
SURF_NORM_DIR	Compensation in direction of surface normal (5-axis) processing type
DISC	Discrete mode: input only via PLC, external presetting
CONT	Continuous mode: Presetting values only by calculating the motion path traversed and the wear constant, internal calculation
AUTO	Automatic mode: Adding the external presetting and internal calculation (**default**)
WEAR_CONST<expr>	User-specific definition of wear constant; it acts modally, this means that with #OTC ON the programmed wear constant is used and not the default wear constant defined in the current tool data. Defining the valid wear constant is optional. Unit: 0,1 µm/m
WEAR_CONST_TOOL	Switch to the default wear constant defined in the current tool data; it acts modally, this means that with #OTC ON the default wear constant (default) defined in the current tool data is used and not the user-specific definition of the wear constant.
ACC_WEIGHT<expr>	Acceleration weighting in percent [1;100], default: 100%

ℹ️ When OTC is deselected with #OTC OFF, the amount of wear (discrete and/or continuous) is included in the calculation for the current tool.

Online tool compensation
TF5200 | TC3 CNC
10   Version 1.0

2.2 Wear compensation of tool radius

Grinding a contour

Use tool radius wear compensation (radius compensation) by preference to grind a <u>contour</u> at the same time as tool radius compensation.

Grinding disc wear in the direction of the disc radius can be compensated continuously or discretely.

In the radius compensation processing type, wear is only considered for <u>active</u> tool radius compensation (TRC).

The figure below shows the tool radius wear:
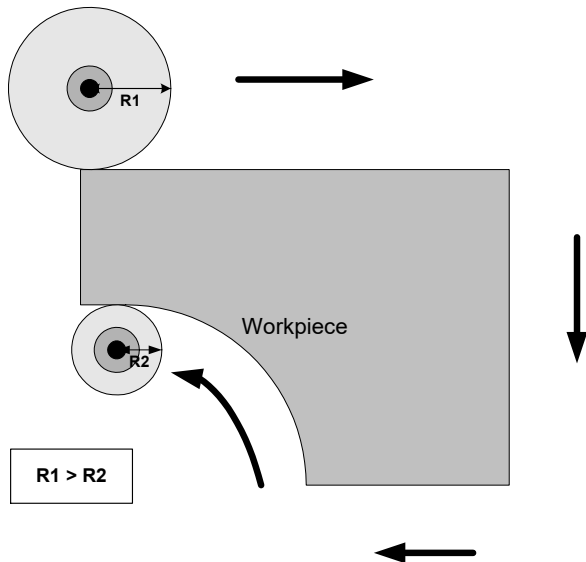

Fig. 2: Wear compensation of tool radius

> **i** The start-up movement in relation to the equidistant path after selecting TRC (G41/G42) is considered without wear.
>
> Motion after deselecting TRC (G40) is also without wear.

BECKHOFF

Legend:

Green:	Path contour with active TRC without OTC offset
Black:	Path contour with **negative** value for OTC radius offset
Red:	Path contour with **positive** value for OTC radius offset
Fig. 3: Contour of the NC program wr_quad_disc.nc

BECKHOFF

Explanation to the figure above (the discrete OTC offset applied is 2 mm)

1. G25 is active in the contour bend. The contour path at this point is not continuous. The predefined OTC offset is applied to another axis over several cycles.
2. The TRC inserts a circular transition because of G26. But the OTC offset is so large that the increase in offset is unable to keep up with the continuous change in the contour.
3. The OTC offset lags behind considerably.
4. Increase the OTC offset
5. Decrease the positive OTC offset and increase the negative OTC offset

The tool radius is influenced by the PLC.

Requirements: After the ControlUnit OTCRadiusOffset is active, the OTC radius offset can then be programmed for the build in use accordingly. This value is then added to each cycle perpendicular to the programmed contour.

For CNC Build >= V2.11.2800:

gpCh[*channel_idx*]^.bahn_mc_control.otc_radius_offset

where channel_idx = [0..HLI_SYS_CH_MAXIDX]

For CNC Build < V2.11.2800:

pMC[*channel_idx*]^.addr^.MCControlBahn_Data.MCControlSGN32Unit_OTCRadiusOffset

where channel_idx = [1.. HLI_SYS_CHNMAX]

PLC access for CNC Build >= V2.11.2800

```
(* enable online tool compensation control unit *)
gpCh[0]^.bahn_mc_control.otc_radius_offset.enable_w := TRUE;

(* write radius offset in the first channel *)
gpCh[0]^.bahn_mc_control.otc_radius_offset.command_w := OTC_Offset;
```

PLC access for CNC build < V2.11.2800

```
(* enable online tool compensation control unit *)
pMC[1]^.addr^.MCControlBahn_Data.MCControlSGN32Unit_OTCRadiusOffset.X_Enable := TRUE;

(* write radius offset in the first channel *)
pMC[1]^.addr^.MCControlBahn_Data.MCControlSGN32Unit_OTCRadiusOffset.D_Command := OTC_Offset;
```

> **i** A continuous contour path is recommended because changing the orientation of the predefined offset is not applied to the axis all at once but is distributed over several cycles.

> **i** On selection, the commands G41/G42 and #OTC ON can be swapped. On deselection, the sequence G40 before #OTC OFF must be maintained. The TRC modes G138/G139 make a path motion between the two commands absolutely necessary.

The functionality of the RADIUS type is shown by the example of the G17 plane:
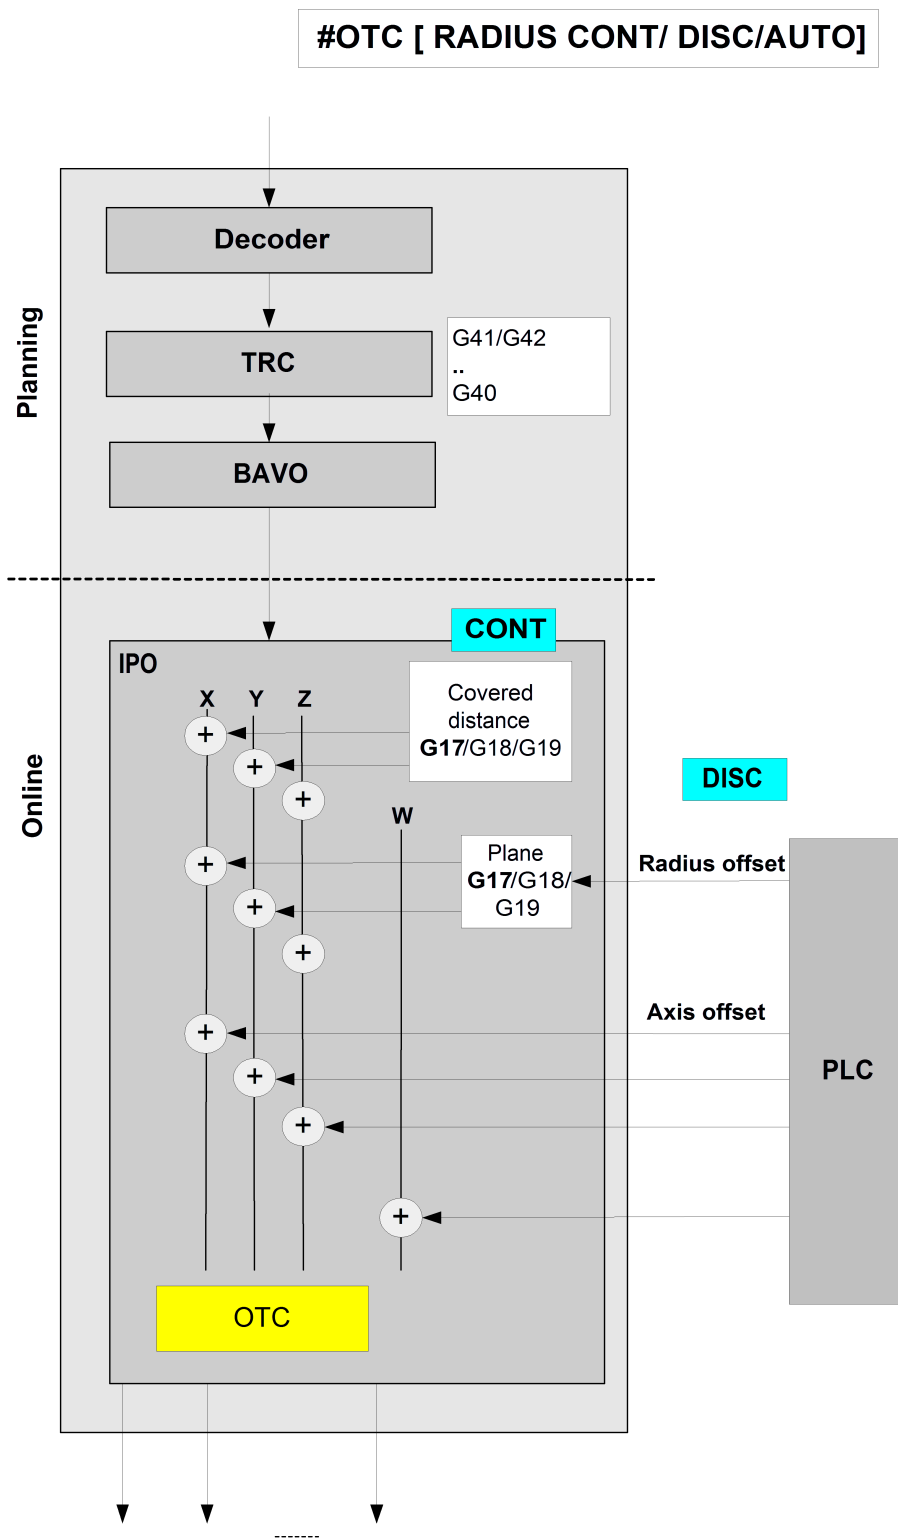

Fig. 4: Description of RADIUS function

2.3   Wear compensation of tool length

Grinding a surface

When the tool length is compensated (length compensation), wear is compensated in the direction of the 3rd main axis. This can take place both continuously and discretely. This procedure is used in particular for processing surfaces (surface grinding).

BECKHOFF
Fig. 5: Wear compensation of tool length

Tool length wear

```
...
N30 D1                 (Select data set for grinding disc)
N40 G00 X0 Y0 Z0
N50 #OTC ON [LENGTH]   (Select OTC)
N60 G1 X1000 F10000
N70 #OTC OFF           (Deselect OTC)
...
```

Distributing continuous wear on 2 main axes depends on the inclination of the grinding disc as described in Section Inclined grinding disc [▶ 18].

The LENGTH operation mode is shown in the figure below:
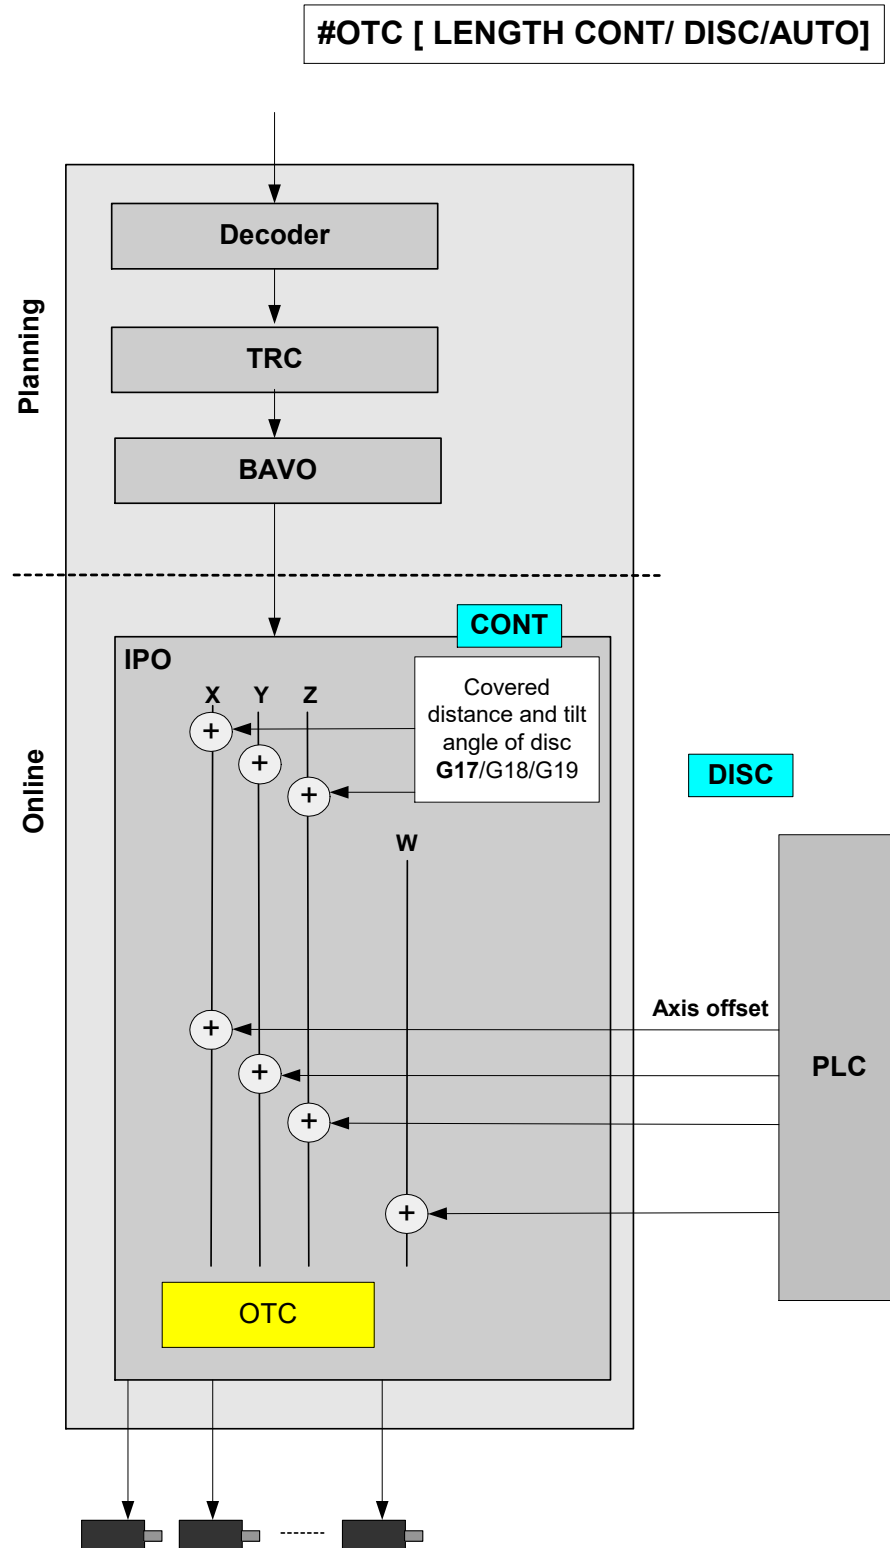

Fig. 6: Description of LENGTH function

BECKHOFF

2.3.1   Inclined grinding disc

Inclined grinding

The incline of the grinding disc is only entered in the tool list (P-TOOL-00032) to grind inclined surfaces. Here the complete lateral surface of the grinding disc is also in contact.

The figure below shows the orientation of the tilt angle using the example of the G17 plane:

Fig. 7: Inclined grinding disc

Online tool compensation
TF5200 | TC3 CNC

Tool orientation is determined by the disc tilt angle. This tool orientation can then be used to apply the resulting wear proportionately to the main axes.

In the figure above, wear is included in the calculation of the X and Z axes.

2.4   Wear compensation in tool direction

Grinding a surface

This compensation type is used to compensate for wear in the tool direction. This can take place both continuously and discretely.
Fig. 8: Wear compensation in tool direction

2.6   Special settings in tool data

Definition of tool type and wear parameters:

```
wz[1].gueltig                   1
wz[1].typ                       2     grinding tool
wz[1].mass_einheit              0
wz[1].laenge                    500000
wz[1].radius                    300000
wz[1].ax_versatz[0]             0
wz[1].ax_versatz[1]             0
wz[1].ax_versatz[2]             0
...
# Wear constant : Unit 0.1 µm/m
wz[1].grinding_wear_const       100000
# Maximum applied discrete input via PLC, unit: 0.1µm
wz[1].grinding_max_infeed       200000
# Disc tilt angle, unit: 0.0001 degree
wz[1].grinding_disc_tilt_angle  0
```

The disc tilt angle must be entered as a function of the mechanical construction.

i   **Unassigned data are assigned the value 0 by default.**

Consequence: If the tool type is not assigned Type 2, the error P-ERR-21391 is generated when #OTC ON is programmed.

If grinding_max_infeed is not set, no discrete offset can be applied.

The following also applies: if grinding_wear_const is not set, it is not possible to calculate the continuous offset depending on the path.

2.7 Connection to PLC

2.7.1 Channel-specific connection

The build-specific definitions apply to the following descriptions of the control units:

CNC Version >= V2.11.2800:　channel_idx = [0..HLI_SYS_CH_MAXIDX]

CNC Version <　V2.11.2800:　channel_idx = [1.. HLI_SYS_CHNMAX]

2.7.1.1 Adding wear radius

The interface can only be used with the RADIUS processing type and DISC or AUTO mode.

OTC radius offset		
Description	The tool radius can be adapted by setting the wear offset depending on wear.	
Special features	The wear offset is not output in a cycle in the CNC. Instead it is output over several cycles.	
ST path	**CNC Version >= V2.11.2800:** gpCh[channel_idx [▶ 26]]^.bahn_mc_control.otc_radius_offset **CNC Version < V2.11.2800:** pMC[channel_idx [▶ 26]]^.addr^.MCControlBahn_Data.MCControlSGN32Unit_OTCRadiusOffset	
CNC build	**>= V2.11.2800**	**< V2.11.2800**
Data type	MC_CONTROL_SGN32_UNIT	MCControlSGN32Unit
Commanded, requested and return value		
ST element	.command_w .request_r .state_r	.D_Command .D_Request .D_State
Data type	DINT	
Unit	0.1 µm	
Value range	[-P-TOOL-00031, P-TOOL-00031]	
Redirection		
ST element	.enable_w	.X_Enable

2.7.1.2   Adding wear in tool direction

If the TOOL_DIR processing type is used, it is possible to use automatic continuous wear compensation and influencing via PLC interface. The mode must be DISC or AUTO.

In the third axis (axis_idx = 3) an offset value can be written in the tool direction. The PLC input of the first two axes is ignored. All the axes in the following sequence can be influenced as usual by the PLC.

OTC offset in surface normal direction		
Description	When this wear offset is set, wear in the direction of the approximated surface normal can be compensated (cf. Radius type in 2.5D).	
Special features	Wear offset is adjusted by the CNC in the surface normal direction over several cycles.	
ST path	**CNC Version >= V2.11.2800:** gpCh[channel_idx [▶ 26]]^.bahn_mc_control.otc_radius_offset **CNC Version < V2.11.2800:** pMC[channel_idx [▶ 26]]^.addr^.MCControlBahn_Data.MCControlSGN32Unit_OTCRadiusOffset	
CNC build	**>= V2.11.2800**	**< V2.11.2800**
Data type	MC_CONTROL_SGN32_UNIT	MCControlSGN32Unit
Commanded, requested and return value		
ST element	.command_w .request_r .state_r	.D_Command .D_Request .D_State
Data type	DINT	
Unit	0.1 µm	
Value range	[-P-TOOL-00031, P-TOOL-00031]	
Redirection		
ST element	.enable_w	.X_Enable

BECKHOFF

2.7.2   Axis-specific connection

The build-specific definitions apply to the following descriptions of the control units:

CNC Version >= V2.11.2800:   axis_idx = [0..HLI_SYS_AX_MAXIDX]

CNC Version <   V2.11.2800:   axis_idx = [1.. HLI_SYS_AXMAX]

2.7.2.1   Adding wear in axis direction

The interface can be used with both for RADIUS or LENGTH processing types. The mode must be DISC or AUTO.

OTC offset		
Description	When this wear offset is set, wear in the direction of this axis can be compensated.	
Special features	The wear offset is distributed by the CNC over several cycles.	
ST path	**CNC Version >= V2.11.2800:** gpAx[axis_idx [▶ 28]]^.ipo_mc_control.otc_offset **CNC Version < V2.11.2800:** pAC[axis_idx [▶ 28]]^.addr^.McControlIpo_Data.MCControlSGN32Unit_OTCOffset	
CNC build	**>= V2.11.2800**	**< V2.11.2800**
Data type	MC_CONTROL_SGN32_UNIT	MCControlSGN32Unit

Commanded, requested and return value	

ST element	.command_w	.D_Command
	.request_r	.D_Request
	.state_r	.D_State
Data type	DINT	
Unit	0.1 µm	
Value range	[-P-TOOL-00031, P-TOOL-00031]	
Redirection		
ST element	.enable_w	.X_Enable

2.7.2.2   Adding wear in surface normal direction

When the SURF_NORM_ORI processing type is used, it is possible to use automatic continuous wear compensation and influencing via the PLC interface. The mode must be DISC or AUTO. The surface normal is approximated based on the current tool orientation and path tangent (cf. RADIUS type). For a continuous change in direction of the surface normal vector, the contour and orientation should be steady at all times.

The input of the first 3 axes is ignored All the axes in the following sequence can be influenced as usual by the PLC.

OTC offset in tool direction		
Description	When this wear offset is set, wear in the direction of the tool axis can be compensated. The offset value must be added to the third axis.	
Special features	Wear offset is adjusted by the CNC in the tool direction over several cycles.	
ST path	**CNC Version >= V2.11.2800:** gpAx[axis_idx [▶ 28]]^.ipo_mc_control.otc_offset **CNC Version < V2.11.2800:** pAC[axis_idx [▶ 28]]^.addr^.McControlIpo_Data.MCControlSGN32Unit_OTCOffset	
CNC build	**>= V2.11.2800**	**< V2.11.2800**
Data type	MC_CONTROL_SGN32_UNIT	MCControlSGN32Unit
Commanded, requested and return value		
ST element	.command_w .request_r .state_r	.D_Command .D_Request .D_State
Data type	DINT	
Unit	0.1 µm	
Value range	[-P-TOOL-00031, P-TOOL-00031]	
Redirection		
ST element	.enable_w	.X_Enable

2.8   Special V.G. variables for OTC

Reading wear values

Current tool wear can be read after processing with the following variables.

With radius compensation processing type in [mm] or [inch]:

- Total radius wear, discrete + continuous wear

    V.G.WZ_AKT.WEAR_RADIUS

- Continuous radius wear

V.G.WZ_AKT.WEAR_RADIUS_CONT

With length compensation processing type in [mm] or [inch]:

- Wear in axis with index <idx>

    V.G.WZ_AKT.WEAR[<idx>]

or

- Wear in axis with name <axis_name>

    V.G.WZ_AKT.WEAR.<axis_name>

The current wear value is supplied after deselecting OTC. The wear value refers to the wear which occurred between selecting and deselecting OTC.

If OTC is selected and deselected repeated in the same NC program, the above variables refer to the accumulated wear.

Writing/reading wear constant

The wear constant is defined as default in the tool data. It can also be read or written in the NC program by the variable V.G.WZ_AKT.WEAR_CONST in [0.1 µm/m]:

Status query: OTC active

The OTC state can be determined in the NC program. To do this, the NC program

V.G.OTC_ACTIVE

of the Boolean type must be readable in the NC program.

NOTICE
While OTC is active, V.G.WZ_AKT wear values are not up-to-date. They are only updated after OTC (#OTC OFF) is deselected.

2.9 Connecting to external tool management

Tool data

The external tool management system must provide the following data to the CNC when a grinding tool is changed (see [FCT-C10//section Tool data]:

- Type: Tool type 2 for grinding tool
- wear_const: Wear constant
- disc_tilt_angle: Grinding disc tilt angle
- ext_discret_limit: Maximum discrete input by the PLC

When the grinding tool is replaced, the CNC informs the external tool management system of the wear:

The wear data sent includes the following:

- wear_radius, total wear consisting of discrete and continuous wear
- wear_radius_cont, continuous wear

This wear data is generated from the time when the tool is replaced. The values must be taken over by the external tool management and are used internally to recalculate the tool geometric data (radius, length).

Unassigned data are assigned the value 0 by default.

Consequence: If the tool type is not assigned Type 2, the error P-ERR-21391 is generated when #OTC ON is programmed.

If grinding_max_infeed is not set, no discrete offset can be applied.

The following also applies: if grinding_wear_const is not set, it is not possible to calculate the continuous offset depending on the path.

---

3 Parameter

3.1 Overview

ID	Parameter	Description
P-TOOL-00001	typ	Tool type
P-TOOL-00030	grinding_wear_const	Wear constant
P-TOOL-00031	grinding_max_infeed	Maximum discrete input
P-TOOL-00032	grinding_tilt_angle	Grinding disc tilt angle
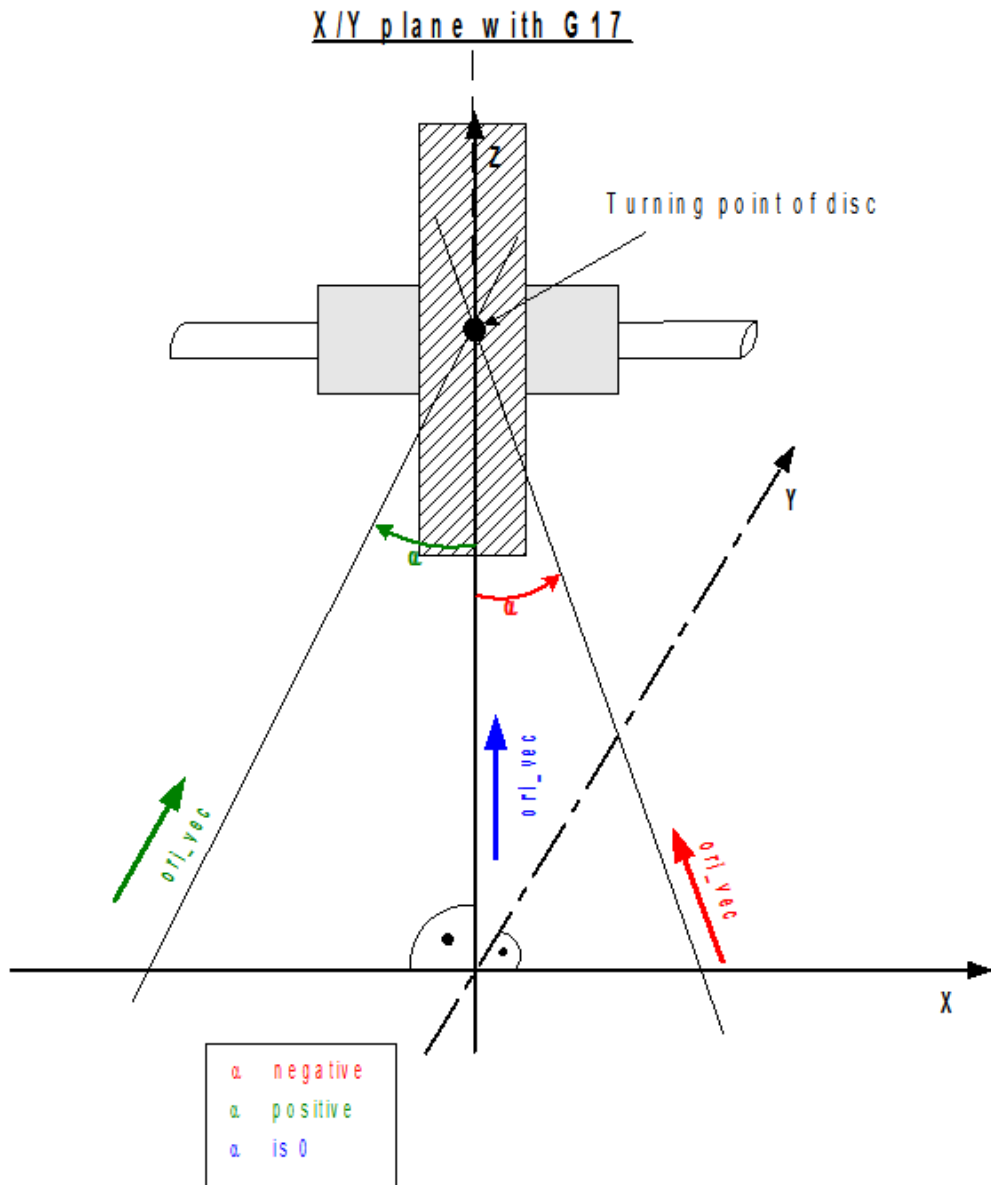

3.2 Description

P-TOOL-00001	**Type**
Description	This parameter is assigned to distinguish between tool types.
Parameter	wz[i].typ
Data type	UNS16
Data range	0: Milling tool
	1: Turning tool
	2: Grinding tool
Dimension	----
Default value	0
Remarks	Parameterisation example: Tool 5 is a milling tool
	wz[5]typ 0

P-TOOL-00030	**Wear constant**
Description	The wear constant is used to calculate continuous tool wear. Alternatively, it can also be defined in the NC program (#OTC […].
Parameter	wz[i].grinding_wear_const
Data type	REAL64
Data range	0 ≤ grinding_wear_const
Dimension	0.1µm/m
Default value	0
Remarks	The wear constant should contain relatively small values. There is no special dynamic consideration based on the actual wear values.

P-TOOL-00031	**Maximum discrete infeed**
Description	The maximum discrete infeed defines the greatest relative change which is assignable by the PLC.
Parameter	wz[i].grinding_max_infeed
Data type	REAL64
Data range	MIN(SGN32) ≤ grinding_max_infeed ≤ MAX(SGN32)
Dimension	0.1µm
Default value	0
Remarks	

P-TOOL-00032	**Grinding disc tilt angle**
Description	The parameter defines the angle between the centre line of the grinding disc and the 3rd main axis for tilted grinding discs.
Parameter	wz[i].grinding_tilt_angle
Data type	REAL64
Data range	-45°≤ grinding_tilt_angle ≤ 45°
Dimension	0.0001°
Default value	0
Remarks	 Grinding disc tilt angle

4 Support and Service

Beckhoff and their partners around the world offer comprehensive support and service, making available fast and competent assistance with all questions related to Beckhoff products and system solutions.

Beckhoff Support

Support offers you comprehensive technical assistance, helping you not only with the application of individual Beckhoff products, but also with other, wide-ranging services:

- Support
- design, programming and commissioning of complex automation systems
- and extensive training program for Beckhoff system components

Hotline:	+49(0)5246/963-157
