

# LP87702-Q1 Dual Buck Converter and 5-V Boost With Diagnostic Functions

## 1 Features

- AEC-Q100 Qualified for Automotive Applications:
  - Device Temperature Grade 1:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ,  $T_A$
- FMEDA and Functional Safety Manual available to support your ASIL compliant system designs
- Two High-Efficiency Step-Down DC/DC converters:
  - Maximum Output Current 3.5 A
  - 2-MHz, 3-MHz, or 4-MHz Switching Frequency
  - Auto PWM/PFM and Forced-PWM Operations
  - Output Voltage = 0.7 V to 3.36 V
- 5-V Boost Converter With Bypass-Mode Option:
  - Maximum Output Current 600 mA
- Two Inputs for External Voltage Monitoring
- Two Programmable Power-Good Signals
- Dedicated Reference Voltage for Diagnostics
- Window Watchdog With Reset Output
- External Clock Input to Synchronize Switching
- Spread-Spectrum Modulation
- Programmable Start-up and Shutdown Delays and Sequencing With Enable Signal
- Configurable General Purpose Outputs (GPOs)
- I<sup>2</sup>C-Compatible Interface Supporting Standard (100 kHz), Fast (400 kHz), Fast+ (1 MHz), and High-Speed (3.4 MHz) Modes
- Interrupt Function With Programmable Masking
- Output Short-Circuit and Overload Protection
- Overtemperature Warning and Protection
- Overvoltage Protection (OVP) and Undervoltage Lockout (UVLO)

## 2 Applications

Automotive Radar, Automotive Camera, Automotive Sensor Fusion, Industrial Radar, Building Automation

## 3 Description

The LP87702-Q1 helps meet the power management requirements of the latest platforms, particularly in automotive radar and camera and industrial radar applications. The device contains two step-down DC/DC converters, and a 5-V boost converter/bypass switch. To support safety critical applications, the device integrates two voltage monitoring inputs for external power supplies, and a window watchdog.

The automatic PWM/PFM (AUTO mode) operation gives high efficiency over a wide output current range for buck converters. The LP87702-Q1 uses remote voltage sensing to compensate IR drop between the converter output and the point-of-load, thus improving the accuracy of the output voltage.

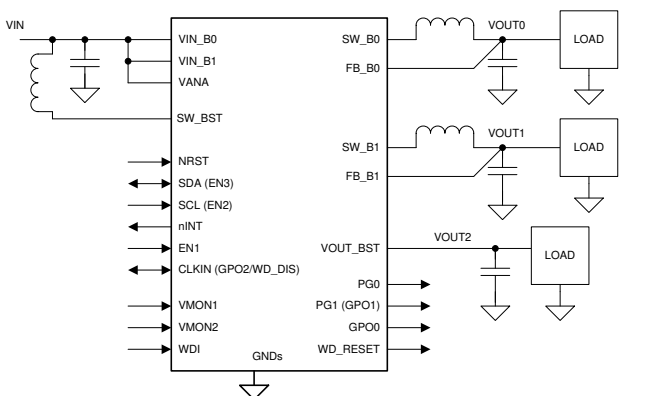

Programmable start-up and shutdown sequences synchronized to the enable signal are supported, including general purpose digital outputs. During start-up and voltage change, the device controls the output slew rate for minimum output voltage overshoot and inrush current. This device contains one-time-programmable (OTP) memory. Each orderable part number has specific OTP settings for a given application. Details of the default OTP configuration for each orderable part number can be found in the technical reference manual.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP87702-Q1	VQFN (32)	5.00 mm x 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Simplified Schematic

### Buck Efficiency vs Output Current

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision A (July 2018) to Revision B</b>	<b>Page</b>
• Added FMEDA and Functional Safety Manual support availability feature .....	<b>1</b>
• Changed Description wording .....	<b>1</b>
• Added cross reference to VANA <sub>OVP</sub> .....	<b>5</b>
• Added test condition .....	<b>9</b>
• Added test condition .....	<b>9</b>
• Changed from typical value to max value .....	<b>10</b>
• Added comment on VANA <sub>OVP</sub> setting and it's impact on device input voltage range .....	<b>16</b>
• Added comment on minimum WDI pulse length .....	<b>26</b>
• Changed BOOST_SC_INT bit set delay from immediate to 1 ms .....	<b>37</b>
• Changed multiple register bit descriptions.....	<b>45</b>

<b>Changes from Original (December 2017) to Revision A</b>	<b>Page</b>
• First release of production-data data sheet .....	<b>1</b>

## 5 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION
NUMBER	NAME		
1	nINT	D/O	Open-drain interrupt output. Active LOW.
2	FB_B0	A	Output voltage feedback for Buck0.
3	FB_B1	A	Output voltage feedback for Buck1.
4	AGND	G	Ground.
5	VANA	P	Supply voltage for analog and digital blocks. Must be connected to same node with VIN_Bx.
6	WD_RESET	D/O	Reset output from window watchdog
7	WDI	D/I	Digital input signal for window watchdog
8	VOUT_BST	P/O	Boost output. Bypass switch output when this mode is selected.
9	SW_BST	P/I	Boost input. Bypass switch input when this mode is selected.
10	PGND_BST	P/G	Power ground for boost.
11	NRST	D/I	Reset signal for the device.
12	GPO0	D/O	General purpose digital output 0.
13, 14	VIN_B1	P/I	Input for Buck1. The separate power pins VIN_Bx are not connected together internally - VIN_Bx pins must be connected together in the application and be locally bypassed.
15, 16	SW_B1	P/O	Buck1 switch node.
17, 18	PGND_B1	P/G	Power Ground for Buck1.
19	EN1	D/I	Programmable Enable 1 signal.
20	SCL	D/I	Serial interface clock input for I2C access. Connect a pullup resistor. Alternative function is programmable enable 2 signal.
21	SDA	D//O	Serial interface data input and output for I2C access. Connect a pullup resistor. Alternative function is programmable enable 3 signal.
22	CLKIN	D//O	External clock input. Alternative function is general purpose digital output 2 (GPO2). Second alternative function is watchdog disable (WD_DIS)
23, 24	PGND_B0	P/G	Power ground for Buck0.
25, 26	SW_B0	P/O	Buck0 switch node.
27, 28	VIN_B0	P/I	Input for Buck0. The separate power pins VIN_Bx are not connected together internally - VIN_Bx pins must be connected together in the application and be locally bypassed.
29	PG0	D/O	Programmable power-good indication signal.
30	VMON1	A/I	Voltage monitoring input 1.
31	VMON2	A/I	Voltage monitoring input 2.
32	PG1	D/O	Programmable power-good indication signal. Alternative function is general purpose digital output 1 (GPO1).
Thermal pad	N/A	G	

A: Analog Pin, D: Digital Pin, G: Ground Pin, P: Power Pin, I: Input Pin, O: Output Pin

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

		MIN	MAX	UNIT
VIN_B0, VIN_B1, SW_BST, VANA	Voltage on input power connections	-0.3	6	V
SW_B0, SW_B1	Voltage on buck switch nodes	-0.3	(VIN_Bx + 0.3 V) with 6-V max	V
FB_B0, FB_B1	Voltage on buck voltage sense nodes	-0.3	(VANA + 0.3 V) with 6-V max	V
VOUT_BST	Voltage on boost output	-0.3	6	V
SCL (EN2), SDA (EN3), VMON1, VMON2	Voltage on voltage monitoring pins	-0.3	(VANA + 0.3 V) with 6-V max	V
NRST, EN1, nINT	Voltage on logic pins (input or output pins)	-0.3	6	V
PG0, PG1 (GPO1), GPO0, CLKIN (GPO2), WDI, WD_RESET	Voltage on logic pins (input or output pins)	-0.3	(VANA + 0.3 V) with 6-V max	V
T <sub>J-MAX</sub>	Junction temperature	-40	150	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C
Maximum lead temperature (soldering, 10 sec.)			260	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground.

### 6.2 ESD Ratings

		VALUE	UNIT	
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 HBM ESD Classification Level 2 <sup>(1)</sup>	±2000	
		Charged-device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4B	All pins	±500
			Corner pins (1, 8, 9, 16, 17, 24, 25, 32)	±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
<b>INPUT VOLTAGE</b>				
VIN_B0, VIN_B1, SW_BST, VANA	Voltage on input power connections. See also VANA <sub>OVp</sub> .	2.8	5.5	V
VMON1, VMON2	Voltage on voltage monitoring pins	0	5.5	V
NRST, EN1, EN2, EN3, nINT	Voltage on logic pins (input or output pins)	0	5.5	V
PG0, PG1 (GPO1), GPO0, CLKIN (GPO2), WDI, WD_RESET	Voltage on logic pins (input or output pins)	0	VANA	V
SCL, SDA	Voltage on I2C interface, Standard (100 kHz), Fast (400 kHz), Fast+ (1 MHz), and High-Speed (3.4 MHz) Modes	0	1.95	V
	Voltage on I2C interface, Standard (100 kHz), Fast (400 kHz), and Fast+ (1 MHz) Modes	0	VANA with 3.6-V max	V
<b>TEMPERATURE</b>				
T <sub>J</sub>	Junction temperature	-40	140	°C
T <sub>A</sub>	Ambient temperature	-40	125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		RHB (VQFN)	UNIT
		32 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	31.7	°C/W
R <sub>θJctop</sub>	Junction-to-case (top) thermal resistance	17.1	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	5.6	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	5.6	°C/W
R <sub>θJcbot</sub>	Junction-to-case (bottom) thermal resistance	1.1	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

### 6.5 Electrical Characteristics

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq 140^{\circ}\text{C}$ , specified  $V_{VANA}$ ,  $V_{VIN\_Bx}$ ,  $V_{VOUT\_Bx}$ ,  $V_{VOUT\_BST}$ , and  $I_{OUT}$  range, unless otherwise noted. Typical values are at  $T_A = 25^{\circ}\text{C}$ ,  $V_{VANA} = V_{VIN\_Bx} = 3.3\text{ V}$ ,  $V_{VOUT\_BST} = 5\text{ V}$  and  $V_{VOUT\_Bx} = 1\text{ V}$ , unless otherwise noted. <sup>(1) (2)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>EXTERNAL COMPONENTS</b>						
C <sub>IN_BUCK</sub>	Input filtering capacitance for buck converters	Effective capacitance, connected from VIN_Bx to PGND_Bx	1.9	10		μF
C <sub>OUT_BUCK</sub>	Output filtering capacitance for buck converters	Effective total capacitance. Maximum includes POL capacitance	15	22	100	μF
C <sub>OUT_BUCK_POL</sub>	Point-of-load (POL) capacitance for buck converters	Optional POL capacitance		22		μF
C <sub>OUT_BST</sub>	Output filtering capacitance for boost converter	Effective capacitance	10	22	40	μF
ESR <sub>C</sub>	Input and output capacitor ESR	[1-10] MHz		2	10	mΩ
L <sub>BUCK</sub>	Inductor for buck converters	Inductance of the inductor		0.47		μH
			-30%		30%	
L <sub>BST</sub>	Inductor for boost converters	Inductance of the inductor, 2-MHz switching		1		μH
		Inductance of the inductor, 4-MHz switching		1		
		Inductance of the inductor	-30%		30%	
DCR <sub>L</sub>	Inductor DCR			25		mΩ
<b>BUCK CONVERTERS</b>						
V <sub>(VIN_Bx)</sub> , V <sub>(VANA)</sub>	Input voltage range		2.8	3.3	5.5	V
V <sub>OUT_Bx</sub>	Output voltage	Programmable voltage range	0.7	1	3.36	V
		Step size, $0.7\text{ V} \leq V_{OUT} < 0.73\text{ V}$		10		mV
		Step size, $0.73\text{ V} \leq V_{OUT} < 1.4\text{ V}$		5		
		Step size, $1.4\text{ V} \leq V_{OUT} \leq 3.36\text{ V}$		20		
I <sub>OUT_Bx</sub>	Output current	Output current			3.5 <sup>(3)</sup>	A
	Minimum voltage difference between V <sub>(VIN_Bx)</sub> and V <sub>OUT_Bx</sub> for electrical characteristics	V <sub>(VIN_Bx)</sub> - V <sub>OUT</sub> , I <sub>OUT_Bx</sub> ≤ 2 A	0.8			V
		V <sub>(VIN_Bx)</sub> - V <sub>OUT</sub> , I <sub>OUT_Bx</sub> > 2 A	1			

- (1) All voltage values are with respect to network ground.
- (2) Minimum (MIN) and Maximum (MAX) limits are specified by design, test, or statistical analysis.
- (3) The maximum output current can be limited by the forward current limit I<sub>LIM\_FWD</sub>. The maximum output current is also limited by the junction temperature and maximum average current over lifetime. The power dissipation inside the die increases the junction temperature and limits the maximum current depending of the length of the current pulse, efficiency, board and ambient temperature.

## Electrical Characteristics (continued)

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq 140^{\circ}\text{C}$ , specified  $V_{\text{VANA}}$ ,  $V_{\text{VIN\_Bx}}$ ,  $V_{\text{VOUT\_Bx}}$ ,  $V_{\text{VOUT\_BST}}$ , and  $I_{\text{OUT}}$  range, unless otherwise noted. Typical values are at  $T_A = 25^{\circ}\text{C}$ ,  $V_{\text{VANA}} = V_{\text{VIN\_Bx}} = 3.3\text{ V}$ ,  $V_{\text{VOUT\_BST}} = 5\text{ V}$  and  $V_{\text{VOUT\_Bx}} = 1\text{ V}$ , unless otherwise noted. <sup>(1)</sup> <sup>(2)</sup>

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT		
DC output voltage accuracy, includes voltage reference, DC load and line regulations, process and temperature	Force PWM mode, $V_{\text{OUT}} < 1.0\text{ V}$	-20		20	mV		
	Force PWM mode, $V_{\text{OUT}} \geq 1.0\text{ V}$	-2%		2%			
	PFM mode, $V_{\text{OUT}} < 1.0\text{ V}$ , the average output voltage level is increased by max. 20 mV	-20		40	mV		
	PFM mode, $V_{\text{OUT}} \geq 1.0\text{ V}$ , the average output voltage level is increased by max. 20 mV	-2%		2% + 20mV			
Ripple voltage	PWM mode, $V_{\text{OUT}} = 1.2\text{ V}$ , $f_{\text{SW}} = 4\text{ MHz}$ , $C_{\text{OUT}} = 22 + 22\text{ }\mu\text{F}$ (GCM31CR71A226KE02)		5		mV <sub>p-p</sub>		
	PFM mode, $L = 0.47\text{ }\mu\text{H}$ , $C_{\text{OUT}} = 22 + 22\text{ }\mu\text{F}$ (GCM31CR71A226KE02)		25				
DC <sub>LNR</sub>	DC line regulation	$I_{\text{OUT}} = I_{\text{OUT(max)}}$			$\pm 0.05$	%/V	
DC <sub>LDR</sub>	DC load regulation in PWM mode	$V_{\text{OUT\_Bx}} = 1.0\text{ V}$ , $I_{\text{OUT}}$ from 0 to $I_{\text{OUT(max)}}$			0.3%		
T <sub>LDSR</sub>	Transient load step response	$I_{\text{OUT}} = 0\text{ A}$ to $3\text{ A}$ , $T_R = T_F = 1\text{ }\mu\text{s}$ , PWM mode, $V_{\text{VIN\_Bx}} = 3.3\text{ V}$ , $V_{\text{OUT\_Bx}} = 1.2\text{ V}$ , $C_{\text{OUT}} = 22 + 22\text{ }\mu\text{F}$ , $L = 0.47\text{ }\mu\text{H}$ , $f_{\text{SW}} = 4\text{ MHz}$			$\pm 65$	mV	
T <sub>LNSR</sub>	Transient line response	$V_{\text{VIN\_Bx}}$ stepping $3\text{ V} \leftrightarrow 3.5\text{ V}$ , $T_R = T_F = 10\text{ }\mu\text{s}$ , $I_{\text{OUT}} = I_{\text{OUT(max)}}$			$\pm 20$	mV	
I <sub>LIM FWD</sub>	Forward current limit for both bucks (peak for every switching cycle)	Programmable range		1.5	4.5	A	
		Step size			0.5		
		Accuracy, $V_{\text{VIN\_Bx}} \geq 3\text{ V}$ , $I_{\text{LIM}} = 4\text{ A}$		-5%	7.5%		20%
		Accuracy, $2.8\text{ V} \leq V_{\text{VIN\_Bx}} < 3\text{ V}$ , $I_{\text{LIM}} = 4\text{ A}$		-20%	7.5%		20%
I <sub>LIM NEG</sub>	Negative current limit		1.6	2	3	A	
R <sub>D(S)ON</sub> BUCK HS FET	On-resistance, high-side FET	Each phase, between VIN_Bx and SW_Bx pins ( $I = 1.0\text{ A}$ )			60	110	m $\Omega$
R <sub>D(S)ON</sub> BUCK LS FET	On-resistance, low-side FET	Each phase, between SW_Bx and PGND_Bx pins ( $I = 1.0\text{ A}$ )			55	80	m $\Omega$
f <sub>SW</sub>	Switching frequency, PWM mode OTP programmable	2-MHz setting or $V_{\text{OUT\_Bx}} < 0.8\text{ V}$		1.8	2	2.2	MHz
		3-MHz setting and $V_{\text{OUT\_Bx}} \geq 0.8\text{ V}$		2.7	3	3.3	
		4-MHz setting and $V_{\text{OUT\_Bx}} \geq 1.1\text{ V}$		3.6	4	4.4	
	Start-up time (soft start)	From ENx to $V_{\text{OUT\_Bx}} = 0.35\text{ V}$ (slew-rate control begins)			120		$\mu\text{s}$
	Overshoot during start-up				50		mV
	Output voltage slew-rate <sup>(4)</sup>	SLEW_RATEx[2:0] = 010, $V_{\text{VOUT\_Bx}} \geq 0.7\text{ V}$		-15%	10	15%	mV/ $\mu\text{s}$
	Output voltage slew-rate <sup>(4)</sup>	SLEW_RATEx[2:0] = 011, $V_{\text{VOUT\_Bx}} \geq 0.7\text{ V}$		-15%	7.5	15%	mV/ $\mu\text{s}$
	Output voltage slew-rate <sup>(4)</sup>	SLEW_RATEx[2:0] = 100, $V_{\text{VOUT\_Bx}} \geq 0.7\text{ V}$		-15%	3.8	15%	mV/ $\mu\text{s}$
	Output voltage slew-rate <sup>(4)</sup>	SLEW_RATEx[2:0] = 101, $V_{\text{VOUT\_Bx}} \geq 0.7\text{ V}$		-15%	1.9	15%	mV/ $\mu\text{s}$
	Output voltage slew-rate <sup>(4)</sup>	SLEW_RATEx[2:0] = 110, $V_{\text{VOUT\_Bx}} \geq 0.7\text{ V}$		-15%	0.94	15%	mV/ $\mu\text{s}$
	Output voltage slew-rate <sup>(4)</sup>	SLEW_RATEx[2:0] = 111, $V_{\text{VOUT\_Bx}} \geq 0.7\text{ V}$		-15%	0.47	15%	mV/ $\mu\text{s}$

(4) The slew-rate can be limited by the current limit (forward or negative current limit), output capacitance and load current. Applies when internal oscillator is used.

### Electrical Characteristics (continued)

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq 140^{\circ}\text{C}$ , specified  $V_{VANA}$ ,  $V_{VIN\_BX}$ ,  $V_{VOUT\_BX}$ ,  $V_{VOUT\_BST}$ , and  $I_{OUT}$  range, unless otherwise noted. Typical values are at  $T_A = 25^{\circ}\text{C}$ ,  $V_{VANA} = V_{VIN\_BX} = 3.3\text{ V}$ ,  $V_{VOUT\_BST} = 5\text{ V}$  and  $V_{VOUT\_BX} = 1\text{ V}$ , unless otherwise noted. <sup>(1) (2)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$I_{PFM-PWM}$	PFM-to-PWM switch - current threshold <sup>(5)</sup>			520		mA
$I_{PWM-PFM}$	PWM-to-PFM switch - current threshold <sup>(5)</sup>			240		mA
	Output pull-down resistance	Converter disabled	75	125	175	$\Omega$
<b>BOOST CONVERTER</b>						
$V_{IN\_BST}$	Input voltage range for boost power inputs		2.8	3.3	4	V
	Input voltage range when bypass switch mode selected		4.5		5.5	V
$V_{OUT\_BST}$	Output voltage, boost mode	BOOST_VSET = 00		4.9		V
		BOOST_VSET = 01		5.0		
		BOOST_VSET = 10		5.1		
		BOOST_VSET = 11		5.2		
$I_{OUT\_BST}$	Output current	Both boost and bypass mode			0.6	A
$I_{LIM\_BST}$	Output current limit	BOOST_ILIM = 00, $V_{IN\_BST} < 3.6\text{ V}$	0.8	1	1.3	A
		BOOST_ILIM = 01, $V_{IN\_BST} < 3.6\text{ V}$	1.1	1.4	1.9	
		BOOST_ILIM = 10, $V_{IN\_BST} < 3.6\text{ V}$	1.5	1.9	2.3	
		BOOST_ILIM = 11, $V_{IN\_BST} < 3.6\text{ V}$	2.2	2.8	3.4	
$V_{OUT\_BST\_DC}$	DC output voltage accuracy, includes voltage reference, DC load and line regulations, process and temperature. Boost mode	Default output voltage	-3%		3%	
$V_{DROP}$	Voltage drop, bypass mode,	$I_{OUT} = 250\text{ mA}$			83	mV
	Ripple voltage, boost mode	22 $\mu\text{F}$ effective output capacitance		20		mV <sub>p-p</sub>
$DC_{LDR}$	DC load regulation, boost mode	$I_{OUT} = 1\text{ mA}$ to $I_{OUT(max)}$		0.3%		
$T_{LDSR}$	Transient load step response, boost mode	$I_{OUT} = 1\text{ mA}$ to 250 mA, $T_R = T_F = 1\text{ }\mu\text{s}$ , 22 $\mu\text{F}$ effective output capacitance, $V_{IN} > 3\text{ V}$	-220		220	mV
$I_{SHORT}$	Short circuit current limitation	During start-up, both boost and bypass mode. Short circuit current limit applies until $V_{OUT\_BST} = V_{IN\_BST}$		625		mA
$R_{DS(ON)}$ BST HS FET	On-resistance, high-side FET	Pin-to-pin, between SW_BST and VOUT_BST pins ( $I = 250\text{ mA}$ )		145	220	m $\Omega$
$R_{DS(ON)}$ BST LS FET	On-resistance, low-side FET	Pin-to-pin, between SW_BST and PGND_BST pins ( $I = 250\text{ mA}$ )		90	175	m $\Omega$
$f_{SW}$	Switching frequency, boost mode	2-MHz setting	1.8	2	2.2	MHz
		4-MHz setting	3.6	4	4.4	MHz
	Start-up time, boost mode	From enable to boost VOUT within 3% of target value. $C_{OUT\_BST} = 22\text{ }\mu\text{F}$		450		$\mu\text{s}$
	Output pull-down resistance	Converter disabled		135		$\Omega$

(5) The final PFM-to-PWM and PWM-to-PFM switchover current varies slightly and is dependant on the output voltage, input voltage and the inductor current level.

## Electrical Characteristics (continued)

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq 140^{\circ}\text{C}$ , specified  $V_{VANA}$ ,  $V_{VIN\_BX}$ ,  $V_{VOUT\_BX}$ ,  $V_{VOUT\_BST}$ , and  $I_{OUT}$  range, unless otherwise noted. Typical values are at  $T_A = 25^{\circ}\text{C}$ ,  $V_{VANA} = V_{VIN\_BX} = 3.3\text{ V}$ ,  $V_{VOUT\_BST} = 5\text{ V}$  and  $V_{VOUT\_BX} = 1\text{ V}$ , unless otherwise noted. <sup>(1)</sup> <sup>(2)</sup>

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>EXTERNAL CLOCK AND PLL</b>					
External input clock <sup>(6)</sup>	Nominal frequency	1		24	MHz
	Nominal frequency step size		1		
	Required accuracy from nominal frequency	-30%		10%	
External clock detection	Delay for detecting loss of external clock, nominal internal clock, clock accuracy $\pm 10\%$			1.8	$\mu\text{s}$

## 7 Detailed Description

### 7.1 Overview

The LP87702-Q1 is a high-efficiency, high-performance power supply IC with two step-down DC/DC converters (Buck0 and Buck1) and boost converter for automotive and industrial applications. Input voltage range is from 2.8 V to 5.5 V. Typical application input voltage levels are 3.3 V and 5 V. With 3.3V input and boost enabled,  $V_{ANA\_OVP}$  is set to 4.3V (typ). When input voltage is 5 V, boost can be used as a load switch and  $V_{ANA\_OVP}$  is set to 5.8 V (typ).  $V_{ANA\_OVP}$  is selected in OTP by  $V_{ANA\_OVP\_SEL}$  and is a fixed factory setting. Table 1 lists the output characteristics of the various converters. Boost has an alternate bypass switch mode. Selection between boost and bypass modes is defined in OTP and is fixed.

**Table 1. Supply Specification**

SUPPLY	OUTPUT		
	$V_{OUT}$ RANGE (V)	RESOLUTION (mV)	$I_{MAX}$ MAXIMUM OUTPUT CURRENT (mA)
Boost	4.9 to 5.2	100	600
Buck0	0.7 to 3.36	10 (0.7 V to 0.73 V) 5 (0.73 V to 1.4 V) 20 (1.4 V to 3.36 V)	3500
Buck1	0.7 to 3.36	10 (0.7 V to 0.73 V) 5 (0.73 V to 1.4 V) 20 (1.4 V to 3.36 V)	3500

The LP87702-Q1 converters support switching clock synchronization to an external clock connected to CLKIN input. The external clock can be from 1 MHz to 24 MHz with 1-MHz steps. Alternatively, optional spread spectrum mode can be enabled to reduce EMI.

LP87702-Q1 features include diagnostics, monitoring and protections for both device internal and system level operation:

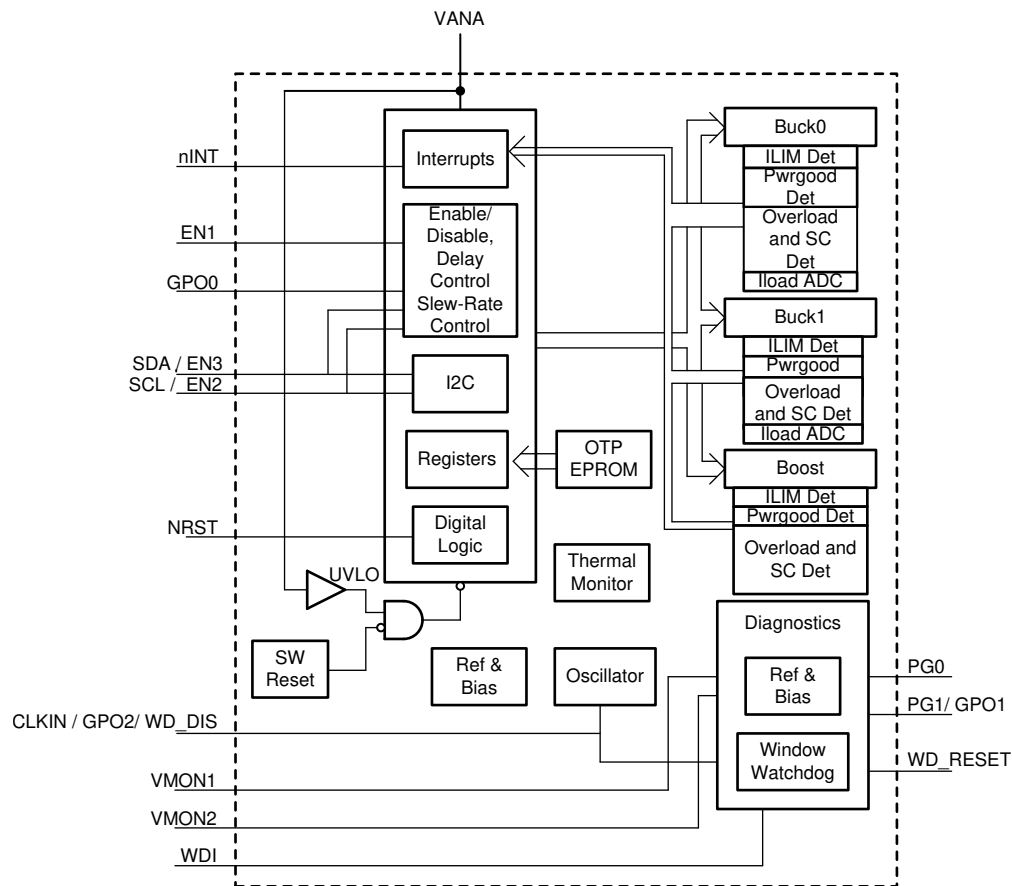

- Soft start
- Input undervoltage lockout
- Programmable undervoltage or window (over- and undervoltage) monitoring for the input (from VANA pin)
- Programmable undervoltage or window (over- and undervoltage) monitoring for the buck and boost converter outputs
- Two inputs (VMONx) with programmable undervoltage or window (over- and undervoltage) thresholds, for monitoring external rails in the system
- One dedicated power-good output (PG0) to which selected monitoring signals can be combined
- Second programmable power-good output (PG1), multiplexed with general purpose output (GPO1)
- Power good flags with maskable interrupt
- Programmable window watchdog
- Buck and boost converter overload detection
- Thermal warning with two selectable thresholds
- Thermal shutdown

LP87702-Q1 control interface:

- Up to three enable inputs ( EN1, EN2 and EN3) with programmable power-up/power-down sequence control
- Optional I2C (multiplexed with EN2 and EN3 inputs)
- Interrupt signal (nINT) to host
- Reset input (NRST)
- One dedicated general purpose output (GPO0)
- Watchdog disable  $WD\_DIS$ , multiplexed with CLKIN/GPO2

## 7.2 Functional Block Diagram

## 7.3 Feature Descriptions

### 7.3.1 Step-Down DC/DC Converters

#### 7.3.1.1 Overview

The LP87702-Q1 includes two high-efficiency step-down DC/DC converters. The buck converters deliver 0.7-V to 3.36-V regulated voltage rails from 2.8-V to 5.5-V input-supply voltage. The converters are designed for flexibility; most of the functions are programmable, thus optimizing the converter operation for each application:

- DVS support with programmable slew rate
- Automatic mode control based on the loading (PWM or PFM mode)
- Forced PWM mode option
- Optional external clock input to minimize crosstalk
- Optional spread spectrum technique to reduce EMI
- Synchronous rectification
- Current mode loop with PI compensator
- Soft start
- Programmable output voltage monitoring with maskable interrupt and selectable connection PG0 and/or PG1
- Average output current sensing (for PFM entry and load current measurement)

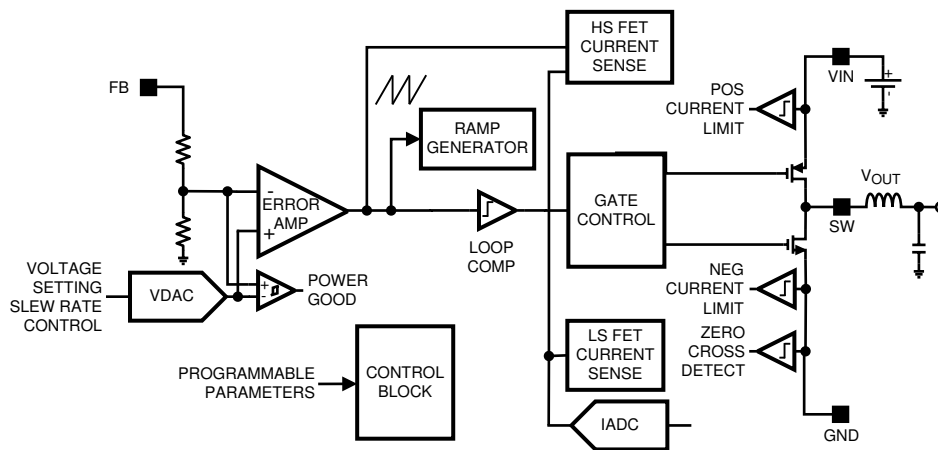

**Feature Descriptions (continued)**

Some of the key parameters that can be programmed via registers (with default values set by OTP bits):

- Output voltage
- Forced PWM operation
- Switch current limit
- Output voltage slew rate
- Enable and disable delays with ENx pin control

There are two modes of operation for the buck converters, depending on the output current required: pulse width modulation (PWM) and pulse-frequency modulation (PFM). The converter operates in PWM mode at high load currents of approximately 520 mA or higher. Lighter output current loads will cause the converter to automatically switch into PFM mode for reduced current consumption when forced PWM mode is disabled. The forced PWM mode can be selected to maintain fixed switching frequency at all load currents. When buck is disabled, buck output is isolated from the input voltage rail. Output has an optional pulldown resistor.

A block diagram of a single buck converter is shown in [Figure 7](#).

Copyright © 2016, Texas Instruments Incorporated

**Figure 7. Detailed Block Diagram Showing One Buck Converter**

**7.3.1.2 Transition Between PWM and PFM Modes**

The LP87702-Q1 buck converter operates in PWM mode at load current of about 520 mA or higher. At lighter load current levels the device automatically switches into PFM mode for reduced current consumption when forced PWM mode is disabled (AUTO mode operation). By combining the PFM and the PWM modes a high efficiency is achieved over a wide output-load current range.

**7.3.1.3 Buck Converter Load Current Measurement**

Buck load current can be monitored via I<sup>2</sup>C registers. The monitored buck converter is selected with the LOAD\_CURRENT\_BUCK\_SELECT bit in SEL\_I\_LOAD register. A write to this selection register starts a current measurement sequence. The converter is forced to PWM mode during the measurement. The measurement sequence is 50 μs long at maximum. LP87702-Q1 can be configured to give out an I\_MEAS\_INT interrupt in INT\_TOP\_1 register after the load current measurement sequence is finished. Load current measurement interrupt can be masked with I\_MEAS\_MASK bit in TOP\_MASK\_1 register. The measurement result can be read from I\_LOAD\_1 and I\_LOAD\_2 registers. The Buck converter load current measurement result is 9-bit wide, with 8 LSB bits stored in I\_LOAD\_1 register and 1 MSB bit stored in I\_LOAD\_2 register. The single bit resolution is 20 mA, with a maximum load current value of 10.22A.

## Feature Descriptions (continued)

### 7.3.2 Boost Converter

The LP87702-Q1 device integrates a boost converter with programmable output voltage from 4.9V to 5.2V in 0.1V steps, and input voltage range from 2.8V to 4V. The boost converter has flexibility to support wide range of application conditions:

- Forced PWM operation
- Optional external clock input to minimize crosstalk
- Optional spread spectrum technique to reduce EMI
- Synchronous rectification
- Current mode loop with PI compensator
- Soft start
- Programmable output voltage monitoring with maskable interrupt and selectable connection to PG0 and/or PG1

Following parameters can be programmed via registers, with default values set by OTP bits unless otherwise noted:

- Output voltage level (BOOST\_VSET)
- Switch current limit (BOOST\_ILIM)
- Enable and disable delays when ENx pin control is used (BOOST\_DELAY register)
- Output pulldown resistor enable/disable when boost is disabled (BOOST\_RDIS\_EN bit, discharge is enabled by default)
- Output voltage monitoring enable/disable and monitoring window thresholds

The boost converter operates in forced PWM mode with fixed switching frequency across all load currents. When boost is disabled, boost output is isolated from the input voltage rail.

Boost converter supports an alternative operating mode as a bypass/load switch, with input voltage range from 4.5V to 5.5V. Operating mode is selected in OTP and is fixed, changing the mode on-the-fly is not supported.

### 7.3.3 Spread-Spectrum Mode

Systems with periodic switching signals may generate a large amount of switching noise in a set of narrowband frequencies (the switching frequency and its harmonics). The usual solution to reduce noise coupling is to add EMI-filters and shields to the boards. The LP87702-Q1 device supports spread-spectrum switching frequency modulation mode that is register controlled. This mode minimizes the need for output filters, ferrite beads, or chokes. In spread spectrum mode, the switching frequency varies between  $0.85 \times f_{SW}$  and  $f_{SW}$ , where  $f_{SW}$  is switching frequency selected in the OTP. Spread spectrum modulation reduces conducted and radiated emissions by the converter and associated passive components and PCB traces (see [Figure 8](#)). This feature is available only when internal RC oscillator is used (EN\_PLL is 0 in PLL\_CTRL register) and it is enabled with the EN\_SPREAD\_SPEC bit in CONFIG register, and it affects both buck converters and the boost converter.

**Feature Descriptions (continued)**

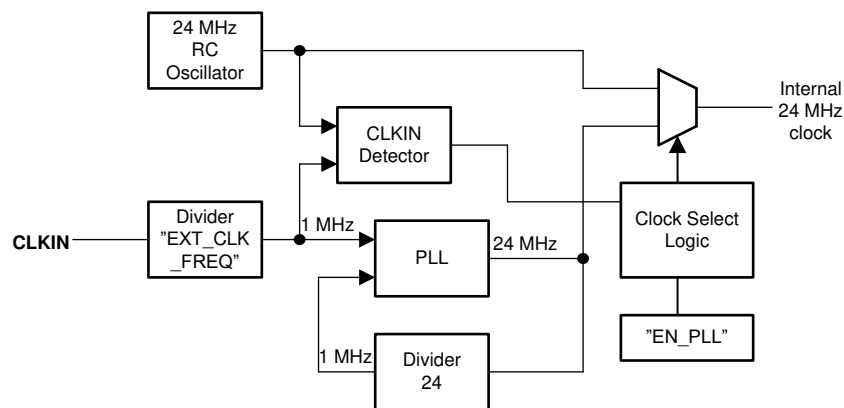

Where a fixed frequency converter exhibits large amounts of spectral energy at the switching frequency, the spread spectrum architecture of the LP87702-Q1 spreads that energy over a large bandwidth.

**Figure 8. Spread Spectrum Modulation**

**7.3.4 Sync Clock Functionality**

The LP87702-Q1 device contains a CLKIN input to synchronize buck and boost converters' switching clock with the external clock. The block diagram of the clocking and PLL module is shown in [Figure 9](#). Depending on the EN\_PLL bit in PLL\_CTRL register and the external clock availability, the external clock is selected and interrupt is generated as shown in [Table 2](#). The interrupt can be masked with SYNC\_CLK\_MASK bit in TOP\_MASK\_1 register. The nominal frequency of the external input clock is set by EXT\_CLK\_FREQ[4:0] bits in PLL\_CTRL register and it can be from 1 MHz to 24 MHz with 1-MHz steps. The external clock must be inside accuracy limits (–30%/+10%) for valid clock detection.

The SYNC\_CLK\_INT interrupt in INT\_TOP\_1 register is also generated in cases the external clock is expected but it is not available. These cases are Startup (Read OTP-to-standby transition) when EN\_PLL = 1 and buck or boost converter is enabled (standby-to-active transition) when EN\_PLL = 1.

**Figure 9. Clock and PLL Module**

**Feature Descriptions (continued)**
**Table 2. PLL Operation**

DEVICE OPERATION MODE	EN_PLL	PLL AND CLOCK DETECTOR STATE	INTERRUPT FOR EXTERNAL CLOCK	CLOCK
STANDBY	0	Disabled	No	Internal RC
ACTIVE	0	Disabled	No	Internal RC
STANDBY	1	Enabled	When external clock disappears or appears	Automatic change to internal RC oscillator when External clock is not available
ACTIVE	1	Enabled	When external clock disappears or appears	Automatic change to internal RC oscillator when External clock is not available

**7.3.5 Power-Up**

The power-up sequence for the LP87702-Q1 is as follows:

- VANA (and VIN\_Bx) reach minimum recommended levels ( $V_{VANA} > VANA_{UVLO}$ ).
- Driving NRST input high initiates OTP read and enables the system I/O interface. Minimum delay from NRST reset input rising edge to I2C write or read access is 1.2ms.
- Device enters STANDBY mode. Watchdog operation starts.
- The host can change the default register setting by I<sup>2</sup>C if needed.
- The converters can be enabled/disabled and the GPOx signals can be controlled by ENx pins and by I<sup>2</sup>C interface.

**7.3.6 Buck and Boost Control**
**7.3.6.1 Enabling and Disabling Converters**

The buck converters can be enabled when the device is in STANDBY or ACTIVE state. There are two ways to enable and disable the buck converters:

- Using BUCKx\_EN bit in BUCKx\_CTRL\_1 register (BUCKx\_EN\_PIN\_CTRL bit is 00 in BUCKx\_CTRL\_1 register)
- Using ENx control pin (BUCKx\_EN bit is 1 in BUCKx\_CTRL\_1 register **AND** BUCKx\_EN\_PIN\_CTRL bit is not 00 in BUCKx\_CTRL\_1 register)

Similarly there are two ways to enable and disable the boost converter:

- Using BOOST\_EN bit in BOOST\_CTRL register (BOOST\_EN\_PIN\_CTRL bit is 0 in BOOST\_CTRL register)
- Using ENx control pin (BOOST\_EN bit is 1 in BOOST\_CTRL register **AND** BOOST\_EN\_PIN\_CTRL bit is not 00 in BOOST\_CTRL register)

If the ENx control pin is used to enable and disable then the delay from the control signal rising edge to start-up is set by BUCKx\_STARTUP\_DELAY[3:0] bits in BUCKx\_DELAY register and BOOST\_STARTUP\_DELAY[3:0] bits in BOOST\_DELAY register. The delay from falling edge of control signal to shutdown is set by BUCKx\_SHUTDOWN\_DELAY[3:0] bits in BUCKx\_DELAY register and BOOST\_SHUTDOWN\_DELAY[3:0] bits in BOOST\_DELAY register. The delays are valid only when ENx pin control is used, not when converters are enabled by I<sup>2</sup>C write to BUCKx\_EN and BOOST\_EN bits.

The control of the converters (with 0-ms delays) is shown in [Table 3](#).

**Table 3. Converter Control**

	BUCKx_EN / BOOST_EN	BUCKx_EN_PIN_C TRL / BOOST_EN_PIN_C TRL	EN1 PIN	EN2 PIN	EN3 PIN	BUCKx OUTPUT VOLTAGE / BOOST OUTPUT VOLTAGE
Enable/disable control with BUCKx_EN/BOOST_EN bit	0	Don't Care	Don't Care	Don't Care	Don't Care	Disabled
	1	00	Don't Care	Don't Care	Don't Care	BUCKx_VSET[7:0] / BOOST_VSET[1:0]
Enable/disable control with EN1 pin	1	01	Low	Don't Care	Don't Care	Disabled
	1	01	High	Don't Care	Don't Care	BUCKx_VSET[7:0] / BOOST_VSET[1:0]
Enable/disable control with EN2 pin	1	10	Don't Care	Low	Don't Care	Disabled
	1	10	Don't Care	High	Don't Care	BUCKx_VSET[7:0] / BOOST_VSET[1:0]
Enable/disable control with EN3 pin	1	11	Don't Care	Don't Care	Low	Disabled
	1	11	Don't Care	Don't Care	High	BUCKx_VSET[7:0] / BOOST_VSET[1:0]

BUCKx converter is enabled by an ENx pin or by I<sup>2</sup>C write access as shown in [Figure 10](#). The soft-start circuit limits the in-rush current during start-up. Output voltage increase rate is typically 30 mV/μsec during soft start. When the output voltage rises to 0.35-V level, the output voltage becomes slew-rate controlled. If there is a short circuit at the output and the output voltage does not increase above a 0.35-V level in 1 ms, the converter is disabled, and interrupt is set. When the output voltage rises above the undervoltage power-good threshold level the BUCKx\_PG\_INT interrupt flag in INT\_BUCK register is set.

Power-good thresholds are defined by BUCKx\_WINDOW bits. A PGOOD\_WINDOW bit in PGOOD\_CTRL register sets the detection method for the valid buck output voltage, either undervoltage detection or undervoltage and overvoltage detection. The powergood interrupt flag when reaching valid output voltage can be masked using BUCKx\_PGR\_MASK bit in BUCK\_MASK register. The power-good interrupt flag can be also generated when the output voltage becomes invalid. The interrupt mask for invalid output voltage detection is set by BUCKx\_PGF\_MASK bit in BUCK\_MASK register. When window monitoring (under and overvoltage monitoring) is selected, mask bits apply when voltage is crossing either threshold. A BUCKx\_PG\_STAT bit in BUCK\_STAT register shows always the validity of the output voltage; '1' means valid, and '0' means invalid output voltage.

**Figure 10. Buck Converter Enable and Disable**

The boost converter is enabled by an ENx pin or by I<sup>2</sup>C write access as shown in [Figure 11](#). The soft-start circuit limits the in-rush current during start-up. Output voltage increase rate is less than 100 mV/μsec during soft start. If there is a short circuit at the output and the output voltage does not reach input voltage level in 1 ms, the converter is disabled, and interrupt is set. When the output voltage reaches the power-good threshold level the BOOST\_PG\_INT interrupt flag in INT\_BOOST register is set.

Power-good thresholds are defined by BOOST\_WINDOW bits. A PGOOD\_WINDOW bit in PGOOD\_CTRL register sets the detection method for the valid boost output voltage, either undervoltage detection or undervoltage and overvoltage detection. The power-good interrupt flag when reaching valid output voltage can be masked using BOOST\_PGR\_MASK bit in BOOST\_MASK register. The power-good interrupt flag can be also generated when the output voltage becomes invalid. The interrupt mask for invalid output voltage detection is set by BOOST\_PGF\_MASK bit in BOOST\_MASK register. A BOOST\_PG\_STAT bit in BOOST\_STAT register shows always the validity of the output voltage; '1' means valid and '0' means invalid output voltage.

The ENx input pins have integrated pulldown resistors. The pulldown resistors are enabled by default and host can disable those with ENx\_PD bits in CONFIG register.

**Figure 11. Boost Converter Enable and Disable**

### 7.3.6.2 Changing Buck Output Voltage

The output voltage of BUCKx converter can be changed by writing to the BUCKx\_VOUT register. The voltage change for buck converter is always slew-rate controlled, and the slew-rate is defined by the BUCKx\_SLEW\_RATE[2:0] bits in BUCKx\_CTRL\_2 register. During voltage change the forced PWM mode is used automatically. When the programmed output voltage is achieved, the mode becomes the one defined by load current, and the BUCKx\_FPWM bit.

The voltage change and power-good interrupts are shown in [Figure 12](#).

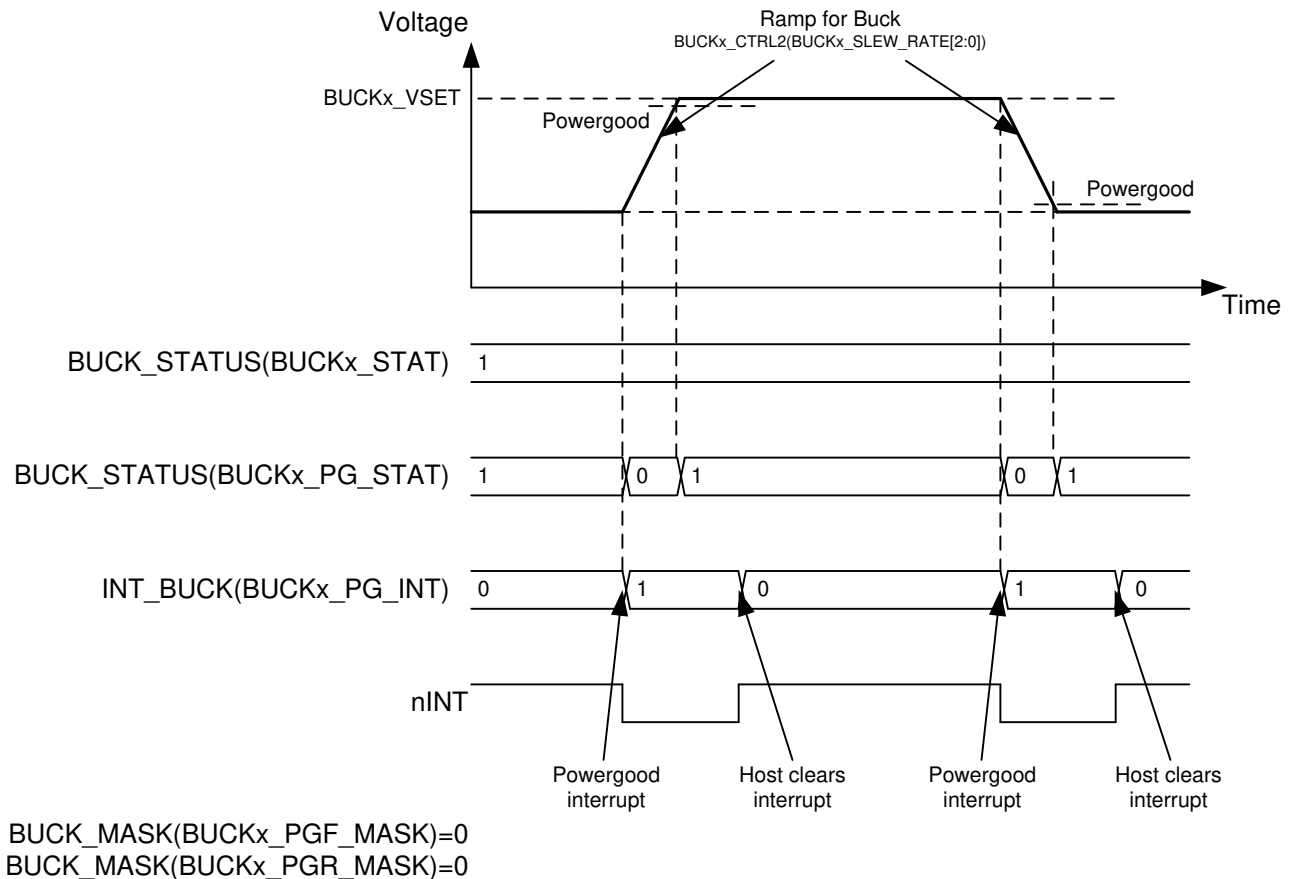

Figure 12. Buck Output Voltage Change

### 7.3.7 Enable and Disable Sequences

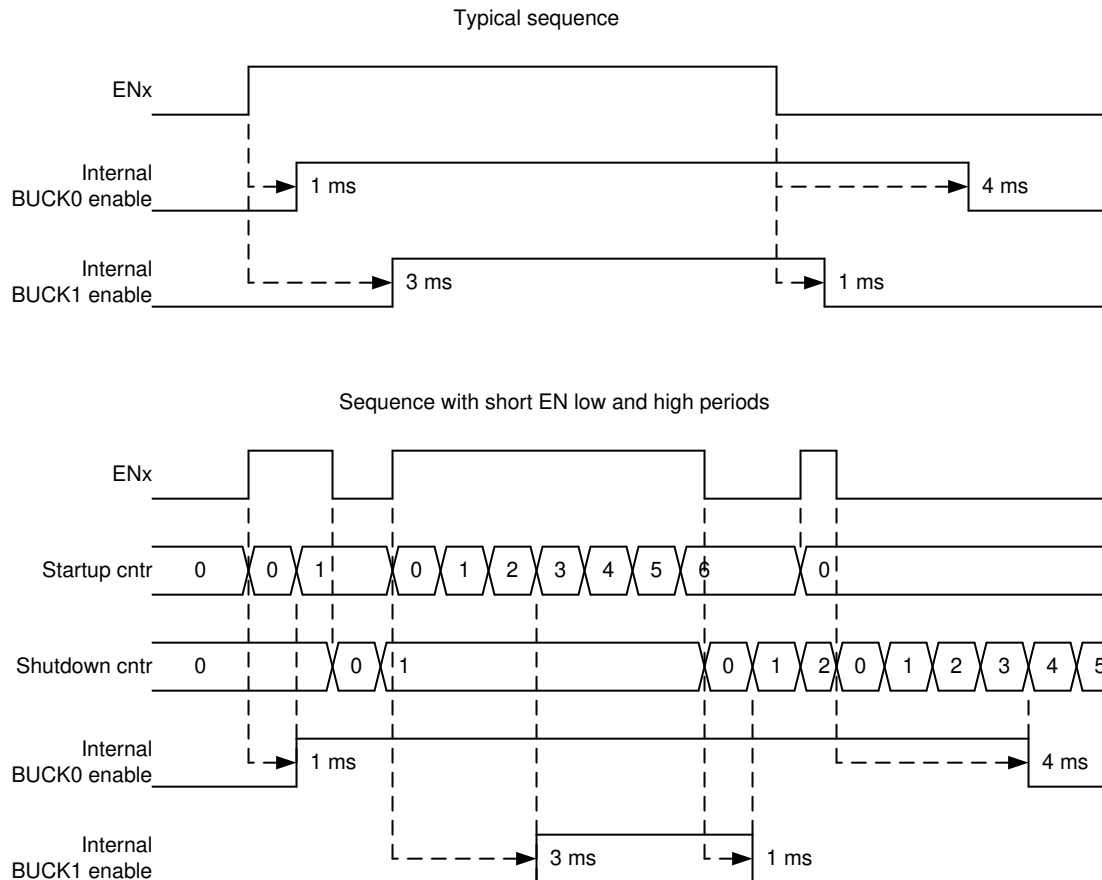

The LP87702-Q1 device supports programmable start-up and shutdown sequencing. An enable control signal is used to initiate the start-up sequence and to turn off the device according to the programmed shutdown sequence. Up to three enable inputs are available: EN1 is a dedicated enable input and EN2, EN3 are multiplexed with I2C interface. The buck converter is selected for sequence control with:

- BUCKx\_CTRL\_1(BUCKx\_EN) = 1
- BUCKx\_CTRL\_1(BUCKx\_EN\_PIN\_CTRL) = 0x1 or 0x2 or 0x3, for EN1 or EN2 or EN3 control, respectively
- BUCKx\_VOUT.(BUCKx\_VSET[7:0]) = Required voltage when EN pin is high
- The delay from rising edge of EN pin to the converter enable is set by BUCKx\_DELAY(BUCKx\_STARTUP\_DELAY[3:0]) bits and
- The delay from falling edge of EN pin to the converter disable is set by BUCKx\_DELAY(BUCKx\_SHUTDOWN\_DELAY[3:0])

In the same way the boost converter is selected for delayed control with:

- BOOST\_CTRL(BOOST\_EN) = 1
- BOOST\_CTRL(BOOST\_EN\_PIN\_CTRL) = 0x1 or 0x2 or 0x3, for EN1 or EN2 or EN3 control, respectively
- BOOST\_CTRL(BOOST\_VSET[2:0]) = Required voltage when EN pin is high
- The delay from rising edge of EN pin to the converter enable is set by BOOST\_DELAY(BOOST\_STARTUP\_DELAY[3:0]) bits and
- The delay from falling edge of EN pin to the converter disable is set by BOOST\_DELAY(BOOST\_SHUTDOWN\_DELAY[3:0])

An example of start-up and shutdown sequences for buck converters are shown in [Figure 13](#). The start-up and shutdown delays for Buck0 converter are 1 ms and 4 ms and for Buck1 converter 3 ms and 1 ms. The delay settings are used only for enable/disable control with EN signal.

**Figure 13. Start-up and Shutdown Sequencing Example**

### 7.3.8 Window Watchdog

Operation of the LP87702-Q1 watchdog is shown in [Figure 14](#) for an example when ENx pin is used for controlling power sequence and ENx pin is active.

WDI is the watchdog function input pin and WD\_RESET is the reset output. WDI pin needs to be pulsed within a certain timing window to avoid watchdog expiration. Minimum pulse width is 100  $\mu$ s. Watchdog expiration always causes a reset pulse at WD\_RESET output, otherwise device behavior after watchdog expiration is programmable. WD\_RESET output polarity and mode, push-pull or open drain, are also programmable.

Watchdog default settings are read from OTP during device start-up. Default settings in WD\_CTRL\_1 and WD\_CTRL\_2 register can be over-written via I2C (as long as WD\_LOCK bit is not set to 1). Writing WD\_LOCK = 1 in WD\_CTRL\_2 register locks watchdog settings until NRST input is driven low, power cycle or register reset by SW\_RESET.

Long open, close and open window periods are independently programmable as shown in [Table 4](#). When long open or open window expires before WDI input is received, watchdog enters WD Reset state. Also when WDI is received during close window, watchdog enters WD Reset. Long open period can be extended by a I2C write to WD\_CTRL\_1 or WD\_CTRL\_2 register; register access initializes the long open counter and the long open period restarts (except in Stop mode).

LP87702-Q1 behavior after WD expiration is programmable :

- When WD\_RESET\_CNTR\_SEL = 00, system restart is disabled and converters are maintained ON. WD\_RESET pin is active for 10 ms. Watchdog returns to Long Open mode.
- When WD\_RESET\_CNTR\_SEL = 01 (restart after first reset pulse), LP87702-Q1 performs shutdown

sequence followed by start-up sequence so the converters are disabled and re-enabled according to the OTP programmed sequences. During start-up, device reloads OTP defaults when `WD_EN_OTP_READ = 1`. Settings valid before shutdown are maintained when `WD_EN_OTP_READ = 0`. `WD_RESET` output pin is active for a period of (10 ms + maximum shutdown delay). Maximum shutdown delay can be selected as 7.5 ms (`SHUTDOWN_DELAY_SEL = 0`) or 15 ms (`SHUTDOWN_DELAY_SEL = 1`). After the restart watchdog returns to Long Open mode.

- Status bit `WD_SYSTEM_RESTART_FLAG` is set to indicate that system restart has happened. Status can be cleared by writing "1" to `WD_CLR_SYSTEM_RESTART_FLAG`. `WD_RESET_CNTR_SEL` can be set to 10 or 11 to select restart after 2 or 4 WD expirations, respectively. Current status of reset counter is available in `WD_RESET_CNTR_STATUS`. Reset counter can be cleared by writing `WD_CLR_RESET_CNTR` to 1.
- Watchdog can also be programmed to perform shutdown sequence and enter STOP mode after the first WD expiration. In STOP mode converters are OFF. `WD_RESET` output pin is activated for a period of (10 ms + maximum shutdown delay), in STOP mode `WD_RESET` is inactive. NRST, power cycle, register reset `SW_RESET`, writing `WD_CLR_SYSTEM_RESTART_FLAG = 1` or writing `WD_SYSTEM_RESTART_FLAG_MODE = 0` is required to recover. This WD operating mode is selected by setting OTP bit `WD_SYS_RESTART_FLAG_MODE = 1`.

Watchdog settings in `WD_CTRL_1` and `WD_CTRL_2` registers are locked by setting `WD_LOCK` bit. `WD_SYSTEM_RESTART_FLAG` and `WD_RESET_CNTR_STATUS` can be cleared even if `WD_LOCK = 1`.

Description above is for a case where ENx pin is used for controlling power sequence and ENx pin is active. Depending on OTP settings and ENx pin state watchdog behavior can be slightly different:

- When ENx pin is used for controlling power sequence and ENx pin is not active, shutdown sequence can not be performed. `WD_RESET` pulse length is fixed 31 ms.
- When ENx pins are not used for power sequence control and all converters and GPOs enabled via I2C, there is no OTP defined power sequence. WD expiration does not cause converter disable/enable sequence even when OTP settings for watchdog are such that restart is enabled. In this case `WD_RESET` pulse is 11 ms.

**Table 4. Watchdog Window Periods**

CONTROL BIT	DEFAULT	VALUES
WD_LONG_OPEN_TIME	OTP	00 - 200 ms 01 - 600 ms 10 - 2000 ms 11 - 5000 ms
WD_CLOSE_TIME	OTP	00 - 10 ms 01 - 20 ms 10 - 50 ms 11 - 100 ms
WD_OPEN_TIME	OTP	00 - 20 ms 01 - 100 ms 10 - 200 ms 11 - 600 ms

LP87702-Q1 supports option to disable watchdog. WD\_DIS pin function is multiplexed with CLKIN/GPIO2 functions. Watchdog disable option can be selected by setting register bit WD\_DIS\_CTRL = 1. When WD\_DIS\_CTRL = 1, WD is disabled if CLKIN/GPIO2/WD\_DIS pin is HIGH and enabled if CLKIN/GPIO2/WD\_DIS pin is LOW. If WD\_DIS\_CTRL is toggled to disable and re-enable WD, WD starts from Long Open window after re-enabling.

Default for WD\_DIS\_CTRL is set in OTP. WD\_DIS\_CTRL value can be changed via I2C until WD settings are locked. When WD\_LOCK is set to 1, WD is enabled regardless of WD\_DIS\_CTRL value. WD\_DIS\_CTRL bit is protected by write lock. Three consecutive codes have to be written to WD\_DIS\_UNLOCK\_CODE to open WD\_DIS\_CTRL for write access.

### 7.3.9 Device Reset Scenarios

There are four reset methods implemented on the LP87702-Q1:

- Software reset with SW\_RESET bit in RESET register
- NRST input signal low
- Undervoltage lockout (UVLO) reset from VANA supply
- Watchdog expiration (depending on watchdog settings)

A SW reset occurs when SW\_RESET bit is set to 1. The bit is automatically cleared after writing. This event disables all the converters immediately, drives GPO signals low, resets all the register bits to the default values and OTP bits are loaded (see [Figure 20](#)). I<sup>2</sup>C interface is not reset during software reset. The host must wait at least 1.2 ms after writing SW reset until making a new I2C read or write to the device.

If VANA supply voltage falls below UVLO threshold level or NRST signal is set low then all the converters are disabled immediately, GPOx signals are driven low and all the register bits are reset to the default values. When the VANA supply voltage rises above UVLO threshold level and NRST signal rises above threshold level, OTP bits are loaded to the registers and a start-up is initiated according to the register settings. The host must wait at least 1.2 ms before reading or writing to I2C interface.

Depending on watchdog settings, watchdog expiration can reset the device to OTP default values.

### 7.3.10 Diagnostics and Protection Features

The LP87702-Q1 provides four levels of protection features:

- Information of input and output voltages. Non-valid voltage sets interrupt or PGx signal
  - Validity of the output voltage of BUCK or BOOST converters
  - Validity of VANA, VMON1 and VMON2 input voltages
- Warnings causing interrupt
  - Peak current limit detection in BUCK or BOOST converters
  - Thermal warning
- Protection events which are disabling the converters
  - Short-circuit and overload protection for BUCK and BOOST converters
  - Input overvoltage protection (VANA<sub>OVP</sub>)
  - Watchdog expiration (optional, depends on watchdog settings)

- Thermal shutdown
- Protection events which are causing the device to shutdown
  - Undervoltage lockout ( $VANA_{UVLO}$ )
- Protections not causing interrupt or converter disable
  - Negative current limit detection in BUCK or BOOST converters

### 7.3.10.1 Voltage Monitorings

The LP87702-Q1 device has programmable voltage monitoring for the BUCKx and BOOST converter output voltages and for VANA, VMON1 and VMON2 inputs. Monitoring of each signal is independently enabled in PGOOD\_CTRL register. Voltage monitoring can be under-voltage monitoring only (PGOOD\_WINDOW = 0) or overvoltage and undervoltage monitoring (PGOOD\_WINDOW = 1). This selection is common for all enabled monitorings. Enabled monitoring signals are combined to generate power-good (PG0, PG1) and/or interrupts as described in [Power-Good Information to Interrupt and PG0 and PG1 Pins](#). Monitoring comparators have a dedicated reference and bias block, which is independent of the main reference and bias block.

Nominal level for the output voltage of BUCKx converter is set with BUCKx\_VSET in BUCKx\_VOUT register. Overvoltage and undervoltage detection levels, with respect to nominal level, are selected with BUCKx\_WINDOW as  $\pm 30$  mV,  $\pm 50$  mV,  $\pm 70$  mV or  $\pm 90$  mV. Nominal level for the output voltage of BOOST converter is set with BOOST\_VSET in BOOST\_CTRL register. Available levels are 4.9 V, 5 V, 5.1 V and 5.2 V. Overvoltage and undervoltage detection levels, with respect to nominal level, are selected with BOOST\_WINDOW as  $\pm 2\%$ ,  $\pm 4\%$ ,  $\pm 6\%$  or  $\pm 8\%$ . Converter monitoring window selection bits are in PGOOD\_LEVEL\_3 register.

Input voltage of LP87702-Q1 is monitored at VANA pin. Nominal level can be selected as 3.3 V or 5 V with VANA\_THRESHOLD bit. Overvoltage and undervoltage detection levels are selected with VANA\_WINDOW as  $\pm 4\%$ ,  $\pm 5\%$  or  $\pm 10\%$  (nominal). VANA\_THRESHOLD and VANA\_WINDOW are set in PGOOD\_LEVEL\_2 register.

VMON1 and VMON2 inputs can be used for monitoring external rails in the system. VMONx settings are defined in PGOOD\_LEVEL\_1 and PGOOD\_LEVEL\_2 registers. Nominal value for the input level of VMONx is selected with VMONx\_THRESHOLD, between 0.65 V to 1.8 V. Higher voltage levels or levels not directly supported can be monitored using an external resistor divider. In this case VMONx\_THRESHOLD must be set as 0.65V to have high-impedance input and the resistor divider must scale the monitored level down to 0.65 V at VMONx pin. Overvoltage and undervoltage detection levels are selected with VMONx\_WINDOW as  $\pm 2\%$ ,  $\pm 3\%$ ,  $\pm 4\%$  or  $\pm 6\%$ .

For more details on the accuracy of the monitoring windows and deglitch filtering see [Specifications](#).

### 7.3.10.2 Interrupts

The LP87702-Q1 sets the flag bits indicating what protection or warning conditions have occurred, and the nINT pin is pulled low. nINT output pin is driven high after all flag bits and pending interrupts are cleared.

Fault detection is indicated by RESET\_REG\_INT interrupt flag bit set in INT\_TOP\_2 register after start-up event.

**Table 5. Summary of Interrupt Signals**

EVENT	SAFE STATE	INTERRUPT BIT	INTERRUPT MASK	STATUS BIT	RECOVERY/INTERRUPT CLEAR
Buck current limit triggered (20- $\mu$ s debounce)	No effect	BUCK_INT = 1 BUCKx_ILIM_INT = 1	BUCKx_ILIM_MASK	BUCKx_ILIM_STAT	Write 1 to BUCKx_ILIM_INT bit Interrupt is not cleared if current limit is active
Boost current limit triggered	No effect	BOOST_INT = 1 BOOST_ILIM_INT = 1	BOOST_ILIM_MASK	BOOST_ILIM_STAT	Write 1 to BOOST_ILIM_INT bit Interrupt is not cleared if current limit is active
Buck short circuit ( $V_{OUT} < 0.35V$ at 1 ms after enable) or Overload ( $V_{OUT}$ decreasing below 0.35 V during operation, 1 ms debounce)	Converter disable	BUCKx_INT = 1 BUCKx_SC_INT = 1	N/A	N/A	Write 1 to BUCKx_SC_INT bit
Boost short circuit	Converter disable	BOOST_INT = 1 BOOST_SC_INT = 1	N/A	N/A	Write 1 to BOOST_SC_INT bit
Thermal warning	No effect	TDIE_WARN_INT = 1	TDIE_WARN_MASK	TDIE_WARN_STAT	Write 1 to TDIE_WARN_INT bit Interrupt is not cleared if temperature is above thermal warning level
Thermal shutdown	All converters disabled immediately and GPOx set to low	TDIE_SD_INT = 1	N/A	TDIE_SD_STAT	Write 1 to TDIE_SD_INT bit Interrupt is not cleared if temperature is above thermal shutdown level
VANA overvoltage ( $VANA_{OVP}$ )	All converters disabled immediately and GPOx set to low	OVP_INT	N/A	OVP_STAT	Write 1 to OVP_INT bit Interrupt is not cleared if VANA voltage is above $VANA_{OVP}$ level
Buck power-good, output voltage becomes valid	No effect	BUCK_INT = 1 BUCKx_PG_INT = 1	BUCKx_PGR_MASK	BUCKx_PG_STAT	Write 1 to BUCKx_PG_INT bit
Buck power-good, output voltage becomes invalid	No effect	BUCK_INT = 1 BUCKx_PG_INT = 1	BUCKx_PGF_MASK	BUCKx_PG_STAT	Write 1 to BUCKx_PG_INT bit
Boost power-good, output voltage becomes valid	No effect	BOOST_INT = 1 BOOST_PG_INT = 1	BOOST_PGR_MASK	BOOST_PG_STAT	Write 1 to BOOST_PG_INT bit
Boost power-good, output voltage becomes invalid	No effect	BOOST_INT = 1 BOOST_PG_INT = 1	BOOST_PGF_MASK	BOOST_PG_STAT	Write 1 to BOOST_PG_INT bit
VMON1 power-good, input voltage becomes valid	No effect	DIAG_INT = 1 VMON1_PG_INT = 1	VMON1_PGR_MASK	VMON1_PG_STAT	Write 1 to VMON1_PG_INT bit
VMON1 power-good, input voltage becomes invalid	No effect	DIAG_INT = 1 VMON1_PG_INT = 1	VMON1_PGF_MASK	VMON1_PG_STAT	Write 1 to VMON1_PG_INT bit
VMON2 power-good, input voltage becomes valid	No effect	DIAG_INT = 1 VMON2_PG_INT = 1	VMON2_PGR_MASK	VMON2_PG_STAT	Write 1 to VMON2_PG_INT bit
VMON2 power-good, input voltage becomes invalid	No effect	DIAG_INT = 1 VMON2_PG_INT = 1	VMON2_PGF_MASK	VMON2_PG_STAT	Write 1 to VMON2_PG_INT bit
VANA power-good, input voltage becomes valid	No effect	DIAG_INT = 1 VANA_PG_INT = 1	VANA_PGR_MASK	VANA_PG_STAT	Write 1 to VANA_PG_INT bit
VANA power-good, input voltage becomes invalid	No effect	DIAG_INT = 1 VANA_PG_INT = 1	VANA_PGF_MASK	VANA_PG_STAT	Write 1 to VANA_PG_INT bit
External clock appears or disappears	No effect to converters	SYNC_CLK_INT <sup>(1)</sup>	SYNC_CLK_MASK	SYNC_CLK_STAT	Write 1 to SYNC_CLK_INT bit
Load current measurement ready	No effect	I_MEAS_INT = 1	I_MEAS_MASK	N/A	Write 1 to I_MEAS_INT bit
Supply voltage $VANA_{UVLO}$ triggered (VANA falling)	Immediate shutdown, registers reset to default values	N/A	N/A	N/A	N/A
Supply voltage $VANA_{UVLO}$ triggered (VANA rising)	Start-up, registers reset to default values and OTP bits loaded	RESET_REG_INT = 1	RESET_REG_MASK	N/A	Write 1 to RESET_REG_INT bit
Software requested reset	Immediate shutdown followed by powerup, registers reset to default values	RESET_REG_INT = 1	RESET_REG_MASK	N/A	Write 1 to RESET_REG_INT bit

(1) Interrupt generated during Clock Detector operation and in case Clock is not available when Clock Detector is enabled.

### 7.3.10.3 Power-Good Information to Interrupt and PG0 and PG1 Pins

LP87702-Q1 supports both interrupt based indication of power-good levels for various voltage settings and using two power-good signals, PG0 and PG1. The selection of monitored signals is independent for the interrupt (nINT) and PG0, PG1 signals. Each signal can include:

- The output voltage of one or both BUCKx converters
- The output voltage of the BOOST converter
- Input voltage of VANA
- Input voltage of VMON1 and/or VMON2
- Thermal warning

The block diagram for power-good connections to PG0 and PG1 pins and interrupt is shown in [Figure 15](#).

Monitored signals are enabled in PGOOD\_CTRL register. Converter output voltage monitoring (not current limit monitoring) can be selected for the indication. Monitoring is enabled by EN\_PGOOD\_BUCKx and EN\_PGOOD\_BOOST bits. When a converter is disabled, the monitoring is automatically masked to prevent it forcing PGx inactive or causing an interrupt. Also monitoring of VANA, VMON1 and VMON2 inputs can be independently enabled via PGOOD\_CTRL register. The type of voltage monitoring for PGx signals and nINT is selected by PGOOD\_WINDOW bit. If the bit is 0, only undervoltage is monitored and if the bit is 1 both undervoltage and overvoltage are monitored. For voltage monitoring thresholds see [Voltage Monitorings](#).

Monitoring interrupts from all the output rails, input rails and thermal warning are combined to nINT pin. Dedicated mask bits are used to select which interrupts control the state of nINT pin. See [Table 5](#) for summary of interrupts, mask bits and interrupt clearing.

Similarly, enabled monitoring signals from all the output rails, input rails and thermal warning are combined to PG0 and PG1 output pins. Register bits SEL\_PGx\_x in PG0\_CTRL and PG1\_CTRL select which of the signals control the state of PG0 and PG1, respectively. The polarity and the output type (push-pull or open-drain) of PG0 and PG1 are selected by PGx\_POL and PGx\_OD bits in PG\_CTRL register.

PGx is only *active* or *asserted* when all monitored input voltages and all output voltages of monitored and enabled converters are within specified tolerance of set target value.

PGx is *inactive* or *de-asserted* if any of the monitored input voltages or output voltages of monitored and enabled converters are outside specified tolerance of set target value.

When PGx\_RISE\_DELAY = 1, PGx is set as *active* or *asserted* with 11 ms delay from the point of time where all enabled power resource output voltages are within specified tolerance for each requested/programmed output voltage.

Thermal shutdown and VANA overvoltage protection events force PGx to default state (assuming PGx polarity set in OTP is active high, PGx are drive low).

Figure 15. Block Diagram of Power-Good Connections

LP87702-Q1 power-good detection has two operating modes, selected in OTP: gated (that is, *unusual*) or continuous (that is, *invalid*) mode of operation. These modes are described in [PGx Pin Gated \(Unusual\) Mode](#) and in [PGx pin Operation in Continuous Mode](#).

### 7.3.10.3.1 PGx Pin Gated (Unusual) Mode

In this mode the PGx signal detects unexpected or unusual situations. Mode is selected by setting PGx\_MODE bit to 0 in PG\_CTRL register.

For the gated mode of operation, PGx behaves as follows:

- PGx is set to active or asserted state upon exiting OTP configuration as an initial default state.
- For each enabled rail PGx status is *active* or *asserted* during an 800- $\mu$ s gated time period from the enable activation, thereby *gating-off* the status indication.
- During normal power-up sequencing and requested voltage changes, PGx state typically remains *active* or *asserted* for normal conditions.
- During an abnormal power-up sequencing and requested voltage changes, PGx status could change to *inactive* or *de-asserted* after an 800- $\mu$ s gated time period if any output voltage is outside of regulation range.
- Using the gated mode of operation could allow the PGx signal to initiate an immediate power shutdown sequence if the PGx signal is wired-OR with signal connected to EN input. This type of circuit configuration provides a smart PORz function for processor that eliminates the need for additional components to generate PORz upon start-up and to monitor voltage levels of key voltage domains.

PGx signal is set inactive if the output voltage of a monitored buck or boost converter is invalid or the output voltage is not valid at 800  $\mu$ s from the enable of the converter. This should be considered when selecting the BUCKx\_SLEW\_RATE setting. To avoid PGx triggering at start-up keep the sum of soft start time and slew rate controlled part of voltage ramp below 800  $\mu$ s. In addition when invalid input voltage at VANA, VMON1 or VMON2 pin is detected PGx is inactive.

Detected fault sets the corresponding fault bit in PG0\_FAULT or in PG1\_FAULT register. The detected fault must be cleared to continue the PGx monitoring. The over-voltage and thermal faults are cleared by writing 1 to the corresponding interrupt bits in INT\_TOP\_1 register. Converter, VMONx and VANA faults are cleared by writing 1 to the corresponding register bit in INT\_BUCK, INT\_BOOST and INT\_DIAG register, respectively. An example of PGx pin operation in gated mode is shown in Figure 16 and the different use cases for PGx signal operation are summarized in Table 6.

**Figure 16. PGx Pin Operation in Gated Mode.**

### 7.3.10.3.2 PGx pin Operation in Continuous Mode

In this mode the PGx signal shows the validity of the requested voltages continuously. Mode is selected by setting PGx\_MODE bit to 1 in PG\_CTRL register.

For the continuous mode of operation, PGx behaves as follows:

- PGx is set to *active* or *asserted* state upon exiting OTP configuration as an initial default state.
- PGx is set to *inactive* or *de-asserted* as soon as converter is enabled.
- PGx status begins indicating output voltage regulation status immediately and continuously.
- During power-up sequencing and requested voltage changes, PGx will toggle between *inactive* or *deasserted* while output voltages are outside of regulation ranges and active or asserted when inside of regulation ranges.

When invalid output voltage of monitored converter is detected, corresponding bit in PG0\_FAULT or PG1\_FAULT register is set to 1 and PGx signal becomes inactive. The PG0\_FAULT and PG1\_FAULT register bits are latched and maintain the fault information until host clears the fault bit by writing 1 to the bit. The PGx signal indicates also interrupts from VANA, VMON1 and VMON2 inputs and thermal warning and shutdown. All are cleared by clearing the interrupt bits.

When converter voltage is transitioning from one target voltage to another, the PGx signal is set inactive.

When PGx signal becomes inactive, the source for the fault can be read from PGx\_FAULT register. If the invalid output voltage becomes valid again the PGx signal becomes active. Thus the PGx signal shows all the time if the monitored output voltages are valid. An example of PGx pin operation in continuous mode is shown in Figure 17.

The PGx signal can be also configured so that it maintains inactive state even when the monitored outputs are valid but there are PG\_FAULT\_x bits pending clearance. This type of operation is selected by setting PGOOD\_FAULT\_GATES\_PGx bit to 1.

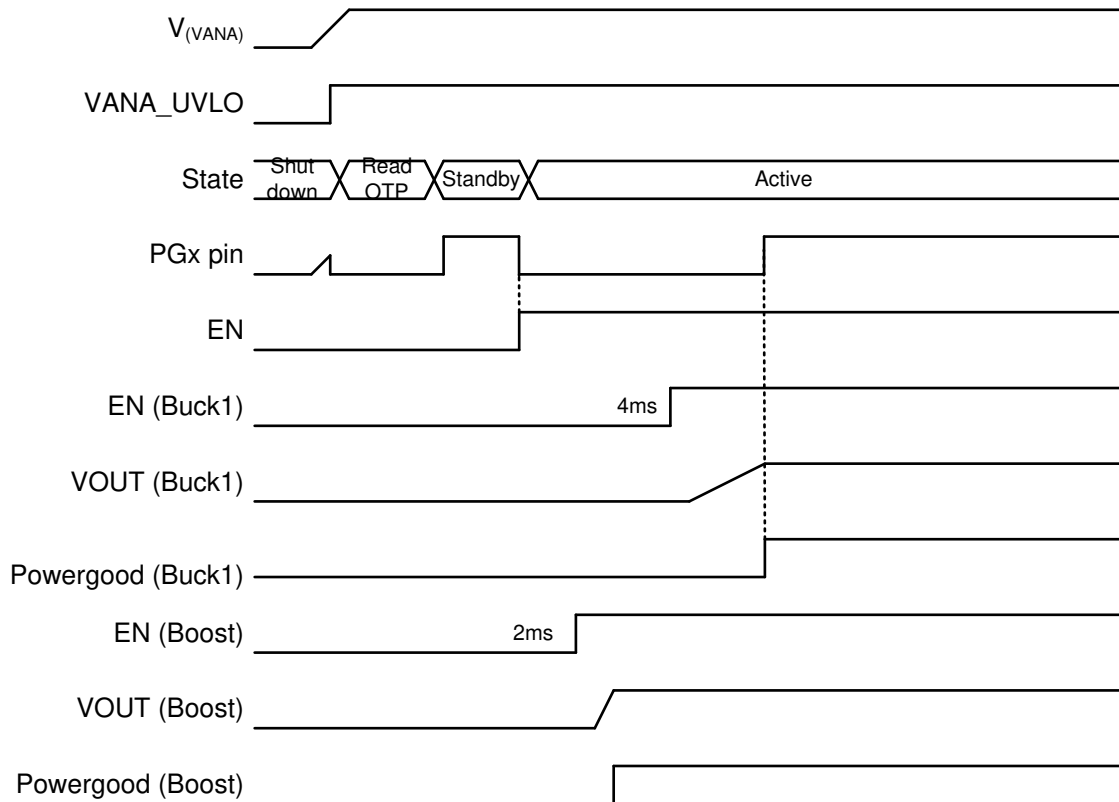

Figure 17. PGx Pin Operation in Continuous Mode

### 7.3.10.3.3 Summary of PG0, PG1 Gated and Continuous Operating Modes

Table 6 summarizes the PGx behavior in different application scenarios, for the gated and continuous operating modes.

**Table 6. PGx Operation**

STATUS / USE CASE	CONDITION	PGx SIGNAL <sup>(1)(2)</sup>	
		GATED MODE PGx_MODE = 0	CONTINUOUS MODE PGx_MODE = 1
Device start-up	Until device state is STANDBY	Low	Low
Converter not selected for PGx monitoring	EN_PGOOD_x = 0	OK	OK
Converter selected for PGx monitoring and disabled by host	BUCKx_EN / BOOST_EN = 0 OR (Pin ctrl AND EN = 0)	OK	OK
Converter start-up delay ongoing	EN = 1	OK	NOK
Converter start-up until valid output voltage reached	Valid output voltage reached in 800 $\mu$ s	OK	NOK
Converter start-up until valid output voltage reached	Valid output voltage not reached at 800 $\mu$ s	NOK	NOK
Output voltage within window limits after start-up	Must be inside limits longer than debounce time	OK	OK
Output voltage spikes (over/undervoltage)	If spikes are outside voltage monitoring threshold(s) longer than debounce time	NOK	NOK
Voltage setting change, output voltage ramp		OK (if new voltage reached in 800 $\mu$ s) NOK after 800 $\mu$ s (if new voltage not reached at 800 $\mu$ s)	NOK
Output voltage within window limits after voltage change	Must be inside limits longer than debounce time	OK	OK
Converter shutdown delay ongoing		OK	OK
Buck converter disabled by host, slew-rate controlled ramp down ongoing		OK	OK
Converter disabled by host, pulldown resistor active (if selected)		OK	OK
Converter short-circuit interrupt pending (converter selected for PGx monitoring)	Faulty converter disabled by short-circuit detection BUCKx_SC_INT / BOOST_SC_INT = 1	NOK	NOK
Thermal shutdown interrupt pending	Converters disabled by thermal shutdown detection TDIE_SD_INT = 1	NOK	NOK
Input (VANA) overvoltage interrupt pending	Converters disabled by overvoltage detection OVP_INT = 1	NOK	NOK
Supply voltage below VANA <sub>UVLO</sub>		Low	Low

(1) NOK (Not OK) means faulty situation. PGx pin is inactive if at least one NOK situation is detected.  
(2) PGx pin is generated from PG\_FAULT register bits and INT\_TOP\_1 register bits TDIE\_SD\_INT, OVP\_INT and INT\_TOP\_2(RESET\_REG\_INT) bit.

### 7.3.10.4 Warning Interrupts for System Level Diagnostics

#### 7.3.10.4.1 Output Power Limit

The buck converters have programmable output peak current limits. The limits are individually programmed for both converters with BUCKx\_ILIM[2:0] bits. If the load current is increased so that the current limit is triggered, the converter continues to regulate to the limit current level (current peak regulation). The voltage may decrease if the load current is higher than limit current. If the current regulation continues for 20  $\mu$ s, the LP87702-Q1 device sets the BUCKx\_ILIM\_INT bit and pulls the nINT pin low. The host processor can read BUCKx\_ILIM\_STAT bits to see if the converter is still in peak current regulation mode. During startup or output voltage ramp (output voltage change has been programmed) no interrupt is generated.

If the load is so high that the output voltage decreases below a 350-mV level, the LP87702-Q1 device disables the converter and sets the BUCKx\_SC\_INT bit. The interrupt is cleared when the host processor writes 1 to BUCKx\_SC\_INT bit. The Buck overload situation is shown in Figure 18.

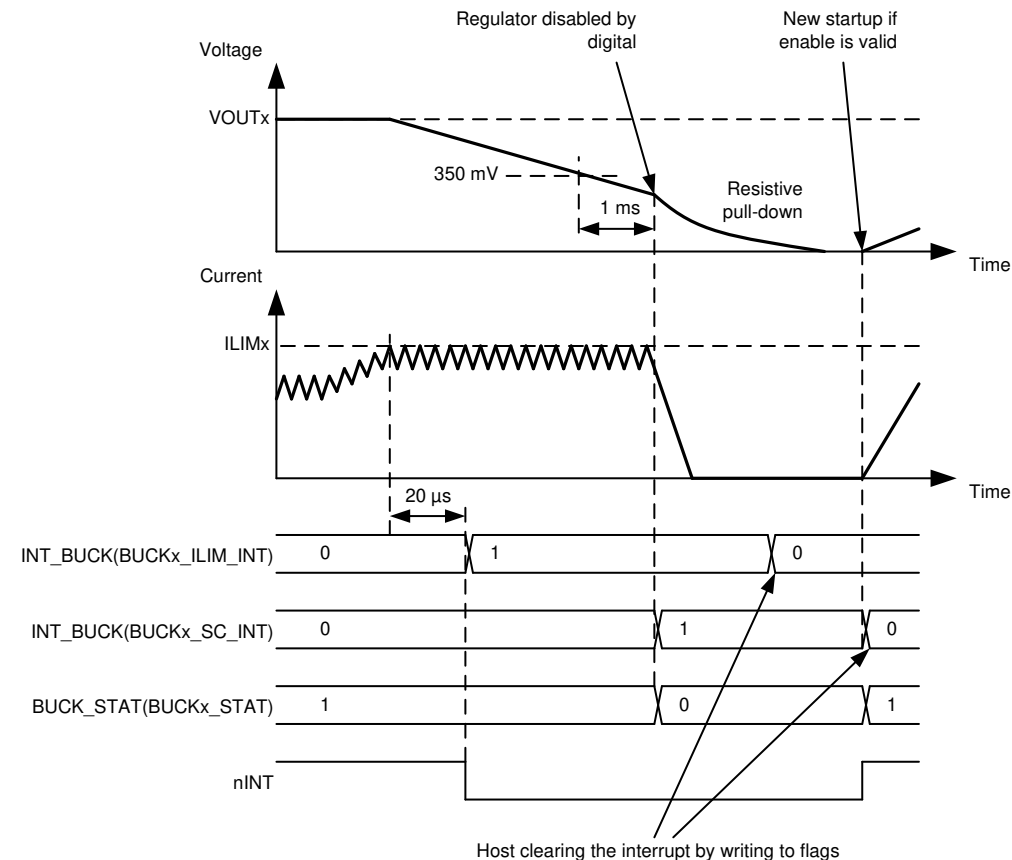

Figure 18. Buck Overload Situation

The boost converter has programmable output peak current limits. The limits are set with BOOST\_ILIM bits. If the load current is increased so that the current limit is triggered, the converter continues to regulate to the limit current level (current peak regulation). The voltage may decrease if the load current is higher than limit current. If the current regulation continues for 64  $\mu$ s, the LP87702-Q1 device sets the BOOST\_ILIM\_INT bit and pulls the nINT pin low. The host processor can read BOOST\_ILIM\_STAT bits to see if the converter is still in peak current regulation mode.

If the load is so high that the output voltage decreases 150mV (typical) below input voltage level converter is disabled after 1 ms. If the output voltage decreases to 2.5 V, boost stops switching. After 1 ms deglitch time boost is fully disabled and interrupt BOOST\_SC\_INT bit is set. The interrupt is cleared when the host processor writes 1 to BOOST\_SC\_INT bit. The Boost overload situation is shown in Figure 19.

**Figure 19. Boost Overload Situation**

The buck converters have a fixed current limit for negative output peak current ( $I_{LIM\_NEG}$ ). When negative coil current increases it is limited below  $I_{LIM\_NEG}$ , converter continues to operate and no interrupt is generated. Operation of the negative peak current limit of the boost converter is similar and limit value is 1.4 A (typical).

#### 7.3.10.4.2 Thermal Warning

The LP87702-Q1 device includes a protection feature against over-temperature by setting an interrupt for host processor. The threshold level of the thermal warning is selected with `TDIE_WARN_LEVEL` bit.

If the LP87702-Q1 device temperature increases above thermal warning level the device sets `TDIE_WARN_INT` bit and pulls `nINT` pin low. The status of the thermal warning can be read from `TDIE_WARN_STAT` bit and the interrupt is cleared by writing 1 to `TDIE_WARN_INT` bit. The thermal warning interrupt can be masked by setting `TDIE_WARN_MASK` bit to 1.

#### 7.3.10.5 Protections Causing Converter Disable

If the converter is disabled because of protection or fault (short-circuit protection, thermal shutdown, overvoltage protection, or undervoltage lockout), the output power FETs are set to high-impedance mode, and the output pulldown resistor is enabled (if enabled with `BUCKx_RDIS_EN` and `BOOST_RDIS_EN` bits). The turnoff time of the output voltage is defined by the output capacitance, load current, and the resistance of the integrated pulldown resistor. The pulldown resistors are active as long as `VANA` voltage is above approximately 1.2-V level.

##### 7.3.10.5.1 Short-Circuit and Overload Protection

A short-circuit protection feature allows the LP87702-Q1 to protect itself and external components against short circuit at the output or against overload during start-up. During start-up, short-circuit at buck converter output is detected when the output voltage is below 350mV (typical) 1 ms after the buck converter is enabled. For boost the fault threshold is 150mV (typical) below input voltage level. Boost converter is disabled if the output voltage is below the threshold level 1 ms after the boost converter is enabled.

In a similar way the overload situation is protected during normal operation. If the feedback-pin voltage of the buck converter falls below 0.35 V and remains below the threshold level for 1 ms the buck converter is disabled. If the output voltage of the boost converter decreases 150 mV below input voltage level, converter is disabled after 1 ms. If the output voltage decreases to 2.5 V, boost is disabled immediately.

In the Buck converter short-circuit and overload situations the BUCKx\_SC\_INT and the BUCK\_INT bits are set to 1, the BUCKx\_STAT bit is set to 0 and the nINT signal is pulled low. In the boost converter short-circuit and overload situations the BOOST\_SC\_INT and the BOOST\_INT bits are set to 1, the BOOST\_STAT bit is set to 0 and the nINT signal is pulled low. The host processor clears the interrupt by writing 1 to the BUCKx\_SC\_INT or BOOST\_SC\_INT bit. Upon clearing the interrupt the converter makes a new start-up attempt if the converter is in enabled state.

#### 7.3.10.5.2 Overvoltage Protection

The LP87702-Q1 device monitors the input voltage from VANA pin in standby and active operation modes. If the input voltage rises above  $VANA_{OVP}$  voltage level, all the converters are disabled immediately (without switching ramp, no shutdown delays), pulldown resistors discharge the output voltages (BUCKx\_RDIS\_EN = 1 and BOOST\_RDIS\_EN = 1), GPOs are set to logic low level, nINT signal is pulled low, OVP\_INT bit is set to 1 and BUCKx\_STAT and BOOST\_STAT bits are set to 0. The host processor clears the interrupt by writing 1 to the OVP\_INT bit. If the input voltage is above over-voltage detection level the interrupt is not cleared. The host can read the status of the overvoltage from the OVP\_STAT bit. Converters cannot be enabled as long as the input voltage is above over-voltage detection level or the overvoltage interrupt is pending.

#### 7.3.10.5.3 Thermal Shutdown

The LP87702-Q1 has an overtemperature protection function that operates to protect itself from short-term misuse and overload conditions. When the junction temperature exceeds around 150°C, the converters are disabled immediately (without switching ramp, no shutdown delays), the TDIE\_SD\_INT bit is set to 1, the nINT signal is pulled low, and the device enters STANDBY. nINT is cleared by writing 1 to the TDIE\_SD\_INT bit. If the temperature is above thermal shutdown level the interrupt is not cleared. The host can read the status of the thermal shutdown from the TDIE\_SD\_STAT bit. Converters cannot be enabled as long as the junction temperature is above thermal shutdown level or the thermal shutdown interrupt is pending.

### 7.3.10.6 Protections Causing Device Power Down

#### 7.3.10.6.1 Undervoltage Lockout

When the input voltage falls below  $VANA_{UVLO}$  at the VANA pin, the buck and boost converters are disabled immediately (without switching ramp, no shutdown delays), and the output capacitor is discharged using the pulldown resistor, and the LP87702-Q1 device enters SHUTDOWN. When  $V_{(VANA)}$  voltage is above  $VANA_{UVLO}$  threshold level, the device powers up to STANDBY state.

If the reset interrupt is unmasked by default (RESET\_REG\_MASK = 0 in TOP\_MASK\_2 register) the RESET\_REG\_INT interrupt in INT\_TOP\_2 register indicates that the device has been in SHUTDOWN. The host processor must clear the interrupt by writing 1 to the RESET\_REG\_INT bit. If the host processor reads the RESET\_REG\_INT flag after detecting an nINT low signal, it knows that the input supply voltage has been below  $VANA_{UVLO}$  level (or the host has requested reset with RESET(SW\_RESET) bit), and the registers are reset to default values.

#### 7.3.11 OTP Error Correction

LP87702-Q1 supports OTP bit error detection and 1-bit error correction per five registers. ECC\_STATUS register bit SED is set if a single bit error was detected and corrected. In case two bit errors have been detected in any bank of five registers, DED bit is set.

#### 7.3.12 Operation of GPO Signals

The LP87702-Q1 device supports up to 3 general purpose output (GPO) signals. The GPO1 signal is multiplexed with PG1 signal and the GPO2 signal is multiplexed with CLKIN and WD\_DIS signals. The selection between signal use are set with GPO1\_SEL and GPO2\_SEL bits in GPO\_CONTROL\_2 register.

The type of the output, either push-pull with  $V_{(VANA)}$  level or open drain, are set with GPO0\_OD and GPO1\_PG1\_OD bits in GPO\_CONTROL\_1 register and GPO2\_OD bit in GPO\_CONTROL\_2 register

The logic level of the GPOx pins are is set by GPO0\_OUT and GPO1\_OUT bits in GPO\_CONTROL\_1 register and GPO2\_OUT bit in GPO\_CONTROL\_2 register.

The control of the GPOs can be included to start-up and shutdown sequences. The GPO control for a sequence with ENx pin is selected by GPOx\_EN\_PIN\_CTRL bits. The delays during start-up and shutdown are set by bits in GPOx\_DELAY registers.

### 7.3.13 Digital Signal Filtering

The digital signals have a debounce filtering. The signal/supply is sampled with a clock signal and a counter. This results as an accuracy of one clock period for the debounce window.

**Table 7. Digital Signal Filtering**

EVENT	SIGNAL/SUPPLY	RISING EDGE	FALLING EDGE
		LENGTH	LENGTH
Enable/Disable for BUCKx, BOOST or GPOx	ENx	3 $\mu$ s <sup>(1)</sup>	3 $\mu$ s <sup>(1)</sup>
VANA undervoltage lockout	VANA	Immediate (VANA voltage rising)	Immediate (VANA voltage falling)
VANA overvoltage	VANA	1 $\mu$ s (VANA voltage rising)	1 $\mu$ s (VANA voltage falling)
Thermal warning	TDIE_WARN_INT	20 $\mu$ s	20 $\mu$ s
Thermal shutdown	TDIE_SD_INT	20 $\mu$ s	20 $\mu$ s
Current limit, BUCKx		20 $\mu$ s	20 $\mu$ s
Current limit, BOOST		64 $\mu$ s	64 $\mu$ s
Overload	FB_B0, FB_B1, VOUT_BST	1 ms	N/V
PGx pin and power-good interrupt (voltage monitoring)	PG0, PG1 / FB_B0, FB_B1	6 $\mu$ s	6 $\mu$ s
PGx pin and power-good interrupt (voltage monitoring)	PG0, PG1 / VOUT_BST, VANA, VMON1, VMON2	15 $\mu$ s	15 $\mu$ s

(1) No glitch filtering, only synchronization.

## 7.4 Device Functional Modes

### 7.4.1 Modes of Operation

**SHUTDOWN:** The  $V_{(VANA)}$  voltage is below  $VANA_{UVLO}$  threshold level or NRST signal is low. All switch, reference, control and bias circuitry of the LP87702-Q1 device are turned off.

**READ OTP:** The main supply voltage  $V_{(VANA)}$  is above  $VANA_{UVLO}$  level and NRST signal is high. The converters are disabled and the reference and bias circuitry of the LP87702-Q1 are enabled. The OTP bits are loaded to registers. I2C access is not allowed during OTP read. This applies also to watchdog (see [Window Watchdog](#)).

**STANDBY:** The main supply voltage  $V_{(VANA)}$  is above  $VANA_{UVLO}$  level and NRST signal is high. All registers can be read or written by the host processor via the system serial interface. Watchdog is active and WDI input is expected to toggle to avoid watchdog expiration. The converters are disabled and the reference, control and bias circuitry of the LP87702-Q1 are enabled. The converters can be enabled if needed.

**ACTIVE:** The main supply voltage  $V_{(VANA)}$  is above  $VANA_{UVLO}$  level and NRST signal is high. At least one converter is enabled. All registers can be read or written by the host processor via the system serial interface. Watchdog is active and WDI input is expected to toggle to avoid watchdog expiration.

The operating modes and transitions between the modes are shown in [Figure 20](#). For the window watchdog detailed operation see [Window Watchdog](#).

Device Functional Modes (continued)

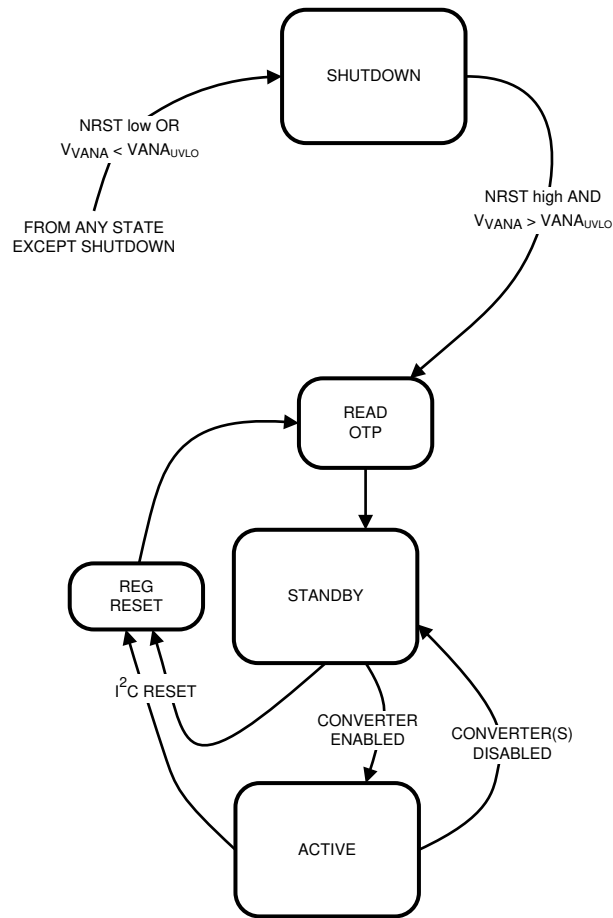

Figure 20. Device Operation Modes.

## 7.5 Programming

### 7.5.1 I<sup>2</sup>C-Compatible Interface

The I<sup>2</sup>C-compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the ICs connected to the bus. The two interface lines are the serial data line (SDA), and the serial clock line (SCL). Every device on the bus is assigned a unique address and acts as either a master or a slave depending on whether it generates or receives the serial clock SCL. The SCL and SDA lines should each have a pull-up resistor placed somewhere on the line and remain HIGH even when the bus is idle. The LP87702-Q1 supports standard mode (100 kHz), fast mode (400 kHz), fast mode plus (1 MHz), and high-speed mode (3.4 MHz).

#### 7.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, the state of the data line can only be changed when clock signal is LOW.

**Figure 21. Data Validity Diagram**

#### 7.5.1.2 Start and Stop Conditions

The LP87702-Q1 is controlled via an I<sup>2</sup>C-compatible interface. START and STOP conditions classify the beginning and end of the I<sup>2</sup>C session. A START condition is defined as SDA transitions from HIGH to LOW while SCL is HIGH. A STOP condition is defined as SDA transition from LOW to HIGH while SCL is HIGH. The I<sup>2</sup>C master always generates the START and STOP conditions.

**Figure 22. Start and Stop Sequences**

The I<sup>2</sup>C bus is considered busy after a START condition and free after a STOP condition. During data transmission the I<sup>2</sup>C master can generate repeated START conditions. A START and a repeated START condition are equivalent function-wise. The data on SDA must be stable during the HIGH period of the clock signal (SCL). In other words, the state of SDA can only be changed when SCL is LOW. [Figure 23](#) shows the SDA and SCL signal timing for the I<sup>2</sup>C-Compatible Bus. See the [Figure 1](#) for timing values.

Programming (continued)

Figure 23. I<sup>2</sup>C-Compatible Timing

7.5.1.3 Transferring Data

Every byte put on the SDA line must be eight bits long, with the most significant bit (MSB) being transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the master. The master releases the SDA line (HIGH) during the acknowledge clock pulse. The LP87702-Q1 pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The LP87702-Q1 generates an acknowledge after each byte has been received.

There is one exception to the *acknowledge after every byte* rule. When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (*negative acknowledge*) the last byte clocked out of the slave. This *negative acknowledge* still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

NOTE

If the  $V_{(VANA)}$  voltage is below  $VANA_{UVLO}$  threshold level during I<sup>2</sup>C communication the LP87702-Q1 device does not drive SDA line. The ACK signal and data transfer to the master is disabled at that time.

After the START condition, the bus master sends a chip address. This address is seven bits long followed by an eighth bit which is a data direction bit (READ or WRITE). For the eighth bit, a 0 indicates a WRITE and a 1 indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

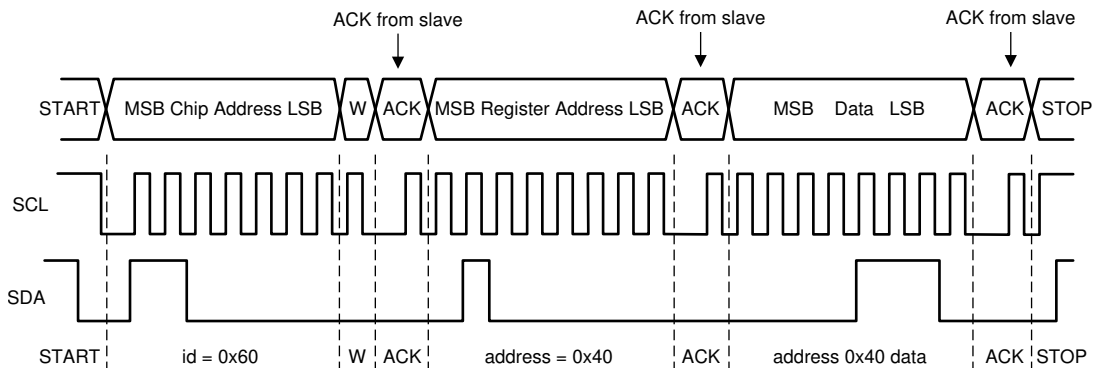

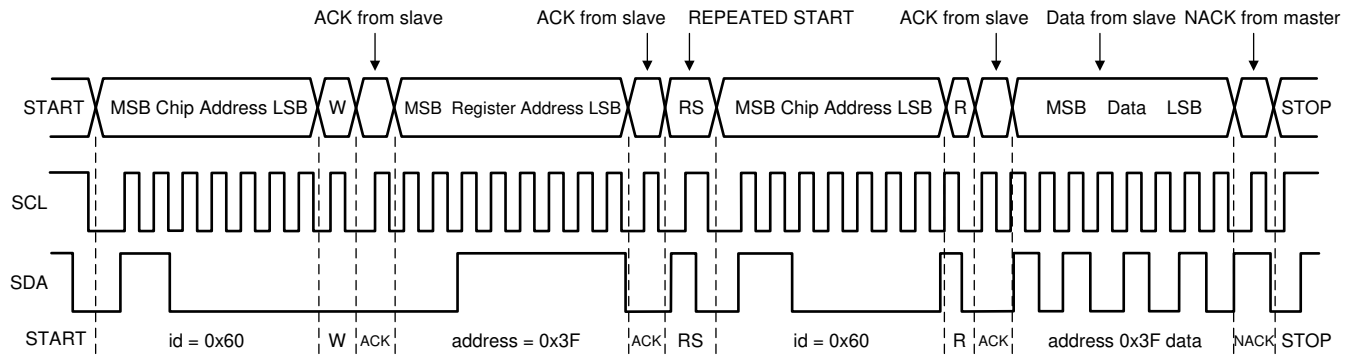

Figure 24. Write Cycle (w = write; SDA = 0), id = Device Address = 60Hex for LP87702-Q1

## Programming (continued)

When READ function is to be accomplished, a WRITE function must precede the READ function as shown above.

**Figure 25. Read Cycle ( r = read; SDA = 1), id = Device Address = 60Hex for LP87702-Q1**

### 7.5.1.4 I<sup>2</sup>C-Compatible Chip Address

The device address for the LP87702-Q1 is 0x60. After the START condition, the I<sup>2</sup>C master sends the 7-bit address followed by an eighth bit, read or write (R/W). R/W = 0 indicates a WRITE and R/W = 1 indicates a READ. The second byte following the device address selects the register address to which the data will be written. The third byte contains the data for the selected register.

A. Here device address is 1100000Bin = 60Hex.

**Figure 26. Device Address**

### 7.5.1.5 Auto Increment Feature

The auto-increment feature allows writing several consecutive registers within one transmission. Every time an 8-bit word is sent to the LP87702-Q1, the internal address index counter will be incremented by one and the next register will be written. Table 8 below shows writing sequence to two consecutive registers. Note that auto increment feature does not work for read.

**Table 8. Auto-Increment Example**

MASTER ACTION	START	DEVICE ADDRESS S = 60H	WRITE		REGISTER ADDRESS S		DATA		DATA		STOP
LP87702-Q1				ACK		ACK		ACK		ACK	

## 7.6 Register Maps

### 7.6.1 Register Descriptions

The LP87702-Q1 is controlled by a set of registers through the system serial interface port. This register map describes the default values for bits which are not read from OTP memory. The asterisk (\*) marking indicates register bits which are updated from OTP memory during READ OTP state. OTP values for each orderable part number are described in a separate technical reference manual TRM.

#### 7.6.1.1 LP8770\_map Registers

Table 9 lists the memory-mapped registers for the LP8770\_map registers. All register offset addresses not listed in Table 9 should be considered as reserved locations and the register contents should not be modified.

**Table 9. LP8770\_MAP Registers**

Offset	Acronym	Register Name	Section
0h	DEV_REV		DEV_REV Register (Offset = 0h) [reset = 0h]
1h	OTP_CODE		OTP_CODE Register (Offset = 1h) [reset = 0h]
2h	BUCK0_CTRL_1		BUCK0_CTRL_1 Register (Offset = 2h) [reset = 8h]
3h	BUCK0_CTRL_2		BUCK0_CTRL_2 Register (Offset = 3h) [reset = 1Ah]
4h	BUCK1_CTRL_1		BUCK1_CTRL_1 Register (Offset = 4h) [reset = 8h]
5h	BUCK1_CTRL_2		BUCK1_CTRL_2 Register (Offset = 5h) [reset = 1Ah]
6h	BUCK0_VOUT		BUCK0_VOUT Register (Offset = 6h) [reset = 0h]
7h	BUCK1_VOUT		BUCK1_VOUT Register (Offset = 7h) [reset = 0h]
8h	BOOST_CTRL		BOOST_CTRL Register (Offset = 8h) [reset = 8h]
9h	BUCK0_DELAY		BUCK0_DELAY Register (Offset = 9h) [reset = 0h]
Ah	BUCK1_DELAY		BUCK1_DELAY Register (Offset = Ah) [reset = 0h]
Bh	BOOST_DELAY		BOOST_DELAY Register (Offset = Bh) [reset = 0h]
Ch	GPO0_DELAY		GPO0_DELAY Register (Offset = Ch) [reset = 0h]
Dh	GPO1_DELAY		GPO1_DELAY Register (Offset = Dh) [reset = 0h]
Eh	GPO2_DELAY		GPO2_DELAY Register (Offset = Eh) [reset = 0h]
Fh	GPO_CONTROL_1		GPO_CONTROL_1 Register (Offset = Fh) [reset = AAh]
10h	GPO_CONTROL_2		GPO_CONTROL_2 Register (Offset = 10h) [reset = Ah]
11h	CONFIG		CONFIG Register (Offset = 11h) [reset = 3Ch]
12h	PLL_CTRL		PLL_CTRL Register (Offset = 12h) [reset = 2h]
13h	PGOOD_CTRL		PGOOD_CTRL Register (Offset = 13h) [reset = 0h]
14h	PGOOD_LEVEL_1		PGOOD_LEVEL_1 Register (Offset = 14h) [reset = 0h]

**Table 9. LP8770\_MAP Registers (continued)**

Offset	Acronym	Register Name	Section
15h	PGOOD_LEVEL_2		PGOOD_LEVEL_2 Register (Offset = 15h) [reset = 0h]
16h	PGOOD_LEVEL_3		PGOOD_LEVEL_3 Register (Offset = 16h) [reset = 0h]
17h	PG_CTRL		PG_CTRL Register (Offset = 17h) [reset = 2h]
18h	PG0_CTRL		PG0_CTRL Register (Offset = 18h) [reset = 0h]
19h	PG0_FAULT		PG0_FAULT Register (Offset = 19h) [reset = 0h]
1Ah	PG1_CTRL		PG1_CTRL Register (Offset = 1Ah) [reset = 0h]
1Bh	PG1_FAULT		PG1_FAULT Register (Offset = 1Bh) [reset = 0h]
1Ch	WD_CTRL_1		WD_CTRL_1 Register (Offset = 1Ch) [reset = 0h]
1Dh	WD_CTRL_2		WD_CTRL_2 Register (Offset = 1Dh) [reset = 1h]
1Eh	WD_STATUS		WD_STATUS Register (Offset = 1Eh) [reset = 0h]
1Fh	RESET		RESET Register (Offset = 1Fh) [reset = 0h]
20h	INT_TOP_1		INT_TOP_1 Register (Offset = 20h) [reset = 0h]
21h	INT_TOP_2		INT_TOP_2 Register (Offset = 21h) [reset = 0h]
22h	INT_BUCK		INT_BUCK Register (Offset = 22h) [reset = 0h]
23h	INT_BOOST		INT_BOOST Register (Offset = 23h) [reset = 0h]
24h	INT_DIAG		INT_DIAG Register (Offset = 24h) [reset = 0h]
25h	TOP_STATUS		TOP_STATUS Register (Offset = 25h) [reset = 0h]
26h	BUCK_STATUS		BUCK_STATUS Register (Offset = 26h) [reset = 0h]
27h	BOOST_STATUS		BOOST_STATUS Register (Offset = 27h) [reset = 0h]
28h	DIAG_STATUS		DIAG_STATUS Register (Offset = 28h) [reset = 0h]
29h	TOP_MASK_1		TOP_MASK_1 Register (Offset = 29h) [reset = 0h]
2Ah	TOP_MASK_2		TOP_MASK_2 Register (Offset = 2Ah) [reset = 1h]
2Bh	BUCK_MASK		BUCK_MASK Register (Offset = 2Bh) [reset = 0h]
2Ch	BOOST_MASK		BOOST_MASK Register (Offset = 2Ch) [reset = 0h]
2Dh	DIAG_MASK		DIAG_MASK Register (Offset = 2Dh) [reset = 0h]
2Eh	SEL_I_LOAD		SEL_I_LOAD Register (Offset = 2Eh) [reset = 0h]
2Fh	I_LOAD_2		I_LOAD_2 Register (Offset = 2Fh) [reset = 0h]
30h	I_LOAD_1		I_LOAD_1 Register (Offset = 30h) [reset = 0h]

**Table 9. LP8770\_MAP Registers (continued)**

Offset	Acronym	Register Name	Section
31h	FREQ_SEL		FREQ_SEL Register (Offset = 31h) [reset = 0h]
32h	BOOST_ILIM_CTRL		BOOST_ILIM_CTRL Register (Offset = 32h) [reset = 0h]
33h	ECC_STATUS		ECC_STATUS Register (Offset = 33h) [reset = 0h]
34h	WD_DIS_CTRL_CODE		WD_DIS_CTRL_CODE Register (Offset = 34h) [reset = 0h]
35h	WD_DIS_CONTROL		WD_DIS_CONTROL Register (Offset = 35h) [reset = 0h]

Complex bit access types are encoded to fit into small table cells. [Table 10](#) shows the codes that are used for access types in this section.

**Table 10. LP8770\_map Access Type Codes**

Access Type	Code	Description
<b>Read Type</b>		
R	R	Read
<b>Write Type</b>		
W	W	Write
<b>Reset or Default Value</b>		
-n		Value after reset or the default value
<b>Register Array Variables</b>		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

#### 7.6.1.1.1 DEV\_REV Register (Offset = 0h) [reset = 0h]

DEV\_REV is shown in [Figure 27](#) and described in [Table 11](#).

Return to [Summary Table](#).

**Figure 27. DEV\_REV Register**

7	6	5	4	3	2	1	0

Lock can be opened by writing 0x87, 0x65, 0x1B by 3 consecutive I2C write sequences to WD_DIS_CTRL_CODE register if WD_LOCK=0. Lock can be closed by writing anything to WD_DIS_CTRL_CODE register or writing WD_LOCK=1.
0	WD_DIS_CTRL	R/W	0h	Watchdog disable pin control. 0 - Watchdog cannot be disabled by WD_DIS pin. 1 - Watchdog can be disabled by WD_DIS pin. (Default from OTP memory) This bit can be written 1 only if WD_LOCK=0 and WD_DIS_CTRL_LOCK=0.

## 8 Application and Implementation

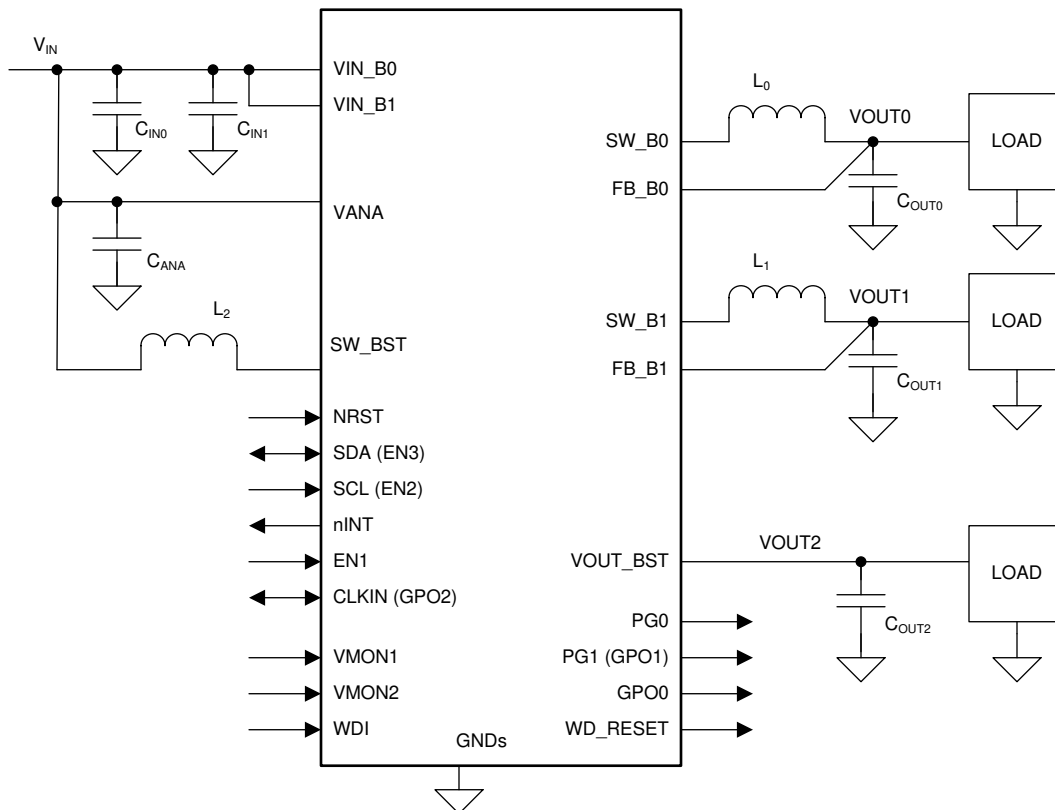

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LP87702-Q1 is a power-management unit including a boost converter, two step-down converters, and three general-purpose digital output signals.

### 8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

Figure 81. LP87702-Q1 Typical Application

#### 8.2.1 Design Requirements

Table 65. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	3.3 V
Output voltages	1.8 V, 1.24 V, 5 V
Switching frequency	4 MHz

## 8.2.2 Detailed Design Procedure

The performance of the LP87702-Q1 device depends greatly on the care taken in designing the printed circuit board (PCB). The use of low-inductance and low serial-resistance ceramic capacitors is strongly recommended, while proper grounding is crucial. Attention should be given to decoupling the power supplies. Decoupling capacitors must be connected close to the device and between the power and ground pins to support high peak currents being drawn from system power rail during turnon of the switching MOSFETs. Keep input and output traces as short as possible, because trace inductance, resistance, and capacitance can easily become the performance limiting items. The separate buck converter power pins VIN\_Bx are not connected together internally. The VIN\_Bx power connections shall be connected together outside the package using power plane construction.

### 8.2.2.1 Application Components

#### 8.2.2.1.1 Inductor Selection

The inductors are L<sub>0</sub>, L<sub>1</sub>, and L<sub>2</sub> are shown in the [Typical Application](#). The inductance and DCR of the inductor affects the control loop of the buck and boost converter. It is recommended to use inductors or similar ones listed in [Table 66](#). Pay attention to the saturation current and temperature rise current of the inductor. Check that the saturation current is higher than the peak current limit and the temperature rise current is higher than the maximum expected rms output current. For minimum effective inductance to ensure good performance refer to [Specifications](#). DC resistance of the inductor should be less than 0.05 Ω for good efficiency at high-current condition. The inductor AC loss (resistance) also affects conversion efficiency. Higher Q factor at switching frequency usually gives better efficiency at light load to middle load. Shielded inductors are preferred as they radiate less noise.

**Table 66. Recommended Inductors for Buck Converters**

MANUFACTURER	PART NUMBER	VALUE	DIMENSIONS L x W x H (mm)	RATED DC CURRENT, I <sub>SAT</sub> max / I <sub>TEMP</sub> max (A)	DCR typ / max (mΩ)
MURATA	DFE252012PD-R47M	0.47 μH (20%)	2.5 x 2 x 1.2	5.2 / 4.0 <sup>(1)</sup>	- / 27
TDK	TFM252012ALMAR47MTAA	0.47 μH (20%)	2.5 x 2 x 1.2	5.8 / 4.9 <sup>(1)</sup>	19 / 24

(1) Operating temperature range is up to 125°C including self temperature rise.

**Table 67. Recommended Inductor for Boost Converters**

MANUFACTURER	PART NUMBER	VALUE	DIMENSIONS L x W x H (mm)	RATED DC CURRENT, I <sub>SAT</sub> max / I <sub>TEMP</sub> max (A)	DCR typ / max (mΩ)
MURATA	DFE252012PD-1R0M	1 μH (20%)	2.5 x 2 x 1.2	3.8 / 3.2 <sup>(1)</sup>	_ / 42
TDK	TFM25201ALMA1R0MTAA	1 μH (20%)	2.5 x 2 x 1.2	4.2 / 3.7 <sup>(1)</sup>	35 / 42

(1) Operating temperature range is up to 125°C including self temperature rise.

#### 8.2.2.1.2 Buck Input Capacitor Selection

The input capacitors C<sub>IN0</sub> and C<sub>IN1</sub> are shown in the [Typical Application](#). A ceramic input bypass capacitor of 10 μF is required for both converters. Place the input capacitor as close as possible to the VIN\_Bx pin and PGND\_Bx pin of the device. A larger value or higher voltage rating improves the input voltage filtering. Use X7R type of capacitors, not Y5V or F. DC bias characteristics of the capacitors must also be considered. Minimum effective input capacitance to ensure good performance is 1.9 μF per buck input at maximum input voltage including tolerances and ambient temperature range. In addition there must be at least 22 μF of additional capacitance common for all the power input pins on the system power rail. See [Table 68](#).

The input filter capacitor supplies current to the high-side FET switch in the first half of each cycle and reduces voltage ripple imposed on the input power source. A ceramic capacitor's low ESR provides the best noise filtering of the input voltage spikes due to this rapidly changing current. Select an input filter capacitor with sufficient ripple current rating. In addition ferrite can be used in front of the input capacitor to reduce the EMI.

**Table 68. Recommended Buck Input Capacitors (X7R Dielectric)**

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS LxWxH (mm)	VOLTAGE RATING
Murata	GCM21BR71A106KE22	10 μF (10%)	0805	2 x 1.25 x 1.25	10 V

TDK	CGA4J3X7S1A106K125AB	10 $\mu$ F (10%)	0805	2 x 1.25 x 1.25	10 V

### 8.2.2.1.3 Buck Output Capacitor Selection

The output capacitor  $C_{OUT0}$  and  $C_{OUT1}$  are shown in [Typical Application](#). A ceramic local output capacitor of 22  $\mu$ F is required for both outputs. Use ceramic capacitors, X7R or X7T types; do not use Y5V or F. DC bias voltage characteristics of ceramic capacitors must be considered. The output filter capacitor smooths out current flow from the inductor to the load, helps maintain a steady output voltage during transient load changes and reduces output voltage ripple. These capacitors must be selected with sufficient capacitance and sufficiently low ESR and ESL to perform these functions. Minimum effective output capacitance for good performance is 15  $\mu$ F per including the DC voltage roll-off, tolerances, aging and temperature effects.

The output voltage ripple is caused by the charging and discharging of the output capacitor and also due to its RESR. The RESR is frequency dependent (as well as temperature dependent); make sure the value used for selection process is at the switching frequency of the part. See [Table 69](#).

POL capacitors can be used to improve load transient performance and to decrease the ripple voltage. A higher output capacitance improves the load step behavior and reduces the output voltage ripple as well as decreases the PFM switching frequency. Note that the output capacitor may be the limiting factor in the output voltage ramp, especially for very large (100- $\mu$ F range) output capacitors. For large output capacitors, the output voltage might be slower than the programmed ramp rate at voltage transitions, because of the higher energy stored on the output capacitance. Also at start-up, the time required to charge the output capacitor to target value might be longer. At shutdown the output voltage is discharged to 0.6 V level using forced-PWM operation. This can increase the input voltage if the load current is small and the output capacitor is large compared to input capacitor. Below 0.6 V level the output capacitor is discharged by the internal discharge resistor and with large capacitor more time is required to settle  $V_{OUT}$  down as a consequence of the increased time constant.

**Table 69. Recommended Buck Output Capacitors (X7R or X7T Dielectric)**

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS LxWxH (mm)	VOLTAGE RATING
Murata	GCM31CR71A226KE02	22 $\mu$ F (10%)	1206	3.2 x 1.6 x 1.6	10 V
TDK	CGA5L1X7S1A226M160AC	22 $\mu$ F (20%)	1206	3.2 x 1.6 x 1.6	10 V

### 8.2.2.1.4 Boost Input Capacitor Selection

A ceramic input capacitor of 10  $\mu$ F is sufficient for most applications. Place the input capacitor close to the SW\_BST pin of the device. Use X7R types, do not use Y5V or F. See [Table 70](#).

**Table 70. Recommended Boost Input Capacitors (X7R Dielectric)**

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS LxWxH (mm)	VOLTAGE RATING
Murata	GCM21BR71A106KE22	10 $\mu$ F (10%)	0805	2.0 x 1.25 x 1.25	10 V

### 8.2.2.1.5 Boost Output Capacitor Selection

Use ceramic capacitors, X7R or X7T types; do not use Y5V or F. Place the output capacitor as close as possible to the  $V_{OUT\_BST}$  pin and  $PGND\_BST$  pin of the device. DC bias voltage characteristics of ceramic capacitors must be considered. DC bias characteristics vary from manufacturer to manufacturer, and DC bias curves should be requested from them as part of the capacitor selection process. These capacitors must be selected with sufficient capacitance and sufficiently low ESR and ESL to support load transients. See [Table 71](#).

**Table 71. Recommended Boost Output Capacitors (X7R or X7T Dielectric)**

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS LxWxH (mm)	VOLTAGE RATING
Murata	GCM31CR71A226KE02	22 $\mu$ F (10%)	1206	3.2 x 1.6 x 1.6	10 V

### 8.2.2.1.6 Supply Filtering Components

The VANA input is used to supply analog and digital circuits in the device. See [Table 72](#) recommended components from for VANA input supply filtering.

**Table 72. Recommended Supply Filtering Components**

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS LxWxH (mm)	VOLTAGE RATING
Murata	GCM188R71C104KA37D	100 nF (10%)	0603	1.6 x 0.8 x 0.8	16 V
Murata	GCM155R71C104KA55D	100 nF (10%)	0402	1.0 x 0.5 x 0.5	16 V

### 8.2.3 Current Limit vs Maximum Output Current

For both the buck converters and the boost the current limit must be set high enough to account for inductor ripple current on top of the maximum output current. Forward current limit for the buck converters is set by BUCK0\_ILIM, BUCK1\_ILIM and for boost by BOOST\_ILIM.

For the buck converter the inductor current ripple can be calculated using [Equation 1](#) and [Equation 2](#):

$$D = \frac{V_{OUT}}{V_{IN(max)} \times \eta} \tag{1}$$

$$\Delta I_L = \frac{(V_{IN(max)} - V_{OUT}) \times D}{f_{SW} \times L} \tag{2}$$

Example using [Equation 1](#) and [Equation 2](#):

$$V_{IN(max)} = 5.5 \text{ V}$$

$$V_{OUT} = 1 \text{ V}$$

$$\eta = 0.75$$

$$f_{SW} = 1.8 \text{ MHz}$$

$$L = 0.38 \text{ }\mu\text{H}$$

$$\text{then } D = 0.242 \text{ and } \Delta I_L = 1.59 \text{ A}$$

Peak current is half of the current ripple. If  $I_{LIM\_FWD\_SET\_OTP}$  is 3 A, the minimum forward current limit would be 2.85 A when taking the -5% tolerance into account. In this case the difference between set peak current and maximum load current = 0.795 A + 0.15 A = 0.945 A.

**Figure 82. Current Limit vs Maximum Output Current**

### 8.2.4 Application Curves

Unless otherwise specified:  $V_{IN} = 3.3\text{ V}$ ,  $V_{OUT\_BUCK} = 1\text{ V}$ ,  $V_{OUT\_BOOST} = 5\text{ V}$ ,  $T_A = 25^\circ\text{C}$ ,  $f_{SW}$ -setting 4 MHz,  $L_0 = L_1 = 0.47\text{ }\mu\text{H}$  (TOKO DFE252012PD-R47M),  $L_2 = 1\text{ }\mu\text{H}$  (TFM252012ALMA1R0),  $C_{OUT\_BUCK}$ ,  $C_{POL\_BUCK}$ , and  $C_{OUT\_BOOST} = 22\text{ }\mu\text{F}$ . Measurements are done using connections in Figure 81.

## 9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 2.8 V and 5.5 V. This input supply must be well regulated and able to withstand maximum input current and maintain stable voltage without voltage drop even at load transition condition. The resistance of the input supply rail must be low enough that the input current transient does not cause too high drop in the LP87702-Q1 supply voltage that can cause false UVLO fault triggering. If the input supply is located more than a few inches from the LP87702-Q1 additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

## 10 Layout

### 10.1 Layout Guidelines

The high frequency and large switching currents of the LP87702-Q1 make the choice of layout important. Good power supply results only occur when care is given to proper design and layout. Layout affects noise pickup and generation and can cause a good design to perform with less-than-expected results. With a range of output currents from milliamps to several amps, good power supply layout is much more difficult than most general PCB design. Use the following steps as a reference to ensure the device is stable and maintains proper voltage and current regulation across its intended operating voltage and current range.

1. Place  $C_{IN}$  as close as possible to the  $V_{IN\_Bx}$  pin and the  $PGND\_Bx$  pin. Route the  $V_{IN}$  trace wide and thick to avoid IR drops. The trace between the positive node of the input capacitor and device  $V_{IN\_Bx}$  pin(s) as well as the trace between the negative node of the input capacitor and power  $PGND\_Bx$  pin(s) must be kept as short as possible. The input capacitance provides a low-impedance voltage source for the switching converter. The inductance of the connection is the most important parameter of a local decoupling capacitor - parasitic inductance on these traces must be kept as tiny as possible for proper device operation.
2. The output filter, consisting of L and  $C_{OUT}$ , converts the switching signal at  $SW\_Bx$  to the noiseless output voltage. It should be placed as close as possible to the device keeping the switch node small, for best EMI behavior. Route the traces between the LP87702-Q1's output capacitors and the load's input capacitors direct and wide to avoid losses due to the IR drop.
3. Input for analog blocks (VANA and AGND) should be isolated from noisy signals. Connect VANA directly to a quiet system voltage node and AGND to a quiet ground point where no IR drop occurs. Place the decoupling capacitor as close as possible to the VANA pin.
4. If remote voltage sensing can be used for the load, connect the device feedback pins  $FB\_Bx$  to the respective sense pins on the load capacitor. The sense lines are susceptible to noise. They must be kept away from noisy signals such as  $PGND\_Bx$ ,  $V_{IN\_Bx}$ , and  $SW\_Bx$ , as well as high bandwidth signals such as the  $I^2C$ . Avoid both capacitive as well as inductive coupling by keeping the sense lines short and direct. Run the lines in a quiet layer. Isolate them from noisy signals by a voltage or ground plane if possible.
5.  $PGND\_Bx$ ,  $V_{IN\_Bx}$  and  $SW\_Bx$  should be routed on thick layers. They must not surround inner signal layers which are not able to withstand interference from noisy  $PGND\_Bx$ ,  $V_{IN\_Bx}$  and  $SW\_Bx$ .

Due to the small package of this converter and the overall small solution size, the thermal performance of the PCB layout is important. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component. Proper PCB layout, focusing on thermal performance, results in lower die temperatures. Wide power traces come with the ability to sink dissipated heat. This can be improved further on multi-layer PCB designs with vias to different planes. This results in reduced junction-to-ambient ( $R_{\theta JA}$ ) and junction-to-board ( $R_{\theta JB}$ ) thermal resistances and thereby reduces the device junction temperature,  $T_J$ . TI strongly recommends performing a careful system-level 2D or full 3D dynamic thermal analysis at the beginning product design process, by using a thermal modeling analysis software.

## 10.2 Layout Example

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, go to the device product folder on ti.com. In the upper right corner, click *Alert me* to register for a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### 11.3 Community Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

#### 11.4 Trademarks

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

#### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
