## Safety

## Definitions and Symbols

#### Abstract

WARNING This symbol indicates high voltage. It calls your attention to items or operations that could be dangerous to you and other persons operating this equipment. Read the message and follow the instructions carefully.

$\qquad$
This symbol is the "Safety Alert Symbol." It occurs with either of two signal words: CAUTION or WARNING, as described below.
A WARNING
Indicates a potentially hazardous situation which, if not avoided,
can result in serious injury or death.

## A CAUTION

Indicates a potentially hazardous situation which, if not avoided, can result in minor to moderate injury, or serious damage to the product. The situation described in the CAUTION may, if not avoided, lead to serious results. Important safety measures are described in CAUTION (as well as WARNING).

## Hazardous High Voltage

#### Abstract

\section*{A WARNING}

Motor control equipment and electronic controllers are connected to hazardous line voltages. When servicing drives and electronic controllers, there may be exposed components with housings or protrusions at or above line potential. Extreme care should be taken to protect against shock.

Stand on an insulating pad and make it a habit to use only one hand when checking components. Always work with another person in case an emergency occurs. Disconnect power before checking controllers or performing maintenance. Be sure equipment is properly grounded. Wear safety glasses whenever working on electronic controllers or rotating machinery.

## Warnings, Cautions and Notices

Read this manual thoroughly and make sure you understand the procedures before you attempt to install, set up, or operate this Cutler-Hammer ${ }^{\circledR}$ SLX9000 Adjustable Frequency Drive from Eaton's electrical business.

## Warnings

## A WARNING

Only a competent electrician may carry out the electrical installation.

## WARNING

The components of the power unit of the drive are live when the SLX9000 drive is connected to power supply. Coming into contact with this voltage is extremely dangerous and may cause death or severe injury. The control unit is isolated from mains potential.

## WARNING

The motor terminals $\mathrm{U}, \mathrm{V}, \mathrm{W}(\mathrm{T} 1, \mathrm{~T} 2, \mathrm{~T} 3$ ) and the DC-link/brake resistor terminals -/+ (in SLX9000 $\geq 1.1 \mathrm{~kW}$ ) are live when drive is connected to mains, even if the motor is not running. Contact with this voltage is extremely dangerous and may cause death or severe injury.

## A WARNING

The control I/O-terminals are isolated from the mains potential. However, the relay outputs and other I/O-terminals may have dangerous control voltage present even when the drive is disconnected from the power supply. Contact with this voltage is extremely dangerous and may cause death or severe injury.

## WARNING

The drive has a large capacitive leakage current. Proper grounding is required. Failure to observe this precaution could result in death or severe injury.

## A WARNING

If the drive is used as a part of a machine, the machine manufacturer is responsible for providing the machine with a main switch (EN 60204-1).

## A WARNING

Only spare parts delivered by Eaton can be used.
If WARNING
If motor thermistor is connected to DIN3, the instructions on
Page 4-9 must be followed, otherwise a serious safety hazard may
result from the connection. result from the connection.

## Cautions

## A CAUTION

The SLX9000 drive is meant for fixed installations only.

## A CAUTION

Do not perform any measurements when the drive is connected to the power supply.

## A CAUTION

After having disconnected the drive from the power supply, wait until the fan stops and the indicators on the keypad go out (if no keypad is attached see the indicator through the keypad base). Wait 5 more minutes before doing any work on drive connections.

## CAUTION

Do not perform any voltage withstand tests on any part of drive. There is a certain procedure according to which the tests shall be performed. Ignoring this procedure may result in damaged product.

## A CAUTION

Prior to measurements on the motor or the motor cable, disconnect the motor cable from the drive.

## A CAUTION

Do not touch the IC-circuits on the circuit boards. Static voltage discharge may damage the components.

## CAUTION

Check the correct positions of the jumpers. Running the motor with signal settings different from the jumper positions will not harm the drive but may damage the motor.

## A CAUTION

The calculated model does not protect the motor if the airflow to the motor is reduced by blocked air intake grill.

## Grounding and ground fault protection

The SLX9000 drive must always be grounded with a ground conductor connected to the ground terminal.
The ground fault protection inside the drive only protects the drive itself against ground faults in the motor or the motor cable.

Due to the high capacity currents present in the drive, fault current protective switches may not function properly. If fault current protective switches are used, they need to be tested with ground fault currents present during possible fault situations.

## Motor and Equipment Safety

## A CAUTION

Before starting the motor, check that the motor is mounted properly and ensure that the machine connected to the motor allows the motor to be started.

A CAUTION
Set the maximum motor speed (frequency) according to the motor and the machine connected to it.

## A CAUTION

Before reversing the motor, make sure that this can be done safely.

## A CAUTION

Make sure that no power correction capacitors are connected to the motor cable.

## A CAUTION

Make sure that the motor terminals are not connected to mains potential.

## Chapter 1 - Overview

## Receiving and Inspection

## Cutler-Hammer ${ }^{\circledR}$ SLX9000 Adjustable Frequency Drives User Manual

## SLX9000 Adjustable Frequency Drives User Manual

SLX9000 Adjustable Frequency Drives User Manual from Eaton's electrical business have undergone scrupulous tests and quality checks at the factory before they are delivered to the customer. However, after unpacking the product, check that no signs of transport damages are to be found on the product and that the delivery is complete (compare the catalog number of the product to the code below, see Table 1-1).

If the drive has been damaged during shipping, please contact the cargo insurance company or the carrier.

If the delivery does not correspond to your order, contact the supplier immediately.
Table 1-1: SLX9000 AF Drive Catalog Numbering System

[^0]
## Storage

If the drive is to be kept in storage before use, make sure that the ambient conditions are acceptable:

Storing temperature: -40 to $158^{\circ} \mathrm{F}\left(-40\right.$ to $\left.70^{\circ} \mathrm{C}\right)$
Relative humidity: $<95 \%$, no condensation

## Maintenance

In normal conditions, Cutler-Hammer drives are maintenance-free. However, we recommend to clean the heatsink (using e.g. a small brush) whenever necessary. Most drives are equipped with a cooling fan, which can easily be changed if necessary.

## Technical Data

SLX9000 is a compact drive with ratings ranging from $3 / 4$ to 75 hp . It is well adapted for HVAC and OEM applications where its uses are almost unlimited.

The Motor and Application Control Block is based on microprocessor software. The microprocessor controls the motor basing on the information it receives through measurements, parameter settings, control I/O and control keypad. The IGBT Inverter Bridge produces a symmetrical, three-phase PWM-modulated AC-voltage to the motor.

The control keypad constitutes a link between the user and the drive. The control keypad is used for parameter setting, reading status data and giving control commands. Instead of the control keypad, a PC can also be used to control the drive if connected through a cable and a serial interface adapter (optional equipment).
The drive can be supplied with control I/O boards OPTAA, OPTAI, OPTB_ or OPTC_.
230V Drives up to $15 \mathrm{hp}\left(\mathrm{I}_{\mathrm{H}}\right)$ and 480 V Drives up to $30 \mathrm{hp}\left(\mathrm{I}_{\mathrm{H}}\right)$ have an internal brake chopper. All other sizes come standard with no brake chopper. For more information, contact Eaton. The input EMC filters are internal and included as standard.

Table 1-8: Technical Information

| Description | Specification |
| :---: | :---: |
| Mains Connection |  |
| Input Voltage $\mathrm{V}_{\text {in }}$ | $208-240 \mathrm{~V} ;-15 \%$ to $+10 \%$ three-phase $380-500 \mathrm{~V} ;-15 \%$ to $+10 \%$ three-phase $525-690 \mathrm{~V} ;-15 \%$ to $+10 \%$ three-phase |
| Input Frequency | $45-66 \mathrm{~Hz}$ |
| Connection to Mains | Once per minute or less (typical application) |
| Motor Connection |  |
| Output Voltage | $0-V_{\text {in }}$ |
| Continuous Output Current | $\mathrm{I}_{\mathrm{H}}$ : Ambient temperature max. $122^{\circ} \mathrm{F}\left(+50^{\circ} \mathrm{C}\right)$, overload $1.5 \times \mathrm{I}_{\mathrm{H}}$ (1 min./ 10 min .) <br> $\mathrm{I}_{\mathrm{L}}$ : Ambient temperature max. $104^{\circ} \mathrm{F}\left(+40^{\circ} \mathrm{C}\right)$, overload $1.1 \times \mathrm{I}_{\mathrm{L}}(1 \mathrm{~min} . / 10 \mathrm{~min}$.) |
| Starting Torque | 150\% (Low overload); 200\% (High overload) |
| Starting Current | $2 \times \mathrm{IH} 2$ secs every 20 secs, if output frequency $<30 \mathrm{~Hz}$ and temperature of heatsink $<+60^{\circ} \mathrm{C}$ |
| Output Frequency | $0-320 \mathrm{~Hz}$ |
| Frequency Resolution | . 01 Hz |

Control Characteristics

| Control Method | Frequency control V/f Open Loop Sensorless Vector Control |
| :---: | :---: |
| Switching Frequency (See Parameter 2.6.8) | 208-230V: 3/4-15 hp: 1 to 16 kHz ; default 10 kHz $20-30 \mathrm{hp}: 1$ to 10 kHz ; default 3.6 kHz 380 -500V: $1-30 \mathrm{hp}: 1$ to 16 kHz ; default 10 kHz $40-60 \mathrm{hp}$ : 1 to 10 kHz ; default 3.6 kHz 525 - 690V: All Sizes: 1 to 6 kHz ; default 1.5 kHz |
| Frequency Reference <br> - Analog Input <br> - Keypad Reference | Resolution . $1 \%$ (10-bit), accuracy $\pm 1 \%$ Resolution .01 Hz |
| Field Weakening Point | $30-320 \mathrm{~Hz}$ |
| Acceleration Time | . $1-3000$ sec. |
| Deceleration Time | . 1 - 3000 sec. |
| Braking Torque | DC brake: $30 \% * \mathrm{~T}_{\mathrm{N}}$ (without brake option) |

Ambient Conditions

| Ambient Operating Temperature | $14^{\circ} \mathrm{F}\left(-10^{\circ} \mathrm{C}\right)$ (no frost) to $122^{\circ} \mathrm{F}\left(50^{\circ} \mathrm{C}\right): \mathrm{I}_{\mathrm{H}}$ <br> $14^{\circ} \mathrm{F}\left(-10^{\circ} \mathrm{C}\right)$ (no frost) to $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right): \mathrm{I}_{\mathrm{L}}$ |
| :--- | :--- |
| Storage Temperature | -40 to $158^{\circ} \mathrm{F}\left(-40\right.$ to $\left.70^{\circ} \mathrm{C}\right)$ |
| Relative Humidity | $0-95 \% \mathrm{RH}$, non-condensing, non-corrosive, <br> no dripping water |
| Air Quality: <br> - Chemical Vapors <br> - Mechanical Particles | IEC $721-3-3$, unit in operation, class 3 C 2 <br> $\mathrm{IEC} 721-3-3$, unit in operation, class 3 S 2 |
| Altitude | $100 \%$ Ioad capacity (no derating) up to $3300 \mathrm{ft}.(1000 \mathrm{~m})$ <br> $1-\%$ derating for each $330 \mathrm{ft}.(100 \mathrm{~m})$ above $3300 \mathrm{ft}.(1000 \mathrm{~m}) ;$ <br> max. $10000 \mathrm{ft}.(3000 \mathrm{~m})$ |

January 2009

Table 1-8: Technical Information (Continued)

| Description | Specification |
| :---: | :---: |
| Ambient Conditions (Continued) |  |
| Vibration <br> EN 50178/EN 60068-2-6 | $5-150 \mathrm{~Hz}$ <br> Displacement amplitude 1 mm (peak) at $5-15.8 \mathrm{~Hz}$ Max acceleration amplitude 1G at $15.8-150 \mathrm{~Hz}$ |
| Shock <br> EN 50178, IEC 68-2-27 | UPS Drop Test (for applicable UPS weights) Storage and shipping: max 15G, 11 mS (in package) |
| Enclosure Class | NEMA Type 1/IP21 or NEMA Type 12/IP54 |
| EMC |  |
| Immunity | Complies with EN 50082-1, -2, EN 61800-3 |
| Emissions | MF4 - MF6: EMC-level H: EN 61800-3 (1996)+A11 (2000) <br> 1. environment, restricted use; 2. environment |
| Safety |  |
|  | EN 50178, EN 60204-1, CE, UL, cUL, FI, GOST R, IEC 61800-5 (see unit nameplate for more detailed approvals) |
| Control Connections |  |
| Analog Input Voltage | $\begin{aligned} & 0-10 \mathrm{~V}, \mathrm{R}_{\mathrm{i}}=200 \mathrm{k} \Omega, \\ & \text { Resolution } 10 \text { bit, accuracy } \pm 1 \% \end{aligned}$ |
| Analog Input Current | O(4) - $20 \mathrm{~mA}, \mathrm{R}_{\mathrm{i}}=250 \Omega$ differential |
| Digital Inputs | 3 positive logic; 18-24V DC |
| Auxiliary Voltage | +24V, $\pm 15 \%$, max. 100 mA |
| Output Reference Voltage | +10V, +3\%, max. load 10 mA |
| Analog Output | 0(4) - 20 mA ; $\mathrm{R}_{\mathrm{L}}$ max. $500 \Omega$; Resolution 16 bit; Accuracy $\pm 1 \%$ |
| Relay Outputs | 1 programmable change-over relay output Switching capacity: 24V DC/8A, 250V AC/8A, 125V DC/.4A |
| Protections |  |
| Overvoltage Protection | Yes |
| Undervoltage Protection | Yes |
| Ground Fault Protection | In case of ground fault in motor or motor cable, only the drive is protected |
| Unit Overtemperature Protection | Yes |
| Motor Overload Protection | Yes |
| Motor Stall Protection | Yes |
| Motor Underload Protection | Yes |
| Short Circuit Protection of +24 V and +10 V Reference Voltages | Yes |
| Overcurrent Protection | Trip limit 4.0* ${ }_{\mathrm{H}}$ instantaneously |

## Chapter 2 - Installation

## Mounting

## Standard Mounting Instructions

1. Measure the mounting space to ensure that it allows for the minimum space surrounding the drive. See dimension tables and Table 2-8.
2. Make sure the mounting surface is flat and strong enough to support the drive, is not flammable, and is not subject to excessive motion or vibration.
3. Ensure that the minimum airflow requirements for your drive are met at the mounting location. See Table 2-9.
4. Mark the location of the mounting holes on the mounting surface, using the template provided on the cover of the cardboard shipping package.
5. Using fasteners appropriate to your drive and mounting surface, securely attach the drive to the mounting surface using all 4 screws or bolts.

## Cooling

Forced air flow cooling is used.
Enough free space needs to be left above and below the drive to ensure sufficient air circulation and cooling. You will find the required dimensions for free space in Table 2-8.

Figure 2-8: Installation Space
Table 2-8: Mounting Space Dimensions

| Frame | Approximate Dimensions in Inches (mm) |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | A | B | C | D |
| MF4 | $.79(20)$ | $.79(20)$ | $3.94(100)$ | $1.97(50)$ |
| MF5 | $.79(20)$ | $.79(20)$ | $4.72(120)$ | $2.36(60)$ |
| MF6 | $1.18(30)$ | $.79(20)$ | $6.30(160)$ | $3.15(80)$ |
| FR7 | $3.15(80)$ | $3.15(80)$ | $11.81(300)$ | $3.94(100)$ |
| FR8 | $5.91(150)$ © | $3.15(80)$ | $11.81(300)$ | $7.87(200)$ |

(1) Extra width is allowed to change the fan without disconnecting cables.
$\mathbf{A}=$ clearance around the drive (see also $\mathbf{B}$ )
B = clearance from one drive to another or distance to cabinet wall
C = free space above the drive
D = free space underneath the drive
Table 2-9: Required Cooling Air

| Frame | Cooling Air Required (cfm) |
| :--- | :--- |
| MF4 | 41 |
| MF5 | 112 |
| MF6 | 250 |
| FR7 | 250 |
| FR8 | 383 |

## Changing EMC Protection Class from H to T

The EMC protection class of SLX9000 drive frames MF4 - MF6 can be changed from class H to class T with a simple procedure presented in Figure 2-9-2-10.

Figure 2-9: Changing of EMC Protection Class, MF4 (left) and MF5 (right), 460V

Figure 2-10: Changing of EMC Protection Class, MF6
Note: Do not attempt to change the EMC-level back to class H. Even if the procedure above is reversed, the drive will no longer fulfill the EMC requirements of class H !

## Chapter 3 - Power Wiring

## Power Connections

Figure 3-1: Power Connections, MF4 - MF6

Figure 3-2: FR7 Power and Motor Wiring Terminals

Figure 3-3: FR8 Power and Motor Wiring Terminals
Use cables with heat resistance of at least $+70^{\circ} \mathrm{C}$. The cables and the fuses must be dimensioned according to Tables 3-1 and 3-2. Installation of cables according to UL regulations is found on Page 3-15.

The fuses also function as cable overload protection.
These instructions apply only to cases with one motor and one cable connection from the drive to the motor. In any other case, ask the factory for more information.

Table 3-1: Cable Types Required to Meet Standards

|  | 1st Environment <br> (Restricted <br> Distribution) <br> Level H/C | 2nd Environment <br> Level L | Level T | Level N |
| :--- | :--- | :--- | :--- | :--- |

| Mains Cable | 1 | 1 | 1 | 1 |
| :--- | :--- | :--- | :--- | :--- |
| Motor Cable | $3 \odot$ | 2 | 1 | 1 |
| Control Cable | 4 | 4 | 4 | 4 |

Level C = EN 61800-3+A11, 1st environment, unrestricted distribution EN 61000-6-3
Level H = EN 61800-3+A11, 1st environment, restricted distribution EN 61000-6-4
Level L = EN 61800-3, 2nd environment
Level T: Consult Eaton.
Level N: Consult Eaton.
1 Power cable intended for fixed installation and the specific mains voltage. Shielded cable not required.
2 Power cable equipped with concentric protection wire and intended for the specific mains voltage.
3 Power cable equipped with compact low-impedance shield and intended for the specific mains voltage.
4 Screened cable equipped with compact low-impedance shield.
(1) $360^{\circ}$ grounding of both motor and FC connection required to meet the standard.

Frames MF4 - MF6, FR7, FR8: A cable entry flange should be used when installing the motor cable at both ends in order to reach the EMC levels.

Note: The EMC requirements are fulfilled at factory defaults of switching frequencies (all frames).

## Cable and Fuse Sizes

Use only copper wire with temperature rating of at least $75^{\circ} \mathrm{C}$.
Table 3-2: Cable and Fuse Sizes - 230V Ratings

| hp | Frame Size | $l_{1}(\mathrm{~A})$ | Fuse (A) | Wire Size ${ }^{\text {® }}$ |  | Terminal Size |  |

## Mounting of Cable Accessories

Enclosed with your drive you have received a plastic bag containing components that are needed for the installation of the mains and motor cables in the drive.

Figure 3-4: Cable Accessories

## Components:

| 1 | Grounding terminals (MF4, MF5) (2) | 5 | Screws, M4x10 (5) |
| :--- | :--- | :--- | :--- |
| 2 | Cable clamps (3) | 6 | Screws, M4×16 (3) |
| 3 | Rubber grommets (sizes vary from class <br> to class) (3) | 7 | Grounding cable clamps (MF6, FR7) (2) <br> (FR8) (1) |
|  | 8 | Grounding screws M5x16 (MF6, FR7) (4) <br> (FR8) (2) |  |

4 Cable entry gland (1)
Note: The cable accessories installation kit for drives of protection class NEMA Type 12 includes all components except 4 and 5.

Table 3-5: Mounting Procedure

| 1 | Make sure that the plastic bag you <br> have received contains all necessary <br> components. |  |
| :--- | :--- | :--- | :--- |
| 2 | Open the cover of the drive. |  |
| 3 |  |  |
| a) the grounding terminals (MF4/MF5) |  |  |
| places for: |  |  |

Table 3-5: Mounting Procedure (Continued)

| 4 | Re-install the cable cover. Mount the <br> cable clamps with the three M4x16 <br> screws as shown. Note that the <br> location of the grounding bar in MF6, <br> FR7 and FR8 is different from what is <br> shown in the picture. |
| :--- | :--- | :--- |
| 5 | Place the rubber grommets in the <br> openings as shown. |
| Fix the cable entry gland to the frame <br> of the drive with the five M4x10 <br> screws. Close the cover of the drive. |  |

## Installation Guidelines

To ensure proper wiring, use the following guidelines:

- Use heat-resistant copper cables only, $+75^{\circ} \mathrm{C}$ or higher.
- The input line cable and line fuses must be sized in accordance with the rated input current of the unit. See Tables 3-2-3-4.
- Consistent with UL listing requirements, for maximum protection of the SLX9000 drive, UL recognized fuses type RK5 should be used for 480 V and 230 V ratings.
- If the motor temperature sensing is used for overload protection, the output cable size may be selected based on the motor specifications.
- If three or more shielded cables are used in parallel for the output on the larger units, every cable must have its own overload protection.
- Avoid placing the motor cables in long parallel lines with other cables.
- If the motor cables run in parallel with other cables, note the minimum distances between the motor cables and other cables given in Table 3-6 below:

Table 3-6: Cable Spacings

| Minimum Distance Between <br> Cables in Feet $(\mathbf{m})$ | Cable in Feet (m) |
| :--- | :--- |
| $1(0.3)$ | $\leq 164(50)$ |
| $3.3(1.0)$ | $\leq 656(200)$ |

- The spacings of Table 3-6 also apply between the motor cables and signal cables of other systems.
- The maximum length of the motor cables is as follows:
- 1 - $2 \mathrm{hp}, 230 \mathrm{~V}$ units, 328 ft . ( 100 m )
- All other hp units, 984 ft ( 300 m )
- The motor cables should cross other cables at an angle of 90 degrees.
- If conduit is being used for wiring, use separate conduits for the input power wiring, the output power wiring, the signal wiring and the control wiring.

## Stripping Lengths of Motor and Mains Cables

Figure 3-5: Stripping of Cables
Table 3-7: Cable Stripping Lengths

| Frame | Approximate Dimensions in Inches (mm) |  |  |  |  |  |  |  |

Figure 3-12: SLX9000, FR7

Figure 3-13: Cable Installation in SLX9000, FR7

Installation of Cables to SLX9000, FR8

Figure 3-14: SLX9000, FR8

Figure 3-15: Cable Installation in SLX9000, FR8

## Cable Installation and the UL Standards

To meet the UL (Underwriters Laboratories) regulations, a UL-approved copper cable with a minimum heat-resistance of $+60 / 75^{\circ} \mathrm{C}$ must be used.

The tightening torques of the terminals are given in Table 3-8.
Table 3-8: Tightening Torques of Terminals

| Frame | Tightening Torque <br> (Nm) | Tightening Torque <br> in-lbs. |
| :--- | :--- | :--- |
| MF4 | $.5-.6$ | $4-5$ |
| MF5 | $1.2-1.5$ | $10-13$ |
| MF6 | 4 | 35 |
| FR7 | 10 | 85 |
| FR8 | $40 / 22$ © | $340 / 187{ }^{\circledR}$ |

(1) The isolation standoff of the bus bar will not withstand the listed tightening torque. Use a wrench to apply a counter torque when tightening.

## Cable and Motor Insulation Checks

1. Motor cable insulation checks

Disconnect the motor cable from terminals $\mathrm{U}, \mathrm{V}$ and W of the drive and from the motor. Measure the insulation resistance of the motor cable between each phase conductor as well as between each phase conductor and the protective ground conductor.
The insulation resistance must be $>1 \mathrm{M} \Omega$.
2. Mains cable insulation checks

Disconnect the mains cable from terminals L1, L2 and L3 of the drive and from the mains. Measure the insulation resistance of the mains cable between each phase conductor as well as between each phase conductor and the protective ground conductor.

The insulation resistance must be $>1 \mathrm{M} \Omega$.
3. Motor insulation checks

Disconnect the motor cable from the motor and open the bridging connections in the motor connection box. Measure the insulation resistance of each motor winding. The measurement voltage must equal at least the motor nominal voltage but not exceed 1000 V . The insulation resistance must be $>1 \mathrm{M} \Omega$.

## Chapter 4 - Control Wiring

## Control Unit

## MF4 - MF6 460V

In frames MF4 - MF6 there are two option board connectors SLOT D and SLOT E (see Figure 4-1). Newest software supports hardware with two board slots. Also older software versions can be used, but they will not support hardware with two board slots.

Figure 4-1: Option Board Slots D and E in Frames MF4 - MF6 460 V only.

## Allowed Option Boards in MF4 - MF6

See below for the allowed option boards in the two slots on MF4 - MF6 drives.

| SLOT D | C3 | C4 | C6 | C7 | Cl | CJ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SLOT E | AA | AI | B1 | B2 | B4 | B5 | B9 | C2 | C3 | C4 | C6 | C7 | C8 | Cl | CJ |

When two option boards are used, the one in slot E has to be OPTAI or OPTAA. Do not use two OPTB_ or OPTC_ boards. Also, combinations of OPTB_ and OPTC_ boards are prohibited.
See descriptions for OPTAA and OPTAI option boards in Appendixes B and C.

## All 230V, FR7 - FR8 460V and All 575V

The control unit of FR7 and FR8 drives consists of the control board and various option boards that plug into the five slot connectors ( A to E ) of the control board.
Galvanic isolation of the control terminals is provided as follows:

- The control connections are isolated from power, and the GND terminals are permanently connected to ground.
- The digital inputs are galvanically isolated from the I/O ground.
- The relay outputs are double-isolated from each other at 300 V AC.

## Option Board General Information

The FR7 and FR8 drives can accommodate a wide selection of expander and adapter option boards to customize the drive for your application needs.

The drive's control unit is designed to accept a total of five option boards. Option boards are available for normal analog and digital inputs and outputs, communication and additional application-specific hardware.
The factory-installed standard option board configuration includes an A9 I/O board and an A2 relay output board, which are installed in slots A and B. For information on additional option boards, see the 9000X Series Drives Option Board User Manual.

Figure 4-2: Option Board Slots
All 230V, FR7 - FR8 480V and All 575V.

## Control Connections

## MF4 - MF6 460V

The basic control connections for MF4 - MF6 are shown on Page 4-3.

Figure 4-3: Control Connections, MF4 - MF6 460V

Table 4-1: Multi-Control Application Default Input/Output Configuration, MF4 - MF6 460V
Reference potentiometer
$1-10 \mathrm{k} \Omega$

Table 4-2: Al1 Configuration, When Programmed as DIN4, MF4 - MF6 460V

|  | Terminal |  | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\Gamma$ | 1 | $+10 \mathrm{~V}_{\text {ref }}$ | Reference output | Voltage for potentiometer, etc. |
| \| | 2 | Al1+ or DIN4 | Analog input, voltage range 0 - 10V DC | Voltage input frequency reference (MF2 - MF3) <br> Voltage/current input frequency reference (MF4 - MF6) <br> Can be programmed as DIN4 |
|  | 3 | AI1- | I/O Ground | Ground for reference and controls |
|  | 4 | Al2+ | Analog input, current range | Voltage or current input frequency |
|  | 5 | Al2-/GND | $0-10 \mathrm{~V} D$ or current range $0-20 \mathrm{~mA}$ | reference |
|  | 6 | +24V | Control voltage output |  |
|  | 7 | GND | I/O ground | Ground for reference and controls |

Reference potentiometer
1-10 $\mathrm{k} \Omega$

Table 4-4: Control Input/Output Terminal Signals, MF4 - MF6 460V

| Term |  | Signal | Description |
| :---: | :---: | :---: | :---: |
| 1 | +10 $\mathrm{V}_{\text {ref }}$ | Reference voltage | Maximum current 10 mA |
| 2 | Al1+ | Analog input, voltage (MF4 and larger: voltage or current) | MF4 - MF6: Selection V or mA with jumper block X8 (see Page 4-3): <br> Default: $0-10 \mathrm{~V}(\mathrm{Ri}=200 \mathrm{k} \Omega)$ <br> $0-20 \mathrm{~mA}(\mathrm{Ri}=250 \mathrm{~W})$ |
| 3 | Al1- | Analog input common | Differential input if not connected to ground; Allows $\pm 20 \mathrm{~V}$ differential mode voltage to GND |
| 4 | Al2+ | Analog input, voltage or current | $\begin{aligned} & \text { Selection V or mA with jumper block X13 } \\ & \begin{array}{l} \text { (MF4-MF6) } \\ \text { Default: } 0-20 \mathrm{~mA}(R \mathrm{Ri}=250 \Omega) \\ 0-10 \mathrm{~V}(\mathrm{Ri}=20 \mathrm{k} \Omega) \end{array} \end{aligned}$ |
| 5 | Al2- | Analog input common | Differential input; <br> Allows $\pm 20 \mathrm{~V}$ differential mode voltage to GND |
| 6 | $24 \mathrm{~V}_{\text {out }}$ | 24 V auxiliary output voltage | $\pm 10 \%$, maximum current 100 mA |
| 7 | GND | I/O ground | Ground for reference and controls |
| 8 | DIN1 | Digital input 1 | $\mathrm{R}_{\mathrm{i}}=\min .5 \mathrm{k} \Omega$ |
| 9 | DIN2 | Digital input 2 |  |
| 10 | DIN3 | Digital input 3 |  |
| 11 | GND | I/O ground | Ground for reference and controls |
| 18 | AO1+ | Analog signal (+output) | Output signal range: |
| 19 | AO1-/GND | Analog output common | Current 0(4)-20 mA, $\mathrm{R}_{\mathrm{L}} \max 500 \Omega$ or |
| A | RS-485 | Serial bus | Differential receiver/transmitter, bus impedance $120 \Omega$ |
| B | RS-485 | Serial bus | Differential receiver/transmitter, bus impedance $120 \Omega$ |
| 30 | +24V | 24 V auxiliary input voltage | Control power supply backup |
| 21 | RO1/1 | Relay output 1 | Switching capacity: 24 V DC/8A |
| 22 | RO1/2 |  | 250 V AC/8A |
| 23 | RO1/3 |  | Relay output terminals are galvanically isolated from the I/O ground |

Table 4-5: Option Board A9 Terminal Descriptions, All 230V, FR7 - FR8 460V and All 575V

| Terminal |  | Signal | Description and Parameter Reference |
| :---: | :---: | :---: | :---: |
| 1 | $+10 \mathrm{~V}_{\text {ref }}$ | Reference voltage | Maximum current 10 mA |
| 2 | Al1+ | Analog input, voltage | Default: $\begin{aligned} & 0-+10 \mathrm{~V}\left(\mathrm{R}_{\mathrm{i}}=200 \mathrm{k} \Omega\right) \\ & -10 \mathrm{~V} \text { to }+10 \mathrm{~V} \text { (joystick control) } \\ & 0-20 \mathrm{~mA}\left(\mathrm{R}_{\mathrm{i}}=250 \Omega\right) \end{aligned}$ <br> Select $V$ or $m A$ with jumper block $X 1$ <br> Differential input if not connected to ground; allows $\pm 20 \mathrm{~V}$ differential mode voltage to GND |
| 3 | GND | Analog input common |  |
| 4 | Al2+ | Analog input | Default: $\begin{aligned} & 0-20 \mathrm{~mA}\left(\mathrm{R}_{\mathrm{i}}=250 \Omega\right) \\ & 0-+10 \mathrm{~V}\left(\mathrm{R}_{\mathrm{i}}=200 \mathrm{k} \Omega\right) \end{aligned}$ <br> -10 V to +10 V (joystick control) <br> Select V or mA with jumper block X2 <br> Differential input if not connected to ground; allows $\pm 20 \mathrm{~V}$ differential mode voltage to GND |
| 5 | GND/Al2- | Analog input common |  |
| 6 | $24 \mathrm{~V}_{\text {out }}$ | 24 V control voltage (bi-directional) | $\pm 15 \%, 250 \mathrm{~mA}$ (all boards total); 150 mA (max. current from single board); Can be used as external power backup for the control (and fieldbus); Galvanically connected to terminal \#12 |
| 7 | GND | I/O ground | Ground for reference and controls; Galvanically connected to terminals \#13, 19 |
| 8 | DIA1 | Digital input 1 | $\mathrm{R}_{\mathrm{i}}=\min .5 \mathrm{k} \Omega$ |
| 9 | DIA2 | Digital input 2 |  |
| 10 | DIA3 | Digital input 3 |  |
| 11 | CMA | Digital input common A for DIN1, DIN2 and DIN3 | Must be connected to GND or 24 V of I/O terminal or to external 24 V or GND. Selection with jumper block X3. |
| 12 | $24 \mathrm{~V}_{\text {out }}$ | 24 V control voltage (bi-directional) | Same as terminal \#6; Galvanically connected to terminal \#6 |
| 13 | GND | I/O ground | Same as terminal \#7; Galvanically connected to terminals \#7 \& 19 |
| 14 | DIB4 | Digital input 4 | $\mathrm{R}_{\mathrm{i}}=\min .5 \mathrm{k} \Omega$ |
| 15 | DIB5 | Digital input 5 |  |
| 16 | DIB6 | Digital input 6 |  |
| 17 | CMB | Digital input common B for DIN4, DIN5 and DIN6 | Must be connected to GND or 24 V of $\mathrm{I} / \mathrm{O}$ terminal or to external 24 V or GND. Select with jumper block X3. |
| 18 | A01+ | Analog signal (+output) | Output signal range: $0-10 \mathrm{~V}$ default <br> Current: 0(4) - 20 mA , RL max $500 \Omega$ or <br> Voltage: $0-10 \mathrm{~V}, \mathrm{RL}>1 \mathrm{k} \Omega$ <br> Selection with jumper block X6. |
| 19 | A01- | Analog output common | Maximum Vin $=48 \mathrm{~V}$ DC; Galvanically connected to terminals \#7, 13 |
| 20 | DO1 | Digital output1 | Open collector, Maximum current $=50 \mathrm{~mA}$ |

Table 4-6: Option Board A2 Terminal Descriptions, All 230V, FR7 - FR8 460V and All 575V

| Terminal |  | Signal | Technical Information |
| :---: | :---: | :---: | :---: |
| 21 | RO1/1 | Normally Closed (NC) | Switching Capacity: <br> 24V DC / 8A <br> 250V AC / 8A <br> 125V DC / 0.4A <br> Min Switching Load: $5 \mathrm{~V} / 10 \mathrm{~mA}$ <br> Continuous Capacity: <2 Arms |

| 23 | RO1/3 | Normally Open (NO) |  |
| 24 | RO2/1 | Normally Closed (NC) | Switching Capacity: <br> 24V DC / 8A <br> 250V AC / 8A <br> 125V DC / 0.4A <br> Min Switching Load: 5V/10 mA <br> Continuous Capacity: <2 Arms |
| 25 | RO2/2 | Common |  |
| 26 | RO2/3 | Normally Open (NO) |  |

## Jumper Selections on SLX9000 Basic Board

The user is able to customize the functions of the drive to better suit an application by selecting certain positions for the jumpers on the SLX9000 board. The positions of the jumpers determine the signal type of analog input (terminal \#2) and whether the termination resistor RS-485 is used or not.

The following figures present the jumper selections of SLX9000 drives:

Figure 4-4: Jumper Selection for SLX9000, MF4 - MF6

## A CAUTION

Check the correct positions of the jumpers. Running the motor with signal settings different from the jumper positions will not harm the drive but may damage the motor.

Note: If you change the Al signal content also remember to change the corresponding parameters (S6.9.1, 6.9.2) in System Menu.

Figure 4-5: Location of Jumper Blocks in the Control Board of MF4 - MF6, 460V

## Motor Thermistor (PTC) Connection

There are three ways to connect a PTC resistor to SLX9000.

1. With optional board OPTAI (recommended method).

SLX9000 drive equipped with OPTAI fulfills IEC 664 if the motor thermistor is insulated (= effective double insulation).
2. With optional board OPTB2.

SLX9000 drive equipped with OPTB2 fulfills IEC 664 if the motor thermistor is insulated (= effective double insulation).
3. With the digital input (DIN3) of SLX9000 drive.

The DIN3 is galvanically connected to other I/Os of SLX9000. This is why reinforced or double insulation of the thermistor (IEC 664) is absolutely required outside the drive (in the motor or between the motor and the drive).

Figure 4-6: Motor Thermistor (PTC) Connection
Note: The drive trips when PTC impedance exceeds $4.7 \mathrm{k} \Omega$.
We strongly recommend the use of OPTAI or OPTB2 board for motor thermistor connection.

## WARNING

If the motor thermistor is connected to DIN3, the instructions above must be followed, otherwise a serious safety hazard may result from the connection.

## Chapter 5 - Menu Information

## Keypad Operation

The control keypad is the link between the SLX9000 drive and the user. The control keypad features an alphanumeric display with seven indicators for the Run status (RUN, counterclockwise, clockwise, READY, STOP, ALARM, FAULT) and three indicators for the control place (I/O term/Keypad/BusComm).
The control information, i.e. the menu number, the displayed value and the numeric information are represented with numeric symbols.

The drive is operable through the seven pushbuttons of the control keypad. Furthermore, the buttons can be used in setting parameters and monitoring values.

The keypad is detachable and isolated from the input line potential.

## Indicators on the Keypad Display

Figure 5-1: Control Keypad and Drive Status Indications

January 2009

## Drive Status Indicators

The drive status symbols tell the user the status of the motor and the drive.
Table 5-1: Drive Status Indicators

| Indicator | Description |
| :---: | :--- |
| RUN | RUN <br> Motor is running; Blinks when the stop command has been given but the <br> frequency is still ramping down. |
| STOP | STOP <br> Indicates that the drive is not running. |
| READY | READY <br> Lights up when AC power is on. In case of a fault, the symbol will not light up. |
| ALARM | ALARM <br> Indicates that the drive is running outside a certain limit and a warning is <br> given. |
| FAULT | FAULT <br> Indicates that unsafe operating conditions were encountered due to which <br> the drive was stopped. |

## Control Place Indicators

The symbols I/O term, Keypad and Bus/Comm (see Table 5-2) indicate the choice of control place made in the Keypad control menu (M3) (see Table 5-6).

Table 5-2: Control Place Indicators

| Indicator | Description |
| :---: | :--- |
| I/O Term | I/O Terminal <br> I/O terminals are selected as the control place i.e. START/STOP commands or <br> reference values etc. are given through the I/O terminals. |
| Keypad | Keypad <br> Control keypad is selected as the control place i.e. the motor can be started or <br> stopped, or its reference values etc. altered from the keypad. |
| Bus/comm | Bus/Comm <br> The drive is controlled through a fieldbus. |

## Numeric Indicators

The numeric indications provide the user with information on present location in the keypad menu structure as well as with information related to the operation of the drive.

## Keypad Pushbuttons

The SLX9000 seven-segment control keypad features seven pushbuttons that are used for the control of the DRIVE (and motor) and parameter setting.

Figure 5-2: Keypad Pushbuttons
Table 5-3: Button Descriptions

| Indicator | Description |
| :---: | :---: |
| $\begin{gathered} \text { ENTER } \\ \text { reser } \end{gathered}$ | There are two operations integrated in this button. The button operates mainly as RESET button except in the parameter edit mode. The button operation is shortly described below. <br> The ENTER button serves for: <br> 1. confirmation of selections <br> 2. fault history reset ( $2-3$ seconds) <br> RESET is used to reset active faults. <br> Note: The motor may start immediately after resetting the faults. |
| (4) | Browser Button Up <br> Browse the main menu and the pages of different submenus. Edit values. |
| (i) | Browser Button Down <br> Browse the main menu and the pages of different submenus. Edit values. |
| (4) | Menu Button Left <br> Move backward in menu. <br> Move cursor left (in parameter menu). <br> Exit edit mode. <br> Press for 2 to 3 seconds to return to main menu. |
| - | Menu Button Right <br> Move forward in menu. <br> Move cursor right (in parameter menu). <br> Enter edit mode. |
| START | START Button <br> Pressing this button starts the motor if the keypad is the active control place. See Page 5-10. |
| stop | STOP Button <br> Pressing this button stops the motor (unless disabled by parameter P3.4). See Page 5-10. STOP button also serves for activating the Start-Up Wizard (see Page 6-4). |

## Menu Navigation

The data on the control keypad are arranged in menus and submenus. The menus are used for the display and editing of measurement and control signals, parameter settings (see Page 5-8) and reference value (see Page 5-11) and fault displays (see Page 5-11).

Figure 5-3: Keypad Display Data
The first menu level consists of menus M1 to E7 and is called the Main Menu. The user can navigate in the main menu with the Browser buttons up and down. The desired submenu can be entered from the main menu with the Menu buttons. When there still are pages to enter under the currently displayed menu or page, the last digit of the figure blinks and you can reach the next menu level by pressing Menu Button Right.

The control keypad navigation chart is shown in Figure 5-4. Please note that menu M1 is located in the lower left corner. From there you will be able to navigate your way up to the desired menu using the menu and browser buttons.

You will find more detailed descriptions of the menus later in this chapter.

Figure 5-4: Keypad Navigation Chart

Table 5-4: Main Menu Functions

| Code | Menu | Min. | Max. | Selections |
| :---: | :---: | :---: | :---: | :---: |
| M1 | Monitoring menu | V1.1 | V1.24 | See Page 5-7 for the monitoring values |
| P2 | Parameter menu | P2.1 | P2.10 | P2.1 = Basic parameters <br> P2.2 = Input signals <br> P2.3 = Output signals <br> P2.4 = Drive control <br> P2.5 = Prohibit frequencies <br> P2.6 = Motor control <br> P2.7 = Protections <br> P2.8 = Autorestart <br> P2.9 = PID control <br> P2.10=Pump and fan control <br> See the Multi-control application manual for detailed parameter lists |
| K3 | Keypad control menu | P3.1 | P3.6 | P3.1 = Selection of control place <br> R3.2 = Keypad reference <br> P3.3 = Keypad direction <br> P3.4 $=$ Stop button activation <br> P3.5 = PID reference 1 <br> P3.6 = PID reference 2 |
| F4 | Active faults menu |  |  | Shows the active faults and their types |
| H5 | Fault history menu |  |  | Shows the fault history list |
| S6 | System menu | S6.3 | S6.10 | S6.3 = Copy parameters <br> S6.5 = Security <br> S6.6 = Keypad settings <br> S6.7 = Hardware settings <br> S6.8 = System info <br> S6.9 = Al mode <br> S6.10 = Fieldbus parameters <br> Parameters are described on Page 5-13 |
| E7 | Expander board menu |  |  |  |

## Monitoring Menu (M1)

You can enter the Monitoring menu from the Main menu by pressing Menu Button Right when the location indication M1 is visible on the display. Figure 5-5 shows how to browse through the monitored values.
The monitored signals carry the indication V\#.\# and listed in Table 5-5. The values are updated once every .3 seconds.
This menu is for signal checking. The values cannot be changed. To change values of the parameters, see Page 5-8.

Figure 5-5: Monitoring Menu

Table 5-5: Monitored Signals

| Code | Signal Name | Unit | ID | Description |
| :--- | :--- | :--- | :--- | :--- |
| V1.1 | Output frequency | Hz | 1 | Frequency to the motor |
| V1.2 | Frequency reference | Hz | 25 |  |
| V1.3 | Motor speed | rpm | 2 | Calculated motor speed |
| V1.4 | Motor current | A | 3 | Measured motor current |
| V1.5 | Motor torque | $\%$ | 4 | Calculated actual torque/nominal torque of the motor |
| V1.6 | Motor power | $\%$ | 5 | Calculated actual power/nominal power of the motor |
| V1.7 | Motor voltage | V | 6 | Calculated motor voltage |
| V1.8 | DC-link voltage | V | 7 | Measured DC-link voltage |
| V1.9 | Unit temperature | ${ }^{\circ} \mathrm{C}$ | 8 | Heatsink temperature |
| V1.10 | Analog input 1 |  | 13 | Al1 |
| V1.11 | Analog input 2 |  | 14 | Al2 |
| V1.12 | Analog output current | mA | 26 | AO1 |
| V1.13 | Analog output current 1, <br> expander board | mA | 31 |  |
| V1.14 | Analog output current 2, <br> expander board | mA | 32 |  |
| V1.15 | DIN1, DIN2, DIN3 |  | 15 | Digital input statuses |
| V1.16 | DIE1, DIE2, DIE3 |  | 33 | I/O expander board: Digital input statuses |
| V1.17 | RO1 |  | 34 | Relay output 1 status |
| V1.18 | ROE1, ROE2, ROE3 |  | 35 | I/O exp. board: Relay output statuses |
| V1.19 | DOE1 |  | 36 | I/O exp. board: Digital output 1 status |
| V1.20 | PID Reference | $\%$ | 20 | In percent of the maximum process reference |
| V1.21 | PID Actual value | $\%$ | 21 | In percent of the maximum actual value |
| V1.22 | PID Error value | $\%$ | 22 | In percent of the maximum error value |
| V1.23 | PID Output | $\%$ | 23 | In percent of the maximum output value |
| V1.24 | Autochange outputs <br> 1, 2, 3 |  | 30 | Used only in pump and fan control |
|  |  |  |  |  |

## Parameter Menu (P2)

Parameter values can be edited by entering the Parameter Menu from the Main Menu when the location indication $\mathbf{P 2}$ is visible on the display. The value editing procedure is presented in Figure 5-6.
Pressing Menu Button Right once takes you to the Parameter Group Menu (G\#). Locate the desired parameter group by using the Browser buttons and press Menu Button Right again to see the group and its parameters. Use the Browser buttons to find the parameter (P\#) you want to edit. Pressing Menu Button Right takes you to the edit mode. As a sign of this, the parameter value starts to blink. You can now change the value in two different ways:

- Set the desired value with the Browser buttons and confirm the change with the ENTER button. Consequently, the blinking stops and the new value is visible in the value field.
- Press Menu Button Right once more. Now you will be able to edit the value digit by digit. This may come in handy, when a relatively greater or smaller value than that on the display is desired. Confirm the change with the ENTER button.

The value will not change unless the ENTER button is pressed. Pressing Menu Button Left takes you back to the previous menu.
Several parameters are locked, i.e. cannot be edited, when the drive is in RUN status. The drive must be stopped to edit these parameters.

The parameter values can also be locked using the function in menu S6 (see Page 5-16).
You can return to the Main Menu any time by pressing Menu Button Left for 1 to 2 seconds.
The basic parameters are listed in Chapter 6. You will find the complete parameter lists and descriptions in the Multi-Control Application manual.
Once in the last parameter of a parameter group, you can move directly to the first parameter of that group by pushing the Browser button up.

Once in the last parameter of a parameter group, you can move directly to the first parameter of that group by pressing Browser Button Up.

See the diagram for parameter value change procedure in Figure 5-6.

Figure 5-6: Parameter Value Change Procedure

## Keypad Control Menu (K3)

In the Keypad Control Menu, you can choose the control place, edit the frequency reference and change the direction of the motor. You can enter the submenu level by pressing Menu Button Right.

Table 5-6: Keypad Control Menu Selections

| Parameters in Menu K3 | Selections |
| :--- | :--- |
| P3.1 = Selection of control place | $\mathbf{1}=$ I/O terminals <br> $\mathbf{2}=$ Keypad <br> $\mathbf{3}=$ Fieldbus |
| R3.2 = Keypad reference |  |
| P3.3 = Keypad direction | $\mathbf{0}=$ Forward <br> $\mathbf{1}=$ Reverse |
| P3.4 = Stop button activation | $\mathbf{0}=$ Limited function of Stop button <br> $\mathbf{1}=$ Stop button always enabled |
| P3.5 = PID reference 1 |  |
| P3.6 = PID reference 2 |  |

## Selection of Control Place

There are three different places (sources) where the drive can be controlled. For each control place, a different symbol will appear on the alphanumeric display:

- I/O terminals
- Keypad (panel)
- Fieldbus

You can change the control place by entering the edit mode with Menu Button Right. The options can then be browsed with the Browser buttons. Select the desired control place with the ENTER button. See Figure 5-7.

Figure 5-7: Selection of Control Place

## Keypad Reference

The keypad reference submenu (R3.2) displays and allows the operator to edit the frequency reference. The changes will take place immediately. This reference value will not, however, influence the rotation speed of the motor unless the keypad has been selected as the active control place.

Note: The maximum difference between the output frequency and the keypad reference is 6 Hz . The program automatically monitors the keypad reference value.
You may edit the reference value (pressing the ENTER button is not necessary). See
Figure 5-6.

## Keypad Direction

The keypad direction submenu displays and allows the operator to change the rotating direction of the motor. This setting will not, however, influence the rotation direction of the motor unless the keypad has been selected as the active control place.

Note: See Table 5-6 for how to change the rotation direction.

## STOP Button Activated

By default, pushing the STOP button will always stop the motor regardless of the selected control place. You can disable this function by giving parameter 3.4 the value $\mathbf{0}$. If the value of this parameter is $\mathbf{0}$, the STOP button will stop the motor only when the keypad has been selected as the active control place.

Note: See Table 5-6 for how to change the value of this parameter.

## Active Faults Menu (F4)

You can enter the Active Faults menu from the Main Menu by pressing Menu Button Right when the location indication F4 is visible on the keypad display.

The memory of active faults can store a maximum of five faults in the order of appearance. The display can be cleared with the RESET button and the read-out will return to the same state it was in before the fault trip. The fault remains active until it is cleared with the RESET button or with a reset signal from the I/O terminal.

Note: Remove external Start signal before resetting the fault to prevent unintentional restart of the drive.

Figure 5-8: Normal State, No Faults

## Fault Types

The drive has two types of faults. These types differ from each other on the basis of the subsequent behavior of the drive. See Table 5-7.

Figure 5-9: Fault Display
Table 5-7: Fault Types

| Fault Type Symbol | Meaning |
| :--- | :--- |
| A (Alarm) | This type of fault is a sign of an unusual operating condition. It does not cause <br> the drive to stop, nor does it require any special actions. The "A fault" remains <br> in the display for about 30 seconds. |
| F (Fault) | An "F fault" makes the drive stop. Actions need to be taken to restart the drive. |

Note: Fault Codes are listed in Appendix A.

## Fault History Menu (H5)

You can enter the Fault History menu from the Main Menu by pressing Menu Button Right when the location indication H 5 is visible on the keypad display.

All faults are stored in the Fault History menu where you can browse them with the Browser buttons. You can return to the previous menu any time by pressing Menu Button Left.

The memory of the drive can store a maximum of 5 faults in order of appearance. The latest fault is indicated by H 5.1 , the one before that by H 5.2 and so on. If there are 5 uncleared faults in the memory, the next fault will erase the oldest fault from the memory.

Pressing the ENTER button for about 2 to 3 seconds resets the whole fault history.

Figure 5-10: Fault History Menu

## System Menu (S6)

You can enter the System Menu from the Main menu by pressing Menu Button Right when the location indication $\mathbf{S 6}$ is visible on the first line of the keypad display.
The controls associated with the general use of the drive, such as keypad settings, customized parameter sets or information about the hardware and software are located under the System Menu.
Table 5-8 has a list of the functions available in the System Menu.
Table 5-8: System Menu Functions

| Code | Function | Min. | Max. | Unit | Default | Cust. | Selections |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| S6.3 | Copy parameters |  |  |  |  |  |  |
| P6.3.1 | Parameter sets |  |  |  |  |  | $\begin{aligned} & \hline \mathbf{0}=\text { Select } \\ & \mathbf{1}=\text { Store set } 1 \\ & \mathbf{2}=\text { Load set } 1 \\ & \mathbf{3}=\text { Store set } 2 \\ & \mathbf{4}=\text { Load set } 2 \\ & \mathbf{5} \text { = Load factory defaults } \\ & \mathbf{6}=\text { Fault } \\ & \mathbf{7}=\text { Wait } \\ & \mathbf{8}=\text { OK } \end{aligned}$ |
| S6.5 | Security |  |  |  |  |  |  |
| P6.5.2 | Parameter lock | 0 | 1 |  | 0 |  | 0 = Change Enabled <br> 1 = Change Disabled |

| P6.10.7 | Communication <br> timeout | 0 | 300 | s |  |  |  |

## Copy Parameters

The Copy parameters submenu ( $\mathbf{S 6 . 3}$ ) is located under the System menu.
The SLX9000 drive allows the user to store and load two customized parameter sets (all parameters included in the application, not the system menu parameters) and to load back the factory default parameter values.

Parameter Sets (S6.3.1)
On Parameter sets page (S6.3.1), push the Menu Button Right to enter the Edit menu. You can store or load two customized parameter sets or load back the factory defaults. Confirm with the ENTER button. Wait until 8 (=OK) appears on the display.

Figure 5-11: Storing and Loading of Parameter Sets

## Security

The Security submenu (S6.5) under the system menu has a function that allows the user to prohibit changes to the parameters.

## Parameter Lock (P6.5.2)

If the parameter lock is activated the parameter values cannot be edited.
Note: This function does not prevent unauthorized editing of parameter values.
Enter the edit mode by pushing the Menu Button Right. Use the Browser buttons to change the parameter lock status ( $\mathbf{0}=$ changes enabled, $\mathbf{1}=$ changes disabled). Accept the change with the ENTER button or return to the previous level with the Menu Button Left.

Figure 5-12: Parameter Locking

## Keypad Settings

In the Keypad Settings submenu under the System menu, you can further customize your drive operator interface.

Locate the Keypad Setting submenu (S6.6). Under the submenu, there are two pages (P\#) associated with the keypad operation:

## Default Page (P6.6.1)

Here you can set the location (page) to which the display automatically moves as the Timeout Time (see below) has expired or as the power is switched on to the keypad.

Press the Menu Button Right once to enter the edit mode. Pressing the Menu Button Right once again makes you able to edit the number of the submenu/page digit by digit. Confirm the new default page value with the ENTER button. You can return to the previous step anytime by pushing the Menu Button Left.

Note: If you set a page that does not exist in the menu, the display will automatically move to the last available page in the menu.

Figure 5-13: Default Page Function

## Timeout Time (P6.6.3)

The Timeout Time setting defines the time after which the keypad display returns to the Default page (P6.6.1).

Enter the edit mode by pressing Menu Button Right. Set the desired timeout time and confirm it with the ENTER button. You can return to the previous menu at any time by pressing Menu Button Left.

Note: This function cannot be disabled.

Figure 5-14: Timeout Time Setting

## Hardware Settings

In the Hardware settings submenu (S6.7) you can further customize the settings of the drive with three parameters: Fan control, HMI acknowledgement timeout and HMI retry.

## Fan Control (P6.7.2)

Note: Only the higher power modules of MF3 have been equipped with a cooling fan, in lower power modules of MF3 the cooling fan is available as optional equipment.
If the cooling fan has been installed in MF3 it runs continuously when the power is switched on.

This function allows you to control the drive's cooling fan. You can set the fan to run continuously when the power is switched on or depending on the temperature of the unit. If the latter function has been selected the fan is switched on automatically when the heatsink temperature reaches $60^{\circ} \mathrm{C}$. The fan receives a stop command when the heatsink temperature falls to $55^{\circ} \mathrm{C}$. However the fan runs for about a minute after receiving the stop command, as well as after changing the value from $\mathbf{0}$ (Continuous) to $\mathbf{1}$ (Temperature).
Enter the edit mode by pushing the Menu Button Right. The present mode shown starts to blink. Use the Browser buttons to change the fan mode. Accept the change with the ENTER button or return to the previous level with the Menu Button Left.

## HMI Acknowledge Timeout (P6.7.3)

This function allows the user to change the timeout of the HMI acknowledgement time.
Note: If the drive has been connected to the PC with a normal cable, the default values of parameters 6.7.3 and 6.7.4 (200 and 5) must not be changed.

If the drive has been connected to the PC via a modem and there is delay in transferring messages, the value of par. 6.7.3 must be set according to the delay as follows:

## Example:

- Transfer delay between the drive and the $\mathrm{PC}=600 \mathrm{~ms}$
- The value of par. 6.7.3 is set to $1200 \mathrm{mS}(2 \times 600$, sending delay + receiving delay)
- The corresponding setting shall be entered in the (Misc)-part of the file NCDrive.ini:
- Retries $=5$
- AckTimeOut = 1200
- TimeOut $=6000$

It must also be considered that intervals that are shorter than the AckTimeOut-time cannot be used in NC-Drive monitoring.

Enter the edit mode by pushing the Menu Button Right. Use the Browser buttons to change the acknowledgement time. Accept the change with the ENTER button or return to the previous level with the Menu Button Left. See Figure 5-15 for how to change the HMI acknowledgement timeout.

Figure 5-15: HMI Acknowledge Timeout

## Number of Retries to Receive HMI Acknowledgement (P6.7.4)

With this parameter you can set the number of times the drive will try receive acknowledgement if this does not succeed within the acknowledgement time (P6.7.3)

Enter the edit mode by pushing the Menu Button Right. The present value shown starts to blink. Use the Browser buttons to change the amount of retries. Accept the change with the ENTER button or return to the previous level with the Menu Button Left.

## System Information

In the submenu S 6.8 under the System menu you can find drive-related hardware and software information as well as operation-related information.
Enter the Info menu by pressing the Menu Button Right. Now you can browse through the information pages with the Browser buttons.

## Counters Submenu (S6.8.1)

In the Counters submenu (S6.8.1) you can find information related to the drive operation times, i.e. the total numbers of MWh, operation days and operation hours passed so far. Unlike the counters in the trip counters menu, these counters cannot be reset.

Note: The operation time counter (days and hours) always runs when the power is on.
Table 5-9: Counter Pages

| Page | Counter |
| :--- | :--- |
| C6.8.1.1 | MWh counter |
| C6.8.1.2 | Operation day counter |
| C6.8.1.3 | Operation hour counter |

## Trip Counters Submenu (S6.8.2)

Trip counters (menu S6.8.2) are counters with values of which can be reset i.e. restored to zero. You have the following resettable counters at your disposal:

Table 5-10: Trip Counter Pages

| Page | Counter |
| :--- | :--- |
| C6.8.2.1 | MWh counter |
| P6.8.2.2 | Clear mWh counter |
| T6.8.2.3 | Operation day counter |
| T6.8.2.4 | Operation hour counter |
| P6.8.2.5 | Clear operation time counter |

Note: The trip counters only run when the motor is running.
Example: When you want to reset the operation counters, you should do the following:

Figure 5-16: MWh Counter Reset

## Software Into Submenu (S6.8.3)

The following information can be found under the Software Info submenu (S6.8.3):
Table 5-11: Software Information Pages

| Page | Content |
| :--- | :--- |
| I6.8.3.1 | Software package |
| I6.8.3.2 | System software version |
| I6.8.3.3 | Firmware interface |
| I6.8.3.4 | System load |

## Application Information Submenu (S6.8.4)

You can find the following information from the Application Info submenu (S6.8.4):
Table 5-12: Application Information Pages

| Page | Content |
| :--- | :--- |
| A6.8.4.1 | Application |
| D6.8.4.1.1 | Application ID |
| D6.8.4.1.2 | Version |
| D6.8.4.1.3 | Firmware interface |

Hardware Information Submenu (S.8.5)
You can find the following information from the Hardware Info submenu (S6.8.5):
Table 5-13: Hardware Information Pages

| Page | Content |
| :--- | :--- |
| I6.8.5.2 | Unit voltage |
| I6.8.5.3 | Brake chopper |

## Connected Options Submenu (S6.8.6)

The Connected options submenu (S6.8.6) shows the following information on the option board connected to the drive:

Table 5-14: Connected Options Submenu

| Page | Content |
| :--- | :--- |
| S6.8.6.1 | Slot E option board |
| I6.8.6.1.1 | Slot E option board status |
| I6.8.6.1.2 | Slot E program version |
| S6.8.6.2 | Slot D option board |
| I6.8.6.2.1 | Slot D option board status |
| I6.8.6.2.2 | Slot D program version |

In this submenu you find information about the option board connected to the control board (see Chapter 4).

You can check the status of the slot by entering the board submenu with the Menu Button Right and using the Browser buttons. Push the Menu Button Right again to display the status of the board. The selections are shown in Table 5-8. The keypad will also display the program version of the respective board when you push either one of the Browser buttons.

For more information on the expander board-related parameters, see Page 5-26.

Figure 5-17: Expander Board Information Menu

## Al mode

The parameters P6.9.1 and P6.9.2 select the analog input mode. P6.9.1 appears only in classes MF4 - MF6.
$\mathbf{0}=$ voltage input (par. 6.9.1 default)
1 = current input (par. 6.9.2 default)

Note: Make sure that the jumper selections correspond to the selections of this parameter. See Figure 4-4.

## Modbus Interface

SLX9000 has a built-in Modbus RTU bus interface. The signal level of the interface is in accordance with the RS-485 standard.

Figure 5-18: Modbus Interface

| Protocol: | Modbus RTU |
| :--- | :--- |
| Baud rates: | $300,600,1200,2400,4800$, |
|  | $9600,19200,38700,57600$ (bit/s) |
| Signal level: | RS-485 (TIA/EIA-485-A) |
| Input impedance: | $2 \mathrm{k} \Omega$ |

## Modbus RTU Protocol

Modbus RTU protocol is a simple but effective fieldbus protocol. Modbus network has a bus topology, where every device has an individual address. With the help of the individual bus addresses the commands are directed to the single devices within the network. Modbus supports also broadcast-type messages, that are received by every device of the bus. Broadcast messages are sent to the address " 0 " which is reserved for these messages.
The protocol includes CRC error detection and parity check for preventing the handling of messages containing errors. In Modbus the data is transferred in hex mode a synchronically and a break of approximately 3.5 characters is used as an end character. The length of the break depends on the used baud rate.

Table 5-15: Modbus Commands Supported by SLX9000

| Function <br> Code | Function Name | Address | Broadcast <br> Messages |
| :--- | :--- | :--- | :--- |
| 03 | Read Holding Register | All ID numbers | No |
| 04 | Read Input Register | All ID numbers | No |
| 06 | Preset Single Register | All ID numbers | Yes |
| 16 | Preset Multiple Register | All ID numbers | Yes |

## Termination Resistor

The RS-485 bus is terminated with $120 \Omega$ termination resistors in both ends. SLX9000 has a built-in termination resistor which is switched off as a default. See the jumper selections in Chapter 4.

## Modbus Address Area

The Modbus bus of SLX9000 uses the ID numbers of the application as addresses. The ID numbers can be found in the parameter tables of the application manual.
When several parameters/monitoring values are read at a time they must be consecutive. 11 addresses can be read and the addresses can be parameters or monitoring values.

## Modbus Process Data

Process data is an address area for fieldbus control. Fieldbus control is active when the value of parameter 3.1 (Control place) is $\mathbf{2}$ (= fieldbus). The contents of the process data has been determined in the application. The following tables present the process data contents in the Multi-Control Application.

Table 5-16: Output Process Data

| Addr. | Modbus Register | Name | Scale | Type |
| :--- | :--- | :--- | :--- | :--- |
| 2101 | 32101,42101 | FB Status Word | - | Binary coded |
| 2102 | 32102,42102 | FB General Status Word | - | Binary coded |
| 2103 | 32103,42103 | FB Actual Speed | 0.01 | \% |
| 2104 | 32104,42104 | Motor speed | 0.01 | $+/-\mathrm{Hz}$ |
| 2105 | 32105,42105 | Motor speed | 1 | +/- Rpm |
| 2106 | 32106,42106 | Motor current | 0.1 | A |
| 2107 | 32107,42107 | Motor Torque | 0.1 | +/- \% (of nominal) |
| 2108 | 32108,42108 | Motor Power | 0.1 | +/- \% (of nominal) |
| 2109 | 32109,42109 | Motor Voltage | 0.1 | V |
| 2110 | 32110,42110 | DC Voltage | 1 | V |
| 2111 | 32111,42111 | Active Fault | - | Fault code |

Table 5-17: Input Process Data

| Addr. | Modbus Register | Name | Scale | Type |
| :--- | :--- | :--- | :--- | :--- |
| 2001 | 32001,42001 | FB Control Word | - | Binary coded |
| 2002 | 32002,42002 | FB General Control Word | - | Binary coded |
| 2003 | 32003,42003 | FB Speed Reference | 0.01 | $\%$ |
| 2004 | 32004,42004 | PID Control Reference | 0.01 | $\%$ |
| 2005 | 32005,42005 | PID Actual Value | 0.01 | $\%$ |
| 2006 | 32006,42006 | - | - | - |
| 2007 | 32007,42007 | - | - | - |
| 2008 | 32008,42008 | - | - | - |
| 2009 | 32009,42009 | - | - | - |
| 2010 | 32010,42010 | - | - | - |
| 2011 | 32011,42011 | - | - | - |

Table 5-18: Status Word

| 15 | 14 | 13 | 12 | 11 | 10 | $\mathbf{9}$ | $\mathbf{8}$ | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| - | - | - | - | - | - | - | - | $F$ | $Z$ | AREF | W | FLT | DIR | RUN | RDY |

Information about the status of the device and messages is indicated in the Status word. The Status word is composed of 16 bits the meanings of which are described in Table 5-19.

Table 5-19: Actual Speed

This is actual speed of the drive. The scaling is $-10000-10000$. In the application, the value is scaled in percentage of the frequency area between set minimum and maximum frequency.

Table 5-20: Control Word

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| - | - | - | - | - | - | - | - | - | - | - | - | - | RST | DIR | RUN |

In SLX9000 applications, the three first bits of the control word are used to control the drive. However, you can customize the content of the control word for your own applications because the control word is sent to the drive as such.

Table 5-21: Speed Reference

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| MSB | - | - | - | - | - | - | - | - | - | - | - | - | - | - | LSB |

This is the Reference 1 to the drive. Used normally as Speed reference. The allowed scaling is $-10000-10000$. In the application, the value is scaled in percentage of the frequency area between the set minimum and maximum frequencies.
Table 5-22: Bit Definitions

| Bit | Description | Value $=\mathbf{1}$ |
| :--- | :--- | :--- |
|  | Value $=\mathbf{0}$ | Run |
| RUN | Stop | Counterclockwise |
| DIR | Clockwise | Rising edge of this bit will reset active fault |
| RST |  | Drive ready |
| RDY | Drive not ready | Fault active |
| FLT | No fault | Warning active |
| W | No warning | Speed reference reached |
| AREF | Ramping | Drive is running at zero speed |
| Z | - | Flux Ready |
| F | - |  |

Fieldbus Parameters
RS-485 Communication Status (I6.10.1)
With this function you can check the status of the RS-485 bus. If the bus is not in use, this value is $\mathbf{0}$.

## xx.yyy

$x x=0-64$ (Number of messages containing errors)
yyy $=0-999$ (Number of messages received correctly)

## Fieldbus Protocol (P6.10.2)

With this function you can select the fieldbus communications protocol.

$$
\begin{aligned}
& \mathbf{0}=\text { Not used } \\
& \mathbf{1}=\text { Modbus protocol }
\end{aligned}
$$

## Slave Address (P6.10.3)

Sets the slave address for the Modbus protocol. You can set any address between 1 and 255.
Baud Rate (P6.10.4)
Selects the baud rate used with the Modbus communication.

$$
\begin{aligned}
& \mathbf{0}=300 \text { baud } \\
& \mathbf{1}=600 \text { baud } \\
& \mathbf{2}=1200 \text { baud } \\
& 3=2400 \text { baud } \\
& 4=4800 \text { baud } \\
& 5=9600 \text { baud } \\
& 6=19200 \text { baud } \\
& 7=38400 \text { baud } \\
& 8=5760 \text { baud }
\end{aligned}
$$

Stop Bits (P6.10.5)
Sets number of stop bits used in Modbus communication.
$0=1$ stop bit
$1=2$ stop bits
Parity Type (P6.10.6)
Here you can select the type of parity checking used with the Modbus communication.

$$
\begin{aligned}
& \mathbf{0}=\text { None } \\
& \mathbf{1}=\text { Odd } \\
& \mathbf{2}=\text { Even }
\end{aligned}
$$

Communication time-out (P6.10.7)
If communication between two messages is broken for a longer time than that defined by this parameter, a communication error is initiated. If the value of this parameter is $\mathbf{0}$, the function is not used.
$0=$ Not used
$1=1$ second
$2=2$ seconds, etc.

## Expander Board Menu (E7)

The Expander board menu makes it possible for the user 1) to see which expander board is connected to the control board and 2 ) to reach and edit the parameters associated with the expander board.

Enter the following menu level (E\#) with the Menu Button Right. You can view and edit the parameter values in the same way as described on Page 5-8.

## Further Keypad Functions

The SLX9000 control keypad embodies additional application-related functions. See Eaton's Multi-Control Application Manual for more information.

## Chapter 6 - Start-Up

## Safety Precautions

Before start-up, note the following directions and warnings:

## WARNING

1 Internal components and circuit boards of the drive (except for the galvanically isolated I/O terminals) are live when the drive is connected to mains potential. Coming into contact with this voltage is extremely dangerous and may cause death or severe injury.
2 The motor terminals U, V, W and the DC-link/brake resistor terminals +/- are live when the drive is connected to DC supply, even if the motor is not running.
3 The control I/O-terminals are isolated from the mains potential. However, the relay outputs and other I/Oterminals may have a dangerous control voltage present even when the drive is disconnected from power supply.

4 Do not make any connections when the drive is connected to the power supply.

5 After having disconnected the drive, wait until the fan stops and the indicators on the keypad go out (if no keypad is attached see the indicator through the keypad base). Wait 5 more minutes before doing any work on drive connections. Do not open the cover before the time has expired.

6 Before connecting the drive to power supply, make sure that the drive's front cover is closed.

## Sequence of Operation

1. Carefully read the safety instructions in the front of this manual and above and follow them.
2. After the installation, make sure that:

- both the drive and the motor are grounded.
- the power supply and motor cables comply with the requirements given in Chapter 3.
- the control cables are located as far as possible from the power cables (see Chapter 3) and the shields of the shielded cables are connected to protective ground. The wires may not touch the electrical components of the drive.
- For option boards only: make sure that the common ends of digital input groups are connected to +24 V or ground of the I/O terminal or the external supply.

3. Check the quality and quantity of cooling air. (See Chapter 2, Mounting Space Dimensions.)
4. Check the inside of the drive for condensation.
5. Check that all Start/Stop switches connected to the I/O terminals are in Stop position.
6. Connect the drive to power supply.
7. Set the parameters of group 1 according to the requirements of your application (see application manual). At least the following parameters should be set:

- motor nominal voltage
- motor nominal frequency
- motor nominal speed
- motor nominal current

You will find the values needed for the parameters on the motor nameplate.
Note: You can also run the Start-Up Wizard. See Page 6-4.
8. Perform run test without motor.

Perform either Test A or Test B:
Test A - Controls from the I/O terminals:

- Turn the Start/Stop switch to ON position.
- Change the frequency reference (potentiometer).
- Check in the Monitoring Menu M1 that the value of Output Frequency changes according to the change of frequency reference.
- Turn the Start/Stop switch to OFF position.

Test B—Control from the control keypad:

- Change the control from the I/O terminals to the keypad as advised on Page 5-10.
- Press the START button on the keypad.
- Move over to the Keypad Control Menu K3 and Keypad Reference submenu (see Keypad Reference on Page 5-11) and change the frequency reference with the Browser up and down buttons.
- Check in Monitoring Menu M1 that the value of Output Frequency changes according to the change of frequency reference.
- Press the STOP button on the keypad.

9. Run the start-up tests without the motor being connected to the process. If this is not possible, make sure that running each test is safe prior to running it. Inform your coworkers of the tests.

- Switch off the supply voltage and wait until the drive has stopped as advised on Page 6-1, Safety Precautions.
- Connect the motor cable to the motor and to the motor cable terminals of the drive.
- Make sure that all Start/Stop switches are in Stop positions.
- Switch the supply voltage ON.
- Repeat test 8A or 8B.

10. Connect the motor to the process (if the start-up test was run without the motor being connected).

- Before running the tests, make sure that this can be done safely.
- Inform your co-workers of the tests.
- Repeat test 8A or 8B.

## Start-Up Wizard

SLX9000 has a built-in start-up wizard, that speeds up the programming of the drive. The wizard helps you choose between four different operating modes, Standard, Fan, Pump and High Performance. Each mode has automatic parameter settings optimized for the mode in question. The programming wizard is started by pressing the STOP button for 5 seconds, when the drive is in stop mode. See Figure 6-1 for the procedure:

Figure 6-1: SLX9000 Start-Up Wizard

| Start-Up Wizard returns all other parameters to factory defaults! |
| :--- |

Note: See the application manual for detailed parameter descriptions.

## Chapter 7 - Basic Application

On the next pages you will find the list of parameters that are essential for the commissioning of the drive. You will find more details of these and other special parameters in Chapter 9.

Note: If you wish to edit the special parameters, you must set the value of par. 2.1.22 to 0 .

## Column explanations:

Code = Location indication on the keypad; Shows the operator the present param. number

Parameter = Name of parameter
Min $\quad=$ Minimum value of parameter
Max $\quad=$ Maximum value of parameter
Unit = Unit of parameter value; Given if available
Default = Value preset by factory
Cust = Customer's own setting
ID = ID number of the parameter (used with PC tools)

- $\quad=$ On the parameter code: parameter value can only be changed after the drive has been stopped.

## Monitoring Values (Control Keypad: Menu M1)

The monitoring values are the actual values of parameters and signals as well as statuses and measurements. Monitoring values cannot be edited. See Page 5-7 for more information.

Table 7-1: Monitoring Values

| Code | Parameter | Unit | ID | Description |
| :---: | :---: | :---: | :---: | :---: |
| V1.1 | Output frequency | Hz | 1 | Frequency to the motor |
| V1.2 | Frequency reference | Hz | 25 |  |
| V1.3 | Motor speed | rpm | 2 | Calculated motor speed |
| V1.4 | Motor current | A | 3 | Measured motor current |
| V1.5 | Motor torque | \% | 4 | Calculated actual torque/nominal torque of the unit |
| V1.6 | Motor power | \% | 5 | Calculated actual power/nominal power of the unit |
| V1.7 | Motor voltage | V | 6 | Calculated motor voltage |
| V1.8 | DC-link voltage | V | 7 | Measured DC-link voltage |
| V1.9 | Unit temperature | ${ }^{\circ} \mathrm{C}$ | 8 | Heatsink temperature |
| V1.10 | Analog input 1 | V | 13 | Al1 |
| V1.11 | Analog input 2 |  | 14 | Al2 |
| V1.12 | Analog output current |  | 26 | AO1 |
| V1.13 | Analog output current 1, expander board | mA | 31 |  |
| V1.14 | Analog output current 2, expander board | mA | 32 |  |
| V1.15 | DIN1, DIN2, DIN3 |  | 15 | Digital input statuses |
| V1.16 | DIE1, DIE2, DIE3 |  | 33 | I/O expander board: Digital input statuses |
| V1.17 | RO1 |  | 34 | Relay output 1 status |
| V1.18 | ROE1, ROE2, ROE3 |  | 35 | I/O exp. board: Relay output statuses |
| V1.19 | DOE1 |  | 36 | I/O exp. board: Digital output 1 status |
| V1.20 | PID Reference | \% | 20 | In percent of the maximum frequency |
| V1.21 | PID Actual value | \% | 21 | In percent of the maximum actual value |
| V1.22 | PID Error value | \% | 22 | In percent of the maximum error value |
| V1.23 | PID Output | \% | 23 | In percent of the maximum output value |
| V1.24 | Autochange outputs 1, 2, 3 |  | 30 | Used only in pump and fan control |
| V1.25 | Mode |  | 66 | Shows the current drive configuration mode selected with start-up wizard: <br> $\mathbf{0}=$ No mode selected (Default) <br> 1 = Standard <br> 2 = Fan <br> 3 = Pump <br> 4 = High performance |

## Parameter List

Table 7-2: Basic Parameters (Control Keypad: Menu P2 $\boldsymbol{\rightarrow}$ B2.1)

| Code | Parameter | Min. | Max. | Unit | Default | Cust. | ID | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P2.1.1 | Min. frequency | 0.00 | Par. 2.1.2 | Hz | 0.00 |  | 101 |  |
| P2.1.2 | Max. frequency | $\begin{array}{\|l} \text { Par. } \\ \text { 2.1. } \end{array}$ | 320.00 | Hz | 50.00 |  | 102 | NOTE: If $\mathrm{f}_{\text {max }}>$ than the motor synchronous speed, check suitability for motor and drive system |
| P2.1.3 | Acceleration time 1 | 0.1 | 3000.0 | s | 1.0 |  | 103 |  |
| P2.1.4 | Deceleration time 1 | 0.1 | 3000.0 | S | 1.0 |  | 104 |  |
| P2.1.5 | Current limit | $0.1 \times \mathrm{I}_{\mathrm{L}}$ | $1.5 \times \mathrm{I}_{\mathrm{L}}$ | A | $\mathrm{I}_{\mathrm{L}}$ |  | 107 | NOTE: Formulas apply approximately for drives up to MF3. For greater sizes, consult the factory. |
| P2.1.6 | Nominal voltage of the motor | 180 | 690 | V | $\begin{aligned} & 240 \mathrm{~V}: 230 \mathrm{~V} \\ & 480 \mathrm{~V}: 400 \mathrm{~V} \end{aligned}$ |  | 110 |  |
| P2.1.7 | Nominal frequency of the motor | 30.00 | 320.00 | Hz | 50.00 |  | 111 | Check the rating plate of the motor |
| P2.1.8 | Nominal speed of the motor | 300 | 20000 | rpm | 1440 |  | 112 | The default applies for a 4-pole motor and a nominal size drive. |
| P2.1.9 | Nominal current of the motor | $0.3 \times \mathrm{I}_{\mathrm{L}}$ | $1.5 \times \mathrm{I}_{\mathrm{L}}$ | A | $\mathrm{I}_{\mathrm{L}}$ |  | 113 | Check the rating plate of the motor |
| P2.1.10 | Motor $\cos \varphi$ | 0.30 | 1.00 |  | 0.85 |  | 120 | Check the rating plate of the motor |
| P2.1.11 | Start function | 0 | 1 |  | 0 |  | 505 | $\begin{aligned} & \mathbf{0}=\text { Ramp } \\ & \mathbf{1}=\text { Flying start } \end{aligned}$ |
| P2.1.12 | Stop function | 0 | 1 |  | 0 |  | 506 | $\begin{aligned} & \mathbf{0}=\text { Coasting } \\ & \mathbf{1}=\text { Ramp } \end{aligned}$ |
| P2.1.13 | V/f optimization | 0 | 1 |  | 0 |  | 109 | $\begin{aligned} & \mathbf{0}=\text { Not used } \\ & \mathbf{1}=\text { Automatic torque boost } \end{aligned}$ |
| P2.1.14 | I/O reference | 0 | 4 |  | 0 |  | 117 | $\begin{aligned} & \hline \mathbf{0}=\text { Al1 } \\ & 1=\text { Al2 } \\ & \mathbf{2}=\text { Keypad reference } \\ & \mathbf{3}=\text { Fieldbus reference } \\ & \text { (FBSpeedReference) } \\ & \mathbf{4}=\text { Motor potentiometer } \end{aligned}$ |
| P2.1.15 | Al2 signal range | 1 | 2 |  | 2 |  | 390 | Not used if Al2 Custom min $>0 \%$ or Al 2 custom max. $\begin{aligned} & <100 \% \\ & 1=0-20 \mathrm{~mA} \\ & 2=4-20 \mathrm{~mA} \\ & 3=0-10 \mathrm{~V} \\ & 4=2-10 \mathrm{~V} \end{aligned}$ |

Table 7-2: Basic Parameters (Control Keypad: Menu P2 $\rightarrow$ B2.1) (Continued)

| Code | Parameter | Min. | Max. | Unit | Default | Cust. | ID | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Chapter 8 - Multi-Control Application

## Introduction

The Multi-Control Application of the Cutler-Hammer ${ }^{\circledR}$ SLX9000 drive by Eaton's electrical business uses direct frequency reference from the analog input 1 as a default. However, a PID controller can be used (for example, in pump and fan applications), which offers versatile internal measuring and adjusting functions.

The direct frequency reference can be used for the control without the PID controller and it can be selected from the analog inputs, fieldbus, keypad, preset speeds or motor potentiometer.

Special parameters for Pump and Fan Control (Group P2.10) can be browsed and edited after changing the value of par 2.9.1 to 2 (Pump and fan control activated).

The PID controller reference can be selected from the analog inputs, fieldbus, PID keypad reference 1 or by enabling the PID keypad reference 2 via digital input. The PID controller actual value can be selected from the analog inputs, fieldbus or the actual values of the motor. PID controller can also be used when the drive is controlled via fieldbus or the control keypad.

- Digital inputs DIN2, DIN3, (DIN4) and optional digital inputs DIE1, DIE2, DIE3 are freely programmable.
- Internal and optional digital/relay and analog outputs are freely programmable.
- Analog input 1 can be programmed as current input, voltage input or digital input DIN4.

Note: If the analog input 1 has been programmed as DIN4 with parameter 2.2.6 (AI1 Signal Range), check that the jumper selections (Figure 9-1) are correct.
Additional functions:

- The PID controller can be used from control places I/O, keypad and fieldbus
- Identification
- Programming wizard
- Sleep function
- Actual value supervision function: fully programmable; off, warning, fault
- Programmable Start/Stop and Reverse signal logic
- Reference scaling
- 2 Preset speeds
- Analog input range selection, signal scaling, inversion and filtering
- Frequency limit supervision
- Programmable start and stop functions
- DC-brake at start and stop
- Prohibit frequency area
- Programmable VHz curve and VHz optimization
- Adjustable switching frequency
- Autorestart function after fault
- Protections and supervisions (all fully programmable; off, warning, fault):
- Current input fault
- External fault
- Output phase
- Undervoltage
- Ground fault
- Motor thermal, stall and underload protection
- Thermistor
- Fieldbus communication
- Option board

## Control Input/Output

Table 8-1: Multi-Control Application Default Input/Output Configuration, MF4 - MF6 460V

| Terminal |  |  |  |  |  |  | Signal | Description |
| :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: |

Table 8-2: Al1 Configuration, When Programmed as DIN4

|  | Terminal |  | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\ulcorner-\square-$ - - | 1 | $+10 \mathrm{~V}_{\text {ref }}$ | Reference output | Voltage for potentiometer, etc. |
| \| | 2 | Al1+ or DIN 4 | Analog input, voltage range 0 - 10V DC | Voltage/current input frequency reference <br> Can be programmed as DIN4 |
|  | 3 | AI1- | I/O Ground | Ground for reference and controls |
|  | 4 | Al2+ | Analog input, current range | Current input frequency reference |
|  | 5 | $\begin{aligned} & \text { Al2- } \\ & \text { /GND } \end{aligned}$ | 0-20 mA |  |
|  | 6 | +24V | Control voltage output |  |
|  | 7 | GND | I/O ground | Ground for reference and controls |

Reference potentiometer
1-10 $\mathrm{k} \Omega$

## Parameter Lists

On the next pages you will find the lists of parameters within the respective parameter groups. The parameter descriptions are given in Chapter 9.

## Column explanations:

| Code | $=$Location indication on the keypad; Shows the operator the present <br> parameter number |
| :--- | :--- |
| Parameter | $=$Name of parameter |
| Min. | $=$ Minimum value of parameter |
| Max. | $=$ Maximum value of parameter |
| Unit | $=$ Unit of parameter value; Given if available |
| Default | $=$ Value preset by factory |
| Cust | $=$ Customer's own setting |
| ID | $=$ ID number of the parameter (used with PC tools) |
|  | $=$On the parameter code: parameter value can only be changed after the drive <br>  <br>  <br> has been stopped. |

## Monitoring Values (Control Keypad: Menu M1)

The monitoring values are the actual values of parameters and signals as well as statuses and measurements. Monitoring values cannot be edited. See Page 5-7 for more information.

Table 8-4: Monitoring Values

| Code | Parameter | Unit | ID | Description |
| :---: | :---: | :---: | :---: | :---: |
| V1.1 | Output frequency | Hz | 1 | Frequency to the motor |
| V1.2 | Frequency reference | Hz | 25 |  |
| V1.3 | Motor speed | rpm | 2 | Calculated motor speed |
| V1.4 | Motor current | A | 3 | Measured motor current |
| V1.5 | Motor torque | \% | 4 | Calculated actua0l torque/nom. torque of the motor |
| V1.6 | Motor power | \% | 5 | Calculated actual power/nom. power of the motor |
| V1.7 | Motor voltage | V | 6 | Calculated motor voltage |
| V1.8 | DC-link voltage | V | 7 | Measured DC-link voltage |
| V1.9 | Unit temperature | ${ }^{\circ} \mathrm{C}$ | 8 | Heat sink temperature |
| V1.10 | Analog input 1 |  | 13 | Al1 |
| V1.11 | Analog input 2 |  | 14 | Al2 |
| V1.12 | Analog output current | mA | 26 | AO1 |
| V1.13 | Analog output current 1, expander board | mA | 31 |  |
| V1.14 | Analog output current 2, expander board | mA | 32 |  |
| V1.15 | DIN1, DIN2, DIN3 |  | 15 | Digital input statuses |
| V1.16 | DIE1, DIE2, DIE3 |  | 33 | I/O expander board: Digital input statuses |
| V1.17 | RO1 |  | 34 | Relay output 1 status |
| V1.18 | ROE1, ROE2, ROE3 |  | 35 | I/O exp. board: Relay output statuses |
| V1.19 | DOE1 |  | 36 | I/O exp. board: Digital output 1 status |
| V1.20 | PID Reference | \% | 20 | In percent of the maximum process reference |
| V1.21 | PID Actual value | \% | 21 | In percent of the maximum actual value |
| V1.22 | PID Error value | \% | 22 | In percent of the maximum error value |
| V1.23 | PID Output | \% | 23 | In percent of the maximum output value |
| V1.24 | Autochange outputs 1, 2, 3 |  | 30 | Used only in pump and fan control |
| V1.25 | Mode |  | 66 | Shows current operation mode selected with start-up wizard: <br> $0=$ Not selected <br> 1 = Standard <br> 2 = Fan <br> 3 = Pump <br> 4 = High Performance |

Basic Parameters (Control Keypad: Menu P2 $\rightarrow$ P2.1)
Table 8-5: Basic Parameters P2.1

| Code | Parameter | Min. | Max. | Unit | Default | Cust | ID | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| P2.1.1 | Min frequency | 0.00 | Par. 2.1.2 | Hz | 0.00 |  | 101 |  |
| P2.1.2 | Max frequency | $\begin{array}{\|l\|} \hline \text { Par. } \\ \text { 2.1.1 } \end{array}$ | 320.00 | Hz | 50.00 |  | 102 | NOTE: If $\mathrm{f}_{\max }>$ than the motor synchronous speed, check suitability for motor and drive system |
| P2.1.3 | Acceleration time 1 | 0.1 | 3000.0 | s | 1.0 |  | 103 |  |
| P2.1.4 | Deceleration time 1 | 0.1 | 3000.0 | s | 1.0 |  | 104 |  |
| P2.1.5 | Current limit | $0.1 \times \mathrm{I}_{\mathrm{L}}$ | $1.5 \times \mathrm{I}_{\mathrm{L}}$ | A | $\mathrm{I}_{\mathrm{L}}$ |  | 107 | NOTE: Consult the factory. |
| P2.1.6 ${ }^{\text {® }}$ | Nominal voltage of the motor | 180 | 690 | V | 400 V |  | 110 |  |
| P2.1.7 ${ }^{\text {® }}$ | Nominal frequency of the motor | 30.00 | 320.00 | Hz | 50.00 |  | 111 | Check the rating plate of the motor |
| P2.1.8 ${ }^{\text {® }}$ | Nominal speed of the motor | 300 | 20000 | rpm | 1440 |  | 112 | The default applies for a 4-pole motor and a nominal size drive. |
| P2.1.9 ${ }^{\text {( }}$ | Nominal current of the motor | $0.3 \times \mathrm{I}_{\mathrm{L}}$ | $1.5 \times \mathrm{I}_{\mathrm{L}}$ | A | $\mathrm{I}_{\mathrm{L}}$ |  | 113 | Check the rating plate of the motor |
| P2.1.10 © | Power factor | 0.30 | 1.00 |  | 0.85 |  | 120 | Check the rating plate of the motor |
| P2.1.11 ${ }^{\text {(1) }}$ | Start function | 0 | 1 |  | 0 |  | 505 | $\begin{array}{\|l\|} \hline \mathbf{0}=\text { Ramp } \\ \mathbf{1}=\text { Flying start } \end{array}$ |

## Keypad Control (Control Keypad: Menu K3)

The parameters for the selection of control place and direction on the keypad are listed in Table 8-15. See the Keypad Control Menu on Page 5-10.

Table 8-15: Keypad Control Parameters, K3

| Code | Parameter | Min. | Max. | Unit | Default | Cust | ID | Note |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| P3.1 | Control place | 1 | 3 |  | 1 |  | 125 | $\mathbf{1}=$ I/O terminal <br> $\mathbf{2}=$ Keypad <br> $\mathbf{3}=$ Fieldbus |
| R3.2 | Keypad reference | Par. <br> 2.1 .1 | Par. <br> 2.1 .2 | Hz |  |  |  |  |
| P3.3 | Direction (on <br> keypad) | 0 | 1 |  | 0 |  | 123 | $\mathbf{0}=$ Forward <br> $\mathbf{1}=$ Reverse |
| R3.4 | Stop button | 0 | 1 |  | 1 |  | 114 | $\mathbf{0}=$ Limited function of Stop button <br> $\mathbf{1}=$ Stop button always enabled |
| R3.5 | PID reference | 0.00 | 100.00 | $\%$ | 0.00 |  |  |  |
| R3.6 | PID reference 2 | 0.00 | 100.00 | $\%$ | 0.00 |  |  | Selected with digital inputs |

## System Menu (Control Keypad: Menu S6)

For parameters and functions related to the general use of the drive, such as customized parameter sets or information about the hardware and software, see Page 5-13.

## Expander Boards (Control Keypad: Menu E7)

The E7 menu shows the expander boards attached to the control board and board-related information. For more information, see Page 5-26.

## Chapter 9 - Description of Parameters

## Basic Parameters

2.1.1 Minimum frequency ..... ID101
2.1.2 Maximum frequency ..... ID102
Defines the frequency limits of the drive. The maximum value for parameters 2.1.1 and 2.1.2 is 320 Hz .
The software will automatically check the values of parameters 2.1.19, 2.1.20, 2.3.13, 2.5.1, 2.5.5 and 2.6.5.

### 2.1.3 Acceleration time 1 <br> ID103

2.1.4 Deceleration time 1
ID104
These limits correspond to the time required for the output frequency to accelerate from the zero frequency to the set maximum frequency (par. 2.1.2).

### 2.1.5 Current limit

ID107
This parameter determines the maximum motor current from the drive. To avoid motor overload, set this parameter according to the rated current of the motor. The current limit is equal to the rated converter current ( $l_{L}$ ) by default.

### 2.1.6 Nominal voltage of the motor <br> ID110

Find this value $\mathrm{V}_{\mathrm{n}}$ on the motor nameplate. This parameter sets the voltage at the field weakening point (parameter 2.6.4) to $100 \% \times U_{\text {nmotor }}$.
2.1.7 Nominal frequency of the motor
ID111
Find this value $f_{n}$ on the motor nameplate. This parameter sets the field weakening point (parameter 2.6.3) to the same value.
2.1.8 Nominal speed of the motor
ID112
Find this value $\mathrm{n}_{\mathrm{n}}$ on the motor nameplate.

### 2.1.9 Nominal current of the motor

ID113
Find this value $I_{n}$ on the motor nameplate.
2.1.10 Power Factor
ID120
Find this value on the motor nameplate.

### 2.1.11 Start function

ID505
Ramp:
$0 \quad$ The drive starts from 0 Hz and accelerates to maximum frequency within the set acceleration time. (Load inertia or starting friction may cause prolonged acceleration times).
Flying start:
1 The drive is able to start into a running motor by applying a small torque to motor and searching for the frequency corresponding to the speed the motor is running at. Searching starts from the maximum frequency towards the actual frequency until the correct value is detected. Thereafter, the output frequency will be increased/decreased to the set reference value according to the set acceleration/deceleration parameters.
Use this mode if the motor is coasting when the start command is given. With the flying start, it is possible to ride through short utility voltage interruptions.

### 2.1.12 Stop function

ID506
Coasting:
$0 \quad$ The motor coasts to a halt without control from the drive after the Stop command.

Ramp:
1 After the Stop command, the speed of the motor is decelerated according to the set deceleration parameters.
If the regenerated energy is high it may be necessary to use an external braking resistor for faster deceleration.
2.1.13 $\mathrm{V} / \mathrm{Hz}$ optimization ID109

0 Not used
1 Automatic torque boost
The voltage to the motor changes automatically which makes the motor produce sufficient torque to start and run at low frequencies. The voltage increase depends on the motor type and power. Automatic torque boost can be used in applications where starting torque due to starting friction is high, e.g. in conveyors.
Note: In high torque - low speed applications - it is likely that the motor will overheat. If the motor has to run a prolonged time under these conditions, special attention must be paid to cooling the motor. Use external cooling for the motor if the temperature tends to rise too high.

### 2.1.14 I/O Reference selection

ID117
Defines the selected frequency reference source when the drive is controlled from the I/O terminal.
$0 \quad$ Al1 reference (terminals 2 and 3, e.g. potentiometer)
1 Al2 reference (terminals 5 and 6, e.g. transducer)
2 Keypad reference (parameter R3.2)
3 Reference from Fieldbus (FBSpeedReference)
4 Motor potentiometer reference
$5 \quad$ Al1/AI2 selection. Selection of AI2 is made programmable by DIN3 Function (P2.1.18)

### 2.1.15 Al2 ( $\mathrm{I}_{\text {in }}$ ) signal range

ID390
1 Signal range 0-20mA
2 Signal range 4-20 mA
3 Signal range $0-10 \mathrm{~V}$
4 Signal range 2-10V
Note: The selections have no effect if par. 2.2.12 $>0 \%$, or par. 2.2.13 $<100 \%$.

### 2.1.16 Analog output function

ID307
This parameter selects the desired function for the analog output signal. See Table 8-5 for the parameter values.

### 2.1.17 DIN2 function

ID319
This parameter has 10 selections. If digital input DIN2 is not used, set the parameter value to 0 .

1
2
3 Stop pulse
4 External fault
Contact closed: Fault is displayed and motor stopped when the input is active

5 External fault
Contact open: Fault is displayed and motor stopped when the input is not active
6 Run enable
Contact open: Start of motor disabled
Contact closed: Start of motor enabled
Coast stop if dropped during RUN
$7 \quad$ Preset speed 2
8 Motor potentiometer UP
Contact closed: Reference increases until the contact is opened.
9 Disable the PID-controller (Direct frequency reference)
10 Interlock 1 (can only be selected when pump and fan control is active, P2.9.1=2)

### 2.1.18 DIN3 function

ID301
The parameter has 13 selections. If digital input DIN3 is not used, set the parameter value to 0 .

1 Reverse
Contact open: Forward
Contact closed: Reverse
2 External fault
Contact closed: Fault is displayed and motor stopped when the input is active

3 External fault
Contact open: Fault is displayed and motor stopped when the input is not active

4 Fault reset
Contact closed: All faults reset
5
Run enable
Contact open: Start of motor disabled
Contact closed: Start of motor enabled
Coast stop if dropped during RUN
6 Preset speed 1
7 Preset speed 2
8 DC braking command
Contact closed: In Stop mode, the DC braking operates until the contact is opened. DC-braking current is about $10 \%$ of the value selected with par. 2.4.3.
9 Motor potentiometer UP Contact closed: Reference increases until the contact is opened.
10 Motor potentiometer DOWN.
Contact closed: Reference decreases until the contact is opened
Disable the PID-controller (Direct frequency reference)
PID Keypad reference 2 selection
Interlock 2 (can only be selected when pump and fan control is active, P2.9.1=2)

Thermistor input (See Page 4-9)
Force control place to I/O
Force control place to Fieldbus
Al1/Al2 selection for I/O Reference (par 2.1.14)
2.1.19 Preset speed 1

ID105
2.1.20 Preset speed 2 ID106

Parameter values are automatically limited between the minimum and maximum frequencies (par. 2.1.1 and 2.1.2).

### 2.1.21 Automatic restart function

ID731
The automatic restart is taken into use with this parameter.
0 Disable
1 Enabled (3 automatic restarts, see par. 2.8.1-2.8.3)

### 2.1.22 Parameter conceal

ID115
With this parameter you can hide all other parameter groups except the basic parameter group (B2.1).
The factory default of this parameter is 0 .
0 Disabled (all parameter groups can be browsed with the keypad)
1 Enabled (only the basic parameters, B2.1, can be browsed with the keypad)

## Input Signals

### 2.2.1 Expander board DIE1 function

ID368
This parameter has 12 selections. If the expander board digital input DIN1 is not used, set the parameter value to 0 .

Selections are the same as in parameter 2.1.18, except:
13 Interlock 1
2.2.2 Expander board DIE2 function

ID330
The selections are the same as in parameter 2.2.1, except:
13 Interlock 2

### 2.2.3 Expander board DIE3 function

ID369
The selections are the same as in parameter 2.2.1, except:
13 Interlock 3

### 2.2.4 DIN4 Function

ID499
If the value of par. 2.2.6 is set to $0, \mathrm{Al} 1$ functions as digital input 4 .
The selections are the same as in parameter 2.2.3.
Note: If you program the analog input as DIN4, check that the jumper selections are correct (see Figure 9-1).

Figure 9-1: Jumper Selections of X4/X8 When Al1 Functions as DIN4

### 2.2.5 Al1 signal selection

Connect the Al1 signal to the analog input of your choice with this parameter.

Figure 9-2: Al1 Signal Selection

The value of this parameter is built from the board indicator and the respective input terminal number. See Figure 9-2 above.

| Board indicator 1 | $=$ Local inputs |
| :--- | :--- |
| Board indicator 2 | $=$ Expander board inputs |
|  |  |
| Input number 0 | $=$ Input 1 |
| Input number 1 | $=$ Input 2 |
| Input number 2 | $=$ Input 3 |
| - |  |
| Input number 9 | $=$ Input 10 |

## Example:

If you set the value of this parameter to $\mathbf{1 0}$, you have selected the local input $\mathbf{1}$ for the Al1 signal. Again, if the value is set to 21, the expander board input 2 has been selected for the Al1 signal.
If you want to use the values of analog input signal for testing purposes only, you can set the parameter value to $\mathbf{0 - 9}$. In this case, value $\mathbf{0}$ corresponds to $\mathbf{0 \%}$, value 1 corresponds to $\mathbf{2 0 \%}$ and any value between 2 and 9 corresponds to $\mathbf{1 0 0 \%}$.

### 2.2.6 Al1 signal range

ID379
With this parameter you can select the Al1 signal range.
$0 \quad$ DIN 4
1 Signal range 0-20 mA
2 Signal range 4-20 mA
3 Signal range $0-10 \mathrm{~V}$
4 Signal range 2 - 10V
Note: The selections have no effect if par. 2.2.7 > 0\%, or par. 2.2.8 < 100\%.
If the value of par. 2.2.6 is set to 0, Al1 functions as digital input 4. See par. 2.2.4.

### 2.2.7 Al1 custom setting minimum ID380 <br> 2.2.8 Al1 custom setting maximum <br> ID381

Set the custom minimum and maximum levels for the Al1 signal within $0-10 \mathrm{~V}$.

### 2.2.9 Al1 signal inversion

ID387
By setting the parameter value to 1 the Al1 signal inversion takes place.

### 2.2.10 Al1 signal filter time

ID378
This parameter, given a value greater than 0 , activates the function that filters out disturbances from the incoming analog $\mathrm{V}_{\text {in }}$ signal.

Long filtering time makes the regulation response slower. See Figure 9-3.

Figure 9-3: Al1 Signal Filtering

### 2.2.11 Al2 signal selection

ID388
Connect the Al2 signal to the analog input of your choice with this parameter. See par. 2.2.5 for the value setting procedure.

### 2.2.12 Al2 signal range

ID390
1 Signal range 0-20 mA
2 Signal range 4-20 mA
3 Signal range $0-10 \mathrm{~V}$
4 Signal range $2-10 \mathrm{~V}$
Note: The selections have no effect if par. 2.2.13>0\%, or par. 2.2.14 < 100\%.
2.2.13 Al2 custom minimum ID391
2.2.14 Al2 custom maximum ID392

These parameters allow you to scale the input current signal between 0 and 20 mA .
Similar to parameters 2.2.7 and 2.2.8.

### 2.2.15 Analog input Al2 signal inversion <br> ID398

See corresponding parameter 2.2.9.

### 2.2.16 Analog input Al2 signal filter time <br> ID389

See corresponding parameter 2.2.10.

### 2.2.17 Motor potentiometer memory reset ID367 (Frequency reference)

$0 \quad$ No reset
1 Memory reset in stop and powerdown
2 Memory reset in powerdown

### 2.2.18 Reference scaling minimum value <br> ID344

2.2.19 Reference scaling maximum value

You can choose a scaling range for the frequency reference between the Minimum and Maximum frequency. If no scaling is desired set the parameter value to 0 .
In Figure 9-4, voltage input Al1 with signal range $0-10 \mathrm{~V}$ is selected for reference.

Figure 9-4: Without (Left) and With (Right) Reference Scaling

### 2.1.20 Keypad frequency reference selection <br> ID121

Defines the selected reference source when the drive is controlled from the keypad.
$0 \quad$ Al1 reference (by default Al1, terminals 2 and 3, e.g. potentiometer)
1 Al2 reference (by default Al2, terminals 5 and 6, e.g. transducer)
2 Keypad reference (parameter 3.2)
3 Reference from Fieldbus (FBSpeedReference)
4 Motor potentiometer reference
5 PID-controller reference

### 2.2.21 Fieldbus frequency reference selection

ID122
Defines the selected reference source when the drive is controlled from the fieldbus. For the parameter values, see par. 2.2.20.

## Output Signals

2.3.1 Relay output 1 function

ID313
2.3.2 Expander board relay output 1 function ID314
2.3.3 Expander board relay output 2 function ID317
2.3.4 Expander board digital output 1 function ID312

Table 9-1: Output Signals via RO1 and Expander Board RO1, RO2 and D01

| Setting value |  | Signal content |
| :---: | :---: | :---: |
| 0 | Not used | Out of operation |
| Relay output RO1 and expander board programmable relays (RO1, RO2) are activated when: |  |  |
|  | Ready | The drive is ready to operate |
| 2 | Run | The drive operates (motor is running) |
| 3 | Fault | A fault trip has occurred |
| 4 | Fault inverted | A fault trip not occurred |
| 5 | Drive overheat warning | The heatsink temperature exceeds $+70^{\circ} \mathrm{C}$ |
| 6 | External fault or warning | Fault or warning depending on par. 2.7.2 |
| 7 | Reference fault or warning | Fault or warning depending on par. 2.7.1 - if analog reference is $4-20 \mathrm{~mA}$ and signal is $<4 \mathrm{~mA}$ |
|  | Warning | Always if a warning exists |
| 9 | Reversed | The reverse command has been selected |
|  | Preset speed | A preset speed has been selected |
|  | At speed | The output frequency has reached the set reference |
| 12 | Motor regulator activated | Overvoltage or overcurrent regulator was activated |
| 13 | Output frequency limit 1 supervision | The output frequency goes outside the set supervision low limit/high limit (see parameters 2.3.12 and 2.3.13 below) |
| 14 | Control from I/O terminals | Selected control place (Menu K3; par. 3.1) is "I/O terminal" |
| 15 | Thermistor fault or warning | The thermistor input of option board indicates overtemperature. Fault or warning depending on parameter 2.7.19. |
| 16 | Actual value supervision active | Parameters 2.7.22-2.7.24 |
|  | Autochange 1 control | Pump 1 control, parameters 2.10.1-2.10.7 |
|  | Autochange 2 control | Pump 2 control, parameters 2.10.1-2.10.7 |
|  | Autochange 3 control | Pump 3 control, parameters 2.10.1-2.10.7 |
| 20 | Al supervision | The relay energizes according to settings of parameters 2.3.14-2.3.16. |

### 2.3.5 Analog output function

ID307
This parameter selects the desired function for the analog output signal.
See Table 8-5 for the parameter values.

### 2.3.6 Analog output filter time ID308

Defines the filtering time of the analog output signal.
If you set value 0 for this parameter, no filtering takes place.

Figure 9-5: Analog Output Filtering

### 2.3.7 Analog output invert

ID309
Inverts the analog output signal:

Maximum output signal $=0 \%$
Minimum output signal = Maximum set value (parameter 2.3.9)
$0 \quad$ Not inverted
1
Inverted

See parameter 2.3.9 below.

Figure 9-6: Analog Output Invert

### 2.3.8 Analog output minimum <br> ID310 the analog output scaling in parameter 2.3.9. <br> 2.3.9 Analog output scale <br> ID311 <br> Scaling factor for the analog output.

Sets the signal minimum to either 0 mA or 4 mA (living zero). Note the difference in

Table 9-2: Analog Output Scaling

| Signal | Max. value of the signal |
| :--- | :--- |
| Output frequency | $100 \% \times \mathrm{f}_{\max }$ |
| Motor speed | $100 \% \times$ Motor nom. speed |
| Output current | $100 \% \times \mathrm{I}_{\mathrm{n} \text { Motor }}$ |
| Motor torque | $100 \% \times \mathrm{T}_{\mathrm{n} \text { Motor }}$ |
| Motor power | $100 \% \times \mathrm{P}_{\mathrm{n} \text { Motor }}$ |
| Motor voltage | $100 \% \times \mathrm{V}_{\mathrm{nmotor}}$ |
| DC-link voltage | 1000 V |
| PI-ref. value | $100 \% \times$ ref. value max. |
| PI act. value 1 | $100 \% \times$ actual value max. |
| PI error value | $100 \% \times$ error value max. |
| PI output | $100 \% \times$ output max. |

Figure 9-7: Analog Output Scaling

### 2.3.10 Expander board analog output 1 function <br> ID472

2.3.11 Expander board analog output 2 function ID479

These parameters select the desired functions for the expander board analog output signals. See par. 2.1.16 for the parameter values.

### 2.3.12 Output frequency limit 1 supervision function

$0 \quad$ No supervision
1 Low limit supervision
2 High limit supervision
If the output frequency goes under/over the set limit (par. 2.3.13) this function generates a warning message via the relay outputs depending on the settings of parameters 2.3.1-2.3.4.

### 2.3.13 Output frequency limit 1 supervised value ID316

Selects the frequency value supervised by parameter 2.3.12.

Figure 9-8: Output Frequency Supervision

### 2.3.14 Analog input supervision

ID356
With this parameter you can select the analog input to be supervised.

| $\mathbf{0}$ | Not used |
| :--- | :--- |
| $\mathbf{1}$ | Al1 |
| $\mathbf{2}$ | Al2 |

### 2.3.15 Analog input supervision OFF limit

ID357
When the signal of analog input selected with par. 2.3.14 falls under the limit set with this parameter, the relay output goes off.

### 2.3.16 Analog input supervision ON limit <br> ID358

When the signal of analog input selected with par. 2.3.14 goes over the limit set with this parameter, the relay output goes on.
This means that if for example ON limit is $60 \%$ and OFF limit is $40 \%$, the relay goes on when signal goes over $60 \%$ and remains on until it falls under $40 \%$.
2.3.17 Relay output 1 ON delay
2.3.18 Relay output 1 OFF delay

With these parameters you can set on- and off-delays to relay output 1 (par 2.3.1).

Figure 9-9: Relay Output 1 ON- and OFF-Delays

## Drive Control

### 2.4.1 Acceleration/Deceleration ramp 1 shape ID500

The start and end of the acceleration and deceleration ramps can be smoothed with this parameter. Setting value 0 gives a linear ramp shape which causes acceleration and deceleration to act immediately to the changes in the reference signal.

Setting value 0.1 - 10 seconds for this parameter produces an S-shaped acceleration/ deceleration. The acceleration time is determined with parameters 2.1.3/2.1.4.

Figure 9-10: Acceleration/Deceleration (S-Shaped)

### 2.4.2 Brake chopper

ID504
Note: An internal brake chopper is installed.
$0 \quad$ No brake chopper used 1 Brake chopper used in Run state 3 Used in Run and Stop state
When the drive is decelerating the motor, the inertia of the motor and the load are fed into an external brake resistor. This enables the drive to decelerate the load with a torque equal to that of acceleration (provided that the correct brake resistor has been selected). See separate Brake resistor installation manual.

### 2.4.3 DC-braking current

ID507
Defines the current injected into the motor during DC-braking.

### 2.4.4 DC-braking time at stop ID508

Determines if braking is ON or OFF and the braking time of the DC-brake when the motor is stopping. The function of the DC-brake depends on the stop function, parameter 2.1.12.

| 0 | DC-brake is not used |
| :--- | :--- |
| $>0$ | DC-brake is in use and its function depends on the Stop function, <br> (par. 2.1.12). The DC-braking time is determined with this <br> parameter. |

Par. 2.1.12 = 0 (Stop function $=$ Coasting):
After the stop command, the motor coasts to a stop without control from the drive.
With the DC injection, the motor can be electrically stopped in the shortest possible time, without using an optional external braking resistor.

The braking time is scaled by the frequency when the DC-braking starts. If the frequency is greater than the nominal frequency of the motor, the set value of parameter 2.4.4 determines the braking time. When the frequency is $\leq 10 \%$ of the nominal, the braking time is $10 \%$ of the set value of parameter 2.4.4.

Figure 9-11: DC-Braking Time When Stop Mode = Coasting

Par. 2.1.12 = 1 (Stop function = Ramp):
After the Stop command, the speed of the motor is reduced according to the set deceleration parameters, as fast as possible, to the speed defined with parameter 2.4.5, where the DC-braking starts.

The braking time is defined with parameter 2.4.4. If high inertia exists, it is recommended to use an external braking resistor for faster deceleration. See Figure 9-12.

Figure 9-12: DC-Braking Time When Stop Mode = Ramp

### 2.4.5 DC-braking frequency in ramp stop <br> ID515

The output frequency at which the DC-braking is applied. See Figure 9-12.

### 2.4.6 DC-braking time at start

ID516
DC-brake is activated when the start command is given. This parameter defines the time before the brake is released. After the brake is released, the output frequency increases according to the set start function by parameter 2.1.11. See Figure 9-13.

Figure 9-13: DC Braking Time at Start

### 2.4.7 Flux brake <br> ID520

Instead of DC braking, flux braking is a useful form of braking with motors $\leq 15 \mathrm{~kW}$.
When braking is needed, the frequency is reduced and the flux in the motor is increased, which in turn increases the motor's capability to brake. Unlike DC braking, the motor speed remains controlled during braking.
Flux braking can be set ON or OFF.
0 Flux braking OFF
1 Flux braking ON
Note: Flux braking converts the energy into heat at the motor and should be used intermittently to avoid motor damage.

### 2.4.8 Flux braking current

ID519
Defines the flux braking current value. It can be set between $0.3 \times \mathrm{I}_{\mathrm{H}}$ (approximately) and the current limit.

## Prohibit Frequencies

### 2.5.1 Prohibit frequency area 1 ; Low limit <br> ID509

2.5.2 Prohibit frequency area 1; High limit

ID510
In some systems it may be necessary to avoid certain frequencies because of mechanical resonance problems. With these parameters it is possible to set a limit for the "skip frequency" region. See Figure 9-14.

Figure 9-14: Prohibit Frequency Area Setting

### 2.5.3 Acceleration/deceleration ramp speed <br> ID518 scaling ratio between prohibit frequency limits

Defines the acceleration/deceleration time when the output frequency is between the selected prohibit frequency range limits (parameters 2.5.1 and 2.5.2). The ramping time (selected acceleration/ deceleration time 1 or 2 ) is multiplied with this factor. E.g. value 0.1 makes the acceleration time 10 times shorter than outside the prohibit frequency range limits.

Figure 9-15: Ramp Speed Scaling Between Prohibit Frequencies

## Motor Control

### 2.6.1 Motor control mode <br> ID600

$0 \quad$ Frequency control: The I/O terminal and keypad references are frequency references and the drive controls the output frequency (output frequency resolution $=0.01 \mathrm{~Hz}$ ).

1 Speed control: The I/O terminal and keypad references are speed references and the drive controls the motor speed (accuracy $\pm 0.5 \%$ ).

### 2.6.2 VHz ratio selection

ID108
Linear: $\mathbf{0}$ The voltage of the motor changes linearly with the frequency in the constant flux area from 0 Hz to the field weakening point where the nominal voltage is supplied to the motor. Linear VHz ratio should be used in constant torque applications. See Figure 9-16.
This default setting should be used if there is no special need for another setting.
Squared: 1 The voltage of the motor changes following a squared curve form with the frequency in the area from 0 Hz to the field weakening point where the nominal voltage is also supplied to the motor. The motor runs under magnetized below the field weakening point and produces less torque and electromechanical noise. Squared VHz ratio can be used in applications where torque demand of the load is proportional to the square of the speed, e.g in centrifugal fans and pumps.

Figure 9-16: Linear and Squared Change of Motor Voltage

Programmable The VHz curve can be programmed with three different points. VHz curve: 2 Programmable VHz curve can be used if the other settings do not satisfy the needs of the application.
Linear with flux The drive starts to search for the minimum motor current and in optimization: 3 order to save energy, lower the disturbance level and the noise. Can be used in applications with constant motor load, such as fans, pumps, etc.

Figure 9-17: Programmable VHz Curve

### 2.6.3 Field weakening point

ID602
The field weakening point is the output frequency at which the output voltage reaches the value set with par. 2.6.4.

### 2.6.4 Voltage at field weakening point

ID603
Above the frequency at the field weakening point, the output voltage remains at the value set with this parameter. Below the frequency at the field weakening point, the output voltage depends on the setting of the VHz curve parameters. See parameters 2.1.13, 2.6.2, 2.6.5, 2.6.6 and 2.6.7 and Figure 9-17.

When the parameters 2.1.6 and 2.1.7 (nominal voltage and nominal frequency of the motor) are set, the parameters 2.6.3 and 2.6.4 are automatically given the corresponding values. If you need different values for the field weakening point and the voltage, change these parameters after setting the parameters 2.1.6 and 2.1.7.

### 2.6.5 VHz curve, middle point frequency

ID604
If the programmable VHz curve has been selected with parameter 2.6.2, this parameter defines the middle point frequency of the curve. See Figure 9-17.

### 2.6.6 VHz curve, middle point voltage ID605

If the programmable VHz curve has been selected with the parameter 2.6.2, this parameter defines the middle point voltage of the curve. See Figure 9-17.

### 2.6.7 Output voltage at zero frequency <br> ID606

This parameter defines the zero frequency voltage of the curve. See Figure 9-17.

### 2.6.8 Switching frequency

ID601
Motor noise can be minimized using a high switching frequency. Increasing the switching frequency reduces the capacity of the drive.

Switching frequency for SLX9000: 1 - 16 kHz

### 2.6.9 Overvoltage controller <br> ID607

2.6.10 Undervoltage controller

ID608
These parameters allow the under-/overvoltage controllers to be switched out of operation. This may be useful, for example, if the utility supply voltage varies more than $-15 \%$ to $+10 \%$ and the application will not tolerate this over-/undervoltage. This regulator controls the output frequency taking the supply fluctuations into account.
Note: Over-/undervoltage trips may occur when controllers are switched out of operation.
$0 \quad$ Controller switched off
1 Controller switched on

### 2.6.11 Identification

ID631
$\begin{array}{ll}\mathbf{0} & \text { No action } \\ 1 & \text { ID no run }\end{array}$
When ID no run is selected, the drive will perform an ID-run when it is started from selected control place. Drive has to be started within 20 seconds, otherwise identification is aborted.
The drive does not rotate the motor during ID no run. When ID run is ready, the drive is stopped. Drive will start normally when the next start command is given.

The ID run improves the torque calculations and the automatic torque boost function. It will also result in a better slip compensation in speed control (more accurate RPM).

## Protections

### 2.7.1 Response to 4 mA reference fault

ID700
0 No response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
A warning or a fault action and message is generated if the $4-20 \mathrm{~mA}$ reference signal is used and the signal falls below 3.5 mA for 5 seconds or below 0.5 mA for 0.5 seconds. The information can also be programmed into relay outputs.

### 2.7.2 Response to external fault

ID701
$0 \quad$ No response

1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
A warning or a fault action and message is generated from the external fault signal in the programmable digital inputs. The information can also be programmed into relay outputs.
2.7.3 Response to undervoltage fault

ID727
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
For the undervoltage limits see Table 1-8.
Note: This protection can not be inactivated.

### 2.7.4 Output phase supervision

ID702
$0 \quad$ No response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
Output phase supervision of the motor ensures that the motor phases have an approximately equal currents.
2.7.5 Ground fault protection

ID703
$0 \quad$ No response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
Ground fault protection ensures that the sum of the motor phase currents is zero. The overcurrent protection is always working and protects the drive from ground faults with high currents.

## Motor Thermal Protection:

The motor thermal protection is to protect the motor from overheating. The drive is capable of supplying higher than nominal current to the motor. If the load requires this high current, there is a risk that the motor will be thermally overloaded. This is the case especially at low frequencies. At low frequencies the cooling effect of the motor is reduced as well as its capacity. If the motor is equipped with an external fan, the load reduction at low speeds is small.
The motor thermal protection is based on a calculated model and it uses the output current of the drive to determine the load on the motor.

The motor thermal protection can be adjusted with parameters. The thermal current $I_{\mathrm{T}}$ specifies the load current above which the motor is overloaded. This current limit is a function of the output frequency.

## A CAUTION

The calculated model does not protect the motor if the airflow to the motor is reduced by blocked air intake grill.

### 2.7.6 Motor thermal protection

ID704
0 No Response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
If tripping is selected, the drive will stop and activate the fault stage.
Deactivating the protection, i.e. setting parameter to 0 , will reset the thermal model of the motor to $0 \%$.

### 2.7.7 Motor thermal protection: Motor ambient ID705 temperature factor

When the motor ambient temperature must be taken into consideration, it is recommended to set a value for this parameter. The value of the factor can be set between $-100.0 \%$ and $100.0 \%$ where $-100.0 \%$ corresponds to $0^{\circ} \mathrm{C}$ and $100.0 \%$ to the maximum running ambient temperature of the motor. Setting this parameter value to $0 \%$ assumes that the ambient temperature is the same as the temperature of the heatsink at power-on.

### 2.7.8 Motor thermal protection: Cooling factor at ID706 zero speed

The cooling power can be set between $0-150.0 \% \times$ cooling power at nominal frequency. See Figure 9-18.

Figure 9-18: Motor Cooling Power

### 2.7.9 Motor thermal protection: Time constant <br> ID707

This time can be set between 1 and 200 minutes.
This is the thermal time constant of the motor. The bigger the motor, the bigger the time constant. The time constant is the time within which the calculated thermal model has reached $63 \%$ of its final value.

The motor thermal time is specific to the motor design and it varies between different motor manufacturers.
If the motor's t6-time (t6 is the time in seconds the motor can safely operate at six times the rated current) is known (given by the motor manufacturer) the time constant parameter can be set basing on it. As a rule of thumb, the motor thermal time constant in minutes equals to $2 x t 6$. If the drive is in stop state, the time constant is internally increased to three times the set parameter value. The cooling in the stop state is based on convection and the time constant is increased. See also Figure 9-19.

Note: If the nominal speed (par. 2.1.8) or the nominal current (par. 2.1.9) of the motor are changed, this parameter is automatically set to the default value (45).

Figure 9-19: Motor Temperature Calculation

### 2.7.10 Motor thermal protection: Motor duty ID708 cycle

Defines how much of the nominal motor load is applied.
The value can be set to $0 \%-100 \%$.

## Stall Protection

The motor stall protection protects the motor from short time overload situations such as one caused by a stalled shaft. The reaction time of the stall protection can be set shorter than that of motor thermal protection. The stall state is defined with two parameters, 2.7.12 (Stall current) and 2.7.13 (Stall frequency). If the current is higher than the set limit and output frequency is lower than the set limit, the stall state is true. There is actually no real indication of the shaft rotation. Stall protection is a type of overcurrent protection.

### 2.7.11 Stall protection

ID709
$0 \quad$ No response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
Setting the parameter to 0 will deactivate the protection and reset the stall time counter.

### 2.7.12 Stall current limit

ID710
The current can be set to $0.0-I_{\text {nMotor }}{ }^{*} 2$. For a stall stage to occur, the current must have exceeded this limit. See Figure 9-20. The software does not allow entering a greater value than $I_{\text {nMotor }}$ *2. If the parameter 2.1.9 Nominal current of motor is changed, this parameter is automatically restored to the default value ( $\mathrm{I}_{\mathrm{n} M \text { otor }}{ }^{*} 1.3$ ).

Figure 9-20: Stall Characteristics Settings

### 2.7.13 Stall time

ID711
This time can be set between 1.0 and 120.0 s.
This is the maximum time allowed for a stall event detection. The stall time is counted by an internal up/down counter.

If the stall time counter value goes above this limit, the protection will cause a trip (see Figure 9-21).

Figure 9-21: Stall Time Count

### 2.7.14 Maximum stall frequency

ID712
The frequency can be set between 1-fmax (par. 2.1.2).
For a stall event to occur, the output frequency must have remained below this limit.

## Underload Protection

The purpose of the motor underload protection is to ensure that there is load on the motor when the drive is running. If the motor loses its load, there might be a problem in the process, e.g. a broken belt or a dry pump.
Motor underload protection can be adjusted by setting the underload curve with parameters 2.7.16 (Field weakening area load) and 2.7.17 (Zero frequency load), see below. The underload curve is a squared curve set between the zero frequency and the field weakening point. The protection is not active below 5 Hz (the underload time counter is stopped).
The torque values for setting the underload curve are set in percentage of nominal torque of the motor. The motor's nameplate data, the parameter Motor nominal current and the drive's nominal current $I_{L}$ are used to find the scaling ratio for the internal torque value. If other than nominal motor is used with the drive, the accuracy of the torque calculation decreases.

### 2.7.15 Underload protection

ID713
$0 \quad$ No response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
If tripping is set active, the drive will stop and activate the fault stage.
Deactivating the protection by setting the parameter to 0 will reset the underload time counter.

### 2.7.16 Underload protection, field weakening <br> ID714 area load

The torque limit can be set between 10.0 and $150.0 \% \times \mathrm{T}_{\mathrm{nMotor}}$.
This parameter gives the value for the minimum torque allowed when the output frequency is above the field weakening point. See Figure 9-22.
If you change the parameter 2.1.9 (Motor nominal current), this parameter is automatically restored to the default value.

Figure 9-22: Setting of Minimum Load
2.7.17 Underload protection, zero frequency load ID715

The torque limit can be set between 5.0 and $150.0 \% \times \mathrm{T}_{\text {nMotor }}$.
This parameter gives value for the minimum torque allowed with zero frequency. See Figure 9-22.
If you change the value of parameter 2.1.9 (Motor nominal current), this parameter is automatically restored to the default value.

### 2.7.18 Underload time

ID716
This time can be set between 2.0 and 600.0 s.
This is the maximum time allowed for an underload state to exist. An internal up/ down counter counts the accumulated underload time. If the underload counter value goes above this limit the protection will cause a trip according to parameter 2.7.15). If the drive is stopped, the underload counter is reset to zero. See Figure 9-23.

Figure 9-23: Underload Time Counter Function

### 2.7.19 Response to thermistor fault

ID732
0 No response
1 Warning
$2 \quad$ Fault, stop mode after fault according to parameter 2.1.12
3 Fault, stop mode after fault always by coasting
Setting the parameter to 0 will deactivate the protection.

### 2.7.20 Response to fieldbus fault

ID733
Sets the response mode for the fieldbus fault if a fieldbus board is used. For more information, see the respective Fieldbus Board Manual.
See parameter 2.7.19.
2.7.21 Response to slot fault

ID734
Sets the response mode for a board slot fault due to missing or broken board.
See parameter 2.7.19.
2.7.22 Actual value supervision function

ID735
$0 \quad$ Not used
1 Warning, if actual value falls below the limit set with par. 2.7.23
2 Warning, if actual value exceeds the limit set with par. 2.7.23
$3 \quad$ Fault, if actual value falls below the limit set with par. 2.7.23
4 Fault, if actual value exceeds the limit set with par. 2.7.23

### 2.7.23 Actual value supervision limit <br> ID736

With this parameter you can set the limit of actual value supervised by par. 2.7.22.

### 2.7.24 Actual value supervision delay

ID737
Sets the delay for the actual value supervision function (par. 2.7.22).
If this parameter is in use, the function of par. 2.7.22 will be active only when the actual value stays outside the defined limit for the time determined by this parameter.

## Auto Restart Parameters

The automatic restart function is active if the value of par. 2.1.21 $=1$. There are always three restart trials.

### 2.8.1 Automatic restart: Wait time

ID717
Defines the time before the drive tries to automatically restart the motor after the fault has disappeared.

January 2009

### 2.8.2 Automatic restart: Trial time

ID718
The Automatic restart function restarts the drive when the faults have disappeared and the waiting time has elapsed.

Figure 9-24: Automatic Restart

The time count starts from the first autorestart. If the number of faults occurring during the trial time exceeds three, the fault state becomes active. Otherwise the fault is cleared after the trial time has elapsed and the next fault starts the trial time count again.

If a single fault remains during the trial time, a fault state is true.

### 2.8.3 Automatic restart, start function ID719

The Start function for Automatic restart is selected with this parameter. The parameter defines the start mode:
$0 \quad$ Start with ramp
1 Flying start
2 Start according to par. 2.1.11

## PID Reference Parameters

### 2.9.1 PID activation

ID163
With this parameter you can activate or deactivate the PID controller or activate the pump and fan control parameters.
$0 \quad$ PID controller deactivated
1 PID controller activated
2 Pump and fan control activated. Parameter group P2.10 becomes visible.

### 2.9.2 PID reference

ID332
Defines which frequency reference source is selected for the PID controller. Default value is 2 .
$0 \quad$ Al1 reference
1 Al2 reference
2 PID reference from the Keypad control page (Group K3, parameter R3.5)
3 Reference from the fieldbus (FBProcessDatalN1)

### 2.9.3 Actual value input

ID334
0 Al1
1 Al2
2 Fieldbus (Actual value 1: FBProcessDatalN2; Actual value 2: FBProcessDatalN3)

3 Motor torque
4 Motor speed
5 Motor current
6 Motor power

### 2.9.4 PID controller gain

This parameter defines the gain of the PID controller. If the value of the parameter is set to $100 \%$ a change of $10 \%$ in the error value causes the controller output to change by $10 \%$
If the parameter value is set to 0 the PID controller operates as ID-controller.
See examples below.

### 2.9.5 PID controller I-time

ID119
This parameter defines the integration time of the PID controller. If this parameter is set to 1.00 second, a change of $10 \%$ in the error value causes the controller output to change by $10.00 \% / \mathrm{s}$. If the parameter value is set to 0.00 s , the PID controller will operate as PD-controller. See examples below.

### 2.9.6 PID controller D-time

ID132
The parameter 2.9.5 defines the derivative time of the PID controller. If this parameter is set to 1.00 second, a change of $10 \%$ in the error value during 1.00 s causes the controller output to change by $10.00 \%$. If the parameter value is set to 0.00 s , the PID controller will operate as PI-controller.

See examples below.

## Example 1:

In order to reduce the error value to zero, with the given values, the drive output behaves as follows:

Given values:

| Par. 2.9.4, $\mathrm{P}=0 \%$ | PID max limit $=100.0 \%$ |
| :--- | :--- |
| Par. 2.9.5, I-time $=1.00 \mathrm{~s}$ | PID min limit $=0.0 \%$ |
| Par. 2.9.6, D-time $=0.00 \mathrm{~s}$ | Min freq. $=0 \mathrm{~Hz}$ |
| Error value (setpoint - process value) $=$ | Max freq. $=50 \mathrm{~Hz}$ |
| $10.00 \%$ |  |

In this example, the PID controller operates practically as ID-controller only.
According to the given value of parameter 2.9.5 (l-time), the PID output increases by 5 Hz ( $10 \%$ of the difference between the maximum and minimum frequency) every second until the error value is 0 .

Figure 9-25: PID Controller Function as I-Controller

## Example 2:

Given values:
Par. 2.9.4, $\mathrm{P}=100 \% \quad$ PID max limit $=100.0 \%$
Par. 2.9.5, I-time $=1.00 \mathrm{~s}$
Par. 2.9.6, D-time $=1.00 \mathrm{~s}$
Error value (setpoint - process value) =

$$
\text { PID min limit }=0.0 \%
$$ $\pm 10 \%$

As the power is switched on, the system detects the difference between the setpoint and the actual process value and starts to either raise or decrease (in case the error value is negative) the PID output according to the l-time. Once the difference between the setpoint and the process value has been reduced to 0 , the output is reduced by the amount corresponding to the value of parameter 2.9.5.
In case the error value is negative, the drive reacts, reducing the output correspondingly.

Figure 9-26: PID Output Curve with the Values of Example 2

## Example 3:

Given values:

| Par. 2.9.4, $P=100 \%$ | PID max limit $=100.0 \%$ |
| :--- | :--- |
| Par. 2.9.5, I -time $=0.00 \mathrm{~s}$ | PID min limit $=0.0 \%$ |
| Par. 2.9.6, D-time $=1.00 \mathrm{~s}$ | Min freq. $=0 \mathrm{~Hz}$ |
| Error value (setpoint - process value) $=$ | Max freq. $=50 \mathrm{~Hz}$ |
| $\pm 10 \% / \mathrm{s}$ |  |

As the error value increases, the PID output also increases according to the set values ( D -time $=1.00 \mathrm{~s}$ ).

Figure 9-27: PID Output with the Values of Example 3

### 2.9.7 Actual value 1 minimum scale <br> ID336

Sets the minimum scaling point for Actual value 1. See Figure 9-28.

### 2.9.8 Actual value 1 maximum scale

ID337
Sets the maximum scaling point for Actual value 1. See Figure 9-28.

Figure 9-28: Example of Actual Value Signal Scaling

### 2.9.9 PID error value inversion

ID340
This parameter allows you to invert the error value of the PID controller (and thus the operation of the PID controller).

$$
\begin{array}{ll}
\mathbf{0} & \text { No inversion } \\
\mathbf{1} & \text { Inverted }
\end{array}
$$

### 2.9.10 Sleep frequency

ID1016
The drive is stopped automatically if the frequency of the drive falls below the Sleep level defined with this parameter for a time greater than that determined by parameter 2.9.11. During the Stop state, the PID controller is operating switching the drive to Run state when the actual value signal either falls below or exceeds (see par. 2.9.13) the Wake-up level determined by parameter 2.9.12. See Figure 9-29.

### 2.9.11 Sleep delay

ID1017
The minimum amount of time the frequency has to remain below the Sleep level before the drive is stopped. See Figure 9-29.

### 2.9.12 Wake-up level

ID1018
The wake-up level defines the frequency below which the actual value must fall or which has to be exceeded before the Run state of the drive is restored. See Figure 9-29.

### 2.9.13 Wake-up function

ID1019
This parameter defines if the restoration of the Run state occurs when the actual value signal falls below or exceeds the Wake-up level (par. 2.9.12). See Figure 9-29.

Figure 9-29: Sleep Function

Table 9-3: Selectable Wake-Up Functions

| Parameter <br> Value | Function | Limit | Description |
| :---: | :---: | :---: | :---: |
| 0 | Wake-up happens when actual value goes below the limit | The limit defined with parameter ID1018 is in percent of the maximum actual value |  |
| 1 | Wake-up happens when actual value exceeds the limit | The limit defined with parameter ID1018 is in percent of the maximum actual value | Actual Value Signal |
| 2 | Wake-up happens when actual value goes below the limit | The limit defined with parameter ID1018 is in percent of the current value of the reference signal |  |
| 3 | Wake-up happens when actual value exceeds the limit | The limit defined with parameter ID1018 is in percent of the current value of the reference signal | Actual <br> Value Signal |

## Pump and Fan Control

The Pump and Fan Control can be used to control one variable speed drive and up to three auxiliary drives. The PID controller of the drive controls the speed of the variable speed drive and gives control signals to start and stop the auxiliary drives to control the total flow. In addition to the eight parameter groups provided as standard, a parameter group for multipump and fan control functions is available.
Pump and Fan Control is used to control the operation of pumps and fans. The application utilizes external contactors for switching between the motors connected to the drive. The autochange feature provides the capability of changing the starting order of the auxiliary drives.

## Short Description of PFC Function and Essential Parameters

## Automatic Changing Between Drives (Autochange \& Interlockings Selection, P2.10.4/ ID1027)

The automatic change of starting and stopping order is activated and applied to either the auxiliary drives only or the auxiliary drives and the drive controlled by the frequency converter depending on the setting of parameter 2.10.4.

The Autochange function allows the starting and stopping order of drives controlled by the pump and fan automatics to be changed at desired intervals. The drive controlled by frequency converter can also be included in the automatic changing and locking sequence (par 2.10.4). The Autochange function makes it possible to equalize the run times of the motors and to prevent, for example, pump stalls due to running breaks that are too long.

- Apply the Autochange function with parameter 2.10.4, Autochange.
- The autochange takes place when the time set with parameter 2.10.5 Autochange interval has expired and the capacity used is below the level defined with parameter 2.10.7, Autochange frequency limit.
- The running drives are stopped and re-started according to the new order.
- External contactors controlled through the relay outputs of the frequency converter connect the drives to the frequency converter or to the mains. If the motor controlled by the frequency converter is included in the autochange sequence, it is always controlled through the relay output activated first. The other relays activated later control the auxiliary drives.

This parameter is used to activate the interlock inputs (Values 3 \& 4). The interlocking signals come from the motor switches. The signals (functions) are connected to digital inputs which are programmed as interlock inputs using the corresponding parameters. The pump and fan control automatics only control the motors with active interlock data.

- If the interlock of an auxiliary drive is inactivated and another unused auxiliary drive available, the latter will be put to use without stopping the frequency converter.
- If the interlock of the controlled drive is inactivated, all motors will be stopped and restarted with the new set-up.
- If the interlock is re-activated in Run status, the automatics will stop all motors immediately and re-start with a new setup. Example: [P1 $\rightarrow$ P3] $\rightarrow$ [P2 LOCKED] $\rightarrow$ [STOP] $\rightarrow$ [P1 $\rightarrow$ P2 $\rightarrow$ P3]

See Page 9-41, Examples.

## Parameter 2.10.5/ID1029, Autochange interval

After expiration of the time defined with this parameter, the autochange function takes place if the capacity used lies below the level defined with parameters 2.10.7 (Autochange frequency limit) and 2.10.6 (Maximum number of auxiliary drives). Should the capacity exceed the value of par 2.10.7, the autochange will not take place before the capacity goes below this limit.

- The time count is activated only if the Start/Stop request is active.
- The time count is reset after the autochange has taken place or on removal of Start request

## Parameters 2.10.6/ID1030, Maximum number of auxiliary drives and 2.10.7/ID1031, Autochange frequency limit

These parameters define the level below which the capacity used must remain so that the autochange can take place.
This level is defined as follows:

- If the number of running auxiliary drives is smaller than the value of parameter 2.10.6, the autochange function can take place.
- If the number of running auxiliary drives is equal to the value of parameter 2.10.6 and the frequency of the controlled drive is below the value of parameter 2.10.7, the autochange can take place.
- If the value of parameter 2.10 .7 is 0.0 Hz , the autochange can take place only in rest position (Stop and Sleep), regardless of the value of parameter 2.10.6.

## Examples

## PFC with interlocks and autochange between 3 pumps (OPT-AA or OPT-B5 option board required)

Situation: 1 controlled drive and 2 auxiliary drives.
Parameter settings: 2.10.1 = 2
Interlock feedback signals used, autochange between all drives used.
Parameter settings: 2.10.4 = 4
DIN4 active (par. 2.2.6 = 0)
The interlock feedback signals come from the digital inputs DIN4 (AI1), DIN2 \& DIN3 selected with parameters 2.1.17, 2.1.18 and 2.2.4.

The control of pump 1 (par. 2.3.1 = 17) is enabled through Interlock 1 (DIN2, 2.1.17 = 10), the control of pump 2 (par. 2.3.2 = 18) through Interlock 2 (DIN3, par. 2.1.18 = 13) and the control of pump 3 (par. 2.3.3 = 19) through Interlock 3 (DIN4).

Figure 9-33: Example of 2-Pump Autochange, Main Diagram

## Description of Pump and Fan Control Parameters

### 2.10.1 Number of auxiliary drives

ID1001
With this parameter the number of auxiliary drives in use will be defined. The functions controlling the auxiliary drives (parameters 2.10.4 to 2.10.7) can be programmed to relay outputs.
2.10.2 Start delay of auxiliary drives

ID1010
The frequency of the drive controlled by the drive must remain above the maximum frequency for the time defined with this parameter before the auxiliary drive is started. The delay defined applies to all auxiliary drives. This prevents unnecessary starts caused by momentary start limit exceedings.

### 2.10.3 Stop delay of auxiliary drives

ID1011
The frequency of the drive controlled by the drive must remain below the minimum frequency for the time defined with this parameter before the drive is stopped. The delay defined applies to all auxiliary drives. This prevents unnecessary stops caused by momentary falls below the stop limit.
2.10.4 Automatic changing between drives ID1027
$0 \quad$ Not used
1 Autochange with aux pumps
This parameter allows you to invert the error value of the PID controller (and thus the operation of the PID controller).

Figure 9-34: Autochange Applied to Auxiliary Drives Only

The drive controlled by the drive is included in the automatics and a contactor is needed for each drive to connect it to either the mains or the drive.

Figure 9-35: Autochange with All Drives

Autochange and interlocks (only auxiliary pumps)
The drive controlled by the drive is included in the automatics and a contactor is needed for each drive to connect it to either the mains or the drive.

4 Autochange and interlocks (Drive and aux pumps)
The drive controlled by the drive is included in the automatics and a contactor is needed for each drive to connect it to either the mains or the drive. DIN 1 is automatically intelocked for Autochange output 1. Interlocks for Autochange output 1, 2, 3 (or DIE1, 2, 3) can be selected with par. 2.1.17 and 2.1.18.

### 2.10.5 Autochange interval

ID1029
After the time defined with this parameter, the autochange function takes place if the capacity used lies below the level defined with parameters 2.10.7 (Autochange frequency limit) and 2.10.6 (Maximum number of auxiliary drives). Should the capacity exceed the value of P2.10.7, the autochange will not take place before the capacity goes below this limit.

- The time count is activated only if the Start/Stop request is active. The time count is reset after the autochange has taken place or on removal of Start request.
- The time count is reset after the autochange has taken place or on removal of Start request.
2.10.6 Maximum number of auxiliary drives
2.10.7 Autochange frequency limit

ID1030
ID1031
These parameters define the level below which the capacity used must remain so that the autochange can take place.

This level is defined as follows:

- If the number of running auxiliary drives is smaller than the value of parameter 2.10.6, the autochange function can take place.
- If the number of running auxiliary drives is equal to the value of parameter 2.10.6 and the frequency of the controlled drive is below the value of parameter 2.10.7, the autochange can take place.
- If the value of parameter 2.10 .7 is 0.0 Hz , the autochange can take place only in rest position (Stop and Sleep) regardless of the value of parameter 2.10.6.

Figure 9-36: Autochange Interval and Limits

### 2.10.8 Start frequency, auxiliary drive 1

ID1002
The frequency of the drive controlled by the drive must exceed the limit defined with these parameters with 1 Hz before the auxiliary drive is started. The 1 Hz overdraft makes a hysteresis to avoid unnecessary starts and stops. See also parameters 2.1.1 and 2.1.2.

### 2.10.9 Stop frequency, auxiliary drive 1

ID1003
The frequency of the drive controlled by the drive must fall with 1 Hz below the limit defined with these parameters before the auxiliary drive is stopped. The stop frequency limit also defines the frequency to which the frequency of the drive controlled by the drive is dropped after starting the auxiliary drive.

## Keypad Control Parameters

## P3.1 Control place

The active control place can be changed with this parameter. For more information, see Page 5-10.

## R3.2 Keypad reference

The frequency reference can be adjusted from the keypad with this parameter. For more information, see Page 5-11.

## P3.3 Keypad direction

This parameter allows you to invert the error value of the PID controller (and thus the operation of the PID controller).

0 Forward: The rotation of the motor is forward, when the keypad is the active control place.
1 Reverse: The rotation of the motor is reversed, when the keypad is the active control place.

For more information, see Page 5-11.

## R3.4 Stop button activated

If you wish to make the Stop button a "hotspot" which always stops the drive regardless of the selected control place, give this parameter the value 1 (default). See Page 5-11.
See also parameter 3.1.

## R3.5 PID reference 1

The PID controller keypad reference can be set between $0 \%$ and $100 \%$. This reference value is the active PID reference if parameter 2.9.2 $=2$.

## R3.6 PID reference 2

The PID controller keypad reference 2 can be set between $0 \%$ and $100 \%$. This reference is active if the DIN\# function=12 and the DIN\# contact is closed.

January 2009

## Control Signal Logic

Figure 9-37: Control Signal Logic of the Multi-Control Application

## Appendix A — Fault Codes

When a fault is detected by the drive's control electronics, the drive is stopped and the symbol F together with the ordinal number of the fault, the fault code and a short fault description appear on the display. The fault can be reset with the RESET button on the control keypad or via the I/O terminal. The faults are stored in the Fault History Menu M5, which can be browsed. Table A-1 contains all the fault codes.

Table A-1: Fault Codes

| Fault <br> Code | Fault | Possible Cause | Solution |
| :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | Overcurrent | Drive has detected too high a current <br> (>4xIn) in the motor cable: <br> $\bullet$ <br> sudden heavy load increase <br> - short circuit in motor cables <br> - <br> unsuitable motor | Check loading. <br> Check motor. <br> Check cables. |
| $\mathbf{2}$ | Overvoltage | The DC-link voltage has exceeded <br> the limits defined in Table 1-8: <br> $\bullet$ <br> too short a deceleration time <br> high overvoltage spikes in supply | Set the deceleration time longer. |
| $\mathbf{3}$ | Ground Fault © | Current measurement has detected <br> that the sum of motor phase currents <br> is not zero. <br> $\bullet$ <br> insulation failure in cables or <br> motor | Check motor cable and motor. |

[^1]January 2009

Table A-1: Fault Codes (Continued)

| Fault Code | Fault | Possible Cause | Solution |
| :---: | :---: | :---: | :---: |
| 9 | Undervoltage ${ }^{(1)}$ | DC-link voltage is under the voltage limits defined in <br> - most probable cause: too low a supply voltage <br> - drive internal fault | In case of temporary supply voltage break, reset the fault and restart the drive. Check the supply voltage. If it is adequate, an internal failure has occurred. <br> Contact your Cutler-Hammer distributor. |
| 10 (1) | Input line supervision | Input line phase is low or missing. | Check the utility supply voltage, cables and connections. |
| 11 | Output phase supervision | Current measurement has detected that there is no current in one motor phase. | Check motor cable and motor. |
| 13 | Drive undertemperature | Heatsink temperature is under $-10^{\circ} \mathrm{C}$. | Provide supplemental heating, or relocate drive. |
| 14 | Drive overtemperature | Heatsink temperature is over $90^{\circ} \mathrm{C}$. <br> Overtemperature warning is issued when the heatsink temperature exceeds $85^{\circ} \mathrm{C}$. | Check the correct amount and flow of cooling air. <br> Check the heatsink for dust. Check the ambient temperature. Make sure that the switching frequency is not too high in relation to ambient temperature and motor load. |
| 15 | Motor stalled (1) | Motor stall protection has tripped. | Check motor. |
| 16 | Motor overtemperature | - motor overheating has been detected by drive motor temperature model <br> - motor is overloaded | Decrease the motor load. If no motor overload exists, check the temperature model parameters. |
| 17 | Motor underload ${ }^{\text {® }}$ | Motor underload protection has tripped. |  |
| 22 | EEPROM checksum fault | Parameter save fault <br> - faulty operation <br> - component failure | Contact your Cutler-Hammer distributor. |
| 24 | Counter fault ${ }^{\text {2 }}$ | Values displayed on counters are incorrect. |  |
| 25 | Microprocessor watchdog fault | - faulty operation <br> - component failure | Reset the fault and restart. Should the fault re-occur, contact your Cutler-Hammer distributor. |
| 29 | Thermistor fault ${ }^{\text {® }}$ | The thermistor input of option board has detected increase of the motor temperature. | Check motor cooling and loading. Check thermistor connection. (If thermistor input of the option board is not in use, it has to be short circuited.) |
| 32 | Fan cooling | The cooling fan did not start when commanded | Contact your Cutler-Hammer distributor. |
| 34 | Internal bus communication | Ambient interference or defective hardware | Should the fault re-occur, contact your Cutler-Hammer distributor. |
| 35 | Application fault | Selected application does not function | Contact your Cutler-Hammer distributor. |

[^2]Table A-1: Fault Codes (Continued)

| Fault Code | Fault | Possible Cause | Solution |
| :---: | :---: | :---: | :---: |
| 39 | Device removed ${ }^{(2)}$ | - option board removed <br> - drive removed | Reset |
| 40 | Device unknown | Unknown option board or drive. | Contact your Cutler-Hammer distributor. |
| 41 | IGBT temperature | IGBT Inverter Bridge overtemperature protection has detected too high a motor current. | Check loading. Check motor size. |
| 44 | Device change ${ }^{\text {2 }}$ | - option board changed <br> - option board has default settings | Reset. |
| 45 | Device added ${ }^{\text {(2) }}$ | - option board changed <br> - option board has default settings | Reset. |
| 50 | Analog input $\mathrm{I}_{\text {in }}<4 \mathrm{~mA}$ (selected signal range 4 to 20 mA ) | Current at the analog input is $<4 \mathrm{~mA}$. <br> - control cable is broken or loose <br> - signal source has failed. | Check the current loop circuitry. |
| 51 | External fault | Digital input failed. Digital input has been programmed as external fault input and this input is active. | Check the programming and the device indicated by the external fault information. Check also the cabling of this device. |
| 52 | Keypad communication fault | The connection between the control keypad and the drive is broken. | Check the keypad connection and keypad cable. |
| 53 | Fieldbus fault ${ }^{\text {® }}$ | The data connection between the fieldbus master and the fieldbus board is broken. | Check installation. <br> If installation is correct contact your Cutler-Hammer distributor. |
| 54 | Slot fault ${ }^{\text {® }}$ | Defective option board or slot. | Check that the board is properly installed and seated in slot. If the installation is correct, contact your Cutler-Hammer distributor. |
| 55 | Actual value supervision | Actual value has exceeded or fallen below (depending on para. 2.7.22) the actual value supervision limit (para. 2.7.23) |  |

## Appendix B — Expander Board OPTAA

## Description of Expander Board OPTAA

Description:
Allowed slots: SLX9000 board slot E
Type ID:
Terminals: $\quad$ Two terminal blocks; screw terminals (M2.6 and M3); no coding
Jumpers: None
Board parameters: None

Figure B-1: Expander Board OPTAA

## I/O Terminals on OPTAA

Table B-1: I/O Terminals of Board OPTAA

| Terminal | Parameter <br> Setting | Description |
| :--- | :--- | :--- |

X3

| 1 | +24 V |  | Control voltage output; voltage for switches etc., max. 150 mA |
| :--- | :--- | :--- | :--- |
| 2 | GND |  | Ground for controls, e.g. for +24V and DO |
| 3 | DIN1 | DIGIN:x.1 | Digital input 1 |
| 4 | DIN2 | DIGIN:x.2 | Digital input 2 |
| 5 | DIN3 | DIGIN:x.3 | Digital input 3 |
| 6 | DO1 | DIOUT:x.1 | Open collector output, $50 \mathrm{~mA} / 48 \mathrm{~V}$ |

X5

Note: The +24 V control voltage terminal can also be used to power the control module (but not the power module).

Eaton Corporation is a diversified power management company ranked among the largest Fortune 500 companies. The electrical group is Eaton's largest division and is a global leader in electrical control, power distribution, power quality, automation, and monitoring products and services.
Eaton's global electrical brands, including Cutler-Hammer ${ }^{\circledR}$, MGE Office Protection Systems ${ }^{\text {™ }}$, Powerware ${ }^{\circledR}$, Holec $^{\circledR}$, MEM $^{\circledR}$, Santak and Moeller, provide customer-driven PowerChain Management ${ }^{\circledR}$ solutions to serve the power system needs of the industrial, institutional, government, utility, commercial, residential, IT, mission critical and OEM markets worldwide.

PowerChain Management solutions help enterprises achieve sustainable and competitive advantages through proactive management of the power system as a strategic, integrated asset throughout its life cycle. With Eaton's distribution, generation and power quality equipment; full-scale engineering services; and information management systems, the power system is positioned to deliver powerful results: greater reliability, operating cost efficiencies, effective use of capital, enhanced safety, and risk mitigation.
