Ursula's Seashell Necklace

Created by Erin St Blaine

Guide Contents

Overview

Look at this shell. Isn't it neat?
Wouldn't it just make your cosplay complete?
Wouldn't they think you're the girl,
The girl that has... everything?

Wear this necklace and it will respond to your beautiful Mermaid voice whenever you talk or sing. Use it to find your Prince, or to steal someone else's Prince if that's your bent. (Hey, it almost worked for Ursula. Ultimate Power Awaits.)

Electronics

- Flora (https://adafru.it/dVl)
- 16 pixel Neopixel Ring (https://adafru.it/dyU)
- 150mAh LiPoly battery (https://adafru.it/dYY)
- Electret Microphone breakout (https://adafru.it/eQw)
- Micro Lipo charger for the battery (http://adafru.it/1304)

Tools

- 3D Printer
- Soldering iron & accessories
- Teensy weensy Philips head screwdriver

Crafty Stuff

- Translucent gold paint (I used Pebeo Vitrail Gold (https://adafru.it/eQx))
- Elastic or necklace cord
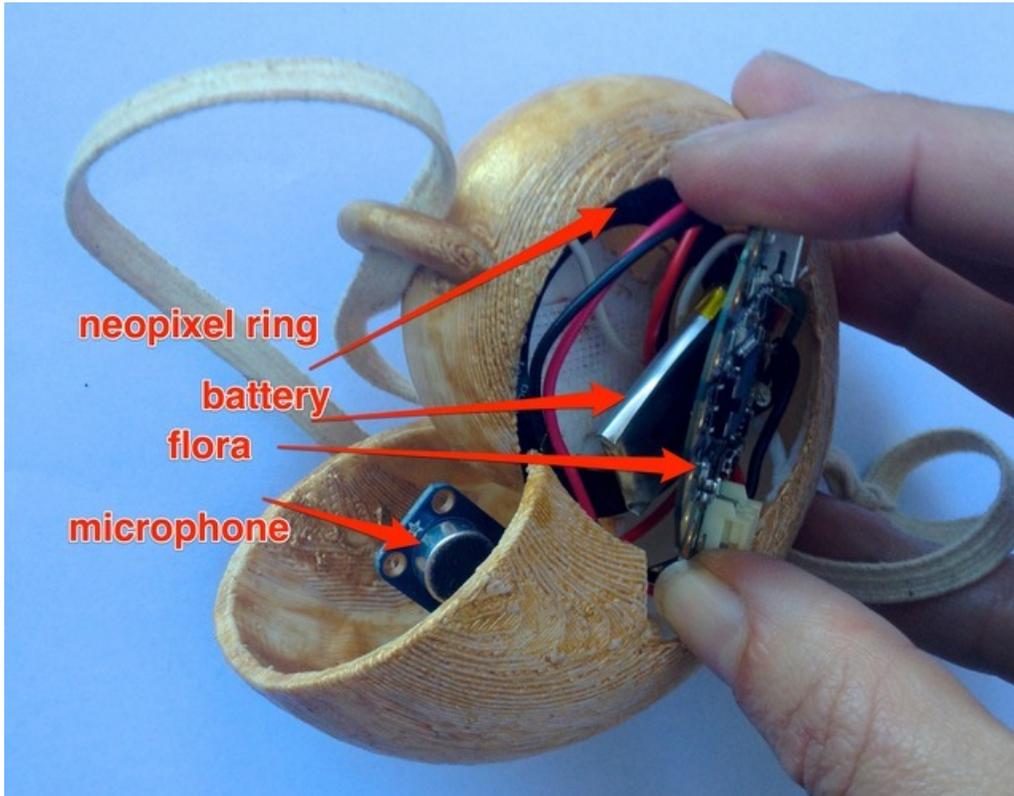

If you like this guide, also check out this Seashell Necklace tutorial (https://adafru.it/xbc) for a new twist on this project using our Circuit Playground board.

3D Printing

Print the seashell in white ABS. Get as much of the raft and supports as possible out from the inside -- you don't want that stuff blocking your lights.

 Once it's done, paint it with gold or yellow translucent paint. I used two coats of Pebeo Vitriol glass paint (https://adafru.it/eQx) which gave it an almost carved-wood look, but any not-too-opaque paint should work.

<div style="background:green">

https://adafru.it/eUa

</div>

https://adafru.it/eUa

If you don't have a 3D printer, you can get one printed at Shapeways (https://adafru.it/eUb). The internet is so great.

- Flora D9 --> Microphone Out
- Flora 3.3V --> Microphone VCC

Assembly
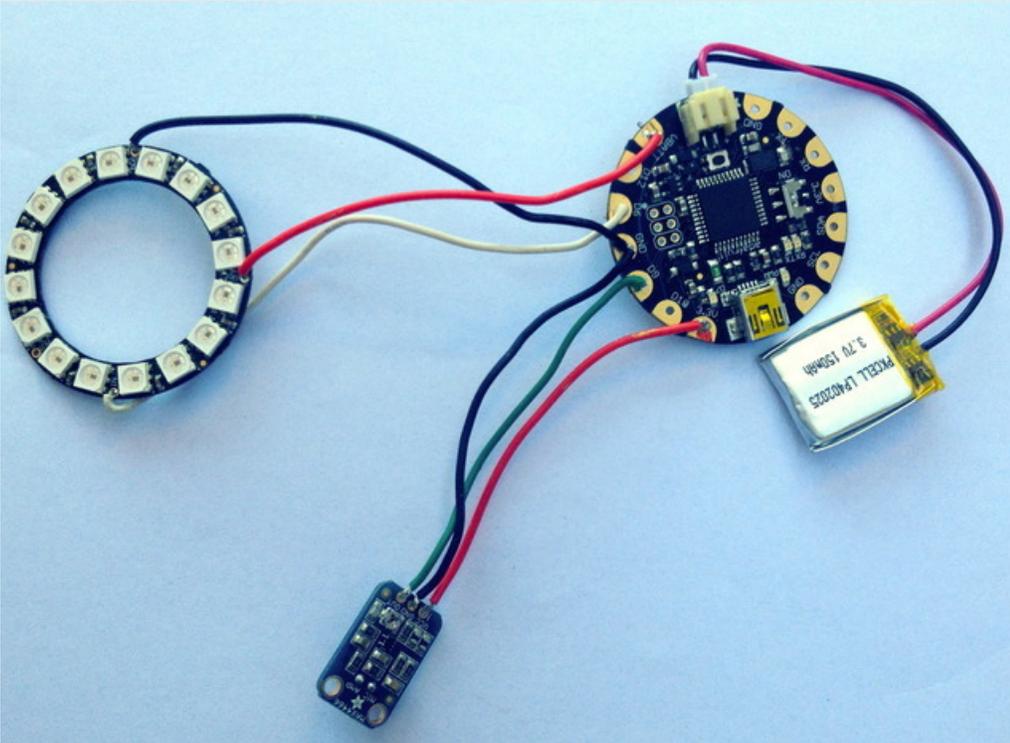

Cut all your wires to about 3" -- this will ensure you've got enough wiggle room to get everything situated in the shell but not have excess wire hanging around.

Stranded (flexible) wire will work best since you may need to flex the components around a bit to get them situated in the seashell.

On the neopixel ring, it's easiest to stick the wire in from the front and solder on the back to ensure you don't melt the LEDs or break anything.

Notice that there are two wires going to Flora's GND pad, so it will work best to twist them together at the ends and solder them in at the same time.

The Code

Software Setup

If this is your first time using Flora, take a look at Getting Started with Flora (https://adafru.it/dwi) to get a guided tour.

Once you've got Flora up and running with Arduino (https://adafru.it/dgt), you'll need to install the **FastLED** library in Arduino (Sketch > Include Library > Manage Libraries...)

Libraries? Why? What's a Library?

In a nutshell, Arduino libraries have a lot of pre-written functions that make your neopixels easy to command. You can do fancy stuff without being a code guru. Yay Libraries!

FastLED is a fast, efficient, easy-to-use Arduino library for programming addressable LED strips and pixels. It has a lot of features to get your animations up and running fast -- and it has a lot of code samples available if you're just learning to code.

All about Arduino Libraries (https://adafru.it/dNR) will tell you everything you ever wanted to know about libraries, including more detailed installation instructions.

Once your curiosity is satiated and your library is installed, copy and paste the code into your Arduino window.

Go to your Tools menu and select Flora from the list of boards. Plug your Flora into your computer via the onboard USB port. Press the "reset" button on your Flora and wait for the blinky red light, then click the upload button in Arduino.

```
/* soundbracelet for FastLED 2.1 or greater

    else if (vol[i] > maxLvl) maxLvl = vol[i];
  }
  // minLvl and maxLvl indicate the volume range over prior frames, used
  // for vertically scaling the output graph (so it looks interesting
  // regardless of volume level).  If they're too close together though
  // (e.g. at very low volume levels) the graph becomes super coarse
  // and 'jumpy'...so keep some minimum distance between them (this
  // also lets the graph go to zero when no sound is playing):
  if((maxLvl - minLvl) < TOP) maxLvl = minLvl + TOP;
  minLvlAvg = (minLvlAvg * 63 + minLvl) >> 6;         // Dampen min/max levels
  maxLvlAvg = (maxLvlAvg * 63 + maxLvl) >> 6;         // (fake rolling average)

} // fastbracelet()
```

If you encounter trouble…

Any time you hit a roadblock with a NeoPixel project, we'll usually ask that you start with the "strandtest" example from our own Adafruit_NeoPixel library. This helps us narrow down whether it's a hardware or software issue. The library is installed similarly to FastLED or any other (Sketch > Include Library > Manage Libraries...)

You'll find the strandtest example under **File→Sketchbook→Libraries→Adafruit_NeoPixel→strandtest**

If strandtest fails to run, this suggests a hardware issue...for example, connecting to the wrong input on the LED ring, or the wrong Flora pin.

If you're new to Arduino programming and LEDs, we usually suggest starting with the Adafruit_NeoPixel library...it's pretty basic, the strip declaration is more conventional, and we can stay on top of keeping it compatible with our own products and the most mainstream Arduino boards.

As FastLED is a more "bleeding edge" third-party library, **we can't always guarantee compatibility across versions or with specific boards.** You can find help through their **community on Google+ (https://adafru.it/ebn)**. This is potent stuff, written by people with a deep appreciation for LED art, and we wanted to showcase it.

Calibration

Microphone Adjustment

You want the necklace to respond to your voice, but not go crazy at every little ambient noise. Some of this adjustment will happen in the code, but the nice thing about this mic breakout is that it has a teensy little adjustment screw. By configuring the code to respond to a medium gain, you'll have wiggle room to adjust on-the-fly for different environments. You'll be able to turn it down for noisy convention halls or up for quiet storytelling sessions.
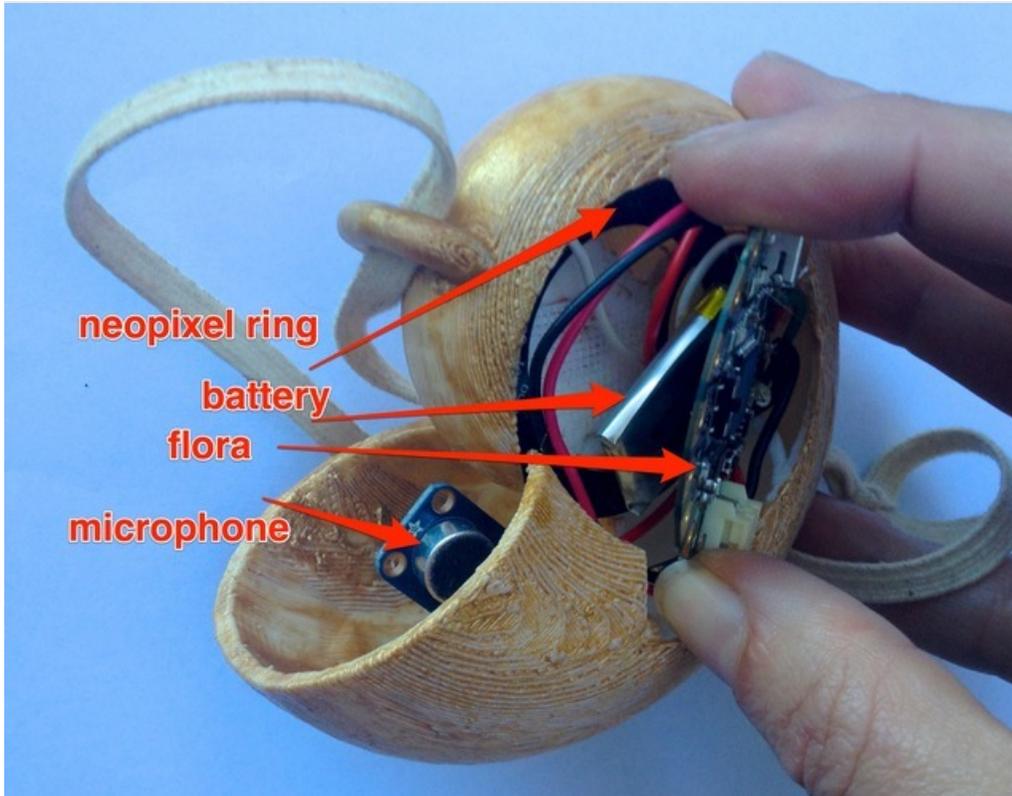

Take your teeny weeny screwdriver and twist the gain adjustment screw until it's roughly in the middle of its turning radius.
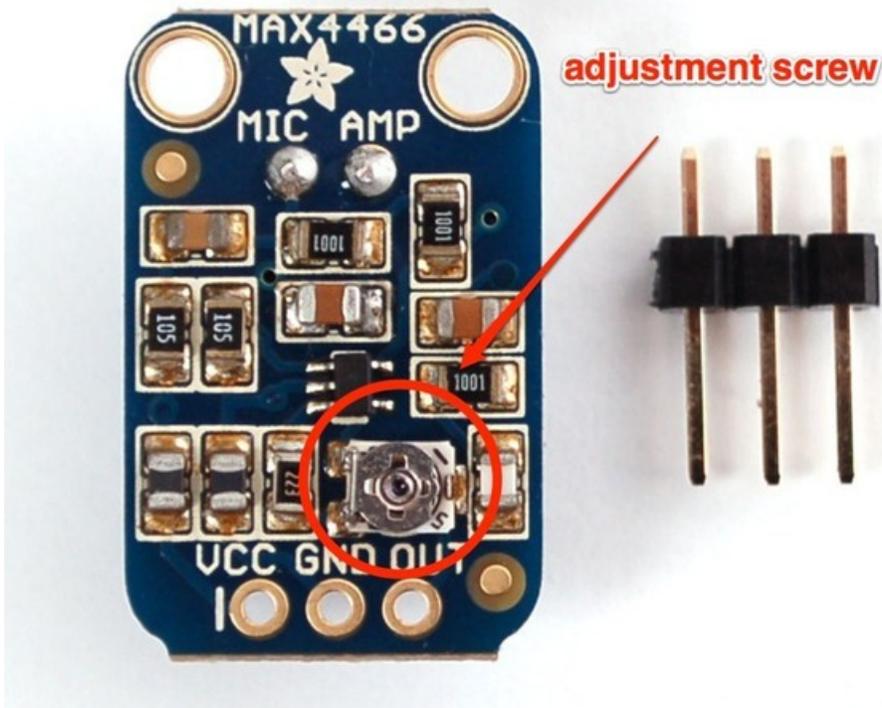

Now, make some noise. See how loud you need to be for your LEDs to respond.

Look at the code and find the value for NOISE. To make the mic more sensitive, make this number smaller. To make it less sensitive, make this number bigger.

Finishing

Put it all together!

First, place the neopixel ring down. There's a star on the back of the ring -- that marks the first LED to light, so put this at the top.

Slip the microphone through into the "bell" part of the shell so it's facing up toward your face when you have the necklace on.

Coil the battery wire around and set it on top of the neopixel ring.

Pop the Flora into place on top of it all and thread your elastic or necklace cord through the ring at the top of the shell. It will all stay in place nicely (you don't need to glue anything) and you can carefully pop the battery cable out for charging.

Turn your necklace on and off with Flora's onboard on/off switch.

When you need to recharge, open the necklace back up. Disconnect the battery and charge using a Micro Lipo Charger. (http://adafru.it/1304)

You may notice that your calibration / sensitivity changes when the mic is inside the seashell. Adjust it with the screw or in the code until you feel the magic.
