

PACMotion™ High Speed Servo Motion Control

Integrated, Scalable, and Precise Control

Emerson provides flexible, easy to use, end-to-end solutions perfect for discrete manufacturing and hybrid control. PACMotion servo motion control continues this approach with high-speed motion, tighter control, and simple integration.

The PACMotion family gives you the ability to increase throughput, improve yield, and reduce expenses while minimizing development costs.

Fully Integrated for System Simplicity

PACMotion is tightly integrated with Emerson PACSystems RX3i and PAC Machine Edition engineering tool. With motion, HMI, PLC, and machine logic events integrated into the same view, PACMotion streamlines synchronization for simple setup, maintenance, and troubleshooting. Standard motion blocks make it easy to assemble applications and operators can even dynamically change motion profiles. This gives you the ability to manage smaller lot sizes and rapid changeovers for increased machine utilization.

High Speed, Precision Control

To facilitate quick and easy implementation, PACMotion uses the open EtherCAT communications protocol. Widely considered the standard for motion control, EtherCAT communications provides the peace of mind that all PACMotion products will work cohesively with your existing, and future, motion control technology.

Scalability and Flexibility

BSpeed is critical for effective motion control, and PACMotion communicates across a 1 Gigabit per second throughput backplane for higher speeds than traditional networks. In fact, communications, position, and path planner loops are updated in quarter, half, and single millisecond intervals respectively. Utilizing a backplane also allows PACMotion to be a directly scalable solution. PACMotion's performance is maintained as you expand so update loops remain constant whether your

system requires 4 axes or 40. This ensures that you never have to worry about performance degradation.

Three Components, One Solution

The PACMotion High Speed Servo Motion Control portfolio combines servo drives, and servo motors, with the PMM345 motion controller to create a single powerful solution.

PACMotion offers high-speed, reliable, and easy to use systems. At Emerson, we're a complete automation provider delivering a powerful and comprehensive portfolio of automation technology. We partner with end users to expand operations while tightening supply chain control.

Easy Upgrade Path

For users with previous generations of PACMotion solutions, we've ensured the migration process is simple and painless. The PMM345 Motion Controller is the same footprint and utilizes the same motion commands as its PMM335 predecessor so you can easily upgrade. We also offer the intuitive PACMotion Workbench software for easy servo drive configuration, and a PACMotion Servo Sizing App to easily select the perfect motor for every situation.

PACMotion Servo Motors – Performance Data Notes

Torque-speed Curve Calculations:

Motor Compatibility and Sizing:

All motors will operate with the 120/240Vac drives. Motors with 320V Max DC Bus Voltage are not compatible with 240/480Vac drives. The Servo motor's Continuous Current is the key metric in properly sizing your drive.

Drive DC Bus Voltage calculation:

$$1.33 \times V_{rms} = V_{dc \text{ bus}}$$

Approximate Values -

$$120 \text{ Vrms} = 160 \text{ Vdc}$$

$$240 \text{ Vrms} = 320 \text{ Vdc}$$

$$400 \text{ Vrms} = 560 \text{ Vdc}$$

$$480 \text{ Vrms} = 640 \text{ Vdc}$$

Bus voltage of the drive is established strictly by the incoming AC power. No internal settings necessary.

Table Footnotes:

- [1] Motor winding temperature rise, $\Delta T = 100^\circ\text{C}$, at 40°C ambient.
- [2] All data referenced to sinusoidal commutation.
- [3] Add parking brake if applicable for total inertia.
- [4] Motor with standard heat sink.
- [5] May be limited at some values of V_{bus} .
- [6] Measured at 25°C .
- [7] Brake motor option reduces continuous torque ratings by following values (all values in Nm):
