

TITAN®

SAFETY AND OPERATING MANUAL

Original Instructions

ROUTER 1250W

TTB591ROU

TITAN®

Congratulations on your purchase of a power tool from TITAN Power Tools (UK) Ltd. We want you to continue getting the best performance from it so this handbook includes information on safety, handling and care. Please retain this handbook in case you need to refer to any of the information in the future.

Your TITAN power tool comes with a 2 year guarantee, so should it develop a fault within this period contact your retailer.

GUARANTEE

This **TITAN** product carries a guarantee of 2 years. If your product develops a fault within this period, you should in the first instance contact the retailer where the item was purchased.

This guarantee specifically excludes losses caused due to:

- Fair wear and tear
- Misuse or abuse
- Lack of routine maintenance
- Failure of consumable items (such as batteries)
- Accidental damage
- Cosmetic damage
- Failure to follow manufacturer's guidelines
- Loss of use of the goods

This guarantee does not affect your statutory rights. This guarantee is only valid in the UK.

For any enquiries relating to the guarantee please refer to your retailer.

ROUTER 1250W

TTB591ROU

49312 1250W ROUTER 1/4" COLLET ASSEMBLY NOTICE

1. Hold the spindle lock and loosen the collet nut with spanner at anti-clock wise.

ATTENTION! Please don't take off the nut.

2. Insert the 1/4" collet into the chuck.

3. Insert the 1/4" router bit into the collet.

4. Hold the spindle lock and tighten the nut with the spanner at clock wise.

ATTENTION! Make sure the nut is fully tightened. Ensure that the top lip (edge) is slightly higher than the collect nut as shown in the picture below .

GENERAL POWER TOOL SAFETY WARNINGS

WARNING: Read all safety warnings and all instructions. Failure to follow the warnings and instructions may result in electric shock, fire and/or serious injury.

Save all warnings and instructions for future reference.

The term "power tool" in the warnings refers to your mains-operated (corded) power tool or battery-operated (cordless) power tool.

1) Work area safety

- a) Keep work area clean and well lit.** Cluttered or dark areas invite accidents.
- b) Do not operate power tools in explosive atmospheres, such as in the presence of flammable liquids, gases or dust.** Power tools create sparks which may ignite the dust or fumes.
- c) Keep children and bystanders away while operating a power tool.** Distractions can cause you to lose control.

2) Electrical safety

- a) Power tool plugs must match the outlet. Never modify the plug in any way. Do not use any adapter plugs with earthed (grounded) power tools.** Unmodified plugs and matching outlets will reduce risk of electric shock.
- b) Avoid body contact with earthed or grounded surfaces, such as pipes, radiators, ranges and refrigerators.** There is an increased risk of electric shock if your body is earthed or grounded.
- c) Do not expose power tools to rain or wet conditions.** Water entering a power tool will increase the risk of electric shock.
- d) Do not abuse the cord. Never use the cord for carrying, pulling or unplugging the power tool.** Keep cord away from heat, oil, sharp edges or moving parts. Damaged or entangled cords increase the risk of electric shock.
- e) When operating a power tool outdoors, use an extension cord suitable for outdoor use.** Use of a cord suitable for outdoor use reduces the risk of electric shock.
- f) If operating a power tool in a damp location is unavoidable, use a residual current device (RCD) protected supply.** Use of an RCD reduces the risk of electric shock.

3) Personal safety

- a) Stay alert, watch what you are doing and use common sense when operating a power tool. Do not use a power tool while you are tired or under the influence of drugs, alcohol or medication.** A moment of inattention while operating power tools may result in serious personal injury.
- b) Use personal protective equipment.** Always wear eye protection. Protective equipment such as dust mask, non-skid safety shoes, hard hat, or hearing protection used for appropriate conditions will reduce personal injuries.
- c) Prevent unintentional starting. Ensure the switch is in the off-position before connecting to power source and/or battery pack,**

picking up or carrying the tool. Carrying power tools with your finger on the switch or energising power tools that have the switch on invites accidents.

d) Remove any adjusting key or wrench before turning the power tool on. A wrench or a key left attached to a rotating part of the power tool may result in personal injury.

e) Do not overreach. Keep proper footing and balance at all times. This enables better control of the power tool in unexpected situations.

f) Dress properly. Do not wear loose clothing or jewellery. Keep your hair, clothing and gloves away from moving parts. Loose clothes, jewellery or long hair can be caught in moving parts.

g) If devices are provided for the connection of dust extraction and collection facilities, ensure these are connected and properly used. Use of dust collection can reduce dust-related hazards.

4) Power tool use and care

a) Do not force the power tool. Use the correct power tool for your application. The correct power tool will do the job better and safer at the rate for which it was designed.

b) Do not use the power tool if the switch does not turn it on and off. Any power tool that cannot be controlled with the switch is dangerous and must be repaired.

c) Disconnect the plug from the power source and/or the battery pack from the power tool before making any adjustments, changing accessories, or storing power tools. Such preventive safety measures reduce the risk of starting the power tool accidentally.

d) Store idle power tools out of the reach of children and do not allow persons unfamiliar with the power tool or these instructions to operate the power tool. Power tools are dangerous in the hands of untrained users.

e) Maintain power tools. Check for misalignment or binding of moving parts, breakage of parts and any other condition that may affect the power tool's operation. If damaged, have the power tool repaired before use. Many accidents are caused by poorly maintained power tools.

f) Keep cutting tools sharp and clean. Properly maintained cutting tools with sharp cutting edges are less likely to bind and are easier to control.

g) Use the power tool, accessories and tool bits etc. in accordance with these instructions, taking into account the working conditions and the work to be performed. Use of the power tool for operations different from those intended could result in a hazardous situation.

5) Service

a) Have your power tool serviced by a qualified repair person using only identical replacement parts. This will ensure that the safety of the power tool is maintained.

ADDITIONAL SAFETY INSTRUCTIONS FOR YOUR ROUTER

1. Hold power tool by insulated gripping surfaces, because the cutter may contact its own cord. Cutting a “live” wire may make exposed metal parts of the power tool “live” and shock the operator.
2. Use clamps or another practical way to secure and support the workpiece to a stable platform. Holding the work by your hand or against the body leaves it unstable and may lead to loss of control.
3. Router bits must not be removed while the machine is running.
4. Protect router bits against shocks and impacts.
5. Only use properly sharpened router bits, otherwise increased cutting force could damage the workpiece.
6. Before use inspect the router bits for any damage. Do not use router bits, which are cracked chipped or otherwise damaged.
7. Make sure that the workpiece is sufficiently supported or clamped. Keep your hands away from the surface to be cut.
8. When fitting a router bit ensure that it is securely engaged within the collet and fully tightened before use!
9. Make sure that router bit has been mounted and fastened correctly. Do not use reducing rings or adapters to make the router bits fit properly.
10. Apply the machine to the workpiece only when the machine is switched on.
11. When working with the machine always hold the machine firmly with both hands and provide for a secure stance.
12. Always wear safety goggles and hearing protection. If desired or required also use another protection for example an apron or helmet.
13. Always disconnect the plug from the socket before you carry out any work on the machine. Only plug-in when the machine is switched off.
14. Keep mains lead clear from working range of the machine. Always lead the cable away behind you.
15. Do not stop the router bits by hand after switching off.
16. The base plate must not be clamped down while the router bits is extended. Lowering and raising the blade must be a smooth operation.
17. Always use the appropriate safety equipment that is required for the product. E.G. Goggles / Safety Spectacles, Ear defenders (essential with tools with a noise rating of over 80 dB(A)), Gloves for handling router bits and face masks. In all cases ensure that the safety equipment is in good condition.

ADDITIONAL SAFETY WARNING FOR CONSTRUCTION DUST

The updated Control of Substances Hazardous to Health Regulations 1st October 2012 now also targets to reduce the risks associated with silica, wood and gypsum dusts. Construction workers are one of the at-risk groups within this because of the dust that they breathe: silica dust is not just a nuisance; it is a real risk to your lungs! Silica is a natural mineral present in large amounts in things like sand, sandstone and granite. It is also commonly found in many construction materials such as concrete and mortar. The silica is broken into very fine dust (also known as Respirable Crystalline Silica

or RCS) during many common tasks such as cutting, drilling and grinding.
Breathing in very fine particles of crystalline silica can lead to the development of:

Lung cancer

Silicosis

Chronic Obstructive Pulmonary Disorder (Chronic obstructive pulmonary disease (COPD))

And breathing in fine particles of wood dust can lead to the development of Asthma

The risk of lung disease is linked to people who regularly breathe construction dust over a period of time, not on the odd occasion.

To protect the lung, the COSHH Regulations sets a limit on the amount of these dusts that you can breathe (called a Workplace Exposure Limit or WEL) when averaged over a normal working day. These limits are not a large amount of dust: when compared to a penny it is tiny – like a small pinch of salt:

This limit is the legal maximum; the most you can breathe after the right controls have been used.

How to reduce the amount of dust?

1. Reduce the amount of cutting by using the best sizes of building products.
2. Use a less powerful tool e.g. a block cutter instead of angle grinder.
3. Using a different method of work altogether – e.g. using a nail gun to direct fasten cable trays instead of drilling holes first.

Please always work with approved safety equipment, such as those dust masks that specially designed to filter out microscopic particles and use the dust extraction facility at all time.

For more information please see the HSE website:

<http://www.hse.gov.uk/construction> or <http://www.hse.gov.uk/pubns/cis69.pdf>

 **WARNING! Some dust particles created by power sanding, sawing, grinding, drilling and other construction jobs contain chemicals known to cause cancer, birth defects or other reproductive harm.** Some examples of these chemicals are:

- Lead from lead-based paints.
 - Crystalline silica from bricks and cement and other masonry products.
 - Arsenic and chromium from chemically treated timber.
- Your risk from these exposures varies, depending upon how often you do this type of work.

To reduce your exposure to these chemicals:

- Work in a well ventilated area.
- Work with approved safety equipment, such as those dust masks that specially designed to filter out microscopic particles and use the dust extraction facility at all time.

VIBRATION

The European Physical Agents (Vibration) Directive has been brought in to help reduce hand arm vibration syndrome injuries to power tool users. The directive requires power tool manufacturers and suppliers to provide indicative vibration test results to enable users to make informed decisions as to the period of time a power tool can be used safely on a daily basis and the choice of tool.

Further Advice can be found at www.hse.gov.uk

Vibration total values (triax vector sum) determined according to EN 60745:

Cutting	Vibration for cutting $a_h = 5.871\text{m/s}^2$
	Uncertainty $K = 1.5\text{m/s}^2$

The declared vibration emission value should be used as a minimum level and should be used with the current guidance on vibration.

Calculating the actual period of the actual period off use can be difficult and the HSE website has further information.

The declared vibration emission been measured in accordance with a standardised test stated above and may be used to compare one tool with another.

The declared vibration emission value may also be used in a preliminary assessment of exposure.

⚠ WARNING: The vibration emission value during actual use of the power tool can differ from the declared value depending on the ways in which the tool is used dependant on the following examples and other variations on how the tool is used:

How the tool is used and the materials being drilled.

The tool being in good condition and well maintained

The use the correct accessory for the tool and ensuring it is sharp and in good condition.

The tightness of the grip on the handles.

And the tool is being used as intended by its design and these instructions.

This tool may cause hand-arm vibration syndrome if its use is not adequately managed

⚠ WARNING: Identify safety measures to protect the operator that are based on an estimation of exposure in the actual conditions of use (taking account of all parts of the operating cycle such as the times when the tool is switched off and when it is running idle in addition to the trigger time). Note The use of other tools will reduce the users' total working period on this tool.

Helping to minimise your vibration exposure risk.

Maintain this tool in accordance with these instructions and keep well lubricated (where appropriate)

Avoid using tools in temperatures of 10°C or less

Plan your work schedule to spread any high vibration tool use across a number of days.

Health Surveillance All employees should be part of an employer's health surveillance scheme to help identify any vibration related diseases at an early stage, prevent disease progression and help employees stay in work.

Double insulation:

The tool is double insulated. This means that all the external metal parts are electrically insulated from the mains power supply. This is done by placing insulation barriers between the electrical and mechanical components making it unnecessary for the tool to be earthed.

Important note:

Be sure the supply is the same as the voltage given on the rating plate. The tool is fitted with a two-core cable and plug.

Remove the mains plug from socket before carrying out any adjustment or servicing.

SYMBOLS

To reduce the risk of injury, user must read instruction manual

Warning

Wear ear protection

Wear eye protection

Wear dust mask

Wear gloves

Double insulation

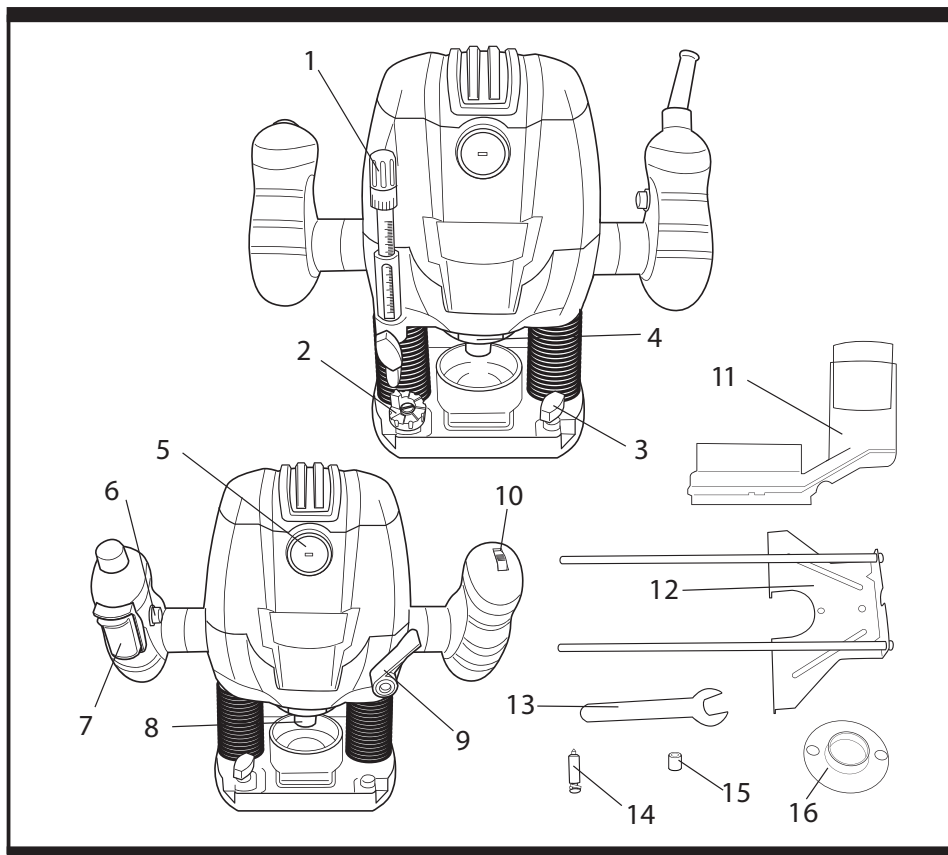

Waste electrical products should not be disposed of with household waste. Please recycle where facilities exist. Check with your Local Authority or retailer for recycling advice.

Conformity to CE directive

yyWxx Manufacturing date code; Year of manufacturing (20yy) and week of manufacturing (Wxx);

1. Depth stop bar with micro-adjustment

2. Turret depth stop

3. Parallel guide locking knob

4. Spindle lock

5. Carbon brush cap

6. Lock off button

7. ON/OFF trigger switch

8. Collet nut

9. Plunge lock lever

10. Variable speed dial

11. Vacuum adaptor

12. Parallel guide

ROUTER 1250W

TTB591ROU

13. Spanner

14. Centring pin

15. Collet

16. Guide bush

TECHNICAL DATA

Voltage	230-240V~ 50Hz
Input power	1250W
Variable speed	11000-30000/min
Plunge depth	55mm
Collet size	1/2"(12.7mm), 1/4"(6.35mm)
Protection class	 II
Machine weight	3.7kg

NOISE DATA

A weighted sound pressure	85.9dB(A) K_{pA} : 3dB(A)
A weighted sound power	96.9dB(A) K_{WA} : 3dB(A)
Wear ear protection when sound pressure is over	80dB(A)

ACCESSOIRES

Dust extraction adaptor	1pc
Guide bush	1pc
Parallel guide	1pc
Spanner	1pc
Collet 6.35mm(1/4" for UK)	1pc
Centre pin	1pc
Long screws (20mm)	2pcs

OPERATIONS INSTRUCTIONS

NOTE: Before using the tool, read the instruction book carefully.

INTENDED USE

This router shall be used for only for light works on the wood. Other uses for the tool will lead to the damage of the tool and a series of dangers to the operator. This tool is intended for DIY home use, or occasional professional use.

1. SWITCHING ON AND OFF (See Fig. 1)

Your router is equipped with a double action switch. Start the tool by depressing the lock-off button (6) and squeeze the trigger switch. Release the trigger switch to stop the tool.

2. USING THE VACUUM ADAPTOR (See Fig. 2)

For the sake of your health and working environment, always use a vacuum adaptor and vacuum. Use the two long screws to fasten the adaptor socket securely to the routing base. The adaptor socket is suitable for vacuum adaptor with a suction hose of 35mm diameter.

3. FITTING THE ROUTER BITS (See Fig. 3 & Fig. 4)

Both 6.35mm(1/4") and 12.7mm(1/2") shaft bits can be used with this product. To use 6.35mm (1/4") size bits, the 1/4" collet (15) must be used. 12.7mm(1/2") size bits can be attached to the router socket directly. Depress and hold the spindle lock to stop the spindle from turning. Whilst holding the spindle lock, loosen the collet nut by rotating it using the supplied spanner. For 6.35mm (1/4") shaft bit Insert the collet into the router shaft socket , then insert a suitable router bit with at least 2/3 of the bit shaft into the collet. For 12.7mm (1/2") shaft bit Insert a suitable router bit directly into the router socket with at least 2/3 of the bit shaft into the router shaft socket . No collet is required for 12.7mm (1/2") bits. Depress and hold the spindle lock and then tighten the collet nut with the supplied spanner.

WARNING: Ensure the correct collet is installed for the router bit to be used, i.e., 1/4" router bits must only be used with the 1/4" collet, you can insert 1/2" (12.7mm) bits into shaft directly, no need collet adaptor.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

Fig.

Fig.

Failure to follow this advice can lead to serious injury as the router bit may not be properly secured in the collet, or may damage the collet. The router bit must be suitable for the speed of the tool! Never use the bit over its rated speed in anytime.

4. ADJUSTING DEPTH OF CUT (See Fig. 5 & Fig. 6)

The depth of cut is the distance between the turret depth stop and the depth stop bar. Router bits vary in depth, the turret depth stop allows for this with its eight positions. Use one of the two following methods:

Method 1: Using a piece of wood method.

Fit the router bit, loosen the depth stop bar fixing screw, pull the plunge lock lever up and plunge the router down until it comes into contact with the workpiece. Lock the router into this position by pushing down the plunge lock lever. Lift up the depth stop bar and insert a piece of wood the same thickness as the depth of cut between the stop bar and turret stop bar.

Tighten the depth stop bar fixing screw (a) and release the plunge lock lever to return the router back to its original position. The depth of cut is now set, see "Starting the router" section for final operation.

Method 2: Using the scale method

Fit the router bit, loosen the depth stop bar fixing screw and release the plunge lock lever. Lower the router down until it contacts the workpiece, lock into this position with the plunge lock lever. The scale on the depth bar now shows the starting position. Note the starting position will vary depending on the bit used. Next add the required depth of the cut to the starting position, i.e.: if the scale shows 20mm and you require a cut of 10mm, then the correct adjustment on the scale is $20+10=30$ mm, if the scale shows 38mm and the required cut is 6mm in depth, the adjustment on the scale will be $38+6=44$ mm. Now move the depth stop bar to the calculated number, and lock bar with the fixing screw. Release the plunge lock lever, the router will return to its original position.

5. MARKING FINE ADJUSTMENT TO CUT DEPTH (See Fig. 7)

If you want to make some accurate adjustment, micro-adjustment can be made by turning the micro depth adjustment knob (b).

6. FITTING THE PARALLEL GUIDE (See Fig. 8)

Before using the parallel guide you will need to assemble the guide. Remove the two screws and washers from the end of the two bars and fit the guide to the bars using the washers and screws you removed. Tighten screws securely. Insert the bars into the grooves in the base of the router. Adjust the guide to the required cutting width and tighten the two parallel guide locking screws.

Fig. 8

7. FITTING THE CENTRING PIN AND MAKING CIRCULAR CUTS (See Fig. 9 & Fig. 10)

The centring pin allows you to make circular cuts.

(a) Fasten the centring pin on the parallel guide but upside down.

(b) Push the guide shaft of the parallel guide.

(c) Place the centring pin against the material.

(d) Set the required radius by adjusting the shaft of the parallel guide and tighten the parallel guide locking screws.

(e) Fixing router in required depth with the plunge lock lever.

(f) Switch on the machine.

(g) After releasing the plunge lock lever, lower the machine slowly.

(h) Cut grooves, shoulders, etc at a steady rate of feed, holding the machine with both hands.

(y) When finished, raise the machine again.

(j) Switch off the machine.

Fig. 9

Fig. 10

8. USING THE GUIDE BUSH (See Fig. 11)

Use this attachment to cut out a shape using a pre-formed template (ie a worktop jig).

Insert the two long screws provided from the bottom side through the guide bush (16) and the holes in the base into the nuts in vacuum adaptor (11) first, and then securely tighten the screws. Thereafter use the instructions provided by the template manufacturer for working.

Fig. 11

Fig. 12

9. VARIABLE SPEED CONTROL SWITCH

(See Fig. 12)

The variable speed control switch allows you to vary the speed of the router enabling the optimum speed to be selected for various size of router bits and to avoid the workpiece being burnt, this can occur especially when cross cutting. The speed increases as you turn the switch towards the higher numbers and decreases on the lower numbers (1 being slowest and MAX fastest).

10. SPEED DIAL

Limit the maximum speed using the speed dial (10). Turn the speed dial (10) backward to increase the speed (Fig. a). A higher setting is suitable when using large diameter router bits or working on hard materials like wood.

Turn the speed dial (10) forward to decrease the speed (Fig. b). A lower setting is suitable when using small diameter router bits or working on soft materials like plastic or aluminium.

Recommended rotation speed

Material	Speed stages
Hardwood (beech)	4 – MAX
Softwood (pine)	5 – MAX
Chipboard	3 – 6
Plastics	3 – 4
Aluminium	1 – 4

NOTE: Above values are for guidance only and may vary according to the actual workpiece.

11. SPEED CONTROL

1. Increase or decrease the speed of the router, rotating the dial. The speed increases as the numbers on the dial increase.
2. Adjust the speed to suit different working materials. The tool works quicker and smoother at different speeds when working in different woods.
3. Determine the optimum speed by making a trial cut in a scrap piece of material.

The setting on the dial equates approximately to no-load speeds that increase from approximately 11000min⁻¹ to approximately 30000min⁻¹ in 7 steps.

Ensure that you use the correct setting for the maximum rated speed of the router bit used.

Speed position	Symbol indicator of speed(min^{-1})
1	11000
2	15000
3	20000
4	24000
5	27000
6	29000
Max	30000

NOTE: Above speed table maybe can not accurate match your product speed, as it is our experience data. Just for reference.

12. STARTING THE ROUTER

NOTE: Before starting work make sure workpiece is firmly secured.

To start the router, press in lock off button with thumb then push on/off switch. Hold the two handles firmly and let the router reach full operation speed, lower the router to its working position, lock router with plunge lock leve. Move smoothly through workpiece. Release switch and lock lever, allow router to return to top starting position. Let the router stop fully before removing from workpiece.

NOTE: Stop the router before adjusting the variable speed.

Direction of feed

The router rotates in a clockwise direction, as a consequence the router must be moved left to right as you face the workpiece and anti-clockwise for outside edges.

Rate of feed

It is important to move the router at the correct speed through the work. The incorrect speed may produce a poor quality cut. Moving too fast can cause bit damage and a rough uneven cut.

A too slow speed can cause the wood to burn and the bit to overheat. The rate of feed will vary depending on the size of bit, material and router speed. To determine the best speed always practice on a small unseen area or a spare piece of the same material first.

WORKING HINTS FOR YOUR ROUTER

1. Using without a guide

This is useful for signwriting and creative work. Use only shallow cuts.

2. Rate of feed

The cutter of your router rotates clockwise.

For more efficient cutting, move your router from left to right as you stand facing the workpiece.

NOTE: When cutting outside edges, move your router anticlockwise and clockwise when cutting inside edges.

MAINTENANCE

Remove battery from the tool and the plug from the socket before carrying out any adjustment, servicing or maintenance.

Your power tool requires no additional lubrication or maintenance. There are no user serviceable parts in your power tool. Never use water or chemical cleaners to clean your power tool. Wipe clean with a dry cloth. Always store your power tool in a dry place. Keep the motor ventilation slots clean. Keep all working controls free of dust. Occasionally you may see sparks through the ventilation slots. This is normal.

If the supply cord of the charger is damaged, it must be replaced by the manufacturer, its service agent or similarly qualified persons in order to avoid a hazard.

Fig. 13

REPLACING THE CARBON BRUSH (See Fig. 13)

If you suspect that the brush may be worn or as a purely precautionary measure, it can be removed and inspected and replaced if required. Firstly remove the cap over the brush housing with a screwdriver. You can now remove the old carbon brush. Slide the new brush into the housing and relocate the cap and secure. Once the brush has been replaced check and confirm that the router still operates.

Allow the unit to run for a few minutes to enable the new brushes to 'bed' down.

ENVIRONMENTAL PROTECTION

 Waste electrical products should not be disposed of with household waste. Please  recycle where facilities exist. Check with your Local Authority or retailer for recycling advice. For further information visit www.recyclemore.co.uk

PLUG REPLACEMENT (UK & IRELAND ONLY)

If you need to replace the fitted plug then follow the instructions below.

IMPORTANT

The wires in the mains lead are coloured in accordance with the following code:

BLUE = NEUTRAL

Brown = Live

As the colours of the wires in the mains lead of this appliance may not correspond with the coloured markings identifying the terminals in your plug, proceed as follows. The wire which is coloured blue must be connected to the terminal which is marked with N. The wire which is coloured brown must be connected to the terminal which is marked with L.

Warning: Never connect live or neutral wires to the earth terminal of the plug. **Only fit an approved 13AMP BS1363/A plug and the correct rated fuse.**

Note: If a moulded plug is fitted and has to be removed take great care in disposing of the plug and severed cable, it must be destroyed to prevent engaging into a socket.

TITAN®

Declaration of conformity

We, Importer
Titan Power Tools (UK) Ltd
Trade House, Mead Avenue, BA22 8RT

Declare that the product:
Designation: ROUTER 1250W
Model: TTB591ROU

Complies with the following Directives:
2014/30/EU Electromagnetic Compatibility Directive,
2006/42/EC Machinery Directive
2014/35/EU Low Voltage Directive,
2011/65/EU Restrictions of the Use of Certain Hazardous Substances in Electrical and Electronic
Equipment
2012/19/EU Waste Electrical and Electronic Equipment (WEEE)

Standards and technical specifications referred to:
