REVISION RECORD

REVISION	DESCRIPTION
01 (2-19-70)	Preliminary edition.
02 (3-16-70)	Pages 5-3 and 5-47 revised.
A (9-15-70)	Manual released; equipment level FA705-A03.
B (5-5-71)	Manual revised; includes Engineering Change Order 26338. Pages 8-3 through 8-30 revised.
C (5-5-71)	Manual revised; includes Field Change Order 25999, equipment level FA705-A01 through A05. Pages 2-2, 2-5, 5-i, 5-ii, 5-iv, 5-v, 5-6, 5-7, 5-16, 5-17, 5-18, 5-19, 5-24, 5-29, 5-39, 5-40, 5-41, 5-43, 5-44, 5-45, 5-47, 7-1, 7-2, 7-3, 7-5, 9-7, 9-8, 9-9, 9-11, 9-16, 9-46, 9-47, 9-56, 9-59, 9-60, 9-69, 9-70, 9-71, 9-72, 9-75, 9-76, 9-77, 9-80, 9-82, 9-83, 9-87, 9-88, 9-96, 9-100, 9-107, 9-108, 9-109, 9-111, 9-112, 9-113, 10-5, 10-6, 10-7, 10-8, 10-21, 10-24, 10-29, 10-30, 10-34, 10-48, 10-51, 10-53, 10-59, 10-60, 10-61, 10-64, 10-67, 10-70, 10-73, 10-74, 10-75, 10-81, 10-83, 10-84, 10-88, 10-106, 10-117, 10-130, 10-133, 10-136, 10-137, and 10-141 revised.
D (5-5-71)	Manual revised; includes Engineering Change Order 26941. Page 8-3 revised.
E (5-5-71)	Manual revised; includes Field Change Order 26676, equipment level FA705-A01 through A06. Pages 5-iii, 5-8, 5-9, 9-63, 9-64, 9-76, 9-113, 10-36, 10-37, 10-38, 10-39, and 10-61 revised.
F (5-5-71)	Manual revised; includes Field Change Order 26574, equipment level FA705-A01 through A07. Page 5-49 revised.
G (1-20-72)	Manual revised, includes Field Change Order 27484. Pages 5-2, 5-3, 5-4, 5-5, 5-6, 5-7, 5-24, 5-25, 9-75, 9-79, 9-102, 9-103, 9-106, 9-112, 10-59, 10-67, 10-119, 10-122, 10-124, 10-125, 10-128, 10-129, and 10-133 revised. Correlation Sheet added.
H (1-20-72)	Manual revised; includes Engineering Change Order 27116. Page 8-8 revised.
J (11-3-72)	Manual revised; includes Field Change Order 28097. Page 5-49 is revised.
K (11-3-72)	Manual revised; includes Field Change Order 31495. Pages 5-44, 5-45, 9-108, 10-69, and 10-132 are revised.
L (11-3-72)	Manual revised; includes Engineering Change Order 32024. Page 5-49 is revised.
M (11-3-72)	Manual revised; includes Field Change Order 32301. Pages 5-6, 5-7, 9-78, 9-108, 9-111, and 10-143 are revised.
N (11-3-72)	Manual revised; includes Field Change Order 32524. Pages 5-26, 5-27, 5-28, 5-29, 9-72, 9-86, 9-113, 10-52, 10-53, 10-68, 10-80, and 10-83 are revised.
P	Manual revised; includes Engineering Change Order 32868, publications change only.
Publication No. 60290000

PREFACE

This manual is intended to be used by customer engineering in maintaining the CONTROL DATA® FA705 Mass Storage Controller and to serve as an aid in understanding the operation of the equipment.

It is assumed that the reader is familiar with the Control Data 3000 Series Computer Input/Output Specifications Manual and the Control Data 3553 and Mass Storage Controller Reference Manual.

The controller operates the following multiple disk drives (MDD) and disk files:

<u>Equipment No.</u>	<u>Product No.</u>
BM102 MDD (dual channel, two disk units)	841 MDD
BM104 MDD (dual channel, one disk unit)	841 MDD
BM101 MDD (single channel, two disk units)	841 MDD
BM103 MDD (single channel, one disk unit)	841 MDD
BH410 Disk File (dual channel, two disk units)	821-2 Disk File
BH408 Disk File (dual channel, one disk unit)	821-1 Disk File

SECTION 1

GENERAL DESCRIPTION

GENERAL DESCRIPTION

FUNCTIONAL CHARACTERISTICS

The CONTROL DATA FA705 Mass Storage Controller is an electrical and logical interface between a 3000 Data Channel and the storage units.

Figure 1-1 shows two subsystem configurations. Up to eight MDD or disk file units, in any combination, can be connected to the controller. Two controllers can be used as shown in Figure 1-1 (maximum subsystem) but only with dual channel disk units.

The main functions of the controller are:

1. Assembly/Disassembly
 - a. Assembly of the serial bit stream from disk unit into 12-bit bytes during Read operations.
 - b. Disassembly of 12-bit bytes from the data channel into a serial format during Write operations.
2. Addressing - The controller stores a 24-bit address, sent from the data channel, and transmits portions of this address to a disk unit to select a cylinder, track, and sector. During Read and Write operations the controller automatically increments the address so that these operations progress sequentially through all sector addresses within a disk unit.
3. Unit Selection - The controller selects one of the eight possible disk units for an operation.
4. Error Detection - The controller provides parity checking for the data channel interface. It also contains a cyclic encoder for checking data read from the disk units.

PHYSICAL CHARACTERISTICS

Figure 1-2 shows the major components in the controller. Standard 3000 logic cards are used throughout.

MINIMUM SUBSYSTEM

MAXIMUM SUBSYSTEM

Figure 1-1. Subsystem Configurations

CABINET DIMENSIONS AND DATA

Height	76 inches
Width	50 inches
Depth	31 inches
Weight	950 lbs.
Heat Dissipation	6100 BTU/hr
Operating Temperature (Input)	50°F - 90°F
Shipping and Storage Temperature	-30°F - 125°F
Humidity During Operation	20% - 80% *
Humidity While Not Operating	5% - 95% *

POWER REQUIREMENTS

The 60-Hz power should be provided by a 2-wire system (hot and neutral) and a separate ground line. The 400-Hz power should be provided by a 4-wire system (three phases and neutral) and a separate ground line. Refer to Table 1-1.

TABLE 1-1. INPUT POWER REQUIREMENTS

Voltage	Frequency	Current	Use
120 single phase	60 Hz	6.7 amperes	Blowers
208	400 Hz	3.3 amperes	Logic Power Supply
40	DC		Terminator Power

*Providing that there is no condensation

Figure 1-2. Chassis Layout, Rear View

SECTION 2

OPERATION

OPERATION

SWITCHES AND INDICATORS

This part lists the switches and indicators on the maintenance panel (Figure 2-1) and other portions of the controller.

CONTROL PANEL (KEY SWITCH)

For normal programmed operation, this switch should be OFF. This switch is used to activate other switches on the maintenance panel.

CONTROL A AND CONTROL B

CONTROL A and CONTROL B are two sets of switches and indicators which provide individual control for each data channel physically connected to the controller. Each set consists of a nine-position rotary switch which permits varying the equipment (controller) designation from 0-7 or STANDBY, and a CONNECTED, RESERVED, and PARITY ERROR indicator which lights when the associated condition exists in the controller.

TRACK

This switch/indicator selects Track mode wherein the remainder of the track designated by the content of the Address register is operated upon, starting at the address held in the Address register. Operation ceases at the end of the selected track.

CYLINDER

This switch/indicator selects Cylinder mode wherein the remainder of the cylinder designated by the content of the Address register is operated upon, starting at the address held in the Address register. Operation ceases at the end of the selected cylinder.

FILE

This switch/indicator selects File mode wherein the remainder of the file designated by the content of the Address register is operated upon, starting at the address held in the Address register. When using this switch, the REPEAT switch should be off since a file will not be repeated automatically.

Figure 2-1. Maintenance Panel and Controls

REPEAT

This switch/indicator causes the selected mode of operation (Track Cylinder or File) to be continuously repeated. This switch should not be used by the programmer/operator. It is meant for maintenance purposes only. When this switch is used, the controller does not stop for any abnormal conditions unless it is unable to continue. When in File mode, this switch should be off. A File will not be repeated.

SEEK ADDRESS

This switch/indicator initiates a Seek operation on the selected unit to the address indicated by the content of the Address register. On completion of the Seek, the selected operation commences.

MASTER CLEAR

This switch/indicator causes a Master Clear in the controller. If a Master Clear is performed while a Write operation is in progress, operation ceases immediately. That sector now contains information which will generate a checkword error if a Read operation is attempted.

DEVICE SELECT

For normal programmed operation, this switch should be OFF. This rotary switch selects the device type (disk drive, disk file) from the maintenance panel.

REGISTER SELECT

This rotary switch provides the capability for displaying and entering information via the Register Display Indicator Switches to or from the register selected.

REGISTER DISPLAY INDICATOR SWITCHES

Thirteen indicator-type pushbutton switches (CLEAR and bits 0-11) provide for displaying and/or entering information to and from the register indicated by the setting of the REGISTER SELECT switch when the Key switch is on. The CLEAR switch clears only the selected register.

DEFECTIVE TRACK

For normal programmed operations this switch should be OFF. This toggle switch is used to write a Defective Track bit in each sector of the Address Headers (refer to Procedures for Writing Address Headers).

DATA

For normal programmed operations, this switch should be in the READ position. In the WRITE position this toggle switch provides for writing data from the panel via the Register Display Indicator switches. The same data byte is written in the entire storage area specified by the mode selection (TRACK, CYLINDER and FILE).

In the Read Position this switch provides for reading data from the selected storage area. The data read is not displayed in the Data register when operating from the panel; however, a checkword error and other errors are displayed in the Status register.

HEADER

For normal programmed operations this switch should be in the READ position. This toggle switch provides for writing or reading address headers in the storage area selected during a control panel operation according to the setting of the ending mode switches (refer to Procedures for Writing Address Headers).

WRITE LOCKOUT

This switch, in conjunction with the Key switch, determines the degree of data protection provided by the controller to the subsystem units as follows:

<u>WRITE LOCKOUT</u>	<u>KEY</u>	<u>DATA</u>
On/Off	Off	Data protected from computer Write if WLO bit present
On	On	Data protected from computer Write if WLO bit present
Off	On	Data not protected even if WLO bit present

CAUTION

Data is not protected during panel operations
if HEADER switch is in Write position.

NOTE

For programmed operation the mode (TRACK, CYLINDER, FILE), REPEAT, SEEK ADDRESS, and MASTER CLEAR switches should be off.

REPEAT SEEK

This switch, located at card location 1D05A, is for maintenance purposes only and causes the disk unit to seek alternately between cylinder 0 and the selected cylinder when:

1. It is on (up position),
2. Track or Cylinder mode is selected, and
3. The SEEK ADDRESS switch is pressed.

REPEAT SEEK OPERATE

This switch, located at card location 1D05B, is for maintenance purposes only and causes the disk unit to seek alternately between cylinder 0 and the selected cylinder and perform an operation when:

1. It is on (up position),
2. The REPEAT SEEK switch is on,
3. Track or Cylinder mode is selected, and
4. The SEEK ADDRESS switch is pressed.

The controller will stop for an error condition and the REPEAT switch will not override an error.

HEAD LIMIT

This switch, located at card location 1D05C is for maintenance purposes only and causes the unused indicator in the SEEK-SWITCH to light when:

1. A maintenance aid switch is left on.
2. The REPEAT-SEEK switch is on (up position).
3. The HEAD-LIMIT switch is on (up position).

MANUAL OPERATION

Operation of the disk storage subsystem is under program control from the computer through the use of the Connect and function codes. Initial manual starting procedures include turning the power on, selecting the various switch settings, and loading a disk pack into the associated unit (if none are presently loaded). Disk packs and files must have headers recorded before they can be used for programmed operations.

POWER

The following procedure turns on the power for the subsystem.

Disk Drive: Turn on the main power switch and terminator power switch (located on top of the power distribution box in the back of the cabinet).

The disk drive units automatically enter a Power On sequence. Each disk drive unit requires approximately 1 minute to come up to speed and land the read/write heads. In a multiple unit system each succeeding disk drive motor is automatically sequenced. The sequencing overlaps and a full complement of drive units should be up to speed in approximately 2 minutes. As soon as the disk drive units become operable (read/write heads landed) and the PHYSICAL UNIT NUMBER indicator lights, operation of the disk drives may begin; however, a 15-minute warm-up period is recommended when commencing from a cold start.

Disk File: Normally the disk file and associated hydraulic unit should have all switches in the proper position and only step 7 should be necessary to activate the units.

CAUTION

The blowers should remain on at all times to prevent dirt accumulation on the disk surfaces.

If the units must be started from a completely shut down position, the following steps should be performed:

1. Open front doors on the disk file and hydraulic unit and the right side door on the disk file.
2. Place all front panel circuit breakers of both units to the ON position.
3. Set both Positioner switches to the NORMAL position.
4. Set all Manual/Automatic switches to the AUTOMATIC position.
5. Set FILE OPERATION switch to the AUTOMATIC position.
6. Set main circuit breaker (located below power distribution panel) to the ON position.
7. Press START and observe START indicator light. The following indicators light temporarily: LOW FILE TEMP, STACK RPM 0, STACK RPM 1, and dc voltages.

The disk file requires approximately 3 minutes to come up to operating speed; the hydraulic unit requires approximately 15 minutes (on water cooled unit).

LOADING AND UNLOADING PROCEDURES

The storage medium of the disk file units cannot be changed. The following procedures should be performed to load or change the storage medium in the disk storage drive:

1. If the unit is operating, turn power OFF by pressing the START switch located on the front of the disk drive unit. Wait until the spindle stops rotating and the SPIN light turns OFF.
2. Pull the appropriate drawer forward as far as possible.
3. Load or unload the pack as follows:

Loading

Place the pack on the spindle and turn the cover handle clockwise to a full stop position. The pack should now be tight on the spindle and the protective cover should lift off easily.

Unloading

Engage the protective cover over the disk pack and rotate the cover three times in a counterclockwise direction. The pack releases from the spindle and can be lifted from the drive unit.

4. Close the disk drive unit drawer and press the START switch on the front of the drive unit. This causes the unit to perform an initial Seek operation which positions and loads the read/write heads and brings the unit to the Ready state.

READY STATE

The controller is always Ready when power is available; however, subsystem readiness (indicated by the Ready status bit) depends upon the state of the selected storage unit.

The requirements and time necessary to bring the subsystem components to the Ready state are:

Disk File

The disk file units are Ready only when all of the following are present:

1. Power is available to the disk and hydraulic units,
2. The hydraulic and air systems are operating,
3. Hydraulic temperature (100°F) and pressure (1100 psi) are up to normal,
4. The disks are spinning and up to speed (1750 rpm), and
5. The positioner is in the landing area and the read/write heads are landed and in an operating position.

Disk Storage Drive

The disk drive units are Ready only when all of the following are present:

1. A pack is loaded,
2. The drawer is closed,
3. The disks are spinning and up to speed (2400 rpm), and
4. An initial seek has been performed to position the read/write heads.

PROCEDURES FOR WRITING ADDRESS HEADERS

Address Headers can be written only from the maintenance panel. In order to write the Header, Defective Track, and Write Lockout bits, the following procedure should be followed:

1. Turn the maintenance panel Key switch ON. Select the proper device type with the DEVICE SELECT Switch.
2. Set the REGISTER SELECT switch to the UNIT position, load the desired unit number into the Unit register and press the SELECT switch.
3. Select the desired ending mode by pressing the appropriate mode switch (TRACK, CYLINDER, etc.).
4. Enter the starting addresses into the upper and lower portions of the Address register. (Select the appropriate portion of the Address register via the REGISTER SELECT switch and enter the starting address by pressing the appropriate indicator/pushbutton switches.)

5. If there is no useable data in the sectors where new headers are to be written, it is recommended that both the HEADER and DATA switch be set to the WRITE position. If there is useful data in the sectors and it is desired that only headers be written, the HEADER switch must be set to the WRITE position and the DATA switch to the READ position.

NOTE

Do not use the REPEAT mode switch when writing headers. Ensure that the REPEAT switch is OFF.

6. If Write Lockout and/or Defective Track bits are to be written, these switches should be set to ON.
7. Press the SEEK ADDRESS switch.

Step 7 initiates the operation which will end when the address of the last sector of the selected storage area has been written or an abnormal condition will be displayed in the Status register.

On completion of the operation, select READ HEADERS and READ DATA and read (verify) the area just written. Error conditions will be displayed in the Status register.

NOTE

When in Read Data mode, the data read is not displayed in the Data register.

When completed, return all switches to their normal positions.

PROCEDURES FOR WRITING DATA

Data can be written from the maintenance panel. The procedure is to read headers and write data. The following procedures should be followed:

1. Turn the maintenance panel Key switch ON. Select the proper device type with the DEVICE SELECT switch.
2. Set the REGISTER SELECT switch to the UNIT position, load the desired unit number into the Unit register, and press the SELECT switch.
3. Select the desired storage mode by pressing the appropriate corporate switch (TRACK, CYLINDER, etc.).

4. Enter the data to be written into the Data register. Select the Data register via the REGISTER SELECT switch and enter the data by pressing the appropriate indicator/pushbutton switches.
5. Set the HEADER switch to READ and the DATA switch to WRITE.
6. The WRITE LOCKOUT and/or DEFECTIVE TRACK switches should be OFF.
7. Press the SEEK ADDRESS switch.

Step 7 initiates the operation which will end when the last sector of the selected storage area has been written or an abnormal condition occurs. Any abnormal condition will be displayed in the Status register.

On completion of the operation, select READ HEADERS and READ DATA and read (verify) the area just written. Error conditions will be displayed in the Status register.

NOTE

When in Read Data mode, the data read is not displayed in the Data register.

When complete, return all switches to their normal positions.

SECTION 3

INSTALLATION AND CHECKOUT

INSTALLATION AND CHECKOUT

CRATING

Should a requirement arise to crate this equipment in preparation for shipment to another destination, consult Procedure 8:504:00 in the Customer Engineering Field Procedures Manual. This should provide the latest information to aid in obtaining packaging materials and kits.

PHYSICAL DIMENSIONS

Physical dimensions of the cabinet are included in Section 1.

POWER REQUIREMENTS

Power requirements are included in Section 1.

POWER CONNECTIONS

Refer to Section 5 for the diagram showing power input terminals. Figure 1-1 shows the location of the power distribution box that houses the power terminals. Power connections should be made according to Figure 3-1, in accordance with local electrical codes.

CABLING AND CONNECTORS

The distance between each cable connector and the floor is shown in Figure 3-2. This information is required when determining the lengths of the cables between the controller and the disk units or data channels. Figure 3-3 shows how the signal cables are connected in a typical system. Figure 3-4 shows disk file cabling.

COOLING REQUIREMENTS

There are no special cooling requirements. Room air is used for cooling purposes.

ENVIRONMENTAL CONSIDERATIONS

Information concerning temperature and humidity is included in Section 1.

Figure 3-1. Power Connections

Figure 3-2. Connector Panel

NOTE:

IN SYSTEMS THAT CONTAIN LESS THAN 5 DISK UNIT CABINETS THE CABLE B CONNECTORS (IJ3 - IJ7) MUST BE USED AS FOLLOWS:

- 1 CABINET USE IJ3 FOR CABLE B
- 2 CABINETS USE IJ3 AND IJ4
- 3 CABINETS USE IJ3, IJ4, AND IJ5
- 4 CABINETS USE IJ3, IJ4, IJ5, AND IJ6

Figure 3-3. Typical System Signal Cabling - MDD

(3) Includes inter-unit cabling

Figure 3-4. Typical Subsystem Signal Cabling (MDD and Disk File)

SECTION 4

THEORY OF OPERATION

THEORY OF OPERATION

SIGNAL DEFINITIONS

DATA CHANNEL INTERFACE

The connector pin numbers are included in the Cable Tabs portion of the Wire Lists, Section 9.

Refer to the 3000 Input/Output Specifications (Pub. No. 60048800) for a description of these signals.

STORAGE UNIT INTERFACE

The connector pin numbers are listed in the Cable Tabs portion of the Wire Lists, Section 9.

Address and Control Bus

These nine lines carry address and control information between the controller and selected storage units. The data on these lines is defined by one of the accompanying select lines.

Cylinder Select *upper address*

When this line is a "1", it indicates to the selected Storage Unit that the Address and Control Bus now contains positioning information. The positioning information is the controller's current cylinder address. The bit assignments are as follows:

<u>Address and Control Bus</u>	<u>Cylinder Number</u>
Bit 0	1
Bit 1	2
Bit 2	4
Bit 3	8
Bit 4	16
Bit 5	32
Bit 6	64
Bit 7	128
Bit 8	256
Bit 9	512

Head Select

When this line is a "1", it indicates to the selected storage unit that the Address and Control Bus now contains head select information. The bit assignments are as follows:

<u>Address and Control Bus</u>	<u>Head Number</u>	<i>lower address</i>
	Disk File	Disk Pack
Bit 0	1	1
Bit 1	2	2
Bit 2	4	4
Bit 3	8	8
Bit 4	16	16
Bit 5	32	Not Used
Bit 6	Not Used	Not Used
Bit 7	Not Used	Not Used
Bit 8	Not Used	Not Used

Difference Select

When this line is a "1", it indicates to the selected disk pack unit that the Address and Control Bus now contains positioning information. The positioning information is the difference between the disk unit's current cylinder and the controller's current cylinder. The bit assignments are as follows:

<u>Address and Control Bus</u>	<u>Cylinder Difference</u>
Bit 0	1
Bit 1	2
Bit 2	4
Bit 3	8
Bit 4	16
Bit 5	32
Bit 6	64
Bit 7	128
Bit 8	256
Bit 9	512

Control Select

When this line is a "1", it indicates to the selected storage unit that the Address and Control Bus now contain control information. Bit assignments are as follows:

<u>Address and Control Bus</u>	<u>Control Signals</u>
Bit 0	<u>Write Enable</u> Disk Units - When this line is a "1", it enables the write driver.
Bit 1	<u>Read Enable</u> Disk Units - When this line is a "1", it enables the read amplifiers.
Bit 2	<u>Seek Forward</u> Disk Units - When this line is a "1", it initiates the positioning sequence in a forward direction.
Bit 3	Not Used
Bit 4	<u>Erase Enable</u> Disk Units - This line follows the Write Enable and is used to erase the data prior to writing.
Bit 5	<u>Seek Backward</u> Disk Units - When this line is a "1", it initiates the positioning sequence in a backward direction.
Bit 6	<u>Restore</u> Disk Packs - When this line is a "1", it initiates positioning motion to position zero.
Bit 7	Not Used

Read Cylinder Select

When this line is a "1", it enables the Address and Control Bus transmitters in the selected disk unit. The information transmitted to the controller is the current cylinder address.

Bit assignments are as follows:

<u>Address and Control Bus</u>	<u>Cylinder</u>
Bit 0	1
Bit 1	2
Bit 2	4
Bit 3	8
Bit 4	16
Bit 5	32
Bit 6	64
Bit 7	128
Bit 8	256

Sector Select

When this line is a "1", it indicates to the selected disk unit that the Address and Control Bus now contains sector information. The bit assignment is as follows:

<u>Address and Control Bus</u>	<u>Sector</u>
Bit 0	1
Bit 1	2
Bit 2	4
Bit 3	8
Bit 4	16

Positioner Ready

When this line is a "1", it indicates that the selected storage unit is in position and is ready to read or write.

On Sector or Seek Error

When this line is a "1", it indicates that any storage unit which has been addressed has either completed a seek or is unable to complete a seek.

Sector Mark

This line is used to receive track reference marks from the selected storage unit.

Index

This line is used to receive a track reference mark from the selected storage unit. All other track reference marks must be measured in time from this point.

Seek Error

When this line is a "1", it indicates that the selected storage unit was unable to complete a Seek operation to the point of returning a Positioner Ready signal to the controller.

Unit Select

Initiates the select sequence in the unit whose logic number corresponds to the number on the four logic number lines.

Unit Selected

These nine lines are used to check which physical storage unit is selected.

Clear

This line goes to a "1", when a Master Clear, Channel Clear, Release, or Function Clear occurs. It will unreserve units on the clear channel without regard for status.

Pack Unsafe

This line indicates that the selected storage unit has one or more fault conditions. These conditions are:

1. More than one head selected.
2. Both write and read controls enabled.
3. Erase driver on and no write driver enabled.
4. Both write drivers enabled.
5. Read or write driver enabled and Not Ready status.

Unit Ready

This line indicates that the selected storage unit is ready to use.

Write Data

This line is used to transfer data to be written to the selected storage unit.

Read Data

This line is used to transfer data from the selected storage unit.

Release

This line clears the Compare Enable FF's in the selected drive unit.

Clock Source

This line carries the recorded clock to the controller.

Unit Busy

Indicates selected unit is reserved by the other channel. When a channel selects a unit which is reserved by another controller, it receives a Unit Busy signal.

SECTION 5

DIAGRAMS

DIAGRAMS

SYMBOL INDEX

The symbol index lists all logic terms in the controller and shows the logic diagram page number for each term.

Logic diagrams represent a symbolic approach to electronic schematics. By using symbols to represent building block circuits, the diagram becomes easy to read if the reader understands the function of the symbols. In Control Data Corporation logic, two signals, a logical 0 ("0") and logical 1 ("1"), are the possible input or output conditions of a circuit. A circuit with an output of "1" is "up" and a circuit with an output of "0" is "down". Detailed descriptions of logic symbols and their associated building block circuit cards are contained in the appropriate printed circuit manual (1604 and 3600 Card Types). Refer to the Literature Distribution Center Catalog for the publication number and latest revision level.

STANDARD LOGIC SYMBOLS

Standard logic diagram symbols for Control Data equipment using 1604- or 3600-type cards are inverters, flip-flops, control delays, capacitive delays, inductive delays, and line drivers and receivers.

Inverters

An inverter is a logic element which provides an output that is an inversion of its input. When more than one input is provided to an inverter, "1's" take precedence over "0's" and drive the output of the inverter to "0". Because any "1" input of several inputs drives the output to a "0", an inverter may be considered an inverting OR (NOR) gate when more than one input is present.

Figure 1. Inverter Symbols

Acceptable conventions for showing multiple OR inputs are given in Figure 2.

Figure 2. OR Circuit Conventions

An AND gate requires that all its inputs be "1's" in order that its output be a "1". If one or more of the inputs to an AND gate are "0", the output is a "0". Figure 3 illustrates conventions for showing AND gates feeding an inverter.

Figure 3. AND Circuit Conventions

Figure 4 illustrates a combination AND/OR input.

Figure 4. AND/OR Circuit Convention

KEY TO LOGIC SYMBOLS

(STANDARD 1604 OR 3600 CARD TYPES)

Flip-Flops (FF)

The flip-flop (FF) is a storage device with two stable states - designated as Set and Clear - and is composed of two or more inverters. The logic symbols (Figure 5) are formed by the combination of inverter symbols. By convention, Set inputs and outputs are shown in the upper part of the symbol and Clear inputs and outputs are shown in the lower part of the symbol.

Figure 5. Flip-Flop Symbols

Figure 6 illustrates the interconnection of inverter symbols to form a flip-flop symbol. The term numbers assigned to each flip-flop are the term numbers of the internal inverters as seen by comparing the terms in Figure 5 with those in Figure 6. Notice that the Set output is the output of inverter K001, and the Clear output is the output of inverters K000 and K002.

Figure 6. Internal Inverter Connections for a Flip-Flop

Control Delay

A control delay is a timing device consisting of an H term which receives the input and one or more V, Y, or N terms to provide the outputs. The H term is essentially a flip-flop with controlled feedback and occupies an entire printed circuit card. The output term(s) are inverter(s) located elsewhere on the logic chassis. The "1" outputs from a control delay are clocked pulses which are delayed one phase time from the "1" inputs. Clock inputs are not shown on the logic diagrams for any H, V, Y, or N terms; these terms, which control the start and duration of the delayed output pulses, may be found in the Equation Summary. Figure 7 illustrates two representative forms of the control delay symbol, with possible inputs and outputs labelled. Figure 8 shows the electrical connections for the two forms.

Figure 7. Control Delay Symbols

Figure 8. Electrical Connections for Control Delay

Control delays may have multiple inputs and/or multiple outputs. When a control delay has multiple output terms (i.e., more than one V, Y, or N term), each output term may have a separate conditioning input.

Capacitive Delays

A capacitive delay is used to delay the "1" input to a logic element. ("0" inputs are not affected by the delay.) Capacitive delays may be active or passive, depending upon whether or not transistors are used as part of the delaying circuit. Delay periods are checked by using a dual-trace scope connected to the input and output of the delay producing element. The actual connection points for the scope and probes vary for different cards and should be determined by referring to the Printed Circuit Manual.

Active delays may be recognized by the circuit letter always present as part of the card location. Pin numbers are also shown when external wiring is needed to connect the proper capacitance. In Figure 9, the pluggable delay uses this wiring to connect to capacitors on the same card. In the third example, this wiring connects to capacitors located on two separate capacitor cards.

Figure 9. Active Capacitive Delays

All passive capacitive delays (Figure 10) are formed by wiring grounded capacitors, located on one or more capacitor cards, as an AND input to the affected logic element. For this reason, all passive delays show pin numbers to provide this external wiring data.

Figure 10. Passive Capacitive Delays

Capacitive delays may be adjustable or nonadjustable, depending on the card type and/or the external wiring connections on the card. When it is necessary to adjust the delay period in order to obtain specified circuit operation (usually done by varying a potentiometer in the RC network), a diagonal arrow is added to the delay symbol as shown in Figure 11.

Figure 11. Adjustable Capacitive Delays

Inductive Delays

An inductive delay is used to delay either the "1" or "0" input to a logic element or as a tapped delay line for timing of operations. The symbol for this delay is an elongated oval with a double vertical line just within the input end of the oval. When used as a tapped delay line, the inductive delay is terminated in its characteristic impedance. Inductive delays are identified

in the same manner as capacitive delays (except for the vertical lines) unless they are used as delay lines. On multi-section cards where no identifying circuit letters are present, pin numbers are shown adjacent to the input and output arrows. Figure 12 shows both kinds of inductive delays.

Figure 12. Inductive Delays

Line Drivers/Receivers

Voltage levels used to represent "1's" and "0's" on cables are different from those used for internal logic. The level shift to and from internal logic is made by line drivers and line receivers. These cards may be considered as inverting the signal electrically, but not logically. The letters commonly associated with these cards are L & M (1604) and R & T (3000 Series). A 3000 Series Receiver may also be used to perform a logical inversion by swapping the twisted pair wires. This usage is indicated by a circle on the input side of the symbol. In Figure 13, "1's" and "0's" have been added to clarify the logic states; they are not part of the symbol.

Figure 13. Typical Line Driver/Receiver Symbols

NON-LOGIC CONVENTION

The use of the double vertical bar, as shown in Figure 13, denotes a shift in signal voltage level from that used in internal logic. The double bar appears on the input or output side of the symbol, depending on which side connects to the non-logic-level signal. No particular voltage level is implied by the double bar - only that it is non-logic.

JACK ASSIGNMENTS

Each numbered term in the logic diagrams contains a jack assignment showing the physical location of that hardware element and the test point (circuit section) associated with it. For some card types, the test point letter is replaced by a pin number. For these cases, a card extender must be used in order to test that section of the card. Also, some symbols show no test point. This is because the entire card is used for one purpose (e.g. a single inverter, FF, or control delay). Figure 14 illustrates the inverter J001, with 2D12A representing its jack assignment.

*When most or all jack assignments are located on one chassis, the chassis numbers for that chassis are omitted. All multi-chassis devices include a chassis number as part of each jack assignment.

Figure 14. Jack Assignment Scheme

CABLE IDENTIFICATION

Cable connections are represented by the MIL-STD-15 symbol and identified as to connector location and pins used, as shown in Figure 15.

Figure 15. Cable Connections

SPECIAL LOGIC SYMBOLS

Nonstandard elements (special logic and/or non-logic elements) are represented by a special circuit symbol (generally a rectangle as shown in Figure 16). The special circuit symbol always shows the symbol designation, jack location, and the card type. Supplemental information may also be shown such as in the case of special delay cards which indicate the delay period. For detailed information refer to the specific card type in the appropriate Printed Circuit or Logic Module Manual.

Figure 16. Symbol for Special Circuits

INPUT/OUTPUT DESIGNATIONS

Where several pages of logic are involved, a symbol index and term list (side cars) are incorporated within the manual. Also in certain instances such as special card types or on equipments for which no equation summary exists (as for peripheral devices) input and output pin numbers are indicated on each logic element as are the output destinations of the elements (Figure 17).

Diagram showing Maintenance Panel Switch Terms (M000-M011) connected to Shift Register (S003-S113), Channel A Data Receivers (R100-R113), Channel B Data Receivers (R000-R011), and Counter I Terms (C001-C111). The diagram includes a legend for inputs and outputs.

INPUTS:
 M000-M011 MAINTENANCE PANEL SWITCH TERMS
 S003-S113 SHIFT REGISTER
 R100-R111 CHAN A DATA RECEIVERS
 R000-R011 CHAN B DATA RECEIVERS
 C001-C111 COUNTER I TERMS

OUTPUTS:
 ADDRESS REGISTER
 UNIT REGISTER
 FUNCTION TRANSLATORS
 BUFFER REGISTER

DATA BUS ENABLES

MAINTENANCE PANEL SWITCHES

MAINT PANEL (REPEAT)

[illegible]

The diagram illustrates the MODES section of a control system, featuring five main input channels and a common output line. Each channel consists of a switch (SW7-SW11) and a series of logic components including ICs (1C13A, 1C11D, 1C11C, 1C11B, 1C11A, 1C12F, 1C12E, 1C12D, 1C12C), MOs (2F16A, MO12, MO28, MO27, MO26, MO25, MO24, MO23, MO22, MO21), and IOs (2120C, J231, 1D07B, 1D07A, 1D08D, 1D08C, 1D08B, 1D09D, 1D01A, 1D10B, 1D10A, 1D10B, 1D10C). The diagram also includes various control signals like SELECT, TRACK, CYLINDER, FILE, REPEAT, READ DATA, WRITE DATA, READ HEADER, WRITE HEADER, and MAINT MODE. A -20V supply is connected to the TRACK line.

Diagram of a rotary switch with 12 positions, numbered 1 to 12. Position 12 is labeled "COMMON".

SECTION 6

MAINTENANCE

MAINTENANCE

TOOLS AND TEST EQUIPMENT REQUIRED FOR MAINTENANCE

Tektronix 545 oscilloscope or equivalent

Type CA Dual Track Plug-in unit for Tektronix 545

Taper Pin Removal and Insertion Tool

Card Extender for 3000 cards, Part No. 30093800

Jeweler's Screwdriver

Standard set of tools required for electronic maintenance

MAINTENANCE PANEL

The maintenance panel can be used to exercise the controller and disk units under manual control. It is also used to write headers on the disk units.

Refer to Section 2 of this manual for a description of the maintenance panel and manual operating procedures.

CONTROLLER PREVENTIVE MAINTENANCE INDEX

Level 1 Weekly or -----150 hours

Level 2 Monthly or ----- 500 hours

Level 3 Quarterly or ----- 1,500 hours

Level 4 Semi-Annual or ----- 3,000 hours

LEVEL	ITEM	PREVENTIVE MAINTENANCE
1	1.1	Check blower operation
1	1.2	Verify operational capability
1	1.3	Check power supply percentage meters
2	2.1	Clean cabinets
2	2.2	Clean air filters
3	3.1	Check power supply output
3	3.2	Check system performance with voltage margins applied
4	4.1	Perform shock test
4	4.2	Mechanical inspection

1.1

CHECK BLOWER OPERATION

CHECK/Conditions

Action

1. Blower power on.
2. Are the blowers in each cabinet providing air circulation?

Yes

No

1. Isolate problem.
2. If required, replace defective blower as follows:
 - a. Lower the back trim panel.
 - b. Remove four bolts that secure the blower housing to the frame.
 - c. Pull the blower housing out.
 - d. Unfasten the power cable at the rear of the blower housing.
 - e. Replace the defective blower.

Go to next item.

1.2

VERIFY OPERATIONAL CAPABILITY

CHECK/Conditions

Action

1. System power on.
2. DC chassis voltages
 - a. +19.6 volt
 - b. -19.6 volt

1. Load the SMM tape
2. Call in and execute the appropriate SMM diagnostic for the controller and peripheral device being tested. Reference the SMM Manual.

1.3

CHECK POWER SUPPLY PERCENTAGE METERS

CHECK/Conditions

Action

1. System power on.

2. Preventive maintenance time
elapsed.

3. Are the percentage meters at 0%?

Yes

No

1. Zero the percentage meters.

4. Turn system over to customer.

2.1

CLEAN CABINETS

CHECK/Conditions

Action

1. System power on.

1. Thoroughly vacuum all dirt and dust from cabinets and immediate area.
2. Using water and a mild detergent solution, wipe down cabinets.

2.2

CLEAN AIR FILTERS

The filter is:

1. Accessible by opening the front doors and lowering the bottom trim.
2. Accessible by lifting up the floor board underneath the front trim.

CHECK/Conditions

Action

1. System power on.
2. Remove the filters.

1. Wash the filters using the following procedure:
 - a. Flush with warm water. Do not use a high pressure stream.
 - b. Shake out moisture and let dry thoroughly.
 - c. Spray intake side of filters with a light coat of Super Filter Coat adhesive, CDC Part No. 12210958.
 - d. Let adhesive dry before replaing filters.

CHECK/Conditions

Action

1. System power on.
2. Cover removed from power supply.
3. Oscilloscope settings as follows:
 - a. Time Base at 1 ms/cm
 - b. A probe only; 10X probe
 - c. Voltage setting at 0.2v/cm
 - d. Sync internal
4. Scope all diode block transformers (pin 11) while completing the following:

NOTE

Use Figure 6-1 as a guide while scoping the diode blocks. Figure 6-1 shows two waveforms. The top waveform is typical of the waveform seen (at pin 11) when the diode block has two open diodes. The bottom waveform is typical of a properly operating circuit.

CHECK: Is the waveform observed similar to the bottom waveform of Figure 6-1?

Figure 6-1.

3.1 (Continued)

CHECK/Conditions

Action

Yes

No

1. If the waveform observed is similar to the upper waveform of Figure 6-1, one or more diodes is defective.
2. Repeat CHECK.

5. Visually inspect the muffin fans in the power supply.

CHECK: Are they operating?

Yes

No

1. Check for 60-cycle, 115 volts at terminals.
2. Correct discrepancy.
3. Repeat CHECK.

6. Measure the voltages, using a precision dc voltmeter.

CHECK: Are the voltages set at ± 19.6 volts?

Yes

No

1. Adjust voltages to the desired levels.
2. Zero any percentage meter where an adjustment was required.
3. Repeat CHECK.

Go to next item.

3.2 CHECK SYSTEM PERFORMANCE WITH VOLTAGE MARGINS APPLIED

Use a precision dc voltmeter to set voltage margins.

On a rotational basis, run all operational tests under all conditions below so that all conditions are covered at least once a month.

CHECK/Conditions	Action
1. System power on. Set dc chassis voltages to (+7-1/2%, +21.1 volts), (+7-1/2%, -21.1 volts)	Run the appropriate SMM diagnostic for the controller and peripheral device being tested. Reference the SMM Manual. Correct any errors.
2. Set dc chassis voltages to (-7-1/2%, +18.1 volts), (-7-1/2%, -18.1 volts)	Run the appropriate SMM diagnostic for the controller and peripheral device being tested. Reference the SMM Manual. Correct any errors.
3. Set dc chassis voltages to (+2.5%, +20.1 volts), (-2.5%, -19.1 volts)	Run the appropriate SMM diagnostic for the controller and peripheral device being tested. Reference the SMM Manual. Correct any errors.
4. Set dc chassis voltages to (-2.5%, +19.1 volts), (+2.5%, -20.1 volts)	Run the appropriate SMM diagnostic for the controller and peripheral device being tested. Reference the SMM Manual. Correct any errors.
5. Return all voltages to normal.	

4.1

PERFORM SHOCK TEST

NOTE

Schedule shock testing on a rotational basis so that each controller is completed at least once each six months.

CHECK/Conditions

Action

1. System power on.
2. Load and execute the appropriate SMM diagnostic for the controller and peripheral device being tested. Reference the SMM Manual.
3. Using a plastic faced hammer, tap lightly in the center of each card in the controller, while monitoring test.

CHECK: Is test still running?

4.2

MECHANICAL INSPECTION

CHECK/Conditions

Action

1. Do all door assemblies open and close without binding on lower trim panel or top assembly?

2. Are the friction catches aligned correctly and free of foreign material?

3. Ensure power supply covers are in place and secured.

4.2 (Continued)

CHECK/Conditions

Action

4. Ensure that the cable cut out covers are in place and are fastened with the turnlock fasteners.
5. Ensure that the power distribution box covers are in place and secured.

This card list shows those logic terms which occupy card sections E or F. These terms do not appear on the standard map, which shows only card sections A, B, C, and D.

DISCRIMINATOR, TYPE BDM

This card discriminates between "1" and clock pulses coming off the disk. The diagram below shows the relationship between timing and data pulses sampled at various points. Because cell time is transient in nature and pattern sensitive, the discriminator must be adjusted for the pattern on both the inner and outer disk positions. Adjustment should be made at TPA 2 so that the signal is long enough to detect all "1's" but short enough to ignore any clocks. TPA 2 should be adjusted for a 250-nsec + pulse.

LINE RECEIVER, TYPE BGM

This card contains three receiver circuits similar to 3000 type receivers. These circuits are self terminating and the input wires cannot be reversed to achieve a logical inversion. The circuits on this card are non-inverting and receive data and signals from the disk units.

NOTES:

1. UNLESS OTHERWISE SPECIFIED:
ALL RESISTANCES ARE IN OHMS.
ALL CAPACITANCES ARE IN PF.
ALL RESISTORS ARE 1/4 W, $\pm 5\%$.
ALL CAPACITORS ARE $\pm 20\%$.
2. REFERENCE DRAWINGS:
ASSEMBLY 52570300
BOARD 52570100

Line Receiver, Type BGM

OSCILLATOR SHAPER, TYPE BFM

This circuit is a 5.06 MHz oscillator and shaper with a square-wave output. The negative pulses should be adjusted for 100 nsec.

NOTES:

1. UNLESS OTHERWISE SPECIFIED:
ALL RESISTANCES ARE IN OHMS.
ALL CAPACITANCES ARE IN PF.
- ALL RESISTORS ARE 1/4 W, $\pm 5\%$.
ALL CAPACITORS ARE $+80\%$ -20% .
2. REFERENCE DRAWINGS:
ASSEMBLY: 52564000
BOARD : 52565000

Oscillator Shaper, Type BFM

PULSE SHAPER, CONVERTER TYPE 6AFH

Each of the two circuits on this card converts an output of the discriminator to controller voltage levels.

NOTES:

1. UNLESS OTHERWISE SPECIFIED:
ALL RESISTANCES ARE IN OHMS.
ALL CAPACITANCES ARE IN PF.
ALL RESISTORS ARE 1/4 W, $\pm 5\%$.
ALL CAPACITORS ARE $+80\%$ -20% .
2. REFERENCE DRAWINGS:
ASSEMBLY: 18225100.
BOARD: 19209700.
3. UNLESS OTHERWISE SPECIFIED:
ALL DIODES ARE CONTROL DATA
DRAWING NUMBER 11802900
POLARIZED $\rightarrow$

Pulse Shaper, Converter Type 6AFH

POWER LOSS DETECTOR, TYPE 6AGH

This card contains a transmitter identical to the type HA19 (transistors Q9, Q10 and Q11) and a power loss detector (transistors Q1 through Q8). Pins 3 and 4 must be connected together in order for the transmitter to operate. A voltage drop of approximately 2 volts in either the +20v or -20v power supplies will disable the transmitter.

NOTES:

1. UNLESS OTHERWISE SPECIFIED:
ALL RESISTANCES ARE IN OHMS.
ALL CAPACITANCES ARE IN PF.
ALL RESISTORS ARE 1/4 W, $\pm 5\%$.
ALL CAPACITORS ARE $\pm 20\%$.
2. REFERENCE DRAWINGS:
ASSEMBLY 18255800
BOARD 18256000

3. ASSEMBLY REQUIRES TWO
CARD LOCATIONS.

PARTS DATA

PARTS DATA

The parts list provides the identification and ordering data necessary for the replacement of electrical and hardware parts for this equipment. The equipment designation, final assembly number, and equipment name appear at the top of each page. The list is arranged in dis-assembly order, using levels of assembly to indicate the relationship of parts.

A typical parts list is shown below:

MAG14-C		18588000	D	MAG14C CENTRAL STORAGE MOD				
L	E	V	E	L*	PART NO.	REV	DESCRIPTION	ECO-NO***
1					18515400	B	SYSTEM SUB-ASSY	
2					18074900	J	STOR MODULE ASSY WIRED	IN 064591
3					18074700	G	PL TOP STORAGE MODULE	
3					18074800	H	STACK AND DR DK ASSY WIRED	
4					18075000	G	STACK ASSY WIRED STOR MODULE	
	5				63130100	F	PLANE ASSY INNER STOR MODULE	IN 020152
	6				63702100	J	BOARD BLANK MEMORY PLANE IN	
3					18541302	00	00000000000000000000000000000000***	

Refer to the Literature Distribution Center Catalog for related manuals on printed circuit card assemblies, peripheral cabinets, power supplies, and vendor parts lists necessary to complete a total parts breakdown of the equipment.

* The level of assembly in relation to the final cabinet assembly (2 is the subassembly of level 1, 3 is the subassembly of level 2, etc).

**The ECO-NO on which the part is either added (IN) or deleted (OUT) in the equipment.

*** If the description column contains all zeros, this means the drawing is not released. Revisions will show corrections.
