Contents

1 General Information

1.1 How to use this documentation

The documentation is an integral part of the product and contains important information on operation and service. The documentation is written for all employees who assemble, install, startup, and service this product.

The documentation must be accessible and legible. Make sure that persons responsible for the system and its operation, as well as persons who work independently on the unit, have read through the documentation carefully and understood it. If you are unclear about any of the information in this documentation, or if you require further information, contact SEW-EURODRIVE.

1.2 Structure of the safety notes

1.2.1 Meaning of the signal words

The following table shows the grading and meaning of the signal words for safety notes, notes on potential risks of damage to property, and other notes.

Signal word	Meaning	Consequences if disregarded
⚠ **DANGER**	Imminent danger	Severe or fatal injuries
⚠ **WARNING**	Possible dangerous situation	Severe or fatal injuries
⚠ **CAUTION**	Possible dangerous situation	Minor injuries
NOTICE	Possible damage to property	Damage to the drive system or its environment
NOTE ON EXPLOSION PROTECTION	Important note on explosion protection	Suspension of explosion protection and resulting hazards
INFORMATION	Useful information or tip: Simplifies the handling of the drive system.	

1.2.2 Structure of the section-related safety notes

Section-related safety notes do not apply to a specific action, but to several actions pertaining to one subject. The used symbols indicate either a general or a specific hazard.

This is the formal structure of a section-related safety note:

⚠ SIGNAL WORD

Type and source of danger.

Possible consequence(s) if disregarded.

- Measure(s) to prevent the danger.

1.2.3 Structure of the embedded safety notes

Embedded safety notes are directly integrated in the instructions just before the description of the dangerous action.

This is the formal structure of an embedded safety note:

- ⚠ **SIGNAL WORD** Nature and source of hazard.

  Possible consequence(s) if disregarded.

  – Measure(s) to prevent the danger.

1.3 Rights to claim under warranty

A requirement of fault-free operation and fulfillment of any rights to claim under limited warranty is that you adhere to the information in the documentation. Read the documentation before you start working with the unit!

1.4 Exclusion of liability

You must comply with the information contained in this documentation to ensure safe operation of the EDR.. explosion-proof AC motors units and to achieve the specified product characteristics and performance requirements. SEW-EURODRIVE assumes no liability for injury to persons or damage to equipment or property resulting from non-observance of the documentation. In such cases, any liability for defects is excluded.

1.5 Copyright

1.6 Product names and trademarks

The brands and product names contained within this publication are trademarks or registered trademarks of the titleholders.

2 Safety Notes

The following basic safety notes must be read carefully to prevent injury to persons and damage to property. The operator must ensure that the basic safety notes are read and adhered to. Make sure that persons responsible for the system and its operation, as well as persons who work independently on the unit, have read through the operating instructions carefully and understood them. If you are unclear about any of the information in this documentation or if you require further information, please contact SEW-EURODRIVE.

2.1 Preliminary information

The following safety notes are primarily concerned with the use of the following components: EDR.. explosion-proof AC motors. If using gearmotors, please also refer to the safety notes in the corresponding operating instructions for:

- Gear unit

Also observe the supplementary safety notes in the individual sections of this documentation.

2.2 General information

⚠ WARNING

During operation, the motors and gearmotors can have live, bare (in the event of open connectors/terminal boxes) and movable or rotating parts as well as hot surfaces, depending on their enclosure.

Severe or fatal injuries.

- All work related to transportation, storage, installation, assembly, connection, startup, maintenance and repair may only be carried out by qualified personnel, in strict observance of:
  - The relevant detailed operating instructions
  - The warning and safety signs on the motor/gearmotor
  - All other project planning documents, operating instructions and wiring diagrams related to the drive
  - The specific regulations and requirements for the system
  - The national/regional regulations governing safety and the prevention of accidents
- Never install damaged products
- Immediately report any damage to the shipping company

Removing the required protection cover or the housing without authorization, improper use as well as incorrect installation or operation may result in severe injuries to persons or damage to property.

This documentation provides additional information.

2.3 Target group

Any mechanical work may only be performed by adequately qualified personnel. Qualified staff in the context of this documentation are persons familiar with the design, mechanical installation, troubleshooting and servicing of the product who possess the following qualifications:

- Training in mechanical engineering, e.g. as a mechanic or mechatronics technician (final examinations must have been passed).
- They are familiar with these operating instructions.

Any electronic work may only be performed by adequately qualified electricians. Qualified electricians in the context of this documentation are persons familiar with electrical installation, startup, troubleshooting and servicing of the product who possess the following qualifications:

- Training in electrical engineering, e.g. as an electrician, electronics or mechatronics technician (final examinations must have been passed).
- They are familiar with these operating instructions.

All work in further areas of transportation, storage, operation and waste disposal must only be carried out by persons who are trained appropriately.

All qualified personnel must wear appropriate protective clothing.

2.4 Designated use

The explosion-proof electric motors are intended for industrial systems.

When installed in machines, startup of the motors (i.e. start of designated operation) is prohibited until it is determined that the machine meets the requirements stipulated in EC Directive 94/9/EC (ATEX Directive).

NOTES ON EXPLOSION PROTECTION

- The motor is only allowed to be operated under the conditions described in the "Startup" section.
- A motor may only be operated with the frequency inverter when the requirements of the prototype test certificates and/or this documentation and the information on the nameplate of the motor, if available, are fulfilled.
- There may be no aggressive substances in the vicinity that could damage the paint and seals.
- The motors must not be operated in areas/applications that cause strong electrical charge on the motor housing, e.g. as a fan motor in a dust-transporting tube as this may cause electrostatic charge of the coated surfaces.

Air-cooled types are dimensioned for ambient temperatures of -20 °C to +40 °C and installation altitudes ≤ 1000 m above sea level. Note that information on the nameplate may differ. The ambient conditions must comply with all the specifications on the nameplate.

2.5 Other applicable documentation

The following publications and documents have to be observed as well:

- Wiring diagrams provided with the motor
- Operating instructions "Explosion-Proof Gear Units R..7, F..7, K..7, S..7 Series, SPIROPLAN® W" for gearmotors
- Operating Instructions "Explosion-Proof VARIBLOC® Variable-Speed Gear Units and Accessories" / "Explosion-Proof VARIMOT® Variable-Speed Gear Units and Accessories"
- Operating instructions of any mounted frequency inverter for motors powered by inverters.
- Operating instructions of installed options, if applicable
- "Explosion-Proof AC Motors" catalog and/or
- "Explosion-proof drives" catalog
- "Explosion-Proof AC Motors EDR.71-225, 315" operating instructions

Please note that the complete range of technical documentation is available at our home page:

www.sew-eurodrive.com

2.6 Transport/storage

Inspect the shipment for any damage that may have occurred in transit as soon as you receive the delivery. Inform the shipping company immediately. It may be necessary to preclude startup.

Tighten the eyebolts securely. They are designed to only carry the weight of the motor/gearmotor; do not attach any additional loads.

The built-in lifting eyebolts comply with DIN 580. Always observe the loads and regulations listed in this standard. If the gearmotor is equipped with two eyebolts, then both should be used for transportation. In this case, the tension force vector of the slings must not exceed a 45° angle according to DIN 580.

Use suitable, sufficiently rated handling equipment if required. Reattach these in the case of further transportation.

Store the motor/gearmotor in a dry, dust-free environment if it is not to be installed straight away. You must not store the motor/gearmotor outdoors or on the fan guard. The motor/gearmotor can be stored for up to 9 months without requiring any special measures before startup.

2.7 Installation

Make sure that the supports are even, the foot and flange mounting is correct and if there is direct coupling, align with precision. Resonances between the rotational frequency and the double network frequency caused by the structure are to be avoided. Release the brake (if installed), turn rotor manually, check for unusual grinding noise. Check the direction of rotation in decoupled status.

Only install or remove belt pulleys and couplings using suitable devices (heat up) and cover with a touch guard. Avoid improper belt tension.

Make the pipe connections that may eventually be required. Mounting positions with shaft ends pointing upwards should be equipped with a cover to prevent foreign objects from falling into the fan. Ensure that ventilation openings are not obstructed and that used air, including air from adjacent units, cannot be drawn in again straight away.

Observe the notes in the "Mechanical Installation" section.

2.8 Electrical connection

All work may only be carried out by qualified personnel. During work, the low-voltage machine must be on standstill, enabled, and safeguarded against an accidental restart. This also applies to auxiliary circuits (e.g. anti-condensation heating or forced cooling fan).

Check that the motor is de-energized!

Exceeding the tolerances in EN 60034-1 (VDE 0530, part 1) – voltage +5 %, frequency +2 %, curve shape, symmetry – increases the heating and influences electromagnetic compatibility. Also observe DIN IEC 60364 and EN 50110 (and, if applicable, other national regulations, such as DIN VDE 0105 for Germany).

In addition to the generally applicable installation regulations for low-voltage equipment, it is also necessary to comply with the special regulations for setting up electrical machinery in potentially explosive atmospheres (operating safety regulations in Germany: EN 60079-14; EN 61241-14 and system-specific regulations).

Observe the wiring information and differing data on the nameplate as well as the wiring diagram in the terminal box.

The connection should be a continuous secure electrical connection (no protruding wire ends); use the cable end equipment intended for this purpose. Establish a secure protective earth connection. When the motor is connected, the distances between live and conductive parts must not be shorter than the minimum values according to DIN EN / IEC 60079-7 and -15 and national regulations. The minimum values according to the respective standards must be observed, see the following table:

Nominal voltage V_N	Distance for motors in category 3 (DIN EN / IEC 60079-15)	Distance for motors in category 2 (DIN EN / IEC 60079-7)
≤ 500 V	5 mm	8 mm
> 500 V to ≤ 690 V	5.5 mm	10 mm

The terminal box must be free of foreign objects, dirt and humidity. Unused cable entry openings and the box itself must be closed so that they are dust and water proof. Secure keys for test mode without output elements. Assure yourself of the flawless operability prior to starting up low-voltage machines.

Observe the notes in the "Electrical Installation" chapter.

2.9 Startup/operation

Whenever changes to normal operation occur, such as increased temperatures, noise, vibrations, etc., try to determine the cause. Consult the manufacturer if required. Never deactivate protection devices, even in test mode. Switch off the motor in case of doubt.

Regularly clean air ducts in dusty or dirty environments.

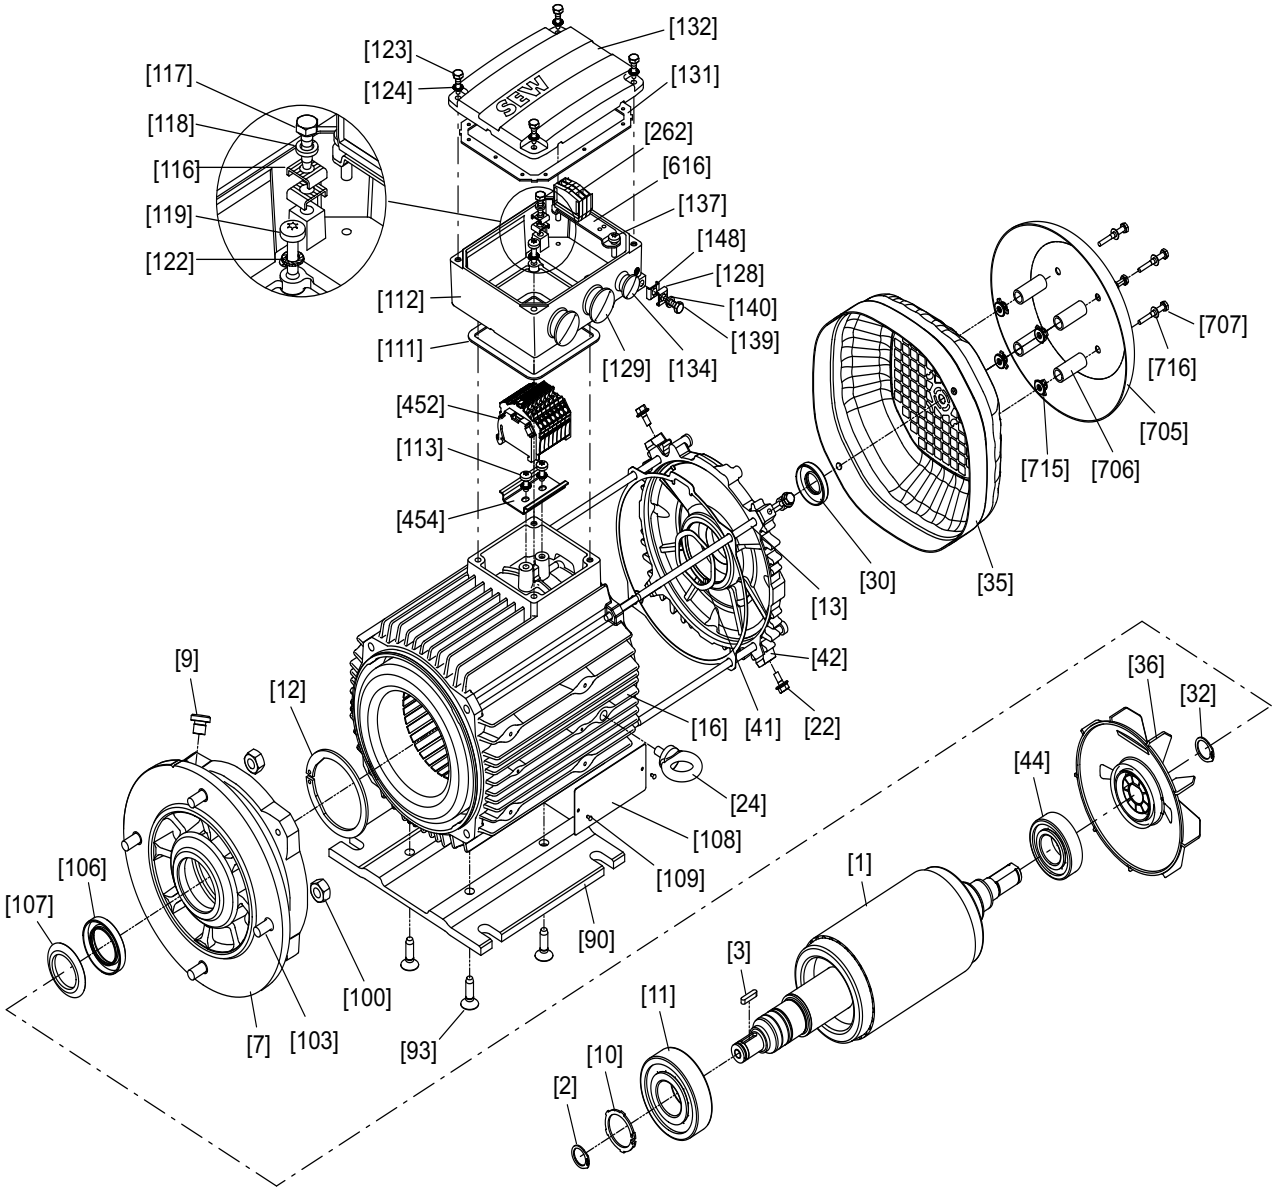
3 Motor Structure

INFORMATION

The following figures are block diagrams. They help you to assign components to the spare parts list. Deviations are possible depending on the motor size and version.

3.1 General structure of EDR.71 – EDR.132

The following figure shows an example of the basic structure of EDR.71 – EDR.132 with cage clamp:

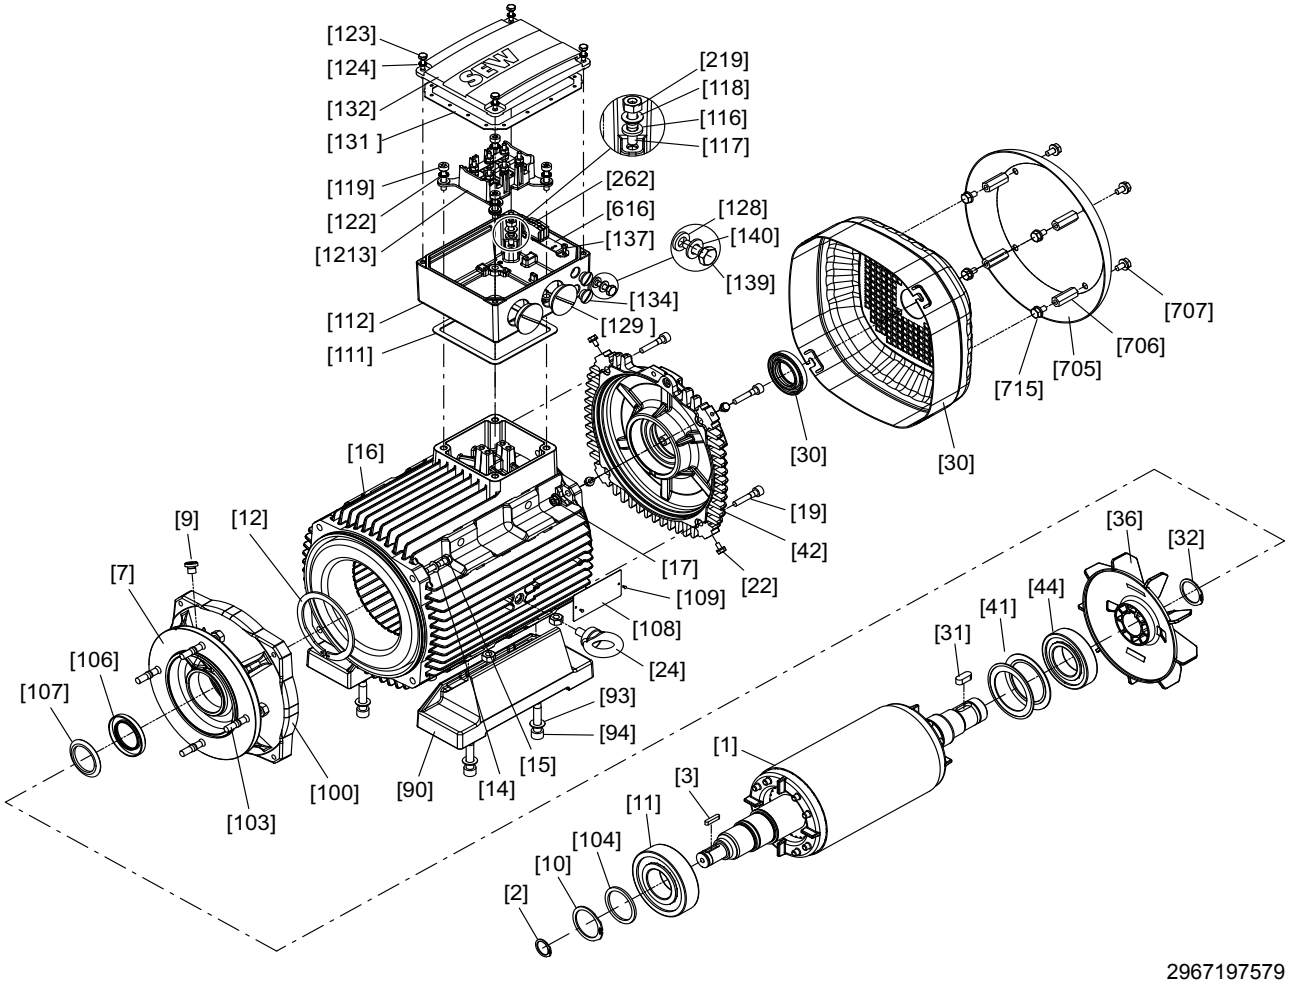


2931885963

[1]	Rotor	[35]	Fan guard	[112]	Terminal box lower part	[137]	Screw
[2]	Retaining ring	[36]	Fan	[113]	Pan head screw	[139]	Hex head screw
[3]	Key	[41]	Shim	[116]	Terminal clip	[140]	Lock washer
[7]	Flanged endshield	[42]	B-side endshield	[117]	Hex head screw	[148]	Terminal clip
[9]	Screw plug	[44]	Grooved ball bearing	[118]	Lock washer	[262]	Terminal
[10]	Retaining ring	[90]	Base plate	[119]	Pan head screw	[392]	Gasket
[11]	Grooved ball bearing	[93]	Countersunk screw	[122]	Lock washer	[452]	Terminal strip
[12]	Retaining ring	[100]	Hex nut	[123]	Hex head screw	[454]	Support rail
[13]	Cap screw	[103]	Stud	[124]	Lock washer	[616]	Retaining plate
[16]	Stator	[106]	Oil seal	[128]	Terminal clip	[705]	Canopy
[22]	Hex head screw	[107]	Oil flinger	[129]	Screw plug	[706]	Spacers
[24]	Eyebolt	[108]	Nameplate	[131]	Gasket for cover	[707]	Pan head screw
[30]	Oil seal	[109]	Grooved pin	[132]	Terminal box cover	[715]	Blind rivet
[32]	Retaining ring	[111]	Gasket for lower part	[134]	Screw plug	[716]	Washer

3.2 General structure EDR.160 – EDR.180

The following figure shows an example of the basic structure of EDR.160 – EDR.180 with anti-twist frame:

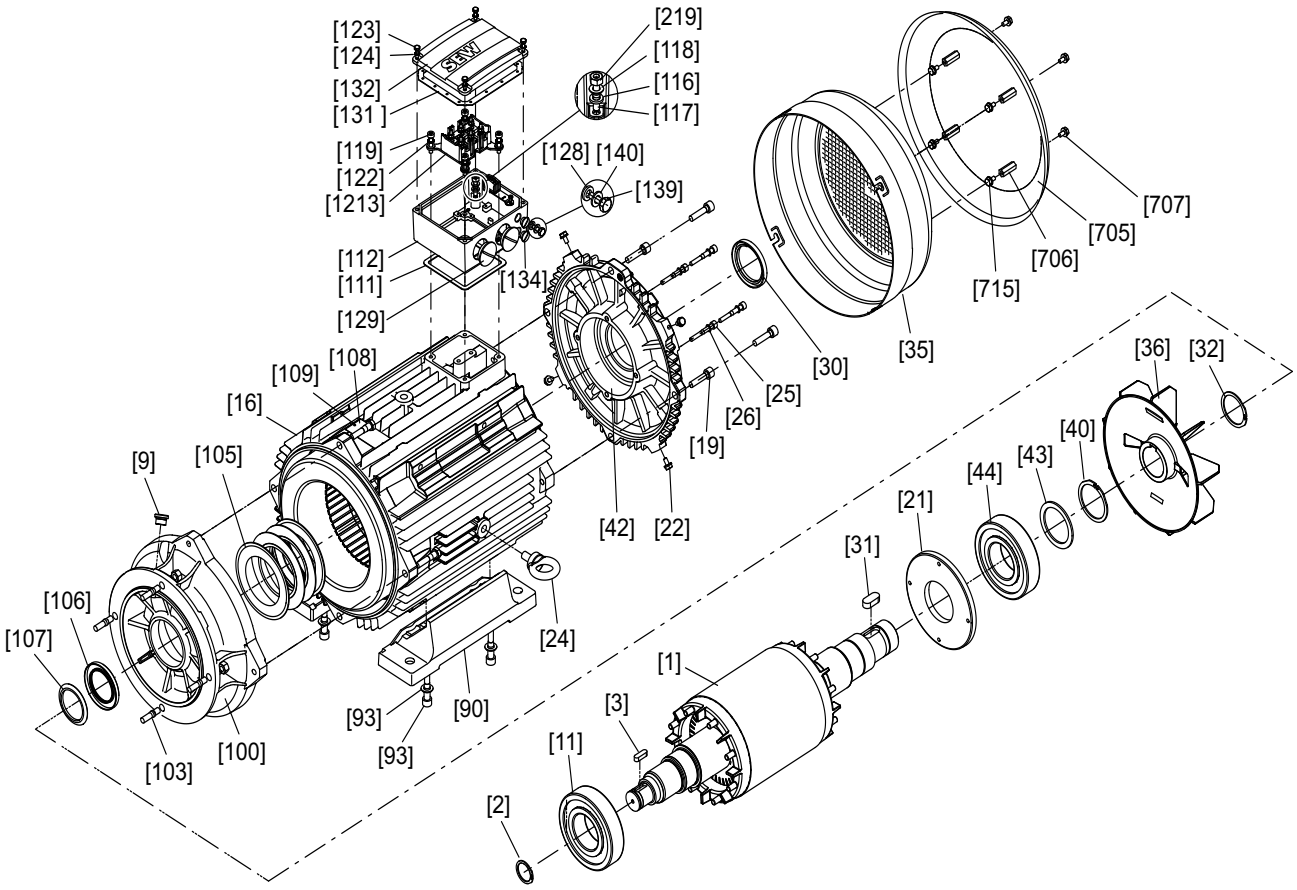


2967197579

[1] Rotor
[2] Retaining ring
[3] Key
[7] Flange
[9] Screw plug
[10] Retaining ring
[11] Grooved ball bearing
[12] Retaining ring
[14] Washer
[15] Hex head screw
[16] Stator
[17] Hex nut
[19] Machine screw
[22] Hex head screw
[24] Eyebolt
[30] Sealing ring
[31] Key
[32] Retaining ring
[35] Fan guard
[36] Fan
[41] Spring washer
[42] B-side endshield
[44] Grooved ball bearing
[90] Foot
[91] Hex nut
[93] Washer
[94] Machine screw
[100] Hex nut
[103] Stud
[104] Supporting ring
[106] Oil seal
[107] Oil flinger
[108] Nameplate
[109] Grooved pin
[111] Gasket for lower part
[112] Terminal box lower part
[116] Serrated lock washer
[117] Stud
[118] Washer
[119] Machine screw
[122] Lock washer
[123] Hex head screw
[124] Lock washer
[128] Serrated lock washer
[129] Screw plug
[131] Gasket for cover
[132] Terminal box cover
[134] Screw plug
[139] Hex head screw
[140] Washer
[219] Hex nut
[705] Canopy
[706] Spacers
[707] Hex head screw
[715] Hex head screw
[1213] Kit (1 anti-twist frame, 1 terminal board, 4 sleeves, 2 screws, 2 nuts)

3.3 General structure EDR.200 – EDR.225

The following figure shows an example of the basic structure of EDR.200 – EDR.225 with anti-twist frame:



3055268107

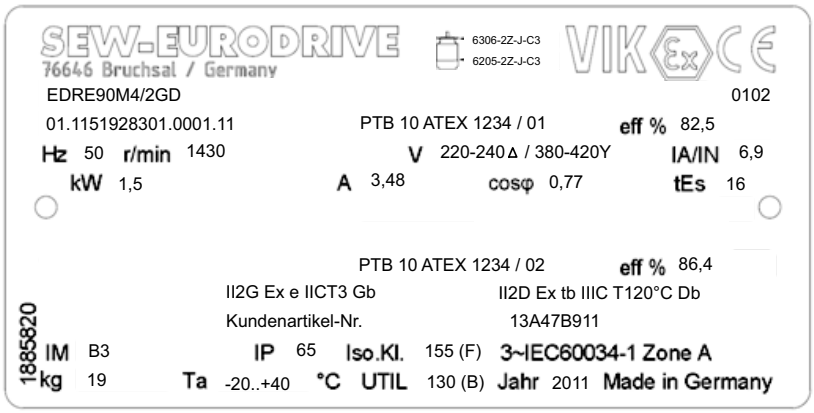
[1]	Rotor	[32]	Retaining ring	[107]	Oil flinger	[131]	Gasket for cover
[2]	Retaining ring	[35]	Fan guard	[108]	Nameplate	[132]	Terminal box cover
[3]	Key	[36]	Fan	[109]	Grooved pin	[134]	Screw plug
[7]	Flange	[40]	Retaining ring	[111]	Gasket for lower part	[139]	Hex head screw
[9]	Screw plug	[42]	B-side endshield	[112]	Terminal box lower part	[140]	Washer
[11]	Grooved ball bearing	[43]	Supporting ring	[107]	Oil flinger	[219]	Hex nut
[16]	Stator	[44]	Grooved ball bearing	[116]	Serrated lock washer	[705]	Canopy
[19]	Machine screw	[90]	Foot	[117]	Stud	[706]	Spacer bolt
[21]	Oil seal flange	[93]	Washer	[118]	Washer	[707]	Hex head screw
[22]	Hex head screw	[94]	Machine screw	[119]	Machine screw	[715]	Hex head screw
[24]	Eyebolt	[100]	Hex nut	[123]	Hex head screw	[1213]	Kit (1 anti-twist frame, 1 terminal board, 4 sleeves, 2 screws, 2 nuts)
[25]	Machine screw	[103]	Stud	[124]	Lock washer		
[26]	Sealing washer	[105]	Spring washer	[128]	Serrated lock washer		
[31]	Key	[106]	Oil seal	[129]	Screw plug		

3.4 Nameplate, type designation

3.4.1 Nameplates of EDR. motors

EDRE motor in category 2GD

The following figure shows an example of the nameplate of an EDRE motor in category 2GD:

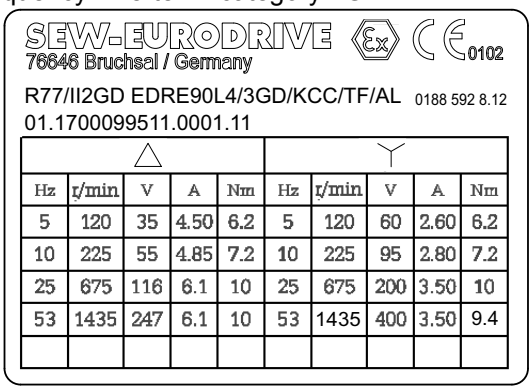


2439213579

The marks (page 158) on the upper edge of the nameplate are only present when the motor has been certified accordingly or when it includes the relevant components.

EDRE motor with frequency inverter

The following figure shows an example of the nameplate of an EDRE motor with frequency inverter in category 2GD:



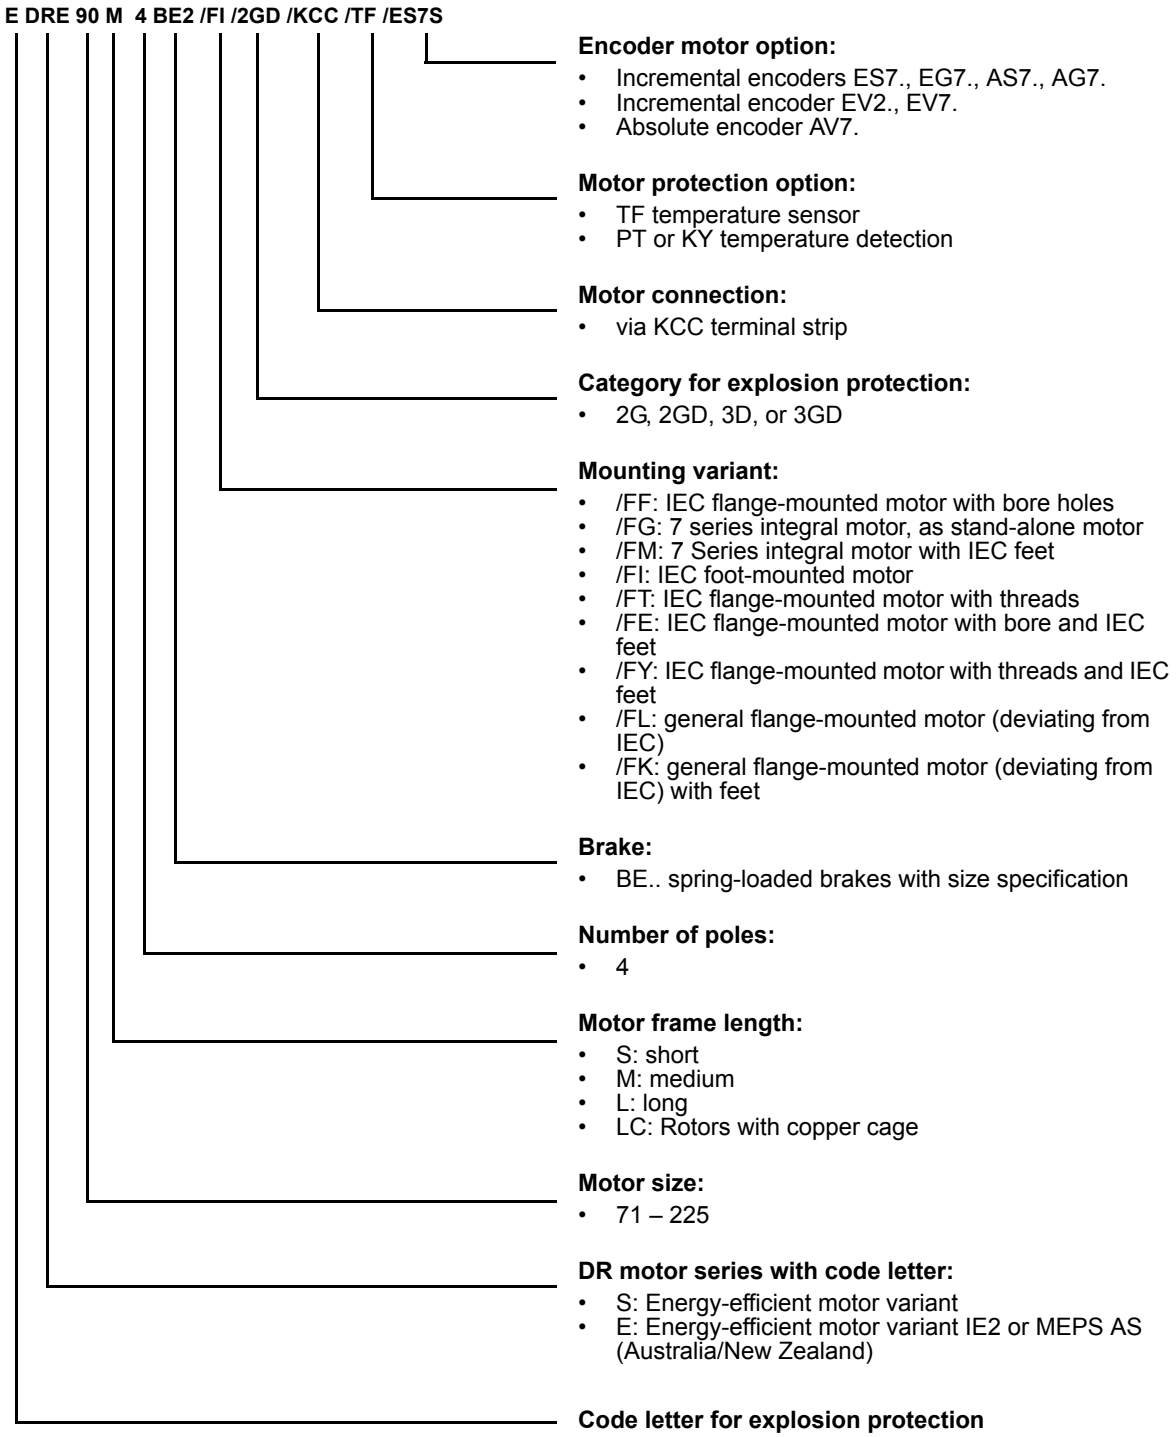
△					Y				
Hz	r/min	V	A	Nm	Hz	r/min	V	A	Nm
5	120	35	4.50	6.2	5	120	60	2.60	6.2
10	225	55	4.85	7.2	10	225	95	2.80	7.2
25	675	116	6.1	10	25	675	200	3.50	10
53	1435	247	6.1	10	53	1435	400	3.50	9.4

9007202350032139

3.4.2 Type designations of EDR. motors

EDR.. series AC motor

The following diagram shows a type designation:



3.5 Additional features

3.5.1 AC motor series

The following table shows the AC motor variants:

Designation	Category	
EDRS..	/2G, /2GD, /3D, /3GD	ATEX motor
EDRE..		ATEX energy-efficient motor, High Efficiency IE2
71 – 225		Sizes: 71 / 80 / 90 / 100 / 112 / 132 / 160 / 180 / 200 / 225
S – L, LC		Lengths: S = short / M = medium / L = long LC = Rotors with copper cage
4		Number of poles

3.5.2 Mounting variants

The following table shows possible output variants:

Designation	Category	Option
/FI	/2G, /2GD, /3D, /3GD	IEC foot-mounted motor with specification of shaft height
/FG		7 series integral motor, as stand-alone motor
/FF		IEC flange-mounted motor with bore holes
/FT		IEC flange-mounted motor with threads
/FL		General flange-mounted motor (other than IEC)
/FM		7-series integral gearmotor with IEC feet, with specification of shaft height if required
/FE		IEC flange-mounted motor with bore holes and IEC feet, with specification of shaft height
/FY		IEC flange-mounted motor with thread and IEC feet, with specification of shaft height if required
/FK		General flange-mounted motor (other than IEC) with feet, with specification of shaft height if required

3.5.3 Mechanical attachments

The following table shows possible mechanical additions:

Designation	Category	Option
BE..	/3GD, /3D	Spring-loaded brake with specification of size
HR	/3GD, /3D	Manual brake release of the brake, automatic disengaging function
HF	/3GD, /3D	Manual brake release, lockable
/RS	/3GD	Backstop (line-powered only)

3.5.4 Temperature sensor / temperature detection

The following table shows the thermal protection options:

Designation	Category	Option
/TF	/2G, /2GD, /3D, /3GD	Temperature sensor (PTC resistor)
/KY		One KTY84 – 130 sensor
/PT		One/three PT100 sensor(s)

3.5.5 Encoder

The following table shows possible encoder variants:

Designation	Category	Option
/ES7S, /EG7S, /EV7S	/3D, /3GD	Mounted speed sensor with sin/cos interface
/ES7R, /EG7R, /EV7R		Mounted speed sensor with TTL (RS-422) interface, V = 9 – 26 V
/ES7C, /EG7C, /EV7C		Mounted speed sensor with HTL interface
/AS7W, /AG7W, /AV7W		Mounted absolute encoder, RS-485 interface (multi-turn)
/AS7Y, /AG7Y, /AV7Y		Mounted absolute encoder, SSI interface (multi-turn)
/ES7A, /EG7A		Mounting adapter for encoders from the SEW portfolio
/XV.A		Mounting adapter for non-SEW encoders
/XV..		Mounted non-SEW encoders

3.5.6 Connection options

The following table shows the connection variants:

Designation	Category	Included in the scope of delivery
/KCC	/2G, /2GD, /3D, /3GD	Terminal strip with cage clamps (for EDR.71 – EDR.132)

3.5.7 Ventilation

The following table shows possible ventilation variants:

Designation	Category	Option
/VE	/3D, /3GD	Forced cooling fan for motors according to 94/9/EC, category 3 (gas / dust)
/AL	/2G, /2GD, /3D, /3GD	Metal fan
/C		Protection canopy for the fan guard

3.5.8 Explosion-proof motors

The following table shows the possible explosion protection categories:

Designation	Option
/2G	Motors according to Directive 94/9/EC, category 2 (gas)
/2GD	Motors according to Directive 94/9/EC, category 2 (gas/dust)
/3D	Motors according to Directive 94/9/EC, category 3 (dust)
/3GD	Motors according to Directive 94/9/EC, category 3 (gas/dust)

3.5.9 Other additional features

The following table shows an additional feature:

Designation	Category	Option
/2W	/2G, /2GD, /3D, /3GD	Second shaft end on the motor/brakemotor

3.6 Designations for explosion protection

With the revision of the explosion protection standards, new designations have been implemented internationally (IEC), the so-called **E**quipment **P**rotection **L**evels (EPL). Parallel to the explosion protection categories, these levels specify the applicability of the devices according to the zone categorization of the potentially explosive atmospheres.

With the revision of EN 60079-0 issued in 2010, the EPL were also adopted by European standards.

The following table shows the assignment of the EPL to the zones:

Gas			Dust		
EPL :	**Category:**	**Use in zone:**	**EPL:**	**Category:**	**Use in zone:**
Ga	1G	0	**Da**	1D	20
Gb	2G	1	**Db**	2D	21
Gc	3G	2	**Dc**	3D	22

With the revision of the IEC 60079 "electrical apparatus for potentially explosive atmospheres" the dust explosion protection has been integrated in this set of standards as part 31. The separate dust standard IEC 61241-1 has become invalid with the release of IEC 60079-31 in November 2008.

The international standard IEC 60079 was harmonized as EN standard with the same number and the same content in 2010.

The equipment group III for dust has also been implemented as part of this integration. Thus there are 3 equipment groups in international standards:

Equipment group	Equipment for the use
I	In mine openings with a risk of firedamp (underground mining)
II	In areas with potentially explosive gas/air mixtures
III	In areas with potentially explosive dust/air mixtures

In addition, the new equipment group III has been split up into three subgroups "A", "B" and "C" depending on the type of dust:

Equipment group	Suitable for atmospheres with	Minimum degree of protection IP (x = placeholder)
IIIA	Inflammable fluffing	5x
IIIB	Non-conducting dust	5x
IIIC	Conducting dust	6x

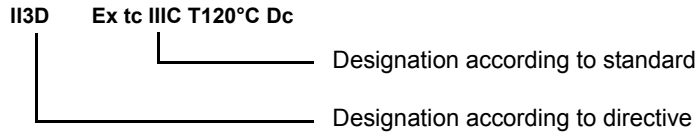
The specific values of equipment groups IIIA to IIIC for the dust/air mixture correspond to the previous designation IIA to IIC for gas/air mixtures.

Previously, the designation IIA to IIC has only be used for motors in EX-d design (flameproof). Now, the designation of motors of a protection type with increased safety "e" is changed from II (without letter) to IIA, IIB, or IIC. This implies demands on the prevention of electrostatic charge of plastic surfaces, e.g. fans and coated, metal surfaces.

The standard changes described above also cause a change of the EX designation of motors that must also be specified on the motor nameplate. The following table lists some examples:

Area	Previous designation	New designation	
		(ATEX)	(IECEx)
	(until 2010)	(since 2010)	(since 2010)
With explosive gas/air mixtures	II2G Ex e II T3	II2G Ex e IIC T3 Gb	Ex e IIC T3 Gb
	II3G Ex nA II T3	II3G Ex nA IIC T3 Gc	Ex nA IIC T3 Gc
With explosive dust/air mixtures	II2D Ex tD A21 IP65 T120°C	II2D Ex tb IIIC T120°C Db	Ex tb IIIC T120°C Db
	II3D Ex tD A22 IP54 T120°C	II3D Ex tc IIIB T120°C Dc	Ex tc IIIB T120°C Dc
	II3D Ex tD A22 IP65 T120°C	II3D Ex tc IIIC T120°C Dc	Ex tc IIIC T120°C Dc

With the designation of the explosion protection, you have to distinguish between the designation according to Directive, e.g. II3D, and the designation according to standard, e.g. Ex tc IIIC T120°C Dc.



Equipment sold within the scope of the European Directive 94/9/EC must show the designation according to Directive 94/9/EC in addition to the standard designation. It is important to note that the directive designation (e.g. with II) and the standard designation (e.g. with III) are two different designations.

Keep in mind that "II" according to the directive defines the equipment group, whereas "II" in connection with the letters A, B, and C is the standard designation for the environment in which the drive is operated.

Since equipment group II of the Directive includes both gas and dust atmospheres, a motor can have the directive designation II3D and the standard designation IIIC, for example.

The goal of the new standard designation is to clearly and explicitly specify the zone and the mixture that the individual drive is approved for.

4 Mechanical Installation

INFORMATION

Observe the safety notes in section 2 of these operating instructions for the mechanical installation.

4.1 Before you start

NOTICE

The mounting position for installation must correspond to the specifications on the nameplate.

Only install the drive if the following conditions are met:

- The specifications on the nameplate of the drive correspond to the supply system or the output voltage of the frequency inverter
- The drive is undamaged (no damage caused by transportation or storage)
- All transport locks have been removed.
- You are certain that the following requirements have been met:
  - Ambient temperature between -20 °C and +40 °C.

    Note that the temperature range of the gear unit may also be restricted (see gear unit operating instructions)

    Note that information on the nameplate may differ. The ambient conditions must comply with all the specifications on the nameplate.
  - No oil, acid, gas, vapors, radiation, etc.
  - Installation altitude max. 1000 m above sea level

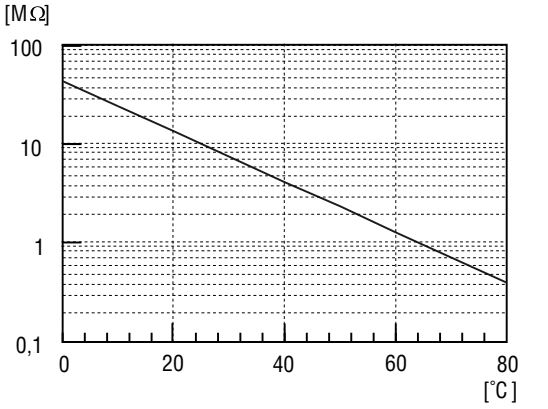
    Observe chapter "Electrical Installation" > "Ambient conditions during operation" > "Installation altitude".
  - Note the restrictions for encoders
  - Special design: Drive configured in accordance with the ambient conditions

The above mentioned information refers to standard orders. The conditions might be different when you order drives other than the standard. Observe any differing conditions in the order confirmation.

4.2 Long-term storage of motors

- Note that the service life of the lubricant in the ball bearings is reduced by 10% per year after the first year of storage.
- Before startup, you should re-lubricate the lubrication devices on motors that have been in storage for longer than 5 years. Observe the information on the motor lubricant plate.
- Check whether the motor has absorbed moisture as a result of being stored for a long time. Measure the insulation resistance for this purpose (measuring voltage 500 V).

The insulation resistance (see following figure) varies greatly depending on the temperature. The motor must be dried if the insulation resistance is not adequate.



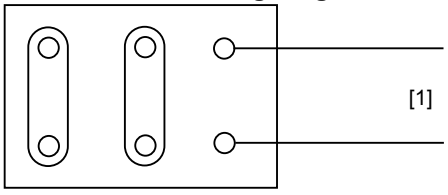
173323019

4.2.1 Drying the motor

Heat the motor:

- With hot air or
- Using isolation transformer
  - Connect the windings in series (see following figures)
  - Auxiliary AC voltage supply max. 10% of the rated voltage with max. 20% of the rated current

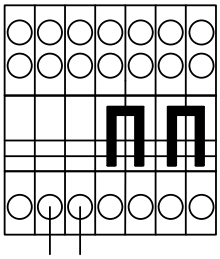
Connection in wiring diagram R13:



2336250251

[1] Transformer

Connection in wiring diagram C13:



[1] Transformer

The drying process is finished when the minimum insulation resistance has been exceeded.

In the terminal box check that:

- The inside is clean and dry
- The connections and fixing parts are free from corrosion
- The gasket and sealing surfaces are functioning
- The cable glands are tight, otherwise clean or replace them

4.3 Motor installation notes

⚠ CAUTION

Sharp edges due to open keyway.

Minor injuries.

- Insert key in keyway.
- Pull protective sleeve over shaft.

⚠ CAUTION

Improper mounting may result in damage to the motor.

Possible damage to property

- Observe the following notes.

NOTICE

The mounting position for installation must correspond with the specifications on the nameplate.

- Motor shaft ends must be thoroughly cleaned of anti-corrosion agents, contamination or similar (use a commercially available solvent). Do not allow the solvent to penetrate the bearings or shaft seals – this could damage the material.
- Mount the gearmotor only on a level, vibration-free and torsionally rigid support structure.
- Make sure the customer's counter-bearing is unobstructed and can move freely.
- Align the motor and the driven machine carefully in order to prevent the output shaft from being exposed to unacceptable strain. Observe the permitted overhung and axial forces.
- Do not jolt or hammer the shaft end.

- Make sure that there is sufficient clearance around the motor/brakemotor to provide for adequate cooling, and that the motor does not draw in warm air from other units. Observe the following minimum clearance:

	Motor / brakemotor
Motor type	**h in mm**
EDR.71, EDR.80	15
EDR.90, EDR.100	20
EDR.112, EDR.132	25
EDR.160	30
EDR.180	35
EDR.200, EDR.225	45

- Balance components for subsequent mounting on the shaft with a half key (motor shafts are balanced with a half key).
- If you have used the hand lever of the self-reengaging manual brake release during startup, you must remove the lever again for regular operation. A bracket is provided for storing the lever on the outside of the motor housing.

INFORMATION

- If using belt pulleys:
  - Only use belts that do not build up an electrostatic charge.
  - Do not exceed the maximum permitted overhung load; for motors without gear units, see chapter "Overhung loads (page 127)".
- Motors in vertical mounting position (e.g. M4/V1) are equipped with a canopy /C as standard.
  On request, the motor can be delivered without canopy. In this case, you have to install a cover when you install the drive in the plant/machine in order to prevent objects from falling into the ventilation openings. Observe the requirements according to EN / IEC 60079-0 and EN / IEC 60079-7. This cover must not obstruct the cooling air supply.
- In mounting positions with the motor output shaft pointing upwards (e.g. M2/V3), a suitable cover must prevent small objects from falling through the fan guard, see also EN/IEC 60079-0. This cover must not obstruct the cooling air supply.

4.3.1 Installation in damp locations or in the open

- Use suitable cable glands for the incoming cable (use reducing adapters if necessary) according to the installation instructions.
- If possible, arrange the terminal box so that the cable entries are pointing downwards.
- Seal the cable entry properly.
- Clean the sealing surfaces of the terminal box and the terminal box cover carefully before re-assembly; replace embrittled gaskets.
- If required, touch up the corrosion protection (especially at the eyebolts).
- Check the degree of protection.
- Protect the shaft against corrosion with a suitable anti-corrosion agent.

4.4 Mounting tolerances

Shaft end	Flanges
Diameter tolerance according to EN 50347 • ISO j6 with Ø ≤ 28 mm • ISO k6 with Ø ≥ 38 mm up to ≤ 48 mm • ISO m6 at Ø ≥ 55 mm • Center bore in accordance with DIN 332, shape DR..	Centering shoulder tolerance in accordance with EN 50347 • ISO j6 with Ø ≤ 250 mm • ISO h6 with Ø ≥ 300 mm

4.5 Assembling the input elements

Input elements that are mounted on the motor shaft end, e.g. pinions, must be warmed up prior to assembly in order to prevent damages to the encoder of stand-alone motors.

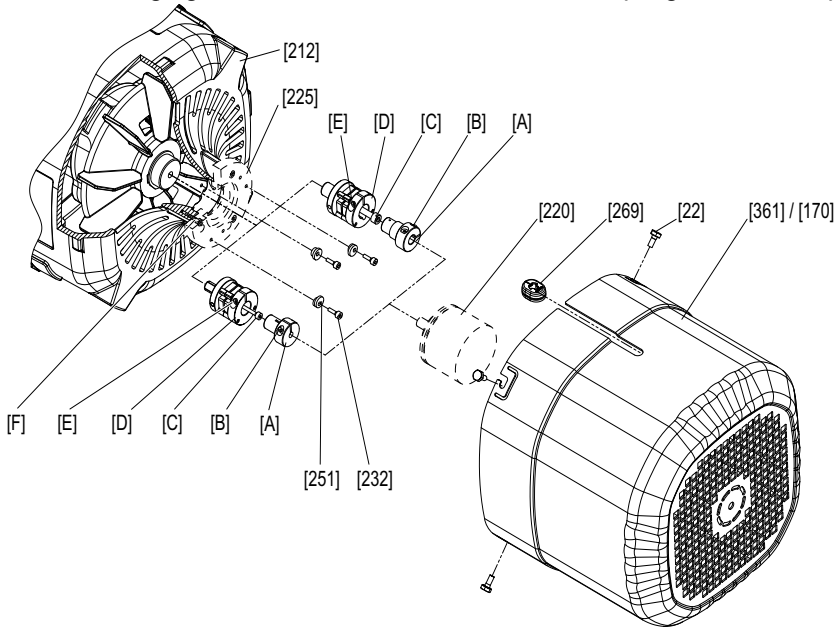
4.6 Non-SEW encoder mounting

If a drive was ordered with non-SEW encoder, SEW-EURODRIVE will deliver the drive with enclosed coupling. You must not connect the coupling for operation without non-SEW encoder.

4.7 Connecting XV.A encoder mounting adapter to EDR.71 – 225 motors

If you have ordered the XV.A encoder mounting adapter, the adapter and the coupling are enclosed with the motor and are to be assembled by the customer.

The following figure shows how to assemble the coupling and the adapter:



3633163787

[22]	Screw	[361]	Extended fan guard
[170]	forced cooling fan guard	[269]	Grommet
[212]	Fan guard with encoder mount	[A]	Adapter
[220]	Encoder	[B]	Retaining screw
[225]	Intermediate flange (not with XV1A)	[C]	Central retaining screw
[232]	Screws (only with XV1A and XV2A)	[D]	Coupling (spread- or solid shaft coupling)
[251]	Conical spring washers (only with XV1A and XV2A)	[E]	Retaining screw
		[F]	Screw

1. If available, remove cover [361] or forced cooling fan guard [170].
2. **For XV2A and XV4A:** Remove intermediate flange [225].
3. Screw in the coupling [D] into the encoder bore of the motor shaft with the screw [C].

   EDR.71 – 132: Tighten the screw [C] with a tightening torque of 3 Nm [26,6 lb-in].

   EDR.160 – 225: Tighten the screw [C] with a tightening torque of 8 Nm [70,8 lb-in].
4. Push the adapter [A] on the encoder [220] and tighten it with the retaining screw [B] with a tightening torque of 3 Nm [26.6 lb-in].

5. **For XV2A and XV4A:** Mount the intermediate flange [225] with the screw [F] with a tightening torque of 3 Nm [26.6 lb-in].
6. Push the encoder and the adapter on the coupling [D] and tighten the retaining screw [E] with a tightening torque of 3 Nm [26.6 lb-in].
7. **With XV1A and XV2A:** Arrange conical spring washers [251] with retaining screws [232] and place in annular groove of the encoder [220] and tighten with a tightening torque of 3 Nm (26.6 lb-in).
8. **For XV3A and XV4A:** Installation by the customer via the bores in the encoder plate.

4.7.1 XH.A encoder mounting adapter

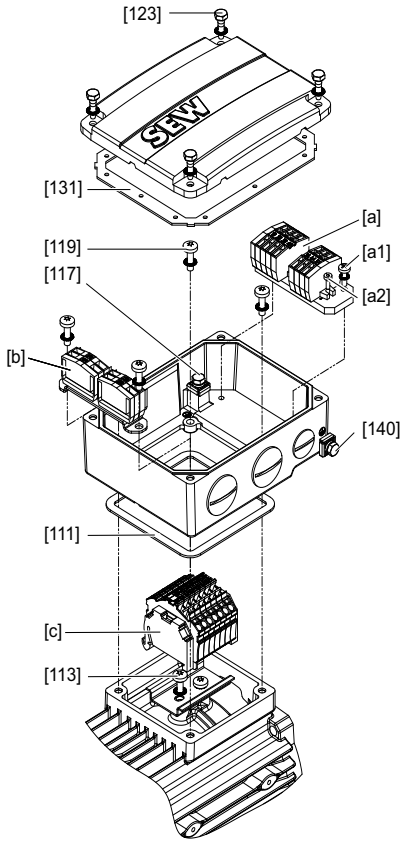
The XH1A, XH7A and XH8A encoder mounting adapters for hollow shaft encoders are premounted on delivery.

Proceed according to chapter "Motor and brake maintenance – preliminary work" (page 97) to mount the encoder.

4.8 Turning the terminal box

4.8.1 Terminal box with cage clamp power connections

The following figure shows the terminal box variant with cage clamps:



18014401261724939

[111] Gasket
[113] Pan head screw DIN rail connection
[117] Hexagon screw grounding inside
[119] Terminal box retaining screws + lock washers (4 x each)
[123] Terminal box cover retaining screws + lock washers (4 x each)
[131] Gasket
[140] Hexagon screw grounding outside
[a] Terminal strip 1
[a1] Screw of option terminal / rectifier
[a2] Flat head screw option terminal
[b] Terminal strip 2 + retaining plate
[c] Power terminal

The type and number of terminal strips varies with the terminal box design and the options.

Proceed as follows to turn the terminal box:

1. Loosen the screws [123] from the terminal box cover and remove the cover.
2. Loosen the retaining screws [119] and the terminal box.
3. Clean the sealing surfaces at the stator shoulder, the bottom and the cover of terminal box.
4. Check the gaskets [111 and 131] for damages and replace them if necessary.
5. Position the terminal box as desired.
6. If the terminal strip 2 [b] has been installed with the retaining screws of the terminal box [119], it must be mounted again to the face of the power terminal after the terminal box has been turned.

INFORMATION

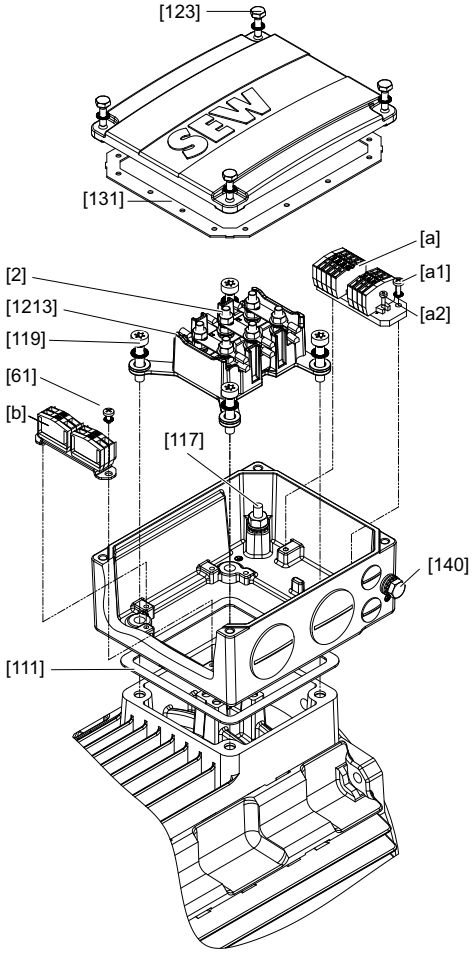
Connection alternatives for 2 terminal strips [a] and [b] are listed in the appendix (page 173).

7. Fasten the bottom part of the terminal box with the screws [119] and the lock washers with one of the following tightening torques:
   - **EDR.71 – 132:** 5 Nm [44.3 lb-in]
   - **EDR.160 – 225:** 25.5 Nm [225.7 lb-in]
8. Fasten the terminal box cover with the screws [123] and the lock washers with the appropriate tightening torque. Make sure the gasket is seated properly.

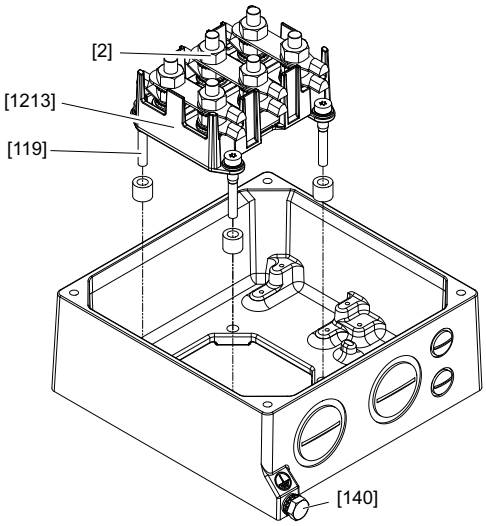
4.8.2 Terminal box with terminal board and anti-twist frame

The following figure shows a terminal box with anti-twist frame:

K1M6 / K1M8 in with aluminum or gray cast design



K1M12S made of gray cast



18014401328547595

[2] Terminal stud nut
[111] Gasket
[117] Hexagon screw grounding inside
[119] Terminal box retaining screws + lock washers (4 x each)
[123] Terminal box cover retaining screws + lock washers (4 x each)
[131] Gasket
[140] Hexagon screw grounding outside
[a] Terminal strip 1
[a1] Screw of option terminal / rectifier
[a2] Flat head screw option terminal
[b] Terminal strip 2
[1213] Kit (1 anti-twist frame, 1 terminal board, 4 sleeves, 2 screws, 2 nuts)

The type and number of terminal strips varies with the terminal box design and the options.

Proceed as follows to turn the terminal box:

1. Loosen the screws [123] from the terminal box cover and remove the cover.
2. Remove the retaining screws [119] of the terminal box.
3. Clean the sealing surfaces at the stator shoulder, the bottom and the cover of terminal box.
4. Check the gaskets [111 and 131] for damages and replace them if necessary.
5. Take the unit consisting of terminal board and anti-twist frame from the terminal box.

   Remove any cables that are already connected before taking out the unit.
6. Position the terminal box as desired.
7. Turn the unit consisting of terminal board and anti-twist frame in the same way as the terminal box and put it back in.

   The terminal board designations U1, V1 and W1 must be pointing towards the cable outputs afterwards.
8. Fasten the bottom part of the terminal box with the screws [119] and the lock washers with one of the following tightening torques:
   - **EDR.71 – 132:** 5 Nm [44.3 lb-in]
   - **EDR.160 – 225:** 25.5 Nm [225.7 lb-in]
9. Re-connect any removed cables according to the following table:

Yellow	White	Brown
W2/T4	U2/T5	V2/T6
Black	Red	Blue
U1/T1	V1/T2	W1/T3

   Tighten the nuts on the connection bolts with the appropriate tightening torque (page 35).

INFORMATION

The connected cables must be free from bends and twists, etc.

Observe the correct order of the small connection accessories, see chapter "Motor connection via terminal board" (page 49).

10. Fasten the terminal box cover with the screws [123] and the lock washers with the appropriate tightening torque (page 35). Make sure the gasket is seated properly.

⚠ WARNING

Possible damage to the motor outputs when turning the terminal board.

Possible damage to property.

- To make sure that the cables have not been damaged, carry out an insulation test after re-assembly, see chapter "Long-term storage of motors" (page 24).

4.8.3 Tightening torques

The following table shows all the tightening torques required for this procedure:

Key number	Screw	Applies to	Tightening torque	
			in Nm	in lb-in
[2]	Terminal stud nut	M6 stud	3	26.6
		M8 stud	6	53.1
		M12 stud	15.5	137.2
[61]	Pan head screw option terminal	EDR.71 – 225	1.8	16.0
[113]	Pan head screw DIN rail connection	EDR.71 – 132	5	44.3
[117]	Hexagon screw grounding inside	EDR.71 – 132	4	35.4
		EDR.160	25.5	225.7
		EDR.180 – 225 (aluminum design)	25.5	225.7
		EDR.180 – 225 (gray-cast iron design)	50	442.5
[119]	Pan head screw of terminal box	EDR.71 – 132	5	44.3
		EDR.160 – 225	25.5	225.7
[123]	Hexagon screw terminal box cover	EDR.71 – 132	4	35.4
		EDR.160	10.3	91.2
		EDR.180 – 225 (aluminum design)	10.3	91.2
		EDR.180 – 225 (gray-cast iron design)	25.5	225.7
[140]	Hexagon screw grounding outside	EDR.71 – 225	4	35.4
[a1]	Screw of option terminal / rectifier	EDR.71 – 225	1.8	16.0
[a2]	Flat head screw option terminal	EDR.71 – 225	1	8.9

4.9 Coating

NOTE ON EXPLOSION PROTECTION

SEW-EURODRIVE delivers the drives with a coating that complies with the requirements regarding the prevention of electrostatic charge according to EN / IEC 60079-0. If you recoat the motors or gearmotors, you have to observe the requirements regarding the prevention of electrostatic charge according to EN / IEC 60079-0 .

4.10 Cover for second shaft end

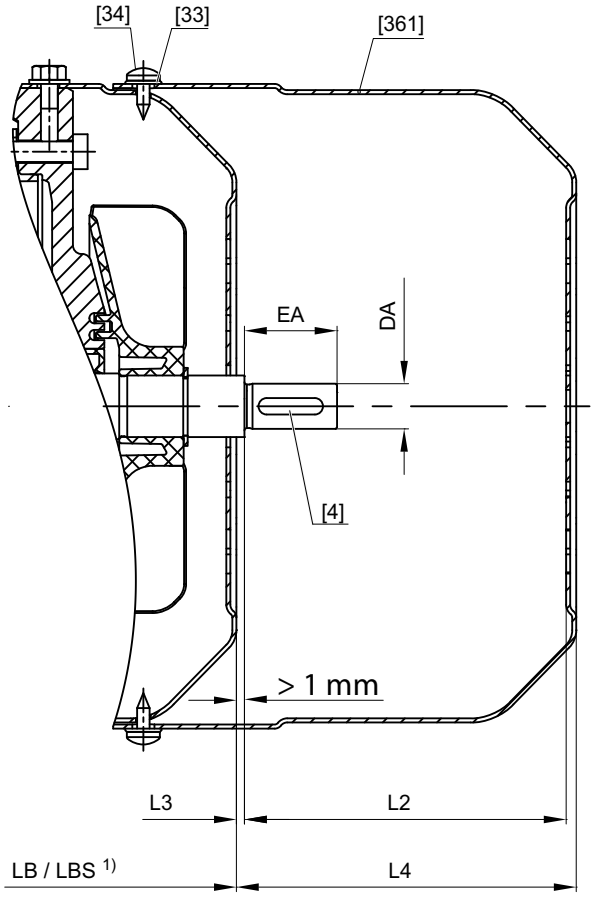
As standard, SEW-EURODRIVE supplies the accessory equipment "second shaft end" with inserted key secured with tape. No cover is supplied as standard. The cover can be ordered separately.

4.10.1 With optional cover

For sizes EDR.71 – EDR.132, a cover is supplied. For size 160 and above, there is no cover available.

The following figure shows the dimensions of the cover:

Sizes EDR.71 – EDR.132



2634738827

[4]	Keyway	LB/LBS	Length of the motor/brakemotor
[33]	Washer	1)	Refer to the catalog for dimensions
[34]	Tapping screw	[361]	Cover

Motor size	DA	EA	L2	L3	L4
EDR.71	11	23	80	2	91.5
EDR.80	14	30	93	2	95.5
EDR.90	14	30	86.5	2	89
EDR.100	14	30	86.5	2	89
EDR.112/132	19	40	122.5	3.5	125

Observe the distances between the shaft shoulder and the fan housing as well as the overhung loads when you connect accessories.

The following table shows the distances between the shaft shoulder and the fan housing:

Motor size	Length of second shaft end in mm	Distance between shaft shoulder and fan housing in mm
71	23	2
80	30	2
90	30	2
100	30	2
112	40	3.5
132	40	3.5

4.10.2 Without optional cover

Variants without cover must be provided with a cover by the customer.

Observe the impact resistance requirements according to EN / IEC 60079-0 when you select and mount the cover.

⚠ CAUTION

Protective cover missing or installed incorrectly.

Severe or fatal injuries.

- Only qualified personnel may mount the protective cover.
- Only start up the motor with the correct protective cover.

5 Electrical Installation

⚠ WARNING

Danger of electric shock.

Severe or fatal injuries!

- Note the following:

- It is essential to comply with the safety notes in chapter 2 during installation!
- Use switch contacts in utilization category AC-3 according to EN 60947-4-1 for switching the motor.
- When motors are powered by inverters, you must adhere to the wiring instructions issued by the inverter manufacturer.
- Observe the operating instructions of the inverter.

5.1 Additional regulations

The generally applicable installation regulations for low-voltage electric equipment (such as DIN IEC 60364, DIN EN 50110) must be complied with when setting up electrical machinery.

5.2 Wiring diagrams and terminal assignment diagrams

Connect the motor only as shown in the wiring diagram(s) included with the motor. Do not connect or start up the motor if the wiring diagram is missing. You can obtain the valid wiring diagrams free of charge from SEW-EURODRIVE.

5.3 Cable entries

The terminal boxes have metric threaded holes according to EN 50262 or NPT threaded holes according to ANSI B1.20.1-1983. All bores are equipped with explosion-proof closing plugs upon delivery.

For a correct cable entry, replace the closing plugs with cable glands with strain relief that are certified for use in the respective hazardous location. Select the cable screw fitting according to the outer diameter of the cable used. For the tightening torque of the cable entry, refer to the operating/installation instructions or the EC prototype test certificate of the cable glands. The IP degree of protection of the cable entry must be at least as high as the IP degree of protection of the motor.

Only use connection glands with screw heads that fit into the existing counterbore.

The following table shows the sizes of the flat bottom counter sinking with the corresponding screw sizes:

Counter sinking in mm	Screw fitting
19	M12
24	M16
30	M20
35	M25
45	M32
56	M40
64	M50
75	M63

All cable entries that are not required must be sealed off with a closing plug after completion of the installation in order to maintain the degree of protection. A closing plug may only be replaced with another explosion-proof closing plug.

5.4 Equipotential bonding

In accordance with EN 60079-14 and IEC 61241-14, it might be necessary to establish a connection to an equipotential bonding system. Observe the chapter "Electrical Installation" / "Improving the grounding (EMC)".

5.5 Wiring notes

Comply with the safety notes during installation.

5.5.1 Protecting the brake control system against interference

Unless they are shielded, brake cables must always be routed separately from other power cables with phased currents to protect brake controls against interference. Power cables with phased currents are in particular

- Output cables from frequency inverters and servo controllers, soft start units and brake units
- Supply cables for braking resistors and similar options

5.5.2 Protecting the motor protection devices against interference

Adhere to the following points to protect SEW motor protection devices (TF temperature sensors) against interference:

- You may route separately shielded supply cables together with switched-mode power lines in one cable.
- Do not route unshielded supply cables together with switched-mode power lines in one cable.

5.6 Special aspects for operation with a frequency inverter

When motors are powered from inverters, you must observe the wiring instructions issued by the inverter manufacturer. Observe section "Operating Modes and Limit Values" and the operating instructions of the frequency inverter.

If a drive operated on the supply system has an earth-leakage current of more than AC/DC 10 mA, one or more of the following conditions for the PE system must be fulfilled:

- The PE conductor has a minimum cross section of 10 mm^2 for copper or 16 mm^2 for aluminum over its entire length.
- If the PE conductor has a cross section smaller than 10 mm^2 (for copper) or 16 mm^2 (for aluminum), a second PE conductor with at least the same cross section must be installed up to the point where the PE conductor has a cross section of minimum 10 mm^2 (for copper) or 16 mm^2 (for aluminum).

  It might be necessary to equip the drive with a separate connection for a second PE conductor.

5.7 Improving the grounding (EMC)

For improved, low-impedance grounding at high frequencies, we recommend using the following connections: SEW-EURODRIVE recommends to use corrosion-resistant connection elements.

If you require an NF equipotential bonding in addition to the HF equipotential bonding, you can apply the conductor at the same point.

The "Improved grounding" option can be ordered as follows:

- completely premounted or as
- "Connecting element" kit for customer installation; part numbers listed in the following table.

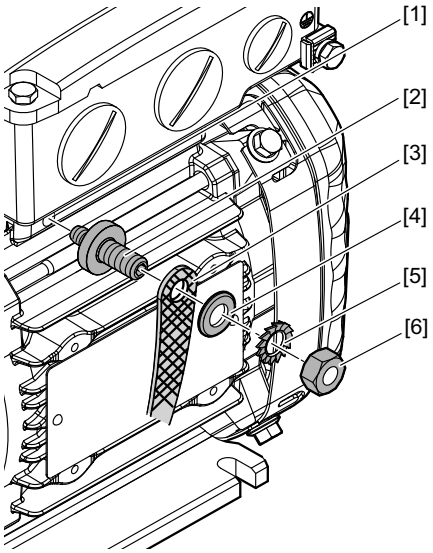
Motor size	Part number of "connecting element" kit
EDR.71S / M EDRE.80S / M	1363 3953
EDR.90M / L	
EDR.100M	
EDR.100 L – EDR.132	1363 3945
EDR.160 – EDR.225	
EDR.160 – EDR.225 with aluminum terminal box	

INFORMATION

For further information regarding the grounding, refer to the SEW publication "Drive Engineering – Practical Implementation, EMC in Drive Engineering".

5.7.1 Size EDR.71S / M and EDR.80S / M

The following figure shows how to install the grounding:



[1] Use of the pre-cast bore at the terminal-box recess/foot

[2] Grounding element with self-tapping screw DIN 7500 M6 x 10, customer M8 x 16, tightening torque 6 Nm (53.1 lb-in)

[3] Ground strap

[4] Disk ISO 7090

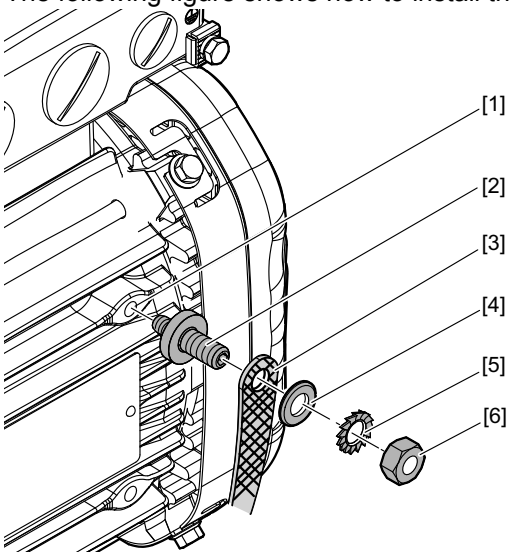
[5] Serrated lock washer DIN 6798

[6] M8 nut

You can order the complete connection element from SEW-EURODRIVE with part number 13633953.

5.7.2 Size EDR.90M / L

The following figure shows how to install the grounding:



[1] Use of the pre-cast bore

[2] Grounding element with self-tapping screw DIN 7500 M6 x 10, customer M8 x 16, tightening torque 6 Nm (53.1 lb-in)

[3] Ground strap

[4] Disk ISO 7090

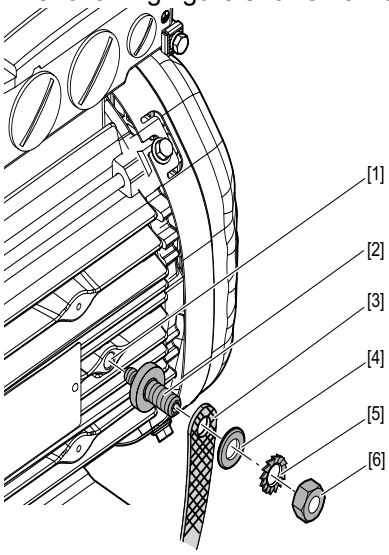
[5] Serrated lock washer DIN 6798

[6] M8 nut

You can order the complete connection element from SEW-EURODRIVE with part number 13633953.

5.7.3 Size EDR.100M

The following figure shows how to install the grounding:

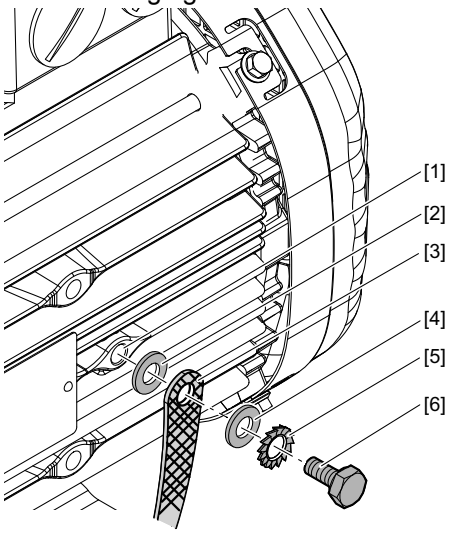


[1] Use of the pre-cast bore
[2] Self-tapping screw DIN 7500 M6 x 10, customer M8 x 16, tightening torque 6 Nm (53.1 lb-in)
[3] Ground strap
[4] Disk ISO 7090
[5] Serrated lock washer DIN 6798
[6] M8 nut

You can order the complete connection element from SEW-EURODRIVE with part number 13633953.

5.7.4 Size EDR.100L – EDR.132

The following figure shows how to install the grounding:

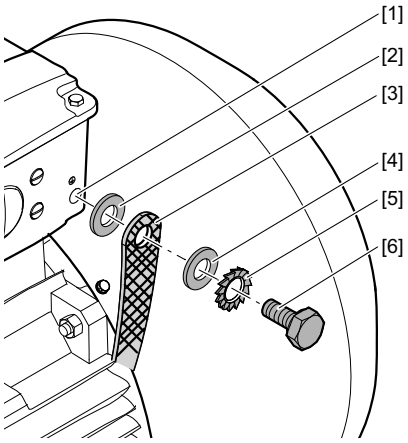


[1] Use of tapped hole for lifting eyes
[2] Disk ISO 7090
[3] Ground strap
[4] Disk ISO 7090
[5] Serrated lock washer DIN 6798
[6] Hexagon screw ISO 4017 M8 x 16, tightening torque 6 Nm (53.1 lb-in)

You can order the complete connection element from SEW-EURODRIVE with part number 13633945.

5.7.5 Sizes EDR.160 – EDR.225

The following figure shows how to install the grounding:



[1] Use of the tapped holes at the terminal box
[2] Disk ISO 7090
[3] Ground strap
[4] Disk ISO 7090
[5] Serrated lock washer DIN 6798
[6]
- Hex head screw ISO 4017 M8 x 16 (with aluminum terminal boxes size EDR.160 – 225), tightening torque 6 Nm (53.1 lb-in)
- Hex head screw ISO 4017 M10 x 25 (with gray cast iron terminal boxes size EDR.160 – 225), tightening torque 10 Nm (88.5 lb-in)

You can order the complete connection element from SEW-EURODRIVE with part number 13633945.

For sizes EDR.160 – 225 with gray cast iron terminal boxes, the grounding is always pre-installed upon delivery.

For aluminum terminal boxes size EDR.160 – 225, you can order the "connection element" kit with part number 13633945.

5.8 Special aspects in switching operation

When the motors are used in switching operation, possible interference of the switchgear must be excluded by ensuring suitable wiring. According to EN 60204 (electrical equipment of machines), motor windings must have interference suppression to protect the numerical or programmable logic controllers. As it is primarily switching operations that cause interference, SEW-EURODRIVE recommends installing protective circuitry in the switching devices.

5.9 Ambient conditions during operation

5.9.1 Ambient temperature

Unless otherwise specified on the nameplate, you must observe the temperature range of -20 °C to +40 °C.

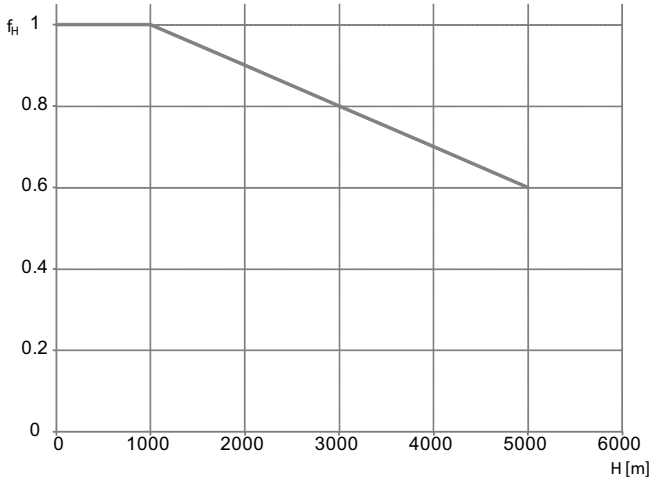
Motors intended for use in higher or lower ambient temperatures have specific designations on the nameplate.

If the motors are used at temperatures above +40 °C (max. +60 °C), the cables and cable glands must be suited for temperatures ≥ 90 °C.

Temperatures below -20 °C (max. -40 °C) require an anti-condensation heating. In addition, the cables and cable glands must me selected according to the respective temperature.

5.9.2 Motor power depending on the installation altitude

The following diagram shows the factor f_H by which the motor power is reduced as a function of the installation altitude.



5408843275

The reduction is calculated as follows: $P_H = f_H \times P_N$

The current is calculated as follows: $I_H = f_H \times I_N$

5.9.3 Hazardous radiation

Motors must not be subjected to hazardous radiation (such as ionizing radiation). Contact SEW-EURODRIVE if necessary.

5.9.4 Harmful gas, vapor and dust

If used according to their designated use, explosion-proof motors are incapable of igniting explosive gases, vapors or dusts. However, explosion-proof motors may not be subjected to gases, vapors or dusts that endanger operational safety, for example through

- Corrosion
- Damage to the protective coating
- Damage to the sealing material, etc.

Seal selection

If the motor is operated in environments with high environmental impact, such as increased ozone values, EDR motors can be equipped with high-quality gaskets. If you have doubts regarding the stability of the gaskets in connection with the respective environmental impacts, consult SEW-EURODRIVE.

5.10 Motors of category 2G, 2GD, 3D and 3GD

5.10.1 General information

The explosion-proof SEW-EURODRIVE motors of the EDR.. series are designed for the following application zones.

Motor category	Area of operation
2G	Application in zone 1 and compliance with the design requirements for equipment group II, category 2G.
2GD	Application in zone 1 or zone 21 and compliance with the design requirements for equipment group II, category 2GD.
3D	Application in zone 22 and compliance with the design requirements for equipment group II, category 3D.
3GD	Application in zone 2 or 22 and compliance with the design requirements for equipment group II, category 3GD.

5.10.2 Special indication "X"

If the special indication "X" appears after the certification number on the declaration of conformity or the prototype test certificate, this indicates the certificate contains special conditions for safe application of the motors.

5.10.3 Temperature classes

The motors are authorized for temperature classes T3 and T4.

The temperature class of the motor variants 3D and 3GD is listed on the nameplate or in the declaration of conformity in the appendix.

The temperature class of the motor variants 2G and 2GD is listed in the type examination certificate that is enclosed with each motor.

5.10.4 Surface temperatures

The surface temperature of the motor can be found on the nameplate, the declaration of conformity or the prototype test certificate.

5.10.5 Protection against impermissibly high surface temperatures

Motors for hazardous locations ensure safe operation under normal operating conditions. The motor must be switched off securely in the case of overload to avoid the risk of impermissibly high surface temperatures.

Motor protection must be in accordance with the respective approvals. There are 2 basic motor protection types. The respective options can be added if available:

Motor protection types	Option
A: Motor current circuit breaker	TF, KY or PT
B: Positive temperature coefficient thermistor (PTC resistor: SEW designation: TF)	KY or PT

The following table shows the type of motor protection required according to the respective approval:

Category	2 (2GD / Gb Db or 2G / Gb)			3 (3GD / Gc Dc or 3G / Dc)		
Operation:	Supply system	Frequency inverter	Pulsed	Supply system	• Frequency inverter • Soft start	Pulsed
Designation (see nameplate):	T_e time	T_e time	T_a time	–	–	–
Motor protection via	**A**	**B**	**B**	**A**	**B**	**B**

For permitted operating modes depending on the motor protection, see chapter "Permitted operating modes" (page 61). SEW-EURODRIVE equips brakemotors in category 3D and 3GD with positive coefficient thermistors (TF).

5.10.6 Protection exclusively with motor protection switch

Note the following when installing the motor protection switch according to EN 60947:

- **For categories 2G and 2GD:** With starting current ratio I_A/I_N listed on the nameplate, the response time of the motor protection switch must be less than the heating time t_E of the motor.
- The motor protection switch must disconnect all poles in the event of a phase failure.
- The motor protection switch must be approved by a notified body and assigned a corresponding inspection number.
- The motor protection switch must be set to the rated motor current indicated on the nameplate. With category 2G and 2GD, the permitted nominal motor current is specified on the prototype test certificate.

5.10.7 Protection exclusively with PTC temperature sensors (TF)

The positive coefficient thermistor must be evaluated using a suitable device. Observe the applicable installation regulations.

⚠ CAUTION

Damage to the temperature sensor due to excessive voltage.

Possible destruction of the temperature sensor.

- Do not apply any voltages > 30 V

The PTC thermistors comply with DIN 44082.

Resistance measurement (measuring instrument with V ≤ 2.5 V or I < 1 mA):

- Standard measured values: 20 – 500 Ω, thermal resistance > 4000 Ω

The PTC thermistor (TF) is required in order to maintain a safe isolation and for thermal monitoring.

The evaluation function of the temperature monitoring must be activated in connection with the temperature sensor measuring circuit and must become effective in the event of an overtemperature.

5.10.8 Protection with motor protection switch and additional PTC thermistor

The conditions stated for exclusive protection with motor protection switches also apply here. Protection with positive temperature coefficient thermistors (TF) only represents a supplementary protection measure which is irrelevant to certification for potentially explosive atmospheres.

INFORMATION

Check during startup whether a trip of the protection device shuts down the drive properly.

5.11 Notes regarding the connection of the motor

INFORMATION

It is essential to comply with the valid wiring diagram! Do not connect or start up the motor if this wiring diagram is missing. The relevant wiring diagrams are available from SEW-EURODRIVE free of charge.

INFORMATION

The terminal box must be free from foreign objects, dirt and humidity. Unused cable entry openings and the terminal box itself must be closed so they are dust and waterproof.

Observe the following points when you connect the motor:

- Check cable cross section
- Arrange terminal links correctly
- Screw on the connections and the PE conductor correctly
- Make sure that the connection cables are not cramped in to avoid damage to the insulation.
- Observe clearances, see chapter "Electrical connection" (page 38)
- In the terminal box: Check winding connections and tighten them if necessary
- Perform the connection in accordance with the enclosed wiring diagram
- Avoid protruding wire ends
- Observe the specified direction of rotation

The following wiring diagrams can be obtained from SEW-EURODRIVE by specifying the motor order number (see chapter "Nameplate, type designation"):

Series	Number of poles	Connection	Associated wiring diagram (designation/number) xx = placeholder for the version
EDR.71-225	4	△ / 人	C13: 68 184 xx 08 R13: 68 001 xx 06

The motors are supplied and connected differently depending on the size and electrical design. Comply with the connection type specified in the following table:

Series	Connection
EDR.71 – EDR.132	• With V < 500 V and I < 17 A: Motor connection via cage clamp terminal • With V > 500 V and I > 17 A: Motor connection via terminal board
EDR.160 – EDR.225	• Motor connection via terminal board

Observe the permitted air and creeping distances when connecting the supply system cable.

5.12 Motor connection via terminal board

The motors are supplied and connected differently depending on the electrical design. Arrange the cables and terminal links as shown in the wiring diagram and screw them on firmly. Observe the tightening torques specified in the following tables:

Motor sizes EDR.71 – EDR.132							
Connection bolt Ø	**Tightening torque of hex nut**	**Connection Customer Cross section**	**Variant**	**Connection type**	**Scope of delivery**	**PE connection stud Ø**	**Variant**
M6	**3.0 Nm** (26.5 lb-in)	**≤ 6 mm² (AWG 10)**	**1**	**Ring cable lug or solid wire**	**Small connection accessories enclosed in bag**	M5	2
M6	3.0 Nm (26.5 lb-in)	≤ 35 mm² (AWG 2)	1	Ring cable lug	Small connection accessories enclosed in bag	M5	2

Motor size EDR.160							
Terminal stud Ø	**Tightening torque of hex nut**	**Customer connection Cross section**	**Variant**	**Connection type**	**Scope of delivery**	**PE connection stud Ø**	**Variant**
M6	3.0 Nm (26.5 lb-in)	≤ 6 mm² (AWG 10)	1	Ring cable lug or solid wire	Small connection accessories enclosed in bag	M8	2
M6	**3.0 Nm** (26.5 lb-in)	**≤ 35 mm² (AWG 2)**	**1**	**Ring cable lug**	**Small connection accessories enclosed in bag**	M8	2
M8	6.0 Nm (53.1 lb-in)	≤ 70 mm² (AWG 2/0)	1	Ring cable lug	Small connection accessories enclosed in bag	M10	2

Motor sizes EDR.180 – EDR.225							
Terminal stud Ø	**Tightening torque of hex nut**	**Customer connection Cross section**	**Variant**	**Connection type**	**Scope of delivery**	**PE connection stud Ø**	**Variant**
M6	3.0 Nm (26.5 lb-in)	≤ 6 mm² (AWG 10)	1	Ring cable lug or solid wire	Small connection accessories enclosed in bag	M8	2
M8	**6.0 Nm** (53.1 lb-in)	**≤ 70 mm² (AWG 2/0)**	**1**	**Ring cable lug**	**Small connection accessories enclosed in bag**	M8	2
M12	15.5 Nm (137.2 lb-in)	35 mm² (AWG 2) – 95 mm² (AWG 3/0)	1	Ring cable lug	Connection parts pre-assembled	M12	2

The designs in bold print apply to S1 operation for the standard voltages and standard frequencies according to the data in the catalog. Other versions may have different connections, for example different terminal stud diameters and/or a different scope of delivery.

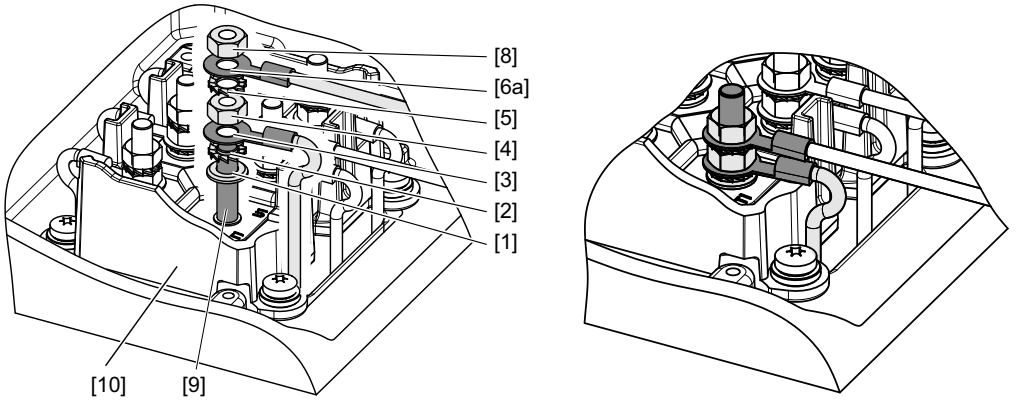
NOTE ON EXPLOSION PROTECTION

Tubular cable lugs according to DIN 46235 must not be used as they may not comply with the permitted minimum clearances.

5.12.1 Variant 1

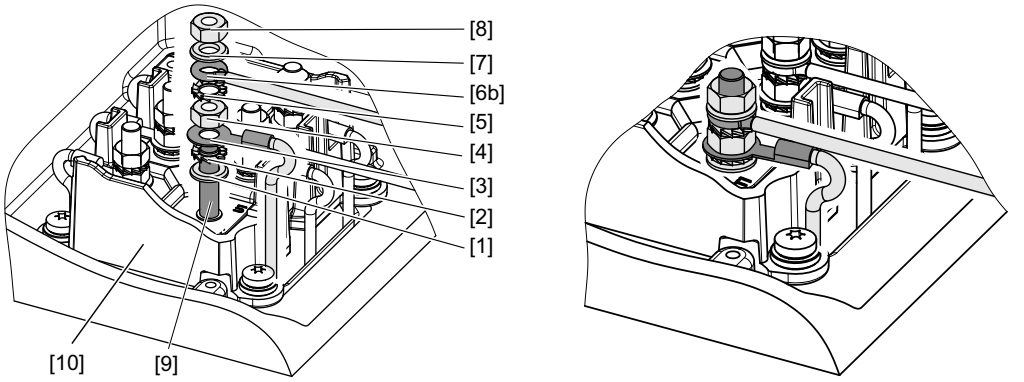
The following figure shows the 2 possible customer connections:

Customer connection with ring cable lug:



3989525643

Customer connection with solid wire:

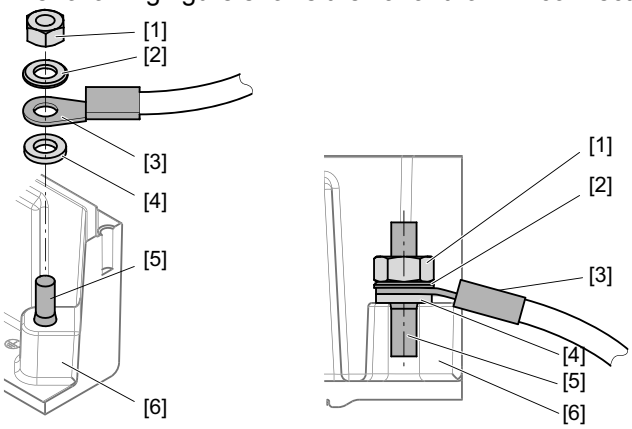


9007201889135499

[1] Washer
[2] Serrated lock washer
[3] Winding connection with ring cable lug
[4] Lower nut
[5] Serrated lock washer
[6a] Winding connection with ring cable lug, e.g. according to DIN 46237 or DIN 46234.
[6b] Winding connection with solid wire, U-shaped
[7] Serrated lock washer
[8] Upper nut
[9] Terminal stud
[10] Anti-twist frame for ensuring the clearances

5.12.2 Variant 2

The following figure shows the variant for PE connection:



9007202075543051

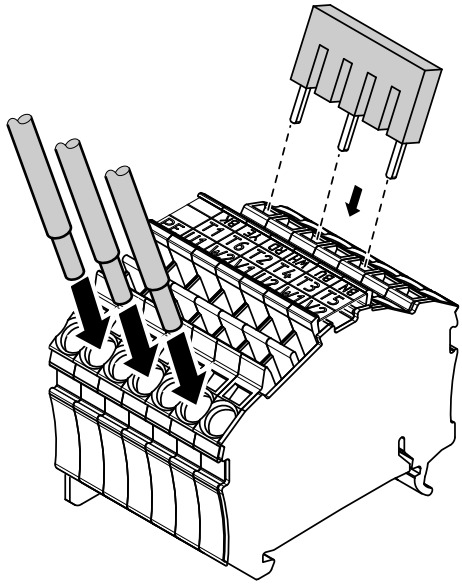
[1] Hex nut
[2] Washer
[3] PE conductor with cable lug
[4] Serrated lock washer
[5] Stud
[6] Terminal box

5.13 Connecting the motor via terminal strip

5.13.1 KCC terminal strip

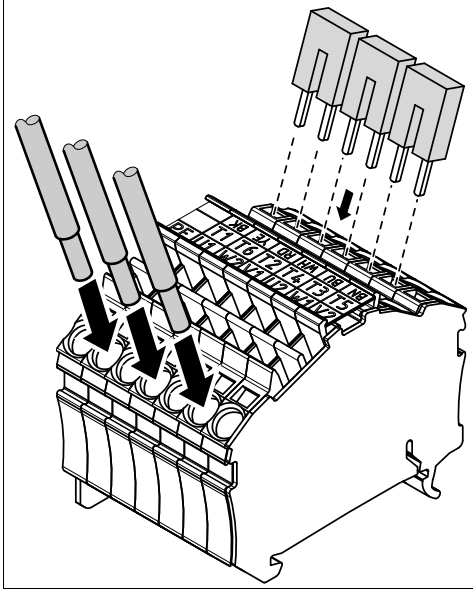
- Perform the connection in accordance with the enclosed wiring diagram
- Check the maximum cable cross section:
  - 4 mm^2 (AWG 12) rigid
  - 4 mm^2 (AWG 12) flexible
  - 2.5 mm^2 (AWG 14) flexible with conductor end sleeve
- In the terminal box: Check winding connections and tighten them if necessary
- Strip-off length 10-12 mm

Arrangement of terminal links for ⅄ connection



9007200251323147

Arrangement of terminal links for △ connection



9007200251325067

5.14 Connecting the brake

The brake is released electrically. The brake is applied mechanically when the voltage is switched off.

⚠ WARNING

Risk of crushing if the hoist falls.

Severe or fatal injuries.

- Comply with the applicable regulations issued by the relevant employer's liability insurance association regarding phase failure protection and the associated circuit/circuit modification!
- Connect the brake according to the provided wiring diagram.
- In view of the DC voltage to be switched and the high level of current load, it is essential to use either special brake contactors or AC contactors with contacts in utilization category AC-3 according to EN 60947-4-1.

5.14.1 Connecting the brake controller

The DC disk brake is either supplied with energy via a brake controller with protection circuit, or in some sizes, it can be supplied directly with DC voltage. For wiring diagrams of the brake controller, see chapter "Appendix" (page 164).

- Operation with direct DC voltage without SEW brake controller is only permitted for brake sizes BE05 – BE2 in category 3GD and 3D.
- If an SEW brake controller is used for motors of category 3GD, this controller must be installed in the control cabinet.
- For brakemotors in category 3D, the SEW brake controller can be installed in the wiring space of the motor or in the control cabinet.
- Connect the brake controller according to the provided wiring diagram
- **Check the cable cross sections – braking currents (see chapter "Technical Data")**
- Brakes must not be released electrically all the time while the motor is at standstill.

5.15 Accessory equipment

Connect accessory equipment as shown in the wiring connection diagram(s) provided with the motor. **Do not connect or start up the accessory equipment if the wiring diagram is missing.** You can obtain the valid wiring diagrams from SEW-EURODRIVE free of charge.

The following additional features are used depending on the respective category, see the following table:

Optional equipment	Category 2	Category 3
Temperature sensor /TF	x	x
Temperature sensor /KY	x	x
Temperature sensor /PT	x	x
Forced cooling fan /VE	–	x
Add-on encoders	–	x
Anti-condensation heater	x	x

5.15.1 Temperature sensor /TF

NOTICE

Damage of the temperature sensor due to excessive heat.

The drive system might be damaged.

- Do not apply voltages > 30 V to the TF temperature sensor.

The PTC thermistors comply with DIN 44082.

Resistance measurement (measuring instrument with V ≤ 2.5 V or I < 1 mA):

- Standard measured values: 20 – 500 Ω, thermal resistance > 4000 Ω

When using the temperature sensor for thermal monitoring, the evaluation function must be activated to maintain reliable isolation of the temperature sensor circuit. If the temperature reaches an excessive level, a thermal protection function must be triggered immediately.

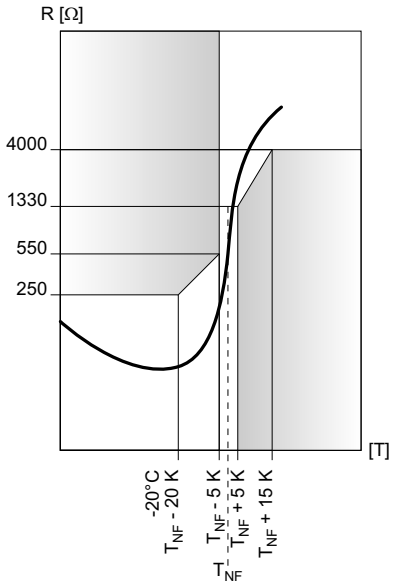
If there is a second terminal box for the TF temperature sensor, the temperature sensor must be connected in this terminal box.

Observe the provided wiring diagram for the connection of the TF temperature sensor. If the wiring diagram is missing, you can obtain it from SEW-EURODRIVE free of charge.

INFORMATION

The temperature sensor TF may not be subjected to voltages > 30 V.

Below figure shows the characteristic curve of the TF with reference to the rated response temperature (referred to as T_{NF}).



5470153483

5.15.2 Temperature sensor /KY (KTY84-130)

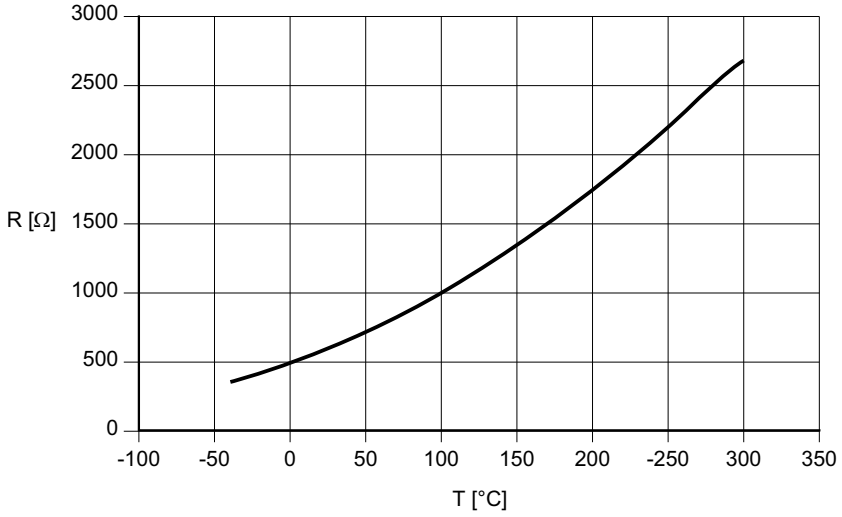
NOTICE

Excessive self-heating of the temperature sensor can damage the insulation of the temperature sensor.

The drive system might be damaged.

- Avoid currents > 4 mA in the circuit of the KTY.
- Observe the correct connection of KTY to ensure correct evaluation of the temperature sensor. Ensure correct polarity.

The characteristic curve in the following figure shows the resistance curve subject to the motor temperature with a measuring current of 2 mA and correct pole connection.



Technical data	KTY84 - 130
Connection	Red (+) Blue (-)
Total resistance at 20 - 25 °C	540 Ω < R < 640 Ω
Test current	< 3 mA

5.15.3 Temperature sensor /PT (PT100)

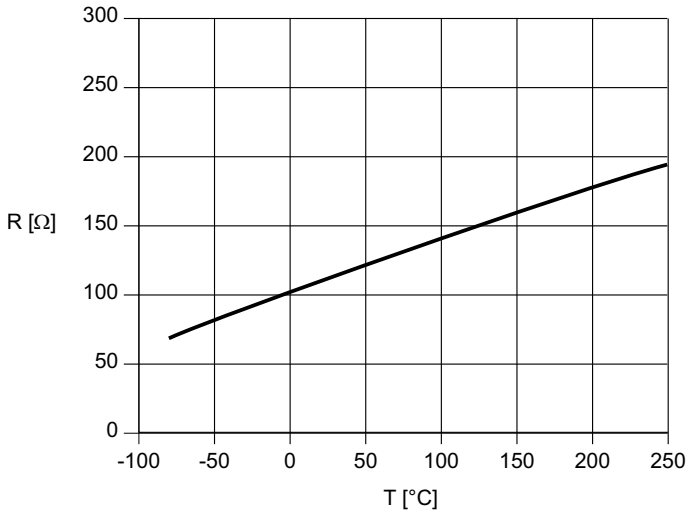
NOTICE

Excessive self-heating of the temperature sensor can damage the insulation of the temperature sensor.

The drive system might be damaged.

- Avoid currents > 4 mA in the circuit of the PT100.
- Observe the correct connection of PT100 to ensure correct evaluation of the temperature sensor. Ensure correct polarity.

The characteristic curve in the following figure shows the resistance curve subject to the motor temperature.



Technical data	PT100
Connection	Red/white
Resistance at 20 - 25 °C per PT100	107 Ω < R < 110 Ω
Test current	< 3 mA

5.15.4 Forced cooling fan /VE

Motors in category II3D and II3GD can be equipped with a forced cooling fan as an option. For notes on connection and safe operation, refer to the operating instructions of the VE forced cooling fan (page 176).

V forced cooling fans must not be used with explosion-proof EDR.. AC motors.

5.15.5 Overview of mount-on encoders

Refer to the wiring connection diagrams on information on how to connect incremental encoders:

Encoder	Motor size	Mounting device	Encoder type	Mounting type	Power supply	Signal	Wiring diagram
ES7S	EDR.71 – 132	ES7A for retrofitting	Incremental encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos	68 180 xx 08
ES7R	EDR.71 – 132	ES7A for retrofitting	Incremental encoder	Shaft-centered	DC 7 – 30 V	TTL (RS 422)	68 179 xx 08
ES7C	EDR.71 – 132	ES7A for retrofitting	Incremental encoder	Shaft-centered	DC 4.5 – 30 V	HTL / TTL (RS 422)	68 179 xx 08
AS7W	EDR.71 – 132	ES7A for retrofitting	Absolute encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos (RS 485)	68 181 xx 08
AS7Y	EDR.71 – 132	ES7A for retrofitting	Absolute encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos + SSI	68 182 xx 07
EG7S	EDR.160 – 225	EG7A for retrofitting	Incremental encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos	68 180 xx 08
EG7R	EDR.160 – 225	EG7A for retrofitting	Incremental encoder	Shaft-centered	DC 7 – 30 V	TTL (RS 422)	68 179 xx 08
EG7C	EDR.160 – 225	EG7A for retrofitting	Incremental encoder	Shaft-centered	DC 4.5 – 30 V	HTL / TTL (RS 422)	68 179 xx 08
AG7W	EDR.160 – 225	EG7A for retrofitting	Absolute encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos (RS 485)	68 181 xx 08
AG7Y	EDR.160 – 225	EG7A for retrofitting	Absolute encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos + SSI	68 182 xx 07
EV2C	EDR.71 – 225	XV1A required	Incremental encoder	Flange centered	DC 9 – 26 V	HTL	–
EV2R	EDR.71 – 225	XV1A required	Incremental encoder	Flange centered	DC 9 – 26 V	TTL (RS 422)	–
EV2S	EDR.71 – 225	XV1A required	Incremental encoder	Flange centered	DC 9 – 26 V	1 Vss sin/cos	–
EV2T	EDR.71 – 225	XV1A required	Incremental encoder	Flange centered	DC 5 V	TTL (RS 485)	–
EV7C	EDR.71 – 132	XV1A required	Incremental encoder	Shaft-centered	DC 4.5 – 30 V	HTL / TTL (RS 422)	–
EV7R	EDR.71 – 132	XV1A required	Incremental encoder	Shaft-centered	DC 7 – 30 V	TTL (RS 422)	–
EV7S	EDR.71 – 225	XV1A required	Incremental encoder	Flange centered	DC 7 – 30 V	1 Vss sin/cos	–
AV7W	EDR.71 – 132	XV1A required	Absolute encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos (RS 485)	–
AV7Y	EDR.71 – 132	XV1A required	Absolute encoder	Shaft-centered	DC 7 – 30 V	1 Vss sin/cos + SSI	–

Encoder connection

When connecting the encoders to the inverters, observe the provided wiring diagrams and the information in these operating instructions as well as the operating instructions/wiring diagrams of the respective inverter and the operating instructions/wiring diagrams provided with the non-SEW encoder if applicable. See Appendix (page 172) for the wiring diagram.

- Maximum cable length (inverter - encoder):
  - 100 m with a capacitance per unit length ≤ 120 nF/km
- Core cross section: 0.20 – 0.5 mm^2 (AWG 24 – 20)
- Use shielded cable with twisted pair conductors and apply shield over large area on both ends:
  - To the connection cover of the encoder, in the cable gland, or in the encoder plug
  - To the inverter on the electronics shield clamp or to the housing of the D-sub connector
- Install the encoder cables separately from the power cables, maintaining a distance of at least 200 mm.
- Compare the operating voltage with the permitted operating voltage range on the encoder nameplate. Deviations in the operating voltage may overheat and damage the encoder.
- Observe the clamping area of 5 to 10 mm of the cable gland of the connection cover. If you use cables with a different cross section, you have to replace the provided cable gland with a suitable other cable gland.
- The cable glands for the cable entry must meet the following conditions:
  - Cramping area is suitable for the respective cable
  - The IP level of the encoder connection is at least as high as the IP level of the actual encoder
  - Use is permitted according to the Ex category/zone
  - The cable is suitable for the respective ambient temperature range.
- Check the flawless state and the proper seat of the connection cover gasket.
- Tighten the screws of the connection cover with a tightening torque of 2 Nm [17.7 lb-in].

5.15.6 Anti-condensation heating

An anti-condensation heating is required when the explosion-proof motors are operated at temperatures below -20 °C.

Above -20 °C, when moisture condensation is expected, the anti-condensation heating is optional.

When connecting the anti-condensation heating, observe the permitted connection voltage for the strip heater according to the motor nameplate as well as the wiring diagram of the motor.

You must not energize the strip heater when the motor is switched-on.

6 Operating Modes and Limit Values

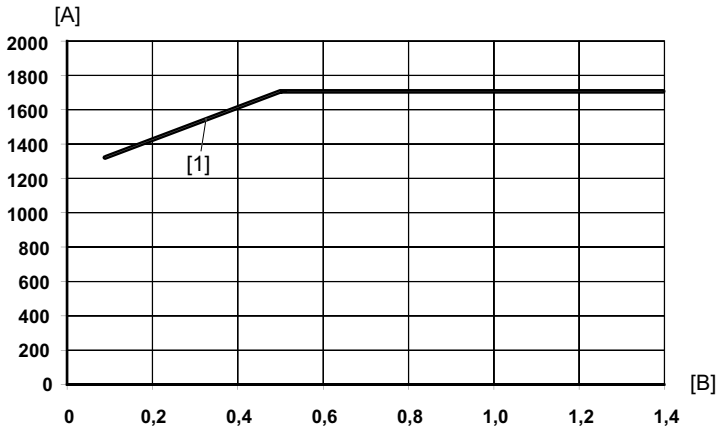
6.1 Permitted operating modes

The following table shows the permitted duty types:

Category	Protection level (EPL)	Protection against impermissibly high temperatures exclusively by	Permitted operating mode
3D **3GD**	**Dc** **Gc, Dc**	Motor protection switch	• S1
		PTC thermistor (TF)	• S1 • Heavy start • Frequency inverter operation • soft start unit
2G **2GD**	**Gb** **Gb, Db**	Motor protection switch	• S1
		PTC thermistor (TF)	• S1 • Frequency inverter operation (if certified)
		PTC thermistor (TF) as sole protection	• S1 • Frequency inverter operation (if certified)

6.1.1 Permitted voltage load for frequency inverter operation

Operating SEW motors on frequency inverters is permitted if the pulse voltages at the motor terminals indicated in the following figure are not exceeded.



[A] Permitted pulse U_{LL} in V
[B] Rise time in µs
[1] Permitted pulse voltage for EDR standard

NOTE ON EXPLOSION PROTECTION

The permitted maximum PE voltage of 1200 V must not be exceeded in IT system operation even in the event of an error.

NOTE ON EXPLOSION PROTECTION

If the permitted pulse voltage is exceeded, you have to provide for according measures to limit the pulse voltage. Consult the manufacturer of the frequency inverter.

INFORMATION

The maximum permitted rated motor voltage for frequency inverter operation is 500 V.

Frequency inverter from SEW-EURODRIVE

When using frequency inverters from SEW-EURODRIVE on supply systems of up to 500 V, the maximally permitted limit values of the EDR.. motors are met.

The maximum permitted motor cable length is 100 m.

A braking resistor and a 4Q startup are mandatory. This prevents that in case of a fault in 1Q operation, the DC link voltage increases to an unacceptable level. External components, e.g. output choke, must not be used.

Frequency inverters from third party manufacturers

If the maximum permitted limit values cannot be met with frequency inverters from other manufacturers, you must take limiting measures. Consult the manufacturer of the frequency inverter.

IT network

In an IT system, an insulation fault between a phase and ground is tolerated. The ground connection of the motor could mean that the maximum permitted limit value for phase-to-ground of 1200 V is exceeded in regenerative operation. To prevent this effectively, you have to install suitable protection elements between the frequency inverter and the motor. Usually, sine filters are installed between frequency inverter and motor for this purpose. For detailed information about component selection and wiring, please contact the manufacturer of the frequency inverter.

Regeneration

The regenerative power supply module of MOVIDRIVE® or MOVIAXIS® can be used with the necessary options without restrictions. The regenerative power supply unit prevents high DC link voltages and ensures that the limit values are not exceeded.

6.2 Use

NOTES ON EXPLOSION PROTECTION

- It is not permitted to connect more than one motor to one frequency inverter.
- The voltage at the motor terminal board must projected be to prevent overheating.
- If the motor voltage is too low (undercompensation), slip increases, which causes higher temperatures in the rotor of the motor.
- If the mechanical load is the same, operation on a frequency inverter causes a more significant motor temperature rise due to the harmonic content in current and voltage.

6.2.1 Motors of category 2G and 2GD

NOTES ON EXPLOSION PROTECTION

- The frequency inverter can only be operated with motors that are permitted for this operating mode according to the EC prototype test certificate.
- Verification that the motor voltage matches the specifications of the EC prototype test certificate must be provided during startup.

The necessary information for this is listed on the nameplate.

6.3 Safe operation of motors in category 2

Project planning is the basic requirement for safe operation of explosion-proof motors. The following points have to be considered:

- Checking the conditions of the typical application
- With deviations from the typical application: Calculate points D and E
- Adhere to the thermal torque limit characteristic curve
- Observe the dynamic limit torque
- Observe motor limit frequency
- Select the suitable frequency inverter
- Braking resistor must be used irrespective of the duty type
- Check the overhung and axial loads on the motor shaft of stand-alone motors
- Observe the maximum gear unit input speed, see n_{emax} on the nameplate
- Observe the maximum gear unit output torque, see M_{amax} on the nameplate

6.3.1 Motor terminal voltage

The calculation of the motor terminal voltage is an important component of project planning.

If the conditions differ from the typical application, you have to calculate the start of the field weakening f_{D*}, the M_{E*} and the current limit I_{E*}, see also chapter "Special application" (page 74).

6.3.2 Maximum permitted torques

The thermal torque limit characteristic curve shows the permitted maximum torque for continuous operation.

The values may be exceeded for brief periods if the effective operating point lies below the thermal limit characteristic curve.

The permitted maximum dynamic limit torque is determined by the short-term current limitation (150% $I_{N\ Motor}$). Take the value $I_{N\ motor}$ from the EC prototype test certificate and/or the nameplate.

6.3.3 Permitted maximum and minimum frequencies

For the maximum and minimum frequencies, refer to the EC type examination certificate and/or the nameplate. The actual values may not exceed or fall below these specifications.

6.3.4 Motor/inverter assignment for motors of category 2G and 2GD

MOVITRAC® B can be used for the basic control range. MOVITRAC® B can also be used for the field weakening range as of version 18225632.11[1)].

MOVIDRIVE® B is only suitable for the basic setting range. This means the *Maximum speed* parameter must be limited to the beginning of the field weakening range.

You must only use frequency inverters that comply with the requirements specified in the EC prototype test certificate.

$I_{N\,FrequencyInverter} \leq 2 \times I_{N\,Motor}$

Combinations for motor voltages other than 230/400 V can be requested from SEW-EURODRIVE.

Motor in ⅄ connection with motor voltage 230/400 V:

x = recommended o = permitted – = not permitted

INFORMATION

The speed can be reduced in case of gearmotors. If in doubt, refer to the nameplate for the permitted values.

6.3.5 Notes for safe operation

General information

Install the frequency inverter outside the potentially explosive atmosphere.

Thermal motor protection

Thermal motor protection is ensured by the following measures:

- Winding temperature monitoring through PTC thermistors (TF) built into the winding. The TF is monitored via an evaluation unit that complies with directive 94/9/EC and is labeled with Ex identification II(2)GD / II(2)G .
- Motor current monitoring according to the specifications of the EC prototype test certificate.
- Motor torque limitation according to the specifications of the EC prototype test certificate.

Overvoltage at the motor terminals

For FI-operated motors, observe chapter "Permitted voltage load in FI operation" (page 62).

EMC measures

The following components are permitted for the MOVIDRIVE® and MOVITRAC® frequency inverters:

- Line filters of the NF...-... series
- Output chokes of the HD... series
- Output filter (sine filter) HF..

  If an output filter is used, the voltage drop at the filter must be taken into account. Observe the "Special application" (page 74) chapter.

Gear units

When parameterizing FI-controlled gearmotors, you have to observe the n_{emax} and M_{amax} values of the gear unit.

6.4 Safe operation of motors in category 3

Project planning is the basic requirement for safe operation of explosion-proof motors. The following points have to be considered:

- Checking the conditions of the typical application
- With deviations from the typical application: Calculate points D and E
- Adhere to the thermal torque limit characteristic curve
- Observe the dynamic limit torque
- Observe motor limit frequency
- Select the suitable frequency inverter
- Braking resistor must be used irrespective of the duty type
- The maximum permitted braking work per switching operation or per emergency stop must be observed, see chapter "Permitted work done by the BE brake for AC motors" (page 148).
- Check the overhung and axial loads on the motor shaft of stand-alone motors
- Observe the maximum gear unit input speed, see n_{emax} on the nameplate
- Observe the maximum gear unit output torque, see M_{amax} on the nameplate

6.4.1 Motor terminal voltage

The calculation of the motor terminal voltage is an important component of project planning.

If the conditions differ from the typical application, you have to calculate the start of the field weakening f_{D*} and the M_{E*}, see also chapter "Special application" (page 74).

6.4.2 Maximum permitted torques

The thermal torque limit characteristic curve shows the permitted maximum torque for continuous operation.

The values may be exceeded for brief periods if the effective operating point lies below the thermal limit characteristic curve, see chapter "Typical application" (page 72).

The maximum dynamic limit torque of motors of category 3 must not exceed 200% of M_N.

Permitted frequencies

Observe the maximum frequencies listed in the assignment tables for the motor/frequency inverter combinations. These values must not be exceeded.

Frequency inverter selection

Base your selection of the right frequency inverter on the table in chapter "Motor/inverter assignment for motors of category 3D and 3GD" (page 69).

6.4.3 Motor/inverter assignment for motors of category 3G and 3GD

Frequency inverters that have similar values with respect to output current and output voltage can also be used. For more information, refer to the standard EN 60079-15.

Combinations for motor voltages other than 230/400 V can be requested from SEW-EURODRIVE.

x = recommended o = permitted – = not permitted

INFORMATION

The speed can be reduced in case of gearmotors. If in doubt, refer to the nameplate for the permitted values.

6.4.4 Notes for safe operation

General information

Install the frequency inverter outside the potentially explosive atmosphere.

Thermal motor protection

Only motors that are equipped with a positive temperature coefficient thermistor (TF) are permitted for operation on a frequency inverter to ensure that the permitted limit temperature is not exceeded. The positive temperature coefficient thermistor has to be evaluated using an appropriate device.

Motors that are suitable for frequency inverter operation have an additional frequency inverter nameplate.

Overvoltage at the motor terminals

For FI-operated motors, observe section "Permitted voltage requirement in FI operation" (page 62)

EMC measures

The following components are permitted for the MOVIDRIVE® and MOVITRAC® frequency inverters:

- Line filters of the NF...-... series
- Output chokes of the HD... series
- Output filter (sine filter) HF..

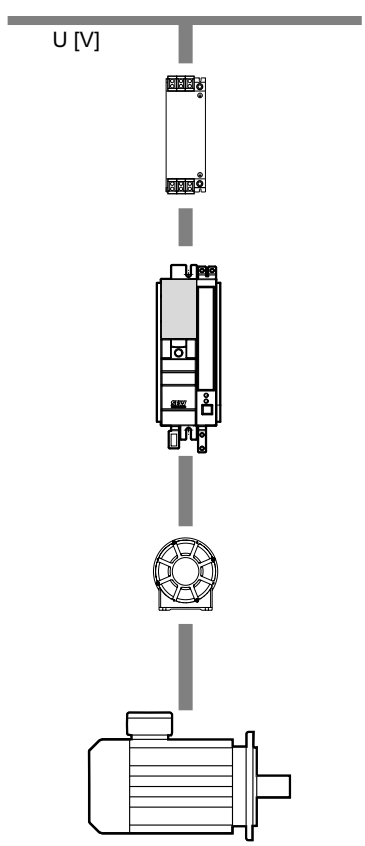
  If an output filter is used, the voltage drop at the filter must be taken into account. Observe the "Special application" (page 74) chapter.

Gear units

When parameterizing FI-controlled gearmotors, you have to observe the n_{emax} and M_{amax} values of the gear unit.

6.5 Typical application

The following conditions must be met:



- Supply system tolerance: ±5 %
- Installation with and without external NF line filter
- Frequency inverter:
  – MOVITRAC® B
  – MOVIDRIVE® B
- Installation without line choke and without sine filter
- Max. motor cable length 100 m
  Maximum permitted voltage: 10 V
- Rated motor voltage[1]: 219 – 241 V /
  380 – 420 V or 230 / 400 V (here for V_{line} = 400 V)

1) The rated motor voltage must be selected depending on the line voltage.

5457884171

6.5.1 Motor terminal voltage

The thermal torque limit curves are based on the assumption that all conditions of a typical application are fulfilled.

The motor terminal voltage must only be dimensioned if the conditions of a typical application are not met. Consult SEW-EURODRIVE in this case.

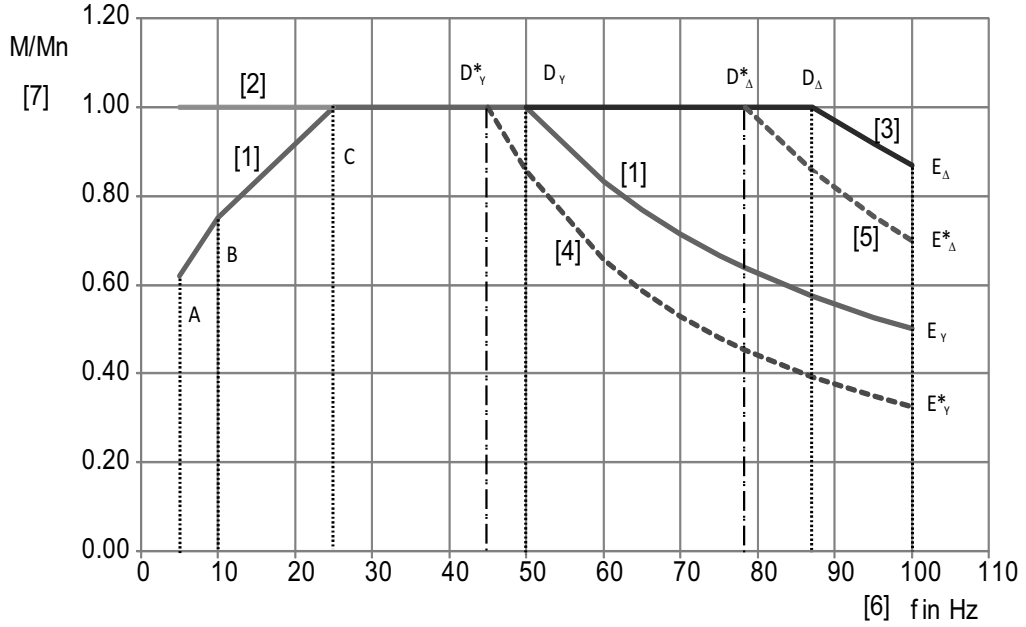
6.5.2 Limit characteristic curves of EDRS and EDRE motors in inverter operation

The thermal torque characteristic curves show the permitted maximum torque ratings for continuous operation.

The values may be exceeded for brief periods if the effective operating point lies below the thermal limit characteristic curve.

Category 3

The following diagram shows the typical limit characteristic curve for category 3. Refer to the nameplate for the exact values:

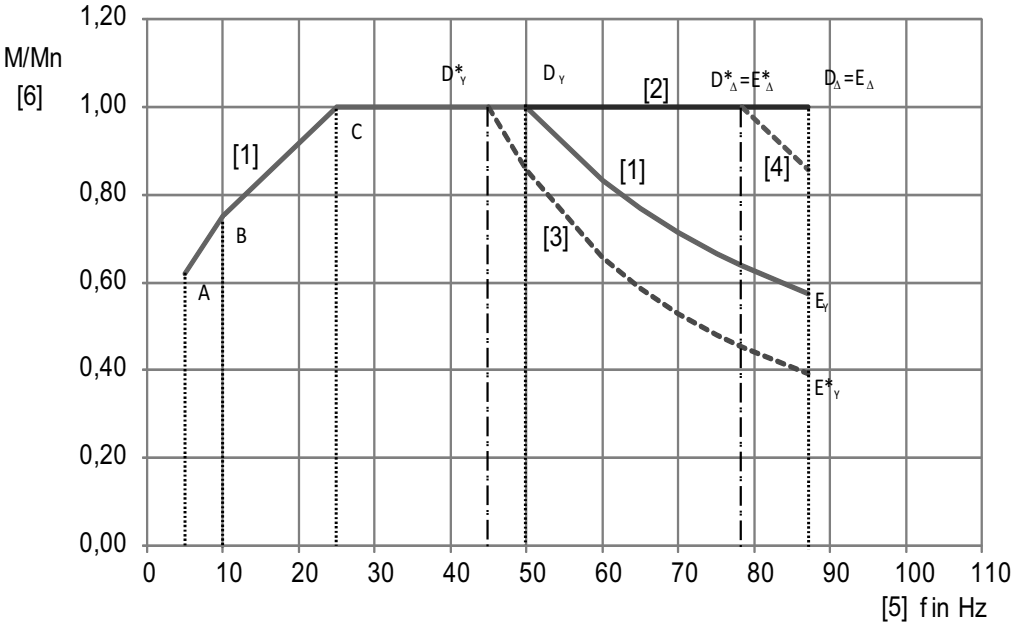


9007202906693003

[1] Star connection
[2] VE fan
[3] Delta connection
[4] Typical application – star connection
[5] Typical application – delta connection
[6] Supply frequency of the motor
[7] Torque ratio M/M_N

Category 2

The following diagram shows the typical limit characteristic curve for category 2. Refer to the nameplate for the exact values:



9007202906697099

[1] Star connection
[2] Delta connection
[3] Typical application – star connection
[4] Typical application – delta connection
[5] Supply frequency of the motor
[6] Torque ratio M/M_N

Points A, B and C

These 3 points limit the torque in the lower speed range in order to protect the from overheating due to the reduced cooling. They do not have to be projected. The variables are included in the startup software and are automatically assigned the permitted values during startup.

Points D, E

The two points illustrate the progress of the torque characteristic in the field weakening if the motor terminal voltage corresponds to the rated motor voltage (ideal case). Field weakening begins at point D. Point E is the permitted torque at limit speed.

Points D*, E* (typical application)

The typical application is characterized by the fact that due to the voltage drop the motor terminal board is not provided with the entire supply voltage. This causes a shift of the field weakening progress. The field weakening starts in point D*.

For the limit speed, the shift of the characteristic results in a reduced torque E*.

The startup software calculates both points D* and E* for the typical application and sets the respective parameters.

6.6 Special application

If the conditions of the typical application are not met, the motor terminal voltage can deviate and, as a result, the motor can heat up excessively.

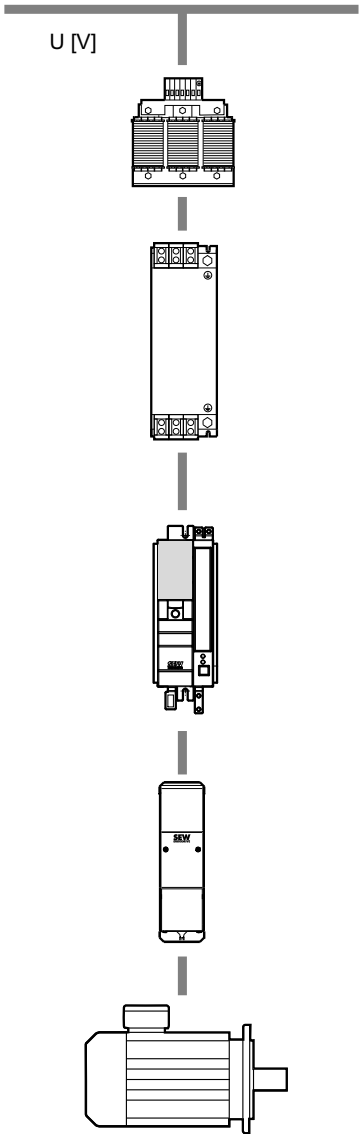
The deviating motor terminal voltage changes the shape of the thermal characteristic curve. The calculation and observation of points D (field weakening f_{D*}) and E (current limit I_{E*} and torque M_{E*}) during startup prevents the motor from overheating. The current limit I_{E*} must only be calculated for drives in category 2.

The project planning procedure is as follows:

- Determining the maximum terminal voltage:
- Calculating the field weakening f_{D*}
- Calculating the torque characteristics M_{E*}

6.6.1 Calculating the motor terminal voltage

The calculation of the motor terminal voltage is an important component of project planning. The results must be considered during startup and corrected, if necessary, to prevent excessive heating of the motor.



V_{line}, observe tolerances

ΔV_{ND}

ΔV_{NF}

$V_{I\_FI} = V_{Line} - \Delta V_{LC} - \Delta V_{LF}$

$V_{O\_FI} = 0.925 \times V_{I\_FI}$

ΔV_{HF}

ΔV_{Perm}

$V_{MotorTerm} = V_{A\_FI} - \Delta V_{HF} - \Delta V_{Perm}$

1458069131

V_{I_FI} = Inverter input voltage in V

V_{O_FI} = Inverter output voltage in V

$\triangle V_{HF}$ = Voltage drop across sine filter in V

$\triangle V_{permitted}$ = Voltage drop across incoming motor cable in V

$\triangle V_{ND}$ = Voltage drop across line choke in V

$\triangle V_{NF}$ = Voltage drop across line filter, in V

For inverter operation, the motor voltage is calculated as follows:

$$V_{Motor} = V_{Line} - (\Delta V_{LineFilter/Choke} + \Delta V_{FI} + \Delta V_{Outp.Filter} + \Delta V_{Cable})$$

Line voltage V_{line}

The line voltage is determined via direct measurement with multimeter or, alternatively, by reading off the DC link voltage ($V_{DC\ link}$) in the inverter ($V_{line} = V_{DC\ link} / \sqrt{2}$).

Voltage drop at the line choke
$\Delta V_{line\ choke}$

The calculation of the voltage drop can be carried out in two ways:

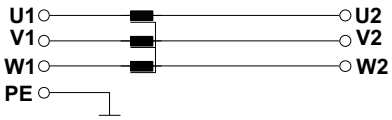
1. Calculation based on an equation
2. based on tabular values

Both options are illustrated below.

1. Voltage drop at the line choke

The extent of the voltage drop is determined by the main inductance and the ohmic share of the inductance.

Typical connection pattern:



Equation for calculating the voltage drop:

$$\Delta V_{LC} = I_{E\_FI} \times \sqrt{3} \times \sqrt{(2 \times \pi \times f \times L_{LC})^2 + R_{LC}{}^2}$$

L_{ND} = Inductance of line choke in H
R_{ND} = Ohmic resistance of line choke in Ω
$\triangle U_{ND}$ = Voltage drop across line choke in V
I_{I_FI} = Nominal input current of the inverter

For the inductance L and the ohmic resistance R of the inductance, refer to the documents for the line choke.

2. Table "percentage voltage drop when using a line choke"

The following table show the extent of the voltage drop as a percentage of the line voltage for the use of a line choke.

Power of the inverter in kW	Nominal input current of the inverter in A	Line choke	Voltage drop in $\%V_N$
0.25	0.9	ND020-013	0
0.37	1.4		
0.55	1.8		
0.75	2.2		
1.1	2.8		
1.5	3.6		
2.2	5		
3	6.3		
4	8.6		
5.5	11.3		
7.5	14.4		
11	21.6	ND030-023	1
15	28.8		
22	41.4	ND045-013	1

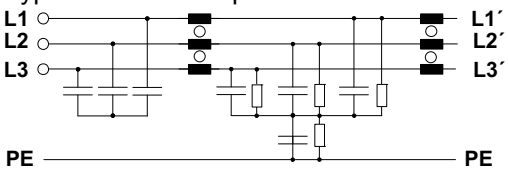
Power of the inverter in kW	Nominal input current of the inverter in A	Line choke	Voltage drop in $\%V_N$
30	54	ND085-013	1.5
37	65.7		
45	80.1		
55	94.5	ND150-013	2
75	117		
90	153	ND200-0033	1
110	180		

Voltage drop at the line filter

The line filter consists of current compensated radio interference suppression chokes. The current flows through the winding of the chokes and the resulting magnetic fields compensate each other.

This is why the inverter current that flows through the line filter is only dampened by the ohmic share of the inductance and the leakage inductance. The leakage inductance is very low compared to the main inductance. Hence the voltage drop via the line filter can be neglected.

Typical connection pattern:



Equation for calculating the voltage drop:

$$\Delta V_{LF} = I_{E\_FI} \times \sqrt{3} \times \sqrt{(2 \times \pi \times f \times L_{Leak})^2 + R_{LF}{}^2}$$

△ U_{NF} = Voltage drop across line filter, in V
I_{I_FI} = Nominal input current of the inverter in A
L_{leak} = Leakage inductance in H
R_{NF} = Ohmic resistance in Ω

Determining the inverter voltage

The inverter input voltage is determined by:

- measuring the mains voltage, or
- calculating the voltage according to the formula $V_{E\_FI} = V_{Line} - \Delta V_{LC} - \Delta V_{LF}$, or
- Reading-off the DC link voltage in the frequency inverter

Voltage drop at the inverter V_{FI}

The voltage drop at the inverter is determined by:

- the voltages across the rectifier path
- the voltages at the output stage transistors
- the principle of converting supply voltage into DC link voltage and into the rotating field voltage
- the anti-overlap times resulting from the clocking of the output stage and the missing voltage-time areas
- the modulation process
- the load state and the energy dissipation of the DC link capacitors

INFORMATION

To simplify the calculation, use the value of **7.5 % of the line input voltage**. This value is to be taken as the maximum possible voltage drop at the inverter. This allows for a reliable project planning.

Voltage drop at the output filter
Δ $V_{Outp.filter}$

The voltage drop at the output filter is proportional to the modulated fundamental output frequency and the motor current. It must be requested from the manufacturer of the output filter in individual cases. The voltage drop of SEW output filters can be read from the table.

$$\Delta V_{Outp.Filter} = I \times \sqrt{3} \times \sqrt{(2 \times \pi \times f \times L)^2 + R^2}$$

Since the resistance R is small enough to be neglected compared to the inductance L, the equation can be simplified to:

$$\Delta V_{Outp.Filter} = I \times \sqrt{3} \times 2 \times \pi \times f \times L$$

Filter				Choke	Voltage drop [V]

HD.. output chokes

The voltage drop is negligible (current-compensated) for SEW-EURODRIVE output chokes (HD...).

Voltage drop at the motor cable
$\Delta V_{Mot.cable}$

The voltage drop of the motor cable depends on the motor current and the cross section, length and material of the cable. The voltage drop can be read from the following table.

cable cross section	Load with I [A]																		
	4	**6**	**8**	**10**	**13**	**16**	**20**	**25**	**30**	**40**	**50**	**63**	**80**	**100**	**125**	**150**	**200**	**250**	**300**
Copper	Voltage drop Δ V [V] with length = 100 m and ϑ = 70 °C																		
1.5 mm²	5.3	8	10.6[1)]	13.3[1)]	17.3[1)]	21.3[1)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]
2.5 mm²	3.2	4.8	6.4	8.1	10.4	12.8[1)]	16[1)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]
4 mm²	1.9	2.8	3.8	4.7	6.5	8.0	10	12.5 [1)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]
6 mm²					4.4	5.3	6.4	8.3	9.9	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]
10 mm²						3.2	4.0	5.0	6.0	8.2	10.2	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]
16 mm²								3.3	3.9	5.2	6.5	7.9	10.0	[2)]	[2)]	[2)]	[2)]	[2)]	[2)]
25 mm²									2.5	3.3	4.1	5.1	6.4	8.0	[2)]	[2)]	[2)]	[2)]	[2)]
35 mm²											2.9	3.6	4.6	5.7	7.2	8.6	[2)]	[2)]	[2)]
50 mm²														4.0	5.0	6.0	[2)]	[2)]	[2)]
70 mm²																	4.6	[2)]	[2)]
95 mm²																	3.4	4.2	[2)]
150 mm²																		2.7	3.3
185 mm²																			2.7

1) This value is not recommended by SEW-EURODRIVE.

2) Load not permitted according to IEC 60364-5-52.

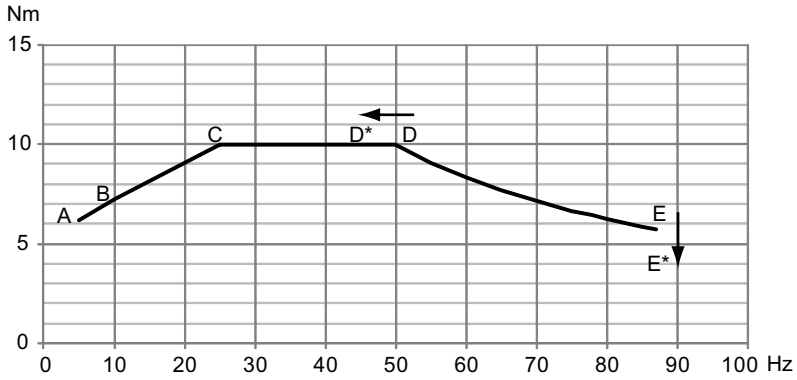
INFORMATION

The voltage drop at the cable is compensated by the IxR compensation. SEW-EURODRIVE frequency inverters adjust this value in the "Automatic calibration ON" mode every time the frequency inverter is started. In order to provide for a voltage reserve in the frequency inverter for this compensation, you have to take into account the voltage loss via the motor cable.

6.6.2 Calculation of the field weakening and the torque characteristic

The calculations described below require values from the EC prototype test certificate.

The following diagram illustrates the S1 limit characteristics of the EDRE90L4 of category 2.



Field weakening

The field weakening is calculated as follows:

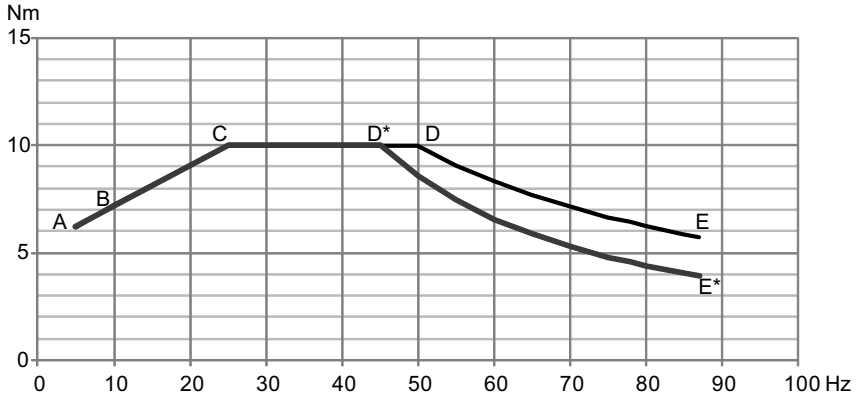
$$f_{D^*} = \frac{V_{MotorTermVoltage}}{V_{RatedMotorVoltage}} \times f_{base}$$

f_D = Start of the field weakening (ideal)
f_{IN} = Maximum speed
f_{D^*} = Start of the field weakening (depending on the actual motor terminal voltage)

torque profile

The torque characteristic is calculated as follows:

$$M_{E^*} = M_{Nom} \times \frac{\left(\frac{f_{D^*}}{f_E} + \left(\frac{f_{D^*}}{f_E} \right)^2 \right)}{2}$$



f_D = Start of the field weakening (ideal)
f_{IN} = Maximum speed
M_{E^*} = reduced torque at maximum speed (depending on the actual motor terminal voltage)

INFORMATION

You have to calculate several auxiliary points to determine an exact curve progression.

6.7 Soft-start units

Soft start units are permitted for motors of category 3 when the motors are equipped with a TF temperature sensor and meet the requirements of EN 60079-14.During startup, you must verify and document whether temperature monitoring is effective and whether the motor starts up correctly. The motor must be disconnected from the supply system when the protection device trips.

7 Startup

INFORMATION

- Observe the safety notes in section 2 during installation.
- In case of problems, refer to the section "Malfunctions".

⚠ WARNING

Danger of electric shock.

Severe or fatal injuries!

Note the following:

- Use switch contacts in utilization category AC-3 according to EN 60947-4-1 for switching the motor.
- When motors are powered by inverters, you must adhere to the wiring instructions issued by the inverter manufacturer.
- Observe the operating instructions of the inverter.

⚠ CAUTION

The surface temperatures on the drive can be very high during operation.

Danger of burns.

- Let the motor cool down before you start your work.

NOTICE

Limit the maximum speed and current at the inverter. For information on the procedure, refer to the documentation of the inverter.

7.1 Before startup

Before startup, make sure that:

- The drive is undamaged and not blocked
- Any transport locks have been removed
- The measures stipulated in chapter "Extended storage of motors" (page 24) are performed after extended storage periods
- All connections have been made properly
- The direction of rotation of the motor/gearmotor is correct
  - Motor rotating clockwise: U, V, W (T1, T2, T3) to L1, L2, L3
- All protective covers have been properly installed
- All motor protection equipment is active and set for the rated motor current
- There are no other sources of danger
- The lockable manual brake release is permitted

7.2 During startup

During startup, make sure that:

- The motor is running properly, which means
  - No overload,
  - No speed fluctuation,
  - No loud noises,
  - No unusual vibrations, etc.
- The braking torque corresponds to the respective application. Observe the "Technical Data" (page 127) chapter and the nameplate.

INFORMATION

On brakemotors with self-reengaging manual brake release, the lever must be removed after startup. A bracket is provided for storing the lever on the outside of the motor housing.

7.3 Parameter setting: Frequency inverters for category 2 motors

INFORMATION

When you start up the frequency inverter, observe the operating instructions of the respective frequency inverter as well as the operating instructions of the gear unit if you use a gearmotor.

7.3.1 Before startup

Prior to startup, check that all the conditions for the typical application (page 72) are met. In the event of deviations from these conditions, you have to calculate the maximum terminal voltage, the field weakening range, and the torque characteristics prior to startup. The effective operating point must be below the new thermal characteristic curve.

7.3.2 Startup procedure for MOVITRAC® 07B

Observe the following points during startup:

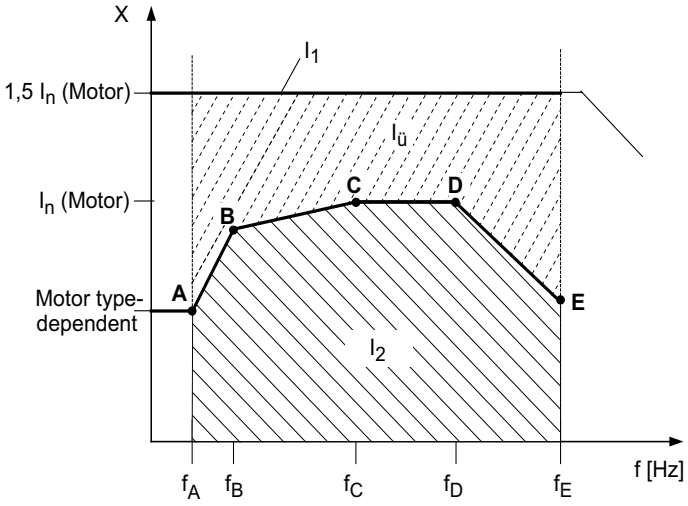
- Use the MOVITOOLS® MotionStudio software, version 5.70 or higher, for a guided startup procedure.
- The startup can only be activated in parameter set 1 due to current limitation function for motors of category 2.
- The system configuration only allows for individual drives.
- You can set either "V/f" or "vector-controlled" for the control mode.
- For the application, you can only select speed control. The options "Hoist", "DC braking" or "Flying start function" must not be used.
- The operating mode must always be set to "4-quadrant operation".
- The correct motor series must be selected in the "Motor type" window.
- In the "Motor selection" window, you must choose the unit category, the line voltage, the motor voltage, the connection type and the type of plant configuration in addition to the motor.

Current limit

In guided startup, the *Current limit* parameter is set to 150% $I_{N\ Mot}$ in the application window. This value must be reduced according to the permitted maximum output torque at the gear unit (M_{amax}).

Current monitoring

The parameters that need to be set for monitoring the current depend on the motor.



I_n	Nominal current in A	X	Current limitation
I_1	Permitted max. current in A	f	Frequency in Hz
I_2	Permitted continuous current range in A	A, B, C, D, E	Limiting points
I_O	Overload current in A		

After motor startup, current limitation I_1 is active. Current limitation I_2 determines the current that is permanently permitted. The Ex-e motor current limitation function is activated automatically during startup for SEW-EURODRIVE motors of category 2.

The speed-dependent current limit is activated via the according motor selection and all the parameters of group P560 are set for points A to E, see the following parameter table. The values are also specified in the EC prototype test certificate.

Parameter	Point A	Point B	Point C	Point D	Point E
Frequency [Hz]	P561	P563	P565	P567	P570
Calculation	via startup software				
Current limit in % of $I_{N\ FI}$	P562	P564	P566	P568	P571
Calculation	via startup software				

In the event of deviations from the typical application, you have to recalculate and manually adapt the parameters for points D (field weakening f_D) and E (current limit I_E), see the following table:

Parameter	Point A	Point B	Point C	Point D	Point E
Frequency [Hz]	P561	P563	P565	P567	P570
Calculation	via startup software			Is required + manual input of f_{D*}	via startup software
Current limit in % of $I_{N\ FI}$	P562	P564	P566	P568	P571
Calculation	via startup software				Is required + manual input of f_{E*} $I_{E*} = I_E \times (N_{E*} / M_{E*})$

Maximum speed

The maximum motor speed must be limited in the "System limits" window. Observe the following when you set the parameter *maximum speed*:

- Maximum speed ≤ motor limit speed (see frequency inverter nameplate) and
- Maximum speed ≤ maximum gear unit input speed n_{emax} (see gear unit nameplate)

Automatic adjustment

The parameter *automatic adjustment* is activated via guided startup. Thus, the frequency inverter sets parameter *IxR value* with each enable signal. A manual change is not permitted.

7.3.3 Startup procedure for MOVIDRIVE® B

INFORMATION

The MOVIDRIVE® B units are only suitable for the basic control range, i.e. the connected motor must not be operated in the field weakening range.

Observe the following points during startup:

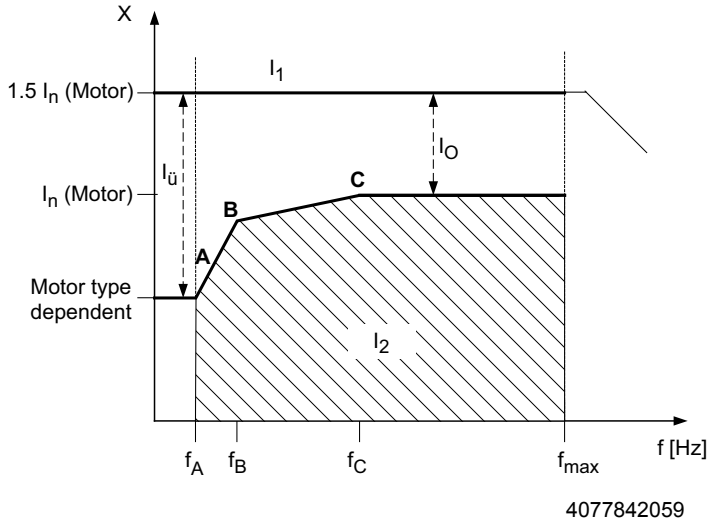
- The startup can only be activated in parameter set 1 due to current limitation function for motors of category 2.
- The first startup must always be a complete startup.
- The motor configuration only allows for individual drives. You can set either "V/f" or "vector-controlled" (VFC) for the control mode.
- The correct motor series must be selected in the "Motor type" window.
- In the "SEW motor type 1" window, you must choose the unit category, the nominal motor voltage, the connection type, and the line voltage in addition to the motor.
- In the application selection window, you can only select speed control. The options "Hoist", "DC braking" or "Flying start function" must not be used.
- The operating mode must always be set to "4-quadrant operation".

Current limit

In guided startup, the *Current limit* parameter is set to 150% $I_{N\ Mot}$ in the parameter window 1. This value must be reduced according to the permitted maximum output torque at the gear unit (M_{amax}).

Current monitoring

The parameters that need to be set for monitoring the current depend on the motor.



I_n	Nominal current in A	X	Current limitation
I_1	Permitted max. current in A	f	Frequency in Hz
I_2	Permitted continuous current range in A	A, B, C	Limiting points
I_O	Overload current in A		

After motor startup, current limitation I_1 is active. Current limitation I_2 determines the current that is permanently permitted. The Ex-e motor current limitation function is activated automatically during startup for SEW-EURODRIVE motors of category 2.

The characteristic curve for MOVIDRIVE® is defined by operating points A, B and C. The parameters of group P560 are preset during startup, see following table. The values are also specified in the EC prototype test certificate.

Parameter	Point A	Point B	Point C
Frequency [Hz]	P561	P563	P565
Current limit in % of $I_{N\ FI}$	P562	P564	P566

Maximum speed

The maximum motor speed must be limited in the "System limits" window. Observe the following when you set the parameter *maximum speed*:

- Maximum speed ≤ start of the field weakening
- Maximum speed ≤ motor limit speed and
- Maximum speed ≤ maximum gear unit input speed n_{emax} (see gear unit nameplate)

Automatic adjustment

The parameter *automatic adjustment* is activated via guided startup. Thus, the frequency inverter sets parameter *IxR value* with each enable signal. A manual change is not permitted.

7.3.4 Overload protection

Operation above the permitted current range is permitted for 60 seconds. To prevent a sudden reduction of the current limitation and thus torque shocks, after about 50 seconds, the current is reduced to the permitted value along a ramp within 10 seconds. The current can again exceed the permitted range after a recovery time of 10 minutes. Operation below 5 Hz is permitted for 60 seconds. After this time has elapsed, the unit switches off with error F110 "Ex e protection" and performs an emergency stop as an error response.

The binary inputs P62_ can be parameterized to "Ex e current limitation active".

Preconditions for the output being set ("1" signal):

- Current limit 1 exceeded
- Recovery time not elapsed yet
- Operation < 5 Hz longer than 60 seconds

The current-time monitoring is not reset by an error reset.

The current-time monitoring is active both for mains operation and 24 V backup mode.

INFORMATION

If the mains is switched off without 24 V backup mode, the monitoring function is reset completely.

7.4 Parameter setting: Frequency inverters for category 3 motors

INFORMATION

When you start up the frequency inverter, observe the operating instructions of the respective frequency inverter as well as the operating instructions of the gear unit if you use a gearmotor.

7.4.1 Before startup

Prior to startup, check that all the conditions for the typical application (page 72) are met. In the event of deviations from these conditions, you have to calculate the maximum terminal voltage, the field weakening range, and the torque characteristics prior to startup. The effective operating point must be below the new thermal characteristic curve.

7.4.2 Startup procedure for MOVITRAC® 07B

Observe the following points during startup:

- Use the MOVITOOLS® MotionStudio software, version 5.70 or higher, for a guided startup procedure.
- Startup and operation of the motors of category 3 is possible in parameter set 1 and 2.
- The system configuration only allows for individual drives.
- You can set either "V/f" or "vector-controlled" for the control mode.
- For the application, you can only select speed control and hoist application. The options "DC braking" or "Flying start function" must not be used.
- The operating mode must always be set to "4-quadrant operation".
- The correct motor series must be selected in the "Motor type" window.
- In the "Motor selection" window, you must choose the unit category, the line voltage, the motor voltage and the connection type in addition to the motor.

Current limit

In guided startup, the *Current limit* parameter is set to 150% $I_{N\ Mot}$ in the application window. This value must be reduced according to the permitted maximum output torque at the gear unit (M_{amax}).

Maximum speed

The maximum motor speed must be limited in the "System limits" window. Observe the following when you set the parameter *maximum speed*:

- Maximum speed ≤ motor limit speed and
- Maximum speed ≤ maximum gear unit input speed n_{emax} (see gear unit nameplate)

Automatic adjustment

The parameter *automatic adjustment* is activated via guided startup. Thus, the frequency inverter sets parameter *IxR value* with each enable signal. A manual change is not permitted.

7.4.3 Startup procedure for MOVIDRIVE® B

Observe the following points during startup:

- Use the MOVITOOLS® MotionStudio software, version 5.70 or higher, for a guided startup procedure.
- Startup and operation of the motors of category 3 is possible in parameter set 1 and 2.

- The first startup must always be a complete startup.
- The motor configuration only allows for individual drives. You can set either "V/f" or "vector-controlled" (VFC) for the control mode.
- The correct motor series must be selected in the "Motor type" window.
- In the "SEW motor type 1" window, you must choose the unit category, the nominal motor voltage, the connection type, and the line voltage in addition to the motor.
- For the application options, you can only select "speed control" and the "hoist" function. The options "DC braking" or "Flying start function" must not be used.
- The operating mode must always be set to "4-quadrant operation" (parameters P820/P821).

Current limit

In guided startup, the *Current limit* parameter is set to 150% $I_{N\ Mot}$ in the parameter window 1. This value must be reduced according to the permitted maximum output torque at the gear unit (M_{amax}).

Maximum speed

The maximum motor speed must be limited in parameter window 2. Observe the following when you set the parameter *maximum speed*:

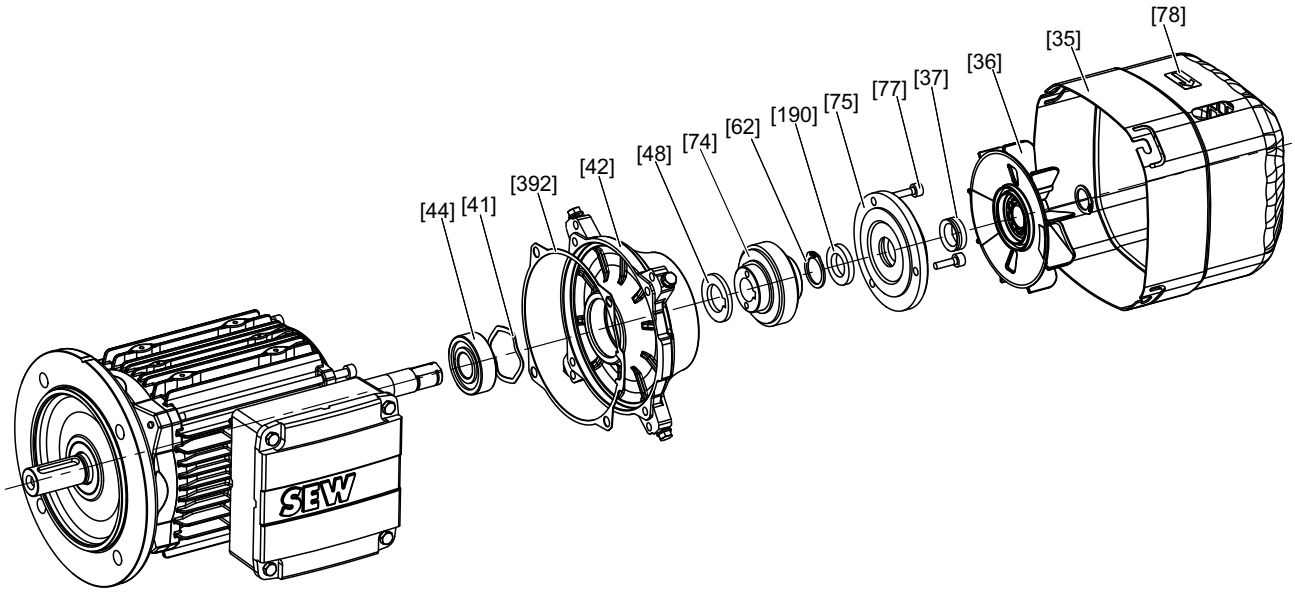
- Maximum speed ≤ motor limit speed and
- Maximum speed ≤ maximum gear unit input speed n_{emax} (see gear unit nameplate)

Automatic adjustment

The parameter *automatic adjustment* is activated via guided startup. Thus, the frequency inverter sets parameter *IxR value* with each enable signal. A manual change is not permitted.

7.5 Changing the blocking direction of motors with backstop

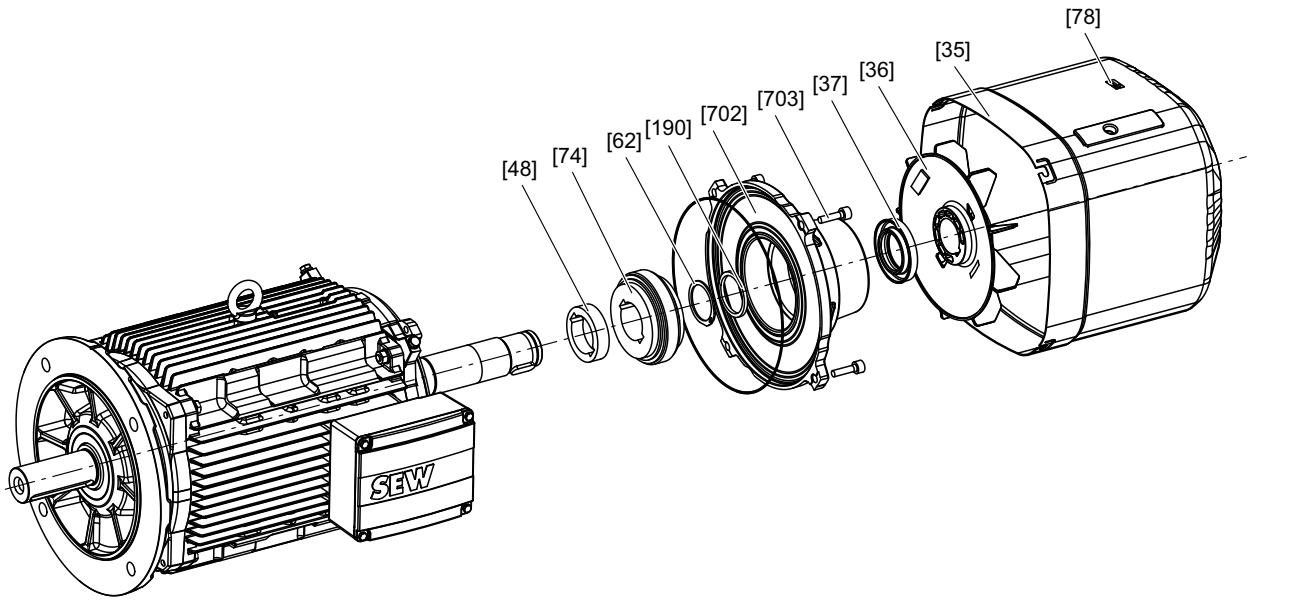
7.5.1 Structure of an EDR.71 – EDR.80 with backstop



1142858251

[35] Fan guard
[36] Fans
[37] Sealing ring
[41] Shim
[42] Backstop endshield
[44] Grooved ball bearing
[48] Spacing ring
[62] Retaining ring
[74] Complete sprag ring
[75] Sealing flange
[77] Screw
[78] Direction of rotation information tag
[190] Felt ring
[392] Sealing

7.5.2 Structure of EDR.90 – EDR.225 with backstop (example)



1142856331

[35] Fan guard
[36] Fan
[37] Sealing ring
[48] Spacing ring
[62] Retaining ring
[74] Complete sprag ring
[78] Direction of rotation information tag
[190] Felt ring
[702] Backstop housing, complete
[703] Machine screw

7.5.3 Changing the blocking direction

A backstop is used to block/preclude a direction of rotation of the motor. The direction of rotation is indicated by an arrow on the fan guard of the motor or on the gearmotor housing.

Observe the direction of rotation of the end shaft and the number of stages when you mount the motor to the gear unit. **Do not start up the motor in blocking direction (ensure correct connection of power supply with motor).** For inspection purposes, you can operate the backstop once with half the motor voltage in the blocking direction.

INFORMATION

The blocking direction may only be changed for drives that are operated on the supply system.

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Before starting work, isolate the motor and, if installed, the forced cooling fan from the power supply.
- Safeguard against accidental startup.
- Carefully observe the steps described below.

Proceed as follows to change the blocking direction:

1. Remove forced cooling fan and incremental encoder (if installed).

   See chapter "Inspection/Maintenance" > "Motor and brake maintenance – preliminary work".

2. Remove flange cover or fan guard [35]
3. EDR.71 – 80: Remove the sealing flange [75].

   EDR.90 – 225: Completely remove the backstop housing [702]

4. Loosen the circlip [62]
5. Remove the wedge element ring [74] via screws in the forcing threads or using a puller
6. Spacing ring [48], if provided, remains installed
7. Turn around wedge element ring [74], check the old grease and replace according to the specifications below and reinstall the wedge element ring.
8. Install circlip [62]

   ⚠ **NOTICE** Damage due to incorrect assembly

   Material damage

   - Do not exert pressure on or hit the wedge element train

9. EDR.71 – 80: Apply SEW L Spezial to the sealing flange [75] and install it. Replace felt ring [190] and sealing ring [37], if required.

   EDR.90 – 225: Replace seal [901], felt ring [190] and sealing ring [37], if required, and install the backstop housing [702].

10. Reinstall the removed parts.
11. Replace the label [78] indicating the direction of rotation

Lubricating the backstop

The backstop is supplied with the corrosion protection low-viscosity grease Mobil LBZ. If you want to use a different grease, make sure it complies with NLGI class 00/000, with a base oil viscosity of 42 mm^2/s at 40 °C on a lithium saponified and mineral oil base. The application temperature range is from -50 °C to +90 °C. See the following table for the amount of grease required.

Motor type	71	80	90/100	112/132	160	180	200/225
Grease quantity [g]	9	11	15	20	30	45	80

The tolerance regarding the grease level is ± 30%.

8 Inspection / Maintenance

⚠ WARNING

Risk of crushing if the hoist falls or in the event of uncontrolled unit behavior.

Severe or fatal injuries.

- Secure or lower hoist drives (danger of falling)
- Safeguard and/or protect the driven machine against touching
- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Only use genuine spare parts in accordance with the valid spare parts list.
- Always install a new brake control system at the same time as replacing the brake coil.

⚠ CAUTION

The surface temperatures on the drive can be very high during operation.

Danger of burns.

- Let the motor cool down before you start your work.

CAUTION

For assembly, the ambient temperature and the oil seals themselves may not be colder than 0 °C, otherwise the oil seals might be damaged.

Only SEW service staff, repair workshops or plants that have the necessary expertise may repair or modify the motor.

Before re-startup of the motor, make sure that all regulations are complied with and document this with a label on the motor or a written test report.

Always perform safety and functional tests following all maintenance and repair work (thermal protection).

INFORMATION

Apply a grease reservoir around the lip of the oil seals before assembly, see chapter "Oder information for lubricants and anti-corrosion agents" (page 155).

NOTES ON EXPLOSION PROTECTION

- Use only original spare parts from the relevant and valid spare parts lists; otherwise, the approval for hazardous locations of the motor will become void.
- The routine test must be repeated whenever motor parts relating to explosion protection are replaced.
- Make sure that the motor is assembled correctly and all openings have been sealed after service and maintenance work.
- Clean motors for hazardous locations regularly. Prevent dust from building up higher than 5 mm.
- Clean the optional VE forced cooling fan at regular intervals. Prevent dust from building up higher than 5 mm. Observe the operating instructions of the forced cooling fan.
- Explosion protection is largely dependent on the IP enclosure. Therefore, always check that the seals are fitted correctly and in perfect condition when performing any work on the machine.
- Explosion protection can only be ensured if motors are serviced and maintained correctly.
- If you repaint the motors or gearmotors, you have to observe the requirements regarding the prevention of electrostatic charge according to EN / IEC 60079-0, see chapter "Painting" (page 35).
- You have to use tie rods with a strength of 8.8 for motors of sizes EDR.71 to EDR.100 that are used for temperatures below -20 °C down to -40 °C according to the nameplate.
- You have to use screws of strength class 8.8 for applications in the low temperature range from -20 °C to -40 °C.

8.1 Inspection and maintenance intervals

The following table lists the inspection and maintenance intervals:

Unit / unit part	Time interval	What to do?
BE brake	• **If used as a working brake:** At least every 3000 hours of operation[1)] • **If used as a holding brake:** Every 0.5 to 2 years, depending on operating conditions[1)]	Brake inspection • Measuring the brake disk thickness • Brake disk, lining • Measuring and adjusting working air gap • Pressure plate • Carrier/gearing • Pressure rings • Sucking off any abrasion • Inspect the switch contacts and replace them, if necessary (e.g. in case of burn-out)
Motor	• **Every 10,000 operating hours** [2)]	Motor inspection: • Check rolling bearing and change if necessary • Replacing the oil seal • Clean the cooling air passages
Drive	• Varies [2)]	• Touch up or renew the surface/anticorrosion coating • if applicable, clean condensation drain hole at the bottom of the fan guard • Clean clogged bores

1) The amount of wear depends on many factors and may be high. The machine manufacturer must calculate the required inspection/maintenance intervals individually in accordance with the project planning documents (e.g. "Project Planning for Drives").

2) The interval depends on outer influences and can be very short, e.g. in the event of high dust concentration in the environment.

If you open the motor during inspection/maintenance, you have to clean it before you close it.

8.1.1 Connection cables

Check the connection cable for damage at regular intervals and replace if necessary.

8.2 Bearing lubrication

8.2.1 Bearing lubrication EDR.71- EDR.225

The motor bearings generally come with lubrication for life.

8.3 Motor and brake maintenance – preliminary work

⚠ WARNING

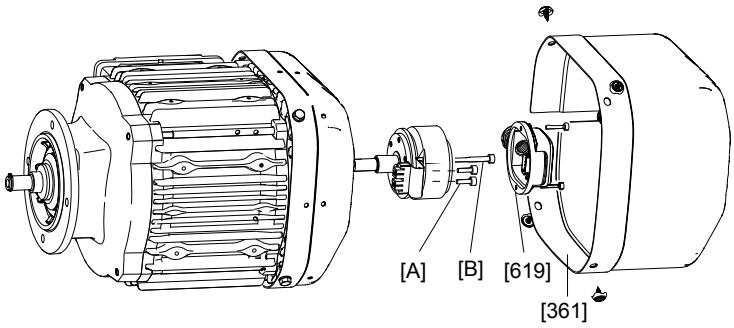
Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Before starting work, isolate the motor, brake, and if installed, the forced cooling fan from the power supply.
- Safeguard against accidental startup.

8.3.1 (Dis)assembling the incremental encoder of the EDR.71 – EDR.132

The following figure illustrates the disassembly procedure using the ES7. incremental encoder as an example:



2636070155

[361] Cover
[619] Connection cover
[A] Screws
[B] Retaining screw

Disassembling ES7./AS7.

- Remove the cover [361].
- Unscrew and remove the connection cover [619]. Do not disconnect the encoder connection cable.
- Unfasten the expansion anchor by unscrewing the screws [A] from the cover grid.

  Always check the expansion anchor for cracks. Replace the expansion anchor in the event of any cracks, damages to the thread, or after 20 uses.
- Unscrew the central retaining screw [B] by about 2 to 3 turns and unfasten the spread shaft cone by tapping lightly on the head of the screw.
- Pull the encoder from the rotor bore.

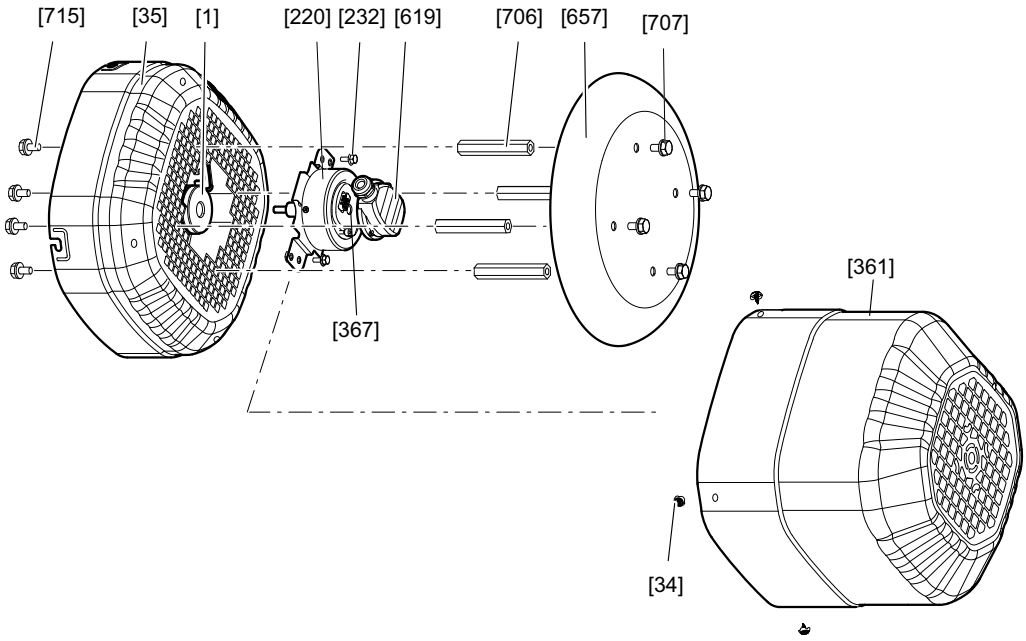
Re-assembly

Proceed as follows to re-assemble the encoder:

- Apply a contact corrosion prevention compound, e.g. NOCO® Fluid to the encoder spigot.
- Tighten the central retaining screw [B] with a tightening torque of 2.9 Nm (25.7 lb-in).
- Press the expansion anchor into the fan guard and make sure that it is fitted properly.
- Screw the retaining screws of the torque arm [A] into the expansion anchor all the way and tighten it with 1.0 Nm (8.8 lb-in).
- Install the connection cover [619].
- Install the extended fan guard [361].

  Prior to assembly, check that the gasket of the connection cover is in flawless condition. Replace damage or porous gaskets.

8.3.2 (Dis)assembling the incremental encoder of the EDR.160 – EDR.225



[1] Rotor	[220] Connection cover	[619] Encoder	[707] Screws
[34] Tapping screw	[232] Screws	[657] Cover	[715] Screws
[35] Fan guard	[367] Retaining screw	[706] Spacer bolt	

Removing EG7./AG7.

- Perform one of the following steps depending on the housing design:
  - Loosen the screws [707] and remove the canopy [657].

    Use SW13 spacer bolts [706] to counterhold.
  - Loosen the screws [34] and remove the extended fan guard [361].
- Unscrew and remove the connection cover [619].
- Remove the screws [232]
- Remove the fan guard [35]
- Force off the encoder [619] by loosening the central retaining screw [367]

  If the encoder is hard to loosen, you can loosen or counterhold the encoder shaft at the installed SW17 spanner flat.

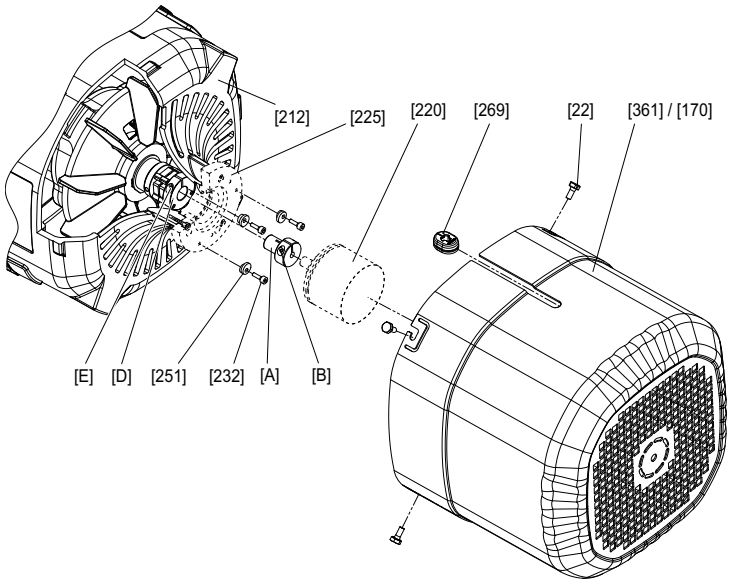
Re-assembly

- Apply a contact corrosion prevention compound, e.g. NOCO®-Fluid to the encoder shaft.
- Apply the encoder in the rotor bore and screw it in with the central retaining screw [367] all the way and tighten the screw with 6 Nm (53.1 lb-in).
- Mount fan guard [35].
- Apply a medium thread locking compound, e.g. Loctite® 243, to the 2 screws and screw the torque plate of the encoder to the fan grille with a tightening torque of 6 Nm (53.1 lb in).
- Install connection cover [619].

  Prior to assembly, check that the gasket of the connection cover is in flawless condition. Replace damage or porous gaskets.
- Install the canopy [657] with the screws [707], or install the extended fan guard [361] with the screws [34].

8.3.3 Removing/installing incremental encoders, absolute encoders and special encoders with XV.A mounting adapter from/on DR.71 – 225

The following figure illustrates the disassembly procedure using a non-SEW encoder as an example:



9007202887906699

[22]	Screw	[361]	Cover (normal/long)
[170]	forced cooling fan guard	[269]	Grommet
[212]	Fan guard with encoder mount	[A]	Adapter
[220]	Encoder	[B]	Clamping screw
[225]	Intermediate flange (not with XV1A)	[D]	Coupling (spread- or solid shaft coupling)
[232]	Screws (enclosed with XV1A and XV2A)	[E]	Clamping screw
[251]	Conical spring washers (enclosed with XV1A and XV2A)		

EV.., AV.. and XV. encoder removal

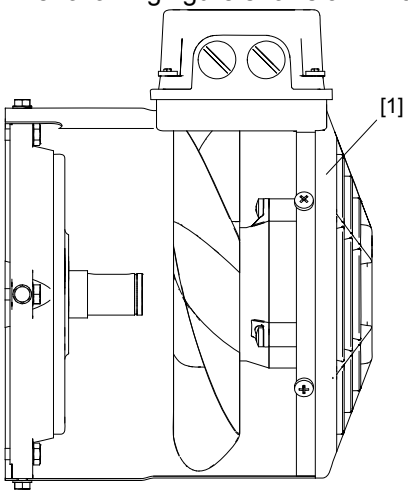
1. Remove the protection cover [361] by loosening the screws [22] or remove forced-cooling fan guard [170].
2. Loosen the retaining screws [232] and turn the conical spring washers [251] outwards.
3. Loosen the clamping screw [E] of the coupling.
4. Remove the adapter [A] and the encoder [220].

Re-assembly

1. Proceed according to chapter "Installing XV.A encoder mounting adapter on EDR.71 – 225 motors (page 29)" to mount the encoder.

8.3.4 Mounting a VE forced cooling fan

The following figure shows a VE forced cooling fan:



[1] Forced cooling fan

1. Before installing the forced cooling fan [1], check the fan wheel and the fan motor for damage.
2. After installation, turn the fan wheel to make sure that the fan wheel does not rub in any place. The clearance between the fan wheel and fixed parts must be at least 1 mm.

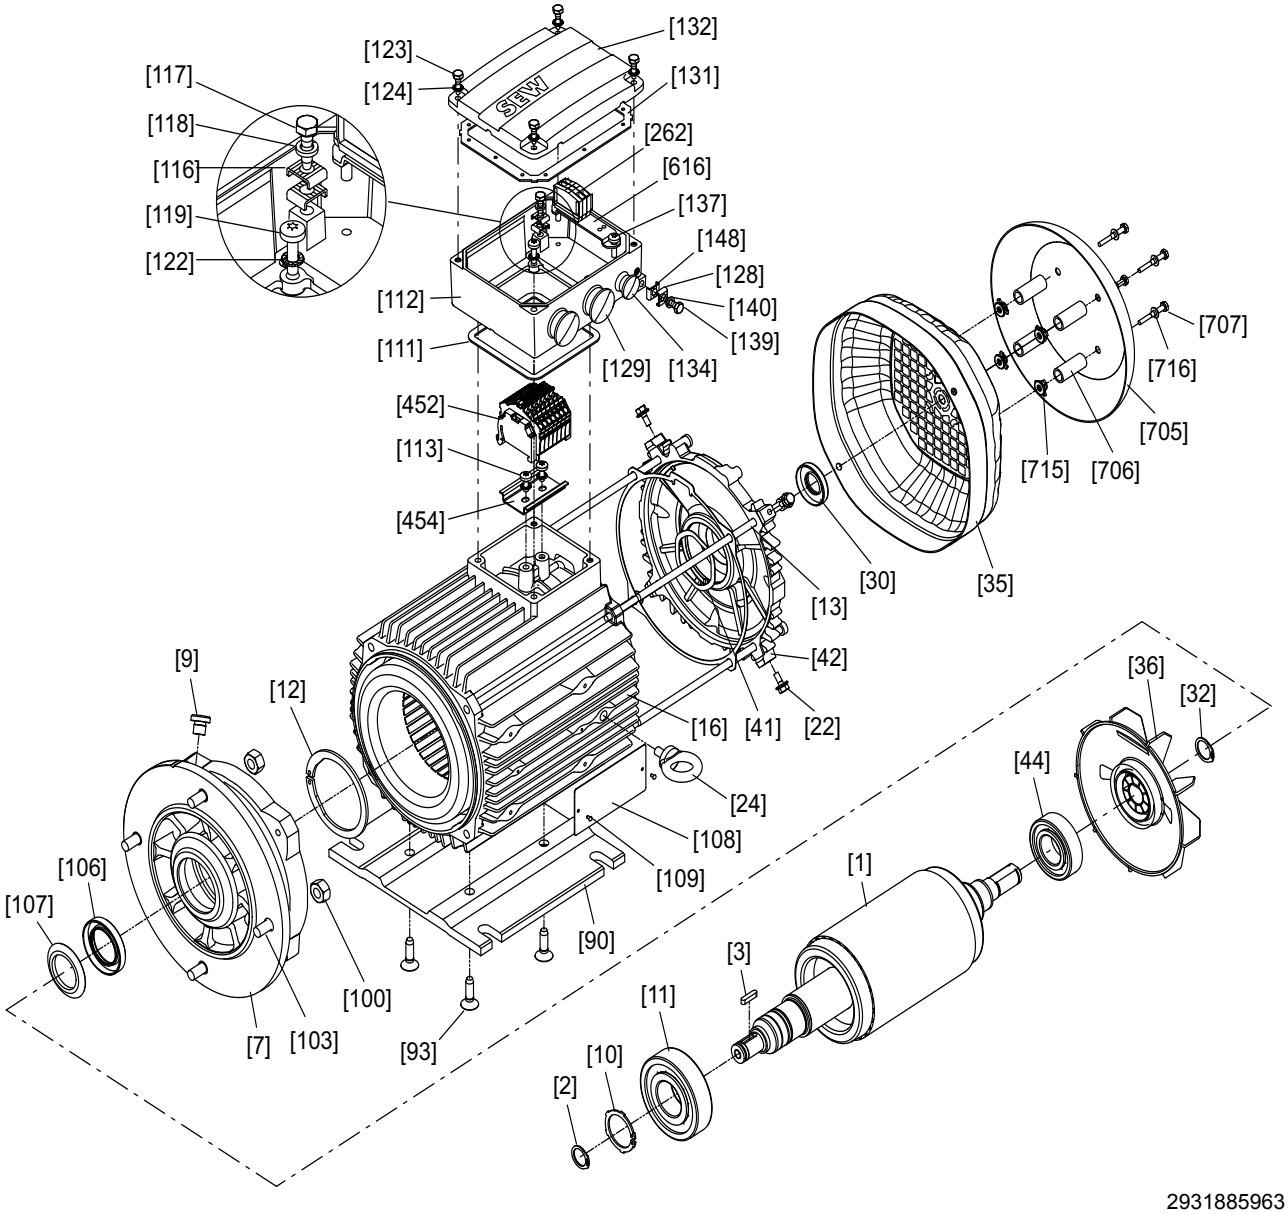
INFORMATION

Observe the operating instructions of the forced cooling fan (page 176).

8.4 Inspection/maintenance for EDR.71 – EDR.225 motors

8.4.1 General structure of EDR.71 – EDR.132

The following figure shows an example of the basic structure of EDR.71 – EDR.132 with cage clamp:

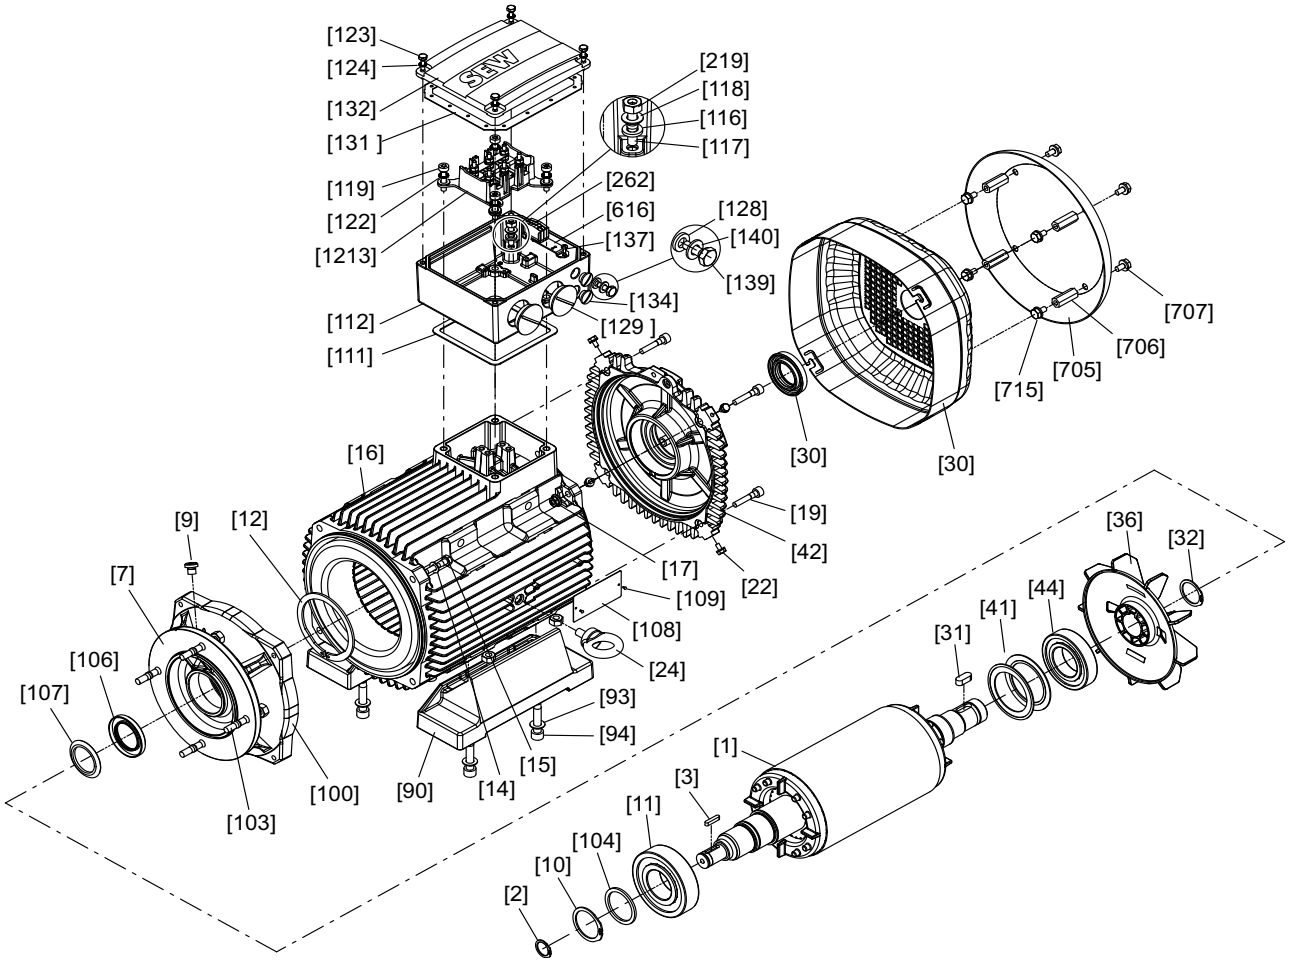


2931885963

[1]	Rotor	[35]	Fan guard	[112]	Terminal box lower part	[137]	Screw
[2]	Retaining ring	[36]	Fan	[113]	Pan head screw	[139]	Hex head screw
[3]	Key	[41]	Shim	[116]	Terminal clip	[140]	Lock washer
[7]	Flanged endshield	[42]	B-side endshield	[117]	Hex head screw	[148]	Terminal clip
[9]	Screw plug	[44]	Grooved ball bearing	[118]	Lock washer	[262]	Terminal
[10]	Retaining ring	[90]	Base plate	[119]	Pan head screw	[392]	Gasket
[11]	Grooved ball bearing	[93]	Countersunk screw	[122]	Lock washer	[452]	Terminal strip
[12]	Retaining ring	[100]	Hex nut	[123]	Hex head screw	[454]	Support rail
[13]	Cap screw	[103]	Stud	[124]	Lock washer	[616]	Retaining plate
[16]	Stator	[106]	Oil seal	[128]	Terminal clip	[705]	Canopy
[22]	Hex head screw	[107]	Oil flinger	[129]	Screw plug	[706]	Spacers
[24]	Eyebolt	[108]	Nameplate	[131]	Gasket for cover	[707]	Pan head screw
[30]	Oil seal	[109]	Grooved pin	[132]	Terminal box cover	[715]	Blind rivet
[32]	Retaining ring	[111]	Gasket for lower part	[134]	Screw plug	[716]	Washer

8.4.2 General structure EDR.160 – EDR.180

The following figure shows an example of the basic structure of EDR.160 – EDR.180 with anti-twist frame:

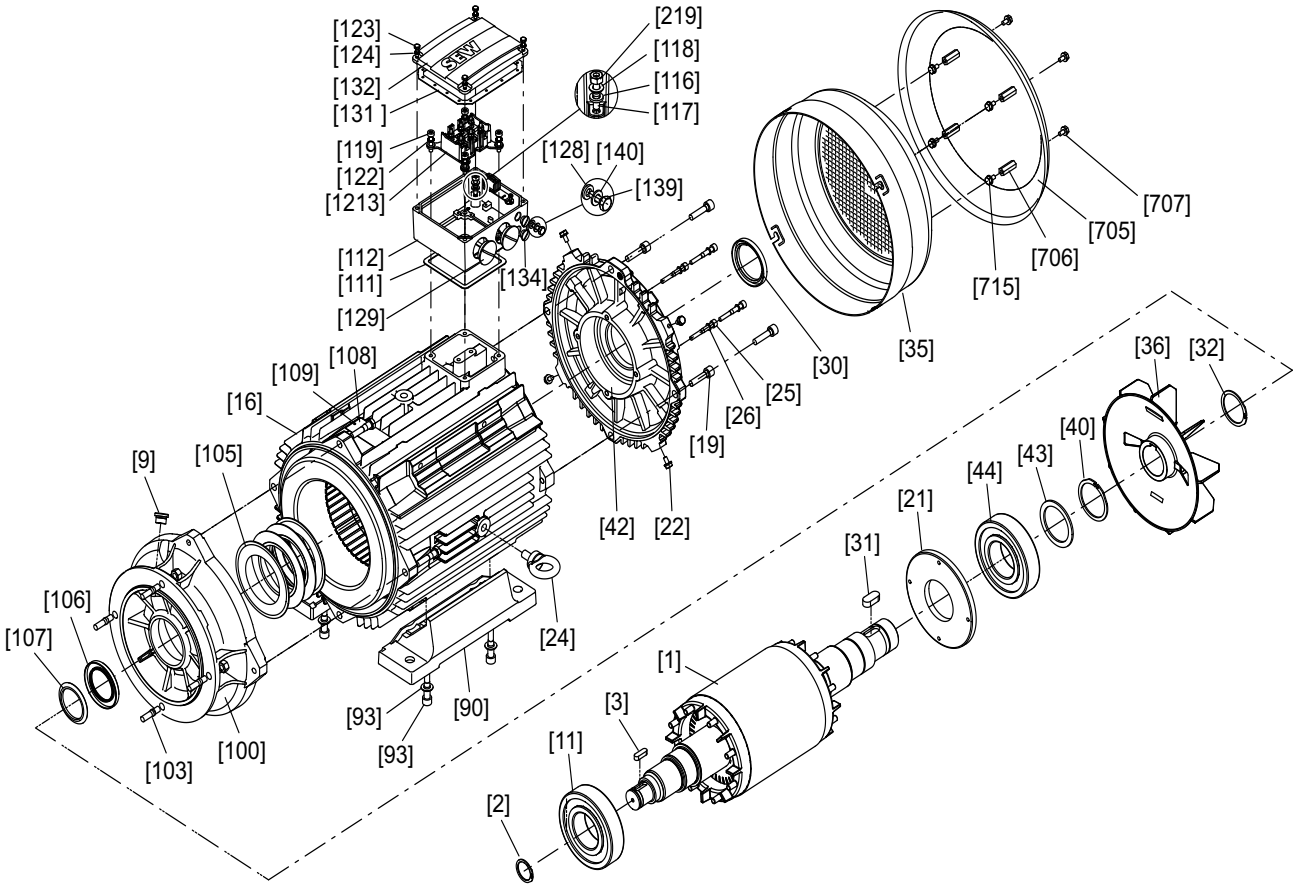


2967197579

[1] Rotor
[2] Retaining ring
[3] Key
[7] Flange
[9] Screw plug
[10] Retaining ring
[11] Grooved ball bearing
[12] Retaining ring
[14] Washer
[15] Hex head screw
[16] Stator
[17] Hex nut
[19] Machine screw
[22] Hex head screw
[24] Eyebolt
[30] Sealing ring
[31] Key
[32] Retaining ring
[35] Fan guard
[36] Fan
[41] Spring washer
[42] B-side endshield
[44] Grooved ball bearing
[90] Foot
[91] Hex nut
[93] Washer
[94] Machine screw
[100] Hex nut
[103] Stud
[104] Supporting ring
[106] Oil seal
[107] Oil flinger
[108] Nameplate
[109] Grooved pin
[111] Gasket for lower part
[112] Terminal box lower part
[116] Serrated lock washer
[117] Stud
[118] Washer
[119] Machine screw
[122] Lock washer
[123] Hex head screw
[124] Lock washer
[128] Serrated lock washer
[129] Screw plug
[131] Gasket for cover
[132] Terminal box cover
[134] Screw plug
[139] Hex head screw
[140] Washer
[219] Hex nut
[705] Canopy
[706] Spacers
[707] Hex head screw
[715] Hex head screw
[1213] Kit (1 anti-twist frame, 1 terminal board, 4 sleeves, 2 screws, 2 nuts)

8.4.3 General structure EDR.200 – EDR.225

The following figure shows an example of the basic structure of EDR.200 – EDR.225 with anti-twist frame:



3055268107

[1]	Rotor	[32]	Retaining ring	[107]	Oil flinger	[131]	Gasket for cover
[2]	Retaining ring	[35]	Fan guard	[108]	Nameplate	[132]	Terminal box cover
[3]	Key	[36]	Fan	[109]	Grooved pin	[134]	Screw plug
[7]	Flange	[40]	Retaining ring	[111]	Gasket for lower part	[139]	Hex head screw
[9]	Screw plug	[42]	B-side endshield	[112]	Terminal box lower part	[140]	Washer
[11]	Grooved ball bearing	[43]	Supporting ring	[107]	Oil flinger	[219]	Hex nut
[16]	Stator	[44]	Grooved ball bearing	[116]	Serrated lock washer	[705]	Canopy
[19]	Machine screw	[90]	Foot	[117]	Stud	[706]	Spacer bolt
[21]	Oil seal flange	[93]	Washer	[118]	Washer	[707]	Hex head screw
[22]	Hex head screw	[94]	Machine screw	[119]	Machine screw	[715]	Hex head screw
[24]	Eyebolt	[100]	Hex nut	[123]	Hex head screw	[1213]	Kit (1 anti-twist frame, 1 terminal board, 4 sleeves, 2 screws, 2 nuts)
[25]	Machine screw	[103]	Stud	[124]	Lock washer		
[26]	Sealing washer	[105]	Spring washer	[128]	Serrated lock washer		
[31]	Key	[106]	Oil seal	[129]	Screw plug		

8.4.4 Inspection procedure for EDR.71 – EDR.225 motors

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove forced cooling fan and incremental encoder (if installed).

   See chapter "Inspection/Maintenance" > "Motor maintenance – preliminary work".

2. Remove fan guard [35] and fan [36].
3. Remove stator:
   - **Sizes EDR.71 – EDR.132:** Remove cap screws [13] from flanged endshield [7] and B-side endshield [42]. Remove stator [16] from flanged endshield [7].
   - **Sizes EDR.160 – EDR.180:** Loosen cap screws [19] and remove B-side endshield [42]. Loosen hexagon screw [15] and remove stator from flanged endshield.
   - **Sizes EDR.200 – EDR.225:**
     - Loosen hexagon screw [15] and remove the flanged endshield [7] from the stator.
     - With gearmotors: Remove oil flinger [107]
     - Loosen cap screws [19] and remove the complete rotor [1] together with the B-side endshield [42].
     - Loosen cap screws [25] and remove the complete rotor [1] from the B-side endshield [42].
4. Visual inspection: Is there any moisture or gear unit oil inside the stator?
   - If not, proceed with step 7
   - If there is moisture, proceed with step 5
   - If there is gear oil, have the motor repaired by a specialist workshop
5. If there is moisture inside the stator:
   - With gearmotors: Remove the motor from the gear unit
   - With motors without a gear unit: Remove the A-flange
   - Remove the rotor [1]
6. Clean the winding, dry it and check it electrically, see chapter "Mechanical Installation" > "Long-term storage of motors" > "Drying the motor".

7. Replace the grooved ball bearings [11] [44] with permitted ball bearings.

   See chapter “Technical Data” > "Permitted rolling bearing types".

8. Reseal the shaft:
   - A-side: Replace the oil seal [106]
   - B-side: Replace the oil seal [95]

     Apply grease to the sealing lip (see chapter "Technical Data" > "Order information for lubricants and anti-corrosion agents").

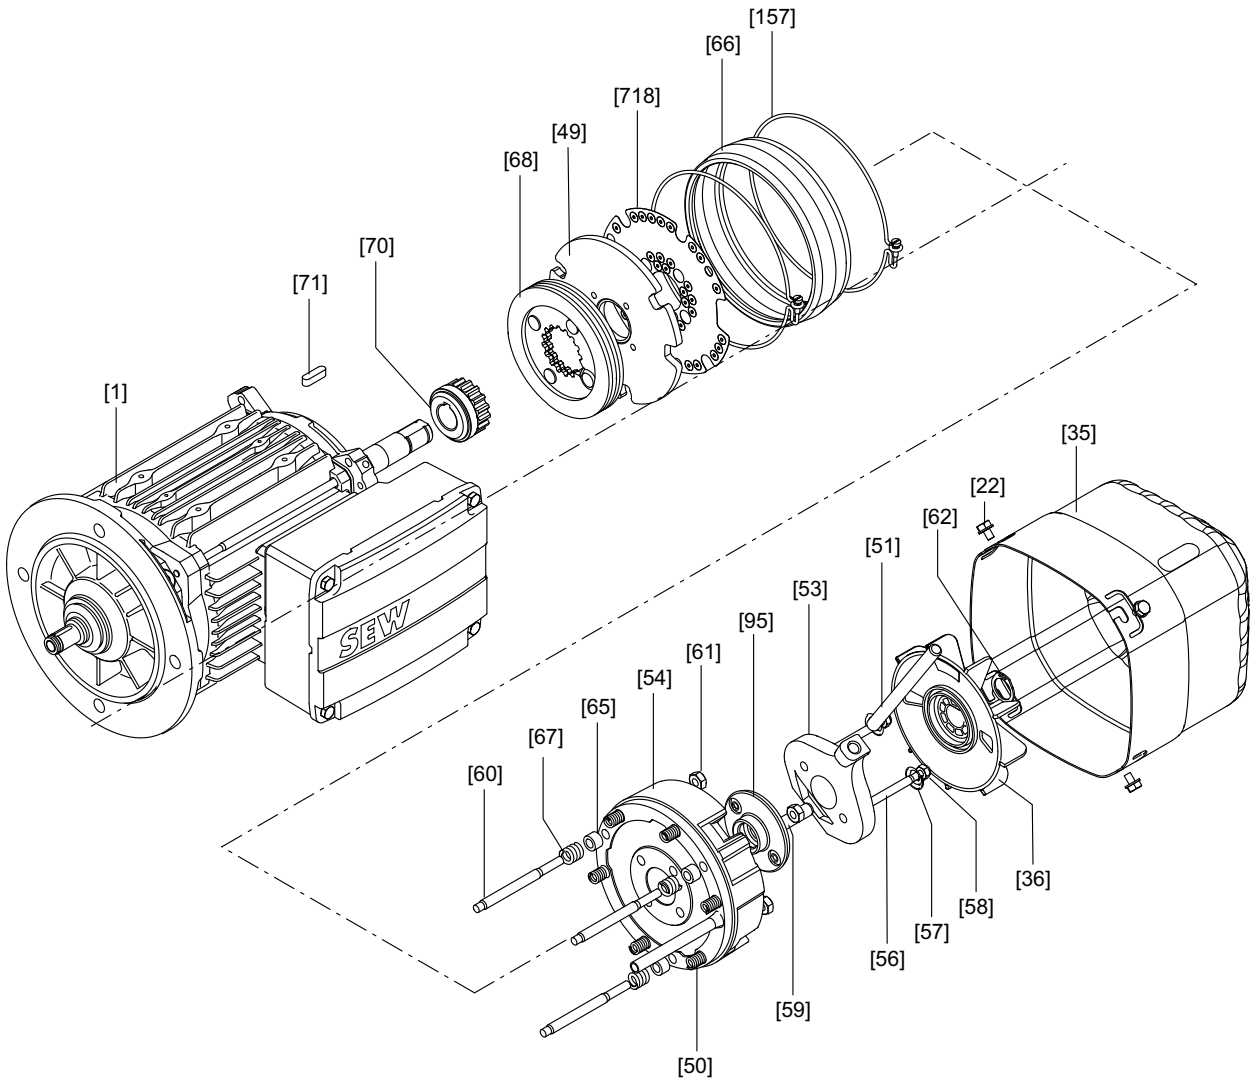
9. Reseal the stator seat:
   - Seal the sealing surface with duroplastic sealing compound

     (operating temperature -40 °C to +180 °C) e.g. "SEW L Spezial".
   - Sizes EDR.71 – EDR.132: Replace sealing [392].

10. Install the motor and accessory equipment.

8.5 Inspection/maintenance for EDR.71 – EDR.225 brakemotors

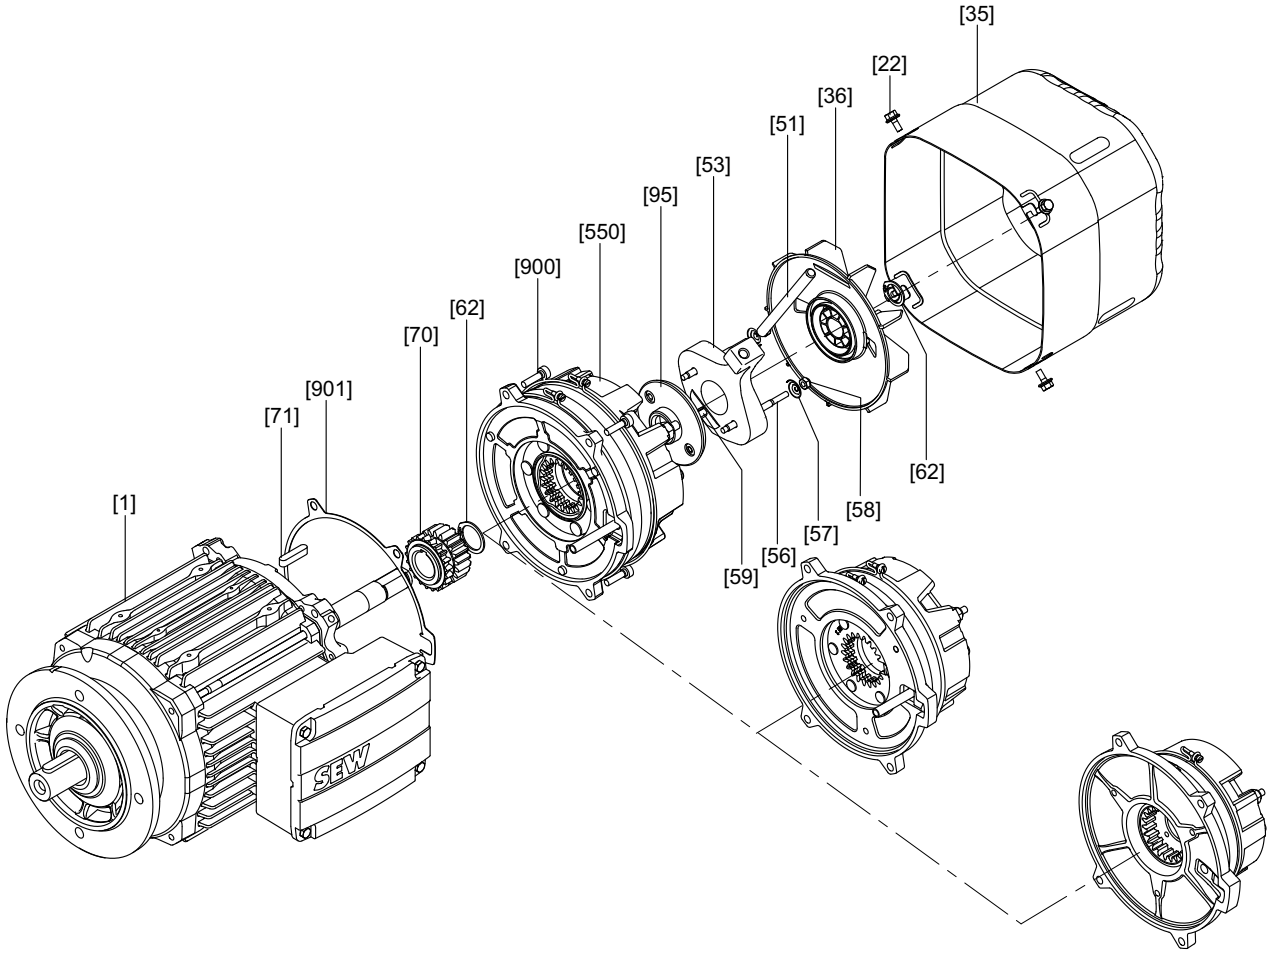
8.5.1 Basic structure of EDR.71 – EDR.80 brakemotors



9007199428941963

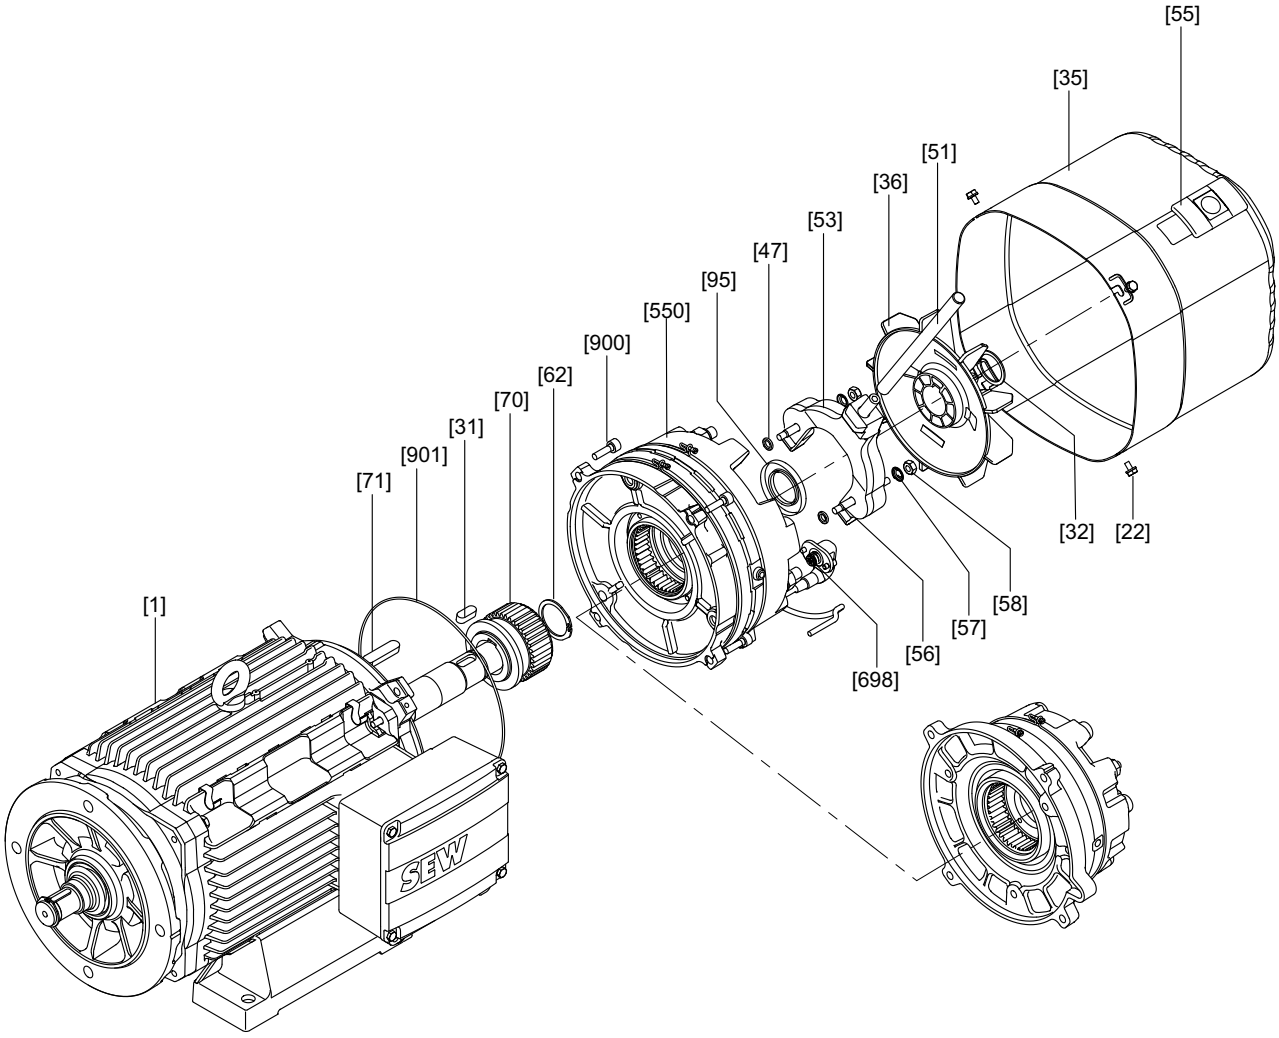
[1] Motor with brake endshield
[22] Hex head screw
[35] Fan guard
[36] Fan
[49] Pressure plate
[50] Brake spring
[51] Hand lever
[53] Release lever
[54] Magnet, complete
[56] Stud
[57] Conical spring
[58] Setting nut
[59] Parallel pin
[60] Stud 3x
[61] Hex nut
[62] Retaining ring
[65] Pressure ring
[66] Rubber sealing collar
[67] Counter spring
[68] Brake disk
[70] Driver
[71] Key
[95] Sealing ring
[157] Clamping straps 2x
[718] Damping plate

8.5.2 Basic structure of EDR.90 – EDR.132 brakemotors



[1] Motor with brake endshield
[22] Hex head screw
[32] Retaining ring
[35] Fan guard
[36] Fan
[51] Hand lever
[53] Release lever
[56] Stud
[57] Conical coil spring
[58] Setting nut
[59] Parallel pin
[62] Retaining ring
[70] Carrier
[71] Key
[95] Sealing ring
[550] Pre-assembled brake
[900] Screw
[901] Sealing

8.5.3 Basic structure of EDR.160 – EDR.225 brakemotors



9007199781964683

[1] Motor with brake endshield
[22] Hex head screw
[31] Key
[32] Retaining ring
[35] Fan guard
[36] Fan
[47] O-ring
[51] Hand lever
[53] Release lever
[55] Closing piece
[56] Stud
[57] Conical coil spring
[58] Setting nut
[62] Retaining ring
[70] Carrier
[71] Key
[95] Sealing ring
[550] Pre-assembled brake
[698] Plug connector complete (only for BE20 – BE32)
[900] Screw
[901] O-ring

8.5.4 Inspection procedure for EDR.71 – EDR.225 brakemotors

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove forced cooling fan and incremental encoder (if installed).

   See section "Motor and brake maintenance – preliminary work" (page 97).

2. Remove fan guard [35] and fan [36].
3. Remove stator:
   - **Sizes EDR.71 – EDR.132:** Remove machine screws [13] from flanged endshield [7] and brake endshield [42]. Remove stator [16] from flanged endshield [7].
   - **Sizes EDR.160 – EDR.180:** Loosen hex head screw [19] and remove brake endshield [42]. Loosen hex head screw [15] and remove stator from flanged endshield.
   - **Sizes EDR.200 – EDR.225:**
     - Loosen hex head screw [15] and remove the flanged endshield [7] from the stator.
     - With gearmotors: Remove oil flinger [107]
     - Loosen hex head screw [19] and remove the complete rotor [1] together with the brake endshield [42].
     - Loosen hex head screw [25] and remove the complete rotor [1] from the brake endshield [42].
4. Remove the brake cable:
   - **BE05 – BE11:** Remove the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE20 – BE32:** Loosen safety screws of the brake plug connector [698] and remove plug connector.
5. Push the brake off the stator and carefully lift it off.
6. Pull the stator back by about 3 to 4 cm.
7. Visual inspection: Is there any moisture or gear unit oil inside the stator?
   - If not, proceed with step 10.
   - If there is moisture, proceed with step 8
   - If there is gear oil, have the motor repaired by a specialist workshop
8. If there is moisture inside the stator:
   - With gearmotors: Remove the motor from the gear unit
   - With motors without a gear unit: Remove the A-flange
   - Remove the rotor [1]
9. Clean the winding, dry it and check it electrically (see chapter "Drying the motor" (page 24)).

10. Replace the grooved ball bearings [11] [44] with permitted ball bearings.

    See section"Permitted rolling bearing types" (page 154).

11. Reseal the shaft:
    - A-side: Replace the oil seal [106]
    - B-side: Replace the oil seal [95]

      Apply grease to the sealing lip (see chapter "Order information for lubricants and anti-corrosion agents" (page 155)).

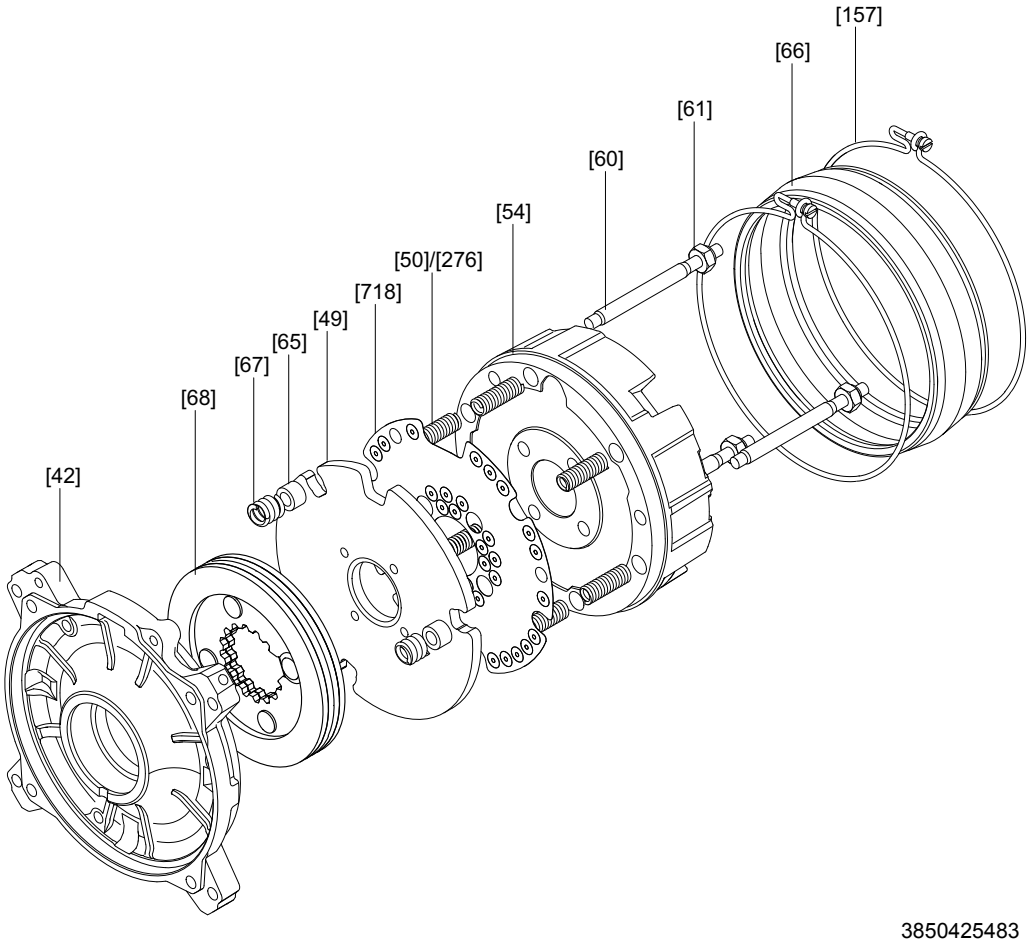
12. Reseal the stator seat:
    - Seal the sealing surface with duroplastic sealing compound

      (Operating temperature – 40 °C to +180 °C) e.g. "SEW L Spezial".
    - Sizes EDR.71 – EDR.132: Replace sealing [392].

13. **Motor sizes EDR.160 – EDR.225:** Replace the O-ring [901] between the brake endshield [42] and the pre-assembled brake [550]. Install the pre-assembled brake [550]

14. Install the motor, the brake and accessory equipment.

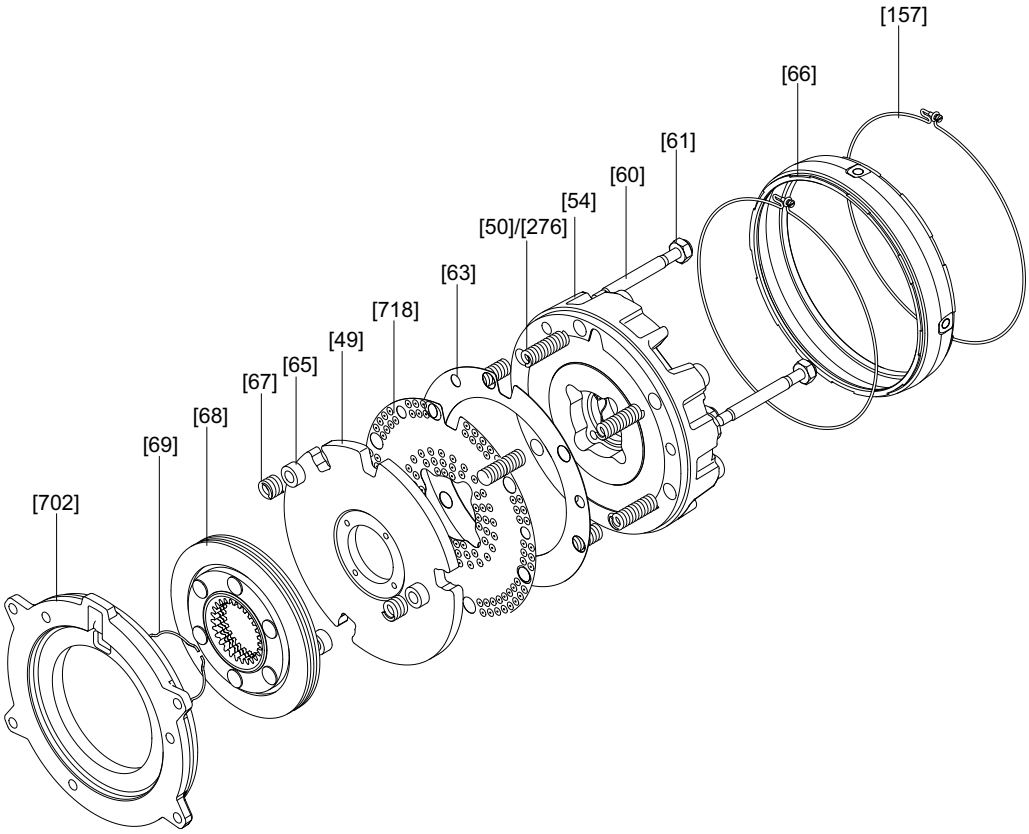
8.5.5 Basic structure of BE05 – BE2 brakes (EDR.71 – EDR.80)



3850425483

[42]	Brake endshield	[61]	Hex nut	[68]	Brake disk
[49]	Pressure plate	[65]	Pressure ring	[157]	Clamping straps 2x
[50]	Brake spring (normal)	[66]	Rubber sealing collar	[276]	Brake spring (blue)
[54]	Magnets, complete	[67]	Counter spring	[718]	Damping plate
[60]	Stud 3x				

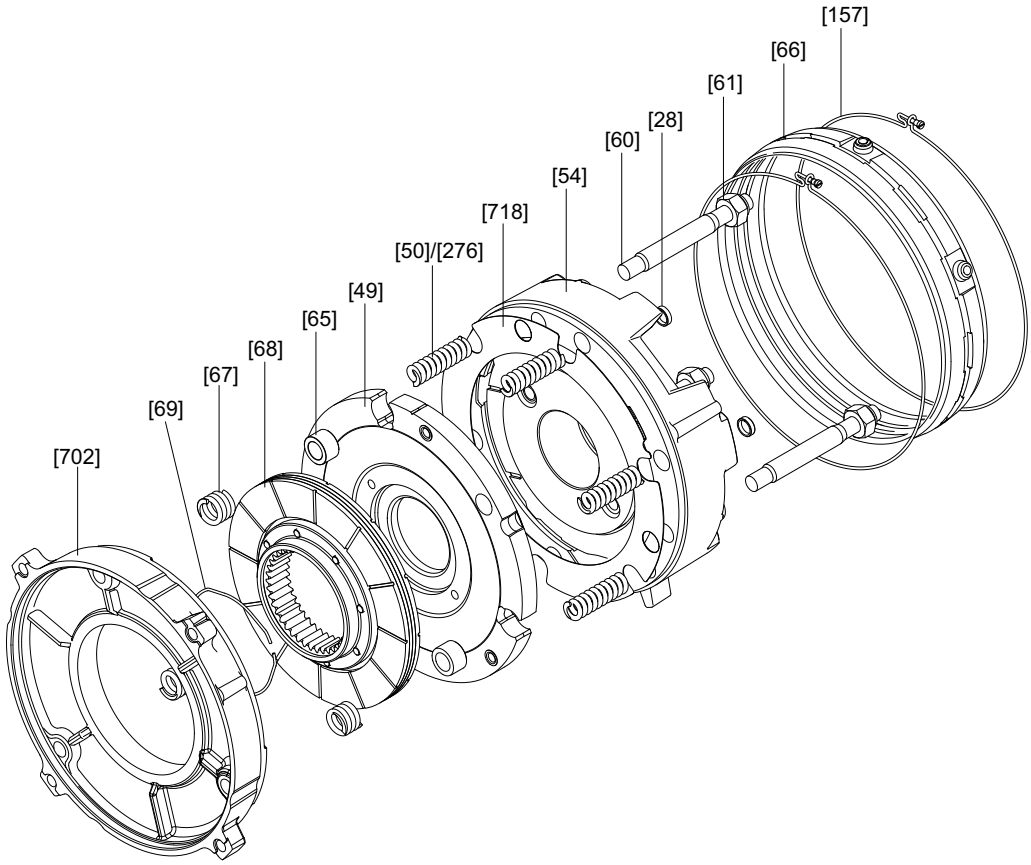
8.5.6 Basic structure of BE1 – BE11 brakes (EDR.90 – EDR.160)



3850423563

[49]	Pressure plate	[63]	Pole sheet	[69]	Circular spring
[50]	Brake spring (normal)	[65]	Pressure ring	[157]	Clamping straps 2x
[54]	Magnets, complete	[66]	Rubber sealing collar	[276]	Brake spring (blue)
[60]	Stud 3x	[67]	Counter spring	[702]	Friction disk
[61]	Hex nut	[68]	Brake disk	[718]	Damping plate

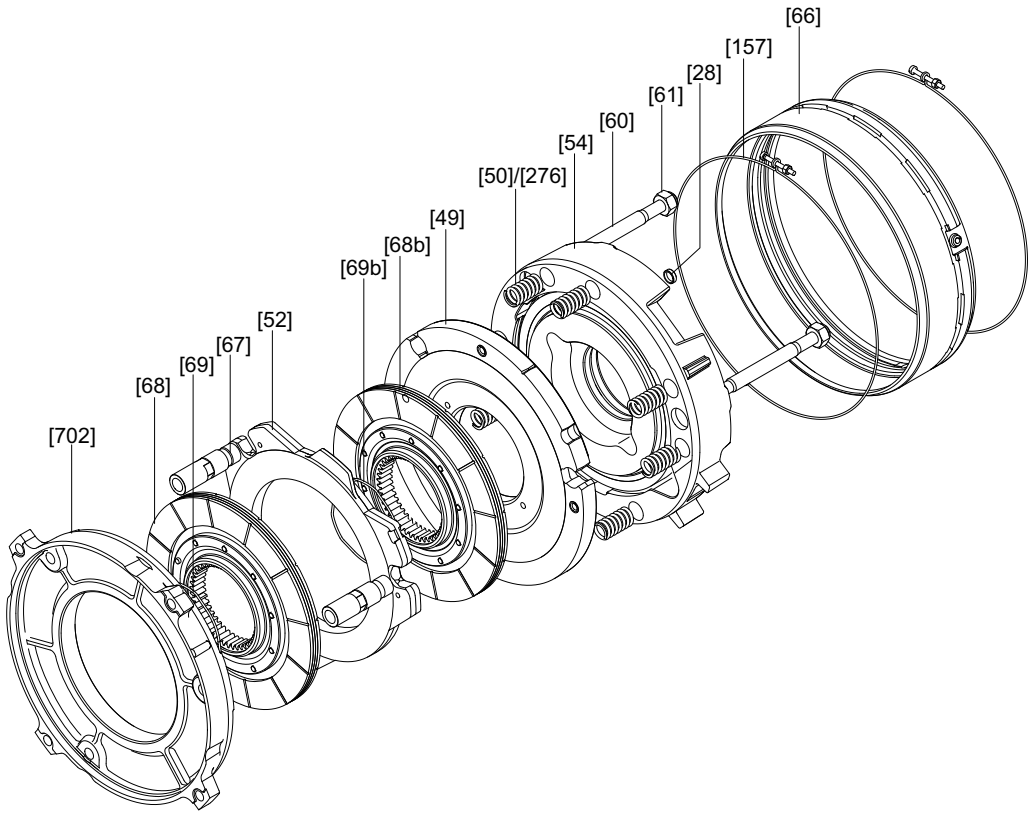
8.5.7 Basic structure of BE20 brakes (EDR.160 – EDR.180)



3850427403

[28]	Closing cap	[61]	Hex nut	[69]	Circular spring
[49]	Pressure plate, complete	[65]	Pressure ring	[157]	Clamping straps 2x
[50]	Brake spring (normal)	[66]	Rubber sealing collar	[276]	Brake spring (blue)
[54]	Magnets, complete	[67]	Counter spring	[702]	Friction disk
[60]	Stud 3x	[68]	Brake disk	[718]	Damping plate

8.5.8 Basic structure of BE30 – BE32 brakes (EDR.180 – EDR.225)



3850429323

[28]	Closing cap	[60]	Stud 3x	[69]	Circular spring
[49]	Pressure plate, complete	[61]	Hex nut	[157]	Clamping straps 2x
[50]	Brake spring (normal)	[66]	Rubber sealing collar	[276]	Brake spring (blue)
[52]	Brake stationary disk	[67]	Adjusting sleeve	[702]	Friction disk
[54]	Magnets, complete	[68]	Brake disk		

8.5.9 Setting the working air gap of BE05 – BE32 brakes

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

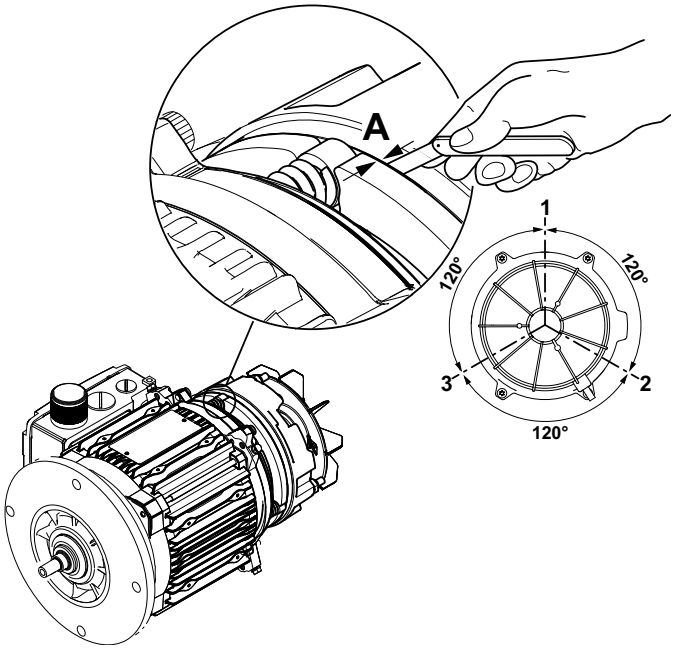
Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove the following:
   - Forced cooling fan and incremental encoder (if installed)

     See chapter "Motor and brake maintenance – preliminary work" (page 97).
   - Flange cover or fan guard [35]
2. Push the rubber sealing collar [66] aside:
   - Loosen the clamping straps [157]
   - Sucking off any abrasion
3. Measure the brake disk [68]:
   - Minimum brake disk thickness see chapter "Technical Data" (page 127).
   - Replace brake disk if necessary, see chapter "Replacing the brake disk of BE05 – BE32 brakes".
4. **BE30 – BE32:** Unfasten the setting sleeves [67] by turning them towards the brake endshield.
5. Measure the working air gap A (see the following figure)

   (use a feeler gauge and measure at three points offset by 120°):
   - **For BE05 – 11:** between pressure plate [49] and damping plate [718]
   - **For BE20 – 32:** between pressure plate [49] and coil body [54]



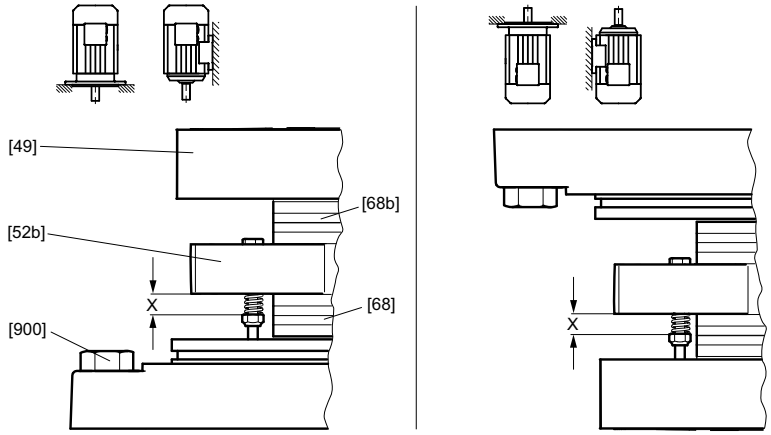
179978635

6. **BE05 – BE20:** Tighten the hex nuts [61] until the working air gap is set correctly, see chapter "Technical Data" (page 127).

   BE30 – BE32: Tighten the hex nuts [61] until the working air gap is 0.25 mm.

7. If you are mounting the BE32 in a vertical position, set the 3 springs on the brake plate to the following measurement:

Mounting position	X in [mm]
Brake at the top	7.3
Brake at the bottom	6.5



[49] Pressure plate
[52b] Brake plate (BE32 only)
[68] Brake disk
[68b] Brake disk (BE32 only)
[900] Hex nut

8. **BE30 – BE32:** Tighten the setting sleeves [67]
   – towards the magnet
   – until the working air gap is set correctly, see chapter "Technical Data" (page 127).
9. Seal hex nuts [61] with duroplastic sealing compound, e.g. "SEW L Spezial".
10. Mount sealing strip [66], clamping straps [157]. Re-install the removed parts.

8.5.10 Replacing the brake disk of BE05 – BE32 brakes

In addition to the brake elements listed in column "BE brake", see chapter "Inspection and maintenance intervals", check the hex nuts [61] for wear when you replace the brake disk. You must always replace the hex nuts [61] when you replace the brake disk.

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

INFORMATION

- The brake of EDR.71 – EDR.80 motor sizes cannot be removed from the motor because the BE brake is directly installed on the brake endshield of the motor.
- The brake of EDR.90 – EDR.225 motor sizes can be removed from the motor for replacing the brake disk because the BE brake is pre-installed on the brake endshield of the motor via a friction disk .

1. Remove the following:
   - Forced cooling fan and incremental encoder (if installed)

     See chapter "Motor and brake maintenance – preliminary work" (page 97).
   - Flange cover or fan guard [35], circlip [32/62] and fan [36]
2. Remove the brake cable
   - **BE05 – BE11:** Remove the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE11 – BE32:** Loosen safety screws of the brake plug connector [698] and remove plug connector.
3. Remove the sealing strip [66] and clamping strap [157]
4. Loosen hex nuts [61], carefully pull off the magnet [54] (brake cable!) and take out the brake springs [50].
5. **BE05 – BE11:** Remove the damping plate [718], pressure plate [49] and brake disk [68]

   BE20 – BE30: Remove pressure plate [49] and brake disk [68]

   BE32: Remove pressure plate [49], brake disks [68] and [68b]
6. Clean the brake parts, check for damage, and replace them if necessary.
7. Install new brake disk(s).
8. Re-install the brake components,
   - Leave out the fan and the fan guard, because the working air gap has to be set first, see chapter "Setting the working air gap of the BE05 – BE32 brakes".

9. Reseal the shaft:
   – Replace the sealing ring [95]

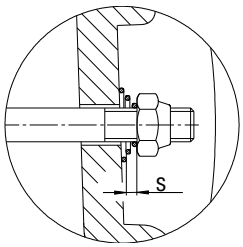
     Apply grease to the sealing lip (see chapter "Order information for lubricants and anti-corrosion agents" (page 155)).
10. In case of manual brake release: Use the setting nuts to adjust the floating clearance "s" between the conical coil springs (pressed flat) and the setting nuts (see following figure).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Set the floating clearance "s" correctly according to the following figure and table so that the pressure plate can move up as the brake lining wears.



177241867

Brake	Floating clearance s [mm]
BE05; BE1; BE2	1.5
BE5; BE11, BE20; BE30; BE32	2

11. Seal hex nuts [61] with duroplastic sealing compound, e.g. "SEW L Spezial" (page 155).
12. Mount sealing strip [66], clamping straps [157]. Re-install the removed parts.

INFORMATION

- The lockable manual brake release (type HF) is already released when resistance is encountered as the set screw is turned.
- The self-reengaging manual brake release (type HR) can be operated with normal hand pressure.
- In brakemotors with self-reengaging manual brake release, the manual brake release lever must be removed after startup/maintenance! A bracket is provided for storing the lever on the outside of the motor.

INFORMATION

Important: After replacing the brake disk, the maximum braking torque is reached only after several cycles.

8.5.11 Changing the braking torque of BE05-BE32 brakes

The braking torque can be altered in stages.

- by changing the type and number of brake springs
- by changing the complete magnet (only possible for BE05 and BE1)
- by changing the brake (from motor size DR.90).
- by changing to a two-disk brake (BE30 only)

For possible braking torque steps, refer to chapter "Technical Data" (page 127).

8.5.12 Changing the brake spring of BE05 – BE32 brakes

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove the following:
   - Forced cooling fan and incremental encoder (if installed)

     See chapter "Motor and brake maintenance – preliminary work" (page 97).
   - Flange cover or fan guard [35], circlip [32/62] and fan [36]
2. Remove the brake cable
   - **BE05 – BE11:** Remove the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE20 – BE32:** Loosen safety screws of the brake plug connector [698] and remove plug connector.
3. Remove the sealing strip [66] and clamping straps [157]; remove manual brake release if necessary:
   - Setting nuts [58], conical coil springs [57], studs [56], releasing lever [53], dowel pin [59]
4. Unfasten hex nuts [61] and pull off the magnet [54]
   - by approx. 50 mm (watch the brake cable)
5. Change or add brake springs [50/276]
   - Position the brake springs symmetrically, see chapter "Work done, working air gap, braking torques". (page 136)
6. Re-install the brake components
   - Leave out the fan and the fan guard, because the working air gap has to be set first, see chapter "Setting the working air gap of the BE05 – BE32 brakes" (page 116).

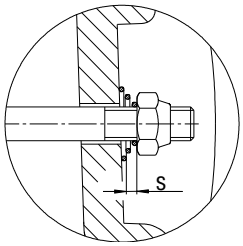
7. In case of manual brake release: Use the setting nuts to adjust the floating clearance "s" between the conical coil springs (pressed flat) and the setting nuts (see following figure).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Set the floating clearance "s" correctly according to the following figure and table so that the pressure plate can move up as the brake lining wears.



177241867

Brake	Floating clearance s [mm]
BE05; BE1; BE2	1.5
BE5; BE11, BE20; BE30; BE32	2

8. Seal hex nuts [61] with duroplastic sealing compound, e.g. "SEW L Spezial" (page 155).
9. Mount sealing strip [66], clamping straps [157]. Re-install the removed parts.

INFORMATION

Replace setting nuts [58] and hex nuts [61] if the removal procedure is repeated.

8.5.13 Changing the magnet of BE05 – BE32 brakes

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove the following:
   - Forced cooling fan and incremental encoder (if installed)

     See chapter "Motor and brake maintenance – preliminary work" (page 97).
   - Flange cover or fan guard [35], circlip [32/62] and fan [36]
2. Remove the brake cable
   - **BE05 – BE11:** Remove the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE20 – BE32:** Loosen safety screws of the brake plug connector [698] and remove plug connector.
3. Remove the sealing strip [66] and clamping straps [157]; remove manual brake release if necessary:
   - Setting nuts [58], conical coil springs [57], studs [56], releasing lever [53], dowel pin [59]
4. Unfasten hex nuts [61], remove magnet body [54], remove brake springs [50/276].
5. Install new magnet body with brake springs. For the possible braking torque steps, please refer to section "Technical Data" (page 127).
6. Clean the brake parts, check for damage, and replace them if necessary.
7. Re-install the brake components
   - Leave out the fan and the fan guard, because the working air gap has to be set first, see chapter "Setting the working air gap of the BE05 – BE20 brakes".
8. Reseal the shaft:
   - Replace the sealing ring [95]

     Apply grease to the sealing lip (see chapter "Order information for lubricants and anti-corrosion agents" (page 155)).

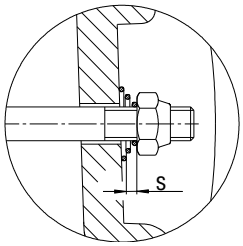
9. In case of manual brake release: Use the setting nuts to adjust the floating clearance "s" between the conical coil springs (pressed flat) and the setting nuts (see following figure).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Set the floating clearance "s" correctly according to the following figure and table so that the pressure plate can move up as the brake lining wears.



177241867

Brake	Floating clearance s [mm]
BE05; BE1; BE2	1.5
BE5; BE11, BE20; BE30; BE32	2

10. Seal hex nuts [61] with duroplastic sealing compound, e.g. "SEW L Spezial" (page 155).
11. Mount sealing strip [66], clamping straps [157]. Re-install the removed parts.
12. Replace brake controller in the event of a brake failure due to an interturn short circuit or a short circuit to frame.

INFORMATION

Replace setting nuts [58] and hex nuts [61] if the removal procedure is repeated.

8.5.14 Changing the brake of EDR.71 – EDR.80

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove the following:
   - Forced cooling fan and incremental encoder (if installed)

     See chapter "Motor and brake maintenance – preliminary work" (page 97).
   - Flange cover or fan guard [35], circlip [32/62] and fan [36]
2. Remove the terminal box cover and loosen the brake cable from the rectifier. If necessary, attach trailing wire to brake cables.
3. Loosen pull rods [13] and remove brake endshield with brake from stator.
4. Loosen the clamping straps [157] and store them.
5. Insert the brake cable of the new brake into the terminal box.
6. Install the new brake, observing the alignment of the cams of the brake endshield.
7. Mont the brake with pull rods [13] of the motor.
8. Mount the stored clamping straps [157] to the new brake.
9. Reseal the shaft:
   - Replace the sealing ring [95]

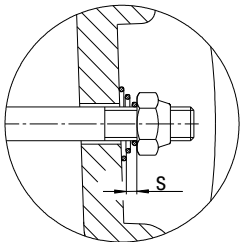
     Apply grease to the sealing lip (see chapter "Order information for lubricants and anti-corrosion agents" (page 155)).
10. In case of manual brake release: Use the setting nuts to adjust the floating clearance "s" between the conical coil springs (pressed flat) and the setting nuts (see following figure).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Set the floating clearance "s" correctly according to the following figure and table so that the pressure plate can move up as the brake lining wears.



177241867

Brake	Floating clearance s [mm]
BE05; BE1; BE2	1.5

11. Seal hex nuts [61] with duroplastic sealing compound, e.g. "SEW L Spezial" (page 155).

8.5.15 Replacing the brake of EDR.90 – EDR.225

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- Isolate the motor, brake, and forced cooling fan, if installed, from the power supply before starting work, safeguarding them against unintentional re-start.
- Carefully observe the steps described below.

1. Remove the following:
   - Forced cooling fan and incremental encoder (if installed)

     See chapter "Motor and brake maintenance – preliminary work" (page 97).
   - Flange cover or fan guard [35], circlip [32/62] and fan [36]
2. Remove the brake cable
   - **BE05 – BE11:** Remove the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE20 – BE32:** Loosen safety screws of the brake plug connector [698] and remove plug connector.
3. Unfasten screws [900] and remove brake from brake endshield.
4. Loosen the clamping straps [157] and store them.
5. **EDR.90 – EDR.132:** Pay attention to the alignment of the gasket [901].
6. Connect the brake cables of the new brake.
7. Install the new brake, observing the alignment of the cams of the friction disk.
8. Mount brake with screws [900].
9. Mount the stored clamping straps [157] to the new brake.
10. Reseal the shaft:
    - Replace the sealing ring [95]

      Apply grease to the sealing lip (see chapter "Order information for lubricants and anti-corrosion agents" (page 155)).

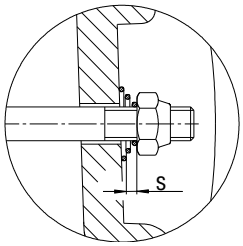
11. In case of manual brake release: Use the setting nuts to adjust the floating clearance "s" between the conical coil springs (pressed flat) and the setting nuts (see following figure).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Set the floating clearance "s" correctly according to the following figure and table so that the pressure plate can move up as the brake lining wears.



177241867

Brake	Floating clearance s [mm]
BE05; BE1; BE2	1.5
BE5; BE11, BE20, BE30, BE32	2

12. Seal hex nuts [61] with duroplastic sealing compound, e.g. "SEW L Spezial" (page 155).

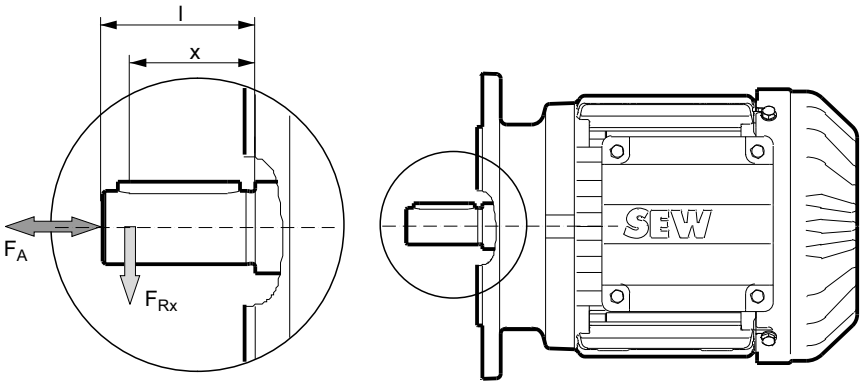
9 Technical Data

9.1 Overhung loads

9.1.1 Permitted overhung loads

Refer to the following diagrams for the permitted overhung load F_{Rx} for EDR AC brake-motors. In order to read the permitted overhung load from the diagram, you must know what the distance x is between the force application point of the overhung load F_R and the shaft shoulder.

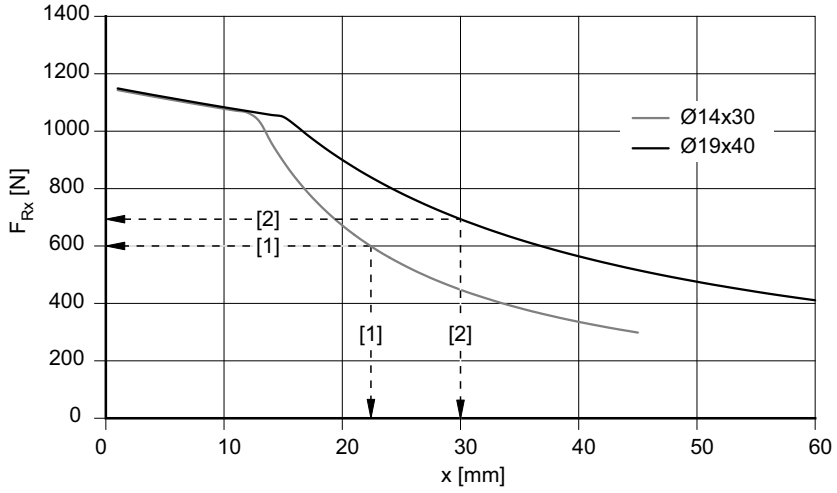
The following figure shows the application point of the overhung load.



2636511499

l = Length of the shaft end
x = Distance between overhung load application point and shaft shoulder
F_{Rx} = Overhung load at force application point
F_A = Axial force

The following diagram shows an example of how you can read the overhung load from the diagram:



2636513163

[1] Motor with shaft diameter 14 mm, force application x at 22 mm, permitted overhung load F_{Rx} = 600 N
[2] Motor with shaft diameter 19 mm, force application x at 30 mm, permitted overhung load F_{Rx} = 700 N

Permitted axial load for EDR motors

You can then determine the permitted axial load F_A by means of the previously determined overhung load F_{Rx}:

$F_A = 0.2 \times F_{Rx}$

9.1.2 Overhung load diagrams of the 4-pole EDR motors

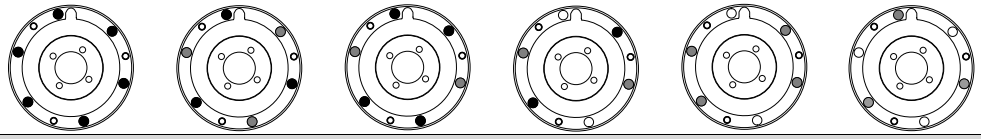
1) When checking the working air gap, note: Parallelism tolerances on the brake disk may cause deviations of ± 0.15 mm after a test run.

The following table shows the brake spring layout:

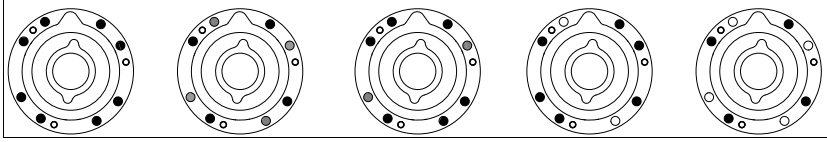
BE05 – BE20:

6 springs | 3 + 3 springs | 4 + 2 springs | 2 + 2 springs | 4 springs | 3 springs



BE30 – BE32:

8 springs | 4 + 4 springs | 6 + 2 springs | 6 springs | 4 springs



9.4 Operating currents

9.4.1 Key

The following tables list the operating currents of the brakes at different voltages.

The acceleration current I_B (= inrush current) flows only for a short time (approx. 160 ms for BE05 – 32) when the brake is released. When using the BG, BS24, or BMS brake controller and direct DC voltage supply without control unit (only possible with brake size BE05 – BE2), increased inrush current does not occur.

The values for the holding currents I_H are r.m.s. values. Only use current measurement units that are designed to measure rms values.

The following values are specified:

P_B	Electric current consumption in the brake coil in watt
V_N	Nominal voltage (nominal voltage range) of the brake in V (AC or DC)
I_H	Holding current in ampere. Rms value of the brake current in the supply cable to the SEW brake controller with high-speed output
I_{DC}	Direct current in ampere in the brake supply cable with direct DC voltage supply or Direct current in ampere in the brake supply cable with DC 24 V supply via BS24, BSG, or BMV.
I_B	Acceleration current in ampere (AC or DC) when operated with SEW brake controller for high-speed excitation
I_B/I_H	Inrush current ratio ESV
I_B/I_{DC}	Inrush current ratio ESV for DC 24 V supply with BSG or BMV

9.4.2 Brake BE05, BE1, BE2

	BE05, BE1	BE2
Max. braking torque in Nm (lb-in)	3.5/7 (31/62)	14 (1566)
Braking power in W (hp)	25 (0.034)	34 (0.046)
Inrush current ratio ESV	4	4

9.5 Resistances

9.5.1 Resistance measurement BE05, BE1, BE2, BE5, BE11, BE20, BE30, BE32

INFORMATION

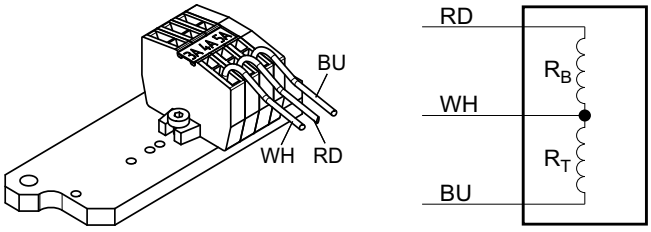
The colored cores of the brake coil must be removed from their terminals for the resistance measurement; otherwise, this could lead to incorrect measurement results.

For drives of category 3GD, the brake controller must always be installed in the control cabinet.

For drives of category 3D, the brake controller can be installed in the control cabinet or in the terminal box.

Brake control system in the control cabinet

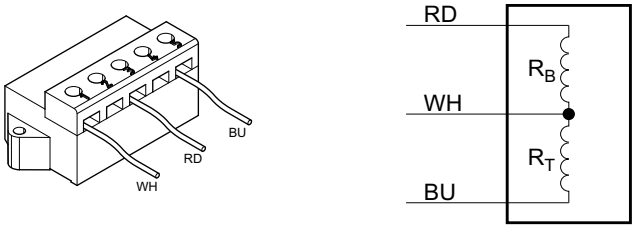
The following figure shows the brake coil resistance measurement at the auxiliary terminal strip in the terminal box when the brake controller is installed in the control cabinet:



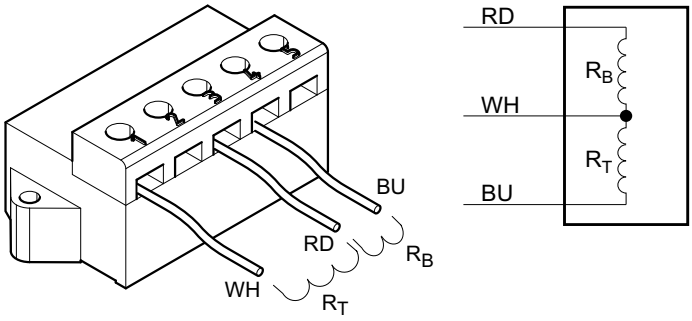
R_B	Acceleration coil resistance at 20 °C (68 °F) [Ω]	RD	Red
R_T	Coil section resistance at 20 °C [Ω]	WH	White
		BU	Blue

Brake controller in the terminal box

The following figure shows the resistance measurement when the brake controller is installed in the terminal box (cut-off in the AC circuit):



The following figure shows the resistance measurement when the brake controller is installed in the terminal box (cut-off in the DC and AC circuit):



9.5.2 Key

The following values are specified:

R_B Acceleration coil resistance at 20 °C (68 °F) [Ω]
R_T Coil section resistance at 20 °C [Ω]
P_B Electric current consumption in the brake coil in watt
I_B/I_H Inrush current ratio ESV
V_N Nominal voltage (nominal voltage range) of the brake in V (AC or DC)

9.6 Brake control

9.6.1 Installation in control cabinet

The following table lists the technical data of brake control systems for installation in the control cabinet and the assignments with regard to motor size and connection technology. The different housings have different colors (= color code) to make them easier to distinguish.

INFORMATION

Brake control systems are not allowed in the connection space of EDR motors of category 3GD.

For EDR motors of category 3D, brake controllers can be installed in the wiring space of the motor and in the control cabinet.

Motor sizes EDR.71 – EDR.225

The table below shows the standard and optional combinations of brakes and brake rectifiers for installation in control cabinets:

	BE05	BE1	BE2	BE5	BE11	BE20	BE30, BE32

9.6.3 Installation in the wiring space of the motor with additional switching relay BSR, BUR – for motors of category 3D only

The following tables show the technical data of the BSR and BUR brake controllers, each with BGE brake controller and SR.R current relay or UR.E voltage relay. The relays are used for the cut-off in the AC and DC circuits without additional switching contacts in the control cabinet.

The BSR brake controller takes the supply voltage for the brake directly from the motor terminal board, which is why it may only be used with drives operated on the supply system (constant voltage). The BUR brake controller can also be used with variable speed drives (frequency inverter operation).

BSR brake control

SR.E is assigned according to the nominal motor current in star connection:

The following table shows the allocation of SR current relays to the nominal motor current I_N in ⅄ connection and the maximum holding current of the brake I_{Hmax}.

$I_{Hmax} = I_H \times 1.3\ A_{Ac}$

EDR.71 – 132

Current relay	Nominal motor current I_N in A in ⅄ connection	Max. holding current of the brake I_{Hmax} in A
SR10E	0.075 – 0.6	1
SR11E	0.6 – 10	1
SR15E	10 – 50	1

EDR.160 – 225

Current relay	Nominal motor current I_N in A in ⅄ connection	Max. holding current of the brake I_{Hmax} in A
SR15E	10 – 30	1
SR19E	30 – 90	1

Type	Function	Voltage	Holding current I_{Hmax} in A	Type	Part number	Color code
BSR	One-way rectifier + current relay for cut-off in the DC circuit	AC 150 – 500 V	1.0	BGE 1.5 + SR10E	825 385 4 828 243 9	Red -
			1.0	BGE 1.5 + SR11E	825 385 4 828 244 7	Red -
			1.0	BGE 1.5 + SR15E	825 385 4 828 245 5	Red -
			1.0	BGE 1.5 + SR19E	825 385 4 828 312 5	Red -
		AC 42 – 150 V	1.0	BGE 3 + SR10E	825 387 0 828 243 9	Blue -
			1.0	BGE 3 + SR11E	825 387 0 828 244 7	Blue -
			1.0	BGE 3 + SR15E	825 387 0 828 245 5	Blue -
			1.0	BGE 3 + SR19E	825 387 0 828 312 5	Blue -

BUR brake control

The BUR brake controller combines the BGE control unit with an electronic voltage relay. The BGE control unit has a separate voltage supply because the voltage at the motor terminal board is not constant (motor operated on frequency inverter).

With a cut-off in the AC circuit, the UR voltage relay triggers a cut-off in the DC circuit of the brake coil almost instantaneously and the brake is applied extremely fast.

The brake voltage is defined automatically on the basis of the motor phase voltage without further customer data. Optionally, other brake voltages can be defined in accordance with the following table.

Brake	BUR (BGE + UR..) for brake control (AC V)											
	79 - 123	124 - 138	139 - 193	194 - 217	218 - 243	244 - 273	274 - 306	307 - 343	344 - 379	380 - 431	432 - 484	485 - 542
BE05												
BE1												
BE2												
BE5												
BE11												
BE20												
BE30												
BE32												

UR15 UR11 Not possible

The assignement of UR.E depends on the selected brake voltage.

Type	Function	Voltage	Holding current I_{Hmax} in A	Type	Part number	Color code
BUR	One-way rectifier + voltage relay for cut-off in the DC circuit	AC 150 – 500 V	1.0	BGE 1.5 + UR15E	825 385 4 828 314 1	Red -
		AC 42 – 150 V		BGE 3 + UR11E	825 387 0 828 313 3	Blue -

9.6.4 Brake voltage supply via motor terminal board

Direct voltage supply to the brake from the motor terminal board or the KCC terminal strip of an EDR type motor (category 3) is only possible with constant speed drives.

In hoists and hoist-like applications, this type of voltage supply is only permitted with an additional current relay (BSR control), which ensures the application of the brake also when the hoist is moving downward.

INFORMATION

In variable-speed motors, the brake voltage must not be picked up at the motor terminal board because the voltage there is not constant.

9.6.5 Parallel operation of several brakes with one controller

INFORMATION

For EDR-type motors, parallel voltage supply of two or more brakes via a single brake controller is not permitted due to the stricter requirements of explosion protection. This means a separate brake controller must be used for each brake.

9.7 Permitted work done by the BE brake for AC motors

If you are using a brake motor, you have to check whether the brake is approved for use with the required starting frequency Z. The following diagrams show the permitted braking work W_{max} per braking operation for different brakes and rated speeds. The values are given with reference to the required switching frequency Z in cycles/hour (1h).

INFORMATION

For brakes BE30 and BE32, braking operations above 1800 rpm are not permitted.

9.8 Permitted braking work of the BE brake in case of an emergency stop

The permitted switching work of the SEW brakes is defined for 750, 1000, 1500, and 3000 rpm in the known W_{max} / Z diagrams.

Often, values for intermediate speeds are required for controlled drives (hoists, hoist-like drives, travel drives). The following diagram and the value tables apply for the operating frequency Z = 1/h. They list the maximally permitted braking work in case of an emergency stop depending on the speed.

Diagram: Maximum braking work for emergency stop

9.10 Lubricant tables

9.10.1 Lubricant table for rolling bearings

INFORMATION

Using the wrong bearing grease might result in increased motor noise.

Motor sizes EDR.71 – EDR.225

The bearings are 2Z or 2RS closed bearings and cannot be re-lubricated.

	Ambient temperature	Manufacturer	Type	DIN designation
Motor rolling bearings	-20 °C to +80 °C	Esso	Polyrex EM[1)]	K2P-20
	+20 °C to +100 °C	Klüber	Barrierta L55/2[2)]	KX2U
	-40 °C to +60 °C	Kyodo Yushi	Multemp SRL[2)]	K2N-40

1) mineral lubricant (= mineral-based rolling bearing grease)

2) Synthetic lubricant (= synthetic-based roller bearing grease)

9.11 Order information for lubricants and anti-corrosion agents

Lubricants and anti-corrosion agents may be obtained directly from SEW-EURODRIVE using the following order numbers.

Use	Manufacturer	Type	Packaging unit	Order number
Lubricant for rolling bearings	Esso	Polyrex EM	400 g	09101470
	SKF	GXN	400 g	09101276
Duroplastic sealing compound	Marston Domsel	SEW L Spezial	80 g	09112286
Lubricant for Sealing rings	Klüber	Klübersynth HLR 46-371 for [95]	6 ml	03258017
	Klüber	Petamo GHY 133 for [30], [37], [106]	10 g	04963458
	Fuchs	Renolit CX-Tom 15 for [30], [37], [106]	On request	On request
Anti-corrosion agent and lubricant	SEW-EURODRIVE	NOCO® FLUID	5.5 g	09107819

9.12 Encoders

9.12.1 Encoders ES7. /AS7. / EG7. and AG7.

This table shows the general technical data for the encoders:

Designation	Value
Operating ambient temperature for the motor	-20 °C to +40 °C
Storage temperature	-15 °C to +70 °C
Maximum angular acceleration	10^4 rad/s^2

9.12.2 Incremental rotary encoders with spread and plug-in shaft

Signal output		TTL	Sin/cos	TTL	HTL
Output current per track	I_{out}	25 mA_{RMS}	10 mA_{RMS}	25 mA_{RMS}	60 mA_{RMS}
Duty factor		1 : 1 ± 20 %	Sin/cos	1 : 1 ± 20 %	
Phase angle A: B		90 ° ± 20 °	90 °	90 ° ± 20 °	
Data memory		-			
Vibration resistance		≤ 100 m/s²			
Shock resistance		≤ 1000 m/s²			
Maximum speed	n_{max}	6000 rpm			
Mass	m	0.36 kg			
Degree of protection		IP66			
Connection		Terminal box on incremental encoder			

9.12.6 Mounting device

Mounting device		XV0A	XV1A	XV2A	XV3A	XV4A
For motors		EDR71 – 225				
Mounting type of encoder		Flange centered with coupling				
Type	Encoder shaft	Any	6 mm	10 mm	12 mm	11 mm
	Centering	Any	50 mm	50 mm	80 mm	85 mm
Suitable for encoder		Provided by the customer or by SEW-EURODRIVE on behalf of the customer.				

9.13 Nameplate marking

The following table lists all markings that can occur on a nameplate and an explanation of what they mean:

Mark	Meaning
CE	CE mark to state compliance with European guidelines, such as the Low Voltage Directive
Ex	ATEX mark to state compliance with the European Directive 94/9/EC
VIK	VIK mark to confirm the compliance with the directive of the German Association of Industrial Machines (V.I.K.)

10 Malfunctions

⚠ WARNING

Risk of crushing if the drive starts up unintentionally.

Severe or fatal injuries.

- De-energize the motor before you start working on the unit.
- Secure the motor against unintended power-up.

⚠ CAUTION

The surface temperatures on the drive can be very high during operation.

Danger of burns.

- Let the motor cool down before you start your work.

NOTICE

Improper troubleshooting measures may damage the drive.

Possible damage to property.

- Note the following information.

- Use only genuine spare parts in accordance with the valid parts list.
- Strictly observe the safety notes in the individual chapters.

10.1 Motor malfunctions

Malfunction	Possible cause	Remedy
Motor does not start up	Supply cable interrupted	Check the connections and (intermediate) terminal points, correct if necessary)
	Brake does not release	See chapter "Brake malfunctions"
	Supply cable fuse has blown	Replace fuse
	Motor protection (switch) has triggered	Check that the motor protection (switch) is set correctly; current specification is on the nameplate
	Motor protection does not trip	Check motor protection control
	Malfunction in control or in the control process	Observe the switching sequence; correct if necessary
Motor only starts with difficulty or does not start at all	Motor power designed for delta connection but connected in star	Correct the connection from star to delta; follow the wiring diagram
	Motor power designed for star-star connection but only connected in star	Correct the connection from star to star-star; follow the wiring diagram
	Voltage or frequency deviate considerably from setpoint, at least while being switched on	Provide better power supply system; reduce the power supply load; Check cross section of supply cable, replace with cable of larger cross section if need be
Motor does not start in star connection, only in delta connection	Star connection does not provide sufficient torque	If the delta inrush current is not too high (observe the regulations of the power supplier), start up directly in delta; Check the project planning and use a larger motor or special version if necessary (consult SEW-EURODRIVE)
	Contact fault on star/delta switch	Check the switch, replace if necessary; Check the connections
Incorrect direction of rotation	Motor connected incorrectly	Swap two phases of the motor supply cable
Motor hums and has high current consumption	Brake does not release	See chapter "Brake malfunctions"
	Winding defective	Send motor to specialist workshop for repair
	Rotor rubbing	
Fuses blow or motor protection trips immediately	Short circuit in the motor supply cable	Repair short circuit
	Supply cables connected incorrectly	Correct the wiring, observe the wiring diagram
	Short circuit in motor	Send motor to specialist workshop for repair
	Ground fault on motor	
Severe speed loss under load	Motor overload	Measure power, check project planning and use larger motor or reduce load if necessary
	Voltage drops	Check cross section of supply cable, replace with cable of larger cross section if need be
Motor heats up excessively (measure temperature)	Overload	Measure power, check project planning and use larger motor or reduce load if necessary
	Insufficient cooling	Provide for cooling air supply or clear cooling air passages, retrofit forced cooling fan if necessary. Check the air filter, clean or replace if necessary
	Ambient temperature too high	Observe the permitted temperature range, reduce the load if necessary
	Motor in delta connection instead of star connection as provided for	Correct the wiring, observe the wiring diagram
	Loose contact in supply cable (one phase missing)	Tighten loose contact, check connections, observe wiring diagram
	Fuse has blown	Look for and rectify cause (see above); replace fuse
	Line voltage deviates from the rated motor voltage by more than 5% (range A)/ 10% (range B).	Adjust motor to line voltage.
	Rated operation type (S1 to S10, DIN 57530) exceeded, e.g. through excessive starting frequency	Adjust the rated operating mode of the motor to the required operating conditions; consult a professional to determine the correct drive if necessary

Malfunction	Possible cause	Remedy
Excessively loud	Ball bearing compressed, dirty or damaged	Re-align motor and the driven machine, inspect rolling bearing and replace if necessary. See section"Permitted rolling bearing types" (page 154).
	Vibration of rotating parts	Look for the case, possibly an imbalance; correct the cause, observe method for balancing
	Foreign bodies in cooling air passages	Clean the cooling air passages

10.2 Brake malfunctions

Malfunction	Possible cause	Remedy
Brake does not release	Incorrect voltage on brake control unit	Apply the correct voltage; brake voltage specified on the nameplate
	Brake control unit failed	Install a new brake control, check resistors and insulation of the brake coils (see "Resistors" section for resistance values). Check switchgear, replace if necessary
	Max. permitted working air gap exceeded because brake lining worn down.	Measure and set working air gap. See the following sections: • "Setting the working air gap of brakes BE05-BE32" If the brake disk is too thin, replace the brake disk. See the following sections: • "Replacing the brake disk of BE05-BE32 brakes"
	Voltage drop along supply cable > 10%	Provide correct connection voltage: brake voltage specifications on the nameplate. Check the cross section of the brake supply cable; increase cross section if necessary.
	Inadequate cooling, brake overheats	Provide for cooling air supply or clear cooling air passages, check air filter, clean or replace if necessary. Replace brake rectifier type BG or BMS by type BGE or BME
	Brake coil has interturn short circuit or a short circuit to frame	Check resistors and insulation of the brake coils (see "Resistors" section for resistance values). Replace complete brake and brake control (specialist workshop), Check switchgear, replace if necessary
	Rectifier defective	Replace rectifier and brake coil; it may be more economical to replace the complete brake.
Brake does not brake	Working air gap not correct	Measure and set working air gap. See the following sections: • "Setting the working air gap of brakes BE05-BE32" If the brake disk is too thin, replace the brake disk. See the following sections: • "Replacing the brake disk of BE05-BE32 brakes"
	Brake lining worn	Replace entire brake disk. See the following sections: • "Replacing the brake disk of BE05-BE32 brakes"
	Incorrect braking torque.	Check the project planning and change the braking torque if needed; see chapter "Technical Data" > "Work done, working air gap, braking torques" • by changing the type and number of brake springs. See the following sections: – "Changing the braking torque of brakes BE05-BE32" (page 120) • by selecting a different brake See section "Braking torque assignment"
Brake does not brake	Working air gap so large that setting nuts for the manual release come into contact.	Set the working air gap. See the following sections: • "Setting the working air gap of brakes BE05-BE32"
	Manual brake release device not set correctly	Set the setting nuts for the manual release correctly See the following sections: • "Changing the braking torque of brakes BE05-BE32" (page 120)
	Brake locked by manual brake release HF	Loosen the setscrew, remove if necessary
Brake is applied with time lag	Brake is switched only on AC voltage side	Switch on DC and AC voltage sides; observe wiring diagram

Malfunction	Possible cause	Remedy
Noises in vicinity of brake	Gearing wear on the brake disk or the carrier caused by jolting startup	Check the project planning, replace the brake disk if necessary See the following sections: • "Replacing the brake disk of BE05-BE32 brakes" Have a specialist workshop replace the carrier
	Alternating torques due to incorrectly set frequency inverter	Check correct setting of frequency inverter according to its operating instructions, correct if necessary.

10.3 Malfunctions when operated with a frequency inverter

The symptoms described in chapter "Motor malfunctions" can also occur when the motor is operated with a frequency inverter. Please refer to the frequency inverter operating instructions for the meaning of the problems that occur and to find information about rectifying the problems.

10.4 Disposal

Dispose of the motors in accordance with the material structure and the regulations in force:

- Iron
- Aluminum
- Copper
- Plastic
- Electronic components
- Oil and grease (not mixed with solvents)

10.5 Customer service

Please have the following information to hand if you require the assistance of our customer service:

- Nameplate data (complete)
- Type and extent of the problem
- Time the problem occurred and any accompanying circumstances
- Assumed cause
- Environmental conditions e.g.:
  - Ambient temperature
  - Humidity
  - Installation altitude
  - Dirt
  - etc.

11 Appendix

11.1 Wiring diagrams

INFORMATION

The motor should be connected as shown in the connection wiring diagram or the assignment diagram, which are supplied with the motor. The following chapter only shows a selection of the common types of connections. You can obtain the relevant wiring diagrams free of charge from SEW-EURODRIVE.

11.1.1 Wiring diagram R13 (68001 xx 06)

△ *connection* The following figure shows △ connection for low voltage.

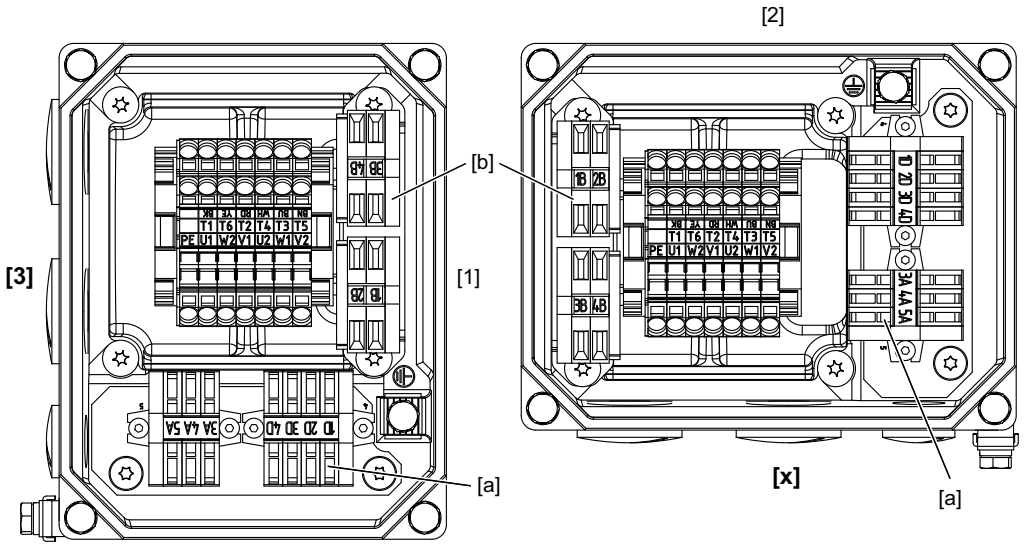
11.3 Terminal strips 1 and 2

The following figure shows the arrangement of the terminal strips for the different terminal box positions.

Terminal box position 1 and 3, here 3[1)] **Terminal box position X and 2, here X[1)]**



9007202526572427

1) If terminal strip 1 does not exist, you can install terminal strip 2 in the position for terminal strip 1 or for the rectifier.

[1]	Terminal box position 1	[X]	Terminal box position X
[2]	Terminal box position 2	[a]	Terminal strip 1 (or rectifier in category 3)
[3]	Terminal box position 3	[b]	Terminal strip 2

The terminals can vary in appearance and design depending on the terminal box variant and the connected options.

INFORMATION

- Remove any cables that are already connected before taking out terminal strip 2.
- The connected cables must be free from bends and twists, etc. when they are connected again.

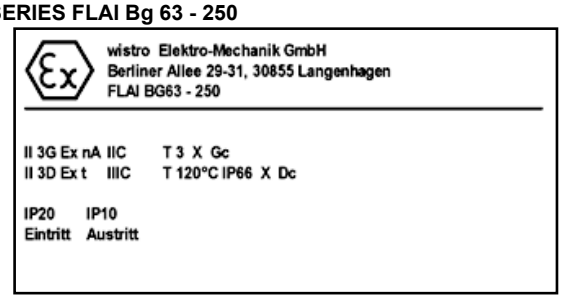
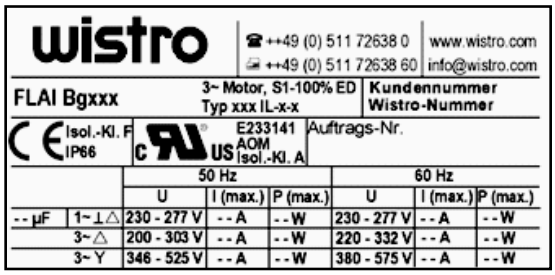
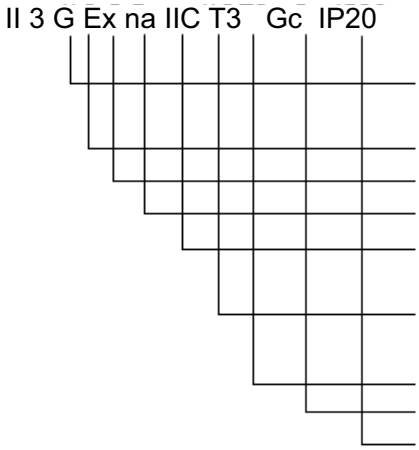
11.5 Operating and maintenance instructions for WISTRO forced cooling fans

Proceed as described in the operating and maintenance instructions for WISTRO forced cooling fans:

OPERATING AND MAINTENANCE INSTRUCTIONS
EXPLOSION-PROOF WISTRO FORCED COOLING FANS for use in potentially explosive dust or gas atmospheres
SERIES FLAI Bg 63 - 250







Units for use in other potentially explosive atmospheres (above ground)

Category 3 for zone 2 and 22
EX atmosphere G: GAS / D: Flammable dust atmosphere
Explosion protection
Protection type nA: Non-sparking equipment; t: Protection through housing

Explosion group IIC: Gases of group IIC; IIIC: Conducting dust

Temperature class/maximum surface temperature T3 = 200 °C
Unit protection level Dc, Gc
The degrees of protection IP20 inlet and IP20 outlet refer to the air inlet and outlet end.

The forced cooling fan is intended for cooling electric motors in potentially explosive atmospheres in zone 2 or 22. The motor that is to be cooled must comply with Directive 94/9/EC. The maximum permitted surface temperature is 120 °C for unit class II 3D and T3 for unit class II 3G. The degree of protection for motor and terminal box is IP66.

The unit is not suitable for installation in atmospheres subject to chemical influences; furthermore, it is not suitable for transporting flammable liquids. The installation must be vibration-free.

X - The ambient temperatures for the individual sizes are listed in appendix 2.
- The maximum surface temperature was measured with a voltage deviation of ±5% according to IEC 60034-1 without safety factor and without dust deposit.

The relevant safety regulations regarding the protection against contact with moving parts (DIN EN ISO 13857) are fulfilled.

Before installation, make sure that the fan wheel is running smoothly and that the blades of the fan wheel are not deformed or bent. This could create unbalances that have a negative effect on the service life. The degree of protection IP10 on the air outlet end must be ensured by the operator on site according to IEC 60034-5.

The installation of the unit must be carried out by qualified personnel while there is no potentially explosive atmosphere and checked and documented by an authorized person.

The electrical connection depends on the operating mode (single phase or three phase) according to the wiring diagram (see appendix). The wiring diagram is also stamped or attached to the terminal box cover. The provisions of EN 60079-14 must be observed for the connection.

The inner connections are established via terminal screws (tightening torque 1.2 + 1.5 Nm). The cables that are connected must be equipped with insulated cable lugs or insulated ring terminals.

The installed screw plug (M16x1.5 thread) is only intended for transport purposes. During normal operation, it must be replaced with cable glands or closing plugs that are approved for use in potentially explosive atmospheres with gases, vapors, mists with minimum protection type "n" and for use in potentially explosive atmospheres with flammable dusts with protection type "t" (protection through housing). The cable glands and closing plugs must also comply with the standards listed on the first page and provide at least IP66. Furthermore, the cable glands or closing plugs must be suited for the respective ambient temperatures. The cable glands must be appropriate for the cable cross section.

The unit must be grounded via the ground connection in the housing.

The max. permitted currents are listed in the table "Voltage operating range – IL series " (see appendix).

After the electrical connections have been established, the terminal box cover must be attached with the screws with a tightening torque of 5.5-6 Nm.

After installation and during startup, a test run must be performed. When this is done, make sure that the direction of rotation of the fan wheel corresponds to the direction arrow on the inside surface of the ventilation grid so that air is blown over the motor that is to be cooled.

Important: If the direction of rotation is incorrect, the cooling performance is considerably lower. There is a risk that the machine part which is to be cooled will overheat.

During operation, make sure that excessive dust does not accumulate on the fan blades, especially in dusty environments, as this generates imbalances that reduce the service life and friction that could cause an ignition. This also applies to environments containing small particles, e.g. in the wood processing industry or coal mills. A canopy is recommended for these or similar applications.

A canopy can easily be retrofitted by loosening the four flange bolts (Instar bolts), inserting the angle brackets, and retightening the screws.

WISTRO units are normally ready for installation when supplied. The bearings are designed to be maintenance-free for a service life of 40,000 operating hours.

The forced cooling fan must be replaced by a new unit after a longer operating period.

Repairs or modifications of the unit must only be carried out after consultation with WISTRO.
