Fieldbus Appendix Anybus-M EtherNet/IP

ABM-EIP - EtherNet/IP Scanner & IT Functionality

Doc.ld. HMSI-168-21 Rev. 1.2

HALMSTAD · CHICAGO · KARLSRUHE · TOKYO · BEIJING · MILANO · MULHOUSE · COVENTRY · PUNE · COPENHAGEN

Important User Information

This document is intended to provide a good understanding of the functionality offered by Anybus-M EtherNet/IP. The document only describes the features that are specific to the Anybus-M EtherNet/IP. For general information regarding the Anybus-M, consult the Anybus-S/M Parallel Design Guide.

Please consult the general Anybus-S Parallel Design Guide for further information about the Anybus-S platform.

The reader of this document is expected to be familiar with high level software design, and communication systems in general. The use of advanced EtherNet/IP-specific functionality may require in-depth knowledge in EtherNet/IP networking internals and/or information from the official EtherNet/IP specifications. In such cases, the people responsible for the implementation of this product should either obtain the EtherNet/IP specification to gain sufficient knowledge or limit their implementation in such a way that this is not necessary.

Liability

Every care has been taken in the preparation of this manual. Please inform HMS Industrial Networks AB of any inaccuracies or omissions. The data and illustrations found in this document are not binding. We, HMS Industrial Networks AB, reserve the right to modify our products in line with our policy of continuous product development. The information in this document is subject to change without notice and should not be considered as a commitment by HMS Industrial Networks AB. HMS Industrial Networks AB assumes no responsibility for any errors that may appear in this document.

There are many applications of this product. Those responsible for the use of this device must ensure that all the necessary steps have been taken to verify that the applications meet all performance and safety requirements including any applicable laws, regulations, codes, and standards.

HMS Industrial Networks AB will under no circumstances assume liability or responsibility for any problems that may arise as a result from the use of undocumented features, timing, or functional side effects found outside the documented scope of this product. The effects caused by any direct or indirect use of such aspects of the product are undefined, and may include e.g. compatibility issues and stability issues.

The examples and illustrations in this document are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular implementation, HMS Industrial Networks AB cannot assume responsibility for actual use based on these examples and illustrations.

Intellectual Property Rights

HMS Industrial Networks AB has intellectual property rights relating to technology embodied in the product described in this document. These intellectual property rights may include patents and pending patent applications in the US and other countries.

Trademark Acknowledgements

Anybus ® is a registered trademark of HMS Industrial Networks AB. All other trademarks are the property of their respective holders.

Warning: This is a class A product. in a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

ESD Note: This product contains ESD (Electrostatic Discharge) sensitive parts that may be damaged if ESD control procedures are not followed. Static control precautions are required when handling the prod-

uct. Failure to observe this may cause damage to the product.

P.3 Conventions & Terminology

The following conventions are used throughout this manual:

- Numbered lists provide sequential steps
- Bulleted lists provide information, not procedural steps
- The terms 'Anybus' or 'module' refers to the Anybus-CompactCom module.
- The terms 'host' or 'host application' refers to the device that hosts the Anybus module.
- · Hexadecimal values are written in the format NNNNh, where NNNN is the hexadecimal value.

Anybus-M EtherNet/IP
Doc.Rev. 1.2
Doc.Id. HMSI-168-21

Doc.ld. HMSI-168-21

P.4 Sales and Support

Please contact the sales and support pages at www.anybus.com.

1. About the Anybus-M EtherNet/IP

The Anybus-M EtherNet/IP provides full EtherNet/IP scanner functionality via the patented Anybus-S application interface. Any device that supports this standard can take advantage of the features offered by the module, providing seamless network integration regardless of network type.

This product conforms to all aspects of the application interface defined in the Anybus-S Parallel Design Guide, making it fully interchangeable with any other device following that specification.

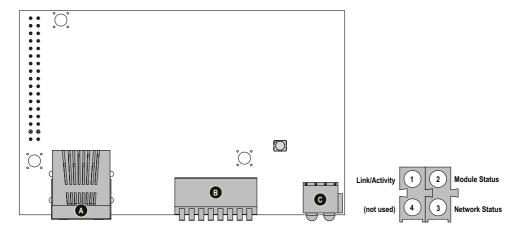

1.1 Features

- · Supports shielded (FTP) and unshielded (UTP) cables
- EtherNet/IP scanner
- Exchanges data with up to 64 slaves
- · Identity customization
- · Built in file system with volatile and non-volatile storage locations
- FTP server
- Web server
- · SMTP client
- Server Side Include (SSI) capability

1.2 Fieldbus Conformance Notes

- This product is pre-certified for network compliance. While this is done to ensure that the final product can be certified, it does not necessarily mean that the final product will not require recertification. Contact HMS for further information.
- Each device on EtherNet/IP is associated with an Electronic Data Sheet (a.k.a .EDS-file), which holds a description of the device and its functions. HMS supplies a generic .EDS-file which can serve as a basis for new implementations; note however that this file must be altered to match the end product (i.e. vendor and identity settings etc.).
- In order to pass conformance tests, the module should not be initiated to an IO data size larger than 500 bytes in each direction.
- In order to pass conformance tests, the mailbox EXACT_IO_MATCH must be sent during initialization, see "Enable Exact IO Match (EXACT_IO_MATCH)" on page 128.

1.3 Overview

| # | Description | |
|---|--------------------|--|
| Α | Ethernet Connector | For more information, see "Connectors" on page 148 |
| В | Switches | IP configuration switches, see "TCP/IP Settings" on page 10 |
| С | Status Indicators | These LEDs indicate run time status and errors to the user, see below. |

Status Indicators

| # | Indication | State | Description |
|---|----------------|-----------------------|--|
| 1 | Link/Activity | Green | Link established |
| | | Green, flashing | Activity; receiving/transmitting data |
| | | Off | No link or power off |
| 2 | Module Status | Green | Device operational - Module is operating correctly in Run-state |
| | | Green, flashing | Standby - Module has not been configured - Scanner in Idle-state |
| | | Red | Major fault - Major unrecoverable fault |
| | | Red, flashing | Minor fault - Minor recoverable fault (originated on timeout) - An originated connection could not be opened |
| | | Alternating Red/Green | Self test - Module is performing power up test procedures |
| | | Off | No power |
| 3 | Network Status | Green | Connected - The module has at least one established EtherNet/IP connection (target or originated) |
| | | Green, flashing | No connections - There are no EtherNet/IP connections established to the module (Class 1 or Class 3, target or originated) |
| | | Red | Duplicate IP - Configured IP address already in use |
| | | Red, flashing | Connection timeout One or several EtherNet/IP <u>target</u> connections have timed out The module can only leave this state if all timed-out target connections are re-established, or if the module is reset. |
| | | Off | No power or no IP address |
| 4 | - | - | - |

Anybus-M EtherNet/IP Doc.Rev. 1.2

2. Basic Operation

2.1 Data Exchange

Parameter Data Areas (Explicit Data)

By default, the Parameter Data portions of the Anybus Input- and Output areas cannot be accessed via EtherNet/IP. Using the mailbox commands PARAMETER_IN_MAP and PARAMETER_OUT_M-AP, it is however possible to map blocks of Parameter Data to the Parameter Data Input- and Output Mapping Objects.

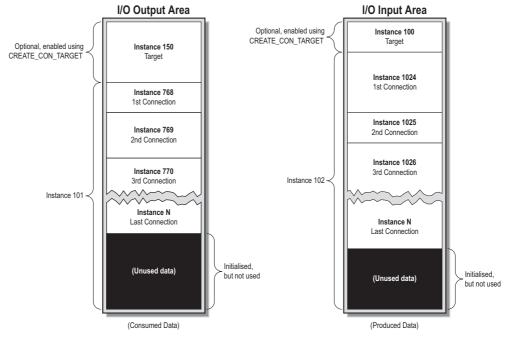

See also...

- "Parameter Data Input Mapping (PARAMETER_IN_MAP)" on page 114
- "Parameter Data Out Area Mapping (PARAMETER_OUT_MAP)" on page 116
- "Parameter Data Input Mapping Object, Class B0h" on page 44
- "Parameter Data Output Mapping Object, Class B1h" on page 45

I/O Data Areas

The Anybus-M EtherNet/IP can exchange I/O data with up to 64 slaves. Additionally, it is possible to allocate a block of I/O data for the scanner itself by issuing the mailbox command CRE-ATE_CON_TARGET, or by setting up a target connection in the scanner configuration, see "Connection Configuration Object, Class F3h" on page 46.

Each connection is represented as two instances in the Assembly Object, which in turn are mapped to the I/O Data portion of the Anybus Input- and Output areas as depicted in the example below. The connections are mapped in the order of their instance number.

See also...

- "Create Connection Target Area (CREATE_CON_TARGET)" on page 132
- "Assembly Object, Class 04h" on page 38
- "Connection Configuration Object, Class F3h" on page 46

2.2 File System

General

The module features a built in file system, which is used to store information such as web files, network communication settings, email messages etc.

The filesystem can be accessed using FTP, HTTP, and by the application via the mailbox interface.

Storage Areas

The filesystem consists of the different storage locations, a.k.a.'Discs':

Disc 0 (1856 kByte, Non Volatile)

This section is intended for static files such as web files etc. Once the product is released, this section can be locked so that it cannot be altered by the end user.

Disc 1 (192 kByte, Non Volatile)

This section is intended for configuration files etc. which can be altered by the end user.

Disc 2 (1024 kByte, Volatile)

This section is intended for temporary storage. Any data placed here will be lost in case of power loss or reset.

Conventions

- '\' (backslash) is used as a path separator
- A 'path' originates from the system root and as such must begin with a '\'
- A 'path' must not end with a '\'
- Names may contain spaces (' ') but must not begin or end with one.
- Names must not contain one of the following characters: $' \ / : * ? " < > |'$
- Names cannot be longer than 48 characters (plus null termination)
- A path cannot be longer than 256 characters (filename included)
- The maximum number of simultaneously open files is 40
- The maximum number of simultaneously open directories is 40

Important Note:

The non-volatile storage is located in FLASH memory. Each FLASH segment can only be erased approximately 100000 times due to the nature of this type of memory.

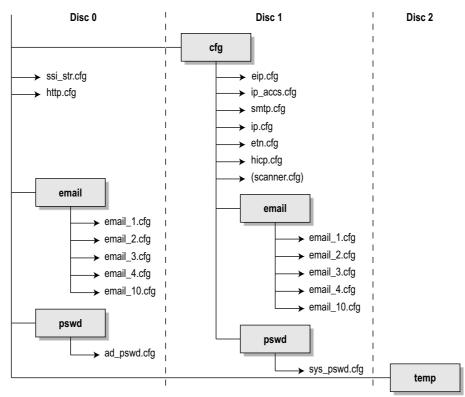

The following operations will erase one or more FLASH segments:

- Deleting, moving or renaming a file or directory
- Writing or appending data to an existing file
- Formatting the filesystem
- Saving scanner configuration

Anybus-M EtherNet/IP

Doc.ld. HMSI-168-21

2.2.1 Filesystem Overview

2.2.2 System Files

The filesystem contains a set of files used for system configuration. These files, known as "system files", are regular ASCII files which can be altered using a standard text editor (such as the Notepad in Microsoft WindowsTM). Note that some of these files may also be altered by the module itself, e.g. when using SSI (see "Server Side Include (SSI)" on page 20).

The format of the system files are based on the concept of 'keys', where each 'key' can be assigned a value, see example below.

```
Example:

[Key1]

value of key1

[Key2]

value of key2
```

Some configuration files can be redirected by placing a file path destination in the file. These are ssi_str.cfg, http.cfg, ip_accs.dfg, smtp.cfg, ip.cfg, etn.cfg, eip.cfg and hicp.cfg.

```
Example:
   [file path]
   \dest\for\content.cfg
```

The exact format of each system file is described in detail later in this document.

Important Note: Contrary to what is state above, the file '\cfg\scanner.cfg' holds the scanner configuration in binary format. This file is created automatically by the module and must not be altered manually.

2.3 Network Reset Handling

The Identity object provides a reset service. By default, incoming reset requests are handled as follows:

• Reset Type 0: 'Power Cycling Reset'

Module is restarted.

• Reset Type 1: 'Out of Box Reset'

The contents of '\cfg\' is erased, and the module is restarted.

Optionally, the module can forward reset requests to the application. To accomplish this, use the following settings in ANYBUS_INIT:

- Set the RDR-bit (bit 4) in the 'Operation Mode'-word
- Set the RST-bit (bit 3) in the 'Event Notification Config.'-word

This will cause the module to generate an Event Notification (which depending on the implementation may or may not trigger an interrupt) each time a network-reset is received. The application can then retrieve the reset-type using GET_ID_RESET_PARAM and perform the desired actions (e.g. erase the '\cfg\' directory and internal configuration settings + reset itself and the Anybus module).

See also...

- "Identity Object, Class 01h" on page 37
- "Enable Exact IO Match (EXACT_IO_MATCH)" on page 128

2.4 DNS Functionality

General

DNS is a service which translates hostnames into IP addresses. To achieve this, the Anybus module asks a DNS server for the IP address of a specified host. If the hostname isn't recognized by the server, it will forward the request to another DNS server until the corresponding address is found.

The Anybus will use this functionality each time a hostname is used instead of an IP address.

Host / Domain Names Conventions

Prior to issuing a DNS request, the Anybus module will process the specified hostname as follows:

- If the hostname does not contain a dot, the Anybus will append the default domain.
- If the hostname ends with a dot, that dot will automatically be removed.
- If the hostname contains a dot but isn't ending with one, the Anybus will issue a DNS request. If this request fails, the Anybus will append the default domain name and retry.

Examples:

(In the examples below, the default domain is 'hms.com')

- 'test' becomes 'test.hms.com'
- 'test.hms.com.' becomes 'test.hms.com'
- 'test.a' will if not found become 'test.a.hms.com'

Anybus-M EtherNet/IP Doc.Rev. 1.2

3. Network Configuration

3.1 TCP/IP Settings

To be able to participate on the network, the module needs a valid TCP/IP configuration. These settings are stored in the system file '\cfg\ip.cfg'.

File Format: [IP address] xxx.xxx.xxx IP address [Subnet mask] xxx.xxx.xxx Subnet mask [Gateway address] xxx.xxx.xxxGateway address [DHCP] DHCP/BootP ON or OFF ON - Enabled [DNS1 address] OFF - Disabled xxx.xxx.xxx Primary and Secondary DNS [DNS2 address] xxx.xxx.xxx.xxx Default domain name for not fully qualified host names [Domain name] Host name of the module domain [Host name] anybus

The settings in this file may also be affected by...

- Mailbox Commands (See "General Configuration Commands" on page 56)
- EtherNet/IP (See "TCP/IP Interface Object, Class F5h" on page 50)
- DHCP/BootP (See "DHCP/BootP" on page 11)
- HICP (See "HICP (Anybus IPconfig)" on page 11)
- SSI (See "Server Side Include (SSI)" on page 20)
- Switches (See below)

If the on-board switches are set to 0 (zero), the module will only use the settings stored in '\cfg\ip.cfg'. If not, the switch setting overrides certain settings in this file as follows:

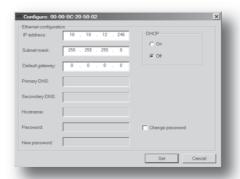

| SW1 | SW2 | SW3 | SW4 | SW5 | SW6 | SW7 | SW8 | DHCP | Subnet | Gateway | IP |
|-----|-----|-----|-----|-----|-----|-----|-----|----------|---------------|------------------|---------------|
| OFF | | Determined | by '\cfg\ip.cfg' | |
| OFF | ON | Disabled | 255.255.255.0 | 192.168.0.255 | 192.168.0.1 |
| OFF | OFF | OFF | OFF | OFF | OFF | ON | OFF | Disabled | 255.255.255.0 | 192.168.0.255 | 192.168.0.2 |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| ON | ON | ON | ON | ON | ON | OFF | ON | Disabled | 255.255.255.0 | 192.168.0.255 | 192.168.0.253 |
| ON | OFF | Disabled | 255.255.255.0 | 192.168.0.255 | 192.168.0.254 |
| ON | | (invali | d setting) | |

Note: The switches are read during startup; any changes require a reset in order to have effect.

3.2 HICP (Anybus IPconfig)

The module supports the HICP protocol used by the Anybus IPconfig utility, which can be downloaded free of charge from the HMS website. This utility may be used to access the network settings of any Anybus product connected to the network via UDP port 3250.

Upon starting the program, the network is scanned for Anybus products. The network can be rescanned at any time by clicking 'Scan'. In the list of detected devices, the module will appear as 'ABM-EIP'.

To alter the network settings of the module, doubleclick on its entry in the list. A window will appear, containing the settings for the module.

Validate the new settings by clicking 'Set'. The new IP configuration will be stored in '\cfg\ip.cfg'.

Optionally, the configuration can be protected from unauthorized access by a password. To enter a password, click on the 'Change password' checkbox, and enter the password under 'New password'.

The password is stored in the system file '\cfg\hicp.cfg'.

File Format: [Password] <password>

Note: This feature cannot be used to alter the network settings if the mailbox command SET_IP_-CONFIG has been issued (see "Set IP Configuration (SET_IP_CONFIG)" on page 57).

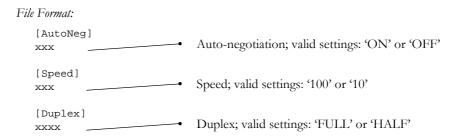

3.3 DHCP/BootP

The module can retrieve the TCP/IP settings from a DHCP or BootP server. If no DHCP server is found, the module will fall back on it's current settings (i.e. the settings currently stored in '\cfg\ip.cfg').

If no current settings are available (i.e. set to 0), the module will halt and indicate an error on the onboard status LEDs (the network configuration can however still be accessed via HICP, see "HICP (Anybus IPconfig)" on page 11.

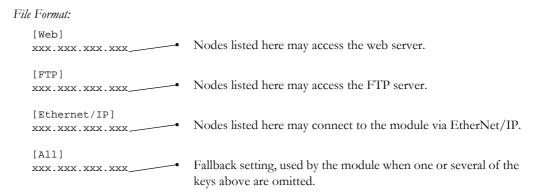

3.4 Speed and Duplex

The module supports 10 or 100Mbit operation in full or half duplex. These settings are stored in the system file 'cfg\etn.cfg'. The settings can also be altered via the Ethernet Link Object, see "Ethernet Link Object, Class F6h" on page 53.

3.5 IP Access Control

It is possible to specify which IP addresses that are permitted to connect to the module. This information is stored in the system file '\cfg\ip_accs.cfg'.

Note: '*' may be used as a wildcard to select IP series.

4. FTP Server

4.1 General

The module features a built in FTP server, which can be used to upload/download files to the filesystem using a standard FTP client.

The FTP server can be disabled using the mailbox command DISABLE_FTP_SERVER, see "Disable FTP server (DISABLE_FTP_SERVER)" on page 66.

The following port numbers are used by the FTP server:

- TCP, port 20 (FTP data port)
- TCP, port 21 (FTP command port)

The FTP server can handle a maximum of 16 simultaneous connections.

Security Levels

The FTP-server features two security levels; admin and normal. Security is set at a per-user basis, or globally using the mailbox command GLOBAL_ADMIN_MODE (see "Global Admin Mode (GLOBAL_ADMIN_MODE)" on page 67).

· Normal level

The root directory will be '\cfg'.

• Admin level (User or global)

The root directory will be '\', i.e. the user has unrestricted access to the file system. If the mailbox command GLOBAL_ADMIN_MODE (see "Global Admin Mode (GLOBAL_ADMIN_MODE)" on page 67) is issued during startup, the module will run in global admin mode, causing the FTP-server to accept any username/password combination. Connecting to the module when running in global admin mode provides unrestricted access to the filesystem.

User Accounts

The user accounts are stored in two files, which are protected from web access:

'\cfg\pswd\sys_pswd.cfg'

This file holds the user accounts for normal-level users.

'\pswd\ad_pswd.cfg'

This file holds the user accounts for admin-level users.

File Format:

The format of these files are as follows:

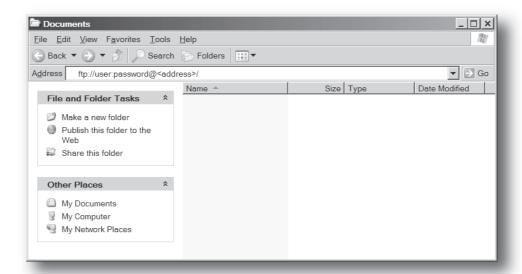

Username1:Password1 Username2:Password2 Username3:Password3

Note: If no valid user accounts has been defined, the module will fall back to global admin mode.

FTP Connection Example (Windows Explorer)

The built in FTP client in Windows Explorer can easily be used to access the filesystem as follows:

- 1. Open the Windows Explorer by right-clicking on the 'Start' button and selecting 'Explore'.
- 2. In the address field, type FTP://<user>:<password>@<address>
 - Substitute <address> with the IP address of the module
 - Substitute <user> with the username
 - Substitute <password> with the password
- **3.** Press enter. The Explorer will now attempt to connect to the module using the specified settings. If successful, the filesystem of the module is displayed in the Explorer window.

5. Web Server

5.1 General

The Anybus module features a flexible web server with SSI capabilities. The built in web pages can be customized to fit a particular application and allow access to I/O data and configuration settings.

The web server communicates through port 80 and can handle a maximum of 48 simultaneous connections.

See also...

• "Disable Web Server (DISABLE_WEB_SERVER)" on page 64

Protected Files

For security reasons, the following files are protected from web access:

- Files located in '\cfg\pswd'
- Files located in '\pswd'
- Files located in a directory which contains a file named 'web_accs.cfg'

Default Web Pages

The Anybus module contains a set of virtual files that can be used when building a web page for configuration of network parameters. These virtual files can be overwritten (not erased) by placing files with the same name in the root of disc 0.

This makes it possible to, for example, replace the HMS logo by uploading a new logo named '\logo.jpg'. It is also possible to make links from a web page to the virtual configuration page. In that case the link shall point to '\config.htm'.

These virtual files are:

\index.htm - Points to the contents of config.htm - Configuration frame page \config.htm \configform.htm \configform2.htm - Configuration form page - Configuration form page \store.htm - Configuration store page \logo.jpg - HMS logo - Configuration picture - picture - picture - Points to the contents of config.htm - Configuration frame page \eth_stat.html \cip_stat.html - Configuration form page \ip_config.shtm - Configuration form page \smtp_config.shtm - Configuration store page \style.css - HMS logo \arrow_red.gif - Configuration picture

5.2 Authorization

Directories can be protected from web access by placing a file called 'web_accs.cfg' in the directory to protect. This file shall contain a list of users that are allowed to access the directory and its subdirectories.

Username1: Password1 Username2: Password2 ... UsernameN: PasswordN Optionally, a login message can be specified by including the key [AuthName]. This message will be displayed by the web browser upon accessing the protected directory.

The list of approved users can optionally be redirected to one or several other files.

Example:

In this example, the list of approved users will be loaded from the files 'here.cfg' and 'too.cfg'.

```
[File path]
\i\put\it\over\here.cfg
\i\actually\put\some\of\it\over\here\too.cfg
[AuthName]
Yeah. Whatsda passwoid?
```

Note that when using this feature, make sure to put the user/password files in a directory that is protected from web access, see "Protected Files" on page 15.

5.3 Content Types

By default, the following content types are recognized by their file extension:

| Content Type | File Extension |
|--------------------------------|--------------------------------------|
| text/html | *.htm, *.html, *.shtm |
| image/gif | *.gif |
| image/jpeg | *.jpeg, *.jpg, *.jpe |
| image/x-png | *.png |
| application/x-javascript | *.js |
| text/plain | *.bat, *.txt, *.c, *.h, *.cpp, *.hpp |
| application/x-zip-compressed | *.zip |
| application/octet-stream | *.exe, *.com |
| text/vnd.wap.wml | *.wml |
| application/vnd.wap.wmlc | *.wmlc |
| image/vnd.wap.wbmp | *.wbmp |
| text/vnd.wap.wmlscript | *.wmls |
| application/vnd.wap.wmlscriptc | *.wmlsc |
| text/xml | *.xml |
| application/pdf | *.pdf |

It is possible to configure/reconfigure the reported content types, and which files that shall be scanned for SSI. This is done in the system file '\http.cfg'.

```
File Format:

[FileTypes]
FileType1:ContentType1
FileType2:ContentType2
...
FileTypeN:ContentTypeN

[SSIFileTypes]
FileType1
FileType2
...
FileTypeN
```

Note: Up to 50 content types and 50 SSI file types may be specified in this file.

6. SMTP Client

6.1 General

The built in email client can send predefined email messages based on trigger-events in the dual port memory (DPRAM). The application can also use the client directly via the mailbox interface.

The client supports SSI, however note that some SSI functions cannot be used in email messages (specified separately for each SSI function).

See also...

- "Server Side Include (SSI)" on page 20
- "Send Email (SEND_EMAIL)" on page 139

Server Settings

The module needs a valid SMTP server configuration in order to be able to send email messages. These settings are stored in the system file '\cfg\smtp.cfg'.

File Format: [SMTP address] xxx.xxx.xxx.xxx Outgoing email server address [SMTP username] user SMTP server login. Optional. [SMTP password] password

See also...

- "Set SMTP Configuration (SET_SMTP_CONFIG)" on page 62
- "Get SMTP Configuration (GET_SMTP_CONFIG)" on page 63"Send Email (SEND_E-MAIL)" on page 139

Event-Triggered Messages

As mentioned previously, the email client can send predefined message based on events in the DPRAM. In operation, this works as follows:

- 1. The trigger source is fetched from the dual port memory
- 2. A logical AND is performed between the trigger source and a mask value
- 3. The result is compared to a reference value according to a specified operand
- **4.** If the end result is true, the email is sent to the specified recipient(s).

Which events that shall cause a particular message to be sent, is specified separately for each message. For more information, see "Email Definitions" on page 19.

Note that the DPRAM is scanned once every 0.5 second, i.e. a trigger-event must be present longer than 0.5 seconds to ensure that it is detected by the Anybus module.

6.2 Email Definitions

The email definitions are stored in the following two directories:

• '\cfg\email'

This directory holds up to 10 messages which can be altered by normal-level FTP-users.

• '\email'

This directory holds up to 10 messages which can be altered by admin-level FTP-users.

Email definition files must be named 'email_1.cfg', 'email_2.cfg'... 'email_10.cfg' in order to be properly recognized by the module.

```
File Format:

[Register]
Area, Offset, Type

[Register Match]
Value, Mask, Operand

[To]
recipient

[From]
sender

[Subject]
subject line

[Headers]
Optional extra headers

[Message]
message body
```

| Key | Value Scani | | | |
|---------|--|----|--|--|
| Area | Source area in DPRAM. Possible values are 'IN' or 'OUT' | No | | |
| Offset | Source offset, written in decimal or hexadecimal. | | | |
| Туре | Source data type. Possible values are 'byte', 'word', and 'long' | | | |
| Value | Used as a reference value for comparison. | | | |
| Mask | Mask value, applied on the trigger source prior to comparison (logical AND). | | | |
| Operand | Possible values are '<', '=' or '>' | | | |
| То | Email recipient Yes | | | |
| From | Sender email address | | | |
| Subject | Email subject. One line only. | | | |
| Headers | Optional; may be used to provide additional headers. | | | |
| Message | The actual message. | | | |

Note: Hexadecimal values must be written with the prefix '0x' in order to be recognized by the module.

7. Server Side Include (SSI)

7.1 General

Server Side Include (from now on referred to as SSI) functionality enables dynamic content to be used on web pages and in email messages.

SSI are special commands embedded in the source document. When the Anybus module encounters such a command, it will execute it, and replace it with the result (when applicable).

Syntax

The 'X's below represents a command opcode and parameters associated with the command.

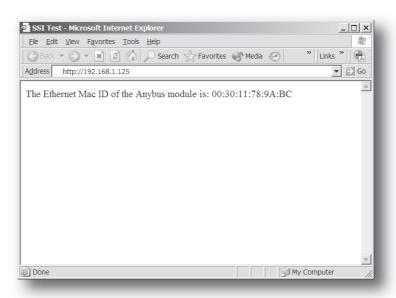

```
<?--#exec cmd_argument='XXXXXXXXXXXXXXXXXXXXXXX'-->
```

Example

The following example causes a web page to display the Ethernet Mac ID of the module:

```
<hr/>
<HTML>
<HEAD><TITLE>SSI Test</TITLE></HEAD>
<BODY>
The Ethernet Mac ID of the Anybus module is:
<?--#exec cmd_argument='DisplayMacID'-->
</BODY>
</HTML>
```

Resulting web page:

7.2 Functions

DisplayMacID

This function returns the MAC ID in format xx:xx:xx:xx:xx.

```
Syntax:
   <?--#exec cmd_argument='DisplayMacId'-->
```

DisplaySerial

This function returns the serial number of the Anybus module.

```
Syntax:
   <?--#exec cmd_argument='DisplaySerial'-->
```

DisplayFWVersion

This function returns the main firmware revision of the Anybus module.

```
Syntax:
   <?--#exec cmd_argument='DisplayFWVersion'-->
```

DisplayBLVersion

This function returns the bootloader firmware revision of the Anybus module.

```
Syntax:
   <?--#exec cmd_argument='DisplayBLVersion'-->
```

DisplayIP

This function returns the currently used IP address.

```
Syntax:
   <?--#exec cmd_argument='DisplayIP'-->
```

DisplaySubnet

This function returns the currently used Subnet mask.

```
Syntax:
   <?--#exec cmd_argument='DisplaySubnet'-->
```

DisplayGateway

This function returns the currently used Gateway address.

```
Syntax:
   <?--#exec cmd_argument='DisplayGateway'-->
```

DisplayDhcpState

This function returns whether DHCP/BootP is enabled or disabled.

```
<?--#exec cmd_argument='DisplayDhcpState( "Output when ON", "Output when OFF"
```

StoreIPConfig

Note: This function cannot be used in email messages.

This SSI function stores a passed IP configuration in the configuration file 'IP.cfg'.

```
Syntax:
   <?--#exec cmd_argument='StoreIPConfig'-->
   Include this line in a HTML page and pass a form with new IP settings to it.
Accepted fields in form:
   SetIp
   SetSubnet
   SetGateway
   SetDhcpState - value "on" or "off"
   SetDNS1
   SetDNS2
   Set.Host.Name
   SetDomainName
Default output:
   Invalid IP address!
   Invalid Subnet mask!
   Invalid Gateway address!
   Invalid IP address or Subnet mask!
```

GetText

Note: This function cannot be used in email messages.

Configuration stored correctly. Failed to store configuration.

Invalid DHCP state! Invalid DNS1! Invalid DNS2!

This SSI function gets the text from an object and stores it in the OUT area.

```
Syntax:
   <?--#exec cmd_argument='GetText( "ObjName", OutWriteString ( offset ), n )'-->
   ObjName- Name of object.
   offset - Specifies the offset from the beginning of the OUT area.
         - Specifies maximum number of characters to read (Optional)
Default output:
   Success
                                     - Write succeeded
                                    - Write failed
   Failure
```

printf

This SSI function includes a formatted string, which may contain data from the Anybus IN/OUT area, on a web page. The formatting of the string is equal to the standard C function printf().

```
Syntax:
   <?--#exec cmd_argument='printf("String to write", Arg1, Arg2, ..., ArgN)'-->
```

Like the standard C function printf() the "String to write" for this SSI function contains two types of objects: Ordinary characters, which are copied to the output stream, and conversion specifications, each of which causes conversion and printing of the next successive argument to printf. Each conversion specification begins with the character % and ends with a conversion character. Between the % and the conversion character there may be, in order:

- Flags (in any order), which modify the specification:
 - which specifies left adjustment of the converted argument in its field.
 - +which specifies that the number will always be printed with a sign

(space) if the first character is not a sign, a space will be prefixed.

- 0 for numeric conversions, specifies padding to the field with leading zeroes.
- which specifies an alternate output form. For o, the first digit will be zero. For x or X, 0x or 0X will be prefixed to a non-zero result. For e, E,f, g and G, the output will always have a decimal point; for g and G, trailing zeros will not be removed.
- A number specifying a minimum field width. The converted argument will be printed in a field at least this wide, and wider if necessary. If the converted argument has fewer characters than the field width it will be padded on the left (or right, if left adjustment has been requested) to make up the field width. The padding character is normally space, but can be 0 if the zero padding flag is present.
- A period, which separates the field width from the precision.
- A number, the precision, that specifies the maximum number of characters to be printed from a string, or the number of digits to be printed after the decimal point for e, E, or F conversions, or the number of significant digits for g or G conversion, or the minimum number of digits to be printed for an integer (leading 0s will be added to make up the necessary width)
- A length modifier h, l (letter ell), or L. "h" Indicates that the corresponding argument is to be printed as a short or unsigned short; "I" indicates that the argument is along or unsigned long.

The conversion characters and their meanings are shown below. If the character after the % is not a conversion character, the behaviour is undefined.

| Character | Argument type, Converted to |
|-----------|--|
| d, i | byte, short; decimal notation (For signed representation. Use signed argument) |
| 0 | byte, short; octal notation (without a leading zero). |
| x, X | byte, short; hexadecimal notation (without a leading 0x or 0X), using abcdef for 0x or ABCDEF for 0X. |
| u | byte, short; decimal notation. |
| С | byte, short;single character, after conversion to unsigned char. |
| S | char*; characters from the string are printed until a "\0" is reached or until the number of characters indicated by the precision have been printed |
| f | float; decimal notation of the form [-]mmm.ddd, where the number of d's is specified by the precision. The default precision is 6; a precision of 0 suppresses the decimal point. |
| e, E | float; decimal notation of the form [-]m.dddddd e+-xx or[-]m.ddddddE+-xx, where the number of d's specified by the precision. The default precision is 6; a precision of 0 suppresses the decimal point. |
| g, G | float; %e or %E is used if the exponent is less than -4 or greater than or equal to the precision; otherwise %f is used. Trailing zeros and trailing decimal point are not printed. |
| % | no argument is converted; print a % |

The arguments that can be passed to the SSI function printf are:

| Argument | Description |
|---------------------------------|--|
| InReadSByte(offset) | Read a signed byte from position offset in the IN area |
| InReadUByte(offset) | Read an unsigned byte from position offset in the IN area |
| InReadSWord(offset) | Read a signed word from position offset in the IN area |
| InReadUWord(offset) | Read an unsigned word from position offset in the IN area |
| InReadSLong(offset) | Read a signed longword from position offset in the IN area |
| InReadULong(offset) | Read an unsigned longword from position offset in the IN area |
| InReadString(offset) | Read a string (char*) from position offset in the IN area |
| InReadFloat(offset) | Read a floating point (float) value from position offset in the IN area |
| OutReadSByte(offset) | Read a signed byte from position offset in the OUT area |
| OutReadUByte(offset) | Read an unsigned byte from position offset in the OUT area |
| OutReadSWord(offset) | Read a signed word (short) from position offset in the OUT area |
| OutReadUWord(offset) | Read an unsigned word (short) from position offset in the OUT area |
| OutReadSLong(offset) | Read a signed longword (long) from position offset in the OUT area |
| OutReadULong(offset) | Read an unsigned longword (long) from position offset in the OUT area |
| OutReadString(offset) | Read a null-terminated string from position offset in the OUT area |
| OutReadFloat(offset) | Read a floating point (float) value from position offset in the OUT area |
| MbReadSByte(id) | Read a signed byte (short) from the application via the mailbox interface |
| MbReadUByte(id) | Read an unsigned byte (short) from the application via the mailbox interface |
| MbReadSWord(id) | Read a signed word from the application via the mailbox interface |
| MbReadUWord(id) | Read an unsigned word from the application via the mailbox interface |
| MbReadSLong(id) | Read a signed longword from the application via the mailbox interface |
| MbReadULong(id) | Read an unsigned longword from the application via the mailbox interface |
| MbReadString(id) | Read a null-terminated string from the application via the mailbox interface |
| MbReadFloat(id) | Read a floating point (float) value from the application via the mailbox interface |
| CipReadSByte(class, inst, attr) | Read a signed byte from a CIP-object |
| CipReadUByte(class, inst, attr) | Read an unsigned byte from a CIP-object |
| CipReadSWord(class, inst, attr) | Read a signed word from a CIP-object |

| Argument | Description |
|---------------------------------------|---|
| CipReadUWord(class, inst, attr) | Read an unsigned word from a CIP-object |
| CipReadSLong(class, inst, attr) | Read a signed longword from a CIP-object |
| CipReadULong(class, inst, attr) | Read an unsigned longword from a CIP-object |
| CipReadFloat(class, inst, attr) | Read a floating point value from a CIP-object |
| CipReadShortString(class, inst, attr) | Read a short string from a CIP-object |
| CipReadString(class, inst, attr) | Read a null-terminated string from a CIP-object |
| CipReadUByteArray(class, inst, attr) | Read an unsigned byte-array from a CIP-object |
| CipReadUWordArray(class, inst, attr) | Read an unsigned word-array from a CIP-object |
| CipReadULongArray(class, inst, attr) | Read an unsigned longword-array from a CIP-object |

scanf

Note: This function cannot be used in email messages.

This SSI function reads a string passed from an object in a HTML form, interprets the string according to the specification in format, and stores the result in the OUT area according to the passed arguments. The formatting of the string is equal to the standard C function call scanf()

```
Syntax:
```

```
<?--#exec cmd_argument='scanf( "ObjName", "format", Argl, ..., ArgN), ErrVall,
..., ErrvalN'-->
```

ObjName - The name of the object with the passed data string format - Specifies how the passed string shall be formatted

Arg1 - ArgN - Specifies where to write the data

ErrVal1 -ErrValN - Optional; specifies the value/string to write in case of an error.

| Character | Input, Argument Type | |
|-----------|---|--|
| d | Decimal number; byte, short | |
| i | Number, byte, short. The number may be in octal (leading 0(zero)) or hexadecimal (leading 0 or 0X) | |
| 0 | Octal number (with or without leading zero); byte, short | |
| u | Unsinged decimal number; unsigned byte, unsigned short | |
| Х | Hexadecimal number (with or without leading 0x or 0X); byte, short | |
| С | Characters; char*. The next input characters (default 1) are placed at the indicated spot. The normal skip over white space is suppressed; to read the next non-white space character, use %1s. | |
| S | Character string (not quoted); char*, pointing to an array of characters large enough for the string and a terminating "\0" that will be added. | |
| e, f, g | Floating-point number with optional sign, optional decimal point and optional exponent; float* | |
| % | Liteal %; no assignment is made. | |

The conversion characters d, i, o, u and x may be preceded by l (letter ell) to indicate that a pointer to 'long' appears in the argument list rather than a 'byte' or a 'short'

The arguments that can be passed to the SSI function scanf are:

| Argument | Description |
|----------------------------------|---|
| OutWriteByte(offset) | Write a byte to position offset in the OUT area |
| OutWriteWord(offset) | Write a word to position offset in the OUT area |
| OutWriteLong(offset) | Write a long to position offset in the OUT area |
| OutWriteString(offset) | Write a string to position offset in the OUT area |
| OutWriteFloat(offset) | Write a floating point value to position offset in the OUT area |
| MbWriteByte(id) | Write a byte to the application via the mailbox interface |
| MbWriteWord(id) | Write a word to the application via the mailbox interface |
| MbWriteLong(id) | Write a longword to the application via the mailbox interface |
| MbWriteString(id) | Write a string to the application via the mailbox interface |
| MbWriteFloat(id) | Write a floating point value to the application via the mailbox interface |
| CipWriteByte(class, inst, attr) | Write a byte value to a CIP-object |
| CipWriteWord(class, inst, attr) | Write a word value to a CIP-object |
| CipWriteLong(class, inst, attr) | Write a longword to a CIP-object |
| CipWriteFloat(class, inst, attr) | Write a floating point value to a CIP-object |

Default output:

Write succeeded Write failed

IncludeFile

This SSI function includes the contents of a file on a web page.

```
<?--#exec cmd_argument='IncludeFile( "File name" )'-->
Default output:
  Success
                                  - <File content>
                                  - Failed to open <filename>
  Failure
```

SaveToFile

Note: This function cannot be used in email messages.

This SSI function saves the contents of a passed form to a file. The passed name/value pair will be written to the file "File name" separated by the "Separator" string. The [Append | Overwrite] parameter determines if the specified file shall be overwritten, or if the data in the file shall be appended.

```
Syntax:
   <?--#exec cmd_argument='SaveToFile( "File name", "Separator",[Append|Over-
  write] )'-->
Default output:
  Success
                                 - Form saved to file
  Failure
                                  - Failed to save form
```

SaveDataToFile

Note: This function cannot be used in email messages.

This SSI function saves the data of a passed form to a file. The "Object name" parameter is optional, if specified, only the data from that object will be stored. If not, the data from all objects in the form will

The [Append | Overwrite] parameter determines if the specified file shall be overwritten, or if the data in the file shall be appended.

```
Syntax:
   <?--#exec cmd_argument='SaveDataToFile( "File name", "Object name", [Ap-
  pend|Overwrite] )'-->
Default output:
   Success
                                  - Form saved to file
  Failure
                                  - Failed to save form
```

DisplayScannerState

This function returns the current scanner mode (run or idle state). It returns the text shown in the brackets below, the first string if the scanner mode is run, the second if the scanner mode is idle.

```
Syntax:
   <?--#exec cmd_argument='DisplayScannerState
   ( "Output when Run", "Output when Idle" )'-->
```

SetScannerState

Note: This function cannot be used in email messages.

This function is used to set the EtherNet/IP Scanner to Run or Idle. A variable called 'scanner state', with the value 'run' or 'idle' (other values will be ignored), shall be present when the form is submitted.

```
Syntax:
   <?--#exec cmd_argument='SetScannerState'-->
Default output:
   Failure
                                   - Change scanner mode not possible
```

See also...

- "Identity Object, Class 01h" on page 37
- "Set Scanner Mode (SET_SCANNER_MODE)" on page 131

StoreUCMMTimeout

This SSI function is used to store a new UCMM timeout (ms) to flash memory. Valid range is 1000 - 30000.

```
Syntax:
   <?--#exec cmd_argument='StoreUCMMTimeout'-->
Accepted fields in form:
   SetUCMMTimeout
Default output:
   Success
                                   - New UCMM timeout successfully stored
   Failure
                                   - Failed to store new UCMM timeout
```

DisplayUCMMTimeout

This SSI function is used to display the currently used UCMM timeout value on a web page.

```
Syntax:
   <?--#exec cmd_argument='DisplayUCMMTimeout'-->
```

7.2.1 SSI Scanlist Functionality

The possibility to check and change the scanlist of the module from the default web pages, is disabled by default. The functionality can be enabled using the mailbox "Scanlist Configuration Web Page Control", see page 68.

If you replace the default web pages with new ones, the functionality will be enabled by default.

Please note, that if the scanlist is to be changed, the module must be in idle mode. The mode of the module can be changed either by a CIP command, by a the SSI command "SetScannerState" (see page 27) or the mailbox "Set Scanner Mode (SET_SCANNER_MODE, see page 131). The module can also be set in idle mode checking the box at the bottom of the first default web page shown.

GetScanListArray

This SSI function is used to get the configured EtherNet/IP scanlist. The output is a javascript array with the requested name, where the first entry is a header row describing each entry item, followed by one entry for each configured connection.

In combination with "EditScanEntry", this function can be used to build up a scanlist configuration web page. There is a default webpage in the flash of the module that holds scanlist configuration pages. These have to be enabled using the "Scanlist configuration web page control" mailbox, see page 68.

```
Syntax in Java code:
   <?--#exec cmd_argument='GetScanListArray( "ScanlistArrayVariableName" )'-->
(When this file is read form the module the SSI-command above is replaced with the array variable "ScanlistArray-
   VariableName" that holds the ScanList.)
Output Example (output for a scanlist containing two entries):
   ScanlistArrayVariableName[0] = ("SN","IP address","Timeout Mult","O->T
   RPI", "O->T Param", "T->O RPI", "T->O Param", "O->T ConnPoint", "O->T Offset",
"T->O ConnPoint", "T->O Offset", "Config inst");
   ScanlistArrayVariableName[1] =
   (1, ``10.10.21.28", 0, 100000, 18454, 100000, 10258, 150, 0, 100, 0, 1);\\
   ScanlistArrayVariableName[2] =
   (1, "10.10.21.29", 0, 100000, 18454, 100000, 10258, 150, 8, 100, 8, 1);
```

ScanlistArrayVariableName.length can be used to get the number of rows in the table.

| Argument | Description | | | | |
|----------------------------------|--|--|--|--|--|
| SN | Connection serial number | | | | |
| IP address | Target IP address | | | | |
| Timeout Mult | Connection timeout multiplier: 0 -> 4 x RPI 1 -> 8 x RPI 2 -> 16 x RPI 3 -> 32 x RPI 4 -> 64 x RPI 5 -> 128 x RPI 6 -> 256 x RPI | | | | |
| O->T RPI T->O RPI | 7 -> 512 x RPI Originator to Target/Target to Originator RPI (Requested packet interval) in μs. | | | | |
| O->T Param T->O Param | Originator to Target/Target to Originator. Information about the connection type and size ^a . | | | | |
| | Connection type mask: 0x6000 (24576) Multicast connection: 0x2000 (8192) Point-to-point connection: 0x4000 (16384) Connection size mask: 0x01FF (size in bytes, 511) See table below for a detailed description. | | | | |
| O->T ConnPoint T->O ConnPoint | Originator to Target/Target to Originator Connection point (normally the Assembly object instance in the target, to which the connection shall connect). | | | | |
| O->T Offset T->O Offset | Offset (in number of 16 bit words) in DPRAM IN/OUT area, where this connection data will be represented. | | | | |

a. The data in this argument is presented in decimal form in the messages.

The table below gives descriptions of the bits in the argument O->T Param, T->O Param.

| Bits | Parameter | Description |
|-------|-----------------|--|
| 0-8 | Connection Size | The maximum size, in bytes, of the data for each direction (where applicable) of the connection. For a variable sized connection, the size shall be the maximum size of the buffer for any transfer. The actual size of the transfer for a variable connection shall be equal to or less than the size specified for the connection. The maximum buffer size shall be dependent on the links that the connection traverses. The connection size includes the sequence count and the 32 bit real time header, if present. |
| 9 | Fixed/Variable | The product only support fixed size connection. The amount of data on each transmission shall be the size specified in the Connection Size parameter. This bit shall always be set to 0 (fixed). |
| 10-11 | Priority | 00: Low 01: High 10: Scheduled (recommended 11: Urgent |
| 12 | Reserved | Set to zero. |
| 13-14 | Connection Type | 00: (reserved)01: Multicast, only supported for T->O.10: Point to Point11: (reserved) |
| 15 | Redundant Owner | Always 0, to indicate an exclusive-owner, input-only or listen-only connection. |

EditScanEntry

This SSI function is used to edit an entry in the configured EtherNet/IP scanlist. Two variable entries are present in the form when it is submitted, "ActionObjectName", specifying which action to take on an entry and "EntryObjectName", with information about the entry to modify. In combination with "GetScanListArray", this function can be used to build up a scanlist configuration web page similar to the one enabled by the "Scanlist configuration web page control" mailbox.

Syntax:

```
<?--#exec cmd_argument='EditScanEntry( "ActionObjectName", "EntryObjectName"
```

| Argument | Description | |
|------------------|-----------------|---|
| ActionObjectName | Specifies the r | name of the HTML form entry holding information about which action to take on a |
| | scanlist entry: | |
| | "delete" | request to delete a scanlist entry |
| | "add" | request to add a scanlist entry |
| | "edit" | request to edit a scanlist entry |
| EntryObjectName | | name of the HTML form entry holding information about the entry the action is valid ffers depending on action: |
| | "delete" | contains the serial number of the scanlist entry to delete |
| | "add" | string of entry data (see "GetScanListArray" on page 30 for details). Independent of Set Connection serial number, the first free place is used. Example: |
| | | "0,"10.10.21.28", 0, 100000, 18454, 100000,10258, 150, 16, 100, 16, 1"a |
| | "edit" | string of entry data Example: |
| | | "2,"10.10.21.28", 0, 100000, 18454, 100000,10258, 150, 16, 100, 16, 1"a |

a. Param data has to be in decimal format. (18458 = 4816h, 10258 = 2812h). The command will result in 10 bytes of I/O data in each direction (a two byte counter and a four byte run/idle header occupies 6 bytes of O->T data and a two byte counter occupies two bytes of T->O data) with 16 words offset in DPRAM transferred every 100 ms.

Note: The list is renumbered at repower to remove unused connection serial numbers.

7.3 Changing SSI output

There is two methods of changing the output strings from SSI functions:

- 1. Changing SSI output defaults by creating a file called "\ssi_str.cfg" containing the output strings for all SSI functions in the system
- **2.** Temporary changing the SSI output by calling the SSI function "SsiOutput()".

7.3.1 SSI Output String File

If the file "\ssi_str.cfg" is found in the filesystem and the file is correctly according to the specification below, the SSI functions will use the output strings specified in this file instead of the default strings.

The files shall have the following format:

```
[StoreEtnConfig]
Success: "String to use on success"
Invalid IP: "String to use when the IP address is invalid"
Invalid Subnet: "String to use when the Subnet mask is invalid"
Invalid Gateway: "String to use when the Gateway address is invalid"
Invalid IP or Subnet: "String to use when the IP address and Subnet mask does
Invalid DNS1: "String to use when the primary DNS cannot be found"
Invalid DNS2: "String to use when the secondary DNS cannot be found"
Save Error: "String to use when storage fails"
Invalid DHCP state: "String to use when the DHCP state is invalid"
[scanf]
Success: "String to use on success"
Failure: "String to use on failure"
[IncludeFile]
Failure: "String to use when failure" 1
[SaveToFile]
Success: "String to use on success"
Failure: "String to use on failure" 1
[SaveDataToFile]
Success: "String to use on success"
Failure: "String to use on failure"^1
[GetText]
Success: "String to use on success"
Failure: "String to use on failure"
```

The contents of this file can be redirected by placing the line '[File path]' on the first row, and a file path on the second.

```
Example:
   [File path]
   \user\ssi_strings.cfg
```

In this example, the settings described above will be loaded from the file 'user\ssi_strings.cfg'.

^{1. &#}x27;%s' includes the filename in the string

7.3.2 Temporary SSI Output change

The SSI output for the next called SSI function can be changed with the SSI function "SsiOutput()" The next called SSI function will use the output according to this call. Thereafter the SSI functions will use the default outputs or the outputs defined in the file '\ssi_str.cfg'. The maximum size of a string is 128 bytes.

```
Syntax:
   <?--#exec cmd_argument='SsiOutput( "Success string", "Failure string" )'-->
Example:
   This example shows how to change the output strings for a scanf SSI call.
   <?--#exec cmd_argument='SsiOutput ( "Parameter1 updated", "Error" )'-->
   <?--#exec cmd_argument="scanf( "Parameter1", "%d", OutWriteByte(0) )'-->
```

8. Ethernet/IP

The module act as a Scanner Class product on the EtherNet/IP network. EtherNet/IP is based on the Common Industrial Protocol (CIP) which is also the application layer used by DeviceNet and Control-Net to exchange data between nodes.

The following port numbers are used for the EtherNet/IP communication:

• TCP, port 41818

Used for encapsulation messages; supports up to 48 concurrent incoming TCP connections.

• UDP, port 41818

Used for encapsulation messaging over UDP.

• UDP, port 2222

Used for I/O data (Class 1, Multicast or Point-to-Point).

System File eip.cfg

EtherNet/IP settings are stored in a system file:

• '\cfg\eip.cfg'

```
File Format:
```

```
[UCMM Timeout]
1500
[Select ACD]
1
[ACD activity]
0
```

The file shall contain one or several of the headers below

[Remote MAC]

 $00:\!00:\!00:\!00:\!00:\!00$

[ARP PDU]

If the file does not exist or if the UCMM timeout value is outside the valid range (1000 - 30000 ms), the default value (1500 ms) will be used. If the value in this file is changed during runtimem the new value will ot be used until the next restart of the module.

Select ACD is mapped to attribute #10 in the TCP/IP object (F5h). If the eip.cfg file does not exist, ACD will be enabled. Valid values are 1 to enable and 0 to disable ACD.

The remaining parameters in the eip.cfg file are members of the LastConflictDetected structure in attribute #11 of the TCP/IP object (F5h). The parameters are written when an ACD conflict occurs and read when a Get_Attribute_Single or a Get_Attributes_All service is received. The parameters are set to 0 if a Set_Attribute_Single service is received. Each by in Remote MAC and ARP PDU is represented by tow digit hexadecimal number.

8.1 Implemented Objects

EtherNet/IP requires some mandatory objects; these are implemented as well as some vendor specific objects. The mandatory objects are the ones in the specification from ODVA.

The following vendor specific objects are implemented:

- Identity Object, Class 01h
- Message Router, Class 02h
- Assembly Object, Class 04h
- Connection Manager Object, Class 06h
- · Diagnostic Object, Class AAh
- Parameter Data Input Mapping Object, Class B0h
- Parameter Data Output Mapping Object, Class B1h
- · Connection Configuration Object, Class F3h
- Port Object, Class F4h
- TCP/IP Interface Object, Class F5h
- Ethernet Link Object, Class F6h

8.1.1 Identity Object, Class 01h

| 3 | Heartbeat instance | No attributes implemented for this instance. Used as a heartbeat instance for |
| | | connections only accessing one "real" connection point. |
| 100 | Produced Data (target) | This instance only exist if CREATE_CON_TARGET has been issued, and |
| | | holds data produced by the module. |
| 150 | Consumed Data (target) | This instance only exist if CREATE_CON_TARGET has been issued, and |
| | | holds data consumed by the module. The 'Run/Idle' information is discarded. |
| 160 - | User configurable consumed | These instances are created by the end user using a configuration tool. The |
| 164 | data ^a | user can select data size and offset for the instance in the memory area of the |
| | | scanner. Originators can later connect to a created instance in the O->T |
| | | direction. |
| 165- | User configurable produced | These instances are created by the end user using a configuration tool. The |
| 169 | data ^a | user can select data size and offset for the instance in the memory area of the scanner. Originators can later connect to a created instance in the T->O |
| | | direction. |
| 101 | Consumed Data (all connections) | Equals the contents of instances 768832 |
| 102 | , | |
| | Produced Data (all connections) | Equals the contents of instances 10241087 |
| 768 | Consumed Data, connection 1 | Consumed data associated with I/O connection no. #1 |
| 700 | O | (Configuration Object instance 1) |
| 769 | Consumed Data, connection 2 | Consumed data associated with I/O connection no. #2 |
| | | (Configuration Object instance 2) |
| | | |
| 831 | Consumed Data, connection 64 | Consumed data associated with I/O connection no. #64 |
| 4004 | D 1 1D 1 1: 1 | (Configuration Object instance 64) |
| 1024 | Produced Data, connection 1 | Produced data associated with I/O connection no. #1 |
| 4005 | D 1 1D 1 1: 0 | (Configuration Object, instance 1) |
| 1025 | Produced Data, connection 2 | Produced data associated with I/O connection no. #2 |
| | | (Configuration Object, instance 2) |
| | | |
| 1087 | Produced Data, connection 64 | Produced data associated with I/O connection no. #64 |
| | | (Configuration Object, instance 2) |

a. Instances 160-164 and 165-169 adds slave functionality to the module. Any other node in the network, e.g. other masters, can use these instances to open a connection to the module.

Note: It is also possible to create target areas dynamically.

Doc.ld. HMSI-168-21

Class 1 Connections

Class 1 connections are used to transfer I/O data. Each class 1 connection establishes two data transports; one consuming, and one producing.

No. of Supported Originated Class 1 Connections:64Max. Input Connection size:509 bytesMin. Output Connection size:504 bytesSupported Packet Rate (API):2...3200msSupported Trigger Types:Cyclic

• Producing Assembly Instances 100, 101, 102

No. of Supported Target Class 1 Connections: 20 per instance (sharing same transport)

No. of Supported Transports

Supported Transport Types Point-to-Point, Multicast

Supported Packet Rate (API): 2...3200ms
Supported Trigger Types: Cyclic

Once a class 1 connection has been established, a transport is received. This transport may be of Point-to-Point or Multicast type. If Point-to-Point, the data is transferred using UDP unicast messages, and no other connections can access the data. If Multicast, the data is transferred with UDP multicast messages, and other connections may use the same transport accessing the data. Producing instances can only be assigned one transport. Therefore, if using Point-to-Point connections, only 1 (one) Class 1 connection can be established. However, 20 connections can be linked to each Multicast transport, allowing 20 Class 1 connections to be established if they all use the same transport.

In order for a connection to use an existing transport, the connection data size must match the data size of the existing transport, or an error response will be returned. If the connection RPI (Requested Packet Interval) does not match the existing connections's API (Actual Packet Interval), the connection will still be established using the API of the existing transport. This API will be returned in the response to the 'Forward Open'-request.

• Consuming Assembly Instance 150

No. of Supported Target Class 1 Connections: 1 per instance

No. of Supported Transports 1

Supported Transport Types Point-to-Point only

Supported Packet Rate (API): Unlimited

Since consuming instances are used to control the outputs, only one connection is allowed to each consuming instance. The transport used for the connection must be Point-to-Point.

Class 3 Target Connections

Class 3 connections are used to establish connections to the message router. Thereafter the connection is used for explicit messaging. Class 3 connections use TCP connections.

Up to 16 simultaneous class 3 connections towards the message router is supported.

Unconnected Send

If additional communication ports have been registered using REGISTER_PORT, unconnected send requests to the module will be routed to the application using the mailbox message ROUTE_RE-QUEST.

Up to 64 messages can be pending before a client will get a 'No resource'-response to an unconnected send request.

Description

This object is used to create and maintain a scanlist for the EtherNet/IP network.

When set in RUN mode, the Anybus-M EtherNet/IP module starts to scan all EtherNet/IP slaves in the network according to the previously configured scanlist. The scanlist can be accessed using Explicit CIP messages via Ethernet or the mailbox interface, and also via the internal web pages using SSI commands, see "SSI Scanlist Functionality" on page 29.

The object specific service parameters can be set and changed by UCMM commands using the mailbox "Send UCMM (SEND_UCMM)", see page 118. The mailbox has to be sent either to the module itself, using the IP address obtained by the mailbox "Get IP configuration (GET_IP_CONFIG)", see page 58, or to the Ethernet port on the module via an external tool.

The module must be in idle mode if the scanlist is to be changed. The mode is controlled by a CIP-command, the SSI command "SetScannerState", see page 27, or the mailbox "Set Scanner Mode (SET_S-CANNER_MODE), see page 131.

Class Attributes

| # | Access | Name | Туре | Value | Description |
|----|--------|-----------------------|---------------|--------------|---|
| 1 | Get | Revision | UINT | 0002h | Revision 2 |
| 2 | Get | Max Instance | UDINT | 0000 0040h | Maximum instance no. = 64h |
| 3 | Get | No. of instances | UDINT | - | - |

| 3 | Get/Set ^a | Configuration | DWORD | - | | Value: Meaning: | | |
| | 000000 | Control | | | | 0 Configuration from non-volatile memory | | |
| | | | | | | (i.e. 'ethcfg.cfg') | | |
| | 0.1 | D (0) : (| 0, , , | | | 2 Configuration from DHCP | | |
| 4 | Get | Port Object | Struct of: | 000 | 01 | Physical link -> Ethernet object | | |
| | | Path Size | UINT | 000 | | 2 words | | |
| _ | | Path | Padded EPATH | 20 F | 6 24 01h | Ethernet Class, Instance 1 | | |
| 5 | Get/Set ^a | Interface Con- figuration | Struct of: | | | | | |
| | | IP Address | UDINT | _ | | Currently used IP address | | |
| | | Subnet Mask | UDINT | _ | | Currently used Subnet mask | | |
| | | Gateway | UDINT | _ | | Currently used Gateway Address | | |
| | | Address | 02 | | | | | |
| | | Name Server 1 | UDINT | - | | Primary DNS | | |
| | | Name Server 2 | UDINT | - | | Secondary DNS | | |
| | | Domain Name | STRING | - | | Default domain name | | |
| 6 | Get/Set ^a | Host Name | STRING | - | | Host name | | |
| 10 | Get/Set | SelectACD | BOOL | - | | Enable ACD | | |
| 11 | Get/Set | LastConflictDe- tected | Struct of: | | | Last detected address conflict. | | |
| | | AcdActivity | USINT | - | | State of ACD activity when last conflict detected. | | |
| | | RemoteMAC | Array of 6 USINT | - | | MAC address of remote node from the ARP PDU in which a conflict was detected. | | |
| | | ArpPdu | Array of 28 USINT | - | | Copy of the raw ARP PDU in which a conflict was detected. | | |

Status Attribute Description

| Bit (s) | Name | Description | | |
|---------|--------------------------------|--|------|---|
| 0-3 | Interface Configuration Status | Indicates the status of the Interface Configuration attrib- | 0 - | The Interface Configuration attribute has not been configured. |
| | | ute | 1 - | The Interface Configuration attribute contains valid configuration obtained from BOOT, DHCP or non-volatile storage. |
| | | | 2- | The IP address member of the Interface Configuration attribute contains valid configuration, obtained from hardware settings, e.g. a pushwheel or a thumbwheel. |
| 4 | Mcast Pending | | wher | hange in the TTL Value and/or Mcast Config n either the TTL Value or Mcast Config attribute is me the device starts. |
| 6 | AcdStatus | Indicates if an address conflict has been detected | | No address conflict detected Address conflict detected |
| 7-31 | (reserved) | Set to zero | | |

8.1.11 Ethernet Link Object, Class F6h

Services

Class services: Get Attribute All

Get Attribute Single

Instance services: Get Attribute All

Get Attribute Single Set Attribute Single Get and Clear

Description

This object maintains link specific counters and status information for the Ethernet communications interface.

Class Attributes

| # | Access | Name | Туре | Value | Description |
|---|--------|------------------|------|-------|----------------------------------|
| 1 | Get | Revision | UINT | 0001h | Revision 1 |
| 2 | Get | Max Instance | UINT | 0001h | 1 is the highest instance number |
| 3 | Get | No. of instances | UINT | 0001h | 1 instance is implemented |

Instance Attributes

| # | Access | Name | Туре | Value | Description |
|---|---------|--------------------------|-------------------|-------------|--|
| 1 | Get | Interface Speed | UDINT | 10 or 100 | The actual speed of the module (MBPS) |
| 2 | Get | Interface Flags | DWORD | - | Interface flags |
| 3 | Get | Physical Address | Array of 6 USINTS | MAC address | Ethernet MAC address of the module |
| 4 | Get | Interface Counters | Struct of: | | - |
| | | In Octets | UDINT | - | Octets received on the interface |
| | | In Ucast Packets | UDINT | - | Unicast packets received on the interface |
| | | In NUcast Packets | UDINT | - | Non-unicast packets received on the interface |
| | | In Discards | UDINT | - | Inbound packets with unknown protocol |
| | | In Errors | UDINT | - | Inbound packets that contain errors (In Discards not included) |
| | | In Unknown Protos | UDINT | - | Inbound packets with unknown protocol |
| | | Out Octets | UDINT | - | Octets sent on the interface |
| | | Out Ucast Packets | UDINT | - | Non-unicast packets sent on the interface |
| | | Out Discards | UDINT | - | Outbound packets with unknown protocol |
| | | Out Errors | UDINT | - | Outbound packets that contain errors (Out Discards not included) |
| 5 | Get | Media Counters | Struct of: | - | - |
| | | Alignment Errors | UDINT | - | Frames received that are not an integral number of octets in length. |
| | | FCS Errors | UDINT | - | Frames received that do not pass the FCS check |
| | | Single Collisions | UDINT | - | Successfully transmitted frames which experienced exactly one collision |
| | | Multiple Collisions | UDINT | - | Successfully transmitted frames which experienced more than one collision |
| | | SQE Test Errors | UDINT | - | Number of times SQRE test error message is generated |
| | | Deferred Transmissions | UDINT | - | Frames for which the first transmission attempt is delayed because the medium is busy |
| | | Late Collisions | UDINT | - | Number of times a collision is detected later than 512 bit-times into the transmission of a packet |
| | | Excessive Collisions | UDINT | - | Frames for which a transmission fails due to excessive collisions |
| | | MAC Transmit Errors | UDINT | - | Frames for which transmission fails due to an internal MAC sub-layer receive error |
| | | Carrier Sense Errors | UDINT | - | Times that the carrier sense condition was lost or never asserted when attempted to transmit a frame |
| | | Frame Too Long | UDINT | - | Frames received that exceed the maximum permitted frame size |
| | | MAC Receive Errors | UDINT | - | Frames for which reception on an interface fails due to an internal MAC sub-layer receive error |
| 6 | Get/Set | Interface Control | Struct of: | • | - |
| | | Control Bits | UDINT | - | Interface Control Bits |
| | | Force Interface Speed | UDINT | - | Speed at which the interface shall be forced to operate. Returns 'Object state Conflict' if auto-negotiation is enabled. |

9. Fieldbus Specific Mailbox Commands

9.1 Fault Information

When a mailbox command cannot be processed, the Message Information register in the header of the response will indicate that an error occurred (Consult the Anybus-S Parallel Design Guide for more information). If the error code is 'Invalid Other' (Fh), extended error information is available in the Fault Information register (Extended word 8).

The fault codes in the Fault Information register are:

| Register Value | Description |
|----------------|---|
| 0001h | Invalid IP-address or Subnet mask |
| 000Ah | Invalid timeout time |
| 000Ch | Failed to open file or file not found |
| 000Dh | Invalid file descriptor |
| 000Eh | Invalid open method |
| 000Fh | No email server configured |
| 0010h | Command aborted |
| 0011h | Too many registered objects |
| 0012h | Object already registered |
| 0013h | Deregistering invalid object |
| 0015h | Unsupported Command |
| 0016h | Failed to send UCMM command |
| 0017h | No timeout |
| 0018h | Invalid port number |
| 0019h | Duplicate port number |
| 001Ah | EPATH too big |
| 001Bh | Mapping Failed |
| 001Ch | Reset notification unsupported |
| 001Dh | Too many open files |
| 001Eh | Failed to create directory |
| 001Fh | Failed to delete directory |
| 0020h | Failed to rename file |
| 0021h | Failed to move file |
| 0022h | Failed to copy file |
| 0023h | Too many open directories |
| 0024h | Failed to open directory or directory not found |
| 0025h | Failed to resolve hostname with DNS |
| 0026h | Timed out resolving hostname with DNS |

9.2 General Configuration Commands

Commands in this category:

| Mailbox Commands | Description | Page |
|---|--|------|
| Set IP Configuration (SET_IP_CON-FIG) | Set network settings | 57 |
| Get IP Configuration (GET_IP_CON-FIG) | Retrieve the currently used network settings | 58 |
| Get MAC Address (GET_MAC_ADDR) | Retrieve the ethernet MAC address from the module | 59 |
| Set MAC Address (SET_MAC_ADDR) | Get the ethernet MAC address of the module | 60 |
| Disable HICP (HICP_DISABLE) | Disable HICP support | 61 |
| Set SMTP Configuration (SET_SMT-P_CONFIG) | Configures the SMTP server address | 62 |
| Get SMTP Configuration (GET_SMT-P_CONFIG) | Configures the SMTP server address | 63 |
| Disable Web Server (DISA-BLE_WEB_SERVER) | This command disables the built in web server | 64 |
| Enable Web Server (ENA-BLE_WEB_SERVER) | This command enables the built in web server | 65 |
| Disable FTP server (DISABLE_FT-P_SERVER) | This command disables the built in FTP server | 66 |
| Global Admin Mode (GLOBAL_AD-MIN_MODE) | This command instruct the module to run in global admin mode | 67 |
| Scanlist Configuration Web Page Control (SCANLIST_CFG_CTRL) | Enable/disable scanlist configuration web pages | 68 |
| Disable Virtual File System (DISA-BLE_VFS) | Disable the virtual file system | 69 |
| Set Speed and Duplex (SET_SPDCONFIG) | Set speed & duplex | 70 |
| Get Speed and Duplex (GET_SPDCONFIG) | Get speed & duplex | 71 |

Anybus-M EtherNet/IP Doc.Rev. 1.2

9.2.1 Set IP Configuration (SET_IP_CONFIG)

Description

This command may be used to specify the TCP/IP network settings. Note that the specified settings will override the corresponding settings in '\cfg\ip.cfg'.

Note: This command may only be issued during initialisation.

| Initiated by | Application |
|-----------------|---|
| Command no. | 0001h |
| Extended Header | Fault information |
| Message data | Network settings. |
| Response data | (the response holds a copy of the command data) |

9.3 Mailbox Socket Interface

The Anybus module features a transparent socket interface, allowing the application to send and receive transparent data via TCP/IP or UDP/IP. The mailbox socket interface can be used in two modes:

Non-blocking

All mailbox operations on these sockets will respond directly - not block until the command is performed. Up to 16 simultaneous non-blocking sockets are supported.

Note: Status information for all non-blocking sockets are available in the fieldbus specific area, see "Fieldbus Specific Area" on page 143.

Blocking

Blocking sockets means that the Anybus will not respond to further socket commands until the previous one has been completed (However, non-socket related commands can still be processed as normal). Up to 32 simultaneous blocking sockets are supported.

Note: Blocking sockets do *not* have any status information in the fieldbus specific area.

Extensive use of this functionality may affect the performance of the module negatively.

Commands in this category:

| Mailbox Command | Description | Page |
|--|--|------|
| Socket non-blocking (SOCKET_NB) | Creates a socket in non-blocking mode. | 73 |
| Socket blocking (SOCKET_B) | Creates a socket in blocking mode. | 74 |
| Listen (LISTEN) | Starts to listen on a socket for incoming connections. | 75 |
| Accept (ACCEPT) | Accepts connections for sockets in blocking mode. | 76 |
| Connect (CONNECT) | Tries to connect a socket to a client. | 77 |
| Send (SEND) | Sends a message to a connected socket. | 79 |
| Receive (RECEIVE) | Receives a message form a connected socket. | 80 |
| Send To (SEND_TO) | Sends a message to an unconnected UDP socket to a specified host. | 81 |
| Receive From (RECV_FROM) | Receives a message from an unconnected UDP socket. | 82 |
| Close (CLOSE) | Closes a socket (and connection). | 83 |
| Send Fragment (SEND_FRAG) | Sends a fragment of a message with a maximum total size of 1460 bytes. | 84 |
| Receive Fragment (RECV_FRAG) | Receives a fragment of a message with a total maximum size of 140 bytes. | 85 |
| Send Fragment To (SEND_FRAG_TO) | Sends a fragment of a message with a total maximum size of 1460 bytes to an unconnected UDP socket. | 87 |
| Receive Fragment From (RECV_FRAG_FROM) | Receives a fragment of a message with a total maximum size of 1460 bytes from an unconnected UDP socket. | 88 |
| Get Socket Option (GET_SOCKET_OPTION) | Read options from a socket. | 90 |
| Set Socket Option (SET_SOCKET_OPTION) | Sets options to a socket | 91 |

9.3.1 Socket Non-Blocking (SOCKET_NB)

Description

This mailbox command creates a socket in non-blocking mode and associates it to a specific port number. If the specified port number is 0, the Anybus module selects a free port.

The response message contains a socket descriptor and the port number. The socket descriptor shall be used on all following operations on the socket. It indicates at which position in the fielbus specific area, information about this socket can be found.

| Initiated by | Application |
|-----------------|---|
| Command no. | 0040h |
| Extended Header | - |
| Message data | The socket type (TCP or UDP) and the port number to bind the socket to. |
| Response data | The response indicates if the command was accepted. The response indicates which socket descriptor that is used and the port number the socket is associated to. |

|-------|-------------|
| 0001h | TCP socket |
| 0002h | UDP socket |

9.3.2 Socket Blocking (SOCKET_B)

Description

This mailbox command creates a socket in blocking mode and associates it to a specific port number. If the specified port number is 0, the Anybus module selects a free port.

The response message contains a socket descriptor and the port number. This descriptor shall be used on all following operations on this socket.

| Initiated by | Application |
|-----------------|---|
| Command no. | 003Fh |
| Extended Header | - |
| Message data | The socket type (TCP or UDP) and the port number to bind the socket to. |
| Response data | The response indicates if the command was accepted. The response indicates which socket descriptor that is used and the port number the socket is associated to. |

Fieldbus Specific Message SOCKET_B 4 bytes of data (2 words)

Socket Type

| Value | Socket type |
|-------|-------------|
| 0001h | TCP socket |
| 0002h | UDP socket |

9.3.3 Listen (LISTEN)

Description

This mailbox command makes a socket listen for new connections. If the Anybus module detects a connection request on the specified socket, a new connected socket will be created, and the current socket will continue listening for new connections. This means that multiple hosts can connect to one listening socket simultaneously.

Note: This command can only be used on a TCP socket.

• Non-blocking sockets

Information about active connections on this socket can be read in the fieldbus specific area, see 11-1 "Memory Map" and 11-3 "Socket Status Structure".

· Blocking sockets

Socket descriptors for new connections connected to this socket can be received by the mailbox command ACCEPT, see 9-76 "Accept (ACCEPT)".

| Initiated by | Application |

Fieldbus Specific Message LISTEN

9.3.4 Accept (ACCEPT)

Description

When a connection request to a listening socket in blocking mode is received, this command receives the socket descriptor of the newly created connected socket.

This command is blocking and will not respond until a connection request is received.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0050h |
| Extended Header | Socket Descriptor, Fault Information, Local Port no, Host Port no, Host IP |

Fieldbus Specific Message ACCEPT

Response dataword

9.3.5 Connect (CONNECT)

Description

This mailbox command tries to establish a connection to a specified IP address and port number.

If the socket is of UDP type this command specifies the peer with which the socket is to be associated, the address is to which datagrams are sent and the only address from which datagrams are received.

If the socket is of TCP type this command attempts to make a connection to another socket. TCP sockets may CONNECT only once, while UDP sockets may use CONNECT multiple times to change their association.

• Non-blocking sockets

If this command is correctly sent, it will be accepted regardless of whether it is possible to establish a connection or not. The result of the operation is available in the fieldbus specific area, see 11-1 "Fieldbus Specific Area".

Blocking sockets

This command will block until a connection is established or the connection request is cancelled due to timeout or connection error.

| Initiated by | Application |

| 0005h | Connection Timeout |
| 0006h | Connection Failed |

9.3.6 Send (SEND)

Description

This mailbox command writes data to a connected socket. A maximum of 256 bytes of data can be sent using this command.

• Non-blocking sockets

If there isn't enough space available for the data in the output buffers, the response will indicate that the amount of data actually sent was less than requested.

Blocking sockets

If there isn't buffer space available for the data in the output buffers this command will block until there is.

| Initiated by | Application |

Fieldbus Specific Message SEND Max. 256 bytes

9.3.7 Receive (RECV)

Description

This mailbox command receives data from a connected socket.

If the specified socket is of TCP type this command will return the requested number of bytes from the received data stream. If the available data is less than requested, all available data will be returned.

If the specified socket is of UDP type this command will return the requested amount of data from the next received datagram. If the datagram is smaller than requested, the entire datagram will be returned in the response message. If the datagram is larger than requested, the excess bytes will be discarded.

A maximum of 256 bytes of data can be received using this command.

• Non-blocking sockets

If no data is available on the socket the response will indicate that 0 bytes of data was received.

· Blocking sockets

If this command is called and no data is available the command will block until there is. If the response indicates that 0 bytes of data was received the connection has been closed by the host. The socket however is still valid and must be closed using the mailbox command CLOSE.

9.3.9 Receive From (RECV_FROM)

Description

This mailbox command reads the next received datagram from a UDP type socket. The response message contains the IP address and port number of the sender.

If the received datagram is smaller than requested, the entire datagram will be returned in the response message. If the received datagram is larger than requested, the excess bytes will be discarded.

A maximum of 256 bytes of data can be received using this command.

· Non-blocking sockets

If the amount of data available on the socket is less than requested, this is reflected in the data size of the response.

· Blocking sockets

If this command is called and no data is available the command will block until there is.

9.3.10 Close (CLOSE)

Description

This mailbox command causes a connected socket to shut down and release its socket descriptor.

· Blocking sockets

Commands still blocking on the socket when it is closed will be aborted and return indicating 0010h (Command aborted)

Note: If a host closes a TCP connection while there is still data available to read on the socket in the client, the client socket will be indicated as connected until all data is read. In this case, if the client tries to send data the mailbox response will report "Can't send more".

Fieldbus Specific Message CLOSE

9.3.11 Send Fragment (SEND_FRAG)

Description

This mailbox command is used when sending messages larger than 256 bytes. Internally the fragments are stored in a buffer until the last fragment is received. The message is then sent to the socket. The maximum size of a fragmented message is 1460 bytes.

It is not possible to send multiple fragmented messages simultaneously. A fragmented message must be completely sent before another fragmented message can be sent on the same or another socket.

• Non-blocking sockets

If there isn't enough space available for the data in the output buffers, the response will indicate that the amount of data actually sent was less than requested.

Blocking sockets

If there isn't buffer space available for the data in the output buffers this command will block until there is.

See below (Only in last fragment)

Fragment Type Value

| Value | Description |
|-------|---|
| 0000h | First fragment of a new message |
| 0001h | Subsequent fragment of the message |
| 0002h | Last fragment of the message. When this fragment is sent the entire message will be sent to the socket. |

9.3.12 Receive Fragment (RECV_FRAG)

Description

This mailbox command is used to receive fragmented messages larger than 256 bytes from a connected socket. Internally the entire message will be read from the socket to a buffer. The fragments of the message can then be read from the buffer using this command.

If the specified socket is of TCP type this command will return the requested number of bytes from the received data stream. If the available data is less than requested, all available data will be returned.

If the specified socket is of UDP type this command will return the requested amount of data from the next received datagram. If the datagram is smaller than requested, the entire datagram will be returned in the response message. If the datagram is larger than requested, the excess bytes will be discarded.

The maximum size of a fragmented message is 1460 bytes.

Non-blocking sockets

If no data is available on the socket the response will indicate that 0 bytes of data was received.

Blocking sockets

If no data is available the command will block until there is. If the response indicates that 0 bytes of data was received the connection has been closed by the host. The socket however is still valid and must be closed using the mailbox command CLOSE.

• Fragment Type Value

| Value | Description |
|-------|--|
| 0000h | Receive first fragment of a new message. This receives a new message from the network. Any unread fragments from earlier received datagrams will be overwritten. |
| 0001h | Receive the next fragment of the message. |

9.3.13 Send Fragment To (SEND_FRAG_TO)

Description

This mailbox command sends a UDP datagram to a specified IP address and port number. This command is used when sending a fragment of a message larger than 256 byte. Internally the fragments are stored in a buffer until the last fragment is received. The message is then sent to the socket. The maximum size of a fragmented message is 1460 bytes.

a. IP-address and Port Number shall only be given in the first fragment.

• Fragment Type Value

| Value | Description |
|-------|---|
| 0000h | First fragment of a new message. |
| 0001h | Subsequent fragment of the message |
| 0002h | Last fragment of the message. When this fragment is sent the entire message will be sent to the socket. |

Anybus-M EtherNet/IP Doc.Rev. 1.2

EtherNet/IP

Doc.ld. HMSI-168-21

9.3.14 Receive Fragment From (RECV_FRAG_FROM)

Description

This mailbox command reads the next received datagram from a UDP type socket. The response message contains the IP address and port number of the sender.

This command is used to receive a fragment of a message larger than 256 bytes. The maximum total size of a fragmented message is 1460 bytes. The maximal size of each fragment is 256 bytes.

If the received datagram is smaller than requested, the entire datagram will be returned in the response message. If the received datagram is larger than requested, the excess bytes will be discarded.

For blocking sockets, the first fragment will block until there is data available on the socket.

Internally the entire message is read from the socket to a buffer. The fragments can then be read from the buffer using this command.

· Non-blocking sockets

If no data is available on the socket the response will indicate that 0 bytes of data was received.

· Blocking sockets

If this command is called but there is no data available on the socket the command will block and not return until there is data available.

Fieldbus Specific Message SET_SOCKET_OPTION

Socket Options

The following options are used to Set settings on a socket:

SO_LINGER

SO_KEEPALIVE

SO_REUSEADDR

IP_MULTICAST_TTL

IP_MULTICAST_LOOP

IP_ADD_MEMBERSHIP

IP_DROP_MEMBERSHIP

TCP_NODELAY

For more information see section "Socket Options" on page 92.

9.3.17 Socket Options

| Name | Socket Option Value | Data Type | Description |
|--------------|------------------------|---|--|
| SO_LINGER | 00000080h | Struct of: UINT32 (I_onoff) UINT32 (I_linger) | Controls the action taken when unsent data is queued on a socket that is being closed. This option is only valid for TCP sockets. |
| | | | I_onoff 0:Linger OFF (default) Other:Linger ON |
| | | | L_linger Normally defines the linger timeout. NOT SUPPORTED, ALWAYS SET TO 0. |
| | | | If SO_LINGER is disabled, Socket Close returns immediately and the connection is closed in the background. |
| | | | If SO_LINGER is enabled with a zero timeout, Socket Close returns immediately and the connection is reset. |
| SO_KEEPALIVE | 00000008h | UINT32 (I_keepalive) | Enables/disables keep alive probes on a socket. This option is only valid for TCP sockets. |
| | | | I_keepalive 0:Keep alive OFF (default) Other:Keep alive ON |
| | | | Keep alive can be used to detect if the host is still active, and if it is not, close down the connection. If keep alive is enabled a keep alive probe will be sent to the host after 2 hours with no data being sent or received on a connection. This packet is designed to provoke an ACK response from the host. If no ACK is received another 8 keep alive probes will be sent with 75 seconds interval, and if none of them is ACKed the connection will be reset. |
| SO_REUSEADDR | 00000004h | UINT32 (I_reuseaddr) | Enables/disables reuse address option on a socket. This option is only valid for TCP sockets. |
| | | | I_reuseaddr 0:Reuse address OFF (default) Other:Reuse address ON |
| | | | When reuse address option is enabled it is possible to reuse a TCP port even if the port is busy in TIME_WAIT state. If the port is busy in other states an error will still be generated. This can be useful for a server implementation that is shut down and directly restarted while sockets are still active on its port. |

Anybus-M EtherNet/IP
Doc.Rev. 1.2
Doc.Id. HMSI-168-21

| IP_MULTICAST_TTL | 0000000Ah | UINT8 (b_ttl) | Sets the TTL value for multicast packets. This option is only valid for UDP sockets. |
|-------------------------|------------|--|---|
| | | | b_ttl 1-255 (Default 1) |
| | | | The TTL value is part of the IP packet header and specifies the number of routers a packet is allowed to pass before it shall be deleted. The default value of 1 prevents multicast packets from being forwarded |
| IP MULTICAST- | 0000000Bh | UINT8 (b_multicastloop) | beyond the local network. |
| _LOOP | 0000000011 | Olivio (b_mulicastioop) | Enables/disables multicast packet loopback. This option is only valid for UDP sockets. |
| | | | I_reuseaddr 0:Multicast loopback OFF 1:Multicast loopback ON (default) |
| IP_ADD_MEMBER- SHIP | 0000000Ch | Struct of: UINT32 (I_multiaddr) UINT32 (I_interface) | Adds membership to a multicast group. This option is only valid for UDP sockets. |
| | | (<u></u> | I_multiaddr IP address of multicast group to join. |
| | | | I_interface IP address of interface to join (own IP address) |
| | | | By joining a multicast group the local multicast router will be notified about the multicast membership (using IGMP) and the local interface network driver will enable reception of multicast datagrams destined for this multicast address. |
| IP_DROP_MEMBER- SHIP | 0000000Dh | Struct of: UINT32 (I_multiaddr) UINT32 (I_interface) | Drops membership from a multicast group. This option is only valid for UDP sockets. |
| | | (= 33 33) | I_multiaddr IP address of multicast |
| | | | group to leave. I_interface IP address of interface (own IP address) |
| | | | By leaving a multicast group the local multicast router will be notified and the local interface network driver will disable reception of multicast datagrams destined for this multicast address. |
| TCP_NODELAY | 00002002h | UINT32 (I_nodelay) | Enables/disables the Nagle algorithm on a socket. This option is only valid on TCP sockets. |
| | | | I_nodelay 0:Nagle algorithm ON (default) |
| | | | I_nodelay Other:Nagle algorithm OFF |
| | | | For some applications, especially request/response applications, the performance over a TCP connection may be poor due to the interaction between the Nagle algorithm and the delayed acknowledgment functionality. Then the TCP_NODELAY option can be used to disable the Nagle algorithm to increase performance. |
| | | | For more information about Nagle algorithm see RFC 896. |

9.4 Mailbox File System Interface

The filesystem is available to the application through the mailbox interface. Commands in this category:

| Mailbox Command | Description | Page |
|--------------------------------|---|------|
| Open File (FILE_OPEN) | Open a file for reading, writing, or appending. | 95 |
| Close File (FILE_CLOSE) | Close a file previously opened using FILE_OPEN | 96 |
| Read File (FILE_READ) | Read data from a file | 97 |
| Write File (FILE_WRITE) | Write data to a file. | 98 |
| Delete File (FILE_DELETE) | Delete a file | 99 |
| Move File (FILE_MOVE) | Moves a file | 100 |
| Rename File (FILE_RENAME) | Rename a file | 101 |
| Copy File (FILE_COPY) | Copy a file | 102 |
| Create Directory (DIR_CREATE) | Create a new directory | 103 |
| Delete Directory (DIR_DELETE) | Delete an empty directory | 104 |
| Open Directory (DIR_OPEN) | Open a directory | 105 |
| Read Directory (DIR_READ) | Read contents of a directory previously opened using DIR_OPEN | 106 |
| Close Directory (DIR_CLOSE) | Close a directory previously opened using DIR_OPEN | 108 |
| Format File System (FORMAT_FS) | Formats the filesystem. | 109 |
| File system Checksum (CRC_FS) | Calculate and return the CRC for the File System | 110 |

9.4.1 Open File (FILE_OPEN)

Description

This command opens a file for reading, writing, or appending. If the specified file does not exist, it will be created.

Fieldbus Specific Message FILE_OPEN

Response data word 1 Response data word 2

• Mode

| Value | Mode |
|-------|---|
| 0000h | Open a file in read mode |
| 0001h | Open a file in write mode. If the specified file does not exist, it will be created. If the specified file already exists, it will be overwritten. |
| 0002h | Open a file in append mode. If the specified file does not exist, it will be created. If the specified file exists, any data written to the file will be appended at end-of-file. |

• Filesize

Current filesize (if applicable).

• File Handle

Unique identifier which must be used on all further operations associated with the file.

9.4.2 Close File (FILE_CLOSE)

Description

This command closes a file previously opened using FILE_OPEN.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0061h |
| Extended Header | File Handle, Filesize & Fault information. |
| Message data | - |
| Response data | - |

Command and response layout

| | Command |
|---------------------|--------------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0061h |
| Data size | 0000h |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | File Handle (high) |
| Extended word 2 | File Handle (low) |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | |
| Extended word 8 | - |

| Expected response | | |
|--------------------|--|--|
| (ID) | | |
| 0002h | | |
| 0061h | | |
| 0000h | | |
| 0001h | | |
| 0001h | | |
| 0000h | | |
| 0000h | | |
| File Handle (high) | | |
| File Handle (low) | | |
| Filesize (high) | | |
| Filesize (low) | | |
| | | |
| - | | |
| | | |
| Fault information | | |

Fieldbus Specific Message FILE_CLOSE

• File Handle

Handle of the file to close. See also "File Handle" on page 95.

• Filesize

Size of the file.

9.4.3 Read File (FILE_READ)

Description

This command reads data from a file previously opened in read mode using FILE_OPEN.

| Initiated by | Application |
|-----------------|---|
| Command no. | 0062h |
| Extended Header | File Handle, no. of bytes to read & Fault information |
| Message data | - |
| Response data | The read data is returned in the response data field. |

Command and response layout

| | Command |
|---------------------|--------------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0062h |
| Data size | 0000h |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | File Handle (high) |
| Extended word 2 | File Handle (low) |
| Extended word 3 | No. of bytes |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |

| Expected response | |
|--------------------|---------------------------|
| (ID) | |
| 0002h | Fieldbus Specific Message |
| 0062h | FILE_READ |
| (size) | Bytes read |
| 0001h | |
| 0001h | |
| 0000h | |
| 0000h | |
| File Handle (high) | |
| File Handle (low) | |
| No. of bytes | Maximum 256 bytes. |
| - | |
| | |
| - | |
| - | |
| Fault information | |
| | |
| Data | Response data |
| | |

• File Handle

File handle of the file to read data from. See also "File Handle" on page 95.

• No. of bytes

Number of bytes to read minus 1 (i.e. a value of 42 will read 43 bytes).

• Data

The actual data read from the file (if applicable).

9.4.4 Write File (FILE_WRITE)

Description

This mailbox command writes data to a file previously opened in write or append mode using FILE_OPEN.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0063h |
| Extended Header | File Handle & Fault information |
| Message data | Data to write |
| Response data | A 'Data size' value of 0 (zero) indicates that the command was unsuccessful, possibly due to a faulty handle, or that the module has run out of storage. |

Command and response layout

| | Command |
|---------------------|----------------------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0063h |
| Data size | (number of bytes to write) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | File Handle (high) |
| Extended word 2 | File Handle (low) |
| Extended word 3 | - |
| Extended word 4 | <u> </u> |
| Extended word 5 | - |
| Extended word 6 | |
| Extended word 7 | |
| Extended word 8 | - |
| Message data | Data |

| Expected response |
|---------------------------|
| (ID) |
| 0002h |
| 0063h |
| (number of written bytes) |
| 0001h |
| 0001h |
| 0000h |
| 0000h |
| File Handle (high) |
| File Handle (low) |
| - |
| - |
| - |
| - |
| - |
| Fault information |
| Data |

Fieldbus Specific Message FILE_WRITE Max. 256 bytes

• File Handle

File handle of the file to write data to. See also "File Handle" on page 95.

• No. of bytes

Number of bytes to write minus 1 (i.e. a value of 42 will read 43 bytes).

• Data

The actual data that shall be written.

9.4.5 Delete File (FILE_DELETE)

Description

This mailbox command deletes a file from the file system.

| Initiated by | Application |
|-----------------|---|
| Command no. | 0064h |
| Extended Header | Fault information |
| Message data | Name and path to the file to delete (NULL terminated) |
| Response data | The response data is a copy of the command data. |

Command and response layout

| | Command |
|---------------------|--|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0064h |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | |
| Message data | Path + filename (String, null-terminated) |

| Expected response | |
|---------------------------|--|
| (ID) | |
| 0002h | |
| 0064h | |
| (size) | |
| 0001h | |
| 0001h | |
| 0000h | |
| 0000h | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| Fault information | |
| Path + filename | |
| (String, null-terminated) | |

Fieldbus Specific Message FILE_DELETE Maximum 256 bytes

9.4.6 Move File (FILE_MOVE)

Description

This command renames a file in the filesystem.

Note: Although the filesystem supports path lengths of up to 256 characters, the total length of the source and destination paths summed together must be less than 256 characters when using this command due to limitations in the mailbox command structure.

| Initiated by | Application |
|-----------------|---|
| Command no. | 0065h |
| Extended Header | Fault information |
| Message data | Name + Path of source and destination, both NULL terminated |
| Response data | The response data is a copy of the command data. |

Command and response layout

| | Command |
|---------------------|--|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0065h |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |
| Message data | Source: Path + filename (String, null-terminated) |
| 3 | Destination: Path + filename (String, null-terminated) |

| Expected response |
|------------------------------|
| (ID) |
| 0002h |
| 0065h |
| (size) |
| 0001h |
| 0001h |
| 0000h |
| 0000h |
| - |
| - |
| - |
| - |
| - |
| - |
| - |
| Fault information |
| Source: Path + filename |
| (String, null-terminated) |
| Destination: Path + filename |
| (String, null-terminated) |

Fieldbus Specific Message FILE_MOVE Size of path strings

9.4.7 Rename File (FILE_RENAME)

Description

This command renames a file in the filesystem.

Note: Although the filesystem supports path lengths of up to 256 characters, the total length of the two pathnames summed together must be less than 256 characters when using this command due to limitations in the mailbox command structure.

| Initiated by | Application |
|-----------------|---|
| Command no. | 0066h |
| Extended Header | Fault information |
| Message data | Name + Path of source and destination, both NULL terminated |
| Response data | The response data is a copy of the command data. |

Command and response layout

| | Command |
|---------------------|--|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0066h |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |
| | Old: Path + filename |
| Message data | (String, null-terminated) |
| | New: Path + filename (String, null-terminated) |

| Expected response | |
|---------------------------|--|
| (ID) | |
| 0002h | |
| 0066h | |
| (size) | |
| 0001h | |
| 0001h | |
| 0000h | |
| 0000h | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| Fault information | |
| Old: Path + filename | |
| (String, null-terminated) | |
| New: Path + filename | |
| (String, null-terminated) | |

Fieldbus Specific Message FILE_RENAME Size of path strings

9.4.8 Copy File (FILE_COPY)

Description

This command copies a file in the filesystem to a specified location.

Note: Although the filesystem supports path lengths of up to 256 characters, the total length of the source and destination paths summed together must be less than 256 characters when using this command due to limitations in the mailbox command structure.

| Initiated by | Application | |
|-----------------|---|--|
| Command no. | 0067h | |
| Extended Header | Fault information | |
| Message data | essage data Name + Path of source and destination, both NULL terminated | |
| Response data | The response data is a copy of the command data. | |

Command and response layout

| | Command |
|---------------------|--|
| 1 | |
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0067h |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | |
| Extended word 2 | |
| Extended word 3 | |
| Extended word 4 | |
| Extended word 5 | |
| Extended word 6 | |
| Extended word 7 | |
| Extended word 8 | - |
| Mossaga data | Source: Path + filename (String, null-terminated) |
| Message data | Destination: Path + filename (String, null-terminated) |

| Expected response | |
|------------------------------|--|
| (ID) | |
| 0002h | |
| 0067h | |
| (size) | |
| 0001h | |
| 0001h | |
| 0000h | |
| 0000h | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| Fault information | |
| Source: Path + filename | |
| (String, null-terminated) | |
| Destination: Path + filename | |
| (String, null-terminated) | |

Fieldbus Specific Message FILE_COPY Size of path strings

9.4.9 Create Directory (DIR_CREATE)

Description

This command creates a directory in the file system.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0068h |
| Extended Header | Fault information |
| Message data | Path and name of the new directory, null terminated. |
| Response data | The response data is a copy of the command data. |

Command and response layout

| | Command |
|---------------------|--|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0068h |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |
| Message data | Path + name (String, null-terminated) |

| Expected response | |
|---------------------------|--|
| (ID) | |
| 0002h | |
| 0068h | |
| (size) | |
| 0001h | |
| 0001h | |
| 0000h | |
| 0000h | |
| - | |
| - | |
| - | |
| - | |
| - | |
| | |
| - | |
| Fault information | |
| Path + name | |
| (String, null-terminated) | |

Fieldbus Specific Message DIR_CREATE Size of path string

Doc.ld. HMSI-168-21

9.4.10 Delete Directory (DIR_DELETE)

Description

This command deletes an empty directory from the file system.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0069h |
| Extended Header | - |
| Message data | Path and name of the directory, null terminated. |
| Response data | The response data is a copy of the command data. |

Command and response layout

| | Command |
|---------------------|--|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0069h |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | |
| Extended word 7 | - |
| Extended word 8 | - |
| Message data | Path + name (String, null-terminated) |

| Expected response | |
|---------------------------|--|
| (ID) | |
| 0002h | |
| 0069h | |
| (size) | |
| 0001h | |
| 0001h | |

| Path + name | |
| (String, null-terminated) | |

Fieldbus Specific Message DIR_DELETE Size of path string

Doc.ld. HMSI-168-21

nybus-M EtherNet/IP

9.4.11 Open Directory (DIR_OPEN)

Description

This command opens a directory and returns a descriptor that should be used on all further operations on the directory.

See also "Reading the Contents of a Directory" on page 107.

| Initiated by | Application |
|-----------------|--|
| Command no. | 006Ah |
| Extended Header | - |
| Message data | Path and name of the directory, null terminated. |
| Response data | Directory handle & Fault information |

Command and response layout

| | Command |
|---------------------|--|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 006Ah |
| Data size | (size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |
| Message data | Path + name (String, null-terminated) |

| Expected response | |
|-------------------------|---------------------------|
| (ID) | |
| 0002h | Fieldbus Specific Message |
| 006Ah | DIR_OPEN |
| 0004h | |
| 0001h | |

| - | |
| - | |
| - | |
| Fault information | |
| Directory Handle (high) | Response data word 1 |
| Directory Handle (low) | Response data word 2 |

• Directory Handle

Unique identifier which must be used on all further operations associated with the directory.

9.4.12 Read Directory (DIR_READ)

Description

This command reads the contents of a directory previously opened using DIR_OPEN. This must be repeated until the response to the command is empty (i.e. until the response data size equals zero).

See also "Reading the Contents of a Directory" on page 107.

| Initiated by | Application |
|-----------------|--|
| Command no. | 006Bh |
| Extended Header | Directory Handle & Fault information |
| Message data | - |
| Response data | Details about one object in the directory. |

Command and response layout

| | Command |
|---------------------|-------------------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 006Bh |
| Data size | 0000h |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |

| (long) | Response data byte 3 |
| | Response data byte 4 |
| Object Flags | Response data byte 5 |
| Object Name (string, null-terminated) | Response data |

· Directory Handle

Unique identifier which must be used on all further operations associated with the directory.

• Object Size

Size of object (i.e. filesize).

· Object Flags

Various flags specifying the nature of the object:

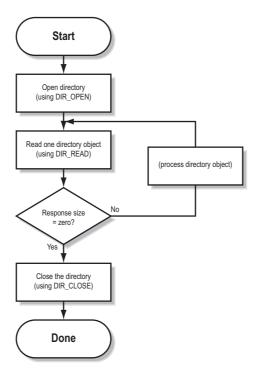

| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-----|----------------|-------|----|------------------------------------|----------------------------|------|-----|
| | (rese | rved) | | SYS | Н | RO | DIR |
| Bit | Description | | | | | | |
| DIR | Directory flag | | | 0: Object is a 1: Object is a | | | |
| RO | Read only | | | 0: Object can 1: Object is re | be read or wri ead-only | tten | |
| Н | Hidden | | | 0: Object is vi 1: Object is hi | | | |
| SYS | System | | | 0: User object 1: System obj | | | |

Object Name

Name of object, null-terminated (e.g. filename or directory name).

Reading the Contents of a Directory

The following flowchart illustrates the process of reading the contents of a directory:

9.4.13 Close Directory (DIR_CLOSE)

Description

This command closes a directory previously opened using DIR_OPEN.

See also "Reading the Contents of a Directory" on page 107.

| Initiated by | Application |
|-----------------|--------------------------------------|
| Command no. | 006Ch |
| Extended Header | Directory Handle & Fault information |
| Message data | - |
| Response data | - |

Command and response layout

9.5 EtherNet/IP Specific Commands

Commands in this category:

| Mailbox Command | Description | Page |
|---|---|------|
| Set Product Info (SET_PRO- DUCT_INFO) | Used for vendor customization | 112 |
| Get Product Info (GET_PRO- DUCT_INFO) | Used for vendor customization | 113 |
| Parameter Data Input Mapping (PARAMETER_IN_MAP) | Maps parameter input data into the parameter input object | 114 |
| Parameter Data Out Area Mapping (PARAMETER_OUT_MAP) | Maps parameter output data into the parameter input object | 116 |
| Send UCMM (SEND_UCMM) | Sends an unconnected message to another EthernNet/IP module | 118 |
| UCMM Request (UCMM_RE-QUEST) | Generated by the module when an UCMM request is addressed to a user-registered object | 120 |
| Register Class (REGISTER_CLASS) | Registers an EtherNet/IP object in the message router object | 121 |
| Deregister Class (DEREGISTER CLASS) | Deregisters a class that is already registered within the message router | 122 |
| Register Port (REGISTER_PORT) | Registers a port in the port object | 123 |
| Route Unconnected Send (ROUTE_REQUEST) | Generated by the module when it receives an unconnected send message. | 126 |
| Enable Exact IO Match (EXACT_IO_MATCH) | Only accept IO connection requests with the exact same sizes as the module has been initiated to. | 128 |
| Get Reset Parameter (GET_ID_RE-SET_PARAM) | Get reset parameter | 129 |
| Change Ethernet Port Number (CHANGE_ETH_PORT_NO) | Change the port number reported by the Port Object for the Ethernet port | 130 |
| Set Scanner Mode (SET_SCAN-NER_MODE) | Set scanner to Run or Idle | 131 |
| Create Connection Target Area (CREATE_CON_TARGET) | Use part of the Anybus IO area as connection target and create instances in the Assembly Object | 132 |
| Set UCMM Timeout (SET_UCMM TIMEOUT) | Set UCMM timeout | 133 |
| Get UCMM Timeout (GET_UCMM TIMEOUT) | Get UCMM timeout for display on e.g. a web page | 133 |
| Set Minimum Class1 O->T Timeout (SET_MIN_CLASS1_OT_TIMEOUT) | Set minimum timeout for Class1 O->T Connections | 135 |

9.5.1 Set Product Info (SET_PRODUCT_INFO)

Description

This command may be used to customize the settings in the Identity Object. Note that the .EDS-file must be adjusted accordingly.

Note: This command may only be issued during initialisation.

| Command initiator | Application |
|----------------------|--|
| Command number | 0082h |
| Extended Header data | - |
| Message data | Identity object information |
| Response message | The response holds a copy of the command data. |

Product serial number

• Product Name

1st byte holds the length of the name in bytes, followed by the actual name as pure ASCII.

9.5.3 Parameter Data Input Mapping (PARAMETER_IN_MAP)

Description

This mailbox command is used to set up blocks of data in the input data area to be used with the Class B0h "Parameter data input mapping object" (See "Parameter Data Input Mapping Object, Class B0h" on page 44). This way, a 'Get_Atrribute_Single' command from the fieldbus can return a specified block of data from the input parameter area. It is possible to map up to 50 attributes.

Attributes are mapped beginning with attribute 1, followed by attributes 2 through 50. Offset in the input parameter area and number of bytes to map is specified for each attribute.

If zero length is specified, the attribute will not be mapped. This way, it is for example possible to map only attributes 1 and 10 by specifying zero length for attributes 2 through 9. It is only necessary to include information in the telegram up to the last used attributes; the remaining attributes will not be mapped.

If any offset or length is invalid, the length and offset will be set to zero in the response and the attribute will not be mapped.

To access the parameters from EtherNet/IP use Class attribute B0h, Instance attribute 01h and Attribute ID 01h through 32h. (See "Parameter Data Input Mapping Object, Class B0h" on page 44)

Note: This command may only be issued during module initialisation, after ANYBUS_INIT.

| Command initiator | Application |

9.5.4 Parameter Data Out Area Mapping (PARAMETER_OUT_MAP)

Description

This mailbox command is used to set up blocks of data in the output data area to be used with the Class B1h "Parameter data output mapping object" (See "Parameter Data Output Mapping Object, Class B1h" on page 45). This way, a Get_Attribute_Single or Set_Attribute_Single command from the field-bus can return/write a specified block of data from/to the output parameter area. It is possible to map up to 50 attributes.

Attributes are mapped beginning with attribute 1, followed by attributes 2 through 50. Offset in the input parameter area and number of bytes to map is specified for each attribute.

If zero length is specified, the attribute will not be mapped. This way, it is for example possible to map only attributes 1 and 10 by specifying zero length for attributes 2 through 9. It is only necessary to include information in the telegram up to the last used attributes; the remaining attributes will not be mapped.

If any offset or length is invalid, the length and offset will be set to zero in the response and the attribute will not be mapped.

To access the parameters from EtherNet/IP use Class attribute B1h, Instance attribute 01h and Attribute ID no. (See "Parameter Data Output Mapping Object, Class B1h" on page 45)

Note: This command may only be issued during module initialisation, after ANYBUS_INIT.

| Command initiator | Application |
|----------------------|--|

9.5.5 Send UCMM (SEND_UCMM)

Description

This command may be used to send an explicit unconnected message directly to a node on the network. (For more information, consult the EtherNet/IP Specification volume 1, section 2-4). This command will not respond until the response from the remote host is received or a timeout has occurred.

| Command initiator | Application |
|----------------------|----------------------------------|
| Command number | 008Ah |
| Extended Header data | Destination IP address |
| Message data | Unconnected message ^a |
| Response message | (service dependant) |

a. For more information, consult the EtherNet/IP Specification volume 1, section 2-4

Command and response layout

| | Command | Expected response | |
|---------------------|------------------------------|--------------------------|---------------------------|
| Message ID | ID | ID | |
| Message information | 4002h | 0002h | Fieldbus Specific Message |
| Command | 008Ah | 008Ah | SEND_UCMM |
| Data size | (data size) | (data size) | Size of data |
| Frame count | 0001h | 0001h | |
| Frame number | 0001h | 0001h | |
| Offset high | 0000h | 0000h | |
| Offset low | 0000h | 0000h | |
| Extended word 1 | Destination IP high word | Destination IP high word | Destination IP high word |
| Extended word 2 | Destination IP low word | Destination IP low word | Destination IP low word |
| Extended word 3 | - | - | |
| Extended word 4 | - | - | |
| Extended word 5 | | - | |
| Extended word 6 | - | - | |
| Extended word 7 | - | - | |
| Extended word 8 | | Fault Information | |
| Message data byte 1 | Service Request | (Service Dependant) | |
| Message data byte 2 | Request Path Size (in words) | | |
| Message data byte 3 | Padded EPATH ^a | | |
| | | | |
| | (optional service data) | | |
| Message data byte n | | | |

a.EPATH is in little-endian format. See EtherNet/IP Specification, Appendix C - 'Data Management'

The following example (see next page) uses the SEND_UCMM command to retrieve data from a node on the network. The remote node is an Allen Bradley ControlLogix5000 with a 1756-ENBT/A Ethernet/IP module. It has VendorID 0001h, Product Type 000C, Product Code 003Ah, Version 1.33 and Serial Number 00121E63h. The request that is sent to the remote node is 'Get_Attribute_All' (0x01) to Class 0x01 and Instance 0x01. This is the identity object, see 5-2.2 in the EtherNet/IP specification for more information about the response.

Fieldbus Specific Message UCMM_REQUEST

Data size

9.5.6 UCMM Request (UCMM_REQUEST)

Description

This message is used when the application has registered an EtherNet/IP class (See "Register Class (REGISTER_CLASS)" on page 121) in the module, and an explicit message request has been generated to this class from a node in the EtherNet/IP network.

The format of the message is the message router / request format. (See EtherNet/IP Specification volume 1 section 2-4). The application will have to process the message, and respond to the module with the data necessary to generate a response on the explicit message request for the object.

9.5.7 Register Class (REGISTER_CLASS)

Description

This mailbox command makes it possible for the application to register objects inside the message router object. If there is a node on the network that sends an explicit message request to the module, address to the registered class, the explicit message will generate an explicit message request telegram, which will be sent from the module to the application. See "UCMM Request (UCMM_REQUEST)" on page 120.

| Command initiator | Application |
|----------------------|--|
| Command number | 008Bh |
| Extended Header data | Fault information |
| Message data | Class ID |
| Response message | The response holds a copy of the command data. |

ID of the class to be deregistered.

9.5.9 Register Port (REGISTER_PORT)

Description

This command may be used to register a port in the Port Object (See EtherNet/IP specification vol. 1 chapters 3 - 7). This must be done for each port in the application if routing has been enabled. The message shall contain the instance attributes 1, 2, 3, 4 and 7, in that order. The class attributes will be updated automatically after each received mailbox command. Port 2 is reserved for the anybus module, and it is not possible to register the same port twice.

Note: This command can only be sent during module initialization.

Fieldbus Specific Message REGISTER_PORT Size of data in bytes

a.See EtherNet/IP Specification, Appendix C - 'Data Management'

Register Port Example

The following example registers a ControlNet redundant port (3) with port number 3. The port object points to class F0h (ControlNet object) instance 01h. The name of the port is "ControlNet", and the node address is 8 on port 3.

Continued on next page...

The [Port] section in the .EDS file shall look like this to suit the example above:

Doc.ld. HMSI-168-21

9.5.10 Route Unconnected Send (ROUTE_REQUEST)

Description

This mailbox message is generated by the module when it receives a valid unconnected send message, i.e. a message addressed to a port registered by the application. The message data contains the whole unconnected send message (See EtherNet/IP spec. Vol. 1 3-5.5.4). The response from the application must contain either a successful or unsuccessful unconnected send response (See EtherNet/IP spec. Vol. 1 3-5.5.4).

If 16 or more message requests are waiting to be processed by the application, the module will respond with a "No resource" error code for all new requests until there are less than 16 unprocessed requests.

| Command initiator | Anybus |
|----------------------|---|
| Command number | 008Fh |
| Extended Header data | - |
| Message data | The unconnected send message received by the module |
| Response message | Unconnected send response message. |

9.5.11 Enable Exact IO Match (EXACT_IO_MATCH)

Description

If this mailbox command is sent, the module will only accept IO connection requests with the exact same IO sizes as those that have been configured for the module.

Note 1: This command can only be sent during module initialization.

Note 2: This command has to be sent if the application is to pass the conformance test.

9.5.15 Create Connection Target Area (CREATE_CON_TARGET)

Description

This command may be used to set up a part of the IO area as a target for an EtherNet/IP connection. When issued, instances 100 and 150 will be created in the Assembly Object accordingly.

Note: This command may only be issued during initialisation, after ANYBUS_INIT.

| Command initiator | Application |
|----------------------|--|
| Command number | 0097h |
| Extended Header data | - |
| Message data | Number of words (Produce & Consume) |
| Response message | The response holds a copy of the command data. |

• No. of words (Consume)

Number of words to use for Consume Area (Instance 150)

9.5.16 Set UCMM Timeout (SET_UCMM_TIMEOUT)

Description

This command is used to set the UCMM timeout in milliseconds. Valid range is 1000 - 30000.

NOTE: The module has to be restarted for a change to the timeout value from this mailbox to take effect.

| Command initiator | Application |
|----------------------|--|
| Command number | 0099h |
| Extended Header data | - |
| Message data | UCMM timeout in milliseconds. Valid values: 1000 - 30000 |
| Response message | The response holds a copy of the command data. |

9.5.18 Set Minimum Class1 O->T Timeout (SET_MIN_CLASS1_OT_TIME-OUT)

Description

This command is used to set the minimum timeout for the Class1 connections in the Originator to Target direction (connections originated by the module). If this mailbox is used the Connection Timeout Multiplier attribute (conn_timeout) in the Connection Configuration object will be altered to conform to the value set in this command.

Valid range is 8 - 1024.

See also...

• "Connection Configuration Object, Class F3h" on page 46

Note: This command can only be sent during module initialization.

| Command initiator | Application |
|----------------------|--|
| Command number | 00B0h |
| Extended Header data | - |
| Message data | Minimum timeout in milliseconds. Valid range is: 8 - 1024. |
| Response message | The response holds a copy of the command data. |

EtherNet/IP 1.2 Doc.ld. HMSI-168-21

9.6 Other Commands

Commands in this category:

| Mailbox Command | Description | Page |
|--|---|------|
| Get DIP Switch GET_DIP_SWITCH | Returns the setting of the onboard DIP switch | 137 |
| DNS Request (DNS_REQUEST) | Asks the configured DNS server for the IP address of a specified host | 138 |
| Send Email (SEND_EMAIL) | Sends an email message to a specified recipient | 139 |
| Request SSI Data (REQUEST_SSI_DATA) | Requests SSI data from the application (issued by the Anybus module) | 141 |
| Write SSI Data (WRITE_SSI_DATA) | Writes SSI data to the application (issued by the Anybus module) | 142 |

Anybus-M EtherNet/IP Doc.Rev. 1.2 Doc.ld. HMSI-168-21

9.6.1 Get DIP Switch (GET_DIP_SWITCH)

Description

This command returns the setting of the onboard switch.

| Initiated by | Application |
|-----------------|--------------|
| Command no. | 0012h |
| Extended Header | - |
| Message data | - |
| Response data | Switch value |

Command and response layout

| | Command |
|---------------------|---------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0012h |
| Data size | 0000h |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | - |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |

| Expected response | |
|-------------------|---------------------------|
| (ID) | |
| 0002h | Fieldbus Specific Message |
| 0012h | GET_DIP_SWITCH |
| 0001h | 1 data byte |
| 0001h | |
| 0001h | |
| 0000h | |
| 0000h | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| Fault information | |
| Switch Value | Response databyte |

Switch Value

| b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|----------|----------|----------|----------|----------|----------|----------|----------|
| Switch 1 | Switch 2 | Switch 3 | Switch 4 | Switch 5 | Switch 6 | Switch 7 | Switch 8 |

A set bit indicates that the switch is in ON position.

9.6.2 DNS Request (DNS_REQUEST)

Description

This command sends a request to the configured DNS server for the IP address of a specified host.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0030h |
| Extended Header | - |
| Message data | Host (string, null-terminated) |
| Response data | IP address of host, or 0.0.0.0 if not found. |

Command and response layout

| | Command |
|---------------------|--------------------------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0030h |
| Data size | (size) |

| IP address (high) | Response data word 1 |
| IP address (low) | Response data word 2 |
| | |

Anybus-M EtherNet/IP
Doc.Rev. 1.2
Doc.Id. HMSI-168-21

9.6.3 Send Email (SEND_EMAIL)

Description

This command sends an email to a specified recipient. The message data is sent as several fragments, with a total maximum size of 1024 bytes. The maximum size of each fragment is 256 bytes.

| Initiated by | Application |
|-----------------|--|
| Command no. | 0070h |
| Extended Header | Fault information |
| Message data | Email message specification, fragmented. |
| Response data | The response data is a copy of the command data. |

Command and response layout

| | Command |
|---------------------|-----------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 0070h |
| Data size | (fragment size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | Fragment Type |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |

| - | |
| SMTP Error | (Last fragment only) |
| Fault information | |
| Fragment Data | |

Anybus-M EtherNet/IP
Doc.Rev. 1.2
Doc.Id. HMSI-168-21

• Fragment Type

This value must match the sequence of the fragments as follows:

| Value | Description |
|-------|-------------------------------|
| 0000h | This is the first fragment |
| 0001h | This is a subsequent fragment |
| 0002h | This is the last fragment |

• SMTP Error

If an SMTP error occurred, the 'SMTP Error' word contains the error code from the SMTP server, see RFC 821 "Simple Mail Transfer Protocol" for more information.

• Fragment Data

The different parts of the email message shall be sent in the following order:

| Fragment no. | Fragment Type | Description | |
|-----------------|---------------|--|--|
| 1st | 0000h | Recipient(s), separated by semicolon (string, null-terminated) | |
| 2nd | 0001h | Sender address (string, null-terminated) | |
| 3rd | | Subject line (string, null-terminated) | |
| 4th | | Message body | |
| | | | |
| | | | |
| | | | |
| | | | |
| (last fragment) | 0002h | | |

9.6.4 Request SSI Data (REQUEST_SSI_DATA)

Description

This message is issued by the Anybus module when a SSI has requested data from the application.

Example:

The following SSI...

<?--#exec cmd_argument='printf("Data: %u", MbReadWord(42))'-->

... will cause the module to issues a REQUEST_SSI_DATA message. The value '42' will be passed to the application.

See also "printf" on page 23.

| Initiated by | Anybus |
|-----------------|----------------|
| Command no. | 00A0h |
| Extended Header | SSI Identifier |
| Message data | SSI Data |
| Response data | - |

Command and response layout

| | Command |
|---------------------|----------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 00A0h |
| Data size | 0000h |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | SSI Identifier |
| Extended word 2 | - |
| Extended word 3 | - |
| Extended word 4 | - |
| Extended word 5 | - |
| Extended word 6 | - |
| Extended word 7 | - |
| Extended word 8 | - |
| | |

| Expected response | |

| (ID) | |
| 0002h | Fie |
| 00A0h | RE |
| (data size) | (Si |
| 0001h | İ |
| 0001h | |
| 0000h | |
| 0000h | |
| SSI Identifier | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| - | |
| SSI Data | Re |
| | J |

Fieldbus Specific Message REQUEST_SSI_DATA (size of data)

Response Data

• SSI Identifier

Identifier which can be used as desired by the application to address a specific block of data.

SSI Data

Data associated with the specified SSI Identifier.

9.6.5 Write SSI Data (WRITE_SSI_DATA)

Description

This message is issued by the Anybus module when a SSI writes data to the application.

Example:

The following SSI...

<?--#exec cmd_argument='scanf("Input", "%i", MbWriteWord(24))'-->

... will cause the module to issues a WRITE_SSI_DATA message each time a form with an object named "Input" is sent to the web server. The value '24' will be passed to the application.

See also "scanf" on page 25.

| Initiated by | Anybus |
|-----------------|----------------|
| Command no. | 00A0h |
| Extended Header | SSI Identifier |
| Message data | - |
| Response data | SSI Data |

Command and response layout

| | Command |
|---------------------|----------------|
| Message ID | (ID) |
| Message information | 4002h |
| Command | 00A1h |
| Data size | (data size) |
| Frame count | 0001h |
| Frame number | 0001h |
| Offset high | 0000h |
| Offset low | 0000h |
| Extended word 1 | SSI Identifier |

| - |

Fieldbus Specific Message WRITE_SSI_DATA (size of data)

• SSI Identifier

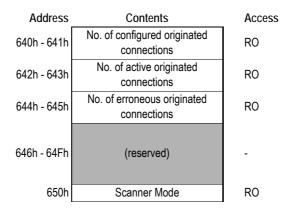

Identifier which can be used as desired by the application to address a specific block of data.

SSI Data

Data associated with the specified SSI Identifier.

10. Fieldbus Specific Area

10.1 Memory Map

• No. of Configured Originated Connection

Number of connections that are configured in the Connection Object.

• No. of Active Originated Connection

Number of connections that are configured and opened without errors.

• No. of Erroneous Originated Connection

Number of connections that cannot be opened because of errors.

• Scanner Mode

0: Idle

1: Run

A. Miscellaneous

A.1 Control Register Area

Fieldbus Type

The fieldbus type value for this product is 0085h.

Module Type

The module type value for this product is 0201h (Anybus-M).

Watchdog Counter Input (7D2h... 7D3h)

If the application has enabled the Watchdog Counter Input and doesn't update it properly, the module will cease all network participation and indicate an internal error on the Module Status LED.

Event Notification Cause/Source Registers

- ON/OFF Line Indication (FBON/FBOF)
 The module is considered on-line when a link has been established on the Ethernet interface.
- Network Reset Functionality (RST)
 The application can be notified of network reset requests via the Event Notification register.

A.2 Firmware Upgrade

The Anybus module supports firmware updates via FTP. Follow the steps below:

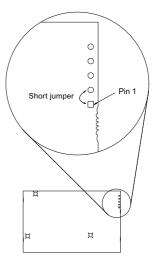

- 1. As a precaution, make a backup copy of the filesystem contents before proceeding.
- 2. Initialise the module
- **3.** Upload the new firmware file(s) to the system root ("\"), or to the 'cfg\'-directory.
- **4.** Reset the Anybus module and wait until the on board LED (watch dog LED) flashes 2Hz green (This may take up to 1 minute).
- **5.** Reset the Anybus module.

The new firmware is now operational.

A.3 Formatting the File System

In case of major file system damage, it is possible to reinitialize the file system as follows:

- 1. Attach a short jumper to the PCB as shown in figure. Apply power.
- 2. Wait until the watchdog LED turns red.
- 3. Disconnect power.
- **4.** Remove jumper.
- **5.** Apply power.
- **6.** Wait approx. 1 minute while the filesystem is being formatted.

B. Technical Specification

B.1 Electrical Specification

B.1.1 Protective Earth (PE) Requirements

All Anybus-S/M modules feature cable shield filters designed in accordance with each network standard. To be able to support this, the application *must* provide a connection to PE (Protective Earth) as described in the general Anybus-S Parallel Design Guide. HMS cannot guarantee proper EMC behaviourAnybus-M EtherNet/IP unless this requirement is fulfilled.

B.1.2 Isolation

Isolation between the application, the network, and protective earth (PE):

| Isolation Barrier | Wor | Working Voltage | | Distance | |
|------------------------|----------|-----------------|----------|----------|--|
| | Creepage | Clearance | External | Internal | |
| Application to PE | 200V | 2500V | 2.0mm | 0.4mm | |
| Application to Network | 250V | 2500V | 2.5mm | 0.4mm | |
| Network to PE | 100V | 1500V | 1.4mm | 0.4mm | |

(Tests performed according to EN 60950-1)

B.1.3 Power Supply

Supply Voltage

The module requires a regulated 5V power supply as specified in the Anybus-S Parallel Design Guide.

Power Consumption

The maximum power consumption is 450mA.

Temperature

Tests performed according to IEC-60068-2-1, IEC-60068-2-2 and IEC 60068-2-14.

Operating: 0 to 70°C(32 to 158°F) Storage: -25 to 85°C(-13 to 185°F)

Humidity

The product is designed for a relative humidity of 5 to 95% non-condensing.

Tests performed according to EN 60068.

B.3 EMC (CE) Pre-compliance

EMC pre-compliance testing has been conducted according to the Electromagnetic Compatibility Directive 2004/108/EC. For more information please consult the EMC pre-compliance document, see product/support pages for Anybus-M EtherNet/IP at www.anybus.com.

C. Connectors

C.1 Application Connector

(Consult the general Anybus-S Parallel Design Guide for more information)

C.2 Ethernet

RJ45 (Standard Connector)

| Pin | Signal | Notes | |
|-----|--------|---|--|
| 1 | TD+ | - | |
| 2 | TD- | - | |
| 3 | RD+ | - | |
| 4 | - | Normally left unused; to ensure signal integrity, these pins are tied together and terminated to PE via a filter circuit in the module. | |
| 5 | - | | |
| 6 | RD- | | |
| 7 | - | Normally left unused; to ensure signal integrity, these pins are tied together and terminated to PE via a filter circuit in the module. | |
| 8 | - | | |

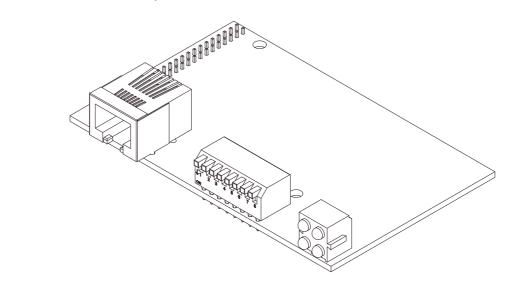

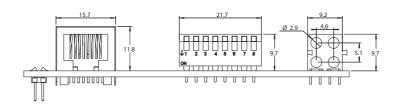

Board to Board

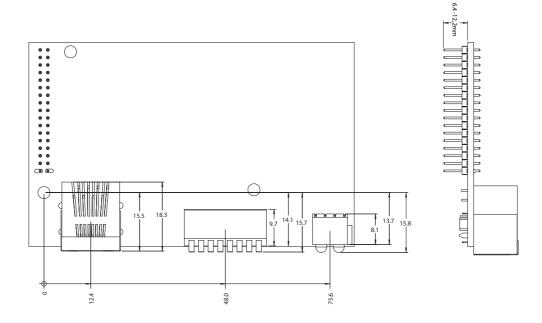

| Pin | Signal | Connect to RJ45 pin | Notes |
|-----|--------|---------------------|--|
| 1 | Shield | Housing | - |
| 2 | - | 4 | (See notes for pins 4 and 5 in RJ45 connector) |
| 3 | - | 5 | |
| 4 | - | - | (not used) |
| 5 | TD+ | 1 | - |
| 6 | TD- | 2 | - |
| 7 | RD+ | 3 | - |
| 8 | - | 7 | (See notes for pins 7 and 8 in RJ45 connector) |
| 9 | RD- | 6 | - |
| 10 | - | 8 | (See notes for pins 7 and 8 in RJ45 connector) |
