pst-circ

A PSTricks package for drawing electric circuits; v.2.18

Herbert Voß

April 28, 2021

Contents

Abstract

The package `pst-circ` is a collection of graphical elements based on PStricks that can be used to facilitate display of electronic circuit elements. For example, an equivalent circuit of a voltage source, its source impedance, and a connected load can easily be constructed along with arrows indicating current flow and potential differences. The emphasis is upon the circuit elements and the details of the exact placement are hidden as much as possible so the author can focus on the circuitry without the distraction of sorting out the underlying vector graphics.

`pst-circ` loads by default the following packages: `pst-node`, `multido`, `pst-xkey`, and, of course `pstricks`. All should be already part of your local TEX installation. If not, or in case of having older versions, go to http://www.CTAN.org/ and load the newest version.

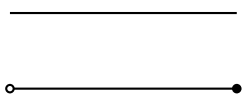
1 The basic system

1.1 Parameters

There are specific parameters defined to change easily the behaviour of the `pst-circ` objects you are drawing. You'll find a list in Section 8 on p. 82.

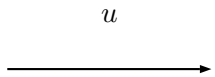
1.2 Macros

Wire



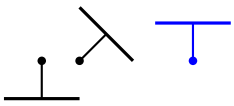
```
\begin{pspicture}(3,2)
   \pnodes(0,1){A}(3,1){B}\wire(A)(B)
   \pnodes(0,0){A}(3,0){B}\wire[arrows=o-*](A)(B)
\end{pspicture}
```

Potential



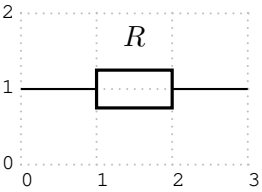
```
\begin{pspicture}(3,2)
   \pnodes(0,1){A}(3,1){B}
   \tension(A)(B){$u$}
\end{pspicture}
```

Ground

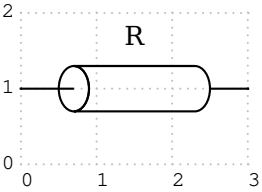


```
\begin{pspicture}(3,2)
   \pnodes(0.5,1){A}(1,1){B}(2.5,1){C}
   \ground(A)
   \ground{135}(B)
   \ground[linecolor=blue]{180}(C)
\end{pspicture}
```

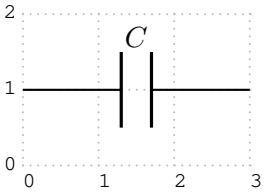
Dipole macros



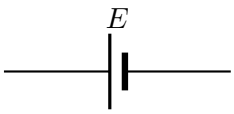
```
\begin{pspicture}[showgrid=true](3,2)
  \pnodes(0,1){A}(3,1){B}
  \resistor(A)(B){$R$}
\end{end{pspicture}
```



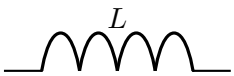
```
\begin{pspicture}[showgrid=true](3,2)
  \pnodes(0,1){A}(3,1){B}
  \RFLine(A)(B){R}
\end{end{pspicture}
```



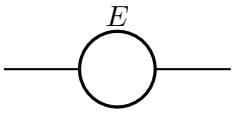
```
\begin{pspicture}[showgrid=true](3,2)
 \pnodes(0,1){A}(3,1){B}
 \capacitor(A)(B){$C$}
\end{pspicture}
```



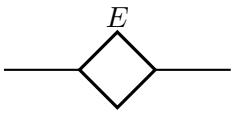
```
\begin{pspicture}(3,2)
 \pnodes(0,1){A}(3,1){B}
 \battery(A)(B){$E$}
\end{pspicture}
```



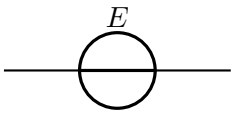
```
\begin{pspicture}(3,2)
 \pnodes(0,1){A}(3,1){B}
 \coil(A)(B){$L$}
\end{pspicture}
```



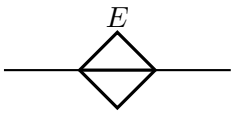
```
\begin{pspicture}(3,2)
 \pnodes(0,1){A}(3,1){B}
 \Ucc[dipolestyle=normal](A)(B){$E$}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
 \pnodes(0,1){A}(3,1){B}
 \Ucc[dipolestyle=diamond](A)(B){$E$}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
 \pnodes(0,1){A}(3,1){B}
 \Ucc[dipolestyle=normalCei](A)(B){$E$}
\end{pspicture}
```



```

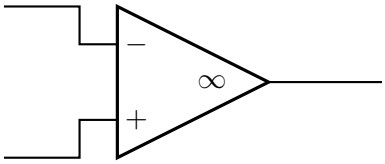
  \cell[labeloffset=1cm](A)(B){Cell}
\end{pspicture}
```

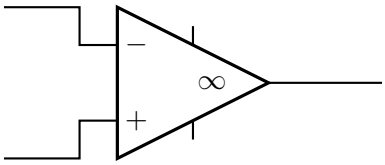
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \igbt[labeloffset=0.7cm, IGBTinvert=false](A)(B){IGBT}
\end{pspicture}
```

Tripole macros

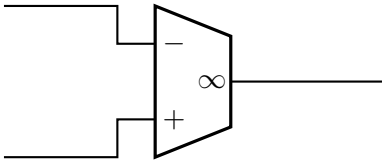
Obviously, tripoles are not node connections. So `pst-circ` tries its best to adjust the position of the tripole regarding the three nodes. Internally, the connections are done by the `\ncangle` pst-node macro. However, the auto-positionning and the auto-connections are not always well chosen, so don't try to use tripole macros in strange situations!



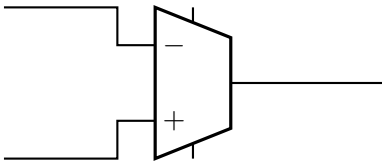
```
\begin{pspicture}(5,2)
  \pnodes(0,0){A}(0,2){B}(5,1){C}
  \OA(B)(A)(C)
\end{pspicture}
```



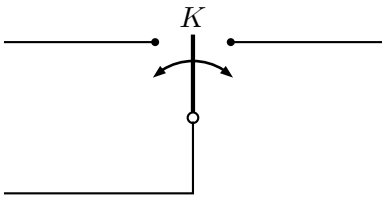
```
\begin{pspicture}(5,2)
 \pnodes(0,0){A}(0,2){B}(5,1){C}
 \OA[OApower=true](B)(A)(C)
\end{pspicture}
```



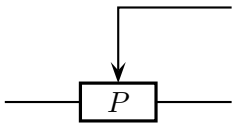
```
\begin{pspicture}(5,2)
 \pnodes(0,0){A}(0,2){B}(5,1){C}
 \GM[GMperfect=true](B)(A)(C)
\end{pspicture}
```



```
\begin{pspicture}(5,2)
 \pnodes(0,0){A}(0,2){B}(5,1){C}
 \GM[GMpower=true](B)(A)(C)
\end{pspicture}
```

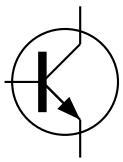


```
\begin{pspicture}(5,2)
   \pnodes(0,2){A}(5,2){B}(0,0){C}
   \Tswitch(A)(B)(C){$K$}
\end{pspicture}
```

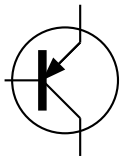


```
\begin{pspicture}(3,3)
   \pnodes(0,1){A}(3,1){B}(3,2.25){C}
   \potentiometer[labeloffset=0pt](A)(B)(C){$P$}
\end{pspicture}
```

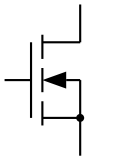
There are many types of transistors included : NPN, PNP, JFET (N and P channels), D-MOSFET (N and P channels), FET (E-MOSFET N and P channels), NMOS, PMOS and IGBT. It's the macro `\transistortype` (and options `\FETchanneltype` and `\DMOSFET`) that determines which transistor will be drawn.



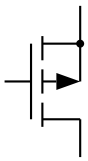
```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.5cm](A)(B)(C)
\end{pspicture}
```



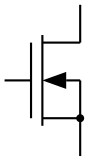
```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.5cm, transistortype=PNP](A)(B)(C)
\end{pspicture}
```



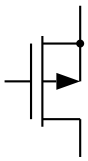
```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.35cm, transistortype=FET](A)(B)(C)
\end{pspicture}
```



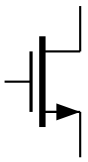
```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.35cm, transistortype=FET, FETchanneltype=P
       ](A)(B)(C)
\end{pspicture}
```



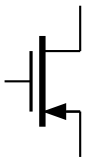
```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.35cm, transistortype=FET, DMOSFET=true](A)
       (B)(C)
\end{pspicture}
```



```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.35cm, transistortype=FET, FETchanneltype=P
       , DMOSFET=true](A)(B)(C)
\end{pspicture}
```



```
\begin{pspicture}(0,0)(2,2)
   \pnodes(0,1){A}(1,0){B}(1,2){C}
   \transistor[basesep=0.35cm, transistortype=NMOS](A)(B)(C)
\end{pspicture}
```



```
\begin{pspicture}(0,0)(2,2)

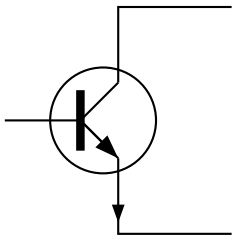
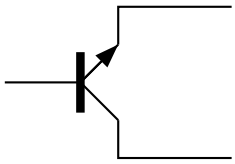
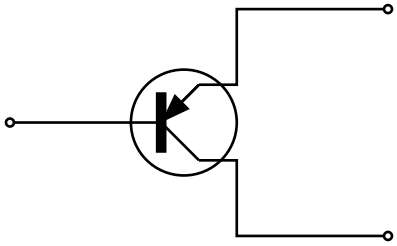
  \transistor[basesep=2cm,arrows=o-o](A)(B)(C)
\end{pspicture}
```



```
\begin{pspicture}(3,4)
\pnode(0,2){A}\pnode(3,0.5){B}
\pnode(3,3.5){C}
\transistor[transistoriemitter=true,
  basesep=1cm](A)(B)(C)
\end{pspicture}
```

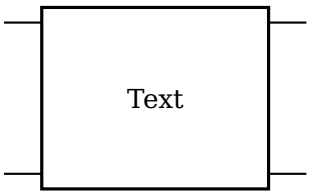


```
\begin{pspicture}(3,3.5)
\pnode(0,2){A}\pnode(3,1){B}
\pnode(3,3){C}
\transistor[transistorinvert,
  basesep=1cm,transistorcircle=false](A)(B)(C)
\end{pspicture}
```

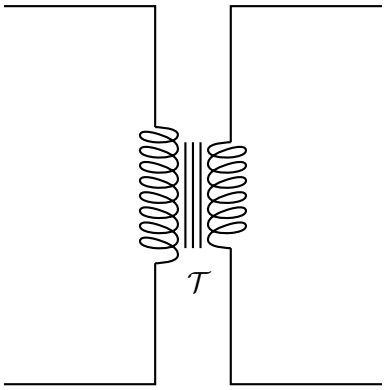


```
\begin{pspicture}(5,3)
  \pnode(0,1.5){A}\psset{linewidth=1pt}
  \transistor[transistortype=PNP,basesep=2cm,
    arrows=o-o](A){Emitter}{Collector}
  \psline{o-}(5,3)(3,3)(3,3|Collector)(Collector)
  \psline{o-}(5,0)(3,0)(3,3|Emitter)(Emitter)
  \psline{o-}(A)([nodesep=2]A)
\end{pspicture}
```

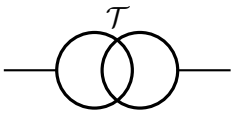
Quadrupole macros



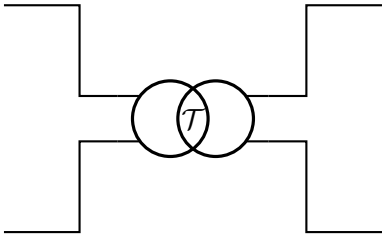
```
\begin{pspicture}(5,3)
 \pnodes(0,2.5){A}(0,0.5){B}%
       (4,2.5){C}(4,0.5){D}
 \quadripole(A)(B)(C)(D){Text}
\end{pspicture}
```



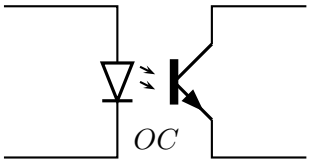
```
\begin{pspicture}(5,5)
 \pnodes(0,5){A}(0,0){B}%
       (5,5){C}(5,0){D}
 \transformer(A)(B)(C)(D){$\mathcal T$}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
 \pnodes(0,1){A}(3,1){B}
 \newtransformer(A)(B){$\mathcal T$}
\end{pspicture}
```



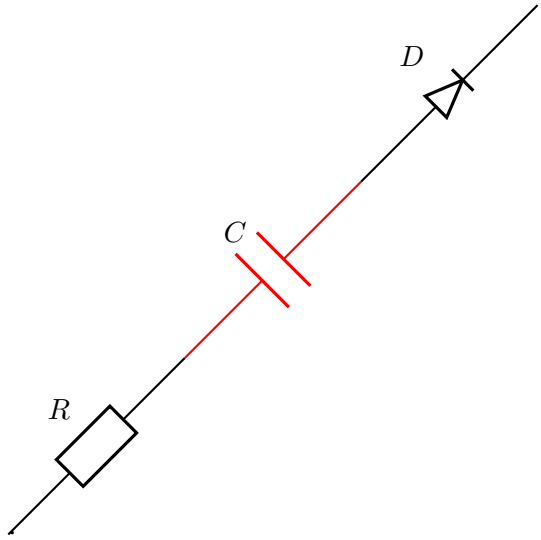
```
\begin{pspicture}(5,3)
 \pnodes(0,3){A}(0,0){B}%
      (5,3){C}(5,0){D}
 \newtransformerquad(A)(B)(C)(D)%
   {$\mathcal T$}
\end{pspicture}
```



```
\begin{pspicture}(5,3)
 \pnodes(0,2.5){A}(0,0.5){B}%
       (4,2.5){C}(4,0.5){D}
 \optoCoupler(A)(B)(C)(D){$OC$}
\end{pspicture}
```

Multidipole

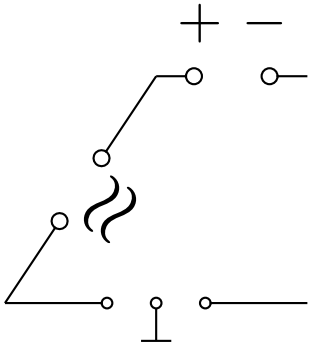
`\multidipole` is a macro that allows multiple dipoles to be drawn between two specified nodes. `\multidipole` takes as many arguments as you want. Note the dot that is after the last dipole.



```
\begin{pspicture}(7,7)
  \pnodes(0,0){A}(7,7){B}
  \multidipole(A)(B)\resistor{$R$}%
    \capacitor[linecolor=red]{$C$}%
    \diode{$D$}{}.
\end{pspicture}
```

Important: for the time being, `\multidipole` takes optional arguments but does not restore original values. We recommand not using it.

Open dipol and open tripol

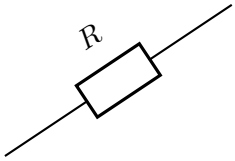


```
\def\Wave{\psscalebox{3}{$\approx$}}
\def\PM{\psscalebox{2}{$+\,\,-$}}
\begin{pspicture}(4,3)
\pnodes(0,0){A}(2,3){B}(4,3){C}(4,0){D}
\OpenDipol[radius=3pt,labelangle=:U,
  labeloffset=-0.5](A)(B){\Wave}
\OpenDipol[radius=3pt,labelangle=:U](B)(C){\PM}
\OpenTripol(A)(D){}
\end{pspicture}
```

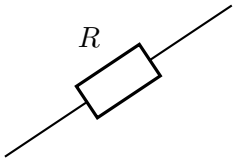
1.3 Parameters

Label parameters

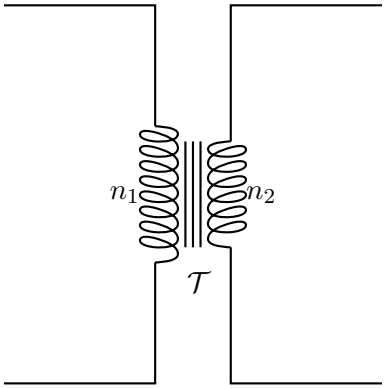
```
\begin{pspicture}(3,1)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[labeloffset=0](A)(B){$R$}
\end{pspicture}
```



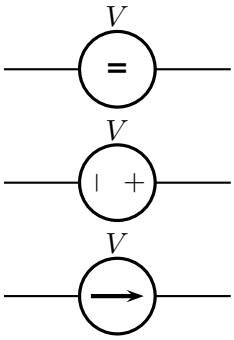
```
\begin{pspicture}(3,2)
  \pnodes(0,0){A}(3,2){B}
  \resistor[labelangle=:U](A)(B){$R$}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnodes(0,0){A}(3,2){B}
  \resistor[labelangle=0](A)(B){$R$}
\end{pspicture}
```



```
\begin{pspicture}(5,5)
  \pnodes(0,5){A}(0,0){B}(5,5){C}(5,0){D}
  \transformer[primarylabel=$n_1$,
    secondarylabel=$n_2$](A)(B)(C)(D){$\mathcal T$}
\end{pspicture}
```

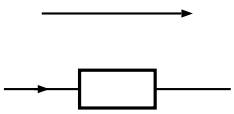


```
\begin{pspicture}(3,4.5)
  \pnodes(0,.5){A}(3,.5){B}
  \Ucc[labelInside=1](A)(B){$V$}
  \pnodes(0,2){A}(3,2){B}
  \Ucc[labelInside=2](A)(B){$V$}
  \pnodes(0,3.5){A}(3,3.5){B}
  \Ucc[labelInside=3](A)(B){$V$}
\end{pspicture}
```

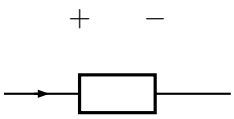
Current intensity and electrical potential parameters

If the `intensity` parameter is set to `true`, an arrow is drawn on the wire connecting one of the nodes to the dipole. If the `tension` parameter is set to `true`, an arrow is drawn parallel to the dipole.

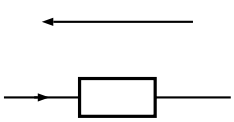
The way those arrows are drawn is set by `dipoleconvention` and `directconvention` parameters. `dipoleconvention` can take two values : `generator` or `receptor`. `directconvention` is a boolean.



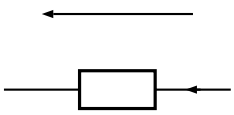
```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensity,tension](A)(B){}
\end{pspicture}
```



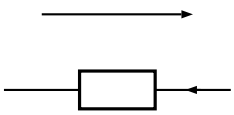
```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensity,tension,tensionstyle=pm](A)(B){}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensity,tension,dipoleconvention=generator](A)(B){}
\end{pspicture}
```

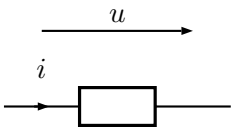


```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensity,tension,directconvention=false](A)(B){}
\end{pspicture}
```

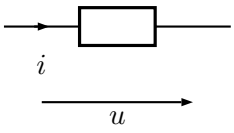


```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensity,tension,
    dipoleconvention=generator,directconvention=false](A)(B){}
\end{pspicture}
```

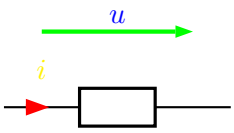
If `intensitylabel` is set to an non empty argument, then `intensity` is automatically set to true. If `tensionlabel` is set to an non empty argument, then `tension` is automatically set to true.



```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensitylabel=$i$,tensionlabel=$u$](A)(B){}
\end{pspicture}
```

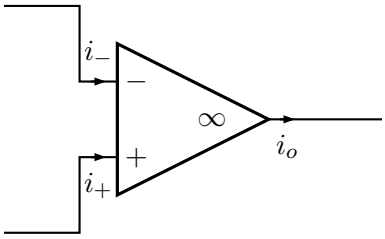


```
\begin{pspicture}(3,2)
  \pnodes(0,1.5){A}(3,1.5){B}
  \resistor[intensitylabel=$i$,intensitylabeloffset=-0.5,
    tensionlabel=$u$,tensionlabeloffset=-1.2,
    tensionoffset=-1](A)(B){}
\end{pspicture}
```

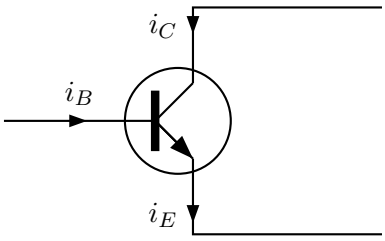


```
\begin{pspicture}(3,2)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor[intensitylabel=$i$,intensitywidth=3\pslinewidth,
    intensitycolor=red,intensitylabelcolor=yellow,
    tensionlabel=$u$,tensionwidth=2\pslinewidth,
    tensioncolor=green,tensionlabelcolor=blue](A)(B){}
\end{pspicture}
```

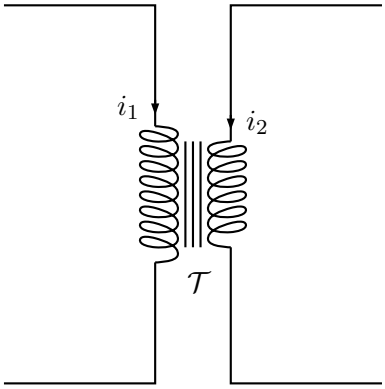
Some specific intensity parameters are available for tripoles and quadrupoles.



```
\begin{pspicture}(5,3)
  \pnodes(0,0){A}(0,3){B}(5,1.5){C}
  \OA[OAipluslabel=$i_+$,
    OAiminuslabel=$i_-$,
    OAioutlabel=$i_o$](B)(A)(C)
\end{pspicture}
```



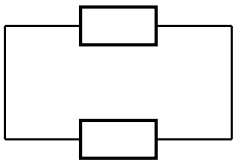
```
\begin{pspicture}(5,3)
  \pnodes(0,1.5){A}(5,0){B}(5,3){C}
  \transistor[basesep=2cm,transistoribaselabel=$i_B$,
    transistoricollectorlabel=$i_C$,
    transistoriemitterlabel=$i_E$](A)(B)(C)
\end{pspicture}
```



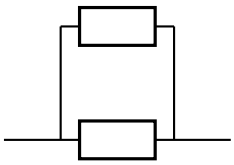
```
\begin{pspicture}(5,5)
  \pnodes(0,5){A}(0,0){B}(5,5){C}(5,0){D}
  \transformer[transformeriprimarylabel=$i_1$,
    transformerisecondarylabel=$i_2$]%
    (A)(B)(C)(D){$\mathcal T$}
\end{pspicture}
```

Parallel parameters

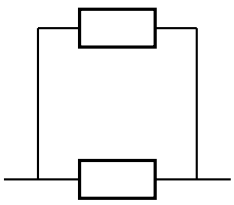
If the `parallel` parameter is set to `true`, the dipole is drawn parallel to the line connecting the nodes.



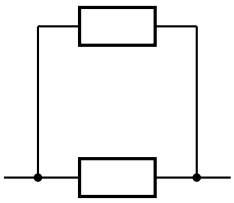
```
\begin{pspicture}(3,3)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor(A)(B){}
  \resistor[parallel](A)(B){}
\end{pspicture}
```



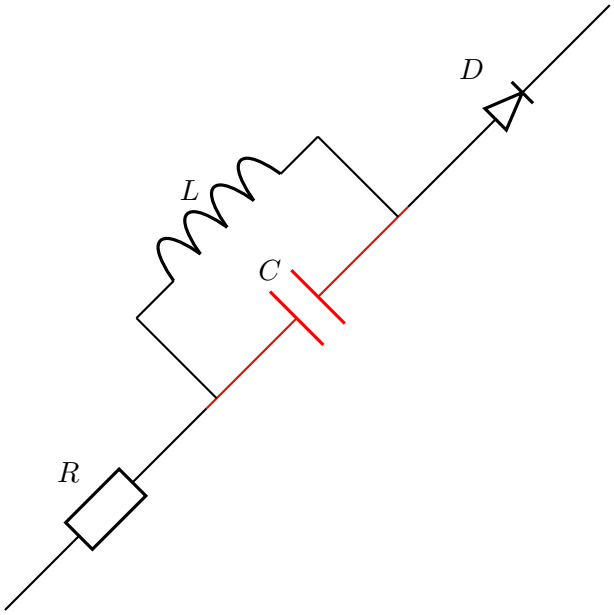
```
\begin{pspicture}(3,3)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor(A)(B){}
  \resistor[parallel,parallelsep=.5](A)(B){}
\end{pspicture}
```



```
\begin{pspicture}(3,3)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor(A)(B){}
  \resistor[parallel,parallelsep=.3,
    parallelarm=2](A)(B){}
\end{pspicture}
```



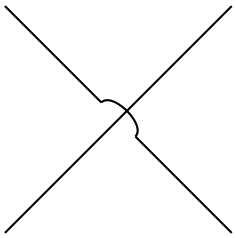
```
\begin{pspicture}(3,3)
  \pnodes(0,.5){A}(3,.5){B}
  \resistor(A)(B){}
  \resistor[parallel,parallelsep=.3,
    parallelarm=2,parallelnode](A)(B){}
\end{pspicture}
```



```
\begin{pspicture}(8,8)
  \pnodes(0,0){A}(8,8){B}
  \multidipole(A)(B)\resistor{$R$}%
    \capacitor[linecolor=red]{$C$}%
    \coil[parallel,parallelsep=.1]{$L$}%
    \diode{$D$}.
\end{pspicture}
```

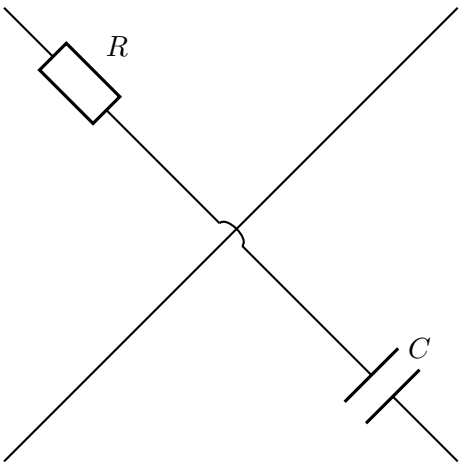
Note: When used with `\multidipole`, the `parallel` parameter must not be set for the first dipole.

Wire intersections



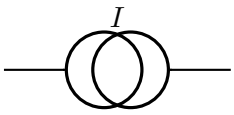
```
\begin{pspicture}(3,3)
  \pnodes(0,0){A}(3,3){B}(0,3){C}(3,0){D}
  \wire(A)(B)
  \wire[intersect,intersectA=A,intersectB=B](C)(D)
\end{pspicture}
```

Wire intersect parameters work also with `\multidipole`.

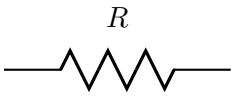


```
\begin{pspicture}(7,7)
  \pnodes(0,0){A}(6,6){B}(0,6){C}(6,0){D}
  \wire(A)(B)
  \multidipole(C)(D)\resistor{$R$}%
    \wire[intersect,intersectA=A,intersectB=B]%
    \capacitor{$C$}.
\end{pspicture}
```

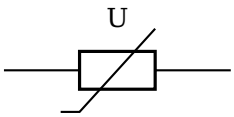
Dipole style parameters



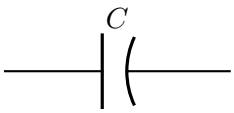
```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \Icc[dipolestyle=twoCircles](A)(B){$I$}
\end{pspicture}
```



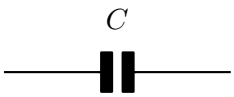
```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \resistor[dipolestyle=zigzag](A)(B){$R$}
\end{pspicture}
```



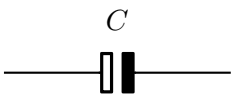
```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \resistor[dipolestyle=varistor](A)(B){U}
\end{pspicture}
```



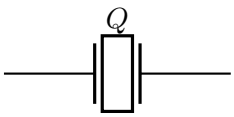
```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \capacitor[dipolestyle=chemical](A)(B){$C$}
\end{pspicture}
```



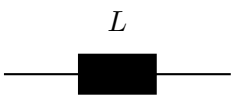
```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \capacitor[dipolestyle=elektor](A)(B){$C$}
\end{pspicture}
```



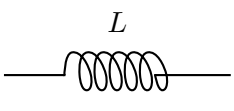
```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \capacitor[dipolestyle=elektorchemical](A)(B){$C$}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \capacitor[dipolestyle=crystal](A)(B){$Q$}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnodes(0,1){A}(3,1){B}
  \coil[dipolestyle=rectangle](A)(B){$L$}
\end{pspicture}
```



```

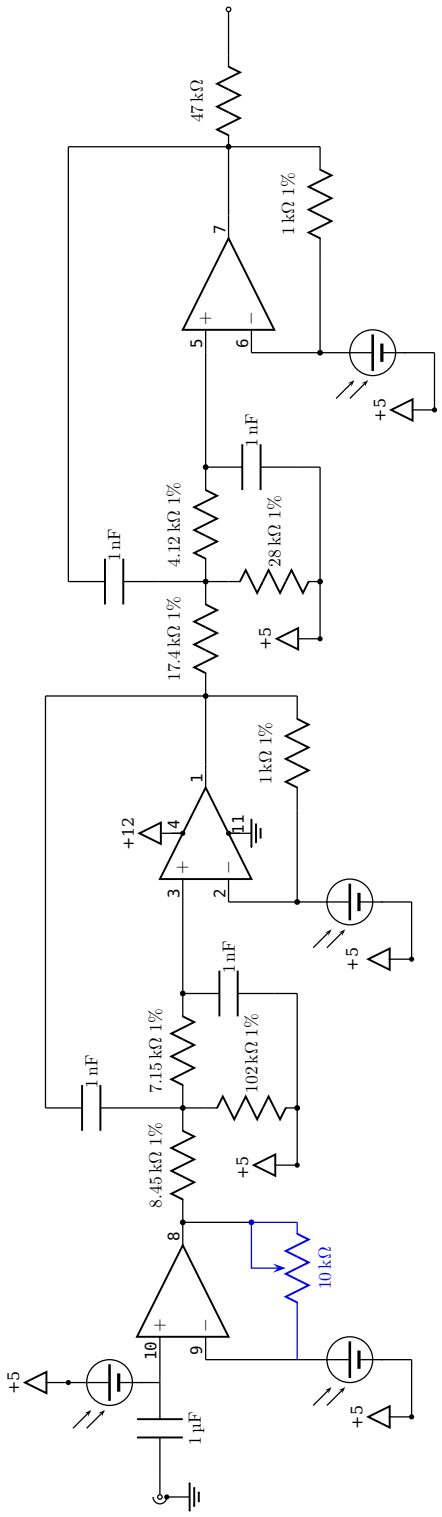
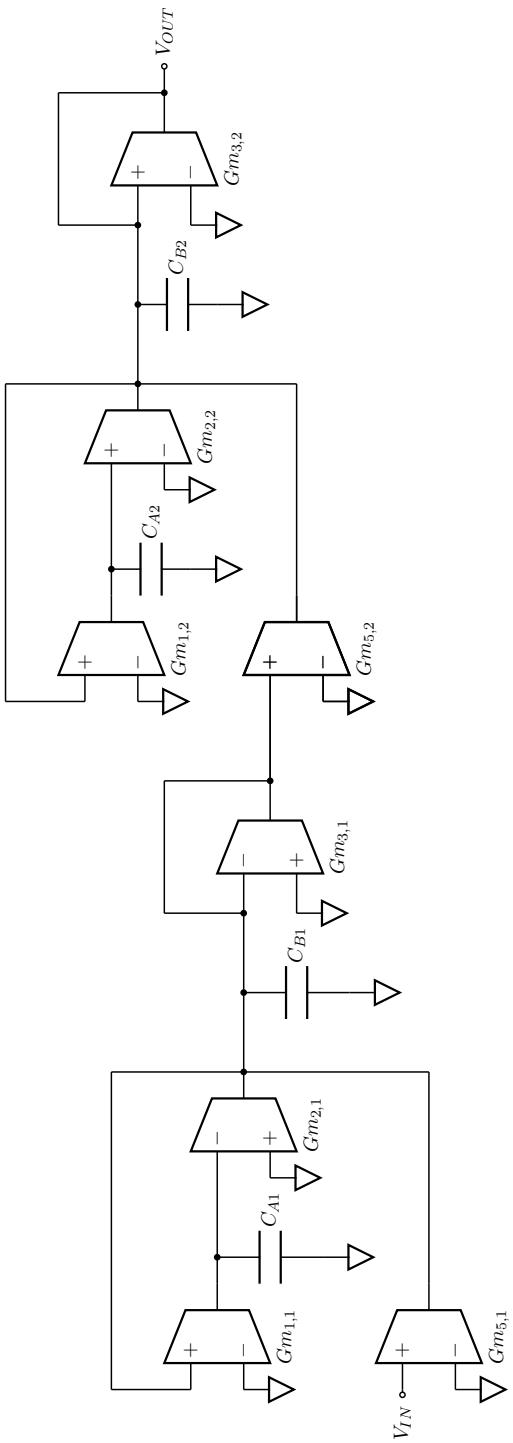
Circuit to harvest Solar Energy



Amplificator for hearing aid

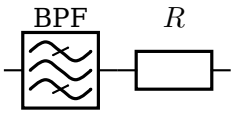


3 Microwave symbols

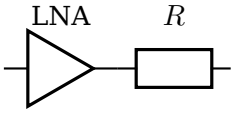
Since for microwave signal, the direction in which the signal spreads is very important, There are dipoleinput or tripoleinput or quadripoleinput and arrowinput parameters. The value of theses parameters are left or right for the first one and true or false for second one.

```
\ifPst@inputarrow
  \ifx\psk@Dinput\pst@Dinput@right
     \pcline[arrows=-C](#2)(dipole@1)
     \pcline[arrows=->,arrowinset=0](#3)(dipole@2)
   \else
     \pcline[arrows=->,arrowinset=0](#2)(dipole@1)
     \pcline[arrows=C-](dipole@2)(#3)
  \fi
\else
  \pcline[arrows=-C](#2)(dipole@1)
  \pcline[arrows=C-](dipole@2)(#3)
\fi
\pcline[fillstyle=none,linestyle=none](#2)(#3)
```

The last line is to correct some problems when I use colors (see example2) To add color in components (Monopole, tripole and Quadripole), there is a new argument. `\multidipole` also works:



```
\begin{pspicture}(4,2)
  \pnodes(0.5,1){A}(3.5,1){B}
  \multidipole(A)(B)\filter{BPF}%
    \resistor{$R$}.
\end{pspicture}
```

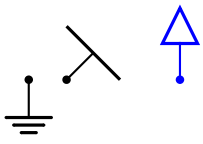


```
\begin{pspicture}(4,2)
  \pnodes(0.5,1){A}(3.5,1){B}
  \multidipole(A)(B)\amplifier{LNA}%
    \resistor{$R$}.
\end{pspicture}
```

3.1 New monopole components

New ground

groundstyle: `ads` | `old` | `triangle`



```
\begin{pspicture}(3,2)
  \pnodes(0.5,1){A}(1,1){B}(2.5,1){C}
  \newground(A)
  \newground[groundstyle=old]{135}(B)
  \newground[linecolor=blue,groundstyle=triangle]{180}(C)
\end{pspicture}
```

Antenna

antennastyle: `two` | `three` | `triangle`

```
\begin{pspicture}(3,2)
  \pnode(1,0.5){A}
  \antenna[antennastyle=three](A)
\end{pspicture}
```

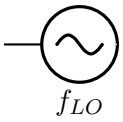
```
\begin{pspicture}(3,2)
  \pnode(1,0.5){A}
  \antenna(A)
\end{pspicture}
```

```
\begin{pspicture}(3,2)
  \pnode(1,0.5){A}
  \antenna[antennastyle=triangle](A)
\end{pspicture}
```

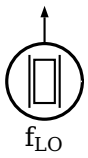
3.2 New monopole macro-components

Oscillator

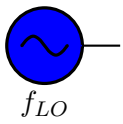
output: top | right | bottom | left
inputarrow: false| true
LOstyle: – | crystal



```
\begin{pspicture}(3,2)
  \pnode(1,1){A}
  \oscillator[output=left,inputarrow=false](A)%
    {$f_{LO}$}{}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(1,1){A}
  \oscillator[output=top,inputarrow=true,LOstyle=crystal](A)%
    {f$_{\textrm{LO}}$}{}
\end{pspicture}
```



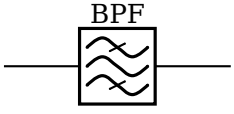
```
\begin{pspicture}(3,2)
  \pnode(1,1){A}
  \oscillator[output=right,inputarrow=false](A)%
    {$f_{LO}$}{fillstyle=solid,fillcolor=blue}
\end{pspicture}
```

```
\begin{pspicture}(3,2)
  \pnode(1,1){A}
  \oscillator[output=bottom,inputarrow=false](A)%
    {$f_{LO}$}{}
\end{pspicture}
```

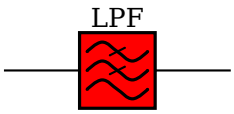
3.3 New dipole macro-components

Filters

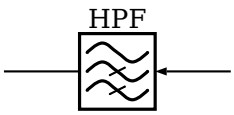
dipolestyle: bandpass | lowpass | highpass
inputarrow: false| true
dipoleinput: left | right



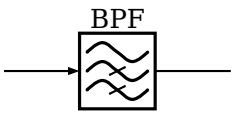
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \filter(A)(B){BPF}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \filter[dipolestyle=lowpass,fillstyle=solid,%
    fillcolor=red](A)(B){LPF}
\end{pspicture}
```



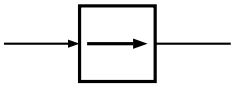
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \filter[dipolestyle=highpass,dipoleinput=right,
    inputarrow=true](A)(B){HPF}
\end{pspicture}
```



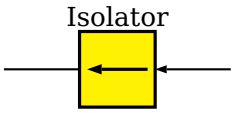
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \filter[dipolestyle=highpass,inputarrow=true](A)(B){BPF}
\end{pspicture}
```

Isolator

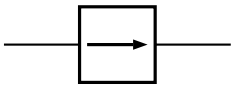
inputarrow: false| true
dipoleinput: left | right



```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \isolator[inputarrow=true](A)(B){}
\end{pspicture}
```



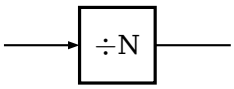
```
\begin{pspicture}(3,2)
\pnode(0,1){A} \pnode(3,1){B}
\isolator[dipoleinput=right,inputarrow=true,
  fillstyle=solid,fillcolor=yellow](A)(B){Isolator}
\end{pspicture}
```



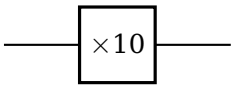
```
\begin{pspicture}(3,2)
  \pnode(0,1){A}\pnode(3,1){B}
  \isolator[dipoleinput=left](A)(B){}
\end{pspicture}
```

Frequency multiplier/divider

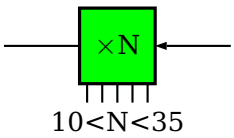
dipolestyle: multiplier | divider
value: N | $n \in N$
programmable: false| true
inputarrow: false| true
dipoleinput: left | right



```
\begin{pspicture}(3,2)
  \pnode(0,1){A}\pnode(3,1){B}
  \freqmult[dipolestyle=divider,inputarrow=true](A)(B){}
\end{pspicture}
```



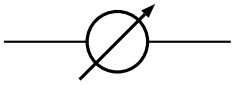
```
\begin{pspicture}(3,2)
  \pnode(0,1){A}\pnode(3,1){B}
  \freqmult[dipolestyle=multiplier,value=10](A)(B){}
\end{pspicture}
```



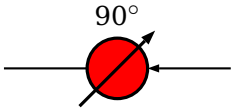
```
\begin{pspicture}(3,3)
\pnode(0,1.5){A}\pnode(3,1.5){B}
\freqmult[dipolestyle=multiplier,programmable=true,
  labeloffset=-1,dipoleinput=right,inputarrow=true,
  fillstyle=solid,fillcolor=green](A)(B){10<N<35}
\end{pspicture}
```

Phase shifter

inputarrow: false| true
dipoleinput: left | right



```
\begin{pspicture}(3,2)
  \pnode(0,1){A1} \pnode(3,1){A2}
  \phaseshifter(A1)(A2){}
\end{pspicture}
```

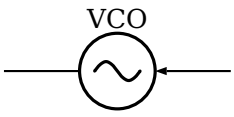


```
\begin{pspicture}(3,2)
\pnode(0,1){B1} \pnode(3,1){B2}
\phaseshifter[inputarrow=true,dipoleinput=right,
  fillstyle=solid,fillcolor=red](B1)(B2){90$^\circ$}
\end{pspicture}
```

VCO

inputarrow: false| true
dipoleinput: left | right

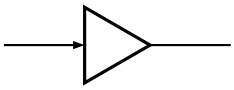
```
\begin{pspicture}(3,2)
  \pnode(0,1){A1} \pnode(3,1){A2}
  \vco[fillstyle=solid,fillcolor=yellow](A1)(A2){}
\end{pspicture}
```



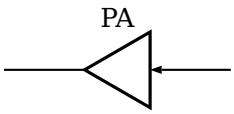
```
\begin{pspicture}(3,2)
  \pnode(0,1){B1} \pnode(3,1){B2}
  \vco[dipoleinput=right,inputarrow=true](B1)(B2){VCO}
\end{pspicture}
```

Amplifier

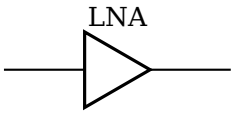
inputarrow: false| true
dipoleinput: left | right



```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \amplifier[inputarrow=true](A)(B){}
\end{pspicture}
```



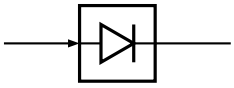
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \amplifier[dipoleinput=right,inputarrow=true](A)(B){PA}
\end{pspicture}
```



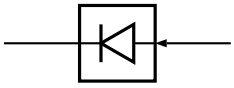
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \amplifier[dipoleinput=left](A)(B){LNA}
\end{pspicture}
```

Detector

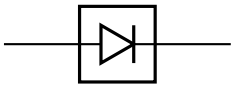
inputarrow: false| true
dipoleinput: left | right



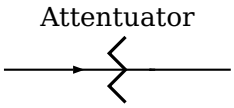
```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \detector[inputarrow=true](A)(B){}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \detector[dipoleinput=right,inputarrow=true](A)(B){}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \detector[dipoleinput=left](A)(B){}
\end{pspicture}
```

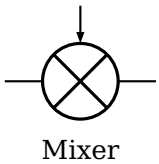


```
\begin{pspicture}(3,2)
  \pnode(0,1){A} \pnode(3,1){B}
  \attenuator[inputarrow,labeloffset=0.7cm,
    dipoleinput=left](A)(B){Attentuator}
\end{pspicture}
```

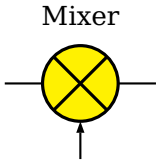
3.4 New tripole macro-components

Mixer

tripolestyle: bottom | top
tripoleconfig: left | right
inputarrow: false| true



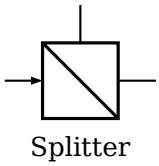
```
\begin{pspicture}(3,2)
  \pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,2){C}
  \mixer[tripolestyle=top,inputarrow=true](A)(B)(C)%
    {Mixer}{}
\end{pspicture}
```



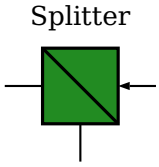
```
\begin{pspicture}(3,2)
  \pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,0){C}
  \mixer[inputarrow=true,tripoleinput=right](A)(B)(C)
    {Mixer}{fillstyle=solid,fillcolor=yellow}
\end{pspicture}
```

Splitter

tripolestyle: bottom | top
tripoleconfig: left | right
inputarrow: false| true



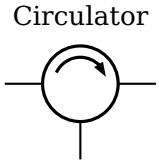
```
\begin{pspicture}(3,2)
\pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,2){C}
 \splitter[inputarrow,
   tripolestyle=top](A)(B)(C){Splitter}{}
\end{pspicture}
```



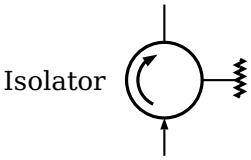
```
\begin{pspicture}(3,2)
\pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,0){C}
 \splitter[inputarrow,
   tripolestyle=bottom,tripoleinput=right, fillstyle=solid, fillcolor=
       ForestGreen](A)(B)(C){Splitter}{}
\end{pspicture}
```

Circulator

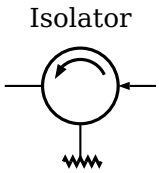
tripolestyle: circulator | isolator
inputarrow: false| true
tripoleinput: left | right



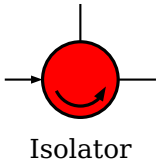
```
\begin{pspicture}(3,2)
 \pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,0){C}
 \circulator{0}(A)(B)(C){Circulator}{}
\end{pspicture}
```



```
\begin{pspicture}(3,3)
 \pnode(1.5,0.5){A}\pnode(1.5,2.5){B}\pnode(0.5,1.5){C}
 \circulator[tripolestyle=isolator,inputarrow=true]{90}%
   (A)(B)(C){Isolator}{}
\end{pspicture}
```



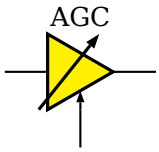
```
\begin{pspicture}(3,2)
\pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,0){C}
\circulator[tripoleconfig=right,tripolestyle=isolator,
   inputarrow=true,tripoleinput=right]{0}%
   (B)(A)(C){Isolator}{}
\end{pspicture}
```



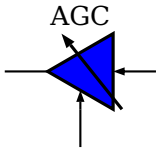
```
\begin{pspicture}(3,2)
\pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,2){C}
\circulator[tripoleconfig=right,
 inputarrow=true]{180}(A)(B)(C){Isolator}%
   {fillstyle=solid,fillcolor=red}
\end{pspicture}
```

Agc

inputarrow: false| true
tripoleinput: left | right



```
\begin{pspicture}(3,2)
  \pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,0){C}
  \agc(A)(B)(C){AGC}{fillstyle=solid,fillcolor=yellow}
\end{pspicture}
```

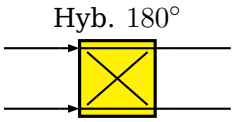


```
\begin{pspicture}(3,2)
  \pnode(0.5,1){A}\pnode(2.5,1){B}\pnode(1.5,0){C}
  \agc[tripoleinput=right,inputarrow=true](A)(B)(C)%
    {AGC}{fillstyle=solid,fillcolor=blue}
\end{pspicture}
```

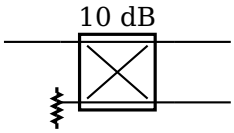
3.5 New quadripole macro-components

Coupler

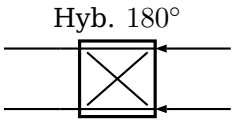
couplerstyle: hybrid | directional
inputarrow: false| true
quadripoleinput: left | right



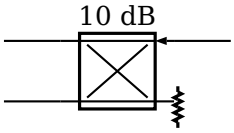
```
\begin{pspicture}(3,2)
  \pnode(0,1.4){A} \pnode(0,0.6){B}
  \pnode(3,1.4){C} \pnode(3,0.6){D}
  \coupler[couplerstyle=hybrid,inputarrow=true](A)(B)(C)(D)%
    {Hyb. $180$\ensuremath{^\circ}}%
    {fillstyle=solid,fillcolor=yellow}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(0,1.4){A} \pnode(0,0.6){B}
  \pnode(3,1.4){C} \pnode(3,0.6){D}
  \coupler[couplerstyle=directional](A)(B)(C)(D){10~dB}{}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(0,1.4){A} \pnode(0,0.6){B}
  \pnode(3,1.4){C} \pnode(3,0.6){D}
  \coupler[couplerstyle=hybrid,inputarrow=true,%
    quadripoleinput=right](A)(B)(C)(D)%
    {Hyb. $180$\ensuremath{^\circ}}{}
\end{pspicture}
```



```
\begin{pspicture}(3,2)
  \pnode(0,1.4){A} \pnode(0,0.6){B}
  \pnode(3,1.4){C} \pnode(3,0.6){D}
  \coupler[couplerstyle=directional,quadripoleinput=right,%
  inputarrow=true](A)(B)(C)(D){10~dB}{}
\end{pspicture}
```

3.6 Examples

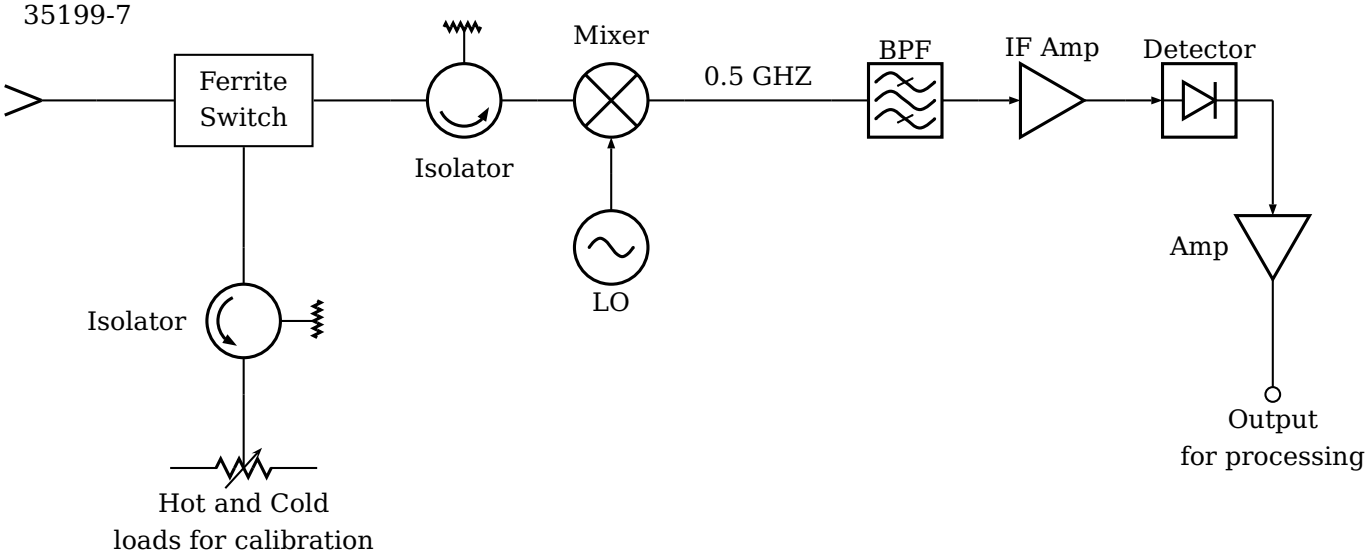
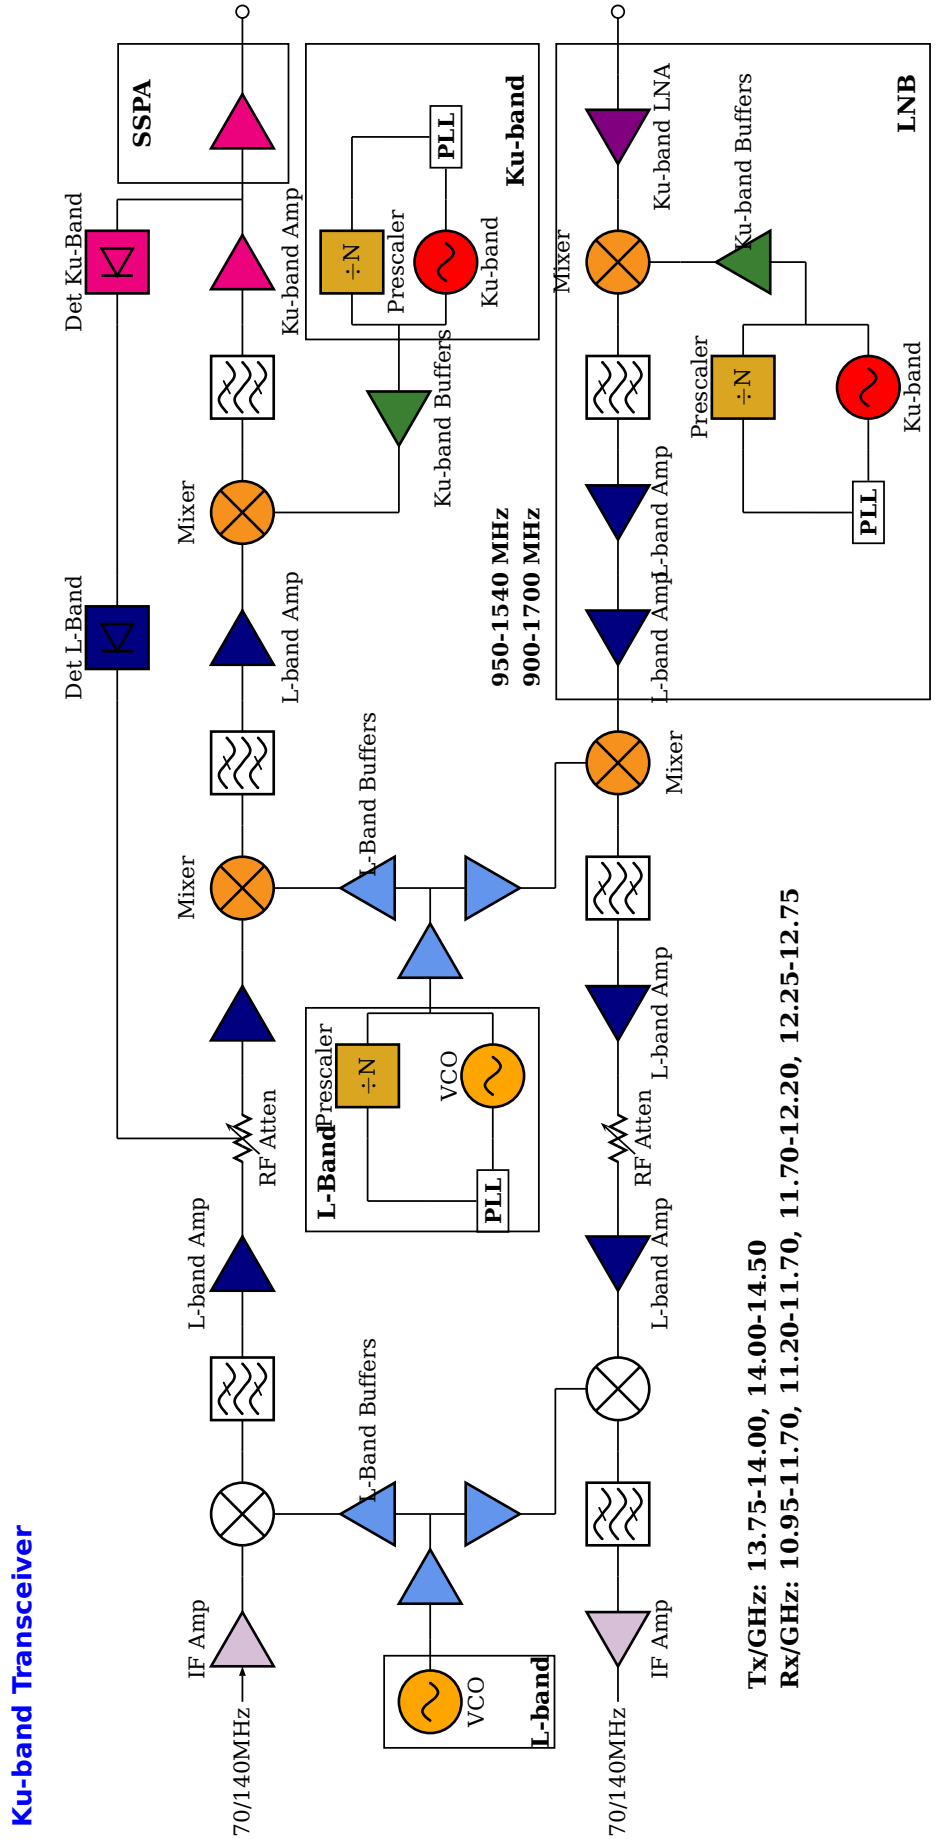
Radiometer block diagram example

From Chang, K., RF and Microwave Wireless Systems, Wiley InterScience, page 319, ISBN 0-471-35199-7



Ku-band Transceiver



4 Flip Flops – logical elements

The syntax for all logical base circuits is

`\logic` `[Options]` `(`x_0`,`y_0`)` {*label*}

where the options and the origin are optional. If they are missing, then the default options, described in the next section and the default origin $(0,0)$ is used. The origin specifies the lower left corner of the logical circuit.

xLkeywordlogicType

```
\logic{Demo}
\logic[logicType=and]{Demo}
\logic(0,0){Demo}
\logic[logicType=and](0,0){Demo}
```

The above four „different“ calls of the `\logic` macro give the same output, because they are equivalent.

4.1 The Options

name	*type*	*default*
`logicShowNode`	boolean	`false`
`logicShowDot`	boolean	`false`
`logicNodestyle`	command	*\footnotesize*
`logicSymbolstyle`	command	*\large*
`logicSymbolpos`	value	*0.5*
`logicLabelstyle`	command	*\small*
`logicType`	string	`and`
`logicChangeLR`	boolean	`false`
`logicWidth`	length	*1.5*
`logicHeight`	length	*2.5*
`logicWireLength`	length	*0.5*
`logicNInput`	number	*2*
`logicJInput`	number	*2*
`logicKInput`	number	*2*

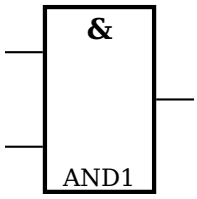
4.2 Basic Logical Circuits

At least the basic objects require a unique label name, otherwise it is not sure, that all nodes will work well. The label may contain any alphanumerical character and most of all symbols. But it is save using only combinations of letters and digits. For example:

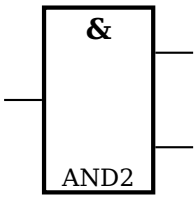
```
And0
a0
a123
12
NOT123a
```

`A_1` is not a good choice, the underscore may cause some problems.

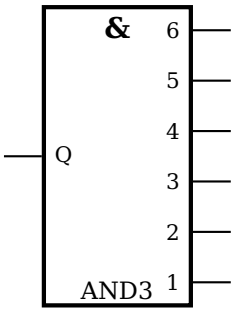
And



```
\begin{pspicture}(-1,0)(3,3)
\logic{AND1}
\end{pspicture}
```

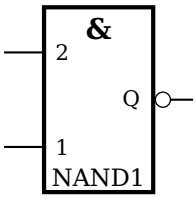


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicChangeLR]{AND2}
\end{pspicture}
```

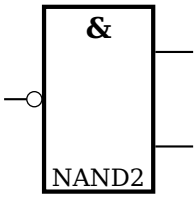


```
\begin{pspicture}(-0.5,0)(4,5)
\logic[logicShowNode,%
  logicWidth=2,
  logicHeight=4,
  logicNInput=6,
  logicChangeLR](1,1){AND3}
\end{pspicture}
```

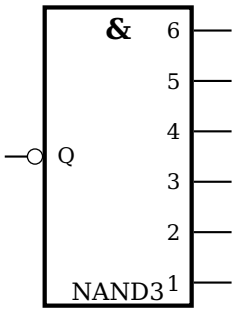
NotAnd



```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nand,
  logicShowNode]{NAND1}
\end{pspicture}
```

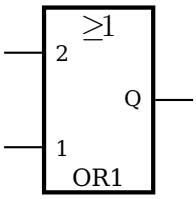


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nand,
  logicChangeLR]{NAND2}
\end{pspicture}
```

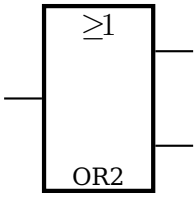


```
\begin{pspicture}(4,5)
\logic[logicType=nand,
  logicShowNode,
  logicWidth=2,
  logicHeight=4,
  logicNInput=6,
  logicChangeLR](1,1){NAND3}
\end{pspicture}
```

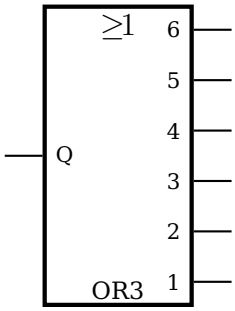
Or



```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=or,
  logicShowNode]{OR1}
\end{pspicture}
```

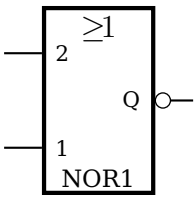


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=or,
  logicChangeLR]{OR2}
\end{pspicture}
```

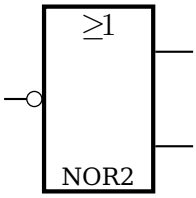


```
\begin{pspicture}(4,5)
\logic[logicType=or,
  logicShowNode,
  logicWidth=2,
  logicHeight=4,
  logicNInput=6,
  logicChangeLR](1,1){OR3}
\end{pspicture}
```

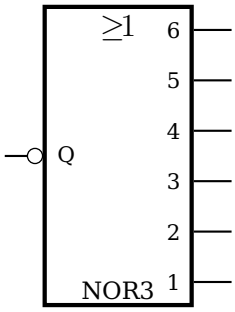
Not Or



```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nor,
  logicShowNode]{NOR1}
\end{pspicture}
```

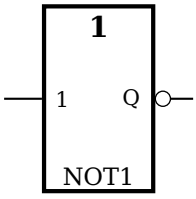


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=nor,
  logicChangeLR]{NOR2}
\end{pspicture}
```

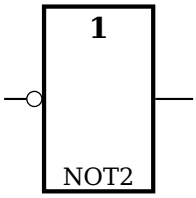


```
\begin{pspicture}(4,5)
\logic[logicType=nor,
  logicShowNode,
  logicWidth=2,
  logicHeight=4,
  logicNInput=6,
  logicChangeLR](1,1){NOR3}
\end{pspicture}
```

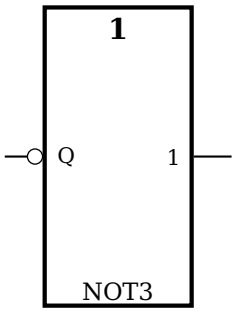
Not



```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=not,
  logicShowNode]{NOT1}
\end{pspicture}
```

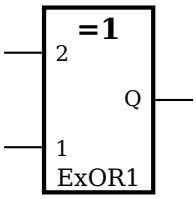


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=not,
  logicChangeLR]{NOT2}
\end{pspicture}
```

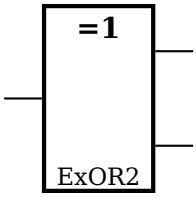


```
\begin{pspicture}(4,5)
\logic[logicType=not,
  logicShowNode,
  logicWidth=2,
  logicHeight=4,
  logicChangeLR](1,1){NOT3}
\end{pspicture}
```

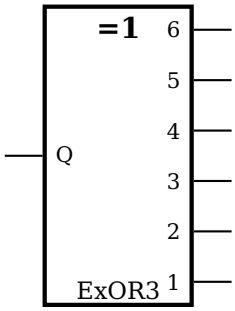
Exclusive OR



```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=exor,
  logicShowNode]{ExOR1}
\end{pspicture}
```

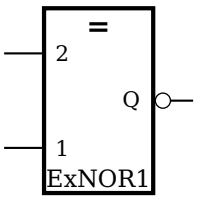


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=exor,
  logicChangeLR]{ExOR2}
\end{pspicture}
```

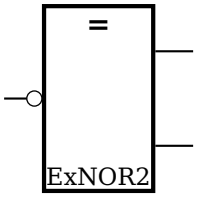


```
\begin{pspicture}(4,5)
\logic[logicType=exor,
  logicShowNode,
  logicNInput=6,
  logicWidth=2,
  logicHeight=4,
  logicChangeLR](1,1){ExOR3}
\end{pspicture}
```

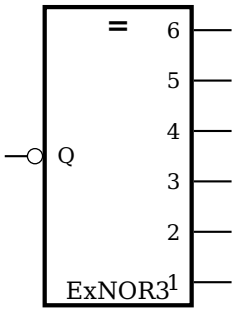
Exclusive NOR



```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=exnor,
  logicShowNode]{ExNOR1}
\end{pspicture}
```

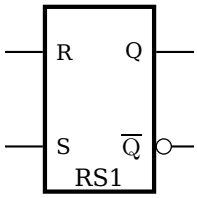


```
\begin{pspicture}(-0.5,0)(3,3)
\logic[logicType=exnor,
  logicChangeLR]{ExNOR2}
\end{pspicture}
```

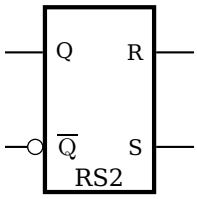


```
\begin{pspicture}(4,5)
\logic[logicType=exnor,
  logicShowNode,
  logicNInput=6,
  logicWidth=2,
  logicHeight=4,
  logicChangeLR](1,1){ExNOR3}
\end{pspicture}
```

4.3 RS Flip Flop

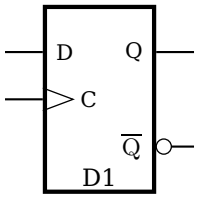


```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode,
  logicType=RS]{RS1}
\end{pspicture}
```

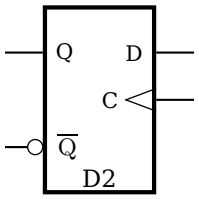


```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode,
  logicType=RS,
  logicChangeLR]{RS2}
\end{pspicture}
```

4.4 D Flip Flop

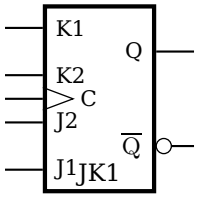


```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode,
  logicType=D]{D1}
\end{pspicture}
```

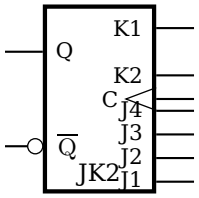


```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode=true,
  logicType=D,
  logicChangeLR]{D2}
\end{pspicture}
```

4.5 JK Flip Flop

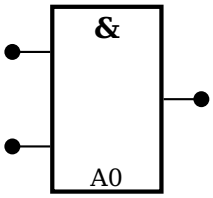


```
\begin{pspicture}(-1,-1)(3,3)
 \logic[logicShowNode,
   logicType=JK,
   logicKInput=2,
   logicJInput=2]{JK1}
\end{pspicture}
```

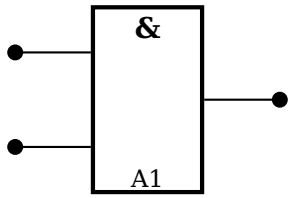


```
\begin{pspicture}(-1,-1)(3,3)
\logic[logicShowNode,logicType=JK,
  logicKInput=2, logicJInput=4,
  logicChangeLR]{JK2}
\end{pspicture}
```

4.6 Other Options



```
\begin{pspicture}(-0.5,0)(3,2.5)
\logic[logicShowDot]{A0}
\end{pspicture}
```



```
\begin{pspicture}(-1,0)(3,2.5)
\logic[logicWireLength=1,
  logicShowDot]{A1}
\end{pspicture}
```

The unit of `logicWireLength` is the same than the actual one for pstricks, set by the `unit` option.

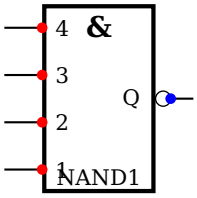
4.7 The Node Names

Every logic circuit is defined with its name, which should be a unique one. If we have the following NAND circuit, then `pst-circ` defines the nodes

```
NAND11, NAND12, NAND13, NAND14, NAND1Q
```

If there exists an inverted output, like for alle Flip Flops, then the negated one gets the appendix `neg` to the node name. For example:

```
NAND1Q, NAND1Qneg
```

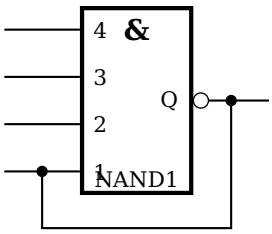


```
\begin{pspicture}(-0.5,0)(2.5,3)
\logic[logicShowNode=true,%
   logicLabelstyle=\footnotesize,%
   logicType=nand,%
   logicNInput=4]{NAND1}
\multido{\n=1+1}{4}{%
  \pscircle*[linecolor=red](NAND1\n){2pt}%
}
\pscircle*[linecolor=blue](NAND1Q){2pt}
\end{pspicture}
```

Now it is possible to draw a line from the output to the input

```
\ncbar[angleA=0,angleB=180]{<Node A>}{<Node B>}
```

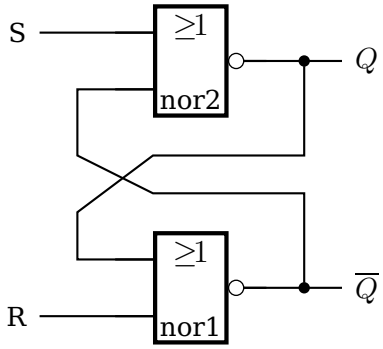
It may be easier to print a grid since the drawing phase and then comment it out if all is finished.



```
\begin{pspicture}(-1,-1)(2.5,3)
\logic[logicShowNode=true,%
   logicLabelstyle=\footnotesize,%
   logicType=nand,%
   logicWireLength=1,%
   logicNInput=4]{NAND1}
   \pnode(-0.5,0|NAND11){tempA}
   \pnode(2,0|NAND1Q){tempB}
\end{pspicture}
\ncbar[angleA=-90,angleB=0,arm=0.75,%
   arrows=*-*, dotsize=0.15]{tempA}{tempB}
```

AN empty argument to the `logicSymbolstyle` and `logicLabelstyle` will suppress the output of the symbol and/or the label. The label, of course, is a mandatory argument because it is the prefix of the node names.

4.8 Examples



```
\begin{pspicture}(-1,0)(5,5)
  \psset{logicType=nor, logicLabelstyle=\normalsize,%
      logicWidth=1, logicHeight=1.5, dotsize=0.15}
  \logic(1.5,0){nor1}

7 Adding new components

Adding new components is not simple unless you need only a simple dipole. For dipoles a macro is provided that generates all helping macros for a new component so that you need to write only the actual drawing code.

If you want to add a new dipole component, you only need the following code:

```
\newCircDipole{ComponentName}%
\def\pst@draw@ComponentName{%
  % The PSTricks code for your component
  % The center of the component is at (0,0)
  \pnode(component_left_end,0){dipole@1}
  \pnode(component_right_end,0){dipole@2}}
```

This code can be placed in the core code or somewhere in the respective document in which case it must be surrounded by `\makeatletter...\makeatother`.

If your new dipole should also work with `\multidipole` then you have to make some changes in the `\multidipole` core code. In the definition of `\pst@multidipole`, look for the last `\ifx` test

```
% ...
% Extract from \pst@multidipole
   \else\ifx\OpenDipol #4\let\pscirc@next\pst@multidipole@OpenDipol% 27
   \else\ifx\OpenTripol #4\let\pscirc@next\pst@multidipole@OpenTripol% 28
   \else                  % Put your modification here
   \else\let\pscirc@next\ignorespaces
   \fi\fi\fi
% Extract form \pst@multidipole
% ...
```

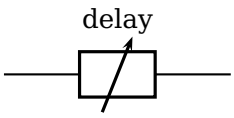
and add (marked with %%%)

```
% ...
% Extract from \pst@multidipole
   \else\ifx\OpenDipol #4\let\pscirc@next\pst@multidipole@OpenDipol% 27
   \else\ifx\OpenTripol #4\let\pscirc@next\pst@multidipole@OpenTripol% 28
   \else\ifx\ComponentName#4\let\next\pst@multidipole@ComponentName%%%
   \else\let\pscirc@next\ignorespaces
   \fi\fi\fi
% Extract form \pst@multidipole
% ...
```

Do the same in `\pst@multidipole@`

```
% ...
% Extract from \pst@multidipole@
   \else\ifx\OpenDipol#1\let\pscirc@next\pst@multidipole@OpenDipol% 27
   \else\ifx\OpenTripol#1\let\pscirc@next\pst@multidipole@OpenTripol% 28
   \else\ifx\ComponentName#1\let\next\pst@multidipole@ComponentName%%%
   \else\let\pscirc@next\ignorespaces\pst@multidipole@output
   \fi\fi\fi
% Extract form \pst@multidipole@
% ...
```

and that's it! All you have to do then is send your modified `pst-circ.tex` to me and it will become part of the official release of `pst-circ`.



```
\begin{pspicture}(3,2)
  \newCircDipole{delayline}
  \makeatletter
  \def\pst@draw@delayline{%
    \psset{linewidth=1.5\pslinewidth}%
    \psframe(-0.5,-0.3)(0.5,0.3)
    \psline[arrows=->](-0.2,-0.5)(0.2,0.5)
    \pnode(-0.5,0){dipole@1}
    \pnode(0.5,0){dipole@2}}%
  \makeatother
  \pnode(0,1){A}\pnode(3,1){B}
  \delayline(A)(B){delay}
\end{pspicture}
```
