### 38.3.2 ADCA Specific Registers

This section describes the registers that are equipped in each of ADCA0 and ADCA1.

### 38.3.2.1 ADCAnVCRj — Virtual Channel Register j

This register is used to control the virtual channel.

Table 38.37 ADCAnVCRj Register Contents

Note 1. These bits are only supported for ADCA0. For ADCA1, when writing, write the value after reset.
Note 2. When GCTRL[5:0] is set to $24_{\mathrm{H}}$ (Self-Diagnosis channel), set MPXE to 0 .
Note 3. This bit is only supported when $\mathrm{j}=33$ to 35 . Otherwise, when writing, write the value after reset.
Note 4. ULS[3:0] =
0000: Upper limit and lower limit are not checked
0001: Upper limit and lower limit are checked for ADCAnULLMTBRO.
0010: Upper limit and lower limit are checked for ADCAnULLMTBR1.
0011: Upper limit and lower limit are checked for ADCAnULLMTBR2.
0100: Upper limit and lower limit are checked for ADCAnULLMTBR3.

0110: Upper limit and lower limit are checked for ADCAnULLMTBR5.
0111: Upper limit and lower limit are checked for ADCAnULLMTBR6.
1000: Upper limit and lower limit are checked for ADCAnULLMTBR7.
Other than above : Setting prohibited (Upper limit and lower limit are not checked when set)

## CAUTION

To prevent malfunction, ADCAnVCRj should be set (except ADIE $=0$ setting when stop procedure of scan group) when SGACT of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0 .

### 38.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register

This register is used to indicate virtual channel setting (PWSAnPVCRx_y register setting) of the PWM-Diag (SG4).

Table 38.39 ADCAnPWDVCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 | MPXE*1 | The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[27] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[11] (even channel) bit. |
|  |  | MPX Enable |
|  |  | Set this bit to 1 when an external analog multiplexer is used. |
|  |  | 0 : The use of MPX is prohibited. |
|  |  | 1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed. |
| 14 to 12 | MPXV[2:0]*1 | These bits are used to set the MPX value to be transferred to an external analog multiplexer by using the PWSAnPVCRx_y.PWSAnVRDTy[26:24] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[10:8] (even channel) bit. |
| 11, 10 | ULS[3:2] | The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[29:28] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[13:12] (even channel) bit. Upper Limit/Lower Limit Table Select*2 |

| 5 to 0 | GCTRL[5:0] | The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[21:16] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[5:0] (even channel) bit. |
|  |  | Physical Channel Select |
|  |  | These bits are used to specify a physical channel to be assigned to virtual channel j . |
|  |  | For the selection of the channel, see Table 38.38, Selection of Physical Channels. |

Note 1. These bits are only supported for ADCA0. For ADCA1, when read, the value after reset is returned.
Note 2. ULS[3:0] =
0000: Upper limit and lower limit are not checked.
0001: Upper limit and lower limit are checked for ADCAnULLMTBRO.
0010: Upper limit and lower limit are checked for ADCAnULLMTBR1.
0011: Upper limit and lower limit are checked for ADCAnULLMTBR2.
0100: Upper limit and lower limit are checked for ADCAnULLMTBR3.
0101: Upper limit and lower limit are checked for ADCAnULLMTBR4.
0110: Upper limit and lower limit are checked for ADCAnULLMTBR5.
0111: Upper limit and lower limit are checked for ADCAnULLMTBR6.
1000: Upper limit and lower limit are checked for ADCAnULLMTBR7.
Other than above : Setting prohibited (Upper limit and lower limit are not checked when set)

### 38.3.2.3 ADCAnDRj — Data Register j

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to ADCAnVCRj and $\operatorname{ADCAnVCR}(j+1)$. As the $A / D$ conversion results, the conversion result for $\operatorname{ADCAnVCR}(j+1)$ is stored in the upper bits ( $\mathrm{ADCAnDR}(\mathrm{j}+1)$ ), and the conversion result for ADCAnVCRj is stored in the lower bits (ADCAnDRj).
Access: ADCAnDRj register is a read-only register that can be read in 32-bit units.
ADCAnDRjL and ADCAnDRjH registers are read-only registers that can be read in 16-bit units.
Address: ADCAnDRj: <ADCAn_base> $+100_{\mathrm{H}}+\mathrm{j} \times 2_{\mathrm{H}}$
ADCAnDRjL: <ADCAn_base> $+100_{\mathrm{H}}+\mathrm{j} \times 2_{\mathrm{H}}$

| $\mathbf{3 1}$ to 16 | $\mathrm{DR}(\mathrm{j}+1)[15: 0]$ | These bits are used to store the A/D conversion result data. <br> (The A/D conversion result for the channel set in ADCAnVCR(j+1) are transferred.) |
| 15 to 0 | DRj[15:0] | These bits are used to store the A/D conversion result data. <br>  |

## CAUTION

ADCAnDIRj.WFLG and ADCAnDIR(j+1).WFLG are cleared by reading ADCAnDRjL or ADCAnDRjH in 16-bit units at this time. If virtual channels 33,34 , and 35 are used exclusively for self-diagnosis, the lower-order bits (DRj[15:0]) for channel 32 cannot be used.

## NOTES

1. $\mathrm{j}=00,02, \ldots, 46,48$ (for ADCAO)
$j=00,02, \ldots, 32,34$ (for ADCA1)
2. By controlling ADCAnADCR.CRAC and ADCAnADCR.CTYP, the data format of this register becomes as follows:

- ADCAnADCR.CTYP $=0$ and ADCAnADCR.CRAC $=0 \rightarrow$ Right alignment is used.
$\rightarrow$ The A/D conversion result for $\operatorname{ADCAnVCR}(j+1)$ is transferred to bits 27 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 11 to 0 .
- ADCAnADCR.CTYP $=0$ and ADCAnADCR.CRAC $=1 \rightarrow$ Left alignment is used.
$\rightarrow$ The A/D conversion result for $\operatorname{ADCAnVCR}(j+1)$ is transferred to bits 31 to 20 , and the $\mathrm{A} / \mathrm{D}$ conversion result for ADCAnVCRj is transferred to bits 15 to 4.
- ADCAnADCR.CTYP $=1$ and ADCAnADCR.CRAC $=0 \rightarrow$ Right alignment is used.
$\rightarrow$ The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 25 to 16 , and the A/D conversion result for ADCAnVCRj is transferred to bits 9 to 0 .
- ADCAnADCR.CTYP $=1$ and ADCAnADCR.CRAC $=1 \rightarrow$ Left alignment is used.
$\rightarrow$ The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 22, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 6 .

### 38.3.2.4 ADCAnDIRj — Data Supplementary Information Register j

This register is a 32-bit read-only register that stores the $\mathrm{A} / \mathrm{D}$ conversion result for ADCAnDRj and information incidental to the A/D converted value.

As the $A / D$ conversion result, the $A D C A n D R j$ value is transferred. As information incidental to the $A / D$ converted value, information about the write flag (WFLG), the MPX value (MPXV[2:0]), and the physical channel (ID[5:0]) is transferred. The data format of the A/D conversion result stored in ADCAnDIRj is the same as that for the ADCAnDRj register.

Table 38.41 ADCAnDIRj Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | MPXE*1 | MPX Enable Flag |
|  |  | 0 : MPX function is not used. |
|  |  | 1: MPX function is used. |
| 30 to 28 | MPXV[2:0]*1 | These bits are used to store the MPX value. |
|  |  | The MPX value to be stored is the MPX value of the most recent conversion result. |
| 27, 26 | Reserved | When read, the value after reset is returned. |
| 25 | WFLG | Write Flag |
|  |  | 0 : ADCAnDRj or ADCAnDIRj is read (cleared when read). |
|  |  | 1: A/D converted value is stored in ADCAnDRj (set when the value is stored). |
| 24 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | ID[5:0] | These bits store the physical channel number (GCTRL) corresponding to the conversion result. |
|  |  | The physical channel number to be stored is the number corresponding to the most recent conversion result. |
| 15 to 0 | DR[15:0] | These bits are used to store the A/D conversion result. |

Note 1. These bits are only supported by ADCAO.
For ADCA1, when read, the value after reset is returned.

### 38.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to the PWM-Diag. As the A/D conversion results, the conversion result for the PWM-Diag (PWDDR) is stored in the upper bits.

The data format of this register is controlled by ADCAnADCR.CRAC and ADCAnADCR.CTYP, as shown below.

- ADCAnADCR.CTYP $=0$, ADCAnADCR.CRAC $=0 \rightarrow$ Right alignment is used.
$\rightarrow$ The A/D conversion result for ADCAnPWDVCR is transferred to bits 27 to 16.
- ADCAnADCR.CTYP $=0$, ADCAnADCR.CRAC $=1 \rightarrow$ Left alignment is used.
$\rightarrow$ The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 20.
- ADCAnADCR.CTYP $=1$, ADCAnADCR.CRAC $=0 \rightarrow$ Right alignment is used.
$\rightarrow$ The A/D conversion result for ADCAnPWDVCR is transferred to bits 25 to 16.
- ADCAnADCR.CTYP $=1$, ADCAnADCR.CRAC $=1 \rightarrow$ Left alignment is used.
$\rightarrow$ The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 22.

### 38.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register

This register is a 32-bit read-only register that stores the A/D conversion result when PWM-Diag is used, and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnPWDSNDR.PWDDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), MPX value (MPXV[2:0]), and physical channel (ID[5:0]) are transferred. The data format of the A/D conversion result stored in ADCAnPWDDIR is the same as that for the ADCAnPWDTSNDR register. In addition, PWDDR[15:0] can be read with corresponded PWGA channel by PWSAnPWDDIRz register. For details, see Section 37, PWM Output/Diagnostic (PWM-Diag).

Table 38.43 ADCAnPWDDIR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | MPXE* ${ }^{1}$ | MPX Enable Flag <br> 0 : The MPX function is not used. <br> 1: The MPX function is used. |
| 30 to 28 | MPXV[2:0] ${ }^{11}$ | These bits are used to store the MPX value. <br> The MPX value to be stored is the MPX value of the most recent conversion result. |
| 27, 26 | Reserved | When read, the value after reset is returned. |
| 25 | WFLG | Write Flag <br> 0 : ADCAnPWDTSNDR or ADCAnPWDDIR is read (cleared when read). <br> 1: The A/D converted value is stored in ADCAnPWDTSNDR (set when the value is stored). |
| 24 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | ID[5:0] | These bits are used to store the physical channel number (GCTRL) corresponding to the conversion result. <br> The physical channel number to be stored is the physical channel number corresponding to the most recent conversion result. |
| 15 to 0 | PWDDR[15:0] | These bits are used to store the A/D conversion result for PWM-Diag. |

Note 1. These bits are only supported for ADCAO.
For ADCA1, when read, the value after reset is returned.

### 38.3.2.7 ADCAnADHALTR — AID Force Halt Register

This register is used to halt conversion for all SGs of ADCAn. The read value is always 0 .

Access: ADCAnADHALTR register is a write-only register that can be written in 32-bit units.
ADCAnADHALTRL register is a write-only register that can be written in 16-bit units.
ADCAnADHALTRLL register is a write-only register that can be written in 8-bit units.
Address: ADCAnADHALTR:<ADCAn_base> +300 ${ }_{\mathrm{H}}$
ADCAnADHALTRL:<ADCAn_base> $+300_{\mathrm{H}}$
ADCAnADHALTRLL:<ADCAn_base> $+300_{\mathrm{H}}$
Value after reset: $\quad 00000000_{H}$

Table 38.44 ADCAnADHALTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | HALT | ADCA Force Halt Trigger |
|  |  | All scan groups are halted and initialized, and ADCA becomes idle state. |
|  |  | Writing of 0: No effect |
|  |  | Writing of 1: Scan groups are halted. |

### 38.3.2.8 ADCAnADCR — AID Control Register

This register is used for ADCAn common control.

Table 38.45 ADCAnADCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | DGON | Self-Diagnostic Voltage Standby Control <br> 0 : The self-diagnostic voltage circuit is turned off. <br> 1: The self-diagnostic voltage circuit is turned on, or the reference voltage is updated. |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CRAC | Alignment Control <br> 0 : The results of conversion to PWDDR and ADCAnDRj are stored right-aligned. <br> 1: The results of conversion to PWDDR and ADCAnDRj are stored left-aligned. |
| 4 | CTYP | 12/10 Bit Select Mode <br> 0 : 12-bit mode <br> 1: 10-bit mode |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | SUSMTD [1:0] | Suspend Mode Select <br> These bits are used to select the suspend method when a higher-priority scan group interrupts a lower-priority scan group. <br> 00: Synchronous suspend when a higher-priority SG or SVSTOP interrupts. <br> 01: Asynchronous suspend when a higher-priority SG (SG2, SG3, SG4) and SVSTOP interrupt SG1, and synchronous suspend when a higher-priority SG (SG3, SG4) and SVSTOP interrupt SG2, or when a higher-priority SG (SG4) and SVSTOP interrupt SG3. <br> 10: Asynchronous suspend when a higher-priority SG or SVSTOP interrupts. <br> 11: Setting prohibited |

## CAUTION

To prevent malfunction, ADCAnADCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

NOTE

- Synchronous suspend:

If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the A/D conversion for the higher-priority SG is performed after the on-going A/D conversion of a channel is completed. After processing for the higher-priority SG is completed, the suspended A/D channel processing for the lower-priority SG is resumed.

- Asynchronous suspend:

If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the on-going channel processing is suspended, and then the A/D conversion for the higher-priority SG is performed. After processing for the higher-priority SG is completed, the suspended A/D channel conversion for the lower-priority SG is resumed.

For details, see Figure 38.25, Example of Synchronous Suspend and Resume Operation and Figure 38.26, Example of Asynchronous Suspend and Resume Operation.

### 38.3.2.9 ADCAnMPXCURR — MPX Current Register

This register is used to store the MPX value for an external analog multiplexer.

Access: ADCAnMPXCURR register is a read-only register that can be read in 32-bit units.
ADCAnMPXCURRL register is a read-only register that can be read in 16-bit units. ADCAnMPXCURRLL register is a read-only register that can be read in 8 -bit units.

Address: ADCAnMPXCURR: <ADCAn_base> $+30 \mathrm{C}_{\mathrm{H}}$
ADCAnMPXCURRL: <ADCAn_base> $+30 \mathrm{C}_{\mathrm{H}}$ ADCAnMPXCURRLL: <ADCAn_base> $+30 \mathrm{C}_{\mathrm{H}}$

Value after reset: $00000000_{\mathrm{H}}$

Table 38.46 ADCAnMPXCURR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | MPXCUR[2:0] | These bits are used to store the current MPX value. <br> If conversion of a virtual channel starts after setting ADCAnVCRj.MPXE to 1 , the setting of ADCAnVCRj.MPXV[2:0] is stored. <br> If conversion of a virtual channel starts after setting ADCAnPWDVCR.MPXE to 1 , the setting of ADCAnPWDVCR.MPXV[2:0] is stored. |

NOTE
In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.10 ADCAnTHSMPSTCR — T\&H Sampling Start Control Register

This register is used to control the start of sampling for all $\mathrm{T} \& \mathrm{Hk}(\mathrm{k}=0$ to 5$)$. The bits are always read as 0 .

Access: ADCAnTHSMPSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHSMPSTCRL register is a write-only register that can be written in 16 -bit units.
ADCAnTHSMPSTCRLL register is a write-only register that can be written in 8 -bit units.
Address: ADCAnTHSMPSTCR: <ADCAn_base> + 314
ADCAnTHSMPSTCRL: <ADCAn_base> $+314_{\mathrm{H}}$
ADCAnTHSMPSTCRLL: <ADCAn_base> $+314_{\mathrm{H}}$
Value after reset: $00000000_{\boldsymbol{H}}$

Table 38.47 ADCAnTHSMPSTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SMPST | T\&H Sampling Start Control Trigger <br> 0 : No effect <br> 1: Sampling for all T\&H is started. |
|  |  | The conditions to place the T\&H circuit in the sampling state are as follows: <br> - Condition to start sampling while T\&H is stopped: 1 being written to ADCAnTHSMPSTCR.SMPST while ADCAnTHER.THkE = 1 ( $k=0$ to 5 ). <br> - Condition to start continuous sampling in automatic sampling: A/D conversion of the hold value for T\&Hk being completed while ADCAnTHER.THkE $=1(\mathrm{k}$ $=0$ to 5) and ADCAnTHCR.ASMPMSK = 1 . |

NOTE
In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.11 ADCAnTHCR — T\&H Control Register

This register controls the sampling transition after A/D conversion of the hold value for T\&H is completed.
Automatic start of sampling on the T\&H circuit after A/D conversion of the hold value for T\&H is completed shortens the time required for the generation of succeeding hold completion triggers.

Table 38.48 ADCAnTHCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ASMPMSK | Automatic Sampling Mask Control |
|  |  | 0: Automatic sampling is not performed. |
|  | 1: Automatic sampling is performed. |  |

## CAUTION

To prevent malfunction, ADCAnTHCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

## NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.12 ADCAnTHAHLDSTCR — T\&H Group A Hold Start Control Register

This register is used to control the start of the hold for T\&H group A. The bits are always read as 0 .

Access: ADCAnTHAHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHAHLDSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHAHLDSTCRLL register is a write-only register that can be written in 8 -bit units.
Address: ADCAnTHAHLDSTCR: <ADCAn_base> $+31 \mathrm{C}_{\mathrm{H}}$
ADCAnTHAHLDSTCRL: <ADCAn_base> $+31 \mathrm{C}_{\mathrm{H}}$
ADCAnTHAHLDSTCRLL: <ADCAn_base> $+31 \mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 00000000_{H}$

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.13 ADCAnTHBHLDSTCR — T\&H Group B Hold Start Control Register

This register is used to control the start of the hold for T\&H group B. The bits are always read as 0 .

Access: ADCAnTHBHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHBHLDSTCRL register is a write-only register that can be written in 16 -bit units. ADCAnTHBHLDSTCRLL register is a write-only register that can be written in 8 -bit units.

Address: ADCAnTHBHLDSTCR: <ADCAn_base> + 320
ADCAnTHBHLDSTCRL: <ADCAn_base> $+320_{\mathrm{H}}$ ADCAnTHBHLDSTCRLL: <ADCAn_base> $+320^{H}$

Value after reset: $\quad 00000000_{H}$

## NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.14 ADCAnTHACR - T\&H Group A Control Register

This register is used to control T\&H group A.

Table 38.51 ADCAnTHACR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Selecting the same scan group as T\&H group B is prohibited. |

## CAUTION

To prevent malfunction, ADCAnTHACR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

NOTE
In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.15 ADCAnTHBCR — T\&H Group B Control Register

This register is used to control T\&H group B.

If ADCAnTHBCR.SGS[1:0] is set to $0_{H}, T \& H$ does not operate. <br> When you enable T\&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0]. <br> 2. Selecting the same scan group as $T \& H$ group $A$ is prohibited. |

## CAUTION

To prevent malfunction, ADCAnTHBCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

NOTE
In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.16 ADCAnTHER — T\&H Enable Register

This register controls enabling and disabling of each T\&H.

Access: ADCAnTHER register can be read or written in 32-bit units.
ADCAnTHERL register can be read or written in 16-bit units.
ADCAnTHERLL register can be read or written in 8-bit units.
Address: ADCAnTHER: <ADCAn_base> $+32 \mathrm{C}_{\mathrm{H}}$

NOTE: If THOE is set to 0, T\&HO is always stopped.

## CAUTION

To prevent malfunction, ADCAnTHER should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

NOTE
In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.17 ADCAnTHGSR — T\&H Group Select Register

This register is used to select a T\&H group for each T\&H.

Access: ADCAnTHGSR register can be read or written in 32-bit units.
ADCAnTHGSRL register can be read or written in 16-bit units.
ADCAnTHGSRLL register can be read or written in 8-bit units.
Address: ADCAnTHGSR: <ADCAn_base> $+330_{\text {H }}$
ADCAnTHGSRL: <ADCAn_base> $+330_{\text {H }}$
ADCAnTHGSRLL: <ADCAn_base> + 330 ${ }_{\mathrm{H}}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.54 ADCAnTHGSR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | TH5GS | T\&H5 Group Select <br> 0 : T\&H5 is selected to group A. <br> 1: T\&H5 is selected to group B. |
| 4 | TH4GS | T\&H4 Group Select <br> 0 : T\&H4 is selected to group A. <br> 1: $\mathrm{T} \& \mathrm{H} 4$ is selected to group $B$. |
| 3 | TH3GS | T\&H3 Group Select <br> 0 : T\&H3 is selected to group A. <br> 1: T\&H3 is selected to group B. |
| 2 | TH2GS | T\&H2 Group Select <br> 0 : T\&H2 is selected to group A. <br> 1: T\&H2 is selected to group B. |
| 1 | TH1GS | T\&H1 Group Select <br> 0 : T\&H1 is selected to group A. <br> 1: T\&H1 is selected to group B. |
| 0 | TH0GS | T\&H0 Group Select <br> 0 : T\&HO is selected to group A. <br> 1: T\&HO is selected to group B. |

## CAUTION

- Do not set T\&H0 to T\&H2 to the same group as T\&H3 to T\&H5.

Example

- Group A: Och, 1ch, 2ch

Group B: 3ch, 4ch, 5ch $\rightarrow$ Setting allowed

- Group A: Och

Group B: 1ch, 2ch $\rightarrow$ Setting allowed

- Group A: 0ch, 1ch, 3ch

Group B: $2 \mathrm{ch}, 4 \mathrm{ch} \rightarrow$ Setting prohibited

- To prevent malfunction, ADCAnTHGSR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

NOTE
In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

### 38.3.2.18 ADCAnSMPCR — Sampling Control Register

This register controls sampling.
ADCAnSMPCR controls the sampling time for SG4 (PWM-Diag) and SG1 to SG3.

```
Access: ADCAnSMPCR register can be read or written in 32-bit units.
ADCAnSMPCRL register can be read or written in 16-bit units.
ADCAnSMPCRLL register can be read or written in 8 -bit units.
Address: ADCAnSMPCR: <ADCAn_base> \(+380_{\text {H }}\)
ADCAnSMPCRL: <ADCAn_base> \(+380_{\mathrm{H}}\)
ADCAnSMPCRLL: <ADCAn_base> \(+380_{H}\)
Value after reset: 0000 0018н
```

Table 38.55 ADCAnSMPCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | SMPT[7:0] | These bits are used to set the sampling time (the number of cycles). |
|  |  | $12_{\mathrm{H}}: 18$ cycles (ADCLK $=8 \mathrm{MHz}$ to 32 MHz ) |
|  | $18_{\mathrm{H}}: 24$ cycles (ADCLK $=8 \mathrm{MHz}$ to 40 MHz$)$ |  |
|  | Settings other than above are prohibited. |  |

## CAUTION

- To prevent malfunction, ADCAnSMPCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .
- When SMPT is changed, the A/D conversion wait time is also changed when MPX is used by virtual channel register j (ADCAnVCRj) or PWM-Diag virtual channel register (ADCAnPWDVCR).

### 38.3.2.19 ADCAnMPXSTBTSELRO to 4 - MPX Stabilization Time Selection Register 0 to 4

This register is used to select the stabilization time for respective physical channels when external multiplexer is used. ADCAnMPXSTBTSELR0 corresponds to physical channels ANIn00 to ANIn07, ADCAnMPXSTBTSELR1 corresponds to physical channels of ANIn08 to ANIn15, ADCAnMPXSTBTSELR2 corresponds to physical channels of ANIn16 to ANIn23, and ADCAnMPXSTBTSELR3 corresponds to physical channels of ANIn24 to ANIn31, and ADCAnMPXSTBTSELR4 corresponds to physical channels of ANIn32 to ANIn35.

```
                    Access: ADCAnMPXSTBTSELRO to 4 registers can be read or written in 32-bit units.
                    ADCAnMPXSTBTSELROL to 4L registers can be read or written in 16-bit units.
                    ADCAnMPXSTBTSELROH to 3H registers can be read or written in 16-bit units.
                    Address: ADCAnMPXSTBTSELRO: <ADCAn_base> + 5FOH

## NOTE

- STBTCH00[2:0] to STBTCH35[2:0] are enabled when the MPXE bit of the ADCAnVCRj or ADCAnPWDVCR register is set to 1.
- In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

## CAUTION

To prevent malfunction, ADCAnMPXSTBTSELR0 to ADCAnMPXSTBTSELR4 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

### 38.3.2.20 ADCAnMPXSTBTR0 to 7 - MPX Stabilization Time Setting Register 0 to 7

This register is used to set the stabilization time when external multiplexer is used.
Stabilization time of corresponded physical channels which is selected by ADCAnMPXSTBTSEL0 to 4 register is set by setting this register.

## CAUTION

To prevent malfunction, ADCAnSFTCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

### 38.3.2.22 ADCAnULLMTBRO to 7 - Upper Limit/Lower Limit Table Register 0 to 7

These registers are used to set the threshold for detection of an upper limit or lower limit error in the A/D converted value. Any of ADCAnULLMTBR0 to ADCAnULLMTBR7 is specified by setting ADCAnPWDVCR.ULS[3:0] and ADCAnVCRj.ULS[3:0] and compared with ADCAnPWDTSNDR and ADCAnDRj.

Access: ADCAnULLMTBR0 to 7 registers can be read or written in 32-bit units.
ADCAnULLMTBROL to 7 L and ADCAnULLMTBROH to 7 H registers can be read or written in 16-bit units.
Address: ADCAnULLMTBRO: <ADCAn_base> $+338_{\mathrm{H}}$

| 15 to 4 | LLMTB[11:0] | Lower Limit Table <br> Specify the threshold for detection of a lower limit error in the A/D converted value. The lower <br> limit error (ADCAnULER.LE) is set when the following condition is met: <br> LLMTB[11:0] > A/D converted value |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## CAUTION

- When A/D conversion is executed in 10-bit mode (ADCAnADCR.CTYP = 1), ULMTB[1:0] and LLMTB[1:0] should be set to 11B and 00B, respectively.
- To prevent malfunction, ADCAnULLMTBR0 to ADCAnULLMTBR7 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .
- The upper-limit table (ULMTB[11:0]) must be greater than the lower-limit table (LLMTB[11:0]).

### 38.3.2.23 ADCAnECR — Error Clear Register

This register is used to control clearing of an error. The read value is always 0 .

Access: ADCAnECR register is a write-only register that can be written in 32-bit units.
ADCAnECRL register is a write-only register that can be written in 16 -bit units.
ADCAnECRLL register is a write-only register that can be written in 8 -bit units.
Address: ADCAnECR: <ADCAn_base> + 344

### 38.3.2.24 ADCAnULER — Upper Limit/Lower Limit Error Register

This register is a read-only register that indicates information regarding the upper limit/lower limit errors.

Access: ADCAnULER register is a read-only register that can be read in 32-bit units.
ADCAnULERL register is a read-only register that can be read in 16-bit units.
ADCAnULERLH register is a read-only register that can be read in 8-bit units.
ADCAnULERLL register is a read-only register that can be read in 8 -bit units.
Address: ADCAnULER: <ADCAn_base> $+348_{H}$
ADCAnULERL: <ADCAn_base> $+348_{H}$
ADCAnULERLL: <ADCAn_base> + 348
ADCAnULERLH: <ADCAn_base> $+348_{H}+1_{H}$
Value after reset: $\quad 00000000_{H}$

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

NOTE
ADCAnULER is updated when the A/D converted value is set in ADCAnDRj or ADCAnPWDTSNDR.

### 38.3.2.25 ADCAnOWER — Overwrite Error Register

This register is a 32/16/8-bit read-only register that indicates an overwrite error. The target for overwrite errors is SG1 to SG3, and not PWM-Diag.

Access: ADCAnOWER register is a read-only register that can be read in 32-bit units.
ADCAnOWERL register is a read-only register that can be read in 16 -bit units.
ADCAnOWERLL register is a read-only register that can be read in 8 -bit units.
Address: ADCAnOWER: <ADCAn_base> $+34 \mathrm{C}_{\mathrm{H}}$
ADCAnOWERL: <ADCAn_base> $+34 \mathrm{C}_{H}$
ADCAnOWERLL: <ADCAn_base> $+34 \mathrm{C}_{\mathrm{H}}$
Value after reset: $00000000_{\mathrm{H}}$

NOTE
ADCAnOWER is updated when the A/D converted value is set in ADCAnDRj.

### 38.3.2.26 ADCAnULEVCFR0 — Upper Limit/Lower Limit Error VC Flag Register 0

This is a flag register for each virtual channel indicating an upper or lower limit error. ADCAnULEVCFR0 corresponds to ADCAnVCRj ( $\mathrm{j}=0$ to 31 ).

Access: ADCAnULEVCFR0 register is a read-only register that can be read in 32-bit units.

### 38.3.2.27 ADCAnULEVCFR1 — Upper Limit/Lower Limit Error VC Flag Register 1

This is a flag register for each virtual channel indicating an upper or lower limit error. ADCAnULEVCFR1 corresponds to ADCAnVCRj ( $\mathrm{j}=32$ to 49 ) and ADCAnPWDVCR.

Access: ADCAnULEVCFR1 register is a read-only register that can be read in 32-bit units.
Address: ADCAnULEVCFR1: <ADCAn_base> + 544 ${ }_{\mathrm{H}}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.65 ADCAnULEVCFR1 Register Contents

### 38.3.3 Scan Group (SG) Specific Registers

This section describes the registers provided for each scan group.

### 38.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register

This register is used to control the start of scan group x . The read value is always 0 .
Access: ADCAnSGSTCRx is a write-only register that can be written in 32-bit units.
ADCAnSGSTCRxL is a write-only register that can be written in 16-bit units
ADCAnSGSTCRxLL is a write-only register that can be written in 8-bit units.
Address: ADCAnSGSTCRx: <ADCAn_base> $+x \times 40_{H}+400_{H}$
ADCAnSGSTCRxL: <ADCAn_base> $+x \times 40_{\mathrm{H}}+400_{\mathrm{H}}$
ADCAnSGSTCRxLL: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+400_{\mathrm{H}}$
Value after reset: $00000000^{H}$

Table 38.66 ADCAnSGSTCRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SGST | Scan Group Start Trigger |
|  |  | Writing 1 to SGST while ADCAnSGSTR.SGACT[3:1] = 0 starts the target SGx. |

### 38.3.3.2 ADCAnPWDSGSTPCR — PWM-Diag Scan Stop Control Register

This is a control register to stop scan group for PWM-Diag. The read value is always 0 .

Access: ADCAnPWDSGSTPCR register is a write-only register that can be written in 32-bit units.
ADCAnPWDSGSTPCRL register is a write-only register that can be written in 16 -bit units. ADCAnPWDSGSTPCRLL register is a write-only register that can be written in 8 -bit units.

Address: ADCAnPWDSGSTPCR: <ADCAn_base> + 504
ADCAnPWDSGSTPCRL: <ADCAn_base> + 504 $_{H}$ ADCAnPWDSGSTPCRLL: <ADCAn_base> + 504

Value after reset: $00000000_{\mathrm{H}}$

Table 38.67 ADCAnPWDSGSTPCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | PWDSGSTP | Scan Group for PWM-Diag Stop Trigger |
|  |  | Writing 1 to PWDSGSTP while ADCAnSGSTR.SGACT[4] = 1. |

### 38.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register

This register is used to control PWM-Diag.

Access: ADCAnPWDSGCR register can be read or written in 32-bit units.
ADCAnPWDSGCRL register can be read or written in 16-bit units.
ADCAnPWDSGCRLL register can be read or written in 8-bit units.
Address: ADCAnPWDSGCR: <ADCAn_base> + 508 ${ }_{\text {H }}$
ADCAnPWDSGCRL: <ADCAn_base> +50 H $_{\text {H }}$
ADCAnPWDSGCRLL: <ADCAn_base> +50 H $_{\text {H }}$
Value after reset: $00000000_{\mathrm{H}}$

Table 38.68 ADCAnPWDSGCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PWDTRGMD | PWM-Diag Trigger Mode Select |
|  |  | 0: PWSA_ADTRG trigger input is disabled. |
|  | 1: PWSA_ADTRG is selected for the trigger input to the PWM-Diag scan group. |  |

## CAUTION

To prevent malfunction, ADCAnPWDSGCR should be set (except clearing PWDTRGMD upon completion of A/D conversion) when SGACT of the PWM-Diag scan group (SG4) is 0 (before the scan group is started).

### 38.3.3.4 ADCAnSGCRx — Scan Group x Control Register

This register controls scan group x .

| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TRGMD | Trigger Mode <br> 0: Trigger input to SGx_TRG is disabled (Hardware trigger disabled). <br> 1: SGx_TRG start trigger or hold complete trigger $A / B$ is selected for the trigger input to SGx. <br> The software trigger is valid regardless of the TRGMD bit setting. |

## CAUTION

To prevent malfunction, ADCAnSGCRx should be set (except clearing TRGMD upon completion of A/D conversion and ADIE $=0$ setting when stop procedure of scan group) when SGACT of all scan groups is 0 (before the scan group is started) and TRGMD of all scan groups is 0 .

### 38.3.3.5 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

Table 38.70 ADCAnSGVCSPx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | VCSP[5:0] | Start Virtual Channel Pointer |
|  | These bits are used to specify the virtual channel from which the SGx scan is to be started. |  |

## CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When writing to the channel pointers, be sure to write in the following order: ADCAnSGVCSPx $\rightarrow$ ADCAnSGVCEPx. When SGx is started, the A/D conversion for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
- Though ADCAnSGVCSPx can be written during the A/D conversion, the register is updated at the time when ADCAnSGVCEPx is written. The new setting is applied when SGx is started next time.
- When the hardware trigger is used, writing to this register during operation is prohibited.

### 38.3.3.6 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer

This register specifies the end pointer of a virtual channel.

Access: ADCAnSGVCEPx register can be read or written in 32-bit units.
ADCAnSGVCEPxL register can be read or written in 16-bit units.
ADCAnSGVCEPxLL register can be read or written in 8-bit units.
Address: ADCAnSGVCEPx: <ADCAn_base> $+x \times 40_{H}+410_{H}$
ADCAnSGVCEPxL: <ADCAn_base> $+x \times 40_{H}+410_{H}$
ADCAnSGVCEPxLL: <ADCAn_base> $+x \times 40_{\mathrm{H}}+410_{\mathrm{H}}$
Value after reset: $00000000_{\mathrm{H}}$

Table 38.71 ADCAnSGVCEPx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | VCEP[5:0] | End Virtual Channel Pointer |
|  |  | These bits are used to specify the virtual channel at which the SGx scan is to be ended. |

## CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When SGx is started, processing for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
ADCAnSGVCEPx can be rewritten even when SGx is being processed. The new setting is applied when SGx is started next time.

### 38.3.3.7 ADCAnSGMCYCRx - Scan Group x Multicycle Register

This register is a $32 / 16 / 8$-bit read/write register that indicates the number of scan times in multicycle scan mode.

Access: ADCAnSGMCYCRx register can be read or written in 32-bit units.
ADCAnSGMCYCRxL register can be read or written in 16-bit units.
ADCAnSGMCYCRxLL register can be read or written in 8-bit units.
Address: ADCAnSGMCYCRx: <ADCAn_base> $+x \times 40_{H}+414_{H}$
ADCAnSGMCYCRxL: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+414_{\mathrm{H}}$
ADCAnSGMCYCRxLL: <ADCAn_base> $+\mathrm{x} \times 4 \mathrm{H}_{\mathrm{H}}+414_{\mathrm{H}}$
Value after reset: $\quad 00000000_{H}$

Table 38.72 ADCAnSGMCYCRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | MCYC[1:0] | Multicycle Number Specification |
|  |  | These bits are used to specify the number of scan times in multicycle scan mode. |
|  | $00_{\mathrm{B}}:$ Number of scans $=1$ |  |
|  | $01_{\mathrm{B}}:$ Number of scans $=2$ |  |
|  | $10_{\mathrm{B}}:$ Setting prohibited |  |
|  | $11_{\mathrm{B}}:$ Number of scans $=4$ |  |

## CAUTION

- To prevent malfunction, ADCAnSGMCYCRx should be set when SGACT of scan group x is 0 (before the scan group is started) and TRGMD is 0 .
- When SGx is started, the scan for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is repeatedly executed as many times as specified in ADCAnSGMCYCRx.

### 38.3.3.8 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register

This register is used to control the clearing of PWM-Diag scan end flag (SEF). The bits are always read as 0 .

Access: ADCAnPWDSGSEFCR register is a write-only register that can be written in 32-bit units.
ADCAnPWDSGSEFCRL register is a write-only register that can be written in 16 -bit units. ADCAnPWDSGSEFCRLL register is a write-only register that can be written in 8 -bit units.

Address: ADCAnPWDSGSEFCR: <ADCAn_base> + 518
ADCAnPWDSGSEFCRL: <ADCAn_base> +518 н
ADCAnPWDSGSEFCRLL: <ADCAn_base> + 518H

|  | 1: Clears the PWM-Diag scan end flag (ADCAnSGSTR.SEF[4]). |  |

### 38.3.3.9 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register

This register is a write-only register that clears the scan end flag (ADCAnSGSTR.SEFx). The read value is always 0 .

Access: ADCAnSGSEFCRx register is a write-only register that can be written in 32-bit units.
ADCAnSGSEFCRxL register is a write-only register that can be written in 16-bit units. ADCAnSGSEFCRxLL register is a write-only register that can be written in 8 -bit units.

Address: ADCAnSGSEFCRx: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+418_{\mathrm{H}}$
ADCAnSGSEFCRxL: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+418_{\mathrm{H}}$ ADCAnSGSEFCRxLL: <ADCAn_base> $+x \times 40_{H}+418_{H}$

### 38.3.3.11 ADCAnSGSTPCRx — Scan Group x Stop Control Register

This is a control register to stop scan group x . The read value is always 0 .

Access: ADCAnSGSTPCRx register is a write-only register that can be written in 32-bit units.
ADCAnSGSTPCRxL register is a write-only register that can be written in 16-bit units. ADCAnSGSTPCRxLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnSGSTPCRx: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+404_{\mathrm{H}}$
ADCAnSGSTPCRxL: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+404_{\mathrm{H}}$ ADCAnSGSTPCRxLL: <ADCAn_base> $+\mathrm{x} \times 40_{\mathrm{H}}+404_{\mathrm{H}}$

Value after reset: $00000000_{\mathrm{H}}$

### 38.3.4 Hardware Trigger Specific Register

### 38.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register

This register is used to select the A/D conversion trigger (hardware trigger) for SGx.

Note 1. ADCA1 supports only TxSEL0 to TxSEL4. When writing to the other bits, write the value after reset.

## CAUTIONS

1. When enabling the LPS trigger factor (SEQADTRG), select and enable only one of ADCAOSGTSEL1.T1SEL4, ADCAOSGTSEL2.T2SEL4, and ADCAOSGTSEL3.T3SEL4.
2. To prevent malfunction, ADCAnSGTSELx should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

## CAUTION

To prevent malfunction, ADCAnPDCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

## NOTE

For on-chip pull-down resistor values, see Section 47A, Electrical Characteristics of RH850/F1KH-D8, Section 47B, Electrical Characteristics of RH850/F1KM-S4 and Section 47C, Electrical Characteristics of RH850/F1KM-S1.

### 38.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2

This register specifies the channel to which the pull down resistor is connected.
For details, see Section 38.5.3, Diagnosis of Open Pins.

Note 1. ADCAnPDCTL2.PDNB [19:0] corresponds to ANInI19S to ANInIOS. For details, see Table 38.28, ADCA0 Analog Input Signals (RH850/F1KH-D8), Table 38.29, ADCA0 Analog Input Signals (RH850/F1KM-S4), Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1), Table 38.32, ADCA1 Analog Input Signals (RH850/F1KH-D8), and Table 38.33, ADCA1 Analog Input Signals (RH850/F1KM-S4). When writing to the bits of unused ANIn signals, write the value after reset.

## CAUTION

To prevent malfunction, SVSDIS should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .

### 38.4 Operation

### 38.4.1 Initial Setting

Figure 38.6, Flowchart for Initial Setting shows an initial setting example of the A/D conversion. For trigger input, see Figure 38.7, Flowchart for Trigger Input in the next section. For interrupt request signals, see Section 38.4.12, Scan End Interrupt Request.

Note: Set these registers as necessary.

Figure 38.6 Flowchart for Initial Setting

### 38.4.2 Trigger Input

The following figure shows the flowchart for trigger input.

Figure 38.7 Flowchart for Trigger Input

NOTE
When an SG start trigger is generated during scanning, the SG start trigger is ignored.

### 38.4.3 Ending/Stopping A/D Conversion

### 38.4.3.1 Ending by ADHALT

The flow for ending A/D conversion is shown below.

Note: The final setting of HALT when A/D conversion ends normally is done to clarify whether the status is "Conversion" or "IDLE". Whether HALT is set or not when A/D conversion ends normally does not affect the A/D conversion accuracy.

Figure 38.8 Flowchart for Ending A/D Conversion by ADHALT

### 38.4.3.2 Stopping by SGSTP (for Each Scan Group)

The flow for stopping A/D conversion for each scan group is shown below with SG1 as an example. Scan group which is selected in T\&H group (Group A or Group B) has to be stopped after stopping of T\&H (Group A or Group B).

Other scan group can be also controlled by its corresponding bit (ADCAnSGSTPCR2.SGSTP,
ADCAnSGSTPCR3.SGSTP and ADCAnPWDSGSTPCR.PWDSGSTP). In case of SGSTP $=1$ is set, it is necessary to confirm the clearing of corresponded scan group of SGACT.

Figure 38.9 Flowchart for Stopping A/D Conversion for Each Scan Group (SG1)

## CAUTION

In order to treat the A/D conversion results and re-set registers correctly after scan group stop setting, more than 14-bus clock (7-times of dummy read) has to be waited. In case of using the interrupt, this procedure is not necessary.

## NOTE

When the scan group stop bit is set right before A/D conversion is completed, the corresponding scan group makes a transition to the IDLE state, but an A/D conversion end interrupt or scan end interrupt may be output. If it has any system inconvenience, disable the interrupt and then set the stop bit.

When the scan group stop bit (ADCAnSGSTPCRx.SGSTP, ADCAnPWDSGSTPCR.PWDSGST) is set, the corresponding scan group enters the IDLE state and SGACT is cleared to 0 after finishing of the virtual channel in progress. An example of the operation is shown below.

Figure 38.11 Example of Scan Group Stop Operation (SG1 channel repeat)

When the stop bit of the scan group that has been suspended due to synchronous/asynchronous suspend is set, the corresponding scan group enters the IDLE state and SGACT is cleared to 0 without resuming the processing.

When the scan group stop bit is set and asynchronous suspend occurs due to interruption by a scan group with a higher priority during processing by a virtual channel, the processing of the virtual channel is stopped as shown in Figure 38.12, Example of Scan Group Stop Operation (Asynchronous suspend of SG1), the virtual channel enters the IDLE state and SGACT is cleared to 0 .

Figure 38.12 Example of Scan Group Stop Operation (Asynchronous suspend of SG1)

### 38.4.4 Example of Scan Group Operation

## (1) Multicycle Scan Mode

The following figure illustrates an operation example where four virtual channels of scan group 1 are converted using the two-cycle scan in multicycle scan mode.

Figure 38.13 Example of Multicycle Scan Operation 1

The following figure illustrates an operation example where a pin is scanned once in multicycle scan mode.

Conditions
Scan group 1: A/D conversion of virtual channel 0 in which a pin is scanned once in multicycle scan mode

Figure 38.14 Example of Multicycle Scan Operation 2

## (2) Continuous Scan Mode

Continuous scan mode allows A/D conversion of the SG channels indicated by the pointers specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to continue until ADCAnADHALTR.HALT or ADCAnSGSTPCRx.SGSTP is asserted. This mode can be used only with SG1.

The following figure shows an example of operation in continuous scan mode.

Figure 38.15 Example of Continuous Scan Operation

### 38.4.5 Channel Repeat Mode

Channel repeat mode allows A/D conversion of the SG channel indicated by the pointer specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to repeat number of channel repeat times specified by ADCAnSGCRx.SCT[1:0]. This mode operates exclusively in each SG. The number of channel repeat times is selectable from 1,2 , and 4.

The following figures show examples of operation under respective conditions.

Figure 38.16 Example of Channel Repeat Operation 1

Conditions
Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice and the two-cycle scan is used in multicycle scan mode

Figure 38.17 Example of Channel Repeat Operation 2

Figure 38.18 Example of Channel Repeat Operation 3

### 38.4.6 Example of Simultaneous Track and Hold Operation

Figure 38.19, Example of Simultaneous Track \& Hold Operation 1 shows an operation example of
simultaneous track and hold.

Figure 38.19 Example of Simultaneous Track \& Hold Operation 1

## CAUTION

- Do not specify the same physical channel in different groups.
- Two-cycle (or more) scan in multicycle scan mode and track \& hold operation using continuous scan mode are prohibited.
- Because ADCAnTHSMPSTCR.SMPST is common to group A and group B, set SMPST after T\&H operation for both group $A$ and group $B$ has been completed.
- If the hardware trigger is asserted before HLDCTE $=1$ and HLDTE $=1$ of ADCAnTHACR register or ADCAnTHBCR register are set and HLDST of ADCAnTHAHLDSTCR register or ADCAnTHBHLDSTCR register is written to hold T\&H, scan operation starts. In that case, the channel switch opens with T\&H staying in the sampling state. Therefore, all scan results are undefined. Do not assert the hardware trigger by setting HLDCTE $=1$ and HLDTE $=1$ before writing HLDST.
- Setting any channel from among 0 to 2 and any channel from among 3 to 5 in the same scan group is prohibited.
- Set the interval between T\&H sampling start control trigger and hold start trigger to be 450 ns or more.
- Set the interval between hold start trigger and completion of the group A/D conversion to be $10 \mu \mathrm{~s}$ or less In suspend mode, do not use T\&H for the channel of a scan group with low priority setting, if suspend time exceeds $10 \mu \mathrm{~s}$.

### 38.4.7 A/D Conversion with External Analog Multiplexer

The following figures show examples of $\mathrm{A} / \mathrm{D}$ conversion in each case.

### 38.4.7.1 A/D Conversion with PWM-Diag Enabled

With the PWM-Diag function enabled, A/D conversion is performed by the signal from the PWM-Diag.
For details on the PWM-Diag function, see Section 37, PWM Output/Diagnostic (PWM-Diag).
To control the A/D conversion, the A/D converter receives the setting information on the MPX by the A/D conversion trigger select (PWSA) signal. The flow of A/D conversion with PWM-Diag is as follows.
(1) Set the channel MPX value of the MPX to ADCAnPWDVCR.MPXV[2:0]. Up to 8 channels can be specified to the MPX.
(2) The A/D conversion is started by the trigger signal PWSA_ADTRG from the PWM-Diag. In addition, when the MPX enable bit (ADCAnPWDVCR.MPXE) is 1, a wait of one A/D-conversion time or configured wait time which is set by ADCAnSTBTR0 to ADCAnSTBTR7 and ADCAnSTBTSELR0 to ADCAnSTBTSELR4 is inserted before A/D conversion is performed.
(3) At the end of A/D conversion, the scan end is notified to the PWM-Diag.

## CAUTION

As the trigger signal PWSA_ADTRG of PWM-Diag function has a higher-priority than SGx_TRG ( $\mathrm{x}=1$ to 3 ), the operation of other scan groups may be kept waiting until the PWM-Diag function is ended.

Figure 38.24, PWM-Diag Operation shows an example of PWM-Diag operation using an MPX.

### 38.4.10 Error Detecting Functions

ADCAn covers upper-limit error, lower-limit error, and overwrite error.

### 38.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function

The upper-limit/lower-limit error detecting function determines whether the A/D converted data is larger than the upper-limit table ADCAnULLMTBR0.ULMTB[11:0] to ADCAnULLMTBR7. ULMTB[11:0] or smaller than the lower-limit table ADCAnULLMTBR0.LLMTB[11:0] to ADCAnULLMTBR7.LLMTB[11:0] at the end of A/D conversion.

### 38.4.10.2 Overwrite Error Detecting Function

If the ADCAnDIRj register or ADCAnDRj register of a virtual channel is not read while ADCAnDIRj.WFLG = 1 (A/D converted value is stored) and the next $\mathrm{A} / \mathrm{D}$ converted value is written in the ADCAnDRj register, an overwrite error is detected.

### 38.4.10.3 SVSTOP Operation

The SVSTOP function is supported by the SVSTOP signal sent from the on-chip debugger control unit. The SVSTOP function stops conversion of the A/D converter when the SVSTOP signal is input during an emulation break. While the SVSTOP signal is high, reading registers ADCAnDRj, ADCAnDIRj, ADCAnSGSTR, ADCAnULER, ADCAnOWER, ADCAnPWDTSNDR, ADCAnPWDDIR, ADCAnULEVCFR0, and ADCAnULEVCFR1 by the external access does not affect these registers.

When the high level is input to SVSTOP while ADCAnEMU.SVSDIS $=0$, ADCAnSGSTR.SGACT[5] is set to 1 to make a transition to the SVSTOP state. Hardware triggers and software triggers are valid in the SVSTOP state. When the high level is input to SVSTOP while ADCAnEMU.SVSDIS $=1$, the ADCA does not make a transition to the SVSTOP state. ADHALT (forced termination of A/D conversion) and scan group stop by ADCAnSGSTPCRx should not be performed in the SVSTOP state.

In operations for synchronous suspension, a new start trigger cannot be accepted over the time from when the high level is input to SVSTOP to the completion of conversion on the channel where conversion is currently proceeding. This time can be up to the time taken for one $\mathrm{A} / \mathrm{D}$ conversion.

The following example illustrates a SVSTOP operation example.

Note: An SG start trigger is accepted even during SVSTOP after the completion of conversion.

Note: After the completion of conversion, the SG start trigger is accepted even during SVSTOP.

Figure 38.31 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD $=10$, ADCAnEMU.SVSDIS $=0$ )

Note: An SG start trigger is accepted even during SVSTOP.
In cases of conflict between clearing of SVSTOP and setting of the scan group start trigger bit, conversion of the suspended scan group is resumed regardless of its priority.

### 38.4.11 Activating Scan Group by a Hardware Trigger

Scan group x can be activated by the hardware trigger input to SGx_TRG. As for the hardware trigger sources to be used, see Table 38.78, List of AID Conversion Hardware Triggers. When activating SGx_TRG by the hardware trigger, set the peripheral function to be used by the trigger and set the start trigger in the $\mathrm{A} / \mathrm{D}$ conversion trigger select control register (ADCAnSGTSELx).
A hardware trigger from external trigger input pin requires digital filter setting. For details, see Section 2A.12, Noise Filter \& Edge/Level Detector, Section 2B.12, Noise Filter \& Edge/Level Detector and Section 2C.12, Noise Filter \& Edge/Level Detector. More than one start trigger can be specified.

### 38.4.11.1 Stopping Scan Group by ADHALT

Setting ADCAnADHALTR.HALT (A/D force halt trigger) to 1 forcibly halts the A/D conversion and clears the scan group status register (ADCAnSGSTR). The error flag of ADCAnULER, ADCAnULEVCFR0, and ADCAnULEVCFR1 (upper limit/lower limit error register) is not cleared. When ADCAnADHALTR.HALT is set, make sure that ADCAnSGSTR.SGACT has been cleared.

### 38.4.12 Scan End Interrupt Request

Scan group $x$ can issue a scan end interrupt request (INT_SGx) to INTC. If ADIE of ADCAnSGCRx is set to 1 , INT_SGx can be output after the SGx scan ends. If ADIE of ADCAnSGCRx is set to 0 , the INT_SGx output when the SGx scan ends can be disabled. If ADIE of ADCAnVCRj is set to 1 , INT_SGx can be output when A/D conversion for virtual channel $j$ in SGx ends. If ADIE of ADCAnVCRj is set to 0 , the INT_SGx output when A/D conversion for virtual channel $j$ in $S G x$ ends can be disabled. Since $S G x$ scan ending is simultaneous with $A / D$ conversion ending for virtual channel $j$ in SGx when ADIEs of both ADCAnSGCRx and ADCAnVCRj are set to 1, INT_SGx occurs only once.

Example 1: A scan is executed for virtual channel 0 or 1 in SG1 when ADIE of ADCAnSGCR1 is 0 , ADIE of VCR0 is 1 , and ADIE of VCR1 is 0 . INT_SG1 is output when A/D conversion ends for virtual channel 0 .

Example 2: A scan is executed for virtual channel 0 or 1 in SG2 when ADIE of ADCAnSGCR2 is 0 , ADIE of VCR0 is 1 , and ADIE of VCR1 is 1 .
INT_SG2 is output when A/D conversion ends for virtual channel 0 and virtual channel 1.
Example 3: A scan is executed for virtual channel 0 or 1 in SG3 when ADIE of ADCAnSGCR3 is 1, ADIE of VCR0 is 0 , and ADIE of VCR1 is 0 .
INT_SG3 is output when a scan ends (when A/D conversion for virtual channel 1 ends).
Furthermore, the DMA can be started when scan ends.
For the setting of DMA, see Section 8, DMA Controller.

Figure 38.33 Example of a Scan Conversion End Interrupt Occurrence

### 38.4.13 A/D Error Interrupt Request

ADCA can issue an A/D error interrupt request (INT_ADE) to INTC. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 1 , the OR condition of the error source is issued as INT_ADE. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 0 , INT_ADE does not output an interrupt.

### 38.5 Self-Diagnostic Function

To check the ADCAn function, the following self-diagnostic functions are available.

## Section 38.5.1, Diagnosis of A/D Conversion Circuit

## Section 38.5.2, Diagnosis of Channel Multiplexer

## Section 38.5.3, Diagnosis of Open Pins

## Section 38.5.4, Diagnosis of T\&H Circuit

The overview of the self-diagnostic functions is shown in the figure below. A detailed description is given in the following sections.

Figure 38.35 Overview of Self-Diagnostic Functions

NOTE
The functions in the dashed-line frames depend on the product.

### 38.5.1 Diagnosis of A/D Conversion Circuit

This function checks whether the $A / D$ converter is operating normally by verifying the $A / D$ conversion for selfdiagnostic voltage (ADDIAGOUT) and the result of conversion. If the result of $\mathrm{A} / \mathrm{D}$ conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the A/D converter are as follows:

- As the self-diagnostic voltage (ADDIAGOUT) level, $A n V_{\text {REF }}, 2 / 3 A n V_{\text {REF }}, 1 / 3 A n V_{\text {REF }}, 1 / 2 A n V_{\text {REF }}$, and $A n V S S$ are selectable by the PSEL[2:0] bits in the ADCAnDGCTL0 register.
- Self-diagnosis of the A/D converter is enabled by performing A/D conversion on one of SG1 to SG3.

### 38.5.1.1 Diagnostic Procedure

The diagnostic procedures are shown below.
Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON $=1$ to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns .
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON $=1$ to update the voltage level.
5. Wait for 500 ns .
6. Set an arbitrary bit of ADCAnVCRj.GCTRL[5:0] to $100100_{\mathrm{B}}$ to select the diagnosis channel.
7. Set ADCAnVCRj.ADIE $=1$ to enable the $\mathrm{A} / \mathrm{D}$ conversion end interrupt.
8. Set ADCAnSGVCSPx to specify the start pointer of virtual channel.
9. Set ADCAnSGVCEPx to specify the end pointer of virtual channel.
10. Generate the start trigger of scan group to perform the $\mathrm{A} / \mathrm{D}$ conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the $\mathrm{A} / \mathrm{D}$ conversion was performed successfully.

NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTLO.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .
2. Clear ADCAnDGCTL0.PSEL[2:0].
3. Clear ADCAnADCR.DGON.

### 38.5.2 Diagnosis of Channel Multiplexer

This function checks whether the path from the analog input to the A/D converter is normal.
Set the A/D conversion reference voltage (DIAGOUT0, DIAGOUT1, DIAGOUT2) by ADCAnDGCTL0.PSEL[2:0] and the channels to be connected by the ADCAnDGCTL1 register to perform A/D conversion using multiple analog channels.

If the result of $\mathrm{A} / \mathrm{D}$ conversion differs from the expected value, an internal circuit may be broken. The features of selfdiagnosis of the channel multiplexer are as follows:

- Channels for diagnosis can be arbitrarily selected from among ADCA0I0 to ADCA0I15 and ADCA1I0 to ADCA1I15.
- As the self-diagnostic voltage level, $2 / 3 A_{n-} V_{\text {Ref }}, 1 / 3 A n V_{\text {ref }}$, and $1 / 2 A n V_{\text {ref }}$ are selectable and one of the three reference voltage levels can be allocated to each channel.

Table 38.84 Selection of Channel to be Diagnosed

| Connection | Select Channel |
| :--- | :--- |
| DIAGOUT0 | Channels $0,3,6,9,12$, and 15 |
| DIAGOUT1 | Channels $1,4,7,10$, and 13 |
| DIAGOUT2 | Channels $2,5,8,11$, and 14 |

- Self-diagnosis of the channel multiplexer is enabled by performing A/D conversion on one of SG1 to SG3 by using multiple channels.

### 38.5.2.1 Diagnostic Procedure

The diagnostic procedure is shown below.
Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON $=1$ to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns .
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON $=1$ to update the voltage level.
5. Wait for 500 ns .
6. Use two or more ADCAnVCRj registers. Set ADCAnVCRj.GCTRL[5:0] bits to select physical channels. Set ADCAnVCRj.ADIE bit to enable the A/D conversion end interrupt.
7. Set ADCAnSGVCSPx register to specify the start pointer of virtual channel.
8. Set ADCAnSGVCEPx register to specify the end pointer of virtual channel.
9. Set ADCAnDGCTL1 register to specify the physical channel to the self-diagnostic channel.
10. Generate the start trigger of scan group to perform the $\mathrm{A} / \mathrm{D}$ conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the $\mathrm{A} / \mathrm{D}$ conversion was performed successfully.

NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTLO.PSEL[2:0]. However, the value of ADCAnDGCTLO.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .
2. Clear ADCAnDGCTL0.PSEL[2:0].
3. Clear ADCAnADCR.DGON.

### 38.5.3 Diagnosis of Open Pins

This function detects whether the analog input pin (ADCAnIm, ADCAnImS) is open due to disconnection, etc. An internal pull-down resistor can be connected to diagnose the analog input pin.
Connect the analog input pin (ADCAnIm, ADCAnImS) with the pull-down resistor for self-diagnosis for A/D conversion of the target channels.

Figure 38.36 Setting of On-chip Pull Down Resistor

When there is a disconnection, the conversion result is almost 0 V and it indicates an open detection.

Figure 38.37 Analog Input Signal Disconnection Detection

## CAUTIONS

1. The pull-down resistors must not be connected during normal A/D conversion operation. Connected pull-down resistors may lead to a drop in the input voltage and result in erroneous A/D conversion results.
2. When the analog input voltage is nearly equal to the voltage level which is pulled down, a disconnection cannot be detected by this function.

### 38.5.3.1 Diagnostic Procedure

1. Set the ADCAnPDCTL1.PDNA or ADCAnPDCTL2.PDNB bit which correspond to analog input pins (ADCAnIm, ADCAnImS) to be diagnosed to enable the pull down resistor.
2. Generate the start trigger of scan group to perform the $A / D$ conversion.
3. Perform the $\mathrm{A} / \mathrm{D}$ conversion multiple times on the same analog input.
4. Monitor the channel's $\mathrm{A} / \mathrm{D}$ conversion results and check if any result declines to almost 0 V .

### 38.5.4 Diagnosis of T\&H Circuit

This function is used to diagnose proper operation of the T\&H0 to T\&H5 circuits for ADCA0I0 to ADCA0I5.
Virtual channel registers 33 to 35 (ADCA0VCR33 to ADCA0VCR35) are used exclusively for comparison of the potential conversion result using the T\&H circuit and that obtained without using the T\&H circuit to detect a failure of the T\&H circuit.

For this diagnosis, the ADCA0THACR.HLDCTE is set to 1 (ADCA0THBCR.HLDCTE $=1$ ) and
ADCA0THACR.HLDTE to 0 (ADCA0THBCR.HLDTE $=0$ ) and the A/D conversion trigger is used as the hold start/end trigger. Connect the reference voltage signal (DIAGOUT0, DIAGOUT1, or DIAGOUT2) selected by ADCAnDGCTL0.PSEL[2:0] to the target channels for diagnosis by using the ADCAnDGCTL1 register.

### 38.5.4.1 Diagnostic Procedure (in case of T\&H circuit ch0 diagnosis)

1. Set ADCA0ADCR.DGON $=1$ to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns .
3. Set ADCA0DGCTL0.PSEL[2:0] $=001_{\mathrm{B}}$ to select $1 / 3 A^{2} V_{\text {REF }}$ voltage level.
4. Set ADCA0ADCR.DGON $=1$ to update the voltage level.
5. Wait for 500 ns .
6. Set ADCA0DGCTL1.CDG0 $=1$ to enable DIAGOUT0.
7. Set ADCA0VCR33.GCTRL[5:0] to ADCAVCR35.GCTRL[5:0] to $000000_{\text {B }}$ to select physical ch0.
8. Set ADCA0VCR33.CNVCLS and ADCA0VCR34.CNVCLS to1 to select normal conversion.
9. Set ADCA0VCR35.CNVCLS $=0$ to select hold value conversion.
10. Set ADCA0THACR.SGS[1:0] $=01_{\mathrm{B}}$ to select SG1 to "T\&H group A".
11. Set ADCAOTHER.THOE $=1$ to enable T\&H circuit ch0.
12. Set ADCA0THGSR.TH0GS $=0$ to select T\&H circuit ch0 to "T\&H group A".
13. Set ADCA0SGVCSP1.VCSP[5:0] =100001 b to select SG1 start pointer to VCR33.
14. Set ADCA0SGVCEP1.VCEP[5:0] = 100011B to select SG1 end pointer to VCR35.
15. Set ADCA0DGCTL0.PSEL[2:0] = $011_{\mathrm{B}}$ to select $2 / 3 \mathrm{AnV}_{\text {REF }}$ voltage level.
16. Set ADCA0THSMPSTCR.SMPST $=1$ to execute T\&H sampling.
17. Wait for 500 ns .
18. Set ADCA0SGSTCR1.SGST = 1 to execute SG1 A/D conversion.
19. Read ADCA0DIR33 to ADCA0DIR35, and check A/D conversion result to see if SG1 A/D conversion has finished.

## NOTES

To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0 .
2. Use the ADCAnTHER register to disable the diagnosed T\&Hk.
3. Clear ADCAnDGCTLO.PSEL[2:0].
4. Clear ADCAnADCR.DGON.

### 38.5.4.2 Diagnosis Mechanism

(1) A reference voltage "A" is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T\&H circuit holds the voltage "A" and an A/D conversion is performed without using the T\&H circuit.

Figure 38.38 T\&H Circuit Diagnostic Mechanisms (1)
(2) A reference voltage " B " is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T\&H circuit still holds the voltage "A" and an A/D conversion is performed without using the T\&H circuit. Note that since reference voltage " $A$ " is being held, reference voltage " $B$ " is not held.

Figure 38.39 T\&H Circuit Diagnostic Mechanisms (2)
(3) An $\mathrm{A} / \mathrm{D}$ conversion is performed using the T\&H circuit. The T\&H circuit continues to hold the voltage A .

Figure 38.40 T\&H Circuit Diagnostic Mechanisms (3)
(4) The diagnosis of T\&H circuit is successful if the following results are obtained:

1. The first result (step 1 ) is voltage " A ".
2. The second result (step 2) is voltage " $B$ ".
3. The last result (step 3 ) is voltage " A " again.

### 38.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined as follows:

- Resolution

Digital output code value from the A/D converter

- Quantization error

An error essentially contained in the A/D converter, which is assumed as $1 / 2$ LSB (Figure 38.41, Definition of AID Conversion Accuracy).

- Offset error

Deviation of the analog input voltage value from the ideal $\mathrm{A} / \mathrm{D}$ conversion characteristics when the digital output changes from the minimum voltage value $000_{\mathrm{H}}$ to $001_{\mathrm{H}}$. However, the quantization error is not included.

- Full scale error

Deviation of the analog input voltage value from the ideal $\mathrm{A} / \mathrm{D}$ conversion characteristics when the digital output changes from $\mathrm{FFE}_{\mathrm{H}}$ to $\mathrm{FFF}_{\mathrm{H}}$. However, the quantization error is not included.

- DNL (Differential nonlinear error)

Deviation between the ideal digital output code width (Vq) and the actual digital output code width (Va), which is assumed as $(\mathrm{Va}-\mathrm{Vq}) / \mathrm{Vq}$. However, the offset error, the full scale error, and the quantization error are not included.

- INL (Integral nonlinear error)

Deviation of the actual value from the ideal A/D conversion characteristics between the zero voltage and the full scale voltage, which is assumed as an integral of DNL from $000_{\mathrm{H}}$ to a digital output code. However, the offset error, the full scale error, and the quantization error are not included.

- Absolute accuracy

Deviation between the digital value and the analog input value. The offset error, the full scale error, the quantization error, DNL, and INL are included.

- Overall error

Deviation between the digital value and the analog input value. The offset error, the full scale error, DNL, and INL are included, but the quantization error isn't included.

Figure 38.41 Definition of A/D Conversion Accuracy

### 38.7 Usage Notes

### 38.7.1 Range of Channel Input Voltage

## CAUTION

ADCAnIm and ADCAnImS input voltages should be used within the specification range. When the channel input voltage exceeds AnVREF or falls below AnVSS, an over-voltage/injected current condition applies.

1. When an over-voltage is applied to ADCAnIm pins (within the specified injected current range) and at the same pins the ADC self-diagnosis (diagnosis of channel multiplexer) is executed an offset voltage to the diagnosis voltage will be measured.
2. When an over-voltage is applied to ADCAnIm pins (within the specified injected current range) and at adjacent pins the ADC self-diagnosis (diagnosis of channel multiplexer) is executed an AD conversion result within the range of TESHOSN will be measured.

Case: Injected current is applied at only two pins (ADCAOIO and ADCAOI1 in the example below) where the ADC selfdiagnosis is executed.

- ADCAOIO and ADCAOI1 with applied injected current, but ADC self-diagnosis executed (CDG0-15 $=1$ set to DIAGOUTn selected).
$\rightarrow$ Conversion result of TESHOSN with offset voltage
- ADCAOI2-15 without applied injected current, but ADC self-diagnosis executed (CDG0-15 $=1$ set to DIAGOUTn selected).
$\rightarrow$ Conversion result of TESHOSN without offset voltage

### 38.7.2 Notes on Application Design

## (1) Analog Input Pins (ADCAnIm, ADCAnImS)

- Ensure that the input voltages on the ADCAnIm and ADCAnImS pins are within the specified ranges. We recommend using diodes with VF of 0.3 V or below to form a clamp to avoid the input of voltages at or above AnVREF and at or below AnVSS. The results of conversion for input voltages at or above AnVREF and at or below AnVSS are undefined and so are not guaranteed. Input of such voltages can also affect the results of conversion on other channels.
- Reduce noise on the analog input pins (ADCAnIm and ADCAnImS) by connecting a resistor Re between the pins and the external sources of analog input signals for conversion and capacitor Ce to the AnVSS pins.
- Avoid analog signal lines crossing digital signal lines and vice versa, since this can introduce noise and reduce performance in A/D conversion.
- We recommend avoiding the driving of large currents through input and output pins near the ADCAnIm and ADCAnImS pins and toggled signals in particular should be kept away from these pins.
- If you are using the standby functions, confirm the Force halt or the Normal end with the flow for Section 38.4.3, Ending/Stopping A/D Conversion. Then, set the ADCAnTHER.THkE bits, which are to be effective on standby, to 0 .
- If you are using the LPS on ADCA0 (also when standby function is used), set the ADCA0SGCRx.TRGMD bit to 1 and the ADCA0SGTSELx.TxSEL bits to SEQTRG (LPS). For details, see Section 15, Low-Power Sampler (LPS).
- Do not connect a channel to be used with the T\&H function to an external analog multiplexer.
- Changes to physical and virtual channels during operation while the T\&H function is in use is prohibited.
- Writing to PWM-Diag-related registers while PWM-Diag is not in use is prohibited.

## (2) Power Wiring

The following methods are recommended to minimize the influence of switching noise from digital circuits on A/D converter accuracy.

- Connect markedly thick wiring patterns to the mesh pattern or connect solid patterns to the power-supply lines.
- Insert bypass capacitors between power-supply pins (EVCC, BVCC, and AnVREF) and ground pins (EVSS, BVCC, and AnVSS).
- We recommend separating the analog power supply (AnVREF) from the digital power supplies (EVCC, BVCC) and providing the voltages from a series regulator. If the analog power supply is to come from the same source as that of the digital power supplies, wire the analog and digital power supplies to an electrolytic capacitor, and provide separate wiring patterns on the board.
We also recommend inserting a chip inductor in the input for the analog power supply. Furthermore, earth the analog and digital grounds to the same point on an electrolytic capacitor, and provide separate wiring patterns for the grounds on the board.
The analog power supply also serves as the analog reference voltage for this product.

## (3) Variation in A/D Converted Data

The effects of noise and variations in the power supply voltages lead to dispersal of the results of A/D conversion. Furthermore, noise on the analog input pins (ADCAnIm and ADCAnImS) or on the reference voltage input pins (AnVREF and AnVSS) can lead to the results of A/D conversion being incorrect.

Apply software processing to avoid ill effects on the system of fluctuations in or incorrectness of the results of A/D conversion.

Examples of software handling are described below.

- Use averaged values from several rounds of A/D conversion
- Execute A/D conversion for several time and omit extreme results
- Repeat the processing for abnormalities to check for repeated abnormalities in the case of results of A/D conversion which will cause malfunctions of the system.
There is a possibility that A/D conversion accuracy of high priority SG become worse when following both conditions are applicable.
(1) During the A/D conversion of low priority SG (e.g. SG1), conversion trigger of the high priority SG (e.g. SG3) occur.
(2) The channel T\&H function of high priority SG (e.g. SG3) is enabled.

The above case is one of an example of SG combination. The SG priority is SG4 $>$ SG3 $>$ SG2 $>$ SG1. The fluctuation of conversion error depends on the external circuit and devices mounted on the customer board.

Figure 38.42 SG priority

Examples of software handling are described below.

- Low priority SG (e.g. SG1) A/D conversion have to be finished 3 ADCLK before the conversion trigger of high priority SG (e.g. SG3), if the SG3 contains the channels which channel T\&H is available.
- If there is a case that high priority SG (e.g. SG3) conversion trigger occur during the conversion of low priority SG (e.g. SG1), disable the high priority SG channel T\&H function.
- If the both conditions mentioned in previous page need to be used, adjust high priority SG (e.g. SG3) conversion trigger timing to synchronize with the following timing (the period shown by arrowed line in the following figure) during A/D conversion of low priority SG (e.g. SG1).

Even if trigger timing is adjusted above recommendation time, conversion error specified in Section 47A, Electrical
Characteristics of RH850/F1KH-D8, Section 47B, Electrical Characteristics of RH850/F1KM-S4 and
Section 47C, Electrical Characteristics of RH850/F1KM-S1 cannot be removed.

Figure 38.43 SG conversion trigger timing

When it is not possible to use the above 3 software handlings, following process is recommended.

- Doing A/D conversion several times and using average of several A/D conversion results.
- Doing continuous A/D conversion several times, remove abnormal conversion result and use only the other results.
- When abnormal A/D conversion result is detected, not to proceed abnormal operation immediately, doing one more $\mathrm{A} / \mathrm{D}$ conversion before proceeding abnormal operation.

The effect of above process is depend on the external circuit and devices mounted on the customer board. Sufficient evaluation of the system is recommended.

## (4) Alternative Input/Output

Analog input (ADCAnIm, ADCAnImS) pins can be used as port pins.
Do not read from input port pins or write to output port pins while an ADCAnIm or ADCAnImS pin function is selected and handling A/D conversion. Doing so may reduce the accuracy of conversion.
Fluctuations in output current from output port pins due to the effects of an external circuit connected to a port pin while A/D conversion is in progress may also reduce the accuracy of conversion. If digital pulses are applied to or digital pulses are output through a pin adjacent to a pin for which A/D conversion is in progress, the A/D converted value may not be as expected due to coupling noise. Accordingly, do not apply pulses to or output pulses from a pin adjacent to a pin for which A/D conversion is in progress.

Note: $\quad \mathrm{C} 1: 4.7 \mu \mathrm{~F}$ to $10 \mu \mathrm{~F}$
C2: $0.01 \mu \mathrm{~F}$ to $0.1 \mu \mathrm{~F}$
Ce: 5 to 10 nF
$\mathrm{Re}: 0$ to $1 \mathrm{k} \Omega$
The values above are for reference.
D1, D2: VF $\leq 0.3 \mathrm{~V}$

Figure 38.44 Example of Noise Protection for Analog Input Circuit

Capacitor C1 is effective for low-frequency noise, and capacitors C2 and Ce are effective for high-frequency noise.
The voltage on an AnVREF pin is undefined immediately after switching from the stopped state to the start of conversion operations, and this may have the effect of reducing the accuracy of conversion. As a countermeasure for this situation, connect capacitors C1 and C2 to the AnVREF pins.

a) Insert an inductor for the analog power input.
b) Wire the analog and digital supplies to a single point near the 5 V power supply and provide separate wiring patterns on the board.
c) Place a bypass capacitor (electrolytic or laminated ceramic) near the common power supply.
d) Wire the analog and digital grounds to a single point near the power supplies, and provide separate wiring patterns for each on the board.
e) Place bypass capacitors (electrolytic or laminated ceramic) near the respective power supply pins.
f) Place capacitor Ce near the analog input pins of the device.

## Section 39 Key Return (KR)

This section contains a generic description of the Key Return (KR).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of KR.

### 39.1 Features of RH850/F1KH, RH850/F1KM KR

### 39.1.1 Number of Units and Channels

This microcontroller has the following number of KR units and channels.

### 39.2 Overview

### 39.2.1 Functional Overview

The Key Return function has the following features:
A key interrupt request signal (INTKRn) can be generated by inputting a falling signal, that goes from high to low, to any of the eight key input pins (KRnTPKR7 to KRnTPKR0).

| :--- | :--- | :--- |
| 7 to 0 | KRnKRMm | Enables/disables the key input signal detection. |
|  | $0:$ Disabled |  |
|  | 1: Enabled |  |

### 39.4 Operation

### 39.4.1 Interrupt Request INTKRn

The interrupt request INTKRn is generated when the level of the corresponding key input pin (KRnTPKRm) is changed from high to low while input to the key input pin (KRnTPKRm) is enabled (KRnKRM.KRnKRMm = 1).

Figure 39.2, Interrupt Request Generation shows how the interrupt request is generated:

Figure 39.2 Interrupt Request Generation

## CAUTIONS

1. The change of a key input pin (KRnTPKRm) level from high to low does not trigger another INTKRn if any of the key return input pins are already low. The next INTKRn is only triggered by a key input pin level changing from high to low if all other key input pins are high.
2. If the key input value changes at the same time the setting of KRnKRM.KRnKRMm is changed, an unintended key interrupt request INTKRn might be generated.
Therefore, mask (disable) INTKRn of the interrupt controller before changing KRnKRM.KRnKRMm from 0 to 1, or from 1 to 0 .

## Section 40A Functional Safety of RH850/F1KH-D8

This section provides an overview of the safety mechanisms included in the RH850/F1KH Series.
This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.
For more information about the development process and safety mechanisms, please contact our sales office.
The following are the failure detection functions provided by this microcontroller.

## 40A. 1 Overview

ECC
Detects failures of memories and data transfer paths and corrects some types of failures.

## Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

## Clock Monitor

Monitors the clock operation to detect abnormal operations.
For details, see Section 13, Clock Monitor (CLMA).

## Data CRC

Generates CRC to detect data errors.
For details, see Section 41, Data CRC (DCRA).

## Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.
For details, see Section 5, Write-Protected Registers.

## 40A. 2 ECC

## 40A.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40A. 1 ECC Overview

| Applicable Memory |  | Applicable Data Width [bits] | Operation upon Error Detection |  |  |  |  | Failure Insertion |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | Ethernet | 32 | SEC-DED | - | SEC-DED | Possible | Possible | Possible |
|  | MMCA | 32 | SEC-DED | - | SEC-DED | Possible | Possible | Possible |

Note 1. For details of ECC for each peripheral IP, see Section 40A.2.6, ECC for Peripheral RAM.
Note 2. For details, see Section 40A.2.2.2, Interrupt Requests, Section 40A.2.4.2, Interrupt Requests, and Section 40A.2.5.2, Interrupt Requests.

## Applicable Data Width

This is the data width to be ECC encoded.
To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).
(1) Reading data to be ECC-encoded including data to be rewritten
(2) Replacing data to be rewritten
(3) Writing back data generated in (2)

## Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.
SED-DED: 1-bit errors and 2-bit errors can only be detected.

## SYSERR

SYSERR can be generated upon error detection.

## Interrupt Notice

An interrupt can be generated upon error detection.

## Error Status

The status of a detected error is retained.

## Address Capture

The address of a detected error is retained.

## Failure Insertion

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 40A.2.2 Code Flash ECC

## 40A.2.2.1 Overview

RH850/F1KH has three code flash ECC decoder circuits implemented, two inside the Processor Element (PE1/PE2) and one on the VCI (system interconnect).

Figure 40A.1, Block Diagram of Code Flash ECC shows the location of three ECC decoders for the code flash.

Figure 40A. 1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.
Table 40A. 2 Summary of Code Flash ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. <br> When enabled, either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction. <br> - 2-bit error detection and 1-bit error detection. <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.) <br> Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. <br> - Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS =1) during data access and instruction fetch. <br> For details of the SYSERR, see Section 3A, CPU System of RH850/F1KH-D8. <br> In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. <br> However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |

Table 40A. 2 Summary of Code Flash ECC

| Item | Description |
| :--- | :--- |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. <br> The ECC 1-bit error status is set only when no error status has been set. <br> The ECC 2-bit error status is set even when the ECC 1-bit error status is set. <br>  <br> A register for clearing the error status is provided. |
| Address capture | When no ECC error status has been set, the address at which the first ECC error occurred is captured. <br> In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also <br> captured. |
| Self-diagnosis | The ECC bit can be read directly. |
| Inhibiting instruction | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction <br> execution |

## 40A.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.
Table 40A. 3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
| :--- | :--- | :--- | :--- |

Note 1. The registers suffixed with symbols "_VCI", "_PE1" and "_PE2" are provided to ECC controllers corresponding to each access port: registers with "_VCI" are provided to the ECC controller for data access from the system interconnect to the code flash, registers with "_PE1" are provided to the ECC controller for fetch access from the CPU1 and registers with "_PE2" are provided to the ECC controller for fetch access from the CPU2.

## 40A.2.2.4 Details of Registers

## (1) CFECCCTL_VCI/PE1/PE2 - Code Flash ECC Control Register

CFECCCTL_VCI/PE1/PE2 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1/PE2, PROT1 and PROT0 need to be 01 ${ }_{\text {b }}$.

```
            Access: CFECCCTL_VCI, CFECCCTL_PE1 and CFECCCTL_PE2 can be read or written in 32-bit units.
                    CFECCCTL_VCIL, CFECCCTL_PE1L and CFECCCTL_PE2L can be read or written in 16-bit units.

| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0 . Set (PROT1, PROT0) $=(0,1)$ when writing to CFECCCTL_VCI/PE1/PE2. |
| 14 | PROTO |  |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | 1-Bit Error Correction Disable |
|  |  | Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting $($ PROT1, PROTO $)=(0,1)$. <br> 0 : Enables correction of a 1-bit error upon detection. <br> 1: Disables correction of a 1-bit error upon detection. |
| 0 | ECCDIS | ECC Disable |
|  |  | Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROTO) $=(0,1)$. |
|  |  | 0: Enables ECC error detection and correction. |
|  |  | 1: Disables ECC error detection and correction. |

## (2) CFERRINT_VCI/PE1/PE2 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1/PE2 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: CFERRINT_VCI, CFERRINT_PE1 and CFERRINT_PE2 can be read or written in 32-bit units.
CFERRINT_VCIL, CFERRINT_PE1L and CFERRINT_PE2L can be read or written in 16-bit units.
CFERRINT_VCILL, CFERRINT_PE1LL and CFERRINT_PE2LL can be read or written in 8-bit units.
Address: CFERRINT_VCI: FFC6 2204H
CFERRINT_VCIL: FFC6 2204 ${ }_{H}$
CFERRINT_VCILL: FFC6 2204 ${ }_{\mathrm{H}}$
CFERRINT_PE1: FFC6 2404

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE $^{* 1}$ | ECC 2-Bit Error Notification Enable |
|  |  | Enables or disables generation of the error notification signal upon detection of a 2-bit error |
|  | when ECC error detection and correction are enabled. |  |
|  | 0: Disables notification of the ECC 2-bit error. |  |
|  | 1: Enables notification of the ECC 2-bit error. |  |
| 0 | ECC 1-Bit Error Notification Enable |  |
|  |  | Enables or disables generation of the error notification signal upon detection of a 1-bit error |
|  | when ECC error detection and correction are enabled. |  |
|  | 0: Disables notification of the ECC 1-bit error. |  |
|  | 1: Enables notification of the ECC 1-bit error. |  |
|  |  |  |

Note 1. This bit is not supported in CFERRINT_PE1/PE2. When writing to this bit in CFERRINT_PE1/PE2, always write 1.
Note 2. Regarding the interrupt request, see Section 40A.2.2.2, Interrupt Requests.

## (3) CFSTCLR_VCI/PE1/PE2 - Code Flash Status Clear Register

CFSTCLR_VCI/PE1/PE2 clears the error flags in the error status register (CF1STERSTR_VCI/PE1/PE2), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1/PE2), and the error address register (CF1STEADR0_VCI/PE1/PE2).

Access: CFSTCLR_VCI, CFSTCLR_PE1 and CFSTCLR_PE2 are write-only registers that can be written in 32-bit units. CFSTCLR_VCIL, CFSTCLR_PE1L and CFSTCLR_PE2L are write-only registers that can be written in 16-bit units. CFSTCLR_VCILL, CFSTCLR_PE1LL and CFSTCLR_PE2LL are write-only registers that can be written in 8-bit units.

## (4) CFOVFSTR_VCI/PE1/PE2 - Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1/PE2 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

| 0 | ERROVF0 | Error Overflow Flag |
|  |  | ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and |
|  | SEDF0) in the error status register has occurred, except when both of the error address and |  |
|  | source of the second error are the same as those of the first error. |  |

## (5) CF1STERSTR_VCI/PE1/PE2 - Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1/PE2 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0 . If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access: CF1STERSTR_VCI, CF1STERSTR_PE1 and CF1STERSTR_PE2 are read-only registers that can be read in 32-bit units.
CF1STERSTR_VCIL, CF1STERSTR_PE1L and CF1STERSTR_PE2L are read-only registers that can be read in 16bit units.

CF1STERSTR_VCILL, CF1STERSTR_PE1LL and CF1STERSTR_PE2LL are read-only registers that can be read in 8 -bit units.

## (6) CF1STEADR0_VCI/PE1/PE2 - Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1/PE2 holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0_VCI/PE1/PE2 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR_VCI/PE1/PE2 register to 1 .

Access: CF1STEADR0_VCI, CF1STEADRO_PE1 and CF1STEADRO_PE2 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L, CF1STEADR0_PE1H, CF1STEADR0_PE2L and CF1STEADR0_PE2H are read-only registers that can be read in 16-bit units.

## (7) CFSTSTCTL_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST $=1$, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
Access: CFSTSTCTL_VCI can be read or written in 32-bit units.
    CFSTSTCTL_VCIL can be read or written in 16-bit units.
Address: CFSTSTCTL_VCI: FFC6 2350H

Table 40A. 13 CFSTSTCTL_VCI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST bit. |
| 14 | PROT0 | The value written is not retained. These bits are always read as 0. |
| 13 to 1 | Reserved | Set (PROT1, PROT0 $)=(0,1)$ when writing to CFSTSTCTL_VCI. |
| 0 | ECCTST | When read, the value after reset is returned. When writing, write the value after reset. |
|  |  | ECC Test |
|  | After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a |  |
|  | value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |  |

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see Section 3A, CPU System of RH850/F1KH-D8.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16 n address. The results of reading code flash are as follows:

Table 40A. 14 Results of Reading Code Flash

| Bit Number | Meaning | Bit Position | Description |
| :--- | :--- | :--- | :--- |
| bit[31:10] | all-0 | 31 to 10 | These bits are always 0. |
| bit[9] | reserved | 9 | Unknown |
| bit[8:0] | ECC bits | 8 to 0 | ECC bits |

## 40A.2.3 Data Flash ECC

## 40A.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40A. 15 Summary of Data Flash ECC

| Item | Description |
| :--- | :--- |

## 40A.2.3.4 Details of Registers

## (1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be 01B.

Access: DFECCCTL can be read or written in 16-bit units.
Address: DFECCCTL: FFC6 2A00H
Value after reset: $\quad 0000_{H}$

Table 40A. 18 DFECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0 . Set $($ PROT1, PROT0) $=(0,1)$ when writing to DFECCCTL. |
| 14 | PROT0 |  |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | 1-bit Error Correction Disable |
|  |  | Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. <br> 0 : Enables correction of a 1-bit error upon detection. <br> 1: Disables correction of a 1-bit error upon detection. |
| 0 | ECCDIS | ECC Disable |
|  |  | Enables or disables ECC error detection and correction. |
|  |  | Write a value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |
|  |  | In the initial state, ECC error detection and correction are enabled. |
|  |  | 0: Enables ECC error detection and correction. |
|  |  | 1: Disables ECC error detection and correction. |

## (2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.
The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access: DFERSTR is a read-only register that can be read in 8 -bit units.
Address: DFERSTR: FFC6 2A04 ${ }_{H}$
Value after reset: $\quad 00_{H}$

## (3) DFERSTC - Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

Access: DFERSTC is a write-only register that can be written in 8-bit units.
Address: DFERSTC: FFC6 2A08H
Value after reset: $\quad 00_{H}$

|  |  | 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in |
|  | DFERSTR.) |  |
|  |  | 1: The SEDF/DEDF flag in DFERSTR is cleared. |

## (4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

```
Access: DFOVFSTR is a read-only register that can be read in 8-bit units.
Address: DFOVFSTR: FFC6 2A0C \({ }_{H}\)
Value after reset: \(\quad 00_{H}\)
```

## (7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0 .

Access: DFEADR is a read-only register that can be read in 32-bit units.
Address: DFEADR: FFC6 2A18 ${ }_{H}$
Value after reset: $00000000_{\mathrm{H}}$

Table 40A. 24 DFEADR Register Contents

## (8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.
After ECC test mode is enabled by setting ECCTST $=1$, the ECC bits can be read.
When writing to DFTSTCTL, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

Access: DFTSTCTL can be read or written in 16-bit units.
Address: DFTSTCTL: FFC6 2A1C ${ }_{H}$
Value after reset: $\quad 0000_{H}$

## 40A.2.4 Local RAM ECC

## 40A.2.4.1 Overview

The local RAM ECC of CPU1/CPU2 is summarized in the table below.
Table 40A. 26 Summary of Local RAM ECC (CPU1/CPU2)

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. <br> When enabled, either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction. <br> - 2-bit error detection and 1-bit error detection. <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. <br> - Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. <br> For details of the SYSERR, see Section 3A, CPU System of RH850/F1KH-D8. <br> In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. <br> However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided. |
| Address capture | When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured. |
| Self-diagnosis | Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly. |
| Others | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions. |

## CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16 -bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

## 40A.2.4.4 Details of Registers

## (1) LRTSTCTL_PE1/PE2 - Local RAM Test Control Register

LRTSTCTL_PE1/PE2 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL_PE1/PE2, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
Access: LRTSTCTL_PE1 and LRTSTCTL_PE2 registers can be read or written in 32-bit units.
LRTSTCTL_PE1L and LRTSTCTL_PE2L registers can be read or written in 16-bit units.
Address: LRTSTCTL_PE1: FFC6 5004H
LRTSTCTL_PE1L: FFC6 5004
LRTSTCTL_PE2: FFC6 5024
LRTSTCTL_PE2L: FFC6 5024
Value after reset: \(\quad 00000000_{\mathrm{H}}\)
```

Table 40A. 31 LRTSTCTL_PE1/PE2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST and DATSEL bits. The value written is not retained. These bits are always read as 0 . Set $($ PROT1, PROT0 $)=(0,1)$ when writing to LRTSTCTL_PE1/PE2. |
| 14 | PROT0 |  |
|  |  |  |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | ECC Test |
|  |  | After ECC test mode is enabled by setting ECCTST $=1$, the ECC bits can be read by reading LRTDATBFO_PE1/PE2 register or written directly. |
|  |  | Write a value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |
| 0 | DATSEL | Data Select |
|  |  | This bit is valid when ECCTST = 1 . This bit selects the RAM bit which can be accessed when writing. |
|  |  | Write a value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |
|  |  | 0: RAM data is selected. |
|  |  | 1: The ECC bits are selected. |

## CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

## (2) LRTDATBF0_PE1/PE2 - Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST $=1$ in the local RAM test control register LRTSTCTL_PE1/PE2, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.
Access: LRTDATBF0_PE1 and LRTDATBF0_PE2 registers are read-only registers that can be read in 32-bit units.
Address: LRTDATBF0_PE1: FFC6 5008н LRTDATBFO_PE2: FFC6 5028H Value after reset: $00000000_{H}$

## (3) LRECCCTL_PE1/PE2 - Local RAM ECC Control Register

LRECCCTL_PE1/PE2 enables or disables ECC error detection and correction and 1-bit error correction.
When writing to LRECCCTL_PE1/PE2, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
            Access: LRECCCTL_PE1 and LRECCCTL_PE2 registers can be read or written in 32-bit units.
            LRECCCTL_PE1L and LRECCCTL_PE2L registers can be read or written in 16-bit units.

## (4) LRERRINT_PE1/PE2 - Local RAM Error Information Control Register

LRERRINT_PE1/PE2 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

```
Access: LRERRINT_PE1 and LRERRINT_PE2 registers can be read or written in 32-bit units.
    LRERRINT_PE1L and LRERRINT_PE2L registers can be read or written in 16-bit units.

## (5) LRSTCLR_PE1/PE2 - Local RAM Status Clear Register

LRSTCLR_PE1/PE2 clears the error flags in the error status register (LR1STERSTR_PE1/PE2), the overflow flag in the error overflow status register (LROVFSTR_PE1/PE2), and the error address register (LR1STEADR0_PE1/PE2). LRSTCLR_PE1/PE2 is a write-only register and is always read as 0 .

Access: LRSTCLR_PE1 and LRSTCLR_PE2 registers are write-only registers that can be written in 32-bit units.
LRSTCLR_PE1L and LRSTCLR_PE2L registers are write-only registers that can be written in 16-bit units.
LRSTCLR_PE1LL and LRSTCLR_PE2LL registers are write-only registers that can be written in 8 -bit units.

## (6) LROVFSTR_PE1/PE2 - Local RAM Error Count Overflow Status Register

LROVFSTR_PE1/PE2 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1/PE2.

```
            Access: LROVFSTR_PE1 and LROVFSTR_PE2 registers are read-only registers that can be read in 32-bit units.
                    LROVFSTR_PE1L and LROVFSTR_PE2L registers are read-only registers that can be read in 16-bit units.
                            LROVFSTR_PE1LL and LROVFSTR_PE2LL registers are read-only registers that can be read in 8-bit units.
            Address: LROVFSTR_PE1: FFC6 540CH

## (7) LR1STERSTR_PE1/PE2 - Local RAM 1st Error Status Register

LR1STERSTR_PE1/PE2 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0 .

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR_PE1/PE2 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR_PE1/PE2.
Access: LR1STERSTR_PE1 and LR1STERSTR_PE2 registers are read-only registers that can be read in 32-bit units. LR1STERSTR_PE1L and LR1STERSTR_PE2L registers are read-only registers that can be read in 16-bit units. LR1STERSTR_PE1LL and LR1STERSTR_PE2LL registers are read-only registers that can be read in 8-bit units.

## (8) LR1STEADR0_PE1/PE2 - Local RAM 1st Error Address Register 0

LR1STEADR0_PE1/PE2 holds the address at which an error has occurred.
The error address is set if an error occurs while error flags are 0 in LR1STERSTR_PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR_PE1/PE2. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0_PE1/PE2 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1/PE2.

Access: LR1STEADRO_PE1 and LR1STEADRO_PE2 registers are read-only registers that can be read in 32-bit units. LR1STEADR0_PE1L, LR1STEADRO_PE1H, LR1STEADR0_PE2L and LR1STEADR0_PE2H registers are read-only registers that can be read in 16-bit units.
LR1STEADR0_PE1LL, LR1STEADR0_PE1LH, LR1STEADR0_PE1HL, LR1STEADR0_PE2LL,
LR1STEADR0_PE2LH and LR1STEADRO_PE2HL registers are read-only registers that can be read in 8 -bit units.

## 40A.2.5 Global RAM (Including the Retention RAM) ECC

## 40A.2.5.1 Overview

## CAUTION

The retention RAM is a part of the global RAM. The ECC for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

In RH850/F1KH, an ECC encoder and an ECC decoder are provided for each bank (bank A and bank B).
Figure 40A.2, Block Diagram of Global RAM ECC shows the location of two ECC decoders and two ECC encoders for the global RAM.

Note 1. Instruction Fetch Unit
Note 2. Load Store Unit
Note 3. GRZF accesses RAM directly. For details, see Section 45.3, Global RAM Zero Fill (GRZF).

Figure 40A. 2 Block Diagram of Global RAM ECC

The global RAM ECC is summarized in the table below.
Table 40A. 39 Summary of Global RAM ECC

| Item | Description |
| :--- | :--- |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. |
|  | When enabled, either of the following settings can be selected. |
|  | - 2-bit error detection and 1-bit error detection/correction |
|  | When disabled, neither error detection nor correction is carried out. |
|  | In the initial state, the ECC function is enabled, and 1-bit errors are detected and |
| corrected, 2-bit errors are detected. |  |

## 40A.2.5.4 Details of Registers

## (1) GRECCCTL_BKA/BKB - Global RAM ECC Control Register

GRECCCTL_BKA/BKB enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 018 when writing to GRECCCTL_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

```
Access: GRECCCTL_BKA and GRECCCTL_BKB can be read or written in 32-bit units GRECCCTL_BKAL and GRECCCTL_BKBL can be read or written in 16 -bit units

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not |
| 14 | retained. These bits are always read as 0.Set PROT1 to 0 and PROTO to 1 when writing to |  |
| this register. |  |  |

## (2) GRERRINT_BKA/BKB— Global RAM Error Information Control Register

GRERRINT_BKA/BKB enables or disables generation of the error notification signal upon detection of an ECC 1-bit error.

The setting of this register is used for accesses through the respective access port.

```
Access: GRERRINT_BKA and GRERRINT_BKB can be read or written in 32-bit units
    GRERRINT_BKAL and GRERRINT_BKBL can be read or written in 16-bit units
    GRERRINT_BKALL and GRERRINT_BKBLL can be read or written in 8-bit units

| 0 | SEDIE | ECC 1-bit error Notification Enable |
|  |  | Enables or disables generation of the error notification signal upon detection of a 1-bit error |
|  | when ECC error detection and correction are enabled. |  |
|  | 0: Disables notification of the ECC 1-bit error. |  |
|  | 1: Enables notification of the ECC 1-bit error. |  |
|  |  |  |

## (3) GRSTCLR_BKA/BKB — Global RAM Status Clear Register

GRSTCLR_BKA/BKB clears the error flags in the error status register (GR1STERSTR_BKA/BKB), the overflow flag in the error count overflow status register (GROVFSTR_BKA/BKB), and the error address register
(GR1STEADR_BKA/BKB). GRSTCLR_BKA/BKB is a write-only register and is always read as 0 .
The setting of this register is used for accesses through the respective access port.

```
            Access: GRSTCLR_BKA and GRSTCLR_BKB are write-only registers that can be written in 32-bit units.
                    GRSTCLR_BKAL and GRSTCLR_BKBL are write-only registers that can be written in 16-bit units.

Table 40A. 46 GRSTCLR_BKA/BKB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, always write 0. |
| 0 | STCLR0 | Error Status Flag Clear |
|  |  | Writing 1 to this bit clears the DEDF and SEDF flags in GR1STERSTR_BKA/BKB, ERROVF0 |
|  |  | flag in GROVFSTR_BKA/BKB, and EADR[19:0] in GR1STEADR_BKA/BKB. |

## (4) GROVFSTR_BKA/BKB— Global RAM Error Count Overflow Status Register

GROVFSTR_BKA/BKB monitors occurrence of error overflow. If a second error occurs after the first error (while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

The setting of this register is used for accesses through the respective access port.

Table 40A. 47 GROVFSTR_BKA/BKB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ERROVF0 | Error Overflow Flag |
|  |  | ERROVFO is set if a second error occurs while any of the error flags |
|  | (DEDF and SEDF) in the error status register is set. |  |
|  | ERROVF0 is not set when the second error occurs at the same address or source like the first |  |
|  | error. |  |

## (5) GR1STERSTR_BKA/BKB— Global RAM 1st Error Status Register

GR1STERSTR_BKA/BKB monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0 . However, the corresponding error flag is set if an ECC 2-bit error occurs only when SEDF bit is set. GR1STERSTR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

## (6) GR1STEADR_BKA/BKB— Global RAM 1st Error Address Register

GR1STEADR_BKA/BKB holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address
is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.
GR1STEADR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access: GR1STEADR_BKA and GR1STEADR_BKB are read-only registers that can be read in 32-bit units. GR1STEADR_BKAL, GR1STEADR_BKBL, GR1STEADR_BKAH and GR1STEADR_BKBH are read-only registers that can be read in 16-bit units. GR1STEADR_BKALL, GR1STEADR_BKALH, GR1STEADR_BKAHL, GR1STEADR_BKBLL, GR1STEADR_BKBLH and GR1STEADR_BKBHL are read-only registers that can be read in 8-bit unit. ## (7) GRTSTCTL_BKA/BKB — Global RAM Test Control Register

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST to 1, any data can be written to the ECC bits.
Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).
Set PROT1 to 0 and PROT0 to 1 when writing to this register.

## (8) GRDECINBF1_BKA/BKB— Global RAM ECC Decoder Input Data Buffer 1

7-bit ECC of global RAM is replaced to this register value by write access to global RAM during GRTSTCTL_BKA/BKB.ECCTST = 1 (test mode).

Access: GRDECINBF1_BKA and GRDECINBF1_BKB can be read or written in 32-bit units.
GRDECINBF1_BKAL and GRDECINBF1_BKBL can be read or written in 16-bit units.

## 40A.2.6 ECC for Peripheral RAM

## 40A.2.6.1 Overview

This is an ECC module for the RAM of the following peripheral modules.
MMCA, CSIH, RS-CANFD, FlexRay and Ethernet AVB.
Table 40A. 52 List of the ECC Functions for the peripheral RAM

| Item | Description |
| :--- | :--- |
| ECC error | ECC error detection and correction can be enabled or disabled. |
| detection/correction | Either of the following settings can be selected. |
|  | - 2-bit error detection and 1-bit error detection/correction |
|  | The ECC error detection/correction can be disabled by using through mode. |
|  | In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs. |
|  | - Error notification can be enabled or disabled when an ECC 2-bit error is detected. |
|  | In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled. |
|  | However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed. |
| Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. |  |
|  | A bit for clearing the error status is provided. |
| Address capture | Only one address at which an ECC error has occurred can be captured. A signal is generated upon <br> detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address <br> (when the first (1-bit or 2-bit) error is detected after the flag is cleared). |

When ECC error detection/correction is performed about RS-CANFD or FlexRay, initialize the RAM area before it is used.

## 40A.2.6.4 Details of Registers

## (1) <Module_Name>CTL — ECC Control Register

The <Module_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.
Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module's operation is stopped.
In addition, when writing to bit 7, EMCA1 and EMCA0 need to be $01_{\mathrm{B}}$.

Note 1. These bits are always read as 0.
Table 40A. 60 <Module_Name>CTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | EMCA1 | Access Control Bits 1 and 0 to ECC Mode Selection |
|  |  | These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0 . When these bits are $01_{\mathrm{B}}$, writing to bit 7 is enabled. |
| 14 | EMCAO |  |
| 13, 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | ECCOVFF | By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set. |
|  |  | 0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. <br> 1: Error address register overflowed |
|  |  | NOTE: This bit clear condition is as follows. <br> (1) Reset |
|  |  | (2) Writing ECER2C $=1$ when ECER2F = 1 or ECER1C $=1$ when ECER1F = 1 <br> (3) Selecting through mode enable (ECTHM = 1) |
| 10 | ECER2C | 2-Bit ECC Error Detection Flag Clear |
|  |  | This bit clears 2-bit error detection flags of ECER2F (bit 2). |
|  |  | This bit is always read as 0 . Writing 0 is ignored. |
|  |  | Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. |
|  |  | When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set. |
| 9 | ECER1C | 1-Bit ECC Error Detection Correction Accumulation Flag Clear |
|  |  | This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0 . Writing 0 is ignored. |
|  |  | Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. |
|  |  | When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set. |
| 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 40A. 60 <Module_Name>CTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ECTHM | ECC Function through Mode Selection <br> Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function. <br> When writing to this bit, write $01_{\mathrm{B}}$ to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function. <br> 0 : Passing through mode is disabled (normal operation mode). <br> 1: Passing through mode is enabled. (ECC function disable) |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EC1ECP | 1-Bit Error Correction Enable <br> This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. <br> 0 : When 1-bit error is detected, the error will be corrected. <br> 1: When 1-bit error is detected, the error will not be corrected. |
| 4 | EC2EDIC | 2-Bit Error Detection Interrupt Control <br> This bit controls whether to generate an interrupt when 2-bit error is detected. <br> 0 : When 2-bit error is detected, a target peripheral module's interrupt will not be generated. <br> 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated. |
| 3 | EC1EDIC | 1-Bit Error Detection Interrupt Control <br> This bit controls whether to generate an interrupt when 1-bit error is detected. <br> 0 : When 1-bit error is detected, a target peripheral module's interrupt will not be generated. <br> 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated. |
| 2 | ECER2F | 2-Bit Error Detection Flag <br> This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM $=0$ ). When 2-bit error interrupt is enabled (EC2EDIC $=1$ ) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output. <br> Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1 ), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated. <br> 0: 2-bit error has not occurred since this bit was cleared. <br> 1: 2-bit error has occurred. <br> This bit is read-only. Writing 0 or 1 does not change internal state. |
| 1 | ECER1F | 1-Bit Error Detection/Correction Flag <br> This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9 ) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared. <br> 0 : 1-bit error has not occurred since this bit was cleared. <br> 1: 1-bit error has occurred. <br> This bit is read-only. Writing 0 or 1 does not change internal state. |
| 0 | ECEMF | ECC Error Message Flag <br> This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data. <br> 0 : The current RAM output data does not have bit errors. <br> 1: The current RAM output data have bit errors. |

## CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

## (2) <Module_Name>TMC — ECC Test Mode Control Register

The <Module_Name>TMC register is used to switch to the test mode, and this register is for test mode control.
This register can be used when a target peripheral module is not accessed to RAM.
When writing to bit 7, ETMA1 and ETMA0 need to be $10_{\mathrm{B}}$.

Note 1. These bits are always read as 0 .
Table 40A. 61 <Module_Name>TMC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | ETMA1 | Access Control Bits 1 and 0 to ECC Test Mode |
| 14 | ETMAO | These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. |
| 13 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC Test Mode Enable |
|  |  | This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write $10_{B}$ to the ETMA1 and ETMAO bits at the same time. <br> 0 : Access to the test mode registers and bits is disabled. <br> 1: Access to the test mode registers and bits is enabled. |

| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM Read Test Mode Selection |
|  |  | This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. <br> 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM. |
| 3 | ECREOS | ECC Redundant Bit Output Data Selection |
|  |  | This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). |
|  |  | This bit is cleared when ECTMCE $=0$ (cleared synchronously). |
|  |  | 0 : ECC data is generated for write data is stored in RAM. |
|  |  | 1: The value of <Module_Name>ERDB Register is stored in RAM. |

## (3) <Module_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.
This register value is used to generate ECC data or syndrome code.
This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE $=1$ ). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00000000_{\mathrm{H}}$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

## (4) <Module_Name>TRC - ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers,
<Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, and <Module_Name>ERDB.
This register can be accessed when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00000000_{\mathrm{H}}$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

## (5) <Module_Name>AD0 - Target ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.
When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Table 40A. 63 <Module_Name>AD0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | Reserved | When read, the value after reset is returned. |
| 30 to 0 | ECEAD[30:0] | ECEADO is a read-only register to hold the address at which an ECC error has occurred. |
|  |  | If an ECC error is detected while ECC error detection is enabled, the RAM address is latched <br> using the detection signal as a trigger, and the address is stored in ECEADO as the address at <br> which the ECC error has occurred. |
|  | The address is stored upon detection of the first ECC error while no error status is set. |  |
|  | However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. |  |
|  | Only one address can be held in ECEADO |  |

## (6) <Module_Name>SYND - ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrome data in ECC test mode.
Writing to this register is ignored.
This register is read-only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

| Access: | This register is a read-only register that can be read in 8-bit units. |

## (7) <Module_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.
Writing to this register is ignored.
This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

| Access: | This register is a read-only register that can be read in 8-bit units. |

## (8) <Module_Name>ECRD - ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.
Writing to this register is ignored.
This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When ECC test mode is disabled ( $<$ Module_Name $>$ TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

| Access: | This register is a read-only register that can be read in 8 -bit units. |

## (9) <Module_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.
This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00_{\mathrm{H}}$ is read.

## (10) SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.
Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

| Access: |  |  | SELB_READTESTW can be read or written in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 40A. 3 Memory Protection

## 40A.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the RH850 Family User's Manual: Software.

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local
RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see Section 3A, CPU System of RH850/F1KH-D8.

- IPG

The CPU Peripheral is protected against illegal accesses.
For details, see Section 3A, CPU System of RH850/F1KH-D8.

- GRG

The global RAM is protected against illegal accesses.

- PBG/HBG

The control registers in the peripheral circuits are protected against illegal accesses. For details, see
Section 40A.3.3, PBG/HBG.

- PBGC

The CPU system has its dedicated PBG function which is called PBG for CPU system. For details, see Section 40A.3.4, PBG for CPU System.

## 40A.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.
Table 40A. 69 Identifiers for Slave Guard

| Identifier | Function |
| :---: | :---: |
| UM | When the CPU makes an access, this indicates the operating mode of the CPU. <br> 0 : Supervisor mode <br> 1: User mode <br> When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0. |
| SPID | When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU. <br> When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. <br> When another master makes an access, the value of this identifier is always $00_{\mathrm{B}}$. |
| PEID | This indicates the access source bus master. $\begin{aligned} & 001_{\mathrm{B}}: \text { CPU1 } \\ & 010_{\mathrm{B}}: \text { CPU2 } \\ & 100_{\mathrm{B}}: \text { Other bus master (H-Bus bus master) } \end{aligned}$ <br> When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. |

## 40A.3.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

## CAUTION

The retention RAM is a part of the global RAM. The Guard for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

Note: MGDGRPROTn_BKA/BKB, MGDGRBADn_BKA/BKB, and MGDGRADVn_BKA/BKB set the protection specifications for each channel ( $\mathrm{n}=0$ to 3 ).
MGDGRSCTL_*, MGDGRSSTAT_*, MGDGRSTYPE_* and MGDGRSAD_* indicate error information on each bank.
"BKA" represents for Bank $A$ and "BKB" represents for Bank B.

Note 1. Access with PEID
PEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
SPID is a bit list with each bit corresponding to a SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFG0.SPID

## CAUTION

Global RAM Guard (GRG) only supports write accesses. The guard setting is not enabled for read accesses.

| 10 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## Setting example

If MGDGRBADn_BKA.AD[19:11] is $170_{\mathrm{H}}$ and MGDGRADVn_BKA.ADV[19:11] is $1 \mathrm{FD}_{\mathrm{H}}$, global RAM guard protection area n is from FEEB $8000_{\mathrm{H}}$ to FEEB $87 \mathrm{FF}_{\mathrm{H}}$ and FEEB $9000_{\mathrm{H}}$ to FEEB $97 \mathrm{FF}_{\mathrm{H}}$.

If MGDGRBADn_BKB.AD[19:11] is $170_{\mathrm{H}}$ and MGDGRADVn_BKB.ADV[19:11] is 1 FD н , global RAM guard protection area $n$ is from FEFB $8000_{\mathrm{H}}$ to FEFB $87 \mathrm{FF}_{\mathrm{H}}$ and FEFB $9000_{\mathrm{H}}$ to $\mathrm{FEFB}^{97 \mathrm{FF}}$ н .

## Concept (e.g. bank A)

When MGDGRBADn_BKA.AD[19:11] is $170_{\mathrm{H}}$, the base address is FEEB $8000_{\mathrm{H}}$.
The settable range is shown by an underline as follows:

The settable range is as follows when MGDGRADVn_BKA.ADV[19:11] is $1 \mathrm{FD}_{\mathrm{H}}$ :

$$
\begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & B
\end{array}
$$

The area to which protection applies is as shown below because the bits set to 0 and the lower eleven bits are not applicable:

$$
\begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 1 & 0 & 0 & x & 0 & x & x & x & x & x & x & x & x & x & x & x & B
\end{array}
$$

Therefore the protection range is as follows:

to
and

$$
\left\lvert\, \begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 0 & 1 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \mathrm{~B} \\
& & & & \mathrm{E} & & & & \mathrm{E} & & & & \mathrm{~B} & & & & 9 & & & & & 0 & & & & & & & & & & & \\
\mathrm{~F}
\end{array}\right.
$$

to

The following 2 Kbytes each (a total of 4 Kbytes) are protected (in hexadecimal):

- FEEB $8000_{\mathrm{H}}$ to FEEB $87 \mathrm{FF}_{\mathrm{H}}$
- FEEB $9000_{\mathrm{H}}$ to FEEB 97 FF

|  | 1: An overflow occurred. |  |
|  |  | If a second guard violation occurs with the error detection flag being set after the first guard |
|  | violation occurs, the error entry overflows and this flag is set because the number of GRG |  |
|  | error entry stages is 1. |  |

## (6) MGDGRSTYPE_BKA/BKB — GRG Error Access Type Register

Access: MGDGRSTYPE_BKA and MGDGRSTYPE_BKB are read-only registers that can be read in 32-bit units.
MGDGRSTYPE_BKAL and MGDGRSTYPE_BKBL are read-only registers that can be read in 16 -bit units.
MGDGRSTYPE_BKALL, MGDGRSTYPE_BKALH, MGDGRSTYPE_BKBLL and MGDGRSTYPE_BKBLH are readonly registers that can be read in 8 -bit units.

## 40A.3.3 PBG/HBG

The PBG/HBG module is divided into several PBG/HBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG/HBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG/HBG group can hold the information of the access that has been rejected.
The following table lists the peripheral circuits to be protected, the corresponding PBG/HBG group names, and the PBG/HBG channel numbers.

## 40A.3.3.2 Details of Registers

## (1) FSGDxxPROTn - PBGxx Protection Register n HFSGDxxPROTn - HBGxx Protection Register n

FSGDxxPROTn and HFSGDxxPROTn specify the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. " n " in the register names and symbols represents the PBG/HBG channel number.

Access: FSGDxxPROTn and HFSGDxxPROTn can be read or written in 32-bit units.
FSGDxxPROTnL, FSGDxxPROTnH, HFSGDxxPROTnL, and HFSGDxxPROTnH can be read or written in 16 -bit units.
FSGDxxPROTnLL, FSGDxxPROTnHL, FSGDxxPROTnHH, HFSGDxxPROTnLL, HFSGDxxPROTnHL, and HFSGDxxPROTnHH can be read or written in 8-bit units.

Address: See Table 40A.80, List of PBG/HBG Protection Registers.
Value after reset: See Table 40A.80, List of PBG/HBG Protection Registers.

Note 1. It varies depending on each register. See Section 40A.3.3.1, List of Registers.

Table 40A. 84 FSGDxxPROTn/HFSGxxPROTn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | PROTLOCK | Register Lock <br> 0: Enables FSGDxxPROTn/HFSGDxxPROTn rewrite. <br> 1: Disables FSGDxxPROTn/HFSGDxxPROTn rewrite. <br> When PROTLOCK is set to 1 , the value is held until reset is asserted. |
| 30 to 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

| 6 | PROTSPID1 | Access with SPID = 1 (CPU1*3)*2 <br> 0 : Disables access with SPID1. <br> 1: Enables access with SPID1. |
| 5 | PROTSPID0 | Access with SPID $=0$ (peripheral device connected to $\mathrm{H}-\mathrm{BUS}$ )*2 <br> 0: Disables access with SPID0. <br> 1: Enables access with SPID0. |
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | PROTRDPDEF | Default Read Protection <br> 0: Enables read access from any master regardless of other setting in this register. <br> 1: The setting of PROTRD is effective. |
| 2 | PROTWRPDEF | Default Write Protection <br> 0: Enables write access from any master regardless of other setting in this register. <br> 1: The setting of PROTWR is effective. |
| 1 | PROTRD | Read Permission <br> 0 : Disables reading by a bus master subject to access filtering. <br> 1: Enables reading by a bus master subject to access filtering. |
| 0 | PROTWR | Write Permission <br> 0 : Disables writing by a bus master subject to access filtering. <br> 1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFGO.SPID

## (2) ERRSLVxxCTL — PBGxx Error Control Register HERRSLVxxCTL — HBGxx Error Control Register

ERRSLVxxCTL and HERRSLVxxCTL clear the status in the error status register with the PBGxx/HBGxx.

```
Access: ERRSLVxxCTL and HERRSLVxxCTL are write-only registers that can be written in 32-bit units.
    ERRSLVxxCTLL and HERRSLVxxCTLL are write-only registers that can be written in 16-bit units.
    ERRSLVxxCTLLL and HERRSLVxxCTLLL are write-only registers that can be written in 8-bit units.
Address: ERRSLVxxCTL: <base_addrO> + OH
    ERRSLVxxCTLL: <base_addrO> + OH
    ERRSLVxxCTLLL: <base_addr0> + OH

## (3) ERRSLVxxSTAT - PBGxx Error Status Register HERRSLVxxSTAT - HBGxx Error Status Register

ERRSLVxxSTAT and HERRSLVxxSTAT hold the status of the illegal access rejected with the PBGxx/HBGxx.

```
Access: ERRSLVxxSTAT and HERRSLVxxSTAT are read-only registers that can be read in 32-bit units.
ERRSLVxxSTATL and HERRSLVxxSTATL are read-only registers that can be read in 16-bit units.
ERRSLVxxSTATLL and HERRSLVxxSTATLL are read-only registers that can be read in 8-bit units.
Address: ERRSLVxxSTAT: <base_addr0> + 4H

Table 40A. 87 ERRSLVxxSTAT/HERRSLVxxSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag |
|  |  | 0: No overflow |
|  |  | 1: An overflow occurred. |
|  |  | If a second guard violation occurs with the error detection flag being set after the first guard |
|  | violation occurs, the error entry overflows and this flag is set because the number of |  |
|  |  | PBG/HBG error entry stages is 1. |
|  |  | Note that this overflow is notified to INTGUARD. |
|  |  | In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. |
|  |  | For an overflow check the OVF bit should be checked. The error information of the guard |
|  |  | violation when an overflow occurs are not captured. |
| 0 | Error Status Flag |  |
|  |  | 0: No PBG/HBG protection violation |
|  |  | 1: PBG/HBG protection violation occurred. |
|  |  |  |

## CAUTION

After writing HERRSLVxxCTL, the value of HERRSLVxxSTAT takes the following procedure for a reflection:

- Execute SYNCM
- Wait for $24 \times$ CPU clock*1 cycles

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTRL and CKSC_CPUCLKD_CTL

## (4) ERRSLVxxADDR — PBGxx Error Address Register HERRSLVxxADDR — HBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.
HERRSLVxxADDR holds the address of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.
Access: ERRSLVxxADDR and HERRSLVxxADDR are read-only registers that can be read in 32-bit units.
Address: ERRSLVxxADDR: <base_addr0> +8 H
HERRSLVxxADDR: <base_addr1> $+8_{H}$
Value after reset: $\quad 00000000_{H}$

Table 40A. 88 ERRSLVxxADDR/HERRSLVxxADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | ADDR[31:2] | Address in which the PBG/HBG protection violation is generated. |
| 1,0 | Reserved | ERRSLVxxADDR: When read, the value after reset is returned. |
|  |  | HERRSLVxxADDR: When read, an undefined value is returned. |

## (5) ERRSLVxxTYPE - PBGxx Error Type Register HERRSLVxxTYPE — HBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.
HERRSLVxxTYPE holds the type of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

## 40A.3.4 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.
Table 40A. 90 Target Registers of PBG for CPU Subsystem

| PBGC Group |  | Channel <br> Group No. | Protection Target Module |

Note 1. Regarding the PBGC registers for the flash memory, see the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

## 40A.3.4.1 List of Registers

The following table lists the registers provided for each PBGC group. And PBG group is equal to module name.

## 40A.3.4.2 Details of Registers

## (1) FSGDCxPROTn - PBGCx Protection Register $\mathbf{n}(x=0,1)$

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.
" n " in the register names and symbols represents the PBGC channel number.

## Access: FSGDCxPROTn register can be read or written in 32-bit units.

FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.
FSGDCxPROTnLL, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8 -bit units.
Address: See Table 40A.91, List of PBGC Protection Registers.
Value after reset: See Table 40A.91, List of PBGC Protection Registers.

Table 40A. 93 FSGDCxPROTn Register Contents

| Bit Position | Bit Name | Function |

| 0 | PROTWR | Write Permission <br> 0 : Disables writing by a bus master subject to access filtering. <br> 1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFGO.SPID

## (2) ERRSLVCxCTL - PBGCx Error Control Register ( $x=0,1$ )

ERRSLVCxCTL clears the status in error status register PBGCx.

Access: ERRSLVCxCTL register is a write-only register that can be written in 32-bit units. ERRSLVCxCTLL register is a write-only register that can be written in 16 -bit units. ERRSLVCxCTLLL register is a write-only register that can be written in 8 -bit units.

Address: ERRSLVCxCTL: FFC4 $\mathrm{C} 800_{\mathrm{H}}+\left(100_{\mathrm{H}} \times \mathrm{x}\right)$
ERRSLVCxCTLL: FFC4 $\mathbf{C 8 0 0}{ }_{H}+\left(100_{H} \times x\right)$ ERRSLVCxCTLLL: FFC4 C800 $+\left(100_{H} \times x\right)$

Value after reset: $00000000_{\mathrm{H}}$

Table 40A. 94 ERRSLVCxCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When writing, write the value after reset. |
| 1 | CLRO | Clears the overflow flag. |
|  |  | 0: Does not clear the overflow flag. |
|  | 1: Clears the overflow flag. |  |
| 0 | CLRE | Clears the error flag. |

| 1 | 0 | Clears the OVF bit. |
| 1 | 1 | Clears the OVF and ERR bits. |

## (3) ERRSLVCxSTAT - PBGCx Error Status Register ( $x=0,1$ )

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

Access: ERRSLVCxSTAT register is a read-only register that can be read in 32-bit units.
ERRSLVCxSTATL register is a read-only register that can be read in 16 -bit units. ERRSLVCxSTATLL register is a read-only register that can be read in 8-bit units.

Address: ERRSLVCxSTAT: FFC4 C804 $+\left(100_{H} \times x\right)$
ERRSLVCxSTATL: FFC4 C804 ${ }_{H}+\left(100_{H} \times x\right)$
ERRSLVCxSTATLL: FFC4 C804 $+\left(100_{H} \times x\right)$
Value after reset: $00000000_{\mathrm{H}}$

Table 40A. 96 ERRSLVCxSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag |
|  | 0: No overflow |  |
|  |  | 1: An overflow occurred. |
|  |  | If a second guard violation occurs with the error detection flag being set after the first guard |
|  | violation occurs, the error entry overflows and this flag is set because the number of PBGC |  |
|  |  | error entry stages is 1. |
|  |  | Note that this overflow is notified to INTGUARD. |
|  |  | In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. |
|  |  | For an overflow check the OVF bit should be checked. The error information of the guard |
|  |  | violation when an overflow occurs are not captured. |
| 0 | Error Status Flag |  |
|  |  | 0: No PBGC protection violation |
|  |  | 1: A PBGC protection violation occurred. |

## (4) ERRSLVCxADDR - PBGCx Error Address Register (x=0,1)

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.
The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxADDR register is a read-only register that can be read in 32-bit units.
Address: $\quad$ FFC4 C808 ${ }_{H}+\left(100_{H} \times x\right)$
Value after reset: $\quad 00000000_{H}$

| 1,0 | Reserved | When read, the value after reset is returned. |

## (5) ERRSLVCxTYPE - PBGCx Error Type Register ( $x=0,1$ )

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.
The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Table 40A. 98 ERRSLVCxTYPE Register Contents

| Bit Position | Bit Name | Function |

## Section 40B Functional Safety of RH850/F1KM-S4

This section provides an overview of the safety mechanisms included in the RH850/F1KM Series.
This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.
For more information about the development process and safety mechanisms, please contact our sales office.
The following are the failure detection functions provided by this microcontroller.

## 40B. 1 Overview

ECC
Detects failures of memories and data transfer paths and corrects some types of failures.

## Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

## Clock Monitor

Monitors the clock operation to detect abnormal operations.
For details, see Section 13, Clock Monitor (CLMA).

## Data CRC

Generates CRC to detect data errors.
For details, see Section 41, Data CRC (DCRA).

## Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.
For details, see Section 5, Write-Protected Registers.

## 40B. 2 ECC

## 40B.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40B. 1 ECC Overview

| Applicable Memory |  | Applicable Data Width [bits] | Operation upon Error Detection |  |  |  |  | Failure Insertion |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | FlexRay | 32 | SEC-DED | - | SEC-DED | Possible | Possible | Possible |
|  | Ethernet | 32 | SEC-DED | - | SEC-DED | Possible | Possible | Possible |

Note 1. For details of ECC for each peripheral IP, see Section 40B.2.6, ECC for Peripheral RAM.
Note 2. For details, see Section 40B.2.2.2, Interrupt Requests, Section 40B.2.4.2, Interrupt Requests, and Section 40B.2.5.2, Interrupt Requests.

## Applicable Data Width

This is the data width to be ECC encoded.
To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).
(1) Reading data to be ECC-encoded including data to be rewritten
(2) Replacing data to be rewritten
(3) Writing back data generated in (2)

## Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.
SED-DED: 1-bit errors and 2-bit errors can only be detected.

## SYSERR

SYSERR can be generated upon error detection.

## Interrupt Notice

An interrupt can be generated upon error detection.

## Error Status

The status of a detected error is retained.

## Address Capture

The address of a detected error is retained.

## Failure Insertion

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 40B.2.2 Code Flash ECC

## 40B.2.2.1 Overview

RH850/F1KM has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

Figure 40B.1, Block Diagram of Code Flash ECC shows the location of two ECC decoders for the code flash.

Figure 40B. 1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.
Table 40B. 2 Summary of Code Flash ECC

| Item | Description |
| :--- | :--- |
| ECC error detection and | ECC error detection and correction can be enabled or disabled. |
| correction | When enabled, either of the following settings can be selected. |
|  | - 2-bit error detection and 1-bit error detection/correction. |
|  | When disabled, neither error detection nor correction is carried out. |
|  | In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are |
| detected. |  |

Table 40B. 2 Summary of Code Flash ECC

| Item | Description |
| :--- | :--- |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. <br> The ECC 1-bit error status is set only when no error status has been set. <br> The ECC 2-bit error status is set even when the ECC 1-bit error status is set. <br>  <br> A register for clearing the error status is provided. |
| Address capture | When no ECC error status has been set, the address at which the first ECC error occurred is captured. <br> In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also <br> captured. |
| Self-diagnosis | The ECC bit can be read directly. |
| Inhibiting instruction | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction <br> execution |

## 40B.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.
Table 40B. 3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| - | ECC 1-bit error interrupt of code flash | SYSERR, INTECCFLIO*1 | - |
|  |  | (SED \& SECDIS = 1) |  |
|  |  | INTECCFLIO | - |
| - | (SED \& SECDIS $=0)$ |  |  |

Note 1. ECCFLIOFEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

| CFECC_VCI | Code flash sub-test control register (VCI) | CFSTSTCTL_VCI | FFC6 2350 ${ }_{\text {H }}$ |

Note 1. The registers suffixed with symbols "_VCI" and "_PE1" are provided to ECC controllers corresponding to each access port: registers with "_VCI" are provided to the ECC controller for data access from the system interconnect to the code flash and registers with "_PE1" are provided to the ECC controller for fetch access from the CPU1.

## 40B.2.2.4 Details of Registers

## (1) CFECCCTL_VCI/PE1 - Code Flash ECC Control Register

CFECCCTL_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
Access: CFECCCTL_VCI and CFECCCTL_PE1 can be read or written in 32-bit units.
    CFECCCTL_VCIL and CFECCCTL_PE1L can be read or written in 16-bit units.
Address: CFECCCTL_VCI: FFC6 2200H

## (2) CFERRINT_VCI/PE1 - Code Flash Error Information Control Register

CFERRINT_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: CFERRINT_VCI and CFERRINT_PE1 can be read or written in 32-bit units.
CFERRINT_VCIL and CFERRINT_PE1L can be read or written in 16 -bit units.
CFERRINT_VCILL and CFERRINT_PE1LL can be read or written in 8 -bit units.

Note 2. Regarding the interrupt request, see Section 40B.2.2.2, Interrupt Requests.

## (3) CFSTCLR_VCI/PE1 - Code Flash Status Clear Register

CFSTCLR_VCI/PE1 clears the error flags in the error status register (CF1STERSTR_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1), and the error address register (CF1STEADR0_VCI/PE1).

Access: CFSTCLR_VCI and CFSTCLR_PE1 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL and CFSTCLR_PE1L are write-only registers that can be written in 16-bit units.

## (4) CFOVFSTR_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

## (5) CF1STERSTR_VCI/PE1 - Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0 . If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access: CF1STERSTR_VCI and CF1STERSTR_PE1 are read-only registers that can be read in 32-bit units.
CF1STERSTR_VCIL and CF1STERSTR_PE1L are read-only registers that can be read in 16 -bit units.

## (6) CF1STEADR0_VCI/PE1 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1 holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0_VCI/PE1 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR_VCI/PE1 register to 1 .

Access: CF1STEADRO_VCI and CF1STEADRO_PE1 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L and CF1STEADR0_PE1H are read-only registers that can be read in 16 -bit units.

## (7) CFSTSTCTL_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST $=1$, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
Access: CFSTSTCTL_VCI can be read or written in 32-bit units.
    CFSTSTCTL_VCIL can be read or written in 16-bit units.

| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST bit. |
| 14 | PROT0 | The value written is not retained. These bits are always read as 0. |
| 13 to 1 | Reserved | Set (PROT1, PROT0 $)=(0,1)$ when writing to CFSTSTCTL_VCI. |
| 0 | ECCTST | When read, the value after reset is returned. When writing, write the value after reset. |
|  |  | ECC Test |
|  | After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a |  |
|  | value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |  |

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see Section 3BC, CPU System of RH850/F1KM.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to $16 n$ address. The results of reading code flash are as follows:

Table 40B. 14 Results of Reading Code Flash

| Bit Number | Meaning | Bit Position | Description |
| :--- | :--- | :--- | :--- |
| bit[31:10] | all-0 | 31 to 10 | These bits are always 0. |

## 40B.2.3 Data Flash ECC

## 40B.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40B. 15 Summary of Data Flash ECC

| Item | Description |
| :--- | :--- |

## 40B.2.3.4 Details of Registers

## (1) DFECCCTL - Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

Access: DFECCCTL can be read or written in 16-bit units.
Address: DFECCCTL: FFC6 2A00H
Value after reset: $\quad 0000_{H}$

|  |  | Write a value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |
|  |  | In the initial state, ECC error detection and correction are enabled. |
|  |  | 0: Enables ECC error detection and correction. |
|  |  | 1: Disables ECC error detection and correction. |

## (2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.
The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access: DFERSTR is a read-only register that can be read in 8 -bit units.
Address: DFERSTR: FFC6 2A04 ${ }_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

## (4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

```
Access: DFOVFSTR is a read-only register that can be read in 8-bit units.
Address: DFOVFSTR: FFC6 2A0C \({ }_{H}\)

## (7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0 .

Access: DFEADR is a read-only register that can be read in 32-bit units.
Address: DFEADR: FFC6 2A18 ${ }_{H}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 40B. 24 DFEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | Reserved | When read, the value after reset is returned. |
| 20 to 2 | DFEADR[20:2] | ECC Error Address |
|  |  | DFEADR is read-only field to monitor the address at which an ECC error has occurred. |
|  |  | This register holds an internal address. |
|  | Convert it to the actual address by adding the data flash base address FF20 $0000_{\mathrm{H}}$. |  |
| 1,0 | Reserved | When read, the value after reset is returned. |

## (8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.
After ECC test mode is enabled by setting ECCTST $=1$, the ECC bits can be read.
When writing to DFTSTCTL, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

Access: DFTSTCTL can be read or written in 16-bit units.
Address: DFTSTCTL: FFC6 2A1C ${ }_{H}$
Value after reset: $\quad 0000_{H}$

## 40B.2.4 Local RAM ECC

## 40B.2.4.1 Overview

The local RAM ECC of CPU1 is summarized in the table below.
Table 40B. 26 Summary of Local RAM ECC (CPU1)

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. <br> When enabled, either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction. <br> - 2-bit error detection and 1-bit error detection. <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. <br> - Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS =1) during data access and instruction fetch. For details of the SYSERR, see Section 3BC, CPU System of RH850/F1KM. <br> In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. <br> However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. <br> The function is set only while no error status is set. <br> A register for clearing the error status is provided. |
| Address capture | When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured. |
| Self-diagnosis | Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly. |
| Others | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions. |

## CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

## 40B.2.4.4 Details of Registers

## (1) LRTSTCTL_PE1 — Local RAM Test Control Register

LRTSTCTL_PE1 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL_PE1, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

## CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

## (2) LRTDATBF0_PE1 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST $=1$ in the local RAM test control register LRTSTCTL_PE1, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

## (3) LRECCCTL_PE1 - Local RAM ECC Control Register

LRECCCTL_PE1 enables or disables ECC error detection and correction and 1-bit error correction.
When writing to LRECCCTL_PE1, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
                Access: LRECCCTL_PE1 register can be read or written in 32-bit units.

## (4) LRERRINT_PE1 — Local RAM Error Information Control Register

LRERRINT_PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: LRERRINT_PE1 register can be read or written in 32-bit units.
LRERRINT_PE1L register can be read or written in 16-bit units.
LRERRINT_PE1LL register can be read or written in 8-bit units.
Address: LRERRINT_PE1: FFC6 5404
LRERRINT_PE1L: FFC6 5404 ${ }_{H}$
LRERRINT_PE1LL: FFC6 5404н
Value after reset: $00000003_{\mathrm{H}}$

|  | 0: Disables notification of the ECC 1-bit error. |  |
|  | 1: Enables notification of the ECC 1-bit error. |  |

## (5) LRSTCLR_PE1 - Local RAM Status Clear Register

LRSTCLR_PE1 clears the error flags in the error status register (LR1STERSTR_PE1), the overflow flag in the error overflow status register (LROVFSTR_PE1), and the error address register (LR1STEADR0_PE1). LRSTCLR_PE1 is a write-only register and is always read as 0 .

Access: LRSTCLR_PE1 register is a write-only register that can be written in 32-bit units.
LRSTCLR_PE1L register is a write-only register that can be written in 16 -bit units.
LRSTCLR_PE1LL register is a write-only register that can be written in 8 -bit units.
Address: LRSTCLR_PE1: FFC6 5408
LRSTCLR_PE1L: FFC6 5408H
LRSTCLR_PE1LL: FFC6 5408H
Value after reset: 00000000 H

## (6) LROVFSTR_PE1 — Local RAM Error Count Overflow Status Register

LROVFSTR_PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

Access: LROVFSTR_PE1 register is a read-only register that can be read in 32-bit units.
LROVFSTR_PE1L register is a read-only register that can be read in 16-bit units.
LROVFSTR_PE1LL register is a read-only register that can be read in 8-bit units.
Address: LROVFSTR_PE1: FFC6 540C ${ }_{H}$
LROVFSTR_PE1L: FFC6 540C ${ }_{H}$
LROVFSTR_PE1LL: FFC6 540C н

|  | second error are the same as those of the first error. |  |

## (7) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR_PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0 .

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR_PE1 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR_PE1.

```
            Access: LR1STERSTR_PE1 register is a read-only register that can be read in 32-bit units.
                LR1STERSTR_PE1L register is a read-only register that can be read in 16-bit units.
                    LR1STERSTR_PE1LL register is a read-only register that can be read in 8-bit units.

## (8) LR1STEADR0_PE1 — Local RAM 1st Error Address Register 0

LR1STEADR0_PE1 holds the address at which an error has occurred.
The error address is set if an error occurs while error flags are 0 in LR1STERSTR_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR_PE1. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0_PE1 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

## 40B.2.5 Global RAM (Including the Retention RAM) ECC

## 40B.2.5.1 Overview

CAUTION
The retention RAM is a part of the global RAM. The ECC for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

In RH850/F1KM-S4, an ECC encoder and an ECC decoder are provided for each bank (bank A and bank B).
Figure 40B.2, Block Diagram of Global RAM ECC shows the location of two ECC decoders and two ECC encoders for the global RAM.

Figure 40B. 2 Block Diagram of Global RAM ECC

The global RAM ECC is summarized in the table below.
Table 40B. 39 Summary of Global RAM ECC

| Item | Description |
| :--- | :--- |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. |
|  | When enabled, either of the following settings can be selected. |
|  | - 2-bit error detection and 1-bit error detection/correction |
|  | When disabled, neither error detection nor correction is carried out. |
|  | In the initial state, the ECC function is enabled, and 1-bit errors are detected and |
| corrected, 2-bit errors are detected. |  |

## 40B.2.5.4 Details of Registers

## (1) GRECCCTL_BKA/BKB - Global RAM ECC Control Register

GRECCCTL_BKA/BKB enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 018 when writing to GRECCCTL_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not <br> retained. These bits are always read as 0.Set PROT1 to 0 and PROT0 to 1 when writing to <br> this register. |
| 14 | PROT0 | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 2 | Reserved | 1-Bit Error Correction Disable |
| 1 | SECDIS | Enables or disables 1-bit error correction when ECC error detection and correction are |
|  |  | enabled. When writing, write 01 to PROT1 and PROT0 at the same time. |
|  |  | 1: 1-bit error correction is performed when a 1-bit error is detected. |
|  |  | ECC Disable is not performed when a 1-bit error is detected. |
| 0 | Enables or disables ECC error detection and correction. When writing, write 01 to PROT1 and |  |

|  |  | 1: Disables ECC error detection and correction. |

## (2) GRERRINT_BKA/BKB— Global RAM Error Information Control Register

GRERRINT_BKA/BKB enables or disables generation of the error notification signal upon detection of an ECC 1-bit error.

The setting of this register is used for accesses through the respective access port.

```
Access: GRERRINT_BKA and GRERRINT_BKB can be read or written in 32-bit units
    GRERRINT_BKAL and GRERRINT_BKBL can be read or written in 16-bit units
    GRERRINT_BKALL and GRERRINT_BKBLL can be read or written in 8-bit units

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, these bits are always read as 0. When writing, always write 0. |
| 0 | SEDIE | ECC 1-bit error Notification Enable |
|  |  | Enables or disables generation of the error notification signal upon detection of a 1-bit error |
|  | when ECC error detection and correction are enabled. |  |
|  | 0: Disables notification of the ECC 1-bit error. |  |
|  | 1: Enables notification of the ECC 1-bit error. |  |
|  |  |  |

## (3) GRSTCLR_BKA/BKB — Global RAM Status Clear Register

GRSTCLR_BKA/BKB clears the error flags in the error status register (GR1STERSTR_BKA/BKB), the overflow flag in the error count overflow status register (GROVFSTR_BKA/BKB), and the error address register
(GR1STEADR_BKA/BKB). GRSTCLR_BKA/BKB is a write-only register and is always read as 0 .
The setting of this register is used for accesses through the respective access port.

```
Access: GRSTCLR_BKA and GRSTCLR_BKB are write-only registers that can be written in 32-bit units. GRSTCLR_BKAL and GRSTCLR_BKBL are write-only registers that can be written in 16-bit units. GRSTCLR_BKALL and GRSTCLR_BKBLL are write-only registers that can be written in 8-bit units
Address: GRSTCLR_BKA: FFC6 4010н
GRSTCLR_BKAL: FFC6 4010 \({ }_{\text {H }}\)
GRSTCLR_BKALL: FFC6 4010 \({ }_{H}\)

Value after reset: \(00000000_{\mathrm{H}}\)
```

Table 40B. 46 GRSTCLR_BKA/BKB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, always write 0. |
| 0 | STCLR0 | Error Status Flag Clear |
|  |  | Writing 1 to this bit clears the DEDF and SEDF flags in GR1STERSTR_BKA/BKB, ERROVF0 |
|  |  | flag in GROVFSTR_BKA/BKB, and EADR[19:0] in GR1STEADR_BKA/BKB. |

## (4) GROVFSTR_BKA/BKB— Global RAM Error Count Overflow Status Register

GROVFSTR_BKA/BKB monitors occurrence of error overflow. If a second error occurs after the first error (while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

The setting of this register is used for accesses through the respective access port.

Table 40B. 47 GROVFSTR_BKA/BKB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ERROVF0 | Error Overflow Flag |
|  |  | ERROVFO is set if a second error occurs while any of the error flags |
|  | (DEDF and SEDF) in the error status register is set. |  |
|  | ERROVF0 is not set when the second error occurs at the same address or source like the first |  |
|  | error. |  |

## (5) GR1STERSTR_BKA/BKB— Global RAM 1st Error Status Register

GR1STERSTR_BKA/BKB monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0 . However, the corresponding error flag is set if an ECC 2-bit error occurs only when SEDF bit is set. GR1STERSTR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Table 40B. 48 GR1STERSTR_BKA/BKB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. |

|  | 0: ECC 2-bit error is not detected. |  |
|  | 1: ECC 2-bit error is detected. |  |
|  | [Clearing condition] |  |
|  | Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. |  |
|  | [Setting condition] |  |
|  | ECC 2-bit error is detected when DEDF is 0. |  |
| 0 | ECC 1-bit Error Monitor Flag |  |
|  | $0:$ ECC 1-bit error is not detected. |  |
|  | 1: ECC 1-bit error is detected. |  |
|  | [Clearing condition] |  |
|  | Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. |  |
|  | [Setting condition] |  |
|  | ECC 1-bit error is detected when DEDF and SEDF are 0. |  |

## (6) GR1STEADR_BKA/BKB— Global RAM 1st Error Address Register

GR1STEADR_BKA/BKB holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address
is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.
GR1STEADR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access: GR1STEADR_BKA and GR1STEADR_BKB are read-only registers that can be read in 32-bit units. GR1STEADR_BKAL, GR1STEADR_BKBL, GR1STEADR_BKAH and GR1STEADR_BKBH are read-only registers that can be read in 16-bit units. GR1STEADR_BKALL, GR1STEADR_BKALH, GR1STEADR_BKAHL, GR1STEADR_BKBLL, GR1STEADR_BKBLH and GR1STEADR_BKBHL are read-only registers that can be read in 8-bit units.

## (7) GRTSTCTL_BKA/BKB — Global RAM Test Control Register

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST to 1, any data can be written to the ECC bits.
Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).
Set PROT1 to 0 and PROT0 to 1 when writing to this register.

| 15 | PROT1 | Enables or disables modification of the ECCTST. |
| 14 | PROT0 | The value written is not retained. These bits are always read as 0. |
|  |  | Set (PROT1, PROT0 $)=(0,1)$ when writing to GRTSTCTL_BKA/BKB. |
| 13 to 1 | Reserved | When read, these bits are always read as 0. When writing, always write 0. |
| 0 | ECCTST | ECC test bit. |
|  |  | This bit permits to switch the ECC data for writing into RAM. |
|  |  | Assert (PROT1, PROT0 $)=(0,1)$ to write to this register. |

## (8) GRDECINBF1_BKA/BKB— Global RAM ECC Decoder Input Data Buffer 1

7-bit ECC of global RAM is replaced to this register value by write access to global RAM during GRTSTCTL_BKA/BKB.ECCTST $=1$ (test mode).

Access: GRDECINBF1_BKA and GRDECINBF1_BKB can be read or written in 32-bit units.
GRDECINBF1_BKAL and GRDECINBF1_BKBL can be read or written in 16-bit units.
GRDECINBF1_BKALL and GRDECINBF1_BKBLL can be read or written in 8-bit units.

## 40B.2.6 ECC for Peripheral RAM

## 40B.2.6.1 Overview

This is an ECC module for the RAM of the following peripheral modules.
CSIH, RS-CANFD, FlexRay and Ethernet AVB.
Table 40B. 52 List of the ECC Functions for the peripheral RAM

| Item | Description |
| :---: | :---: |
| ECC error detection/correction | ECC error detection and correction can be enabled or disabled. <br> Either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction <br> - 2-bit error detection and 1-bit error detection <br> The ECC error detection/correction can be disabled by using through mode. <br> In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Error notification can be enabled or disabled when an ECC 2-bit error is detected. <br> - Error notification can be enabled or disabled when an ECC 1-bit error is detected. <br> In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled. However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed. |
| Error status | Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. A bit for clearing the error status is provided. |
| Address capture | Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared). |
| CAUTION |  |

When ECC error detection/correction is performed about RS-CANFD or FlexRay, initialize the RAM area before it is used.

## 40B.2.6.4 Details of Registers

## (1) <Module_Name>CTL — ECC Control Register

The <Module_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.
Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module's operation is stopped.
In addition, when writing to bit 7, EMCA1 and EMCA0 need to be $01_{\mathrm{B}}$.

| Access: |  |  | This register can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |

Note 1. These bits are always read as 0.
Table 40B. 59 <Module_Name>CTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | EMCA1 | Access Control Bits 1 and 0 to ECC Mode Selection |
|  |  | These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0 . When these bits are $01_{\mathrm{B}}$, writing to bit 7 is enabled. |
| 14 | EMCAO |  |
| 13, 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | ECCOVFF | By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set. |
|  |  | 0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. <br> 1: Error address register overflowed |
|  |  | NOTE: This bit clear condition is as follows. <br> (1) Reset |
|  |  | (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C $=1$ when ECER1F = 1 <br> (3) Selecting through mode enable (ECTHM = 1) |
| 10 | ECER2C | 2-Bit ECC Error Detection Flag Clear |
|  |  | This bit clears 2-bit error detection flags of ECER2F (bit 2). |
|  |  | This bit is always read as 0 . Writing 0 is ignored. |
|  |  | Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. |
|  |  | When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set. |
| 9 | ECER1C | 1-Bit ECC Error Detection Correction Accumulation Flag Clear |
|  |  | This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0 . Writing 0 is ignored. |
|  |  | Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. |
|  |  | When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set. |
| 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 40B. 59 <Module_Name>CTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ECTHM | ECC Function through Mode Selection <br> Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function. <br> When writing to this bit, write $01_{\mathrm{B}}$ to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function. <br> 0 : Passing through mode is disabled (normal operation mode). <br> 1: Passing through mode is enabled. (ECC function disable) |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EC1ECP | 1-Bit Error Correction Enable <br> This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. <br> 0 : When 1-bit error is detected, the error will be corrected. <br> 1: When 1-bit error is detected, the error will not be corrected. |
| 4 | EC2EDIC | 2-Bit Error Detection Interrupt Control <br> This bit controls whether to generate an interrupt when 2-bit error is detected. <br> 0 : When 2-bit error is detected, a target peripheral module's interrupt will not be generated. <br> 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated. |
| 3 | EC1EDIC | 1-Bit Error Detection Interrupt Control <br> This bit controls whether to generate an interrupt when 1-bit error is detected. <br> 0 : When 1-bit error is detected, a target peripheral module's interrupt will not be generated. <br> 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated. |
| 2 | ECER2F | 2-Bit Error Detection Flag <br> This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled ( $E C T H M=0$ ). When 2-bit error interrupt is enabled (EC2EDIC $=1$ ) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output. <br> Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM $=$ 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated. <br> 0: 2-bit error has not occurred since this bit was cleared. <br> 1: 2-bit error has occurred. <br> This bit is read-only. Writing 0 or 1 does not change internal state. |
| 1 | ECER1F | 1-Bit Error Detection/Correction Flag <br> This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM $=0$ ). Write 1 to the ECER1C bit (bit 9 ) to clear the flag. When through mode is enabled ( $E C T H M=1$ ), this bit is cleared. <br> 0 : 1-bit error has not occurred since this bit was cleared. <br> 1: 1-bit error has occurred. <br> This bit is read-only. Writing 0 or 1 does not change internal state. |
| 0 | ECEMF | ECC Error Message Flag <br> This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled ( $E C T H M=1$ ) and there is no 1-bit error in decode circuit input data. <br> 0 : The current RAM output data does not have bit errors. <br> 1: The current RAM output data have bit errors. |

## CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

## (2) <Module_Name>TMC — ECC Test Mode Control Register

The <Module_Name>TMC register is used to switch to the test mode, and this register is for test mode control.
This register can be used when a target peripheral module is not accessed to RAM.
When writing to bit 7, ETMA1 and ETMA0 need to be $10_{\mathrm{B}}$.

Note 1. These bits are always read as 0 .
Table 40B. 60 <Module_Name>TMC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | ETMA1 | Access Control Bits 1 and 0 to ECC Test Mode |
| 14 | ETMAO | These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. |
| 13 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC Test Mode Enable |
|  |  | This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write $10_{\mathrm{B}}$ to the ETMA1 and ETMAO bits at the same time. <br> 0 : Access to the test mode registers and bits is disabled. <br> 1: Access to the test mode registers and bits is enabled. |
|  |  | Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS |
| 6,5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM Read Test Mode Selection |
|  |  | This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). |
|  |  | 0 : Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. |
|  |  | 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM. |
| 3 | ECREOS | ECC Redundant Bit Output Data Selection |
|  |  | This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). |
|  |  | This bit is cleared when ECTMCE $=0$ (cleared synchronously). |
|  |  | 0 : ECC data is generated for write data is stored in RAM. |
|  |  | 1: The value of <Module_Name>ERDB Register is stored in RAM. |

Table 40B. 60 <Module_Name>TMC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 | ECENS | ECC Encoder Input Selection <br> This bit specifies data written to RAM or the value of the <Module_Name>TED register as the input to the ECC encoder. <br> Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). <br> This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : ECC data is generated from write data to RAM <br> 1: ECC data is generated from register value of the <Module_Name>TED. |
| 1 | ECDCS | ECC Decoder Input Selection <br> This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of <Module_Name>TED. Writing to this bit is enabled only when ECTMCE $=1$ (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : Syndrome code generation and error detection are performed from RAM Data. <br> 1: Syndrome code generation and error detection are performed from <Module_Name>TED register value. |
| 0 | ECREIS | ECC Redundant Bit Input Data Selection <br> This bit specifies which ECC data is for generation of syndrome code and error detection, ECC data stored in RAM or the value of the <Module_Name>ERDB. <br> Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : Syndrome code generation and error detection are performed from ECC data stored in RAM. <br> 1: Syndrome code generation and error detection are performed from <Module_Name>ERDB register value. |

## (3) <Module_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.
This register value is used to generate ECC data or syndrome code.
This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE $=1$ ). When $<$ Module_Name>TMC.ECTMCE $=0$, writing to this register is ignored and $00000000_{\mathrm{H}}$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

|  |  |  |  | When <Module_Name>TMC.ECDCS = 1, the value of this register is used to generate syndrome code that is stored in ECC decode syndrome data register (<Module_Name>SYND). |  |  |  |  |  |  |  |  |  |  |  |  |

## (4) <Module_Name>TRC — ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers,
<Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, and <Module_Name>ERDB.
This register can be accessed when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00000000_{\mathrm{H}}$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

## (5) <Module_Name>AD0 - Target ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.
When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Table 40B. 62 <Module_Name>AD0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | Reserved | When read, the value after reset is returned. |
| 30 to 0 | ECEAD[30:0] | ECEADO is a read-only register to hold the address at which an ECC error has occurred. |
|  |  | If an ECC error is detected while ECC error detection is enabled, the RAM address is latched <br> using the detection signal as a trigger, and the address is stored in ECEADO as the address at <br> which the ECC error has occurred. |
|  | The address is stored upon detection of the first ECC error while no error status is set. |  |
|  | However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. |  |
|  | Only one address can be held in ECEADO |  |

## (6) <Module_Name>SYND - ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrome data in ECC test mode.
Writing to this register is ignored.
This register is read-only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

## (7) <Module_Name>HORD - ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.
Writing to this register is ignored.
This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

| Access: | This register is a read-only register that can be read in 8-bit units. |

## (8) <Module_Name>ECRD - ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.
Writing to this register is ignored.
This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When ECC test mode is disabled ( $<$ Module_Name $>$ TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

| Access: | This register is a read-only register that can be read in 8 -bit units. |

| 6 to 0 | ECRD[6:0] | These bits can read ECC data generated at the time of RAM data writing and can read ECC <br> data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS <br> $=1$. |

## (9) <Module_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.
This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00_{\mathrm{H}}$ is read.

| :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ERDB[6:0] | These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS $=1$, the value read from these bits is ECC data read from the RAM. <br> When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data. |

## (10) SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.
Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

| Access: |  |  | This register can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 40B. 3 Memory Protection

## 40B.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the RH850 Family User's Manual: Software.

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local
RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see Section 3BC, CPU System of RH850/F1KM.

- IPG

The CPU Peripheral is protected against illegal accesses.
For details, see Section 3BC, CPU System of RH850/F1KM.

- GRG

The global RAM is protected against illegal accesses.

- PBG/HBG

The control registers in the peripheral circuits are protected against illegal accesses. For details, see
Section 40B.3.3, PBG/HBG.

- PBGC

The CPU system has its dedicated PBG function which is called PBG for CPU system. For details, see Section 40B.3.4, PBG for CPU System.

## 40B.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.
Table 40B. 68 Identifiers for Slave Guard

| Identifier | Function |
| :---: | :---: |
| UM | When the CPU makes an access, this indicates the operating mode of the CPU. <br> 0 : Supervisor mode <br> 1: User mode <br> When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0 . |
| SPID | When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU. <br> When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. <br> When another master makes an access, the value of this identifier is always $00_{B}$. |
| PEID | This indicates the access source bus master. <br> $001_{\mathrm{B}}$ : CPU1 <br> $10 \mathrm{~B}_{\mathrm{B}}$ : Other bus master (H-Bus bus master) <br> When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. |

## 40B.3.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

## CAUTION

The retention RAM is a part of the global RAM. The Guard for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

Note: MGDGRPROTn_BKA/BKB, MGDGRBADn_BKA/BKB, and MGDGRADVn_BKA/BKB set the protection specifications for each channel ( $\mathrm{n}=0$ to 3 ).
MGDGRSCTL_*, MGDGRSSTAT_*, MGDGRSTYPE_* and MGDGRSAD_* indicate error information on each bank. "BKA" represents for Bank $A$ and "BKB" represents for Bank B.

## 40B.3.2.2 Details of Registers

(1) MGDGRPROTn_BKA/BKB — GRG Protection Setting Register $\mathbf{n}$ ( $\mathbf{n}=\mathbf{0}$ to 3)

Access: MGDGRPROTn_BKA and MGDGRPROTn_BKB can be read or written in 32-bit units
MGDGRPROTn_BKAL, MGDGRPROTn_BKBL, MGDGRPROTn_BKAH and MGDGRPROTn_BKBH can be read or
written in 16-bit units
MGDGRPROTn_BKALL, MGDGRPROTn_BKAHL, MGDGRPROTn_BKAHH, MGDGRPROTn_BKBLL,
MGDGRPROTn_BKBHL and MGDGRPROTn_BKBHH can be read or written in 8 -bit units.

Note 1. Access with PEID
PEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
SPID is a bit list with each bit corresponding to a SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFG0.SPID

## CAUTION

Global RAM Guard (GRG) only supports write accesses. The guard setting is not enabled for read accesses.

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 20 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 19 to 11 | ADV[19:11] | Valid Compare Address |
|  |  | Setting MGDGRADVn_BKA/BKB[19:11] to 1 executes address compare. |
|  |  | If all the bits of MGDGRADVn_BKA/BKB[19:11] are 1,2 Kbytes, which is the minimum unit based on the address specified by MGDGRBADn_BKA/BKB, are protected. However, if all the bits of MGDGRADVn_BKA/BKB[19:11] are 0, all the areas of global RAM are protected. |
| 10 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## Setting example

If MGDGRBADn_BKA.AD[19:11] is $1 \mathrm{D} 0_{\mathrm{H}}$ and $\operatorname{MGDGRADVn\_ BKA.ADV[19:11]~is~} 1 \mathrm{FD}_{\mathrm{H}}$, global RAM guard protection area n is from FEEE 8000H to FEEE 87FF H $_{\mathrm{H}}$ and FEEE 9000 ${ }_{\mathrm{H}}$ to FEEE 97FF ${ }_{\mathrm{H}}$.

If MGDGRBADn_BKB.AD[19:11] is 1D0 ${ }_{\mathrm{H}}$ and MGDGRADVn_BKB.ADV[19:11] is 1 FD , global RAM guard protection area $n$ is from FEFE $8000_{\mathrm{H}}$ to FEFE 87FF $_{\mathrm{H}}$ and FEFE $9000_{\mathrm{H}}$ to FEFE 97 FF H

## Concept (e.g. bank A)

When MGDGRBADn_BKA.AD[19:11] is 1D0 ${ }_{\mathrm{H}}$, the base address is FEEE $8000_{\mathrm{H}}$.
The settable range is shown by an underline as follows:

The settable range is as follows when MGDGRADVn_BKA.ADV[19:11] is $1 \mathrm{FD}_{\mathrm{H}}$ :

$$
\begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & B
\end{array}
$$

The area to which protection applies is as shown below because the bits set to 0 and the lower eleven bits are not applicable:

$$
\begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 0 & 0 & x & 0 & x & x & x & x & x & x & x & x & x & x & x & B
\end{array}
$$

Therefore the protection range is as follows:

to

$$
\begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & \mathrm{~B} \\
& & & & \mathrm{E} & & & & & \mathrm{E} & & & & & \mathrm{E} & & & & & 8 & & & & & & 7 & & & & & & \mathrm{~F} & \\
& & & & \mathrm{~F} & & & & \mathrm{H}
\end{array}
$$

and

$$
\left\lvert\, \begin{array}{|llll|llll|llll|llll|llll|llll|llll|llll|l}
1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \mathrm{~B} \\
& & & & \mathrm{E} & & & & \mathrm{E} & & & & \mathrm{E} & & & & 9 & & & & & 0 & & & & & & & & & & & \\
\mathrm{H}
\end{array}\right.
$$

to

The following 2 Kbytes each (a total of 4 Kbytes) are protected (in hexadecimal):

- FEEE $8000_{\mathrm{H}}$ to FEEE $87 \mathrm{FF}_{\mathrm{H}}$
- FEEE $9000_{\mathrm{H}}$ to FEEE $97 \mathrm{FF}_{\mathrm{H}}$

## 40B.3.3 PBG/HBG

The PBG/HBG module is divided into several PBG/HBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG/HBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG/HBG group can hold the information of the access that has been rejected.
The following table lists the peripheral circuits to be protected, the corresponding PBG/HBG group names, and the PBG/HBG channel numbers.

Note 1. For details, see Section 5, Write-Protected Registers, Section 9BC, Reset Controller of RH850/F1KM, Section 10B, Power Supply Circuit of RH850/F1KM-S4, Section 11BC, Supply Voltage Monitor of RH850/F1KM, Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, Section 13, Clock Monitor (CLMA), Section 14, Stand-By Controller (STBC), and Section 15, Low-Power Sampler (LPS).
Note 2. Regarding the PBG registers for the flash memory, see the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.
Note 3. Regarding the PBG register addresses, see Table 40B.79, List of PBG/HBG Protection Registers.
Note 4. Regarding the RS-CANFD guard group, see Section 24, CANFD Interface (RS-CANFD).

NOTE
Be sure to enable PBG/HBG before disabling register access clock of each clock domain.

## 40B.3.3.1 List of Registers

The following table lists the registers provided for each PBG/HBG group. And PBG/HBG group is equal to module name.

## 40B.3.3.2 Details of Registers

## (1) FSGDxxPROTn - PBGxx Protection Register n HFSGDxxPROTn - HBGxx Protection Register n

FSGDxxPROTn and HFSGDxxPROTn specify the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. " n " in the register names and symbols represents the PBG/HBG channel number.

Access: FSGDxxPROTn and HFSGDxxPROTn can be read or written in 32-bit units.
FSGDxxPROTnL, FSGDxxPROTnH, HFSGDxxPROTnL, and HFSGDxxPROTnH can be read or written in 16 -bit units.
FSGDxxPROTnLL, FSGDxxPROTnHL, FSGDxxPROTnHH, HFSGDxxPROTnLL, HFSGDxxPROTnHL, and HFSGDxxPROTnHH can be read or written in 8-bit units.

Address: See Table 40B.79, List of PBG/HBG Protection Registers.
Value after reset: See Table 40B.79, List of PBG/HBG Protection Registers.

Note 1. It varies depending on each register. See Section 40B.3.3.1, List of Registers.

Table 40B. 83 FSGDxxPROTn/HFSGxxPROTn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | PROTLOCK | Register Lock <br> 0: Enables FSGDxxPROTn/HFSGDxxPROTn rewrite. <br> 1: Disables FSGDxxPROTn/HFSGDxxPROTn rewrite. <br> When PROTLOCK is set to 1 , the value is held until reset is asserted. |
| 30 to 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

| 24 to 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | PROTPEID4 | Access with PEID $=4$ (peripheral device connected to $\mathrm{H}-\mathrm{BUS})^{\star 1}$ <br> 0: Disables access with PEID4. <br> 1: Enables access with PEID4. |
| 20,19 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | PROTPEID1 | Access with PEID $=1$ (CPU1) ${ }^{\star 1}$ <br> 0: Disables access with PEID1. <br> 1: Enables access with PEID1. |
| 17 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | PROTSPID3 | Access with SPID $=3^{* 2}$ <br> 0: Disables access with SPID3. <br> 1: Enables access with SPID3. |

Table 40B. 83 FSGDxxPROTn/HFSGxxPROTn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | PROTSPID2 | Access with SPID $=2^{* 2}$ <br> 0: Disables access with SPID2. <br> 1: Enables access with SPID2. |
| 6 | PROTSPID1 | Access with SPID $=1\left(\text { CPU1 }^{\star 3}\right)^{\star 2}$ <br> 0 : Disables access with SPID1. <br> 1: Enables access with SPID1. |
| 5 | PROTSPID0 | Access with SPID $=0$ (peripheral device connected to $\mathrm{H}-\mathrm{BUS}$ ) ${ }^{\star 2}$ <br> 0: Disables access with SPID0. <br> 1: Enables access with SPID0. |
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | PROTRDPDEF | Default Read Protection <br> 0 : Enables read access from any master regardless of other setting in this register. <br> 1: The setting of PROTRD is effective. |
| 2 | PROTWRPDEF | Default Write Protection <br> 0 : Enables write access from any master regardless of other setting in this register. <br> 1: The setting of PROTWR is effective. |
| 1 | PROTRD | Read Permission <br> 0: Disables reading by a bus master subject to access filtering. <br> 1: Enables reading by a bus master subject to access filtering. |
| 0 | PROTWR | Write Permission <br> 0 : Disables writing by a bus master subject to access filtering. <br> 1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFGO.SPID

## (2) ERRSLVxxCTL - PBGxx Error Control Register HERRSLVxxCTL — HBGxx Error Control Register

ERRSLVxxCTL and HERRSLVxxCTL clear the status in the error status register with the PBGxx/HBGxx.

```
Access: ERRSLVxxCTL and HERRSLVxxCTL are write-only registers that can be written in 32-bit units.
    ERRSLVxxCTLL and HERRSLVxxCTLL are write-only registers that can be written in 16-bit units.
    ERRSLVxxCTLLL and HERRSLVxxCTLLL are write-only registers that can be written in 8-bit units.
Address: ERRSLVxxCTL: <base_addrO> + OH
    ERRSLVxxCTLL: <base_addrO> + OH
    ERRSLVxxCTLLL: <base_addr0> + OH
    HERRSLVxxCTL: <base_addr1> + OH

## (3) ERRSLVxxSTAT - PBGxx Error Status Register HERRSLVxxSTAT - HBGxx Error Status Register

ERRSLVxxSTAT and HERRSLVxxSTAT hold the status of the illegal access rejected with the PBGxx/HBGxx.

```
Access: ERRSLVxxSTAT and HERRSLVxxSTAT are read-only registers that can be read in 32-bit units.
ERRSLVxxSTATL and HERRSLVxxSTATL are read-only registers that can be read in 16-bit units.
ERRSLVxxSTATLL and HERRSLVxxSTATLL are read-only registers that can be read in 8-bit units.
Address: ERRSLVxxSTAT: <base_addr0> + 4H

Table 40B. 86 ERRSLVxxSTAT/HERRSLVxxSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag |
|  |  | 0: No overflow |
|  |  | 1: An overflow occurred. |
|  |  | If a second guard violation occurs with the error detection flag being set after the first guard |
|  | violation occurs, the error entry overflows and this flag is set because the number of |  |
|  |  | PBG/HBG error entry stages is 1. |
|  |  | Note that this overflow is notified to INTGUARD. |
|  |  | In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. |
|  |  | For an overflow check the OVF bit should be checked. The error information of the guard |
|  |  | violation when an overflow occurs are not captured. |
| 0 | Error Status Flag |  |
|  |  | 0: No PBG/HBG protection violation |
|  |  | 1: PBG/HBG protection violation occurred. |
|  |  |  |

## CAUTION

After writing HERRSLVxxCTL, the value of HERRSLVxxSTAT takes the following procedure for a reflection:

- Execute SYNCM
- Wait for $24 \times$ CPU clock*1 cycles

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTRL and CKSC_CPUCLKD_CTL

## (4) ERRSLVxxADDR — PBGxx Error Address Register HERRSLVxxADDR - HBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.
HERRSLVxxADDR holds the address of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.
Access: ERRSLVxxADDR and HERRSLVxxADDR are read-only registers that can be read in 32-bit units.
Address: ERRSLVxxADDR: <base_addr0> + 8H $_{H}$
HERRSLVxxADDR: <base_addr1> $+8_{H}$
Value after reset: $\quad 00000000_{H}$

## (5) ERRSLVxxTYPE - PBGxx Error Type Register HERRSLVxxTYPE - HBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxTYPE holds the type of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.
Access: ERRSLVxxTYPE and HERRSLVxxTYPE are read-only registers that can be read in 32-bit units. ERRSLVxxTYPEL and HERRSLVxxTYPEL are read-only registers that can be read in 16-bit units.
Address: ERRSLVxxTYPE: <base_addr0> $+\mathrm{C}_{\mathrm{H}}$
ERRSLVxxTYPEL: <base_addr0> $+\mathrm{C}_{\mathrm{H}}$
HERRSLVxxTYPE: <base_addr1> $+\mathrm{C}_{\mathrm{H}}$

## 40B.3.4 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

## 40B.3.4.2 Details of Registers

## (1) FSGDCxPROTn - PBGCx Protection Register $\mathbf{n}(x=0,1)$

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.
" n " in the register names and symbols represents the PBGC channel number.

Access: FSGDCxPROTn register can be read or written in 32-bit units.
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16 -bit units.
FSGDCxPROTnLL, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8 -bit units.
Address: See Table 40B.90, List of PBGC Protection Registers.
Value after reset: See Table 40B.90, List of PBGC Protection Registers.

Table 40B. 92 FSGDCxPROTn Register Contents

| 2 | PROTWRPDEF | Default Write Protection <br> 0: Enables write access from any master regardless of other setting in this register. <br> 1: The setting of PROTWR is effective. |
| 1 | PROTRD | Read Permission <br> 0 : Disables reading by a bus master subject to access filtering. <br> 1: Enables reading by a bus master subject to access filtering. |
| 0 | PROTWR | Write Permission <br> 0 : Disables writing by a bus master subject to access filtering. <br> 1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFGO.SPID

## (2) ERRSLVCxCTL - PBGCx Error Control Register ( $x=0,1$ )

ERRSLVCxCTL clears the status in error status register PBGCx.

Access: ERRSLVCxCTL register is a write-only register that can be written in 32-bit units. ERRSLVCxCTLL register is a write-only register that can be written in 16 -bit units. ERRSLVCxCTLLL register is a write-only register that can be written in 8 -bit units.

Address: ERRSLVCxCTL: FFC4 $\mathrm{C} 800_{\mathrm{H}}+\left(100_{\mathrm{H}} \times \mathrm{x}\right)$
ERRSLVCxCTLL: FFC4 $\mathbf{C 8 0 0}{ }_{H}+\left(100_{H} \times x\right)$ ERRSLVCxCTLLL: FFC4 C800 $+\left(100_{H} \times x\right)$

Value after reset: $00000000_{\mathrm{H}}$

## (4) ERRSLVCxADDR - PBGCx Error Address Register ( $x=0,1$ )

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.
The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxADDR register is a read-only register that can be read in 32-bit units.

## Section 40C Functional Safety of RH850/F1KM-S1

This section provides an overview of the safety mechanisms included in the RH850/F1KM Series.
This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.
For more information about the development process and safety mechanisms, please contact our sales office.
The following are the failure detection functions provided by this microcontroller.

## 40C. 1 Overview

ECC
Detects failures of memories and data transfer paths and corrects some types of failures.

## Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

## Clock Monitor

Monitors the clock operation to detect abnormal operations. For details, see Section 13, Clock Monitor (CLMA).

## Data CRC

Generates CRC to detect data errors.
For details, see Section 41, Data CRC (DCRA).

## Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.
For details, see Section 5, Write-Protected Registers.

## 40C. 2 ECC

## 40C.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40C. 1 ECC Overview

| Applicable Memory |  | Applicable Data Width [bits] | Operation upon Error Detection |  |  |  |  | Failure Insertion |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Peripheral RAM*1 | CSIH | 32 | SEC-DED | - | SEC-DED | Possible | Possible | Possible |
|  | RSCANFD | 32 | SEC-DED | - | SEC-DED | Possible | Possible | Possible |

Note 1. For details of ECC for each peripheral IP, see Section 40C.2.5, ECC for Peripheral RAM.
Note 2. For details, see Section 40C.2.2.2, Interrupt Requests and Section 40C.2.4.2, Interrupt Requests.

## Applicable Data Width

This is the data width to be ECC encoded.
To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).
(1) Reading data to be ECC-encoded including data to be rewritten
(2) Replacing data to be rewritten
(3) Writing back data generated in (2)

## Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected. SED-DED: 1-bit errors and 2-bit errors can only be detected.

## SYSERR

SYSERR can be generated upon error detection.

## Interrupt Notice

An interrupt can be generated upon error detection.

## Error Status

The status of a detected error is retained.

## Address Capture

The address of a detected error is retained.

## Failure Insertion

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

## 40C.2.2 Code Flash ECC

## 40C.2.2.1 Overview

RH850/F1KM has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

Figure 40C.1, Block Diagram of Code Flash ECC shows the location of two ECC decoders for the code flash.

Figure 40C. 1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.
Table 40C. 2 Summary of Code Flash ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction. <br> - 2-bit error detection and 1-bit error detection. <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.) <br> Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2bit error during data access and instruction fetch. <br> - Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1bit error (SECDIS = 1) during data access and instruction fetch. <br> For details of the SYSERR, see Section 3BC, CPU System of RH850/F1KM. <br> In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. <br> However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |

Table 40C. 2 Summary of Code Flash ECC

| Item | Description |
| :--- | :--- |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. <br>  <br>  <br>  <br>  <br> The ECC 1-bit error status is set only when no error status has been set. <br> The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing <br> the error status is provided. |
| Address capture | When no ECC error status has been set, the address at which the first ECC error occurred is captured. <br> In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error <br> is also captured. |
| Self-diagnosis | The ECC bit can be read directly. |
| Inhibiting instruction execution | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction <br> fetching avoids the execution of incorrect instructions. |

## 40C.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.
Table 40C. 3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

| Unit Interrupt Signal | Description | Name | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| - | ECC 1-bit error interrupt of code flash | SYSERR, INTECCFLIO*1 | - |
|  |  | (SED \& SECDIS = 1) |  |
|  |  | INTECCFLIO | - |
| - | (SED \& SECDIS = 0) |  |  |

Note 1. ECCFLIOFEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Note 1. The registers suffixed with symbols "_VCI" and "_PE1" are provided to ECC controllers corresponding to each access port: registers with "_VCl" are provided to the ECC controller for data access from the system interconnect to the code flash and registers with "_PE1" are provided to the ECC controller for fetch access from the CPU1.

## 40C.2.2.4 Details of Registers

## (1) CFECCCTL_VCI/PE1 - Code Flash ECC Control Register

CFECCCTL_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
            Access: CFECCCTL_VCI and CFECCCTL_PE1 can be read or written in 32-bit units.
            CFECCCTL_VCIL and CFECCCTL_PE1L can be read or written in 16-bit units.
                Address: CFECCCTL_VCI: FFC6 2200H
            CFECCCTL_VCIL: FFC6 2200H
            CFECCCTL_PE1: FFC6 2400H
            CFECCCTL_PE1L: FFC6 2400H

| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not |
| 14 | retained. These bits are always read as 0. Set (PROT1, PROT0) $=(0,1)$ when writing to |  |
| CFECCCTL_VCI/PE1. |  |  |

## (2) CFERRINT_VCI/PE1 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

```
Access: CFERRINT_VCI and CFERRINT_PE1 can be read or written in 32-bit units.
CFERRINT_VCIL and CFERRINT_PE1L can be read or written in 16-bit units.
    CFERRINT_VCILL and CFERRINT_PE1LL can be read or written in 8-bit units.

| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE $^{\star 1}$ | ECC 2-Bit Error Notification Enable |
|  |  | Enables or disables generation of the error notification signal upon detection of a 2-bit error |
|  | when ECC error detection and correction are enabled. |  |
|  | 0: Disables notification of the ECC 2-bit error. |  |
|  | 1: Enables notification of the ECC 2-bit error. |  |
| 0 | ECC 1-Bit Error Notification Enable |  |
|  |  | Enables or disables generation of the error notification signal upon detection of a 1-bit error |
|  | when ECC error detection and correction are enabled. |  |
|  | 0: Disables notification of the ECC 1-bit error. |  |
|  | 1: Enables notification of the ECC 1-bit error. |  |

Note 1. This bit is not supported in CFERRINT_PE1. When writing to this bit in CFERRINT_PE1, always write 1.
Note 2. Regarding the interrupt request, see Section 40C.2.2.2, Interrupt Requests.

## (3) CFSTCLR_VCI/PE1 — Code Flash Status Clear Register

CFSTCLR_VCI/PE1 clears the error flags in the error status register (CF1STERSTR_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1), and the error address register(CF1STEADR0_VCI/PE1).

Access: CFSTCLR_VCI and CFSTCLR_PE1 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL and CFSTCLR_PE1L are write-only registers that can be written in 16 -bit units.
CFSTCLR_VCILL and CFSTCLR_PE1LL are write-only registers that can be written in 8 -bit units.
Address: CFSTCLR_VCI: FFC6 2208

| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, write the value after reset. |
| 0 | STCLR0 | Error Status Clear |
|  |  | 0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in |
|  | CF1STERSTR_VCI/PE1; ERROVF0 flag in CFOVFSTR_VCI/PE1; and |  |
|  | CF1STEADRO_VCI/PE1.) |  |
|  |  | 1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1; |
|  |  | ERROVF0 flag in CFOVFSTR_VCI/PE1; and CF1STEADR0_VCI/PE1. |

## (4) CFOVFSTR_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ERROVF0 | Error Overflow Flag |
|  |  | ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and SEDF0) |
| in the error status register has occurred, except when both of the error address and source of the |  |  |
|  | second error are the same as those of the first error. |  |
|  | $0:$ Did not occur. |  |
|  | 1: Occurred. |  |
|  | [Clearing condition] |  |
|  | Set the STCLRO bit in CFSTCLR_VCI/PE1 to 1. |  |

## (5) CF1STERSTR_VCI/PE1 — Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0 . If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access: CF1STERSTR_VCI and CF1STERSTR_PE1 are read-only registers that can be read in 32-bit units.
CF1STERSTR_VCIL and CF1STERSTR_PE1L are read-only registers that can be read in 16-bit units.
CF1STERSTR_VCILL and CF1STERSTR_PE1LL are read-only registers that can be read in 8-bit units.
Address: CF1STERSTR_VCI: FFC6 2210H

|  | Set the STCLRO bit in CFSTCLR_VCI/PE1 to 1. |  |
|  | [Setting condition] |  |
|  | ECC 2-bit error is detected when DEDF0 is 0. |  |
| 0 | ECC 1-Bit Error Monitor Flag |  |
|  | 0: ECC 1-bit error is not detected. |  |
|  | 1: ECC 1-bit error is detected when DEDF0 flag is 0. |  |
|  | [Clearing condition] |  |

|  | [Setting condition] |  |
|  | ECC 1-bit error is detected when DEDF0, SEDF0 are 0. |  |

## (6) CF1STEADR0_VCI/PE1 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1 holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0_VCI/PE1 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR_VCI/PE1 register to 1 .

Access: CF1STEADRO_VCI and CF1STEADR0_PE1 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L and CF1STEADR0_PE1H are read-only registers that can be read in 16 -bit units.

CF1STEADR0_VCILL, CF1STEADR0_VCILH, CF1STEADR0_VCIHL, CF1STEADR0_VCIHH,
CF1STEADR0_PE1LL, CF1STEADR0_PE1LH, CF1STEADR0_PE1HL and CF1STEADR0_PE1HH are read-only registers that can be read in 8 -bit units.

## (7) CFSTSTCTL_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1 , the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

```
Access: CFSTSTCTL_VCI can be read or written in 32-bit units.
    CFSTSTCTL_VCIL can be read or written in 16-bit units.
Address: CFSTSTCTL_VCI: FFC6 2350н

Table 40C. 13 CFSTSTCTL_VCI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST bit. |
| 14 | PROT0 | The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) $=(0$, <br> 1) when writing to CFSTSTCTL_VCI. |
| 13 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECCTST | ECC Test |
|  |  | After ECC test mode is enabled by setting ECCTST $=1$, ECC bits can be read directly. Write a <br> value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see Section 3BC, CPU System of RH850/F1KM.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16 n address. The results of reading code flash are as follows:

Table 40C. 14 Results of Reading Code Flash

| Bit Number | Meaning | Bit Position | Description |
| :--- | :--- | :--- | :--- |
| bit[31:10] | all-0 | 31 to 10 | These bits are always 0. |
| bit[9] | reserved | 9 | Unknown |
| bit[8:0] | ECC bits | 8 to 0 | ECC bits |

## 40C.2.3 Data Flash ECC

## 40C.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40C. 15 Summary of Data Flash ECC

| Item | Description |
| :--- | :--- |
| ECC error detection and | ECC error detection and correction can be enabled or disabled. |
| correction | When enabled, either of the following settings can be selected. |
|  | - 2-bit error detection and 1-bit error detection / correction. |
|  | When disabled, neither error detection nor correction is carried out. |
|  | In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are |
| detected. |  |

## 40C.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

## 40C.2.3.4 Details of Registers

## (1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be $01_{\text {B }}$.

| Access: | DFECCCTL can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | DFECCCTL: FFC6 $2 \mathrm{~A} 00_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

Table 40C. 18 DFECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | PROT1 | Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0 . Set $($ PROT1, PROT0 $)=(0,1)$ when writing to DFECCCTL. |
| 14 | PROT0 |  |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | 1-bit Error Correction Disable |
|  |  | Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting $($ PROT1, PROT0) $=(0,1)$. <br> 0 : Enables correction of a 1-bit error upon detection. <br> 1: Disables correction of a 1-bit error upon detection. |
| 0 | ECCDIS | ECC Disable |
|  |  | Enables or disables ECC error detection and correction. |
|  |  | Write a value to this bit simultaneously with the setting (PROT1, PROT0) $=(0,1)$. |
|  |  | In the initial state, ECC error detection and correction are enabled. |
|  |  | 0 : Enables ECC error detection and correction. |
|  |  | 1: Disables ECC error detection and correction. |

## (2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.
The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

## Access: DFERSTR is a read-only register that can be read in 8 -bit units.

Address: DFERSTR: FFC6 2A04H
Value after reset: $\quad 00_{H}$

## (4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

| Access: | DFOVFSTR is a read-only register that can be read in 8-bit units. |
| ---: | :--- |
| Address: | DFOVFSTR: FFC6 $2 \mathrm{~A} 0 \mathrm{C}_{\mathrm{H}}$ |

## (6) DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: DFERRINT can be read or written in 8 -bit units.
Address: DFERRINT: FFC6 2A14H
Value after reset: $\quad 02 \mathrm{H}$

## (7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0 .

| Access: | DFEADR is a read-only register that can be read in 32-bit units. |
| ---: | :--- |

| :--- | :--- | :--- |
| 31 to 21 | Reserved | When read, the value after reset is returned. |
| 20 to 2 | DFEADR[20:2] | ECC Error Address |
|  |  | DFEADR is read-only field to monitor the address at which an ECC error has occurred. |
|  |  | This register holds an internal address. |
|  | Convert it to the actual address by adding the data flash base address FF20 $0000_{H}$. |  |
| 1,0 | Reserved | When read, the value after reset is returned. |

## (8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.
After ECC test mode is enabled by setting ECCTST $=1$, the ECC bits can be read.
When writing to DFTSTCTL, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

Access: DFTSTCTL can be read or written in 16-bit units.
Address: DFTSTCTL: FFC6 2A1C ${ }_{H}$
Value after reset: $\quad 0000_{H}$

Table 40C. 25 DFTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | PROT1 | Enables or disables modification of the ECCTST bit. |
| 14 | PROT0 | The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) $=(0$, <br> 1) when writing to DFTSTCTL. |
| 13 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECCTST | ECC Test |
|  |  | Sets ECC test mode. |
|  | Write a value to this bit simultaneously with the setting $($ PROT1, PROT0 $)=(0,1)$. |  |

## 40C.2.4 Local RAM (Including the Retention RAM) ECC

## 40C.2.4.1 Overview

## CAUTION

The retention RAM is a part of the local RAM. The ECC for the retention RAM is shared with the local RAM. Therefore, use for the retention RAM the same register as that for the local RAM.

The local RAM ECC of CPU1 is summarized in the table below.
Table 40C. 26 Summary of Local RAM ECC (CPU1)

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction. <br> - 2-bit error detection and 1-bit error detection. <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. <br> - Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see Section 3BC, CPU System of RH850/F1KM. <br> In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. <br> However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed. |
| Error status | The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. <br> The function is set only while no error status is set. A register for clearing the error status is provided. |
| Address capture | When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured. |
| Self-diagnosis | Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly. |
| Others | Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions. |

## CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

## 40C.2.4.4 Details of Registers

## (1) LRTSTCTL_PE1 - Local RAM Test Control Register

LRTSTCTL_PE1 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits. When writing to LRTSTCTL_PE1, PROT1 and PROT0 need to be $01_{\mathrm{B}}$.

Table 40C. 31 LRTSTCTL_PE1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PROT1 | Enables or disables modification of the ECCTST and DATSEL bits. |
| 14 | PROT0 | The value written is not retained. These bits are always read as 0 . Set $($ PROT1, PROT0 $)=(0$, 1) when writing to LRTSTCTL_PE1. |
| 13 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | ECC Test <br> After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1 register or written directly. <br> Write a value to this bit simultaneously with the setting $($ PROT1, PROT0 $)=(0,1)$. |
| 0 | DATSEL | Data Select <br> This bit is valid when ECCTST = 1 . This bit selects the RAM bit which can be accessed when writing. <br> Write a value to this bit simultaneously with the setting $($ PROT1, PROT0 $)=(0,1)$. <br> 0 : RAM data is selected. <br> 1: The ECC bits are selected. |

## CAUTION

When ECC test mode for the local RAM is enabled ( $E C C T S T=1$ ), the local RAM should be accessed in 4-byte units.

## (2) LRTDATBF0_PE1 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST $=1$ in the local RAM test control register LRTSTCTL_PE1, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.
Access: LRTDATBF0_PE1 register is a read-only register that can be read in 32-bit units.

## (5) LRSTCLR_PE1 — Local RAM Status Clear Register

LRSTCLR_PE1 clears the error flags in the error status register (LR1STERSTR_PE1), the overflow flag in the error overflow status register (LROVFSTR_PE1), and the error address register (LR1STEADR0_PE1). LRSTCLR_PE1 is a write-only register and is always read as 0 .

Access: LRSTCLR_PE1 register is a write-only register that can be written in 32-bit units.
LRSTCLR_PE1L register is a write-only register that can be written in 16 -bit units.
LRSTCLR_PE1LL register is a write-only register that can be written in 8-bit units.

## (6) LROVFSTR_PE1 - Local RAM Error Count Overflow Status Register

LROVFSTR_PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

Access: LROVFSTR_PE1 register is a read-only register that can be read in 32-bit units.
LROVFSTR_PE1L register is a read-only register that can be read in 16 -bit units.
LROVFSTR_PE1LL register is a read-only register that can be read in 8 -bit units.

## (7) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR_PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0 .

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR_PE1 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR_PE1.

Access: LR1STERSTR_PE1 register is a read-only register that can be read in 32-bit units.
LR1STERSTR_PE1L register is a read-only register that can be read in 16-bit units. LR1STERSTR_PE1LL register is a read-only register that can be read in 8-bit units.

## (8) LR1STEADR0_PE1 — Local RAM 1st Error Address Register 0

LR1STEADR0_PE1 holds the address at which an error has occurred.
The error address is set if an error occurs while error flags are 0 in LR1STERSTR_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0_PE1 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

## 40C.2.5 ECC for Peripheral RAM

## 40C.2.5.1 Overview

This is an ECC module for the RAM of the following peripheral modules.
CSIH and RS-CANFD.
Table 40C. 39 List of the ECC Functions for the peripheral RAM

| Item | Description |
| :---: | :---: |
| ECC error detection/correction | ECC error detection and correction can be enabled or disabled. <br> Either of the following settings can be selected. <br> - 2-bit error detection and 1-bit error detection/correction <br> - 2-bit error detection and 1-bit error detection <br> The ECC error detection/correction can be disabled by using through mode. <br> In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected. |
| Error notification | A notification is sent when an ECC error occurs. <br> - Error notification can be enabled or disabled when an ECC 2-bit error is detected. <br> - Error notification can be enabled or disabled when an ECC 1-bit error is detected. <br> In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled. However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed. |
| Error status | Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. A bit for clearing the error status is provided. |
| Address capture | Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared). |
| CAUTION |  |

When ECC error detection/correction is performed about RS-CANFD, initialize the RAM area before it is used.

## 40C.2.5.4 Details of Registers

## (1) <Module_Name>CTL — ECC Control Register

The <Module_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.
Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module's operation is stopped.
In addition, when writing to bit 7, EMCA1 and EMCA0 need to be $01_{\mathrm{B}}$.

| Access: |  |  | This register can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: |  |  | See Table 40C.42, List of ECC Modules and Table 40C.43, List of Registers. |  |  |  |  |  |  |  |  |  |  |  |  |  |

Note 1. These bits are always read as 0.
Table 40C. 44 <Module_Name>CTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | EMCA1 | Access Control Bits 1 and 0 to ECC Mode Selection |
| 14 | EMCA0 | These bits specify whether updating the ECTHM bit (bit 7 ) is disabled or enabled. The value <br> written to these bits is not retained. When these bits are read, the read value is always 0. <br> When these bits are $01_{\mathrm{B}}$, writing to bit 7 is enabled. |
| 13,12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | ECCOVFF | By detecting an error while the error status is set and the new error has another address than <br> the already latched (not cleared or reset is not issued), this bit is set. |
|  |  |  |
|  |  | 0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. |
|  | 1: Error address register overflowed |  |

NOTE: This bit clear condition is as follows.
(1) Reset
(2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C $=1$ when ECER1F = 1
(3) Selecting through mode enable (ECTHM = 1)

| 10 | ECER2C | 2-Bit ECC Error Detection Flag Clear |
| :---: | :---: | :---: |
|  |  | This bit clears 2-bit error detection flags of ECER2F (bit 2). |
|  |  | This bit is always read as 0 . Writing 0 is ignored. |
|  |  | Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. |
|  |  | When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set. |
| 9 | ECER1C | 1-Bit ECC Error Detection Correction Accumulation Flag Clear |
|  |  | This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0 . Writing 0 is ignored. |
|  |  | Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. |
|  |  | When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set. |
| 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 40C.44 <Module_Name>CTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | ECTHM | ECC Function through Mode Selection |
|  |  | Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 <br> disables the ECC function. |
|  |  | When writing to this bit, write 01 |

## CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

## (2) <Module_Name>TMC — ECC Test Mode Control Register

The <Module_Name>TMC register is used to switch to the test mode, and this register is for test mode control.
This register can be used when a target peripheral module is not accessed to RAM.
When writing to bit 7, ETMA1 and ETMA0 need to be $10_{\mathrm{B}}$.

Note 1. These bits are always read as 0 .
Table 40C. 45 <Module_Name>TMC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | ETMA1 | Access Control Bits 1 and 0 to ECC Test Mode |
| 14 | ETMAO | These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. |
| 13 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC Test Mode Enable |
|  |  | This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write $10_{\mathrm{B}}$ to the ETMA1 and ETMAO bits at the same time. <br> 0 : Access to the test mode registers and bits is disabled. <br> 1: Access to the test mode registers and bits is enabled. |

| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM Read Test Mode Selection |
|  |  | This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. <br> 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM. |
| 3 | ECREOS | ECC Redundant Bit Output Data Selection |
|  |  | This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE $=1$ (can be set simultaneously). |
|  |  | This bit is cleared when ECTMCE $=0$ (cleared synchronously). |
|  |  | 0 : ECC data is generated for write data is stored in RAM. |
|  |  | 1: The value of <Module_Name>ERDB Register is stored in RAM. |

| 2 | ECENS | ECC Encoder Input Selection <br> This bit specifies data written to RAM or the value of the <Module_Name>TED register as the input to the ECC encoder. <br> Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). <br> This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : ECC data is generated from write data to RAM <br> 1: ECC data is generated from register value of the <Module_Name>TED. |
| 1 | ECDCS | ECC Decoder Input Selection <br> This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of <Module_Name>TED. Writing to this bit is enabled only when ECTMCE $=1$ (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : Syndrome code generation and error detection are performed from RAM Data. <br> 1: Syndrome code generation and error detection are performed from <Module_Name>TED register value. |
| 0 | ECREIS | ECC Redundant Bit Input Data Selection <br> This bit specifies which ECC data is for generation of syndrome code and error detection, ECC data stored in RAM or the value of the <Module_Name>ERDB. <br> Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE $=0$ (cleared synchronously). <br> 0 : Syndrome code generation and error detection are performed from ECC data stored in RAM. <br> 1: Syndrome code generation and error detection are performed from <Module_Name>ERDB register value. |

## (3) <Module_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.
This register value is used to generate ECC data or syndrome code.
This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00000000_{\mathrm{H}}$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

## (4) <Module_Name>TRC - ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers,
<Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, and <Module_Name>ERDB.
This register can be accessed when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00000000_{\mathrm{H}}$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

## (5) <Module_Name>AD0 - Target ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.
When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

| Access: <br> Address: |  |  | This register is a read-only register that can be read in 32-bit units. <br> See Table 40C.42, List of ECC Modules and Table 40C.43, List of Registers. |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 30 to 0 | ECEAD[30:0] | ECEADO is a read-only register to hold the address at which an ECC error has occurred. |
|  |  | If an ECC error is detected while ECC error detection is enabled, the RAM address is latched <br> using the detection signal as a trigger, and the address is stored in ECEADO as the address at <br> which the ECC error has occurred. |
|  | The address is stored upon detection of the first ECC error while no error status is set. |  |
|  | However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. |  |
|  | Only one address can be held in ECEADO |  |

## (6) <Module_Name>SYND — ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrome data in ECC test mode.
Writing to this register is ignored.
This register is read-only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

## (7) <Module_Name>HORD - ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.
Writing to this register is ignored.
This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

## (8) <Module_Name>ECRD - ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.
Writing to this register is ignored.
This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE $=1$ ). When ECC test mode is disabled ( $<$ Module_Name $>$ TMC.ECTMCE $=0$ ), $00_{\mathrm{H}}$ is read.

| Access: | This register is a read-only register that can be read in 8-bit units. |

| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECRD[6:0] | These bits can read ECC data generated at the time of RAM data writing and can read ECC <br> data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS <br> $=1$. |

## (9) <Module_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.
This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When $<$ Module_Name $>$ TMC.ECTMCE $=0$, writing to this register is ignored and $00_{\mathrm{H}}$ is read.

Table 40C. 51 <Module_Name>ERDB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ERDB[6:0] | These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS =1, the value read from these bits is ECC data read from the RAM. |
|  |  | When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data. |

## (10) SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.
Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

## 40C. 3 Memory Protection

## 40C.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the RH850 Family User's Manual: Software

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see Section 3BC, CPU System of RH850/F1KM.

- IPG

The CPU Peripheral is protected against illegal accesses. For details, see Section 3BC, CPU System of RH850/F1KM.

- PBG

The control registers in the peripheral circuits are protected against illegal accesses. For details, see Section 40C.3.2, PBG.

- PBGC

The CPU system has its dedicated PBG function which is called a PBG for CPU system. For details, see Section 40C.3.3, PBG for CPU System.

## 40C.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.
Table 40C. 53 Identifiers for Slave Guard

| Identifier | Function |
| :--- | :--- |
| UM | When the CPU makes an access, this indicates the operating mode of the CPU. <br> 0: Supervisor mode <br> 1: User mode |
|  | When the PDMA makes an access, the value of this identifier is the value in the channel master <br> setting register. <br> When another master makes an access, the value of this identifier is always 0. |
| SPID | When the CPU makes an access, this indicates the system protection identifier SPID that is <br> assigned to the CPU. <br> When the PDMA makes an access, the value of this identifier is the value in the channel master <br> setting register. <br> When another master makes an access, the value of this identifier is always $00_{\mathrm{B}}$. |
| PEID | This indicates the access source bus master. <br> $001_{\mathrm{B}}$ : CPU1 |

When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.

## 40C.3.2 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG group can hold the information of the access that has been rejected.
The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

## 40C.3.2.2 Details of Registers

## (1) FSGDxxPROTn — PBGxx Protection Register n

FSGDxxPROTn specifies the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. " $n$ " in the register names and symbols represents the PBG channel number.

Access: FSGDxxPROTn register can be read or written in 32-bit units.
FSGDxxPROTnL and FSGDxxPROTnH registers can be read or written in 16-bit units.
FSGDxxPROTnLL, FSGDxxPROTnHL and FSGDxxPROTnHH registers can be read or written in 8-bit units.
Address: See Table 40C.55, List of PBG Protection Registers.
Value after reset: See Table 40C.55, List of PBG Protection Registers.

Note 1. It varies depending on each register. See Section 40C.3.2.1, List of Registers.
Table 40C. 58 FSGDxxPROTn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | PROTLOCK | Register Lock <br> 0: Enables FSGDxxPROTn rewrite. <br> 1: Disables FSGDxxPROTn rewrite. <br> When PROTLOCK is set to 1 , the value is held until reset is asserted. |
| 30 to 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | PROTUM | User Mode Access <br> 0 : Enables access in supervisor mode. <br> 1: Enables access in user mode and supervisor mode. |
| 24 to 19 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | PROTPEID1 | Access with PEID $=1$ (CPU1) ${ }^{\star 1}$ <br> 0: Disables access with PEID1. <br> 1: Enables access with PEID1. |
| 17 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | PROTSPID3 | Access with SPID $=3^{* 2}$ <br> 0: Disables access with SPID3. <br> 1: Enables access with SPID3. |
| 7 | PROTSPID2 | Access with SPID $=2^{* 2}$ <br> 0: Disables access with SPID2. <br> 1: Enables access with SPID2. |

Table 40C. 58 FSGDxxPROTn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 6 | PROTSPID1 | Access with SPID $=1\left(\text { CPU1 }{ }^{* 3}\right)^{\star 2}$ <br> 0 : Disables access with SPID1. <br> 1: Enables access with SPID1. |
| 5 | PROTSPID0 | Access with SPID $=0{ }^{* 2}$ <br> 0 : Disables access with SPIDO. <br> 1: Enables access with SPID0. |
| 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | PROTRDPDEF | Default Read Protection <br> 0: Enables read access from any master regardless of other setting in this register. <br> 1: The setting of PROTRD is effective. |
| 2 | PROTWRPDEF | Default Write Protection <br> 0: Enables write access from any master regardless of other setting in this register. <br> 1: The setting of PROTWR is effective. |
| 1 | PROTRD | Read Permission <br> 0: Disables reading by a bus master subject to access filtering. <br> 1: Enables reading by a bus master subject to access filtering. |
| 0 | PROTWR | Write Permission <br> 0 : Disables writing by a bus master subject to access filtering. <br> 1: Enables writing by a bus master subject to access filtering. |

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFG0.SPID

## (2) ERRSLVxxCTL - PBGxx Error Control Register

ERRSLVxxCTL clears the status in the error status register with the PBGxx.

```
            Access: ERRSLVxxCTL is write-only register that can be written in 32-bit units.
                    ERRSLVxxCTLL is write-only register that can be written in 16-bit units.
                    ERRSLVxxCTLLL is write-only register that can be written in 8-bit units.

| 1 | 0 | Clears the OVF bit. |
| 1 | 1 | Clears the OVF and ERR bits. |

## (3) ERRSLVxxSTAT - PBGxx Error Status Register

ERRSLVxxSTAT holds the status of the illegal access rejected with the PBGxx.

Access: ERRSLVxxSTAT is read-only register that can be read in 32-bit units.
ERRSLVxxSTATL is read-only register that can be read in 16-bit units. ERRSLVxxSTATLL is read-only register that can be read in 8-bit units.

Address: ERRSLVxxSTAT: <base_addr0> +4 H
ERRSLVxxSTATL: <base_addr0> $+4_{H}$ ERRSLVxxSTATLL: <base_addr0> $+4_{H}$

Value after reset: $00000000_{\mathrm{H}}$

Table 40C. 61 ERRSLVxxSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag |
|  | 0: No overflow |  |
|  | 1: An overflow occurred. |  |
|  |  | If a second guard violation occurs with the error detection flag being set after the first guard |
|  |  | violation occurs, the error entry overflows and this flag is set because the number of PBG error |
|  |  | entry stages is 1. |
|  |  | Note that this overflow is notified to INTGUARD. |
|  |  | In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. |
|  |  | For an overflow check the OVF bit should be checked. The error information of the guard |
|  |  | violation when an overflow occurs are not captured. |
| 0 | Error Status Flag |  |
|  |  | 0: No PBG protection violation |
|  |  | 1: A PBG protection violation occurred. |
|  |  |  |

## (4) ERRSLVxxADDR — PBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

Table 40C. 62 ERRSLVxxADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | ADDR[31:2] | Address in which the PBG protection violation is generated. |
| 1,0 | Reserved | When read, the value after reset is returned. |

## (5) ERRSLVxxTYPE — PBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

```
            Access: ERRSLVxxTYPE is read-only register that can be read in 32-bit units.
            ERRSLVxxTYPEL is read-only register that can be read in 16-bit units.
            Address: ERRSLVxxTYPE: <base_addr0> + CH
            ERRSLVxxTYPEL: <base_addr0> + CH

Table 40C. 63 ERRSLVxxTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 13 | PEID[2:0] | PEID of the access source from which the PBG protection violation is generated. |
| 12 to 10 | Reserved | When read, the value after reset is returned. |
| 9,8 | SPID[1:0] | SPID of the access source from which the PBG protection violation is generated. |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 | UM | UM of the access source from which the PBG protection violation is generated. |
| 5 | Reserved | When read, the value after reset is returned. |
| 4 to 1 | These bits are read as an undefined value. |  |
| 0 | This bit is set to 1 when the access that has generated the PBG protection violation is a write <br> access. |  |

## 40C.3.3 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.
Table 40C. 64 Target Registers of PBG for CPU Subsystem

| PBGC <br> Group | Group No. | Channel Number | Protection Target Module | Target Register |

## 40C.3.3.2 Details of Registers

## (1) FSGDCxPROTn - PBGCx Protection Register $\mathbf{n}(x=0,1)$

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.
" n " in the register names and symbols represents the PBGC channel number.

Access: FSGDCXPROTn register can be read or written in 32-bit units.
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.
FSGDCxPROTnLL, FSGDCxPROTnHL and FSGDCxPROTnHH registers can be read or written in 8 -bit units.
Address: See Table 40C.65, List of PBGC Protection Registers.
Value after reset: See Table 40C.65, List of PBGC Protection Registers.

Table 40C. 67 FSGDCxPROTn Register Contents

|  |  | 0: Disables writing by a bus master subject to access filtering. |
|  |  | 1: Enables writing by a bus master subject to access filtering. |

## Note 1. Access with PEID

PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.
Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.
Note 3. Setting value of MCFG0.SPID
(2) ERRSLVCxCTL — PBGCx Error Control Register ( $x=0,1$ )

ERRSLVCxCTL clears the status in error status register PBGCx.

Access: ERRSLVCxCTL is a write-only register that can be written in 32-bit units.
ERRSLVCxCTLL is a write-only register that can be written in 16-bit units. ERRSLVCxCTLLL is a write-only register that can be written in 8-bit units.

Address: ERRSLVCxCTL: FFC4 $\mathrm{C} 800_{\mathrm{H}}+\left(100_{\mathrm{H}} \times \mathrm{x}\right)$
ERRSLVCxCTLL: FFC4 C800 ${ }_{H}+\left(100_{H} \times x\right)$ ERRSLVCxCTLLL: FFC4 C800H $+\left(100_{\mathrm{H}} \times \mathrm{x}\right)$

Value after reset: $00000000_{\mathrm{H}}$

## (3) ERRSLVCxSTAT - PBGCx Error Status Register ( $x=0,1$ )

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

Table 40C. 70 ERRSLVCxSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | OVF | Error Entry Overflow Flag |
|  | 0: No overflow |  |
|  | 1: An overflow occurred. |  |
|  |  | If a second guard violation occurs with the error detection flag being set after the first guard |
|  |  | violation occurs, the error entry overflows and this flag is set because the number of PBGC |
|  |  | error entry stages is 1. |
|  |  | Note that this overflow is notified to INTGUARD. |
|  |  | In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. |
|  |  | For an overflow check the OVF bit should be checked. The error information of the guard |
|  |  | violation when an overflow occurs are not captured. |
| 0 | Error Status Flag |  |
|  |  | 0: No PBGC protection violation |
|  |  | 1: A PBGC protection violation occurred. |
|  |  |  |

## (4) ERRSLVCxADDR — PBGCx Error Address Register ( $x=0,1$ )

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx. The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Table 40C. 71 ERRSLVCxADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |

## Section 41 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of DCRA.

### 41.1 Features of RH850/F1KH, RH850/F1KM DCRA

### 41.1.1 Number of Units

This microcontroller has the following number of DCRA units.
Each DCRA unit has single channel interface.
Table 41.1 Number of Units (RH850/F1KH-D8)

### 41.1.2 Register Base Addresses

DCRAn base addresses are listed in the following table.
DCRAn register addresses are given as offsets from the base addresses.
Table 41.5 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <DCRA0_base> | FFF7 $0000_{\mathrm{H}}$ |

### 41.2 Overview

### 41.2.1 Functional Overview

The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
(X32+X26+X23+X22+X16+X12+X11+X10+X8+X7+X5+X4+X2 +X1+1)
- 16-bit CCITT CRC
(X16+X12+X5+1)
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.

### 41.3 Registers

### 41.3.1 List of Registers

DCRA registers are listed in the following table.
For details about <DCRAn_base>, Section 41.1.2, Register Base Addresses.
Table 41.8 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| DCRAn | CRC input register | DCRAnCIN | <DCRAn_base> + 00 |
|  | CRC data register | DCRAnCOUT | <DCRAn_base> $+04_{H}$ |
|  | CRC control register | DCRAnCTL | <DCRAn_base> $+20_{H}$ |

### 41.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.
The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

Table 41.9 DCRAnCIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DCRAnCIN[31:0] | Input Data for CRC Calculation |
|  |  | The valid bits are: |
|  | - For 32 bit effective bit width: DCRAnCIN[31:0] |  |
|  | - For 16 bit effective bit width: DCRAnCIN[15:0] |  |
|  | - For 8 bit effective bit width: DCRAnCIN[7:0] |  |

### 41.3.3 DCRAnCOUT — CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet polynomial or the 16-bit CCITT polynomial.

Note 1. The read value after reset is $00000000_{\mathrm{H}}$ since the 32 -bit Ethernet CRC polynomial is selected as the CRC generating function after reset.

Table 41.10 DCRAnCOUT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 0 | DCRAnCOUT | Result of the CRC Code Generation |
|  |  | When the 16 -bit CCITT polynomial is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined. |
|  |  | The read value of this register is a value obtained by performing EXOR calculation for the following value: |
|  |  | - For 32-bit Ethernet polynomial: FFFF FFFFF |
|  |  | - For 16-bit CCITT polynomial: $0000_{\text {H }}$ |
|  |  | For example, when DCRAnCOUT $=55555555_{\mathrm{H}}$ for the 32-bit Ethernet polynomial, $A A A A A A A A_{H}$ is read. |

## CAUTION

This register must be initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

### 41.3.4 DCRAnCTL — CRC Control Register

This register controls the CRC generation process.

Table 41.11 DCRAnCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2,1 | DCRAnISZ[1:0] | Specify the CRC input bit width. |
|  |  | $00: 32$ bits (DCRAnCIN[31:0]) |
|  | 01: 16 bits (DCRAnCIN[15:0]) |  |
|  | 10: 8 bits (DCRAnCIN[7:0]) |  |
|  | 11: Setting prohibited |  |

## CAUTION

- If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.
- The CRC input bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Changing the CRC input bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

### 41.4 Operation

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16 -bit CCITT. The initial starting value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flowchart below shows the CRC generating procedure.

Figure 41.2 Flowchart of Data CRC Function A

NOTES

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized with the initial start value.
2. DCRAnCOUT must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials The following is the example of setting values.

Table 41.12 Setting Example of Initial Start Values (When Read at a Reset)

|  | Initial Start Value | EXOR Value | DCRAnCOUT Read Value |
| :--- | :--- | :--- | :--- |
| 16-bit CCITT | XXXX FFFF $_{\mathrm{H}}$ | XXXX 0000 | ( |
| 32-bit Ethernet | FFFF FFFF $_{\mathrm{H}}$ | FFFF FFFFF $_{\mathrm{H}}$ | XXXX FFFF $_{\mathrm{H}}$ |

Note: X: Undefined

## Section 43 On-Chip Debug Unit (OCD)

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001 ${ }^{\text {TM }}-2003$ Class $3^{* 1}$, a Nexus debug interface standard.

Note 1. This function is supported only by products with an EVTO pin.

## CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.

### 43.1 Overview of RH850/F1KH, RH850/F1KM OCD

### 43.1.1 Functional Overview

The on-chip debug functions described below are supported by the microcontroller.

## (1) Debug Interface

This microcontroller supports the following as debug interfaces: Nexus Interface, Low Pin Debug Interface (1 pin) hereinafter called "LPD (1 pin)", and Low Pin Debug Interface (4 pins) - hereinafter called "LPD (4 pins)".

On-chip debug can be performed using these debug interfaces.
NOTE
When LPD (1 pin) is used, LPD is operating by the clock of MainOSC.

## (2) Debug Monitoring Function

Debug-dedicated monitor program space is mounted and is used during debugging.
The basic debug functions below can be used by running a monitoring program.

- Downloading the user-created program
- Reading and writing the memory and registers
- Running the user-created program starting at any address
(3) On-chip Break

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for any access (access address, access data).

## (4) Software Break

Software break points can be specified at any execution address.

## (5) Peripheral Break

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the usercreated program is stopped, for instance upon a breakpoint hit.

## (6) Forced Break

Execution of the user-created program can be interrupted forcibly.

## (7) Forced Reset

This device (microcontroller) can be forcibly reset.

## (8) Real Time RAM Monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

## (9) Dynamic Memory Modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

## (10) Timer Function

Using a 32-bit counter, the time for running the user-created program can be measured based on the clock for debug. For the measurement accuracy, see the user's manual of the debugger.

## (11) Mask Function

Masking the following factors is possible.

- All reset sources except for a POC reset and a wakeup reset
- $\overline{\text { MEMC0WAIT }} * 1$

Note 1. This function is supported only by products with MEMC.

## (12) Hot Plug-in Function

Debugging can be started in normal operating mode without the external reset input.
NOTE
When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up process. About the INTDCUTDI interrupt, see Table 7A.4, El Level Maskable Interrupt Sources, Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4) and Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1) (Channel No.21).

## (13) Security Function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

For details on how to set the ID code, see the user's manual of the debugger.

## (14) Trace Function

Execution history, data changes, etc. of the user-created program can be obtained.
NOTE
The trace function is only available in devices with 8-MB memory in RH850/F1KH-D8.
The trace function is only available in devices with 4-MB memory in RH850/F1KM-S4.
The trace function is only available in devices with 1-MB memory in RH850/F1KM-S1.

### 43.2 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the usercreated program is stopped, for instance upon a breakpoint hit.

During peripheral break, the peripheral modules operate as follows.

## a. Modules that stop unconditionally regardless of the EPC.SVSTOP setting

Table 43.4 Modules that Stop Unconditionally Regardless of the EPC.SVSTOP Setting (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

## Module

Window watchdog timer (WDTA)

## CAUTION

RH850/F1KH-D8:
Do not write to the WDTAn when using the individual break function.
In order for the WDTAn of a CPUn for which break points have not been configured to receive clear commands, writing to the WDTAn by using SVACCESS is not disabled.
If WDTAOMD or a trigger register is written on the debugger GUI or by some other means, it might cause an unintentional reset.
To prevent this, be sure to configure synchronous breaks for all CPUs. (SVACCESS is enabled by a tool.)

## b. Modules that continue to operate by the setting of emulation registers even when EPC.SVSTOP = 1

### 43.3 Hot Plug-in in Each Mode

### 43.3.1 RUN Mode

When Hot Plug-in has occurred in RUN mode, it is necessary to maintain the current state.

### 43.3.2 STOP/DeepSTOP Mode

When Hot Plug-in has occurred in STOP/DeepSTOP mode, it is necessary to transfer in RUN mode.

Figure 43.1 Hot Plug-in in STOP/DeepSTOP Mode

### 43.3.3 Cyclic RUN Mode

When Hot Plug-in has occurred in Cyclic RUN mode, it is necessary to transfer in DeepSTOP mode and wakeup to RUN mode.

All regulators in ISO are made operating state in OCD mode.
Then, on the occurrence of interrupt of "DCUTDI Low level Detection interrupt (INTDCUTDI)", it is necessary for a transfer order to be executed to DeepSTOP mode by user (software) if on-chip debugging is performed.

The sequence of the time when to enter to OCD mode in Cyclic RUN mode is mentioned below.

Figure 43.2 Hot Plug-in in Cyclic RUN Mode

### 43.3.4 Cyclic STOP Mode

When Hot Plug-in has occurred in Cyclic STOP mode, it is necessary to transfer in Cyclic RUN mode.
Then, on the occurrence of wakeup factor of DCUTDI, it is necessary for a transfer to be executed as the same case of Cyclic RUN mode.
The sequence of the time when to enter to OCD mode in Cyclic STOP mode is mentioned below.

### 43.4 Registers

### 43.4.1 List of Registers

OCD register is listed in the following table.
Table 43.9 List of Register

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| - | Emulation peripheral control register | EPC | - |

### 43.4.2 EPC - Emulation Peripheral Control Register

This register stops operation of peripheral functions (timer, serial interface, and A/D converter) in debug mode (SVSTOP).

Table 43.10 EPC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | Reserved | - |
| 6 | SVSTOP | Stops operation of peripheral functions (timer, serial interface, and A/D converter) during debugging. <br> 0 : Does not stop operation <br> 1: Stops operation |
| 5 to 0 | Reserved | - |

NOTE
EPC is set by the debugger. Setting by the user program is prohibited. As for the setting of the debugger, see the user's manual of the debugger.

### 43.5 Cautions on Using On-Chip Debugging

### 43.5.1 Treatment of Devices Used for Debugging

Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the write/erase endurance of the flash memory cannot be guaranteed.

### 43.5.2 Reset Assertion when a Debugger is Connected

If a program in which a reset is asserted at the start of program execution is executed when a debugger is being used, the microcontroller is reset before preparation for communications between the OCD emulator and microcontroller is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. To ensure that the debugger operates properly when debugging a program in which a reset is asserted at the start of program execution, insert a wait between the start of program and reset assertion.

### 43.5.3 Restrictions when HS IntOSC is Used as the Main Clock Source Instead of MainOSC

Need to change the debug interface configuration (OPJTAG) to LPD (4 pins) in advance if E1 Emulator is used for debug.

LPD (1 pin) mode cannot be used.

### 43.5.4 Restrictions when the Writing of OCD_MD and Reset are Occur at the Same Time, or Restrictions when the Writing of MTR (DBG_CTRLP) and Reset are Occur at the Same Time

When the writing of OCD_MD and reset are occur at the same time, or the writing of MTR (DBG_CTRLP) and reset are occur at the same time, it is a possibility of terminal hazard.

If the debugger was disconnected, please reconnect the debugger.

### 43.5.5 Transition to DeepSTOP Mode when a Debugger is Connected

When a debugger is in use, when a program to transition to DeepSTOP mode is executed immediately following the start of the program, the microcomputer stops power supply to the Isolated area (ISO area) before preparation for communications between the OCD emulator and microcomputer is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. A wait must be inserted during the period from release from the reset state and transition to DeepSTOP mode by the emulator for correct operation of the debugger when debugging a program to transition to DeepSTOP mode immediately after the program starts.

## Section 44 Flash Memory

This section describes the flash memory mounted on RH850/F1KH, RH850/F1KM.
The first part in this section describes the characteristics of the mounted flash memory and the characteristics specific to RH850/F1KH, RH850/F1KM, such as the memory map, flash memory programming, and ECC.

### 44.1 Features of RH850/F1KH, RH850/F1KM Flash Memory

- Includes code flash memory and data flash memory

The code flash memory can store program codes and data and has the user area and the extended user area.
The data flash memory is used for storing data.

- Method of flash memory programming

Flash memory programming via a serial interface and programming of flash memory by a user program (selfprogramming) are supported.

- Support for BGO (Back Ground Operation)

## RH850/F1KH-D8, RH850/F1KM-S4:

- The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
- The BGO function allows programs to be executed in the code flash memory while the code flash memory is being programmed/erased. (There are restrictions of programming/erasing area and reading area combination. See Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8) and Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)).

RH850/F1KM-S1:

- The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
- Flash memory data security
- Support for security functions to protect against illicit tampering with or reading out of data in the flash memory
- Support for protection functions to protect against erroneous overwriting of the flash memory
- Option byte function

RH850/F1KH-D8, RH850/F1KM-S4:

- Sets the operation after releasing reset for ports, WDTA, CVM, clock divider mode for CPUCLK, FlexRay, Ethernet AVB and RESETOUT .

RH850/F1KM-S1:

- Sets the operation after releasing reset for ports, WDTA, CVM and RESETOUT .
- Support for the error detection/correction function (ECC) in the code flash memory and data flash memory

Built-in ECC function can detect 2-bit errors and detect/correct 1-bit errors.

- Interrupts can be acknowledged in self-programming mode.

For code flash sizes and data flash sizes of each product, see the following sections.

- Section 4A.1, Address Space
- Section 4B.1, Address Space
- Section 4C.1, Address Space

### 44.2 Structure of Memory

### 44.2.1 Mapping of Code Flash Memory

Figure 44.1, Mapping of the Code Flash Memory (RH850/F1KH-D8), Figure 44.2, Mapping of the Code Flash Memory (RH850/F1KM-S4), Figure 44.3, Mapping of the Code Flash Memory (RH850/F1KM-S1), illustrates the mapping of the code flash memory.

The user area of the code flash memory is divided into 8 and 32 KB blocks, which serve as the units of erasure. A single 32 KB block is also incorporated as the extended user area. The user area and extended user area are available as areas for storing the user program.

### 44.4 Functions

### 44.4.1 Functional Overview

The flash memory can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions. Table 44.2, Methods of Programming gives an overview of the methods of programming and the corresponding operating modes.

Table 44.2 Methods of Programming

| Method of Programming | Description | Operating Mode |
| :---: | :---: | :---: |
| Serial programming | A dedicated flash memory programmer allows on-board programming of the flash memory after the device is mounted on the target system. | Serial programming mode |
|  | A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system. |  |
| Self-programming | The user program that is written to code flash memory in advance by serial programming also allows updating the flash memory. | Normal operating mode User boot mode |
|  | The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is selfprogramming. |  |
|  | For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory. |  |
|  | RH850/F1KH-D8, RH850/F1KM-S4: |  |
|  | In addition, when the specific conditions of the code flash memory range for updating and the code flash memory range for reading are satisfied, the background operation can be used. (see Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8), Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)). <br> In this case, the code flash memory can be update using the instructions for programming in the code flash memory by self-programming. |  |
|  | When background operation cannot be used, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the internal RAM in advance and executed. |  |
|  | RH850/F1KM-S1: |  |
|  | Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by selfprogramming. |  |
|  | In such cases, a program for updating must be transferred to the local RAM in advance and executed. |  |

Renesas provides a library for self-programming. For details on this library, see the user's manuals for the code flash library and data flash library of this device.

Table 44.3, Basic Functions at a Glance lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by a library function or the user program enables self-programming.

Table 44.3 Basic Functions at a Glance

| Function | Description | Level of Support ( $\checkmark$ : Supported, $\Delta$ : Conditionally Supported, —: Not Supported) |  |
| :---: | :---: | :---: | :---: |
|  |  | Serial Programming | Self-Programming |
| Blank checking | This is used to check a specified block to ensure that writing to it has not already proceeded. The flash memory supports various security functions.
The OTP setting and authentication of the ID code are security functions for use with serial programming and selfprogramming.

Page 4189 of 4535

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the flash memory are listed in Table 44.4, Summary of Security Functions.

### 44.5 Serial Programming

A dedicated flash memory programmer can be used to handle flash memory in serial programming mode.

## Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the microcontroller by the flash memory programmer to proceed.

### 44.5.1 Environments for Programming

The recommended environments for handling the flash memory of the microcontroller with data are described below.

Figure 44.9 Environments for Handling Programs of the Flash Memory

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

NOTE
For details on the PG-FP5, see the PG-FP5 Flash Memory Programmer User's Manual. For details on the Renesas Flash Programmer of flash programming software, see the Renesas Flash Programmer Flash Programming Software User's Manual.

### 44.6 Communication Modes

### 44.6.1 Asynchronous Flash Programming Interface - 1-Wire UART

The single-wire asynchronous serial programming interface, 1 -wire UART is connected to the flash memory programmer with the following port.

- FPDR (JP0_0): Receive data input/transmit data output

### 44.6.2 Asynchronous Flash Programming Interface - 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output

### 44.6.3 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output
- FPCK (JP0_2): Serial clock input

The flash memory programmer outputs the serial data clock SCK, and the microcontroller operates as a slave. NOTE

For details on Renesas Flash Programmer, see the Renesas Flash Programmer Flash Programming Software User's Manual.

### 44.6.4 Selection of Communication Method

The communication method can be selected by pulse input to the FLMD0 pin (up to 7 pulses) after transition to the flash memory programming mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

Figure 44.10, Selection of Communication Method shows the relation between the number of pulses and communication method.

Figure 44.10 Selection of Communication Method

### 44.7 Self-Programming

### 44.7.1 Outline

The RH850/F1KH and RH850/F1KM supports programming of the flash memory by the user program itself. Renesas Electronics provides a code flash library and a data flash library for use with user programs. These libraries can be used for writing to the code flash memory and to the data flash memory.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to internal RAM in advance of the programming operation, and executed from the given destination to perform the programming.

In addition, when the specific conditions of the code flash memory range for updating and the code flash memory range for reading are satisfied, the background operation can be used. (see Table 44.6, Conditions under which
Background Operation is Usable (RH850/F1KH-D8), Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4), Table 44.8, Conditions under which Background Operation is Usable (RH850/F1KM-S1)). In this case, the code flash memory can be update using the instructions for programming in the code flash memory by self-programming. The programming program can also be copied to the internal RAM in advance and executed to program the code flash memory.

When background operation cannot be used, the programming program can be copied to the internal RAM in advance and executed to program the code flash memory.

Figure 44.11 Schematic View of Self-Programming

For details on the self-programming of flash memory, see the user's manuals for the code flash and data flash libraries for this device.

### 44.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

### 44.7.3 Enabling Self-Programming

The self-programming function can be activated in normal operating mode and user boot mode.
Erasure and programming of the code flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.
The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in Section 44.7.3.1, FLMDCNT Register.

### 44.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.
The correct write sequence using the FLMDPCMD register is required in order to update this register. For details, see Section 5, Write-Protected Registers.
Access: This register can be read or written in 32-bit units.

### 44.8 Reading Flash Memory

### 44.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception.

### 44.8.2 Reading Data Flash Memory

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programmed again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

### 44.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register

This register is used to specify the number of wait cycles to be inserted when reading the data in the data flash.
Set the number of wait cycles to be inserted in the clock cycle when reading the data flash according to the operating clock frequency of the CPU ( $\mathrm{f}_{\text {CPUCLK }}$ ).

Access: This register can be read or written in 8-bit units.

## NOTES

1. The read access time to the data flash is calculated by the number of wait cycles.

RH850/F1KH-D8, RH850/F1KM-S4:
Read access time to the data flash $=\{20+$ (Number of wait cycles $\times 8)\} /$ CPU operating frequency
(CKDIVMD = 1, including products of CPU frequency 160 MHz max.)
Read access time to the data flash $=\{20+($ Number of wait cycles $\times 4)\} /$ CPU operating frequency
(CKDIVMD = 0)
RH850/F1KM-S1:
Read access time to the data flash $=\{17+$ (Number of wait cycles $\times 4$ ) $\}$ / CPU operating frequency However, the time may be changed depending on the combination of instructions before and after the execution.
2. $\quad \checkmark$ indicates the number of wait cycles that can be set.

### 44.8.2.2 PRDNAMEn — Product Name Storage Register ( $\mathrm{n}=1$ to 3 )

This register stores the product name. The product part name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, and PRDNAME3 correspond to the fourth to first bytes, eighth to fifth bytes, and twelfth to ninth bytes of the product part name respectively.

### 44.8.2.3 CHIPIDnXX — Chip ID Register ( $n=1,2, X X=L L, L H, H L, H H$ )

The RH850/F1KH and RH850/F1KM provides the option of a unique chip ID of the device.

Access: These registers are read-only registers that can be read in 32-bit units.
Address: CHIPID1LL: FFCD 00E0H
CHIPID1LH: FFCD 00E4 CHIPID1HL: FFCD 00E8 CHIPID1HH: FFCD 00EC ${ }_{H}$ CHIPID2LL: FFCD 00FOH CHIPID2LH: FFCD 00F4 CHIPID2HL: FFCD 00F8 ${ }_{\text {H }}$ CHIPID2HH: FFCD 00FC ${ }_{H}$

### 44.9 Option Bytes

The option bytes of the flash memory are an expansion area and hold data specified by the user for a variety of purposes. Initial settings for peripheral modules and so on as specified by the option bytes become effective on release from the reset state. Table 44.19, Value of Shipping (RH850/F1KH-D8), Table 44.20, Value of Shipping (RH850/F1KM-S4, RH850/F1KM-S1) shows the value of shipping.

### 44.9.1 Option Byte Setting

Be sure to set the option byte area that corresponds to the optional functions listed below, before writing a program to the flash memory.

The optional functions specified by the option bytes are as follows.

- Function of port group JP0
- Activation code method of WDTA2*2
- Start mode of WDTA2*2
- Enabling or disabling WDTA2*2
- Activation code method of WDTA1
- Start mode of WDTA1
- Enabling or disabling WDTA1
- Activation code method of WDTA0
- Start mode of WDTA0
- Enabling or disabling WDTA0
- Initial value of the overflow interval time for WDTA2*2, WDTA1 and WDTA0
- Enabling or disabling of RESETOUT
- Enabling the high voltage monitor
- Enabling the low voltage monitor
- Clock divider mode for CPUCLK*1
- Enabling or disabling FlexRay*1
- Enabling or disabling Ethernet AVB 0*1
- Enabling or disabling Ethernet AVB 1*2
- Enabling or disabling PE2*2
- Enabling or disabling PE2 Boot*2

Note 1. This function is not supported in RH850/F1KM-S1.
Note 2. This function is supported in RH850/F1KH-D8.

### 44.9.2 OPBTO — Option Byte 0

The settings and bit positions of the option bytes are listed below.
For details on how to set an option byte, see the user's manual of the flash programmer for serial programming as well as the code flash library for self-programming.

Note: Value after reset: user defined (values of shipping are shown in Table 44.19, Value of Shipping (RH850/F1KHD8) and Table 44.20, Value of Shipping (RH850/F1KM-S4, RH850/F1KM-S1)).

### 44.10 Usage Notes

## (1) Reading areas where Programming or Erasure was Interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid the reading out of undefined data, which might cause a malfunction, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

## (2) Reading the Code Flash Memory that has been Erased but Not yet been Programmed Again

Note that reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

## (3) Prohibition of Additional Writing

Writing to a given area two or more times is not possible. When overwriting data in an area of flash memory after writing to the area has been completed, erase the area first.

## (4) Resets During Programming and Erasure

In the case of the external reset during programming and erasure, wait for at least the minimum value of $\overline{\text { RESET }}$ input low level width once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

## (5) Allocation of Vectors for Interrupts and Other Exceptions During Programming and Erasure

Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

## (6) Abnormal Termination of Programming and Erasure

Even if programming/erasure ends abnormally due to the assertion of a reset by the RESET pin, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming/erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to ensure that the corresponding area is completely erased before using.

If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

## (7) Items Prohibited During Programming, Erasure and Blank check.

Do not perform the following operations during programming, erasure, and blank check.

- Set the operating voltage from the power supply outside the allowed range.

RH850/F1KH-D8, RH850/F1KM-S4:

- Change the frequency of the peripheral clock.

## RH850/F1KM-S1

- Change of all clock register described in Section 12C, Clock Controller.

The following steps have to be applied during writing and/or erasing:
(a) Please do not select the HS IntOSC and EMCLK as clock source when writing and/or erasing the code/data flash. This is also applicable when the HS IntOSC is set as PLL1 source clock.
(b) Please disable CLMA0, and CLMA3. (Set CLMA0CTL0.CLMA0CLME $=0$, CLMA3CTL0.CLMA3CLME $=0$ )
(c) Please disable the LPS $(\operatorname{DPEN}=0, \operatorname{ADEN}=0)$ when writing and/or erasing the code/data flash.

If (a) to (c) above are difficult to apply, please contact your local sales representative.
(8) Erasure of all flash memory before clearing the configuration

Erase the user area of code flash and all of the data area of data flash before clearing the configuration.

## (9) Restriction on Serial Programming when HS IntOSC is Used

RH850/F1KH-D8, RH850/F1KM-S4:

- 1-wire/2-wire UART mode cannot be used.
- The E1 emulator cannot be used.

## RH850/F1KM-S1

Please do not select the HS IntOSC and EMCLK as clock source during serial programming mode.
When the HS IntOSC and EMCLK are set, there is a possibility that a failure occurs during flash write or flash erase. In case the flash write and flash erase process are finished successfully, the write and erase can be guaranteed.

## Section 45 RAM

This section describes the RAM mounted on RH850/F1KH, RH850/F1KM.

### 45.1 Features of RH850/F1KH, RH850/F1KM RAM

- RH850/F1KH and RH850/F1KM includes the following RAMs:
- Local RAM (LRAM)

The local RAM is accessible at high speed. Values in the local RAM are not retained in DeepSTOP mode.

- Global RAM (GRAM)

RH850/F1KH-D8:
The global RAM is used for serving as a source or destination for DMA transfer. The global RAM is divided into banks A and B and parallel access to both banks is possible. Values in global RAM are not retained in DeepSTOP mode.
RH850/F1KM-S4:
The global RAM is used for serving as a source or destination for DMA transfer. The global RAM is divided into banks A and B and parallel access to both banks is possible. Values in global RAM are not retained in DeepSTOP mode.

RH850/F1KM-S1:
There is no global RAM in RH850/F1KM-S1

- Retention RAM (RRAM)

RH850/F1KH-D8:
The retention RAM is a part of the global RAM (Bank B). Values in the retention RAM are retained in DeepSTOP mode.
In addition, even if the power-supply voltage (REG0VCC / REG1VCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI). RH850/F1KM-S4:

The retention RAM is a part of the global RAM (Bank B). Values in the retention RAM are retained in DeepSTOP mode.
In addition, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).
RH850/F1KM-S1:
The retention RAM is a part of the local RAM and is also accessible at high speed. Values in the retention RAM are retained in DeepSTOP mode.
In addition, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).

Access time for each RAM is shown in the table below.

NOTE
There is possibility that number of access clock of above table is changed depending on the combination before and after instructions.
When RAM access is misaligned, these number is increased.

- Error detection/correction function (ECC) in the local RAM, global RAM and retention RAM

The ECC function is included, which can detect 2-bit errors and detect/correct 1-bit errors. For details, see
Section 40A, Functional Safety of RH850/F1KH-D8, Section 40B, Functional Safety of RH850/F1KMS4 and Section 40C, Functional Safety of RH850/F1KM-S1.

### 45.3.6 Functional Overview

This function is memory ZERO fill and verify check for GRAM area (including RRAM)
GRZF cannot arbitrate access from other bus-master. So, when GRZF is in busy status, do not access the same bank on GRAM that GRZF is accessing. If other bus-master accesses to the same bank that GRZF is accessing, the operation of GRZF is terminated and INTGRZF occurs with error status. Also, the access of other bus master will not be fulfilled (Writing is ignored, and read data cannot be guaranteed).
Other bus-master can access to the bank that GRZF is not accessing.

### 45.3.7.3 GRZFSTS — GRZF Status Register

This register is the status of the memory ZERO fill performed.

Table 45.17 GRZFSTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RSTS | Run status |
|  |  | 0: Stop |
|  |  | 1: Busy |
| 30 to 26 | Reserved | When read, the value after reset is returned. |
| 25,24 | SSTS[1:0] | Stop status |
|  |  | $00_{\mathrm{B}}:$ No error |
|  |  | $01_{\mathrm{B}}:$ Forcibly stop |
|  |  | $10_{\mathrm{B}}:$ Stop with verify error |
|  |  | SSTS will be cleared at the next startup |
|  |  | When read, the value after reset is returned. |
| 23 to 21 | Reserved | Progress status (executed address) |
| 20 to 0 | PSTS[20:0] |  |

The value of progress address indicated by the PSTS is not guaranteed, if stopped by the forcibly stop or contention access of other bus master. Please restart without changing value of the start address and size.

### 45.3.7.4 GRZFSA — GRZF Start Address Setting Register

This register is used to set start address of the memory ZERO fill performed.

Table 45.18 GRZFSA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | OFST[10:0] | These bits are fixed to $7 F 7_{H}$ to indicate the GRAM start address configured when this register <br> is read in 32-bit units. |
| 20 | BANK | Target Bank of global RAM |
|  |  | 0: BankA |
|  |  | 1: BankB (Including retention RAM) |
| 19 to 0 | START[19:0] | Target Start Address (bits 9 to 0 is fixed to 0) |
|  |  | 1 KB unit |

NOTE
This register can be rewritten only when the Stop state. Writing in operation will be ignored.

### 45.3.7.5 GRZFSZ — GRZF Fill Size Setting Register

This register is used to set fill size of the memory ZERO fill performed

Table 45.19 GRZFSZ Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 19 to 0 | SIZE[19:0] | Memory fill size setting (bits 9 to 0 is fixed to 0 ). |

## CAUTIONS

1. This register can be rewritten only when the Stop state. Writing in operation will be ignored.
2. The size setting across BankA and BankB is prohibited.

### 45.3.8 Operation

This module effects only global RAM bank A and global RAM bank B. The RRAM area belong to global RAM bank
B. So this module also effects the RRAM area.

Global RAM Zero Fill (GRZF) consists of the following function:

- FILL function

Write zero to GRAM

- VERI function

Write zero to GRAM and verify the data GRAM have been zero

The transition state from Busy state to Stop state always generate the Interrupt request.
The cause for transition from Busy state to Stop state are shown below:

- Success in FILL function to all the target banks.
- Conflict occur when the other master accesses the target bank while running.
- Verify error occur when the RAM area is not zero at VERI function.
- Forcibly stop by GRZFCTL.OPE[7:0] $=00000000_{B}$.

### 45.3.8.1 Procedure for FILL and VERI Function

The procedure for FILL and VERI function is shown below.

Figure 45.5 FILL and VERI Flow

### 45.3.8.2 Interrupt Sources

GRZF can generate the following interrupt requests:

- The interrupt occurs when transition from Busy to Stop in both FILL function and VERI function.
- When an interrupt occurred, the source of the interrupt is identified by checking GRZFSTS.SSTS. This status flag holds the value until the next startup (accordingly, does not change when the GRZF module transition from Busy to Stop).

### 45.4 Usage Notes

- Before accessing the global, local or retention RAM with ECC error detection and correction enabled, initialize the RAM by setting the access size to the largest bit length.
- Accessing the RAM before initializing it may lead to the detection of ECC errors. ECC errors may be detected if initialization is not handled in the maximum unit of access, for example, when 32-bit word RAM is accessed in 8 - or 16-bit units.

The following notes apply to the GRZF. See Figure 40A.2, Block Diagram of Global RAM ECC and Figure 40B.2, Block Diagram of Global RAM ECC.

- When GRZF accesses to GRAM, GRZF does not use ECC encoder or decoder. When there is any differences between the read value and the write value in 39 bits including GRZF 32 bits (all 0 ) and ECC code 7 bits, a verify error is occurred in GRZF. The verify error can be checked by the GRZFSTS.SSTS[1:0].
- Global RAM Guard (GRG) cannot guard the access from GRZF to GRAM.

## Section 46 Boundary Scan

This section contains a generic description of boundary scan.
The RH850/F1KH, RH850/F1KM has a JTAG interface and provides a boundary scan function.

### 46.1 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of the RH850/F1KH, RH850/F1KM conforms to IEEE Std 1149.1-2001.

### 46.2 Features of RH850/F1KH, RH850/F1KM Boundary Scan

- Five control signals (DCUTCK, DCUTDI, DCUTDO, DCUTMS, and $\overline{\text { DCUTRST }}$ )
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has four instructions.

- BYPASS

Test mode conforming to the IEEE 1149.1

- EXTEST

Test mode conforming to the IEEE 1149.1

- SAMPLE/PRELOAD

Test mode conforming to the IEEE 1149.1

- IDCODE

Test mode conforming to the IEEE 1149.1

Figure 46.1, Block Diagram of JTAG Interface shows a block diagram of the JTAG interface.

Figure 46.1 Block Diagram of JTAG Interface

### 46.3 External Input/Output Pins

There are five JTAG control signals: DCUTCK, DCUTDI, DCUTMS, DCUTDO, and $\overline{\text { DCUTRST }}$.
Table 46.1, Pin Configuration shows the pin configuration.
Table 46.1 Pin Configuration

| Pin Name | Description |
| :--- | :--- |
| DCUTCK | Serial data input/output clock pin |
|  | Data is input to DCUTDI and is output from DCUTDO in synchronization with this clock signal. |
| DCUTMS | Mode select input pin <br> Changing the level of this signal in synchronization with DCUTCK changes the state of the TAP controller. For <br> the protocol, see Figure 46.2, TAP Controller State Transition Diagram. |
| DCUTRST | Reset input pin <br>  <br>  <br>  <br>  <br> A low-level input of this signal resets the JTAG interface. This signal is accepted asynchronously with <br> DCUTCK. |
| SCUTDO | Serial data input pin <br> Data is input in synchronization with DCUTCK and sent to the JTAG interface. |

### 46.4 Registers

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 46.2 Register Configuration

| Register Name | Symbol | Access Size | Value After Reset*11 |
| :--- | :--- | :--- | :--- |
| Instruction register | SDIR | 8 | $55_{H}$ |
| ID register | SDID | 32 | See Table 46.5, ID Register Codes <br> (RH850/F1KH-D8), Table 46.6, ID |
|  |  |  | Register Codes (RH850/F1KM-S4), <br> Table 46.7, ID Register Codes <br> (RH850/F1KM-S1). |
| Bypass register |  | 1 | Undefined |
| Boundary scan register | SDBSR | - | Undefined |

Note 1. Registers are initialized when $\overline{\text { DCUTRST }}$ pin is 0 or when TAP is in the Test-Logic-Reset state.

Instructions can be serially transferred from the serial data input pin (DCUTDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which DCUTDI and DCUTDO are connected in BYPASS mode. The boundary scan register (SDBSR) is connected to DCUTDI and DCUTDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID register (SDID) is a 32-bit register, from which the fixed code is output via DCUTDO in IDCODE mode.

Table 46.3, Serial Transfer Types shows the serial transfer types possible with the JTAG interface registers.
Table 46.3 Serial Transfer Types

| Register | Serial Input | Serial Output |
| :--- | :--- | :--- |
| SDIR | Possible | Impossible $^{\star 1}$ |
| SDBPR | Possible | Possible |
| SDBSR | Possible | Possible |
| SDID | Impossible | Possible |

Note 1. A fixed value is read out.

### 46.4.1 Instruction Register (SDIR)

The instruction register (SDIR) is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a lowlevel input of DCUTRST or in the TAP Test-Logic-Reset state. Operation is not guaranteed if a reserved instruction is set in this register.

Table 46.4 Boundary Scan Instructions

| Instruction Code |  |  |  |  |  |  | Description |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | JTAG EXTEST |
| 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | JTAG SAMPLE/PRELOAD |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | JTAG IDCODE (initial value) |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | JTAG BYPASS |
| Other than above |  |  |  |  |  |  |  |  |

### 46.4.2 ID Register (SDID)

The ID register (SDID) is a 32-bit register with a device specific ID.
SDID can be read from the JTAG interface when the IDCODE instruction is set, but cannot be accessed from the CPU .
For the read values, see Table 46.5, ID Register Codes (RH850/F1KH-D8), Table 46.6, ID Register Codes (RH850/F1KM-S4), Table 46.7, ID Register Codes (RH850/F1KM-S1) and Table 46.2, Register Configuration.

| 48 pins | 0001 | 1000001110010111 | 01000100011 | 1 |

### 46.4.3 Bypass Register (SDBPR)

The bypass register (SDBPR) is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBPR is not initialized by a power-on reset or by a low-level input of DCUTRST .

### 46.4.4 Boundary Scan Register (SDBSR)

The boundary scan register (SDBSR) is a shift register for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBSR is not initialized by a power-on reset or a low-level input of $\overline{\text { DCUTRST }}$.

### 46.5 Operation

### 46.5.1 TAP Controller

Figure 46.2, TAP Controller State Transition Diagram shows the state transition of the TAP controller. The transition condition is the DCUTMS value at the rising edge of DCUTCK.

Figure 46.2 TAP Controller State Transition Diagram

NOTE
The DCUTDI value is sampled at the rising edge of DCUTCK and is shifted at the falling edge. DCUTDO is in the highimpedance state in the states other than Shift-DR and Shift-IR. A low-level input of $\overline{\text { DCUTRST }}$ causes transition to Test-Logic-Reset state asynchronously with DCUTCK.

### 46.5.2 Supported Instructions

### 46.5.2.1 BYPASS

The BYPASS instruction is a required standard instruction to operate the bypass register. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

### 46.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this device; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this device is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this device.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this device.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

### 46.5.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this device is mounted on the printed-circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the ( $\mathrm{N}-1$ )th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

### 46.5.2.4 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by a low-level input of DCUTRST or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

### 46.5.3 Pins Subject to Boundary Scan

All pins, excluding pins such as external clock input pins or power supply pins, are subject to boundary scan.
The pins which are not subjected to boundary scan are listed in Table 46.8, Pins not Subject to Boundary Scan
(RH850/F1KH-D8) and Table 46.9, Pins not Subject to Boundary Scan (RH850/F1KM-S4, RH850/F1KMS1).

Table 46.8 Pins not Subject to Boundary Scan (RH850/F1KH-D8)

| Type | Pin Name |
| :--- | :--- |
| JTAG interface | DCUTCK, DCUTDI, DCUTDO, DCUTMS, DCUTRST |
| Power supply pins | REGOVCC, REG1VCC, AWOVCL, AWOVSS, ISOVCL, ISOVSS |

Note 1. Only available for 272/233/176/144-pin versions.
The following signals are only sampled in boundary scan mode.
Table 46.10 Pins Subject to Boundary Scan (Sampling Only)

| Function | Pin Name |
| :--- | :---: |
| Reset | RESET |
| Mode setting | FLMDO |

The following pins are shared by the analog buffer. Accordingly, boundary scan only applies to general I/O pins.
Table 46.11 Pins Subject to Boundary Scan (Only General I/O Pins)

| Function | Pin Name |
| :--- | :--- |
| ADCA0 input | P8_0-12, P9_0-4, AP0_0-15 |
| ADCA1 input | P18_0-15, P19_0-3, AP1_0-15 |

NOTE
In boundary scan mode, the level of the following pins must be fixed:
P10_1 = Low, P10_2 = High, and P10_8 = High

### 46.6 Usage Notes

1. Once an instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert an instruction that has no effect on chip operation (such as BYPASS) between the instructions.
2. To start the system in boundary scan mode, de-assert DCUTRST while RESET is high. Also be sure to set DCUTMS to high before de-asserting DCUTRST and ensure that DCUTMS remains high for $600 \mathrm{~ns}+$ five DCUTCK clock cycles after de-asserting DCUTRST .
3. For the maximum clock frequency that can be input to DCUTCK, see Section 47A, Electrical Characteristics of RH850/F1KH-D8, Section 47B, Electrical Characteristics of RH850/F1KM-S4 and Section 47C, Electrical Characteristics of RH850/F1KM-S1.
4. If serial transfer is performed exceeding the number of bits of the register connected between DCUTDI and DCUTDO, the data that is input from DCUTDI is output from DCUTDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert DCUTRST . In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via DCUTDO at the falling edge of DCUTCK.
7. To facilitate debugging, route DCUTRST on the board in such a way that patterns can be easily cut.

Note 2. Regarding operation temperature of each product, see Section 1A.3, RH850/F1KH Product Lineup.

## 47A.1.2.2 AC Characteristic Measurement Condition

(1) AC Test Input Measurement Points

(2) AC Test Output Measurement Points

(3) Load Conditions

## CAUTION

If the load capacitance exceeds 30 pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30 pF .

## 47A. 2 Absolute Maximum Ratings

## CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

## 47A.2.2 Port Voltages

| Item | Pin Group*1 | Symbol | Condition | MIN. | TYP. | MAX. |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

## 47A.2.3 Port Current

Definition of the condition:

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

Note:

- GPIO: General-purpose I/O pin (JP0, P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24, AP0, AP1)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, BVCC/BVSS, A0VREF/AOVSS, A1VREF/A1VSS)

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.
Note 2. Supports Cload: 100 pF
Note 3. Supports Cload: 50 pF
Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.
Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.
Note 6. Only available for 324-pin devices.

Note 1. The condition of "TYP." shows the specification with the following conditions. Also, the value is just for reference only.

- $\mathrm{Tj}=25^{\circ} \mathrm{C}$
- REGOVCC $=E V C C=B V C C=A 0 V R E F=A 1 V R E F=5.0 V$
- REG1VCC $=3.3 \mathrm{~V}$
- AWOVSS $=$ EVSS $=$ BVSS $=$ AOVSS $=$ A1VSS $=0 \mathrm{~V}$

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below $\mathrm{Tj} \leq 150^{\circ} \mathrm{C}$ and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

## CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0 and PgA1, TESHOSN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESHOSN deviating value will increase sharply with increasing absolute value of injection current.

Note 1. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of $N=1$, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. "N" is the value of "Clock divisor N" defined by FOUTDIV register.
Note 3. The selection of $\mathrm{N}=3$ is prohibited when slow mode is used.

- If the system does not extend the RIICnSCL signal's low state hold time: $\mathrm{t}_{\mathrm{su}}$ : DAT $\geq 250 \mathrm{~ns}$
- If the system extends the RIICnSCL signal's low state hold time:

Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line (1250 ns: Normal mode $I^{2} \mathrm{C}$ bus specification).

Note: Conversion accuracy when ADCAOImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

Note 1. This does not include quantization error
Note 2. $3.0+1.3 \times$ (the number of used T\&H)
Note 3. Include the oscillation accuracy of HS IntOSC.
Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as "sampling time + successive approximation time".

## CAUTION

When an external digital pulse is applied to $A P 0, A P 1, P 8, P 9, P 18$, and $P 19$ pins during an $A / D$ conversion this may lead to an $A / D$ conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

## CAUTION

This specification is not tested during outgoing inspection. Therefore RIN and CIN are reference values only and not guaranteed. In addition these values are specified as maximum values.

## 47A. 7 Flash Programming Characteristics

## 47A.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

| Number of rewrites ${ }^{\star 1}$ | CWRT | Data retention of 20 years ${ }^{* 2}$ | 1000 | 30 | MHz |

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is " n " ( $\mathrm{n}=1000$ ), the device can be erased " n " times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1 . However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).
Note 2. Retention period under average $\mathrm{Ta}=85^{\circ} \mathrm{C}$. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. $\quad f_{\text {PCLK }}=1 / 8 f_{\text {CPUCLK_н }}$ : System operating frequency for internal flash.
Note 4. Only for program/erase operation.

## 47A.7.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGOVCC $=\mathrm{EVCC}=\mathrm{VPOC}$ to 5.5 V , REG1VCC $=\mathrm{VPOC}$ to 3.6 V , REG1VCC $\leq$ REG0VCC,
BVCC = VPOC to REGOVCC, A0VREF = 3.0 V to 5.5 V , A1VREF $=3.0 \mathrm{~V}$ to 5.5 V ,
AWOVSS $=\mathrm{ISOVSS}=\mathrm{EVSS}=\mathrm{BVSS}=\mathrm{A} O V S S=A 1 V S S=0 \mathrm{~V}$,
CAWOVCL: $0.1 \mu \mathrm{~F} \pm 30 \%$, CISOVCL: $0.1 \mu \mathrm{~F} \pm 30 \%, \mathrm{Tj}=-40$ to (depend on the product) ${ }^{\circ} \mathrm{C}$,
$C L=30 \mathrm{pF}$

| Number of rewrites*1 | CWRT | Data retention 20 years*2 | 125 k |  |  | times |
|  |  | Data retention 3 years*2 | 250 k |  |  | times |

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is " $n$ " ( $n=125000$ ), the device can be erased " $n$ " times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1 . However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).
Note 2. Retention period under average $\mathrm{Ta}=85^{\circ} \mathrm{C}$. This is the period starting on completion of a successful erasure of the data flash memory.
Note 3. $\quad f_{\text {PCLK }}=1 / 8 f_{\text {CPUCLK_н }}$ : System operating frequency for internal flash.
Note 4. Only for program/erase operation.

Note 1. "VPOC" means POC (power-on clear) detection voltage. For more detail, see Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics.
Note 2. Regarding operation temperature of each product, see Section 1B.3, RH850/F1KM Product Lineup.

## 47B.1.2.2 AC Characteristic Measurement Condition

(1) AC Test Input Measurement Points

(2) AC Test Output Measurement Points

(3) Load Conditions

## CAUTION

If the load capacitance exceeds 30 pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30 pF .

## 47B. 2 Absolute Maximum Ratings

## CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

Note 1. For clock specification of peripherals, see Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4.
Note 2. This frequency depends on the internal oscillator (LS IntOSC).
Note 3. "VPOC" means POC (power-on clear) detection voltage (TYP. 2.85 V ). For detail, see Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V .
When the power supply voltage is VPOC to 3.0 V , the device does not malfunction.
Note 4. Reliability restrictions from 1.35 V to 1.43 V .
Note 5. Devided by 2 on MEMC internal.

Products of CPU frequency 160 MHz max.

Note 1. For clock specification of peripherals, see Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4.
Note 2. This frequency depends on the internal oscillator (LS IntOSC).
Note 3. "VPOC" means POC (power-on clear) detection voltage (TYP. 2.85 V ). For detail, see Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V
When the power supply voltage is VPOC to 3.0 V , the device does not malfunction.
Note 4. Reliability restrictions from 1.35 V to 1.43 V .
Note 5. Devided by 2 on MEMC internal.

| Item | Symbol | Condition | MIN. | TYP. | MAX. |
| :--- | :--- | :--- | :--- | :--- | :--- |
| MainOSC frequency* |  |  |  |  |  |

Note 1. Oscillator stabilization time is time until being set ("1") in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written " 1 ", and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.
Note 2. This is reference value.
Note 3. The following four crystal/ceramic resonator frequencies are supported: $8 \mathrm{MHz}, 16 \mathrm{MHz}, 20 \mathrm{MHz}$ and 24 MHz

## (2) MainOSC (In Case of External Clock Input to X1)

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X1 clock Input frequency*1 | $\mathrm{f}_{\mathrm{EX}}$ |  | 8 |  | 24 | MHz |
| X1 clock Input cycle time | $\mathrm{t}_{\text {EXCYC }}$ |  | 41.7 |  | 125 | ns |
| X1 High level Input voltage | $\mathrm{V}_{\mathrm{IH}}$ |  | $0.7 \times$ REGVCC |  | REGVCC +0.5 | V |
|  |  | @Flash Programing Interface*2 | $0.8 \times$ REGVCC |  | REGVCC + 0.5 | V |
| X1 Low level Input voltage | $\mathrm{V}_{\text {IL }}$ |  | -0.5 |  | $0.3 \times$ REGVCC | V |
|  |  | @Flash Programing Interface*2 | -0.5 |  | $0.2 \times$ REGVCC | V |
| X1 Input leakage current | $\underline{\mathrm{ILIH}}$ | $\mathrm{VI}=$ REGVCC |  |  | 0.5 | $\mu \mathrm{A}$ |
|  | $\mathrm{I}_{\text {LIL }}$ | $\mathrm{VI}=0 \mathrm{~V}$ |  |  | -0.5 | $\mu \mathrm{A}$ |
| X1 clock Input low-level pulse width | $\mathrm{t}_{\mathrm{ExL}}$ | $\mathrm{f}_{\mathrm{Ex}}=8 \mathrm{MHz}$ | 58 |  |  | ns |
|  |  | $\mathrm{f}_{\mathrm{EX}}=16 \mathrm{MHz}$ | 26 |  |  | ns |
|  |  | $\mathrm{f}_{\mathrm{Ex}}=20 \mathrm{MHz}$ | 20 |  |  | ns |
|  |  | $\mathrm{f}_{\mathrm{EX}}=24 \mathrm{MHz}$ | 16 |  |  | ns |
| X1 clock Input high-level pulse width | $\mathrm{t}_{\mathrm{EXH}}$ | $\mathrm{f}_{\mathrm{Ex}}=8 \mathrm{MHz}$ | 58 |  |  | ns |
|  |  | $\mathrm{f}_{\mathrm{Ex}}=16 \mathrm{MHz}$ | 26 |  |  | ns |
|  |  | $\mathrm{f}_{\mathrm{Ex}}=20 \mathrm{MHz}$ | 20 |  |  | ns |
|  |  | $\mathrm{f}_{\mathrm{EX}}=24 \mathrm{MHz}$ | 16 |  |  | ns |
| X1 clock Input period jitter |  |  | -0.3 |  | 0.3 | ns |

Note 1. The following four external clock input frequencies are supported: $8 \mathrm{MHz}, 16 \mathrm{MHz}, 20 \mathrm{MHz}$ and 24 MHz .
Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF .
(3) Subosc

| Item | Symbol | Condition | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SubOSC frequency | $\mathrm{f}_{\text {sosc }}$ | Crystal | 30 | 32.768 | 38 | kHz |
| SubOSC current consumption | $I_{\text {sosc }}$ | After stabilization |  | $1.5^{* 2}$ | $4^{\star 2}$ | $\mu \mathrm{A}$ |
| SubOSC DC operating point | $\mathrm{V}_{\text {SOSCDCOP }}$ |  |  | $0.65 * 2$ |  | V |
| SubOSC oscillation stabilization time | $\mathrm{t}_{\text {SSTB }}$ |  |  | *1 |  | S |

Note 1. Oscillator stabilization time is time until being set ("1") in SOSCS.SOSCCLKACT bit after SOSCE.SOSCENTRG bit is written " 1 ", and depends on the setting value of SOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.
Note 2. This is reference value.

## CAUTION

The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.
Note 2. Supports Cload: 100 pF
Note 3. Supports Cload: 50 pF
Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.
Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.
Note 6. Only available for 176-pin, 233-pin and 272-pin devices.

Note 1. The condition of "TYP." shows the specification with the following conditions. Also, the value is just for reference only.

- $\mathrm{Tj}=25^{\circ} \mathrm{C}$
- REGVCC $=\mathrm{EVCC}=\mathrm{BVCC}=\mathrm{A} 0 V R E F=\mathrm{A} 1 \mathrm{VREF}=5.0 \mathrm{~V}$
- AWOVSS = EVSS = BVSS = AOVSS = A1VSS = 0V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below $\mathrm{Tj} \leq 150^{\circ} \mathrm{C}$ and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

|  |  |  | Total |  |  | -60 | mA |
|  |  | PgR | Per pin |  |  | -10 | mA |

## CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgAO and PgA1, TESHOSN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESHOSN deviating value will increase sharply with increasing absolute value of injection current.

Note: If the system does not extend the RIICnSCL signal low hold time ( $t_{\text {Low }}$ ), only the maximum data hold time ( $\mathrm{t}_{\mathrm{HD}}$ : DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.
Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note: If the system does not extend the RIICnSCL signal low hold time ( $\mathrm{t}_{\mathrm{Low}}$ ), only the maximum data hold time ( $\mathrm{t}_{\mathrm{HD}}$ : DAT) needs to be satisfied.
Note 1. At the start condition, the first clock pulse is generated after the hold time.
Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.
Note 3. The fast mode $I^{2} \mathrm{C}$ bus can be used in normal mode $I^{2} \mathrm{C}$ bus system. In this case, set the fast mode $I^{2} \mathrm{C}$ bus so that it meets the following conditions.

- If the system does not extend the RIICnSCL signal's low state hold time: $\mathrm{t}_{\mathrm{su}}$ : DAT $\geq 250 \mathrm{~ns}$
- If the system extends the RIICnSCL signal's low state hold time:

Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line (1250 ns: Normal mode $I^{2} \mathrm{C}$ bus specification).

Note: Conversion accuracy when ADCAOImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.
Note 1. This does not include quantization error.
Note 2. $3.0+1.3 \times$ (the number of used T\&H)
Note 3. Include the oscillation accuracy of HS IntOSC.
Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as "sampling time + successive approximation time".

## CAUTION

When an external digital pulse is applied to AP0, AP1, P8, P9, P18, and P19 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

This specification is not tested during outgoing inspection. Therefore RIN and CIN are reference values only and not guaranteed. In addition these values are specified as maximum values.

## 47B.7 Flash Programming Characteristics

## 47B.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

| Number of rewrites*1 | CWRT | Data retention of 20 years ${ }^{* 2}$ | 1000 |  | times |  |

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is " $n$ " ( $n=1000$ ), the device can be erased " n " times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1 . However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average $\mathrm{Ta}=85^{\circ} \mathrm{C}$. This is the period starting on completion of a successful erasure of the code flash memory.
Note 3. $\quad f_{\text {PCLK }}=1 / 8 f_{\text {CPUCLK_н: }}$ System operating frequency for internal flash.
Note 4. Only for program/erase operation.

## 47C.1.2 General Measurement Conditions

## 47C.1.2.1 Common Conditions

- Power supply
- REGVCC $=$ EVCC $=$ VPOC $^{* 1}$ to 5.5 V
- $\mathrm{A} 0 \mathrm{VREF}=3.0 \mathrm{~V}$ to 5.5 V
- AWOVSS $=$ ISOVSS $=$ EVSS $=$ A0VSS $=0 \mathrm{~V}$
- Capacitance of the internal regulator
- CAWOVCL: $0.1 \mu \mathrm{~F} \pm 30 \%$
- CISOVCL: $0.1 \mu \mathrm{~F} \pm 30 \%$
- Operating temperature
- $\mathrm{Tj}=-40$ to $+130^{\circ} \mathrm{C} @ \operatorname{R7F7016xx3AFP*2}$
- $\mathrm{Tj}=-40$ to $+150^{\circ} \mathrm{C} @ \operatorname{R7F7016xx4AFP*2}$
$\mathrm{xx}=84,85,86,87,88,89,90,91,92,93,94,95$
- Load conditions
- $\mathrm{CL}=30 \mathrm{pF}$

Note 1. "VPOC" means POC (power-on clear) detection voltage. For more detail, see Section 47C.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics.
Note 2. Regarding operation temperature of each product, see Section 1C.3, RH850/F1KM Product Lineup.

## 47C.1.2.2 AC Characteristic Measurement Condition

(1) AC Test Input Measurement Points

(2) AC Test Output Measurement Points

(3) Load Conditions

## CAUTION

If the load capacitance exceeds 30 pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30 pF .

## 47C. 2 Absolute Maximum Ratings

## CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

## 47C.2.1 Supply Voltages

| HS IntOSC oscillation stabilization time | $\mathrm{t}_{\text {RHSTB }}$ |  |  |  | 54.4 | $\mu \mathrm{s}$ |

Note 1. This is reference value.
Note 2. The HS IntOSC frequency may not meet the specification range ( $8.00 \mathrm{MHz} \pm 0.4 \mathrm{MHz}, 8.00 \mathrm{MHz} \pm 0.08 \mathrm{MHz}$ after user trimming @ trimming temp) in the while writing/erasing the code/data flash.

Note 3. The HS IntOSC frequency may not meet the specification range in the Cyclic STOP/Cyclic RUN mode.

Note 1. This is reference value.
Note 2. Lock time is time until being set ("1") in PLL1S.PLL1CLKACT bit after PLL1E.PLL1ENTRG bit is written " 1 ".
Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).
Note 4. Do not select the PLL1 as clock source during the code/data flash write and/or erase.

Note 1. The condition of "TYP." shows the specification with the following conditions. Also, the value is just for reference only.

- $\mathrm{Tj}=25^{\circ} \mathrm{C}$
- REGVCC $=E V C C=A 0 V R E F=5.0 \mathrm{~V}$
- AWOVSS = EVSS $=$ AOVSS $=0 \mathrm{~V}$

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below $\mathrm{Tj} \leq 150^{\circ} \mathrm{C}$ and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

| Item | Symbol | Condition |  | MIN. | TYP. | MAX. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Positive overload current VIN > VCC | $\mathrm{I}_{\text {INJPM }}$ | PgE | Per pin |  |  | 10 | mA |

|  |  | PgA0 | Per pin |  |  | -10 | mA |
|  |  |  | Total |  |  | -60 | mA |

## CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgAO, TESHOSN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESHOSN deviating value will increase sharply with increasing absolute value of injection current.

Note: Conversion accuracy when ADCAOImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.
Note 1. This does not include quantization error.
Note 2. $3.0+1.3 \times$ (the number of used T\&H)
Note 3. Include the oscillation accuracy of HS IntOSC.
Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as "sampling time + successive approximation time".

## CAUTION

When an external digital pulse is applied to APO, P8, and P9 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse. The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

This specification is not tested during outgoing inspection. Therefore RIN and CIN are reference values only and not guaranteed. In addition these values are specified as maximum values.

## 47C. 7 Flash Programming Characteristics

## 47C.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGVCC = EVCC = VPOC to $5.5 \mathrm{~V}, \mathrm{AOVREF}=3.0 \mathrm{~V}$ to 5.5 V , AWOVSS $=\mathrm{ISOVSS}=\mathrm{EVSS}=\mathrm{A} 0 \mathrm{VSS}=0 \mathrm{~V}$, CAWOVCL: $0.1 \mu \mathrm{~F} \pm 30 \%$, CISOVCL: $0.1 \mu \mathrm{~F} \pm 30 \%$,

| Number of rewrites*1 | CWRT | Data retention of 20 years*2 | 1000 | 30 | MHz |

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is " n " ( $\mathrm{n}=1000$ ), the device can be erased " $n$ " times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1 . However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average $\mathrm{Ta}=85^{\circ} \mathrm{C}$. This is the period starting on completion of a successful erasure of the code flash memory.

[^1]:    Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see (q) RBASE - Reset Vector Base Address Register.

[^2]:    Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see (q) RBASE - Reset Vector Base Address Register.

[^3]:    Note: The channel number in the offset addresses and " $m$ " in the register symbols are numbers in the range from 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, from 0 to 15 in RH850/F1KM-S1. The correspondence is as follows.

[^4]:    Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK4.

[^5]:    When configuring this register, see Table 19.36, List of Cautions when Configuring the Registers.

[^6]:    To clear CFTXIF, CFRXIF, or CFMLT flag to 0 , the program must write 0 . When writing, use a store instruction to write " 0 " to the given flag and " 1 " to other flags.

[^7]:    When TAUDnCMORm.TAUDnCOS[1] = 1, the value of TAUDnCNTm is not loaded to TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

[^8]:    Note 1. The value after reset differs depending on bank A or bank B.

[^9]:    Note 1. The value after reset differs depending on bank A or bank B.

[^10]:    These specifications are not tested on sorting and are specified based on the device characterization.

[^11]:    Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.
