# RH850/F1KH, RH850/F1KM 

## User's Manual: Hardware

## Renesas microcontroller RH850 Family

[^0]
## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

## Notes for CMOS devices

(1) Voltage application waveform at input pin:
(2) Handling of unused input pins:
(3) Precaution against ESD:
(4) Status before initialization:

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.
(5) Power ON/OFF sequence:

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.
(6) Input of signal during power off state:

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

## How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/F1KH, RH850/F1KM and design application systems using the following RH850/F1KH, RH850/F1KM microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/F1KH, RH850/F1KM shown in the Organization below.
Organization This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3KH User's Manual: Software).

| Hardware |
| :--- |
| Pin functions |
| CPU function |
| On-chip peripheral functions |
| Flash memory programming |

| Software |
| :--- |
| Overview |
| Processor Model |
| Register Reference |
| Exceptions and Interrupts |
| Memory Management |
| Instruction Reference |
| Reset |
| Appendix |

How to read this It is assumed that the readers of this manual have general knowledge in the fields of manual electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/F1KH, RH850/F1KM.
$\rightarrow$ Read this manual according to the Contents.
To understand the details of an instruction function
$\rightarrow$ See RH850G3KH User's Manual: Software (R01US0165E) available separately.

This RH850/F1KH, RH850/F1KM Hardware User's Manual corresponds to Rev.1.10.
The RH850/F1KH-D8 description relates to a revision level of Rev.1.00.
The xxA section describes the functionality of RH850/F1KH-D8.
The $x x B$ section describes the functionality of RH850/F1KM-S4.
The $x x C$ section describes the functionality of RH850/F1KM-S1.
The xxAB section describes the functionality of RH850/F1KH-D8 and RH850/F1KM-S4.
The xxBC section describes the functionality of RH850/F1KM-S4 and RH850/F1KM-S1.
The xxx section describes the functionality of all related products.

Conventions Data significance: Higher digits on the left and lower digits on the right Active low representation: xxx (overscore over pin or signal name)
Memory map address: Higher addresses on the top and lower addresses on the bottom
Note: Footnote for item marked with Note in the text
Caution: Information requiring particular attention
Remark: Supplementary information
Numeric representation: Binary ... $x x x x$ or $\mathrm{xxxx}_{\mathrm{B}}$
Decimal ... xxxx
Hexadecimal ... xxxx $_{H}$
Prefix indicating power of 2 (address space, memory capacity):
$K$ (kilo): $2^{10}=1,024$
$M$ (mega): $2^{20}=1,024^{2}$
$G$ (giga): $2^{30}=1,024^{3}$

## Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

## (1) Access

The register can be accessed in the bit unit indicated here.

## (2) Address

This is the register address.
For base address, see description of base address in each section.
(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from $A$ to $F$ or as $X$ where they are undefined.
(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32 -bit registers, 15 to 0 for 16 -bit registers, and 7 to 0 for 8 bit registers.
(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).
(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0 : The value after a reset is 0 .
1 : The value after a reset is 1 .

- : The value after a reset is undefined.
(7) R/W

This is the bit attribute of all bits of the register.

R/W : The bit or field is readable and writable.
R : The bit or field is readable.
Note that all reserved bits are indicated as R . When written, the value specified in the bit chart or the value after a reset should be written. In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R -attribute bits will be ignored unless otherwise specified.

W : This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.
(8) Function

This is function of the bit.

## Table of Contents

Section 1A Overview of RH850/F1KH-D8 ..... 95
1A. 1 RH850/F1KH Product Features ..... 95
1A. 2 RH850/F1KH Functions ..... 96
1A. 3 RH850/F1KH Product Lineup ..... 99

2B.13.4.5 DNFA<name>ENL - Digital Noise Elimination Enable L Register ..... 433
Section 2C Pin Function of RH850/F1KM-S1 ..... 434
2C. 1 Pin Connection Diagram ..... 434
2C. 2 Pin Description ..... 446
2C. 3 Pin Functions During and After Reset ..... 450
2C. 4 Port State in Standby Mode ..... 452
2C. 5 Recommended Connection of Unused Pins ..... 452
2C. 6 Features of RH850/F1KM Port ..... 453
2C.6.1 Port Group ..... 453
2C.6.2 Port Group Index n ..... 453
2C.6.3 Register Base Addresses ..... 453
2C.6.4 Clock Supply ..... 453
2C. 7 Port Functions ..... 454
2C.7.1 Functional Overview. ..... 454
2C.7.2 Terms ..... 455
2C.7.2.1 JTAG Ports ..... 455
2C.7.3 Overview of Pin Functions ..... 456
2C.7.4 Pin Data Input/Output. ..... 458
2C.7.4.1 Output Data ..... 458
2C.7.4.2 Input Data ..... 458
2C.7.4.3 Writing to the Pn Register ..... 459
2C. 8 Schematic View of Port Control ..... 460
2C. 9 Port Group Configuration Registers ..... 461
2C.9.1 Overview ..... 461
2C.9.2 Pin Function Configuration ..... 464
2C.9.2.1 PMCn / JPMC0 — Port Mode Control Register ..... 464
2C.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register ..... 465
2C.9.2.3 PIPCn - Port IP Control Register ..... 466
2C.9.2.4 PMn / APMn / JPM0 — Port Mode Register. ..... 467
2C.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register ..... 468
2C.9.2.6 PIBCn / APIBCn / JPIBC0 — Port Input Buffer Control Register ..... 470
2C.9.2.7 PFCn / JPFC0 - Port Function Control Register ..... 471
2C.9.2.8 PFCEn / JPFCE0 - Port Function Control Expansion Register. ..... 472
2C.9.2.9 PFCAEn - Port Function Control Additional Expansion Register ..... 473
2C.9.3 Pin Data Input/Output. ..... 475
2C.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register ..... 475
2C.9.3.2 PPRn / APPRn / JPPR0 — Port Pin Read Register ..... 476
2C.9.3.3 Pn / APn / JPO - Port Register ..... 477
2C.9.3.4 PNOTn / APNOTn / JPNOTO - Port NOT Register ..... 478
2C.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register ..... 479
2C.9.4 Configuration of Electrical Characteristics ..... 480
2C.9.4.1 PUn / JPU0 — Pull-Up Option Register. ..... 480
2C.9.4.2 PDn / JPD0 - Pull-Down Option Register ..... 481
2C.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register ..... 482
2C.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register ..... 483
2C.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register ..... 484
2C.9.4.6 JPISA0 — Port Input Buffer Selection Advanced Register ..... 485
2C.9.5 Port Register Protection ..... 486
2C.9.6 Flowchart Examples for Port Settings ..... 486
2C.9.6.1 Batch Setting ..... 487
2C.9.6.2 Individual Settings ..... 488
2C. 10 Port (General I/O) Function Overview ..... 491
2C.10.1 JTAG Port 0 (JPO) ..... 492
2C.10.1.1 Alternative Function ..... 492
2C.10.1.2 Control Registers ..... 493
2C.10.2 Port 0 (PO) ..... 494
2C.10.2.1 Alternative Function ..... 494
2C.10.2.2 Control Registers ..... 496
2C.10.3 Port 8 (P8) ..... 498
2C.10.3.1 Alternative Function ..... 498
2C.10.3.2 Control Registers ..... 500
2C.10.4 Port 9 (P9) ..... 502
2C.10.4.1 Alternative Function ..... 502
2C.10.4.2 Control Registers ..... 503
2C.10.5 Port 10 (P10) ..... 505
2C.10.5.1 Alternative Function ..... 505
2C.10.5.2 Control Registers ..... 507
2C.10.6 Port 11 (P11) ..... 509
2C.10.6.1 Alternative Function ..... 509
2C.10.6.2 Control Registers ..... 510
2C.10.7 Analog Port 0 (APO) ..... 511
2C.10.7.1 Alternative Function ..... 511
2C.10.7.2 Control Registers ..... 512
2C. 11 Port (Special I/O) Function Overview ..... 513
2C.11.1 Special I/O after Reset ..... 513
2C.11.1.1 P8_6: RESETOUT ..... 513
2C.11.1.2 JP0_0 to JP0_5: Debug Interface ..... 516
2C.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer ..... 516
2C.11.1.4 Mode Pins ..... 516
2C.11.2 A/D Input Alternative I/O ..... 517
2C.11.3 Special I/O Control ..... 518
2C.11.3.1 Direct I/O Control (PIPC) ..... 518
2C.11.3.2 Input Buffer Control (PISn/JPIS0, JPISA0) ..... 519
2C.11.3.3 Output Buffer Control (PDSC) ..... 521
2C. 12 Noise Filter \& Edge/Level Detector ..... 523
2C.12.1 Port Filter Assignment ..... 523
2C.12.1.1 Input Pins that Incorporate Analog Filter Type A ..... 523
2C.12.1.2 Input Pins that Incorporate Analog Filter Type B ..... 524
2C.12.1.3 Input Pins that Incorporate Analog Filter Type C ..... 525
2C.12.1.4 Input Pins that Incorporate Digital Filter Type D ..... 526
2C.12.1.5 Input Pins that Incorporate Digital Filter Type E ..... 527
2C.12.2 Clock Supply for Port Filters ..... 529
2C. 13 Description of Port Noise Filter \& Edge/Level Detection ..... 530
2C.13.1 Overview ..... 530
2C.13.1.1 Analog Filter Types ..... 530
2C.13.1.2 Digital Filter Types ..... 530
2C.13.2 Analog Filters ..... 531
2C.13.2.1 Analog Filter Characteristic ..... 531
2C.13.2.2 Analog Filter Control Registers ..... 531
2C.13.2.3 Analog Filter in Standby Mode ..... 531
2C.13.3 Digital Filters ..... 534
2C.13.3.1 Digital Filter Characteristic ..... 534
2C.13.3.2 Digital Filter Groups ..... 535
2C.13.3.3 Digital Filters in Standby Mode ..... 535
2C.13.3.4 Digital Filter Control Registers ..... 536

Section 3A CPU System of RH850/F1KH-D8 ..... 542
3A. 1 Overview ..... 542
3A.1.1 Block Configuration ..... 542
3A. 2 CPU ..... 545
3A.2.1 Core Functions ..... 545
3A.2.1.1 Features ..... 545
3A.2.1.2 Register Set ..... 546
3A.2.1.3 Instruction ..... 583
3A.2.2 Buffers for Code Flash ..... 584
3A.2.2.1 Features ..... 584
3A.2.2.2 Function of Buffers ..... 584
3A.2.2.3 Registers for Buffer Control ..... 585
3A.2.3 Inter-Processor Interrupts ..... 586
3A.2.3.1 Inter-Processor Interrupt Control Registers ..... 586
3A.2.4 Reliability Functions ..... 588
3A.2.4.1 PE Guard Function (PEG) ..... 588
3A.2.4.2 PE's Internal Peripheral Device Protection Function (IPG) ..... 594
3A.2.4.3 System Error Generator Function (SEG) ..... 601
3A. 3 Inter-CPU Functions ..... 606
3A.3.1 Processor Element Identifier ..... 606
3A.3.2 Inter-Processor Interrupt Function ..... 606
3A.3.3 Exclusive Control ..... 606
3A.3.3.1 Exclusive Control Register (G0MEVm; m = 0 to 31) ..... 606
3A.3.3.2 Operation of the LDL.W and STC.W Instructions ..... 608
3A. 4 CPU2 Boot Up Operation ..... 609
3A. 5 Notes ..... 610
3A.5.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution. ..... 610
3A.5.2 Ensure Coherency after Rewriting the Code Flash ..... 611
3A.5.3 Access to Registers by Using Bit-Manipulation Instructions ..... 611
3A.5.4 Caution of Prefetching ..... 611
3A.5.5 Overwriting Context upon Acceptance of Multiple Exceptions ..... 611
Section 3BC CPU System of RH850/F1KM ..... 612
3BC. 1 Overview ..... 612
3BC.1.1 Block Configuration ..... 612
3BC. 2 CPU ..... 615
3BC.2.1 Core Functions ..... 615
3BC.2.1.1 Features ..... 615
3BC.2.1.2 Register Set ..... 616
3BC.2.1.3 Instruction ..... 653
3BC.2.2 Buffers for Code Flash ..... 654
3BC.2.2.1 Features ..... 654
3BC.2.2.2 Function of Buffers ..... 654
3BC.2.2.3 Registers for Buffer Control ..... 655
3BC.2.3 Reliability Functions ..... 656
3BC.2.3.1 PE Guard Function (PEG) ..... 656
3BC.2.3.2 PE's Internal Peripheral Device Protection Function (IPG) ..... 662
3BC.2.3.3 System Error Generator Function (SEG) ..... 669
3BC. 3 Notes ..... 675
3BC.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution. ..... 675
3BC.3.2 Ensure Coherency after Rewriting the Code Flash ..... 676
3BC.3.3 Access to Registers by Using Bit-Manipulation Instructions ..... 676
3BC.3.4 Caution of Prefetching ..... 676
3BC.3.5 Overwriting Context upon Acceptance of Multiple Exceptions ..... 676
Section 4A Address Space of RH850/F1KH-D8 ..... 677
4A. 1 Address Space ..... 677
4A. 2 Address Space Viewed from Each Bus Master. ..... 680
4A.2.1 Space in which Instructions can be Fetched ..... 680
4A.2.2 Data Space Accessible by CPU1 ..... 680
4A.2.3 Data Space Accessible by CPU2 ..... 680
4A.2.4 Data Space Accessible by DMA ..... 680
4A.2.5 Data Space Accessible by Flexray ..... 680
4A.2.6 Data Space Accessible by ETNB ..... 680
4A.2.7 Data Space Accessible by Each Bus Master ..... 681
4A. 3 Peripheral I/O Address Map ..... 683
Section 4B Address Space of RH850/F1KM-S4 ..... 691
4B. 1 Address Space ..... 691
4B. 2 Address Space Viewed from Each Bus Master ..... 698
4B.2.1 Space in which Instructions can be Fetched ..... 698
4B.2.2 Data Space Accessible by CPU ..... 698
4B.2.3 Data Space Accessible by DMA ..... 698
4B.2.4 Data Space Accessible by Flexray ..... 698
4B.2.5 Data Space Accessible by ETNB ..... 698
4B.2.6 Data Space Accessible by Each Bus Master. ..... 699
4B. 3 Peripheral I/O Address Map ..... 700
Section 4C Address Space of RH850/F1KM-S1 ..... 707
4C. 1 Address Space ..... 707
4C. 2 Address Space Viewed from Each Bus Master ..... 709
4C.2.1 Space in which Instructions can be Fetched ..... 709
4C.2.2 Data Space Accessible by CPU ..... 709
4C.2.3 Data Space Accessible by Each Bus Master. ..... 709
4C. 3 Peripheral I/O Address Map ..... 710
Section 5 Write-Protected Registers ..... 716
5.1 Overview ..... 716
5.1.1 Functional Overview. ..... 716
5.1.2 Writing Procedure to Write-Protected Registers ..... 716
5.1.3 Interrupt during Write Protection Unlock ..... 717
5.1.4 Emulation Break during Write Protection Unlock Sequence ..... 718
5.1.5 Write-Protection Target Registers ..... 718
5.2 Registers ..... 726
5.2.1 List of Registers ..... 726
5.2.2 Details of Control Protection Cluster Registers ..... 731
5.2.2.1 PROTCMDn — Protection Command Register ..... 731
5.2.2.2 PROTSn — Protection Status Register ..... 732
5.2.3 Details of Clock Monitor Control and Test Protection Cluster Registers ..... 733
5.2.3.1 CLMAnPCMD - CLMAn Protection Command Register ..... 733
5.2.3.2 CLMAnPS — CLMAn Protection Status Register ..... 734
5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register ..... 735
5.2.3.4 PROTSCLMA — Clock Monitor Test Protection Status Register ..... 736
5.2.4 Details of Core Voltage Monitor Protection Cluster Registers ..... 737
5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register ..... 737
5.2.4.2 PROTSCVM - Core Voltage Monitor Protection Status Register ..... 738
5.2.5 Details of Port Protection Cluster Registers ..... 739
5.2.5.1 PPCMDn — Port Protection Command Register ..... 739
5.2.5.2 PPROTSn — Port Protection Status Register ..... 740
5.2.6 Details of Self-Programming Protection Cluster Registers ..... 741
5.2.6.1 FLMDPCMD - FLMD Protection Command Register ..... 741
5.2.6.2 FLMDPS — FLMD Protection Error Status Register ..... 742
Section 6 Operating Mode ..... 743
Section 7A Exception/Interrupts of RH850/F1KH-D8 ..... 744
7A. 1 Features of RH850/F1KH Exception/Interrupts ..... 744
7A. 2 Interrupt Sources ..... 747
7A.2.1 Interrupt Sources ..... 747
7A.2.1.1 FE Level Non-Maskable Interrupts ..... 747
7A.2.1.2 FE Level Maskable Interrupts ..... 747
7A.2.1.3 El Level Maskable Interrupts ..... 749
7A.2.2 FE Level Non-Maskable Interrupt Sources ..... 761
7A.2.2.1 List of Registers ..... 761
7A.2.2.2 WDTNMIF - FENMI Factor Register ..... 761
7A.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register ..... 762
7A.2.3 FE Level Maskable Interrupt Sources ..... 763
7A.2.3.1 List of Registers ..... 763
7A.2.3.2 FEINTF - FEINT Factor Register ..... 763
7A.2.3.3 FEINTFMSK — FEINT Factor Mask Register ..... 766
7A.2.3.4 FEINTFC - FEINT Factor Clear Register ..... 769
7A. 3 Edge/Level Detection ..... 772
7A. 4 Interrupt Controller Control Registers ..... 773
7A.4.1 List of Registers ..... 773
7A.4.2 ICxxx - El Level Interrupt Control Registers ..... 774
7A.4.3 IMRm — El Level Interrupt Mask Registers ( $m=0$ to 11) ..... 776
7A.4.4 IBDxxx — El Level Interrupt Binding Registers ..... 777
7A.4.5 FNC - FE Level NMI Status Register ..... 787
7A.4.6 FIC — FE Level Maskable Interrupt Status Register ..... 788
7A. 5 El Level Maskable Interrupt Select Register ..... 789
7A.5.1 List of Registers ..... 789
7A.5.2 SELB_INTC1 - INTC1 Interrupt Select Register ..... 790
7A. 6 Interrupt Function System Registers ..... 792
7A.6.1 FPIPR — FPI Exception Interrupt Priority ..... 792
7A.6.2 ISPR — Priority of Interrupt being Serviced ..... 792
7A.6.3 PMR — Interrupt Priority Masking ..... 792
7A.6.4 ICSR — Interrupt Control Status ..... 792
7A.6.5 INTCFG — Interrupt Function Setting ..... 792
7A. 7 Operation when Acknowledging an Interrupt ..... 793
7A.7.1 Exception Source Codes for Different Types of SYSERR Exceptions ..... 795
7A. 8 Return from Interrupts ..... 796
7A. 9 Interrupt Operation ..... 797
7A.9.1 Interrupt Mask Function of El Level Maskable Interrupt (EIINT) ..... 797
7A.9.2 Interrupt Priority Level Judgment ..... 797
7A.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled. ..... 798
7A.9.2.2 Masking through Priority Mask Register (PMR) ..... 798
7A.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected ..... 798
7A.9.2.4 Interrupt Suspended by CPU ..... 798
7A.9.3 Interrupt Request Acknowledgement Conditions and the Priority ..... 802
7A.9.4 Exception Priority of Interrupts and the Priority Mask ..... 802
7A.9.5 Interrupt Priority Mask ..... 802
7A.9.6 Priority Mask Function. ..... 802
7A.9.7 Exception Management ..... 802
7A.9.8 Inter-Processor Interrupts ..... 803
7A.9.9 Broadcast Function (Broadcast Communication Function) ..... 803
7A.9.9.1 Example of Operation ..... 804
7A.9.9.2 Inter-Processor Interrupt Flow ..... 805
7A. 10 Exception Handler Address ..... 806
7A.10.1 Direct Vector Method ..... 807
7A.10.2 Table Reference Method ..... 809
Section 7BC Exception/Interrupts of RH850/F1KM ..... 811
7BC. 1 Features of RH850/F1KM Exception/Interrupts ..... 811
7BC. 2 Interrupt Sources ..... 813
7BC.2.1 Interrupt Sources ..... 813
7BC.2.1.1 FE Level Non-Maskable Interrupts ..... 813
7BC.2.1.2 FE Level Maskable Interrupts ..... 813
7BC.2.1.3 El Level Maskable Interrupts ..... 816
7BC.2.2 FE Level Non-Maskable Interrupt Sources ..... 837
7BC.2.2.1 List of Registers ..... 837
7BC.2.2.2 WDTNMIF - FENMI Factor Register ..... 837
7BC.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register ..... 838
7BC.2.3 FE Level Maskable Interrupt Sources ..... 839
7BC.2.3.1 List of Registers ..... 839
7BC.2.3.2 FEINTF - FEINT Factor Register ..... 840
7BC.2.3.3 FEINTFMSK — FEINT Factor Mask Register ..... 843
7BC.2.3.4 FEINTFC - FEINT Factor Clear Register ..... 846
7BC. 3 Edge/Level Detection ..... 849
7BC. 4 Interrupt Controller Control Registers ..... 851
7BC.4.1 List of Registers ..... 851
7BC.4.2 ICxxx - El Level Interrupt Control Registers ..... 852
7BC.4.3 IMRm — El Level Interrupt Mask Registers ( $\mathrm{m}=0$ to 11) ..... 854
7BC.4.4 FNC - FE Level NMI Status Register ..... 855
7BC.4.5 FIC — FE Level Maskable Interrupt Status Register ..... 856
7BC. 5 El Level Maskable Interrupt Select Register ..... 857
7BC.5.1 List of Registers ..... 857
7BC.5.2 SELB_INTC1 — INTC1 Interrupt Select Register ..... 858
7BC. 6 Interrupt Function System Registers ..... 860
7BC.6.1 FPIPR — FPI Exception Interrupt Priority ..... 860
7BC.6.2 ISPR — Priority of Interrupt being Serviced ..... 860
7BC.6.3 PMR — Interrupt Priority Masking ..... 860
7BC.6.4 ICSR — Interrupt Control Status ..... 860
7BC.6.5 INTCFG - Interrupt Function Setting ..... 860
7BC. 7 Operation when Acknowledging an Interrupt ..... 861
7BC.7.1 Exception Source Codes for Different Types of SYSERR Exceptions ..... 863
7BC. 8 Return from Interrupts ..... 864
7BC. 9 Interrupt Operation ..... 865
7BC.9.1 Interrupt Mask Function of El Level Maskable Interrupt (EIINT) ..... 865
7BC.9.2 Interrupt Priority Level Judgment ..... 865
7BC.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled ..... 866
7BC.9.2.2 Masking through Priority Mask Register (PMR) ..... 866
7BC.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected ..... 866
7BC.9.2.4 Interrupt Suspended by CPU ..... 866
7BC.9.3 Interrupt Request Acknowledgement Conditions and the Priority ..... 870
7BC.9.4 Exception Priority of Interrupts and the Priority Mask ..... 870
7BC.9.5 Interrupt Priority Mask ..... 870
7BC.9.6 Priority Mask Function ..... 870
7BC.9.7 Exception Management ..... 870
7BC. 10 Exception Handler Address ..... 871
7BC.10.1 Direct Vector Method ..... 872
7BC.10.2 Table Reference Method ..... 874
Section 8 DMA Controller ..... 876
8.1 Features of RH850/F1KH, RH850/F1KM DMA Controller ..... 876
8.1.1 Number of Channels ..... 876
8.1.2 Register Base Addresses ..... 877
8.1.3 Interrupt Requests ..... 878
8.1.4 DMA Trigger Factors ..... 882
8.2 Overview ..... 892
8.2.1 Overview ..... 892
8.2.2 Term Definition ..... 893
8.3 DMA Function ..... 894
8.3.1 Basic Operation of DMA Transfer ..... 894
8.3.1.1 Transfer Mode ..... 894
8.3.1.2 Executing a DMA Cycle ..... 894
8.3.1.3 Updating Transfer Information ..... 894
8.3.1.4 Last Transfer and Address Reload Transfer ..... 895
8.3.1.5 Transfer Completion Interrupt Output ..... 895
8.3.1.6 Continuous Transfer ..... 896
8.3.2 Channel Priority Order ..... 898
8.3.2.1 DMAC Channel Arbitration ..... 898
8.3.2.2 Interface Arbitration ..... 899
8.3.3 Reload Function ..... 899
8.3.3.1 Overview of the Reload Function ..... 899
8.3.3.2 Operation of Reload Function 1 ..... 900
8.3.3.3 Reload Function 2 ..... 901
8.3.3.4 Timing of Setting DMAC Reload Registers. ..... 902
8.3.4 Chain Function ..... 903
8.3.4.1 Overview ..... 903
8.3.4.2 Setting Up the Chain Function ..... 904
8.3.4.3 Caution for Using the Chain Function ..... 904
8.3.5 DMAC Operation ..... 905
8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests ..... 905
8.3.5.2 Generating and Accepting a Software DMA Transfer Request ..... 905
8.3.5.3 Executing DMA Transfer ..... 905
8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request. ..... 906
8.4.1 DMA Suspension and Resume by Software Control ..... 906
8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel ..... 906
8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR ..... 908
8.4.4 List of Suspend, Resume, and Transfer Abort Functions ..... 908
8.5 Error Control ..... 909
8.5.1 Type of Error ..... 909
8.5.2 DMA Transfer Error ..... 909
8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs ..... 909
8.6 Reliability Functions ..... 910
8.6.1 Overview ..... 910
8.6.2 Register Access Protection Function ..... 910
8.6.2.1 Identifying the Accessing Master ..... 910
8.6.2.2 Master Access ..... 910
8.6.2.3 Channel Assignment ..... 910
8.6.2.4 Illegal Access ..... 911
8.6.3 Master Information Inherit Function ..... 911
8.6.4 Other Reliability Functions ..... 912
8.6.4.1 Restriction on the Next Channel in the Chain ..... 912
8.7 Setting Up DMA Transfer ..... 913
8.7.1 Overview of Setting Up DMA ..... 913
8.7.2 Setting Up the Overall DMA Operation ..... 913
8.7.3 Setting Up the DMA Channel Setting ..... 914
8.7.3.1 Setting Up the DMAC Channel Setting ..... 914
8.8 Global Registers ..... 916
8.8.1 List of Global Register Address ..... 916
8.8.2 Details of Global Registers ..... 919
8.8.2.1 PDMAnDMACTL — DMA Control Register ..... 919
8.8.2.2 PDMAnDMACER — DMAC Error Register ..... 920
8.8.2.3 PDMAnDMOCMV — DMAC0 Register Access Protection Violation Register ..... 921
8.8.2.4 PDMAnDM1CMV — DMAC1 Register Access Protection Violation Register ..... 922
8.8.2.5 PDMAnDM2CMV — DMAC2 Register Access Protection Violation Register ..... 923
8.8.2.6 PDMAnDM3CMV — DMAC3 Register Access Protection Violation Register ..... 924
8.8.2.7 PDMAnCMVC — Register Access Protection Violation Clear Register ..... 925
8.8.2.8 PDMAnDMyiCM — DMAC Channel Master Setting (yi = 00 to 07,10 to 17,20 to 27, and 30 to 37 in RH850/F1KH-D8, yi $=00$ to 07,10 to 17,20 to 27 , and 30 to 37 in RH850/F1KM-S4, yi $=00$ to 07 and 10 to 17 in RH850/F1KM-S1) ..... 926
8.9 DMAC Channel Registers ..... 927
8.9.1 DMAC Channel Register Addresses ..... 927
8.9.2 Details of DMAC Channel Registers ..... 929
8.9.2.1 PDMAnDSAm — DMAC Source Address Register ..... 929
8.9.2.2 PDMAnDDAm — DMAC Destination Address Register ..... 930
8.9.2.3 PDMAnDTCm — DMAC Transfer Count Register ..... 931
8.9.2.4 PDMAnDTCTm — DMAC Transfer Control Register ..... 932
8.9.2.5 PDMAnDRSAm — DMAC Reload Source Address Register. ..... 935
8.9.2.6 PDMAnDRDAm — DMAC Reload Destination Address Register. ..... 936
8.9.2.7 PDMAnDRTCm — DMAC Reload Transfer Count Register ..... 937
8.9.2.8 PDMAnDCENm — DMAC Channel Operation Enable Setting Register ..... 938
8.9.2.9 PDMAnDCSTm — DMAC Transfer Status Register ..... 939
8.9.2.10 PDMAnDCSTSm — DMAC Transfer Status Set Register ..... 941
8.9.2.11 PDMAnDCSTCm — DMAC Transfer Status Clear Register ..... 942
8.9.2.12 PDMAnDTFRm — DTFR Setting Register ..... 943
8.9.2.13 PDMAnDTFRRQm — DTFR Transfer Request Status Register. ..... 944
8.9.2.14 PDMAnDTFRRQCm — DTFR Transfer Request Clear Register. ..... 945
8.10 DMA Trigger Factor Select Registers ..... 946
8.10.1 List of DMA Trigger Factor Select Register Address ..... 946
8.10.2 DTFSEL_TAUD0/DTFSEL_TAUB0/DTFSEL_TAUB1 — DMA Trigger Factor Select Register ..... 947
Section 9A Reset Controller of RH850/F1KH-D8 ..... 952
9A. 1 Overview ..... 952
9A.1.1 Reset Sources ..... 953
9A.1.2 Reset Controller Redundancy ..... 954
9A.1.3 Reset Output ( $\overline{\text { RESETOUT }}$ ) ..... 955
9A.1.4 Reset Flag ..... 955
9A.1.5 Clock Supply ..... 955
9A. 2 Configuration ..... 956
9A.2.1 Block Diagram ..... 956
9A. 3 Registers ..... 959
9A.3.1 Reset Controller Registers Overview ..... 959
9A.3.2 Details of Reset Flag Registers ..... 960
9A.3.2.1 RESF - Reset Factor Register ..... 960
9A.3.2.2 RESFC — Reset Factor Clear Register ..... 962
9A.3.2.3 RESFR — Redundant Reset Factor Register ..... 964
9A.3.2.4 RESFCR — Redundant Reset Factor Clear Register ..... 966
9A.3.3 Details of Software Reset Control Register ..... 968
9A.3.3.1 SWRESA — Software Reset Register ..... 968
9A. 4 Functional Description ..... 969
9A.4.1 Reset Flags ..... 969
9A.4.2 Power-On Clear (POC) Reset ..... 969
9A.4.3 Low-Voltage Indicator (LVI) Reset ..... 972
9A.4.4 Core Voltage Monitor (CVM) Reset ..... 973
9A.4.5 External Reset ( $\overline{R E S E T}$ ) ..... 974
9A.4.6 Watchdog Timer (WDTA) Reset ..... 975
9A.4.7 Software Reset ..... 975
9A.4.8 Clock Monitor (CLMA) Reset ..... 976
9A.4.9 Debugger Reset ..... 976
Section 9BC Reset Controller of RH850/F1KM ..... 977
9BC. 1 Overview ..... 977
9BC.1.1 Reset Sources ..... 978
9BC.1.2 Reset Controller Redundancy ..... 979
9BC.1.3 Reset Output ( $\overline{\text { RESETOUT }}$ ) ..... 980
9BC.1.4 Reset Flag ..... 980
9BC.1.5 Clock Supply ..... 980
9BC. 2 Configuration ..... 981
9BC.2.1 Block Diagram ..... 981
9BC. 3 Registers ..... 985
9BC.3.1 Reset Controller Registers Overview ..... 985
9BC.3.2 Details of Reset Flag Registers ..... 986
9BC.3.2.1 RESF - Reset Factor Register ..... 986
9BC.3.2.2 RESFC - Reset Factor Clear Register ..... 988
9BC.3.2.3 RESFR — Redundant Reset Factor Register ..... 990
9BC.3.2.4 RESFCR — Redundant Reset Factor Clear Register ..... 992
9BC.3.3 Details of Software Reset Control Register ..... 994
9BC.3.3.1 SWRESA — Software Reset Register ..... 994
9BC.3.4 Details of Cyclic RUN Mode Reset Vector Address Register ..... 995
9BC.3.4.1 CYCRBASE - Cyclic RUN Mode RBASE Register ..... 995
9BC. 4 Functional Description ..... 996
9BC.4.1 Reset Flags ..... 996
9BC.4.2 Power-On Clear (POC) Reset ..... 996
9BC.4.3 Low-Voltage Indicator (LVI) Reset ..... 999
9BC.4.4 Core Voltage Monitor (CVM) Reset ..... 1000
9BC.4.5 External Reset ( $\overline{\mathrm{RESET}}$ ) ..... 1001
9BC.4.6 Watchdog Timer (WDTA) Reset ..... 1002
9BC.4.7 Software Reset ..... 1002
9BC.4.8 Clock Monitor (CLMA) Reset ..... 1003
9BC.4.9 Debugger Reset ..... 1003
9BC.4.10 Reset Vector Address of CPU ..... 1004
Section 10A Power Supply Circuit of RH850/F1KH-D8 ..... 1005
10A. 1 Function ..... 1005
10A.1.1 Power Supply Pins ..... 1006

12C.4.2.6 MOSCM — MainOSC Mode Control Register ..... 1180
12C.4.2.7 ROSCE - HS IntOSC Enable Register ..... 1181
12C.4.2.8 ROSCS - HS IntOSC Status Register ..... 1182
12C.4.2.9 ROSCSTPM - HS IntOSC Stop Mask Register ..... 1183
12C.4.2.10 PLL1E - PLL1 Enable Register ..... 1184
12C.4.2.11 PLL1S - PLL1 Status Register ..... 1185
12C.4.2.12 PLL1C - PLL1 Control Register ..... 1186
12C.4.2.13 PLL1 Input Clock Selection. ..... 1188
12C.4.2.14 PPLLCLK Source Clock Selection ..... 1190
12C.4.2.15 ROSCUT — HS IntOSC User Trimming Register ..... 1192
12C.4.3 Clock Selector Control Register ..... 1193
12C.4.3.1 WDTAO Clock Domain C_AWO_WDTA ..... 1193
12C.4.3.2 TAUJ Clock Domain C_AWO_TAUJ ..... 1196
12C.4.3.3 RTCA Clock Domain C_AWO_RTCA. ..... 1201
12C.4.3.4 ADCA0 Clock Domain C_AWO_ADCA ..... 1206
12C.4.3.5 FOUT Clock Domain C_AWO_FOUT. ..... 1211
12C.4.3.6 CPU Clock Domain C_ISO_CPUCLK ..... 1214
12C.4.3.7 Peripheral Clock Domains C_ISO_PERI1 and C_ISO_PERI2 ..... 1218
12C.4.3.8 RLIN Clock Domains C_ISO_LIN ..... 1222
12C.4.3.9 RS-CANFD Clock Domains C_ISO_CAN and C_ISO_CANOSC ..... 1227
12C.4.3.10 CSI Clock Domain C_ISO_CSI ..... 1233
12C.4.3.11 RIIC Clock Domain C_ISO_IIC ..... 1235
12C. 5 Clock Domain Setting Method ..... 1237
12C.5.1 Clock Domain Setting ..... 1237
12C.5.1.1 Overview of Clock Selector Register ..... 1237
12C.5.1.2 Setting Procedure for Clock Domain ..... 1238
12C.5.2 Stopping the Clock in Stand-by Mode. ..... 1238
12C.5.3 Clock Domain Settings ..... 1239
12C. 6 Frequency Output Function (FOUT) ..... 1241
12C.6.1 Functional Overview. ..... 1241
12C.6.2 Clock Supply ..... 1241
12C.6.3 Registers ..... 1242
12C.6.3.1 List of Registers ..... 1242
12C.6.3.2 FOUTDIV - Clock Division Ratio Register ..... 1243
12C.6.3.3 FOUTSTAT — Clock Divider Status Register ..... 1244
Section 13 Clock Monitor (CLMA) ..... 1245
13.1 Features of RH850/F1KH, RH850/F1KM CLMA ..... 1245
13.1.1 Number of Units ..... 1245
13.1.2 Register Base Addresses ..... 1246
13.1.3 Clock Supply ..... 1247
13.1.4 Reset Sources ..... 1248
13.1.5 Internal Input/Output Signals ..... 1249
13.2 Overview ..... 1250
13.2.1 Functional Overview. ..... 1250
13.3 Enabling CLMA ..... 1251
13.4 Functions ..... 1252
13.4.1 Detection of Abnormal Clock Frequencies ..... 1252
13.4.2 Notification of Abnormal Clock Frequency ..... 1254
13.5 Registers ..... 1255
13.5.1 List of Registers ..... 1255
13.5.2 CLMAnCTLO — CLMAn Control Register 0 ..... 1256
13.5.3 CLMAnCMPH — CLMAn Compare Register H ..... 1257
13.5.4 CLMAnCMPL — CLMAn Compare Register L ..... 1257
13.5.5 CLMATEST — CLMA Test Register ..... 1258
13.5.6 CLMATESTS — CLMA Test Status Register ..... 1260
13.5.7 CLMAnEMUO — CLMAn Emulation Register 0 ..... 1261
13.6 Usage Notes for CLMAn ..... 1262
Section 14 Stand-By Controller (STBC) ..... 1263
14.1 Functions ..... 1263
14.1.1 Types of Stand-By Mode ..... 1263
14.1.2 Wake-Up Control ..... 1264
14.1.2.1 Wake-Up Factors for Stand-By Modes ..... 1264
14.1.2.2 Setting of Wake-Up Factors ..... 1271
14.1.3 On-Chip Debug Wake-Up ..... 1278
14.1.4 I/O Buffer Control ..... 1279
14.1.4.1 I/O Buffer Hold State ..... 1279
14.1.4.2 I/O Buffers during STOP Mode ..... 1279
14.1.4.3 I/O Buffers during DeepSTOP Mode ..... 1279
14.1.5 Transition to Stand-By Mode ..... 1280
14.1.6 Clock Supply ..... 1281
14.2 Registers ..... 1282
14.2.1 List of Registers ..... 1282
14.2.2 Details of Stand-By Controller Control Registers ..... 1283
14.2.2.1 STBCOPSC - Power Save Control Register. ..... 1283
14.2.2.2 STBCOSTPT — Power Stop Trigger Register ..... 1284
14.2.2.3 WUF0/WUF1/WUF20/WUF_ISO0 — Wake-Up Factor Registers ..... 1285
14.2.2.4 WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers ..... 1286
14.2.2.5 WUFC0/WUFC1/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers ..... 1287
14.2.2.6 IOHOLD - I/O Buffer Hold Control Register ..... 1288
14.3 Mode Transition ..... 1289
14.3.1 STOP Mode ..... 1289
14.3.2 DeepSTOP Mode ..... 1293
14.3.3 Cyclic RUN Mode ..... 1298
14.3.4 Cyclic STOP Mode ..... 1301
14.4 Writing to the Stand-By Controller Related Registers ..... 1302
14.5 Clock Oscillator Behavior During Stand-By Mode Transition ..... 1302
14.6 Cautions when Using Stand-By Modes ..... 1308
14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger ..... 1308
Section 15 Low-Power Sampler (LPS) ..... 1309
15.1 Features of RH850/F1KH, RH850/F1KM LPS ..... 1309
15.1.1 Number of Units ..... 1309
15.1.2 Register Base Address ..... 1312
15.1.3 Clock Supply ..... 1312
15.1.4 Interrupt Requests ..... 1312
15.1.5 Reset Sources ..... 1312
15.1.6 External Input/Output Signals ..... 1313
15.1.7 Internal Input/Output Signals ..... 1313
15.2 Overview ..... 1314
15.2.1 Functional Overview. ..... 1314
15.3 Registers ..... 1315
15.3.1 List of Registers ..... 1315
15.3.2 SCTLR — LPS Control Register ..... 1316
15.3.3 EVFR — Event Flag Register ..... 1317
15.3.4 DPSELRO — DPIN Select Register 0 ..... 1318
15.3.5 DPSELRM — DPIN Select Register M ..... 1319
15.3.6 DPSELRH — DPIN Select Register H ..... 1320
15.3.7 DPDSR0 — DPIN Data Set Register 0 ..... 1321
15.3.8 DPDSRM — DPIN Data Set Register M ..... 1322
15.3.9 DPDSRH — DPIN Data Set Register H ..... 1323
15.3.10 DPDIMRO — DPIN Data Input Monitor Register 0 ..... 1324
15.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1 ..... 1324
15.3.12 DPDIMR2 — DPIN Data Input Monitor Register 2 ..... 1325
15.3.13 DPDIMR3 — DPIN Data Input Monitor Register 3 ..... 1325
15.3.14 DPDIMR4 — DPIN Data Input Monitor Register 4 ..... 1326
15.3.15 DPDIMR5 — DPIN Data Input Monitor Register 5 ..... 1326
15.3.16 DPDIMR6 — DPIN Data Input Monitor Register 6 ..... 1327
15.3.17 DPDIMR7 — DPIN Data Input Monitor Register 7 ..... 1327
15.3.18 CNTVAL — Count Value Register ..... 1328
15.3.19 SOSTR — LPS Operation Status Register ..... 1329
15.4 Digital Input Mode ..... 1330
15.4.1 Digital Port Error Interrupt ..... 1336
15.5 Analog Input Mode ..... 1337
15.5.1 Analog Port Error Interrupt. ..... 1342
Section 16 External Memory Access Controller (MEMC) ..... 1343
16.1 Features of RH850/F1KH, RH850/F1KM MEMC ..... 1343
16.1.1 Number of Units ..... 1343
16.1.2 Register Base Address ..... 1344
16.1.3 Clock Supply ..... 1344
16.1.4 Reset Sources ..... 1345
16.1.5 External Input/Output Signals ..... 1345
16.2 Overview ..... 1346
16.2.1 Functional Overview. ..... 1346
16.2.1.1 Multiplexed Bus ..... 1346
16.2.1.2 Chip Select Output Function ..... 1346
16.2.1.3 Data Endian Setting Function ..... 1346
16.2.1.4 Programmable Wait Setting Functions ..... 1346
16.2.1.5 External Wait Function ..... 1346
16.2.1.6 External Wait Error Detection Function ..... 1347
16.3 Registers ..... 1348
16.3.1 List of Registers ..... 1348
16.3.2 DEC — Data Endian Configuration Register ..... 1349
16.3.3 DWC — Data Wait Configuration Register ..... 1350
16.3.4 DHC — Data Hold Wait Configuration Register ..... 1351
16.3.5 DSC — Data Setup Wait Configuration Register ..... 1352
16.3.6 AWC — Address Wait Configuration Register ..... 1353
16.3.7 ICC — Idle Cycle Configuration Register ..... 1355
16.3.8 EWC - External Wait Error Configuration Register ..... 1357
16.4 Functions ..... 1358
16.4.1 Bus Control Functions ..... 1358
16.4.1.1 Chip Select Output Function ..... 1358
16.4.1.2 Bus Sizing Function ..... 1361
16.4.1.3 Data Endian Setting Function ..... 1361
16.4.2 Wait Functions ..... 1362
16.4.2.1 Programmable Data Wait Function ..... 1362
16.4.2.2 External Wait Function ..... 1363
16.4.2.3 External Wait Error Detection Function ..... 1364
16.4.2.4 Data Setup Wait Function ..... 1365
16.4.2.5 Data Hold Wait Function ..... 1366
16.4.2.6 Address Setup Wait Function ..... 1367
16.4.2.7 Address Hold Wait Function ..... 1368
16.4.2.8 Idle Insertion Function ..... 1369
16.4.3 Memory Connection Example ..... 1370
16.4.3.1 SRAM Connection Example ..... 1370
16.4.4 Data Access Flow ..... 1371
16.4.4.1 Data Flow for Byte Access (for Reading and Writing) ..... 1372
16.4.4.2 Data Flow for Half-Word Read Access ..... 1374
16.4.4.3 Data Flow for Half-Word Write Access ..... 1376
16.4.4.4 Data Flow for Word Read Access ..... 1378
16.4.4.5 Data Flow for Word Write Access ..... 1381
16.5 Notes on Use of MEMC ..... 1384
Section 17 Serial Flash Memory Interface A (SFMA) ..... 1385
17.1 Features of RH850/F1KH, RH850/F1KM SFMA ..... 1385
17.1.1 Number of Units ..... 1385
17.1.2 Register Base Address ..... 1386
17.1.3 Clock Supply ..... 1386
17.1.4 Reset Sources ..... 1386
17.1.5 External Input/Output Signals ..... 1387
17.2 Overview ..... 1388
17.2.1 Functional Overview. ..... 1388
17.2.2 Block Diagram ..... 1389
17.3 Registers ..... 1390
17.3.1 List of Registers ..... 1390
17.3.2 SFMAnCMNCR — SFMAn Common Control Register ..... 1391
17.3.3 SFMAnSSLDR — SFMAn SSL Delay Register ..... 1393
17.3.4 SFMAnSPBCR — SFMAn Bit Rate Register ..... 1395
17.3.5 SFMAnDRCR — SFMAn Data Read Control Register. ..... 1396
17.3.6 SFMAnDRCMR — SFMAn Data Read Command Setting Register ..... 1398
17.3.7 SFMAnDREAR — SFMAn Data Read Extended Address Setting Register ..... 1399
17.3.8 SFMAnDROPR — SFMAn Data Read Option Setting Register ..... 1400
17.3.9 SFMAnDRENR — SFMAn Data Read Enable Setting Register ..... 1401
17.3.10 SFMAnSMCR — SFMAn SPI Mode Control Register ..... 1403
17.3.11 SFMAnSMCMR — SFMAn SPI Mode Command Setting Register ..... 1404
17.3.12 SFMAnSMADR — SFMAn SPI Mode Address Setting Register ..... 1405
17.3.13 SFMAnSMOPR — SFMAn SPI Mode Option Setting Register ..... 1406
17.3.14 SFMAnSMENR — SFMAn SPI Mode Enable Setting Register ..... 1407
17.3.15 SFMAnSMRDR — SFMAn SPI Mode Read Data Register. ..... 1409
17.3.16 SFMAnSMWDR — SFMAn SPI Mode Write Data Register ..... 1410
17.3.17 SFMAnCMNSR — SFMAn Common Status Register ..... 1411
17.3.18 SFMAnDRDMCR — SFMAn Data Read Dummy Cycle Setting Register ..... 1412
17.3.19 SFMAnSMDMCR — SFMAn SPI Mode Dummy Cycle Setting Register ..... 1413
17.4 Operation ..... 1414
17.4.1 System Configuration ..... 1414
17.4.2 Address Map ..... 1414
17.4.3 32-bit Serial Flash Addresses ..... 1414
17.4.4 Operating Modes ..... 1415
17.4.5 External Address Space Read Mode ..... 1415
17.4.5.1 Normal Read Operation ..... 1415
17.4.5.2 Burst Read Operation ..... 1416
17.4.5.3 Burst Read Operation with Automatic SPBSSL Negation ..... 1418
17.4.6 Initial Setting Flow ..... 1419
17.4.7 Read Cache ..... 1420
17.4.7.1 Address Array ..... 1420
17.4.7.2 Data Array ..... 1420
17.4.7.3 Read Operation ..... 1420
17.4.7.4 Data Replacement ..... 1420
17.4.8 SPI Operating Mode ..... 1421
17.4.8.1 Transfer Start ..... 1421
17.4.8.2 Read/Write Enable ..... 1421
17.4.8.3 Retention of SPBSSL Pin Assertion ..... 1422
17.4.8.4 Initial Setting Flow ..... 1422
17.4.8.5 Data Transfer Setting Flow ..... 1423
17.4.9 Transfer Format ..... 1424
17.4.9.1 SPBSSL Pin Enable Polarity Control ..... 1424
17.4.9.2 SPBCLK Output ..... 1424
17.4.9.3 Data Transmission and Reception Timing ..... 1424
17.4.9.4 Delay Settings ..... 1424
17.4.10 Data Format ..... 1425
17.4.10.1 Data Registers ..... 1425
17.4.10.2 Data Enable ..... 1425
17.4.10.3 Bit Size ..... 1426
17.4.11 Data Pin Control ..... 1428
17.4.12 SPBSSL Pin Control ..... 1429
17.4.12.1 External Address Space Read Mode ..... 1429
17.4.12.2 SPI Operating Mode ..... 1429
17.4.13 Flags ..... 1429
17.4.13.1 SSLF Bit ..... 1429
17.4.13.2 TEND Bit ..... 1429
17.4.13.3 Register Re-writing Timing ..... 1429
17.5 Usage Notes ..... 1430
17.5.1 Notes on Transfer to Read Data in SPI Operating Mode ..... 1430
17.5.1.1 Transfer to Read Data While the Signal on the SPBSSL Pin is De-asserted ..... 1430
17.5.1.2 Transfer to Read Data While the Signal on the SPBSSL Pin is Asserted ..... 1430
17.5.2 Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode... ..... 1430
Section 18 Multi Media Card Interface A (MMCA) ..... 1431
18.1 Features of RH850/F1KH, RH850/F1KM MMCA ..... 1431
18.1.1 Number of Units ..... 1431
18.1.2 Register Base Address ..... 1431
18.1.3 Clock Supply ..... 1432
18.1.4 Interrupt Requests ..... 1432
18.1.5 Reset Sources ..... 1432
18.1.6 External Input/Output Signals ..... 1432
18.2 Overview ..... 1433
18.2.1 Features ..... 1433
18.2.2 Block Diagram ..... 1433
18.3 Registers ..... 1434
18.3.1 List of Registers ..... 1434
18.3.2 MMCAnCE_CMD_SET — MMCAn Command Setting Register ..... 1435
18.3.3 MMCAnCE_ARG — MMCAn Argument Register ..... 1437
18.3.4 MMCAnCE_ARG_CMD12 - MMCAn Argument Register for Automatically-Issued CMD12 ..... 1438
18.3.5 MMCAnCE_CMD_CTRL — MMCAn Command Control Register ..... 1439
18.3.6 MMCAnCE_BLOCK_SET — MMCAn Transfer Block Setting Register ..... 1440
18.3.7 MMCAnCE_CLK_CTRL — MMCAn Clock Control Register. ..... 1441
18.3.8 MMCAnCE_BUF_ACC — MMCAn Buffer Access Configuration Register ..... 1443
18.3.9 MMCAnCE_RESP3 to MMCAnCE_RESP0 - MMCAn Response Registers 3 to 0 ..... 1444
18.3.10 MMCAnCE_RESP_CMD12 — MMCAn Response Register for Automatically-Issued CMD12 ..... 1445
18.3.11 MMCAnCE_DATA — MMCAn Data Register ..... 1446
18.3.12 MMCAnCE_BOOT — MMCAn Boot Operation Setting Register ..... 1447
18.3.13 MMCAnCE_INT — MMCAn Interrupt Flag Register ..... 1448
18.3.14 MMCAnCE_INT_EN — MMCAn Interrupt Enable Register ..... 1453
18.3.15 MMCAnCE_HOST_STS1 — MMCAn Status Register 1 ..... 1455
18.3.16 MMCAnCE_HOST_STS2 — MMCAn Status Register 2 ..... 1456
18.3.17 MMCAnCE_SWRESA — MMCAn Software Reset Register. ..... 1458
18.4 Operations ..... 1459
18.4.1 Interrupt Requests ..... 1459
18.4.2 DMA Specifications ..... 1460
18.4.2.1 DMA for Buffer Writing ..... 1460
18.4.2.2 DMA for Buffer Reading ..... 1460
18.4.3 Operations ..... 1461
18.4.3.1 Command/Response Formats ..... 1461
18.4.3.2 Data Block Format ..... 1462
18.4.3.3 Buffer Structure and Buffer Access ..... 1463
18.4.3.4 Automatic CMD12 Issuance ..... 1465
18.4.3.5 MMC Clock Frequency in Boot Operations ..... 1466
18.4.3.6 High Priority Interrupt (HPI) ..... 1466
18.4.3.7 Background Operation ..... 1467
18.4.3.8 Handling of this Module in the Case of Error/Timeout ..... 1467
18.4.4 Examples of Setting ..... 1468
18.4.4.1 Legends ..... 1468
18.4.4.2 Command Transmission ..... 1468
18.4.4.3 Command Transmission $\rightarrow$ Response Reception ..... 1469
18.4.4.4 Command Transmission $\rightarrow$ Response Reception (with Response Busy) ..... 1470
18.4.4.5 Single-Block Read ..... 1472
18.4.4.6 Multi-Block Read ..... 1473
18.4.4.7 Multi-Block Read (with Automatic CMD12 Issuance) ..... 1474
18.4.4.8 Single-Block Write ..... 1475
18.4.4.9 Multi-Block Write ..... 1476
18.4.4.10 Multi-Block Write (with Automatic CMD12 Issuance) ..... 1477
18.4.4.11 Boot Operations ..... 1478
18.4.4.12 Forcible Termination ..... 1479
18.4.4.13 Setting Values of MMCAnCE_CMD_SET ..... 1480
18.5 Detection and Correction of Errors in MMCA RAM ..... 1482
Section 19 Clocked Serial Interface G (CSIG) ..... 1483
19.1 Features of RH850/F1KH, RH850/F1KM CSIG ..... 1483
19.1.1 Number of Units ..... 1483
19.1.2 Register Base Addresses ..... 1484
19.1.3 Clock Supply ..... 1484
19.1.4 Interrupt Requests ..... 1485
19.1.5 Reset Sources ..... 1486
19.1.6 External Input/Output Signals ..... 1487
19.1.7 Data Consistency Check ..... 1489
19.2 Overview ..... 1490
19.2.1 Functional Overview. ..... 1490
19.2.2 Functional Overview Description ..... 1490
19.2.3 Block Diagram ..... 1491
19.3 Registers ..... 1492
19.3.1 List of Registers ..... 1492
19.3.2 CSIGnCTLO — CSIGn Control Register 0 ..... 1493
19.3.3 CSIGnCTL1 — CSIGn Control Register 1 ..... 1494
19.3.4 CSIGnCTL2 - CSIGn Control Register 2 ..... 1496
19.3.5 CSIGnSTR0 - CSIGn Status Register 0 ..... 1497
19.3.6 CSIGnSTCRO - CSIGn Status Clear Register 0 ..... 1499
19.3.7 CSIGnBCTLO — CSIGn Rx-Only Mode Control Register 0 ..... 1500
19.3.8 CSIGnCFG0 — CSIGn Configuration Register 0 ..... 1501
19.3.9 CSIGnTXOW - CSIGn Transmission Register 0 for Word Access ..... 1503
19.3.10 CSIGnTXOH — CSIGn Transmission Register 0 for Half Word Access ..... 1504
19.3.11 CSIGnRX0 — CSIGn Reception Register 0 ..... 1504
19.3.12 CSIGnEMU — CSIGn Emulation Register ..... 1505
19.3.13 List of Cautions ..... 1506
19.4 Interrupt Sources ..... 1507
19.4.1 Interrupt Delay ..... 1507
19.4.2 INTCSIGTIC (Communication Status Interrupt) ..... 1508
19.4.3 INTCSIGTIR (Reception Status Interrupt) ..... 1509
19.4.4 INTCSIGTIRE (Communication Error Interrupt) ..... 1509
19.5 Operation ..... 1510
19.5.1 Master/Slave Mode ..... 1510
19.5.1.1 Master Mode ..... 1510
19.5.1.2 Slave Mode ..... 1511
19.5.2 Master/Slave Connections ..... 1511
19.5.2.1 One Master and One Slave ..... 1511
19.5.2.2 One Master and Multiple Slaves ..... 1512
19.5.3 Transmission Clock Selection ..... 1513
19.5.4 Data Transfer Modes ..... 1514
19.5.4.1 Transmit-Only Mode ..... 1514
19.5.4.2 Receive-Only Mode ..... 1514
19.5.4.3 Transmit/Receive Mode ..... 1514
19.5.5 Data Length Selection ..... 1515
19.5.5.1 Data Length Selection without Extended Length ..... 1515
19.5.5.2 Data Length Selection with Extended Data Length ..... 1516
19.5.6 Serial Data Direction Selection Function ..... 1518
19.5.7 Communication in Slave Mode ..... 1519
19.5.8 Handshake Function ..... 1520
19.5.8.1 Slave Mode ..... 1520
19.5.8.2 Master Mode ..... 1521
19.5.9 Loop-Back Mode ..... 1523
19.5.10 Error Detection ..... 1524
19.5.10.1 Data Consistency Check ..... 1524
19.5.10.2 Parity Check ..... 1525
19.5.10.3 Overrun Error ..... 1525
19.6 Operating Procedures ..... 1527
19.6.1 Master Mode Transmission/Reception by DMA ..... 1527
Section 20 Clocked Serial Interface H (CSIH) ..... 1529
20.1 Features of RH850/F1KH, RH850/F1KM CSIH ..... 1529
20.1.1 Number of Units ..... 1529
20.1.2 Register Base Addresses ..... 1531
20.1.3 Clock Supply ..... 1531
20.1.4 Interrupt Requests ..... 1532
20.1.5 Reset Sources ..... 1533
20.1.6 External Input/Output Signals ..... 1534
20.1.7 Data Consistency Check ..... 1536
20.2 Overview ..... 1537
20.2.1 Functional Overview. ..... 1537
20.2.2 Functional Overview Description ..... 1538
20.2.3 Block Diagram ..... 1539
20.3 Registers ..... 1540
20.3.1 List of Registers ..... 1540
20.3.2 CSIHnCTLO - CSIHn Control Register 0 ..... 1541
20.3.3 CSIHnCTL1 — CSIHn Control Register 1 ..... 1542
20.3.4 CSIHnCTL2 — CSIHn Control Register 2 ..... 1544
20.3.5 CSIHnSTR0 - CSIHn Status Register 0 ..... 1546
20.3.6 CSIHnSTCRO - CSIHn Status Clear Register 0 ..... 1550
20.3.7 CSIHnMCTLO — CSIHn Memory Control Register 0 ..... 1551
20.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1 ..... 1552
20.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2 ..... 1553
20.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0 ..... 1555
20.3.11 CSIHnCFGx - CSIHn Configuration Register x (x=0 to 7) .....  1557
20.3.12 CSIHnTXOW — CSIHn Transmit Data Register 0 for Word Access ..... 1562
20.3.13 CSIHnTXOH — CSIHn Transmit Data Register 0 for Half Word Access ..... 1563
20.3.14 CSIHnRXOW — CSIHn Receive Data Register 0 for Word Access ..... 1564
20.3.15 CSIHnRXOH — CSIHn Receive Data Register 0 for Half Word Access ..... 1565
20.3.16 CSIHnEMU — CSIHn Emulation Register ..... 1566
20.3.17 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y=0 to 3) ..... 1567
20.3.18 List of Cautions ..... 1568
20.4 Interrupt Sources ..... 1571
20.4.1 Overview ..... 1571
20.4.2 Interrupt Delay ..... 1572
20.4.3 INTCSIHTIC (Communication Status Interrupt) ..... 1573
20.4.3.1 INTCSIHTIC in Direct Access Mode ..... 1574
20.4.3.2 INTCSIHTIC in FIFO Mode ..... 1575
20.4.3.3 INTCSIHTIC in Job Mode ..... 1576
20.4.4 INTCSIHTIR (Reception Status Interrupt) ..... 1577
20.4.4.1 INTCSIHTIR in Direct Access Mode ..... 1577
20.4.4.2 INTCSIHTIR in Dual Buffer Mode ..... 1578
20.4.5 INTCSIHTIRE (Communication Error Interrupt) ..... 1579
20.4.6 INTCSIHTIJC (Job Completion Interrupt) ..... 1580
20.5 Operation ..... 1581
20.5.1 Operating Modes (Master/Slave) ..... 1581
20.5.1.1 Master Mode ..... 1581
20.5.1.2 Slave Mode ..... 1582
20.5.2 Master/Slave Connections ..... 1583
20.5.2.1 One Master and One Slave ..... 1583
20.5.2.2 One Master and Multiple Slaves ..... 1584
20.5.3 Chip Selection (CS) Features ..... 1585
20.5.3.1 Configuration Registers ..... 1585
20.5.3.2 CS Example ..... 1587
20.5.3.3 Job Concept ..... 1587
20.5.4 Details of Chip Select Timing ..... 1588
20.5.4.1 Changing the Clock Phase ..... 1588
20.5.4.2 Changing the Data Phase ..... 1590
20.5.5 Transmission Clock Selection ..... 1591
20.5.6 CSIH Buffer Memory ..... 1593
20.5.6.1 FIFO Mode ..... 1593
20.5.6.2 Dual Buffer Mode ..... 1594
20.5.6.3 Transmit-Only Buffer Mode ..... 1594
20.5.6.4 Direct Access Mode ..... 1594
20.5.7 Data Transfer Modes ..... 1595
20.5.7.1 Transmit-Only Mode ..... 1595
20.5.7.2 Transmit/Receive Mode ..... 1595
20.5.7.3 Receive-Only Mode ..... 1595
20.5.8 Data Length Selection ..... 1596
20.5.8.1 Data Length from 2 to 16 Bits ..... 1596
20.5.8.2 Data Length Greater than 16 Bits ..... 1597
20.5.9 Serial Data Direction Selection ..... 1599
20.5.10 Slave Select (SS) Function ..... 1600
20.5.10.1 Communication Timing Using SS Function ..... 1600
20.5.10.2 CSIHTSSO Operation ..... 1601
20.5.11 Handshake Function ..... 1602
20.5.11.1 Slave Mode ..... 1602
20.5.11.2 Master Mode ..... 1605
20.5.12 Error Detection ..... 1606
20.5.12.1 Data Consistency Check ..... 1606
20.5.12.2 Parity Check ..... 1608
20.5.12.3 Time-Out Error ..... 1609
20.5.12.4 Overflow Error ..... 1610
20.5.12.5 Overrun Error ..... 1612
20.5.13 Loop-Back Mode ..... 1615
20.5.14 CPU-Controlled High Priority Communication Function ..... 1616
20.5.15 Enforced Chip Select Idle Setting ..... 1619
20.6 Operating Procedures ..... 1620
20.6.1 Procedures in Direct Access Mode ..... 1620
20.6.1.1 Transmission/Reception in Master Mode when Job Mode is Disabled ..... 1620
20.6.1.2 Transmission/Reception in Master Mode when Job Mode is Enabled ..... 1622
20.6.2 Procedures in Transmit-Only Buffer Mode ..... 1624
20.6.2.1 Transmission/Reception in Master Mode when Job Mode is Disabled ..... 1624
20.6.2.2 Transmission/Reception in Master Mode when Job Mode is Enabled ..... 1626
20.6.3 Procedures in Dual Buffer Mode ..... 1628
20.6.3.1 Transmission/Reception in Master Mode when Job Mode is Disabled ..... 1628
20.6.3.2 Transmission/Reception in Master Mode when Job Mode is Enabled ..... 1630
20.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled ..... 1632
20.6.4 Procedures in FIFO Mode ..... 1634
20.6.4.1 Transmission/Reception in Master Mode when Job Mode is Disabled ..... 1634
20.6.4.2 Transmit/Receive Mode when Job Mode is Enabled in Master Mode ..... 1636
20.7 Detection and Correction of Errors in CSIHn RAM ..... 1638
Section 21 LIN Master Interface (RLIN2) ..... 1639
21.1 Features of RH850/F1KH, RH850/F1KM RLIN2 ..... 1639
21.1.1 Number of Units and Channels ..... 1639
21.1.2 Register Base Addresses ..... 1643
21.1.3 Clock Supply ..... 1643
21.1.4 Interrupt Requests ..... 1644
21.1.5 Reset Sources ..... 1645
21.1.6 External Input/Output Signals ..... 1646
21.2 Overview ..... 1647
21.2.1 Functional Overview. ..... 1647
21.2.2 Block Diagram ..... 1648
21.3 Registers. ..... 1649
21.3.1 List of Registers ..... 1649
21.3.2 Global Registers ..... 1650
21.3.2.1 RLN24nGLWBR — LIN Wake-Up Baud Rate Select Register ..... 1650
21.3.2.2 RLN24nGLBRP0 — LIN Baud Rate Prescaler 0 Register ..... 1651
21.3.2.3 RLN24nGLBRP1 — LIN Baud Rate Prescaler 1 Register ..... 1652
21.3.2.4 RLN24nGLSTC — LIN Self-Test Control Register ..... 1653
21.3.3 Channel Registers ..... 1654
21.3.3.1 RLN24nmLiMD — LIN Mode Register ..... 1654
21.3.3.2 RLN24nmLiBFC — LIN Break Field Configuration Register ..... 1655
21.3.3.3 RLN24nmLiSC — LIN Space Configuration Register ..... 1656
21.3.3.4 RLN24nmLiWUP — LIN Wake-Up Configuration Register ..... 1657
21.3.3.5 RLN24nmLilE — LIN Interrupt Enable Register ..... 1658
21.3.3.6 RLN24nmLiEDE — LIN Error Detection Enable Register ..... 1659
21.3.3.7 RLN24nmLiCUC — LIN Control Register ..... 1661
21.3.3.8 RLN24nmLiTRC — LIN Transmission Control Register ..... 1662
21.3.3.9 RLN24nmLiMST — LIN Mode Status Register ..... 1663
21.3.3.10 RLN24nmLiST — LIN Status Register ..... 1664
21.3.3.11 RLN24nmLiEST — LIN Error Status Register ..... 1666
21.3.3.12 RLN24nmLiDFC — LIN Data Field Configuration Register ..... 1668
21.3.3.13 RLN24nmLiIDB — LIN ID Buffer Register ..... 1670
21.3.3.14 RLN24nmLiCBR — LIN Checksum Buffer Register ..... 1671
21.3.3.15 RLN24nmLiDBRb — LIN Data Buffer b Register ..... 1672
21.4 Interrupt Sources ..... 1673
21.5 Modes ..... 1674
21.6 LIN Reset Mode ..... 1676
21.7 LIN Operation Mode ..... 1677
21.8 LIN Wake-Up Mode ..... 1677
21.9 Header Transmission/Response Transmission/Response Reception ..... 1678
21.9.1 Header Transmission ..... 1678
21.9.2 Response Transmission ..... 1679
21.9.3 Response Reception ..... 1680
21.10 Data Transmission/Reception ..... 1681
21.10.1 Data Transmission ..... 1681
21.10.2 Data Reception ..... 1682
21.11 Transmission/Reception Data Buffering ..... 1683
21.11.1 Transmission of LIN Frames ..... 1683
21.11.2 Reception of LIN Frames ..... 1684
21.12 Wake-Up Transmission/Reception ..... 1685
21.12.1 Wake-Up Transmission ..... 1685
21.12.2 Wake-Up Reception ..... 1686
21.12.3 Wake-Up Collision ..... 1686
21.13 Status ..... 1687
21.14 Error Status ..... 1688
21.14.1 Types of Error Statuses ..... 1688
21.14.2 Target Time Domain for Error Detection ..... 1689
21.15 LIN Self-Test Mode ..... 1690
21.15.1 Transition to LIN Self-Test Mode ..... 1691
21.15.2 Transmission in LIN Self-Test Mode ..... 1692
21.15.3 Reception in LIN Self-Test Mode ..... 1693
21.15.4 Exiting LIN Self-Test Mode ..... 1694
21.16 Baud Rate Generator ..... 1695
Section 22 LIN/UART Interface (RLIN3) ..... 1696
22.1 Features of RH850/F1KH, RH850/F1KM RLIN3 ..... 1696
22.1.1 Number of Units and Channels ..... 1696
22.1.2 Register Base Addresses ..... 1699
22.1.3 Clock Supply ..... 1699
22.1.4 Interrupt Requests ..... 1700
22.1.5 Reset Sources ..... 1702
22.1.6 External Input/output Signals ..... 1703
22.2 Overview ..... 1705
22.2.1 Functional Overview. ..... 1705
22.2.2 Block Diagram ..... 1709
22.2.3 Terms Used in Block Diagram ..... 1709
22.3 Registers ..... 1710
22.3.1 List of Registers ..... 1710
22.3.2 LIN Master Related Registers ..... 1712
22.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ..... 1712
22.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register ..... 1713
22.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register ..... 1714
22.3.2.4 RLN3nLSTC — LIN Self-Test Control Register ..... 1715
22.3.2.5 RLN3nLMD — LIN Mode Register ..... 1716
22.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register ..... 1718
22.3.2.7 RLN3nLSC - LIN Space Configuration Register ..... 1719
22.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register ..... 1720
22.3.2.9 RLN3nLIE — LIN Interrupt Enable Register ..... 1721
22.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register ..... 1723
22.3.2.11 RLN3nLCUC - LIN Control Register ..... 1725
22.3.2.12 RLN3nLTRC — LIN Transmission Control Register ..... 1726
22.3.2.13 RLN3nLMST — LIN Mode Status Register ..... 1727
22.3.2.14 RLN3nLST — LIN Status Register ..... 1728
22.3.2.15 RLN3nLEST - LIN Error Status Register ..... 1730
22.3.2.16 RLN3nLDFC - LIN Data Field Configuration Register ..... 1732
22.3.2.17 RLN3nLIDB — LIN ID Buffer Register ..... 1734
22.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register ..... 1735
22.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b=1 to 8) ..... 1736
22.3.3 LIN Slave Related Registers ..... 1738
22.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ..... 1738
22.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register ..... 1740
22.3.3.3 RLN3nLSTC — LIN Self-Test Control Register ..... 1741
22.3.3.4 RLN3nLMD — LIN Mode Register ..... 1742
22.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register ..... 1743
22.3.3.6 RLN3nLSC - LIN Space Configuration Register ..... 1744
22.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register ..... 1745
22.3.3.8 RLN3nLIE — LIN Interrupt Enable Register ..... 1746
22.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register ..... 1748
22.3.3.10 RLN3nLCUC - LIN Control Register ..... 1750
22.3.3.11 RLN3nLTRC — LIN Transmission Control Register ..... 1751
22.3.3.12 RLN3nLMST — LIN Mode Status Register ..... 1753
22.3.3.13 RLN3nLST — LIN Status Register ..... 1754
22.3.3.14 RLN3nLEST - LIN Error Status Register ..... 1756
22.3.3.15 RLN3nLDFC - LIN Data Field Configuration Register ..... 1758
22.3.3.16 RLN3nLIDB - LIN ID Buffer Register ..... 1760
22.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register ..... 1761
22.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register ( $b=1$ to 8) ..... 1762
22.3.4 UART Related Registers ..... 1763
22.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ..... 1763
22.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register ..... 1764
22.3.4.3 RLN3nLMD — UART Mode Register ..... 1765
22.3.4.4 RLN3nLBFC — UART Configuration Register ..... 1766
22.3.4.5 RLN3nLSC — UART Space Configuration Register ..... 1768
22.3.4.6 RLN3nLEDE —UART Error Detection Enable Register ..... 1769
22.3.4.7 RLN3nLCUC - UART Control Register ..... 1770
22.3.4.8 RLN3nLTRC — UART Transmission Control Register ..... 1771
22.3.4.9 RLN3nLMST — UART Mode Status Register ..... 1772
22.3.4.10 RLN3nLST — UART Status Register ..... 1773
22.3.4.11 RLN3nLEST — UART Error Status Register ..... 1775
22.3.4.12 RLN3nLDFC — UART Data Field Configuration Register ..... 1777
22.3.4.13 RLN3nLIDB — UART ID Buffer Register. ..... 1778
22.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register ..... 1779
22.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b=1 to 8) ..... 1780
22.3.4.16 RLN3nLUOER — UART Operation Enable Register ..... 1781
22.3.4.17 RLN3nLUOR1 — UART Option Register 1 ..... 1782
22.3.4.18 RLN3nLUTDR — UART Transmission Data Register ..... 1784
22.3.4.19 RLN3nLURDR — UART Reception Data Register ..... 1785
22.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register ..... 1786
22.4 Interrupt Sources ..... 1787
22.5 Modes ..... 1788
22.6 LIN Reset Mode ..... 1790
22.7 LIN Mode ..... 1791
22.7.1 LIN Master Mode ..... 1794
22.7.1.1 Header Transmission ..... 1794
22.7.1.2 Response Transmission ..... 1795
22.7.1.3 Response Reception. ..... 1796
22.7.2 LIN Slave Mode ..... 1797
22.7.2.1 Header Reception ..... 1797
22.7.2.2 Response Transmission ..... 1800
22.7.2.3 Response Reception ..... 1801
22.7.2.4 No-response Request ..... 1802
22.7.3 Data Transmission/Reception ..... 1803
22.7.3.1 Data Transmission ..... 1803
22.7.3.2 Data Reception ..... 1804
22.7.4 Transmission/Reception Data Buffering ..... 1805
22.7.4.1 Transmission of LIN Frames. ..... 1805
22.7.4.2 Reception of LIN Frames ..... 1806
22.7.4.3 Multi-Byte Response Transmission/Reception Function ..... 1807
22.7.5 Wake-up Transmission/Reception ..... 1808
22.7.5.1 Wake-up Transmission ..... 1808
22.7.5.2 Wake-up Reception ..... 1809
22.7.5.3 Wakeup Collision ..... 1809
22.7.6 Statuses ..... 1810
22.7.7 Error Statuses ..... 1812
22.7.7.1 LIN Master Mode ..... 1812
22.7.7.2 LIN Slave Mode ..... 1814
22.8 UART Mode ..... 1816
22.8.1 Transmission ..... 1816
22.8.1.1 Continuous Transmission ..... 1818
22.8.1.2 UART Buffer Transmission ..... 1819
22.8.1.3 Data Transmission ..... 1821
22.8.1.4 Transmission Start Wait Function ..... 1823
22.8.2 Reception ..... 1824
22.8.2.1 Data Reception ..... 1825
22.8.3 Expansion Bits ..... 1826
22.8.3.1 Expansion Bit Transmission ..... 1826
22.8.3.2 Expansion Bit Reception ..... 1826
22.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison) ..... 1827
22.8.3.4 Expansion Bit Reception (with Data Comparison) ..... 1828
22.8.4 Statuses ..... 1829
22.8.5 Error Statuses ..... 1830
22.9 LIN Self-Test Mode ..... 1831
22.9.1 Transition to LIN Self-Test Mode ..... 1833
22.9.2 Transmission in LIN Master Self-Test Mode ..... 1834
22.9.3 Reception in LIN Master Self-Test Mode ..... 1835
22.9.4 Transmission in LIN Slave Self-Test Mode ..... 1836
22.9.5 Reception in LIN Slave Self-Test Mode ..... 1838
22.9.6 Exiting LIN Self-Test Mode ..... 1839
22.10 Baud Rate Generator ..... 1840
22.10.1 LIN Master Mode ..... 1840
22.10.2 LIN Slave Mode ..... 1841
22.10.3 UART Mode ..... 1842
22.11 Noise Filter ..... 1843
Section $23 \quad I^{2} \mathrm{C}$ Bus Interface (RIIC) ..... 1845
23.1 Features of RH850/F1KH, RH850/F1KM RIIC ..... 1845
23.1.1 Number of Units ..... 1845
23.1.2 Register Base Addresses ..... 1845
23.1.3 Clock Supply ..... 1846
23.1.4 Interrupt Requests ..... 1846
23.1.5 Reset Sources ..... 1846
23.1.6 External Input/Output Signals ..... 1847
23.2 Overview ..... 1848
23.2.1 Functional Overview ..... 1848
23.2.2 Block Diagram ..... 1850
23.3 Registers ..... 1852
23.3.1 List of Registers ..... 1852
23.3.2 RIICnCR1 - $I^{2} \mathrm{C}$ Bus Control Register 1 ..... 1853
23.3.3 RIICnCR2 - I ${ }^{2} \mathrm{C}$ Bus Control Register 2 ..... 1856
23.3.4 RIICnMR1 - ${ }^{2} \mathrm{C}$ Bus Mode Register 1 ..... 1860
23.3.5 RIICnMR2 - $I^{2} \mathrm{C}$ Bus Mode Register 2 ..... 1862
23.3.6 RIICnMR3 - I ${ }^{2} \mathrm{C}$ Bus Mode Register 3 ..... 1864
23.3.7 RIICnFER - I ${ }^{2} \mathrm{C}$ Bus Function Enable Register ..... 1867
23.3.8 RIICnSER - $I^{2} \mathrm{C}$ Bus Status Enable Register ..... 1869
23.3.9 RIICnIER — I ${ }^{2} \mathrm{C}$ Bus Interrupt Enable Register ..... 1871
23.3.10 RIICnSR1 - I ${ }^{2} \mathrm{C}$ Bus Status Register 1 ..... 1873
23.3.11 RIICnSR2 - ${ }^{2} \mathrm{C}$ Bus Status Register 2 ..... 1876
23.3.12 RIICnSARy — $I^{2} C$ Slave Address Register y ( $\mathrm{y}=0$ to 2 ) ..... 1881
23.3.13 RIICnBRL — I ${ }^{2} \mathrm{C}$ Bus Bit Rate Low-Level Register ..... 1883
23.3.14 RIICnBRH — $I^{2} C$ Bus Bit Rate High-Level Register ..... 1884
23.3.15 RIICnDRT — I ${ }^{2}$ C Bus Transmit Data Register ..... 1887
23.3.16 RIICnDRR - $I^{2} \mathrm{C}$ Bus Receive Data Register ..... 1888
23.3.17 RIICnDRS — $I^{2} \mathrm{C}$ Bus Shift Register ..... 1889
23.4 Interrupt Sources ..... 1890
23.5 Operation ..... 1891
23.5.1 Communication Data Format ..... 1891
23.5.2 Initial Settings ..... 1893
23.5.3 Master Transmit Operation ..... 1894
23.5.4 Master Receive Operation ..... 1898
23.5.5 Slave Transmit Operation ..... 1904
23.5.6 Slave Receive Operation ..... 1907
23.6 SCL Synchronization Circuit ..... 1910
23.7 Facility for Delaying SDA Output ..... 1911
23.8 Digital Noise-Filter Circuits ..... 1912
23.9 Address Match Detection ..... 1913
23.9.1 Slave-Address Match Detection ..... 1913
23.9.2 Detection of the General Call Address ..... 1916
23.9.3 Device-ID Address Detection ..... 1917
23.10 Automatic Low-Hold Function for SCL ..... 1919
23.10.1 Function to Prevent Wrong Transmission of Transmit Data ..... 1919
23.10.2 NACK Reception Transfer Suspension Function ..... 1920
23.10.3 Function to Prevent Failure to Receive Data ..... 1921
23.11 Arbitration-Lost Detection Functions ..... 1923
23.11.1 Master Arbitration-Lost Detection (MALE Bit) ..... 1923
23.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit) ..... 1925
23.11.3 Slave Arbitration-Lost Detection (SALE Bit) ..... 1926
23.12 Start Condition/Restart Condition/Stop Condition Issuing Function ..... 1927
23.12.1 Issuing a Start Condition ..... 1927
23.12.2 Issuing a Restart Condition ..... 1927
23.12.3 Issuing a Stop Condition ..... 1929
23.13 Bus Hanging ..... 1930
23.13.1 Timeout Function ..... 1930
23.13.2 Extra SCL Clock Cycle Output Function ..... 1932
23.13.3 RIIC Reset and Internal Reset ..... 1933
23.14 Reset Function of RIIC ..... 1934
Section 24 CANFD Interface (RS-CANFD) ..... 1936
24.1 Features of RH850/F1KH, RH850/F1KM RS-CANFD ..... 1936
24.1.1 Number of Units and Channels ..... 1936
24.1.2 Register Base Addresses ..... 1943
24.1.3 Clock Supply ..... 1944
24.1.4 Interrupt Requests ..... 1945
24.1.5 Reset Sources. ..... 1949
24.1.6 External Input/Output Signals ..... 1949
24.2 Overview ..... 1950
24.2.1 Functional Overview. ..... 1950
24.2.2 Interface Modes ..... 1953
24.2.3 CAN FD Protocol ..... 1953
24.2.4 Block Diagram ..... 1954
24.3 Registers ..... 1955
24.3.1 List of Registers ..... 1955
24.3.2 Details of Channel-related Registers ..... 1961
24.3.2.1 RCFDCnCFDCmNCFG - Channel Nominal Bit Rate Configuration Register ( $\mathrm{m}=0$ to 7) ..... 1961
24.3.2.2 RCFDCnCFDCmCTR — Channel Control Register ( $m=0$ to 7) ..... 1963
24.3.2.3 RCFDCnCFDCmSTS — Channel Status Register ( $m=0$ to 7) ..... 1969
24.3.2.4 RCFDCnCFDCmERFL — Channel Error Flag Register ( $m=0$ to 7) ..... 1972
24.3.2.5 RCFDCnCFDCmDCFG - Channel Data Bit Rate Configuration Register ( $\mathrm{m}=0$ to 7 ) ..... 1976
24.3.2.6 RCFDCnCFDCmFDCFG - Channel CAN FD Configuration Register ( $\mathrm{m}=0$ to 7) ..... 1979
24.3.2.7 RCFDCnCFDCmFDCTR — Channel CAN FD Control Register ( $m=0$ to 7) ..... 1983
24.3.2.8 RCFDCnCFDCmFDSTS — Channel CAN FD Status Register ( $m=0$ to 7 ) ..... 1984
24.3.2.9 RCFDCnCFDCmFDCRC — Channel CAN FD CRC Register ( $m=0$ to 7) ..... 1986
24.3.3 Details of Global-related Registers ..... 1988
24.3.3.1 RCFDCnCFDGCFG - Global Configuration Register ..... 1988
24.3.3.2 RCFDCnCFDGCTR — Global Control Register ..... 1992
24.3.3.3 RCFDCnCFDGSTS - Global Status Register ..... 1994
24.3.3.4 RCFDCnCFDGERFL — Global Error Flag Register ..... 1996
24.3.3.5 RCFDCnCFDGTSC — Global Timestamp Counter Register. ..... 1999
24.3.3.6 RCFDCnCFDGTINTSTS0 - Global TX Interrupt Status Register 0 ..... 2000
24.3.3.7 RCFDCnCFDGTINTSTS1 - Global TX Interrupt Status Register 1 ..... 2003
24.3.3.8 RCFDCnCFDGFDCFG — Global FD Configuration Register ..... 2006
24.3.4 Details of Receive Rule-related Registers ..... 2007
24.3.4.1 RCFDCnCFDGAFLECTR — Receive Rule Entry Control Register ..... 2007
24.3.4.2 RCFDCnCFDGAFLCFG0 — Receive Rule Configuration Register 0 ..... 2008
24.3.4.3 RCFDCnCFDGAFLCFG1 — Receive Rule Configuration Register 1 ..... 2010
24.3.4.4 RCFDCnCFDGAFLIDj — Receive Rule ID Register ( $\mathrm{j}=0$ to 15) ..... 2012
24.3.4.5 RCFDCnCFDGAFLMj — Receive Rule Mask Register ( $\mathrm{j}=0$ to 15) ..... 2014
24.3.4.6 RCFDCnCFDGAFLP0 j - Receive Rule Pointer 0 Register ( $\mathrm{j}=0$ to 15) ..... 2016
24.3.4.7 RCFDCnCFDGAFLP1 $\dot{j}$ - Receive Rule Pointer 1 Register ( $\mathrm{j}=0$ to 15) ..... 2018
24.3.5 Details of Receive Buffer-related Registers ..... 2019
24.3.5.1 RCFDCnCFDRMNB — Receive Buffer Number Register ..... 2019
24.3.5.2 RCFDCnCFDRMNDy — Receive Buffer New Data Register ( $\mathrm{y}=0$ to 3) ..... 2020
24.3.5.3 RCFDCnCFDRMIDq — Receive Buffer ID Register ( $q=0$ to 127) ..... 2021
24.3.5.4 RCFDCnCFDRMPTRq — Receive Buffer Pointer Register ( $q=0$ to 127) ..... 2023
24.3.5.5 RCFDCnCFDRMFDSTSq — Receive Buffer CAN FD Status Register ( $q=0$ to 127) ..... 2025
24.3.5.6 RCFDCnCFDRMDFb_q — Receive Buffer Data Field Register ( $b=0$ to $15, q=0$ to 127) ..... 2027
24.3.6 Details of Receive FIFO Buffer-related Registers ..... 2028
24.3.6.1 RCFDCnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ..... 2028
24.3.6.2 RCFDCnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ..... 2031
24.3.6.3 RCFDCnCFDRFPCTRx - Receive FIFO Buffer Pointer Control Register ( $\mathrm{x}=0$ to 7) ..... 2033
24.3.6.4 RCFDCnCFDRFIDx - Receive FIFO Buffer Access ID Register ( $x=0$ to 7) ..... 2034
24.3.6.5 RCFDCnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register ( $\mathrm{x}=0$ to 7) ..... 2036
24.3.6.6 RCFDCnCFDRFFDSTSx - Receive FIFO CAN FD Status Register ( $\mathrm{x}=0$ to 7 ) ..... 2038
24.3.6.7 RCFDCnCFDRFDFd_x — Receive FIFO Buffer Access Data Field Register ( $\mathrm{d}=0$ to $15, \mathrm{x}=0$ to 7 ) ..... 2040
24.3.7 Transmit/Receive FIFO Buffer-related Registers ..... 2041
24.3.7.1 RCFDCnCFDCFCCk - Transmit/receive FIFO Buffer Configuration and Control Register (k=0 to 23) ..... 2041
24.3.7.2 RCFDCnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 23). ..... 2045
24.3.7.3 RCFDCnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 23) ..... 2048
24.3.7.4 RCFDCnCFDCFIDk - Transmit/receive FIFO Buffer Access ID Register (k = 0 to 23) ..... 2050
24.3.7.5 RCFDCnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register ( $\mathrm{k}=0$ to 23) ..... 2052
24.3.7.6 RCFDCnCFDCFFDCSTSk — Transmit/receive FIFO CAN FD Configuration/status Register (k=0 to 23) ..... 2054
24.3.7.7 RCFDCnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field Register ( $\mathrm{d}=0$ to 15, k=0 to 23) ..... 2056
24.3.8 Details of FIFO Status-related Registers ..... 2057
24.3.8.1 RCFDCnCFDFESTS — FIFO Empty Status Register ..... 2057
24.3.8.2 RCFDCnCFDFFSTS — FIFO Full Status Register ..... 2059
24.3.8.3 RCFDCnCFDFMSTS — FIFO Message Lost Status Register ..... 2061
24.3.8.4 RCFDCnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ..... 2063
24.3.8.5 RCFDCnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ..... 2064
24.3.8.6 RCFDCnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ..... 2066
24.3.9 Details of FIFO DMA-related Registers ..... 2068
24.3.9.1 RCFDCnCFDCDTCT — DMA Enable Register ..... 2068
24.3.9.2 RCFDCnCFDCDTSTS — DMA Status Register ..... 2070
24.3.10 Details of Transmit Buffer-related Registers ..... 2072
24.3.10.1 RCFDCnCFDTMCp - Transmit Buffer Control Register ( $\mathrm{p}=0$ to 255) ..... 2072
24.3.10.2 RCFDCnCFDTMSTSp — Transmit Buffer Status Register ( $\mathrm{p}=0$ to 255) ..... 2074
24.3.10.3 RCFDCnCFDTMIDp — Transmit Buffer ID Register ( $p=0$ to 255) ..... 2076
24.3.10.4 RCFDCnCFDTMPTRp - Transmit Buffer Pointer Register ( $p=0$ to 255) ..... 2078
24.3.10.5 RCFDCnCFDTMFDCTRp - Transmit Buffer CAN FD Configuration Register ( $\mathrm{p}=0$ to 255) ..... 2080
24.3.10.6 RCFDCnCFDTMDFb_p - Transmit Buffer Data Field Register (b = 0 to 15, $\mathrm{p}=0$ to 255) ..... 2082
24.3.10.7 RCFDCnCFDTMIECm — Transmit Buffer Interrupt Enable Configuration Register ( $\mathrm{m}=0$ to 7 ) ..... 2083
24.3.11 Details of Transmit Buffer Status-related Registers ..... 2085
24.3.11.1 RCFDCnCFDTMTRSTSm — Transmit Buffer Transmit Request Status Register ( $\mathrm{m}=0$ to 7) ..... 2085
24.3.11.2 RCFDCnCFDTMTARSTSm — Transmit Buffer Transmit Abort Request Status Register ( $\mathrm{m}=0$ to 7 ) ..... 2087
24.3.11.3 RCFDCnCFDTMTCSTSm - Transmit Buffer Transmit Complete Status Register ( $\mathrm{m}=0$ to 7) ..... 2089
24.3.11.4 RCFDCnCFDTMTASTSm - Transmit Buffer Transmit Abort Status Register ( $\mathrm{m}=0$ to 7 ) ..... 2091
24.3.12 Details of Transmit Queue-related Registers ..... 2093
24.3.12.1 RCFDCnCFDTXQCCm — Transmit Queue Configuration and Control Register ( $\mathrm{m}=0$ to 7) ..... 2093
24.3.12.2 RCFDCnCFDTXQSTSm - Transmit Queue Status Register ( $m=0$ to 7) ..... 2095
24.3.12.3 RCFDCnCFDTXQPCTRm - Transmit Queue Pointer Control Register ( $\mathrm{m}=0$ to 7) ..... 2097
24.3.13 Details of Transmit History-related Registers ..... 2098
24.3.13.1 RCFDCnCFDTHLCCm — Transmit History Configuration and Control Register ( $\mathrm{m}=0$ to 7 ) ..... 2098
24.3.13.2 RCFDCnCFDTHLSTSm — Transmit History Status Register ( $m=0$ to 7) ..... 2100
24.3.13.3 RCFDCnCFDTHLPCTRm - Transmit History Pointer Control Register ( $\mathrm{m}=0$ to 7) ..... 2102
24.3.13.4 RCFDCnCFDTHLACCOm — Transmit History Access Register 0 ( $m=0$ to 7). ..... 2103
24.3.13.5 RCFDCnCFDTHLACC1m — Transmit History Access Register 1 ( $\mathrm{m}=0$ to 7) ..... 2104
24.3.14 Details of Test-related Registers ..... 2105
24.3.14.1 RCFDCnCFDGTSTCFG — Global Test Configuration Register ..... 2105
24.3.14.2 RCFDCnCFDGTSTCTR — Global Test Control Register ..... 2108
24.3.14.3 RCFDCnCFDGLOCKK — Global Lock Key Register ..... 2109
24.3.14.4 RCFDCnCFDRPGACCr — RAM Test Page Access Register ( $\mathrm{r}=0$ to 63) ..... 2110
24.4 Interrupt Sources and DMA Trigger ..... 2111
24.4.1 Interrupt Sources ..... 2111
24.4.2 DMA Trigger ..... 2115
24.5 CAN Modes ..... 2116
24.5.1 Global Modes ..... 2116
24.5.1.1 Global Stop Mode ..... 2118
24.5.1.2 Global Reset Mode ..... 2118
24.5.1.3 Global Test Mode ..... 2118
24.5.1.4 Global Operating Mode ..... 2118
24.5.2 Channel Modes ..... 2119
24.5.2.1 Channel Stop Mode ..... 2120
24.5.2.2 Channel Reset Mode ..... 2120
24.5.2.3 Channel Halt Mode ..... 2121
24.5.2.4 Channel Communication Mode ..... 2121
24.5.2.5 Bus Off State ..... 2122
24.5.3 Initializing Registers by Transition to CAN Mode ..... 2123
24.6 Reception Functions ..... 2125
24.6.1 Data Processing Using the Receive Rule Table ..... 2125
24.6.1.1 Acceptance Filter Processing ..... 2126
24.6.1.2 DLC Filter Processing ..... 2127
24.6.1.3 Routing Processing ..... 2127
24.6.1.4 Label Addition Processing ..... 2127
24.6.1.5 Mirror Function Processing ..... 2127
24.6.1.6 Timestamp ..... 2128
24.7 Transmission Functions ..... 2129
24.7.1 Transmit Priority Determination ..... 2130
24.7.2 Transmission Using Transmit Buffers ..... 2131
24.7.2.1 Transmit Abort Function ..... 2131
24.7.2.2 One-Shot Transmission Function (Retransmission Disabling Function) ..... 2131
24.7.3 Transmission Using FIFO Buffers ..... 2132
24.7.3.1 Interval Transmission Function ..... 2132
24.7.4 Transmission Using Transmit Queues ..... 2135
24.7.5 Transmit Data Padding (in CAN FD Mode and in CAN FD only Mode) ..... 2135
24.7.6 Transmit History Function ..... 2135
24.8 Gateway Function ..... 2138
24.8.1 CAN-CAN FD Gateway. ..... 2138
24.9 Test Function ..... 2139
24.9.1 Standard Test Mode ..... 2139
24.9.2 Listen-Only Mode ..... 2139
24.9.3 Self-Test Mode (Loopback Mode) ..... 2140
24.9.3.1 Self-Test Mode 0 (External Loopback Mode) ..... 2140
24.9.3.2 Self-Test Mode 1 (Internal Loopback Mode) ..... 2141
24.9.4 Restricted Operation Mode (CAN FD Mode and CAN FD Only Mode) ..... 2141
24.9.5 RAM Test ..... 2141
24.9.6 Inter-Channel Communication Test ..... 2142
24.9.6.1 CRC Error Test ..... 2143
24.10 RS-CANFD Setting Procedure ..... 2144
24.10.1 Initial Settings ..... 2144
24.10.1.1 Clock Setting ..... 2146
24.10.1.2 Bit Timing Setting ..... 2146
24.10.1.3 Communication Speed Setting ..... 2148
24.10.1.4 Receive Rule Setting ..... 2150
24.10.1.5 Buffer Setting ..... 2151
24.10.1.6 Transmitter Delay Compensation ..... 2153
24.10.2 Reception Procedure ..... 2154
24.10.2.1 Receive Buffer Reading Procedure ..... 2154
24.10.2.2 FIFO Buffer Reading Procedure ..... 2156
24.10.2.3 FIFO Buffer Reading Procedure by DMA Transfer. ..... 2160
24.10.3 Transmission Procedure ..... 2161
24.10.3.1 Procedure for Transmission from Transmit Buffers ..... 2161
24.10.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers ..... 2165
24.10.3.3 Procedure for Transmission from the Transmit Queue ..... 2169
24.10.3.4 Transmit History Buffer Reading Procedure ..... 2170
24.10.4 Test Settings ..... 2171
24.10.4.1 Self-Test Mode Setting Procedure ..... 2171
24.10.4.2 Procedure for Releasing the Protection ..... 2172
24.10.4.3 RAM Test Setting Procedure ..... 2173
24.10.4.4 Inter-Channel Communication Test Setting Procedure ..... 2174
24.11 Notes on the RS-CANFD Module ..... 2175
24.12 Detection and Correction of Errors in RS-CANFD RAM ..... 2177
Section 25 FlexRay (FLXA) ..... 2178
25.1 Features of RH850/F1KH, RH850/F1KM FLXA ..... 2178
25.1.1 Number of Units and Channels ..... 2178
25.1.2 Register Base Address ..... 2180
25.1.3 Clock Supply ..... 2180
25.1.4 Interrupt Requests ..... 2181
25.1.5 Reset Sources ..... 2182
25.1.6 External Input/Output Signals ..... 2182
25.1.7 Functions ..... 2183
25.1.8 Block Diagram ..... 2184
25.2 Registers ..... 2187
25.2.1 List of Registers ..... 2187
25.2.2 FlexRay Operation Register. ..... 2190
25.2.2.1 FLXAnFROC - FlexRay Operation Control Register ..... 2190
25.2.2.2 FLXAnFROS — FlexRay Operation Status Register ..... 2193
25.2.3 Special Registers ..... 2195
25.2.3.1 FLXAnFRTEST1 — FlexRay Test Register 1 ..... 2195
25.2.3.2 FLXAnFRTEST2 — FlexRay Test Register 2 ..... 2200
25.2.3.3 FLXAnFRLCK — FlexRay Lock Register ..... 2201
25.2.4 Interrupt Registers ..... 2202
25.2.4.1 FLXAnFREIR — FlexRay Error Interrupt Register ..... 2202
25.2.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register ..... 2207
25.2.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register ..... 2213
25.2.4.4 FLXAnFRSILS — FlexRay Status Interrupt Line Select Register ..... 2215
25.2.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register ..... 2217
25.2.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register ..... 2219
25.2.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register ..... 2221
25.2.4.8 FLXAnFRSIER — FlexRay Status Interrupt Disable Register ..... 2223
25.2.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register ..... 2225
25.2.5 FlexRay Timer Registers ..... 2226
25.2.5.1 FLXAnFRTOC — FlexRay Timer 0 Configuration Register ..... 2226
25.2.5.2 FLXAnFRT1C - FlexRay Timer 1 Configuration Register ..... 2228
25.2.5.3 FLXAnFRT2C — FlexRay Timer 2 Configuration Register ..... 2230
25.2.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1 ..... 2232
25.2.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2 ..... 2235
25.2.6 CC Control Registers ..... 2236
25.2.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1 ..... 2236
25.2.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2 ..... 2243
25.2.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3 ..... 2244
25.2.6.4 FLXAnFRNEMC — FlexRay NEM Configuration Register ..... 2245
25.2.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1 ..... 2246
25.2.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2 ..... 2249
25.2.6.7 FLXAnFRMHDC - FlexRay MHD Configuration Register ..... 2251
25.2.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1 ..... 2252
25.2.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2 ..... 2253
25.2.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3 ..... 2254
25.2.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4 ..... 2256
25.2.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5 ..... 2258
25.2.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6 ..... 2260
25.2.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7 ..... 2261
25.2.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8 ..... 2262
25.2.6.16 FLXAnFRGTUC9 — FlexRay GTU Configuration Register 9 ..... 2263
25.2.6.17 FLXAnFRGTUC10 - FlexRay GTU Configuration Register 10 ..... 2265
25.2.6.18 FLXAnFRGTUC11 — FlexRay GTU Configuration Register 11 ..... 2266
25.2.7 CC Status Registers ..... 2268
25.2.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register ..... 2268
25.2.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register ..... 2272
25.2.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register ..... 2274
25.2.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register ..... 2275
25.2.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register. ..... 2276
25.2.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register ..... 2277
25.2.7.7 FLXAnFRSFS — FlexRay Sync Frame Status Register ..... 2278
25.2.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register ..... 2281
25.2.7.9 FLXAnFRACS - FlexRay Aggregated Channel Status Register ..... 2284
25.2.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m ( $m=1$ to 15) ..... 2288
25.2.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m ( $m=1$ to 15) ..... 2290
25.2.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m ( $m=1$ to 3 ) ..... 2292
25.2.8 Message Buffer Control Registers ..... 2293
25.2.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register ..... 2293
25.2.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register ..... 2297
25.2.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register ..... 2299
25.2.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register ..... 2300
25.2.9 Message Buffer Status Registers ..... 2301
25.2.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register ..... 2301
25.2.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register ..... 2304
25.2.9.3 FLXAnFRFSR — FlexRay FIFO Status Register ..... 2305
25.2.9.4 FLXAnFRMHDF - FlexRay Message Handler Constraints Flags Register ..... 2307
25.2.9.5 FLXAnFRTXRQi — FlexRay Transmission Request i $(i=1$ to 4) ..... 2311
25.2.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i=1 to 4) ..... 2312
25.2.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i ( $\mathrm{i}=1$ to 4 ) ..... 2313
25.2.10 Input Buffer ..... 2314
25.2.10.1 FLXAnFRWRDSx — FlexRay Write Data Section Register x (x = 1 to 64) ..... 2315
25.2.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1 ..... 2316
25.2.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2 ..... 2319
25.2.10.4 FLXAnFRWRHS3 - FlexRay Write Header Section Register 3 ..... 2320
25.2.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register ..... 2321
25.2.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register ..... 2323
25.2.11 Output Buffer ..... 2325
25.2.11.1 FLXAnFRRDDSx — FlexRay Read Data Section Register $x$ ( $x=1$ to 64) ..... 2325
25.2.11.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1 ..... 2327
25.2.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2 ..... 2329
25.2.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3 ..... 2331
25.2.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register ..... 2333
25.2.11.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register ..... 2339
25.2.11.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register. ..... 2341
25.2.12 Data Transfer Control Register ..... 2343
25.2.12.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register ..... 2343
25.2.12.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register ..... 2346
25.2.12.3 FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register ..... 2349
25.2.12.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register ..... 2350
25.2.12.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register ..... 2351
25.2.12.6 FLXAnFRIQC - FlexRay Input Queue Control Register ..... 2352
25.2.12.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register ..... 2353
25.2.12.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register ..... 2354
25.2.12.9 FLXAnFRAHBC — FlexRay H-Bus Configuration Register ..... 2356
25.2.13 Data Transfer Status Register ..... 2357
25.2.13.1 FLXAnFRITS — FlexRay Input Transfer Status Register ..... 2357
25.2.13.2 FLXAnFROTS — FlexRay Output Transfer Status Register ..... 2361
25.2.13.3 FLXAnFRAES — FlexRay Access Error Status Register. ..... 2366
25.2.13.4 FLXAnFRAEA — FlexRay Access Error Address Register ..... 2369
25.2.13.5 FLXAnFRDAi — FlexRay Message Data Available Register i (i=0 to 3) ..... 2370
25.3 Functional Description ..... 2372
25.3.1 FlexRay Module Operation Control ..... 2372
25.3.1.1 FlexRay Module Enable ..... 2372
25.3.1.2 FlexRay Module Disable ..... 2373
25.3.2 Communication Cycle ..... 2375
25.3.2.1 Static Segment ..... 2375
25.3.2.2 Dynamic Segment ..... 2376
25.3.2.3 Symbol Window ..... 2376
25.3.2.4 Network Idle Time (NIT) ..... 2376
25.3.2.5 Configuration of NIT Start and Offset Correction Start ..... 2377
25.3.3 Communication Modes ..... 2378
25.3.3.1 Time-Triggered Distributed (TT-D) ..... 2378
25.3.4 Clock Synchronization ..... 2379
25.3.4.1 Global Time ..... 2379
25.3.4.2 Local Time ..... 2379
25.3.4.3 Synchronization Process ..... 2379
25.3.5 Error Handling ..... 2381
25.3.5.1 Clock Correction Failed Counter ..... 2381
25.3.5.2 Passive to Active Counter ..... 2382
25.3.5.3 HALT Command ..... 2382
25.3.5.4 FREEZE Command ..... 2382
25.3.6 Communication Controller States ..... 2383
25.3.6.1 Communication Controller State Diagram ..... 2383
25.3.6.2 DEFAULT_CONFIG State ..... 2384
25.3.6.3 CONFIG State ..... 2385
25.3.6.4 READY State ..... 2385
25.3.6.5 WAKEUP State ..... 2386
25.3.6.6 STARTUP State ..... 2390
25.3.6.7 NORMAL_ACTIVE State ..... 2395
25.3.6.8 NORMAL_PASSIVE State ..... 2395
25.3.6.9 HALT State ..... 2396
25.3.7 Network Management ..... 2397
25.3.8 Filtering and Masking ..... 2398
25.3.8.1 Slot Counter Filtering ..... 2398
25.3.8.2 Cycle Counter Filtering ..... 2399
25.3.8.3 Channel ID Filtering ..... 2400
25.3.8.4 FIFO Filtering ..... 2400
25.3.9 Transmit Process ..... 2401
25.3.9.1 Static Segment ..... 2401
25.3.9.2 Dynamic Segment ..... 2401
25.3.9.3 Transmit Buffers. ..... 2401
25.3.9.4 Frame Transmission ..... 2402
25.3.9.5 Null Frame Transmission ..... 2403
25.3.10 Receive Process ..... 2404
25.3.10.1 Dedicated Receive Buffers ..... 2404
25.3.10.2 Frame Reception ..... 2404
25.3.10.3 Null Frame Reception ..... 2405
25.3.11 FIFO Function ..... 2406
25.3.11.1 Description ..... 2406
25.3.11.2 Configuration of the FIFO ..... 2408
25.3.11.3 Access to the FIFO ..... 2408
25.3.12 Message Handling ..... 2409
25.3.12.1 Reconfiguration of Message Buffers ..... 2409
25.3.12.2 Host Access to Message RAM ..... 2411
25.3.12.3 FlexRay Protocol Controller Access to Message RAM ..... 2417
25.3.13 Message RAM ..... 2418
25.3.13.1 Header Partition ..... 2420
25.3.13.2 Data Partition ..... 2424
25.3.13.3 Message Data Integrity Check ..... 2425
25.3.13.4 Host Handling of Access Errors ..... 2427
25.3.14 Module Interrupt ..... 2428
25.3.15 Assignment of FlexRay Configuration Parameters ..... 2429
25.3.16 Usage of Data Transfer ..... 2431
25.3.16.1 Input Data Transfer. ..... 2432
25.3.16.2 Output Data Transfer ..... 2441
25.3.16.3 Data Structure Transfer Scheduling ..... 2451
25.3.16.4 Behavior in Case of Data Transfer Access Error. ..... 2452
25.3.16.5 Behaviors in Case of RAM Read Errors ..... 2454
25.3.16.6 Data Transfer Timings ..... 2456
25.3.17 Byte Alignment ..... 2459
25.3.17.1 Little Endian Alignment ..... 2459
25.3.17.2 Big Endian Alignment. ..... 2460
25.4 Detection and Correction of Errors in FlexRay RAM ..... 2461
Section 26 Ethernet AVB (ETNB) ..... 2462
26.1 Features of RH850/F1KH, RH850/F1KM ETNB ..... 2462
26.1.1 Number of Units ..... 2462
26.1.2 Register Base Addresses ..... 2463
26.1.3 Clock Supply ..... 2463
26.1.4 Interrupt Requests ..... 2464
26.1.5 Reset Sources ..... 2464
26.1.6 External Input/Output Signals ..... 2465
26.2 Overview ..... 2467
26.2.1 Functional Overview ..... 2467
26.2.2 Block Diagram ..... 2468
26.3 Registers ..... 2469
26.3.1 List of Registers ..... 2469
26.3.2 ETNBnCCC - AVB-DMAC Mode Register ..... 2471
26.3.3 ETNBnDBAT — Descriptor Base Address Table Register ..... 2474
26.3.4 ETNBnDLR — Descriptor Base Address Load Request Register ..... 2475
26.3.5 ETNBnCSR - AVB-DMAC Status Register ..... 2478
26.3.6 ETNBnCDARq — Current Descriptor Address Register q ( $q=0$ to 21) ..... 2481
26.3.7 ETNBnESR - Error Status Register ..... 2482
26.3.8 ETNBnRCR — Receive Configuration Register ..... 2484
26.3.9 ETNBnRQCi — Receive Queue Configuration Register i ( $\mathrm{i}=0$ to 4) ..... 2487
26.3.10 ETNBnRPC — Receive Padding Configuration Register ..... 2489
26.3.11 ETNBnUFCS — Unread Frame Counter Stop Level Configuration Register ..... 2490
26.3.12 ETNBnUFCVi — Unread Frame Counter Register i (i=0 to 4) ..... 2491
26.3.13 ETNBnUFCDi — Unread Frame Counter Decrement Register i ( $i=0$ to 4) ..... 2492
26.3.14 ETNBnSFO - Separation Filter Offset Register ..... 2494
26.3.15 ETNBnSFPi — Separation Filter Pattern Register i (i=0 to 31) ..... 2495
26.3.16 ETNBnSFMi — Separation Filter Mask Register i (i=0 or 1) ..... 2496
26.3.17 ETNBnTGC — Transmit Configuration Register ..... 2497
26.3.18 ETNBnTCCR - Transmit Configuration Control Register ..... 2499
26.3.19 ETNBnTSR — Transmit Status Register ..... 2501
26.3.20 ETNBnTFA0 - Timestamp FIFO Access Register 0 ..... 2503
26.3.21 ETNBnTFA1 — Timestamp FIFO Access Register 1 ..... 2504
26.3.22 ETNBnTFA2 - Timestamp FIFO Access Register 2 ..... 2505
26.3.23 ETNBnCIVRc - CBS Increment Value Register c (c=0 or 1) ..... 2506
26.3.24 ETNBnCDVRc - CBS Decrement Value Register c (c = 0 or 1) ..... 2507
26.3.25 ETNBnCULc - CBS Upper Limit Register c (c = 0 or 1) ..... 2508
26.3.26 ETNBnCLLc - CBS Lower Limit Register c (c = 0 or 1) ..... 2509
26.3.27 ETNBnDIC — Descriptor Interrupt Control Register ..... 2510
26.3.28 ETNBnDIS — Descriptor Interrupt Status Register ..... 2512
26.3.29 ETNBnEIC - Error Interrupt Control Register ..... 2514
26.3.30 ETNBnEIS — Error Interrupt Status Register ..... 2516
26.3.31 ETNBnRIC0 - Receive Interrupt Control Register 0 ..... 2520
26.3.32 ETNBnRISO — Receive Interrupt Status Register 0 ..... 2522
26.3.33 ETNBnRIC1 — Receive Interrupt Control Register 1 ..... 2524
26.3.34 ETNBnRIS1 — Receive Interrupt Status Register 1 ..... 2525
26.3.35 ETNBnRIC2 — Receive Interrupt Control Register 2 ..... 2526
26.3.36 ETNBnRIS2 — Receive Interrupt Status Register 2 ..... 2528
26.3.37 ETNBnTIC — Transmit Interrupt Control Register ..... 2531
26.3.38 ETNBnTIS — Transmit Interrupt Status Register ..... 2532
26.3.39 ETNBnISS — Interrupt Summary Status Register ..... 2534
26.3.40 ETNBnGCCR - gPTP Configuration Control Register ..... 2537
26.3.41 ETNBnGMTT — gPTP Maximum Transit Time Configuration Register ..... 2540
26.3.42 ETNBnGPTC - gPTP Presentation Time Comparison Register ..... 2541
26.3.43 ETNBnGTI - gPTP Timer Increment Configuration Register ..... 2542
26.3.44 ETNBnGTOi - gPTP Timer Offset Configuration Register i ( $\mathrm{i}=0$ to 2 ) ..... 2543
26.3.45 ETNBnGIC — gPTP Interrupt Control Register ..... 2544
26.3.46 ETNBnGIS - gPTP Interrupt Status Register ..... 2545
26.3.47 ETNBnGCTi - gPTP Timer Capture Register i (i = 0 to 2). ..... 2546
26.3.48 ETNBnECMR - E-MAC Mode Register ..... 2547
26.3.49 ETNBnRFLR — Receive Frame Length Register ..... 2550
26.3.50 ETNBnECSR - E-MAC Status Register ..... 2551
26.3.51 ETNBnECSIPR — E-MAC Interrupt Permission Register ..... 2552
26.3.52 ETNBnPIR — PHY Interface Register ..... 2553
26.3.53 ETNBnPLSR — PHY LINK Status Register ..... 2554
26.3.54 ETNBnAPFTP - Auto PAUSE Frame Time Parameter Register ..... 2555
26.3.55 ETNBnMPR - Manual PAUSE Frame Register ..... 2556
26.3.56 ETNBnPFTCR — PAUSE Frame Transmit Counter ..... 2557
26.3.57 ETNBnPFRCR — PAUSE Frame Receive Counter ..... 2558
26.3.58 ETNBnMAHR — MAC Address High Register ..... 2559
26.3.59 ETNBnMALR — MAC Address Low Register ..... 2560
26.3.60 ETNBnTROCR — Transmit Retry Over Counter Register ..... 2561
26.3.61 ETNBnCDCR — Late Collision Detect Counter Register ..... 2562
26.3.62 ETNBnLCCR — Lost Carrier Counter Register ..... 2563
26.3.63 ETNBnCEFCR - CRC Error Frame Receive Counter Register ..... 2564
26.3.64 ETNBnFRECR — Frame Receive Error Counter Register ..... 2565
26.3.65 ETNBnTSFRCR — Too-Short Frame Receive Counter Register ..... 2566
26.3.66 ETNBnTLFRCR — Too-Long Frame Receive Counter Register ..... 2567
26.3.67 ETNBnRFCR — Residual-Bit Frame Receive Counter Register ..... 2568
26.3.68 ETNBnMAFCR — Multicast Address Frame Receive Counter Register ..... 2569
26.3.69 ETNBnIFCTL - Communication Interface Control Register. ..... 2570
26.4 Operation ..... 2571
26.4.1 AVB-DMAC Operating Modes ..... 2572
26.4.1.1 Operating Modes ..... 2573
26.4.1.2 How to Set the Operating Mode ..... 2574
26.4.1.3 Operating Mode Transitions Due to Hardware ..... 2576
26.4.2 Common Control for Transmission and Reception ..... 2577
26.4.2.1 Initialization Procedure ..... 2577
26.4.2.2 Scheduling Reception and Transmission ..... 2582
26.4.2.3 Checking Integrity ..... 2584
26.4.3 Descriptors ..... 2587
26.4.3.1 Data Representation in URAM ..... 2587
26.4.3.2 Using Descriptor Chains in Queues ..... 2589
26.4.3.3 Descriptor Base Address Table ..... 2590
26.4.3.4 Descriptor Chain Processing ..... 2591
26.4.3.5 Descriptor Interrupts ..... 2592
26.4.3.6 Descriptor Type ..... 2593
26.4.3.7 Tips for Optimizing Performance in Handling Descriptors ..... 2601
26.4.4 Control in Reception ..... 2602
26.4.4.1 Reception Queues ..... 2603
26.4.4.2 Setting Up Reception Descriptors ..... 2608
26.4.4.3 Reception Processing ..... 2610
26.4.4.4 Unread Frame Counters ..... 2617
26.4.5 Transmission Control ..... 2619
26.4.5.1 Transmission Modes ..... 2619
26.4.5.2 Setting Up Transmission Descriptors ..... 2625
26.4.5.3 Transmission ..... 2627
26.4.5.4 Timestamping in Transmission ..... 2632
26.4.6 CBS (Credit-Based Shaping) ..... 2635
26.4.6.1 Restrictions on CIV, CDV and Mfactor ..... 2639
26.4.6.2 Credit Incrementation During Inter-Frame Gaps (IFGs) ..... 2640
26.4.6.3 Example ..... 2641
26.4.7 IEEE802.1: gPTP ..... 2643
26.4.7.1 gPTP Timer ..... 2643
26.4.7.2 Free-Running Operation ..... 2644
26.4.7.3 Synchronization with the Grandmaster Clock ..... 2644
26.4.7.4 Support Provided by the gPTP Timer in Transmission and Reception ..... 2645
26.4.8 Support for IEEE 1722 ..... 2645
26.4.9 Flow Control ..... 2646
26.4.10 Interrupts ..... 2647
26.4.10.1 Transmit/Receive Data Management Interrupt ..... 2647
26.4.10.2 Error Management Interrupt ..... 2648
26.4.10.3 Other Management (FIFO Warning, etc.) Interrupts ..... 2648
26.4.10.4 E-MAC Interrupt ..... 2648
26.4.11 Flows of Operations ..... 2649
26.4.11.1 Flow of E-MAC Initialization ..... 2649
26.4.11.2 Flow of AVB-DMAC Initialization ..... 2650
26.4.11.3 Flow for the AVB-DMAC in Reception ..... 2651
26.4.11.4 Flow for the AVB-DMAC in Transmission ..... 2652
26.4.11.5 Flow for Stopping AVB-DMAC Operation in Reception ..... 2653
26.4.11.6 Flow for Stopping AVB-DMAC Operation in Transmission ..... 2653
26.4.11.7 Flow for Stopping and Resetting the AVB-DMAC ..... 2654
26.4.11.8 Flow for Emergency Stopping the AVB-DMAC ..... 2655
26.4.11.9 Flow of gPTP Initialization ..... 2656
26.4.11.10 Flow of gPTP Timestamping in Transmission ..... 2657
26.4.11.11 Flow of gPTP Timestamping and Synchronization in Reception ..... 2658
26.4.11.12 Flow of Capturing gPTP Presentation Times ..... 2659
26.4.11.13 Flow of AVTP Presentation Time Comparison ..... 2660
26.4.11.14 Flow of Loopback Mode Operation ..... 2661
26.4.12 Connection to PHY-LSI ..... 2662
26.4.12.1 MII Frame Transmission/Reception Timing ..... 2662
26.4.12.2 Accessing MII Registers ..... 2664
26.4.13 Usage Notes ..... 2667
26.4.13.1 Checksum Calculation of Ethernet Frames ..... 2667
26.4.13.2 Rx-FIFO Read Error May Not be Flagged when Using FEMPTY_ND Descriptor ..... 2668
26.4.13.3 When Trying to Release Non-Existing Timestamp FIFO Entry, New FIFO Update Flag May be Lost ..... 2668
26.4.13.4 gPTP Compare May Fail for Range of Compare Values ..... 2669
26.4.13.5 UFC Stop Level Triggers ETNBnRIS2.QFFr Even No Received Frame is Lost. ..... 2669
26.4.13.6 ETNBnRIS0.FRFr may be lost when Data Processing Stops Close to or Below the Configured Warning Level ..... 2669
26.4.13.7 Notes on Using the Intelligent Checksum Function ..... 2669
26.4.13.8 Receive Frame Interrupt and Descriptor Interrupt may be issued before Completion of Writing Data ..... 2669
26.5 Detection and Correction of Errors in Ethernet AVB RAM ..... 2670
Section 27 Single Edge Nibble Transmission (RSENT) ..... 2671
27.1 Features of RH850/F1KH, RH850/F1KM RSENT ..... 2671
27.1.1 Number of Units ..... 2671
27.1.2 Register Base Addresses ..... 2671
27.1.3 Clock Supply ..... 2672
27.1.4 Interrupt Requests ..... 2672
27.1.5 Reset Sources ..... 2672
27.1.6 External Input/Output Signals ..... 2672
27.2 Overview ..... 2673
27.2.1 Block Diagram ..... 2674
27.3 Registers ..... 2675
27.3.1 List of Registers ..... 2675
27.3.2 RSENTnTSPC — RSENT Timestamp Register ..... 2676
27.3.3 RSENTnTSC - RSENT Timestamp Counter ..... 2678
27.3.4 RSENTnCC — RSENT Communication Configuration Register ..... 2679
27.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register ..... 2682
27.3.6 RSENTnIDE — RSENT Interrupt/DMA Enable Register ..... 2684
27.3.7 RSENTnMDC — RSENT Mode Control Register ..... 2687
27.3.8 RSENTnSPCT — RSENT SPC Transmission Register ..... 2688
27.3.9 RSENTnMST — RSENT Mode Status Register ..... 2689
27.3.10 RSENTnCS — RSENT Communication Status Register ..... 2690
27.3.11 RSENTnCSC — RSENT Communication Status Clear Register ..... 2694
27.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register ..... 2696
27.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register ..... 2697
27.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register ..... 2699
27.3.15 RSENTnML — RSENT Message Length Register ..... 2700
27.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register. ..... 2701
27.3.17 RSENTnFRXD — RSENT Fast Channel Receive Data Register ..... 2702
27.3.18 RSENTnCPLM — RSENT Calibration Pulse Length Mirror Register ..... 2704
27.3.19 RSENTnMLM — RSENT Message Length Mirror Register ..... 2705
27.3.20 RSENTnFRTSM — RSENT Fast Channel Receive Timestamp Mirror Register ..... 2706
27.3.21 RSENTnEFRD0 — RSENT Expanded Fast Channel Receive Data Register 0 ..... 2707
27.3.22 RSENTnEFRD1 — RSENT Expanded Fast Channel Receive Data Register 1 ..... 2709
27.4 Operation ..... 2710
27.4.1 Modes of Operation ..... 2710
27.4.1.1 RESET Mode ..... 2711
27.4.1.2 CONFIGURATION Mode ..... 2711
27.4.1.3 OPERATION IDLE Mode ..... 2711
27.4.1.4 OPERATION ACTIVE Mode ..... 2711
27.4.1.5 Register Behavior in Operation Modes ..... 2712
27.4.2 Clock Configuration ..... 2713
27.4.2.1 Timestamp ..... 2713
27.4.2.2 Communication Clock Configuration ..... 2715
27.4.3 RSENT Operation ..... 2716
27.4.3.1 Changing Operation Modes ..... 2716
27.4.3.2 Message Reception ..... 2719
27.4.4 SPC Function ..... 2733
27.4.5 Interrupts and Checks ..... 2735
Section 28 Reserved ..... 2737
Section 29 Window Watchdog Timer (WDTA) ..... 2738
29.1 Features of RH850/F1KH, RH850/F1KM WDTA ..... 2738
29.1.1 Number of Units ..... 2738
29.1.2 Register Base Addresses ..... 2739
29.1.3 Clock Supply ..... 2739
29.1.4 Interrupt Requests ..... 2740
29.1.5 Reset Sources. ..... 2741
29.1.6 Internal Input/Output Signals ..... 2741
29.1.7 State in RUN Mode and Stand-by Modes ..... 2742
29.2 Overview ..... 2743
29.2.1 Functional Overview. ..... 2743
29.2.2 Block Diagram ..... 2746
29.3 Registers. ..... 2747
29.3.1 List of Registers ..... 2747
29.3.2 WDTAnWDTE — WDTA Enable Register ..... 2748
29.3.3 WDTAnEVAC — WDTA Enable VAC Register ..... 2750
29.3.4 WDTAnREF — WDTA Reference Value Register ..... 2752
29.3.5 WDTAnMD — WDTA Mode Register ..... 2753
29.4 Interrupt Sources ..... 2754
29.5 Functions ..... 2755
29.5.1 WDTA after Reset Release ..... 2755
29.5.1.1 Start Modes ..... 2755
29.5.1.2 WDTA Settings after Reset Release ..... 2755
29.5.1.3 Default Start Mode Timing ..... 2756
29.5.1.4 Software Trigger Start Mode Timing ..... 2757
29.5.2 WDTA Trigger ..... 2758
29.5.2.1 Calculating an Activation Code when the VAC Function is Used ..... 2759
29.5.3 WDTA Error Detection ..... 2760
29.5.3.1 WDTA Error Mode ..... 2761
29.5.4 75\% Interrupt Request Signals ..... 2762
29.5.5 Window Function ..... 2764
Section 30 OS Timer (OSTM) ..... 2765
30.1 Features of RH850/F1KH, RH850/F1KM OSTM ..... 2765
30.1.1 Number of Units ..... 2765
30.1.2 Register Base Addresses ..... 2766
30.1.3 Clock Supply ..... 2766
30.1.4 Interrupt Requests ..... 2767
30.1.5 Reset Sources ..... 2768
30.2 Overview ..... 2769
30.2.1 Functional Overview. ..... 2769
30.2.2 Block Diagram ..... 2769
30.2.3 Count Clock ..... 2770
30.2.4 Interrupt Sources (OSTMTINT) ..... 2770
30.3 Registers ..... 2771
30.3.1 List of Registers ..... 2771
30.3.2 OSTMnCMP — OSTMn Compare Register ..... 2772
30.3.3 OSTMnCNT — OSTMn Counter Register ..... 2773
30.3.4 OSTMnTE — OSTMn Count Enable Status Register ..... 2774
30.3.5 OSTMnTS — OSTMn Count Start Trigger Register ..... 2775
30.3.6 OSTMnTT — OSTMn Count Stop Trigger Register ..... 2776
30.3.7 OSTMnCTL — OSTMn Control Register ..... 2777
30.3.8 OSTMnEMU — OSTMn Emulation Register ..... 2778
30.4 Operation ..... 2779
30.4.1 Starting and Stopping OSTM ..... 2779
30.4.2 Interval Timer Mode ..... 2779
30.4.2.1 Basic Operation in Interval Timer Mode ..... 2779
30.4.2.2 Operation when OSTMnCMP $=00000000 \mathrm{~h}$ ..... 2782
30.4.2.3 Setting Procedure for Interval Timer Mode ..... 2783
30.4.3 Free-Run Compare Mode ..... 2784
30.4.3.1 Basic Operation in Free-Run Compare Mode ..... 2784
30.4.3.2 Operation when OSTMnCMP $=00000000^{H}$ ..... 2786
30.4.3.3 Setting Procedure for Free-Run Compare Mode ..... 2786
Section 31 Timer Array Unit B (TAUB) ..... 2787
31.1 Features of RH850/F1KH, RH850/F1KM TAUB ..... 2787
31.1.1 Number of Units and Channels ..... 2787
31.1.2 Register Base Addresses ..... 2788
31.1.3 Clock Supply ..... 2788
31.1.4 Interrupt Requests ..... 2789
31.1.5 Reset Sources ..... 2791
31.1.6 External input/output Signals ..... 2792
31.1.7 TAUBn Input Selection ..... 2797
31.1.7.1 List of Registers ..... 2798
31.1.7.2 SELB_TAUBOI — TAUBTTINm Input Signal Selection Register ..... 2799
31.1.7.3 SELB_TAUB1I — TAUBTTINm Input Signal Selection Register ..... 2800
31.2 Overview ..... 2801
31.2.1 Functional Overview. ..... 2801
31.2.2 Terms ..... 2802
31.2.3 Functional List of Timer Operations ..... 2803
31.2.4 TAUB I/O and Interrupt Request Signals ..... 2804
31.2.5 Block Diagram ..... 2805
31.2.6 Description of Blocks ..... 2806
31.3 Registers ..... 2807
31.3.1 List of Registers ..... 2807
31.3.2 Details of TAUBn Prescaler Registers ..... 2808
31.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register ..... 2808
31.3.3 Details of TAUBn Control Registers ..... 2811
31.3.3.1 TAUBnCDRm - TAUBn Channel Data Register ..... 2811
31.3.3.2 TAUBnCNTm - TAUBn Channel Counter Register ..... 2812
31.3.3.3 TAUBnCMORm - TAUBn Channel Mode OS Register ..... 2813
31.3.3.4 TAUBnCMURm - TAUBn Channel Mode User Register ..... 2816
31.3.3.5 TAUBnCSRm - TAUBn Channel Status Register ..... 2817
31.3.3.6 TAUBnCSCm - TAUBn Channel Status Clear Trigger Register ..... 2817
31.3.3.7 TAUBnTS - TAUBn Channel Start Trigger Register ..... 2818
31.3.3.8 TAUBnTE - TAUBn Channel Enable Status Register ..... 2818
31.3.3.9 TAUBnTT — TAUBn Channel Stop Trigger Register ..... 2819
31.3.4 Details of TAUBn Simultaneous Rewrite Registers ..... 2820
31.3.4.1 TAUBnRDE - TAUBn Channel Reload Data Enable Register ..... 2820
31.3.4.2 TAUBnRDS - TAUBn Channel Reload Data Control Channel Select Register . ..... 2820
31.3.4.3 TAUBnRDM - TAUBn Channel Reload Data Mode Register ..... 2821
31.3.4.4 TAUBnRDC - TAUBn Channel Reload Data Control Register ..... 2821
31.3.4.5 TAUBnRDT - TAUBn Channel Reload Data Trigger Register ..... 2822
31.3.4.6 TAUBnRSF - TAUBn Channel Reload Status Register ..... 2822
31.3.5 Details of TAUBn Output Registers ..... 2823
31.3.5.1 TAUBnTOE - TAUBn Channel Output Enable Register. ..... 2823
31.3.5.2 TAUBnTO - TAUBn Channel Output Register ..... 2823
31.3.5.3 TAUBnTOM - TAUBn Channel Output Mode Register ..... 2824
31.3.5.4 TAUBnTOC - TAUBn Channel Output Configuration Register ..... 2825
31.3.5.5 TAUBnTOL - TAUBn Channel Output Active Level Register ..... 2826
31.3.6 Details of TAUBn Dead Time Output Registers ..... 2826
31.3.6.1 TAUBnTDE - TAUBn Channel Dead Time Output Enable Register ..... 2826
31.3.6.2 TAUBnTDL - TAUBn Channel Dead Time Output Level Register ..... 2827
31.3.7 TAUBn Emulation Register ..... 2828
31.3.7.1 TAUBnEMU - TAUBn Emulation Register ..... 2828
31.4 General Operating Procedure ..... 2829
31.5 Concepts of Synchronous Channel Operation ..... 2830
31.5.1 Rules of Synchronous Channel Operation Function ..... 2830
31.5.2 Simultaneous Start and Stop of Synchronous Channel Counters ..... 2832
31.5.2.1 Simultaneous Start and Stop within the Same Unit ..... 2832
31.6 Simultaneous Rewrite ..... 2833
31.6.1 Introduction ..... 2833
31.6.2 How to Control Simultaneous Rewrite ..... 2834
31.6.2.1 Initial Settings ..... 2835
31.6.2.2 Start Counter and Count Operation ..... 2835
31.6.2.3 Simultaneous Rewrite ..... 2835
31.6.3 Other General Rules of Simultaneous Rewrite ..... 2836
31.6.4 Types of Simultaneous Rewrite ..... 2837
31.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A) ..... 2837
31.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B) ..... 2838
31.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1) ..... 2840
31.7 Channel Output Modes ..... 2842
31.7.1 General Procedures for Specifying a Channel Output Mode ..... 2844
31.7.2 Channel Output Modes Controlled Independently by TAUBn Signals ..... 2845
31.7.2.1 Independent Channel Output Mode 1 ..... 2845
31.7.2.2 Independent Channel Output Mode 2 ..... 2845
31.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals ..... 2845
31.7.3.1 Synchronous Channel Output Mode 1 ..... 2845
31.7.3.2 Synchronous Channel Output Mode 2 ..... 2845
31.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output ..... 2846
31.8 Start Timing in Each Operating Modes ..... 2847
31.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode ..... 2847
31.8.2 Event Count Mode ..... 2848
31.8.3 Other Operating Modes ..... 2848
31.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts ..... 2849
31.10 Interrupt Generation upon Overflow ..... 2850
31.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function ..... 2851
31.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement) ..... 2852
31.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function ..... 2853
31.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) ..... 2854
31.11 TAUBTTINm Edge Detection ..... 2855
31.12 Independent Channel Operation Functions ..... 2856
31.12.1 Interval Timer Function ..... 2856
31.12.1.1 Overview ..... 2856
31.12.1.2 Equations ..... 2856
31.12.1.3 Block Diagram and General Timing Diagram ..... 2857
31.12.1.4 Register Settings ..... 2858
31.12.1.5 Operating Procedure for Interval Timer Function ..... 2860
31.12.1.6 Specific Timing Diagrams ..... 2861
31.12.2 TAUBTTINm Input Interval Timer Function ..... 2866
31.12.2.1 Overview ..... 2866
31.12.2.2 Block Diagram and General Timing Diagram ..... 2867
31.12.2.3 Register Settings ..... 2868
31.12.2.4 Operating Procedure for TAUBTTINm Input Interval Timer Function ..... 2869
31.12.2.5 Specific Timing Diagrams ..... 2870
31.12.3 Clock Divide Function ..... 2871
31.12.3.1 Overview ..... 2871
31.12.3.2 Block Diagram and General Timing Diagram ..... 2872
31.12.3.3 Register Settings ..... 2873
31.12.3.4 Operating Procedure for Clock Divide Function ..... 2874
31.12.3.5 Specific Timing Diagrams ..... 2875
31.12.4 External Event Count Function ..... 2877
31.12.4.1 Overview ..... 2877
31.12.4.2 Equations ..... 2877
31.12.4.3 Block Diagram and General Timing Diagram ..... 2878
31.12.4.4 Register Settings ..... 2879
31.12.4.5 Operating Procedure for External Event Count Function ..... 2880
31.12.4.6 Specific Timing Diagrams ..... 2881
31.12.5 One-Pulse Output Function ..... 2883
31.12.5.1 Overview ..... 2883
31.12.5.2 Equations ..... 2883
31.12.5.3 Block Diagram and General Timing Diagram ..... 2884
31.12.5.4 Register Settings ..... 2885
31.12.5.5 Operating Procedure for One-Pulse Output Function ..... 2886
31.12.6 TAUBTTINm Input Pulse Interval Measurement Function ..... 2887
31.12.6.1 Overview ..... 2887
31.12.6.2 Equations ..... 2888
31.12.6.3 Block Diagram and General Timing Diagram ..... 2888
31.12.6.4 Register Settings ..... 2889
31.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function ..... 2890
31.12.6.6 Specific Timing Diagrams: Overflow Behavior ..... 2891
31.12.7 TAUBTTINm Input Signal Width Measurement Function ..... 2895
31.12.7.1 Overview ..... 2895
31.12.7.2 Equations ..... 2896
31.12.7.3 Block Diagram and General Timing Diagram ..... 2896
31.12.7.4 Register Settings ..... 2897
31.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function ..... 2898
31.12.7.6 Specific Timing Diagrams: Overflow Behavior ..... 2899
31.12.8 TAUBTTINm Input Position Detection Function ..... 2904
31.12.8.1 Overview ..... 2904
31.12.8.2 Equations ..... 2904
31.12.8.3 Block Diagram and General Timing Diagram ..... 2905
31.12.8.4 Register Settings ..... 2906
31.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function ..... 2907
31.12.8.6 Specific Timing Diagrams ..... 2908
31.12.9 TAUBTTINm Input Period Count Detection Function ..... 2909
31.12.9.1 Overview ..... 2909
31.12.9.2 Equations ..... 2909
31.12.9.3 Block Diagram and General Timing Diagram ..... 2910
31.12.9.4 Register Settings ..... 2911
31.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function ..... 2912
31.12.9.6 Specific Timing Diagrams ..... 2913
31.12.9.7 Operation stop and restart ..... 2913
31.12.10 TAUBTTINm Input Pulse Interval Judgment Function ..... 2914
31.12.10.1 Overview ..... 2914
31.12.10.2 Block Diagram and General Timing Diagram ..... 2915
31.12.10.3 Register Settings ..... 2916
31.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function ..... 2917
31.12.11 TAUBTTINm Input Signal Width Judgment Function ..... 2918
31.12.11.1 Overview ..... 2918
31.12.11.2 Block Diagram and General Timing Diagram ..... 2919
31.12.11.3 Register Settings ..... 2920
31.12.11.4 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function ..... 2921
31.12.12 Overflow Interrupt Output Function (during TAUBTTINm Width Measurement) ..... 2922
31.12.12.1 Overview ..... 2922
31.12.12.2 Block Diagram and General Timing Diagram ..... 2923
31.12.12.3 Register Settings ..... 2924
31.12.12.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement) ..... 2925
31.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) ..... 2926
31.12.13.1 Overview ..... 2926
31.12.13.2 Block Diagram and General Timing Diagram ..... 2927
31.12.13.3 Register Settings ..... 2928
31.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection). ..... 2929
31.13 Independent Channel Simultaneous Rewrite Functions ..... 2930
31.13.1 Simultaneous Rewrite Trigger Generation Function Type 1 ..... 2930
31.13.1.1 Overview ..... 2930
31.13.1.2 Equations ..... 2931
31.13.1.3 Block Diagram and General Timing Diagram ..... 2932
31.13.1.4 Register Settings for The Upper Channel ..... 2934
31.13.1.5 Register Settings for the Lower Channel(s) ..... 2935
31.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1 ..... 2936
31.14 Synchronous Channel Operation Functions ..... 2937
31.14.1 PWM Output Function ..... 2937
31.14.1.1 Overview ..... 2937
31.14.1.2 Equations ..... 2938
31.14.1.3 Block Diagram and General Timing Diagram ..... 2938
31.14.1.4 Register Settings for the Master Channel ..... 2940
31.14.1.5 Register Settings for the Slave Channel(s) ..... 2942
31.14.1.6 Operating Procedure for PWM Output Function ..... 2944
31.14.1.7 Specific Timing Diagrams ..... 2945
31.14.2 One-Shot Pulse Output Function ..... 2949
31.14.2.1 Overview ..... 2949
31.14.2.2 Equations ..... 2950
31.14.2.3 Block Diagram and General Timing Diagram ..... 2950
31.14.2.4 Register Settings for the Master Channel ..... 2952
31.14.2.5 Register Settings for the Slave Channel ..... 2954
31.14.2.6 Operating Procedure for One-Shot Pulse Output Function ..... 2956
31.14.2.7 Specific Timing Diagrams ..... 2957
31.14.3 Delay Pulse Output Function ..... 2963
31.14.3.1 Overview ..... 2963
31.14.3.2 Equations ..... 2964
31.14.3.3 Block Diagram and General Timing Diagram ..... 2965
31.14.3.4 Register Settings for the Master Channel ..... 2967
31.14.3.5 Register Settings for Slave Channel 1 ..... 2969
31.14.3.6 Register Settings For Slave Channel 2 ..... 2971
31.14.3.7 Register Settings for Slave Channel 3 ..... 2973
31.14.3.8 Operating Procedure for Delay Pulse Output Function ..... 2974
31.14.3.9 Specific Timing Diagrams ..... 2976
31.14.4 AD Conversion Trigger Output Function Type 1 ..... 2978
31.14.4.1 Overview ..... 2978
31.14.4.2 Block Diagram and General Timing Diagram ..... 2978
31.14.5 Triangle PWM Output Function ..... 2980
31.14.5.1 Overview ..... 2980
31.14.5.2 Equations ..... 2981
31.14.5.3 Block Diagram and General Timing Diagram ..... 2982
31.14.5.4 Register Settings for the Master Channel ..... 2984
31.14.5.5 Register Settings for the Slave Channel(s) ..... 2986
31.14.5.6 Operating Procedure for Triangle PWM Output Function ..... 2988
31.14.5.7 Specific Timing Diagrams ..... 2989
31.14.6 Triangle PWM Output Function with Dead Time ..... 2991
31.14.6.1 Overview ..... 2991
31.14.6.2 Equations ..... 2993
31.14.6.3 Block Diagram and General Timing Diagram ..... 2994
31.14.6.4 Register Settings for the Master Channel ..... 2997
31.14.6.5 Register Settings for Slave Channel 2 ..... 2999
31.14.6.6 Register Settings for Slave Channel 3 ..... 3001
31.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time ..... 3003
31.14.6.8 Specific Timing Diagrams ..... 3004
31.14.7 A/D Conversion Trigger Output Function Type 2 ..... 3014
31.14.7.1 Overview ..... 3014
31.14.7.2 Block Diagram and General Timing Diagram ..... 3014
Section 32 Timer Array Unit D (TAUD) ..... 3016
32.1 Features of RH850/F1KH, RH850/F1KM TAUD ..... 3016
32.1.1 Number of Units and Channels ..... 3016
32.1.2 Register Base Address ..... 3017
32.1.3 Clock Supply ..... 3017
32.1.4 Interrupt Requests ..... 3018
32.1.5 Reset Sources ..... 3018
32.1.6 External Input/Output Signals ..... 3019
32.1.7 Internal Input/Output Signals ..... 3020
32.1.8 TAUDO Input Selection ..... 3020
32.1.8.1 List of Registers ..... 3021
32.1.8.2 SELB_TAUDOI — TAUDTTINm Input Signal Selection Register ..... 3021
32.2 Overview ..... 3022
32.2.1 Functional Overview ..... 3022
32.2.2 Terms ..... 3023
32.2.3 Functional List of Timer Operations ..... 3024
32.2.4 TAUD I/O and Interrupt Request Signals ..... 3025
32.2.5 Block Diagram ..... 3026
32.2.6 Description of Blocks ..... 3027
32.3 Registers ..... 3028
32.3.1 List of Registers ..... 3028
32.3.2 Details of TAUDn Prescaler Registers ..... 3029
32.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register ..... 3029
32.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register ..... 3032
32.3.3 Details of TAUDn Control Registers ..... 3033
32.3.3.1 TAUDnCDRm - TAUDn Channel Data Register ..... 3033
32.3.3.2 TAUDnCNTm - TAUDn Channel Counter Register ..... 3034
32.3.3.3 TAUDnCMORm - TAUDn Channel Mode OS Register ..... 3035
32.3.3.4 TAUDnCMURm - TAUDn Channel Mode User Register ..... 3038
32.3.3.5 TAUDnCSRm - TAUDn Channel Status Register ..... 3039
32.3.3.6 TAUDnCSCm - TAUDn Channel Status Clear Trigger Register ..... 3040
32.3.3.7 TAUDnTS - TAUDn Channel Start Trigger Register ..... 3040
32.3.3.8 TAUDnTE - TAUDn Channel Enable Status Register ..... 3041
32.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register ..... 3041
32.3.4 Details of TAUDn Simultaneous Rewrite Registers ..... 3042
32.3.4.1 TAUDnRDE - TAUDn Channel Reload Data Enable Register ..... 3042
32.3.4.2 TAUDnRDS - TAUDn Channel Reload Data Control Channel Select Register ..... 3042
32.3.4.3 TAUDnRDM - TAUDn Channel Reload Data Mode Register ..... 3043
32.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register ..... 3043
32.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register ..... 3044
32.3.4.6 TAUDnRSF - TAUDn Channel Reload Status Register ..... 3044
32.3.5 Details of TAUDn Output Registers ..... 3045
32.3.5.1 TAUDnTOE - TAUDn Channel Output Enable Register ..... 3045
32.3.5.2 TAUDnTO - TAUDn Channel Output Register ..... 3045
32.3.5.3 TAUDnTOM - TAUDn Channel Output Mode Register ..... 3046
32.3.5.4 TAUDnTOC - TAUDn Channel Output Configuration Register ..... 3046
32.3.5.5 TAUDnTOL - TAUDn Channel Output Active Level Register ..... 3047
32.3.6 Details of TAUDn Dead Time Output Registers ..... 3048
32.3.6.1 TAUDnTDE - TAUDn Channel Dead Time Output Enable Register ..... 3048
32.3.6.2 TAUDnTDM - TAUDn Channel Dead Time Output Mode Register ..... 3048
32.3.6.3 TAUDnTDL — TAUDn Channel Dead Time Output Level Register ..... 3049
32.3.7 Details of TAUDn Real-time/Modulation Output Registers ..... 3050
32.3.7.1 TAUDnTRE - TAUDn Channel Real-time Output Enable Register ..... 3050
32.3.7.2 TAUDnTRC - TAUDn Channel Real-time Output Control Register ..... 3050
32.3.7.3 TAUDnTRO - TAUDn Channel Real-time Output Register ..... 3051
32.3.7.4 TAUDnTME - TAUDn Channel Modulation Output Enable Register ..... 3051
32.3.8 TAUDn Emulation Register ..... 3052
32.3.8.1 TAUDnEMU - TAUDn Emulation Register ..... 3052
32.4 Operating Procedure ..... 3053
32.5 Concepts of Synchronous Channel Operation ..... 3054
32.5.1 Rules of Synchronous Channel Operation ..... 3054
32.5.2 Simultaneous Start and Stop of Synchronous Channel Counters ..... 3056
32.5.2.1 Simultaneous Start and Stop within the Same Unit ..... 3056
32.5.2.2 Simultaneous Start between the Units ..... 3056
32.6 Simultaneous Rewrite ..... 3057
32.6.1 Overview of Operations ..... 3057
32.6.2 How to Control Simultaneous Rewrite ..... 3059
32.6.2.1 Initial Settings ..... 3060
32.6.2.2 Start Counter and Count Operation ..... 3060
32.6.2.3 Simultaneous Rewrite ..... 3060
32.6.3 Other General Rules of Simultaneous Rewrite ..... 3061
32.6.4 Types of Simultaneous Rewrite ..... 3062
32.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A) ..... 3062
32.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B) ..... 3064
32.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1) ..... 3065
32.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2) ..... 3067
32.7 Channel Output Modes ..... 3069
32.7.1 General Procedures for Specifying a Channel Output Mode ..... 3071
32.7.2 Channel Output Modes Controlled Independently by TAUDn Signals ..... 3072
32.7.2.1 Independent Channel Output Mode 1 ..... 3072
32.7.2.2 Independent Channel Output Mode 1 with Real-Time Output ..... 3072
32.7.2.3 Independent Channel Output Mode 2. ..... 3073
32.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals ..... 3074
32.7.3.1 Synchronous Channel Output Mode 1 ..... 3074
32.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output ..... 3074
32.7.3.3 Synchronous Channel Output Mode 2 ..... 3074
32.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output ..... 3075
32.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output ..... 3076
32.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output. ..... 3077
32.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output ..... 3077
32.8 Start Timing in Each Operating Modes ..... 3078
32.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode ..... 3078
32.8.2 Event Count Mode ..... 3079
32.8.3 Other Operating Modes ..... 3079
32.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts ..... 3080
32.10 Interrupt Generation upon Overflow ..... 3081
32.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function ..... 3082
32.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width) ..... 3083
32.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function ..... 3084
32.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count) ..... 3085
32.11 TAUDTTINm Edge Detection ..... 3086
32.12 Independent Channel Operation Functions ..... 3087
32.12.1 Interval Timer Function ..... 3087
32.12.1.1 Overview ..... 3087
32.12.1.2 Equations ..... 3087
32.12.1.3 Block Diagram and General Timing Diagram ..... 3088
32.12.1.4 Register Settings ..... 3089
32.12.1.5 Operating Procedure for Interval Timer Function ..... 3091
32.12.1.6 Specific Timing Diagrams ..... 3092
32.12.2 TAUDTTINm Input Interval Timer Function ..... 3096
32.12.2.1 Overview ..... 3096
32.12.2.2 Equations ..... 3096
32.12.2.3 Block Diagram and General Timing Diagram ..... 3097
32.12.2.4 Register Settings ..... 3098
32.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function ..... 3100
32.12.2.6 Specific Timing Diagrams ..... 3101
32.12.3 Clock Divide Function ..... 3102
32.12.3.1 Overview ..... 3102
32.12.3.2 Equations ..... 3103
32.12.3.3 Block Diagram and General Timing Diagram ..... 3103
32.12.3.4 Register Settings ..... 3104
32.12.3.5 Operating Procedure for Clock Divide Function ..... 3106
32.12.3.6 Specific Timing Diagrams ..... 3107
32.12.4 External Event Count Function ..... 3109
32.12.4.1 Overview ..... 3109
32.12.4.2 Equations ..... 3109
32.12.4.3 Block Diagram and General Timing Diagram ..... 3110
32.12.4.4 Register Settings ..... 3111
32.12.4.5 Operating Procedure for External Event Count Function ..... 3112
32.12.4.6 Specific Timing Diagrams ..... 3113
32.12.5 Delay Count Function ..... 3115
32.12.5.1 Overview ..... 3115
32.12.5.2 Equations ..... 3115
32.12.5.3 Block Diagram and General Timing Diagram ..... 3116
32.12.5.4 Register Settings ..... 3117
32.12.5.5 Operating Procedure for Delay Count Function ..... 3118
32.12.6 One-Pulse Output Function ..... 3119
32.12.6.1 Overview ..... 3119
32.12.6.2 Equations ..... 3119
32.12.6.3 Block Diagram and General Timing Diagram ..... 3120
32.12.6.4 Register Settings ..... 3121
32.12.6.5 Operating Procedure for One-Pulse Output Function ..... 3123
32.12.7 TAUDTTINm Input Pulse Interval Measurement Function ..... 3124
32.12.7.1 Overview ..... 3124
32.12.7.2 Equations ..... 3125
32.12.7.3 Block Diagram and General Timing Diagram ..... 3126
32.12.7.4 Register Settings ..... 3127
32.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function ..... 3128
32.12.7.6 Specific Timing Diagrams: Overflow Operation ..... 3129
32.12.8 TAUDTTINm Input Signal Width Measurement Function ..... 3132
32.12.8.1 Overview ..... 3132
32.12.8.2 Equations ..... 3133
32.12.8.3 Block Diagram and General Timing Diagram ..... 3133
32.12.8.4 Register Settings ..... 3134
32.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function ..... 3135
32.12.8.6 Specific Timing Diagrams: Overflow Operation ..... 3136
32.12.9 TAUDTTINm Input Position Detection Function ..... 3140
32.12.9.1 Overview ..... 3140
32.12.9.2 Equations ..... 3140
32.12.9.3 Block Diagram and General Timing Diagram ..... 3141
32.12.9.4 Register Settings ..... 3142
32.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function ..... 3143
32.12.9.6 Specific Timing Diagrams ..... 3144
32.12.10 TAUDTTINm Input Period Count Detection Function ..... 3145
32.12.10.1 Overview ..... 3145
32.12.10.2 Equations ..... 3145
32.12.10.3 Block Diagram and General Timing Diagram ..... 3146
32.12.10.4 Register Settings ..... 3147
32.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function ..... 3148
32.12.10.6 Specific Timing Diagrams ..... 3149
32.12.11 TAUDTTINm Input Pulse Interval Judgment Function ..... 3150
32.12.11.1 Overview ..... 3150
32.12.11.2 Block Diagram and General Timing Diagram ..... 3151
32.12.11.3 Register Settings ..... 3152
32.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function. ..... 3153
32.12.12 TAUDTTINm Input Signal Width Judgment Function ..... 3154
32.12.12.1 Overview ..... 3154
32.12.12.2 Block Diagram and General Timing Diagram ..... 3155
32.12.12.3 Register Settings ..... 3156
32.12.12.4 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function ..... 3157
32.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement) ..... 3158
32.12.13.1 Overview ..... 3158
32.12.13.2 Block Diagram and General Timing Diagram ..... 3159
32.12.13.3 Register Settings ..... 3160
32.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement) ..... 3161
32.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection) ..... 3162
32.12.14.1 Overview ..... 3162
32.12.14.2 Block Diagram and General Timing Diagram ..... 3163
32.12.14.3 Register Settings ..... 3164
32.12.14.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection) ..... 3165
32.12.15 One-Phase PWM Output Function ..... 3166
32.12.15.1 Overview ..... 3166
32.12.15.2 Block Diagram and General Timing Diagram ..... 3167
32.12.15.3 Register Settings for Lower Channels ..... 3169
32.12.15.4 Register Settings for Upper Channels ..... 3171
32.12.15.5 Operating Procedure for One-phase PWM Output Function ..... 3172
32.13 Independent Channel Real-Time Functions ..... 3173
32.13.1 Real-Time Output Function Type 1 ..... 3173
32.13.1.1 Overview ..... 3173
32.13.1.2 Equations ..... 3174
32.13.1.3 Block Diagram and General Timing Diagram ..... 3174
32.13.1.4 Register Settings for Upper Channels ..... 3176
32.13.1.5 Register Settings for Lower Channels ..... 3178
32.13.1.6 Operating Procedure for Real-Time Output Function Type 1 ..... 3179
32.13.1.7 Specific Timing Diagrams ..... 3180
32.13.2 Real-Time Output Function Type 2 ..... 3181
32.13.2.1 Overview ..... 3181
32.13.2.2 Block Diagram and General Timing Diagram ..... 3182
32.13.2.3 Register Settings for Upper Channels ..... 3184
32.13.2.4 Register Settings for Lower Channels ..... 3186
32.13.2.5 Operating Procedure for Real-Time Output Function Type 2 ..... 3187
32.13.2.6 Specific Timing Diagrams ..... 3188
32.14 Independent Channel Simultaneous Rewrite Functions ..... 3189
32.14.1 Simultaneous Rewrite Trigger Generation Function Type 1 ..... 3189
32.14.1.1 Overview ..... 3189
32.14.1.2 Equations ..... 3190
32.14.1.3 Block Diagram and General Timing Diagram ..... 3191
32.14.1.4 Register Settings for Upper Channels ..... 3193
32.14.1.5 Register Settings for Lower Channels ..... 3194
32.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1 ..... 3195
32.14.2 Simultaneous Rewrite Trigger Generation Function Type 2 ..... 3196
32.14.2.1 Overview ..... 3196
32.14.2.2 Block Diagram and General Timing Diagram ..... 3197
32.14.2.3 Register Settings for Upper Channels ..... 3199
32.14.2.4 Register Settings for Lower Channels ..... 3201
32.14.2.5 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2 ..... 3203
32.15 Synchronous Channel Operation Functions ..... 3204
32.15.1 PWM Output Function ..... 3204
32.15.1.1 Overview ..... 3204
32.15.1.2 Equations ..... 3205
32.15.1.3 Block Diagram and General Timing Diagram ..... 3205
32.15.1.4 Register Settings for the Master Channel ..... 3207
32.15.1.5 Register Settings for Slave Channels ..... 3209
32.15.1.6 Operating Procedure for PWM Output Function ..... 3211
32.15.1.7 Specific Timing Diagrams ..... 3212
32.15.2 One-Shot Pulse Output Function ..... 3215
32.15.2.1 Overview ..... 3215
32.15.2.2 Equations ..... 3216
32.15.2.3 Block Diagram and General Timing Diagram ..... 3216
32.15.2.4 Register Settings for the Master Channel ..... 3218
32.15.2.5 Register Settings for Slave Channels ..... 3220
32.15.2.6 Operating Procedure for One-Shot Pulse Output Function ..... 3222
32.15.2.7 Specific Timing Diagrams ..... 3223
32.15.3 Trigger Start PWM Output Function ..... 3227
32.15.3.1 Overview ..... 3227
32.15.3.2 Equations ..... 3228
32.15.3.3 Block Diagram and General Timing Diagram ..... 3228
32.15.3.4 Register Settings for the Master Channel ..... 3230
32.15.3.5 Register Settings for Slave Channels ..... 3232
32.15.3.6 Operating Procedure for Trigger Start PWM Output Function ..... 3234
32.15.3.7 Specific Timing Diagrams ..... 3235
32.15.4 Delay Pulse Output Function ..... 3238
32.15.4.1 Overview ..... 3238
32.15.4.2 Equations ..... 3239
32.15.4.3 Block Diagram and General Timing Diagram ..... 3240
32.15.4.4 Register Settings for the Master Channel ..... 3242
32.15.4.5 Register Settings for Slave Channel 1 ..... 3244
32.15.4.6 Register Settings for Slave Channel 2 ..... 3246
32.15.4.7 Register Settings for Slave Channel 3 ..... 3248
32.15.4.8 Operating Procedure for Delay Pulse Output Function ..... 3250
32.15.4.9 Specific Timing Diagrams ..... 3252
32.15.5 Offset Trigger Output Function ..... 3254
32.15.5.1 Overview ..... 3254
32.15.5.2 Equations ..... 3255
32.15.5.3 Block Diagram and General Timing Diagram ..... 3255
32.15.5.4 Register Settings for the Master Channel ..... 3257
32.15.5.5 Register Settings for Slave Channels ..... 3259
32.15.5.6 Operating Procedure for Offset Trigger Output Function ..... 3261
32.15.5.7 Specific Timing Diagrams ..... 3262
32.15.6 A/D Conversion Trigger Output Function Type 1 ..... 3264
32.15.6.1 Overview ..... 3264
32.15.6.2 Block Diagram and General Timing Diagram ..... 3264
32.15.7 Triangle PWM Output Function ..... 3266
32.15.7.1 Overview ..... 3266
32.15.7.2 Equations ..... 3267
32.15.7.3 Block Diagram and General Timing Diagram ..... 3268
32.15.7.4 Register Settings for the Master Channel ..... 3270
32.15.7.5 Register Settings for Slave Channels ..... 3272
32.15.7.6 Operating Procedure for Triangle PWM Output Function. ..... 3274
32.15.7.7 Specific Timing Diagrams ..... 3275
32.15.8 Triangle PWM Output Function with Dead Time ..... 3277
32.15.8.1 Overview ..... 3277
32.15.8.2 Equations ..... 3279
32.15.8.3 Block Diagram and General Timing Diagram ..... 3280
32.15.8.4 Register Settings for the Master Channel ..... 3282
32.15.8.5 Register Settings for Slave Channel 2 ..... 3284
32.15.8.6 Register Settings for Slave Channel 3 ..... 3286
32.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time ..... 3288
32.15.8.8 Specific Timing Diagrams ..... 3289
32.15.9 A/D Conversion Trigger Output Function Type 2 ..... 3291
32.15.9.1 Overview ..... 3291
32.15.9.2 Block Diagram and General Timing Diagram ..... 3291
32.15.10 Interrupt Request Signals Culling Function ..... 3293
32.15.10.1 Overview ..... 3293
32.15.10.2 Equations ..... 3294
32.15.10.3 Block Diagram and General Timing Diagram ..... 3294
32.15.10.4 Register Settings for the Master Channel ..... 3296
32.15.10.5 Register Settings for the Slave Channel ..... 3298
32.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function ..... 3299
32.15.10.7 Specific Timing Diagrams ..... 3300
32.16 Synchronous Non-Complementary and Complementary Modulation Output Functions ..... 3301
32.16.1 Non-Complementary Modulation Output Function Type 1 ..... 3301
32.16.1.1 Overview ..... 3301
32.16.1.2 Equations ..... 3302
32.16.1.3 Block Diagram and General Timing Diagram ..... 3303
32.16.1.4 Register Settings for the Master Channel ..... 3305
32.16.1.5 Register Settings for Slave Channel 1 ..... 3307
32.16.1.6 Register Settings for Slave Channels 2 to 7 ..... 3309
32.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1 ..... 3311
32.16.1.8 Specific Timing Diagrams ..... 3313
32.16.2 Non-Complementary Modulation Output Function Type 2 ..... 3314
32.16.2.1 Overview ..... 3314
32.16.2.2 Equations ..... 3316
32.16.2.3 Block Diagram and General Timing Diagram ..... 3317
32.16.2.4 Register Settings for the Master Channel ..... 3319
32.16.2.5 Register Settings for Slave Channel 1 ..... 3321
32.16.2.6 Register settings for slave channels 2 to 7 ..... 3323
32.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2 ..... 3325
32.16.2.8 Specific Timing Diagrams ..... 3327
32.16.3 Complementary Modulation Output Function ..... 3328
32.16.3.1 Overview ..... 3328
32.16.3.2 Equations ..... 3331
32.16.3.3 Block Diagram and General Timing Diagram ..... 3332
32.16.3.4 Register Settings for the Master Channel ..... 3334
32.16.3.5 Register Settings for Slave Channel 1 ..... 3336
32.16.3.6 Register settings for slave channels 2, 4, and 6 ..... 3338
32.16.3.7 Register settings for slave channels 3,5 , and 7 ..... 3340
32.16.3.8 Operating Procedure for Complementary Modulation Output Function ..... 3342
32.16.3.9 Specific Timing Diagrams ..... 3344
Section 33 Timer Array Unit J (TAUJ) ..... 3346
33.1 Features of RH850/F1KH, RH850/F1KM TAUJ ..... 3346
33.1.1 Number of Units and Channels ..... 3346
33.1.2 Register Base Addresses ..... 3347
33.1.3 Clock Supply ..... 3348
33.1.4 Interrupt Requests ..... 3349
33.1.5 Reset Sources ..... 3349
33.1.6 External Input/Output Signals ..... 3350
33.1.7 Internal Input/Output Signals ..... 3350
33.1.8 TAUJO / TAUJ2 Input Selection ..... 3351
33.1.8.1 List of Registers ..... 3353
33.1.8.2 SELB_TAUJOI — TAUJTTINm Input Signal Selection Register ..... 3353
33.1.8.3 SELB_TAUJ2I — TAUJTTINm Input Signal Selection Register ..... 3354
33.2 Overview ..... 3355
33.2.1 Functional Overview. ..... 3355
33.2.2 Terms ..... 3355
33.2.3 Functional List of Timer Operations ..... 3356
33.2.4 TAUJ I/O and Interrupt Request Signals ..... 3356
33.2.5 Block Diagram ..... 3357
33.2.6 Description of Block Diagram ..... 3358
33.3 Registers. ..... 3359
33.3.1 List of Registers ..... 3359
33.3.2 Details of TAUJn Prescaler Registers .....  3360
33.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register ..... 3360
33.3.2.2 TAUJnBRS - TAUJn Prescaler Baud Rate Setting Register ..... 3363
33.3.3 Details of TAUJn Control Registers ..... 3364
33.3.3.1 TAUJnCDRm - TAUJn Channel Data Register ..... 3364
33.3.3.2 TAUJnCNTm - TAUJn Channel Counter Register ..... 3365
33.3.3.3 TAUJnCMORm - TAUJn Channel Mode OS Register ..... 3366
33.3.3.4 TAUJnCMURm - TAUJn Channel Mode User Register ..... 3369
33.3.3.5 TAUJnCSRm - TAUJn Channel Status Register ..... 3370
33.3.3.6 TAUJnCSCm - TAUJn Channel Status Clear Trigger Register ..... 3370
33.3.3.7 TAUJnTS - TAUJn Channel Start Trigger Register. ..... 3371
33.3.3.8 TAUJnTE - TAUJn Channel Enable Status Register ..... 3371
33.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register ..... 3372
33.3.4 Details of TAUJn Simultaneous Rewrite Register ..... 3373
33.3.4.1 TAUJnRDE - TAUJn Channel Reload Data Enable Register ..... 3373
33.3.4.2 TAUJnRDM - TAUJn Channel Reload Data Mode Register ..... 3373
33.3.4.3 TAUJnRDT - TAUJn Channel Reload Data Trigger Register ..... 3374
33.3.4.4 TAUJnRSF - TAUJn Channel Reload Status Register ..... 3374
33.3.5 Details of TAUJn Output Registers ..... 3375
33.3.5.1 TAUJnTOE - TAUJn Channel Output Enable Register. ..... 3375
33.3.5.2 TAUJnTO - TAUJn Channel Output Register ..... 3375
33.3.5.3 TAUJnTOM - TAUJn Channel Output Mode Register ..... 3376
33.3.5.4 TAUJnTOC - TAUJn Channel Output Configuration Register ..... 3377
33.3.5.5 TAUJnTOL - TAUJn Channel Output Active Level Register ..... 3378
33.3.6 TAUJn Emulation Register ..... 3378
33.3.6.1 TAUJnEMU — TAUJn Emulation Register ..... 3378
33.4 Operating Procedure ..... 3379
33.5 Concepts of Synchronous Channel Operation Function ..... 3380
33.5.1 Rules of Synchronous Channel Operation Function ..... 3380
33.5.2 Simultaneous Start and Stop of Synchronous Channel Counters ..... 3382
33.5.2.1 Simultaneous Start and Stop within a TAUJ Unit ..... 3382
33.5.2.2 Simultaneous Start between TAUJ Units ..... 3382
33.6 Simultaneous Rewrite ..... 3383
33.6.1 How to Control Simultaneous Rewrite ..... 3383
33.6.1.1 Initial Settings ..... 3384
33.6.1.2 Start Counter and Count Operation ..... 3384
33.6.1.3 Simultaneous Rewrite ..... 3384
33.6.2 Other General Rules for Simultaneous Rewrite ..... 3384
33.6.3 Simultaneous Rewrite Procedure ..... 3385
33.7 Channel Output Modes ..... 3387
33.7.1 General Procedures for Specifying a Channel Output Mode ..... 3389
33.7.2 Channel Output Modes Controlled Independently by TAUJn Signals ..... 3390
33.7.2.1 Independent Channel Output Mode 1 ..... 3390
33.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals ..... 3390
33.7.3.1 Synchronous Channel Output Mode 1 ..... 3390
33.8 Start Timing in Each Operating Modes ..... 3391
33.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode ..... 3391
33.8.2 Other Operating Modes ..... 3392
33.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts ..... 3393
33.10 Interrupt Generation upon Overflow ..... 3394
33.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function ..... 3395
33.11 TAUJTTINm Edge Detection ..... 3396
33.12 Independent Channel Operation Functions ..... 3397
33.12.1 Interval Timer Function ..... 3397
33.12.1.1 Overview ..... 3397
33.12.1.2 Equations ..... 3397
33.12.1.3 Block Diagram and General Timing Diagram ..... 3398
33.12.1.4 Register Settings ..... 3399
33.12.1.5 Operating Procedure for Interval Timer Function ..... 3401
33.12.1.6 Specific Timing Diagrams ..... 3402
33.12.2 TAUJTTINm Input Interval Timer Function ..... 3405
33.12.2.1 Overview ..... 3405
33.12.2.2 Equations ..... 3405
33.12.2.3 Block Diagram and General Timing Diagram ..... 3406
33.12.2.4 Register Settings ..... 3407
33.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function ..... 3409
33.12.2.6 Specific Timing Diagrams ..... 3410
33.12.3 TAUJTTINm Input Pulse Interval Measurement Function ..... 3411
33.12.3.1 Overview ..... 3411
33.12.3.2 Equations ..... 3412
33.12.3.3 Block Diagram and General Timing Diagram ..... 3412
33.12.3.4 Register Settings ..... 3413
33.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function ..... 3414
33.12.3.6 Specific Timing Diagrams: Overflow Behavior ..... 3415
33.12.4 TAUJTTINm Input Signal Width Measurement Function ..... 3418
33.12.4.1 Overview ..... 3418
33.12.4.2 Equations ..... 3418
33.12.4.3 Block Diagram and General Timing Diagram ..... 3419
33.12.4.4 Register Settings ..... 3420
33.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function ..... 3421
33.12.4.6 Specific Timing Diagrams: Overflow Behavior ..... 3422
33.12.5 TAUJTTINm Input Position Detection Function ..... 3425
33.12.5.1 Overview ..... 3425
33.12.5.2 Equations ..... 3425
33.12.5.3 Block Diagram and General Timing Diagram ..... 3426
33.12.5.4 Register Settings ..... 3427
33.12.5.5 Operating Procedure for TAUJTTINm Input Position Detection Function ..... 3428
33.12.5.6 Specific Timing Diagrams ..... 3429
33.12.6 TAUJTTINm Input Period Count Detection Function ..... 3430
33.12.6.1 Overview ..... 3430
33.12.6.2 Equations ..... 3430
33.12.6.3 Block Diagram and General Timing Diagram ..... 3431
33.12.6.4 Register Settings ..... 3432
33.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function ..... 3433
33.12.6.6 Specific Timing Diagrams ..... 3434
33.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) ..... 3435
33.12.7.1 Overview ..... 3435
33.12.7.2 Block Diagram and General Timing Diagram ..... 3436
33.12.7.3 Register Settings ..... 3437
33.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) ..... 3438
33.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) ..... 3439
33.12.8.1 Overview ..... 3439
33.12.8.2 Block Diagram and General Timing Diagram ..... 3440
33.12.8.3 Register Settings ..... 3441
33.12.8.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) ..... 3442
33.13 Synchronous Channel Operation Functions ..... 3443
33.13.1 PWM Output Function ..... 3443
33.13.1.1 Overview ..... 3443
33.13.1.2 Equations ..... 3444
33.13.1.3 Block Diagram and General Timing Diagram ..... 3444
33.13.1.4 Register Settings for the Master Channel ..... 3446
33.13.1.5 Register Settings for the Slave Channel(s) ..... 3448
33.13.1.6 Operating Procedure for PWM Output Function ..... 3450
33.13.1.7 Specific Timing Diagrams ..... 3451
Section 34 Real-Time Clock (RTCA) ..... 3454
34.1 Features of RH850/F1KH, RH850/F1KM RTCA ..... 3454
34.1.1 Number of Units ..... 3454
34.1.2 Register Base Address ..... 3454
34.1.3 Clock Supply ..... 3455
34.1.4 Interrupt Requests ..... 3455
34.1.5 Reset Sources ..... 3455
34.1.6 External Input/Output Signals ..... 3455
34.2 Overview ..... 3456
34.2.1 Functional Overview ..... 3456
34.2.2 Block Diagram ..... 3456
34.2.3 Description of Blocks ..... 3457
34.3 Registers ..... 3458
34.3.1 List of Registers ..... 3458
34.3.2 Details of RTCA Control Registers ..... 3459
34.3.2.1 RTCAnCTLO - RTCA Control Register 0 ..... 3459
34.3.2.2 RTCAnCTL1 — RTCA Control Register 1 ..... 3460
34.3.2.3 RTCAnCTL2 — RTCA Control Register 2 ..... 3461
34.3.3 Details of RTCA Sub-Counter Registers ..... 3463
34.3.3.1 RTCAnSUBC - RTCA Sub-Count Register ..... 3463
34.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer ..... 3464
34.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register ..... 3465
34.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register ..... 3466
34.3.4 Details of RTCA Clock Counter and Buffer Registers ..... 3467
34.3.4.1 RTCAnSECC - RTCA Seconds Count Register ..... 3467
34.3.4.2 RTCAnSEC - RTCA Seconds Count Buffer Register ..... 3468
34.3.4.3 RTCAnMINC - RTCA Minutes Count Register ..... 3469
34.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register ..... 3470
34.3.4.5 RTCAnHOURC - RTCA Hours Count Register ..... 3471
34.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register ..... 3473
34.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register ..... 3474
34.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register ..... 3475
34.3.4.9 RTCAnDAYC - RTCA Day of the Month Count Register ..... 3476
34.3.4.10 RTCAnDAY - RTCA Day of the Month Count Buffer Register ..... 3477
34.3.4.11 RTCAnMONC - RTCA Month Count Register ..... 3478
34.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register ..... 3479
34.3.4.13 RTCAnYEARC - RTCA Year Count Register ..... 3480
34.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register ..... 3481
34.3.5 Details of RTCA Special Counter and Buffer Registers ..... 3482
34.3.5.1 RTCAnTIMEC — RTCA Time Count Register ..... 3482
34.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register ..... 3483
34.3.5.3 RTCAnCALC — RTCA Calendar Count Register ..... 3484
34.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register ..... 3485
34.3.6 Details of RTCA Alarm Time Setting Registers ..... 3486
34.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register ..... 3486
34.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register ..... 3487
34.3.6.3 RTCAnALW - RTCA Alarm Day of the Week Setting Register ..... 3488
34.3.7 RTCA Emulation Register ..... 3489
34.3.7.1 RTCAnEMU — RTCA Emulation Register ..... 3489
34.4 Operation ..... 3490
34.4.1 Clock Counter Format ..... 3491
34.4.2 Fixed Interval Interrupt Function ..... 3491
34.4.3 Alarm Interrupt Function ..... 3492
34.4.4 Clock Error Correction ..... 3493
34.4.4.1 Setting the Correction Value and the Operator ..... 3494
34.4.4.2 Impact of the Repetition Interval ..... 3494
34.4.4.3 Sample Settings ..... 3495
34.5 Procedures for Setup, Writing and Reading ..... 3497
34.5.1 Initial Setting of the RTCA ..... 3497
34.5.1.1 RTCA Stop Procedure ..... 3497
34.5.1.2 RTCA Initialization Procedure ..... 3498
34.5.2 Updating Clock Counters ..... 3499
34.5.3 Reading Clock Counters ..... 3500
34.5.3.1 Procedure for Reading Count Buffer Registers ..... 3500
34.5.3.2 Procedure for Reading Counter Registers Directly ..... 3502
34.5.4 Reading RTCAnSRBU ..... 3503
34.5.5 Writing to RTCAnSUBU ..... 3504
34.5.6 Writing to RTCAnSCMP ..... 3505
34.6 Timing Diagrams ..... 3506
34.6.1 Timing of Counter Start ..... 3506
34.6.2 Timing of Clock Counter Update while Counter Is Enabled ..... 3507
34.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled ..... 3508
Section 35 Encoder Timer (ENCA) ..... 3509
35.1 Features of RH850/F1KH, RH850/F1KM ENCA ..... 3509
35.1.1 Number of Units ..... 3509
35.1.2 Register Base Address ..... 3509
35.1.3 Clock Supply ..... 3510
35.1.4 Interrupt Requests ..... 3510
35.1.5 Reset Sources ..... 3510
35.1.6 External Input/Output Signals ..... 3510
35.1.7 Internal Input/Output Signals ..... 3511
35.2 Overview ..... 3512
35.2.1 Functional Overview. ..... 3512
35.2.2 Block Diagram ..... 3513
35.3 Registers ..... 3514
35.3.1 List of Registers ..... 3514
35.3.2 ENCAnCTL - ENCAn Control Register ..... 3515
35.3.3 ENCAnIOC0 - ENCAn I/O Control Register 0 ..... 3517
35.3.4 ENCAnIOC1 — ENCAn I/O Control Register 1 ..... 3518
35.3.5 ENCAnFLG - ENCAn Status Flag Register ..... 3520
35.3.6 ENCAnFGC - ENCAn Status Flag Clear Register ..... 3521
35.3.7 ENCAnCCRO — ENCAn Capture/Compare Register 0 ..... 3522
35.3.8 ENCAnCCR1 — ENCAn Capture/Compare Register 1 ..... 3522
35.3.9 ENCAnCNT — ENCAn Counter Register ..... 3523
35.3.10 ENCAnTE — ENCAn Timer Enable Status Register ..... 3523
35.3.11 ENCAnTS - ENCAn Timer Start Trigger Register ..... 3524
35.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register ..... 3524
35.3.13 ENCAnEMU - ENCAn Emulation Register ..... 3525
35.4 Operation ..... 3526
35.4.1 Timer Counter Operation ..... 3526
35.4.2 Up/Down Control of Timer Counter ..... 3528
35.4.2.1 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=00_{\mathrm{B}}$ ..... 3528
35.4.2.2 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=00_{\mathrm{B}}$ ..... 3529
35.4.2.3 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=10_{\mathrm{B}}$ ..... 3530
35.4.2.4 When ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 11 B ..... 3531
35.4.3 Timer Counter Clear Control by Encoder Input ..... 3532
35.4.3.1 Clearing Method when ENCAnSCE $=0$ ..... 3532
35.4.3.2 Clearing Method when ENCAnSCE $=1$ ..... 3532
35.4.4 Functions of ENCAnCCRO ..... 3533
35.4.4.1 Compare Function ..... 3533
35.4.4.2 Capture Function ..... 3533
35.4.5 Functions of ENCAnCCR1 ..... 3534
35.4.5.1 Compare Function ..... 3534
35.4.5.2 Capture Function ..... 3535
35.4.5.3 Timer Counter Clearing upon Compare Register Match ..... 3536
35.4.6 Startup/Stop of Timer Counter ..... 3536
35.4.6.1 Startup of Timer ..... 3536
35.4.6.2 Stop of Timer ..... 3536
35.5 ENCAn Setting Sequences ..... 3537
35.5.1 ENCAn Setting Procedure ..... 3537
35.5.1.1 Initial Setting Procedure for the Counter ..... 3537
35.5.1.2 Initial Setting Procedure for Counter Clear ..... 3538
35.5.1.3 Setting Procedure for ENCAnCCR0 Register ..... 3538
35.5.1.4 Setting Procedure for ENCAnCCR1 Register ..... 3539
35.6 Timing Chart ..... 3540
35.6.1 Overflow Occurrence and Overflow Flag Clear Operation ..... 3540
35.6.2 Underflow Occurrence and Underflow Flag Clear Operation ..... 3541
35.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3542
35.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3543
35.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3544
35.6.6 Overflow Operation Immediately after Startup ..... 3546
35.6.7 Underflow Operation Immediately after Startup ..... 3547
35.6.8 Using the ENCAnLDE Function Immediately after Startup ..... 3548
35.6.9 ENCAnLDE Function (Loading Count Value) ..... 3549
35.6.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCRO Register ..... 3551
35.6.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3552
35.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input ..... 3554
35.6.13 Capture Operation between Count Clocks (ENCAnCCR1) ..... 3556
35.6.14 Capture Operation between Count Clocks (ENCAnCCRO) ..... 3557
35.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0 ..... 3558
35.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1 ..... 3559
35.6.17 Encoder Operation when Compare Match Clear Control is Disabled ..... 3560
35.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1 ..... 3561
35.6.18.1 Accompanying Capture Operation ..... 3561
35.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11в) ..... 3562
35.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 B ) ..... 3563
35.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 B ) ..... 3563
35.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL $=1$, ENCAnBCL $=0$, ENCAnZCL $=1$, and ENCAnUDS[1:0] = 11 B ) ..... 3564
35.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE $=0$ ..... 3565
Section 36 Motor Control ..... 3566
36.1 Features of RH850/F1KH, RH850/F1KM Motor Control ..... 3566
36.1.1 Number of Units ..... 3566
36.1.2 Register Base Addresses ..... 3568
36.1.3 Clock Supply ..... 3568
36.1.4 Interrupt Requests ..... 3568
36.1.5 Reset Sources ..... 3568
36.1.6 External Input/Output Signals ..... 3569
36.1.7 Internal Output Signals ..... 3570
36.2 Overview ..... 3571
36.2.1 Functional Overview ..... 3571
36.2.2 Basic Structure of Motor Control ..... 3572
36.2.3 Block Diagram ..... 3573
36.2.4 Definition of Terms ..... 3574
36.3 Registers ..... 3575
36.3.1 List of Registers ..... 3575
36.3.2 TAPAnCTLO - TAPA Control Register 0 ..... 3576
36.3.3 TAPAnCTL1 - TAPA Control Register 1 ..... 3577
36.3.4 TAPAnFLG - TAPA Flag Register ..... 3578
36.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register ..... 3579
36.3.6 TAPAnACTS — TAPA Asynchronous Hi-Z Control Start Trigger Register ..... 3579
36.3.7 TAPAnACTT — TAPA Asynchronous Hi-Z Control Stop Trigger Register ..... 3580
36.3.8 TAPAnOPHS — TAPA Hi-Z Start Trigger Register ..... 3580
36.3.9 TAPAnOPHT — TAPA Hi-Z Stop Trigger Register ..... 3581
36.3.10 TAPAnEMU — TAPA Emulation Register ..... 3581
36.4 Asynchronous Hi-Z Control Function ..... 3582
36.4.1 Overview ..... 3582
36.4.2 System Configuration Example. ..... 3583
36.4.3 Basic Operation ..... 3584
36.4.4 Asynchronous Hi-Z Control Using Software Trigger ..... 3586
36.4.5 Operating Procedure ..... 3587
36.4.6 TAPAO Hi-Z Control Input Selection ..... 3588
36.4.7 Registers ..... 3590
36.4.7.1 PICOHIZCENn - Hi-Z Output Control Register $\mathrm{n}(\mathrm{n}=0)$ ..... 3590
36.5 INT Signal Output Selection Function ..... 3591
36.5.1 Configuration of the INT Signal Output Selection Function ..... 3591
36.5.2 Block Diagram ..... 3592
36.5.3 Registers ..... 3593
36.5.3.1 PICOREG2n0 - Timer I/O Control Register 2n0 ( $\mathrm{n}=0$ ) ..... 3593
36.6 A/D Converter Conversion Trigger Selection Function ..... 3594
36.6.1 Configuration of A/D Converter Conversion Trigger Selection Function ..... 3594
36.6.2 Block Diagram ..... 3595
36.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode ..... 3596
36.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function ..... 3598
36.7 ADCA Trigger Selection Function ..... 3599
36.7.1 Functional Overview. ..... 3599
36.7.2 Configuration ..... 3599
36.7.3 Registers ..... 3600
36.7.3.1 PICOADTEN4nj - A/D Conversion Trigger Output Control Register 4nj ( $\mathrm{n}=0, \mathrm{j}=0$ to 2 ) ..... 3600
36.7.4 Example of Operation ..... 3601
36.7.5 Setup Flow ..... 3601
36.8 Simultaneous Start Trigger Function ..... 3602
36.8.1 Functional Overview. ..... 3602
36.8.2 Configuration ..... 3602
36.8.3 Registers ..... 3603
36.8.3.1 PICOSSER0 - Simultaneous Start Control Register 0 ..... 3603
36.8.3.2 PICOSSER2 - Simultaneous Start Control Register 2 ..... 3603
36.8.3.3 PICOSST — Simultaneous Start Trigger Control Register ..... 3604
36.8.4 Example of Operation ..... 3605
36.8.5 Setup Flow ..... 3606
36.9 Trigger \& Pulse Width Measuring Function ..... 3607
36.9.1 Functional Overview ..... 3607
36.9.2 Configuration ..... 3607
36.9.3 Registers ..... 3609
36.9.3.1 PIC0REG31 - Timer I/O Control Register 31 ..... 3609
36.9.4 Example of Operation ..... 3611
36.9.5 Setup Flow ..... 3613
36.9.6 Setting Examples for Operation Functions ..... 3616
36.10 A/D Trigger Encoder Capture Function ..... 3619
36.10.1 Functional Overview ..... 3619
36.10.2 Configuration ..... 3619
36.10.3 Registers ..... 3620
36.10.3.1 PICOREG30 - Timer I/O Control Register 30 ..... 3620
36.10.4 Example of Operation ..... 3621
36.10.5 Setup Flow ..... 3622
36.10.6 Setting Examples for Operation Functions ..... 3623
36.11 Three-Phase PWM Output with Dead Time ..... 3624
36.11.1 Functional Overview ..... 3624
36.11.2 Configuration ..... 3624
36.11.3 Registers ..... 3627
36.11.3.1 PICOREG2n2 - Timer I/O Control Register 2n2 ( $\mathrm{n}=0$ ) ..... 3627
36.11.3.2 PICOHIZCENn - Hi-Z Output Control Register n ( $\mathrm{n}=0$ ) ..... 3628
36.11.4 Operation Example ..... 3629
36.11.4.1 Pwm Output ..... 3629
36.11.4.2 One-Phase PWM Output ..... 3629
36.11.4.3 SR Flip-Flop Circuit ..... 3630
36.11.5 Setup Flow ..... 3638
36.11.6 Setting Examples for Operation Functions ..... 3640
36.11.6.1 TAUDn Settings (Active High Example) ..... 3640
36.11.6.2 PIC Settings ..... 3644
36.12 High-accuracy Triangle PWM Output with Dead Time ..... 3645
36.12.1 Functional Overview ..... 3645
36.12.2 Configuration ..... 3646
36.12.3 Registers ..... 3648
36.12.3.1 PICOREG2n0 - Timer I/O Control Register 2n0 ( $\mathrm{n}=0$ ) ..... 3648
36.12.3.2 PICOREG2n1 - Timer I/O Control Register 2n1 ( $\mathrm{n}=0$ ) ..... 3649
36.12.3.3 PICOREG2n2 - Timer I/O Control Register 2n2 $(\mathrm{n}=0)$ ..... 3651
36.12.3.4 PICOREG2n3 - Timer I/O Control Register $2 \mathrm{n} 3(\mathrm{n}=0)$ ..... 3652
36.12.3.5 PICOHIZCENn - Hi-Z Output Control Register $\mathrm{n}(\mathrm{n}=0)$ ..... 3654
36.12.4 Operation Example ..... 3655
36.12.4.1 Triangle PWM Output with Dead Time ..... 3655
36.12.4.2 One-shot Pulse Output ..... 3655
36.12.4.3 U phase Combination Circuit (PFN001) ..... 3656
36.12.4.4 Logical Operation Circuit (FN0i) (i=0 or 1) ..... 3658
36.12.5 Setup Flow ..... 3668
36.12.6 Setting Examples for Operation Functions ..... 3670
36.12.6.1 TAUDn Settings (active high example) ..... 3670
36.12.6.2 PIC Settings (Active High Example) ..... 3676
36.13 Delay Pulse Output with Dead Time. ..... 3677
36.13.1 Functional Overview. ..... 3677
36.13.2 Configuration ..... 3677
36.13.2.1 TAUDn Configuration ..... 3678
36.13.3 Registers ..... 3680
36.13.3.1 PICOREG2n2 - Timer I/O Control Register $2 \mathrm{n} 2(\mathrm{n}=0)$ ..... 3680
36.13.3.2 PICOHIZCENn - Hi-Z Output Control Register n ( $\mathrm{n}=0$ ) ..... 3681
36.13.4 Operation Example ..... 3682
36.13.4.1 Delay Pulse Output Function ..... 3682
36.13.4.2 One-phase PWM Output ..... 3682
36.13.5 Setup Flow ..... 3688
36.13.6 Setting Examples for Operation Functions ..... 3691
36.13.6.1 TAUDn Settings ..... 3691
36.13.6.2 Peripheral Interconnections Settings ..... 3696
Section 37 PWM Output/Diagnostic (PWM-Diag) ..... 3697
37.1 Features of RH850/F1KH, RH850/F1KM PWM-Diag ..... 3697
37.1.1 Number of Units ..... 3697
37.1.2 Register Base Addresses ..... 3700
37.1.3 Clock Supply ..... 3701
37.1.4 Interrupt Requests ..... 3701
37.1.5 Reset Sources ..... 3710
37.1.6 External Input/Output Signals ..... 3710
37.1.7 Internal Output Signals ..... 3710
37.1.8 Functional Overview. ..... 3712
37.1.9 Block Diagram ..... 3714
37.2 Registers ..... 3715
37.2.1 List of Registers ..... 3715
37.2.1.1 PWBAnBRSm — PWMCLKm Cycle Configuration Register ..... 3716
37.2.1.2 PWBAnTE — PWMCLKm Enable Status Register ..... 3717
37.2.1.3 PWBAnTS — PWMCLKm Start Trigger Register. ..... 3718
37.2.1.4 PWBAnTT — PWMCLKm Stop Trigger Register ..... 3719
37.2.1.5 PWBAnEMU - PWBA Emulation Register ..... 3720
37.2.1.6 PWGAnCTL — PWGA Control Register ..... 3721
37.2.1.7 PWGAnCNT — PWM Cycle Count Register ..... 3722
37.2.1.8 PWGAnCSDR — PWM Output Set Condition Register ..... 3722
37.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register ..... 3723
37.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register ..... 3723
37.2.1.11 PWGAnTCR — PWGA_TRGOUTn Control Register ..... 3724
37.2.1.12 PWGAnCSBR — PWGAnCSDR Buffer Register ..... 3724
37.2.1.13 PWGAnCRBR — PWGAnCRDR Buffer Register ..... 3725
37.2.1.14 PWGAnCTBR — PWGAnCTDR Buffer Register ..... 3725
37.2.1.15 PWGAnTCBR — PWGAnTCR Buffer Register ..... 3726
37.2.1.16 PWGAnRSF — Buffer Register Reload Status Register ..... 3726
37.2.1.17 PWGAnRDT — Buffer Register Reload Trigger Register ..... 3727
37.2.1.18 SLPWGAk — PWGA Synchronous Trigger Register ( $\mathrm{k}=0$ to 2) ..... 3728
37.2.1.19 PWGAPRD - PWGA Period Setting Register ..... 3729
37.2.1.20 PWGAPRDSLk — PWGA Period Selection Register ( $k=0$ to 2 ) ..... 3730
37.2.1.21 PWSAnCTL — PWSA Control Register ..... 3731
37.2.1.22 PWSAnSTR - Trigger Queue Status Register ..... 3732
37.2.1.23 PWSAnSTC - Trigger Queue Status Clear Register ..... 3732
37.2.1.24 PWSAnQUEj - Trigger Queue Register ( $\mathrm{j}=0$ to 7) ..... 3733
37.2.1.25 PWSAnPVCRx_y — PWM-Diag Mode A/D Setting Register. ..... 3734
37.2.1.26 PWSAnPWDDIRz - PWM-Diag Data Supplementary Information Register ..... 3736
37.2.1.27 PWSAnEMU — PWSA Emulation Control Register ..... 3737
37.2.1.28 PWGAINTFhk — PWGA Interrupt Factor Register ( $k=0$ to 2) ..... 3738
37.2.1.29 PWGAINTMSKhk — PWGA Interrupt Mask Register ( $k=0$ to 2) ..... 3739
37.2.1.30 PWGAINTFChk — PWGA Interrupt Factor Clear Register ( $\mathrm{k}=0$ to 2) ..... 3740
37.3 Operating Procedure ..... 3741
37.4 Operation Waveform of PWM-Diag ..... 3744
37.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output ..... 3744
37.4.1.1 Basic Operation Waveform of PWGA. ..... 3744
37.4.1.2 Operation Waveform when Compare Buffer Register Simultaneous Rewrite for PWGA is Executed ..... 3745
37.4.1.3 Operation Waveform when PWGAnTCBR Register Rewrite for PWGA is Executed ..... 3746
37.4.1.4 Operation Waveform when Stopping and Restarting PWGA Operation ..... 3749
37.4.1.5 Waveforms of PWGA Operation with Specific Settings. ..... 3751
37.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA ..... 3753
37.5 PWM-Diag Related Function in A/D Converter (ADCA) ..... 3755
37.6 ADCA Registers when the PWM-Diag Function is Used ..... 3755
Section 38 A/D Converter (ADCA) ..... 3756
38.1 Features of RH850/F1KH, RH850/F1KM ADCA ..... 3756
38.1.1 Number of Units and Channels ..... 3756
38.1.2 Register Base Addresses ..... 3761
38.1.3 Clock Supply ..... 3761
38.1.4 Interrupt Requests ..... 3762
38.1.5 Reset Sources ..... 3763
38.1.6 External Input/Output Signals ..... 3764
38.2 Overview ..... 3771
38.2.1 Functional Overview. ..... 3771
38.2.2 Block Diagram ..... 3772
38.3 Registers ..... 3778
38.3.1 List of Registers ..... 3778
38.3.2 ADCA Specific Registers ..... 3780
38.3.2.1 ADCAnVCRj — Virtual Channel Register j ..... 3780
38.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register ..... 3783
38.3.2.3 ADCAnDRj — Data Register j ..... 3785
38.3.2.4 ADCAnDIRj — Data Supplementary Information Register j ..... 3787
38.3.2.5 ADCAnPWDTSNDR - PWM-Diag Data Register ..... 3788
38.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register ..... 3789
38.3.2.7 ADCAnADHALTR - A/D Force Halt Register ..... 3790
38.3.2.8 ADCAnADCR - A/D Control Register ..... 3791
38.3.2.9 ADCAnMPXCURR — MPX Current Register ..... 3793
38.3.2.10 ADCAnTHSMPSTCR — T\&H Sampling Start Control Register ..... 3794
38.3.2.11 ADCAnTHCR - T\&H Control Register ..... 3795
38.3.2.12 ADCAnTHAHLDSTCR — T\&H Group A Hold Start Control Register ..... 3796
38.3.2.13 ADCAnTHBHLDSTCR — T\&H Group B Hold Start Control Register ..... 3797
38.3.2.14 ADCAnTHACR - T\&H Group A Control Register ..... 3798
38.3.2.15 ADCAnTHBCR — T\&H Group B Control Register ..... 3800
38.3.2.16 ADCAnTHER - T\&H Enable Register ..... 3802
38.3.2.17 ADCAnTHGSR — T\&H Group Select Register ..... 3804
38.3.2.18 ADCAnSMPCR — Sampling Control Register ..... 3806
38.3.2.19 ADCAnMPXSTBTSELRO to 4 - MPX Stabilization Time Selection Register 0 to 4 ..... 3807
38.3.2.20 ADCAnMPXSTBTR0 to 7 — MPX Stabilization Time Setting Register 0 to 7 ..... 3810
38.3.2.21 ADCAnSFTCR — Safety Control Register ..... 3812
38.3.2.22 ADCAnULLMTBR0 to 7 — Upper Limit/Lower Limit Table Register 0 to 7 ..... 3813
38.3.2.23 ADCAnECR - Error Clear Register ..... 3815
38.3.2.24 ADCAnULER — Upper Limit/Lower Limit Error Register ..... 3816
38.3.2.25 ADCAnOWER — Overwrite Error Register ..... 3818
38.3.2.26 ADCAnULEVCFR0 — Upper Limit/Lower Limit Error VC Flag Register 0 ..... 3819
38.3.2.27 ADCAnULEVCFR1 — Upper Limit/Lower Limit Error VC Flag Register 1 ..... 3820
38.3.3 Scan Group (SG) Specific Registers ..... 3821
38.3.3.1 ADCAnSGSTCRx - Scan Group x Start Control Register. ..... 3821
38.3.3.2 ADCAnPWDSGSTPCR — PWM-Diag Scan Stop Control Register ..... 3822
38.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register ..... 3823
38.3.3.4 ADCAnSGCRx - Scan Group x Control Register ..... 3824
38.3.3.5 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer ..... 3825
38.3.3.6 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer ..... 3826
38.3.3.7 ADCAnSGMCYCRx — Scan Group x Multicycle Register ..... 3827
38.3.3.8 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register ..... 3828
38.3.3.9 ADCAnSGSEFCRx - Scan Group x Scan End Flag Clear Register ..... 3829
38.3.3.10 ADCAnSGSTR - Scan Group Status Register ..... 3830
38.3.3.11 ADCAnSGSTPCRx — Scan Group x Stop Control Register ..... 3832
38.3.4 Hardware Trigger Specific Register ..... 3833
38.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register ..... 3833
38.3.5 Self-Diagnosis Specific Registers ..... 3836
38.3.5.1 ADCAnDGCTLO — Self-Diagnosis Control Register 0 ..... 3836
38.3.5.2 ADCAnDGCTL1 — Self-Diagnosis Control Register 1 ..... 3837
38.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1 ..... 3838
38.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2 ..... 3839
38.3.6 Emulation Specific Register ..... 3840
38.3.6.1 ADCAnEMU - Emulation Control Register ..... 3840
38.4 Operation ..... 3841
38.4.1 Initial Setting ..... 3841
38.4.2 Trigger Input ..... 3842
38.4.3 Ending/Stopping A/D Conversion ..... 3843
38.4.3.1 Ending by ADHALT ..... 3843
38.4.3.2 Stopping by SGSTP (for Each Scan Group) ..... 3844
38.4.4 Example of Scan Group Operation ..... 3848
38.4.5 Channel Repeat Mode ..... 3850
38.4.6 Example of Simultaneous Track and Hold Operation ..... 3852
38.4.7 A/D Conversion with External Analog Multiplexer ..... 3854
38.4.7.1 A/D Conversion with PWM-Diag Enabled ..... 3856
38.4.8 Example of Synchronous Suspend and Resume Operation ..... 3858
38.4.9 Example of Asynchronous Suspend and Resume Operation ..... 3859
38.4.10 Error Detecting Functions ..... 3860
38.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function ..... 3860
38.4.10.2 Overwrite Error Detecting Function ..... 3860
38.4.10.3 SVSTOP Operation ..... 3860
38.4.11 Activating Scan Group by a Hardware Trigger ..... 3864
38.4.11.1 Stopping Scan Group by ADHALT ..... 3864
38.4.12 Scan End Interrupt Request ..... 3865
38.4.13 A/D Error Interrupt Request ..... 3866
38.5 Self-Diagnostic Function ..... 3867
38.5.1 Diagnosis of A/D Conversion Circuit ..... 3868
38.5.1.1 Diagnostic Procedure ..... 3868
38.5.2 Diagnosis of Channel Multiplexer ..... 3869
38.5.2.1 Diagnostic Procedure ..... 3870
38.5.3 Diagnosis of Open Pins ..... 3871
38.5.3.1 Diagnostic Procedure ..... 3872
38.5.4 Diagnosis of T\&H Circuit ..... 3873
38.5.4.1 Diagnostic Procedure (in case of T\&H circuit ch0 diagnosis) ..... 3873
38.5.4.2 Diagnosis Mechanism ..... 3874
38.6 Definition of A/D Conversion Accuracy ..... 3876
38.7 Usage Notes ..... 3877
38.7.1 Range of Channel Input Voltage ..... 3877
38.7.2 Notes on Application Design ..... 3877
Section 39 Key Return (KR) ..... 3882
39.1 Features of RH850/F1KH, RH850/F1KM KR ..... 3882
39.1.1 Number of Units and Channels ..... 3882
39.1.2 Register Base Address ..... 3883
39.1.3 Clock Supply ..... 3883
39.1.4 Interrupt Requests ..... 3883
39.1.5 Reset Sources ..... 3883
39.1.6 External Input/Output Signals ..... 3883
39.2 Overview ..... 3884
39.2.1 Functional Overview. ..... 3884
39.2.2 Block Diagram ..... 3884
39.3 Registers ..... 3885
39.3.1 List of Registers ..... 3885
39.3.2 KRnKRM — Key Return Mode Register ..... 3885
39.4 Operation ..... 3886
39.4.1 Interrupt Request INTKRn ..... 3886
Section 40A Functional Safety of RH850/F1KH-D8 ..... 3887
40A. 1 Overview ..... 3887
40A. 2 ECC ..... 3888
40A.2.1 Overview ..... 3888
40A.2.2 Code Flash ECC ..... 3890
40A.2.2.1 Overview ..... 3890
40A.2.2.2 Interrupt Requests ..... 3891
40A.2.2.3 List of Registers ..... 3892
40A.2.2.4 Details of Registers ..... 3893
40A.2.3 Data Flash ECC ..... 3902
40A.2.3.1 Overview ..... 3902
40A.2.3.2 Interrupt Requests ..... 3902
40A.2.3.3 List of Registers ..... 3903
40A.2.3.4 Details of Registers ..... 3904
40A.2.4 Local RAM ECC ..... 3910
40A.2.4.1 Overview ..... 3910
40A.2.4.2 Interrupt Requests ..... 3911
40A.2.4.3 List of Registers ..... 3911
40A.2.4.4 Details of Registers ..... 3912
40A.2.5 Global RAM (Including the Retention RAM) ECC ..... 3920
40A.2.5.1 Overview ..... 3920
40A.2.5.2 Interrupt Requests ..... 3922
40A.2.5.3 List of Registers ..... 3923
40A.2.5.4 Details of Registers ..... 3924
40A.2.6 ECC for Peripheral RAM ..... 3932
40A.2.6.1 Overview ..... 3932
40A.2.6.2 Interrupt Requests ..... 3933
40A.2.6.3 List of Registers ..... 3934
40A.2.6.4 Details of Registers ..... 3936
40A. 3 Memory Protection ..... 3948
40A.3.1 Overview ..... 3948
40A.3.1.1 Identifiers for Slave Guard ..... 3949
40A.3.2 GRG (Global RAM Guard) ..... 3950
40A.3.2.1 List of Registers ..... 3951
40A.3.2.2 Details of Registers ..... 3952
40A.3.3 PBG/HBG ..... 3961
40A.3.3.1 List of Registers ..... 3967
40A.3.3.2 Details of Registers ..... 3973
40A.3.4 PBG for CPU System ..... 3979
40A.3.4.1 List of Registers ..... 3981
40A.3.4.2 Details of Registers ..... 3982
Section 40B Functional Safety of RH850/F1KM-S4 ..... 3988
40B. 1 Overview ..... 3988
40B. 2 ECC ..... 3989
40B.2.1 Overview ..... 3989
40B.2.2 Code Flash ECC ..... 3991
40B.2.2.1 Overview ..... 3991
40B.2.2.2 Interrupt Requests ..... 3992
40B.2.2.3 List of Registers ..... 3993
40B.2.2.4 Details of Registers ..... 3994
40B.2.3 Data Flash ECC ..... 4003
40B.2.3.1 Overview ..... 4003
40B.2.3.2 Interrupt Requests ..... 4003
40B.2.3.3 List of Registers ..... 4004
40B.2.3.4 Details of Registers. ..... 4005
40B.2.4 Local RAM ECC ..... 4011
40B.2.4.1 Overview ..... 4011
40B.2.4.2 Interrupt Requests ..... 4012
40B.2.4.3 List of Registers ..... 4012
40B.2.4.4 Details of Registers ..... 4013
40B.2.5 Global RAM (Including the Retention RAM) ECC ..... 4021
40B.2.5.1 Overview ..... 4021
40B.2.5.2 Interrupt Requests ..... 4023
40B.2.5.3 List of Registers ..... 4024
40B.2.5.4 Details of Registers ..... 4025
40B.2.6 ECC for Peripheral RAM ..... 4033
40B.2.6.1 Overview ..... 4033
40B.2.6.2 Interrupt Requests ..... 4034
40B.2.6.3 List of Registers ..... 4035
40B.2.6.4 Details of Registers. ..... 4037
40B. 3 Memory Protection ..... 4049
40B.3.1 Overview ..... 4049
40B.3.1.1 Identifiers for Slave Guard ..... 4050
40B.3.2 GRG (Global RAM Guard) ..... 4051
40B.3.2.1 List of Registers ..... 4052
40B.3.2.2 Details of Registers ..... 4053
40B.3.3 PBG/HBG ..... 4062
40B.3.3.1 List of Registers ..... 4068
40B.3.3.2 Details of Registers. ..... 4074
40B.3.4 PBG for CPU System ..... 4080
40B.3.4.1 List of Registers ..... 4082
40B.3.4.2 Details of Registers ..... 4083
Section 40C Functional Safety of RH850/F1KM-S1 ..... 4089
40C. 1 Overview ..... 4089
40C. 2 ECC ..... 4090
40C.2.1 Overview ..... 4090
40C.2.2 Code Flash ECC ..... 4092
40C.2.2.1 Overview ..... 4092
40C.2.2.2 Interrupt Requests ..... 4094
40C.2.2.3 List of Registers ..... 4094
40C.2.2.4 Details of Registers ..... 4095
40C.2.3 Data Flash ECC ..... 4104
40C.2.3.1 Overview ..... 4104
40C.2.3.2 Interrupt Requests ..... 4104
40C.2.3.3 List of Registers ..... 4105
40C.2.3.4 Details of Registers ..... 4106
40C.2.4 Local RAM (Including the Retention RAM) ECC ..... 4112
40C.2.4.1 Overview ..... 4112
40C.2.4.2 Interrupt Requests ..... 4113
40C.2.4.3 List of Registers ..... 4113
40C.2.4.4 Details of Registers ..... 4114
40C.2.5 ECC for Peripheral RAM ..... 4122
40C.2.5.1 Overview ..... 4122
40C.2.5.2 Interrupt Requests ..... 4123
40C.2.5.3 List of Registers ..... 4124
40C.2.5.4 Details of Registers ..... 4125
40C. 3 Memory Protection ..... 4136
40C.3.1 Overview ..... 4136
40C.3.1.1 Identifiers for Slave Guard ..... 4137
40C.3.2 PBG ..... 4138
40C.3.2.1 List of Registers ..... 4142
40C.3.2.2 Details of Registers ..... 4146
40C.3.3 PBG for CPU System ..... 4152
40C.3.3.1 List of Registers ..... 4153
40C.3.3.2 Details of Registers ..... 4154
Section 41 Data CRC (DCRA) ..... 4160
41.1 Features of RH850/F1KH, RH850/F1KM DCRA ..... 4160
41.1.1 Number of Units ..... 4160
41.1.2 Register Base Addresses ..... 4160
41.1.3 Clock Supply ..... 4161
41.1.4 Reset Sources. ..... 4161
41.2 Overview ..... 4162
41.2.1 Functional Overview. ..... 4162
41.2.2 Block Diagram ..... 4162
41.2.3 Operational Circuit ..... 4163
41.3 Registers. ..... 4164
41.3.1 List of Registers ..... 4164
41.3.2 DCRAnCIN — CRC Input Register ..... 4164
41.3.3 DCRAnCOUT — CRC Data Register ..... 4165
41.3.4 DCRAnCTL - CRC Control Register ..... 4166
41.4 Operation ..... 4167
Section 42 Security Function ..... 4168
Section 43 On-Chip Debug Unit (OCD) ..... 4169
43.1 Overview of RH850/F1KH, RH850/F1KM OCD ..... 4169
43.1.1 Functional Overview. ..... 4169
43.1.2 External Input/Output Pins ..... 4171
43.2 Peripheral Break Control ..... 4172
43.3 Hot Plug-in in Each Mode ..... 4176
43.3.1 RUN Mode ..... 4176
43.3.2 STOP/DeepSTOP Mode ..... 4176
43.3.3 Cyclic RUN Mode ..... 4176
43.3.4 Cyclic STOP Mode ..... 4177
43.4 Registers. ..... 4178
43.4.1 List of Registers ..... 4178
43.4.2 EPC - Emulation Peripheral Control Register ..... 4178
43.5 Cautions on Using On-Chip Debugging ..... 4179
43.5.1 Treatment of Devices Used for Debugging ..... 4179
43.5.2 Reset Assertion when a Debugger is Connected ..... 4179
43.5.3 Restrictions when HS IntOSC is Used as the Main Clock Source Instead of MainOSC ..... 4179
43.5.4 Restrictions when the Writing of OCD_MD and Reset are Occur at the Same Time, or Restrictions when the Writing of MTR (DBG_CTRLP) and Reset are Occur at the Same Time ..... 4179
43.5.5 Transition to DeepSTOP Mode when a Debugger is Connected ..... 4179
Section 44 Flash Memory ..... 4180
44.1 Features of RH850/F1KH, RH850/F1KM Flash Memory ..... 4180
44.2 Structure of Memory ..... 4182
44.2.1 Mapping of Code Flash Memory ..... 4182
44.2.2 Mapping of Data Flash Memory ..... 4185
44.3 Operating Modes Associated with Flash Memory ..... 4187
44.4 Functions ..... 4188
44.4.1 Functional Overview. ..... 4188
44.5 Serial Programming ..... 4192
44.5.1 Environments for Programming ..... 4192
44.6 Communication Modes ..... 4193
44.6.1 Asynchronous Flash Programming Interface - 1-Wire UART ..... 4193
44.6.2 Asynchronous Flash Programming Interface - 2-Wire UART ..... 4193
44.6.3 Synchronous Flash Programming Interface CSI ..... 4193
44.6.4 Selection of Communication Method ..... 4194
44.7 Self-Programming ..... 4195
44.7.1 Outline ..... 4195
44.7.2 Background Operation ..... 4196
44.7.3 Enabling Self-Programming ..... 4198
44.7.3.1 FLMDCNT Register ..... 4199
44.8 Reading Flash Memory ..... 4200
44.8.1 Reading Code Flash Memory ..... 4200
44.8.2 Reading Data Flash Memory ..... 4200
44.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register ..... 4201
44.8.2.2 PRDNAMEn — Product Name Storage Register ( $\mathrm{n}=1$ to 3) ..... 4204
44.8.2.3 CHIPIDnXX - Chip ID Register ( $n=1,2, X X=L L, L H, H L, H H$ ) ..... 4206
44.9 Option Bytes ..... 4207
44.9.1 Option Byte Setting ..... 4208
44.9.2 OPBTO — Option Byte 0 ..... 4209
44.9.3 OPBT1 — Option Byte 1 ..... 4211
44.10 Usage Notes ..... 4212
Section 45 RAM ..... 4214
45.1 Features of RH850/F1KH, RH850/F1KM RAM ..... 4214
45.2 Memory Configuration ..... 4216
45.3 Global RAM Zero Fill (GRZF) ..... 4219
45.3.1 Number of Units ..... 4219
45.3.2 Register Base Address ..... 4219
45.3.3 Clock Supply ..... 4219
45.3.4 Interrupt Requests ..... 4220
45.3.5 Reset Sources ..... 4220
45.3.6 Functional Overview ..... 4221
45.3.7 Registers ..... 4222
45.3.7.1 List of Registers ..... 4222
45.3.7.2 GRZFCTL - GRZF Control Register ..... 4223
45.3.7.3 GRZFSTS - GRZF Status Register ..... 4224
45.3.7.4 GRZFSA - GRZF Start Address Setting Register ..... 4225
45.3.7.5 GRZFSZ - GRZF Fill Size Setting Register ..... 4226
45.3.8 Operation ..... 4227
45.3.8.1 Procedure for FILL and VERI Function ..... 4227
45.3.8.2 Interrupt Sources ..... 4228
45.4 Usage Notes ..... 4229
Section 46 Boundary Scan ..... 4230
46.1 Overview ..... 4230
46.2 Features of RH850/F1KH, RH850/F1KM Boundary Scan ..... 4230
46.3 External Input/Output Pins ..... 4232
46.4 Registers ..... 4233
46.4.1 Instruction Register (SDIR) ..... 4234
46.4.2 ID Register (SDID) ..... 4234
46.4.3 Bypass Register (SDBPR) ..... 4235
46.4.4 Boundary Scan Register (SDBSR) ..... 4235
46.5 Operation ..... 4236
46.5.1 TAP Controller. ..... 4236
46.5.2 Supported Instructions ..... 4237
46.5.2.1 BYPASS ..... 4237
46.5.2.2 SAMPLE/PRELOAD ..... 4237
46.5.2.3 EXTEST ..... 4237
46.5.2.4 IDCODE ..... 4237
46.5.3 Pins Subject to Boundary Scan ..... 4238
46.6 Usage Notes ..... 4239
Section 47A Electrical Characteristics of RH850/F1KH-D8 ..... 4240
47A. 1 Overview ..... 4240
47A.1.1 Pin Groups ..... 4240
47A.1.1.1 324-Pin Version ..... 4240
47A.1.1.2 Reserved ..... 4240
47A.1.1.3 233-Pin Version ..... 4240
47A.1.1.4 176-Pin Version ..... 4240
47A.1.2 General Measurement Conditions ..... 4241
47A.1.2.1 Common Conditions ..... 4241
47A.1.2.2 AC Characteristic Measurement Condition ..... 4242
47A. 2 Absolute Maximum Ratings ..... 4243
47A.2.1 Supply Voltages ..... 4243
47A.2.2 Port Voltages ..... 4243
47A.2.3 Port Current ..... 4244
47A.2.3.1 324-Pin Version ..... 4245
47A.2.3.2 Reserved ..... 4246
47A.2.3.3 233-Pin Version ..... 4247
47A.2.3.4 176-Pin Version ..... 4249
47A.2.4 Temperature Condition ..... 4250
47A. 3 Operational Condition ..... 4251
47A.3.1 Recommended Operating Conditions ..... 4251
47A.3.2 Oscillator Characteristics ..... 4255
47A.3.3 Internal Oscillator Characteristics ..... 4259
47A.3.4 PLL Characteristics ..... 4260
47A.3.4.1 PLL0 (for CPU, with SSCG) Characteristics ..... 4260
47A.3.4.2 PLL1 (for CPU/Peripheral) Characteristics ..... 4261
47A. 4 DC Characteristics ..... 4262
47A.4.1 Capacitance ..... 4262
47A.4.2 Pin Characteristics ..... 4263
47A.4.2.1 Output Current ..... 4271
47A.4.3 Power Supply Currents ..... 4275
47A.4.4 Injection Currents ..... 4278
47A.4.4.1 Absolute Maximum Ratings ..... 4279
47A.4.4.2 DC Characteristics for Overload Current ..... 4280
47A.4.5 Power Management Characteristics ..... 4281
47A.4.5.1 Regulator Characteristics ..... 4281
47A.4.5.2 Voltage Detector (POC, LVI, VLVI, CVM) Characteristics ..... 4282
47A.4.5.3 Power Up/Down Timing ..... 4285
47A.4.5.4 CPU Reset Release Timing ..... 4290
47A. 5 AC Characteristics ..... 4291
47A.5.1 RESET Timing ..... 4291
47A.5.2 Mode Timing ..... 4292
47A.5.3 Interrupt Timing ..... 4293

RH850/F1KH, RH850/F1KM
Renesas microcontroller

## Section 1A Overview of RH850/F1KH-D8

## 1A. 1 RH850/F1KH Product Features

The features of the RH850/F1KH are described below.
The RH850/F1KH is a 32-bit single-chip microcontroller with two G3KH CPU core. The key features of the F1KH are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

## Applications

The RH850/F1KH is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## 1A. 2 RH850/F1KH Functions

Table 1A. 1 Overview of Product

| Product Name |  |  | RH850/F1KH-D8 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 176 Pins | 233 Pins | 324 Pins |
| Memory |  |  | See Table 1A.2, Product Lineup. |  |  |
| External Memory Access Controller (MEMC) |  |  | 23 bit Address Bus |  | 24 bit Address Bus |
| Serial Flash Memory I/F (SFMA) |  | Bus width | 4 bit |  |  |
|  |  | Mode | SDR |  |  |
|  |  | Max. clock | 40 MHz |  |  |
| Memory Card I/F (MMCA) |  | Bus width | Not provided |  | 8 bit |
|  |  | Mode |  |  | Backward-compatible |
|  |  | Max. clock |  |  | 20 MHz |
| CPU | CPU System |  | G3KH (Dual Core) |  |  |
|  | CPU frequency |  | 240 MHz max. |  |  |
|  | FPU |  | Single-precision |  |  |
|  | Protection Function | Memory Protection Unit (MPU) | Provided |  |  |
|  |  | Internal Peripheraldevice Guard (IPG) | Provided |  |  |
|  |  | Processor Element Guard (PEG) | Provided |  |  |
| DMA |  |  | 64 channels |  |  |
| Operating clock | Main Oscillator (MainOSC) |  | 8/16/20/24 MHz |  |  |
|  | Low Speed Internal Oscillator (LS IntOSC) |  | 240 kHz (typ.) |  |  |
|  | High Speed Internal Oscillator (HS IntOSC) |  | 8 MHz (typ.) |  |  |
|  | PLL | $\begin{aligned} & \text { PLLO } \\ & \text { (for CPU, with SSCG) } \end{aligned}$ | Provided |  |  |
|  |  | PLL1 <br> (for CPU/Peripheral) | Provided |  |  |
|  | Sub Oscillator (SubOSC) |  | 32.768 kHz |  |  |
| I/O port |  |  | 144 | 174 | 246 |
| A/D converter | ADCAO | Physical input channels | Total 34 ch (12 bit resolution: $16 \mathrm{ch}+10$ bit resolution: 18 ch ) |  |  |
|  |  | External multiplexer support for channel number extension | Provided |  |  |
|  |  | Channels with T\&H | Provided |  |  |
|  | ADCA1 | Physical input channels | Total 24 ch (12 bit resolution: $16 \mathrm{ch}+$ 10 bit resolution: 8 ch ) | Total 36 ch <br> (12 bit resolution: $16 \mathrm{ch}+10$ bit resolution: 20 ch ) |  |
|  |  | External multiplexer support for channel number extension | Not provided |  |  |
|  |  | Channels with T\&H | Not provided |  |  |

Table 1A. 1 Overview of Product

| Product Name |  | RH850/F1KH-D8 |  |  |

|  |  | 176 Pins | 233 Pins | 324 Pins |
| Timer | Timer Array Unit D (TAUD) | 1 unit (16 bit resolution timers $\times 16$ channels /unit) |  |  |
|  | Timer Array Unit B (TAUB) | 2 units (16 bit resolution timers $\times 16$ channels /unit) |  |  |
|  | Timer Array Unit J (TAUJ) | 4 units ( 32 bit resolution timers $\times 4$ channels /unit) |  |  |
|  | Operating System Timer (OSTM) | 10 units |  |  |
|  | Real-Time Clock (RTCA) | 1 unit |  |  |
|  | Encoder Timer (ENCA) | 1 unit |  |  |
|  | Window Watchdog Timer A (WDTA) | 3 units |  |  |
| Serial interfaces | Clocked Serial Interface G (CSIG) | 5 channels |  |  |
|  | Clocked Serial Interface H (CSIH) | 5 channels |  |  |
|  | CAN Interface (RS-CANFD) | 8 channels |  | 12 channels |
|  | LIN/UART Interface (RLIN3) | 8 channels |  |  |
|  | LIN Master Interface (RLIN2) | 10 channels | 12 channels | 16 channels |
|  | $1^{2} \mathrm{C}$ Interface (RIIC) | 2 channels |  |  |
|  | Clock Extension Peripheral Interface (CXP1) | Not provided |  |  |
|  | Single Edge Nibble Transmission (RSENT) | 2 channels |  |  |
|  | FlexRay Interface (FLXA) | 2 channel (A ch, B ch) |  |  |
|  | Ethernet AVB (ETNB) | 1 channel (MII) |  | 2 channels (MII) |
| External Interrupts | Maskable | 24 |  |  |
|  | Non-maskable (NMI) | 1 |  |  |
| Other functions | Clock Monitors (CLMA) | For PLLO, PLL1, HS IntOSC, MainOSC |  |  |
|  | Data CRC (DCRA) | 4 channels |  |  |
|  | Low-Voltage Indicator (LVI) | Provided |  |  |
|  | Power-On Clear (POC) | Provided |  |  |
|  | Core Voltage Monitors (CVM) | Provided |  |  |
|  | Error Correction Coding (ECC) | For Code flash, Data flash, Local RAM, Retention RAM, Global RAM, CSIH, RS-CANFD, FLXA, ETNB |  | For Code flash, Data flash, Local RAM, Retention RAM, Global RAM, CSIH, RS-CANFD, FLXA, ETNB, MMCA |
|  | Low Power Sampler (LPS) | Provided |  |  |
|  | PWM Output/Diagnostic (PWM-Diag) | 72 channels | 80 channels | 96 channels |
|  | Motor Control | 1 unit |  |  |
|  | Key Return (KR) | 8 channels |  |  |
|  | CLOCK OUTPUT (FOUT) | Provided |  |  |
|  | RESET OUTPUT ( $\overline{\text { RESETOUT }}$ ) | Provided |  |  |
|  | Intelligent Cryptographic Unit Master D (ICUMD) | Provided |  |  |
|  | On-Chip debug (OCD) | Provided |  |  |
|  | Boundary Scan | Provided |  |  |

## Section 1B Overview of RH850/F1KM-S4

## 1B. 1 RH850/F1KM Product Features

The features of the RH850/F1KM are described below.
The RH850/F1KM is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1KM are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

## Applications

The RH850/F1KM is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## Section 1C Overview of RH850/F1KM-S1

## 1C. $1 \quad$ RH850/F1KM Product Features

The features of the RH850/F1KM are described below.
The RH850/F1KM is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1KM are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode, in which the power supply to the most circuits of the microcontroller can be turned off.

## Applications

The RH850/F1KM is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

## 1C. 2 RH850/F1KM Functions

Table 1C. 1 Overview of Product

| Product Name |  |  | RH850/F1KM-S1 |  |  |  |

## CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- (e.g.) When RS-CANFD channel 0 is used:

| CANOTX | P0_0 | P10_1 |
| :--- | :--- | :--- |
| CANORX | P0_1 | P10_0 |

Use one of the following pin combinations:

- P0_0 and P0_1, or
- P10_0 and P10_1.

The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.

- (e.g.) When CSIH4 is used:

| CSIH4SC | P1_5 | P23_3 |
| :--- | :--- | :--- |
| CSIH4SO | P2_4 | P23_1 |
| CSIH4SI | P1_4 | P23_2 |

Use one of the following pin combinations:

- P1_5, P2_4 and P1_4, or
-P23_3, 23_1 and P23_2.
The pin combinations of the following are not allowed:

```
-P1_5, P2_4 and P23_2
-P1_5, P23_1 and P1_4
-P23_3, P2_4 and P23_2
-P1_5, P23_1 and P23_2
- P23_3, P2_4 and P1_4
-P23_3, P23_1 and P1_4.
```

## 2A. 3 Pin Functions During and After Reset

Table 2A. 6 Pin Functions During and After Reset

| Pins | During Reset | After Reset |
| :---: | :---: | :---: |
| JP0_0 | High impedance | JP0_0: Input |
|  |  | Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) |
|  |  | Nexus I/F: DCUTDI input |
|  |  | LPD (4 pins): LPDI input |
|  |  | LPD (1 pin): LPDIO input/output |
| JP0_1 | High impedance | JP0_1: Input |
|  |  | Serial programming mode: FPDT |
|  |  | Nexus I/F: DCUTDO output |
|  |  | LPD (4 pins): LPDO output |
|  |  | LPD (1 pin): High impedance |
| JP0_2 | High impedance | JP0_2: Input |
|  |  | Serial programming mode: FPCK |
|  |  | Nexus I/F: DCUTCK input |
|  |  | LPD (4 pins): LPDCLK input |
|  |  | LPD (1 pin): High impedance |
| JP0_3 | High impedance | JP0_3: Input |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: DCUTMS input |
|  |  | LPD (4 pins): High impedance |
|  |  | LPD (1 pin): High impedance |
| JP0_4 | Input*3,*5 | JP0_4: Input |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: DCUTRST input*1 |
|  |  | LPD (4 pins): High impedance |
|  |  | LPD (1 pin): High impedance |
| JP0_5 | High impedance |  |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: $\overline{\text { DCURDY output }}$ |
|  |  | LPD (4 pins): LPDCLKOUT output |
|  |  | LPD (1 pin): High impedance |
| JP0_6 | High impedance |  |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: $\overline{\text { EVTO }}$ output |
|  |  | LPD (4 pins): High impedance |
|  |  | LPD (1 pin): High impedance |
| P8_6 | Output*2,*4 | Output (OPBTO.RESETOUTEN = 1)*2 |
|  |  | High impedance (OPBTO.RESETOUTEN $=0)^{* 2, * 4}$ |
| P0 to P3, P8 to P13, P18 to P24 (except P8_6, P10_1, P10_2, P10_6 and P10_8) | High impedance | High impedance |
| P10_1 | High impedance | High impedance (FLMD0 = 0) |
|  |  | High impedance (FLMD0 = 1, FLMD1 = 0) |
|  |  | MODE0 input (FLMD0 = 1, FLMD1 = 1) |
| P10_2 | High impedance | High impedance (FLMD0 = 0) |
|  |  | High impedance (FLMD0 = 1, FLMD1 = 0) |
|  |  | MODE1 input (FLMD0 = 1, FLMD1 = 1) |

Table 2A. 6 Pin Functions During and After Reset

| Pins | During Reset | After Reset |
| :---: | :---: | :---: |
| P10_6 | High impedance | High impedance (FLMD0 $=0$ ) |
|  |  | High impedance (FLMD0 $=1$, FLMD1 $=0$ ) |
|  |  | High impedance (FLMD0 $=1$, FLMD1 $=1, \mathrm{MODE0}=0, \mathrm{MODE} 1=0$ ) |
|  |  | High impedance (FLMD0 $=1$, FLMD1 $=1, \mathrm{MODE0}=0, \mathrm{MODE} 1=1$ ) |
|  |  | High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) |
|  |  | MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1) |
| P10_8 | High impedance | High impedance (FLMD0 = 0) |
|  |  | FLMD1 input (FLMD0 = 1) |
| FLMD0 | Input | Input |
| RESET | Input | Input |
| AP0, AP1 | High impedance | High impedance |

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.
Note 2. $\overline{R E S E T O U T}$ is output. For details, see Section 2A.11, Port (Special I/O) Function Overview.
Note 3. When the power is turned on or when $\overline{\text { RESET }}$ is low level, JPO_4 pin should be driven low level.
Note 4. If OPBTO.RESETOUTEN $=0$, P8_6 pin status has a possibility to become unstable (less than $15 \mu \mathrm{~s}$ ) at the transition moment to reset status by internal reset factors.
Note 5. When $\overline{R E S E T}$ is low level, on-chip pull-down resistor is connected to JP0_4.

## 2A. 4 Port State in Standby Mode

For the port state in standby mode, see Section 14.1.4, I/O Buffer Control.

## 2A. 5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.
Table 2A. 7 Recommended Connection of Unused Pins

| Pin | Recommended Connection of Unused Pins |
| :---: | :---: |
| A0VREF, A1VREF | Connected to EVCC or BVCC |
| A0VSS, A1VSS | Connected to EVSS or BVSS |
| RESET | Connected to EVCC or BVCC via a resistor |
| XT1 | Connected to REGnVCC or AWOVSS via a resistor*2 (bit 0 of IPIBC0 $=1$ ) Connected to AWOVSS (bit 0 of IPIBC0 = 0) |
| X1 | Connected to AWOVSS via a resistor |
| X2 | Open |
| IP0_0 | Connected to REGnVCC or AWOVSS via a resistor*2 (bit 0 of IPIBC0 $=1$ ) Open (bit 0 of IPIBCO $=0$ ) |
| ```JP0 (excluding JP0_4) P0 P1 P2 P3 P8 (excluding P8_6) P9 P20 P23``` | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open |
| P8_6 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open |
| JP0_4 | Connected to EVSS via a resistor |
| P10_1, P10_2, P10_6, P10_8 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open |

Table 2A. 7 Recommended Connection of Unused Pins

| Pin | Recommended Connection of Unused Pins |
| :---: | :---: |
| P10 (excluding P10_1, P10_2, P10_6, P10_8) | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to BVCC or BVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) |
| $\begin{aligned} & \text { P11 } \\ & \text { P12 } \end{aligned}$ | Output: Open |
| P13 P18 P19 P21 P22 P24 |  |
| AP0 | Input: Open (when the PIBCn_m bit is 0 ) <br> Connected to AOVREF or AOVSS via a resistor (when the PIBCn_m bit is 1 ) <br> Output: Open |
| AP1 | Input: Open (when the PIBCn_m bit is 0 ) <br> Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1 ) Output: Open |
| Nexus/LPD I/F (JP0) | DCUTDI/LPDI/LPDIO (JPO_0): Connected to EVCC via a resistor <br> DCUTDO/LPDO (JP0_1): Open <br> DCUTCK/LPDCLK (JPO_2): Open <br> DCUTMS (JP0_3): Connected to EVCC via a resistor <br> DCUTRST (JPO_4): Connected to EVSS via a resistor*1 <br> $\overline{\text { DCURDY /LPDCLKOUT (JP0_5): Open }}$ <br> $\overline{\text { EVTO (JPO_6): Open }}$ |

Note 1. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.
Note 2. XT1 = IP0_0 (XT2) = REGnVCC or AWOVSS should be set.
XT1 is connected to IP0_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

## 2A. 6 Features of RH850/F1KH Port

## 2A.6.1 Port Group

The RH850/F1KH provides the following port groups, indicated by the numbers in the table below.

| Table 2A.8 | Port Groups in RH850/F1KH-D8 |  |
| :--- | :--- | :--- |
| No. of Pins | Port Group | RH850/F1KH-D8 |
| 176 pins | Number | 14 |
|  | Name | P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0 |
| 233 pins | Number | 17 |
|  | Name | P0 to P3, P8 to P13, P18 to P20, JP0, AP0, AP1, IP0 |
| 324 pins | Number | 21 |
|  | Name | P0 to P3, P8 to P13, P18 to P24, JP0, AP0, AP1, IP0 |
|  |  |  |

## 2A.6.2 Port Group Index $\mathbf{n}$

Throughout this section, the port groups are identified by using the index " $n$ ". For example, the port mode control register of the Pn pin is PMCn ( $\mathrm{n}=0$ to 3,8 to 13,18 to 24 ).

## 2A.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.
Port and JTAG port register addresses are given as offsets from the base addresses.
Table 2A. 9 Register Base Addresses

| Base Address Name | Base Address |
| :--- | :--- |
| <PORTn_base> | FFC1 $0000_{\mathrm{H}}$ |
| <JPORT0_base> | FFC2 $0000_{\mathrm{H}}$ |

## 2A.6.4 Clock Supply

The clock supply to ports is shown in the following table.
Table 2A. 10 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| Port | Register access clock | CPUCLK_UL |

## 2A. 7 Port Functions

The microcontroller has various pins for input/output functions, known as ports. The ports are organized in port groups.
The RH850/F1KH also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see Section 2A.7.2, Terms.

## 2A.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16 .
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

Table 2A.39, JTAG Port 0 (JP0), Table 2A.41, Port 0 (P0), Table 2A.43, Port 1 (P1), Table 2A.45, Port 2 (P2), Table 2A.47, Port 3 (P3), Table 2A.49, Port 8 (P8), Table 2A.51, Port 9 (P9), Table 2A.53, Port 10 (P10), Table 2A.55, Port 11 (P11), Table 2A.57, Port 12 (P12), Table 2A.59, Port 13 (P13), Table 2A.61, Port 18 (P18), Table 2A.63, Port 19 (P19), Table 2A.65, Port 20 (P20), Table 2A.67, Port 21 (P21), Table 2A.69, Port 22 (P22), Table 2A.71, Port 23 (P23), Table 2A.73, Port 24 (P24), Table 2A.75, Analog Port 0 (AP0), Table 2A.77, Analog Port 1 (AP1), Table 2A.79, Input Port 0 (IP0), and Section 2A.9.2, Pin Function Configuration.

## CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

## [Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JPO_0 (1st input alternative function)
- P0_1 (2nd, 3rd input alternative function)
- P10_0 (2nd input alternative function)

In the above case, when the 1 st input alternative function (INTPO) of JPO_0 is selected, using the 2nd input alternative function (CANORX/INTPO) of P0_1 only for the CAN signal is also prohibited.

## 2A.7.2 Terms

The following terms are used in this section:

## Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.
A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

## Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

## Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called "port".
The corresponding name is Pn _m. For example, $\mathrm{P} 0 \_7$ denotes port 7 of port group 0 . It is referenced as "port P0_7".

## Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

## 2A.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.
JTAG port group registers and bit names are prefixed by a "J". For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE
In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

## 2A.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m bit = 0)

A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.

- Software I/O control alternative mode (PMCn.PMCn_m bit $=1$, PIPCn.PIPCn_m bit $=0$ )

In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.

- Direct I/O control alternative mode (PMCn.PMCn_m bit $=1$, PIPCn.PIPCn_m bit $=1$ )

In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.
Table 2A. 11 Pin Function Configuration (Overview)

| Mode | Bit |  |  | 1/O |
| :---: | :---: | :---: | :---: | :---: |
|  | PMCn_m | PMn_m | PIPCn_m |  |
| Port mode | 0 | 0 | X | O |
|  |  | 1*1 |  | 1 |
| Software I/O control alternative mode | 1 | 0 | 0 | O |
|  |  | 1 | 0 | I |
| Direct I/O control alternative mode |  | X | 1 | Controlled by the alternative function |

Note 1. The input buffer must be enabled (PIBCn_m bit $=1$ ).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit = 0 )
- Output (PMn_m bit = 0): Alternative output mode 1 to Alternative output mode 7
- Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
- The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2A. 12 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)

| Mode | Register |  |  |  |  | 1/O |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PIPC*1 | PM** | PFCAE | PFCE | PFC |  |
| Alternative output mode 1 (ALT-OUT1) | 0 | 0 | 0 | 0 | 0 | 0 |
| Alternative input mode 1 (ALT-IN1) |  | 1 |  |  |  | 1 |
| Alternative output mode 2 (ALT-OUT2) |  | 0 |  |  | 1 | 0 |
| Alternative input mode 2 (ALT-IN2) |  | 1 |  |  |  | 1 |
| Alternative output mode 3 (ALT-OUT3) |  | 0 |  | 1 | 0 | 0 |
| Alternative input mode 3 (ALT-IN3) |  | 1 |  |  |  | 1 |
| Alternative output mode 4 (ALT-OUT4) |  | 0 |  |  | 1 | 0 |
| Alternative input mode 4 (ALT-IN4) |  | 1 |  |  |  | 1 |
| Alternative output mode 5 (ALT-OUT5) |  | 0 | 1 | 0 | 0 | 0 |
| Alternative input mode 5 (ALT-IN5) |  | 1 |  |  |  | 1 |
| Alternative output mode 6 (ALT-OUT6) |  | 0 |  |  | 1 | 0 |
| Alternative input mode 6 (ALT-IN6) |  | 1 |  |  |  | 1 |
| Alternative output mode 7 (ALT-OUT7) |  | 0 |  | 1 | 0 | 0 |
| Alternative input mode 7 (ALT-IN7) |  | 1 |  |  |  | I |
| Other than the above | Setting prohibited |  |  |  |  |  |

Note 1. If PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.
If a pin is in alternative mode ( $\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}$ bit $=1$ ), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

## 2A.7.4 Pin Data Input/Output

The registers used for data input/output are described below.
The location that is read via the PPRn register differs depending on the pin mode.

## 2A.7.4.1 Output Data

In the port mode $\left(P M C n . P M C n \_m=0\right)$, the value of the $P n . P n \_m$ is output from the $P n \_m$ pin.

## 2A.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.
The different PPRn read modes are shown in the table below.
Table 2A. 13 PPRn_m Read Values

| $\begin{aligned} & \text { PMC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PM } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIBC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PODC } \\ & \text { n_m } \end{aligned}$ | Mode | PPRn_m Read Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | X | X | Port input, input buffer disabled | Pn.Pn_m bit |
|  |  | 1 |  | X | Port input, input buffer enabled | Pn_m pin |
|  | 0 | X |  | 0 | Port push-pull output | Pn.Pn_m bit*1 |
|  |  |  |  | 1 | Port open-drain output |  |
| 1 | 1 | X | 0 | X | Software I/O control alternative input | Pn_m pin |
|  | 0 |  |  | 0 | Software I/O control alternative pushpull output | Output signal from the alternative function*1 |
|  |  |  |  | 1 | Software I/O control alternative opendrain output |  |
|  | X |  | 1 | 0 | Direct I/O control alternative input or push-pull output | I/O port in alternative mode: <br> - Input: Pn_m pin <br> - Output: Output signal from the alternative function*1 |
|  |  |  |  | 1 | Direct I/O control alternative input or open-drain output |  |

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.
The control registers in the above table have the following effects:

- PMCn.PMCn_m bit

This bit selects port mode $\left(\mathrm{PMCn}_{-} \mathrm{m}=0\right)$ or alternative mode $\left(\mathrm{PMCn}_{-} \mathrm{m}=1\right)$.

- PMn.PMn_m bit

This bit selects input $\left(\mathrm{PMn} \mathrm{\_m}=1\right)$ or output $\left(\mathrm{PMn} \mathrm{\_m}=0\right)$ when the port mode $(\mathrm{PMCn} \mathrm{m}=0)$ and software I/O control alternative mode ( $\mathrm{PMCn} \mathrm{m}=1, \operatorname{PIPCn} \mathrm{~m}=0$ ) have been selected.

- PIBCn.PIBCn_m bit

This bit disables $($ PIBCn_m $=0)$ or enables $(\operatorname{PIBCn} \mathrm{m}=1)$ the input buffer in input port mode $($ PMCn_m $=0$ and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the $\operatorname{Pn} . \mathrm{Pn}_{-} \mathrm{m}$ bit; otherwise the $\mathrm{Pn} \_\mathrm{m}$ pin level is returned.

- PIPCn.PIPCn_m bit

This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- PODCn.PODCn_m bit

This bit selects push-pull output $(\operatorname{PODCn} \mathbf{m}=0)$ or open-drain output $($ PODCn_m $=1)$.

- PBDCn.PBDCn_m bit

In output mode, when this bit is set to 1 , the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

## CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m =1).
Note, however, that the level of the $\mathrm{Pn} \_\mathrm{m}$ pin will be input to the alternative function that the $\mathrm{Pn} \_\mathrm{m}$ pin is being used as.

## 2A.7.4.3 Writing to the Pn Register

The data to be output via port $\mathrm{Pn}_{-} \mathrm{m}$ in port mode $\left(\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}\right.$ bit $\left.=0\right)$ is held in port register Pn .
Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.

In this case, new data can be written directly to the Pn register.

- By performing an indirect bitwise operation (a "set", "reset", or "not" operation) on the Pn register.

An indirect bitwise operation ("set", "reset", or "not") can be performed on the Pn register by using the following two registers:

- Port Set/Reset register PSRn

If the PSRn.PSRn $(m+16)$ bit $=1$, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.

- Port NOT register PNOTn

By setting PNOTn.PNOTn_m to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.
An indirect bitwise operation on the Pn register ("set", "reset", or "not") has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

## 2A. 8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

Figure 2A. 5 Schematic View of Port Control

## CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

## 2A. 9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

## - Section 2A.9.2, Pin Function Configuration

- Section 2A.9.3, Pin Data Input/Output
- Section 2A.9.4, Configuration of Electrical Characteristics

## 2A.9.1 Overview

The following registers are used for setting the individual pins of the port groups.
For details on $<$ PORTn_base $>$ and $<$ JPORT0_base $>$, see Section 2A.6.3, Register Base Addresses.
Table 2A. 14 Port Group Configuration Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| Pin function configuration |  |  |  |
| PORT | Port mode control register | PMCn | <PORTn_base> + 0400 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPMC0 | <JPORTO_base> + 0040 ${ }_{\text {H }}$ |
| PORT | Port mode control set/reset register | PMCSRn | <PORTn_base> + 0900 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPMCSR0 | <JPORT0_base> + 0090 ${ }_{\text {H }}$ |
| PORT | Port IP control register | PIPCn | <PORTn_base> + 4200 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| PORT | Port mode register | PMn | <PORTn_base> $+0300_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APMn | <PORTn_base> $+03 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPM0 | <JPORT0_base> + 0030 ${ }_{\text {H }}$ |
| PORT | Port mode set/reset register | PMSRn | <PORTn_base> + 0800 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APMSRn | <PORTn_base> $+08 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPMSR0 | <JPORTO_base> + 0080 ${ }_{\text {H }}$ |
| PORT | Port input buffer control register | PIBCn | <PORTn_base> + 4000 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APIBCn | <PORTn_base> $+40 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPIBC0 | <JPORTO_base> + 0400 ${ }_{\text {H }}$ |
| PORT |  | IPIBC0 | <PORTn_base> + 40FOH |
| PORT | Port function control register | PFCn | <PORTn_base> + 0500 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPFC0 | <JPORT0_base> + 0050 ${ }_{\text {H }}$ |
| PORT | Port function control expansion register | PFCEn | <PORTn_base> + 0600 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPFCE0 | <JPORT0_base> + 0060 ${ }_{\text {H }}$ |
| PORT | Port function control additional expansion register | PFCAEn | <PORTn_base> + 0 A $00_{H}+\mathrm{n} \times 4$ |
| Pin data input/output |  |  |  |
| PORT | Port bidirection control register | PBDCn | <PORTn_base> + 4100 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APBDCn | <PORTn_base> $+41 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPBDC0 | <JPORT0_base> $+0410_{H}$ |
| PORT | Port pin read register | PPRn | <PORTn_base> + 0200 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APPRn | <PORTn_base> + $02 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPPR0 | <JPORT0_base> + 0020 ${ }_{\text {H }}$ |
| PORT |  | IPPR0 | <PORTn_base> + 02FOH |

Table 2A. 14 Port Group Configuration Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| Pin data input/output |  |  |  |
| PORT | Port register | Pn | <PORTn_base> + 0000 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APn | <PORTn_base> + $00 \mathrm{C8} \mathrm{H}_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JP0 | <JPORT0_base> + 0000 ${ }_{\text {H }}$ |
| PORT | Port NOT register | PNOTn | <PORTn_base> + 0700 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APNOTn | <PORTn_base> + 07C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPNOTO | <JPORT0_base> + 0070 ${ }_{\text {H }}$ |
| PORT | Port set/reset register | PSRn | <PORTn_base> + 0100 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APSRn | <PORTn_base> + 01C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |

| PORT | Port protection command register | PPCMDn | <PORTn_base> + 4C00 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPPCMD0 | <JPORTO_base> + 04COH |
| PORT | Port protection status register | PPROTSn | <PORTn_base> + 4B00 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPPROTS0 | <JPORTO_base> + 04B0 ${ }_{\text {H }}$ |

## Index n

In Table 2A.14, Port Group Configuration Registers, the index " $n$ " in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group $n(P n)$. The values for $n$ differ according to the number of pins on the device in the way shown in Table 2A.15, Number of Pins on the Device, Name of Port Groups, and Values for " $n$ " in Register Symbols.

Table 2A. 15 Number of Pins on the Device, Name of Port Groups, and Values for "n" in Register Symbols

| Number of Pins on the Device | Port Groups | Values for "n" |
| :--- | :--- | :--- |
| 176 pins | P0, P1, P2, P8, P9, P10, P11, P12, P18, P20 | $0,1,2,8,9,10,11,12,18,20$ |
|  | AP0, AP1 | 0,1 |
|  | P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20 | $0,1,2,3,8,9,10,11,12,13,18,19,20$ |
|  | AP0, AP1 | 0,1 |
| 324 pins | P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, | $0,1,2,3,8,9,10,11,12,13,18,19,20,21$, |
|  | P21, P22, P23, P24 | $22,23,24$ |
|  | AP0, AP1 | 0,1 |

## JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.
All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

## Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2A.9.2 Pin Function Configuration

## 2A.9.2. $\quad$ PMCn / JPMCO — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Table 2A. 16 PMCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMCn_[15:0] | Specifies the operation mode of the corresponding pin. |
|  | $0:$ Port mode |  |
|  | 1: Alternative mode |  |

## CAUTIONS

1. $I / O$ is not controlled by only setting alternative mode (PMCn.PMCn_m bit $=1$ ). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1 .
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see Section 2A.12, Noise Filter \& Edge/Level Detector, and Section 2A.13, Description of Port Noise Filter \& Edge/Level Detection.

## NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

## 2A.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.
The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

| Access: $\begin{array}{ll}P \\ & \text { to } \\ & J \\ & \text { to }\end{array}$ |  |  | PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_{\mathrm{H}}$. Reading bits 15 to 0 returns the value of register PMCn. <br> JPMCSRO: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000 н. Reading bits 7 to 0 returns the value of register JPMCO. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} \text { Address: } & \text { PMCSRn: <PORTn_base> }+0900 \mathrm{H}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,20,21,22,23,24) \\ & \text { JPMCSR0: <JPORT0_base> + 0090 } \mathrm{H}^{* 1} \end{aligned}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 2A. 17 PMCSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | $\begin{aligned} & \text { PMCSRn_ } \\ & \text { [31:16] } \end{aligned}$ | Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. <br> 0 : PMCn_m is not affected by PMCSRn_m. <br> 1: PMCn_m is PMCSRn_m. <br> Example: <br> If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15. |
| 15 to 0 | $\begin{aligned} & \text { PMCSRn_ } \\ & {[15: 0]} \end{aligned}$ | Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1 . <br> 0 : PMCn_m is 0 . <br> 1: PMCn_m is 1 . |
| NOTE |  |  |

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

## 2A.9.2.3 PIPCn - Port IP Control Register

This register specifies whether the I/O direction of the $\mathrm{Pn} \_\mathrm{m}$ pin is controlled by the port mode register $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}$ or by an alternative function.

If the $\mathrm{Pn} \_\mathrm{m}$ pin is operated in alternative mode (PMCn.PMCn_m $=1$ ) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}$ setting.

Regarding the alternative functions for which the PIPC register must be set, see Section 2A.11, Port (Special I/O) Function Overview.

## 2A.9.2.4 PMn / APMn / JPMO — Port Mode Register

This register specifies whether the individual pins of the port group $n$ are in input mode or in output mode.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).

Note 2. The PM8 register is as follows.
When the OPBTO.RESETOUTEN $=1$, the PM8 register is $\mathrm{FFBF}_{\mathrm{H}}$. When the OPBTO.RESETOUTEN $=0$, the PM8 register is FFFF $_{H}$.
Note 3. The PM8_6 bit is as follows.
When the OPBTO.RESETOUTEN $=1$, the PM8_6 bit is 0 .
When the OPBTO.RESETOUTEN $=0$, the PM8_6 bit is 1 .
Table 2A. 19 PMn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMn_[15:0] | Specifies input/output mode of the corresponding pin. |
|  | $0:$ Output mode (output enabled) |  |
|  |  | 1: Input mode (output disabled) |

## NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and $P M n . P M n \_m=1$ ), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the $I / O$ direction in port mode (PMCn.PMCn_m $=0$ ) and alternative mode (PMCn.PMCn_m=1), since PIPCn.PIPCn_m = 0 after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPMO) are JPM0_[7:0].

## 2A.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.
The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

|  |  |  | PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_{\mathrm{H}}$. <br> Reading bits 15 to 0 returns the value of registers PMn and APMn. <br> JPMSRO: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000 H . Bits 15 to 8 are read as $\mathrm{FF}_{\mathrm{H}}$. Reading bits 7 to 0 returns the value of register JPMO. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device.
See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (APO), and Table 2A.78, Control Registers (AP1).
Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is $0000 \mathrm{FFBF}_{\mathrm{H}}$.
When the OPBT0.RESETOUTEN $=0$, the PMSR8 register is 0000 FFFF $_{H}$.
Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN $=1$, the PMSR8_6 bit is 0 .
When the OPBTO.RESETOUTEN $=0$, the PMSR8_6 bit is 1 .
Table 2A. 20 PMSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMSRn_[31:16] | Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to $\mathrm{PMn} \_\mathrm{m}$. <br> 0 : PMn_m is not affected by PMSRn_m. <br> 1: PMn_m is PMSRn_m. <br> Example: <br> If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15. |
| 15 to 0 | PMSRn_[15:0] | Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. <br> 0 : $P M n \_m$ is 0 . <br> 1: PMn_m is 1 . |

## NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSRO) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0].

## 2A.9.2.6 PIBCn / APIBCn / JPIBCO / IPIBCO — Port Input Buffer Control Register

In input port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \mathrm{m}=0$ and $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}=1$ ), this register enables the port pin's input buffer.

Table 2A. 21 PIBCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIBCn_[15:0] | Enables/disables the input buffer. |
|  |  | $0:$ Input buffer disabled |
|  |  | 1: Input buffer enabled |

## NOTES

1. When the input buffer is disabled, through current does not flow even when the pin level is $\mathrm{Hi}-\mathrm{Z}$. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBCO) are JPIBC0_[7:0]

## CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

## 2A.9.2.7 PFCn / JPFCO — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.
Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

```
Access: PFCn: This register can be read or written in 16-bit units.
JPFCO: This register can be read or written in 8-bit units.
Address: PFCn: <PORTn_base> \(+0500_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,20,24)\)
JPFC0: <JPORTO_base> + 0050** \({ }^{* 1}\)
Value after reset: \(\quad 0000_{H}\)
```

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.66, Control Registers (P20), and Table 2A.74, Control Registers (P24).

Table 2A. 22 PFCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCn_[15:0] | Specifies the alternative function of the pin. <br>  |
| For details, see Table 2A.25, Setting Alternative Functions. |  |  |

The control bits of the JTAG port function control register (JPFCO) are JPFC0_[7:0].

## 2A.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.
Some alternative functions directly control the I/O of the $\mathrm{Pn} \_\mathrm{m}$ pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the $\mathrm{I} / \mathrm{O}$ is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

| Access: |  |  | PFCEn: This register can be read or written in 16-bit units. <br> JPFCEO: This register can be read or written in 8-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JPO), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.62, Control Registers (P18), and Table 2A.66, Control Registers (P20).

Table 2A. 23 PFCEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCEn_[15:0] | Specifies the alternative function of the pin. |
|  |  | For details, see Table 2A.25, Setting Alternative Functions. |

## 2A.9.2.9 PFCAEn - Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.
Some alternative functions directly control the I/O of the $\mathrm{Pn} \_\mathrm{m}$ pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the $\mathrm{I} / \mathrm{O}$ is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

| Access: |  |  | PFCAEn: This register can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), and Table 2A.66, Control Registers (P20).

Table 2A. 24 PFCAEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCAEn_[15:0] | Specifies the alternative function of the pin. |
|  |  | For details, see Table 2A.25, Setting Alternative Functions. |

Table 2A. 25 Setting Alternative Functions

| PFCAEn_m | PFCEn_m | PFCn_m | PMn_m | Function |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 | Alternative input mode 1 |
|  |  |  | 0 | Alternative output mode 1 |
|  |  | 1 | 1 | Alternative input mode 2 |
|  |  |  | 0 | Alternative output mode 2 |
|  | 1 | 0 | 1 | Alternative input mode 3 |
|  |  |  | 0 | Alternative output mode 3 |
|  |  | 1 | 1 | Alternative input mode 4 |
|  |  |  | 0 | Alternative output mode 4 |
| 1 | 0 | 0 | 1 | Alternative input mode 5 |
|  |  |  | 0 | Alternative output mode 5 |
|  |  | 1 | 1 | Alternative input mode 6 |
|  |  |  | 0 | Alternative output mode 6 |
|  | 1 | 0 | 1 | Alternative input mode 7 |
|  |  |  | 0 | Alternative output mode 7 |
|  |  | 1 | X | Setting prohibited |

## CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to " 1 ".
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited. For example, if the $a / b / c$ pin is used as $b$, the $b / d / e$ pin cannot be used as $b$. In this case, the $b / d / e$ pin must be configured as a pin function other than $b$.

NOTE
For more details on the assignment of each function, see Section 2A.10.1.2, Control Registers to Section 2A.10.15.2, Control Registers.

## 2A.9.3 Pin Data Input/Output

## 2A.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JPO), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).

Table 2A. 26 PBDCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PBDCn[15:0] | Enables/disables bidirectional mode of the corresponding pin. |
|  | $0:$ Bidirectional mode disabled |  |
|  | 1: Bidirectional mode enabled |  |

## CAUTION

- When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m =0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m =1).
- However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

NOTE
The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

## 2A.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the $\operatorname{Pn} \_m$ pin, whether it is the value of the $\mathrm{Pn} . \mathrm{Pn} \_\mathrm{m}$ bit or the level of an alternative output function.

| Access: <br> Address: |  | ess: <br> ess: | PPRn, <br> JPPRO: <br> PPRn: <br> APPRn <br> JPPRO: <br> IPPR0: | PPRn, <br> This reg <br> ORTn <br> <POR <br> <JPOR <br> PPORT | PRO: <br> ter is <br> base> <br> _base> <br> _base <br> base> | ese reg <br> read-on <br> 0200 H <br> $+02 \mathrm{C} 8$ <br> $+0020$ <br> 02 FO | ters ar regist <br> $n \times 4$ <br> $+n \times 4$ | read-o <br> that can $\begin{aligned} & =0,1, \\ & n=0,1 \end{aligned}$ | y regis <br> be rea $3,8,9$ | s that <br> in 8-bit <br> 10, 11, | units. 2, 13, | $\text { ,19, } 2$ | bit units. 21, 22, | 23, 24) |  |  |

Note 1. The effective bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JPO), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), Table 2A.78, Control Registers (AP1), and Table 2A.80, Control Registers (IP0).

Table 2A. 27 PPRn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PPRn_[15:0] | The Pn_m Pin, Pn.Pn_m value or alternative function output. |
| NOTES |  |  |

1. For the read values of the PPRn register, see Section 2A.7.4, Pin Data Input/Output.
2. The control bits of the JTAG port pin read register (JPPRO) are JPPRO_[7:0].

## 2A.9.3.3 Pn / APn / JPO — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and $\mathrm{PMn} . \mathrm{PMn}_{-} \mathrm{m}=0$ ).

Access: Pn, APn: These registers can be read or written in 16 -bit units.
JPO: This register can be read or written in 8-bit units.
Address: Pn: <PORTn_base> $+0000_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22,23,24)$
APn: <PORTn_base> $+00 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1)$
JPO: <JPORTO_base> $+0000{ }^{*}{ }^{* 1}$
Value after reset: $\quad 0000_{H}$

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).

Table 2A. 28 Pn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | Pn_[15:0] | Sets the output level of the Pn_m pin $(m=0$ to 15$)$. |
|  | $0:$ Outputs low level |  |
|  | 1: Outputs high level |  |

## NOTE

The control bits of the JTAG port register (JP0) are JP0_[7:0].

## 2A.9.3.4 PNOTn / APNOTn / JPNOTO — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000h is returned.
JPNOTO: This register is a write-only register that can be written in 8-bit units. When read, $00_{\mathrm{H}}$ is returned.
Address: PNOTn: <PORTn_base> $+0700_{H}+n \times 4(n=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22,23,24)$
APNOTn: <PORTn_base> $+07 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1)$
JPNOTO: <JPORTO_base> + 0070 $\mathrm{H}^{* 1}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Note 1. The effective bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (AP0), and Table 2A.78, Control Registers (AP1).

Table 2A. 29 PNOTn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PNOTn_[15:0] | Specifies if Pn.Pn_m is inverted. |
|  | $0: P n . P n \_m$ is not inverted $\left(P n \_m \rightarrow P n \_m\right)$ |  |
|  |  | 1: Pn.Pn_m is inverted $\left(\overline{P n \_m} \rightarrow P n \_m\right)$ |
| NOTE |  |  |

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

## 2A.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.
The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Note 1. The effective bit positions (value for the index $m$ ) vary depending on the number of pins for each device.
See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), Table 2A.74, Control Registers (P24), Table 2A.76, Control Registers (APO), and Table 2A.78, Control Registers (AP1).

Table 2A. 30 PSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PSRn_[31:16] | Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to $P n \_m$. <br> 0 : Pn_m is not affected by PSRn_m <br> 1: Pn_m is PSRn_m <br> Example: <br> If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15. |
| 15 to 0 | PSRn_[15:0] | Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. $\begin{aligned} & \text { 0: Pn_m = } 0 \\ & \text { 1: } \mathrm{Pn} \_m=1 \end{aligned}$ |

## NOTE

The control bits of the JTAG port set/reset register (JPSRO) are JPSR0_[31:0].

## 2A.9.4 Configuration of Electrical Characteristics

## 2A.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

Table 2A. 31 PUn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PUn_[15:0] | Specifies whether an internal pull-up resistor is connected to the corresponding pin. |
|  |  | 0: No internal pull-up resistor connected |
|  |  | 1: An internal pull-up resistor connected |
| NOTES |  |  |

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m $=1$ ) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

## 2A.9.4.2 PDn / JPDO - Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).

Table 2A. 32 PDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PDn_[15:0] | Specifies whether to connect an internal pull-down resistor to the corresponding pin. |
|  | $0:$ No internal pull-down resistor connected |  |
|  | 1: An internal pull-down resistor connected |  |

## NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m $=1$ ) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPDO) are JPDO_[7:0].

## 2A.9.4.3 PDSCn / JPDSCO — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn register is required in order to update this register. For details, see Section 5, Write-Protected Registers. Regarding the alternative functions for which the PDSC register needs to be set, see Section 2A.11.3.3, Output Buffer Control (PDSC).

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).

Table 2A. 33 PDSCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PDSCn_[15:0] | Specifies the port drive strength of the output buffer of the port pin. |
|  |  | 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) |
|  |  | 1: High drive strength (when the frequency output from the pin is 40 MHz or less). |

## 2A.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see Section 5, Write-Protected Registers.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.
See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JPO), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).
Note 2. The PODC8 register is as follows.
When the OPBTO.RESETOUTEN $=1$, the PODC8 register is $00000040_{\mathrm{H}}$. When the OPBTO.RESETOUTEN $=0$, the PODC8 register is $00000000_{\mathrm{H}}$.
Note 3. The PODC8_6 bit is as follows.
When the OPBTO.RESETOUTEN $=1$, the PODC8_6 bit is 1 .
When the OPBTO.RESETOUTEN $=0$, the PODC8_6 bit is 0 .
Table 2A. 34 PODCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PODCn_[15:0] | Specifies the output buffer function. |
|  |  | 0: Push-pull |
|  | 1: Open-drain |  |

## NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

## 2A.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISn: This register can be read or written in 16-bit units.
JPIS0: This register can be read or written in 8 -bit units.
Address: PISn: <PORTn_base> $+4700_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22,23,24)$
JPISO: <JPORTO_base> + 0470 ${ }^{* 1}$
Value after reset: $\quad$ FFFF $_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { PIS } \\ & \text { n_15 } \end{aligned}$ | $\begin{gathered} \text { PIS } \\ \text { n_14 } \end{gathered}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_13 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_12 } \end{aligned}$ | $\begin{gathered} \text { PIS } \\ \text { n_11 } \end{gathered}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_10 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_9 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_8 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_7 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_6 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_5 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_4 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_3 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_2 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_1 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_0 } \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JP0), Table 2A.42, Control Registers (P0), Table 2A.44, Control Registers (P1), Table 2A.46, Control Registers (P2), Table 2A.48, Control Registers (P3), Table 2A.50, Control Registers (P8), Table 2A.52, Control Registers (P9), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.64, Control Registers (P19), Table 2A.66, Control Registers (P20), Table 2A.68, Control Registers (P21), Table 2A.70, Control Registers (P22), Table 2A.72, Control Registers (P23), and Table 2A.74, Control Registers (P24).

Table 2A. 35 PISn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PISn_[15:0] | Specifies the input buffer Characteristics: |
|  | $0:$ Type 1 (SHMT1) |  |
|  | 1: Type 2 (SHMT4) |  |

## NOTES

1. Details of the definition of type 1 and type 2 are given in Section 2A.11.3.2, Input Buffer Control (PISn/JPISO, PISAn/JPISA0). For details, also see Section 47A, Electrical Characteristics of RH850/F1KH-D8 for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPISO) are JPIS0_[7:0].

## 2A.9.4.6 PISAn / JPISAO — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

| Access: | PISAn: This register can be read or written in 16-bit units. JPISAO: This register can be read or written in 8-bit units. |
| :---: | :---: |
| Address: | $\begin{aligned} & \text { PISAn: <PORTn_base> }+4 \text { A }_{0} 0_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=10,11,12,13,18,21,22) \\ & \text { JPISAO: <JPORTO_base> }+04 \mathrm{AO}_{\mathrm{H}^{* 1}} \end{aligned}$ |
| Value after reset: | 0000 H |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { PISA } \\ & \text { n_15 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_14 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_13 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_12 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_11 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_10 } \end{aligned}$ | $\begin{gathered} \text { PISA } \\ \text { n_9 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_8 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_7 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_6 } \end{gathered}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_5 } \end{aligned}$ | $\begin{gathered} \text { PISA } \\ \text { n_4 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_3 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_2 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_1 } \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_0 } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2A.10, Port (General I/O) Function Overview: Table 2A.40, Control Registers (JPO), Table 2A.42, Control Registers (P0), Table 2A.54, Control Registers (P10), Table 2A.56, Control Registers (P11), Table 2A.58, Control Registers (P12), Table 2A.60, Control Registers (P13), Table 2A.62, Control Registers (P18), Table 2A.68, Control Registers (P21), and Table 2A.70, Control Registers (P22).

Table 2A. 36 PISAn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PISA_[15:0] | Specifies the input buffer characteristics: |
|  |  | 0: Type 2 (SHMT4) |
|  | 1: Type 5 (TTL) |  |

Table 2A. 37 Port Input Selection Advanced Register Contents

| PISAn | PISn | Function |
| :--- | :--- | :--- |
| 0 | 0 | Type 1 input buffer is selected (SHMT1) |
|  | 1 | Type 2 input buffer is selected (SHMT4) |
| 1 | $X$ | Type 5 input buffer is selected (TTL) |

## NOTE

Details of the definition of type 2 and type 5 are given in Section 2A.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0). For details, also see Section 47A, Electrical Characteristics of RH850/F1KH-D8 for input buffer characteristics.

## 2A.9.5 Port Register Protection

RH850/F1KH has Port Protection Command Register (PPCMDn) and Port Protection Status Register (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see Section 5, Write-Protected Registers.

## 2A.9.6 Flowchart Examples for Port Settings

Examples of the port settings are shown in the flowchart below.

## CAUTION

If the port is set to the PIPCn.PIPCn_m = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0 . If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

## 2A.9.6.1 Batch Setting

An example of specifying batch port settings is shown in the flowchart below.

Note 1. While $P M C=0$, an interrupt may be triggered during the configuration of the port registers under the following conditions: For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.
For INTPO-6 and INTP9-23 interrupt requests:
- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2A. 6 Example of Port Settings (When Specified in Batch)

## 2A.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

Figure 2A. 7 Example of Port Settings (in Port Mode)
(1) With IP Control

Figure 2A. 8 Example of Port Settings (in Alternative Mode)

## (2) Without IP Control

Note 1. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions: For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.
For INTP0-6 and INTP9-23 interrupt requests:
- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2A. 9 Example of Port Settings (in Alternative Mode)

## 2A. 10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m $=1$, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2A. 38 Port Function

## 2A.10.1.2 Control Registers

Table 2A. 40 Control Registers (JP0)

| Register | Function | $\begin{aligned} & \text { Register } \\ & \text { Size } \end{aligned}$ | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |

## CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected
2. Use ADC functions with their initial settings. For details, see Table 2A.50, Control Registers (P8).
3. When the RESETOUT function is selected for the P8_6 pin, the output on the pin is at the low level during a reset and after release from the reset state. For details, see Section 2A.11.1.1, P8_6: RESETOUT .

## 2A.10.6.2 Control Registers

Table 2A. 50 Control Registers (P8)

| Register | Function | Register Size | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |

## CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
2. Use ADC functions with their initial settings. For details, see Table 2A.62, Control Registers (P18).

## 2A.10.12.2 Control Registers

Table 2A. 62 Control Registers (P18)

| APIBC1 | Analog port input buffer control register 1 | 16 | 15-0 | RN | 40 CCH | 0000н | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| APBDC1 | Analog port bidirection control register 1 | 16 | 15-0 | RN | 41 CC C | $0000{ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

## 2A.10.21.2 Control Registers

Table 2A. 80 Control Registers (IP0)

|  |  | Register Size | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Register | Function |  | Position | RM ${ }^{* 1}$ |  |  | 176 <br> Pins | $233$ <br> Pins | $272$ <br> Pins | $324$ <br> Pins |
| IPPR0 | Input port pin read register 0 | 16 | 0 | R | 02F0H | $0^{0000}{ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| IPIBC0 | Port input buffer control register 0 | 16 | 0 | RM | 40FOH | 0000 H | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned. When writing to unused bits, write the value after reset.

## CAUTION

When the IP0_0/XT2 pin is used as an input port, set the IPIBC0.0 bit to 1 and stop the SOSC operation. For details on the settings for SOSC operations, see Section 12AB.4.2.7, SOSCE — SubOSC Enable Register. When the IP0_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0.0 bit to 0 .

## 2A. 11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

## 2A.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

## 2A.11.1.1 P8_6: RESETOUT

The P8_6 pin ( RESETOUT signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.
(Case 1): OPBT0.RESETOUTEN $=1$

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 0: Output mode
- PODC8.PODC8_6 = 1: Open-drain
(Case 2): OPBT0.RESETOUTEN $=0$
- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 1: Input mode
- PODC8.PODC8_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see Section 44.9.2, OPBTO - Option Byte 0, also see Section 9A.1.3, Reset Output ( RESETOUT ).

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

Figure 2A. 10 P8_6 Pin ( $\overline{\text { RESETOUT }}$ Signal) Operation While a Reset is asserted and released:
(Case 1) OPBTO.RESETOUTEN setting is 1

Note 1. When a reset except POC reset occurs with RESETOUT disable (OPBTO.RESETOUTEN $=0$ ), P8_6 pin ( $\overline{\text { RESETOUT }}$ signal) will be changed to $\mathrm{Hi}-\mathrm{z}$.

Figure 2A. 11 P8_6 Pin ( RESETOUT Signal) Operation While a Reset is asserted and released: (Case 2) OPBTO.RESETOUTEN setting is 0

## 2A.11.1.2 JPO_0 to JPO_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2A. 81 Debug Interface

| OPJTAG1 | OPJTAG0 | Mode | JP0_0 | JP0_1 | JP0_2 | JP0_3 | JPO_4 | JP0_5 | JP0_6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | Nexus I/F | DCUTDI input | DCUTDO output | DCUTCK input | DCUTMS input | $\begin{aligned} & \overline{\text { DCUTRST }} \\ & \text { input } \end{aligned}$ | $\begin{aligned} & \hline \overline{\text { DCURDY }} \\ & \text { output } \end{aligned}$ | $\overline{\text { EVTO }}$ output |
| 0 | 1 | LPD <br> (4 pins) | LPDI input | LPDO output | LPDCLK input | Port/ alternative function | Port/ alternative function | LPDCLK OUT output | Port/ alternative function |
| 1 | 0 | LPD <br> (1 pin) | LPDIO input/output | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function |

## NOTE

For the OPJTAG [1:0] settings, see Section 44.9.2, OPBTO — Option Byte 0.

## 2A.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See Flash Programmer's Manual for details.

## 2A.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.
The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see Section 6, Operating Mode.

## 2A.11.1.5 IPO_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0_0 bit = 1, the IP0_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

## 2A.11.2 A/D Input Alternative I/O

The following ports are permanently connected to $A / D$ input functions. (However, an analog input to the $A / D$ is controlled by the $\mathrm{A} / \mathrm{D}$ module.)

Table 2A. 82 A/D Input Alternative Pins

| Port | A/D Input | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 176 Pins | 233 Pins | 272 Pins | 324 Pins |
| P8_0 | ADCAOIOS | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |

## 2A.11.3 Special I/O Control

## 2A.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.
The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1 .
For details, see Section 2A.9.2.3, PIPCn — Port IP Control Register.
Table 2A. 83 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

| Function | Alternative functions Name | Port Name | Power Supply Area | Control | Reference Section |

## 2A.11.3.2 Input Buffer Control (PISn/JPISO, PISAn/JPISAO)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/PISAn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type $1 / 2$ or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in Table 2A.85, JTAG Port Input Buffer Characteristics Selection.

Table 2A. 84 Port Input Buffer Characteristics Selection

| Port Name | Input Buffer Selection |  |  | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 2A. 85 JTAG Port Input Buffer Characteristics Selection

|  | Input Buffer Selection |  |  | Devices |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port Name | Type 1 (JPIS0_m = 0 \& JPISA0_m = 0) | Type 2 <br>  <br> JPISA0_m = 0) | Type 5 <br> (JPISAO_m = 1) | 176 Pins | 233 Pins | 272 Pins | 324 Pins |
| JP0_0 | SHMT1 | SHMT4 | TTL*1,*2,*3,*4 | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_1 | SHMT1 | SHMT4 | - | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_2 | SHMT1 | SHMT4 | TTL*1,*2,*3 | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_3 | SHMT1 | SHMT4 | TTL*1,*2 | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_4 | - | SHMT4 | -*1,*2 | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_5 | SHMT1 | SHMT4 | - | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_6 | SHMT1 | SHMT4 | - | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |

Note 1. TTL is selected for Boundary scan mode without JPISAO register setting.
Note 2. TTL is selected for Nexus in normal operating mode without JPISAO register setting.
Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISAO register setting.
Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

NOTES

1. For the SHMT1, SHMT4 and TTL pin characteristics, see Section 47A, Electrical Characteristics of RH850/F1KH-D8.
2. For the input buffer after reset, Type 2 (SHMT4) is selected.

## 2A.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2A. 86 Output Buffer Characteristics Selection

| Port Name | Output Drive Strength Selection |  | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Slow Mode (PDSCn_m = 0) | Fast Mode (PDSCn_m = 1) | 176 Pins | 233 Pins | 272 Pins | 324 Pins |
| JP0_1 | 10 MHz | 40 MHz | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
| JP0_2 | 10 MHz | 40 MHz | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |

Note 1. Supports Cload: 100 pF (The load capacitance of CSIHO is 100 pF .)
Note 2. Supports Cload: 50 pF (The load capacitance of CSIH 1 to CSIH 4 are 50 pF .)
Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see Section 47A.5, AC Characteristics.

## 2A. 12 Noise Filter \& Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KH supports both analog and digital filters.
It also supports the function for edge and level detection after the signals have passed through a filter.
The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter \& edge/level detection control registers and control bits, and register addresses.
For details on the digital/analog filter function and noise filter \& edge/level detection control registers, see Section 2A.13, Description of Port Noise Filter \& Edge/Level Detection.

NOTE
In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2A.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

## 2A.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m=0 to 7)

A dedicated FCLA0CTLm_<name> register is provided for each pin in a port that incorporates an analog filter.
Table 2A. 87 Input Pins that Incorporate Analog Filter Type A

| Module Name | Input Pin | FCLA0CTL Register Configuration |  | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Register | Address | 176 Pins | 233 Pins | 272 Pins | 324 Pins |

Note 1. For details on edge detection for TAUJ, see Section 33.3.3.4, TAUJnCMURm - TAUJn Channel Mode User Register.
Note 2. For details on edge detection for TAPA, see Section 36.3.2, TAPAnCTLO - TAPA Control Register 0.

## 2A.12.1.3 Input Pins that Incorporate Analog Filter Type C

The input pins of analog filter type C only incorporate an analog filter function.
Table 2A. 89 Input Pins that Incorporate Analog Filter Type C

|  | Input Pin |
| :--- | :--- |
|  | FLMD0 |
|  | FLMD1 |
|  | MODE0 |
|  | MODE1 |
|  | MODE2 |
|  | RESET |
|  | DCUTRST |

## 2A.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<name> ( $\mathrm{m}=0$ to 2 )

Each port with a digital filter has a special FCLA0CTLm_<name> register.

- Digital noise elimination control register DNFA<name $>$ CTL

Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.

- Digital noise elimination enable register DNFA<name $>$ EN

The setting of the DNFA<name $>$ ENL[2:0] bits in DNFA<name $>$ EN enables or disables digital noise elimination for three input signals per group.
Table 2A. 90 Input Pins that Incorporate Digital Filter Type D

|  | Device |  |  |  | Digital Noise Elimination Control Register |  | Digital Noise Elimination Enable Register |  |  | Filter Control Register |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 2A.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA $<$ name $>$ CTL

Each DNFA<name $>$ CTL control register controls digital filter processing for up to 16 input signals per group.

- Digital noise elimination enable register DNFA<name>EN

The setting of the DNFA<name $>$ ENL[7:0] and DNFA<name $>\mathrm{ENH}[7: 0]$ bits in DNFA<name $>\mathrm{EN}$ enables or disables digital noise elimination for up to 16 input signals per group.

Table 2A. 91 Input Pins that Incorporate Digital Filter Type E

| Input Pin | Devises |  |  |  | Digital Noise Elimination Control Register |  | Digital Noise Elimination Enable Register |  |  | Edge <br> Detection |

| TAUB1 | Isolated area <br> (ISO area) | Digital filter <br> type E | DNFATCKI | CKSC_IPERI2S_CTL | - |
| ENCA0 | Isolated area <br> (ISO area) | Digital filter <br> type E | DNFATCKI | CKSC_IPERI1S_CTL | - |
| SENTn | Isolated area <br> (ISO area) | Digital filter <br> type E | DNFATCKI | CKSC_IPERI2S_CTL | - |

Note 1. Power Domain

NOTE
For the Setting Register, see Section 12AB.4.3, Clock Selector Control Register.

## 2A. 13 Description of Port Noise Filter \& Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.
NOTE
In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2A.13.1 Overview

## 2A.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.

Used for external interrupt signals.

- Type B: An analog filter

Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.

- Type C: An analog filter only

Used for the external RESET input and mode signals.

## 2A.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection. Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function. Used for the timer input signals and encoder input signals.

## 2A.13.2 Analog Filters

## 2A.13.2.1 Analog Filter Characteristic

See Section 47A, Electrical Characteristics of RH850/F1KH-D8 for the input conditions for signals input to pins that incorporate an analog filter.

## 2A.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in Table 2A.87, Input Pins that Incorporate Analog Filter Type A.

## 2A.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

## (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

Figure 2A. 12 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<name>.FCLA0INTLm_<name>.

- FCLA0INTLm_<name> bit $=0$ : Edge detection

Whether a rising or falling edge is detected can be specified by setting the
FCLA0CTLm_<name $>$.FCLA0INTRm_<name> and FCLA0CTLm_<name $>$.FCLA0INTFm_<name> bits.

- FCLA0INTLm_<name $>$ bit $=1$ : Level detection

The detection of a high level or low level can be specified by setting
FCLA0CTLm_<name>.FCLA0INTRm_<name> bit.
The table below summarizes the detection conditions of the analog filter.
Table 2A. 93 Analog Filter Event Detection Conditions

| FCLAOINTLm_<name> | FCLAOINTFm_<name> | FCLAOINTRm_<name> | Edge Detection | Level Detection |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | No edge detected | Disabled |
|  | 0 | 1 | Rising edge |  |
|  | 1 | 0 | Falling edge |  |
|  | 1 | 1 | Rising and falling edges |  |
| 1 | X | 0 | Disabled | Low level |
|  | X |  |  | High level |

## Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

## (2) Analog filter type B

A block diagram of analog filter type B is shown below.

Figure 2A. 13 Block Diagram of Analog Filter Type B

## Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

## (3) Analog filter type C

A block diagram of analog filter type C is shown below.

Figure 2A. 14 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

## Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2A.13.3 Digital Filters

## 2A.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.
The input signal is sampled with the sampling frequency fs.
If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<name $>$ CTL.DNFA<name $>\operatorname{PRS}[2: 0]$ select the sampling frequency based on
$\mathrm{f}_{\mathrm{s}}=\mathrm{f}_{\text {DNFATCKI }} / 2^{\text {DNFA<name }}$ PRS[2:0]
where fDNFATCKI is the frequency of the DNFATCKI clock.
- DNFA<name>CTL.DNFA<name>NFSTS[1:0] determines the number of same level samples, "s", (2 to 5): $\mathrm{s}=\mathrm{DNFA}<$ name $>\operatorname{NFSTS}[1: 0]+2$

External signal pulses shorter than the following are suppressed at all times.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}
$$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$$
(s+1) \times 1 / f_{s}
$$

External signal pulses in the following range may be suppressed or judged as valid.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}} \text { to }(\mathrm{s}+1) \times 1 / \mathrm{f}_{\mathrm{s}}
$$

The filter operation is illustrated in the figure below with DNFA<name $>\operatorname{NFSTS}[1: 0]=01_{\mathrm{B}}$, i.e. $\mathrm{s}=3$ same level samples.

Figure 2A. 15 Digital Filter Function

## 2A.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.
The digital filter characteristics, specified by DNFA<name $>$ CTL.DNFA $<n a m e>P R S[2: 0]$ and
DNFA<name $>$ NFSTS[1:0] apply to the signals.
However, the digital filter for each signal can be enabled or disabled separately by

CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm ( $m=0$ to 7 ) = 1 and DNFA<name>EN.DNFA<name>ENHm $(m=0$ to 7$)=1)$ for the port pin to switch to the alternative function.
$\mathrm{s}=\mathrm{DNFA}<n a m e>N F S T S[1: 0]+2$
$s \times 1 / \mathrm{f}_{\mathrm{s}}+2 \times 1 /$ fonfatcki $^{\text {d }}$
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm ( $\mathrm{m}=0$ to 7 ) $=1$ and DNFA<name>EN.DNFA<name>ENHm $(\mathrm{m}=0$ to 7 ) $=$ 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}+3 \times 1 / \text { fonfatcki }
$$

## 2A.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2A.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA $<$ name $>$ CTL and digital noise elimination enable register DNFA<name $>$ EN are used to set all the filters in the same group (<name> $=$ peripheral function group).
The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name $>$ EN register enables/disables each filter by setting the corresponding bit in DNFA $<$ name $>$ EN.DNFA $<$ name $>$ ENLm ( $\mathrm{m}=0$ to 7 ) and DNFA $<$ name $>$ EN.DNFA $<$ name $>$ ENHm ( $\mathrm{m}=0$ to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm_ADCn registers are ordered in groups of 3 registers with the same index $n$. The register index $n$ is in 0 or 1 .

The assignment of the input signals to the control registers and their addresses are given in Table 2A.90, Input Pins that Incorporate Digital Filter Type D and Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.

## CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm $(\mathrm{m}=0$ to 7$)=1$ and DNFA<name>EN.DNFA<name>ENHm $(m=0$ to 7$)=1$. Otherwise an unintended filter output may be generated.

## (1) Digital filter type D

A block diagram of digital filter type D is shown below.

Figure 2A. 16 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.
Table 2A. 94 Output Options for Digital Filter Type D

| DNFA<name>EN.DNFA<name>ENLm | Signals Output to Peripheral Functions |
| :--- | :--- |
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## (2) Digital filter type $E$

A block diagram of digital filter type E is shown below.

Figure 2A. 17 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.
Table 2A. 95 Output Options for Digital Filter Type E

| DNFA<name>EN.DNFA<name>ENLm and |  |
| :--- | :--- |
| DNFA<name>EN.DNFA<name>ENHm | Signals Output to Peripheral Functions |
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## 2A.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:
Table 2A. 96 List of Filter Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| FCLA0 | Filter control register $m$ | FCLA0CTLm_<name> | The addresses are shown in the tables in |
| DNF | Digital noise elimination control register | DNFA<name>CTL | Section 2A.12.1, Port Filter |
|  | Digital noise elimination enable register | DNFA<name>EN |  |

## 2A.13.4.1 FCLAOCTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.
Address: The allocation of input signals to FCLAOCTLm_<name> registers and the address of each register are shown in the tables in Section 2A.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | FCLAOINTLm _<name> | FCLAOINTFm _<name> | FCLAOINTRm _<name> |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 2A. 97 FCLA0CTLm_<name> Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | FCLAOINTLm _<name> | Detection Mode Selection <br> 0 : Edge detection <br> 1: Level detection <br> NOTE: This bit is only valid for analog filter type A. |
| 1 | FCLAOINTFm _<name> | - In level detection mode (FCLAOINTLm_<name> = 1): This bit has no effect. <br> - In edge detection mode (FCLAOINTLm_<name> = 0): Falling edge detection control <br> 0 : Falling edge detection disabled <br> 1: Falling edge detection enabled <br> NOTE: This bit is only valid for analog filter type A and digital filter type D. However, digital filter type $D$ is placed in edge detection mode. |
| 0 | FCLAOINTRm _<name> | - In level detection mode (FCLAOINTLm_<name> = 1): Detected level selection <br> 0 : Low level detection <br> 1: High level detection <br> - In edge detection mode (FCLAOINTLm_<name> = 0): Rising edge detection control <br> 0 : Rising edge detection disabled <br> 1: Rising edge detection enabled <br> NOTE: This bit is only valid for analog filter type A and digital filter type D. However, digital filter type $D$ is placed in edge detection mode. |

## CAUTION

Digital filter type D: Always set bit 2 to "0".

## 2A.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.
NOTE
This register is only valid for digital filter type D and digital filter type E .

Access: This register can be read or written in 8-bit units.
Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see Table 2A.90, Input Pins that Incorporate Digital Filter Type D and Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | DNFA< | TS[1:0] | - | - | DNFA<name>PRS[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R | R | R/W | R/W | R/W |

Table 2A. 98 DNFA<name>CTL Register Contents

## 2A.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.
NOTE
This register is only valid for digital filter type D and digital filter type E .

Access: This register can be read or written in 16-bit units.
The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see Table 2A.90, Input Pins that Incorporate Digital Filter Type D and Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 10 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 2A. 99 DNFA<name>EN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | DNFA<name> | Digital Noise Elimination Enable/Disable Control |
|  | ENH[7:0] | 0: Fixed to low level |
|  | DNFA<name> | 1: Input signal passed through filter |
|  | ENL[7:0] |  |

## 2A.13.4.4 DNFA<name>ENH - Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.
NOTE
This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.
Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DNFA<name> ENH7 | DNFA<name> ENH6 | DNFA<name> ENH5 | DNFA<name> ENH4 | DNFA<name> ENH3 | DNFA<name> ENH2 | DNFA<name> ENH1 | DNFA<name> ENHO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see Section 2A.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.

## 2A.13.4.5 DNFA<name>ENL - Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register. NOTE

This register is only valid for digital filter type D and digital filter type E .

## Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see Table 2A.90, Input Pins that Incorporate Digital Filter Type D and Table 2A.91, Input Pins that Incorporate Digital Filter Type E in Section 2A.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DNFA <name> ENL7 | DNFA <name> ENL6 | DNFA <name> ENL5 | DNFA <name> ENL4 | DNFA <name> ENL3 | DNFA <name> ENL2 | DNFA <name> ENL1 | DNFA <name> <br> ENLO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see Section 2A.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.

## Section 2B Pin Function of RH850/F1KM-S4

This section describes the pin and port functions.
Section 2B.1, Pin Connection Diagram to Section 2B.5, Recommended Connection of Unused Pins describe the pin connections and respective pins.

Section 2B.6, Features of RH850/F1KM Port to Section 2B.13, Description of Port Noise Filter \& Edge/Level Detection describe the general port functions.

| XT1, XT2 | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | Sub OSC connections | SOSC |

## CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- (e.g.) When RS-CANFD channel 0 is used:

| CANOTX | P0_0 | P10_1 |
| :--- | :--- | :--- |
| CANORX | P0_1 | P10_0 |

Use one of the following pin combinations:

- P0_0 and P0_1, or
- P10_0 and P10_1.

The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.

## 2B. 3 Pin Functions During and After Reset

Table 2B. $7 \quad$ Pin Functions During and After Reset

| Pins | During Reset | After Reset |
| :---: | :---: | :---: |
| JP0_0 | High impedance | JP0_0: Input |
|  |  | Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) |
|  |  | Nexus I/F: DCUTDI input |
|  |  | LPD (4 pins): LPDI input |
|  |  | LPD (1 pin): LPDIO input/output |
| JP0_1 | High impedance | JP0_1: Input |
|  |  | Serial programming mode: FPDT |
|  |  | Nexus I/F: DCUTDO output |
|  |  | LPD (4 pins): LPDO output |
|  |  | LPD (1 pin): High impedance |
| JP0_2 | High impedance | JP0_2: Input |
|  |  | Serial programming mode: FPCK |
|  |  | Nexus I/F: DCUTCK input |
|  |  | LPD (4 pins): LPDCLK input |
|  |  | LPD (1 pin): High impedance |
| JP0_3 | High impedance | JP0_3: Input |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: DCUTMS input |
|  |  | LPD (4 pins): High impedance |
|  |  | LPD (1 pin): High impedance |
| JP0_4 | Input*3,*5 | JP0_4: Input |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: DCUTRST input*1 |
|  |  | LPD (4 pins): High impedance |
|  |  | LPD (1 pin): High impedance |
| JP0_5 | High impedance | JP0_5: Input |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: DCURDY output |
|  |  | LPD (4 pins): LPDCLKOUT output |
|  |  | LPD (1 pin): High impedance |
| JP0_6 | High impedance | JP0_6: Input |
|  |  | Serial programming mode: High impedance |
|  |  | Nexus I/F: EVTO output |
|  |  | LPD (4 pins): High impedance |
|  |  | LPD (1 pin): High impedance |
| P8_6 | Output*2,*4 | Output (OPBT0.RESETOUTEN = 1)*2 |
|  |  | High impedance (OPBT0.RESETOUTEN $=0$ ) ${ }^{2, * 4}$ |
| P0 to P3, P8 to P13, P18 to P22 (except P8_6, P10_1, P10_2, P10_6 and P10_8) | High impedance | High impedance |
| P10_1 | High impedance | High impedance (FLMD0 = 0) |
|  |  | High impedance (FLMD0 = 1, FLMD1 = 0) |
|  |  | MODE0 input (FLMD0 = 1, FLMD1 = 1) |
| P10_2 | High impedance | High impedance (FLMD0 $=0$ ) |
|  |  | High impedance (FLMD0 = 1, FLMD1 = 0) |
|  |  | MODE1 input (FLMD0 = 1, FLMD1 = 1) |

Table 2B. $7 \quad$ Pin Functions During and After Reset

| Pins | During Reset | After Reset |
| :---: | :---: | :---: |
| P10_6 | High impedance | High impedance (FLMDO $=0$ ) |
|  |  | High impedance (FLMD0 $=1$, FLMD1 $=0$ ) |
|  |  | High impedance (FLMD0 $=1$, FLMD1 $=1, \mathrm{MODE} 0=0, \mathrm{MODE} 1=0)$ |
|  |  | High impedance (FLMD0 $=1$, FLMD1 $=1, \mathrm{MODE0}=0, \mathrm{MODE} 1=1$ ) |
|  |  | High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) |
|  |  | MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1) |
| P10_8 | High impedance | High impedance (FLMD0 $=0$ ) |
|  |  | FLMD1 input (FLMD0 = 1) |
| FLMD0 | Input | Input |
| RESET | Input | Input |
| AP0, AP1 | High impedance | High impedance |

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.
Note 2. $\quad$ RESETOUT is output. For details, see Section 2B.11, Port (Special I/O) Function Overview.
Note 3. When the power is turned on or when $\overline{\text { RESET }}$ is low level, JPO_4 pin should be driven low level.
Note 4. If OPBT0.RESETOUTEN $=0$, P8_6 pin status has a possibility to become unstable (less than $15 \mu \mathrm{~s}$ ) at the transition moment to reset status by internal reset factors.
Note 5. When $\overline{R E S E T}$ is low level, on-chip pull-down resistor is connected to JP0_4.

## 2B. 4 Port State in Standby Mode

For the port state in standby mode, see Section 14.1.4, I/O Buffer Control.

## 2B. 5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.
Table 2B. 8 Recommended Connection of Unused Pins

| Pin | Recommended Connection of Unused Pins |
| :---: | :---: |
| A0VREF, A1VREF*1 | [Excluding 100-Pin LQFP] |
|  | Connected to EVCC or BVCC |
|  | [100-Pin LQFP] |
|  | Connected to EVCC |
| A0VSS, A1VSS*1 | [Excluding 100-Pin LQFP] |
|  | Connected to EVSS or BVSS |
|  | [100-Pin LQFP] |
|  | Connected to EVSS |
| RESET | [Excluding 100-Pin LQFP] |
|  | Connected to EVCC or BVCC via a resistor |
|  | [100-Pin LQFP] |
|  | Connected to EVCC via a resistor |
| XT1 | Connected to REGVCC or AWOVSS via a resistor*3 (bit 0 of IPIBC0 = 1) |
|  | Connected to AWOVSS (bit 0 of IPIBC0 = 0) |
| X1 | Connected to AWOVSS via a resistor |
| X2 | Open |
| IP0_0 | Connected to REGVCC or AWOVSS via a resistor*3 (bit 0 of IPIBC0 $=1$ ) |
|  | Open (bit 0 of IPIBC0 = 0) |
| JP0 (excluding JP0_4) | Input: Open (when the PIBCn_m and PMCn_m bits are 0) |
| P0 | Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) |
| P1 | Output: Open |
| P2 Output. Open |  |
| P3 |  |
| P8 (excluding P8_6) |  |
| P9 - |  |
| P20 |  |
| P8_6 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) |
|  | Output: Open |
| JP0_4 | Connected to EVSS via a resistor |
| P10_1, P10_2, P10_6, P10_8 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) |
|  | Output: Open |

Table 2B. 8 Recommended Connection of Unused Pins

| Pin | Recommended Connection of Unused Pins |
| :---: | :---: |
| P10 (excluding P10_1, P10_2, P10_6, P10_8) | [Excluding 100-Pin LQFP] |
|  | Input: Open (when the PIBCn_m and PMCn_m bits are 0) |
| P11 | Connected to BVCC or BVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) |
| P12 | Output: Open |
| P13 | [100-Pin LQFP] |
| P19 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) |
| P21 | Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) |
| P22 | Output: Open |
| AP0 | Input: Open (when the PIBCn_m bit is 0) |
|  | Connected to AOVREF or AOVSS via a resistor (when the PIBCn_m bit is 1 ) |
|  | Output: Open |
| AP1 | Input: Open (when the PIBCn_m bit is 0) |
|  | Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1 ) |
|  | Output: Open |
| Nexus/LPD I/F (JP0) | DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor |
|  | DCUTDO/LPDO (JP0_1): Open |
|  | DCUTCK/LPDCLK (JP0_2): Open |
|  | DCUTMS (JP0_3): Connected to EVCC via a resistor |
|  | DCUTRST (JP0_4): Connected to EVSS via a resistor*2 |
|  | DCURDY /LPDCLKOUT (JP0_5):Open |
|  | EVTO (JP0_6): Open*1 |

Note 1. Only available for 272-pin, 233-pin, 176-pin and 144-pin devices
Note 2. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.
Note 3. $\mathrm{XT} 1=\mathrm{IPO} 0(\mathrm{XT} 2)=$ REGVCC or AWOVSS should be set.
XT1 is connected to IP0_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

## 2B. 6 Features of RH850/F1KM Port

## 2B.6.1 Port Group

The RH850/F1KM provides the following port groups, indicated by the numbers in the table below.
Table 2B. 9 Port Groups in RH850/F1KM-S4

| No. of Pins | Port Group | RH850/F1KM-S4 |
| :--- | :--- | :--- |
| 100 pins | Number | 7 |
|  | Name | P0, P8 to P11, JP0, AP0 |
| 144 pins | Number | 13 |
|  | Name | P0, P1, P8 to P12, P18, P20, JP0, AP0, AP1, IP0 |
| 176 pins | Number | 14 |
|  | Name | P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0 |
| 233 pins | Number | 17 |
|  | Name | P0 to P3, P8 to P13, P18 to P20, JP0, AP0, AP1, IP0 |
| 272 pins | Number | 19 |
|  | Name | P0 to P3, P8 to P13, P18 to P22, JP0, AP0, AP1, IP0 |

## 2B.6.2 Port Group Index $\mathbf{n}$

Throughout this section, the port groups are identified by using the index "n". For example, the port mode control register of the Pn pin is PMCn ( $\mathrm{n}=0$ to 3,8 to 13,18 to 22 ).

## 2B.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.
Port and JTAG port register addresses are given as offsets from the base addresses.
Table 2B. 10 Register Base Addresses

| Base Address Name | Base Address |
| :--- | :--- |
| <PORTn_base> | FFC1 $0000_{\mathrm{H}}$ |
| <JPORT0_base> | FFC2 $0000_{\mathrm{H}}$ |

## 2B.6.4 Clock Supply

The clock supply to ports is shown in the following table.
Table 2B. 11 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| Port | Register access clock | CPUCLK_UL |

## 2B. 7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.
The RH850/F1KM also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see Section 2B.7.2, Terms

## 2B.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16 .
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

Table 2B.40, JTAG Port 0 (JP0), Table 2B.42, Port 0 (P0), Table 2B.44, Port 1 (P1), Table 2B.46, Port 2 (P2), Table 2B.48, Port 3 (P3), Table 2B.50, Port 8 (P8), Table 2B.52, Port 9 (P9), Table 2B.54, Port 10 (P10), Table 2B.56, Port 11 (P11), Table 2B.58, Port 12 (P12), Table 2B.60, Port 13 (P13), Table 2B.62, Port 18 (P18), Table 2B.64, Port 19 (P19), Table 2B.66, Port 20 (P20), Table 2B.68, Port 21 (P21), Table 2B.70, Port 22 (P22), Table 2B.72, Analog Port 0 (AP0), Table 2B.74, Analog Port 1 (AP1), Table 2B.76, Input Port 0 (IP0), and Section 2B.9.2, Pin Function Configuration.

## CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

## [Example]

INTP0 is assigned to the following pins on this device. However, the INTPO function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JPO_0 (1st input alternative function)
- P0_1 (2nd, 3rd input alternative function)
- P10_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTPO) of JPO_0 is selected, using the 2nd input alternative function (CANORXINTPO) of PO_1 only for the CAN signal is also prohibited.

## 2B.7.2 Terms

The following terms are used in this section:

## Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.
A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

## Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

## Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called "port".
The corresponding name is $\mathrm{Pn} \_\mathrm{m}$. For example, $\mathrm{P} 0 \_7$ denotes port 7 of port group 0. It is referenced as "port P0_7".

## Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

## 2B.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.
JTAG port group registers and bit names are prefixed by a "J". For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE
In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

## 2B.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode $($ PMCn.PMCn_m bit $=0)$

A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.

- Software I/O control alternative mode (PMCn.PMCn_m bit $=1$, PIPCn.PIPCn_m bit $=0$ )

In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.

- Direct I/O control alternative mode (PMCn.PMCn_m bit $=1$, PIPCn.PIPCn_m bit $=1$ )

In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.
Table 2B. 12 Pin Function Configuration (Overview)

| Mode | Bit |  |  | 1/O |
| :---: | :---: | :---: | :---: | :---: |
|  | PMCn_m | PMn_m | PIPCn_m |  |
| Port mode | 0 | 0 | X | O |
|  |  | 1*1 |  | 1 |
| Software I/O control alternative mode | 1 | 0 | 0 | 0 |
|  |  | 1 | 0 | 1 |
| Direct I/O control alternative mode |  | X | 1 | Controlled by the alternative function |

Note 1. The input buffer must be enabled (PIBCn_m bit $=1$ ).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit $=0$ )
- Output $($ PMn_m bit $=0)$ : Alternative output mode 1 to Alternative output mode 7
- Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
- The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2B. 13 Alternative Mode Selection Overview (PMCn.PMCn_m Bit =1)

| Mode | Register |  |  |  |  | I/O |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PIPC** | PM*1 | PFCAE | PFCE | PFC |  |
| Alternative output mode 1 (ALT-OUT1) | 0 | 0 | 0 | 0 | 0 | O |
| Alternative input mode 1 (ALT-IN1) |  | 1 |  |  |  | I |
| Alternative output mode 2 (ALT-OUT2) |  | 0 |  |  | 1 | O |
| Alternative input mode 2 (ALT-IN2) |  | 1 |  |  |  | 1 |
| Alternative output mode 3 (ALT-OUT3) |  | 0 |  | 1 | 0 | O |
| Alternative input mode 3 (ALT-IN3) |  | 1 |  |  |  | I |
| Alternative output mode 4 (ALT-OUT4) |  | 0 |  |  | 1 | O |
| Alternative input mode 4 (ALT-IN4) |  | 1 |  |  |  | I |
| Alternative output mode 5 (ALT-OUT5) |  | 0 | 1 | 0 | 0 | O |
| Alternative input mode 5 (ALT-IN5) |  | 1 |  |  |  | I |
| Alternative output mode 6 (ALT-OUT6) |  | 0 |  |  | 1 | O |
| Alternative input mode 6 (ALT-IN6) |  | 1 |  |  |  | I |
| Alternative output mode 7 (ALT-OUT7) |  | 0 |  | 1 | 0 | 0 |
| Alternative input mode 7 (ALT-IN7) |  | 1 |  |  |  | I |
| Other than the above | Setting prohibited |  |  |  |  |  |

Note 1. If PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.
If a pin is in alternative mode ( $\mathrm{PMCn} . \mathrm{PMCn} \mathrm{m}$ bit $=1$ ), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

## 2B.7.4 Pin Data Input/Output

The registers used for data input/output are described below.
The location that is read via the PPRn register differs depending on the pin mode.

## 2B.7.4.1 Output Data

In the port mode ( $\mathrm{PMCn} . \mathrm{PMCn} n_{-} \mathrm{m}$ bit $=0$ ), the value of the $\mathrm{Pn} . \mathrm{Pn}_{-} \mathrm{m}$ bit is output from the Pn m pin.

## 2B.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.
The different PPRn read modes are shown in the table below.
Table 2B. 14 PPRn_m Read Values

| $\begin{aligned} & \text { PMC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PM } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIBC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PODC } \\ & \text { n_m } \end{aligned}$ | Mode | PPRn_m Read Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | X | X | Port input, input buffer disabled | Pn.Pn_m bit |
|  |  | 1 |  | X | Port input, input buffer enabled | Pn_m pin |
|  | 0 | X |  | 0 | Port push-pull output | Pn.Pn_m bit** |
|  |  |  |  | 1 | Port open-drain output |  |
| 1 | 1 | X | 0 | X | Software I/O control alternative input | Pn_m pin |
|  | 0 |  |  | 0 | Software I/O control alternative pushpull output | Output signal from the alternative function*1 |
|  |  |  |  | 1 | Software I/O control alternative opendrain output |  |
|  | X |  | 1 | 0 | Direct I/O control alternative input or push-pull output | I/O port in alternative mode: <br> - Input: Pn_m pin <br> - Output: Output signal from the alternative function*1 |
|  |  |  |  | 1 | Direct I/O control alternative input or open-drain output |  |

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.
The control registers in the above table have the following effects:

- PMCn.PMCn_m bit

This bit selects port mode $\left(\mathrm{PMCn}_{-} \mathrm{m}=0\right)$ or alternative mode $\left(\mathrm{PMCn}_{-} \mathrm{m}=1\right)$.

- PMn.PMn_m bit

This bit selects input $\left(\mathrm{PMn} \_\mathrm{m}=1\right)$ or output $\left(\mathrm{PMn} \_\mathrm{m}=0\right)$ when the port mode $\left(\mathrm{PMCn} \_\mathrm{m}=0\right)$ and software I/O control alternative mode ( $\mathrm{PMCn} \mathrm{m}=1$, PIPCn_m $=0$ ) have been selected.

- PIBCn.PIBCn_m bit

This bit disables $\left(\operatorname{PIBCn} n_{-}=0\right)$ or enables $(\operatorname{PIBCn} m=1)$ the input buffer in input port mode (PMCn_m $=0$ and $P M n \_m=1$ ). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.

- PIPCn.PIPCn_m bit

This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- PODCn.PODCn_m bit

This bit selects push-pull output $\left(\operatorname{PODCn} \_\mathrm{m}=0\right)$ or open-drain output $(\operatorname{PODCn} \mathrm{m}=1)$.

- PBDCn.PBDCn_m bit

In output mode, when this bit is set to 1 , the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

## CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m bit = 1, PMn.PMn_m bit = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m bit =1).
Note, however, that the level of the Pn_m pin will be input to the alternative function that the $\mathrm{Pn} \_\mathrm{m}$ pin is being used as.

## 2B.7.4.3 Writing to the Pn Register

The data to be output via port $\mathrm{Pn}_{-} \mathrm{m}$ in port mode $\left(\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}\right.$ bit $\left.=0\right)$ is held in port register Pn .
Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.

In this case, new data can be written directly to the Pn register.

- By performing an indirect bitwise operation (a "set", "reset", or "not" operation) on the Pn register.

An indirect bitwise operation ("set", "reset", or "not") can be performed on the Pn register by using the following two registers:

- Port Set/Reset register PSRn

If the PSRn.PSRn $(\mathrm{m}+16) \mathrm{bit}=1$, the value of the $\operatorname{Pn} . \operatorname{Pn} \mathrm{m}$ bit is determined by the value of the PSRn.PSRn_m bit.
In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.

- Port NOT register PNOTn

By setting PNOTn.PNOTn_m bit to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.
An indirect bitwise operation on the Pn register ("set", "reset", or "not") has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

## 2B. 8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

Figure 2B. 6 Schematic View of Port Control

## CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

## 2B.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- Section 2B.9.2, Pin Function Configuration
- Section 2B.9.3, Pin Data Input/Output
- Section 2B.9.4, Configuration of Electrical Characteristics

## 2B.9.1 Overview

The following registers are used for setting the individual pins of the port groups.
For details on $<$ PORTn_base $>$ and $<$ JPORT0_base $>$, see Section 2B.6.3, Register Base Addresses.
Table 2B. 15 Port Group Configuration Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| Pin function configuration |  |  |  |
| PORT | Port mode control register | PMCn | <PORTn_base> $+0400_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPMC0 | <JPORTO_base> + 0040 ${ }_{\text {H }}$ |
| PORT | Port mode control set/reset register | PMCSRn | <PORTn_base> $+0900_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPMCSR0 | <JPORT0_base> + 0090 ${ }_{\text {H }}$ |
| PORT | Port IP control register | PIPCn | <PORTn_base> $+4200_{\mathrm{H}}+\mathrm{n} \times 4$ |
| PORT | Port mode register | PMn | <PORTn_base> $+0300_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APMn | <PORTn_base> + 03C8H $+\mathrm{n} \times 4$ |
| JTAG |  | JPM0 | <JPORT0_base> + 0030 ${ }_{\text {H }}$ |
| PORT | Port mode set/reset register | PMSRn | <PORTn_base> $+0800_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APMSRn | <PORTn_base> + 08C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPMSR0 | <JPORT0_base> + 0080 ${ }_{\text {H }}$ |
| PORT | Port input buffer control register | PIBCn | <PORTn_base> + 4000 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
|  |  | APIBCn | <PORTn_base> + 40C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPIBC0 | <JPORT0_base> + 0400 ${ }_{\text {H }}$ |
| PORT |  | IPIBC0 | <PORTn_base> + 40FOH |
| PORT | Port function control register | PFCn | <PORTn_base> + $0500_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPFC0 | <JPORTO_base> + 0050 ${ }_{\text {H }}$ |
| PORT | Port function control expansion register | PFCEn | <PORTn_base> + $0600_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPFCE0 | <JPORTO_base> + 0060 ${ }_{\text {H }}$ |
| PORT | Port function control additional expansion register | PFCAEn | <PORTn_base> + 0 A00 ${ }_{\mathrm{H}}+\mathrm{n} \times 4$ |
| Pin data input/output |  |  |  |
| PORT | Port bidirection control register | PBDCn | <PORTn_base> $+4100_{H}+\mathrm{n} \times 4$ |
|  |  | APBDCn | <PORTn_base> $+41 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPBDC0 | <JPORTO_base> + 0410 ${ }_{\text {H }}$ |
| PORT | Port pin read register | PPRn | <PORTn_base> $+0200_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APPRn | <PORTn_base> + 02C8 ${ }_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPPR0 | <JPORTO_base> + 0020 ${ }_{\text {H }}$ |
| PORT |  | IPPR0 | <PORTn_base> + 02FOH |

Table 2B. 15 Port Group Configuration Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| Pin data input/output |  |  |  |
| PORT | Port register | Pn | <PORTn_base> + $0000{ }_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APn | <PORTn_base> + $00 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JP0 | <JPORT0_base> + 0000 ${ }_{\text {H }}$ |
| PORT | Port NOT register | PNOTn | <PORTn_base> + $0700_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APNOTn | <PORTn_base> + 07C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPNOT0 | <JPORT0_base> + 0070 ${ }_{\text {H }}$ |
| PORT | Port set/reset register | PSRn | <PORTn_base> $+0100_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APSRn | <PORTn_base> + 01C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPSR0 | <JPORT0_base> + 0010 ${ }_{\text {H }}$ |
| Configuration of electrical characteristics |  |  |  |
| PORT | Pull-up option register | PUn | <PORTn_base> + 4300 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPU0 | <JPORT0_base> + 0430 ${ }_{\text {H }}$ |
| PORT | Pull-down option register | PDn | <PORTn_base> + 4400 ${ }_{\text {H }}+\mathrm{n} \times 4$ |

| PORT | Port open drain control register | PODCn | <PORTn_base> + 4500 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPODC0 | <JPORT0_base> + 0450 ${ }_{\text {H }}$ |
| PORT | Port input buffer selection register | PISn | <PORTn_base> + 4700 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPIS0 | <JPORTO_base> + 0470 ${ }_{\text {H }}$ |
| PORT | Port input buffer selection advanced register | PISAn | $<$ PORTn_base $>+4 \mathrm{~A} 00_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPISA0 | <JPORT0_base> + 04A0 ${ }_{\text {H }}$ |
| Port register protection |  |  |  |
| PORT | Port protection command register | PPCMDn | <PORTn_base> + 4C00 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPPCMD0 | <JPORT0_base> + 04C0 ${ }_{\mathrm{H}}$ |
| PORT | Port protection status register | PPROTSn | <PORTn_base> + 4B00 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPPROTS0 | <JPORT0_base> + 04B0 ${ }_{\text {H }}$ |

## Index n

In Table 2B.15, Port Group Configuration Registers, the index " n " in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group $n(P n)$. The values for $n$ differ according to the number of pins on the device in the way shown in Table 2B.16, Number of Pins on the Device, Name of Port Groups, and Values for " $n$ " in Register Symbols.

Table 2B. 16 Number of Pins on the Device, Name of Port Groups, and Values for "n" in Register Symbols

| Number of Pins on the Device | Port Groups | Values for " n " |
| :---: | :---: | :---: |
| 100 pins | P0, P8, P9, P10, P11 | 0, 8, 9, 10, 11 |
|  | AP0 | 0 |
| 144 pins | P0, P1, P8, P9, P10, P11, P12, P18, P20 | $0,1,8,9,10,11,12,18,20$ |
|  | AP0, AP1 | 0,1 |
| 176 pins | P0, P1, P2, P8, P9, P10, P11, P12, P18, P20 | 0, 1, 2, 8, 9, 10, 11, 12, 18, 20 |
|  | AP0, AP1 | 0, 1 |
| 233 pins | $\begin{aligned} & \text { P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, } \\ & \text { P18, P19, P20 } \end{aligned}$ | $0,1,2,3,8,9,10,11,12,13,18,19,20$ |
|  | AP0, AP1 | 0, 1 |
| 272 pins | P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22 | $0,1,2,3,8,9,10,11,12,13,18,19,20,21,22$ |
|  | AP0, AP1 | 0, 1 |

## JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.
All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

## Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2B.9.2 Pin Function Configuration

## 2B.9.2. $\quad$ PMCn / JPMCO — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Table 2B. 17 PMCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMCn_[15:0] | Specifies the operation mode of the corresponding pin. |
|  | $0:$ Port mode |  |
|  | 1: Alternative mode |  |

## CAUTIONS

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit $=1$ ). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1 .
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see Section 2B.12, Noise Filter \& Edge/Level Detector, and Section 2B.13, Description of Port Noise Filter \& Edge/Level Detection.

NOTE
The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

## 2B.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.
The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

| Access: $\begin{array}{ll}\text { P } \\ & \text { to } \\ & \\ & \text { to }\end{array}$ |  |  | PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000 H . Reading bits 15 to 0 returns the value of register PMCn. <br> JPMCSRO: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000 H . Reading bits 7 to 0 returns the value of register JPMCO. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: |  |  | PMCSRn: <PORTn_base> $+0900_{H}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,20)$ JPMCSRO: <JPORT0_base> + 0090 ${ }^{* 1}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. <br> See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), and Table 2B.67, Control Registers (P20). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 2B. 18 PMCSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMCSRn_[31:16] | Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. <br> 0 : PMCn_m is not affected by PMCSRn_m. <br> 1: PMCn_m is PMCSRn_m. <br> Example: <br> If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15. |
| 15 to 0 | PMCSRn_[15:0] | Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. <br> 0 : PMCn_m is 0 . <br> 1: PMCn_m is 1 . |

## NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

## 2B.9.2.3 PIPCn - Port IP Control Register

This register specifies whether the I/O direction of the $\mathrm{Pn} \_\mathrm{m}$ pin is controlled by the port mode register $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}$ or by an alternative function.

If the $\mathrm{Pn} \_\mathrm{m}$ pin is operated in alternative mode (PMCn.PMCn_m $=1$ ) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

Regarding the alternative functions for which the PIPC register must be set, see Section 2B.11, Port (Special I/O)

## Function Overview.

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | PIPCn: <PORTn_base> $+4200_{H}+n \times 4(n=0,10,11,12,20)^{\star 1}$ |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.43, Control Registers (P0), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), and Table 2B.59, Control Registers (P12).

Table 2B. 19 PIPCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIPCn_[15:0] | Specifies the I/O mode. |
|  | $0: I / O$ mode is selected by PMn.PMn_m (software I/O control). |  |
|  | $1: I / O$ mode is selected by the peripheral function (direct I/O control). |  |

## 2B.9.2.4 PMn / APMn / JPMO — Port Mode Register

This register specifies whether the individual pins of the port group $n$ are in input mode or in output mode.

Note 2. The PM8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8 register is $\mathrm{FFBF}_{\mathrm{H}}$. When the OPBTO.RESETOUTEN $=0$, the PM8 register is FFFF $_{H}$.
Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN $=1$, the PM8_6 bit is 0 .
When the OPBTO.RESETOUTEN $=0$, the PM8_6 bit is 1 .
Table 2B. 20 PMn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMn_[15:0] | Specifies input/output mode of the corresponding pin. |
|  | $0:$ Output mode (output enabled) |  |
|  | 1: Input mode (output disabled) |  |

## NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and $P M n . P M n \_m=1$ ), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m = 1), since PIPCn.PIPCn_m = 0 after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

## 2B.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.
The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

|  |  |  | PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_{\mathrm{H}}$. <br> Reading bits 15 to 0 returns the value of registers PMn and APMn. <br> JPMSRO: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000 H . Bits 15 to 8 are read as $\mathrm{FF}_{\mathrm{H}}$. Reading bits 7 to 0 returns the value of register JPMO. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $0000 \mathrm{FFFFH}^{* 2}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.
See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (AP0), and Table 2B.75, Control Registers (AP1).
Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN $=1$, the PMSR8 register is $0000 \mathrm{FFBF}_{\mathrm{H}}$. When the OPBT0.RESETOUTEN $=0$, the PMSR8 register is $0000 \mathrm{FFFF}_{\mathrm{H}}$.
Note 3. The PMSR8_6 bit is as follows.
When the OPBTO.RESETOUTEN $=1$, the PMSR8_6 bit is 0 .
When the OPBTO.RESETOUTEN $=0$, the PMSR8_6 bit is 1 .
Table 2B. 21 PMSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMSRn_[31:16] | Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. <br> 0 : PMn_m is not affected by PMSRn_m. <br> 1: PMn_m is PMSRn_m. <br> Example: <br> If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15. |
| 15 to 0 | PMSRn_[15:0] | Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1 . <br> 0 : $P M n \_m$ is 0 . <br> 1: $P M n \_m$ is 1 . |

## NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSRO) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0]

## 2B.9.2.6 PIBCn / APIBCn / JPIBCO / IPIBCO — Port Input Buffer Control Register

In input port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}=0$ and $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}=1$ ), this register enables the port pin's input buffer.

| Access: | PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units. <br> JPIBC0: This register can be read or written in 8-bit units. |
| :---: | :---: |
| Address: | PIBCn: <PORTn_base> $+4000_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22)$ |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (AP0), Table 2B.75, Control Registers (AP1) and Table 2B.77, Control Registers (IP0).

Table 2B. 22 PIBCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIBCn_[15:0] | Enables/disables the input buffer. |
|  | $0:$ Input buffer disabled |  |
|  | $1:$ Input buffer enabled |  |

## NOTES

1. When the input buffer is disabled, through current does not flow even when the pin level is $\mathrm{Hi}-\mathrm{Z}$. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBCO) are JPIBC0_[7:0]

## CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

## 2B.9.2.7 PFCn / JPFCO — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.
Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

```
            Access: PFCn: This register can be read or written in 16-bit units.
JPFC0: This register can be read or written in 8-bit units.
Address: PFCn: <PORTn_base> \(+0500_{H}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,8,9,10,11,12,13,18,20)\)
JPFC0: <JPORTO_base> + 0050** \({ }^{* 1}\)
Value after reset: \(\quad 0000_{H}\)
```

| Bit | $15 \quad 14$ |  | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), and Table 2B.67, Control Registers (P20).

Table 2B. 23 PFCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCn_[15:0] | Specifies the alternative function of the pin. <br> For details, see Table 2B.26, Setting Alternative Functions. |
| NOTE |  |  |

The control bits of the JTAG port function control register (JPFCO) are JPFC0_[7:0].

## 2B.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.
Some alternative functions directly control the I/O of the $\mathrm{Pn} \_\mathrm{m}$ pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the $\mathrm{I} / \mathrm{O}$ is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

## 2B.9.2.9 PFCAEn - Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.
Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the $\mathrm{I} / \mathrm{O}$ is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10),
Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), and Table 2B.67, Control Registers (P20).

Table 2B. 25 PFCAEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCAEn_[15:0] | Specifies the alternative function of the pin. |
|  |  | For details, see Table 2B.26, Setting Alternative Functions. |

Table 2B. 26 Setting Alternative Functions

| PFCAEn_m | PFCEn_m | PFCn_m | PMn_m | Function |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 | Alternative input mode 1 |
|  |  |  | 0 | Alternative output mode 1 |
|  |  | 1 | 1 | Alternative input mode 2 |
|  |  |  | 0 | Alternative output mode 2 |
|  | 1 | 0 | 1 | Alternative input mode 3 |
|  |  |  | 0 | Alternative output mode 3 |
|  |  | 1 | 1 | Alternative input mode 4 |
|  |  |  | 0 | Alternative output mode 4 |
| 1 | 0 | 0 | 1 | Alternative input mode 5 |
|  |  |  | 0 | Alternative output mode 5 |
|  |  | 1 | 1 | Alternative input mode 6 |
|  |  |  | 0 | Alternative output mode 6 |
|  | 1 | 0 | 1 | Alternative input mode 7 |
|  |  |  | 0 | Alternative output mode 7 |
|  |  | 1 | X | Setting prohibited |

## CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to " 1 ".
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited. For example, if the $a / b / c$ pin is used as $b$, the $b / d / e$ pin cannot be used as $b$. In this case, the $b / d / e$ pin must be configured as a pin function other than $b$.

NOTE
For more details on the assignment of each function, see Section 2B.10.1.2, Control Registers to Section 2B.10.15.2, Control Registers.

## 2B.9.3 Pin Data Input/Output

## 2B.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JPO), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (AP0), and Table 2B.75, Control Registers (AP1).

Table 2B. 27 PBDCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PBDCn[15:0] | Enables/disables bidirectional mode of the corresponding pin. |
|  | $0:$ Bidirectional mode disabled |  |
|  | 1: Bidirectional mode enabled |  |

## CAUTION

- When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m =0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m =1).
- However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

## NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

## 2B.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the $\mathrm{Pn} \_\mathrm{m}$ pin, whether it is the value of the $\mathrm{Pn} . \mathrm{Pn} \_\mathrm{m}$ bit or the level of an alternative output function.
Access: PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units.
JPPRO: This register is a read-only register that can be read in 8-bit units.
Address: PPRn: <PORTn_base> $+0200_{H}+n \times 4(n=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22)$
APPRn: <PORTn_base> $+02 \mathrm{C} 8_{H}+\mathrm{n} \times 4(\mathrm{n}=0,1)$
JPPRO: <JPORTO_base> $+0020_{\mathrm{H}}$
IPPRO: <PORTn_base> + 02F0 ${ }_{H}{ }^{* 1}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device.
See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JPO), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (AP0), Table 2B.75, Control Registers (AP1) and Table 2B.77, Control Registers (IP0).

Table 2B. 28 PPRn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PPRn_[15:0] | The Pn_m Pin, Pn.Pn_m value or alternative function output. |

## NOTES

1. For the read values of the PPRn register, see Section 2B.7.4, Pin Data Input/Output.
2. The control bits of the JTAG port pin read register (JPPRO) are JPPRO_[7:0].

## 2B.9.3.3 Pn / APn / JPO — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}=0$ and $\mathrm{PMn} . \mathrm{PMn}_{-} \mathrm{m}=0$ ).

Access: Pn, APn: These registers can be read or written in 16 -bit units.
JPO: This register can be read or written in 8-bit units.
Address: Pn: <PORTn_base> + 0000 $+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22)$
APn: <PORTn_base> $+00 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,1)$
JPO: <JPORTO_base> $+0000{ }^{*}{ }^{* 1}$
Value after reset: $\quad 0000_{H}$

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (AP0), and Table 2B.75, Control Registers (AP1).

Table 2B. 29 Pn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | Pn_[15:0] | Sets the output level of the Pn_m pin $(m=0$ to 15$)$. |
|  | $0:$ Outputs low level |  |
|  | 1: Outputs high level |  |

## NOTE

The control bits of the JTAG port register (JPO) are JP0_[7:0].

## 2B.9.3.4 PNOTn / APNOTn / JPNOTO — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000 H is returned.

JPNOTO: This register is a write-only register that can be written in 8-bit units. When read, $00_{\mathrm{H}}$ is returned.
Address: PNOTn: <PORTn_base> $+0700_{H}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,19,20,21,22)$
APNOTn: <PORTn_base> + 07C8 ${ }_{H}+\mathrm{n} \times 4(\mathrm{n}=0,1)$
JPNOTO: <JPORT0_base> + 0070 ${ }_{\mathrm{H}}{ }^{* 1}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { PNOT } \\ & \text { n_15 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_14 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_13 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_12 } \end{aligned}$ | $\begin{gathered} \text { PNOT } \\ \text { n_11 } \end{gathered}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_10 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_9 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_8 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_7 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_6 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_5 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_4 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_3 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_2 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_1 } \end{aligned}$ | $\begin{aligned} & \text { PNOT } \\ & \text { n_0 } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (APO), and Table 2B.75, Control Registers (AP1).

Table 2B. 30 PNOTn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PNOTn_[15:0] | Specifies if Pn.Pn_m is inverted. |
|  | $0:$ Pn.Pn_m is not inverted $\left(P n \_m \rightarrow P n \_m\right)$ |  |
|  | 1: Pn.Pn_m is inverted $\left(\overline{P n \_m} \rightarrow P n \_m\right)$ |  |

## NOTE

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

## 2B.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.
The upper 16 bits of PSRn act as a mask which specifies whether or not the value $\operatorname{Pn} . \mathrm{Pn}_{\mathrm{L}} \mathrm{m}$ is set by the corresponding bit in the lower 16 bits of PSRn.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.
See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), Table 2B.71, Control Registers (P22), Table 2B.73, Control Registers (AP0), and Table 2B.75, Control Registers (AP1).

Table 2B. 31 PSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PSRn_[31:16] | Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn _m. <br> 0 : Pn_m is not affected by PSRn_m <br> 1: Pn_m is PSRn_m <br> Example: <br> If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15. |
| 15 to 0 | PSRn_[15:0] | Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. $\begin{aligned} & \text { 0: } \mathrm{Pn} \_m=0 \\ & \text { 1: } \mathrm{Pn} \_m=1 \end{aligned}$ |

## NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

## 2B.9.4 Configuration of Electrical Characteristics

## 2B.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

#### Abstract

Access: PUn: This register can be read or written in 16-bit units. JPU0: This register can be read or written in 8-bit units. Address: PUn: <PORTn_base> $+4300_{H}+\mathrm{n} \times 4(\mathrm{n}=0,1,2,3,8,9,10,11,12,13,18,19,20,21$, 22) JPU0: <JPORTO_base> $+0430_{\mathrm{H}}{ }^{* 1}$ Value after reset: $\quad 0000_{H}$ 

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JPO), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), and Table 2B.71, Control Registers (P22).

Table 2B. 32 PUn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PUn_[15:0] | Specifies whether an internal pull-up resistor is connected to the corresponding pin. |
|  | $0:$ No internal pull-up resistor connected |  |
|  | 1: An internal pull-up resistor connected |  |

## NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

## 2B.9.4.2 PDn / JPDO — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), and Table 2B.71, Control Registers (P22).

Table 2B. 33 PDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PDn_[15:0] | Specifies whether to connect an internal pull-down resistor to the corresponding pin. |
|  |  | 0: No internal pull-down resistor connected |
|  |  | 1: An internal pull-down resistor connected |

## NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m $=1$ ) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPDO) are JPDO_[7:0].

## 2B.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see Section 5, Write-Protected Registers. Regarding the alternative functions for which the PDSC register needs to be set, see Section 2B.11.3.3, Output
Buffer Control (PDSC).

## 2B.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see Section 5, Write-Protected Registers.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device.
See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JPO), Table 2B.43, Control Registers (P0), Table 2B.45, Control Registers (P1), Table 2B.47, Control Registers (P2), Table 2B.49, Control Registers (P3), Table 2B.51, Control Registers (P8), Table 2B.53, Control Registers (P9), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), Table 2B.63, Control Registers (P18), Table 2B.65, Control Registers (P19), Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21), and Table 2B.71, Control Registers (P22).
Note 2. The PODC8 register is as follows.
When the OPBTO.RESETOUTEN $=1$, the PODC8 register is $00000040_{\mathrm{H}}$. When the OPBTO.RESETOUTEN $=0$, the PODC8 register is $00000000_{\mathrm{H}}$.
Note 3. The PODC8_6 bit is as follows.
When the OPBTO.RESETOUTEN $=1$, the PODC8_6 bit is 1 . When the OPBTO.RESETOUTEN $=0$, the PODC8_6 bit is 0 .

Table 2B. 35 PODCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PODCn_[15:0] | Specifies the output buffer function. |
|  |  | 0: Push-pull |
|  | 1: Open-drain |  |

## NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

## 2B.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

## 2B.9.4.6 PISAn / JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

| Access: | PISAn: This register can be read or written in 16-bit units. |
| ---: | :--- |
|  | JPISAO: This register can be read or written in 8-bit units. |
| Address: | PISAn: $<$ PORTn_base> +4 AOO $_{H}+n \times 4(n=10,11,12,13,18)$ |
|  | JPISAO: $<$ JPORTO_base $>+04 A O_{H}{ }^{* 1}$ |
| Value after reset: | $0000_{H}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { PISA } \\ & \text { n_15 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_14 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_13 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_12 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_11 } \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_10 } \end{aligned}$ | $\begin{gathered} \text { PISA } \\ \text { n_9 } \end{gathered}$ | $\begin{aligned} & \text { PISA } \\ & \mathrm{n} \_8 \end{aligned}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_7 } \end{aligned}$ | $\begin{gathered} \text { PISA } \\ \text { n_6 } \end{gathered}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_5 } \end{aligned}$ | $\begin{gathered} \text { PISA } \\ \mathrm{n} \_4 \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_3 } \end{gathered}$ | $\begin{aligned} & \text { PISA } \\ & \text { n_2 } \end{aligned}$ | $\begin{gathered} \text { PISA } \\ \mathrm{n} \_1 \end{gathered}$ | $\begin{gathered} \text { PISA } \\ \text { n_0 } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2B.10, Port (General I/O) Function Overview: Table 2B.41, Control Registers (JP0), Table 2B.55, Control Registers (P10), Table 2B.57, Control Registers (P11), Table 2B.59, Control Registers (P12), Table 2B.61, Control Registers (P13), and Table 2B.63, Control Registers (P18).

Table 2B. 37 PISAn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PISA_[15:0] | Specifies the input buffer characteristics: |
|  |  | 0: Type $2($ SHMT4) |
|  | 1: Type $5(\mathrm{TTL})$ |  |

Table 2B. 38 Port Input Selection Advanced Register Contents

| PISAn | PISn | Function |
| :--- | :--- | :--- |
| 0 | 0 | Type 1 input buffer is selected (SHMT1) |
| 1 | $X$ | Type 2 input buffer is selected (SHMT4) |
| NOTE |  | Type 5 input buffer is selected (TTL) |

Details of the definition of type 2 and type 5 are given in Section 2B.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0). For details, also see Section 47B, Electrical Characteristics of RH850/F1KM-S4 for input buffer characteristics.

## 2B.9.5 Port Register Protection

RH850/F1KM has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see Section 5, Write-Protected Registers.

## 2B.9.6 Flowchart Examples for Port Settings

Examples of the port settings are shown in the flowchart below.

## CAUTION

If the port is set to the PIPCn.PIPCn_m = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0 . If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

## 2B.9.6.1 Batch Setting

An example of specifying batch port settings is shown in the flowchart below.

Note 1. While $P M C=0$, an interrupt may be triggered during the configuration of the port registers under the following conditions: For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.
For INTP0-6 and INTP9-23 interrupt requests:
- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2B. $7 \quad$ Example of Port Settings (When Specified in Batch)

## 2B.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

Figure 2B. 8 Example of Port Settings (in Port Mode)
(1) With IP Control

Figure 2B. 9 Example of Port Settings (in Alternative Mode)

## (2) Without IP Control

Note 1. While $\mathrm{PMC}=0$, an interrupt may be triggered during the configuration of the port registers under the following conditions:
For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.
For INTP0-6 and INTP9-23 interrupt requests:
- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2B. 10 Example of Port Settings (in Alternative Mode)

## 2B. 10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m $=1$, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2B. 39 Port Function

| Port | Pin Name | Size | Direction | Power Domain | Special Alternative Function | Device |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| JTAG Port 0 | JP0_0-5 | 6 bits | In/Out | AWO | JTAG, LPD | $\checkmark$ | - | - | - | - |
|  | JP0_0-6 | 7 bits |  |  |  | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Port 0 | P0_0-14 | 15 bits | In/Out | AWO |  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Port 1 | P1_0-5, 8-11 | 10 bits | In/Out | AWO |  | - | $\checkmark$ | - | - | - |
|  | P1_0-5, 8-15 | 14 bits |  |  |  | - | - | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Port 2 | P2_0-6 | 7 bits | In/Out | AWO |  | - | - | $\checkmark$ | - | - |
|  | P2_0-15 | 16 bits |  |  |  | - | - | - | $\checkmark$ | $\checkmark$ |
| Port 3 | P3_0 | 1 bit | In/Out | AWO |  | - | - | - | $\checkmark$ | - |
|  | P3_0-10 | 11 bits |  |  |  | - | - | - | - | $\checkmark$ |
| Port 8 | P8_2-12 | 11 bits | In/Out | AWO | ADCA0 (10-bit resolution) | $\checkmark$ | - | - | - | - |
|  | P8_0-12 | 13 bits |  |  | RESETOUT | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Port 9 | P9_0-4 | 5 bits | In/Out | ISO | ADCA0 (10-bit resolution) | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Port 10 | P10_0-14 | 15 bits | In/Out | ISO |  | $\checkmark$ | - | - | - | - |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned. When writing to unused bits, write the value after reset.

1．The behavior and performance are not guaranteed when undocumented alternative functions are selected．
2．Use ADC functions with their initial settings．For details，see Table 2B．51，Control Registers（P8）
3．When the RESETOUT function is selected for the P8＿6 pin，the output on the pin is at the low level during a reset and after release from the reset state．For details，see Section 2B．11．1．1，P8＿6：RESETOUT

## 2B.10.6.2 Control Registers

Table 2B. 51 Control Registers (P8)

| Register | Function | Register Size | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |  |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned. When writing to unused bits, write the value after reset.

## 2B.10.19.2 Control Registers

Table 2B. 77 Control Registers (IP0)

| Register | Function | Register <br> Size | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Position | RW ${ }^{* 1}$ |  |  | $\begin{array}{\|l\|} \hline 100 \\ \text { Pins } \end{array}$ | $\begin{aligned} & 144 \\ & \text { Pins } \end{aligned}$ | $\begin{aligned} & \hline 176 \\ & \text { Pins } \end{aligned}$ | $\begin{array}{\|l\|} \hline 233 \\ \text { Pins } \end{array}$ | $\begin{array}{\|l\|} \hline 272 \\ \text { Pins } \\ \hline \end{array}$ |
| IPPR0 | Input port pin read register 0 | 16 | 0 | R | 02FOH | ${ }^{0000}{ }_{\text {H }}$ | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| IPIBC0 | Port input buffer control register 0 | 16 | 0 | RNW | 40FOH | 0000 ${ }_{\text {H }}$ | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned. When writing to unused bits, write the value after reset

## CAUTION

When the IP0_0/XT2 pin is used as an input port, set the IPIBC0.0 bit to 1 and stop the SOSC operation. For details on the settings for SOSC operations, see Section 12AB.4.2.7, SOSCE — SubOSC Enable Register. When the IPO_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0.0 bit to 0 .

## 2B. 11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

## 2B.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

## 2B.11.1.1 P8_6: RESETOUT

The P8_6 pin ( RESETOUT signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.
(Case 1): OPBT0.RESETOUTEN $=1$

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 0: Output mode
- PODC8.PODC8_6 = 1: Open-drain
(Case 2): OPBT0.RESETOUTEN $=0$
- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 1: Input mode
- PODC8.PODC8_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see Section 44.9.2, OPBT0 - Option Byte 0, also see Section 9BC.1.3, Reset Output ( RESETOUT ).

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

Figure 2B. 11 P8_6 Pin ( $\overline{\text { RESETOUT }}$ Signal) Operation While a Reset is asserted and released: (Case 1) OPBTO.RESETOUTEN setting is 1

Note 1. When a reset except POC reset occurs with RESETOUT disable (OPBTO.RESETOUTEN $=0$ ), P8_6 pin ( $\overline{\text { RESETOUT }}$ signal) will be changed to Hi-z.

Figure 2B. 12 P8_6 Pin ( $\overline{\text { RESETOUT }}$ Signal) Operation While a Reset is asserted and released: (Case 2) OPBTO.RESETOUTEN setting is 0

## 2B.11.1.2 JPO_0 to JPO_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2B. 78 Debug Interface

| OPJTAG1 | OPJTAG0 | Mode | JPO_0 | JP0_1 | JP0_2 | JP0_3 | JPO_4 | JP0_5 | JP0_6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | Nexus I/F | DCUTDI input | DCUTDO output | DCUTCK input | DCUTMS input | DCUTRST input | $\begin{aligned} & \hline \text { DCURDY } \\ & \text { output } \end{aligned}$ | EVTO output |
| 0 | 1 | LPD (4 pins) | LPDI input | LPDO output | LPDCLK input | Port/ alternative function | Port/ alternative function | LPDCLK OUT output | Port/ alternative function |
| 1 | 0 | LPD (1 pin) | LPDIO input/output | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function | Port/ alternative function |

NOTE
For the OPJTAG[1:0] settings, see Section 44.9.2, OPBT0 - Option Byte 0.

## 2B.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See Flash Programmer's Manual for details.

## 2B.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.
The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see Section 6, Operating Mode.

## 2B.11.1.5 IPO_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0_0 bit = 1, the IP0_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

## 2B.11.2 A/D Input Alternative I/O

The following ports are permanently connected to $A / D$ input functions. (However, an analog input to the $A / D$ is controlled by the $\mathrm{A} / \mathrm{D}$ module.)

Table 2B. 79 A/D Input Alternative Pins

| Port | A/D Input | Device |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| P8_0 | ADCAOIOS | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

## 2B.11.3 Special I/O Control

## 2B.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.
The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1 .
For details, see Section 2B.9.2.3, PIPCn — Port IP Control Register.
Table 2B. 80 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

| Function | Alternative functions Name | Port Name | Power Supply Area | Control | Reference Section |

## 2B.11.3.2 Input Buffer Control (PISn/JPISO, PISAn/JPISAO)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/PISAn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type $1 / 2$ or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in Table 2B.82, JTAG Port Input Buffer Characteristics Selection.

Table 2B. 81 Port Input Buffer Characteristics Selection

| Port Name | Input Buffer Selection |  |  | Device |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Type 1 (PISn_m = 0 \& PISAn_m = 0) | Type 2 (PISn_m = 1 \& PISAn_m = 0) | Type 5 <br> (PISAn_m = 1) | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |

Note 1. TTL is selected for Boundary scan mode without JPISAO register setting.
Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.
Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISAO register setting.
Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISAO register setting.
NOTES

1. For the SHMT1, SHMT4 and TTL pin characteristics, see Section 47B, Electrical Characteristics of RH850/F1KM-S4.
2. For the input buffer after reset, Type 2 (SHMT4) is selected.

## 2B.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2B. 83 Output Buffer Characteristics Selection

| Port Name | Output Drive Strength Selection |  | Device |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Slow Mode (PDSCn_m = 0) | Fast Mode (PDSCn_m = 1) | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| JP0_1 | 10 MHz | 40 MHz | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note 1. Supports Cload: 100 pF (The load capacitance of CSIH0 is 100 pF.)
Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH3 are 50 pF .)
Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see Section 47B.5, AC Characteristics.

## 2B. 12 Noise Filter \& Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KM supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.
The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter \& edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter \& edge/level detection control registers, see
Section 2B.13, Description of Port Noise Filter \& Edge/Level Detection.
NOTE
In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2B.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

## 2B.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m=0 to 7)

A dedicated FCLA0CTLm_<name> register is provided for each pin in a port that incorporates an analog filter.
Table 2B. 84 Input Pins that Incorporate Analog Filter Type A

| Module Name | Input Pin | FCLA0CTL Register Configuration |  | Device |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | DCUTRST |

## 2B.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<name> ( $\mathrm{m}=0$ to 2 )

Each port with a digital filter has a special FCLA0CTLm_<name> register.

- Digital noise elimination control register DNFA<name $>$ CTL

Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.

- Digital noise elimination enable register DNFA<name $>$ EN

The setting of the DNFA $<$ name $>\mathrm{ENL}[2: 0]$ bits in DNFA $<$ name $>\mathrm{EN}$ enables or disables digital noise elimination for three input signals per group.
Table 2B. 87 Input Pins that Incorporate Digital Filter Type D

## 2B.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name $>$ CTL

Each DNFA<name $>$ CTL control register controls digital filter processing for up to 16 input signals per group.

- Digital noise elimination enable register DNFA<name>EN

The setting of the DNFA<name $>$ ENL[7:0] and DNFA<name $>\mathrm{ENH}[7: 0]$ bits in DNFA<name $>\mathrm{EN}$ enables or disables digital noise elimination for up to 16 input signals per group.

Table 2B. 88 Input Pins that Incorporate Digital Filter Type E

| Input Pin | Devises |  |  |  |  | Digital Noise Elimination Control Register |  | Digital Noise Elimination Enable Register |  |  | Edge Detection |

| RSENTn | Isolated area <br> (ISO area) | Digital filter type E | DNFATCKI | CKSC_IPERI2S_CTL | - |

Note 1. Power Domain

NOTE
For the Setting Register, see Section 12AB.4.3, Clock Selector Control Register.

## 2B.13 Description of Port Noise Filter \& Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.
NOTE
In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2B.13.1 Overview

## 2B.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.

Used for external interrupt signals.

- Type B: An analog filter

Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.

- Type C: An analog filter only

Used for the external RESET input and mode signals.

## 2B.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection. Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function. Used for the timer input signals and encoder input signals.

## 2B.13.2 Analog Filters

## 2B.13.2.1 Analog Filter Characteristic

See Section 47B, Electrical Characteristics of RH850/F1KM-S4 for the input conditions for signals input to pins that incorporate an analog filter.

## 2B.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in Table 2B.84, Input Pins that Incorporate Analog Filter Type A.

## 2B.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

## (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

Figure 2B. 13 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<name>.FCLA0INTLm_<name>.

- FCLA0INTLm_<name> bit $=0$ : Edge detection

Whether a rising or falling edge is detected can be specified by setting the
FCLA0CTLm_<name $>$.FCLA0INTRm_<name> and FCLA0CTLm_<name $>$.FCLA0INTFm_<name> bits.

- FCLA0INTLm_<name> bit = 1: Level detection

The detection of a high level or low level can be specified by setting
FCLA0CTLm_<name>.FCLA0INTRm_<name> bit.
The table below summarizes the detection conditions of the analog filter.
Table 2B. 90 Analog Filter Event Detection Conditions

| FCLAOINTLm_<name> | FCLAOINTFm_<name> | FCLAOINTRm_<name> | Edge Detection | Level Detection |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | No edge detected | Disabled |
|  | 0 | 1 | Rising edge |  |
|  | 1 | 0 | Falling edge |  |
| 1 | 1 | 1 | Rising and falling edges |  |
|  | X | 0 | Disabled | Low level |
|  | X |  |  | High level |

## Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

## (2) Analog filter type $B$

A block diagram of analog filter type B is shown below.

Figure 2B. 14 Block Diagram of Analog Filter Type B

## Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

## (3) Analog filter type C

A block diagram of analog filter type C is shown below.

Figure 2B. 15 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

## Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2B.13.3 Digital Filters

## 2B.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.
The input signal is sampled with the sampling frequency fs.
If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.
If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.
Both parameters can be specified:

- DNFA<name $>$ CTL.DNFA<name $>$ PRS[2:0] select the sampling frequency based on
$\mathrm{f}_{\mathrm{s}}=\mathrm{f}_{\text {DNFATCKI }} / 2^{\text {DNFA<name>PRS[2:0] }}$
where fDNFATCKI is the frequency of the DNFATCKI clock.
- DNFA<name $>$ CTL.DNFA<name $>$ NFSTS[1:0] determines the number of same level samples, "s", (2 to 5):

$$
\mathrm{s}=\mathrm{DNFA}<\text { name }>\text { NFSTS[1:0] }+2
$$

External signal pulses shorter than the following are suppressed at all times.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}
$$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$$
(\mathrm{s}+1) \times 1 / \mathrm{f}_{\mathrm{s}}
$$

External signal pulses in the following range may be suppressed or judged as valid.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}} \text { to }(\mathrm{s}+1) \times 1 / \mathrm{f}_{\mathrm{s}}
$$

The filter operation is illustrated in the figure below with DNFA $<$ name $>\operatorname{NFSTS}[1: 0]=01_{\mathrm{B}}$, i.e. $\mathrm{s}=3$ same level samples.

Figure 2B. 16 Digital Filter Function

## 2B.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.
The digital filter characteristics, specified by DNFA<name $>$ CTL.DNFA $<n a m e>$ PRS[2:0] and
DNFA<name $>$ NFSTS[1:0] apply to the signals.
However, the digital filter for each signal can be enabled or disabled separately by

CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm ( $m=0$ to 7 ) = 1 and DNFA<name>EN.DNFA<name>ENHm $(m=0$ to 7$)=1)$ for the port pin to switch to the alternative function.
$\mathrm{s}=\mathrm{DNFA}<n a m e>N F S T S[1: 0]+2$
$\mathrm{s} \times 1 / \mathrm{f} \mathrm{s}+2 \times 1 /$ fonfatcki
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm $(\mathrm{m}=0$ to 7$)=1$ and DNFA<name>EN.DNFA<name>ENHm $(\mathrm{m}=0$ to 7 ) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}+3 \times 1 / \mathrm{f} \text { DNFATCKI }
$$

## 2B.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2B.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA $<$ name $>$ CTL and digital noise elimination enable register DNFA<name $>$ EN are used to set all the filters in the same group (<name> $=$ peripheral function group).
The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name $>$ EN register enables/disables each filter by setting the corresponding bit in DNFA $<$ name $>$ EN.DNFA $<$ name $>$ ENLm ( $\mathrm{m}=0$ to 7 ) and DNFA $<$ name $>$ EN.DNFA $<$ name $>$ ENHm ( $\mathrm{m}=0$ to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm_ADCn registers are ordered in groups of 3 registers with the same index $n$. The register index $n$ is in 0 or 1 .

The assignment of the input signals to the control registers and their addresses are given in Table 2B.87, Input Pins that Incorporate Digital Filter Type D and Table 2B.88, Input Pins that Incorporate Digital Filter Type E in Section 2B.12.1, Port Filter Assignment.

## CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm $(\mathrm{m}=0$ to 7$)=1$ and DNFA<name>EN.DNFA<name>ENHm $(m=0$ to 7$)=1$. Otherwise an unintended filter output may be generated.

## (1) Digital filter type D

A block diagram of digital filter type D is shown below.

Figure 2B. 17 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.
Table 2B. 91 Output Options for Digital Filter Type D

| DNFA<name>EN.DNFA<name>ENLm | Signals Output to Peripheral Functions |
| :--- | :--- |
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## (2) Digital filter type E

A block diagram of digital filter type E is shown below.

Figure 2B. 18 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.
Table 2B. 92 Output Options for Digital Filter Type E

| DNFA<name>EN.DNFA<name>ENLm and |  |
| :--- | :--- |
| DNFA<name>EN.DNFA<name>ENHm | Signals Output to Peripheral Functions |
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## 2B.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:
Table 2B. 93 List of Filter Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| FCLA0 | Filter control register $m$ | FCLAOCTLm_<name> | The addresses are shown in the tables in |
| DNF | Digital noise elimination control register | DNFA<name>CTL | Section 2B.12.1, Port Filter |
|  | Digital noise elimination enable register | DNFA<name>EN |  |
|  | Digital noise elimination enable H register | DNFA<name>ENH |  |
|  | Digital noise elimination enable L register | DNFA<name>ENL |  |

## 2B.13.4.1 FCLAOCTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.
Address: The allocation of input signals to FCLAOCTLm_<name> registers and the address of each register are shown in the tables in Section 2B.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | FCLAOINTLm _<name> | FCLAOINTFm _<name> | FCLAOINTRm _<name> |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 2B. 94 FCLAOCTLm_<name> Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | FCLAOINTLm _<name> | Detection Mode Selection <br> 0 : Edge detection <br> 1: Level detection <br> NOTE: This bit is only valid for analog filter type A. |
| 1 | FCLAOINTFm _<name> | - In level detection mode (FCLAOINTLm_<name> = 1): This bit has no effect. <br> - In edge detection mode (FCLAOINTLm_<name> = 0): Falling edge detection control <br> 0 : Falling edge detection disabled <br> 1: Falling edge detection enabled <br> NOTE: This bit is only valid for analog filter type A and digital filter type D. However, digital filter type $D$ is placed in edge detection mode. |
| 0 | FCLAOINTRm _<name> | - In level detection mode (FCLAOINTLm_<name> = 1): Detected level selection <br> 0 : Low level detection <br> 1: High level detection <br> - In edge detection mode (FCLAOINTLm_<name> = 0): Rising edge detection control <br> 0 : Rising edge detection disabled <br> 1: Rising edge detection enabled <br> NOTE: This bit is only valid for analog filter type A and digital filter type D. However, digital filter type $D$ is placed in edge detection mode. |

## CAUTION

Digital filter type D: Always set bit 2 to "0".

## 2B.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.
NOTE
This register is only valid for digital filter type D and digital filter type E .

Access: This register can be read or written in 8-bit units.
Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see Table 2B.87, Input Pins that Incorporate Digital Filter Type D and Table 2B.88, Input Pins that Incorporate Digital Filter Type E in Section 2B.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

Table 2B. 95 DNFA<name>CTL Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |
|  |  |  |  |
| 6, 5 | DNFA<name> NFSTS[1:0] | The DNFA<name>NFSTS[1:0] bits specify the number of samples used to judge whether an external signal pulse is valid. |  |
|  |  | DNFA<name>NFSTS[1:0] | Number of Samples |
|  |  | 00, | 2 |
|  |  | 01B | 3 |
|  |  | 10 ${ }_{\text {B }}$ | 4 |
|  |  | 11 ${ }_{\text {B }}$ | 5 |
| 4, 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |
|  |  |  |  |

|  |  | 111 ${ }^{\text {b }}$ | DNFATCKI/128 |

## 2B.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.
NOTE
This register is only valid for digital filter type D and digital filter type E .

Access: This register can be read or written in 16-bit units.
The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see Table 2B.87, Input Pins that Incorporate Digital Filter Type D and Table 2B.88, Input Pins that Incorporate Digital Filter Type E in Section 2B.12.1, Port Filter Assignment.

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 2B. 96 DNFA<name>EN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | DNFA<name> | Digital Noise Elimination Enable/Disable Control |
|  | ENH[7:0] | 0: Fixed to low level |
|  | DNFA<name> | 1: Input signal passed through filter |
|  | ENL[7:0] |  |

## 2B.13.4.4 DNFA<name>ENH - Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.
NOTE
This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.
Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see Table 2B.88, Input Pins that Incorporate Digital Filter Type E in Section 2B.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DNFA<name> ENH7 | DNFA<name> ENH6 | DNFA<name> ENH5 | DNFA<name> ENH4 | DNFA<name> ENH3 | DNFA<name> ENH2 | DNFA<name> ENH1 | DNFA<name> ENHO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see Section 2B.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.

## 2B.13.4.5 DNFA<name>ENL - Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register. NOTE

This register is only valid for digital filter type $D$ and digital filter type $E$.

|  | Access: <br> Address: | This register can be read or written in 8-bit or 1-bit units. <br> For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see Table 2B.87, Input Pins that Incorporate Digital Filter Type D and Table 2B.88, Input Pins that Incorporate Digital Filter Type E in Section 2B.12.1, Port Filter Assignment. |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  | $0 \mathrm{O}_{\mathrm{H}}$ |  |  |  |  |  |  |
| Bit | 7 | 6 5 |  | 4 | 3 | 2 | 1 | 0 |
|  | DNFA<name> ENL7 | DNFA<name> ENL6 | DNFA<name> ENL5 | DNFA<name> ENL4 | DNFA<name> ENL3 | DNFA<name> ENL2 | DNFA<name> ENL1 | DNFA<name> ENLO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see Section 2B.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.

## Section 2C Pin Function of RH850/F1KM-S1

This section describes the pin and port functions.
Section 2C.1, Pin Connection Diagram to Section 2C.5, Recommended Connection of Unused Pins describe the pin connections and respective pins.

Section 2C.6, Features of RH850/F1KM Port to Section 2C.13, Description of Port Noise Filter \& Edge/Level Detection describe the general port functions.

| TAUJnOm | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0 | TAUJn channel output m |  |
|  | $\begin{aligned} & \mathrm{n}=0 \text { to } 3 \\ & \mathrm{~m}=0 \text { to } 3 \end{aligned}$ | $\begin{aligned} & \mathrm{n}=0 \text { to } 3 \\ & \mathrm{~m}=0 \text { to } 3 \end{aligned}$ | $\begin{aligned} & \mathrm{n}=0 \text { to } 3 \\ & \mathrm{~m}=0 \text { to } 3 \end{aligned}$ | $\begin{aligned} & \mathrm{n}=0 \text { to } 3 \\ & \mathrm{~m}=0 \text { to } 3 \end{aligned}$ |  |  |  |
| X1, X2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | MainOSC connections | MOSC |

## CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- (e.g.) When RS-CANFD channel 0 is used:

$$
\begin{array}{lll}
\text { CANOTX } & \text { P0_0 } & \text { P10_1 } \\
\text { CANORX } & \text { P0_1 } & \text { P10_0 }
\end{array}
$$

Use one of the following pin combinations:

- P0_0 and P0_1, or
- P10_0 and P10_1.

The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.

## 2C. 3 Pin Functions During and After Reset

Table 2C. 6 Pin Functions During and After Reset

| Pins | During Reset | After Reset |
| :--- | :--- | :--- |
| JP0_0 | High impedance | JP0_0: Input |
|  |  | Serial programming mode: FPDR, FPDT (1 wire UART) |
|  |  | FPDR (2 wire UART) |
|  |  | Nexus I/F: DCUTDI input LPD (4 pins): LPDI input |
|  |  | LPD (1 pin): LPDIO input/output |

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.
Note 2. $\overline{R E S E T O U T}$ is output. For details, see Section 2C.11, Port (Special I/O) Function Overview.
Note 3. When the power is turned on or when $\overline{\text { RESET }}$ is low level, JPO_4 pin should be driven low level.
Note 4. If OPBTO.RESETOUTEN $=0$, P8_6 pin status has a possibility to become unstable (less than $15 \mu \mathrm{~s}$ ) at the transition moment to reset status by internal reset factors.
Note 5. When $\overline{R E S E T}$ is low level, on-chip pull-down resistor is connected to JP0_4.

## 2C. 4 Port State in Standby Mode

For the port state in standby mode, see Section 14.1.4, I/O Buffer Control.

## 2C.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.
Table 2C. 7 Recommended Connection of Unused Pins

| Pin | Recommended Connection of Unused Pins |
| :---: | :---: |
| AOVREF | Connected to EVCC |
| A0VSS | Connected to EVSS |
| RESET | Connected to EVCC via a resistor |
| X1 | Connected to AWOVSS via a resistor |
| X2 | Open |
| ```JP0 (excluding JP0_4) P0 P8 (excluding P8_6) P9``` | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) <br> Output: Open |
| P8_6 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) <br> Output: Open |
| JP0_4 | Connected to EVSS via a resistor |
| $\begin{aligned} & \text { P10 (excluding P10_1, P10_2, } \\ & \text { P10_6, P10_8) } \\ & \text { P11 } \end{aligned}$ | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) <br> Output: Open |
| P10_1, P10_2, P10_6, P10_8 | Input: Open (when the PIBCn_m and PMCn_m bits are 0) <br> Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open |
| AP0 | Input: Open (when the PIBCn_m bit is 0 ) <br> Connected to AOVREF or AOVSS via a resistor (when the PIBCn_m bit is 1 ) <br> Output: Open |
| Nexus/LPD I/F (JP0) | DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JPO_3): Connected to EVCC via a resistor DCUTRST (JP0_4): Connected to EVSS via a resistor*1 DCURDY /LPDCLKOUT (JP0_5): Open |

Note 1. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

## 2C. 6 Features of RH850/F1KM Port

## 2C.6.1 Port Group

The RH850/F1KM provides the following port groups, indicated by the numbers in the table below.
Table 2C. 8 Port Groups in RH850/F1KM-S1

| No. of Pins | Port Group | RH850/F1KM-S1 |
| :--- | :--- | :--- |
| 48 pins | Number | 6 |
|  | Name | P0, P8 to P10, JP0, AP0 |
| 64 pins | Number | 6 |
|  | Name | P0, P8 to P10, JP0, AP0 |
| 80 pins | Number | 7 |
|  | Name | P0, P8 to P11, JP0, AP0 |
| 100 pins | Number | 7 |
|  | Name | P0, P8 to P11, JP0, AP0 |

## 2C.6.2 Port Group Index $\mathbf{n}$

Throughout this section, the port groups are identified by using the index "n". For example, the port mode control register of the $\operatorname{Pn}$ pin is $\operatorname{PMCn}(n=0$, and 8 to 11$)$.

## 2C.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.
Port and JTAG port register addresses are given as offsets from the base addresses.
Table 2C. 9 Register Base Addresses

| Base Address Name | Base Address |
| :--- | :--- |
| <PORTn_base> | FFC1 $0000_{\mathrm{H}}$ |
| <JPORT0_base> | FFC2 $0000_{\mathrm{H}}$ |

## 2C.6.4 Clock Supply

The clock supply to ports is shown in the following table.
Table 2C. 10 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| Port | Register access clock | CPUCLK_UL |

## 2C. 7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.
The RH850/F1KM also has several control registers to enable pins to be used as other than general-purpose input/output pins.
For a description of the terms pin, port, and port group, see Section 2C.7.2, Terms.

## 2C.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16 .
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

Table 2C.39, JTAG Port 0 (JPO), Table 2C.41, Port 0 (P0), Table 2C.43, Port 8 (P8), Table 2C.45, Port 9 (P9), Table 2C.47, Port 10 (P10), Table 2C.49, Port 11 (P11), Table 2C.51, Analog Port 0 (AP0) and Section 2C.9.2, Pin Function Configuration.

## CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

## [Example]

INTP0 is assigned to the following pins on this device. However, the INTPO function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JPO_0 (1st input alternative function)
- P0_1 (2nd, 3rd input alternative function)
- P10_0 (2nd input alternative function)

In the above case, when the 1 st input alternative function (INTPO) of JPO_0 is selected, using the 2nd input alternative function (CANORXINTPO) of P0_1 only for the CAN signal is also prohibited.

## 2C.7.2 Terms

The following terms are used in this section:

## Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.
A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

## Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

## Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called "port".
The corresponding name is $\mathrm{Pn} \_\mathrm{m}$. For example, $\mathrm{P} 0 \_7$ denotes port 7 of port group 0. It is referenced as "port P0_7".

## Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

## 2C.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.
JTAG port group registers and bit names are prefixed by a "J". For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE
In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

## 2C.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode $($ PMCn.PMCn_m bit $=0)$

A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.

- Software I/O control alternative mode (PMCn.PMCn_m bit $=1$, PIPCn.PIPCn_m bit $=0$ )

In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.

- Direct I/O control alternative mode (PMCn.PMCn_m bit $=1$, PIPCn.PIPCn_m bit $=1$ )

In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.
An overview of the register settings is given in the tables below.
Table 2C. 11 Pin Function Configuration (Overview)

| Mode | Bit |  |  | 1/O |
| :---: | :---: | :---: | :---: | :---: |
|  | PMCn_m | PMn_m | PIPCn_m |  |
| Port mode | 0 | 0 | X | 0 |
|  |  | 1*1 |  | 1 |
| Software I/O control alternative mode | 1 | 0 | 0 | O |
|  |  | 1 | 0 | 1 |
| Direct l/O control alternative mode |  | X | 1 | Controlled by the alternative function |

Note 1. The input buffer must be enabled (PIBCn_m bit $=1$ ).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit $=0$ )
- Output $($ PMn_m bit $=0)$ : Alternative output mode 1 to Alternative output mode 7
- Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
- The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2C. 12 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)

| Mode | Register |  |  |  |  | I/O |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PIPC*1 | PM* ${ }^{* 1}$ | PFCAE | PFCE | PFC |  |
| Alternative output mode 1 (ALT-OUT1) | 0 | 0 | 0 | 0 | 0 | O |
| Alternative input mode 1 (ALT-IN1) |  | 1 |  |  |  | 1 |
| Alternative output mode 2 (ALT-OUT2) |  | 0 |  |  | 1 | O |
| Alternative input mode 2 (ALT-IN2) |  | 1 |  |  |  | I |
| Alternative output mode 3 (ALT-OUT3) |  | 0 |  | 1 | 0 | O |
| Alternative input mode 3 (ALT-IN3) |  | 1 |  |  |  | I |
| Alternative output mode 4 (ALT-OUT4) |  | 0 |  |  | 1 | O |
| Alternative input mode 4 (ALT-IN4) |  | 1 |  |  |  | I |
| Alternative output mode 5 (ALT-OUT5) |  | 0 | 1 | 0 | 0 | O |
| Alternative input mode 5 (ALT-IN5) |  | 1 |  |  |  | 1 |
| Alternative output mode 6 (ALT-OUT6) |  | 0 |  |  | 1 | 0 |
| Alternative input mode 6 (ALT-IN6) |  | 1 |  |  |  | 1 |
| Alternative output mode 7 (ALT-OUT7) |  | 0 |  | 1 | 0 | 0 |
| Alternative input mode 7 (ALT-IN7) |  | 1 |  |  |  | I |
| Other than the above | Setting prohibited |  |  |  |  |  |

Note 1. If PIPCn.PIPCn_m bit $=1$, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.
If a pin is in alternative mode ( $\mathrm{PMCn} . \mathrm{PMCn} \mathrm{m}$ bit $=1$ ), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

## 2C.7.4 Pin Data Input/Output

The registers used for data input/output are described below.
The location that is read via the PPRn register differs depending on the pin mode.

## 2C.7.4.1 Output Data

In the port mode ( $\mathrm{PMCn} . \mathrm{PMCn} n_{-} \mathrm{m}$ bit $=0$ ), the value of the $\mathrm{Pn} . \mathrm{Pn}_{-} \mathrm{m}$ bit is output from the Pn m pin.

## 2C.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits. The different PPRn read modes are shown in the table below.

Table 2C. 13 PPRn_m Read Values

| $\begin{aligned} & \text { PMC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PM } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIBC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PODC } \\ & \text { n_m } \end{aligned}$ | Mode | PPRn_m Read Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | X | X | Port input, input buffer disabled | Pn.Pn_m bit |
|  |  | 1 |  | X | Port input, input buffer enabled | Pn_m pin |
|  | 0 | X |  | 0 | Port push-pull output | Pn.Pn_m bit** |
|  |  |  |  | 1 | Port open-drain output |  |
| 1 | 1 | X | 0 | X | Software I/O control alternative input | Pn_m pin |
|  | 0 |  |  | 0 | Software I/O control alternative pushpull output | Output signal from the alternative function*1 |
|  |  |  |  | 1 | Software I/O control alternative opendrain output |  |
|  | X |  | 1 | 0 | Direct I/O control alternative input or push-pull output | I/O port in alternative mode: <br> - Input: Pn_m pin <br> - Output: Output signal from the alternative function*1 |
|  |  |  |  | 1 | Direct I/O control alternative input or open-drain output |  |

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.
The control registers in the above table have the following effects:

- PMCn.PMCn_m bit

This bit selects port mode $(\operatorname{PMCn} \mathrm{m}=0)$ or alternative mode $\left(\mathrm{PMCn}_{-} \mathrm{m}=1\right)$.

- PMn.PMn_m bit

This bit selects input $\left(\mathrm{PMn} \mathrm{\_m}=1\right)$ or output $\left(\mathrm{PMn} \_\mathrm{m}=0\right)$ when the port mode $(\mathrm{PMCn} \mathrm{m}=0)$ and software I/O control alternative mode ( $\mathrm{PMCn} \mathrm{m}=1$, PIPCn_m $=0$ ) have been selected.

- PIBCn.PIBCn_m bit

This bit disables $($ PIBCn_m $=0)$ or enables $\left(\operatorname{PIBCn} \_m=1\right)$ the input buffer in input port mode $($ PMCn_m $=0$ and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.

- PIPCn.PIPCn_m bit

This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- PODCn.PODCn_m bit

This bit selects push-pull output $(\operatorname{PODCn} \mathrm{m}=0)$ or open-drain output $($ PODCn_m $=1)$.

- PBDCn.PBDCn_m bit

In output mode, when this bit is set to 1 , the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

## CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m bit = 1, PMn.PMn_m bit =0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m bit =1).
Note, however, that the level of the Pn_m pin will be input to the alternative input function that the Pn_m pin is being used as.

## 2C.7.4.3 Writing to the Pn Register

The data to be output via port $\mathrm{Pn}_{-} \mathrm{m}$ in port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \mathrm{m}$ bit $=0$ ) is held in port register Pn . Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.

In this case, new data can be written directly to the Pn register.

- By performing an indirect bitwise operation (a "set", "reset", or "not" operation) on the Pn register.

An indirect bitwise operation ("set", "reset", or "not") can be performed on the Pn register by using the following two registers:

- Port Set/Reset register PSRn

If the PSRn.PSRn $(\mathrm{m}+16)$ bit $=1$, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.

- Port NOT register PNOTn

By setting PNOTn.PNOTn_m bit to 1 , the Pn.Pn_m bit can be inverted without writing directly to the Pn register.
An indirect bitwise operation on the Pn register ("set", "reset", or "not") has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

## 2C.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

Figure 2C. 5 Schematic View of Port Control

## CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

## 2C. 9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

## - Section 2C.9.2, Pin Function Configuration

- Section 2C.9.3, Pin Data Input/Output
- Section 2C.9.4, Configuration of Electrical Characteristics

## 2C.9.1 Overview

The following registers are used for setting the individual pins of the port groups.
For details on $<$ PORTn_base $>$ and $<$ JPORT0_base $>$, see Section 2C.6.3, Register Base Addresses.
Table 2C. 14 Port Group Configuration Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| Pin function configuration |  |  |  |
| PORT | Port mode control register | PMCn | <PORTn_base> + 0400 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPMC0 | <JPORT0_base> + 0040 ${ }_{\text {H }}$ |
| PORT | Port mode control set/reset register | PMCSRn | <PORTn_base> + 0900 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPMCSR0 | <JPORT0_base> + 0090 ${ }_{\text {H }}$ |
| PORT | Port IP control register | PIPCn | <PORTn_base> $+4200_{\mathrm{H}}+\mathrm{n} \times 4$ |
| PORT | Port mode register | PMn | <PORTn_base> $+0300_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APMn | <PORTn_base> $+03 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPM0 | <JPORT0_base> + 0030 ${ }_{\text {H }}$ |
| PORT | Port mode set/reset register | PMSRn | <PORTn_base> $+0800_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APMSRn | <PORTn_base> $+08 \mathrm{C} 8_{H}+\mathrm{n} \times 4$ |
| JTAG |  | JPMSR0 | <JPORT0_base> + 0080 ${ }_{\text {H }}$ |
| PORT | Port input buffer control register | PIBCn | <PORTn_base> $+4000_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APIBCn | <PORTn_base> $+40 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPIBC0 | <JPORT0_base> + 0400 ${ }_{\text {H }}$ |
| PORT | Port function control register | PFCn | <PORTn_base> + 0500 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPFC0 | <JPORT0_base> + 0050 ${ }_{\text {H }}$ |
| PORT | Port function control expansion register | PFCEn | <PORTn_base> + 0600 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPFCE0 | <JPORT0_base> + 0060 ${ }_{\text {H }}$ |
| PORT | Port function control additional expansion register | PFCAEn | <PORTn_base> + 0 A00 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| Pin data input/output |  |  |  |
| PORT | Port bidirection control register | PBDCn | <PORTn_base> $+4100_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APBDCn | <PORTn_base> + 41-88H $+\mathrm{n} \times 4$ |
| JTAG |  | JPBDC0 | <JPORT0_base> + 0410 ${ }_{\text {H }}$ |
| PORT | Port pin read register | PPRn | <PORTn_base> $+0200_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APPRn | <PORTn_base> $+02 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPPR0 | <JPORTO_base> + 0020 ${ }_{\text {H }}$ |
| PORT | Port register | Pn | <PORTn_base> $+0000_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APn | <PORTn_base> + 00C8 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JP0 | <JPORT0_base> + 0000 ${ }_{\text {H }}$ |

Table 2C. 14 Port Group Configuration Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| Pin data input/output |  |  |  |
| PORT | Port NOT register | PNOTn | <PORTn_base> $+0700_{H}+\mathrm{n} \times 4$ |
|  |  | APNOTn | <PORTn_base> $+07 \mathrm{C} 8_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPNOT0 | <JPORT0_base> + 0070 ${ }_{\text {H }}$ |
| PORT | Port set/reset register | PSRn | <PORTn_base> $+0100_{\mathrm{H}}+\mathrm{n} \times 4$ |
|  |  | APSRn | <PORTn_base> $+01 \mathrm{C} 8_{H}+\mathrm{n} \times 4$ |
| JTAG |  | JPSR0 | <JPORTO_base> + 0010 ${ }_{\text {H }}$ |
| Configuration of electrical characteristics |  |  |  |
| PORT | Pull-up option register | PUn | <PORTn_base> + 4300 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPU0 | <JPORTO_base> + 0430 ${ }_{\text {H }}$ |
| PORT | Pull-down option register | PDn | <PORTn_base> $+4400_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPD0 | <JPORT0_base> + 0440 ${ }_{\text {H }}$ |
| PORT | Port drive strength control register | PDSCn | <PORTn_base> $+4600_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPDSC0 | <JPORT0_base> + 0460 ${ }_{\text {H }}$ |
| PORT | Port open drain control register | PODCn | <PORTn_base> $+4500_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPODC0 | <JPORTO_base> + 0450 ${ }_{\text {H }}$ |
| PORT | Port input buffer selection register | PISn | <PORTn_base> $+4700_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPIS0 | <JPORT0_base> + 0470 ${ }_{\text {H }}$ |
| JTAG | Port input buffer selection advanced register | JPISA0 | <JPORTO_base> + 04A0 ${ }_{\text {H }}$ |
| Port register protection |  |  |  |
| PORT | Port protection command register | PPCMDn | <PORTn_base> + 4C00 ${ }_{\text {H }}+\mathrm{n} \times 4$ |
| JTAG |  | JPPCMD0 | <JPORTO_base> + 04CO ${ }_{\text {H }}$ |
| PORT | Port protection status register | PPROTSn | <PORTn_base> $+4 \mathrm{B00}{ }_{\mathrm{H}}+\mathrm{n} \times 4$ |
| JTAG |  | JPPROTS0 | <JPORTO_base> + 04B0 ${ }_{\text {H }}$ |

## Index n

In Table 2C.14, Port Group Configuration Registers, the index " $n$ " in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group $n(P n)$. The values for $n$ differ according to the number of pins on the device in the way shown in Table 2C.15, Number of Pins on the Device, Name of Port Groups, and Values for " $n$ " in Register Symbols.

Table 2C. 15 Number of Pins on the Device, Name of Port Groups, and Values for " $n$ " in Register Symbols

| Number of Pins on the Device | Port Groups | Values for " n " |
| :--- | :--- | :--- |
| 48 pins | $\mathrm{P0}, \mathrm{P} 8, \mathrm{P9}, \mathrm{P} 10$ | $0,8,9,10$ |
|  | AP0 | 0 |
| 64 pins | P0, P8, P9, P10 | $0,8,9,10$ |
|  | AP0 | 0 |
| 80 pins | P0, P8, P9, P10, P11 | $0,8,9,10,11$ |
|  | AP0 | 0 |
| 100 pins | P0, P8, P9, P10, P11 | $0,8,9,10,11$ |
|  | AP0 | 0 |

## JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.
All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

## Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

## 2C.9.2 Pin Function Configuration

## 2C.9.2.1 PMCn / JPMCO — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

## CAUTIONS

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit $=1$ ). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1 .
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLAOCTLm_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see Section 2C.12, Noise Filter \& Edge/Level Detector, and Section 2C.13, Description of Port Noise Filter \& Edge/Level Detection.

NOTE
The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

## 2C.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.
The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

| Access: $\begin{array}{ll}\text { P } \\ & \text { to } \\ & J \\ & \text { to }\end{array}$ |  |  | PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as $0000_{\mathrm{H}}$. Reading bits 15 to 0 returns the value of register PMCn. <br> JPMCSRO: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000 H . Reading bits 7 to 0 returns the value of register JPMC0. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: |  |  | $\begin{aligned} & \text { PMCSRn: <PORTn_base> }+0900_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,8,9,10,11) \\ & \text { JPMCSR0: <JPORT0_base> + } 0090^{* 1} \end{aligned}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 2C. 17 PMCSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMCSRn_[31:16] | Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. <br> 0 : PMCn_m is not affected by PMCSRn_m. <br> 1: PMCn_m is PMCSRn_m. <br> Example: <br> If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15. |
| 15 to 0 | PMCSRn_[15:0] | Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. <br> 0 : PMCn_m is 0 . <br> 1: PMCn_m is 1 . |

## NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

## 2C.9.2.3 PIPCn - Port IP Control Register

This register specifies whether the I/O direction of the $\operatorname{Pn} \_\mathrm{m}$ pin is controlled by the port mode register PMn.PMn_m or by an alternative function.

If the $\mathrm{Pn} \_\mathrm{m}$ pin is operated in alternative mode (PMCn.PMCn_m $=1$ ) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.
Regarding the alternative functions for which the PIPC register must be set, see Section 2C.11, Port (Special I/O) Function Overview.

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | PIPCn: $<$ PORTn_base $>+4200_{H}+n \times 4(n=0,10,11)^{* 1}$ |
| Value after reset: | $0000_{H}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { PIPC } \\ & \text { n_15 } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_14 } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_13 } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_12 } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_11 } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_10 } \end{aligned}$ | $\begin{gathered} \text { PIPC } \\ \text { n_9 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_8 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_7 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_6 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_5 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_4 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_3 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_2 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_1 } \end{gathered}$ | $\begin{gathered} \text { PIPC } \\ \text { n_0 } \end{gathered}$ |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.42, Control Registers (P0), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 18 PIPCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIPCn_[15:0] | Specifies the I/O mode. |
|  | $0: I / O$ mode is selected by PMn.PMn_m (software I/O control). |  |
|  | $1: I / O$ mode is selected by the peripheral function (direct I/O control). |  |

## 2C.9.2.4 PMn / APMn / JPMO — Port Mode Register

This register specifies whether the individual pins of the port group $n$ are in input mode or in output mode.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (APO).
Note 2. The PM8 register is as follows.
When the OPBTO.RESETOUTEN $=1$, the PM 8 register is $\mathrm{FFBF}_{\mathrm{H}}$. When the OPBTO.RESETOUTEN $=0$, the PM 8 register is $\mathrm{FFFF}_{\mathrm{H}}$.

Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN $=1$, the PM8_6 bit is 0 .
When the OPBTO.RESETOUTEN $=0$, the PM8_6 bit is 1 .
Table 2C. 19 PMn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMn_[15:0] | Specifies input/output mode of the corresponding pin. |
|  | $0:$ Output mode (output enabled) |  |
|  | 1: Input mode (output disabled) |  |

## NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and $P M n . P M n \_m=1$ ), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, $\mathrm{PMn} . \mathrm{PMn} \_m$ specifies the $\mathrm{I} / \mathrm{O}$ direction in port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \mathrm{\_m}=0$ ) and alternative mode (PMCn.PMCn_m=1), since PIPCn.PIPCn_m = 0 ( $/ / O$ mode is controlled by PMn.PMn_m) after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

## 2C.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.
The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (APO).
Note 2. The PMSR8 register is as follows.
When the OPBTO.RESETOUTEN $=1$, the PMSR8 register is $0000 \mathrm{FFBF}_{\mathrm{H}}$.
When the OPBT0.RESETOUTEN $=0$, the PMSR8 register is 0000 FFFF $_{H}$.
Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8_6 bit is 0 .
When the OPBTO.RESETOUTEN $=0$, the PMSR8_6 bit is 1 .
Table 2C. 20 PMSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMSRn_[31:16] | Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to $\mathrm{PMn} \_\mathrm{m}$. <br> 0 : PMn_m is not affected by PMSRn_m. <br> 1: PMn_m is PMSRn_m. <br> Example: <br> If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15. |
| 15 to 0 | PMSRn_[15:0] | Data bits that specify the value of $\operatorname{PMn} \_m$ if $P M S R n \_m$ of the corresponding upper bit (PMSRn_[31:16]) is 1. <br> 0 : $P M n \_m$ is 0 . <br> 1: PMn_m is 1 . |

## NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSRO) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0]

## 2C.9.2.6 PIBCn / APIBCn / JPIBC0 — Port Input Buffer Control Register

In input port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \mathrm{m}=0$ and $\mathrm{PMn} . \mathrm{PMn} \mathrm{m}=1$ ), this register enables the port pin's input buffer.

|  | Ac | ess: | PIBCn, <br> JPIBCO <br> PIBCn: <br> APIBCn <br> JPIBC0: | APIBCn: <br> This reg <br> <PORTn <br> <POR <br> <JPOR | These <br> ster ca <br> base> <br> _base <br> 0_bas | gisters <br> be read <br> $4000_{\mathrm{H}}$ <br> $+40 \mathrm{C} 8$ <br> $+0400$ | an be or writt $\begin{aligned} & n \times 4 \\ & (n=0) \end{aligned}$ | ר = 0, 8, | units. $9,10,11$ | -bit un |  |  |  |  |  |  |

| Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (AP0). |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 2C. 21 PIBCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIBCn_[15:0] | Enables/disables the input buffer. |
|  |  | 0: Input buffer disabled |
|  | 1: Input buffer enabled |  |
| NOTES |  |  |

1. When the input buffer is disabled, through current does not flow even when the pin level is $\mathrm{Hi}-\mathrm{Z}$. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBCO) are JPIBC0_[7:0].

## CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

## 2C.9.2.7 PFCn / JPFC0 - Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.
Some alternative functions directly control the I/O of the $\mathrm{Pn} \_\mathrm{m}$ pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

```
            Access: PFCn: This register can be read or written in 16-bit units.
                    JPFC0: This register can be read or written in 8-bit units.
Address: PFCn: <PORTn_base> + 0500н + n x 4 (n=0,8,9,10, 11)
    JPFC0: <JPORTO_base> + 0050**1
Value after reset: }000\mp@subsup{0}{H}{
```

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 22 PFCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCn_[15:0] | Specifies the alternative function of the pin. <br> For details, see Table 2C.25, Setting Alternative Functions. |
| NOTE |  |  |

The control bits of the JTAG port function control register (JPFC0) are JPFC0_[7:0].

## 2C.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.
Some alternative functions directly control the I/O of the $\mathrm{Pn} \_\mathrm{m}$ pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the $\mathrm{I} / \mathrm{O}$ is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

```
            Access: PFCEn: This register can be read or written in 16-bit units.
                    JPFCEO: This register can be read or written in 8-bit units.
Address: PFCEn: <PORTn_base> + 0600H}+n\times4(n=0,8,9,10,11
    JPFCEO: <JPORTO_base> + 0060H*1
Value after reset: }000\mp@subsup{0}{H}{
```

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 23 PFCEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCEn_[15:0] | Specifies the alternative function of the pin. <br> For details, see Table 2C.25, Setting Alternative Functions. |
| NOTE |  |  |

The control bits of the JTAG port function control register (JPFCEO) are JPFCE0_[7:0].

## 2C.9.2.9 PFCAEn - Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.
Some alternative functions directly control the I/O of the $\mathrm{Pn} \_\mathrm{m}$ pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the $\mathrm{I} / \mathrm{O}$ is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

| Access: <br> Address: |  |  | PFCAEn: This register can be read or written in 16-bit units. <br> PFCAEn: <PORTn_base> $+0 \mathrm{AOO}_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,8,9,10,11)^{\star 1}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

|  | 1 | 0 | 1 | Alternative input mode 3 |
|  |  |  | 0 | Alternative output mode 3 |
|  |  | 1 | 1 | Alternative input mode 4 |
|  |  |  | 0 | Alternative output mode 4 |
| 1 | 0 | 0 | 1 | Alternative input mode 5 |
|  |  |  | 0 | Alternative output mode 5 |
|  |  | 1 | 1 | Alternative input mode 6 |
|  |  |  | 0 | Alternative output mode 6 |
|  | 1 | 0 | 1 | Alternative input mode 7 |
|  |  |  | 0 | Alternative output mode 7 |
|  |  | 1 | X | Setting prohibited |

## CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to " 1 ".
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited.
For example, if the $a / b / c$ pin is used as $b$, the $b / d / e$ pin cannot be used as $b$. In this case, the $b / d / e$ pin must be configured as a pin function other than $b$.

NOTE
For more details on the assignment of each function, see Sections 2C.10.1, JTAG Port 0 (JP0) to 2C.10.7, Analog Port 0 (APO).

## 2C.9.3 Pin Data Input/Output

## 2C.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

## CAUTION

When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m = 1).
However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

NOTE
The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

## 2C.9.3.2 PPRn / APPRn / JPPR0 — Port Pin Read Register

This register reflects the actual level of the $\mathrm{Pn} \_\mathrm{m}$ pin, whether it is the value of the $\mathrm{Pn} . \mathrm{Pn} \_\mathrm{m}$ bit or the level of an alternative output function.

```
            Access: PPRn, APPRn: These registers are read-only registers that can be read in 16-bit units.
                            JPPRO: This register is a read-only register that can be read in 8-bit units.
Address: PPRn: <PORTn_base> + 0200H + n }\times4(\textrm{n}=0,8,9,10,11
    APPRn: <PORTn_base> + 02C8H ( }\textrm{n}=0
    JPPRO: <JPORTO_base> + 0020н*1
Value after reset: }000\mp@subsup{0}{H}{
```

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (APO).

Table 2C. 27 PPRn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PPRn_[15:0] | The Pn_m Pin, Pn.Pn_m value or alternative function output. |

## NOTES

1. For the read values of the PPRn register, see Section 2C.7.4, Pin Data Input/Output.
2. The control bits of the JTAG port pin read register (JPPRO) are JPPRO_[7:0].

## 2C.9.3.3 Pn / APn / JPO — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode ( $\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}=0$ and $\left.P M n . P M n \_m=0\right)$.

Access: Pn, APn: These registers can be read or written in 16-bit units.
JP0: This register can be read or written in 8-bit units.
Address: $\quad \mathrm{Pn}:<$ PORTn_base $>+0000_{H}+\mathrm{n} \times 4(\mathrm{n}=0,8,9,10,11)$
APn: <PORTn_base> $+00 \mathrm{C} 8_{H}(\mathrm{n}=0)$
JPO: <JPORTO_base> + 0000 ${ }^{* 1}$
Value after reset: $\quad 0000 \mathrm{H}$

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (APO).

Table 2C. 28 Pn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | Pn_[15:0] | Sets the output level of the $\operatorname{Pn\_ m}$ pin $(m=0$ to 15). |
|  |  | 0: Outputs low level |
|  | 1: Outputs high level |  |

## NOTE

The control bits of the JTAG port register (JP0) are JP0_[7:0].

## 2C.9.3.4 PNOTn / APNOTn / JPNOTO — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16 -bit units. When read, $0000_{\mathrm{H}}$ is
returned.
JPNOTO: This register is a write-only register that can be written in 8 -bit units. When read, $00_{H}$ is returned.
Address: PNOTn: <PORTn_base> $+0700_{H}+n \times 4(n=0,8,9,10,11)$
APNOTn: <PORTn_base> + 07C8 ( $\mathrm{n}=0$ )
JPNOTO: <JPORTO_base> + 0070н * ${ }^{* 1}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), Table 2C.50, Control Registers (P11) and Table 2C.52, Control Registers (APO).

Table 2C. 29 PNOTn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PNOTn_[15:0] | Specifies if Pn.Pn_m is inverted. |
|  | $0:$ Pn.Pn_m is not inverted $\left(P n \_m \rightarrow P n \_m\right)$ |  |
|  | 1: Pn.Pn_m is inverted $\left(\overline{P n \_m} \rightarrow P n \_m\right)$ |  |

## NOTE

The control bits of the JTAG port NOT register are JPNOTO_[7:0].

## 2C.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.
The upper 16 bits of PSRn act as a mask which specifies whether or not the value $\operatorname{Pn} . \mathrm{Pn}_{\mathrm{L}} \mathrm{m}$ is set by the corresponding bit in the lower 16 bits of PSRn.

## NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

## 2C.9.4 Configuration of Electrical Characteristics

## 2C.9.4. $\quad$ PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

| Access: | PUn: This register can be read or written in 16-bit units. <br>  <br>  <br> JPUO: This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: $\quad$ | PUn: $<$ PORTn_base $>+4300_{H}+n \times 4(n=0,8,9,10,11)$ |
|  | JPUO: $<$ JPORTO_base $>+0430_{H}{ }^{* 1}$ |
| Value after reset: | $0000_{H}$ |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 31 PUn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PUn_[15:0] | Specifies whether an internal pull-up resistor is connected to the corresponding pin. |
|  |  | 0: No internal pull-up resistor connected |
|  | 1: An internal pull-up resistor connected |  |

## NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m =1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

## 2C.9.4.2 PDn / JPDO — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

$\begin{aligned}$$$
\text { Access: }
$$$& \text { PDn: This register can be read or written in 16-bit units. } \\ & \text { JPDO: This register can be read or written in 8-bit units. } \\ \text { Address: } & \text { PDn: <PORTn_base> }+4400_{H}+n \times 4(n=0,8,9,10,11) \\ & \text { JPDO: <JPORTO_base> }+0440_{H^{* 1}} \\ \text { Value after reset: } & 0000_{H}\end{aligned}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PDn_15 | PDn_14 | PDn_13 | PDn_12 | PDn_11 | PDn_10 | PDn_9 | PDn_8 | PDn_7 | PDn_6 | PDn_5 | PDn_4 | PDn_3 | PDn_2 | PDn_1 | PDn_0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 32 PDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PDn_[15:0] | Specifies whether to connect an internal pull-down resistor to the corresponding pin. |
|  |  | $0:$ No internal pull-down resistor connected |
|  | 1: An internal pull-down resistor connected |  |

## NOTES

1. If a pin is configured such that both an internal pull-up resistor ( $P$ Un.PUn_m =1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

## 2C.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see Section 5, Write-Protected Registers. Regarding the alternative functions for which the PDSC register needs to be set, see Section 2C.11.3.3, Output Buffer Control (PDSC).

| Access: <br> Address: |  |  | PDSCn, JPDSCO: These registers can be read or written in 32-bit units. <br> PDSCn: <PORTn_base> $+4600_{\mathrm{H}}+\mathrm{n} \times 4(\mathrm{n}=0,10,11)$ <br> JPDSCO: <JPORTO_base> + 0460 ${ }_{\mathrm{H}}{ }^{\star 1}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | $\begin{aligned} & \text { PDSC } \\ & \text { n_15 } \end{aligned}$ | $\begin{gathered} \text { PDSC } \\ \text { n_14 } \end{gathered}$ | $\begin{aligned} & \text { PDSC } \\ & \mathrm{n} \_13 \end{aligned}$ | $\begin{gathered} \text { PDSC } \\ \text { n_12 } \end{gathered}$ | $\begin{aligned} & \text { PDSC } \\ & \text { n_11 } \end{aligned}$ | $\begin{aligned} & \text { PDSC } \\ & \text { n_10 } \end{aligned}$ | $\begin{gathered} \text { PDSC } \\ \text { n_9 } \end{gathered}$ | $\begin{aligned} & \text { PDSC } \\ & \text { n_8 } \end{aligned}$ | $\begin{gathered} \text { PDSC } \\ \text { n_7 } \end{gathered}$ | $\begin{aligned} & \text { PDSC } \\ & \text { n_6 } \end{aligned}$ | $\begin{gathered} \text { PDSC } \\ \text { n_5 } \end{gathered}$ | $\begin{gathered} \text { PDSC } \\ \text { n_4 } \end{gathered}$ | $\begin{gathered} \text { PDSC } \\ \text { n_3 } \end{gathered}$ | $\begin{gathered} \text { PDSC } \\ \text { n_2 } \end{gathered}$ | $\begin{gathered} \text { PDSC } \\ \text { n_1 } \end{gathered}$ | $\begin{aligned} & \text { PDSC } \\ & \text { n_0 } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 33 PDSCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PDSCn_[15:0] | Specifies the port drive strength of the output buffer of the port pin. |
|  |  | 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) |
|  |  | 1: High drive strength (when the frequency output from the pin is 40 MHz or less). |
| NOTE |  |  |

The control bits of the JTAG port drive strength control register (JPDSC0) are JPDSC0_[31:0].

## 2C.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see Section 5, Write-Protected

## Registers.

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).
Note 2. The PODC8 register is as follows.
When the OPBT0.RESETOUTEN $=1$, the PODC8 register is $00000040_{\mathrm{H}}$. When the OPBTO.RESETOUTEN $=0$, the PODC8 register is $00000000_{\mathrm{H}}$.
Note 3. The PODC8_6 bit is as follows.
When the OPBTO.RESETOUTEN $=1$, the PODC8_6 bit is 1 . When the OPBTO.RESETOUTEN $=0$, the PODC8_6 bit is 0 .

Table 2C. 34 PODCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PODCn_[15:0] | Specifies the output buffer function. |
|  |  | 0: Push-pull |
|  | 1: Open-drain |  |

## NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

## 2C.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

| Access: | PISn: This register can be read or written in 16-bit units. |
| ---: | :--- |
|  | JPISO: This register can be read or written in 8-bit units. |
| Address: | PISn: <PORTn_base> $+4700_{H}+\mathrm{n} \times 4(\mathrm{n}=0,8,9,10,11)$ |
|  | JPISO: <JPORTO_base> $+0470_{\mathrm{H}}{ }^{* 1}$ |
| Value after reset: | FFFF $_{H}$ |

| Bit | $15 \quad 14$ |  | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { PIS } \\ & \text { n_15 } \end{aligned}$ | $\begin{gathered} \text { PIS } \\ \text { n_14 } \end{gathered}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_13 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_12 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_11 } \end{aligned}$ | $\begin{aligned} & \text { PIS } \\ & \text { n_10 } \end{aligned}$ | PISn_9 | PISn_8 | PISn_7 | PISn_6 | PISn_5 | PISn_4 | PISn_3 | PISn_2 | PISn_1 | PISn_0 |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JP0), Table 2C.42, Control Registers (P0), Table 2C.44, Control Registers (P8), Table 2C.46, Control Registers (P9), Table 2C.48, Control Registers (P10), and Table 2C.50, Control Registers (P11).

Table 2C. 35 PISn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PISn_[15:0] | Specifies the input buffer Characteristics: |
|  |  | 0: Type 1 (SHMT1) |
|  | 1: Type 2 (SHMT4) |  |

## NOTES

1. Details of the definition of type 1 and type 2 are given in Section 2C.11.3.2, Input Buffer Control (PISn/JPISO, JPISA0). For details, also see Section 47C, Electrical Characteristics of RH850/F1KM-S1 for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPISO) are JPISO_[7:0]

## 2C.9.4.6 JPISAO — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

| Access: | JPISAO: This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | JPISAO: <JPORTO_base> +04 AO $^{* 1}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

Note 1. The valid bit positions (value for the index $m$ ) vary depending on the number of pins for each device. See the following tables in Section 2C.10, Port (General I/O) Function Overview: Table 2C.40, Control Registers (JPO).

Table 2C. 36 JPISA0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4, 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| $3,2,0$ | JPISAO_[3, 2, 0] | Specifies the input buffer characteristics: |
|  |  | 0: Type 2 (SHMT4) |
|  | 1: Type 5 (TTL) |  |

Table 2C. 37 JTAG Port Input Selection Advanced Register Contents

| JPISA0 | JPIS0 | Function |
| :--- | :--- | :--- |
| 0 | 0 | Type 1 input buffer is selected (SHMT1) |
|  | 1 | Type 2 input buffer is selected (SHMT4) |
| 1 | $X$ | Type 5 input buffer is selected (TTL) |
| NOTE |  |  |

Details of the definition of type 2 and type 5 are given in Section 2C.11.3.2, Input Buffer Control (PISn/JPISO, JPISA0). For details, also see Section 47C, Electrical Characteristics of RH850/F1KM-S1 for input buffer characteristics.

## 2C.9.5 Port Register Protection

RH850/F1KM has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see Section 5, Write-Protected Registers.

## 2C.9.6 Flowchart Examples for Port Settings

Examples of the port settings are shown in the flowchart below.

## CAUTION

If the port is set to the PIPCn.PIPCn_m bit $=0$ and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0 . If an interrupt- related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

## 2C.9.6.1 Batch Setting

An example of specifying batch port group settings is shown in the flowchart below.

Note 1. There is no PISAn.PISAn_m bit in RH850/F1KM-S1.
Note 2. While $\mathrm{PMC}=0$, an interrupt may be triggered during the configuration of the port registers under the following conditions:
For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.
For INTP0-5 and INTP10-12 interrupt requests:
- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2C. 6 Example of Port Settings (When Specified in Batch)

## 2C.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

Figure 2C. 7 Example of Port Settings (in Port Mode)

## (1) With IP Control

Figure 2C. 8 Example of Port Settings (in Alternative Mode)

## (2) Without IP Control

Note 1. There is no PISAn.PISAn_m bit in RH850/F1KM-S1.
Note 2. While $\mathrm{PMC}=0$, an interrupt may be triggered during the configuration of the port registers under the following conditions:
For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.
For INTP0-5 and INTP10-12 interrupt requests:
- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2C. 9 Example of Port Settings (in Alternative Mode)

## 2C. 10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2C. 38 Port Function

| Port | Pin Name | Size | Direction | Power Domain | Special Alternative Function | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| JTAG Port 0 | JPO_0-5 | 6 bits | In/Out | AWO | JTAG, LPD | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Port 0 | P0_0-3 | 4 bits | In/Out | AWO |  | $\checkmark$ | - | - | - |
|  | PO_0-6 | 7 bits |  |  |  | - | $\checkmark$ | - | - |
|  | PO_0-12 | 13 bits |  |  |  | - | - | $\checkmark$ | - |
|  | P0_0-14 | 15 bits |  |  |  | - | - | - | $\checkmark$ |
| Port 8 | P8_0-1 | 2 bits | In/Out | AWO | ADCA0 (10-bit resolution) | $\checkmark$ | - | - | - |
|  | P8_0-6 | 7 bits |  |  |  | - | $\checkmark$ | $\checkmark$ | - |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

1．The behavior and performance are not guaranteed when alternative functions are not assigned to the register．
2．Use $A D C$ functions with their initial settings．For details，see Table 2C．44，Control Registers（P8）．
3．When the RESETOUT function is selected for the P8＿6 pin，the P8＿6 pin outputs a low－level as the RESETOUT signal while a reset is asserted and continues to output a low level after the reset is released．For details，see Section 2C．11．1．1，P8＿6：RESETOUT ．

## 2C.10.3.2 Control Registers

Table 2C. 44 Control Registers (P8)

| Register | Function | Register Size | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Position | RW* ${ }^{* 1}$ |  |  | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| P8 | Port register 8 | 16 | 1,0 | RW | $0^{0020}{ }_{\text {H }}$ | $0000{ }_{H}$ | $\checkmark$ | - | - | - |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned. When writing to unused bits, write the value after reset.

## CAUTION

P8_6 drives a low level after any kind of reset release, until it is later configured differently by register settings. For details, see Section 2C.11.1.1, P8_6: $\overline{\text { RESETOUT }}$.

CAUTIONS

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings. For details, see Table 2C.46, Control Registers (P9)

## 2C.10.4.2 Control Registers

Table 2C. 46 Control Registers (P9)

| Register | Function | $\begin{aligned} & \text { Register } \\ & \text { Size } \end{aligned}$ | Effective Bit |  | Offset Address | Value after Reset | Device |  |  |  |

| APMSR0 | Analog port mode set/reset register 0 | 32 | 23-16, 7-0 | RW | 08C8H | 0000 FFFFF | $\checkmark$ | - | - | - |
|  |  |  | 25-16, 9-0 |  |  |  | - | $\checkmark$ | - | - |
|  |  |  | 26-16, 10-0 |  |  |  | - | - | $\checkmark$ | - |
|  |  |  | 31-16, 15-0 |  |  |  | - | - | - | $\checkmark$ |
| APIBCO | Analog port input buffer control register 0 | 16 | 7-0 | RW | 40C8H | 0000 H | $\checkmark$ | - | - | - |
|  |  |  | 9-0 |  |  |  | - | $\checkmark$ | - | - |
|  |  |  | 10-0 |  |  |  | - | - | $\checkmark$ | - |
|  |  |  | 15-0 |  |  |  | - | - | - | $\checkmark$ |
| APBDC0 | Analog port bidirection control register 0 | 16 | 7-0 | RW | $41 \mathrm{C} 8_{\mathrm{H}}$ | $0^{0000}{ }_{H}$ | $\checkmark$ | - | - | - |
|  |  |  | 9-0 |  |  |  | - | $\checkmark$ | - | - |
|  |  |  | 10-0 |  |  |  | - | - | $\checkmark$ | - |
|  |  |  | 15-0 |  |  |  | - | - | - | $\checkmark$ |

Note 1. The unused bits are read-only (R). When read, the value after reset is returned. When writing to unused bits, write the value after reset.

## 2C.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

## 2C.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

## 2C.11.1.1 P8_6: RESETOUT

The P8_6 pin ( RESETOUT signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.
(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 0: Output mode
- PODC8.PODC8_6 = 1: Open-drain
(Case 2): OPBT0.RESETOUTEN $=0$
- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 1: Input mode
- PODC8.PODC8_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see Section 44.9.2, OPBTO — Option Byte 0, also see Section 9BC.1.3, Reset Output ( RESETOUT ).

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

Figure 2C. 10 P8_6 Pin ( $\overline{\text { RESETOUT }}$ Signal) Operation While a Reset is asserted and released: (Case 1) OPBTO.RESETOUTEN setting is 1

Note 1. When a reset except POC reset occurs with $\overline{\text { RESETOUT }}$ disable (OPBTO.RESETOUTEN $=0$ ), P8_6 pin ( $\overline{\text { RESETOUT }}$ signal) will be changed to Hi-z.

Figure 2C. 11 P8_6 Pin ( $\overline{\text { RESETOUT }}$ Signal) Operation While a Reset is asserted and released: (Case 2) OPBTO.RESETOUTEN setting is 0

## 2C.11.1.2 JPO_0 to JP0_5: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2C. 53 Debug Interface

| OPJTAG1 | OPJTAG0 | Mode | JP0_0 | JP0_1 | JP0_2 | JP0_3 | JP0_4 | JP0_5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | Nexus I/F | DCUTDI input | DCUTDO <br> output | DCUTCK <br> input | DCUTMS <br> input | $\overline{\text { DCUTRST }}$ <br> input | DCURDY <br> output |
| 0 | 1 | LPD (4 pins) | LPDI input | LPDO output | LPDCLK input | Port/ <br> alternative <br> function | Port/ <br> alternative <br> function | LPDCLK OUT <br> output |
| 1 | 0 | LPD (1 pin) | LPDIO <br> input/output | Port/ <br> alternative <br> function | Port/ <br> alternative <br> function | Port/ <br> alternative <br> function | Port/ <br> alternative <br> function | Port/ <br> alternative <br> function |

NOTE
For the OPJTAG[1:0] settings, see Section 44.9.2, OPBT0 - Option Byte 0.

## 2C.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See Flash Programmer's Manual for details.

## 2C.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.
The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see Section 6, Operating Mode.

## 2C.11.2 A/D Input Alternative I/O

The following ports are permanently connected to $A / D$ input functions. (However, an analog input to the $A / D$ is controlled by the $\mathrm{A} / \mathrm{D}$ module.)

Table 2C. 54 A/D Input Alternative Pins

| Port | A/D Input | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

## 2C.11.3 Special I/O Control

## 2C.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.
The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1. For details, see
Section 2C.9.2.3, PIPCn — Port IP Control Register.
Table 2C. 55 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

| Function | Alternative Functions Name | Port Name | Power Supply Area | Control | Reference Section |
| :---: | :---: | :---: | :---: | :---: | :---: |
| TAPA | TAPA0UP | P10_0 | ISO | U phase Hi-Z control | Section 36 |
|  | TAPAOUN | P10_1 | ISO |  |  |

## 2C.11.3.2 Input Buffer Control (PISn/JPIS0, JPISAO)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/ JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type $1 / 2$ or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in Table 2C.57, JTAG Port Input Buffer Characteristics Selection.

Table 2C. 56 Port Input Buffer Characteristics Selection

| Port Name | Input Buffer Selection |  | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Type 1 (PISn_m = 0) | Type 2 (PISn_m = 1) | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| P0_0 | SHMT1 | SHMT4 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| P0_1 | SHMT1 | SHMT4 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Table 2C. 57 JTAG Port Input Buffer Characteristics Selection

|  | Input Buffer Selection |  |  | Devices |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port <br> Name | Type 1 <br>  <br> JPISAO_m = 0) | Type 2 <br>  <br> JPISAO_m = 0) | Type 5 <br> (JPISAO_m = 1) | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| JPO_0 | SHMT1 | SHMT4 | TTL*1,*2,*3,*4 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JP0_1 | SHMT1 | SHMT4 | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JPO_2 | SHMT1 | SHMT4 | TTL*1,*2,*3 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JP0_3 | SHMT1 | SHMT4 | TTL*1,*2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JPO_4 | - | SHMT4 | -*1,*2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JP0_5 | SHMT1 | SHMT4 | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note 1. TTL is selected for Boundary scan mode without JPISAO register setting.
Note 2. TTL is selected for Nexus in normal operating mode without JPISAO register setting.
Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.
Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISAO register setting.

## NOTES

1. For the SHMT1, SHMT4, and TTL pin characteristics, see Section 47C, Electrical Characteristics of RH850/F1KM-S1.
2. For the input buffer after reset, Type 2 (SHMT4) is selected.

## 2C.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2C. 58 Output Buffer Characteristics Selection

| Port Name | Output Drive Strength Selection |  | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Slow Mode (PDSCn_m = 0) | Fast Mode (PDSCn_m = 1) | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| JP0_1 | 10 MHz | 40 MHz | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JP0_2 | 10 MHz | 40 MHz | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| JP0_3 | 10 MHz | 40 MHz | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

| P11_6 | 10 MHz | $40 \mathrm{MHz}^{* 2}$ | - | - | - | $\checkmark$ |
| P11_7 | 10 MHz | $40 \mathrm{MHz}^{* 2}$ | - | - | - | $\checkmark$ |

Note 1. Supports Cload: 100 pF (The load capacitance of CSIH0 is 100 pF .)
Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH3 are 50 pF .)
Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see Section 47C.5, AC Characteristics.

## 2C. 12 Noise Filter \& Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KM supports both analog and digital filters.
It also supports the function for edge and level detection after the signals have passed through a filter.
The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter \& edge/level detection control registers and control bits, and register addresses.
For details on the digital/analog filter function and noise filter \& edge/level detection control registers, see
Section 2C.13, Description of Port Noise Filter \& Edge/Level Detection.
NOTE
In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2C.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

## 2C.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

Filter control register FCLA0CTLm_<name> ( $\mathrm{m}=0$ to 7)
A dedicated FCLA0CTLm_<name> register is provided for each pin in a port that incorporates an analog filter.
Table 2C. 59 Input Pins that Incorporate Analog Filter Type A

| Module Name | Input Pin | FCLAOCTL Register Configuration |  | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Register | Address | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| FCLA0 | NMI | FCLA0CTLO_NMI | FFC3 4000 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP0 | FCLA0CTLO_INTPL | FFC3 4020 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP1 | FCLA0CTL1_INTPL | FFC3 4024 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP2 | FCLA0CTL2_INTPL | FFC3 4028 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP3 | FCLA0CTL3_INTPL | FFC3 402C ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP4 | FCLA0CTL4_INTPL | FFC3 4030 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP5 | FCLA0CTL5_INTPL | FFC3 4034 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP6 | FCLA0CTL6_INTPL | FFC3 4038 ${ }_{\text {H }}$ | - | - | $\checkmark$ | $\checkmark$ |
|  | INTP7 | FCLA0CTL7_INTPL | FFC3 403C ${ }_{\text {H }}$ | - | - | $\checkmark$ | $\checkmark$ |
|  | INTP8 | FCLA0CTLO_INTPH | FFC3 4040 ${ }_{\text {H }}$ | - | - | $\checkmark$ | $\checkmark$ |
|  | INTP10 | FCLA0CTL2_INTPH | FFC3 4048 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP11 | FCLA0CTL3_INTPH | FFC3 404C ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | INTP12 | FCLA0CTL4_INTPH | FFC3 4050 ${ }_{\text {H }}$ | - | - | $\checkmark$ | $\checkmark$ |
|  | INTP13 | FCLA0CTL5_INTPH | FFC3 4054 ${ }_{\text {H }}$ | - | - | - | $\checkmark$ |

## 2C.12.1.2 Input Pins that Incorporate Analog Filter Type B

The input pins of analog filter type B incorporate an analog filter. Edge/level detection is controlled by the registers for individual peripheral functions.

Table 2C. 60 Input Pins that Incorporate Analog Filter Type B

| Input Pin | Edge/Level Detection | Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| TAUJOIO | Edge detection*1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

| KROI5 | Low level detection | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| KROI6 | Low level detection | - | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| KROI7 | Low level detection | - | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note 1. For details on edge detection for TAUJ, see Section 33.3.3.4, TAUJnCMURm - TAUJn Channel Mode User Register.
Note 2. For details on edge detection for TAPA, see Section 36.3.2, TAPAnCTLO - TAPA Control Register 0.

## 2C.12.1.3 Input Pins that Incorporate Analog Filter Type C

The input pins of analog filter type C only incorporate an analog filter function.
Table 2C. 61 Input Pins that Incorporate Analog Filter Type C

|  | Input Pin |
| :--- | :--- |
|  | FLMD0 |
|  | FLMD1 |
|  | MODE0 |
|  | MODE1 |
|  | MODE2 |
|  | RESET |
|  | DCUTRST |

## 2C.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m=0 to 2 )

Each port with a digital filter has a special FCLA0CTLm_<name> register.

- Digital noise elimination control register DNFA<name $>$ CTL

Each DNFA $<$ name $>$ CTL control register controls digital filter processing for three input signals per group.

- Digital noise elimination enable register DNFA<name $>$ EN

The setting of the DNFA $<$ name $>$ ENL[2:0] bits in DNFA $<$ name $>$ EN enables or disables digital noise elimination for three input signals per group.
Table 2C. 62 Input Pins that Incorporate Digital Filter Type D

| Input Pin | Device |  |  |  | Digital Noise Elimination Control Register |  | Digital Noise Elimination Enable Register |  |  | Filter Control Register |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 2C.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name $>$ CTL

Each DNFA $<$ name $>$ CTL control register controls digital filter processing for up to 16 input signals per group.

- Digital noise elimination enable register DNFA<name $>$ EN

The setting of the DNFA $<$ name $>$ ENL[7:0] and DNFA $<$ name $>\mathrm{ENH}$ [7:0] bits in DNFA $<n a m e>$ EN enables or disables digital noise elimination for up to 16 input signals per group.

Table 2C. 63 Input Pins that Incorporate Digital Filter Type E

| Input Pin | Devises |  |  |  | Digital Noise Elimination Control Register |  | Digital Noise Elimination Enable Register |  |  | Edge Detection |

Note 1. For the setting for TAUD edge detection, see Section 32.3.3.4, TAUDnCMURm - TAUDn Channel Mode User Register.
Note 2. For the setting for TAUB edge detection, see Section 31.3.3.4, TAUBnCMURm — TAUBn Channel Mode User Register.
Note 3. For the setting for ENCA edge detection, see Section 35.3.3, ENCAnIOCO - ENCAn I/O Control Register 0.
Note 4. RSENT does not have the edge detection.

## 2C.12.2 Clock Supply for Port Filters

The following table shows the clock supply for each filter type in each port domain.
Table 2C. 64 Clock Supply for Port Filters

| Peripheral Function | Port Domain*1 | Filter Type | Filter Clock | Setting Register |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Source Clock Selection | Clock Selection |
| ADCA0 | Always-On area (AWO area) | Digital filter type D | DNFATCKI | CKSC_AADCAS_CTL | CKSC_AADCAD_CTL |
| TAUDO | Isolated area (ISO area) | Digital filter type E | DNFATCKI | CKSC_IPERI1S_CTL | - |
| TAUB0 | Isolated area (ISO area) | Digital filter type E | DNFATCKI | CKSC_IPERI2S_CTL | - |
| ENCAO | Isolated area (ISO area) | Digital filter type E | DNFATCKI | CKSC_IPERI1S_CTL | - |
| RSENTn | Isolated area (ISO area) | Digital filter type E | DNFATCKI | CKSC_IPERI2S_CTL | - |

Note 1. Power Domain

NOTE
For the Setting Register, see Section 12C.4.3, Clock Selector Control Register.

## 2C. 13 Description of Port Noise Filter \& Edge/Level Detection

> External signals pass through different types of filters according to the use of each external input signal.

NOTE
In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

## 2C.13.1 Overview

## 2C.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.

Used for external interrupt signals.

- Type B: An analog filter

Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.

- Type C: An analog filter only

Used for the external $\overline{\text { RESET }}$ input and mode signals.

## 2C.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection. Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function. Used for the timer input signals and encoder input signals.

## 2C.13.2 Analog Filters

## 2C.13.2.1 Analog Filter Characteristic

See Section 47C, Electrical Characteristics of RH850/F1KM-S1 for the input conditions for signals input to pins that incorporate an analog filter.

## 2C.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in Table 2C.59, Input Pins that Incorporate Analog Filter Type A.

## 2C.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.
The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

## (1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

Figure 2C. 12 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<name>.FCLA0INTLm_<name>.

- FCLA0INTLm_<name> bit = 0: Edge detection

Whether a rising or falling edge is detected can be specified by setting the
FCLA0CTLm_<name>.FCLA0INTRm_<name> and FCLA0CTLm_<name>.FCLA0INTFm_<name> bits.

- FCLA0INTLm_<name $>$ bit $=1$ : Level detection

The detection of a high level or low level can be specified by setting
FCLA0CTLm_<name>.FCLA0INTRm_<name $>$ bit.

The table below summarizes the detection conditions of the analog filter.
Table 2C. 65 Analog Filter Event Detection Conditions

| FCLAOINTLm_<name> | FCLAOINTFm_<name> | FCLAOINTRm_<name> | Edge Detection | Level Detection |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | No edge detected | Disabled |
|  | 0 | 1 | Rising edge |  |
|  | 1 | 0 | Falling edge |  |
|  | 1 | 1 | Rising and falling edges |  |
| 1 | X | 0 | Disabled | Low level |
|  | X |  |  | High level |

## Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

## (2) Analog filter type B

A block diagram of analog filter type B is shown below.

Figure 2C. 13 Block Diagram of Analog Filter Type B

## Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

## (3) Analog filter type C

A block diagram of analog filter type C is shown below.

Figure 2C. 14 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

## Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2C.13.3 Digital Filters

## 2C.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.
The input signal is sampled with the sampling frequency fs.
If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.
Both parameters can be specified:

- DNFA<name $>$ CTL.DNFA<name $>$ PRS[2:0] select the sampling frequency based on

$$
\mathrm{f}_{\mathrm{s}}=\mathrm{f}_{\mathrm{DNFATCKI}} / 2^{\text {DNFA<name>PRS[2:0] }}
$$

where $\mathrm{f}_{\text {DNFATCKI }}$ is the frequency of the DNFATCKI clock.

- DNFA<name $>$ CTL.DNFA<name $>$ NFSTS[1:0] determines the number of same level samples, "s", (2 to 5):

$$
\mathrm{s}=\mathrm{DNFA}<\text { name }>\text { NFSTS[1:0] }+2
$$

External signal pulses shorter than the following are suppressed at all times.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}
$$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$$
(s+1) \times 1 / \mathrm{f}_{\mathrm{s}}
$$

External signal pulses in the following range may be suppressed or judged as valid.

$$
\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}} \text { to }(\mathrm{s}+1) \times 1 / \mathrm{f}_{\mathrm{s}}
$$

The filter operation is illustrated in the figure below with DNFA $<n a m e>\operatorname{NFSTS}[1: 0]=01_{\mathrm{B}}$, i.e. $\mathrm{s}=3$ same level samples.

Figure 2C. 15 Digital Filter Function

## 2C.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.
The digital filter characteristics, specified by DNFA<name $>$ CTL.DNFA $<n a m e>$ PRS[2:0] and
DNFA<name $>$ NFSTS[1:0] apply to the signals.
However, the digital filter for each signal can be enabled or disabled separately by
DNFA $<$ name $>$ EN.DNFA $<n a m e>E N L m ~(m=0$ to 7 ) and DNFA<name $>$ EN.DNFA $<$ name $>$ ENHm ( $\mathrm{m}=0$ to 7 ).

## CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm (m=0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm $(m=0$ to 7$)=1)$ for the port pin to switch to the alternative function. $\mathrm{s}=\mathrm{DNFA}<n a m e>N F S T S[1: 0]+2$
$\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}+2 \times 1 / \mathrm{f}$ DNFATCKI
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm $(\mathrm{m}=0$ to 7$)=1$ and DNFA<name>EN.DNFA<name>ENHm $(\mathrm{m}=0$ to 7$)=$ 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.
$\mathrm{s} \times 1 / \mathrm{f}_{\mathrm{s}}+3 \times 1 / \mathrm{f}$ dNFATCKI

## 2C.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

## 2C.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<name $>$ CTL and digital noise elimination enable register DNFA<name $>$ EN are used to set all the filters in the same group (<name> $=$ peripheral function group).
The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name $>$ EN register enables/disables each filter by setting the corresponding bit in DNFA $<$ name $>$ EN.DNFA $<$ name $>$ ENLm ( $\mathrm{m}=0$ to 7 ) and DNFA $<$ name $>$ EN.DNFA $<$ name $>$ ENHm ( $\mathrm{m}=0$ to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm_ADCn registers are ordered in groups of 3 registers with the same index $n$. The register index $n$ is in 0 or 1 .

The assignment of the input signals to the control registers and their addresses are given in Table 2C.62, Input Pins that Incorporate Digital Filter Type D and Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.

## CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm $(\mathrm{m}=0$ to 7$)=1$ and DNFA<name>EN.DNFA<name>ENHm $(m=0$ to 7$)=1$. Otherwise an unintended filter output may be generated.

## (1) Digital filter type D

A block diagram of digital filter type D is shown below.

Figure 2C. 16 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.
Table 2C. 66 Output Options for Digital Filter Type D

| DNFA<name>EN.DNFA<name>ENLm | Signals Output to Peripheral Functions |
| :--- | :--- |
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## (2) Digital filter type E

A block diagram of digital filter type E is shown below.

Figure 2C. 17 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.
Table 2C. 67 Output Options for Digital Filter Type E

| DNFA<name>EN.DNFA<name>ENLm and |  |
| :--- | :--- |
| DNFA<name>EN.DNFA<name>ENHm | Signals Output to Peripheral Functions |
| 0 | Fixed to low level |
| 1 | Input signal passed through filter |

## 2C.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:
Table 2C. 68 List of Filter Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| FCLA0 | Filter control register $m$ | FCLA0CTLm_<name> | The addresses are shown in the tables in |
| DNF | Digital noise elimination control register | DNFA<name>CTL | Section 2C.12.1, Port Filter |
|  | Digital noise elimination enable register | DNFA<name>EN |  |
|  | Digital noise elimination enable H register | DNFA<name>ENH |  |
|  | Digital noise elimination enable L register | DNFA<name>ENL |  |

## 2C.13.4.1 FCLAOCTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.
Address: The allocation of input signals to FCLAOCTLm_<name> registers and the address of each register are shown in the tables in Section 2C.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | FCLAOINTLm <name> | FCLAOINTFm <name> | FCLAOINTRm <name> |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 2C. 69 FCLAOCTLm_<name> Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | FCLAOINTLm_ <name> | Detection Mode Selection <br> 0 : Edge detection <br> 1: Level detection <br> NOTE: This bit is only valid for analog filter type A. |
| 1 | FCLAOINTFm <name> | - In level detection mode (FCLAOINTLm_<name> = 1): This bit has no effect. <br> - In edge detection mode (FCLAOINTLm_<name> = 0): Falling edge detection control <br> 0 : Falling edge detection disabled <br> 1: Falling edge detection enabled <br> NOTE: This bit is only valid for analog filter type A and digital filter type D. However, digital filter type $D$ is placed in edge detection mode. |
| 0 | FCLAOINTRm_ <name> | - In level detection mode (FCLAOINTLm_<name> = 1): Detected level selection <br> 0 : Low level detection <br> 1: High level detection <br> - In edge detection mode (FCLAOINTLm_<name> = 0): Rising edge detection control <br> 0 : Rising edge detection disabled <br> 1: Rising edge detection enabled <br> NOTE: This bit is only valid for analog filter type A and digital filter type D. However, digital filter type $D$ is placed in edge detection mode. |

## CAUTION

Digital filter type D: Always set bit 2 to "0".

## 2C.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.
NOTE
This register is only valid for digital filter type D and digital filter type E .

Access: This register can be read or written in 8-bit units.
Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see Table 2C.62, Input Pins that Incorporate Digital Filter Type D and Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | DNFA<name>NFSTS[1:0] | - | - | DNFA<name>PRS[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W R/W | R | R | R/W | R/W | R/W |

Table 2C. 70 DNFA<name>CTL Register Contents

## 2C.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.
NOTE
This register is only valid for digital filter type D and digital filter type E .

Access: This register can be read or written in 16-bit units.
The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see Table 2C.62, Input Pins that Incorporate Digital Filter Type D and Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| :--- | :--- | :--- |
| 15 to 0 | DNFA<name> | Digital Noise Elimination Enable/Disable Control |
|  | ENH[7:0] | 0 : Fixed to low level |
|  | DNFA<name> | 1: Input signal passed through filter |
|  | ENL[7:0] |  |

## 2C.13.4.4 DNFA<name>ENH — Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.
NOTE
This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.
Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see Section 2C.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.

## 2C.13.4.5 DNFA<name>ENL — Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name $>$ EN register. NOTE

This register is only valid for digital filter type $D$ and digital filter type $E$.

Access: This register can be read or written in 8-bit or 1-bit units.
Address: For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see Table 2C.62, Input Pins that Incorporate Digital Filter Type D and Table 2C.63, Input Pins that Incorporate Digital Filter Type E in Section 2C.12.1, Port Filter Assignment.

Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

For details of the respective bit functions, see Section 2C.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register.

## Section 3A CPU System of RH850/F1KH-D8

## 3A. 1 Overview

## 3A.1.1 Block Configuration

Figure 3A.1, Block Configuration Diagram of the RH850/F1KH shows the block configuration diagram of RH850/F1KH.

Figure 3A. 1 Block Configuration Diagram of the RH850/F1KH

## CPU1 (PE1)

The RH850G3KH2.0 Core is used as the main CPU.

## CPU2 (PE2)

The RH850G3KH2.0 Core is used as an enhanced performance CPU.

## Local RAM

Each CPU has a high-speed accessible RAM

## Global RAM

The global RAM is a large-capacity RAM for data sharing among CPUs and with DMA.

## Retention RAM

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous global RAM area is assigned for the retention RAM, the retention RAM can also serve as a global RAM for sharing data with the DMA.

## Code flash

The code flash memory is included for program storage. It is connected with CPU1 and CPU2 via the flash interface.

## Data flash

The data flash memory can be rewritten by the CPUs. It has a greater write endurance than the code flash memory.

## P-Bus and H-Bus

The P-Bus connects the peripheral IPs. The P-Bus is divided into five peripheral groups, 1 to 5 .

## INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2. INTC1 is an interrupt controller exclusive to each CPU. INTC2 is a common interrupt controller that CPU1 and CPU2 share. The PE to which an interrupt request is bound can be specified by a register setting.

## DMA

The DMA transfer module (PDMA) is included.

## Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:
(1) PE guard (PEG)

The PE guard is a function to prevent unauthorized access to the resources (local RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.
(2) Internal Peripheral Guard (IPG)

The PE with system interconnects supports "Internal Peripheral Guard" (IPG) that protects the registers of peripherals against invalid accesses.
(3) Global RAM guard (GRG)

The global RAM guard is a function to prevent unauthorized access to the global RAM and retention RAM from
an external master. The global RAM is in the unprotected state (accessible from all bus master) after reset is released. For details, see Section 40A, Functional Safety of RH850/F1KH-D8.
(4) Peripheral guard (PBG / HBG)

The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.
For details, see Section 40A, Functional Safety of RH850/F1KH-D8.

## 3A. 2 CPU

## 3A.2.1 Core Functions

## 3A.2.1.1 Features

Table 3A.1, Features of the RH850G3KH2.0 Core lists features of the RH850G3KH2.0 core.
Table 3A. $1 \quad$ Features of the RH850G3KH2.0 Core

| Item | Feature |
| :---: | :---: |
| CPU | - Advanced 32-bit architecture for embedded control <br> - 32-bit internal data bus <br> - Thirty-two 32-bit general-purpose registers <br> - RISC-type instruction set <br> - Long-/short-format load/store instructions <br> - Three-operand instructions <br> - Instruction set based on C language <br> - CPU operating modes <br> - User mode and supervisor mode <br> - Address space: 4-Gbyte linear address space for both data and instructions |
| Coprocessor | - Floating-point operation coprocessor (FPU) <br> - Supports single precision (32 bits) <br> - Supports data types and exceptions conforming to IEEE754. <br> - Rounding mode: Neighborhood, 0 direction, $+\infty$ direction, and $-\infty$ direction <br> - Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754 |
| Exception/Interrupt | - 16 interrupt priority levels settable for each channel <br> - Vector selection method selectable according to performance request or memory usage <br> - Direct branching exception vectors <br> - Indirect branching exception vectors referring to the address table <br> - Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt |
| Memory management | - Memory protection function (MPU): 16 areas settable |
| Cache | - No cache memory is equipped. |

## 3A.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

## (1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).
Table 3A. 2 Program Registers

| Program Register | Name | Function | Description |
| :--- | :--- | :--- | :--- |
| General-purpose <br> registers | r0 | Zero register | Always retains "0" |
|  | r1 | Assembler reserved register | Used as working register for generating addresses |
|  | r2 | Register for address and data variables (used when the real-time OS used does not use this <br> register) |  |
|  | r3 | Stack pointer (SP) | Used for generating a stack frame when a function is called |
|  | r4 | Global pointer (GP) | Used for accessing a global variable in the data area |
|  | r5 | Text pointer (TP) | Used as a register that indicates the start of the text area (area <br> where program code is placed) |
|  | r6 to r29 | Register for address and data variables |  |
|  | r30 | Element pointer (EP) | Used as a base pointer for generating addresses when <br> accessing memory |
|  | Renk pointer (LP) | Used when the compiler calls a function |  |

NOTE
For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

## (a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30

These registers are implicitly used by instructions.
r 0 is a register that always retains " 0 ". It is used for operations that use 0 and addressing with base address being 0 . r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.
r30 is used as a base pointer when the SLD or SST instruction accesses memory.
2. r1, r4, r5, r31

These registers are implicitly used by the assembler and C compiler.
When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.
3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

## (b) PC - Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0 , and branching to an odd number address is disabled.

Table 3A. 3 PC Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | PC31 to PC1 | These bits indicate the address of the instruction being executed. | R/W | $* 1$ |
| 0 | PC0 | This bit is fixed to 0. Branching to an odd number address is disabled. | R/W | 0 |

[^1]
## (2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.
System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3A. $4 \quad$ Basic System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
| :---: | :---: | :---: | :---: |
| SRO, 0 | EIPC | Status save registers when acknowledging El level exception | SV |
| SR1, 0 | EIPSW | Status save registers when acknowledging El level exception | SV |
| SR2, 0 | FEPC | Status save registers when acknowledging FE level exception | SV |
| SR3, 0 | FEPSW | Status save registers when acknowledging FE level exception | SV |
| SR5, 0 | PSW | Program status word | *1 |
| SR6, 0 | FPSR | (Refer to FPU function registers.) | CU and SV |
| SR7, 0 | FPEPC | (Refer to FPU function registers.) | CU and SV |
| SR8, 0 | FPST | (Refer to FPU function registers.) | CU |
| SR9, 0 | FPCC | (Refer to FPU function registers.) | CU |
| SR10, 0 | FPCFG | (Refer to FPU function registers.) | CU |
| SR11, 0 | FPEC | (Refer to FPU function registers.) | CU and SV |
| SR13, 0 | EIIC | El level exception source register | SV |
| SR14, 0 | FEIC | FE level exception source register | SV |
| SR16, 0 | CTPC | CALLT execution status save register | UM |
| SR17, 0 | CTPSW | CALLT execution status save register | UM |
| SR20, 0 | CTBP | CALLT base pointer register | UM |
| SR28, 0 | EIWR | El level exception working register | SV |
| SR29, 0 | FEWR | FE level exception working register | SV |
| SR0, 1 | MCFG0 | Machine configuration register | SV |
| SR2, 1 | RBASE | Reset vector base address register | SV |
| SR3, 1 | EBASE | Exception handler vector address register | SV |
| SR4, 1 | INTBP | Base address register of the interrupt handler address table | SV |
| SR5, 1 | MCTL | CPU control | SV |
| SR6, 1 | PID | Processor ID register | SV |
| SR11, 1 | SCCFG | SYSCALL operation setting register | SV |
| SR12, 1 | SCBP | SYSCALL base pointer register | SV |
| SR0, 2 | HTCFG0 | Thread configuration register | SV |
| SR6, 2 | MEA | Memory error address register | SV |
| SR7, 2 | ASID | Address space ID register | SV |
| SR8, 2 | MEI | Memory error information register | SV |

Note 1. The access permission differs depending on the bit.

## (a) EIPC - Status Save Register when Acknowledging El Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see "Types of Exceptions" in Software Manual).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

Table 3A. 5 EIPC Register Contents

|  |  |  | Falue after |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |  |
| 31 to 1 | EIPC31 to | These bits indicate the PC saved when an El level exception is <br> acknowledged. | R/W | Undefined |  |
| 0 | EIPC1 | EIPC0 | This bit indicates the PC saved when an El level exception is acknowledged. <br> Always set this bit to 0. Even if it is set to 1, the value transferred to the PC <br> when the EIRET instruction is executed is 0. | R/W | Undefined |
|  |  |  |  |  |  |

## (b) EIPSW - Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.
Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3A. 6 EIPSW Register Contents

| Bit Position | Bit Name | Function | Ralue after |
| :--- | :--- | :--- | :--- | :--- |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | Reset |

## (c) FEPC - Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see "Types of Exceptions" in Software Manual).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

Table 3A. 7 FEPC Register Contents

|  |  |  | Value after |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |  |
| 31 to 1 | FEPC31 to | These bits indicate the PC saved when an FE level exception is <br> acknowledged. | R/W | Undefined |  |
| 0 | FEPC1 | FEPC0 | This bit indicates the PC saved when an FE level exception is acknowledged. <br> Always set this bit to 0. Even if it is set to 1, the value transferred to the PC <br> when the FERET instruction is executed is 0. | R/W | Undefined |
|  |  |  |  |  |  |

## (d) FEPSW - Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.
Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3A. 8 FEPSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 29 to 17 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit stores the PSW.CU field setting when an FE level exception is acknowledged. | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an FE level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 0 | z | This bit stores the PSW.Z bit setting when an FE level exception is acknowledged. | R/W | 0 |

## (e) PSW - Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

## CAUTIONS

1. When the LDSR instruction is used to change the contents of bit7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution. See "APPENDIX A. Hazard Resolution Procedure for System Registers" in Software Manual when the content of the other bits in this register is changed.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3A.9, Access Permission for PSW Register for the access permission for each bit.

Table 3A. 9 Access Permission for PSW Register

| Bit |  | Access Permission when Reading | Access Permission when Writing |
| :--- | :--- | :--- | :--- |
| 30 | UM | UM | SV $^{* 1}$ |
| 16 | CU | UM | SV $^{* 1}$ |
| 15 | EBV | UM | SV $^{* 1}$ |
| 7 | NP | UM | SV $^{* 1}$ |
| 6 | EP | UM | SV $^{* 1}$ |
| 5 | ID | UM | SV $^{* 1}$ |
| 4 | SAT | UM | UM |
| 3 | CY | UM | UM |
| 2 | OV | UM | UM |
| 1 | S | UM | UM |
| 0 | Z | UM | UM |

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1 . In this case, writing is ignored.

Table 3A. 10 PSW Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | R | 0 |
| 30 | UM | This bit indicates that the CPU is in user mode (in UM mode) <br> 1: User mode | R/W | 0 |  |
| 29 to 17 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  |
| 16 |  | This bit indicates the coprocessor use permissions. When the bit <br> corresponding to the coprocessor is 0, a coprocessor unusable exception <br> occurs if an instruction for the coprocessor is executed or a coprocessor <br> resource (system register) is accessed. | R/W | 0 | 0 |

CU bit 16: FPU

Table 3A. 10 PSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 15 | EBV | This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) RBASE - Reset Vector Base Address Register) and EBASE ((r) EBASE - Exception Handler Vector Address Register) in this section. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of El level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see Table 7A.1, List of Exception Sources. | R/W | 0 |

0 : The acknowledgement of FE level exception is enabled.
1: The acknowledgement of FE level exception is disabled.

| 6 | EP | This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1 . <br> 0 : An exception other than an interrupt is not being serviced. <br> 1: An exception other than an interrupt is being serviced. | R/W | 0 |
| :---: | :---: | :---: | :---: | :---: |
| 5 | ID | This bit disables the acknowledgement of El level exception. When an El level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of El level exception. As for the exceptions which the ID bit disables the acknowledgment, see Table 7A.1, List of Exception Sources. This bit is also used to disable El level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the El instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. <br> 0: El level exception is not being processed or the section is not a critical section (after execution of El instruction). <br> 1: El level exception is being processed or the section is a critical section (after execution of DI instruction). | R/W | 1 |
| 4 | SAT*1 | This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1 , but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. <br> 0 : Not saturated <br> 1: Saturated | R/W | 0 |
| 3 | CY | This bit indicates whether a carry or borrow has occurred in the operation result. | R/W | 0 |

0: Carry and borrow have not occurred.
1: Carry or borrow has occurred.

| 2 | $\mathrm{OV} * 1$ | This bit indicates whether or not an overflow has occurred during an operation. <br> 0 : Overflow has not occurred. <br> 1: Overflow has occurred. | R/W | 0 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $\mathrm{S}^{* 1}$ | This bit indicates whether or not the result of an operation is negative. <br> 0 : Result of operation is positive or 0 . <br> 1: Result of operation is negative. | R/W | 0 |
| 0 | Z | This bit indicates whether or not the result of an operation is 0 . <br> 0 : Result of operation is not 0 . <br> 1: Result of operation is 0 . | R/W | 0 |

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

| Operation Result Status | Flag Status |  |  | Operation Result after Saturation <br> Processing |
| :--- | :--- | :--- | :--- | :--- |
|  | SAT | OV | S |  |

## (f) EIIC - El Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3A. 11 EIIC Register Contents

|  |  |  | Value after <br> Bit Position | Bit Name | Function |
| :--- | :--- | :--- | :--- | :--- | :--- |

## (g) FEIC - FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3A. 12 FEIC Register Contents

|  |  |  | Value after <br> Bit Position | Bit Name | Function |
| :--- | :--- | :--- | :--- | :--- | :--- |$\quad$ R/W | Reset |
| :--- | :--- |

## (h) CTPC - Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

Table 3A. 13 CTPC Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | CTPC31 to <br> CTPC1 | These bits indicate the PC of the instruction after the CALLT instruction. | R/W | Undefined |  |
| 0 | CTPC0 | This bit indicates the PC of the instruction after the CALLT instruction. <br> Always set this bit to 0. Even if it is set to 1, the value transferred to the PC <br> when the CTRET instruction is executed is 0. | R/W | Undefined |  |
|  |  |  |  |  |  |

## (i) CTPSW - Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

Table 3A. 14 CTPSW Register Contents

| Bit Position | Bit Name | Function | (Reserved for future expansion. Be sure to set to 0.) | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | SAT | This bit stores the PSW.SAT bit setting when the CALLT instruction is <br> executed. | R/W | 0 |
| 4 | CY | This bit stores the PSW.CY bit setting when the CALLT instruction is <br> executed. | R/W | 0 |  |
| 3 | OV | This bit stores the PSW.OV bit setting when the CALLT instruction is <br> executed. | R/W | 0 |  |
| 2 | S | This bit stores the PSW.S bit setting when the CALLT instruction is executed. | R/W | 0 |  |
| 1 | This bit stores the PSW.Z bit setting when the CALLT instruction is executed. | R/W | 0 |  |  |

## (j) CTBP - CALLT Base Pointer Register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.
Be sure to set the CTBP register to a halfword address.

Table 3A. 15 CTBP Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | CTBP31 to <br> CTBP1 | These bits indicate the base pointer address of the CALLT instruction. <br> These bits indicate the start address of the table used by the CALLT <br> instruction. | R/W | Undefined |
|  | CTBP0 | This bit indicates the base pointer address of the CALLT instruction. <br> This bit indicates the start address of the table used by the CALLT instruction. <br> Always set this bit to 0. | $R$ | 0 |
| 0 |  |  |  |  |

## (k) ASID - Address Space ID Register

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

Table 3A. 16 ASID Register Contents

|  |  |  |  | Value after |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 10 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |
| 9 to 0 | ASID | These bits indicate the address space ID. | R/W | Undefined |

## (I) EIWR - El Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

Table 3A. 17 EIWR Register Contents

| Bit Position | Bit Name | Function | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | EIWR31 to | These bits constitute a working register that can be used for any purpose <br> during the servicing of an El level exception. This register can be used to <br> temporarily save the values of general-purpose registers, etc. | R/W | Undefined |
|  | EIWR0 | Reset |  |  |

## (m) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

Table 3A. 18 FEWR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | FEWR31 to | These bits constitute a working register that can be used for any purpose <br> during the servicing of an FE level exception. This register can be used to <br> temporarily save the values of general-purpose registers, etc. | R/W | Undefined |
|  | FEWR0 |  |  |  |

## (n) HTCFG0 - Thread Configuration Register

Table 3A. 19 HTCFG0 Register Contents

| Bit Position | Bit Name | Function | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 19 | - | (Reserved for future expansion. Be sure to set to 0.) | Reset |  |
| 18 to 16 | PEID | These bits indicate the processor element number. | R | 0 |
| 15 | - | (Reserved for future expansion. Be sure to set to 1.$)$ | R | $* 2$ |
| 14 to 0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 1 |

Note 1. The value after reset is $00018000_{\mathrm{H}}$ for CPU1 (PE1) and $00028000_{\mathrm{H}}$ for CPU2 (PE2).
Note 2. The value after reset is $001_{\mathrm{B}}$ for CPU1 (PE1) and $010_{\mathrm{B}}$ for CPU2 (PE2).
(o) MEA — Memory Error Address Register

Table 3A. 20 MEA Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 0 | MEA | These bits store the violation address when an MAE (misaligned) or MPU <br> occurs. | R/W | Undefined |

## (p) MEI — Memory Error Information Register

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

Table 3A. 21 MEI Register Contents

| Bit Position | Bit Name | Function | Ralue after |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 21 | - | (Reserved for future expansion. Be sure to set to 0.) | Reset |

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3A. 22 Instructions Causing Exceptions and Values of MEI Register

| Instruction | REG | DS | U | RW | ITYPE |
| :--- | :--- | :--- | :--- | :--- | :--- |
| SLD.B | dst | 0 (byte) | 0 (signed) | 0 (read) | $000000_{B}$ |
| SLD.BU | dst | 0 (byte) | 1 (unsigned) | 0 (read) | $00000_{B}$ |
| SLD.H | dst | 1 (halfword) | 0 (signed) | 0 (read) | $000000_{B}$ |
| SLD.HU | dst | 1 (halfword) | 1 (unsigned) | 0 (read) | $000000_{B}$ |
| SLD.W | dst | 2 (word) | 0 (signed) | 0 (read) | $00000_{B}$ |
| SST.B | src | 0 (byte) | 0 (signed) | 1 (write) | $000000_{B}$ |
| SST.H | src | 1 (halfword) | 0 (signed) | 1 (write) | $000000_{B}$ |

Table 3A. 22 Instructions Causing Exceptions and Values of MEI Register

| Instruction | REG | DS | U | RW | ITYPE |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SST.W | src | 2 (word) | 0 (signed) | 1 (write) | $00000{ }_{B}$ |
| LD.B (disp16) | dst | 0 (byte) | 0 (signed) | 0 (read) | 00001 B |
| LD.BU (disp16) | dst | 0 (byte) | 1 (unsigned) | 0 (read) | 00001 B |
| LD.H (disp16) | dst | 1 (halfword) | 0 (signed) | 0 (read) | 00001 B |
| LD.HU (disp16) | dst | 1 (halfword) | 1 (unsigned) | 0 (read) | 00001 B |
| LD.W (disp16) | dst | 2 (word) | 0 (signed) | 0 (read) | 00001 B |
| ST.B (disp16) | src | 0 (byte) | 0 (signed) | 1 (write) | 00001 B |
| ST.H (disp16) | src | 1 (halfword) | 0 (signed) | 1 (write) | 00001 B |
| ST.W (disp16) | src | 2 (word) | 0 (signed) | 1 (write) | $0_{00001}{ }_{\text {B }}$ |
| LD.B (disp23) | dst | 0 (byte) | 0 (signed) | 0 (read) | $00010_{B}$ |
| LD.BU (disp23) | dst | 0 (byte) | 1 (unsigned) | 0 (read) | $0^{00010}{ }_{\text {B }}$ |
| LD.H (disp23) | dst | 1 (halfword) | 0 (signed) | 0 (read) | 00010 ${ }_{\text {B }}$ |
| LD.HU (disp23) | dst | 1 (halfword) | 1 (unsigned) | 0 (read) | $0^{00010}{ }_{B}$ |
| LD.W (disp23) | dst | 2 (word) | 0 (signed) | 0 (read) | $0^{00010}{ }_{\text {B }}$ |
| ST.B (disp23) | src | 0 (byte) | 0 (signed) | 1 (write) | 00010 ${ }_{\text {B }}$ |
| ST.H (disp23) | src | 1 (halfword) | 0 (signed) | 1 (write) | $0^{00010}{ }_{B}$ |
| ST.W (disp23) | src | 2 (word) | 0 (signed) | 1 (write) | $0^{00010}{ }_{\text {B }}$ |
| LD.DW (disp23) | dst | 3 (double-word) | 0 (signed) | 0 (read) | 00010 ${ }_{\text {B }}$ |
| ST.DW (disp23) | src | 3 (double-word) | 0 (signed) | 1 (write) | $00010_{B}$ |
| LDL.W | dst | 2 (word) | 0 (signed) | 0 (read) | 00111 ${ }_{\text {B }}$ |
| STC.W | src | 2 (word) | 0 (signed) | 1 (write) | $00111_{\text {B }}$ |
| CAXI | dst | 2 (word) | 0 (signed) | 0 (read)/1 (write) | $01000{ }_{B}$ |
| SET1 | - | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | $01001^{\text {B }}$ |
| CLR1 | - | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | 01001 B |
| NOT1 | - | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | $01001_{B}$ |
| TST1 | - | 0 (byte) | 0 (signed) | 0 (read) | 01001 ${ }_{\text {B }}$ |
| PREPARE | - | 2 (word) | 0 (signed) | 1 (write) | $0^{01100}{ }_{B}$ |
| DISPOSE | - | 2 (word) | 0 (signed) | 0 (read) | $0^{01100}{ }_{B}$ |
| PUSHSP | - | 2 (word) | 0 (signed) | 1 (write) | $01101_{B}$ |
| POPSP | - | 2 (word) | 0 (signed) | 0 (read) | 01101 ${ }_{\text {B }}$ |
| SWITCH | - | 1 (halfword) | 0 (signed) | 0 (read) | $10000_{B}$ |
| CALLT | - | 1 (halfword) | 1 (unsigned) | 0 (read) | $10001^{\text {B }}$ |
| SYSCALL | - | 2 (word) | 0 (signed) | 0 (read) | $10010_{\text {B }}$ |
| CACHE | - | - | - | - | - |
| Interrupt (table reference)*1 | - | 2 (word) | 0 (signed) | 0 (read) | $10101^{\text {B }}$ |

Note 1. When reading the interrupt vector by using the table reference method.

NOTE
dst: destination register number, src: source register number

## (q) RBASE - Reset Vector Base Address Register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0 , this vector address is also used as the exception vector address.

Table 3A. 23 RBASE Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | RBASE31 to RBASE9 | These bits indicate the reset vector when there is a reset. When PSW.EBV = 0 , this address is also used as the exception vector. <br> For RBASE8 to RBASE0, 0 is used implicitly. | R | CPU1: <br> 00000000 <br> 00000000 <br> 0000000 B <br> CPU2: <br> 00000000 <br> 10000000 <br> $0000000_{B}{ }^{* 1}$ |
| 8 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See Section 7A.10.1, Direct Vector Method. This bit is valid when PSW.EBV $=0$. | R | 0 |

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

## (r) EBASE - Exception Handler Vector Address Register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

Table 3A. 24 EBASE Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 9 | EBASE31 to <br> EBASE9 | The exception handler routine address is changed to the address resulting <br> from adding the offset address of each exception to the base address <br> specified for this register. <br> For EBASE8 to EBASE0, 0 is used implicitly. | R/W | Undefined |
| 8 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W |  |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt servicing <br> is reduced. See Section 7A.10.1, Direct Vector Method. | R/W | Undefined |

## (s) INTBP - Base Address Register of the Interrupt Handler Address Table

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

Table 3A. 25 INTBP Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 9 | INTBP31 to | These bits indicate the base pointer address for an interrupt when the table <br> reference method is used. <br> INTBP9 | The value indicated by these bits is the first address in the table used to <br> determine the exception handler when the interrupt specified by the table <br> reference method (EIINT0 to ElINT511) is acknowledged. <br> For INTBP8 to INTBP0, 0 is used implicitly. | Undefined |
| 8 to 0 | - | (Reserved for future expansion. Be sure to set to 0. .) | R/W |  |

## (t) PID - Processor ID Register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

Table 3A. 26 PID Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | PID | Architecture Identifier | R | $05_{\text {H }}$ |
|  |  | This identifier indicates the architecture of the processor. |  |  |
| 23 to 8 |  | Function Identifier | R | $0^{0003}{ }_{H}$ |
|  |  | This identifier indicates the functions of the processor. <br> These bits indicate whether or not functions defined per bit are implemented <br> (1: implemented, 0: not implemented). <br> Bits 23 to 11: Reserved <br> Bit 10: Double-precision floating-point operation function <br> Bit 9: Single-precision floating-point operation function <br> Bit 8: Memory protection function (MPU) |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
| 7 to 0 |  | Version Identifier | R | $\mathrm{A8}_{\mathrm{H}}$ |
|  |  | This identifier indicates the version of the processor. |  |  |

## (u) SCCFG - SYSCALL Operation Setting Register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Table 3A. 27 SCCFG Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0. ) | R/W | R |

## (v) SCBP - SYSCALL Base Pointer Register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.
Be sure to set a word address to the SCBP register.

Table 3A. 28 SCBP Register Contents

| Bit Position | Bit Name | Function | Value after |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | SCBP31 to <br> SCBP2 | These bits indicate the base pointer address of the SYSCALL instruction. <br> These bits indicate the start address of the table used by the SYSCALL <br> instruction. | R/W | Undefined |  |
| 1,0 | SCBP1, <br> SCBP0 | These bits indicate the base pointer address of the SYSCALL instruction. <br> These bits indicate the start address of the table used by the SYSCALL <br> instruction. <br> Always set these bits to 0. | R | 0 |  |

## (w) MCFGO - Machine Configuration Register

This register indicates the CPU configuration.

Table 3A. 29 MCFG0 Register Contents

|  |  |  |  | Value after <br> Bit Position |
| :--- | :--- | :--- | :--- | :--- |
| Bit Name | Function | Reset |  |  |
| 31 to 18 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 17,16 | SPID | These bits indicate the system protection number. | $\mathrm{R} / \mathrm{W}$ | $*{ }^{* 2}$ |
| 15 to 3 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 2 | - | (Reserved for future expansion. Be sure to set to 1.$)$ | R | 1 |
| 1,0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |

Note 1. The value after reset is $00010004_{H}$ for CPU1 (PE1) and $00020004_{H}$ for CPU2 (PE2).
Note 2. The value after reset is $01_{B}$ for CPU1 (PE1) and $10_{B}$ for CPU2 (PE2).

## (x) MCTL - Machine Control Register

This register is used to control the CPU.

Table 3A. 30 MCTL Register Contents

| Bit Position | Bit Name | Function | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 | - | (Reserved for future expansion. Be sure to set to 1.) | R/W | Reset |

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.
Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

## (3) Interrupt Function Registers

Table 3A. 31 Interrupt Function System Registers

| Register No. <br> (regID, selID) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR7, 1 | FPIPR | FPI exception interrupt priority setting register | SV |
| SR10, 2 | ISPR | Priority of interrupt being serviced register | SV |
| SR11, 2 | PMR | Interrupt priority masking register | SV |
| SR12, 2 | ICSR | Interrupt control status register | SV |
| SR13, 2 | INTCFG | Interrupt function setting register | SV |

## (a) FPIPR - FPI Exception Interrupt Priority Setting Register

This register is used to set the interrupt priority of FPI exception.

Table 3A. 32 FPIPR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | FPIPR | These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16. <br> Specifying 17 or greater is prohibited. <br> FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized. | R/W | 0 |

NOTE: A set value of more than 16 is treated as 16.

## (b) ISPR — Priority of Interrupt being Serviced Register

This register retains the priority of the EIINTn interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

Table 3A. 33 ISPR Register Contents

|  |  |  |  | Value after <br> Bit Position |
| :--- | :--- | :--- | :--- | :--- |
| Bit Name | Function | (Reserved for future expansion. Be sure to set to 0.) | R/W | Reset |
| 15 to 16 | - | ISP15 to ISPO | These bits indicate the acknowledgment status of an EIINTn interrupt with a <br> priority that corresponds to the relevant bit position. | $\mathrm{R}^{\star 3}$ |

0 : An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged.
1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core.

The bit positions correspond to the following priority levels.

| Bit | Priority |
| :--- | :--- |
| 0 | Priority 0 (highest) |
| 1 | Priority 1 $\quad:$ |
| 14 | Priority 14 |
| 15 | Priority 15 (lowest) |

> When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1 . If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISPO bits that are set to 1 ( 0 is the highest priority) is cleared to $0 .{ }^{* 1}$
> While a bit in this register is set to 1 , same or lower priority interrupts (EIINTn) and FPI exceptions*2 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.
> When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0 .

Note 2. Since FPI exceptions have the same level of priority as EIINTn interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.
Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

## (c) PMR — Interrupt Priority Masking Register

This register is used to mask the specified interrupt priority.

Table 3A. 34 PMR Register Contents

| Bit Position | Bit Name | Function |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 16 | - | (Reserved for future expansion. Be sure to set to 0.) |  | R | 0 |
| 15 to 0 | PM15 to PM0 | These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. <br> 0 : Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled. <br> 1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled. |  | R/W | 0 |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  |  |  |  |  |
|  |  | The bit positions correspond to the following priority levels: |  |  |  |
|  |  | Bit | Priority |  |  |
|  |  | 0 | Priority 0 (highest) |  |  |
|  |  | 1 | Priority 1 |  |  |
|  |  |  | : |  |  |
|  |  | 14 | Priority 14 |  |  |
|  |  | 15 | Priority 15 and priority 16 (lowest) |  |  |

While a bit in this register is set to 1, interrupts (EIINTn) and FPI exceptions*¹ with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*².

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.
Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00 ${ }_{H}$ can be set, but $\mathrm{FOFO} 0_{H}$ or $00 F F_{H}$ cannot.

## (d) ICSR - Interrupt Control Status Register

This register indicates the interrupt control status in the CPU.

Table 3A. 35 ICSR Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | R |
| 1 | PMFP | This bit indicates that an FPI exception with the priority level masked by the <br> PMR register exists. | R | 0 |
| 0 | PMEI | This bit indicates that an interrupt (EIINTn) with the priority level masked by <br> the PMR register exists. | R | 0 |

## (e) INTCFG - Interrupt Function Setting Register

This register is used to specify settings related to the CPU's internal interrupt function.

Table 3A. 36 INTCFG Register Contents

| Bit Position | Bit Name | Function | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | Reset |
| 0 | ISPC | This bit specifies how the ISPR register is updated. | R | 0 |

0 : The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored.
1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed.

If this bit is cleared to 0 , the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored.
If this bit is set to 1 , the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program.
In normal cases, the ISPC bit should be cleared to 0 . When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register.

## (4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1KH supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation

Table 3A. 37 FPU System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR6, 0 | FPSR | Floating-point operation setting/status register | CU and SV |
| SR7, 0 | FPEPC | Floating-point exception program counter register | CU and SV |
| SR8, 0 | FPST | Floating-point operation status register | CU |
| SR9, 0 | FPCC | Floating-point operation comparison result register | CU |
| SR10, 0 | FPCFG | Floating-point operation configuration register | CU |
| SR11,0 | FPEC | Floating-point exception control register | CU and SV |

## (a) FPSR — Floating-point Operation Setting/Status Register

This register indicates the execution status of floating-point operations and any exceptions that occur.

Note 1. Cause bits (XC)
Note 2. Enable bits(XE)
Note 3. Preservation bits (XP)
Table 3A. 38 FPSR Register Contents

| Bit Position | Bit Name | Function | These are the CC (condition) bits. They store the results of floating-point <br> comparison instructions. The CC7 to CCO bits are not affected by any <br> instructions except the comparison instruction and LDSR instruction. <br> 0: Comparison result is false <br> 1: Comparison result is true | R/W | Reset |
| :--- | :--- | :--- | :--- | :--- | :--- |

| RM Bits |  |  |  |
| :--- | :--- | :--- | :--- |
| 19 | 18 | Mnemonic | Description |
| 0 | 0 | RN | Rounds the result to the nearest representable value. If the value <br> is exactly in-between the two nearest representable values, the <br> result is rounded toward the value whose least significant bit is 0. |
| 0 | 1 | RZ | Rounds the result toward 0. The result is the nearest to the value <br> that does not exceed the absolute value of the result with infinite <br> accuracy. |
| 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value <br> greater than the accurate result with infinite accuracy. |
| 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value <br> less than the accurate result with infinite accuracy. |

| 17 | FS | This bit enables values that cannot be normalized (subnormal numbers) to be <br> flushed. If the FS bit is set, input operands and operation results that are <br> subnormal numbers are flushed without causing an unimplemented operation <br> exception (E). An input operand that is a subnormal number is flushed to 0 <br> with the same sign. |
| :--- | :--- | :--- |
| Operation results that are subnormal numbers either become 0 or the |  |  |
| minimum normalized number, depending on the rounding mode. |  |  |

Note 1. If the rounding mode is RN and the FPSR.FN bit is set to 1 , flushing will occur in the direction of higher accuracy.

| 16 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | $R$ | 0 |
| :--- | :--- | :--- | :--- | :--- |
| 15 to 10 | XC (E, V, Z, O, | These are the cause bits. | R/W | Undefined |
|  | $\mathrm{U}, \mathrm{I})$ |  |  |  |

Table 3A. 38 FPSR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 9 to 5 | $\begin{aligned} & \text { XE } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the enable bits. | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the preservation bits. | R/W | Undefined |

## (b) FPEPC - Floating-point Exception Program Counter Register

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

Table 3A. 39 FPEPC Register Contents

| Bit Position | Bit Name | Function | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | FPEPC31 to <br> FPEPC1 | These bits store the program counter (PC) of the floating-point instruction that <br> caused the exception when a floating-point operation exception that is <br> enabled by an enable bit occurs. | R/W | Undefined |
| 0 | FPEPC0 | This bit stores the program counter (PC) of the floating-point instruction that <br> caused the exception when a floating-point operation exception that is <br> enabled by an enable bit occurs. <br> Always set this bit to 0. | R | 0 |

## (c) FPST — Floating-point Operation Status Register

This register reflects the contents of the FPSR register bits related to the operation status.

Table 3A. 40 FPST Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 14 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 13 to 8 | $\begin{aligned} & \text { XC (E, V, Z, O, } \\ & \text { U, I) } \end{aligned}$ | These are cause bits. Values written to these bits are reflected in FPSR.XC bits. | R/W | Undefined |
| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | IF | This bit accumulates and indicates information about the flushing of input operands. | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are preservation bits. Values written to these bits are reflected in FPSR.XP bits. | R/W | Undefined |

## (d) FPCC — Floating-point Operation Comparison Result Register

This register reflects the contents of the FPSR.CC[7:0] bits.

Table 3A. 41 FPCC Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 to 0 | CC[7:0] | These are CC (condition) bits. They store the result of a floating-point comparison instruction. The $C C[7: 0]$ bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. <br> 0 : Comparison result is false <br> 1: Comparison result is true | R/W | Undefined |

## (e) FPCFG - Floating-point Operation Configuration Register

This register reflects the contents of the FPSR register bits related to the operation settings.

Table 3A. 42 FPCFG Register Contents

| Bit Position | Bit Name | Function |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 10 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 9, 8 | RM | These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. <br> Values written to these bits are reflected in RM bits of FPSR. |  |  |  | R/W | 0 |
|  |  | RM Bits |  |  |  |  |  |
|  |  | 9 | 8 | Mnemonic | Description |  |  |
|  |  | 0 | 0 | RN | Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0 . |  |  |
|  |  | 0 | 1 | RZ | Rounds the result toward 0 . The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy. |  |  |
|  |  | 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value greater than the accurate result with infinite accuracy. |  |  |
|  |  | 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value less than the accurate result with infinite accuracy. |  |  |
| 7 to 5 | - | (Reserved for future expansion. Be sure to set to 0 .) |  |  |  | R | 0 |
| 4 to 0 | $\begin{aligned} & \text { XE } \\ & (V, Z, O, \cup, I) \end{aligned}$ | These are the enable bits. |  |  |  | R/W | 0 |

## (f) FPEC - Floating-point Exception Control Register

This register controls the floating-point operation exception.

Table 3A. 43 FPEC Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | FPIVD*1 | This bit indicates the status of reporting the FPI exception. <br> If this bit is set to 1 , the FPI exception is reported to the CPU but is not acknowledged. It is automatically cleared to 0 when the CPU acknowledges the FPI exception. <br> While this bit is set to 1 , all the floating-point instructions are invalidated. Report of the FPI exception can be canceled by clearing (0) this bit by the LDSR instruction while it is set to 1 . When report of the FPI exception is canceled, the CPU does not acknowledge the FPI exception. <br> 0 : FPI exception is not reported. <br> 1: FPI exception is reported. | R/W | 0 |

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1 .

## (5) MPU Function Registers

Table 3A. 44 MPU Function System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
| :---: | :---: | :---: | :---: |
| SR0, 5 | MPM | Memory protection operation mode setting | SV |
| SR1, 5 | MPRC | MPU region control | SV |
| SR4, 5 | MPBRGN | MPU base region number | SV |
| SR5, 5 | MPTRGN | MPU end region number | SV |
| SR8, 5 | MCA | Memory protection setting check address | SV |
| SR9, 5 | MCS | Memory protection setting check size | SV |
| SR10, 5 | MCC | Memory protection setting check command | SV |
| SR11, 5 | MCR | Memory protection setting check result | SV |
| SR0, 6 | MPLA0 | Protection area lower limit address | SV |
| SR1, 6 | MPUAO | Protection area upper limit address | SV |
| SR2, 6 | MPAT0 | Protection area attribute | SV |
| SR4, 6 | MPLA1 | Protection area lower limit address | SV |
| SR5, 6 | MPUA1 | Protection area upper limit address | SV |
| SR6, 6 | MPAT1 | Protection area attribute | SV |
| SR8, 6 | MPLA2 | Protection area lower limit address | SV |
| SR9, 6 | MPUA2 | Protection area upper limit address | SV |
| SR10, 6 | MPAT2 | Protection area attribute | SV |
| SR12, 6 | MPLA3 | Protection area lower limit address | SV |
| SR13, 6 | MPUA3 | Protection area upper limit address | SV |
| SR14, 6 | MPAT3 | Protection area attribute | SV |
| SR16, 6 | MPLA4 | Protection area lower limit address | SV |
| SR17, 6 | MPUA4 | Protection area upper limit address | SV |
| SR18, 6 | MPAT4 | Protection area attribute | SV |
| SR20, 6 | MPLA5 | Protection area lower limit address | SV |
| SR21, 6 | MPUA5 | Protection area upper limit address | SV |
| SR22, 6 | MPAT5 | Protection area attribute | SV |
| SR24, 6 | MPLA6 | Protection area lower limit address | SV |
| SR25, 6 | MPUA6 | Protection area upper limit address | SV |
| SR26, 6 | MPAT6 | Protection area attribute | SV |
| SR28, 6 | MPLA7 | Protection area lower limit address | SV |
| SR29, 6 | MPUA7 | Protection area upper limit address | SV |
| SR30, 6 | MPAT7 | Protection area attribute | SV |
| SR0, 7 | MPLA8 | Protection area lower limit address | SV |
| SR1, 7 | MPUA8 | Protection area upper limit address | SV |
| SR2, 7 | MPAT8 | Protection area attribute | SV |
| SR4, 7 | MPLA9 | Protection area lower limit address | SV |
| SR5, 7 | MPUA9 | Protection area upper limit address | SV |
| SR6, 7 | MPAT9 | Protection area attribute | SV |
| SR8, 7 | MPLA10 | Protection area lower limit address | SV |
| SR9, 7 | MPUA10 | Protection area upper limit address | SV |
| SR10, 7 | MPAT10 | Protection area attribute | SV |
| SR12, 7 | MPLA11 | Protection area lower limit address | SV |
| SR13, 7 | MPUA11 | Protection area upper limit address | SV |

Table 3A. 44 MPU Function System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
| :---: | :---: | :---: | :---: |
| SR14, 7 | MPAT11 | Protection area attribute | SV |
| SR16, 7 | MPLA12 | Protection area lower limit address | SV |
| SR17, 7 | MPUA12 | Protection area upper limit address | SV |
| SR18, 7 | MPAT12 | Protection area attribute | SV |
| SR20, 7 | MPLA13 | Protection area lower limit address | SV |
| SR21, 7 | MPUA13 | Protection area upper limit address | SV |
| SR22, 7 | MPAT13 | Protection area attribute | SV |
| SR24, 7 | MPLA14 | Protection area lower limit address | SV |
| SR25, 7 | MPUA14 | Protection area upper limit address | SV |
| SR26, 7 | MPAT14 | Protection area attribute | SV |
| SR28, 7 | MPLA15 | Protection area lower limit address | SV |
| SR29, 7 | MPUA15 | Protection area upper limit address | SV |
| SR30, 7 | MPAT15 | Protection area attribute | SV |

## (a) MPM — Memory Protection Operation Mode Register

The memory protection mode register is used to define the basic operating state of the memory protection function.

Table 3A. 45 MPM Register Contents

| Bit Position | Bit Name | Function | Ralue after |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | Reset |

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.
Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.
(b) MPRC - MPU Region Control Register

Table 3A. 46 MPRC Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| $\mathbf{3 1}$ to 16 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | $R$ | 0 |
| 15 to 0 | E15 to E0 | These are the enable bits for each protection area. Bit En is a copy of bit <br> MPATn.E (where $\mathrm{n}=15$ to 0$).$ | R/W | 0 |

## (c) MPBRGN - MPU Base Region Register

This register indicates the minimum usable MPU area number.

Table 3A. 47 MPBRGN Register Contents

|  |  |  |  | Value after <br> Bit Position |
| :--- | :--- | :--- | :--- | :--- |
| Bit Name | Function | R/W | Reset |  |
| (Reserved for future expansion. Be sure to set to 0. ) | R | 0 |  |  |
| 4 to 0 | - | MPBRGN | These bits indicate the smallest number of an MPU area. | R |

## (d) MPTRGN - MPU End Region Register

This register indicates the maximum usable MPU area number +1 .

Table 3A. 48 MPTRGN Register Contents

| Bit Position | Bit Name | Function | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | MPTRGN | These bits indicate the largest number of an MPU area +1. <br> These bits indicate the maximum number of MPU areas incorporated into the <br> hardware. | R | $10000_{B}$ |

## (e) MCA - Memory Protection Setting Check Address Register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

Table 3A. 49 MCA Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 0 | MCA31 to | These bits are used to specify the start address of the memory area that is <br> subject to a memory protection setting check in bytes. | R/W | Undefined |
|  | MCA0 |  |  |  |

## (f) MCS - Memory Protection Setting Check Size Register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

Table 3A. 50 MCS Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | MCS31 to | These bits are used to specify the size of the memory area that is subject to a <br> memory protection setting check and the size of the target area in bytes. <br> Because the specified size is assumed to represent an unsigned integer, it is <br> not possible to check an area in the direction in which the address value <br> decreases relative to the MCA register value. | Undefined |  |
|  |  | Do not specify $00000000_{\mathrm{H}}$ for the MCS register. |  |  |
|  |  |  |  |  |

## (g) MCC - Memory Protection Setting Check Command Register

This register is used to specify the base address of the area where memory protection settings are checked.

Table 3A. 51 MCC Register Contents

| Bit Position | Bit Name | Function | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | MCC31 to | When any value is written to the MCC register, a memory protection setting <br> check starts. By setting up the MCA/MCS register and then writing to the MCC <br> register, results are stored in MCR. | R/W | Reset |

## (h) MCR — Memory Protection Setting Check Result Register

This register is used to store the results of a memory protection setting check.
Be sure to clear bits 31 to 9,7 and 6 .

Table 3A. 52 MCR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 8 | OV | If the specified area includes $00000000_{H}$ or 7 FFF FFFF $_{H}, 1$ is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | SXE | If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 4 | SWE | If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 3 | SRE | If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 2 | UXE | If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 1 | UWE | If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 0 | URE | If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |

## (i) MPLAn - Protection Area Lower Limit Address Register

These registers indicate the lower limit address of area n (where $\mathrm{n}=0$ to 15 ).

Table 3A. 53 MPLAn Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 2 | MPLA31 to | These bits indicate the lower limit address of area $n$. | R/W | Undefined |
|  | MPLA2 | For MPLA1 and MPLA0, 0 is used implicitly. |  |  |
| 1,0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |

## (j) MPUAn - Protection Area Upper Limit Address Register

These registers indicate the upper limit address of area $n$ (where $n=0$ to 15 ).

Table 3A. 54 MPUAn Register Contents

|  |  |  | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 2 | MPUA31 to | These bits indicate the upper limit address of area n. | R/W | Undefined |
|  | MPUA2 | For MPUAn.MPUA1 and MPUA0, 1 is used implicitly. |  |  |
| 1,0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |

## (k) MPATn - Protection Area Attribute Register

These registers indicate the attributes of area $n$ (where $n=0$ to 15 ).

Table 3A. 55 MPATn Register Contents

| Bit Position | Bit Name | Function | Ralue after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 26 | - | (Reserved for future expansion. Be sure to set to 0. ) | Reset |

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

## (6) Cache Operation Function Registers

The RH850/F1KH does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3A. 56 Cache Operation Function Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
| :---: | :---: | :---: | :---: |
| SR12, 4 | BWERRL | Not implemented. A value of 0 is returned when read and writing is ignored. | SV |
| SR13, 4 | BWERRH |  | SV |
| SR14, 4 | BRERRL |  | SV |
| SR15, 4 | BRERRH |  | SV |
| SR16, 4 | ICTAGL |  | SV |
| SR17, 4 | ICTAGH |  | SV |
| SR18, 4 | ICDATL |  | SV |
| SR19, 4 | ICDATH |  | SV |
| SR20, 4 | DCTAGL |  | SV |
| SR21, 4 | DCTAGH |  | SV |
| SR22, 4 | DCDATL |  | SV |
| SR23, 4 | DCDATH |  | SV |
| SR24, 4 | ICCTRL |  | SV |
| SR25, 4 | DCCTRL |  | SV |
| SR26, 4 | ICCFG |  | SV |
| SR27, 4 | DCCFG |  | SV |
| SR28, 4 | ICERR |  | SV |
| SR29, 4 | DCERR |  | SV |

## 3A.2.1.3 Instruction

See "Instruction" in Software Manual.
A snooze instruction halts operation of the CPU1/2 core for 32 clocks.

## 3A.2.2 Buffers for Code Flash

## 3A.2.2.1 Features

CPUn ( $\mathrm{n}=1,2$ ) accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also
Figure 40A.1, Block Diagram of Code Flash ECC for ECC decoders in these paths.

Figure 3A. 2 Buffers for Code Flash

## 3A.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

Two-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

16 entry branch history buffer is mounted to decrease branch penalty.
One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these three buffers.

## 3A.2.2.3 Registers for Buffer Control

(1) List of Buffer Control Registers

Table 3A. 57 Buffer Control Register (Base Address: FFC5 B000H)

|  | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Module Name |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| FBUF_CTRL | $+00 \mathrm{O}_{\mathrm{H}}$ | 4 | Flash buffer clear control register | FBUFCCTL | - | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $00000000_{\text {H }}$ |

## (2) Register Sets

Access: FBUFCCTL register can be read or written in 32-bit units.
FBUFCCTLL register can be read or written in 16 -bit units.
FBUFCCTLLL register can be read or written in 8 -bit units.
Address: FBUFCCTL: FFC5 $\mathrm{BOOO}_{\mathrm{H}}$
FBUFCCTLL: FFC5 B000н
FBUFCCTLLL: $\operatorname{FFC} 5 \mathrm{BOOO}_{\mathrm{H}}$

Table 3A. 58 FBUFCCTL Register Contents

| Bit Position | Bit Name | Function | Value after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. <br> When writing, write the value after reset. | Reset |

Please do following procedures when you want to clear the buffers.
Step 1: Write 0 to FBUFCCTL.FBUFCLR
Step 2: Write 1 to FBUFCCTL.FBUFCLR
Step 3: Write 0 to FBUFCCTL.FBUFCLR
Step 4: Read the FBUFCCTL register (dummy read)
Step 5: Execute the SYNCP instruction
Step 6: Execute the SYNCI instruction
If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCLR $=1$.

## 3A.2.3 Inter-Processor Interrupts

Four registers (IPIR_CHn) are provided for communicating four channels of interrupts between the CPUs (PEs).
IPIR_CH0 to IPIR_CH3 are assigned to CH0 to CH3 of user interrupts (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating the bits corresponding to each PE.

## 3A.2.3.1 Inter-Processor Interrupt Control Registers

These registers are located in the CPU Peripheral.
Table 3A. 59 List of Registers

| Module Name | Address | Register Name | Symbol | R/W | Access Size |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| IPIRSS | FFFE EC80 ${ }_{\text {H }}$ | Inter-PE interrupt register 0 | IPIR_CH0 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |
|  | FFFE EC84 ${ }_{\text {H }}$ | Inter-PE interrupt register 1 | IPIR_CH1 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $00000000_{\mathrm{H}}$ |
|  | FFFE EC88 ${ }_{\text {H }}$ | Inter-PE interrupt register 2 | IPIR_CH2 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |
|  | FFFE EC8C ${ }_{\text {H }}$ | Inter-PE interrupt register 3 | IPIR_CH3 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $00000000_{H}$ |

(1) IPIR_CHn — Inter-PE Interrupt Register n ( $\mathrm{n}=0$ to 3 )

Access: IPIR_CHn can be read or written in 32-bit units.
IPIR_CHnL can be read or written in 16-bit units.
IPIR_CHnLL can be read or written in 8-bit units.
Address: $\quad$ IPIR_CHn: FFFE EC80 $+\mathrm{n} \times \mathrm{H}_{\mathrm{H}}$
IPIR_CHnL: FFFE EC80 ${ }_{H}+n \times 4_{H}$
IPIR_CHnLL: FFFE $E C 80_{H}+n \times 4_{H}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

Table 3A. 60 IPIR_CHn Registers Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | PE2 | Inter-PE Interrupt Request to PE2 <br> Writing 1 to this bit enables an interrupt request to PE2. This bit is automatically cleared to 0 when the interrupt request has been notified. <br> 0 : Inter-PE interrupt request output is not specified or an interrupt request is not being output. <br> 1: Interrupt request output is specified or an interrupt request is being output. |
| 0 | PE1 | Inter-PE Interrupt Request to PE1 <br> Writing 1 to this bit enables an interrupt request to PE1. This bit is automatically cleared to 0 when the interrupt request has been notified. <br> 0 : Inter-PE interrupt request output is not specified or an interrupt request is not being output. <br> 1: Interrupt request output is specified or an interrupt request is being output. |

## 3A.2.4 Reliability Functions

## 3A.2.4.1 PE Guard Function (PEG)

## (1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in (3) List of PEG Protection Setting Registers enables access by masters other than own PE.
(1) Detecting PE guard violation

If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.
(2) Blocking unauthorized access

When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.
(3) Notifying occurrence of violation

An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected.
A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.
(2) Protection Made by SPID

- Setting PEG Protection
- Up to four areas can be set depending on the local RAM address of the own PE.
- The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
- "Read enable" and "write enable" can be set for each area.
- "Enable" or "disable" can be selected based on the system protection identifier (SPID) for each area.
- Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas $0,1,2$, or 3 ? If so, go to step 3 . Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access

- The system protection identifier (SPID) is enabled.
- Required operations (read/write) are enabled.

Otherwise, return an error response.

## (3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM in the PE can be specified.

Table 3A. 61 PEG Registers (Base Address: FFFE E600н)

| Module Name | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

(4) Register Set
(a) PEGSP - PEG SPID Control Register

```
Access: PEGSP register can be read or written in 32-bit units.
PEGSPL register can be read or written in 16-bit units
PEGSPLL register can be read or written in 8-bit units.
Address: PEGSP: FFFE E60CH
PEGSPL: FFFE E60C \({ }_{H}\)
PEGSPLL: FFFE E60C \({ }_{H}\)
```

Table 3A. 62 PEGSP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SPEN | Access permission to external master with specified SPID. |
|  | 0: Not permit. |  |
|  | 1: Permit. |  |

## (b) PEGGnMK - PEG Area n Mask Setting Register ( $\mathrm{n}=0$ to 3 )

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit $m$ of the access address.

```
Access: PEGGnMK register can be read or written in 32-bit units.
PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.
PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8 -bit units.
Address: PEGGnMK: FFFE E680 \({ }_{H}+\left(10_{H} \times \mathrm{n}\right)\)
PEGGnMKL: FFFE E680 \({ }_{H}+\left(10_{\mu} \times n\right)\),
PEGGnMKH: FFFE E682 \(+\left(10_{H} \times n\right)\)
PEGGnMKLH: FFFE E681 \({ }_{H}+\left(10_{H} \times n\right)\),
PEGGnMKHL: FFFE E682 \({ }_{\boldsymbol{H}}+\left(10_{H} \times \mathrm{n}\right)\),
PEGGnMKHH: FFFE E683 \({ }_{\mathrm{H}}+\left(10_{\mathrm{H}} \times \mathrm{n}\right)\)
```

Table 3A. 63 PEGGnMK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | GnMASK | 0: Target bits are compared when determining the PE guard area. |
|  |  | 1: Target bits are not compared when determining the PE guard area. |
| 11 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

NOTE
When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

## (c) PEGGnBA - PEG Area n Base Setting Register ( $\mathrm{n}=0$ to 3 )

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n . Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

| Address: |  |  | PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG | A regi <br> AL, P <br> ALL, <br> A: FF <br> AL: FF <br> AH: F <br> ALL F <br> ALH <br> AHL: <br> AHH: | er can <br> GGnBA <br> EGGnB <br> E684 <br> E E684 <br> EE E686 <br> FE E68 <br> FE E68 <br> FFE E68 <br> FFE E6 | read <br> regist <br> H, PE <br> $\left(10_{H}\right.$ <br> $+\left(10_{H}\right.$ <br> $+\left(10^{H}\right.$ <br> $+(10$ <br> $+(10$ <br> + (10 <br> $7_{\mathrm{H}}+(1$ | written <br> can b <br> nBAH <br> n), <br> n) <br> n), <br> n), <br> $\times n$ ), <br> $\times n$ ) | $\begin{aligned} & \text { 32-bit } \\ & \text { ead or } \\ & \text { PEG } \end{aligned}$ | units. <br> written in <br> nBAHH | 16 -bit registers | nits. can be r | ead or wr | iten in | 8 -bit unit |  |  |

| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 12 | GnBASE |  |  | Base address that specifies the range of PE guard protection area n . |  |  |  |  |  |  |  |  |  |  |  |  |
| 11 to 8 | Reserved |  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 7 | GnSP3 |  |  | Access permission setting from SPID = 3 external master to PE guard protection area n . <br> 0 : Not permit. <br> 1: Permit. |  |  |  |  |  |  |  |  |  |  |  |  |
| 6 | GnSP2 |  |  | Access permission setting from SPID $=2\left(C P U 2^{\star 1}\right)$ external master to PE guard protection area n . |  |  |  |  |  |  |  |  |  |  |  |  |
| 5 | GnSP1 |  |  | Access permission setting from SPID $=1\left(C P U 1^{\star 1}\right)$ external master to PE guard protection area n . |  |  |  |  |  |  |  |  |  |  |  |  |
| 4 | GnSP0 |  |  | Access permission setting from SPID $=0$ (peripheral device connected to H -BUS) external master to PE guard protection area n . <br> 0 : Not permit. <br> 1: Permit. |  |  |  |  |  |  |  |  |  |  |  |  |
| 3 | Reserved |  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 2 | GnWR |  |  | Write access permission to PE guard protection area n . <br> 0 : Write access is disabled. <br> 1: Write access is enabled. |  |  |  |  |  |  |  |  |  |  |  |  |

Table 3A. 64 PEGGnBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | GnRD | Read access permission to PE guard protection area n. |
|  |  | 0: Read access is disabled. |
|  |  | 1: Read access is enabled. |
| 0 | GnEN | Enables or Disables the setting for the access enable conditions to PE guard protection area |
|  |  | n. |
|  |  |  |
|  |  | 0: Settings for access enable conditions are disabled. |
|  | 1: Settings for access enable conditions are enabled. |  |

Note 1. Setting value of MCFGO.SPID

NOTE
When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

## 3A.2.4.2 PE's Internal Peripheral Device Protection Function (IPG)

## (1) Overview of the IPG Function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to the SEG, the PEG, the IPIR, the MEV, the INTC1 and P-Bus.

## (a) Detecting Violation of Peripheral Device Protection

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device protection is set, the access is detected as "violation of peripheral device protection".

## (b) Storing Unauthorized Access Information

When a violation of peripheral device protection is detected, the unauthorized-access information is stored in the IPG's internal register.

## (c) Blocking Unauthorized Accesses

When a violation of peripheral device protection is detected, unauthorized accesses to peripheral devices are blocked to prevent contents of peripheral devices from being modified illegally.

## (d) Notifying Violation

When a violation of peripheral device protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

NOTE
Even if a request for generating an exception is immediately sent to the CPU in step (d) Notifying Violation above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripheral devices. (Accesses after a violation has occurred result in unauthorized accesses.)

## (2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripheral devices simultaneously is made due to misalignment or doubleword access, the access is executed when all such accesses are enabled.

## (3) IPG Protection Setting Registers for Illegal Users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.

Table 3A. 65 IPG Registers (Base Address: FFFE E000 ${ }_{\text {H }}$ )

| Module Name | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right* ${ }^{1}$ | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| IPG | $+002_{\text {H }}$ | 2 | Peripheral device protection violation access information register | IPGECRUM | SV | R/W | - | $\checkmark$ | $\checkmark$ | - | Undefined (retained) |
|  | $+008{ }_{\text {H }}$ | 4 | Peripheral device protection violation access address register | IPGADRUM | SV | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | Undefined (retained) |
|  | $+00 \mathrm{D}_{\mathrm{H}}$ | 1 | Peripheral device protection enable register | IPGENUM | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+020_{\text {H }}$ | 1 | Peripheral device protection setting register 0 | IPGPMTUM0 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+022_{\text {H }}$ | 1 | Peripheral device protection setting register 2 | IPGPMTUM2 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+023_{H}$ | 1 | Peripheral device protection setting register 3 | IPGPMTUM3 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+024_{H}$ | 1 | Peripheral device protection setting register 4 | IPGPMTUM4 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |

Note 1. Registers for which "SV" is described are accessible by accesses with SV right (UM = 0).

## (4) Register Set

## (a) IPGECRUM — Peripheral Device Protection Violation Access Information Register

| Bit | Access: <br> Address: |  | IPGECRUM register can be read or written in 16-bit units. IPGECRUML register can be read or written in 8 -bit units. IPGECRUM: FFFE E002н IPGECRUML: FFFE E002 ${ }^{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | WD | HW | BY | EX | WR | RD | VD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | - | - | - | - | - | - | - |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 3A. 66 | IPGECRUM Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 7 | Reserved |  |  | These bits are always read as 0 . The write value should always be 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 6 | WD |  |  | This bit is set to 1 when a violation occurred in read word, instruction fetch read access, write word, CAXI, LDL or STC. In other cases, this bit is cleared to 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 5 | HW |  |  | This bit is set to 1 when a violation occurred in read halfword or write haflword. In other cases, this bit is cleared to 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 4 | BY |  |  | This bit is set to 1 when a violation occurred in read byte, write byte or bit operation. In other cases, this bit is cleared to 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 3 | EX |  |  | This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 2 | WR |  |  | This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 1 | RD |  |  | This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 | VD |  |  | This bit is set to 1 when a violation of peripheral device protection is detected by a program with the relevant right. Even if another violation of peripheral device protection is detected while this bit is 1, data of this IPGECRUM register and the IPGADRUM register is not updated and is retained. |  |  |  |  |  |  |  |  |  |  |  |  |

NOTE
When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.
(b) IPGADRUM — Peripheral Device Protection Violation Access Address Register

Table 3A. 67 IPGADRUM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | EADR | These bits store the address of the access in which a violation occurred. |

NOTE
When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.
(c) IPGENUM — Peripheral Device Protection Enable Register

## (d) IPGPMTUMO — Peripheral Device Protection Setting Register 0

| Bit | Access <br> Address | IPGPMTUMO register can be read or written in 8-bit units. <br> IPGPMTUMO: FFFE E02OH |  |  |  | 2 | 1 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | - | X1 | W1 | R1 | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R | R | R |

Table 3A. 69 IPGPMTUM0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 6 | X1 | This bit sets whether to enable instruction fetch read access to P-Bus. |
|  |  | 0: Instruction fetch read access to P-Bus is treated as violation. (Value after reset) |
|  | 1: Instruction fetch read access to P-Bus is not restricted. |  |
| 5 | W1 | This bit sets whether to enable write access to P-Bus. |
|  | 0: Write access to P-Bus is treated as violation. (Value after reset) |  |
|  |  | 1: Write access to P-Bus is not restricted. |
| 4 |  | This bit sets whether to enable read access to P-Bus. |
|  | 0: Read access to P-Bus is treated as violation. (Value after reset) |  |
|  |  | 1: Read access to P-Bus is not restricted. |
| 3 to 0 | Reserved | These bits are always read as 0. The write value should always be 0. |

## (e) IPGPMTUM2 - Peripheral Device Protection Setting Register 2

Access: IPGPMTUM2 register can be read or written in 8-bit units.
Address: IPGPMTUM2: FFFE E022H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | W1 | R1 | - | - | W0 | R0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R/W | R/W |

Table 3A. 70 IPGPMTUM2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | Reserved | These bits are always read as 0 . The write value should always be 0. |
| 5 | W1 | This bit sets whether to enable write access to GOMEVm/IPIR_CHn. <br> 0: Write access to GOMEVm/IPIR_CHn is treated as violation. (Value after reset) <br> 1: Write access to GOMEVm/IPIR_CHn is not restricted. |
| 4 | R1 | This bit sets whether to enable read access to GOMEVm/IPIR_CHn. <br> 0 : Read access to GOMEVm/IPIR_CHn is treated as violation. (Value after reset) <br> 1: Read access to GOMEVm/IPIR_CHn is not restricted. |
| 3, 2 | Reserved | These bits are always read as 0 . The write value should always be 0 . |
| 1 | W0 | This bit sets whether to enable write access to INTC1. <br> 0 : Write access to INTC1 is treated as violation. (Value after reset) <br> 1: Write access to INTC1 is not restricted |
| 0 | R0 | This bit sets whether to enable read access to INTC1. <br> 0 : Read access to INTC1 is treated as violation. (Value after reset) <br> 1: Read access to INTC1 is not restricted. |

## (f) IPGPMTUM3 - Peripheral Device Protection Setting Register 3

Table 3A. 71 IPGPMTUM3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 5 | W1 | This bit sets whether to enable write access to SysErrGen. |
|  |  | $0:$ Write access to SysErrGen is treated as violation. (Value after reset) |
|  | 1: Write access to SysErrGen is not restricted. |  |
| 4 | R1 | This bit sets whether to enable read access to SysErrGen. |
|  |  | 0: Read access to SysErrGen is treated as violation. (Value after reset) |
|  |  | 1: Read access to SysErrGen is not restricted |
| 3 to 0 | Reserved | These bits are always read as 0. The write value should always be 0. |

(g) IPGPMTUM4 - Peripheral Device Protection Setting Register 4

Access: IPGPMTUM4 register can be read or written in 8-bit units.
Address: IPGPMTUM4: FFFE E024 ${ }_{\text {H }}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | wo | Ro |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3A. 72 IPGPMTUM4 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 1 | W0 | This bit sets whether to enable write access to its own PEG. |
|  | 0: Write access to its own PEG is treated as violation. (Value after reset) |  |
|  | 1: Write access to its own PEG is not restricted. |  |
| 0 | R0 | This bit sets whether to enable read access to its own PEG. |
|  | 0: Read access to its own PEG is treated as violation. (Value after reset) |  |
|  | 1: Read access to its own PEG is not restricted |  |

## 3A.2.4.3 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.
Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.
The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

## (1) List of SEG Function Control Registers

Table 3A. 73 SEG Register (Base Address: FFFE E980H)

| Module Name | Address Offset | Size (Byte) | Register Name | Abbreviation | Right*1 | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| SEG | $+0 \mathrm{H}_{\mathrm{H}}$ | 2 | SEG error control register | SEGCONT | SV | R/W | - | - | $\checkmark$ | - | 0000 ${ }_{\text {H }}$ |
|  | $+02{ }_{H}$ | 2 | SEG error flag register | SEGFLAG | SV | R/W | - | - | $\checkmark$ | - | $0000{ }_{H}$ |
|  | $+08_{\text {H }}$ | 4 | SEG error address information register | SEGADDR | SV | R/W | - | - | - | $\checkmark$ | Undefined (retained) |

Note 1. Registers for which "SV" is described are writable with the SV right $(\mathrm{UM}=0)$. Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

## (2) Register Set

## (a) SEGCONT - SEG Error Control Register

This register is used to enable (=1) or disable (=0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | VCSE | APIE | IPGE | - | TCME | - | VCIE | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R/W | R | R/W | R | R | R | R |

Table 3A. 74 SEGCONT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | VCSE | This bit enables notification of an error response detected inside system interconnect: <br> - Error response from external bus masters in write access <br> - Illegal response to local RAM or peripherals or Flash from optional master in access (except instruction fetch from CPU). And illegal response to optional slave from external AHB master in access. |
| 9 | APIE | This bit enables notification of an error response from peripherals. The error notification includes the following cases: <br> - Error response from peripherals in write access <br> - PBG error in write access |
| 8 | IPGE | This bit enables notification of IPG illegal access detection. |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | TCME | This bit enables notification of an error during data access to its own local RAM from PE master. <br> The error notification includes the following cases: <br> - ECC uncorrectable error (DED or SED \& SECDIS=1) <br> - Detection of an access to RAM unimplemented area |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | VCIE | This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM, retention RAM, other PE local RAM, H-Bus and CodeFlash by PE. The error notification includes the following cases: <br> - IPG error from CPU peripherals and P-Bus <br> - Error response from H -Bus peripherals <br> - PBG error / HBG error from P-Bus and H-Bus <br> - GRG error from global RAM and retention RAM <br> - PEG error from other PE local RAM <br> - ECC uncorrectable error from CodeFlash, global RAM, retention RAM and other PE local RAM (DED or SED \& SECDIS = 1) <br> This bit enables notification of an error response when accessing to a part of access prohibited areas in address map. |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## (b) SEGFLAG - SEG Error Flag Register

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0 . Both setting and clearing of each flag are supported in writing to the register.

Table 3A. 75 SEGFLAG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | VCSF | Flag corresponding to bit 10 of the SEGCONT register |
| 9 | APIF | Flag corresponding to bit 9 of the SEGCONT register |
| 8 | IPGF | Flag corresponding to bit 8 of the SEGCONT register |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | Reserved | Flag corresponding to bit 6 of the SEGCONT register |
| 5 | VCIF | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | Reserved | Flag corresponding to bit 4 of the SEGCONT register |
| 3 to 0 | When read, the value after reset is returned. When writing, write the value after reset. |  |

NOTE
An error may lead to setting of multiple error flags in SEG. For example, if an IPG error occurs at peripheral registers read, both IPGF bit and VCIF bit in SEGFLAG are set.

## (c) SEGADDR - Error Address Information Register

Address information (one record) which is notified with error occurrence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Address[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | Address[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 3A. 76 SEGADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | Address | These bits store the error address information. |

## CAUTIONS

1. SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit, APIF bit or IPGF bit in SEGFLAG register.
2. In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

## (3) SEG Function

## (a) SEG Function: SYSERR Request Notification by Error Flag

- Setting an error flag takes precedence over clearing the same flag.
- A simultaneous clearing operation is ignored.
- Priority of error factors
- The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
- The bit position of error factors is reported as a "SysErr factor code."
- Conditions for starting SysErr request notification
- Even if a flag which error notification is disabled by SEGCONT register is set to 1 , notification is not made.
- Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
- After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
- Even after notification is finished, the flag is not cleared automatically.
- Notification is not made until setting or clearing the flag again.
- If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

## (b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
- No information is retained by setting or clearing an error flag in SEGFLAG register.
- When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1 , overwrite to the SEGADDR register is inhibited.
- If error occurrence input continues, information of subsequent error factors is not retained.
- To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

## (c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

## 3A. 3 Inter-CPU Functions

## 3A.3.1 Processor Element Identifier

The PEID, processor element ID number, can be read from the PEID field in the HTCFG0 register. Which CPU core is executing a specific program can be checked by referring to the PEID. The following shows the PEID of this product.

| CPU Core | PEID |
| :--- | :--- |
| CPU1 (PE1) | $001_{B}$ |
| CPU2 (PE2) | $010_{B}$ |

## 3A.3.2 Inter-Processor Interrupt Function

Each CPU has the IPIR register as a peripheral function. Setting of the IPIR register enables an EI-level interrupt request from a PE to another PE. For details, see Section 3A.2.3, Inter-Processor Interrupts.

## 3A.3.3 Exclusive Control

The local RAM, global RAM, retention RAM, and exclusive control registers (G0MEVm; $m=0$ to 31 ) are available as a resource for exclusive control. Atomic operation instructions LDL/STC, CAXI, SET1, CLR1, and NOT1 can be executed on the local RAM, global RAM, and retention RAM. CAXI, SET1, CLR1, and NOT1 can be executed on the exclusive control registers (G0MEVm). Note that the LD and ST instructions can also access these resources, but the access is not atomic.

## 3A.3.3.1 Exclusive Control Register (G0MEVm; m = 0 to 31)

This register supports exclusive control for variable shared between PEs (common resources). (MEV: Mutual Exclusion Variable Register)

- Thirty-two 32-bit G0MEVm registers are included.
- G0MEVm can be accessed in 8-, 16-, or 32-bit units.
- Access from CPU1 (PE1) and CPU2 (PE2) can be made.
- Atomic operation instructions CAXI, SET1, CLR1, and NOT1 can be executed.

CPU1 (PE1) and CPU2 (PE2) each have an independent access path for G0MEVm registers. Therefore, when CPU1 (PE1) and CPU2 (PE2) each access different G0MEVm registers, they do not need to wait for access. When they access the same G0MEVm register, however, waiting for access is required.

Table 3A. 77 List of Registers

| Module Name | Address*1 | Register Name | Symbol | R/W | Access Size |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| MEV | $+{ }^{+00_{H}}$ | Exclusive control register 0 | GOMEVO | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |
|  | $+04_{H}$ | Exclusive control register 1 | G0MEV1 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |
|  | +08 ${ }_{\text {H }}$ | Exclusive control register 2 | G0MEV2 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |
|  | : | : | : | : | : | : | : | : | : |
|  | $+7 \mathrm{C}_{\mathrm{H}}$ | Exclusive control register 31 | G0MEV31 | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }^{\text {H }}$ |

Note 1. Base address: FFFE ECOOH
(1) GOMEVm - Exclusive Control Register m (m = 0 to 31)

Access: GOMEVm can be read or written in 32-bit units.
GOMEVmL and GOMEVmH can be read or written in 16-bit units
GOMEVmLL, GOMEVmLH, GOMEVmHL, GOMEVmHH can be read or written in 8-bit units.
Address: $\quad$ GOMEVm: FFFE ECOOH $+m \times 4_{H}$,
GOMEVmL: FFFE ECOO ${ }_{H}+m \times 4_{H}$,
GOMEVmH: FFFE ECOO ${ }_{H}+m \times 4_{H}+2_{H}$,
GOMEVmLL: FFFE ECOO $\mathrm{H}+\mathrm{m} \times 4_{\mathrm{H}}$,
GOMEVmLH: FFFE ECOO $H+m \times 4_{H}+1_{H}$,
GOMEVmHL: FFFE ECOOH $+m \times 4 \boldsymbol{H}+2 \boldsymbol{H}$,
GOMEVmHH: FFFE ECOO ${ }_{H}+m \times 4_{H}+3_{H}$
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | GOMEVm[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | GOMEVm[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 3A. 78 G0MEVm Registers Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | GOMEVm[31:0] | These bits set the value for exclusive control. |

## 3A.3.3.2 Operation of the LDL.W and STC.W Instructions

The LDL.W and STC.W instructions can be used to perform atomic read-modify-write operations for accurate processing in the updating of memory in multicore systems. The LDL.W and STC.W instructions operate as follows.

- Link generation: The CPU is capable of generating links to both the local RAM and global RAM (including the retention RAM). Executing the LDL.W instruction on the target RAM for the operation leads to the link flag being set and a link being generated in response to reading by the instruction. Two link flag systems are provided, one each for the following two areas of RAM.
(1) The local RAM for the given processor
(2) The global RAM (including the retention RAM)
- Success in storing: After a link has been generated, storing will only proceed in response to executing an STC.W instruction corresponding to the generated link.
- Failure in storing: If a link is lost, storing does not proceed even when an STC.W instruction for the corresponding address is processed. Storing also does not proceed when an STC.W instruction that does not correspond to the link is processed.
- Condition for successful storing: If the following condition is met, the STC.W instruction is judged to be for the address corresponding to the link.
- The address for the LDL.W instruction which generated the link matches that for the STC.W instruction.
- Loss of the link: If any of the following occurs, the link flag is cleared and the link is lost.
- Any of the following processing by the CPU for which the link was generated:
- Execution of a STC.W instruction. The corresponding link (for (1) or (2) above) will be lost irrespective of the success or failure of storing.
- Occurrence of an exception or the CPU executing an instruction to return from an exception processing routine (FERET or EIRET). The link flags for both areas of RAM are cleared.
- Successive execution of LDL.W instructions for a location with the same link flags. The link generated in
- response to the preceding LDL.W instruction will be lost. Do not execute such processing
- Execution of a storing operation other than an STC.W instruction for the address generating the link. Do not execute such processing.
- Access as described below by another bus master:

Any storing operation, including execution of an STC.W instruction for the address generating the link. The corresponding link will be lost.

Success of the STC.W instruction means that the LDL.W and STC.W instructions have realized an atomic read-modifywrite operation.

## 3A. 4 CPU2 Boot Up Operation

After reset is released, CPU1 starts to fetch instruction. Initial condition of CPU2 is decided by option byte setting and its boot up condition can be set and confirmed by BOOTCTRL register.

## (1) List of Register

Table 3A. 79 BOOTCTRL Register (Base Address: FFC5 8000 )

| Module Name | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| - | $+00_{\text {H }}$ | 4 | BOOTCTRL register | BOOTCTRL | - | R/W | - | - | - | $\checkmark$ | $\begin{aligned} & 00000006_{H} \\ & \text { or } \\ & 00000002_{H} \end{aligned}$ |

## (2) BOOTCTRL - Boot Control Register

This register is used to control the start-up of CPU2. By setting bit to " 1 ", CPU2 starts its pipeline operation. When the value of CPU2EN is " 1 ", it cannot be overwritten to " 0 " excluding reset.

Note 1. The setting of the option byte OPBTO.PE2BOOTEN is reflected. For details on the option byte, see Section 44.9, Option Bytes.

Table 3A. 80 BOOTCTRL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | CPU2EN | CPU2 operation setting |
|  |  | 0: Invalid boot up of CPU2. |
|  | 1: Valid boot up of CPU2. When the value of PE2EN (option byte) is " 0 ", it cannot be |  |
|  |  | overwritten to "1". |
| 1,0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## 3A. 5 Notes

## 3A.5.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see APPENDIX A, Hazard Resolution Procedure for System Registers in the RH850G3KH User's Manual: Software.

When the updated results in the control registers are to be used by the subsequent instruction:
Example 1: An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.

Proceed as follows in this case.
(1) Execute the store instruction to update a control register (ST.W, etc.).
(2) Perform a dummy read of the above control register (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute the subsequent instruction (EI).

In case of RH850/F1KH, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

Example 2: When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.
(1) Execute the store instruction to update the control register A (ST.W, etc.).
(2) Perform a dummy read of the above control register (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute the store instruction to access the control register B (ST.W, LD.W, etc.).

In case of RH850/F1KH, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

## When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.
(1) Execute the store instruction to update a memory (ST.W, etc.).
(2) Perform a dummy read of the above memory (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute SYNCI.
(5) Execute the subsequent instruction (branch instruction, etc.).
(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.
(1) Execute the store instruction to update a control register (ST.W, etc.).
(2) Perform a dummy read of the control register (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute SYNCI.
(5) Execute the subsequent instruction (branch instruction, etc.).

## When switching the code flash memory area:

In this case, see Section 10, Usage Notes, (7) Updating the BFASELR register in the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

## 3A.5.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in Section 3A.2.2, Buffers for Code Flash.

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

## 3A.5.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8 -bit units. Thus, access by a bitmanipulation instruction is only possible for registers for which reading and writing in 8 -bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

## 3A.5.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

## 3A.5.5 Overwriting Context upon Acceptance of Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see the List of Exception Sources in the RH850G3KH User's Manual: Software.

## Section 3BC CPU System of RH850/F1KM

## 3BC. 1 Overview

## 3BC.1.1 Block Configuration

Figure 3BC.1, Block Configuration Diagram of the RH850/F1KM-S4 shows the block configuration diagram of RH850/F1KM-S4.

Figure 3BC. 1 Block Configuration Diagram of the RH850/F1KM-S4

Figure 3BC.2, Block Configuration Diagram of the RH850/F1KM-S1 shows the block configuration diagram of RH850/F1KM-S1.

Figure 3BC. 2 Block Configuration Diagram of the RH850/F1KM-S1

## CPU1 (PE1)

The RH850G3KH2.0 Core is used as the main CPU.

## Local RAM

This is a high-speed accessible RAM

## Global RAM

The global RAM is a large-capacity RAM for data sharing among CPU and with DMA.
This is not supported with RH850/F1KM-S1.

## Retention RAM

## RH850/F1KM-S4:

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous global RAM area is assigned for the retention RAM, the retention RAM can also serve as a global RAM for sharing data with the DMA.

## RH850/F1KM-S1:

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous local RAM area is assigned for the retention RAM, the retention RAM can also serve as a local RAM for sharing data with the DMA.

## Code flash

The code flash memory is included for program storage. It is connected with CPU1 via the flash interface.

## Data flash

The data flash memory can be rewritten by the CPU1. It has a greater write endurance than the code flash memory.

## P-Bus and H-Bus (RH850/F1KM-S4)

The P-Bus connects the peripheral IPs. The P-Bus is divided into five peripheral groups, 1 to 5.

## P-Bus (RH850/F1KM-S1)

The P-Bus connects the peripheral IPs. The P-Bus is divided into three peripheral groups, 1 to 3.

## INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2.

## DMA

The DMA transfer module (PDMA) is included.

## Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:
(1) PE guard (PEG)

The PE guard is a function to prevent unauthorized access to the resources (local RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.
(2) Internal Peripheral Guard (IPG)

The PE with system interconnects supports "Internal Peripheral Guard" (IPG) that protects the registers of peripherals against invalid accesses.
(3) Global RAM guard (GRG) (RH850/F1KM-S4)

The global RAM guard is a function to prevent unauthorized access to the global RAM and retention RAM from an external master. The global RAM is in the unprotected state (accessible from all bus master) after reset is released. For details, see Section 40B, Functional Safety of RH850/F1KM-S4.
(4) Peripheral guard (PBG / HBG (RH850/F1KM-S4))

The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.
For details, see Section 40B, Functional Safety of RH850/F1KM-S4 and Section 40C, Functional Safety of RH850/F1KM-S1.

## 3BC. 2 CPU

## 3BC.2.1 Core Functions

## 3BC.2.1.1 Features

Table 3BC.1, Features of the RH850G3KH2.0 Core lists features of the RH850G3KH2.0 core.
Table 3BC. 1 Features of the RH850G3KH2.0 Core

| Item | Feature |
| :---: | :---: |
| CPU | - Advanced 32-bit architecture for embedded control <br> - 32-bit internal data bus <br> - Thirty-two 32-bit general-purpose registers <br> - RISC-type instruction set <br> - Long-/short-format load/store instructions <br> - Three-operand instructions <br> - Instruction set based on C language <br> - CPU operating modes <br> - User mode and supervisor mode <br> - Address space: 4-Gbyte linear address space for both data and instructions |
| Coprocessor | - Floating-point operation coprocessor (FPU) <br> - Supports single precision (32 bits) <br> - Supports data types and exceptions conforming to IEEE754. <br> - Rounding mode: Neighborhood, 0 direction, $+\infty$ direction, and $-\infty$ direction <br> - Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754 |
| Exception/Interrupt | - 16 interrupt priority levels settable for each channel <br> - Vector selection method selectable according to performance request or memory usage <br> - Direct branching exception vectors <br> - Indirect branching exception vectors referring to the address table <br> - Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt |
| Memory management | - Memory protection function (MPU): 16 areas settable |
| Cache | - No cache memory is equipped. |

## 3BC.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

## (1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).
Table 3BC. 2 Program Registers

| Program Register | Name | Function | Description |
| :--- | :--- | :--- | :--- |
| General-purpose <br> registers | r0 | Zero register | Always retains "0" |
|  | r1 | Assembler reserved register | Used as working register for generating addresses |
|  | r2 | Register for address and data variables (used when the real-time OS used does not use this <br> register) |  |
|  | r3 | Stack pointer (SP) | Used for generating a stack frame when a function is called |
|  | r4 | Global pointer (GP) | Used for accessing a global variable in the data area |
|  | r5 | Text pointer (TP) | Used as a register that indicates the start of the text area (area <br> where program code is placed) |
|  | r6 to r29 | Register for address and data variables |  |
|  | r30 | Element pointer (EP) | Used as a base pointer for generating addresses when <br> accessing memory |
|  | Renk pointer (LP) | Used when the compiler calls a function |  |

NOTE
For further descriptions of r 1 , r 3 to r 5 , and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

## (a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30

These registers are implicitly used by instructions.
r 0 is a register that always retains " 0 ". It is used for operations that use 0 and addressing with base address being 0 . r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.
r30 is used as a base pointer when the SLD or SST instruction accesses memory.
2. r1, r4, r5, r31

These registers are implicitly used by the assembler and C compiler.
When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.
3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

## (b) PC - Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0 , and branching to an odd number address is disabled.

Table 3BC. 3 PC Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | PC31 to PC1 | These bits indicate the address of the instruction being executed. | R/W | $*_{1}$ |
| 0 | PC0 | This bit is fixed to 0. Branching to an odd number address is disabled. | R/W | 0 |

[^2]
## (2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.
System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3BC. 4 Basic System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
| :---: | :---: | :---: | :---: |
| SRO, 0 | EIPC | Status save registers when acknowledging El level exception | SV |
| SR1, 0 | EIPSW | Status save registers when acknowledging El level exception | SV |
| SR2, 0 | FEPC | Status save registers when acknowledging FE level exception | SV |
| SR3, 0 | FEPSW | Status save registers when acknowledging FE level exception | SV |
| SR5, 0 | PSW | Program status word | *1 |
| SR6, 0 | FPSR | (Refer to FPU function registers.) | CU and SV |
| SR7, 0 | FPEPC | (Refer to FPU function registers.) | CU and SV |
| SR8, 0 | FPST | (Refer to FPU function registers.) | CU |
| SR9, 0 | FPCC | (Refer to FPU function registers.) | CU |
| SR10, 0 | FPCFG | (Refer to FPU function registers.) | CU |
| SR11, 0 | FPEC | (Refer to FPU function registers.) | CU and SV |
| SR13, 0 | ElIC | El level exception source register | SV |
| SR14, 0 | FEIC | FE level exception source register | SV |
| SR16, 0 | CTPC | CALLT execution status save register | UM |
| SR17, 0 | CTPSW | CALLT execution status save register | UM |
| SR20, 0 | CTBP | CALLT base pointer register | UM |
| SR28, 0 | EIWR | El level exception working register | SV |
| SR29, 0 | FEWR | FE level exception working register | SV |
| SR0, 1 | MCFG0 | Machine configuration register | SV |
| SR2, 1 | RBASE | Reset vector base address register | SV |
| SR3, 1 | EBASE | Exception handler vector address register | SV |
| SR4, 1 | INTBP | Base address register of the interrupt handler address table | SV |
| SR5, 1 | MCTL | CPU control | SV |
| SR6, 1 | PID | Processor ID register | SV |
| SR11, 1 | SCCFG | SYSCALL operation setting register | SV |
| SR12, 1 | SCBP | SYSCALL base pointer register | SV |
| SR0, 2 | HTCFG0 | Thread configuration register | SV |
| SR6, 2 | MEA | Memory error address register | SV |
| SR7, 2 | ASID | Address space ID register | SV |
| SR8, 2 | MEI | Memory error information register | SV |

Note 1. The access permission differs depending on the bit.

## (a) EIPC - Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see "Types of Exceptions" in Software Manual).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

Table 3BC. 5 EIPC Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |

## (b) EIPSW - Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.
Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3BC. 6 EIPSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an El level exception is acknowledged. | R/W | 0 |
| 29 to 17 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit stores the PSW.CU field setting when an El level exception is acknowledged. | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an El level exception is acknowledged. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an El level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an El level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an El level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an El level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an El level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an El level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an El level exception is acknowledged. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when an El level exception is acknowledged. | R/W | 0 |

## (c) FEPC - Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see "Types of Exceptions" in Software Manual).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

Table 3BC. 7 FEPC Register Contents

|  |  |  | Value after |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |  |
| 31 to 1 | FEPC31 to | These bits indicate the PC saved when an FE level exception is <br> acknowledged. | R/W | Undefined |  |
| 0 | FEPC1 | FEPC0 | This bit indicates the PC saved when an FE level exception is acknowledged. <br> Always set this bit to 0. Even if it is set to 1, the value transferred to the PC <br> when the FERET instruction is executed is 0. | R/W | Undefined |
|  |  |  |  |  |  |

## (d) FEPSW - Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.
Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3BC. 8 FEPSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 29 to 17 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit stores the PSW.CU field setting when an FE level exception is acknowledged. | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged. | R/w | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an FE level exception is acknowledged. | R/w | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an FE level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 0 | z | This bit stores the PSW.Z bit setting when an FE level exception is acknowledged. | R/W | 0 |

## (e) PSW - Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

## CAUTIONS

1. When the LDSR instruction is used to change the contents of bit7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution. See "APPENDIX A. Hazard Resolution Procedure for System Registers" in Software Manual when the content of the other bits in this register is changed.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3BC.9, Access Permission for PSW Register for the access permission for each bit.

Table 3BC. 9 Access Permission for PSW Register

| Bit |  | Access Permission when Reading | Access Permission when Writing |
| :--- | :--- | :--- | :--- |
| 30 | UM | UM | SV $^{* 1}$ |
| 16 | CU | UM | SV $^{* 1}$ |
| 15 | EBV | UM | SV $^{* 1}$ |
| 7 | NP | UM | SV $^{* 1}$ |
| 6 | EP | UM | SV $^{* 1}$ |
| 5 | ID | UM | SV $^{* 1}$ |
| 4 | SAT | UM | UM |
| 3 | CY | UM | UM |
| 2 | OV | UM | UM |
| 1 | S | UM | UM |
| 0 | Z | UM | UM |

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1 . In this case, writing is ignored.

Table 3BC. 10 PSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit indicates that the CPU is in user mode (in UM mode) <br> 0 : Supervisor mode <br> 1: User mode | R/W | 0 |
| 29 to 17 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | CU | This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0 , a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. | R/W | 0 | CU bit 16: FPU

Table 3BC. 10 PSW Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 15 | EBV | This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) RBASE - Reset Vector Base Address Register) and EBASE ((r) EBASE - Exception Handler Vector Address Register) in this section. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of El level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see Table 7BC.1, List of Exception Sources. | R/W | 0 |

0 : The acknowledgement of $F E$ level exception is enabled.
1: The acknowledgement of FE level exception is disabled.

| 6 | EP | This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1 . <br> 0 : An exception other than an interrupt is not being serviced. <br> 1: An exception other than an interrupt is being serviced. | R/W | 0 |
| :---: | :---: | :---: | :---: | :---: |
| 5 | ID | This bit disables the acknowledgement of El level exception. When an El level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of El level exception. As for the exceptions which the ID bit disables the acknowledgment, see Table 7BC.1, List of Exception Sources. This bit is also used to disable El level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the $D I$ instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. <br> 0: El level exception is not being processed or the section is not a critical section (after execution of EI instruction). <br> 1: El level exception is being processed or the section is a critical section (after execution of DI instruction). | R/W | 1 |
| 4 | SAT*1 | This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1 , but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. <br> 0: Not saturated <br> 1: Saturated | R/W | 0 |
| 3 | CY | This bit indicates whether a carry or borrow has occurred in the operation result. | R/W | 0 |

0: Carry and borrow have not occurred.
1: Carry or borrow has occurred.

| 2 | $\mathrm{OV}^{* 1}$ | This bit indicates whether or not an overflow has occurred during an <br> operation. <br> 0: Overflow has not occurred. <br> 1: Overflow has occurred. | R/W | 0 |
| :--- | :--- | :--- | :--- | :--- |

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

| Operation Result Status | Flag Status |  |  | Operation Result after Saturation <br> Processing |
| :--- | :--- | :--- | :--- | :--- |
|  | SAT | OV | S |  |

## (f) EIIC - El Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3BC. 11 ElIC Register Contents

|  |  |  | Value after <br> Bit Position | Bit Name | Function |
| :--- | :--- | :--- | :--- | :--- | :--- |

## (g) FEIC - FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3BC. 12 FEIC Register Contents

|  |  |  | Value after <br> Bit Position | Bit Name | Function |
| :--- | :--- | :--- | :--- | :--- | :--- |$\quad$ R/W | Reset |
| :--- | :--- |

## (h) CTPC - Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

Table 3BC. 13 CTPC Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | CTPC31 to <br> CTPC1 | These bits indicate the PC of the instruction after the CALLT instruction. | R/W | Undefined |  |
| 0 | CTPC0 | This bit indicates the PC of the instruction after the CALLT instruction. <br> Always set this bit to 0. Even if it is set to 1, the value transferred to the PC <br> when the CTRET instruction is executed is 0. | R/W | Undefined |  |
|  |  |  |  |  |  |

## (i) CTPSW - Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

Table 3BC. 14 CTPSW Register Contents

| Bit Position | Bit Name | Function | (Reserved for future expansion. Be sure to set to 0.) | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | SAT | This bit stores the PSW.SAT bit setting when the CALLT instruction is <br> executed. | R/W | 0 |
| 4 | CY | This bit stores the PSW.CY bit setting when the CALLT instruction is <br> executed. | R/W | 0 |  |
| 3 | OV | This bit stores the PSW.OV bit setting when the CALLT instruction is <br> executed. | R/W | 0 |  |
| 2 | S | This bit stores the PSW.S bit setting when the CALLT instruction is executed. | R/W | 0 |  |
| 1 | This bit stores the PSW.Z bit setting when the CALLT instruction is executed. | R/W | 0 |  |  |

## (j) CTBP - CALLT Base Pointer Register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.
Be sure to set the CTBP register to a halfword address.

Table 3BC. 15 CTBP Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | CTBP31 to <br> CTBP1 | These bits indicate the base pointer address of the CALLT instruction. <br> These bits indicate the start address of the table used by the CALLT <br> instruction. | R/W | Undefined |
| 0 | CTBP0 | This bit indicates the base pointer address of the CALLT instruction. <br> This bit indicates the start address of the table used by the CALLT instruction. <br> Always set this bit to 0. | $R$ | 0 |

## (k) ASID - Address Space ID Register

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

Table 3BC. 16 ASID Register Contents

|  |  |  |  | Value after <br> Bit Position |
| :--- | :--- | :--- | :--- | :--- |
| Bit Name | Function | R/W | Reset |  |
| $\mathbf{3 1}$ to 10 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 9 to 0 | ASID | These bits indicate the address space ID. | R/W | Undefined |

## (I) EIWR - El Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

Table 3BC. 17 EIWR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | EIWR31 to | These bits constitute a working register that can be used for any purpose <br> during the servicing of an El level exception. This register can be used to <br> temporarily save the values of general-purpose registers, etc. | R/W | Undefined |
|  | EIWR0 |  |  |  |

## (m) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

Table 3BC. 18 FEWR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | FEWR31 to | These bits constitute a working register that can be used for any purpose <br> during the servicing of an FE level exception. This register can be used to <br> temporarily save the values of general-purpose registers, etc. | R/W | Undefined |
|  | FEWR0 |  |  |  |

## (n) HTCFG0 - Thread Configuration Register

Table 3BC. 19 HTCFG0 Register Contents

| Bit Position | Bit Name | Function | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 19 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | $\mathrm{R} / \mathrm{W}$ | Reset |
| 18 to 16 | PEID | These bits indicate the processor element number. | 0 |  |
| 15 | - | (Reserved for future expansion. Be sure to set to 1.$)$ | R | $001_{\mathrm{B}}$ |
| 14 to 0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 1 |

## (o) MEA - Memory Error Address Register

Table 3BC. 20 MEA Register Contents

| Bit Position | Bit Name | Function | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | MEA | These bits store the violation address when an MAE (misaligned) or MPU <br> occurs. | R/W | Undefined |

## (p) MEI — Memory Error Information Register

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

Table 3BC. 21 MEI Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 21 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 20 to 16 | REG | These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. <br> For details, see Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |
| 15 to 11 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 10, 9 | DS | These bits indicate the data type of the instruction that caused the exception. ${ }^{11}$ <br> 0 : Byte (8 bits) <br> 1: Halfword (16 bits) <br> 2: Word (32 bits) <br> 3: Double-word (64 bits) | R/W | Undefined |

For details, see Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.

| 8 | This bit indicates the sign extension method of the instruction that caused the R/W Undefined |
| :--- | :--- | :--- |
| exception. |  |
|  | 0: Signed |
| 1: Unsigned |  |

For details, see Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register.

| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| :---: | :---: | :---: | :---: | :---: |
| 5 to 1 | ITYPE | These bits indicate the instruction that caused the exception. For details, see Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |
| 0 | RW | This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). <br> 0: Read (Load-memory) <br> 1: Write (Store-memory) <br> For details, see Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register. | R/W | Undefined |

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3BC. 22 Instructions Causing Exceptions and Values of MEI Register

| Instruction | REG | DS | U | RW | ITYPE |
| :--- | :--- | :--- | :--- | :--- | :--- |
| SLD.B | dst | 0 (byte) | 0 (signed) | 0 (read) | $000000_{B}$ |
| SLD.BU | dst | 0 (byte) | 1 (unsigned) | 0 (read) | $00000_{B}$ |
| SLD.H | dst | 1 (halfword) | 0 (signed) | 0 (read) | $000000_{B}$ |

| LDL.W | dst | 2 (word) | 0 (signed) | 0 (read) | $00111_{B}$ |
| STC.W | SrC | 2 (word) | 0 (signed) | 1 (write) | $00111_{\text {B }}$ |
| CAXI | dst | 2 (word) | 0 (signed) | 0 (read)/1 (write) | $01000_{B}$ |
| SET1 | - | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | 01001 B |
| CLR1 | - | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | 01001 B |
| NOT1 | - | 0 (byte) | 0 (signed) | 0 (read)/1 (write) | $01001_{B}$ |
| TST1 | - | 0 (byte) | 0 (signed) | 0 (read) | 01001 B |
| PREPARE | - | 2 (word) | 0 (signed) | 1 (write) | 01100 ${ }_{\text {B }}$ |
| DISPOSE | - | 2 (word) | 0 (signed) | 0 (read) | $01100{ }_{B}$ |
| PUSHSP | - | 2 (word) | 0 (signed) | 1 (write) | $01101_{B}$ |
| POPSP | - | 2 (word) | 0 (signed) | 0 (read) | $01101_{B}$ |
| SWITCH | - | 1 (halfword) | 0 (signed) | 0 (read) | $10000_{B}$ |
| CALLT | - | 1 (halfword) | 1 (unsigned) | 0 (read) | 10001 B |
| SYSCALL | - | 2 (word) | 0 (signed) | 0 (read) | $10010_{B}$ |
| CACHE | - | - | - | - | - |
| Interrupt (table reference)*1 | - | 2 (word) | 0 (signed) | 0 (read) | $10101_{B}$ |

Note 1. When reading the interrupt vector by using the table reference method.

NOTE
dst: destination register number, src: source register number

## (q) RBASE - Reset Vector Base Address Register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0 , this vector address is also used as the exception vector address.

Table 3BC. 23 RBASE Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | RBASE31 to RBASE9 | These bits indicate the reset vector when there is a reset. When PSW.EBV = | R | 00000000 |
|  |  | 0 , this address is also used as the exception vector. |  | 00000000 |
|  |  | For RBASE8 to RBASE0, 0 is used implicitly. |  | $0000000{ }^{* 1}$ |
| 8 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See Section 7BC.10.1, Direct Vector Method. This bit is valid when PSW.EBV $=0$. | R | 0 |

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

## (r) EBASE - Exception Handler Vector Address Register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

Table 3BC. 24 EBASE Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 9 | EBASE31 to <br> EBASE9 | The exception handler routine address is changed to the address resulting <br> from adding the offset address of each exception to the base address <br> specified for this register. <br> For EBASE8 to EBASE0, 0 is used implicitly. | R/W | Undefined |  |
|  |  | (Reserved for future expansion. Be sure to set to 0.) |  |  |  |
| 8 to 1 | - | When the RINT bit is set, the exception handler address for interrupt servicing <br> is reduced. See Section 7BC.10.1, Direct Vector Method. | R/W | Undefined |  |
| 0 | RINT |  |  |  |  |

## (s) INTBP - Base Address Register of the Interrupt Handler Address Table

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

Table 3BC. 25 INTBP Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 9 | INTBP31 to | These bits indicate the base pointer address for an interrupt when the table <br> reference method is used. <br> INTBP9 | The value indicated by these bits is the first address in the table used to <br> determine the exception handler when the interrupt specified by the table <br> reference method (EIINT0 to ElINT511) is acknowledged. <br> For INTBP8 to INTBP0, 0 is used implicitly. | Undefined |
| 8 to 0 | - | (Reserved for future expansion. Be sure to set to 0. .) | R/W |  |

## (t) PID - Processor ID Register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

Table 3BC. 26 PID Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | PID | Architecture Identifier | R | $05_{\text {H }}$ |
|  |  | This identifier indicates the architecture of the processor. |  |  |
| 23 to 8 |  | Function Identifier | R | $0^{0003}{ }_{H}$ |
|  |  | This identifier indicates the functions of the processor. <br> These bits indicate whether or not functions defined per bit are implemented <br> (1: implemented, 0: not implemented). <br> Bits 23 to 11: Reserved <br> Bit 10: Double-precision floating-point operation function <br> Bit 9: Single-precision floating-point operation function <br> Bit 8: Memory protection function (MPU) |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
| 7 to 0 |  | Version Identifier | R | $\mathrm{A8}_{\mathrm{H}}$ |
|  |  | This identifier indicates the version of the processor. |  |  |

## (u) SCCFG - SYSCALL Operation Setting Register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Table 3BC. 27 SCCFG Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0. ) | R/W | R |

## (v) SCBP - SYSCALL Base Pointer Register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

Table 3BC. 28 SCBP Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | SCBP31 to <br> SCBP2 | These bits indicate the base pointer address of the SYSCALL instruction. <br> These bits indicate the start address of the table used by the SYSCALL <br> instruction. | R/W | Undefined |  |
| 1,0 | SCBP1, <br> SCBP0 | These bits indicate the base pointer address of the SYSCALL instruction. <br> These bits indicate the start address of the table used by the SYSCALL <br> instruction. <br> Always set these bits to 0. | R | 0 |  |

## (w) MCFG0 - Machine Configuration Register

This register indicates the CPU configuration.

Table 3BC. 29 MCFG0 Register Contents

|  |  |  |  | Value after <br> Rit Position |
| :--- | :--- | :--- | :--- | :--- |
| Bit Name | Function | R/W | Reset |  |
| 31 to 18 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 17,16 | SPID | These bits indicate the system protection number. | $\mathrm{R} / \mathrm{W}$ | $01_{\mathrm{B}}$ |
| 15 to 3 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |
| 2 | - | (Reserved for future expansion. Be sure to set to 1.$)$ | R | 1 |
| 1,0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |

## (x) MCTL - Machine Control Register

This register is used to control the CPU.

Table 3BC. 30 MCTL Register Contents
$\left.\begin{array}{lllll}\hline & & & \begin{array}{l}\text { Value after } \\ \text { Bit Position }\end{array} & \text { Bit Name }\end{array}\right)$

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.
Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

## (3) Interrupt Function Registers

Table 3BC. 31 Interrupt Function System Registers

| Register No. <br> (regID, selID) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR7, 1 | FPIPR | FPI exception interrupt priority setting register | SV |
| SR10, 2 | ISPR | Priority of interrupt being serviced register | SV |
| SR11, 2 | PMR | Interrupt priority masking register | SV |
| SR12, 2 | ICSR | Interrupt control status register | SV |
| SR13, 2 | INTCFG | Interrupt function setting register | SV |

## (a) FPIPR - FPI Exception Interrupt Priority Setting Register

This register is used to set the interrupt priority of FPI exception.

Table 3BC. 32 FPIPR Register Contents

| Bit Position | Bit Name | Function | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | Reset | R |

NOTE: A set value of more than 16 is treated as 16.

## (b) ISPR — Priority of Interrupt being Serviced Register

This register retains the priority of the EIINTn interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

Table 3BC. 33 ISPR Register Contents

|  |  |  | Value after <br> Bit Position | Bit Name |
| :--- | :--- | :--- | :--- | :--- |

0 : An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged.
1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core.

The bit positions correspond to the following priority levels.

| Bit | Priority |
| :--- | :--- |
| 0 | Priority 0 (highest) |
| 1 | Priority 1 |
| $\quad:$ |  |
| 14 | Priority 14 |
| 15 | Priority 15 (lowest) |

> When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1 . If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 ( 0 is the highest priority) is cleared to $0 . \star^{\star 1}$
> While a bit in this register is set to 1 , same or lower priority interrupts (EIINTn) and FPI exceptions*2 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.
> When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0 .

Note 2. Since FPI exceptions have the same level of priority as EIINTn interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.
Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

## (c) PMR — Interrupt Priority Masking Register

This register is used to mask the specified interrupt priority.

Table 3BC. 34 PMR Register Contents

| Bit Position | Bit Name | Function |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 16 | - | (Reserved for future expansion. Be sure to set to 0.) |  | R | 0 |
| 15 to 0 | PM15 to PM0 | These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. |  | R/W | 0 |
|  |  |  |  |  |  |
|  |  | 0 : Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled. |  |  |  |
|  |  | 1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled. |  |  |  |
|  |  | The bit positions correspond to the following priority levels: |  |  |  |
|  |  | Bit | Priority |  |  |
|  |  | 0 | Priority 0 (highest) |  |  |
|  |  | 1 | Priority 1 |  |  |
|  |  |  | : |  |  |
|  |  | 14 | Priority 14 |  |  |
|  |  | 15 | Priority 15 and priority 16 (lowest) |  |  |

While a bit in this register is set to 1, interrupts (EIINTn) and FPI exceptions*1 with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged ${ }^{\star 2}$.

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.
Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00 ${ }_{H}$ can be set, but $\mathrm{FOFO} 0_{H}$ or $00 F F_{H}$ cannot.

## (d) ICSR - Interrupt Control Status Register

This register indicates the interrupt control status in the CPU.

Table 3BC. 35 ICSR Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | R |
| 1 | PMFP | This bit indicates that an FPI exception with the priority level masked by the <br> PMR register exists. | R | 0 |
| 0 | PMEI | This bit indicates that an interrupt (EIINTn) with the priority level masked by <br> the PMR register exists. | R | 0 |

## (e) INTCFG - Interrupt Function Setting Register

This register is used to specify settings related to the CPU's internal interrupt function.

Table 3BC. 36 INTCFG Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | ISPC | This bit specifies how the ISPR register is updated. | R/W | 0 |
|  |  | 0 : The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. <br> 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. |  |  |
|  |  | If this bit is cleared to 0 , the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored. |  |  |
|  |  | If this bit is set to 1 , the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. |  |  |
|  |  | In normal cases, the ISPC bit should be cleared to 0 . When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register. |  |  |

## (4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1KM supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation

Table 3BC. 37 FPU System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR6, 0 | FPSR | Floating-point operation setting/status register | CU and SV |
| SR7, 0 | FPEPC | Floating-point exception program counter register | CU and SV |
| SR8, 0 | FPST | Floating-point operation status register | CU |
| SR9, 0 | FPCC | Floating-point operation comparison result register | CU |
| SR10, 0 | FPCFG | Floating-point operation configuration register | CU |
| SR11,0 | FPEC | Floating-point exception control register | CU and SV |

## (a) FPSR — Floating-point Operation Setting/Status Register

This register indicates the execution status of floating-point operations and any exceptions that occur.

Note 1. Cause bits (XC)
Note 2. Enable bits(XE)
Note 3. Preservation bits (XP)
Table 3BC. 38 FPSR Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | CC[7:0] | These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. <br> 0 : Comparison result is false <br> 1: Comparison result is true |  |  |  |  |  |  | R/W | Undefined |
| 23 | FN | This bit enables flush-to-nearest mode. When the FN bit is set to 1 , if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number. |  |  |  |  |  |  | R/W | 0 |
| 22 | IF | This bit accumulates and indicates information about the flushing of input operands. |  |  |  |  |  |  | R/W | 0 |
| 21 | PEM | This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1 , exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions. |  |  |  |  |  |  | R/W | 0 |
| 20 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  |  |  |  | R | 0 |
| 19, 18 | RM | These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. |  |  |  |  |  |  | R/W | 00 |
|  |  | RM Bits |  |  |  |  |  |  |  |  |
|  |  | 19 | 18 | Mnemonic | Descrip |  |  |  |  |  |
|  |  | 0 | 0 | RN |  | ult to ween d tow | repres arest re ue who | alue. If the value ble values, the gnificant bit is 0 . |  |  |
|  |  | 0 | 1 | RZ | Round that do accura | ult to xceed | result te value $\qquad$ | rest to the value sult with infinite |  |  |
|  |  | 1 | 0 | RP | Round greate | ult to <br> accu | he resul with infi | st to a value racy. |  |  |
|  |  | 1 | 1 | RM | Round less th | ult to cura | he resul infinite | st to a value |  |  |
| 17 | FS | This bit enables values that cannot be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign. <br> Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode. |  |  |  |  |  |  | R/W | 1 |
|  |  |  |  |  |  |  |  |  |  |  |
|  |  | Operation Result that is a Subnormal Number |  |  | Rounding Mode and Value after Flushing |  |  |  |  |  |
|  |  |  |  |  | RN*1 | RZ | RP | RM |  |  |
|  |  | Positive |  |  | +0 | +0 | $+2^{\text {Emin }}$ | +0 |  |  |
|  |  | Negative |  |  | -0 | -0 | -0 | $-2^{\text {Emin }}$ |  |  |

Note 1. If the rounding mode is RN and the FPSR.FN bit is set to 1 , flushing will occur in the direction of higher accuracy.

| 16 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | $R$ | 0 |
| :--- | :--- | :--- | :--- | :--- |
| 15 to 10 | XC (E, V, Z, O, | These are the cause bits. | R/W | Undefined |
|  | $\mathrm{U}, \mathrm{I})$ |  |  |  |

Table 3BC. 38 FPSR Register Contents

|  |  |  | Value after |
| :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | These are the enable bits. |
| 9 to 5 | XE |  | R/W |
|  | $(V, Z, O, \cup, I)$ |  | 0 |
| 4 to 0 | XP | These are the preservation bits. | R/W |

## (b) FPEPC - Floating-point Exception Program Counter Register

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

Table 3BC. 39 FPEPC Register Contents

| Bit Position | Bit Name | Function | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | FPEPC31 to <br> FPEPC1 | These bits store the program counter (PC) of the floating-point instruction that <br> caused the exception when a floating-point operation exception that is <br> enabled by an enable bit occurs. | R/W | Undefined |
| 0 | FPEPC0 | This bit stores the program counter (PC) of the floating-point instruction that <br> caused the exception when a floating-point operation exception that is <br> enabled by an enable bit occurs. <br> Always set this bit to 0. | R | 0 |

## (c) FPST — Floating-point Operation Status Register

This register reflects the contents of the FPSR register bits related to the operation status.

Table 3BC. 40 FPST Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 14 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 13 to 8 | $\begin{aligned} & \text { XC (E, V, Z, O, } \\ & \text { U, I) } \end{aligned}$ | These are cause bits. Values written to these bits are reflected in FPSR.XC bits. | R/W | Undefined |
| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | IF | This bit accumulates and indicates information about the flushing of input operands. | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are preservation bits. Values written to these bits are reflected in FPSR.XP bits. | R/W | Undefined |

## (d) FPCC — Floating-point Operation Comparison Result Register

This register reflects the contents of the FPSR.CC[7:0] bits.

Table 3BC. 41 FPCC Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 to 0 | CC[7:0] | These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. <br> 0 : Comparison result is false <br> 1: Comparison result is true | R/W | Undefined |

## (e) FPCFG - Floating-point Operation Configuration Register

This register reflects the contents of the FPSR register bits related to the operation settings.

Table 3BC. 42 FPCFG Register Contents

| Bit Position | Bit Name | Function |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 10 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 9, 8 | RM | These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. <br> Values written to these bits are reflected in RM bits of FPSR. |  |  |  | R/W | 0 |
|  |  | RM Bits |  |  |  |  |  |
|  |  | 9 | 8 | Mnemonic | Description |  |  |
|  |  | 0 | 0 | RN | Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0 . |  |  |
|  |  | 0 | 1 | RZ | Rounds the result toward 0 . The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy. |  |  |
|  |  | 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value greater than the accurate result with infinite accuracy. |  |  |
|  |  | 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value less than the accurate result with infinite accuracy. |  |  |
| 7 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 4 to 0 | $\begin{aligned} & \text { XE } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the enable bits. |  |  |  | R/W | 0 |

## (f) FPEC - Floating-point Exception Control Register

This register controls the floating-point operation exception.

Table 3BC. 43 FPEC Register Contents

| Bit Position | Bit Name | Function | Ralue after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | Reset |

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1 .

## (5) MPU Function Registers

Table 3BC. 44 MPU Function System Registers

| Register No. (regID, selID) | Symbol | Function | Access Permission |
| :---: | :---: | :---: | :---: |
| SRO, 5 | MPM | Memory protection operation mode setting | SV |
| SR1, 5 | MPRC | MPU region control | SV |
| SR4, 5 | MPBRGN | MPU base region number | SV |
| SR5, 5 | MPTRGN | MPU end region number | SV |
| SR8, 5 | MCA | Memory protection setting check address | SV |
| SR9, 5 | MCS | Memory protection setting check size | SV |
| SR10, 5 | MCC | Memory protection setting check command | SV |
| SR11, 5 | MCR | Memory protection setting check result | SV |
| SR0, 6 | MPLAO | Protection area lower limit address | SV |
| SR1, 6 | MPUAO | Protection area upper limit address | SV |
| SR2, 6 | MPAT0 | Protection area attribute | SV |
| SR4, 6 | MPLA1 | Protection area lower limit address | SV |
| SR5, 6 | MPUA1 | Protection area upper limit address | SV |
| SR6, 6 | MPAT1 | Protection area attribute | SV |
| SR8, 6 | MPLA2 | Protection area lower limit address | SV |
| SR9, 6 | MPUA2 | Protection area upper limit address | SV |
| SR10, 6 | MPAT2 | Protection area attribute | SV |
| SR12, 6 | MPLA3 | Protection area lower limit address | SV |
| SR13, 6 | MPUA3 | Protection area upper limit address | SV |
| SR14, 6 | MPAT3 | Protection area attribute | SV |
| SR16, 6 | MPLA4 | Protection area lower limit address | SV |
| SR17, 6 | MPUA4 | Protection area upper limit address | SV |
| SR18, 6 | MPAT4 | Protection area attribute | SV |
| SR20, 6 | MPLA5 | Protection area lower limit address | SV |
| SR21, 6 | MPUA5 | Protection area upper limit address | SV |
| SR22, 6 | MPAT5 | Protection area attribute | SV |
| SR24, 6 | MPLA6 | Protection area lower limit address | SV |
| SR25, 6 | MPUA6 | Protection area upper limit address | SV |
| SR26, 6 | MPAT6 | Protection area attribute | SV |
| SR28, 6 | MPLA7 | Protection area lower limit address | SV |
| SR29, 6 | MPUA7 | Protection area upper limit address | SV |
| SR30, 6 | MPAT7 | Protection area attribute | SV |
| SRO, 7 | MPLA8 | Protection area lower limit address | SV |
| SR1, 7 | MPUA8 | Protection area upper limit address | SV |
| SR2, 7 | MPAT8 | Protection area attribute | SV |
| SR4, 7 | MPLA9 | Protection area lower limit address | SV |
| SR5, 7 | MPUA9 | Protection area upper limit address | SV |
| SR6, 7 | MPAT9 | Protection area attribute | SV |
| SR8, 7 | MPLA10 | Protection area lower limit address | SV |
| SR9, 7 | MPUA10 | Protection area upper limit address | SV |
| SR10, 7 | MPAT10 | Protection area attribute | SV |
| SR12, 7 | MPLA11 | Protection area lower limit address | SV |
| SR13, 7 | MPUA11 | Protection area upper limit address | SV |

Table 3BC. 44 MPU Function System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR14, 7 | MPAT11 | Protection area attribute | SV |
| SR16, 7 | MPLA12 | Protection area lower limit address | SV |
| SR17, 7 | MPUA12 | Protection area upper limit address | SV |
| SR18, 7 | MPAT12 | Protection area attribute | SV |
| SR20, 7 | MPLA13 | Protection area lower limit address | SV |
| SR21, 7 | MPUA13 | Protection area upper limit address | SV |
| SR22, 7 | MPAT13 | Protection area attribute | SV |
| SR24, 7 | MPLA14 | Protection area lower limit address | SV |
| SR25, 7 | MPUA14 | Protection area upper limit address | SV |
| SR26, 7 | MPAT14 | Protection area attribute | SV |
| SR28, 7 | MPLA15 | Protection area lower limit address | SV |
| SR29, 7 | MPUA15 | Protection area upper limit address | SV |
| SR30, 7 | MPAT15 | Protection area attribute | SV |

## (a) MPM — Memory Protection Operation Mode Register

The memory protection mode register is used to define the basic operating state of the memory protection function.

Table 3BC. 45 MPM Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | SVP | In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area. ${ }^{* 1}$ <br> 0 : As usual, implicitly enable all access in SV mode. <br> 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2 | R/W | 0 |
| 0 | MPE | This bit is used to specify whether to enable or disable the MPU function. <br> 0: Disable <br> 1: Enable | R/W | 0 |

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.
Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.
(b) MPRC - MPU Region Control Register

Table 3BC. 46 MPRC Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| $\mathbf{3 1}$ to 16 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | $R$ | 0 |
| 15 to 0 | E15 to E0 | These are the enable bits for each protection area. Bit En is a copy of bit <br> MPATn.E (where $\mathrm{n}=15$ to 0$).$ | R/W | 0 |

## (c) MPBRGN - MPU Base Region Register

This register indicates the minimum usable MPU area number.

Table 3BC. 47 MPBRGN Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R |  |
| 4 to 0 | MPBRGN | These bits indicate the smallest number of an MPU area. | 0 |  |

## (d) MPTRGN - MPU End Region Register

This register indicates the maximum usable MPU area number +1 .

Table 3BC. 48 MPTRGN Register Contents

| Bit Position | Bit Name | Function | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | Reset |  |
| 4 to 0 | MPTRGN | These bits indicate the largest number of an MPU area +1. <br> These bits indicate the maximum number of MPU areas incorporated into the <br> hardware. | R | 10 |

## (e) MCA - Memory Protection Setting Check Address Register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

Table 3BC. 49 MCA Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 0 | MCA31 to | These bits are used to specify the start address of the memory area that is <br> subject to a memory protection setting check in bytes. | R/W | Undefined |
|  | MCA0 |  |  |  |

## (f) MCS - Memory Protection Setting Check Size Register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

Table 3BC. 50 MCS Register Contents

| Bit Position | Bit Name | Function | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | MCS31 to | These bits are used to specify the size of the memory area that is subject to a <br> memory protection setting check and the size of the target area in bytes. <br> Because the specified size is assumed to represent an unsigned integer, it is <br> not possible to check an area in the direction in which the address value <br> decreases relative to the MCA register value. | Undefined |  |
|  |  | Do not specify $00000000_{\mathrm{H}}$ for the MCS register. |  |  |
|  |  |  |  |  |

## (g) MCC - Memory Protection Setting Check Command Register

This register is used to specify the base address of the area where memory protection settings are checked.

Table 3BC. 51 MCC Register Contents

| Bit Position | Bit Name | Function | Value after <br> 31 to 0 | MCC31 to | When any value is written to the MCC register, a memory protection setting <br> check starts. By setting up the MCA/MCS register and then writing to the MCC <br> register, results are stored in MCR. |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | Because the check is started by any written value, a check can be started by <br> using r0 as the source register without using any unnecessary registers. Note |  |  |  |  |

## (h) MCR — Memory Protection Setting Check Result Register

This register is used to store the results of a memory protection setting check.
Be sure to clear bits 31 to 9,7 and 6 .

Table 3BC. 52 MCR Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 8 | OV | If the specified area includes $00000000_{\mathrm{H}}$ or 7 FFF FFFF $_{\mathrm{H}}, 1$ is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 7,6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | SXE | If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 4 | SWE | If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 3 | SRE | If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 2 | UXE | If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 1 | UWE | If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 0 | URE | If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |

## (i) MPLAn - Protection Area Lower Limit Address Register

These registers indicate the lower limit address of area n (where $\mathrm{n}=0$ to 15 ).

Table 3BC. 53 MPLAn Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 2 | MPLA31 to | These bits indicate the lower limit address of area $n$. | R/W | Undefined |
|  | MPLA2 | For MPLA1 and MPLA0, 0 is used implicitly. |  |  |
| 1,0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |

## (j) MPUAn - Protection Area Upper Limit Address Register

These registers indicate the upper limit address of area $n$ (where $n=0$ to 15 ).

Table 3BC. 54 MPUAn Register Contents

|  |  |  | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit Position | Bit Name | Function | R/W | Reset |
| 31 to 2 | MPUA31 to | These bits indicate the upper limit address of area n. | R/W | Undefined |
|  | MPUA2 | For MPUAn.MPUA1 and MPUA0, 1 is used implicitly. |  |  |
| 1,0 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |

## (k) MPATn - Protection Area Attribute Register

These registers indicate the attributes of area $n$ (where $n=0$ to 15 ).

Table 3BC. 55 MPATn Register Contents

| Bit Position | Bit Name | Function | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 26 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 25 to 16 | ASID | These bits indicate the ASID value to be used as the area match condition. | R/W | Undefined |
| 15 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | E | This bit indicates whether area n is enabled or disabled. <br> 0 : Area n is disabled. <br> 1: Area n is enabled. | R/W | 0 |
| 6 | G | 0 : Areas match only if ASIDs are equal. <br> 1: Areas match even if ASIDs are not equal. <br> If this bit is 0, MPATn.ASID $=$ ASID.ASID is used as the area match condition. If this bit is 1 , areas may match even if the values of MPATn.ASID and ASID.ASID are not equal. | R/W | Undefined |
| 5 | SX | This bit indicates the execution privilege for the supervisor mode.*1 <br> 0 : Execution is disabled. <br> 1: Execution is enabled. | R/W | Undefined |
| 4 | SW | This bit indicates whether writing is enabled in the supervisor mode.*1 <br> 0 : Writing is disabled. <br> 1 : Writing is enabled. | R/W | Undefined |
| 3 | SR | This bit indicates whether writing is enabled in the supervisor mode.*1 <br> 0 : Reading is disabled. <br> 1: Reading is enabled. | R/W | Undefined |
| 2 | UX | This bit indicates the execution privilege for the user mode. <br> 0 : Execution is disabled. <br> 1: Execution is enabled. | R/W | Undefined |
| 1 | UW | This bit indicates whether writing is enabled in the user mode. <br> 0 : Writing is disabled. <br> 1: Writing is enabled. | R/W | Undefined |
| 0 | UR | This bit indicates whether writing is enabled in the user mode. <br> 0 : Reading is disabled. <br> 1: Reading is enabled. | R/W | Undefined |

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

## (6) Cache Operation Function Registers

The RH850/F1KM does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3BC. 56 Cache Operation Function Registers

| Register No. (regID, selID) | Symbol | Function | Access <br> Permission |
| :---: | :---: | :---: | :---: |
| SR12, 4 | BWERRL | Not implemented. A value of 0 is returned when read and writing is ignored. | SV |
| SR13, 4 | BWERRH |  | SV |
| SR14, 4 | BRERRL |  | SV |
| SR15, 4 | BRERRH |  | SV |
| SR16, 4 | ICTAGL |  | SV |
| SR17, 4 | ICTAGH |  | SV |
| SR18, 4 | ICDATL |  | SV |
| SR19, 4 | ICDATH |  | SV |
| SR20, 4 | DCTAGL |  | SV |
| SR21, 4 | DCTAGH |  | SV |
| SR22, 4 | DCDATL |  | SV |
| SR23, 4 | DCDATH |  | SV |
| SR24, 4 | ICCTRL |  | SV |
| SR25, 4 | DCCTRL |  | SV |
| SR26, 4 | ICCFG |  | SV |
| SR27, 4 | DCCFG |  | SV |
| SR28, 4 | ICERR |  | SV |
| SR29, 4 | DCERR |  | SV |

## 3BC.2.1.3 Instruction

See "Instruction" in Software Manual.
A snooze instruction halts operation of the CPU core for 32 clocks.

## 3BC.2.2 Buffers for Code Flash

## 3BC.2.2.1 Features

CPU accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also
Figure 40B.1, Block Diagram of Code Flash ECC, Figure 40C.1, Block Diagram of Code Flash ECC for ECC decoders in these paths.

Figure 3BC. 3 Buffers for Code Flash

## 3BC.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

One-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

## RH850/F1KM-S4:

16 entry branch history buffer is mounted to decrease branch penalty.
One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these three buffers.

## RH850/F1KM-S1:

One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these two buffers.

## 3BC.2.2.3 Registers for Buffer Control

## (1) List of Buffer Control Registers

Table 3BC. 57 Buffer Control Register (Base Address: FFC5 B000 ${ }_{\text {H }}$ )

|  | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Module Name |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| FBUF_CTRL | $+00 \mathrm{O}_{\mathrm{H}}$ | 4 | Flash buffer clear control register | FBUFCCTL | - | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |

## (2) Register Sets

Access: FBUFCCTL register can be read or written in 32-bit units.
FBUFCCTLL register can be read or written in 16 -bit units.
FBUFCCTLLL register can be read or written in 8 -bit units.
Address: FBUFCCTL: FFC5 B000 ${ }_{H}$
FBUFCCTLL: FFC5 B000 ${ }_{\boldsymbol{H}}$
FBUFCCTLLL: $\operatorname{FFC} 5 \mathrm{BOOO}_{\mathrm{H}}$

Table 3BC. 58 FBUFCCTL Register Contents

| Bit Position | Bit Name | Function | Value after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. <br> When writing, write the value after reset. | Reset |

Please do following procedures when you want to clear the buffers.
Step 1: Write 0 to FBUFCCTL.FBUFCLR
Step 2: Write 1 to FBUFCCTL.FBUFCLR
Step 3: Write 0 to FBUFCCTL.FBUFCLR
Step 4: Read the FBUFCCTL register (dummy read)
Step 5: Execute the SYNCP instruction
Step 6: Execute the SYNCI instruction
If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCLR $=1$.

## 3BC.2.3 Reliability Functions

## 3BC.2.3.1 PE Guard Function (PEG)

## (1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM*1 in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in (3) List of PEG Protection Setting Registers enables access by masters other than own PE.

Note 1. It is the local RAM and the retention RAM in RH850/F1KM-S1.
(1) Detecting PE guard violation

If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.
(2) Blocking unauthorized access

When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.
(3) Notifying occurrence of violation

An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected.
A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

## (2) Protection Made by SPID

- Setting PEG Protection
- Up to four areas can be set depending on the local RAM address*1 of the own PE.
- The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
- "Read enable" and "write enable" can be set for each area.
- "Enable" or "disable" can be selected based on the system protection identifier (SPID) for each area.

Note 1. It is the local RAM address and the retention RAM address in RH850/F1KM-S1.

- Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area*1? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas $0,1,2$, or 3 ? If so, go to step 3 . Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.

- The system protection identifier (SPID) is enabled.
- Required operations (read/write) are enabled.

Otherwise, return an error response.
Note 1. It is the local RAM area and the retention RAM area in RH850/F1KM-S1.

## (3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM*1 in the PE can be specified.

Note 1. It is local RAM and retention RAM in RH850/F1KM-S1.

Table 3BC. 59 PEG Registers (Base Address: FFFE $\mathbf{E 6 0 0}{ }_{\text {н }}$ )

| Module Name | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right | R/W | Operable Bit |  |  |  | Value after Reset |

|  | +0A4 ${ }_{\text {H }}$ | 4 | PEG area 2 base setting register | PEGG2BA | - | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |
|  | $+\mathrm{OBO}_{\mathrm{H}}$ | 4 | PEG area 3 mask setting register | PEGG3MK | - | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $00000000_{\text {H }}$ |
|  | $+0 \mathrm{~B} 4_{\mathrm{H}}$ | 4 | PEG area 3 base setting register | PEGG3BA | - | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0000 0000 ${ }_{\text {H }}$ |

## (4) Register Set

## (a) PEGSP - PEG SPID Control Register

```
Access: PEGSP register can be read or written in 32-bit units.
PEGSPL register can be read or written in 16-bit units
PEGSPLL register can be read or written in 8-bit units.
Address: PEGSP: FFFE E60CH
PEGSPL: FFFE E60C \({ }_{H}\)
PEGSPLL: FFFE E60C \({ }_{H}\)
```

Table 3BC. 60 PEGSP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SPEN | Access permission to external master with specified SPID. |
|  | 0: Not permit. |  |
|  | 1: Permit. |  |

## (b) PEGGnMK - PEG Area n Mask Setting Register ( $\mathrm{n}=0$ to 3 )

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit $m$ of the access address.

```
Access: PEGGnMK register can be read or written in 32-bit units.
PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.
PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.
Address: PEGGnMK: FFFE E680 \({ }_{H}+\left(10_{H} \times \mathrm{n}\right)\)
PEGGnMKL: FFFE E680 \({ }_{H}+\left(10_{\mu} \times n\right)\),
PEGGnMKH: FFFE E682 \(+\left(10_{H} \times n\right)\)
PEGGnMKLH: FFFE E681 \(+\left(10_{H} \times n\right)\),
PEGGnMKHL: FFFE E682 \({ }_{H}+\left(10_{H} \times n\right)\),
PEGGnMKHH: FFFE E683 \({ }_{\mathrm{H}}+\left(10_{\mathrm{H}} \times \mathrm{n}\right)\)
```

Table 3BC. 61 PEGGnMK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | GnMASK | 0: Target bits are compared when determining the PE guard area. |
|  |  | 1: Target bits are not compared when determining the PE guard area. |
| 11 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

NOTE
When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

## (c) PEGGnBA - PEG Area n Base Setting Register ( $\mathrm{n}=0$ to 3 )

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n . Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

| Address: |  |  | PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG <br> PEGG | A regis <br> AL, P <br> ALL, <br> A: FF <br> AL: F <br> AH: F <br> ALL F <br> ALH <br> AHL: <br> AHH: | er can <br> GGBA <br> EGGB <br> E684 <br> E E68 <br> EE E68 <br> E E68 <br> FE E68 <br> FEE E6 <br> FFE E687 | read <br> regist <br> H, PE <br> $+\left(10_{H}\right.$ <br> $+(10$ <br> + (10 <br> + (10 <br> + (10 <br> + <br> $7_{\mathrm{H}}+(1$ | written <br> can <br> nBA <br> n), <br> n) <br> n ), <br> n), <br> $\times n$ ), <br> $\times n$ ) | 32-bi <br> ead or PEG | units. <br> written in <br> nBAHH | 16-bit registers | units. <br> can be r | ead or w | tten in | -bit units. |  |  |

| Table 3BC. 62 PEGGnBA Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 12 | GnBASE |  |  | Base address that specifies the range of PE guard protection area n . |  |  |  |  |  |  |  |  |  |  |  |  |
| 11 to 8 | Reserved |  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 7 | GnSP3 |  |  | Access permission setting from SPID $=3$ external master to PE guard protection area n . <br> 0 : Not permit. <br> 1: Permit. |  |  |  |  |  |  |  |  |  |  |  |  |
| 6 | GnSP2 |  |  | Access permission setting from SPID $=2$ external master to PE guard protection area n . <br> 0 : Not permit. <br> 1: Permit. |  |  |  |  |  |  |  |  |  |  |  |  |
| 5 | GnSP1 |  |  | Access permission setting from SPID = $1\left(C P U 1^{* 1}\right)$ external master to PE guard protection area n . <br> 0 : Not permit. <br> 1: Permit. |  |  |  |  |  |  |  |  |  |  |  |  |
| 4 | GnSP0 |  |  | Access permission setting from SPID $=0$ (peripheral device connected to $\mathrm{H}-\mathrm{BUS}{ }^{* 2}$ ) external master to PE guard protection area $n$. <br> 0 : Not permit. <br> 1: Permit. |  |  |  |  |  |  |  |  |  |  |  |  |
| 3 | Reserved |  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 2 | GnWR |  |  | Write access permission to PE guard protection area $n$. <br> 0 : Write access is disabled. <br> 1: Write access is enabled. |  |  |  |  |  |  |  |  |  |  |  |  |

Table 3BC. 62 PEGGnBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | GnRD | Read access permission to PE guard protection area n. |
|  |  | $0:$ Read access is disabled. |
|  | 1: Read access is enabled. |  |
| 0 | GnEN | Enables or Disables the setting for the access enable conditions to PE guard protection area |
|  | n. |  |
|  |  | 0: Settings for access enable conditions are disabled. |
|  | 1: Settings for access enable conditions are enabled. |  |

Note 1. Setting value of MCFG0.SPID
Note 2. H-BUS is only supported by RH850/F1KM-S4.

NOTE
When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

## 3BC.2.3.2 PE's Internal Peripheral Device Protection Function (IPG)

## (1) Overview of the IPG Function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to the SEG, the PEG, the INTC1 and P-Bus.

## (a) Detecting Violation of Peripheral Device Protection

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device protection is set, the access is detected as "violation of peripheral device protection".

## (b) Storing Unauthorized Access Information

When a violation of peripheral device protection is detected, the unauthorized-access information is stored in the IPG's internal register.

## (c) Blocking Unauthorized Accesses

When a violation of peripheral device protection is detected, unauthorized accesses to peripheral devices are blocked to prevent contents of peripheral devices from being modified illegally.

## (d) Notifying Violation

When a violation of peripheral device protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

NOTE
Even if a request for generating an exception is immediately sent to the CPU in step (d) Notifying Violation above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripheral devices. (Accesses after a violation has occurred result in unauthorized accesses.)

## (2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripheral devices simultaneously is made due to misalignment or doubleword access, the access is executed when all such accesses are enabled.

## (3) IPG Protection Setting Registers for Illegal Users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.

Table 3BC. 63 IPG Registers (Base Address: FFFE E000H)

| Module Name | Address Offset | Size <br> (Byte) | Register Name | Abbreviation | Right* ${ }^{1}$ | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| IPG | $+002_{\text {H }}$ | 2 | Peripheral device protection violation access information register | IPGECRUM | SV | R/W | - | $\checkmark$ | $\checkmark$ | - | Undefined (retained) |
|  | $+008{ }_{\text {H }}$ | 4 | Peripheral device protection violation access address register | IPGADRUM | SV | R/W | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | Undefined (retained) |
|  | $+00 \mathrm{D}_{\mathrm{H}}$ | 1 | Peripheral device protection enable register | IPGENUM | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+020_{\text {H }}$ | 1 | Peripheral device protection setting register 0 | IPGPMTUM0 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+022_{\text {H }}$ | 1 | Peripheral device protection setting register 2 | IPGPMTUM2 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+023_{H}$ | 1 | Peripheral device protection setting register 3 | IPGPMTUM3 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |
|  | $+024_{H}$ | 1 | Peripheral device protection setting register 4 | IPGPMTUM4 | SV | R/W | - | $\checkmark$ | - | - | $00_{H}$ |

Note 1. Registers for which "SV" is described are accessible by accesses with SV right (UM = 0).

## (4) Register Set

## (a) IPGECRUM — Peripheral Device Protection Violation Access Information Register

Table 3BC. 64 IPGECRUM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 7 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 6 | WD | This bit is set to 1 when a violation occurred in read word, instruction fetch read access, write <br> word, CAXI, LDL or STC. In other cases, this bit is cleared to 0. |
| 5 | HW | This bit is set to 1 when a violation occurred in read halfword or write haflword. In other cases, <br> this bit is cleared to 0. |
| 4 | This bit is set to 1 when a violation occurred in read byte, write byte or bit operation. In other <br> cases, this bit is cleared to 0. |  |
| 3 | EX | This bit is set to 1 when a violation occurred in an instruction fetch read access. In other <br> cases, this bit is cleared to 0. |
| 1 | This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of <br> the CAXI instruction. In other cases, this bit is cleared to 0. |  |
| 0 | This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the <br> CAXI instruction. In other cases, this bit is cleared to 0. |  |

NOTE
When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.
(b) IPGADRUM — Peripheral Device Protection Violation Access Address Register

Table 3BC. 65 IPGADRUM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | EADR | These bits store the address of the access in which a violation occurred. |

NOTE
When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.
(c) IPGENUM — Peripheral Device Protection Enable Register

## Access: IPGENUM register can be read or written in 8-bit units. <br> Address: IPGENUM: FFFE E00D н $_{\text {н }}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | IRE | E |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3BC. 66 IPGENUM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | Reserved | These bits are always read as 0 . The write value should always be 0 . |
| 1 | IRE | This bit sets whether to store the access information in the peripheral device protection violation access address register and the peripheral device protection violation access information register when a violation of peripheral device protection occurred in an instruction fetch access. <br> 0 : Instruction fetch access information is not stored. (value after reset) <br> 1: Instruction fetch access information is stored. <br> CAUTION: If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0 . |
| 0 | E | This bit enables or disables the peripheral devices protection function against accesses by the relevant access right. <br> 0 : The peripheral device protection function is disabled. (Value after reset) <br> 1: The peripheral device protection function is enabled. |

(d) IPGPMTUMO — Peripheral Device Protection Setting Register 0

| Bit | Access: IPGPMTUMO register can be read or written in 8-bit units. <br> Address: IPGPMTUMO: FFFE E02O ${ }_{H}$ |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | X1 | W1 | R1 | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R | R | R |

Table 3BC. 67 IPGPMTUM0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 6 | X1 | This bit sets whether to enable instruction fetch read access to P-Bus. |
|  |  | 0: Instruction fetch read access to P-Bus is treated as violation. (Value after reset) |
|  | 1: Instruction fetch read access to P-Bus is not restricted. |  |
| 5 | W1 | This bit sets whether to enable write access to P-Bus. |
|  |  | 0: Write access to P-Bus is treated as violation. (Value after reset) |
|  | 1: Write access to P-Bus is not restricted. |  |
| 4 | R1 | This bit sets whether to enable read access to P-Bus. |
|  |  | 0: Read access to P-Bus is treated as violation. (Value after reset) |
|  |  | 1: Read access to P-Bus is not restricted. |
| 3 to 0 | Reserved |  |

(e) IPGPMTUM2 - Peripheral Device Protection Setting Register 2

Access: IPGPMTUM2 register can be read or written in 8-bit units.
Address: IPGPMTUM2: FFFE E022 ${ }_{\text {H }}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | wo | R0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3BC. 68 IPGPMTUM2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 1 | W0 | This bit sets whether to enable write access to INTC1. |
|  | $0:$ Write access to INTC1 is treated as violation. (Value after reset) |  |
|  | 1: Write access to INTC1 is not restricted |  |
| 0 | R0 | This bit sets whether to enable read access to INTC1. |
|  | $0:$ Read access to INTC1 is treated as violation. (Value after reset) |  |
|  |  | 1: Read access to INTC1 is not restricted. |

## (f) IPGPMTUM3 - Peripheral Device Protection Setting Register 3

| Access: IPGPMTUM3 register can be read or written in 8-bit units. <br> Address: IPGPMTUM3: FFFE E023 ${ }_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | - | - | W1 | R1 | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R |

Table 3BC. 69 IPGPMTUM3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 6 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 5 | W1 | This bit sets whether to enable write access to SysErrGen. |
|  |  | 0 : Write access to SysErrGen is treated as violation. (Value after reset) |
|  | 1: Write access to SysErrGen is not restricted. |  |
| 4 | R1 | This bit sets whether to enable read access to SysErrGen. |
|  |  | 0 : Read access to SysErrGen is treated as violation. (Value after reset) |
|  |  | 1: Read access to SysErrGen is not restricted |
| 3 to 0 | Reserved | These bits are always read as 0. The write value should always be 0. |

(g) IPGPMTUM4 - Peripheral Device Protection Setting Register 4

Access: IPGPMTUM4 register can be read or written in 8-bit units.
Address: IPGPMTUM4: FFFE E024 ${ }_{\text {H }}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | wo | Ro |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3BC. 70 IPGPMTUM4 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | These bits are always read as 0. The write value should always be 0. |
| 1 | W0 | This bit sets whether to enable write access to its own PEG. |
|  | 0: Write access to its own PEG is treated as violation. (Value after reset) |  |
|  | 1: Write access to its own PEG is not restricted. |  |
| 0 | R0 | This bit sets whether to enable read access to its own PEG. |
|  | 0: Read access to its own PEG is treated as violation. (Value after reset) |  |
|  | 1: Read access to its own PEG is not restricted |  |

## 3BC.2.3.3 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.
Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.
The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

## (1) List of SEG Function Control Registers

Table 3BC. 71 SEG Register (Base Address: FFFE E980н)

| Module Name | Address Offset | Size (Byte) | Register Name | Abbreviation | Right*1 | R/W | Operable Bit |  |  |  | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | 1 | 8 | 16 | 32 |  |
| SEG | $+0 \mathrm{O}_{\mathrm{H}}$ | 2 | SEG error control register | SEGCONT | SV | R/W | - | - | $\checkmark$ | - | 0000 ${ }_{\text {H }}$ |
|  | $+02_{\text {H }}$ | 2 | SEG error flag register | SEGFLAG | SV | R/W | - | - | $\checkmark$ | - | $0^{0000}{ }_{\text {H }}$ |
|  | $+08_{H}$ | 4 | SEG error address information register | SEGADDR | SV | R/W | - | - | - | $\checkmark$ | Undefined (retained) |

Note 1. Registers for which "SV" is described are writable with the SV right $(\mathrm{UM}=0)$. Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

## (2) Register Set

## (a) SEGCONT - SEG Error Control Register

This register is used to enable (=1) or disable (=0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

Table 3BC. 72 SEGCONT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | VCSE | This bit enables notification of an error response detected inside system interconnect: <br> - Error response from external bus masters in write access <br> - Illegal response to local RAM or peripherals or Flash from optional master in access (except instruction fetch from CPU). And illegal response to optional slave from external AHB master in access. |
| 9 | APIE | This bit enables notification of an error response from peripherals. The error notification includes the following cases: <br> - Error response from peripherals in write access <br> - PBG error in write access |
| 8 | IPGE | This bit enables notification of IPG illegal access detection. |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | TCME | This bit enables notification of an error during data access to its own local RAM ${ }^{* 1}$ from PE master. <br> The error notification includes the following cases: <br> - ECC uncorrectable error (DED or SED \& SECDIS=1) <br> - Detection of an access to RAM unimplemented area |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 3BC. 72 SEGCONT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 4 | VCIE | RH850/F1KM-S4: |
|  |  | This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM, retention RAM, H-Bus and CodeFlash by PE. |
|  |  | The error notification includes the following cases: |
|  |  | - IPG error from CPU peripherals and P-Bus |
|  |  | - Error response from H -Bus peripherals |
|  |  | - PBG error / HBG error from P-Bus and H-Bus |
|  |  | - GRG error from global RAM and retention RAM |
|  |  | - ECC uncorrectable error from CodeFlash, global RAM and retention RAM (DED or SED \& SECDIS = 1) |
|  |  | This bit enables notification of an error response when accessing to a part of access prohibited areas in address map. |
|  |  | RH850/F1KM-S1: |
|  |  | This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM and CodeFlash by PE. |
|  |  | The error notification includes the following cases: |
|  |  | - IPG error from CPU peripherals and P-Bus |
|  |  | - PBG error from P-Bus |
|  |  | - ECC uncorrectable error from CodeFlash (DED or SED \& SECDIS = 1) |
|  |  | This bit enables notification of an error response when accessing to a part of access prohibited areas in address map. |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Note 1. It is local RAM and retention RAM in RH850/F1KM-S1.

## (b) SEGFLAG - SEG Error Flag Register

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0 . Both setting and clearing of each flag are supported in writing to the register.

Table 3BC. 73 SEGFLAG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | VCSF | Flag corresponding to bit 10 of the SEGCONT register |
| 9 | APIF | Flag corresponding to bit 9 of the SEGCONT register |
| 8 | IPGF | Flag corresponding to bit 8 of the SEGCONT register |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | Reserved | Flag corresponding to bit 6 of the SEGCONT register |
| 5 | VCIF | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | Reserved | Flag corresponding to bit 4 of the SEGCONT register |

NOTE
An error may lead to setting of multiple error flags in SEG. For example, if an IPG error occurs at peripheral registers read, both IPGF bit and VCIF bit in SEGFLAG are set.

## (c) SEGADDR - Error Address Information Register

Address information (one record) which is notified with error occurrence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Address[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | Address[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 3BC. 74 SEGADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | Address | These bits store the error address information. |

## CAUTIONS

1. SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit, APIF bit or IPGF bit in SEGFLAG register.
2. In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

## (3) SEG Function

## (a) SEG Function: SYSERR Request Notification by Error Flag

- Setting an error flag takes precedence over clearing the same flag.
- A simultaneous clearing operation is ignored.
- Priority of error factors
- The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
- The bit position of error factors is reported as a "SysErr factor code."
- Conditions for starting SysErr request notification
- Even if a flag which error notification is disabled by SEGCONT register is set to 1 , notification is not made.
- Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
- After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
- Even after notification is finished, the flag is not cleared automatically.
- Notification is not made until setting or clearing the flag again.
- If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

## (b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
- No information is retained by setting or clearing an error flag in SEGFLAG register.
- When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1 , overwrite to the SEGADDR register is inhibited.
- If error occurrence input continues, information of subsequent error factors is not retained.
- To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

## (c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

## 3BC. 3 Notes

## 3BC.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see APPENDIX A, Hazard Resolution Procedure for System Registers in the RH850G3KH User's Manual: Software.

When the updated results in the control registers are to be used by the subsequent instruction:
Example 1: An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.
Proceed as follows in this case.
(1) Execute the store instruction to update a control register (ST.W, etc.).
(2) Perform a dummy read of the above control register (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute the subsequent instruction (EI).

In case of RH850/F1KM, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

Example 2: When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.
(1) Execute the store instruction to update the control register A (ST.W, etc.).
(2) Perform a dummy read of the above control register (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute the store instruction to access the control register B (ST.W, LD.W, etc.).

In case of RH850/F1KM, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

## When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.
(1) Execute the store instruction to update a memory (ST.W, etc.).
(2) Perform a dummy read of the above memory (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute SYNCI.
(5) Execute the subsequent instruction (branch instruction, etc.).
(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.
(1) Execute the store instruction to update a control register (ST.W, etc.).
(2) Perform a dummy read of the control register (LD.W, etc.).
(3) Execute SYNCP.
(4) Execute SYNCI.
(5) Execute the subsequent instruction (branch instruction, etc.).

## When switching the code flash memory area:

In this case, see Section 10, Usage Notes, (7) Updating the BFASELR register in the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

## 3BC.3.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in Section 3BC.2.2, Buffers for Code Flash.

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

## 3BC.3.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8 -bit units. Thus, access by a bitmanipulation instruction is only possible for registers for which reading and writing in 8 -bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

## 3BC.3.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

## 3BC.3.5 Overwriting Context upon Acceptance of Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see the List of Exception Sources in the RH850G3KH User's Manual: Software.

## Section 4A Address Space of RH850/F1KH-D8

## 4A. 1 Address Space

Table 4A.1, Address Space (8-MB 176/233/324-Pin Product) to Table 4A.2, Address Space (6-MB
176/233/324-Pin Product) show the address space of the RH850/F1KH.

## CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4A.1, Address Space (8-MB 176/233/324-Pin Product) to Table 4A.2, Address Space (6-MB 176/233/324-Pin Product). If such an address is accessed, operation is not guaranteed.

NOTE
The Local RAM is accessible through the following three address areas in the address space.
CPU1 area: Address area accessible from CPU1, CPU2, DMA, FlexRay and ETNB.
CPU2 area: Address area accessible from CPU1, CPU2, DMA, FlexRay and ETNB.
Self area: Mirrored address area, accessible only from CPU (CPU1, CPU2) to refer the CPU's self resource.

Table 4A. 1 Address Space (8-MB 176/233/324-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000{ }_{\text {H }}$ to 003F FFFF ${ }_{\text {H }}$ | Code Flash (bank A) | 4 MB |
| $00400000^{\text {H }}$ to 007F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $00800000^{\text {H }}$ to 00BF FFFF ${ }_{\text {H }}$ | Code Flash (bank B) | 4 MB |
| $00 \mathrm{CO} 0000_{\mathrm{H}}$ to 00FF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $01000000_{\text {H }}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000_{\text {H }}$ to $1001 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10020000_{\mathrm{H}}$ to 1002 1FFF $_{\mathrm{H}}$ | FlexRay Interface (FLXA) | 8 KB |
| $1002 \mathrm{2000}_{\mathrm{H}}$ to $1002 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10030000_{\mathrm{H}}$ to 100303 FF H | External Memory Access Controller (MEMC) | 1 KB |
| $10030400_{\text {H }}$ to $1003 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10040000_{\text {H }}$ to $10040 \mathrm{FFF}_{\mathrm{H}}$ | Serial Flash Memory Interface (SFMA) | 4 KB |
| $10041000^{\text {H }}$ to 1 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $20000000^{\text {H }}$ to $20 F F \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area(CS0) | $16 \mathrm{MB}^{* 4}$ |
| $21000000{ }_{H}$ to 21 FF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $22000000_{\text {H }}$ to 22FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area(CS1) | $16 \mathrm{MB}^{* 4}$ |
| $23000000_{\mathrm{H}}$ to 23FF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $24000000{ }_{\text {H }}$ to $24 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area(CS2) | $16 \mathrm{MB}^{* 4}$ |
| $25000000_{\mathrm{H}}$ to 27FF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $28000000_{\mathrm{H}}$ to $28 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area(CS3) | $16 \mathrm{MB}^{* 4}$ |
| $29000000_{\mathrm{H}}$ to $2 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $30000^{0000}{ }_{\text {H }}$ to 33FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Serial Flash Memory Area | 64 MB |
| $34000000_{\mathrm{H}}$ to FE9C $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FE9D $0000{ }_{\text {H }}$ to FE9F $\mathrm{FFFF}_{\mathrm{H}}$ | Local RAM (CPU2 area) | 192 KB*1 |
| $\mathrm{FEAO}^{0000}{ }_{\text {H }}$ to FEBC FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FEBD}^{0000}{ }_{\mathrm{H}}$ to FEBF FFFF ${ }_{\text {H }}$ | Local RAM (CPU1 area) | 192 KB*1 |

Table 4A. 1 Address Space (8-MB 176/233/324-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| FEC0 0000 ${ }_{\text {H }}$ to FEDC FFFFF ${ }_{H}$ | Access prohibited area |  |
| FEDD $0000{ }_{\text {H }}$ to FEDF FFFF ${ }_{\text {H }}$ | Local RAM (self area) | 192 KB*1 |
| FEE0 $0000_{\text {H }}$ to FEEB 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEEB $8000_{\text {H }}$ to FEEF FFFF ${ }_{\text {H }}$ | Global RAM A | 288 KB*2 |
| FEF0 0000 ${ }_{\text {H }}$ to FEF0 FFFFF ${ }_{\text {H }}$ | Retention RAM | 64 KB |
| FEF1 $0000{ }_{\text {H }}$ to FEFB 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEFB $8000_{\mathrm{H}}$ to FEFF FFFF $_{\mathrm{H}}$ | Global RAM B | 288 KB*2 |
| FF00 $0000{ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FF20 00000 ${ }^{\text {to }}$ FF23 $\mathrm{FFFF}_{\mathrm{H}}$ | Data flash | 256 KB*3 |
| FF24 0000 ${ }_{\text {H }}$ to FF9F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFA0 $0000{ }_{\mathrm{H}}$ to FFFD $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area | $6 \mathrm{MB}-128 \mathrm{~KB}$ |
| $\mathrm{FFFE}^{0000}{ }_{\text {H }}$ to FFFE DFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFFE E000 ${ }_{\text {H }}$ to FFFE FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF $0000_{\text {H }}$ to FFFF 4FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFFF 5000 ${ }_{\text {H }}$ to FFFF FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area | 44 KB |

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 2. 256 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.
Note 4. 8 MB in 176/233-pin products: For details, see Section 16, External Memory Access Controller (MEMC).

## 4A. 2 Address Space Viewed from Each Bus Master

Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) shows address spaces viewed from each bus master.

## 4A.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, global RAM, and retention RAM.

## 4A.2.2 Data Space Accessible by CPU1

See Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) for the spaces accessible from the CPU1.

## 4A.2.3 Data Space Accessible by CPU2

See Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) for the spaces accessible from the CPU2.

## 4A.2.4 Data Space Accessible by DMA

See Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) for the spaces accessible from the DMA.

## 4A.2.5 Data Space Accessible by Flexray

See Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) for the spaces accessible from the Flexray.

## 4A.2.6 Data Space Accessible by ETNB

See Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) for the spaces accessible from the ETNB.

## 4A.2.7 Data Space Accessible by Each Bus Master

See Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) for the spaces accessible from Each Bus Master.

Table 4A. 3 Address Space Viewed from Each Bus Master (8-MB Product)

| Address | Resource | From CPU1 | From CPU2 | From DMA | From FlexRay | From ETNB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $00000000^{\text {H }}$ to 003F $\mathrm{FFFF}_{\mathrm{H}}$ | Code Flash (bank A) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| 0040 0000 ${ }_{\text {H }}$ to 007F $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $00800000_{\mathrm{H}}$ to 00BF $\mathrm{FFFF}_{\mathrm{H}}$ | Code Flash (bank B) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $00 \mathrm{CO} 0000 \mathrm{H}_{\text {H }}$ to 00FF FFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $01000000^{\text {H }}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $01008000{ }_{\text {H }}$ to $1001 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $10020000^{\text {H }}$ to $10021 \mathrm{FFF}_{\mathrm{H}}$ | FlexRay Interface (FLXA) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $1002 \mathrm{2000}_{\mathrm{H}}$ to $1002 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $10030000{ }_{H}$ to $100303 \mathrm{FF}_{\mathrm{H}}$ | External Memory Access Controller (MEMC) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $10030400^{\text {H }}$ to $1003 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $10040^{0000}{ }_{\text {H }}$ to $10040 \mathrm{OFF}_{\mathrm{H}}$ | Serial Flash Memory Interface (SFMA) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $10041000^{\text {H }}$ to 1 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $20000000_{\mathrm{H}}$ to $20 F F \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CSO) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $21000000_{\mathrm{H}}$ to $21 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $22000000_{\mathrm{H}}$ to $22 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CS1) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $23000000_{\mathrm{H}}$ to $23 F F \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $24000000_{\mathrm{H}}$ to $24 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CS2) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $25000000_{\mathrm{H}}$ to $27 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $28000000_{\mathrm{H}}$ to $28 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CS3) | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $29000000_{\mathrm{H}}$ to $2 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| $30000000^{\text {H }}$ to $33 F F \mathrm{FFFF}_{\mathrm{H}}$ | External Serial Flash Memory Area | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| $34000000^{\text {H }}$ to FE9C FFFF ${ }_{H}$ | Access prohibited area |  |  |  |  |  |
| FE9D $0000_{\mathrm{H}}$ to FE9F FFFF ${ }_{\mathrm{H}}$ | Local RAM (CPU2 area) | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| FEA0 $0000_{\text {H }}$ to FEBC FFFF ${ }_{H}$ | Access prohibited area |  |  |  |  |  |
| FEBD 0000 ${ }_{\text {H }}$ to FEBF FFFF ${ }_{\text {H }}$ | Local RAM (CPU1 area) | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| FEC0 $0000_{\mathrm{H}}$ to FEDC $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| FEDD $0000_{\mathrm{H}}$ to FEDF FFFF ${ }_{\mathrm{H}}$ | Local RAM (self area) | $\checkmark$ | $\checkmark$ |  |  |  |
| FEE0 $0000{ }_{\text {H }}$ to FEEB 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |  |  |  |  |
| FEEB $8000_{\mathrm{H}}$ to FEEF $\mathrm{FFFF}_{\mathrm{H}}$ | Global RAM A | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| FEFO $0000{ }_{\text {H }}$ to FEFO $\mathrm{FFFF}_{\mathrm{H}}$ | Retention RAM | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| FEF1 0000 ${ }_{\text {H }}$ to FEFB 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |  |  |  |  |
| FEFB $8000_{\text {H }}$ to FEFF FFFF $_{\mathrm{H}}$ | Global RAM B | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| FF00 0000 ${ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |  |  |  |  |
| FF20 0000 ${ }_{\text {H }}$ to FF23 $\mathrm{FFFF}_{\mathrm{H}}$ | Data flash | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| FF24 $0000{ }_{\text {H }}$ to FF9F $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| FFA0 0000 ${ }_{\text {H }}$ to FFFD $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |
| FFFE $0000_{\mathrm{H}}$ to FFFE DFFF $_{\mathrm{H}}$ | Access prohibited area |  |  |  |  |  |
| FFFEE $000{ }_{\text {H }}$ to FFFE FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area (self area) | $\checkmark$ | $\checkmark$ |  |  |  |
| FFFF $0000_{\text {H }}$ to FFFF 4FFF ${ }_{\text {H }}$ | Access prohibited area |  |  |  |  |  |
| FFFFF $5000{ }_{\text {H }}$ to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |

## Section 4B Address Space of RH850/F1KM-S4

## 4B. 1 Address Space

Table 4B.1, Address Space (4-MB 176/233/272-Pin Product) to Table 4B.6, Address Space (3-MB 100Pin Product) show the address space of the RH850/F1KM.

## CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4B.1, Address Space (4-MB 176/233/272-Pin Product) to Table 4B.6,
Address Space (3-MB 100-Pin Product). If such an address is accessed, operation is not guaranteed.

NOTE
The Local RAM is accessible through the following two address areas in the address space.
CPU1 area: Address area accessible from CPU, DMA, FlexRay and ETNB.
Self area: Mirrored address area, accessible only from CPU to refer the CPU's self resource.

Table 4B. 1 Address Space (4-MB 176/233/272-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000^{\text {H }}$ to 003F FFFF ${ }_{\text {H }}$ | Code Flash | 4 MB |
| $00400000{ }_{\text {H }}$ to 00FF FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $01000000{ }_{\text {H }}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000{ }_{\text {H }}$ to $1001 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10020000_{\text {H }}$ to $10021 \mathrm{FFF}_{\mathrm{H}}$ | FlexRay Interface (FLXA) | 8 KB |
| $1002 \mathrm{2000}_{\mathrm{H}}$ to $1002 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10030000_{\mathrm{H}}$ to $100303 \mathrm{FF}_{\mathrm{H}}$ | External Memory Access Controller (MEMC) | 1 KB |
| $10030400{ }_{\text {H }}$ to $1003 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10040^{0000}{ }_{\text {H }}$ to $10040 \mathrm{OFF}_{\mathrm{H}}$ | Serial Flash Memory Interface (SFMA) | 4 KB |
| $10041000^{\text {H }}$ to 1 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $20000000_{\mathrm{H}}$ to 20FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CS0) | $16 \mathrm{MB}^{* 4}$ |
| $21000000_{\mathrm{H}}$ to $21 \mathrm{FF} \mathrm{FFFF} \mathrm{H}_{\mathrm{H}}$ | Access prohibited area |  |
| $22000000_{\text {H }}$ to $22 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CS1) | $16 \mathrm{MB}^{* 4}$ |
| $23000000_{\mathrm{H}}$ to $23 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $24000000_{\text {H }}$ to $24 \mathrm{FF} \mathrm{FFFF} \mathrm{H}_{\mathrm{H}}$ | External Memory Area (CS2) | $16 \mathrm{MB}^{\star 4}$ |
| $25000000{ }_{\text {H }}$ to $27 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $28000000_{\mathrm{H}}$ to $28 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ | External Memory Area (CS3) | $16 \mathrm{MB}^{* 4}$ |
| $29000000_{\text {H }}$ to 2 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $30000000^{\text {H }}$ to 33FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Serial Flash Memory Area | 64 MB |
| $34000000_{H}$ to FEBB FFFF ${ }^{\text {H }}$ | Access prohibited area |  |
| FEBC $0000_{\mathrm{H}}$ to FEBF FFFFF | Local RAM (CPU1 area) | 256 KB*1 |
| FEC0 $0000_{\mathrm{H}}$ to FEDB FFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| FEDC $0000_{\mathrm{H}}$ to FEDF FFFF ${ }_{\mathrm{H}}$ | Local RAM (self area) | 256 KB*1 |
| FEE0 0000 ${ }_{\text {H }}$ to FEEE 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEEE $8000_{\mathrm{H}}$ to FEEF FFFF ${ }_{\mathrm{H}}$ | Global RAM A | 96 KB *2 |
| FEF0 $0000{ }_{\text {H }}$ to FEFO $\mathrm{FFFF}_{\mathrm{H}}$ | Retention RAM | 64 KB |
| FEF1 0000 ${ }_{\text {H }}$ to FEFE 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |

Table 4B. 1 Address Space (4-MB 176/233/272-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| FEFE 8000 ${ }_{\text {H }}$ to FEFF FFFF ${ }_{\text {H }}$ | Global RAM B | 96 KB*2 |
| FF00 $0000 \mathrm{H}_{\mathrm{H}}$ to FF1F FFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| FF20 0000 ${ }_{\text {H }}$ to FF21 $\mathrm{FFFF}_{\mathrm{H}}$ | Data flash | 128 KB*3 |
| FF22 0000\% ${ }^{\text {to }}$ FF9F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FFAO}^{0000}{ }_{\mathrm{H}}$ to FFFD $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area | 6 MB - 128 KB |
| FFFE $0000_{\mathrm{H}}$ to FFFE $\mathrm{DFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FFFE $\mathrm{EOOO}_{\mathrm{H}}$ to FFFE FFFFF | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF $0000{ }_{\text {H }}$ to FFFF 4FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFFF $5000{ }_{\text {H }}$ to FFFF FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area | 44 KB |

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.
Note 4. 8 MB in 176/233-pin products: For details, see Section 16, External Memory Access Controller (MEMC).

Table 4B. 2 Address Space (4-MB 144-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000{ }_{\text {H }}$ to 003F FFFF ${ }_{\text {H }}$ | Code Flash | 4 MB |
| $00400000{ }_{\text {H }}$ to 00FF FFFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $01000000_{\text {H }}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000_{\mathrm{H}}$ to $1001 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10020000_{\text {H }}$ to $10021 \mathrm{FFF}_{\mathrm{H}}$ | FlexRay Interface (FLXA) | 8 KB |
| $1002 \mathrm{2000}_{\mathrm{H}}$ to $1003 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10040000^{\text {H }}$ to $10040 \mathrm{FFF}_{\mathrm{H}}$ | Serial Flash Memory Interface (SFMA) | 4 KB |
| $10041000^{\text {H }}$ to 2 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $30000000^{\text {H }}$ to 33FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Serial Flash Memory Area | 64 MB |
| $34000000_{\mathrm{H}}$ to FEBB $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $\mathrm{FEBC}^{0000}{ }_{\text {H }}$ to FEBF FFFF ${ }_{\text {H }}$ | Local RAM (CPU1 area) | 256 KB*1 |
| FECO $0000{ }_{\text {H }}$ to FEDB FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FEDC}^{0000_{H}}$ to FEDF FFFF ${ }_{\text {H }}$ | Local RAM (self area) | 256 KB*1 |
| FEE0 $0000{ }_{\text {H }}$ to FEEE 7FFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| FEEE $8000_{\text {H }}$ to FEEF FFFF ${ }_{\text {H }}$ | Global RAM A | 96 KB*2 |
| $\mathrm{FEFO}^{0000}{ }_{\text {H }}$ to FEF0 $\mathrm{FFFF}_{\mathrm{H}}$ | Retention RAM | 64 KB |
| FEF1 $0000{ }_{\mathrm{H}}$ to FEFE $7 \mathrm{FFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FEFE 8000 ${ }_{\text {H }}$ to FEFF FFFF ${ }_{\mathrm{H}}$ | Global RAM B | $96 \mathrm{~KB}^{* 2}$ |
| FF00 $0000{ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FF20 0000 ${ }_{\text {H }}$ to FF21 $\mathrm{FFFF}_{\mathrm{H}}$ | Data flash | 128 KB*3 |
| FF22 0000 ${ }_{\text {H }}$ to FF9F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| ${\mathrm{FFA0} 000 \mathrm{H}_{\mathrm{H}} \text { to FFFD FFFF }}_{\mathrm{H}}$ | On-chip peripheral I/O area | $6 \mathrm{MB}-128 \mathrm{~KB}$ |
| FFFE $0000{ }_{\text {H }}$ to FFFE DFFF $_{\mathrm{H}}$ | Access prohibited area |  |
| FFFE $\mathrm{E000}_{\mathrm{H}}$ to FFFE FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF 0000 ${ }_{\text {H }}$ to FFFF 4FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFFF $5000_{\text {H }}$ to FFFF FFFF $_{\text {H }}$ | On-chip peripheral I/O area | 44 KB |

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.

Table 4B. 3 Address Space (4-MB 100-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000^{\text {H }}$ to 003F FFFF ${ }_{\text {H }}$ | Code Flash | 4 MB |
| $00400000_{\text {H }}$ to 00FF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $01000000^{\text {H }}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000{ }_{\text {H }}$ to $1001 \mathrm{FFFF}_{\text {H }}$ | Access prohibited area |  |
| $10020000_{\mathrm{H}}$ to 1002 1FFF ${ }_{\text {H }}$ | FlexRay Interface (FLXA) | 8 KB |
| $1002 \mathbf{2 0 0 0}_{\mathrm{H}}$ to FEBB FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEBC $0000_{\mathrm{H}}$ to FEBF FFFF ${ }_{\mathrm{H}}$ | Local RAM (CPU1 area) | 256 KB*1 |
| FEC0 $0000_{\mathrm{H}}$ to FEDB FFFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| FEDC $0000_{\text {H }}$ to FEDF $\mathrm{FFFF}_{\mathrm{H}}$ | Local RAM (self area) | 256 KB*1 |
| FEE0 0000 ${ }_{\text {H }}$ to FEEE 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEEE $8000_{\mathrm{H}}$ to FEEF FFFF ${ }_{\mathrm{H}}$ | Global RAM A | 96 KB *2 |
| FEF0 0000 ${ }_{\text {H }}$ to FEFO $\mathrm{FFFF}_{\mathrm{H}}$ | Retention RAM | 64 KB |
| FEF1 0000 ${ }_{\text {H }}$ to FEFE 7FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEFE $8000_{\mathrm{H}}$ to FEFF $\mathrm{FFFF}_{\mathrm{H}}$ | Global RAM B | 96 KB*2 |
| FF00 $0000{ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FF20 $0000{ }_{\mathrm{H}}$ to FF21 $\mathrm{FFFF}_{\mathrm{H}}$ | Data flash | 128 KB *3 |
| $\mathrm{FF} 22 \mathrm{0000}_{\mathrm{H}}$ to FF9F $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FFA0 $0000_{\mathrm{H}}$ to FFFD $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area | $6 \mathrm{MB}-128 \mathrm{~KB}$ |
| FFFE $0000_{\mathrm{H}}$ to FFFE $\mathrm{DFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FFFEE $\mathrm{EOOO}_{\mathrm{H}}$ to FFFE $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFF $0000{ }_{\text {H }}$ to FFFF $4 \mathrm{FFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FFFFF 5000 ${ }_{\text {H }}$ to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ | On-chip peripheral I/O area | 44 KB |

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.

Table 4B. 4 Address Space (3-MB 176/233/272-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000{ }_{\text {H }}$ to 002F FFFF ${ }_{\text {H }}$ | Code Flash | 3 MB |
| $00300000_{\mathrm{H}}$ to 00FF FFFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $01000000_{\mathrm{H}}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000_{\text {H }}$ to $1001 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10020000_{\mathrm{H}}$ to $10021 \mathrm{FFF}_{\mathrm{H}}$ | FlexRay Interface (FLXA) | 8 KB |
| $10022000^{\text {H }}$ to $1002 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10030000_{\mathrm{H}}$ to $100303 \mathrm{FF}_{\mathrm{H}}$ | External Memory Access Controller (MEMC) | 1 KB |
| $10030400_{\text {H }}$ to $1003 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10040000_{\text {H }}$ to $10040 \mathrm{FFF}_{\mathrm{H}}$ | Serial Flash Memory Interface (SFMA) | 4 KB |
| $10041000^{\text {H }}$ to 1 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $20000000^{\text {H }}$ to 20FF FFFF ${ }_{\text {H }}$ | External Memory Area (CSO) | $16 \mathrm{MB}^{* 4}$ |
| $21000000_{\mathrm{H}}$ to 21FF FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $22000000_{\text {H }}$ to 22FF FFFF ${ }_{\text {H }}$ | External Memory Area (CS1) | $16 \mathrm{MB}^{\star 4}$ |
| $23000000_{\mathrm{H}}$ to 23FF FFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| $24000000_{\text {H }}$ to 24FF FFFF ${ }_{\text {H }}$ | External Memory Area (CS2) | $16 \mathrm{MB}^{* 4}$ |
| $25000000{ }_{\text {H }}$ to 27FF FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $28000000{ }_{H}$ to 28FF FFFF ${ }_{\text {H }}$ | External Memory Area (CS3) | $16 \mathrm{MB}^{* 4}$ |
| $29000000{ }_{\text {H }}$ to 2FFF FFFF ${ }^{\text {H }}$ | Access prohibited area |  |
| $30000^{0000}{ }_{\text {H }}$ to 33FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Serial Flash Memory Area | 64 MB |
| $34000000_{H}$ to FEBC FFFF ${ }^{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FEBD}^{0000}{ }_{\mathrm{H}}$ to FEBF FFFFF ${ }_{\mathrm{H}}$ | Local RAM (CPU1 area) | 192 KB*1 |
| FEC0 $0000_{\mathrm{H}}$ to FEDC $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FEDD $0000_{\mathrm{H}}$ to FEDF FFFF ${ }_{\mathrm{H}}$ | Local RAM (self area) | 192 KB*1 |
| FEE0 $0000{ }_{\text {H }}$ to FEEE FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FEEF $0000{ }_{\text {H }}$ to FEEF FFFF ${ }_{\text {H }}$ | Global RAM A | $64 \mathrm{~KB}^{* 2}$ |
| FEF0 $0000{ }_{\text {H }}$ to FEF0 FFFFF ${ }_{\text {H }}$ | Retention RAM | 64 KB |
| FEF1 $0^{0000}{ }_{\text {H }}$ to FEFE FFFF ${ }_{H}$ | Access prohibited area |  |
| FEFF $0000_{\mathrm{H}}$ to FEFF FFFF ${ }_{\mathrm{H}}$ | Global RAM B | 64 KB*2 |
| FF00 0000 ${ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FF} 20^{00000}{ }_{\text {H }}$ to FF21 $\mathrm{FFFF}_{\mathrm{H}}$ | Data flash | $128 \mathrm{~KB}^{* 3}$ |
| FF22 0000 ${ }_{\text {H }}$ to FF9F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFA0 $0000{ }_{\text {H }}$ to FFFD FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area | $6 \mathrm{MB}-128 \mathrm{~KB}$ |
| $\mathrm{FFFE}^{0000}{ }_{\text {H }}$ to FFFE $\mathrm{DFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FFFE E000 ${ }_{\text {H }}$ to FFFE FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area (self area) | 8 KB |
| FFFFF $0000_{\mathrm{H}}$ to FFFF 4FFF ${ }_{\text {H }}$ | Access prohibited area |  |
| FFFF 5000 ${ }_{\text {H }}$ to FFFF FFFFF | On-chip peripheral I/O area | 44 KB |

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.
Note 4. 8 MB in 176/233-pin products: For details, see Section 16, External Memory Access Controller (MEMC).

Table 4B. 5 Address Space (3-MB 144-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000^{\text {H }}$ to 002F FFFF ${ }_{\text {H }}$ | Code Flash | 3 MB |
| $00300000_{\mathrm{H}}$ to 00FF FFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| $01000000_{\mathrm{H}}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000_{\text {H }}$ to $1001 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10020000_{\text {H }}$ to $10021 \mathrm{FFF}_{\mathrm{H}}$ | FlexRay Interface (FLXA) | 8 KB |
| $1002 \mathrm{2000}_{\mathrm{H}}$ to $1003 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10040000_{\text {H }}$ to $10040 \mathrm{FFF}_{\mathrm{H}}$ | Serial Flash Memory Interface (SFMA) | 4 KB |
| $10041000^{\text {H }}$ to 2 FFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $30000000_{\mathrm{H}}$ to 33FF $\mathrm{FFFF}_{\mathrm{H}}$ | External Serial Flash Memory Area | 64 MB |
| $34000000_{\mathrm{H}}$ to FEBC FFFF ${ }^{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FEBD}^{0000}{ }_{\mathrm{H}}$ to FEBF FFFF ${ }_{\mathrm{H}}$ | Local RAM (CPU1 area) | 192 KB*1 |
| $\mathrm{FECO}^{0000}{ }_{\mathrm{H}}$ to FEDC FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $\mathrm{FEDD}^{0000}{ }_{\text {H }}$ to FEDF FFFF ${ }_{\text {H }}$ | Local RAM (self area) | 192 KB*1 |
| $\mathrm{FEEO}^{0000}{ }_{\mathrm{H}}$ to FEEE FFFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| FEEF $0000{ }_{\mathrm{H}}$ to FEEF FFFF ${ }_{\mathrm{H}}$ | Global RAM A | $64 \mathrm{~KB}^{* 2}$ |
| FEF0 $0000_{\mathrm{H}}$ to FEF0 $\mathrm{FFFF}_{\mathrm{H}}$ | Retention RAM | 64 KB |

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see Section 45, RAM.
Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see Section 44, Flash Memory.

## 4B. 2 Address Space Viewed from Each Bus Master

Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) shows address spaces viewed from each bus master.

## 4B.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, global RAM, and retention RAM.

## 4B.2.2 Data Space Accessible by CPU

See Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) for the spaces accessible from the CPU.

## 4B.2.3 Data Space Accessible by DMA

See Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) for the spaces accessible from the DMA.

## 4B.2.4 Data Space Accessible by Flexray

See Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) for the spaces accessible from the Flexray.

## 4B.2.5 Data Space Accessible by ETNB

See Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) for the spaces accessible from the ETNB.

## 4B.2.6 Data Space Accessible by Each Bus Master

See Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) for the spaces accessible from Each Bus Master.

Table 4B. $7 \quad$ Address Space Viewed from Each Bus Master (4-MB Product)

| Address | Resource | From CPU | From DMA | From FlexRay | From ETNB |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $00000000{ }_{\text {H }}$ to 003F FFFF ${ }_{\text {H }}$ | Code Flash | $\checkmark$ | $\checkmark$ |  |  |
| $00400000{ }_{\text {H }}$ to 00FF FFFFF ${ }_{\text {H }}$ | Access prohibited area |  |  |  |  |
| $01000000_{\mathrm{H}}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | $\checkmark$ | $\checkmark$ |  |  |

## Section 4C Address Space of RH850/F1KM-S1

## 4C. 1 Address Space

Table 4C.1, Address Space (1-MB 48/64/80/100-Pin Product), Table 4C.2, Address Space (768-KB 48/64/80/100-Pin Product), and Table 4C.3, Address Space (512-KB 48/64/80/100-Pin Product) show the address space of the RH850/F1KM.

## CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4C.1, Address Space (1-MB 48/64/80/100-Pin Product), Table 4C.2, Address Space (768-KB 48/64/80/100-Pin Product), and Table 4C.3, Address Space (512-KB 48/64/80/100-Pin Product). If such an address is accessed, operation is not guaranteed.

NOTE
The Local RAM is accessible through the following two address areas in the address space.
CPU1 area: Address area accessible from CPU and DMA.
Self area: Mirrored address area, accessible only from CPU to refer the CPU's self resource.

Table 4C. 1 Address Space (1-MB 48/64/80/100-Pin Product)

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000{ }_{\text {H }}$ to 000F $\mathrm{FFFF}_{\mathrm{H}}$ | Code Flash | 1 MB |
| $00100000^{\text {H }}$ to 00FF FFFFF ${ }_{\text {H }}$ | Access prohibited area |  |
| $01000000_{\mathrm{H}}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | 32 KB |
| $01008000{ }_{\text {H }}$ to FEBD FFFF ${ }_{\text {H }}$ | Access prohibited area |  |

## 4C. 2 Address Space Viewed from Each Bus Master

Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product) shows address spaces viewed from each bus master.

## 4C.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, and retention RAM.

## 4C.2.2 Data Space Accessible by CPU

See Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product) for the spaces accessible from the CPU.

## 4C.2.3 Data Space Accessible by Each Bus Master

See Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product) for the spaces accessible from Each Bus Master.

Table 4C. 4 Address Space Viewed from Each Bus Master (1-MB Product)

| Address | Resource | From CPU | From DMA |
| :---: | :---: | :---: | :---: |
| $00000000{ }_{\text {H }}$ to 000F $\mathrm{FFFF}_{\mathrm{H}}$ | Code Flash | $\checkmark$ | $\checkmark$ |
| $00100000{ }_{H}$ to 00FF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |
| $01000000_{\text {H }}$ to $01007 \mathrm{FFF}_{\mathrm{H}}$ | Code Flash (Extended user area) | $\checkmark$ | $\checkmark$ |
| $01008000{ }_{H}$ to FEBD FFFF ${ }_{\text {H }}$ | Access prohibited area |  |  |
| FEBE $0000_{\mathrm{H}}$ to FEBF 7FFF ${ }_{\mathrm{H}}$ | Local RAM (CPU1 area) | $\checkmark$ | $\checkmark$ |
| FEBF $8000{ }_{\text {H }}$ to FEBF FFFF ${ }_{\text {H }}$ | Retention RAM (CPU1 area) | $\checkmark$ | $\checkmark$ |
| FEC0 0000 ${ }_{\text {H }}$ to FEDD FFFF ${ }_{\text {H }}$ | Access prohibited area |  |  |
| FEDE $0000_{\text {H }}$ to FEDF 7FFF ${ }_{\text {H }}$ | Local RAM (self area) | $\checkmark$ |  |
| FEDF $8000^{\text {H }}$ to FEDF FFFF ${ }_{\mathrm{H}}$ | Retention RAM (self area) | $\checkmark$ |  |
| FEE0 0000 ${ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |  |
| FF20 0000 ${ }_{\text {H }}$ to FF20 $\mathrm{FFFF}_{\mathrm{H}}$ | Data Flash | $\checkmark$ | $\checkmark$ |
| FF21 $00000_{H}$ to FF9F FFFF ${ }_{\text {H }}$ | Access prohibited area |  |  |
| $\mathrm{FFAO}^{0000}{ }_{\mathrm{H}}$ to FFFD FFFF ${ }_{\mathrm{H}}$ | On-chip peripheral I/O area | $\checkmark$ | $\checkmark$ |
| FFFE $0000_{\mathrm{H}}$ to FFFE $\mathrm{DFFF}_{\mathrm{H}}$ | Access prohibited area |  |  |
| FFFE $\mathrm{E000}_{\mathrm{H}}$ to FFFE FFFF ${ }_{\mathrm{H}}$ | On-chip peripheral I/O area (self area) | $\checkmark$ |  |
| FFFF $0000_{\mathrm{H}}$ to FFFF $4 \mathrm{FFF}_{\mathrm{H}}$ | Access prohibited area |  |  |
| FFFFF $5000{ }_{\text {H }}$ to FFFF FFFF ${ }_{\text {H }}$ | On-chip peripheral I/O area | $\checkmark$ | $\checkmark$ |

Note: The following color coding is used in the map above.

| Fetch and data access available |
| :---: |
| Data access available |
| Access prohibited |

## 4C. 3 Peripheral I/O Address Map

Table 4C.5, Peripheral I/O Address Map shows peripheral I/O address map.

| Address | Peripheral Group | Peripheral I/O |
| :---: | :---: | :---: |
| FF00 0000 ${ }_{\text {H }}$ to FF1F FFFF ${ }_{\text {H }}$ | - | Access prohibited area |
| FF20 0000 ${ }_{\text {H }}$ to FF20 FFFF ${ }_{\text {H }}$ | 2 | Data Flash |
| FF21 0000 ${ }_{\text {H }}$ to FF9F FFFFF ${ }_{\text {H }}$ | - | Access prohibited area |
| FFAO $0000{ }_{H}$ to FFAO $001 \mathrm{~F}_{\mathrm{H}}$ | 1 | FLMD |
| FFA0 $0020_{\mathrm{H}}$ to FFA0 0 FFFF ${ }_{\mathrm{H}}$ | - | Access prohibited area |
| FFAO 1000 ${ }_{\text {H }}$ to FFAO $103 \mathrm{~F}_{\mathrm{H}}$ | - | Access prohibited area |
| FFA0 $1040^{\text {H }}$ to FFAO 1FFF ${ }_{\mathrm{H}}$ | - | Access prohibited area |
| FFA0 2000 ${ }^{\text {H }}$ to FFA0 $201 \mathrm{~F}_{\mathrm{H}}$ | - | Access prohibited area |
| FFA0 2020 ${ }^{\text {H }}$ to FFA0 $\mathrm{FFFF}_{\mathrm{H}}$ | - | Access prohibited area |
| FFA1 $0000_{\mathrm{H}}$ to FFA1 $1 \mathrm{FFF}_{\mathrm{H}}$ | 1 | Flash controller |
| FFA1 $\mathbf{2 0 0 0}_{\text {H }}$ to FFA1 $\mathrm{FFFF}_{\mathrm{H}}$ | - | Access prohibited area |
| FFA2 0000 ${ }^{\text {H }}$ to FFA2 FFFF $_{\mathrm{H}}$ | 1 | FACI command-issuing area |
| FFA3 $0000_{\mathrm{H}}$ to FFBF FFFF ${ }_{\text {H }}$ | - | Access prohibited area |

## Section 5 Write-Protected Registers

This section contains a generic description of the write-protected registers.
The first part in this section describes the features specific to the write-protected registers, and the ensuing sections describe the various registers.

### 5.1 Overview

### 5.1.1 Functional Overview

The RH850/F1KH, RH850/F1KM products require a special procedure using write-protected registers to set important registers that affect the system, such as clock, reset, and port-related registers. The settings of protected registers are protected against illegal writing by programs by requiring a special procedure. For details about the protected registers, see Section 5.1.5, Write-Protection Target Registers. Write-protected registers are managed in units of protected registers called register protection clusters.

### 5.1.2 Writing Procedure to Write-Protected Registers

Write access to a write-protected register is enabled by using the following protection unlock sequence:

1. Write the fixed value $000000 \mathrm{~A} 5_{\mathrm{H}}$ to the protection command register.
2. Write the desired value to the protected register.
3. Write the bit-wise inversion of the desired value to the protected register.
4. Write the desired value to the protected register.
5. Verify that the desired value has been written to the protected register.

Verify successful write of the desired value to the protected register by verifying that the error monitor bit in the protection status register is " 0 ".

In case the write was not successful, indicated by the error monitor bit set to " 1 ", the entire sequence has to be restarted at step 1.

If another register (second register) is accessed between step 1 and step 4 of the above sequence for writing to a writeprotected register (first register), the protection mechanism operates as follows:

- If the second register belongs to the same cluster, the write to the protected register fails (the error monitor bit is set to 1 ). The entire sequence has to be restarted at step 1 .
- If the second register does not belong to the same cluster, the protection unlock sequence is not disrupted and the write to the first register completes successfully.

### 5.1.3 Interrupt during Write Protection Unlock

If an interrupt occurs during the protection unlock sequence, the protection mechanism operates as follows:
(1) If an interrupt request is accepted during the protection unlock sequence and write access to a register of the same cluster is performed.

The protection unlock sequence is disrupted, so the write operation to the protected register cannot be completed upon returning from the interrupt service routine. Figure 5.1, Example of Interruption of Register
Protection Unlock Sequence shows an execution example.

Figure 5.1 Example of Interruption of Register Protection Unlock Sequence
(2) If an interrupt request is accepted during the protection unlock sequence and write access to a register of a different cluster is performed.

The protection unlock sequence is not disrupted, so the write operation to the protected register is completed upon returning from the interrupt service routine. Figure 5.2, Example of Successful Protection Unlock Sequence shows an execution example.

Main routine

Step1: write to "cluster A" protection command register (Write data $=000000 \mathrm{~A} 5_{\mathrm{H}}$ )
Step2: write to "cluster A" protected register (Write data $=$ expected value)
Step3: write to "cluster A" protected register (Write data $=$ inverted data of expected value) Step4: write to "cluster A" protected register (Write data $=$ expected value)
Step5: read and verify the error monitor bit

Figure 5.2 Example of Successful Protection Unlock Sequence

For more information on registers of RH850/F1KH, RH850/F1KM register protection clusters, see Section 5.1.5, Write-Protection Target Registers.

### 5.1.4 Emulation Break during Write Protection Unlock Sequence

If an emulation break occurs during the protection unlock sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed.

Even if any register of the same cluster is accessed during the break, the protection unlock sequence is not disrupted and the error monitor bit is not set to 1 .

### 5.1.5 Write-Protection Target Registers

The registers that are protected through the write-protection control registers are listed below.
Table 5.1 Write-Protection Target Registers (RH850/F1KH-D8)

| Protection Target | Protection Target Register | Protection Control Register |  | Protection Cluster |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Command Register | Status Register |  |
| Clock controller | MOSCE | PROTCMD0 | PROTS0 | Control protection cluster 0 |

|  | CVMDIAG |  |  |  |
| Self-programming function | FLMDCNT | FLMDPCMD | FLMDPS | Self-programming protection cluster |

Note 1. Each port group has its own protection command register and status register. For details, see Section 5.1.5(1), Port Protection Clusters.
(1) Port Protection Clusters

The following port control registers have a write protection function:

- Port open drain control registers (PODCn, JPODC0)
- Port drive strength control registers (PDSCn, JPDSC0)

The write protected port registers are divided into two port protection clusters as shown in the following table:
Table 5.4 Port Protection Clusters (RH850/F1KH-D8)

| Port Protection Cluster | Port Group |
| :--- | :--- |
| 0 | $\mathrm{JP0}, \mathrm{P0}, \mathrm{P} 1, \mathrm{P} 2, \mathrm{P} 3$, P8 |
| 1 | $\mathrm{P} 9, \mathrm{P} 10, \mathrm{P} 11, \mathrm{P} 12, \mathrm{P} 13, \mathrm{P} 18, \mathrm{P} 19, \mathrm{P} 20, \mathrm{P} 21, \mathrm{P} 22, \mathrm{P} 23, \mathrm{P} 24$ |

Table 5.5 Port Protection Clusters (RH850/F1KM-S4)

| Port Protection Cluster | Port Group |
| :--- | :--- |
| 0 | JP0, P0, P1, P2, P3, P8 |
| 1 | P9, P10, P11, P12, P13, P18, P19, P20, P21, P22 |

Table 5.6 Port Protection Clusters (RH850/F1KM-S1)

| Port Protection Cluster | Port Group |
| :--- | :--- |
| 0 | JP0, P0, P8 |
| 1 | P9, P10, P11 |

NOTE
Each port group n has its own port protection command register PPCMDn and port protection status register PPROTSn.
However, any port protection command registers of the same port protection cluster can be used in the protection unlock sequence. For instance, PPCMD0 can be used to unlock PODC8.

### 5.2 Registers

### 5.2.1 List of Registers

The following table lists the write-protection control registers.
Table $5.7 \quad$ List of Registers (RH850/F1KH-D8)

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |

### 5.2.2 Details of Control Protection Cluster Registers

### 5.2.2.1 PROTCMDn — Protection Command Register

This register is used to initiate the write protection unlock sequence for write-protected registers.

## Index n

An index " $n$ " denotes the number of protection command registers. For details, see Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8), Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4) and Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1).

| Access: <br> Address: |  |  | This register is a write-only register that can be written in 32-bit units. <br> See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1). |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 5.10 PROTCMDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | PCMDn[7:0] | Protection command register bits to enable writing to protected registers of control protection <br> cluster |

### 5.2.2.2 PROTSn - Protection Status Register

This register indicates the status of the protection unlock sequence performed by PROTCMDn.

## Index n

An index " $n$ " denotes the number of protection command registers. For details, see Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8), Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4) and Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1).

### 5.2.3 Details of Clock Monitor Control and Test Protection Cluster Registers

### 5.2.3.1 CLMAnPCMD - CLMAn Protection Command Register

This register is a protection command register for the CLMAnCTL0 register.

## Index n

An index " $n$ " denotes the number of protection command registers. For details, see Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8), Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4) and Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1).

Access: This register is a write-only register that can be written in 8 -bit units.
Address: $\quad$ See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1)

Value after reset: $\quad 00_{H}$

Table 5.12 CLMAnPCMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | CLMAnREG[7:0] | Protection command register bits to enable writing to the CLMAnCTLO register |

### 5.2.3.2 CLMAnPS — CLMAn Protection Status Register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

Index $\mathbf{n}$
An index " $n$ " denotes the number of protection command registers. For details, see Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8), Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4) and Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1).

| Access: | This register is a read-only register that can be read in 8-bit units. |
| ---: | :--- |
| Address: | See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, |
|  | List of Registers (RH850/F1KM-S1). |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 5.13 CLMAnPS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | CLMAnPRERR | Write protection sequence error monitor |
|  | $0:$ No protection error occurred |  |
|  | 1: Protection error occurred |  |

### 5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register

This register is a protection command register for the CLMATEST register.

Access: This register is a write-only register that can be written in 32-bit units.
Address: $\quad$ See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1).

| Value after reset: |  |  | XXXX XX00\% |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 5.14 PROTCMDCLMA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When writing to these bits, write "0". |
| 0 | CLMATREG[7:0] | Protection command register bits to enable writing to the CLMATEST register |

### 5.2.3.4 PROTSCLMA — Clock Monitor Test Protection Status Register

This register is used to verify whether the write-protected register (CLMATEST) has been successfully written or not.

Access: This register is a read-only register that can be read in 32-bit units.
Address: $\quad$ See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1).

Value after reset: $00000000_{\mathrm{H}}$

Table 5.15 PROTSCLMA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | CLMATPRERR | Write protection sequence error monitor |
|  |  | $0:$ No protection error occurred |
|  | 1: Protection error occurred |  |

### 5.2.4 Details of Core Voltage Monitor Protection Cluster Registers

### 5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register

This register is a protection command register for the CVMF and CVMDIAG registers.

Access: This register is a write-only register that can be written in 32-bit units.
Address: $\quad$ See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1).

Value after reset: $\quad \mathrm{XXXX} \times \times 0 \mathrm{O}_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 5.17 PROTSCVM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | CVMFPRERR | Write protection sequence error monitor |
|  |  | $0:$ No protection error occurred |
|  | 1: Protection error occurred |  |

### 5.2.5 Details of Port Protection Cluster Registers

### 5.2.5.1 PPCMDn — Port Protection Command Register

PPCMDn is a protection command register for port group n.

## Index n

An index " $n$ " denotes the number of protection command registers. For details, see Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8), Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4) and Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1).

| Access: <br> Address: |  |  | This register is a write-only register that can be written in 32-bit units. <br> See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | XXXX XX00н |  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit | 31 | 30 | 29 | 28 |  |  |  |  |  |  |  |  |  |  |  |  |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|  | - | - | - | - | - | - | - | - | PPCMDn[7:0] |  |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | w | w | w | w | w | w | w | w |

Table 5.18 PPCMDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | PPCMDn[7:0] | Protection command register bits that enable writing to port protection cluster registers |

NOTE
The protection command register for port group JP0 is JPPCMDO. Its bits are JPPCMD0[7:0].

### 5.2.5.2 PPROTSn — Port Protection Status Register

PPROTSn is a protection status register for write-protected registers of port group n. It indicates the status of the protection sequence operated by PPCMDn.

## Index $\mathbf{n}$

An index " $n$ " denotes the number of protection command registers. For details, see Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8), Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4) and Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1).

| Access: <br> Address: |  |  | This register is a read-only register that can be read in 32-bit units. <br> See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $00000000{ }_{H}$ |  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit | 31 | 30 | 29 | H 28 |  |  |  |  |  |  |  |  |  |  |  |  |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c\|} \hline \text { PPROT } \\ \text { SnPRE } \\ \text { RR } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 5.19 PPROTSn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | PPROTSnPRERR | Write protection sequence error monitor |
|  | $0:$ No protection error occurred |  |
|  | 1: Protection error occurred |  |

NOTE
The protection status register for port group JP0 is JPPROTSO. Its bit is JPPROTSOPRERR.

### 5.2.6 Details of Self-Programming Protection Cluster Registers

### 5.2.6.1 FLMDPCMD — FLMD Protection Command Register

FLMDPCMD is a protection command register for the FLMDCNT register.

Access: This register is a write-only register that can be written in 32-bit units.
Address: $\quad$ See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1).

Value after reset: $\quad \mathrm{XXXX} \times \times 0 \mathrm{O}_{\mathrm{H}}$

Table 5.20 FLMDPCMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When writing to these bits, write 0. |
| 7 to 0 | FLMDPC[7:0] | Protection command register bits that enable writing to FLMDCNT register |

### 5.2.6.2 FLMDPS — FLMD Protection Error Status Register

This register is used to verify whether the write-protected register (FLMDCNT) has been successfully written or not.

Access: This register is a read-only register that can be read in 32 -bit units.
Address: $\quad$ See Table 5.7, List of Registers (RH850/F1KH-D8), Table 5.8, List of Registers (RH850/F1KM-S4) and Table 5.9, List of Registers (RH850/F1KM-S1)

Value after reset: $00000000_{\mathrm{H}}$

Table 5.21 FLMDPS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | FLMDPRERR | Write protection sequence error monitor |
|  |  | $0:$ No protection error occurred |
|  | 1: Protection error occurred |  |

## Section 6 Operating Mode

This section describes the operating mode and mode selection of the RH850/F1KH, RH850/F1KM.
The RH850/F1KH, RH850/F1KM has the operating mode shown below.

- Normal operating mode

This mode is for execution of the user program. The on-chip debug functions also use this mode. If FLMD0 is pulled up high during operation in this mode, writing to the code flash memory through self-programming is enabled.

RH850/F1KH-D8:
CPU2 (PE2) start-up control at reset release depends on the option byte setting. For details of the option byte, see

## Section 44.9.2, OPBTO - Option Byte 0.

- Serial programming mode

The dedicated flash memory programmer enables erasing/writing to flash memory.

- Boundary scan mode

This mode allows boundary scan tests compliant with IEEE Standard 1149.1.

- User boot mode

This mode is the same as normal operating mode except that the reset vector address is fixed to " $01000000_{\mathrm{H}}$ ", and transition to standby modes is not supported.
RH850/F1KH-D8:
CPU2 (PE2) is disabled regardless of the option byte setting in this mode.

When the external reset or power-on clear reset is generated, the state of the FLMD0, FLMD1, MODE0, MODE1, and MODE2 pins are used to determine the operating mode after reset is released. The operating mode is fixed by the release of these reset factors. Table 6.1, Selection of Operating Mode lists the relationship between the pin settings and the operating mode.

Table 6.1 Selection of Operating Mode

| Pins |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| FLMD0 | FLMD1 (P10_8) | MODE0 (P10_1) | MODE1 (P10_2) | MODE2 (P10_6) | Operating Mode |
| 0 | $x$ | $x$ | $x$ | $x$ | Normal operating mode |
| 1 | 0 | $x$ | $x$ | $x$ | Serial programming mode |
| 1 | 1 | 0 | 1 | 1 | Boundary scan mode |
| 1 | 1 | 1 | 1 | User boot mode |  |
| Other than the above |  |  |  |  | Setting prohibited |

## CAUTION

To change operating mode, restart from power-on clear reset. (Remove the power supply once and apply it again.) In the case of only by the external reset, some functions are not initialized after the mode transitions. For details of functions not initialized by the external reset, see Section 9A.1.1, Reset Sources and 9BC.1.1, Reset Sources.

## Section 7A Exception/Interrupts of RH850/F1KH-D8

## 7A. 1 Features of RH850/F1KH Exception/Interrupts

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in the RH850G3KH User's Manual: Software.
Table 7A. 1 List of Exception Sources

| Name | Symbol | Source | Priority | Saved to |
| :---: | :---: | :---: | :---: | :---: |
| Reset | RESET | Reset input | High | - |
| FE level non-maskable interrupt*1 | FENMI | FENMI input | A | FE |
| System error exception | SYSERR | SYSERR input |  | FE |
| FE level maskable interrupt*1 | FEINT | FEINT input |  | FE |
| Floating-point arithmetic exception (imprecise) | FPI | Execution of FPU instruction |  | El |
| El level maskable interrupt*1 | EIINT | Interrupt controller |  | El |
| Memory protection exception (execution right) | MIP | Memory protection violation |  | FE |
| System error exception | SYSERR | Error input at instruction fetch |  | FE |
| Reserved instruction exception | RIE | Execution of reserved instruction |  | FE |
| Coprocessor unusable exception | UCPOP | Execution of coprocessor instruction/access right violation |  | FE |
| Privileged instruction exception | PIE | Execution of privileged instruction |  | FE |
| Misaligned exception | MAE | Generation of misaligned access |  | FE |
| Memory protection exception (access right) | MDP | Memory protection violation |  | FE |
| Floating-point arithmetic exception (precise) | FPP | Execution of FPU instruction |  | El |
| System call | SYSCALL | Execution of SYSCALL instruction |  | El |
| FE level trap | FETRAP | Execution of FETRAP instruction |  | FE |
| El level trap 0 | TRAPO | Execution of TRAP instruction | $\nabla$ | El |
| El level trap 1 | TRAP1 | Execution of TRAP instruction | Low | El |

Note 1. These interrupt exceptions are described in this section.

## (1) Interrupts

The following three exceptions in Table 7A.1, List of Exception Sources are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)

An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.

- An FENMI interrupt is acknowledged even if the CPU system register PSW.NP $=1$.
- Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
- FEINT can be acknowledged if the CPU system register PSW.NP $=0$. It is masked if PSW.NP $=1$.
- Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)

An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.

- EIINT can be acknowledged if the CPU system register PSW.NP $=0$.

It is masked if PSW.NP $=1$, EIINT with a higher priority is being processed, or PSW.ID $=1$.

- Return from an EIINT interrupt is possible and so is recovery.
- Interrupt masking can be specified for each interrupt channel.
- 16 interrupt priority levels can be specified for each interrupt channel
- In this section, the EIINT that corresponds to interrupt channel $n$ is indicated by "INTn", whereas the EIINT that corresponds to interrupt source xxx is indicated by "INTxxx".

For the PSW register, see Table 3A.10, PSW Register Contents and the RH850G3KH User's Manual: Software.
NOTE
Return: Indicates whether or not the program can resume from where it was interrupted.
Recovery: Indicates whether or not the processor status (status of processor resources including general-purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in Section 7A.2, Interrupt Sources.

## (2) Overview of interrupts

- Simultaneous distribution of interrupt sources to multiple cores
- A single interrupt source can be distributed to multiple CPU cores.
(Distribution target cores: CPU1/CPU2)
- Target interrupt sources: Non-maskable interrupt 1 source,

FE level interrupt 1 source, EI level interrupts 29 sources

- Priority levels for interrupt

16 priority levels of maskable interrupts by request can be set by interrupt control register.

- Detecting methods of external interrupts (TNMI/INTPm)

A method of detecting external interrupts (TNMI and INTPm) can be selected from five types: rising edge, falling edge, both edges, low level, and high level.

- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.
- Inter-processor interrupts

High-speed inter-processor interrupts are enabled.

## 7A. 2 Interrupt Sources

## 7A.2.1 Interrupt Sources

## 7A.2.1.1 FE Level Non-Maskable Interrupts

(1) Priority

See Table 7A.1, List of Exception Sources.
(2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.
(3) Status Register

See Section 7A.4.5, FNC — FE Level NMI Status Register.

## (4) Return Instruction

None
Table 7A. 2 FE Level Non-Maskable Interrupt Requests

| Interrupt |  |  | Interrupt Request |  | Unit | Priority | Exception <br> Source <br> Code | Handler Address 00000... |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Symbol | Control Register |  |  |  |  |  |  |  |
|  | Name | Address | Name | Source |  |  |  |  |
| FENMI | FNC | FFFE EA78 ${ }_{\text {H }}$ | TNMI | NMI pin | Port | *1 | OEOH | OEOH |
|  |  |  | WDTAONMI | WDTAO FENMI interrupt | WDTAO |  |  |  |
|  |  |  | WDTA1NMI | WDTA1 FENMI interrupt | WDTA1 |  |  |  |
|  |  |  | WDTA2NMI | WDTA2 FENMI interrupt | WDTA2 |  |  |  |

Note 1. See Table 7A.1, List of Exception Sources.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See Section 7A.2.2, FE Level Non-Maskable Interrupt Sources for details.

## 7A.2.1.2 FE Level Maskable Interrupts

(1) Priority

See Table 7A.1, List of Exception Sources.
(2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).
(3) Status Register

See Section 7A.4.6, FIC - FE Level Maskable Interrupt Status Register.
(4) Return Instruction

FERET

Table 7A. 3 FE Level Maskable Interrupt Requests (RH850/F1KH-D8)

Note 1. See Table 7A.1, List of Exception Sources.
Note 2. INTOSTMO can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTMO is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTMO.
Note 3. INTOSTM5 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM5 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM5

* Timing monitor (TSU)

This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

## 7A.2.1.3 El Level Maskable Interrupts

## (1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by <name>.
For details of the names used in IC<name>, see Table 7A.4, El Level Maskable Interrupt Sources.

- Interrupt request name: INT<name>

The prefix "INT" is appended to <name>.

- Interrupt request control register: IC<name>

The prefix "IC" is appended to <name>.
The 16 -bit register IC<name> can also be accessed in byte units:

- Low byte (bits [7:0]) of the IC <name> register: IC <name>L The suffix "L" is appended to the register name $\mathbf{I C}<$ name $>$.
- High byte (bits [15:8]) of the IC <name> register: IC <name>H The suffix "H" is appended to the register name IC<name>.
- Interrupt control register bit names: CT<name>, RF<name>, MK<name>, TB<name>, $\mathbf{P} 3<n a m e>, \mathbf{P} 2<n a m e>$, $\mathbf{P 1}$ <name>, $\mathbf{P 0}<$ name>
The bit prefix "CT", "RF", "MK", "TB", "P3", "P2", "P1", or "P0" is appended to the interrupt <name>.

## Example

The interrupt request from channel 2 of TAUD0 channel (<name> = TAUD0I2) is named

## INTTAUD0I2

The related interrupt control registers are
ICTAUD0I2, ICTAUD0I2L, ICTAUD0I2H
The bits in this register are
CTTAUD0I2,RFTAUD0I2, MKTAUD0I2, TBTAUD0I2, P3TAUD0I2, P2TAUD0I2, P1TAUD0I2, P0TAUD0I2

## (2) Priority

See Table 7A.1, List of Exception Sources.

## (3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

## (4) Control Register

EI level maskable interrupt control register
See Section 7A.4.2, ICxxx — EI Level Interrupt Control Registers.

## (5) Return Instruction

EIRET instruction

## (6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 382 channels with a cascade connection of INTC1 and INTC2.

- INTC1

CPU1 and CPU2 have their own interrupt controllers.
Each CPU accesses the INTC1 register that corresponds to respective CPUs.
INTC1 controls high-speed interrupt and has the following functions:

- Priority setting
- Interrupt mask setting
- INTC2

INTC2 is a common interrupt controller that CPU1 and CPU2 share.
INTC2 controls low-speed interrupts and has the following functions.

- Priority setting
- Interrupt mask setting
- Binding setting

Figure 7A. 1 Configuration Diagram of El Level Maskable Interrupt

## CAUTION

As CPUCLK_L is the operating clock for INTC2, the EIINT32 to EIINT381 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

See Table 7A.4, EI Level Maskable Interrupt Sources lists EI level maskable interrupts.

| 381 | ICDMA63 | FFFF B2FA ${ }_{\text {H }}$ | INTDMA63 | DMA37 transfer completion | PDMA1 | Edge | 117D ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |  |  | $+5 \mathrm{~F} 4 \mathrm{H}$ |

Note 1. Each interrupt is connected to INTC1 channel 0 to 31 and INTC2 channel 32 to 381.
Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an El level interrupt control register. For details, see Section 7A.4.2, ICxxx - El Level Interrupt Control Registers. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in Section 3A.5.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution are required to reflect the result of the register update to the subsequent instruction.
Note 3. Irrespective of interrupt channels, an offset address is determined in the range from $+100_{\mathrm{H}}$ to $1 \mathrm{~F} 0_{\mathrm{H}}$ according to the priority ( 0 to 15).
Note 4. Irrespective of the priority, offset addresses are uniformly $+100_{\mathrm{H}}$.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position $=$ INTBP register + channel number $\times 4$ bytes
Note 6. The same interrupt source is assigned to different interrupt channels. For details, see Section 7A.5.2, SELB_INTC1 INTC1 Interrupt Select Register.
Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see Section 37, PWM Output/Diagnostic (PWM-Diag).
Note 8. For details, see Section 7A.10, Exception Handler Address.
Note 9. INTOSTMO can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTMO functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. INTOSTM5 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM5 functions as the TSU (timing supervision unit). It is used as ElINT when OSTM5 functions as anything other than the TSU function.
Note 11. For details on the interrupt source, see the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

Renesns

## 7A.2.2 FE Level Non-Maskable Interrupt Sources

## 7A.2.2.1 List of Registers

The following table lists the FE Level Non-Maskable Interrupt Sources registers.
Table 7A. 5 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| ECON_NMI | FENMI factor register | WDTNMIF | FFCO 0000 |
|  | WDTNMI factor clear register | WDTNMIFC | FFCO 0008 |

## 7A.2.2.2 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 7A. 6 WDTNMIF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | WDTA2NMIF | WDTA2NMI flag |
|  |  | 0: No WDTA2NMI occurred |
|  | 1: WDTA2NMI has occurred |  |
| 2 | WDTA1NMIF | WDTA1NMI flag |
|  |  | 0: No WDTA1NMI occurred |
|  |  | 1: WDTA1NMI has occurred |
| 1 |  | WDTAONMI flag |
|  |  | 0: No WDTAONMI occurred |
|  |  | 1: WDTAONMI has occurred |
| 0 | TNMIF signal flag from the NMI pin |  |
|  |  | 0: No TNMI occurred |
|  |  | 1: TNMI has occurred |

## 7A.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

Table 7A. 7 WDTNMIFC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | Reserved | When writing, write the value after reset. |
| 3 | WDTA2NMIFC | WDTA2NMIF flag clear |
|  |  | $0:-$ |
|  |  | 1: Clear |
| 2 | WDTA1NMIFC | WDTA1NMIF flag clear |
|  |  | $0:-$ |
|  |  | 1: Clear |
| 1 |  | WDTAONMIF flag clear |
|  |  | 0: - |
|  |  | 1: Clear |
| 0 | TNMIFC | $0:-$ |
|  |  | $1:$ Clear |

## 7A.2.3 FE Level Maskable Interrupt Sources

## 7A.2.3.1 List of Registers

The following table lists the FE Level Maskable Interrupt Sources registers.
Table 7A. $8 \quad$ List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| ECON_FEINT | FEINT factor register | FEINTF | FFC0 0100 |
|  | FEINT factor mask register | FEINTFMSK | FFC0 0104 |
|  | FEINT factor clear register | FEINTFC | FFC0 0108 |

## 7A.2.3.2 FEINTF - FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 7A. 9 FEINTF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | DMAFEIF | INTDMAERR interrupt occurrence |
|  |  | 0: No interrupt occurred |
|  |  | 1: Interrupt has occurred |
| 30 | ECCMMCAORAM $^{\text {FEIF*1 }}$ | INTECCMMCAORAM interrupt occurrence |
|  |  | 0: No interrupt occurred |
|  | ECCETH1 | 1: Interrupt has occurred |
| 29 | FEIF*1 | INTECCETH1 interrupt occurrence |
|  |  | 1: Interrupt has occurred |
| 28 | OSTM9FEIF | INTOSTM9_FE interrupt occurrence |
|  |  | 0: No interrupt occurred |
|  |  | 1: Interrupt has occurred |
| 27 | OSTM8FEIF | INTOSTM8_FE interrupt occurrence |
|  |  | 0: No interrupt occurred |
|  |  | 1: Interrupt has occurred |

Table 7A. 9 FEINTF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 26 | OSTM7FEIF | INTOSTM7_FE interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 25 | OSTM6FEIF | INTOSTM6_FE interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |

| 4 | ECCEEPO <br> FEIF | INTECCEEPO interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | LVILFEIF | INTLVIL interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |

Note 1. For the supported products, see Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8).

## 7A.2.3.3 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 7A. 10 FEINTFMSK Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | DMAFEIFMSK | INTDMAERR interrupt mask <br> 0: Not masked <br> 1: Masked |

Note 1. For the supported products, see Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8).

## 7A.2.3.4 FEINTFC — FEINT Factor Clear Register

This register clears the bits of the FEINT factor register (FEINTF).

## CAUTION

After confirming that handling by both handlers is complete after the completion of processing by a handler for an FEINT interrupt of CPU1 or CPU2, use the FEINT factor clear register (FEINTFC) to clear the flag for the given FEINT interrupt. For example, if processing by CPU1 takes less time than that by CPU2, checking only for the advance completion of processing by CPU1 creates a concern of repeated processing of the interrupt.

Table 7A. 11 FEINTFC Register Contents

Note 1. For the supported products, see Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8).

## 7A. 3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:
Table 7A. 12 External Interrupt Edge/Level Detection Registers (RH850/F1KH-D8)

| Interrupt | Register |
| :--- | :--- |
| TNMI | FCLA0CTL0_NMI |
| INTP0 | FCLA0CTL0_INTPL |
| INTP1 | FCLA0CTL1_INTPL |
| INTP2 | FCLA0CTL2_INTPL |
| INTP3 | FCLA0CTL3_INTPL |
| INTP4 | FCLA0CTL4_INTPL |
| INTP5 | FCLA0CTL5_INTPL |
| INTP6 | FCLA0CTL6_INTPL |
| INTP7 | FCLA0CTL7_INTPL |
| INTP8 | FCLA0CTL0_INTPH |
| INTP9 | FCLA0CTL1_INTPH |
| INTP10 | FCLA0CTL2_INTPH |
| INTP11 | FCLA0CTL3_INTPH |
| INTP12 | FCLA0CTL4_INTPH |
| INTP13 | FCLA0CTL5_INTPH |
| INTP14*1 | FCLA0CTL6_INTPH |
| INTP15*1 | FCLA0CTL7_INTPH |
| INTP16*1 | FCLA0CTL0_INTPU |
| INTP17*1 | FCLA0CTL1_INTPU |
| INTP18*1 | FCLA0CTL2_INTPU |
| INTP19*1 | FCLA0CTL3_INTPU |
| INTP20*1 | FCLA0CTL4_INTPU |
| INTP21*1 | FCLA0CTL5_INTPU |
| INTP22*1 |  |
| INTP23*1 |  |

Note 1. For the supported products, see Table 7A.4, EI Level Maskable Interrupt Sources.

See Section 2A, Pin Function of RH850/F1KH-D8 for details of these registers.

## 7A. 4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm ( $m=0$ to 11), IBDxxx, FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

## 7A.4.1 List of Registers

The following table lists the Interrupt Controller Control registers.
Table 7A. 13 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| INTC1 | El level interrupt control registers | ICxxx*1 | See Table 7A.4, El Level Maskable Interrupt Sources |
|  | El level interrupt mask registers | IMR0 | FFFE EAFOH |
|  | El level interrupt binding registers | IBDxxx*1 | See Table 7A.17, List of IBDxxx Registers |
| INTC2 | El level interrupt control registers | ICxxx*2 | See Table 7A.4, El Level Maskable Interrupt Sources |
|  | El level interrupt mask registers | IMRm | FFFF B400 ${ }_{\text {H }}+\left(04_{\mathrm{H}} \times \mathrm{m}\right)$ |
|  | El level interrupt binding registers | IBDxxx*2 | See Table 7A.17, List of IBDxxx Registers |
| INTC1 | FE level NMI status register | FNC | FFFE EA78 ${ }_{\text {H }}$ |
|  | FE level maskable interrupt status register | FIC | FFFE EA7A ${ }_{\text {H }}$ |

Note 1. Channel No. 0 to 31.
Note 2. Channel No. 32 or more.

Among the registers shown in Table 7A.16, IBDxxx Register Contents, ICxxx, IMR0, and IBDxxx, which correspond to interrupt channel numbers 0 to 31, are located in INTC1 of the CPU peripheral field included in each CPU. Each register of these can only be accessed from CPU1 or CPU2 which includes it.

Writing is only possible in supervisor mode (PSW.UM = 0).
Among the registers shown in Table 7A.16, IBDxxx Register Contents, ICxxx, IMR1 to IMR11, and IBDxxx, which correspond to interrupt channel numbers 32 to 381 , are located in INTC2 of peripheral group 0 . Writing to these registers is only possible in supervisor mode $(\mathrm{UM}=0)$ by a PE bound to IBDxxx or in supervisor mode $(\mathrm{UM}=0)$ by CPU1.

When writing to IMR1 to IMR11, only the bits corresponding to the conditions described above are overwritten; other bits are not updated.

Among the registers shown in Table 7A.16, IBDxxx Register Contents, the values of those listed as reserved for the given channel numbers in Table 7A.4, El Level Maskable Interrupt Sources, must retain their values after a reset.

## 7A.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see Table 7A.4, El Level Maskable Interrupt Sources.

## CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.
Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).
For bit-manipulation instructions, see also Section 3A.5.3, Access to Registers by Using Bit-Manipulation Instructions.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see Table 7A.4, EI Level Maskable Interrupt Sources.

Table 7A. 14 ICxxx Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 15 | CTxxx | This bit indicates the type of interrupt detection. This bit is read only. <br> 0 : Edge detection <br> 1: Level detection <br> When writing in 8 -bit or 16 -bit units, write the value after reset. |  |
| 14, 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 12 | RFxxx | The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an El level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged. <br> 0 : No interrupt request is made. <br> 1: Interrupt request is made. |  |
|  |  | Input Interface | Operation |
|  |  | Edge detection <br> (CTxxx = 0) | This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software. |
|  |  | Level detection (CTxxx = 1) | This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core. |

Table 7A. 14 ICxxx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | MKxxx | This is the interrupt request mask bit. <br> When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked. <br> When the interrupt request from the channel is masked with MKxxx $=1$, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register. <br> 0 : Enables interrupt processing <br> 1: Disables interrupt processing |
| 6 | TBxxx | This bit is used to select the way to determine the interrupt vector. <br> 0 : Direct jumping to an address determined from the level of priority <br> 1: Table reference <br> For details on the way to determine the interrupt vector, see the RH850G3KH User's Manual: Software. |
| 5, 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | P3xxx to P0xxx | These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. <br> When multiple El level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority. |

## CAUTIONS

1. Do not access ICxxx registers of interrupt channels listed as "Reserved" in Table 7A.4, El Level Maskable Interrupt Sources, and of the channels which are not incorporated in the product.
2. When a channel $n$ is defined as broadcast interrupt (IBDxxx.CST =1), MKxxx and RFxxx bits of the ICxxx register of the channel must be set to 0 after an initial configuration of the channel. In the period when the EIINTn interrupt is enabled, it is prohibited to mask ( $M K x x x=1$ ) an interrupt processing of the channel. When it is necessary to mask a broadcast interrupt, MKBNO of ICBNO registers in INTC1 of each PE can be used to mask the corresponding broadcast interrupt.

Page 775 of 4535

## 7A.4.3 IMRm — El Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

Table 7A. 15 IMRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | IMRmEIMK | These are interrupt mask bits for El level maskable interrupt (EIINT) channels 0 to 381. |
|  | $(\mathrm{~m} \times 32+31)$ to | $0:$ Enables interrupt servicing |
|  | IMRmEIMK | 1: Disables interrupt servicing |
|  | $(\mathrm{m} \times 32+0)$ |  |

## CAUTIONS

1. MKxxx bits which correspond to channels listed as "Reserved" in Table 7A.4, El Level Maskable Interrupt Sources and to channels which are not incorporated in the product must be set to " 1 ".
2. When a channel is used as broadcast interrupt (IBDxxx.CST =1), IMRmEIMKn bit corresponding to the channel must be set to 0 .

## 7A.4.4 IBDxxx — El Level Interrupt Binding Registers

These registers, each of which is for an EI level maskable interrupt (EIINT), are used to set the conditions for control of the interrupts. The registers are initialized by any type of reset.

Note 1. IBDxxx registers of CPU1 (PE1) (interrupt number 0 to 31): PEID[2:0] $=001 \mathrm{~B}$ IBDxxx registers of CPU2 (PE2) (interrupt number 0 to 31): PEID[2:0] = 010B IBDxxx registers (from interrupt number 32): PEID[2:0]= 001b

Table 7A. 16 IBDxxx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CST | This bit specifies whether interrupt input to the corresponding interrupt channel is or is not conveyed to multiple destinations (broadcast). <br> It can only be set in INTC2. The bit in IBDxxx for interrupt number 0 to 31 (INTC1) has the fixed value 0 . <br> 0 : The interrupt is handled as a normal interrupt (default value). <br> 1: The interrupt is conveyed to multiple destinations. |
| 30 to 25 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 24 | BCP0 | These bits specify the number of the broadcast port for output when the CST bit is 1 . If the CST bit is 0 , the setting of these bits are ignored. <br> The bits in IBDxxx for interrupt number 0 to 31 (INTC1) has the fixed value 0. <br> 0 : Output to broadcast port 0 <br> 1: Output to broadcast port 1 |
| 23 to 18 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 17, 16 | GPID[1:0] | These bits are implemented only in the IBDxxx registers (the interrupt number 32 or later). Select one of the followings for setting according to PEID settings. <br> 00: When CPU1 is selected for a binding destination by using PEID <br> 01: When CPU2 is selected for a binding destination by using PEID <br> Other than the above: Setting prohibited <br> These bits are reserved in the IBDxxx registers corresponding to interrupt number 0 to 31 . When writing, write 0 . These bits are always read as 0 . |
| 15 to 3 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after reset. |

Table 7A. 16 IBDxxx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 2 to 0 | PEID[2:0] | Specify destination for binding (requesting) an interrupt. |
|  |  | However, the PEID bit in the IBDxxx registers (interrupt number 0 to 31) |
|  | multiplexed by each CPU (PE) is fixed to each CPU (PE) number and cannot be changed. |  |
|  | 001: An interrupt is bound to CPU1. |  |
|  | 010: An interrupt is bound to CPU2. |  |

## CAUTIONS

1. Do not change the value of the corresponding IBDxxx register while the request for EIINT is being processed.
2. Only INTBNO and INTBN1 support broadcast interrupts in this product. So, total 2 IBDxxx register of CST = 1 can be set.
3. The channel of INTC2 that can be bind to broadcast communication input is only edge detection type.

## 7A.4.5 FNC - FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).
This register is initialized by any reset.

| Access: | FNC is a read-only register that can be read in 16-bit units. |
| :---: | :--- |
|  | FNCH is a read-only register that can be read in 8- or 1-bit units. |
| Address: | FNC: FFFE EA78 |
|  | FNCH: FFFE EA79 |
| Value after reset: | $0000_{\mathrm{H}}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | FNRF | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7A. 18 FNC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FNRF | Interrupt request flag |
|  |  | $0:$ No interrupt request |
|  |  | 1: Interrupt request occurred |
|  |  | This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by |
|  |  | the CPU core. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

## 7A.4.6 FIC - FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).
This register is initialized by any reset.

| Access: | FIC is a read-only register that can be read in 16-bit units. |
| :---: | :--- |
|  | FICH is a read-only register that can be read in 8- or 1-bit units. |
| Address: | FIC: FFFE EA7A ${ }_{H}$ |
|  | FICH: FFFE EA7B ${ }_{H}$ |
| Value after reset: | $8000_{H}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | FIRF | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7A. 19 FIC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FIRF | Interrupt request flag |
|  |  | 0: No interrupt request |
|  | 1: Interrupt request occurred |  |
|  |  | This bit cannot be set or cleared by software. It can only be read. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

## 7A. 5 El Level Maskable Interrupt Select Register

The following registers are used to select an EI level maskable interrupt.

## 7A.5.1 List of Registers

The following table lists the EI Level Maskable Interrupt Select register.
Table 7A. 20 List of Register

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| SL_INTC | INTC1 interrupt select register | SELB_INTC1 | FFC0 1000 |

## 7A.5.2 SELB_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled. This register is initialized by any reset.

NOTE
The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see Table 7A.4, EI Level Maskable Interrupt Sources.

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | FFCO $1000_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

Table 7A. 21 SELB_INTC1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | SELB_INTC1_12 | Interrupt channel selection <br> 0: INTADCAOI2 (Channel 20) INTCSIHOIJC (Channel 32) <br> 1: INTCSIHOIJC_1 (Channel 20) INTADCAOI2_2 (Channel 32) |
| 11 | SELB_INTC1_11 | Interrupt channel selection <br> 0: INTTAUDOI14 (Channel 15) INTCSIH3IJC (Channel 161) <br> 1: INTCSIH3IJC_1 (Channel 15) INTTAUDOI14_2 (Channel 161) |
| 10 | SELB_INTC1_10 | Interrupt channel selection <br> 0: INTTAUDOI12 (Channel 14) INTCSIH3IRE (Channel 160) <br> 1: INTCSIH3IRE_1 (Channel 14) INTTAUDOI12_2 (Channel 160) |

| NOTE |  |  |
| For the supported products, see Table 7A.4, El Level Maskable Interrupt Sources. |  |  |

## CAUTION

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC1.

## 7A. 6 Interrupt Function System Registers

See Table 3A.31, Interrupt Function System Registers.

## 7A.6.1 FPIPR — FPI Exception Interrupt Priority

See Table 3A.32, FPIPR Register Contents.
7A.6.2 ISPR — Priority of Interrupt being Serviced
See Table 3A.33, ISPR Register Contents.
7A.6.3 PMR — Interrupt Priority Masking
See Table 3A.34, PMR Register Contents.
7A.6.4 ICSR — Interrupt Control Status
See Table 3A.35, ICSR Register Contents.
7A.6.5 INTCFG - Interrupt Function Setting
See Table 3A.36, INTCFG Register Contents.

## 7A. 7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.
(1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.
(2) Calculate the exception handler address according to the current PSW value.*1
(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception source code in the FEIC.
- Update the PSW.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.
(4) For EI level exceptions, the following processing is performed:
- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception source code in the EIIC.
- Update the PSW.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

Note 1. For details, see Section 7A.10, Exception Handler Address.
Note 2. For the values to be updated, see Table 4.1 Exception Cause List in the RH850G3KH User's Manual: Software.

The following figure shows steps (1) to (4).

Figure 7A. 2 Operation when Acknowledging an Interrupt

## 7A.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.
Table 7A. 22 Exception Source Codes for Different Types of SYSERR Exceptions

| Exception Source Code | Source of SYSERR Generation |
| :---: | :---: |
| $11_{\text {H }}$ | - Detection of an error during the fetching of an instruction from the code flash memory area |
| $13_{\mathrm{H}}$ | - Detection of an error during the fetching of an instruction from the local, global or retention RAM areas |
| $14_{\text {H }}$ | - Detection of an error during access to data in the code flash area <br> - Detection of an error during read access to a module via the system interconnect or PBUS The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1 |
| $16_{H}$ | - Detection of an error during access to data in the own local RAM areas <br> The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1 |
| $18_{H}$ | - Detection of an IPG error <br> The exception source code reports an occurrence of a system error factor corresponding to VCIF, IPGF bit of SEGFLAG register*1 |
| $19_{\text {H }}$ | - Detection of an error during write access to a module via the PBUS <br> The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1 |
| $1 \mathrm{~A}_{\mathrm{H}}$ | - Detection of an error inside system interconnect <br> The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1 |

Note 1. See Section 3A.2.4.3, System Error Generator Function (SEG) for details.

## 7A. 8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:
(1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.
(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.
(3) When EP $=0$ and INTCFG.ISPC $=0$, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

Figure 7A. 3 Flow of Return from Interrupts

## 7A. 9 Interrupt Operation

## 7A.9.1 Interrupt Mask Function of El Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7A. 23 Operation of the MKxxx Bit

| ICxxx.MKxxx | Operation |
| :--- | :--- |
| 1 | Masks interrupt |
| 0 | Enables interrupt |

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

## [Operation example]

(1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.
(2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

## CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending ( $R F x x x=1$ ), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFXXx bit to 1 , the interrupt will not occur as long as the interrupt is masked with $M K x x x=1$.
To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

## 7A.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

## FENMI > FEINT > EIINT

See the RH850G3KH User's Manual: Software for other exceptions.

For EIINT(INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15 : 0 is the highest and 15 is the lowest. Among multiple EIINT(INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7A. 24 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels during Operation

| EIINT (INTn) | ICxxx.P[3:0]xxx Setting | Priority Level During Operation |
| :--- | :--- | :--- |
| INT0 | 3 | 10 |
| INT1 | 4 | 11 |
| INT2 | 0 | 1 |
| INT3 | 0 | 2 |
| INT4 | 1 | 3 |
| INT5 | 2 | 6 |
| INT6 | 2 | 7 |
| INT7 | 1 | 4 |
| INT8 | 1 | 5 |
| INT9 | 2 | 8 |
| INT10 | 2 | 9 |

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT (INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

## 7A.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.
The priority level of the interrupt currently being handled is stored in the ISPR register.
Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

## 7A.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.
For the PMR register, see Table 3A.34, PMR Register Contents, or the RH850G3KH User's Manual: Software.

## 7A.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

## 7A.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

## Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1 . If a subsequent EIINT interrupt with the priority level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

Figure 7A.4, Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1) shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1 . Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

Figure 7A. 4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)

Note 1. "a" to "u" in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7A. 5 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

## CAUTION

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.

Note 1. "a" to "c" in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7A. 6 Example of Servicing Simultaneously Generated Interrupt Requests

## 7A.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See the RH850G3KH User's Manual: Software.

## 7A.9.4 Exception Priority of Interrupts and the Priority Mask

See the RH850G3KH User's Manual: Software.

## 7A.9.5 Interrupt Priority Mask

See the RH850G3KH User's Manual: Software.

## 7A.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.
The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7A. 25 Operation of the PMR.PMm Bit

| PMR.PMm | Operation |
| :--- | :--- |
| 0 | Acknowledges requests from priority level $m$ interrupt source. |
| 1 | Masks requests from priority level $m$ interrupt source. |

Note: m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with Section 7A.9.7, Exception Management.

For details on the PMR register, see Table 3A.34, PMR Register Contents, or the RH850G3KH User's Manual: Software.

## 7A.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1KH. For details, see the RH850G3KH User's Manual: Software.

## 7A.9.8 Inter-Processor Interrupts

Four registers (IPIR_CHn) for conveying interrupts between PEs are provided.
IPIR_CH0 to IPIR_CH3 are assigned to CH0 to CH3 of user interrupt (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating bits corresponding to respective PEs.

Interrupt priority levels can be set for each source in interrupt control registers, 16 levels for CPU1 and CPU2.

## 7A.9.9 Broadcast Function (Broadcast Communication Function)

All interrupts have an interrupt register and an interrupt-binding register.
Any single interrupt can be allocated to each PE by setting IBDxxx.CST to 0 (value after a reset) and IBDxxx.PEID[2:0] to a desired value.

Each interrupt which is type of edge detection can be conveyed to both PEs by using the broadcast function (setting IBDxxx.CST to 1). For detection type of each interrupt, refer to Table 7A.4, EI Level Maskable Interrupt Sources.

This product only supports the use of two broadcast interrupt. Accordingly, only two IBDxxx.CST bit can be set to 1 and broadcase destination (INTBN0 or INTBN1) can be selected by BCP0 bit setting.

All interrupts for INTC1 that have interrupt number 4 or 5 are allocated to the broadcast interrupt, INTBN0 or INTBN1.

- Allocating multiple interrupt channels to the broadcast interrupt is prohibited.
- The setting of the ICxxx.P[3:0] bits for the interrupt priority level of an INTxxx allocated as a broadcast interrupt is ignored.
- The ICBN0.MKBN0, ICBN1.MKBN1 interrupt mask bit of INTC1 can be used to mask broadcast interrupts for PEs.
- The interrupt vector for the broadcast interrupt of INTC1 (INTBN0, INTBN1) is the same for both PEs.

## 7A.9.9.1 Example of Operation

- The example is described about INTOSTM0 interrupt, which is allocated to interrupt number 84 of INTC2.
- Multiple-conveyance (broadcast) port 0 is in use (INTBN0 is in use).
- The broadcast interrupt (INTBN0) is connected to INTC1 as interrupt number 4
- Set the IBDOSTM0.CST bit to $1_{\mathrm{B}}$ (enabling broadcasting).
- Set the IBDOSTM0.BCP0 bit to $0_{\mathrm{B}}$ (selecting broadcast port 0 ).
- Doing so leads to the allocation of the INTOSTM0 interrupt to interrupt number 4 of PE1 and PE2.
- The ICBN0.P[3:0]BN0 bits define the order of priority for this interrupt.
- The allocated mask bit is ICBN0.MKBN0 and ICBN0.RFBN0 is the interrupt request flag (accordingly, INTBN0 can be separately enabled or disabled for each PE in each INTC1).

When INTOSTM0 is generated, this interrupt request is conveyed from INTC2 to INTC1 through the broadcast interrupt.

Accordingly, the ICBN0.RFBN0 bit for INTC1 is set to $1_{\mathrm{B}}$ in both PE1 and PE2.
Both PEs execute the corresponding interrupt routine and each ICBN0.RFBN0 is automatically cleared.
All register settings are listed in the table overleaf.
Table 7A. 26 Register Settings (INTC2)

| Register Name | Bit Name | Setting Value | Description |
| :--- | :--- | :--- | :--- |
| ICOSTM0 | CTOSTM0 | 0 | The user can only read the value. |
|  | RFOSTM0 | - | No function if the setting is for broadcast interrupts |
|  | MKOSTM0 | $1 / 0$ | The user can set the value. |
|  | TBOSTM0 | - | No function if the setting is for broadcast interrupts |
|  | P[3:0]OSTM0 | - | No function if the setting is for broadcast interrupts |
| IBDOSTM0 | CST | 1 | Interrupt input is conveyed to multiple destinations (broadcast). |
|  | BCP0 | 0 | Output to broadcast port 0 |
|  | PEID[2:0] | - | No function if the setting is for broadcast interrupts |

Table 7A. 27 Register Settings (INTC1)

| Register Name | Bit Name | Setting Value | Description |
| :--- | :--- | :--- | :--- |
| ICBN0 | CTBN0 | 0 | The user can only read the value. |
|  | RFBNO | $1 / 0$ | Interrupt flag for broadcast interrupts |
|  | MKBN0 | $1 / 0$ | Mask flag for broadcast interrupts |
|  | TBBN0 | $1 / 0$ | The user can set the value. |
|  | P[3:0]BN0 | 0 to 15 | The user can set the value. |
| IBDBN0 | CST | 0 | Fixed to 0 |
|  | BCP0 | 0 | Fixed to 0 |
|  | PEID[2:0] | 001 (PE1) | Fixed |
|  |  | 010 (PE2) |  |

## 7A.9.9.2 Inter-Processor Interrupt Flow

Figure 7A.7, Example of Inter-Processor Interrupt Processing Flow shows a flow example of interprocessor interrupt processing.

- Inter-processor interrupt generates an interrupt request by writing 1 to applicable bits of PE to which an interrupt of the inter-processor interrupt register (IPIR_CHn ( $\mathrm{n}=0$ to 3 )) are requested.
- The settings of interrupt request of the inter-PE interrupt registers (IPIR_CHn ( $\mathrm{n}=0$ to 3 )) are automatically cleared to 0 after notification of an interrupt request is complete.

Figure 7A. 7 Example of Inter-Processor Interrupt Processing Flow

## 7A. 10 Exception Handler Address

In the RH850/F1KH, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory

## CAUTION

The exception handler address of EIINT (INTn) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT (INTn)). In the RH850/F1KH, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

## 7A.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in Table 7A.28, Selection of Base Register/Offset Address to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit*1. When the PSW.EBV bit is set to 1 , the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0 , the value of the RBASE register is used as the base address.

For reset input the RBASE register is always used for reference.
In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of $100_{\mathrm{H}}$. If the bit is cleared to 0 , the offset address is determined according to Table 7A.28, Selection of Base

## Register/Offset Address.

Note 1. Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

Figure 7A. 8 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7A. 28 Selection of Base Register/Offset Address

| Exception/Interrupt | PSW.EB | PSW.EBV = 1 | RINT $=0$ | RINT = 1 |
| :---: | :---: | :---: | :---: | :---: |
|  | Base Register |  | Offset Address |  |
| RESET | RBASE | N.A. | $000{ }_{\text {H }}$ | $000{ }_{H}$ |
| SYSERR |  | EBASE | $0^{010_{H}}$ | 010 ${ }_{\text {H }}$ |
| Reserved |  |  | 020 ${ }_{\text {H }}$ | 020 ${ }_{\text {H }}$ |
| FETRAP |  |  | 030 ${ }_{\text {H }}$ | $03 \mathrm{H}_{\mathrm{H}}$ |
| TRAP0 |  |  | 040 ${ }_{\text {H }}$ | 040 ${ }_{\text {H }}$ |
| TRAP1 |  |  | 050 ${ }_{\text {H }}$ | 050 ${ }_{\text {H }}$ |
| RIE |  |  | 060 ${ }_{\text {H }}$ | $0600^{H}$ |
| FPP/FPI |  |  | 070 ${ }_{\text {H }}$ | 070 ${ }_{\text {H }}$ |
| UCPOP |  |  | 080 ${ }_{\text {H }}$ | 080 ${ }_{\text {H }}$ |
| MIP/MDP |  |  | $090_{H}$ | $0^{090}{ }_{H}$ |
| PIE |  |  | $\mathrm{OAO}_{\mathrm{H}}$ | $\mathrm{OAO}_{\mathrm{H}}$ |
| MAE |  |  | $\mathrm{OCO}_{\mathrm{H}}$ | $\mathrm{OCO}_{\mathrm{H}}$ |
| Reserved |  |  | ODO ${ }_{\mathrm{H}}$ | ODO ${ }_{\mathrm{H}}$ |
| FENMI |  |  | $\mathrm{OEO}_{\mathrm{H}}$ | OEOH |
| FEINT |  |  | $\mathrm{OFO}_{\mathrm{H}}$ | $\mathrm{OFO}_{\mathrm{H}}$ |
| INTn (Priority level 0) |  |  | $100_{\mathrm{H}}$ | $100_{\mathrm{H}}$ |
| INTn (Priority level 1) |  |  | $110_{\mathrm{H}}$ |  |
| INTn (Priority level 2) |  |  | $120_{\mathrm{H}}$ |  |
| INTn (Priority level 3) |  |  | $130_{\mathrm{H}}$ |  |
| INTn (Priority level 4) |  |  | $140_{\mathrm{H}}$ |  |
| INTn (Priority level 5) |  |  | $150{ }_{H}$ |  |
| INTn (Priority level 6) |  |  | $160_{\mathrm{H}}$ |  |
| INTn (Priority level 7) |  |  | $170_{\mathrm{H}}$ |  |
| INTn (Priority level 8) |  |  | $180_{\mathrm{H}}$ |  |
| INTn (Priority level 9) |  |  | $190_{\text {H }}$ |  |
| INTn (Priority level 10) |  |  | $1 \mathrm{AO}_{\mathrm{H}}$ |  |
| INTn (Priority level 11) |  |  | $1 \mathrm{B0}_{\mathrm{H}}$ |  |
| INTn (Priority level 12) |  |  | $1 \mathrm{CO}_{\mathrm{H}}$ |  |
| INTn (Priority level 13) |  |  | $1 \mathrm{DO}_{\mathrm{H}}$ |  |
| INTn (Priority level 14) |  |  | $1 \mathrm{EO}_{\mathrm{H}}$ |  |
| INTn (Priority level 15) |  |  | $1 \mathrm{F0} \mathrm{H}$ |  |

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

## 7A.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1KH uses the table reference method for interrupts that assume the above usage.
If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:
$<1>$ In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV $=0$ and RBASE.RINT $=1$
- When PSW.EBV = 1 and EBASE.RINT = 1
- When the interrupt channel setting is not the table reference method
<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position $=$ INTBP register + channel number $\times 4$ bytes
$<3>$ Read word data starting at the interrupt handler address read position calculated in <2>.
<4> Use the word data read in <3> as the exception handler address.

Table 7A.29, Exception Handler Address Expansion shows the exception handler address read positions corresponding to each interrupt channel and
Figure 7A.9, Table Reference Method shows an overview of the allocation in memory.
Table 7A. 29 Exception Handler Address Expansion

| Type of Interrupt | Exception Handler Address Read Position |
| :--- | :--- |
| El level maskable interrupt channel 0 | INTBP register value $+0 \times 4$ |
| El level maskable interrupt channel 1 | INTBP register value $+1 \times 4$ |
| El level maskable interrupt channel 2 | INTBP register value $+2 \times 4$ |
| $:$ | $:$ |
| El level maskable interrupt channel 380 | INTBP register value $+380 \times 4$ |
| El level maskable interrupt channel 381 | INTBP register value $+381 \times 4$ |

## Section 7BC Exception/Interrupts of RH850/F1KM

## 7BC. 1 Features of RH850/F1KM Exception/Interrupts

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in the RH850G3KH User's Manual: Software.
Table 7BC. 1 List of Exception Sources

| Name | Symbol | Source | Priority | Saved to |
| :---: | :---: | :---: | :---: | :---: |
| Reset | RESET | Reset input | High | - |
| FE level non-maskable interrupt*1 | FENMI | FENMI input | A | FE |
| System error exception | SYSERR | SYSERR input |  | FE |
| FE level maskable interrupt*1 | FEINT | FEINT input |  | FE |
| Floating-point arithmetic exception (imprecise) | FPI | Execution of FPU instruction |  | El |
| El level maskable interrupt*1 | EIINT | Interrupt controller |  | El |
| Memory protection exception (execution right) | MIP | Memory protection violation |  | FE |
| System error exception | SYSERR | Error input at instruction fetch |  | FE |
| Reserved instruction exception | RIE | Execution of reserved instruction |  | FE |
| Coprocessor unusable exception | UCPOP | Execution of coprocessor instruction/access right violation |  | FE |
| Privileged instruction exception | PIE | Execution of privileged instruction |  | FE |
| Misaligned exception | MAE | Generation of misaligned access |  | FE |
| Memory protection exception (access right) | MDP | Memory protection violation |  | FE |
| Floating-point arithmetic exception (precise) | FPP | Execution of FPU instruction |  | El |
| System call | SYSCALL | Execution of SYSCALL instruction |  | El |
| FE level trap | FETRAP | Execution of FETRAP instruction |  | FE |
| El level trap 0 | TRAPO | Execution of TRAP instruction | $\nabla$ | El |
| El level trap 1 | TRAP1 | Execution of TRAP instruction | Low | El |

Note 1. These interrupt exceptions are described in this section.

## (1) Interrupts

The following three exceptions in Table 7BC.1, List of Exception Sources are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)

An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.

- An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1 .
- Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
- FEINT can be acknowledged if the CPU system register PSW.NP $=0$. It is masked if PSW.NP $=1$.
- Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)

An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.

- EIINT can be acknowledged if the CPU system register PSW.NP $=0$.

It is masked if PSW.NP $=1$, EIINT with a higher priority is being processed, or PSW.ID $=1$.

- Return from an EIINT interrupt is possible and so is recovery.
- Interrupt masking can be specified for each interrupt channel.
- 16 interrupt priority levels can be specified for each interrupt channel
- In this section, the EIINT that corresponds to interrupt channel $n$ is indicated by "INTn", whereas the EIINT that corresponds to interrupt source xxx is indicated by "INTxxx".

For the PSW register, see Table 3BC.10, PSW Register Contents and the RH850G3KH User's Manual: Software.
NOTE
Return: Indicates whether or not the program can resume from where it was interrupted.
Recovery: Indicates whether or not the processor status (status of processor resources including general-purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in Section 7BC.2, Interrupt Sources.

## (2) Overview of interrupts

- Priority levels for interrupt

16 priority levels of maskable interrupts by request can be set by interrupt control register.

- Detecting methods of external interrupts (TNMI/INTPm)

A method of detecting external interrupts (TNMI and INTPm) can be selected from five types:
rising edge, falling edge, both edges, low level, and high level.

- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.

## 7BC. 2 Interrupt Sources

## 7BC.2.1 Interrupt Sources

## 7BC.2.1.1 FE Level Non-Maskable Interrupts

(1) Priority

See Table 7BC.1, List of Exception Sources.
(2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.
(3) Status Register

See Section 7BC.4.4, FNC — FE Level NMI Status Register.

## (4) Return Instruction

None

Table 7BC. 2 FE Level Non-Maskable Interrupt Requests

| Interrupt |  |  | Interrupt Request |  | Unit | Priority | Exception <br> Source <br> Code |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Symbol | Control Register |  | Name | Source |  |  |  |  |
|  | Name | Address |  |  |  |  |  |  |
| FENMI | FNC | FFFE EA78 ${ }_{\text {H }}$ | TNMI | NMI pin | Port | *1 | OEOH | OEOH |
|  |  |  | WDTAONMI | WDTAO FENMI interrupt | WDTA0 |  |  |  |
|  |  |  | WDTA1NMI | WDTA1 FENMI interrupt | WDTA1 |  |  |  |

Note 1. See Table 7BC.1, List of Exception Sources.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See Section 7BC.2.2, FE Level Non-Maskable Interrupt Sources for details.

## 7BC.2.1.2 FE Level Maskable Interrupts

(1) Priority

See Table 7BC.1, List of Exception Sources.
(2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).
(3) Status Register

See Section 7BC.4.5, FIC — FE Level Maskable Interrupt Status Register.

## (4) Return Instruction

FERET

Table 7BC. 3 FE Level Maskable Interrupt Requests (RH850/F1KM-S4)

| Interrupt |  |  | Interrupt Request |  | Unit |  | $\begin{aligned} & \stackrel{n}{=} \\ & \dot{\underline{1}} \\ & \underset{\sim}{J} \end{aligned}$ |  | $\begin{aligned} & \stackrel{n}{\bar{c}} \\ & \underset{\sim}{N} \\ & \underset{N}{2} \end{aligned}$ | $\begin{aligned} & \stackrel{n}{=} \\ & \underset{0}{N} \\ & \underset{N}{N} \end{aligned}$ | Priority | Exception <br> Source <br> Code | Handler <br> Address <br> 00000... |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  |  | INTECCFLRAM | FLXAO ECC 1-bit error or 2-bit error interrupt | FLXAO | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCNFDRAM | RCFDC0 ECC 1-bit error or 2-bit error interrupt | RCFDC0 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIHO | CSIHO ECC 1-bit error or 2-bit error interrupt | CSIHO | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIH1 | CSIH1 ECC 1-bit error or 2-bit error interrupt | CSIH1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIH2 | CSIH2 ECC 1-bit error or 2-bit error interrupt | CSIH2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIH3 | CSIH3 ECC 1-bit error or 2-bit error interrupt | CSIH3 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCFLIO | Code Flash ECC 1-bit error or 2-bit error interrupt | Code flash | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCRAM | RAM ECC 1-bit error or 2bit error interrupt | RAM | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTOSTM0_FE*2 | OSTM0 interrupt | OSTM0 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTLVIH | LVI voltage detection (rising) | LVI | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTGUARD | PE Guard (PEG) error or Global RAM Guard (GRG) error or Peripheral Guard (PBG/HBG/PBGC) | PEG, GRG, PBG/HBG/P BGC | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTOSTM1_FE | OSTM1 interrupt | OSTM1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTOSTM2_FE | OSTM2 interrupt | OSTM2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTOSTM3_FE | OSTM3 interrupt | OSTM3 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTOSTM4_FE | OSTM4 interrupt | OSTM4 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCETH | ETNB0 ECC 1-bit error or 2-bit error interrupt | ETNBO | - | - | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTDMAERR | DMA transfer error interrupt | PDMAO | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |

Note 1. See Table 7BC.1, List of Exception Sources.
Note 2. INTOSTMO can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTMO is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTMO.

* Timing monitor (TSU)

This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

Table 7BC. 4 FE Level Maskable Interrupt Requests (RH850/F1KM-S1)

| Interrupt |  |  | Interrupt Request |  | Unit | $\begin{aligned} & \stackrel{\varrho}{0} \\ & \underset{\sim}{\infty} \\ & \underset{\sim}{\infty} \end{aligned}$ | $\begin{aligned} & \stackrel{n}{2} \\ & \stackrel{y}{6} \end{aligned}$ | $\begin{aligned} & n \\ & \stackrel{n}{\bar{O}} \\ & \circ \\ & \hline \end{aligned}$ | $\begin{aligned} & \frac{n}{1} \\ & \stackrel{\rightharpoonup}{0} \\ & 8 \\ & \hline-1 \end{aligned}$ | Priority | Exception <br> Source <br> Code | Handler <br> Address 00000... |

|  |  |  | INTECCEEPO | Data flash ECC 1-bit error or 2-bit error interrupt | Data flash | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCNFDRAM | RCFDCO ECC 1-bit error or 2-bit error interrupt | RCFDC0 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIHO | CSIHO ECC 1-bit error or 2-bit error interrupt | CSIHO | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIH1 | CSIH1 ECC 1-bit error or 2-bit error interrupt | CSIH1 | - | - | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIH2 | CSIH2 ECC 1-bit error or 2-bit error interrupt | CSIH2 | - | - | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCCSIH3 | CSIH3 ECC 1-bit error or 2-bit error interrupt | CSIH3 | - | - | - | $\checkmark$ |  |  |  |
|  |  |  | INTECCFLIO | Code Flash ECC 1-bit error or 2-bit error interrupt | Code flash | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTECCRAM | RAM ECC 1-bit error or 2bit error interrupt | RAM | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTOSTM0_FE*2 | OSTM0 interrupt | OSTM0 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTLVIH | LVI voltage detection (rising) | LVI | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTGUARD | PE Guard (PEG) error or Peripheral Guard (PBG/PBGC) | PEG, PBG/PBGC | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |
|  |  |  | INTDMAERR | DMA transfer error interrupt | PDMAO | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |

Note 1. See Table 7BC.1, List of Exception Sources.
Note 2. INTOSTMO can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTMO is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTMO.

* Timing monitor (TSU)

This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

## 7BC.2.1.3 El Level Maskable Interrupts

## (1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by <name>.
For details of the names used in IC<name>, see Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, El Level Maskable Interrupt Sources (RH850/F1KM-S1).

- Interrupt request name: INT<name>

The prefix "INT" is appended to <name>.

- Interrupt request control register: IC<name>

The prefix "IC" is appended to <name>.
The 16-bit register IC<name> can also be accessed in byte units:

- Low byte (bits [7:0]) of the IC <name> register: IC <name>L The suffix " L " is appended to the register name IC<name>.
- High byte (bits [15:8]) of the IC <name> register: IC <name>H The suffix " H " is appended to the register name $\mathbf{I C}<$ name $>$.
- Interrupt control register bit names: CT<name>, RF<name>, MK<name>, TB<name>, $\mathbf{P} 3<n a m e>, \mathbf{P 2 < n a m e > , ~}$ $\mathbf{P 1}$ <name>, $\mathbf{P 0}$ <name>
The bit prefix "CT", "RF", "MK", "TB", "P3", "P2", "P1", or "P0" is appended to the interrupt <name>.

## Example

The interrupt request from channel 2 of TAUD0 channel (<name> = TAUD0I2) is named

## INTTAUD0I2

The related interrupt control registers are
ICTAUD0I2, ICTAUD0I2L, ICTAUD0I2H
The bits in this register are
CTTAUD0I2,RFTAUD0I2, MKTAUD0I2, TBTAUD0I2, P3TAUD0I2, P2TAUD0I2, P1TAUD0I2, P0TAUD0I2
(2) Priority

See Table 7BC.1, List of Exception Sources.

## (3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

## (4) Control Register

EI level maskable interrupt control register
See Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers.

## (5) Return Instruction

## EIRET instruction

## (6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 377 channels with a cascade connection of INTC1 and INTC2.

Figure 7BC. 1 Configuration Diagram of El Level Maskable Interrupt

## CAUTION

As CPUCLK_L is the operating clock for INTC2, the EIINT32 to EIINT376 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1) lists EI level maskable interrupts.

Table 7BC. 5 El Level Maskable Interrupt Sources (RH850/F1KM-S4)

| Interrupt |  |  | Interrupt Request |  |  |  |  | $\begin{aligned} & n \\ & \underline{=} \\ & 0 \\ & 0 \\ & \hline \end{aligned}$ | $\begin{aligned} & n \\ & : \underline{n} \\ & J \\ & \underset{\sim}{n} \end{aligned}$ | $\begin{aligned} & \text { n } \\ & =0 \\ & 0 \\ & 0 \\ & \hline \end{aligned}$ | $\begin{aligned} & \stackrel{n}{\underline{n}} \\ & \text { ल } \\ & \text { N } \end{aligned}$ | $\begin{aligned} & \text { n } \\ & \stackrel{n}{N} \\ & N \\ & N \end{aligned}$ | Handler Address (Offset) ${ }^{*}$ |  |  |

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 376.
Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an El level interrupt control register. For details, see Section 7BC.4.2, ICxxx - El Level Interrupt Control Registers. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution are required to reflect the result of the register update to the subsequent instruction.
Note 3. Irrespective of interrupt channels, an offset address is determined in the range from $+100_{H}$ to $1 F 0_{H}$ according to the priority ( 0 to 15).
Note 4. Irrespective of the priority, offset addresses are uniformly $+100_{\mathrm{H}}$.
Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula. Exception handler address read position $=$ INTBP register + channel number $\times 4$ bytes
Note 6. The same interrupt source is assigned to different interrupt channels. For details, see Section 7BC.5.2, SELB_INTC1 INTC1 Interrupt Select Register.
Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see Section 37, PWM Output/Diagnostic (PWM-Diag).
Note 8. For details, see Section 7BC.10, Exception Handler Address.
Note 9. INTOSTMO can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTMO functions as the TSU (timing supervision unit). It is used as EIINT when OSTMO functions as anything other than the TSU function.
Note 10. For details on the interrupt source, see the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 357.
Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an El level interrupt control register. For details, see Section 7BC.4.2, ICxxx - El Level Interrupt Control Registers. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution are required to reflect the result of the register update to the subsequent instruction.
Note 3. Irrespective of interrupt channels, an offset address is determined in the range from $+100_{H}$ to $1 \mathrm{FO}_{\mathrm{H}}$ according to the priority ( 0 to 15).
Note 4. Irrespective of the priority, offset addresses are uniformly $+100_{\mathrm{H}}$.
Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position $=$ INTBP register + channel number $\times 4$ bytes
Note 6. The same interrupt source is assigned to different interrupt channels. For details, see Section 7BC.5.2, SELB_INTC1 INTC1 Interrupt Select Register.
Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see Section 37, PWM Output/Diagnostic (PWM-Diag).
Note 8. For details, see Section 7BC.10, Exception Handler Address.
Note 9. INTOSTMO can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTMO functions as the TSU (timing supervision unit). It is used as EIINT when OSTMO functions as anything other than the TSU function.
Note 10. For details on the interrupt source, see the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

## 7BC.2.2 FE Level Non-Maskable Interrupt Sources

## 7BC.2.2.1 List of Registers

The following table lists the FE Level Non-Maskable Interrupt Sources registers.
Table 7BC. 7 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| ECON_NMI | FENMI factor register | WDTNMIF | FFCO 0000 |
|  | WDTNMI factor clear register | WDTNMIFC | FFCO 0008 |

## 7BC.2.2.2 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 7BC. 8 WDTNMIF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | WDTA1NMIF | WDTA1NMI flag |
|  |  | 0: No WDTA1NMI occurred |
|  | 1: WDTA1NMI has occurred |  |
| 1 | WDTA0NMIF | WDTAONMI flag |
|  | 0: No WDTAONMI occurred |  |
|  | 1: WDTAONMI has occurred |  |
| 0 | TNMIF | Input signal flag from the NMI pin |
|  | 0: No TNMI occurred |  |
|  | 1: TNMI has occurred |  |

## 7BC.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

Access: This register is a write-only register that can be written in 32-bit units.
Address: FFCO 0008 ${ }_{\mathrm{H}}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 7BC. 9 WDTNMIFC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When writing, write the value after reset. |
| 2 | WDTA1NMIFC | WDTA1NMIF flag clear |
|  |  | $0:-$ |
|  |  | 1: Clear |
| 1 | WDTAONMIFC | WDTA0NMIF flag clear |
|  | $0:-$ |  |
|  |  | 1: Clear |
| 0 | TNMIFC | TNMIF flag clear |
|  | $0:-$ |  |
|  |  | $1:$ Clear |

## 7BC.2.3 FE Level Maskable Interrupt Sources

## 7BC.2.3.1 List of Registers

The following table lists the FE Level Maskable Interrupt Sources registers.
Table 7BC. 10 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| ECON_FEINT | FEINT factor register | FEINTF | FFC0 0100 |
|  | FEINT factor mask register | FEINTFMSK | FFC0 0104 |
|  | FEINT factor clear register | FEINTFC | FFC0 0108 |

## 7BC.2.3.2 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 7BC. 11 FEINTF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | DMAFEIF | INTDMAERR interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |
| 30 to 24 | Reserved | When read, the value after reset is returned. |
| 23 | $\begin{aligned} & \text { ECCETH } \\ & \text { FEIF*1 } \end{aligned}$ | RH850/F1KM-S4: <br> INTECCETH interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. |
| 22 | Reserved | When read, the value after reset is returned. |
| 21 | OSTM4FEIF | RH850/F1KM-S4: <br> INTOSTM4_FE interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. |
| 20 | OSTM3FEIF | RH850/F1KM-S4: <br> INTOSTM3_FE interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. |

Table 7BC. 11 FEINTF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 19 | OSTM2FEIF | RH850/F1KM-S4: <br> INTOSTM2_FE interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. |
| 18 | OSTM1FEIF | RH850/F1KM-S4: <br> INTOSTM1_FE interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. |
| 17 | GUARDFEIF | INTGUARD interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |
| 16 | Reserved | When read, the value after reset is returned. |
| 15 | LVIHFEIF | INTLVIH interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 14 | OSTMO <br> FEIF | INTOSTMO_FE interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 13 | ECCRAM FEIF | INTECCRAM interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |
| 12 | ECCFLIO <br> FEIF | INTECCFLIO interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |
| 11 | Reserved | When read, the value after reset is returned. |
| 10 | $\begin{aligned} & \text { ECCCSIH3 } \\ & \text { FEIF }^{* 2} \end{aligned}$ | INTECCCSIH3 interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |
| 9 | $\begin{aligned} & \text { ECCCSIH2 } \\ & \text { FEIF*2 }^{*} \end{aligned}$ | INTECCCSIH2 interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 8 | $\begin{aligned} & \text { ECCCSIH1 } \\ & \text { FEIF*2 } \end{aligned}$ | INTECCCSIH1 interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 7 | $\begin{aligned} & \text { ECCCSIHO } \\ & \text { FEIF } \end{aligned}$ | INTECCCSIHO interrupt occurrence <br> 0 : No interrupt occurred <br> 1: Interrupt has occurred |
| 6 | ECCCNFDRA MFEIF | INTECCCNFDRAM interrupt occurrence <br> 0: No interrupt occurred <br> 1: Interrupt has occurred |

Table 7BC. 11 FEINTF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 5 | ECCFLRAM | RH850/F1KM-S4: |
|  | FEIF | INTECCFLRAM interrupt occurrence |
|  |  | 0: No interrupt occurred |
|  |  | 1: Interrupt has occurred |
|  |  | RH850/F1KM-S1: |
|  | When read, the value after reset is returned. |  |
| 4 | FECEEP0 | INTECCEEP0 interrupt occurrence |
|  |  | $0:$ No interrupt occurred |
|  |  | 1: Interrupt has occurred |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | LVILFEIF | INTLVIL interrupt occurrence |
|  |  | $0:$ No interrupt occurred |
|  |  | 1: Interrupt has occurred |

Note 1. For the supported products, see Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4).
Note 2. For the supported products, see Table 7BC.4, FE Level Maskable Interrupt Requests (RH850/F1KM-S1).

## 7BC.2.3.3 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 7BC. 12 FEINTFMSK Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | DMAFEIFMSK | INTDMAERR interrupt mask <br> 0: Not masked <br> 1: Masked |
| 30 to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | $\begin{aligned} & \text { ECCETH } \\ & \text { FEIFMSK*1 } \end{aligned}$ | RH850/F1KM-S4: <br> INTECCETH interrupt mask <br> 0: Not masked <br> 1: Masked <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | OSTM4 <br> FEIFMSK | RH850/F1KM-S4: <br> INTOSTM4_FE interrupt mask <br> 0: Not masked <br> 1: Masked <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | OSTM3 <br> FEIFMSK | RH850/F1KM-S4: <br> INTOSTM3_FE interrupt mask <br> 0 : Not masked <br> 1: Masked <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 7BC. 12 FEINTFMSK Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 19 | OSTM2 <br> FEIFMSK | ```RH850/F1KM-S4: INTOSTM2_FE interrupt mask 0 : Not masked 1: Masked RH850/F1KM-S1:``` <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | OSTM1 <br> FEIFMSK | ```RH850/F1KM-S4: INTOSTM1_FE interrupt mask 0 : Not masked 1: Masked RH850/F1KM-S1:``` <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | GUARD FEIFMSK | INTGUARD interrupt mask <br> 0: Not masked <br> 1: Masked |
| 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | LVIHFEIFMSK | INTLVIH interrupt mask <br> 0: Not masked <br> 1: Masked |
| 14 | OSTMOFEI <br> FMSK | INTOSTMO_FE interrupt mask <br> 0 : Not masked <br> 1: Masked |
| 13 | ECCRAMFEI FMSK | INTECCRAM interrupt mask <br> 0: Not masked <br> 1: Masked |
| 12 | ECCFLIO <br> FEIFMSK | INTECCFLIO interrupt mask <br> 0 : Not masked <br> 1: Masked |
| 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | $\begin{aligned} & \text { ECCCSIH3 } \\ & \text { FEIFMSK² } \end{aligned}$ | INTECCCSIH3 interrupt mask <br> 0 : Not masked <br> 1: Masked |
| 9 | $\begin{aligned} & \text { ECCCSIH2 } \\ & \text { FEIFMSK² } \end{aligned}$ | INTECCCSIH2 interrupt mask <br> 0: Not masked <br> 1: Masked |
| 8 | $\begin{aligned} & \text { ECCCSIH1 } \\ & \text { FEIFMSK² } \end{aligned}$ | INTECCCSIH1 interrupt mask <br> 0 : Not masked <br> 1: Masked |
| 7 | ECCCSIHO <br> FEIFMSK | INTECCCSIHO interrupt mask <br> 0 : Not masked <br> 1: Masked |
| 6 | ECCCNFDRAM FEIFMSK | INTECCCNFDRAM interrupt mask <br> 0 : Not masked <br> 1: Masked |
| 5 | ECCFLRAM FEIFMSK | RH850/F1KM-S4: <br> INTECCFLRAM interrupt mask <br> 0 : Not masked <br> 1: Masked <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 7BC. 12 FEINTFMSK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 4 | ECCEEPO | INTECCEEPO interrupt mask |
|  | FEIFMSK | 0: Not masked |
|  |  | 1: Masked |
| 3 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | LVILFEIFMSK | INTLVIL interrupt mask |
|  |  | $0:$ Not masked |
|  |  | 1: Masked |

Note 1. For the supported products, see Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4).
Note 2. For the supported products, see Table 7BC.4, FE Level Maskable Interrupt Requests (RH850/F1KM-S1).

## 7BC.2.3.4 FEINTFC — FEINT Factor Clear Register

This register clears the bits of the FEINT factor register (FEINTF).

Table 7BC. 13 FEINTFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | DMAFEIFC | DMAFEIF flag clear |
|  |  | 0: - |
|  |  | 1: Clear |
| 30 to 24 | Reserved | When writing, write the value after reset. |
| 23 | ECCETH | RH850/F1KM-S4: |

|  | FEIFC | $0:-$ |
|  |  | 1: Clear |

Table 7BC. 13 FEINTFC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 3 to 1 | Reserved | When writing, write the value after reset. |
| 0 | LVILFEIFC | LVILFEIF flag clear |
|  | $0:-$ |  |
|  | 1: Clear |  |

Note 1. For the supported products, see Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4).
Note 2. For the supported products, see Table 7BC.4, FE Level Maskable Interrupt Requests (RH850/F1KM-S1).

## 7BC. 3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.
The following registers are used to specify the edge and level of each interrupt:
Table 7BC. 14 External Interrupt Edge/Level Detection Registers (RH850/F1KM-S4)

| Interrupt | Register |
| :---: | :---: |
| TNMI | FCLAOCTLO_NMI |
| INTP0 | FCLAOCTLO_INTPL |
| INTP1 | FCLA0CTL1_INTPL |
| INTP2 | FCLA0CTL2_INTPL |
| INTP3 | FCLA0CTL3_INTPL |
| INTP4 | FCLA0CTL4_INTPL |
| INTP5 | FCLA0CTL5_INTPL |
| INTP6 | FCLA0CTL6_INTPL |
| INTP7 | FCLA0CTL7_INTPL |
| INTP8 | FCLA0CTLO_INTPH |
| INTP9 | FCLA0CTL1_INTPH |
| INTP10 | FCLA0CTL2_INTPH |
| INTP11 | FCLA0CTL3_INTPH |
| INTP12 | FCLA0CTL4_INTPH |
| INTP13 | FCLA0CTL5_INTPH |
| INTP14*1 | FCLA0CTL6_INTPH |
| INTP15*1 | FCLA0CTL7_INTPH |
| INTP16*1 | FCLAOCTLO_INTPU |
| INTP17*1 | FCLA0CTL1_INTPU |
| INTP18*1 | FCLA0CTL2_INTPU |
| INTP19*1 | FCLA0CTL3_INTPU |
| INTP20*1 | FCLA0CTL4_INTPU |
| INTP21*1 | FCLA0CTL5_INTPU |
| INTP22*1 | FCLA0CTL6_INTPU |
| INTP23*1 | FCLA0CTL7_INTPU |

Note 1. For the supported products, see Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4).
See Section 2B, Pin Function of RH850/F1KM-S4 for details of these registers.

Table 7BC. 15 External Interrupt Edge/Level Detection Registers (RH850/F1KM-S1)

| Interrupt | Register |
| :--- | :--- |
| TNMI | FCLA0CTLO_NMI |
| INTP0 | FCLAOCTLO_INTPL |
| INTP1 | FCLAOCTL1_INTPL |
| INTP2 | FCLA0CTL2_INTPL |
| INTP3 | FCLA0CTL3_INTPL |
| INTP4 | FCLA0CTL4_INTPL |
| INTP5 | FCLA0CTL5_INTPL |
| INTP6*1 | FCLA0CTL6_INTPL |
| INTP7*1 | FCLA0CTL__INTPL |
| INTP8*1 | FCLA0CTLO_INTPH |
| INTP10 | FCLA0CTL2_INTPH |
| INTP11 | FCLA0CTL3_INTPH |
| INTP12*1 | FCLA0CTL_INTPH |
| INTP13*1 | FCLA0CTL5_INTPH |

Note 1. For the supported products, see Table 7BC.6, El Level Maskable Interrupt Sources (RH850/F1KM-S1).

See Section 2C, Pin Function of RH850/F1KM-S1 for details of these registers.

## 7BC. 4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm ( $m=0$ to 11), FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0 ).

## 7BC.4.1 List of Registers

The following table lists the Interrupt Controller Control registers.
Table 7BC. 16 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| INTC1 | El level interrupt control registers | ICxxx*1 | See Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, El Level Maskable Interrupt Sources (RH850/F1KM-S1) |
|  | El level interrupt mask registers | IMR0 | FFFE EAFOH |
| INTC2 | El level interrupt control registers | ICxxx*2 | See Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, El Level Maskable Interrupt Sources (RH850/F1KM-S1) |
|  | El level interrupt mask registers | IMRm | FFFF B400 ${ }_{\text {H }}+\left(04_{\mathrm{H}} \times \mathrm{m}\right)$ |
| INTC1 | FE level NMI status register | FNC | FFFE EA78 ${ }_{\text {H }}$ |
|  | FE level maskable interrupt status register | FIC | FFFE EA7A ${ }_{\text {H }}$ |

Note 1. Channel No. 0 to 31.
Note 2. Channel No. 32 or more.

## 7BC.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1).

## CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.
Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).
For bit-manipulation instructions, see also Section 3BC.3.3, Access to Registers by Using Bit-Manipulation Instructions.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

| Access: |  |  | ICxxx can be read or written in 16 -bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | ICxxxH and ICxxxL can be read or written in 8- or 1-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Address: |  |  | See Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | $008 \mathrm{~F}_{\mathrm{H}}$ (edge detection), $808 \mathrm{~F}_{\mathrm{H}}$ (level detection)** |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | CTxxx | - | - | RFxxx | - | - | - | - | MKxxx | TBxxx | - | - | P3xxx | P2xxx | P1xxx | P0xxx |
| Value after reset | 0/1*1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R/W | R | R | R | R | R/W | R/W | R | R | R/W | R/W | R/W | R/W |

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1).

Table 7BC. 17 ICxxx Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 15 | CTxxx | This bit indicates the type of interrupt detection. This bit is read only. <br> 0 : Edge detection <br> 1: Level detection <br> When writing in 8-bit or 16 -bit units, write the value after reset. |  |
| 14, 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 12 | RFxxx | This is an inte The RFxxx bit maskable inte <br> 0 : No inter <br> 1: Interrup | est flag. <br> ritten from a program. Setting the RFxxx bit to 1 generates an El level INTn), just as when an interrupt request is acknowledged. <br> st is made. <br> s made. |
|  |  | Input Interface | Operation |
|  |  | Edge detection <br> (CTxxx = 0) | This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software. |
|  |  | Level detection (CTxxx =1) | This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core. |

Table 7BC. 17 ICxxx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | MKxxx | This is the interrupt request mask bit. <br> When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked. <br> When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register. <br> 0 : Enables interrupt processing <br> 1: Disables interrupt processing |
| 6 | TBxxx | This bit is used to select the way to determine the interrupt vector. <br> 0 : Direct jumping to an address determined from the level of priority <br> 1: Table reference <br> For details on the way to determine the interrupt vector, see the RH850G3KH User's Manual: Software. |
| 5, 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | P3xxx to P0xxx | These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. <br> When multiple El level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority. |

## CAUTION

Do not access ICxxx registers of interrupt channels listed as "Reserved" in Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, El Level Maskable Interrupt Sources (RH850/F1KM-S1) and of the channels which are not incorporated in the product.

## 7BC.4.3 IMRm - El Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

```
Access: IMRm can be read or written in 32-bit units.
IMRmH and IMRmL can be read or written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.
Address: IMRO: FFFE EAFOH
    IMROL: FFFE EAFOH,
    IMROH: FFFE EAF2H
    IMROLH: FFFE EAF1H,
    IMROHL: FFFE EAF2H,
    IMROHH: FFFE EAF3H
    IMRm (m = 1 to 11): FFFFF B400 H}+(0\mp@subsup{4}{H}{}\timesm
    IMRmL (m=1 to 11): FFFFF B400H}+(0\mp@subsup{4}{\textrm{H}}{}\times\textrm{m}
    IMRmH (m = 1 to 11): FFFF B400H}+(0\mp@subsup{0}{H}{}\timesm)+2H
    IMRmLL (m=1 to 11): FFFFF B400 H}+(0\mp@subsup{4}{H}{}\timesm
    IMRmLH (m = 1 to 11): FFFFF B400 }+(0\mp@subsup{0}{H}{}\timesm)+\mp@subsup{1}{H}{}
    IMRmHL (m = 1 to 11): FFFFF B400 H}+(0\mp@subsup{4}{H}{}\timesm)+2H
    IMRmHH (m = 1 to 11): FFFF B400 H}+(0\mp@subsup{4}{H}{}\timesm)+\mp@subsup{3}{H}{
    Value after reset: FFFF FFFFF

Table 7BC. 18 IMRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | IMRmEIMK | These are interrupt mask bits for El level maskable interrupt (EIINT) channels 0 to 376. |
|  | $(\mathrm{~m} \times 32+31)$ to | 0 : Enables interrupt servicing |
|  | IMRmEIMK | 1: Disables interrupt servicing |
|  | $(\mathrm{m} \times 32+0)$ |  |

## CAUTION

MKxxx bits which correspond to channels listed as "Reserved" in Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1) and to channels which are not incorporated in the product must be set to " 1 ".

## 7BC.4.4 FNC - FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).
This register is initialized by any reset.

| Access: | FNC is a read-only register that can be read in 16-bit units. |
| :---: | :--- |
|  | FNCH is a read-only register that can be read in 8- or 1-bit units. |
| Address: | FNC: FFFE EA78 |
|  | FNCH: FFFE EA79 |
| Value after reset: | $0000_{\mathrm{H}}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | FNRF | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7BC. 19 FNC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FNRF | Interrupt request flag |
|  |  | $0:$ No interrupt request |
|  |  | 1: Interrupt request occurred |
|  |  | This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by |
|  |  | the CPU core. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

## 7BC.4.5 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).
This register is initialized by any reset.

| $\qquad$ Access: | FIC is a read-only register that can be read in 16-bit units. |
| :---: | :--- |
|  | FICH is a read-only register that can be read in 8- or 1-bit units. |
| Address: | FIC: FFFE EA7A ${ }_{H}$ |
|  | FICH: FFFE EA7B ${ }_{H}$ |
| Value after reset: | $8000_{H}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | FIRF | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7BC. 20 FIC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | FIRF | Interrupt request flag |
|  |  | 0: No interrupt request |
|  |  | 1: Interrupt request occurred |
|  |  | This bit cannot be set or cleared by software. It can only be read. |
| 11 to 0 | Reserved | When read, the value after reset is returned. |

## 7BC. 5 EI Level Maskable Interrupt Select Register

The following registers are used to select an EI level maskable interrupt.

## 7BC.5.1 List of Registers

The following table lists the EI Level Maskable Interrupt Select register.
Table 7BC. 21 List of Register

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| SL_INTC | INTC1 interrupt select register | SELB_INTC1 | FFCO 1000 |

## 7BC.5.2 SELB_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled. This register is initialized by any reset.

NOTE
The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see Table 7BC.5, El Level Maskable Interrupt Sources (RH850/F1KM-S4), Table 7BC.6, El Level Maskable Interrupt Sources (RH850/F1KM-S1).

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | FFCO $1000_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

7BC.6.2 ISPR — Priority of Interrupt being Serviced
See Table 3BC.33, ISPR Register Contents.
7BC.6.3 PMR — Interrupt Priority Masking
See Table 3BC.34, PMR Register Contents.

7BC.6.4 ICSR — Interrupt Control Status
See Table 3BC.35, ICSR Register Contents.
7BC.6.5 INTCFG - Interrupt Function Setting
See Table 3BC.36, INTCFG Register Contents.

## 7BC. 7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.
(1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.
(2) Calculate the exception handler address according to the current PSW value.*1
(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception source code in the FEIC.
- Update the PSW.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.
(4) For EI level exceptions, the following processing is performed:
- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception source code in the EIIC.
- Update the PSW.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

Note 1. For details, see Section 7BC.10, Exception Handler Address.
Note 2. For the values to be updated, see Table 4.1 Exception Cause List in the RH850G3KH User's Manual: Software.

The following figure shows steps (1) to (4).

Figure 7BC. 2 Operation when Acknowledging an Interrupt

## 7BC.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.
Table 7BC. 23 Exception Source Codes for Different Types of SYSERR Exceptions

| Exception Source Code | Source of SYSERR Generation |
| :---: | :---: |
| $11_{\text {H }}$ | - Detection of an error during the fetching of an instruction from the code flash memory area |
| $13_{\mathrm{H}}$ | - Detection of an error during the fetching of an instruction from the local, global or retention RAM areas |
| $14_{H}$ | - Detection of an error during access to data in the code flash area <br> - Detection of an error during read access to a module via the system interconnect or PBUS The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1 |
| $16_{\text {H }}$ | - Detection of an error during access to data in the own local RAM areas <br> The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1 |
| $18_{H}$ | - Detection of an IPG error <br> The exception source code reports an occurrence of a system error factor corresponding to VCIF, IPGF bit of SEGFLAG register*1 |
| $19_{\text {H }}$ | - Detection of an error during write access to a module via the PBUS <br> The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1 |
| $1 \mathrm{~A}_{\mathrm{H}}$ | - Detection of an error inside system interconnect <br> The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1 |

Note 1. See Section 3BC.2.3.3, System Error Generator Function (SEG) for details.

## 7BC. 8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:
(1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.
(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.
(3) When EP $=0$ and INTCFG.ISPC $=0$, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

Figure 7BC. 3 Flow of Return from Interrupts

## 7BC. 9 Interrupt Operation

## 7BC.9.1 Interrupt Mask Function of El Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7BC. 24 Operation of the MKxxx Bit

| ICxxx.MKxxx | Operation |
| :--- | :--- |
| 1 | Masks interrupt |
| 0 | Enables interrupt |

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

## [Operation example]

(1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.
(2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

## CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending ( $R F x x x=1$ ), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1 , the interrupt will not occur as long as the interrupt is masked with MKxxx $=1$.
To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

## 7BC.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT
See the RH850G3KH User's Manual: Software for other exceptions.

For EIINT (INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to $15: 0$ is the highest and 15 is the lowest. Among multiple EIINT (INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7BC. 25 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels during Operation

| EIINT (INTn) | ICxxx.P[3:0]xxx Setting | Priority Level During Operation |
| :--- | :--- | :--- |
| INT0 | 3 | 10 |
| INT1 | 4 | 11 |
| INT2 | 0 | 1 |
| INT3 | 0 | 2 |
| INT4 | 1 | 3 |
| INT5 | 2 | 6 |
| INT6 | 2 | 7 |
| INT7 | 1 | 4 |
| INT8 | 1 | 5 |
| INT9 | 2 | 8 |
| INT10 | 2 | 9 |

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT (INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

## 7BC.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.
The priority level of the interrupt currently being handled is stored in the ISPR register.
Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

## 7BC.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.
For the PMR register, see Table 3BC.34, PMR Register Contents, or the RH850G3KH User's Manual: Software.

## 7BC.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0] xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

## 7BC.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

## Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1 . If a subsequent EIINT interrupt with the priority level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

Figure 7BC.4, Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1) shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1 . Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

Figure 7BC. 4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)

Note 1. "a" to "u" in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7BC. 4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

## CAUTION

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.

Note 1. "a" to " c " in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7BC. 5 Example of Servicing Simultaneously Generated Interrupt Requests

## 7BC.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See the RH850G3KH User's Manual: Software.

## 7BC.9.4 Exception Priority of Interrupts and the Priority Mask

See the RH850G3KH User's Manual: Software.

## 7BC.9.5 Interrupt Priority Mask

See the RH850G3KH User's Manual: Software.

## 7BC.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.
The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7BC. 26 Operation of the PMR.PMm Bit

| PMR.PMm | Operation |
| :--- | :--- |
| 0 | Acknowledges requests from priority level $m$ interrupt source. |
| 1 | Masks requests from priority level $m$ interrupt source. |

Note: $m=0$ to 15

The presence of EIINT interrupts held pending with this function can be checked with Section 7BC.9.7, Exception Management.
For details on the PMR register, see Table 3BC.34, PMR Register Contents, or the RH850G3KH User's Manual: Software.

## 7BC.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1KM. For details, see the RH850G3KH User's Manual: Software.

## 7BC. 10 Exception Handler Address

In the RH850/F1KM, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

## CAUTION

The exception handler address of EIINT (INTn) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT (INTn)). In the RH850/F1KM, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

## 7BC.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in Table 7BC.27, Selection of Base Register/Offset Address to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit*1. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0 , the value of the RBASE register is used as the base address.

For reset input the RBASE register is always used for reference.
In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1 , all user interrupts are handled using an offset of $100_{\mathrm{H}}$. If the bit is cleared to 0 , the offset address is determined according to Table 7BC.27, Selection of Base

## Register/Offset Address.

Note 1. Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

Figure 7BC. 6 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7BC. 27 Selection of Base Register/Offset Address

| Exception/Interrupt | PSW.EB | PSW.EBV = 1 | RINT $=0$ | RINT = 1 |
| :---: | :---: | :---: | :---: | :---: |
|  | Base Register |  | Offset Address |  |
| RESET | RBASE | N.A. | $000{ }_{\text {H }}$ | $000{ }_{H}$ |
| SYSERR |  | EBASE | $0^{010}{ }_{\text {H }}$ | $0^{010}{ }_{\text {H }}$ |
| Reserved |  |  | 020 ${ }_{\text {H }}$ | $0^{020}{ }_{H}$ |
| FETRAP |  |  | $0^{030}{ }_{H}$ | $0^{030}{ }_{\text {H }}$ |
| TRAP0 |  |  | 040 ${ }_{\text {H }}$ | $0^{040}{ }_{\text {H }}$ |
| TRAP1 |  |  | 050 ${ }_{\text {H }}$ | 050 ${ }_{\text {H }}$ |
| RIE |  |  | 060 ${ }_{\text {H }}$ | $0600^{\text {H }}$ |
| FPP/FPI |  |  | 070 ${ }_{\text {H }}$ | 070 ${ }_{\text {H }}$ |
| UCPOP |  |  | 080 ${ }_{\text {H }}$ | 080 ${ }_{\text {H }}$ |
| MIP/MDP |  |  | $0^{090}{ }_{H}$ | $0^{090}{ }_{H}$ |
| PIE |  |  | $\mathrm{OAO}_{\mathrm{H}}$ | $\mathrm{OAO}_{\mathrm{H}}$ |
| MAE |  |  | $\mathrm{OCO}_{\mathrm{H}}$ | $\mathrm{OCO}_{\mathrm{H}}$ |
| Reserved |  |  | ODO ${ }_{\text {H }}$ | ODO ${ }_{\text {H }}$ |
| FENMI |  |  | OEOH | $0 \mathrm{EO} \mathrm{H}_{\mathrm{H}}$ |
| FEINT |  |  | $\mathrm{OFO}_{\mathrm{H}}$ | $\mathrm{OFO}_{\mathrm{H}}$ |
| INTn (Priority level 0) |  |  | $100_{\mathrm{H}}$ | $100_{H}$ |
| INTn (Priority level 1) |  |  | $110_{\mathrm{H}}$ |  |
| INTn (Priority level 2) |  |  | $120_{\text {H }}$ |  |
| INTn (Priority level 3) |  |  | $130_{\mathrm{H}}$ |  |
| INTn (Priority level 4) |  |  | $140_{\mathrm{H}}$ |  |
| INTn (Priority level 5) |  |  | $150{ }_{\text {H }}$ |  |
| INTn (Priority level 6) |  |  | $160_{\mathrm{H}}$ |  |
| INTn (Priority level 7) |  |  | $170_{\mathrm{H}}$ |  |
| INTn (Priority level 8) |  |  | $180_{\mathrm{H}}$ |  |
| INTn (Priority level 9) |  |  | $190_{H}$ |  |
| INTn (Priority level 10) |  |  | $1 \mathrm{AO}_{\mathrm{H}}$ |  |
| INTn (Priority level 11) |  |  | $1 \mathrm{BO}_{\mathrm{H}}$ |  |
| INTn (Priority level 12) |  |  | $1 \mathrm{CO}_{\mathrm{H}}$ |  |
| INTn (Priority level 13) |  |  | $1 \mathrm{DO}_{\mathrm{H}}$ |  |
| INTn (Priority level 14) |  |  | $1 \mathrm{EO}_{\mathrm{H}}$ |  |
| INTn (Priority level 15) |  |  | $1 \mathrm{FO}_{\mathrm{H}}$ |  |

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

## 7BC.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1KM uses the table reference method for interrupts that assume the above usage.
If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:
$<1>$ In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV $=0$ and RBASE.RINT $=1$
- When PSW.EBV = 1 and EBASE.RINT $=1$
- When the interrupt channel setting is not the table reference method
<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position $=$ INTBP register + channel number $\times 4$ bytes
$<3>$ Read word data starting at the interrupt handler address read position calculated in <2>.
<4> Use the word data read in <3> as the exception handler address.

Table 7BC.28, Exception Handler Address Expansion shows the exception handler address read positions corresponding to each interrupt channel and
Figure 7BC.7, Table Reference Method shows an overview of the allocation in memory.
Table 7BC. 28 Exception Handler Address Expansion

| Type of Interrupt | Exception Handler Address Read Position |
| :--- | :--- |
| El level maskable interrupt channel 0 | INTBP register value $+0 \times 4$ |
| El level maskable interrupt channel 1 | INTBP register value $+1 \times 4$ |
| El level maskable interrupt channel 2 | INTBP register value $+2 \times 4$ |
| $:$ | $:$ |
| El level maskable interrupt channel 375 | INTBP register value $+375 \times 4$ |
| El level maskable interrupt channel 376 | INTBP register value $+376 \times 4$ |

Figure 7BC. 7 Table Reference Method

## Section 8 DMA Controller

This section contains a generic description of the DMA controller (DMA).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of channels, register base addresses, etc.

The remainder of the section describes the functions and registers of DMA.

### 8.1 Features of RH850/F1KH, RH850/F1KM DMA Controller

### 8.1.1 Number of Channels

This microcontroller has the following number of DMA channels.
Table 8.1 Number of Channels (RH850/F1KH-D8)

|  | RH850/F1KH-D8 | RH850/F1KH-D8 | RH850/F1KH-D8 |
| :--- | :--- | :--- | :--- |
| Product Name | 176 Pins | 233 Pins | 324 Pins |
| Number of Channels | $64 \mathrm{ch}(8 \mathrm{ch} \times 4 \times 2)$ | $64 \mathrm{ch}(8 \mathrm{ch} \times 4 \times 2)$ | $64 \mathrm{ch}(8 \mathrm{ch} \times 4 \times 2)$ |

Table 8.2 Number of Channels (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Product Name | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| Number of channels | $32 \mathrm{ch}(8 \mathrm{ch} \times 4)$ | $32 \mathrm{ch}(8 \mathrm{ch} \times 4)$ | $32 \mathrm{ch}(8 \mathrm{ch} \times 4)$ | $32 \mathrm{ch}(8 \mathrm{ch} \times 4)$ | $32 \mathrm{ch}(8 \mathrm{ch} \times 4)$ |

Table 8.3 Number of Channels (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| Number of channels | $16 \mathrm{ch}(8 \mathrm{ch} \times 2)$ | $16 \mathrm{ch}(8 \mathrm{ch} \times 2)$ | $16 \mathrm{ch}(8 \mathrm{ch} \times 2)$ | $16 \mathrm{ch}(8 \mathrm{ch} \times 2)$ |

Table $8.4 \quad$ Indices (RH850/F1KH-D8)

| Index | Description |
| :--- | :--- |
| n | In this section, the DMA units are identified with an index " n " for example, as PDMAn $(\mathrm{n}=0,1)$. |
| y | In this section, the DMA groups are identified with an index " y " for example, as DMACy $(\mathrm{y}=0$ to 3 ). |
| m | In this section, the DMA channels are identified with an index " m ". For example, PDMAnDSAm ( $\mathrm{m}=0$ <br> DMA source address register. |
| i | In this section, the DMAC channels are identified with an index " $\mathrm{i} "$. For example, PDMAnDMyiCM ( $\mathrm{i}=0$ <br> DMAC channel master. |

Table $8.5 \quad$ Indices (RH850/F1KM-S4)

| Index | Description |
| :--- | :--- |
| n | In this section, the DMA units are identified with an index " n " for example, as PDMAn $(\mathrm{n}=0)$. |
| y | In this section, the DMA groups are identified with an index " y " for example, as DMACy $(\mathrm{y}=0$ to 3$)$. |
| m | In this section, the DMA channels are identified with an index " m ". For example, PDMAnDSAm ( $\mathrm{m}=0$ to 31 ) is the <br>  <br> i |

Table 8.6 Indices (RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | In this section, the DMA units are identified with an index " n " for example, as PDMAn $(\mathrm{n}=0)$. |
| y | In this section, the DMA groups are identified with an index " y " for example, as DMACy $(\mathrm{y}=0,1)$. |
| m | In this section, the DMA channels are identified with an index " m ". For example, PDMAnDSAm $(\mathrm{m}=0$ <br> DMA source address register. |
| i | In this section, the DMAC channels are identified with an index " i ". For example, PDMAnDMyiCM ( $\mathrm{i}=0$ <br>  |

### 8.1.2 Register Base Addresses

The DMA base addresses are listed in the following table.
The DMA register addresses are given as offsets from the base addresses.
Table 8.7 Register Base Addresses (RH850/F1KH-D8)

| Base Address Name | Base Address |
| :--- | :--- |
| <DMAO_base> | FFFF $8000_{\mathrm{H}}$ |
| <DMA1_base> | FFFF $9000_{\mathrm{H}}$ |

Table 8.8 Register Base Address (RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <DMAO_base> | FFFF $8000_{\mathrm{H}}$ |

### 8.1.3 Interrupt Requests

The DMA interrupt requests are listed in the following table.
Table 8.9 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Number |
| :---: | :---: | :---: |
| PDMAO |  |  |
| INTDMAO | PDMAO DMA00 transfer completion | 60 |
| INTDMA1 | PDMA0 DMA01 transfer completion | 61 |
| INTDMA2 | PDMA0 DMA02 transfer completion | 62 |
| INTDMA3 | PDMA0 DMA03 transfer completion | 63 |
| INTDMA4 | PDMA0 DMA04 transfer completion | 64 |

Table 8.12 Interrupt Request (FE Level Non-Maskable Interrupts) (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Name |
| :--- | :--- | :--- |
| INTDMAERR | DMA transfer error interrupt | INTDMAERR |

### 8.1.4 DMA Trigger Factors

DMA trigger factors can be selected by setting the PDMAnDTFRm.REQSEL[6:0] bits.
The following table lists all DMA trigger factors which can be selected by the PDMAnDTFRm register.
Table 8.13 DMA Trigger Factor (RH850/F1KH-D8)

| DMA Trigger Number PDMAnDTFRm.REQSEL[6:0] | DMA Trigger Factor | F1KH-D8 <br> 176 Pins | F1KH-D8 233 Pins | F1KH-D8 <br> 272 Pins | F1KH-D8 324 Pins |
| :---: | :---: | :---: | :---: | :---: | :---: |

Note 1. For details, see Section 8.10.2, DTFSEL_TAUD0/DTFSEL_TAUB0/DTFSEL_TAUB1 — DMA Trigger Factor Select Register.

Note 2. For details INTDMAFL of the function, see the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface.

### 8.2 Overview

### 8.2.1 Overview

Direct memory access (DMA) is used to access data without intervention of the CPU.
DMA includes a DMA transfer module called DMAC. A DMAC includes registers for storing transfer information.

## - RH850/F1KH-D8

DMA has two 8-channel $\times 4$-group DMAC modules. 2 DMA modules operate respectively as different master. This chapter describes the function of one DMAC unit.

- RH850/F1KM-S4

DMA has one 8 -channel $\times 4$-group DMAC modules.

- RH850/F1KM-S1

DMA has one 8-channel $\times 2$-group DMAC modules.
In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request. The DTFR can handle 128 types of hardware DMA transfer sources.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see Section 4A, Address Space of RH850/F1KH-D8, Section 4B, Address Space of RH850/F1KM-S4 and Section 4C, Address Space of RH850/F1KM-S1.

## CAUTION

DMA can be used after PEG access permission setting.

- RH850/F1KH-D8:

When accessing from the DMA to the local RAM in the PE, the PEGSP register, PEGGnMK register ( $\mathrm{n}=0$ to 3 ), PEGGnBA register ( $\mathrm{n}=0$ to 3 ) and PDMAnDMyiCM register ( $\mathrm{yi}=00$ to 07,10 to 17,20 to 27 , and 30 to 37 ) must be set.

- RH850/F1KM-S4:

When accessing from the DMA to the local RAM in the PE, the PEGSP register, PEGGnMK register ( $\mathrm{n}=0$ to 3 ), PEGGnBA register ( $\mathrm{n}=0$ to 3 ) and PDMAnDMyiCM register (yi $=00$ to 07,10 to 17,20 to 27 , and 30 to 37 ) must be set.

- RH850/F1KM-S1:

When accessing from the DMA to the local RAM and the retention RAM in the PE, the PEGSP register, PEGGnMK register ( $\mathrm{n}=0$ to 3 ), PEGGnBA register ( $\mathrm{n}=0$ to 3 ) and PDMAnDMyiCM register ( $\mathrm{yi}=00$ to 07,10 to 17 ) must be set.

### 8.2.2 Term Definition

Table 8.16, List of Term Definitions shows the terms used in this section.
Table 8.16 List of Term Definitions

| Term | Description |
| :--- | :--- |
| DMA transfer | A general term for data transfer carried out by DMA. |
| DMA cycle | A series of actions that consist of reading an amount of data specified by the transfer size <br> $(8 / 16 / 32 / 64 / 128$ bits) from the address specified by the source address and writing it to the <br> address specified by the destination address. The first half of the DMA cycle (reading part) is <br> called a read cycle, and the second half (writing part) is called a write cycle. |
| Hardware DMA transfer source | A trigger for a DMA transfer request sent by an internal peripheral device. |
| Hardware DMA transfer request | A DMA transfer request generated by a hardware DMA transfer source. |
| Software DMA transfer request | A DMA transfer request generated by software writing to a register. |
| DMA transfer request | A trigger to start DMA transfer with the DMAC. |
| Transfer information | The information required for DMA transfer, including the source address, destination address, <br> transfer data size, and transfer count. |
| Single transfer | DMA transfer consisting of one DMA cycle started by one DMA transfer request. |
| Block transfer 1 | DMA transfer consisting of the number of DMA cycles specified by the transfer count in the <br> transfer information, started by one DMA transfer request. |
| Block transfer 2 | DMA transfer consisting of the number of DMA cycles specified by the address reload count in <br> the transfer information, started by one DMA transfer request. |
| Block transfer | A general term for both block transfer 1 and block transfer 2. |
| Last transfer | The DMA cycle carried out when the transfer count in the transfer information is 1. |
| Address reload transfer | The DMA cycle carried out when the address reload count in the transfer information is 1 <br> reload function 2 is used. |
| Suspension | An action of pausing DMA transfer during block transfer. You can resume DMA transfer after <br> suspension. |
| Transfer abort | An action of resuming suspended DMA transfer. |

### 8.3 DMA Function

### 8.3.1 Basic Operation of DMA Transfer

### 8.3.1.1 Transfer Mode

DMA has three transfer modes.

## Single Transfer

One DMA cycle is executed when a DMA transfer request is acknowledged.

## Block Transfer 1

The number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is acknowledged.

## Block Transfer 2

The number of DMA cycles specified by the address reload count are executed when a DMA transfer request is acknowledged. If the value specified in the address reload count is larger than the value in the transfer count register, the number of DMA cycles specified in the transfer count register are executed.

### 8.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete.
For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

### 8.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows:

## Source Address and Destination Address

Transfer information will be updated as described in Table 8.17, Updating the Source Addresses and the Destination Addresses according to the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 8.17 Updating the Source Addresses and the Destination Addresses

| Count Direction | Transfer Data Size | Address after Update |
| :---: | :---: | :---: |
| Increment | 8 bits | (address before update) $+00000001_{\text {H }}$ |
|  | 16 bits | (address before update) $+00000002_{\text {H }}$ |
|  | 32 bits | (address before update) $+00000004_{\mathrm{H}}$ |
|  | 64 bits | (address before update) $+00000008_{\text {H }}$ |
|  | 128 bits | (address before update) $+00000010_{\mathrm{H}}$ |
| Decrement | 8 bits | (address before update) - $00000001_{\text {H }}$ |
|  | 16 bits | (address before update) - 0000 0002 ${ }_{\text {H }}$ |
|  | 32 bits | (address before update) - $00000004_{\text {H }}$ |
|  | 64 bits | (address before update) - $00000008_{\text {H }}$ |
|  | 128 bits | (address before update) - $00000010_{\mathrm{H}}$ |
| Fixed | - | Same as the address before update. |

When you use the reload function, a special update rule is applied other than the one described in Table 8.17, Updating the Source Addresses and the Destination Addresses for the last transfer and the address reload transfer. For details, see Section 8.3.3, Reload Function.

## Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.
The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see Section 8.3.3, Reload Function.

## Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

### 8.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (PDMAnDCSTm.TC) is set when the last transfer is complete.

The channel operation enable (PDMAnDCENm.DTE) bit is cleared when the last transfer is complete (when continuous transfer is disabled).

- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see Section 8.3.3, Reload Function.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details,
see Section 8.3.3, Reload Function.

### 8.3.1.5 Transfer Completion Interrupt Output

DMA can output a transfer completion interrupt to external devices.

## Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (PDMAnDTCTm.TCE) is set in the transfer control register, a DMAC requests a transfer completion interrupt when the last transfer is complete.

Figure 8.1, Transfer Completion Interrupt shows the operation of the transfer completion interrupt.

Figure 8.1 Transfer Completion Interrupt

### 8.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (PDMAnDCSTm.TC) and clears the channel operation enable (PDMAnDCENm.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer

If the continuous transfer is used, the channel operation enable (PDMAnDCENm.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (PDMAnDTCTm.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1 . The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

Figure 8.2, Operation of Continuous Transfer by a DMAC shows an operation of continuous transfer by a DMAC.

Figure 8.2 Operation of Continuous Transfer by a DMAC

### 8.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

### 8.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is "channel $0>$ channel $1>$ channel $2>$ channel $3>$ channel $4>$ channel $5>$ channel 6 $>$ channel 7" for DMAC0, and "channel $8>$ channel $9>$ channel $10>$ channel $11>$ channel $12>$ channel 13
$>$ channel $14>$ channel 15 " for DMAC1, "channel $16>$ channel $17>$ channel $18>$ channel $19>$ channel 20
> channel $21>$ channel $22>$ channel 23 " for DMAC2, and "channel $24>$ channel $25>$ channel $26>$ channel 27
$>$ channel $28>$ channel $29>$ channel $30>$ channel 31" for DMAC3.
Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.
If, at the timing when one DMA cycle completes in the middle of a block transfer of a channel, there is a DMA transfer request from a channel with a higher priority, a DMA cycle of the channel with the higher priority will be executed as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority may interrupt.

Figure 8.3 DMAC Channel Arbitration

Cycle numbers shown in Figure 8.3, DMAC Channel Arbitration are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In Figure 8.3, DMAC Channel Arbitration, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. However, since the DMA cycle for channel 2 is still ongoing, no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Because channel 1 uses block transfer, this DMA cycle continues at Cycle 10 where there are no other DMA transfer requests from other channel. At Cycle 11, a DMA transfer request for channel 0 is generated. However, since the DMA cycle for channel 1 is still ongoing, no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1 .

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for
channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

### 8.3.2.2 Interface Arbitration

DMAC0, DMAC1, DMAC2, and DMAC3 work independently and execute DMA transfer.

### 8.3.3 Reload Function

### 8.3.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

### 8.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in Table 8.18, Operation of Reload Function 1 are executed at the timing of the last transfer according to the reload function 1 setting.

Table 8.18 Operation of Reload Function 1

| Reload Function 1 Setting | Register | Action at the Last Transfer |
| :---: | :---: | :---: |
| 00 <br> (Reload function 1 disabled.) | Source address | Not reloaded. |
|  | Destination address | Not reloaded. |
|  | Transfer count | Not reloaded. |
|  | Address reload count | Not reloaded. |
| $01$ <br> (Reload function 1 enabled. Reloading source address and transfer count.) | Source address | The reload source address is copied to this. |
|  | Destination address | Not reloaded. |
|  | Transfer count | The reload transfer count is copied to this. |
|  | Address reload count | If the reload function 2 is disable: Not reloaded. <br> If the reload function 2 is enabled: The reload address reload count is copied to this. |
| 10 <br> (Reload function 1 enabled. <br> Reloading destination address and transfer count.) | Source address | Not reloaded. |
|  | Destination address | The reload destination address is copied to this. |
|  | Transfer count | The reload transfer count is copied to this. |
|  | Address reload count | If the reload function 2 is disable: Not reloaded. <br> If the reload function 2 is enabled: The reload address reload count is copied to this. |
| 11 <br> (Reload function 1 enabled. Reloading source address, destination address, and transfer count.) | Source address | The reload source address is copied to this. |
|  | Destination address | The reload destination address is copied to this. |
|  | Transfer count | The reload transfer count is copied to this. |
|  | Address reload count | If the reload function 2 is disable: Not reloaded. <br> If the reload function 2 is enabled: The reload address reload count is copied to this. |

Figure 8.4, Operation of Reload Function 1 shows an operation of the reload function 1.

Figure 8.4 Operation of Reload Function 1

### 8.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in Table 8.19, Operation of Reload Function 2 are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 8.19 Operation of Reload Function 2

| Reload Function 2 Setting | Register | Action at the Address Reload Transfer |
| :---: | :---: | :---: |
| 00 <br> (Reload function 2 disabled.) | Source address | Not reloaded. |
|  | Destination address | Not reloaded. |
|  | Address reload count | Not reloaded. |
| 01 <br> (Reload function 2 enabled. <br> Reloading source address and address reload count.) | Source address | The reload source address is copied to this. |
|  | Destination address | Not reloaded. |
|  | Address reload count | The reload address reload count is copied to this. |
| 10 <br> (Reload function 2 enabled. <br> Reloading destination address and address reload count.) | Source address | Not reloaded. |
|  | Destination address | The reload destination address is copied to this. |
|  | Address reload count | The reload address reload count is copied to this. |
| 11 <br> (Reload function 2 enabled. Reloading source address and destination address and address reload count.) | Source address | The reload source address is copied to this. |
|  | Destination address | The reload destination address is copied to this. |
|  | Address reload count | The reload address reload count is copied to this. |

Figure 8.5, Operation of Reload Function 2 shows an operation of the reload function 2.

Figure 8.5 Operation of Reload Function 2

Figure 8.6, Operation when Combining the Reload Function 1 and the Reload Function 2 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

Figure 8.6 Operation when Combining the Reload Function 1 and the Reload Function 2

### 8.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). However, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and update of the reload register by users. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

### 8.3.4 Chain Function

### 8.3.4.1 Overview

DMA offers a function called a chain function. With this function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options:

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 8.7, Operation of "Always Chain" shows the operation of "always chain."

Figure 8.7 Operation of "Always Chain"

Figure 8.8, Operation of "Chain at the Last Transfer" shows the operation of "chain at the last transfer."

Figure 8.8 Operation of "Chain at the Last Transfer"

### 8.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (PDMAnDTCTm.CHNE) and the next channel in the chain selection (PDMAnDTCTm.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

### 8.3.4.3 Caution for Using the Chain Function

The chain function is enabled by setting the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same group (DMAC0, DMAC1, DMAC2, and DMAC3). You cannot specify a channel in another group for its next channel in the chain.

### 8.3.5 DMAC Operation

### 8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (PDMAnDTCTm.DRS) bit in the DMAC transfer control register (PDMAnDTCTm) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, DTFR selects one out of 128 hardware DMA transfer factor and assigned to each channel of the DMAC. This assignment is configured in the DTFR setting registers.

### 8.3.5.2 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (PDMAnDCSTm.SR) in the DMAC transfer status register (PDMAnDCSTm) using the DMAC transfer status set register (PDMAnDCSTSm), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (PDMAnDCSTCm). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

### 8.3.5.3 Executing DMA Transfer

When the DMAC accepts a DMA transfer request for a channel, the DMAC executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, DMAC does DMAC channel arbitration and decides a channel to be acknowledged.

### 8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request

### 8.4.1 DMA Suspension and Resume by Software Control

The DMA control register (PDMAnDMACTL) is used to suspend DMA transfer for all channels.
When the DMA suspension bit (PDMAnDMACTL.DMASPD) in the DMA control register is set, DMA puts all channels into the suspended state. If all channels are in the suspended state and the DMA suspension bit in the DMA control register is cleared, DMA restores all channels from the suspended state to the normal state and resumes the DMA transfer of the suspended channel.

When all channels are in the suspended state, DMA transfer is suspended for all channels without changing the value of the PDMAnDCENm.DTE bit of each DMAC channel.

### 8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel

You can suspend the DMA transfer of a DMAC channel by clearing the channel operation enable bit (PDMAnDCENm.DTE) in the DMAC channel operation enable setting register for the channel. If a DMA cycle is ongoing, the DMA transfer of the channel is suspended after the currently ongoing DMA cycle is finished. If you set the PDMAnDCENm.DTE bit again while the DMA transfer of the channel is suspended, the DMA transfer of the channel is resumed.

If you want to abort the currently ongoing DMA transfer of a DMAC channel, similarly clear the channel operation enable bit (PDMAnDCENm.DTE) in the DMAC channel operation enable setting register, and then clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, or clear the software DMA transfer request flag (PDMAnDCSTm.SR) using the DMAC transfer request flag clear bit (PDMAnDCSTCm.SRC) in the DMAC transfer status clear register in the case of a software DMA transfer request.

In case that the continuous transfer enable bit (PDMAnDTCTm.MLE) is set, the channel operation enable bit (PDMAnDCENm.DTE) is kept to be set. Even though the channel operation enable bit (PDMAnDCENm.DTE) is cleared by software during a DMA cycle in a last transfer, the function of the continuous transfer enable bit (PDMAnDTCTm.MLE) is given high priority and the channel operation enable bit (PDMAnDCENm.DTE) is set after completion of the last transfer.

If you want to abort an ongoing DMA transfer of a DMAC channel when continuous transfer function is enabled, please clear the continuous transfer enable bit (PDMAnDTCTm.MLE) first and then clear the channel operation enable bit (PDMAnDCENm.DTE) to abort DMA transfer of the DMAC channel. Only for the operation, DMAC Transfer Control Register (PDMAnDTCTm) can be written under the channel operation is enabled (PDMAnDCENm.DTE $=1$ ).

Figure 8.9, Example of Suspension, Resume, and Transfer Abort of a DMAC Channel shows an example of suspension, resume, and transfer abort of a DMAC channel.

In Figure 8.9, Example of Suspension, Resume, and Transfer Abort of a DMAC Channel, both channels 0 and 1 execute block transfer. At time tick 1, DMA transfer of channel 1 starts. At time tick 2, a DMA transfer request for channel 0 is accepted. As a result of DMAC channel arbitration, DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 1 . At time tick 3 , the last transfer of channel 0 is complete, and the remaining DMA transfer in the block transfer of channel 1 starts. At time tick 4, the last transfer of channel 1 is complete. After time tick 5, DMA transfer of channel 0 and DMA transfer of channel 1 are executed similarly. At time tick 7, the DMA transfer of channel 0 is suspended and, as a result of DMAC channel arbitration, the DMA transfer of channel 1 starts. At time tick 8, the last transfer of channel 1 is complete, and then, at time tick 9 , the DMA transfer of channel 0 resumes. At time tick 10, the DMA transfer of channel 0 is suspended again, and then, at time tick 11 , the DMA transfer of channel 0 is aborted. At time tick 12, the suspended state for channel 0 is cleared, but the DMA transfer of channel 0 is not executed because the DMA transfer is aborted at time tick 11 .

Figure 8.9 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

### 8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (PDMAnDTFRm.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (PDMAnDTFRRQCm.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that was input to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

In case that DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, if DTFR hardware DMA transfer source selection enable bit is set to disable (PDMAnDTFRm.REQEN $=0$ ) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

### 8.4.4 List of Suspend, Resume, and Transfer Abort Functions

Table 8.20 List of Suspend, Resume, and Transfer Abort Functions

| Function | How to Execute the Function | Operation | Possibility of DMA Transfer Abort | Master that can Execute the Function (See Section 8.6, Reliability Functions.) |
| :---: | :---: | :---: | :---: | :---: |
| DMA suspension and resume by software control | Setting and clearing the PDMAnDMACTL.DMAS PD | All channels are in the suspended state. | Not possible*1 | Special master |
| Suspension and resume of a DMAC channel | Clearing and setting the PDMAnDCENm.DTE in each channel register*2 | DMA transfer of a channel is suspended. | Possible (by clearing the DMA transfer request flag in suspension state) | Special master, and general master assigned to the channel. |

Note 1. In order to abort DMA transfer, you need to abort transfer for the DMAC channel.
Note 2. In case that the continuous transfer enable bit (PDMAnDTCTm.MLE) is set, please clear the continuous transfer enable bit (PDMAnDTCTm.MLE) first before clearing the PDMAnDCENm.DTE bit to suspend the channel and set the continuous transfer enable bit (PDMAnDTCTm.MLE) before setting the PDMAnDCENm.DTE bit to resume the channel.

### 8.5 Error Control

### 8.5.1 Type of Error

DMA can generate the following type of error.

- DMA Transfer Error

This error is generated when error is detected in the read cycle or write cycle in a DMA cycle. This error can be generated in all DMAC channels during execution of DMA transfer.
A DMA transfer error leads to INTDMAERR interrupt request which is a source of FEINT.

### 8.5.2 DMA Transfer Error

### 8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (PDMAnDCSTm.ER) in the DMAC transfer status register of the channel where the DMA transfer error occurred is set. The DMAC error register (PDMAnDMACER) shows the transfer error flags of all 32 DMAC channels.

On a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer disable on transfer error setting (PDMAnDTCTm.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (PDMAnDTCTm.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel where the DMA transfer error occurred is set, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the result of write operation is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address register, destination address register, transfer count register, and address reload count register are updated.

### 8.6 Reliability Functions

### 8.6.1 Overview

In this product, DMA provides the following reliability functions:

- Register access protection function
- Master information inherit function

### 8.6.2 Register Access Protection Function

- RH850/F1KH-D8

This product is designed to assign each DMA channel to CPU1 or CPU2.

- RH850/F1KM-S4, RH850/F1KM-S1

This product is designed to assign DMA channel to a CPU1.
The register access protection function allows write access to the transfer information of each DMA channel only from the master assigned to the channel and prohibits write access from other masters.

The register access protection function enables you, for example, to prevent the settings of the channel from being updated by masters other than the one assigned to the channel.

### 8.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the processor element ID number (PEID) of the accessing master, the system protection ID configured by the accessing CPU (SPID), and whether the CPU is in the supervisor mode (PSW.UM = 0) or the user mode (PSW.UM = 1).

### 8.6.2.2 Master Access

DMA handles accesses from CPU in the supervisor mode (PSW.UM $=0$ ) as accesses from special masters. Special masters are allowed to read from or write to all DMA registers.

DMA handles the other masters except special masters as general masters. General masters are allowed to read from all DMA registers, but allowed to write to the following specific registers.

- Channel registers of the channels assigned by the channel assignment. (For details, see Section 8.6.2.3, Channel Assignment.)

From general masters, write access to registers other than the above is not allowed.

### 8.6.2.3 Channel Assignment

To each channel, DMA can assign a master so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (PDMAnDMyiCM) by the CPU in the supervisor mode (PSW.UM = $0)$.

In general master access, the master assigned to a channel by the channel assignment is allowed to write the channel registers of the channel. If the channel registers of a channel is written by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see Section 8.6.2.4, Illegal Access.

### 8.6.2.4 Illegal Access

DMA handles the following access as illegal access.
(1) Write access to global registers from general masters
(2) Write access to channel registers from general masters who are not assigned to the channel

DMA never treat read access from any master as illegal access.
DMA's actions against illegal access are as follows:
For both cases (1) and (2),

- Write access is ignored.

Only for the case (2),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, DMAC2, and DMAC3 have their own register access protection violation registers (PDMAnDM0CMV, PDMAnDM1CMV, PDMAnDM2CMV, and PDMAnDM3CMV respectively).

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically.

In addition, it is recommended that, when a master uses DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

### 8.6.3 Master Information Inherit Function

In this product, DMA inherits master information that is equivalent to the master information of the master to which the DMA channel is assigned.

The master information that is output from DMA is shown in Table 8.21, Master Information that is Output from DMA.

Table 8.21 Master Information that is Output from DMA

| Meaning | Value that is Output from DMA |
| :--- | :--- |
| UM | UM bit value in the channel master setting register |
| SPID | SPID bit value in the channel master setting register |
| PEID | PEID bit value in the channel master setting register |

### 8.6.4 Other Reliability Functions

### 8.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.
When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.
When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the channel master settings are not the same for either PEID or UM, a chain request is not sent.

### 8.7 Setting Up DMA Transfer

### 8.7.1 Overview of Setting Up DMA

Table 8.22 Overview of Setting Up DMA

| No. | Master that Configures the Setting | Description | Register |  | Necessity of the Setting |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Special master (CPU1/2 in the supervisor mode$(U M=0))$ | Overall DMA operation setting | PDMAnDMOOCM to PDMAnDM37CM | DMAC channel master setting | Mandatory |
| 2 |  | Status clear | PDMAnCMVC | Channel protection violation clear register | Recommended |
| 3 | Master assigned to the DMAC channel | Channel setting | PDMAnDSAm | DMAC source address | Mandatory |
| 4 |  |  | PDMAnDDAm | DMAC destination address | Mandatory |
| 5 |  |  | PDMAnDTCm | DMAC transfer count | Mandatory |
| 6 |  |  | PDMAnDTCTm | DMAC transfer control | Mandatory |
| 7 |  |  | PDMAnDRSAm | DMAC reload source address | Mandatory if the reload function is used |
| 8 |  |  | PDMAnDRDAm | DMAC reload destination address | Mandatory if the reload function is used |
| 9 |  |  | PDMAnDRTCm | DMAC reload transfer count | Mandatory if the reload function is used |
| 10 |  |  | PDMAnDTFRm | DTFR setting register | Mandatory |
| 11 |  | Status clear | PDMAnDCSTCm | DMAC transfer status clear | Mandatory |
| 12 |  |  | PDMAnDTFRRQCm | DTFR transfer request clear | Recommended |
| 13 |  | Channel operation enable | PDMAnDCENm | DMAC channel operation enable setting | Mandatory |

### 8.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.
To configure the overall DMA operation, the special master (CPU1/2 in the supervisor mode ( $\mathrm{UM}=0$ ) ) needs to set up global registers. Global registers can be set up only by special master access. For details, see Section 8.6, Reliability Functions.

The following register must be set up to configure the overall DMA operation.

- DMAC channel master setting registers (PDMAnDMyiCM)

These registers configure channel assignment. (For details, see Section 8.6, Reliability Functions.)
If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DMAC0 register access protection violation register (PDMAnDM0CMV)
- DMAC1 register access protection violation register (PDMAnDM1CMV)
- DMAC2 register access protection violation register (PDMAnDM2CMV)
- DMAC3 register access protection violation register (PDMAnDM3CMV)

### 8.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC.
To configure the DMA channel setting, each channel's master assigned by the channel assignment sets channel registers.

### 8.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting in case of using DMAC.

## (1) Disabling the DMAC Channel Operation

If the channel operation enable (PDMAnDCENm.DTE) in the DMAC channel operation enable setting register (PDMAnDCENm) is set, clear the PDMAnDCENm.DTE bit to disable the channel operation.

## (2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (PDMAnDSAm)
- DMAC destination address register (PDMAnDDAm)
- DMAC transfer count register (PDMAnDTCm)
- DMAC transfer control register (PDMAnDTCTm)
- DMAC reload source address register (PDMAnDRSAm)
- DMAC reload destination address register (PDMAnDRDAm)
- DMAC reload transfer count register (PDMAnDRTCm)

## (3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (PDMAnDTCTm.DRS) bit in the DMAC transfer control register (PDMAnDTCTm) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.
If you use the hardware DMA transfer request, you need to select the source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection
(PDMAnDTFRm.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (PDMAnDTFRm.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (PDMAnDTFRRQm.DRQ) retained in the DTFR using the DTFR transfer request clear register (PDMAnDTFRRQCm) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection
(PDMAnDTFRm.REQEN) in the DTFR setting register.

## (4) Clearing the Transfer Status

The DMAC transfer status register (PDMAnDCSTm) may retain the result of the previous DMA transfer, so clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (PDMAnDCSTCm).

## (5) Enabling the DMAC Channel Operation

Set the channel operation enable (PDMAnDCENm.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and become ready for DMA transfer.

### 8.8 Global Registers

### 8.8.1 List of Global Register Address

The global register addresses are listed in the table below.
For <DMAn_base>, see Section 8.1.2, Register Base Addresses.
Table 8.23 List of Global Register Address (RH850/F1KH-D8)

| Unit Name | Register Name | Symbol | Address | Access <br> Permission |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Special Master | General Master |
| PDMAn | DMA control register | PDMAnDMACTL | <DMAn_base> + 0000 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC error register | PDMAnDMACER | <DMAn_base> + 0020 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC0 register access protection violation register | PDMAnDMOCMV | <DMAn_base> + 0030 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC1 register access protection violation register | PDMAnDM1CMV | <DMAn_base> + 0034 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ |
|  | Register access protection violation clear register | PDMAnCMVC | <DMAn_base> + 003C ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 register access protection violation register | PDMAnDM2CMV | <DMAn_base> + 0040 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC3 register access protection violation register | PDMAnDM3CMV | <DMAn_base> + 0044 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC0 channel 0 channel master setting | PDMAnDM00CM | <DMAn_base> + 0100 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC0 channel 1 channel master setting | PDMAnDM01CM | <DMAn_base> + 0104 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC0 channel 2 channel master setting | PDMAnDM02CM | <DMAn_base> + 0108H | $\checkmark$ | -*1 |
|  | DMAC0 channel 3 channel master setting | PDMAnDM03CM | <DMAn_base> + 010C ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC0 channel 4 channel master setting | PDMAnDM04CM | <DMAn_base> + 0110 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC0 channel 5 channel master setting | PDMAnDM05CM | <DMAn_base> + 0114 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC0 channel 6 channel master setting | PDMAnDM06CM | <DMAn_base> + 0118 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC0 channel 7 channel master setting | PDMAnDM07CM | <DMAn_base> + 011C ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 0 channel master setting | PDMAnDM10CM | <DMAn_base> + 0120 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 1 channel master setting | PDMAnDM11CM | <DMAn_base> + 0124 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 2 channel master setting | PDMAnDM12CM | <DMAn_base> + 0128 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 3 channel master setting | PDMAnDM13CM | <DMAn_base> + 012C ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 4 channel master setting | PDMAnDM14CM | <DMAn_base> + 0130 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 5 channel master setting | PDMAnDM15CM | <DMAn_base> + 0134 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 6 channel master setting | PDMAnDM16CM | <DMAn_base> + 0138 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 7 channel master setting | PDMAnDM17CM | <DMAn_base> + 013C ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 0 channel master setting | PDMAnDM20CM | <DMAn_base> + 0140 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 1 channel master setting | PDMAnDM21CM | <DMAn_base> + 0144 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 2 channel master setting | PDMAnDM22CM | <DMAn_base> + 0148 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 3 channel master setting | PDMAnDM23CM | <DMAn_base> + 014CH | $\checkmark$ | -*1 |
|  | DMAC2 channel 4 channel master setting | PDMAnDM24CM | <DMAn_base> + 0150 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 5 channel master setting | PDMAnDM25CM | <DMAn_base> + 0154 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 6 channel master setting | PDMAnDM26CM | <DMAn_base> + 0158 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC2 channel 7 channel master setting | PDMAnDM27CM | <DMAn_base> + 015CH | $\checkmark$ | -*1 |
|  | DMAC3 channel 0 channel master setting | PDMAnDM30CM | <DMAn_base> + 0160 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |

|  | DMAC1 channel 5 channel master setting | PDMAnDM15CM | <DMAn_base> + 0134 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 6 channel master setting | PDMAnDM16CM | <DMAn_base> + 0138 ${ }_{\text {H }}$ | $\checkmark$ | -*1 |
|  | DMAC1 channel 7 channel master setting | PDMAnDM17CM | <DMAn_base> + 013C ${ }_{\text {H }}$ | $\checkmark$ | -*1 |

Note 1. The registers are read only for general master.

### 8.8.2 Details of Global Registers

### 8.8.2.1 PDMAnDMACTL — DMA Control Register

Table 8.26 PDMAnDMACTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DMASPD | DMA suspension |
|  |  | This bit indicates that DMA transfer for all channels is suspended. If a user writes 1 to this bit, |
|  | DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of |  |
|  | DMA transfer for all channels can be released. |  |
|  | The suspension controlled by this bit is independent from the suspension controlled by the |  |
|  | transfer enable bit (PDMAnDCENm.DTE) of each DMAC channel. That means, if this bit is set |  |
|  | to 1, all DMA transfers are suspended regardless of the values of the PDMAnDCENm.DTE bit |  |
|  | of each DMAC channel. |  |
|  | Writing to this bit does not affect the PDMAnDCENm.DTE bit of each DMAC channel. |  |
|  | 0: DMA suspension cleared |  |
|  | 1: DMA suspension request/DMA suspension ongoing |  |
|  |  |  |

### 8.8.2.2 PDMAnDMACER — DMAC Error Register

| Access: <br> Address: |  |  | This register is a read-o$\begin{aligned} & \text { <DMAn_base> + 0020 } \\ & 00000000_{\mathrm{H}} \end{aligned}$ |  |  | regist | that c | be rea | $\text { in } 32-1$ | units. |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 8.27 PDMAnDMACER Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | DM3ER[7:0] | RH850F1KH-D8, RH850/F1KM-S4 |
|  |  | DMAC3 DMA transfer error status |
|  |  | These bits show the DMA transfer error status of channels 0 through 7 of the DMAC3. |
|  |  | Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC3 and is read-only. |
|  |  | 0: DMA transfer error is not generated |
|  |  | 1: DMA transfer error is generated |
|  |  | RH850/F1KM-S1: |
|  |  | When read, the value after reset is returned. |
| 23 to 16 | DM2ER[7:0] | RH850F1KH-D8, RH850/F1KM-S4 |
|  |  | DMAC2 DMA transfer error status |
|  |  | These bits show the DMA transfer error status of channels 0 through 7 of the DMAC2. |
|  |  | Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC2 and is read-only. |
|  |  | 0: DMA transfer error is not generated |
|  |  | 1: DMA transfer error is generated |
|  |  | RH850/F1KM-S1: |
|  |  | When read, the value after reset is returned. |
| 15 to 8 | DM1ER[7:0] | DMAC1 DMA transfer error status |
|  |  | These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. |
|  |  | Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC1 and is read-only. |
|  |  | 0 : DMA transfer error is not generated |
|  |  | 1: DMA transfer error is generated |
| 7 to 0 | DM0ER[7:0] | DMAC0 DMA transfer error status |
|  |  | These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. |
|  |  | Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMACO and is read-only. |
|  |  | 0 : DMA transfer error is not generated |
|  |  | 1: DMA transfer error is generated |

### 8.8.2.3 PDMAnDMOCMV — DMACO Register Access Protection Violation Register

Table 8.28 PDMAnDMOCMV Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | Reserved | When read, the value after reset is returned. |
| 22 to 17 | PEID[2:0] <br> SPID[1:0] <br> UM | Illegal access master information <br> These bits retain the accessing master information of the first illegal access after the PDMAnDMOCMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDMOCMV.VF bit is 1 , these bits do not change. <br> These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 4 | $\mathrm{VCH}[2: 0]$ | Channel where an illegal access occurred. <br> These bits retain the channel number ( 0 to 7 ) of the first illegal access after the PDMAnDMOCMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDMOCMV.VF bit is 1 , these bits do not change. These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | VF | Illegal access flag <br> This bit shows whether illegal access occurred in the DMAC0. <br> 0 : No illegal access has occurred in the DMACO <br> 1: Illegal access has occurred in the DMAC0 <br> If illegal access occurs in the DMAC0 while this bit is 0 , this bit is set, and PDMAnDMOCMV.PEID[2:0], PDMAnDMOCMV.SPID[1:0], PDMAnDM0CMV.UM and PDMAnDMOCMV.VCH[2:0] store their respective information. <br> If illegal access occurs in the DMAC0 while this bit is 1 , this bit remains 1 , and the contents of PDMAnDMOCMV.PEID[2:0], PDMAnDMOCMV.SPID[1:0], PDMAnDMOCMV.UM and PDMAnDMOCMV.VCH[2:0] do not change. <br> This bit can be cleared by using the PDMAnCMVC register. |

### 8.8.2.4 PDMAnDM1CMV — DMAC1 Register Access Protection Violation Register

Table 8.29 PDMAnDM1CMV Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | Reserved | When read, the value after reset is returned. |
| 22 to 17 | PEID[2:0] <br> SPID[1:0] <br> UM | Illegal access master information <br> These bits retain the accessing master information of the first illegal access after the PDMAnDM1CMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDM1CMV.VF bit is 1 , these bits do not change. These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 4 | $\mathrm{VCH}[2: 0]$ | Channel where an illegal access occurred. <br> These bits retain the channel number ( 0 to 7 ) of the first illegal access after the PDMAnDM1CMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDM1CMV.VF bit is 1 , these bits do not change. These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | VF | Illegal access flag <br> This bit shows whether illegal access occurred in the DMAC1. <br> 0 : No illegal access has occurred in the DMAC1 <br> 1: Illegal access has occurred in the DMAC1 <br> If illegal access occurs in the DMAC1 while this bit is 0 , this bit is set, and PDMAnDM1CMV.PEID[2:0], PDMAnDM1CMV.SPID[1:0], PDMAnDM1CMV.UM and PDMAnDM1CMV.VCH[2:0] store their respective information. <br> If illegal access occurs in the DMAC1 while this bit is 1 , this bit remains 1 , and the contents of PDMAnDM1CMV.PEID[2:0], PDMAnDM1CMV.SPID[1:0], PDMAnDM1CMV.UM and PDMAnDM1CMV.VCH[2:0] do not change. <br> This bit can be cleared by using the PDMAnCMVC register. |

### 8.8.2.5 PDMAnDM2CMV — DMAC2 Register Access Protection Violation Register

Table 8.30 PDMAnDM2CMV Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | Reserved | When read, the value after reset is returned. |
| 22 to 17 | PEID[2:0] <br> SPID[1:0] <br> UM | Illegal access master information <br> These bits retain the accessing master information of the first illegal access after the PDMAnDM2CMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDM2CMV.VF bit is 1 , these bits do not change. <br> These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 4 | VCH[2:0] | Channel where an illegal access occurred. <br> These bits retain the channel number ( 0 to 7 ) of the first illegal access after the PDMAnDM2CMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDM2CMV.VF bit is 1 , these bits do not change. <br> These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | VF | Illegal access flag <br> This bit shows whether illegal access occurred in the DMAC2. <br> 0: No illegal access has occurred in the DMAC2 <br> 1: Illegal access has occurred in theDMAC2 <br> If illegal access occurs in the DMAC2 while this bit is 0 , this bit is set, and PDMAnDM2CMV.PEID[2:0], PDMAnDM2CMV.SPID[1:0], PDMAnDM2CMV.UM and PDMAnDM2CMV.VCH[2:0] store their respective information. <br> If illegal access occurs in the DMAC2 while this bit is 1, this bit remains 1, and the contents of PDMAnDM2CMV.PEID[2:0], PDMAnDM2CMV.SPID[1:0], PDMAnDM2CMV.UM and PDMAnDM2CMV.VCH[2:0] do not change. <br> This bit can be cleared by using the PDMAnCMVC register. |

### 8.8.2.6 PDMAnDM3CMV — DMAC3 Register Access Protection Violation Register

Table 8.31 PDMAnDM3CMV Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | Reserved | When read, the value after reset is returned. |
| 22 to 17 | PEID[2:0] <br> SPID[1:0] <br> UM | Illegal access master information <br> These bits retain the accessing master information of the first illegal access after the PDMAnDM3CMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDM3CMV.VF bit is 1 , these bits do not change. <br> These bits are read-only and cannot be cleared. |
| 16 to 7 | Reserved | When read, the value after reset is returned. |
| 6 to 4 | VCH[2:0] | Channel where an illegal access occurred. <br> These bits retain the channel number ( 0 to 7 ) of the first illegal access after the PDMAnDM3CMV.VF bit is cleared to 0 . <br> If illegal access occurs while the PDMAnDM3CMV.VF bit is 1 , these bits do not change. <br> These bits are read-only and cannot be cleared. |
| 3 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | VF | Illegal access flag <br> This bit shows whether illegal access occurred in the DMAC3. <br> 0: No illegal access has occurred in the DMAC3 <br> 1: Illegal access has occurred in the DMAC3 <br> If illegal access occurs in the DMAC3 while this bit is 0 , this bit is set, and PDMAnDM3CMV.PEID[2:0], PDMAnDM3CMV.SPID[1:0], PDMAnDM3CMV.UM and PDMAnDM3CMV.VCH[2:0] store their respective information. <br> If illegal access occurs in the DMAC3 while this bit is 1, this bit remains 1, and the contents of PDMAnDM3CMV.PEID[2:0], PDMAnDM3CMV.SPID[1:0], PDMAnDM3CMV.UM and PDMAnDM3CMV.VCH[2:0] do not change. <br> This bit can be cleared by using the PDMAnCMVC register. |

### 8.8.2.7 PDMAnCMVC — Register Access Protection Violation Clear Register

Table 8.32 PDMAnCMVC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | DM3VC | RH850/F1KH-D8, RH850/F1KM-S4: <br> DMAC3 illegal access flag clear <br> The DMAC3 illegal access flag (PDMAnDM3CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0 . <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | DM2VC | RH850/F1KH-D8, RH850/F1KM-S4: <br> DMAC2 illegal access flag clear <br> The DMAC2 illegal access flag (PDMAnDM2CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0 . <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DM1VC | DMAC1 illegal access flag clear <br> The DMAC1 illegal access flag (PDMAnDM1CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0 . |
| 0 | DMOVC | DMAC0 illegal access flag clear <br> The DMAC0 illegal access flag (PDMAnDMOCMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0 . |

### 8.8.2.8 PDMAnDMyiCM — DMAC Channel Master Setting ( $\mathrm{yi}=00$ to 07, 10 to 17, 20 to 27, and 30 to 37 in RH850/F1KH-D8, yi $=00$ to 07,10 to 17, 20 to 27, and 30 to 37 in RH850/F1KM-S4, yi $=00$ to 07 and 10 to 17 in RH850/F1KM-S1)

Table 8.33 PDMAnDMyiCM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 4 | PEID[2:0] | Channel master PEID setting <br> Specifies the PEID information of the master assigned to the channel. <br>  <br>  <br>  <br> 3,2 |
|  | Set PEID value of PE that configures this register. |  |

## CAUTION

PDMAnDM00CM to PDMAnDM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.
PDMAnDM10CM to PDMAnDM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively
PDMAnDM20CM to PDMAnDM27CM configure the channel master information of the DMAC2 channel 0 to 7 respectively
PDMAnDM30CM to PDMAnDM37CM configure the channel master information of the DMAC3 channel 0 to 7 respectively.

For information about the functions this register offers, see Section 8.6, Reliability Functions.

### 8.9 DMAC Channel Registers

### 8.9.1 DMAC Channel Register Addresses

The DMAC channel registers are listed in the table below.
For <DMAn_base>, see Section 8.1.2, Register Base Addresses.
Table 8.34 DMAC Channel Register Addresses

| Module <br> Name | Register Name | Symbol | Address | Access Permission |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Special Master | General Master |
| PDMAn | DMAC source address | PDMAnDSAm | <DMAn_base> + 0400 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DMAC destination address | PDMAnDDAm | <DMAn_base> + 0404 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DMAC transfer count | PDMAnDTCm | <DMAn_base> + 0408 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DMAC transfer control | PDMAnDTCTm | <DMAn_base> + 040C ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DMAC reload source address | PDMAnDRSAm | <DMAn_base> + 0410 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DMAC reload destination address | PDMAnDRDAm | $\begin{aligned} & \text { <DMAn_base> }+0414_{\mathrm{H}} \\ & +40_{\mathrm{H}} \times[\text { channel number }] \end{aligned}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC reload transfer count | PDMAnDRTCm | <DMAn_base> + 0418 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DMAC channel operation enable setting | PDMAnDCENm | $\begin{aligned} & \text { <DMAn_base> }+0420_{\mathrm{H}} \\ & +40_{\mathrm{H}} \times \text { [channel number] } \end{aligned}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC transfer status | PDMAnDCSTm | $\begin{aligned} & <\text { DMAn_base> }+0424_{\mathrm{H}} \\ & \left.+40_{\mathrm{H}} \times \text { [channel number }\right] \end{aligned}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC transfer status set | PDMAnDCSTSm | $\begin{aligned} & <\text { DMAn_base> }+0428_{\mathrm{H}} \\ & \left.+40_{\mathrm{H}} \times \text { [channel number }\right] \end{aligned}$ | $\checkmark$ | $\checkmark$ |
|  | DMAC transfer status clear | PDMAnDCSTCm | <DMAn_base> + 042C ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DTFR setting | PDMAnDTFRm | <DMAn_base> + 0430 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DTFR transfer request status | PDMAnDTFRRQm | <DMAn_base> $+0434_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |
|  | DTFR transfer request clear | PDMAnDTFRRQCm | <DMAn_base> + 0438 ${ }_{H}$ <br> $+40_{\mathrm{H}} \times$ [channel number] | $\checkmark$ | $\checkmark$ |

[^3]| Channel Number m | Channel | Channel Number m | Channel |
| :---: | :---: | :---: | :---: |
| 0 | DMACO channel 0 | 16 | DMAC2 channel 0 |
| 1 | DMAC0 channel 1 | 17 | DMAC2 channel 1 |
| 2 | DMACO channel 2 | 18 | DMAC2 channel 2 |
| 3 | DMACO channel 3 | 19 | DMAC2 channel 3 |
| 4 | DMACO channel 4 | 20 | DMAC2 channel 4 |
| 5 | DMACO channel 5 | 21 | DMAC2 channel 5 |
| 6 | DMACO channel 6 | 22 | DMAC2 channel 6 |
| 7 | DMAC0 channel 7 | 23 | DMAC2 channel 7 |
| 8 | DMAC1 channel 0 | 24 | DMAC3 channel 0 |
| 9 | DMAC1 channel 1 | 25 | DMAC3 channel 1 |
| 10 | DMAC1 channel 2 | 26 | DMAC3 channel 2 |
| 11 | DMAC1 channel 3 | 27 | DMAC3 channel 3 |
| 12 | DMAC1 channel 4 | 28 | DMAC3 channel 4 |
| 13 | DMAC1 channel 5 | 29 | DMAC3 channel 5 |
| 14 | DMAC1 channel 6 | 30 | DMAC3 channel 6 |
| 15 | DMAC1 channel 7 | 31 | DMAC3 channel 7 |

### 8.9.2 Details of DMAC Channel Registers

### 8.9.2.1 PDMAnDSAm — DMAC Source Address Register

Access: This register can be read or written in 32-bit units.
Address: <DMAn_base> $+0400_{H}+40_{H} \times$ Ch. No. $m$
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SA[31:0] | Source address <br> Specifies the DMA transfer source address. These bits are updated whenever a DMA cycle is <br> executed. If you read from these bits, the transfer source address for the next DMA cycle is <br> read. |

## CAUTIONS

1. It is forbidden to write to these bits when the channel operation is enabled (PDMAnDCENm.DTE bit $=1$ ). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | SA3 | SA2 | SA1 | SA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $\times$ | $\times$ | $\times$ | $\times$ |
| 16 bits | $\times$ | $\times$ | $\times$ | 0 |
| 32 bits | $\times$ | $\times$ | 0 | 0 |
| 64 bits | $\times$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.2 PDMAnDDAm — DMAC Destination Address Register

Access: This register can be read or written in 32-bit units.
Address: $\quad$ <DMAn_base> $+0404_{H}+40_{H} \times$ Ch. No. $m$
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1) Value after reset: $\quad 00000000_{H}$

Table 8.36 PDMAnDDAm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DA[31:0] | Destination address |
|  |  | Specifies the DMA transfer destination address. These bits are updated whenever a DMA <br> cycle is executed. If you read from these bits, the transfer destination address for the next <br> DMA cycle is read. |

## CAUTIONS

1. It is forbidden to write to these bits when the channel operation is enabled (PDMAnDCENm.DTE bit $=1$ ). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. ( $\times$ denotes an arbitrary bit.)
The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | DA3 | DA2 | DA1 | DA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $\times$ | $\times$ | $\times$ | $\times$ |
| 16 bits | $\times$ | $\times$ | $\times$ | 0 |
| 32 bits | $\times$ | $\times$ | 0 | 0 |
| 64 bits | $\times$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.3 PDMAnDTCm — DMAC Transfer Count Register

```
Access: This register can be read or written in 32-bit units.
Address: <DMAn_base> \(+0408_{H}+40_{H} \times\) Ch. No. \(m\)
( \(m=0\) to 31 in RH850/F1KH-D8, \(m=0\) to 31 in RH850/F1KM-S4, \(m=0\) to 15 in RH850/F1KM-S1)
Value after reset: \(\quad 00000000_{H}\)
```

Table 8.37 PDMAnDTCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | ARC[15:0] | Address reload count <br> Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. <br> When the reload function 2 or block transfer 2 is used, PDMAnDTCm.ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, PDMAnDTCm.ARC[15:0] is not updated. <br> If the value is $0000_{\mathrm{H}}$, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536. |
| 15 to 0 | TRC[15:0] | Transfer count <br> Configures the number of transfers. PDMAnDTCm.TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion $\left(0000_{H}\right)$ is retained. |
|  |  | TRC15-0 Operation |
|  |  | $000 \mathrm{O}_{\mathrm{H}} \quad$ The number of transfers is 65536, or the transfer is complete. |
|  |  | $0001_{H} \quad$ The number of transfers is 1 , or remaining transfer count is 1. |
|  |  | : |
|  |  | $\mathrm{FFFF}_{\mathrm{H}} \quad$ The number of transfers is 65535, or remaining transfer count is 65535. |

## CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (PDMAnDCENm.DTE bit $=1$ ). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

### 8.9.2.4 PDMAnDTCTm — DMAC Transfer Control Register

```
Access: This register can be read or written in 32-bit units.
Address: <DMAn_base> \(+040 \mathrm{C}_{\mathrm{H}}+40_{\mathrm{H}} \times \mathrm{Ch}\). No. m
( \(m=0\) to 31 in RH850/F1KH-D8, \(m=0\) to 31 in RH850/F1KM-S4, \(m=0\) to 15 in RH850/F1KM-S1)
Value after reset: \(\quad 00000000_{\mathrm{H}}\)
```

Table 8.38 PDMAnDTCTm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 27 | ESE | DMA transfer disable on transfer error setting <br> Specifies whether to execute a DMA cycle when the PDMAnDCSTm.ER bit is set due to DMA transfer error. <br> If this bit is cleared to 0 , even when the PDMAnDCSTm.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1 , the following DMA cycles are not executed when the PDMAnDCSTm.ER bit is set due to DMA transfer error. <br> 0: DMA cycles are executed while the PDMAnDCSTm.ER bit is set. <br> 1: DMA cycles are not executed while the PDMAnDCSTm.ER bit is set. |
| 26 | DRS | DMA transfer request selection assignment <br> Selects the type of DMA transfer requests to be accepted. <br> 0: Software DMA transfer request <br> 1: Hardware DMA transfer request |
| 25 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 18 | CHNSEL[2:0] | Selection of next channel in the chain <br> Specifies the next channel in the chain. <br> The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC. It is prohibited to specify the channel as the next channel in the chain. <br> (If you do, the correct operation is not guaranteed.) |
| 17, 16 | CHNE[1:0] | Chain enable <br> Selects the chain function. <br> 00: Disabled <br> 01: Chain at the last transfer <br> A chain request is generated at the completion of the DMA cycle when the remaining transfer count is one. <br> 10: Setting prohibited. (The operation is not guaranteed.) <br> 11: Always chain <br> A chain request is generated at the completion of every DMA cycle. |
| 15 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | TCE | Transfer completion interrupt enable <br> If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer. |

Table 8.38 PDMAnDTCTm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 13 | MLE | Continuous transfer enable <br> If this bit is set, the PDMAnDCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the PDMAnDCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. <br> 0 : The PDMAnDCENm.DTE bit is cleared at the completion of DMA transfer. The next DMA transfer starts only after the PDMAnDCSTm.TC bit is cleared. <br> 1: The PDMAnDCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the PDMAnDCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. |
| 12, 11 | RLD2M[1:0] | Reload function 2 setting <br> Specifies the reload function 2. <br> 00: Reload function 2 is disabled. <br> 01: Reload function 2 is enabled. <br> The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. <br> 10: Reload function 2 is enabled. <br> The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. <br> 11: Reload function 2 is enabled. <br> The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. |
| 10, 9 | RLD1M[1:0] | Reload function 1 setting <br> Specifies the reload function 1. <br> 00: Reload function 1 is disabled. <br> 01: Reload function 1 is enabled. <br> The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1 . (If the reload function 2 is enabled, the address reload count is also reloaded.) <br> 10: Reload function 1 is enabled. <br> The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1 . (If the reload function 2 is enabled, the address reload count is also reloaded.) <br> 11: Reload function 1 is enabled. <br> The source address, destination address, and transfer count are reloaded the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) |
| 8, 7 | DACM[1:0] | Destination address count direction <br> Specifies the count direction of the destination address. |
|  |  | DACM1 DACM0 Direction of Count |
|  |  | 0 0 Increment |
|  |  | 0 1 Decrement |
|  |  | 10 Fixed |
|  |  | 115 |
| 6, 5 | SACM[1:0] | Source address count direction <br> Specifies the count direction of the source address. |
|  |  | SACM1 SACM0 Direction of Count |
|  |  | 0 0 Increment |
|  |  | 0 1 Decrement |
|  |  | 10 Fixed |
|  |  | 110 Setting prohibited (The operation is not guaranteed.) |

Table 8.38 PDMAnDTCTm Register Contents

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4 to 2 | DS[2:0] | Transfer data size Specifies the transfer data size. |  |  |  |
|  |  |  |  |  |  |
|  |  | DS2 | DS1 | DSO | Transfer |
|  |  | 0 | 0 | 0 | 8 bits |
|  |  | 0 | 0 | 1 | 16 bits |
|  |  | 0 | 1 | 0 | 32 bits |
|  |  | 0 | 1 | 1 | 64 bits |
|  |  | 1 | 0 | 0 | 128 bits |
|  |  | Other | above |  | Setting p |
| 1, 0 | TRM[1:0] | Transfer mode |  |  |  |
|  |  | Specifies the DMA transfer mode. |  |  |  |
|  |  | 00: Single transfer |  |  |  |
|  |  | 01: Block transfer 1 (The number of transfers is specified by the transfer count.) |  |  |  |
|  |  | 10: Block transfer 2 (The number of transfers is specified by the address reload count.) |  |  |  |

## CAUTIONS

1. Except for the case to clear PDMAnDTCTm.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (PDMAnDCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for each bits, the correct operation is not guaranteed.

### 8.9.2.5 PDMAnDRSAm — DMAC Reload Source Address Register

Access: This register can be read or written in 32-bit units.
Address: $\quad$ <DMAn_base> $+0410_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. $m$
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1) Value after reset: $\quad 00000000_{H}$

Table 8.39 PDMAnDRSAm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RSA[31:0] | Reload source address |
|  |  | Specifies the source address to be reloaded to the DMA source address register when the <br> reload function 1 or reload function 2 is used. |

## CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. ( $\times$ denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | RSA3 | RSA2 | RSA1 | RSA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $\times$ | $\times$ | $\times$ | $\times$ |
| 16 bits | $\times$ | $\times$ | $\times$ | 0 |
| 32 bits | $\times$ | $\times$ | 0 | 0 |
| 64 bits | $\times$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.6 PDMAnDRDAm — DMAC Reload Destination Address Register

```
Access: This register can be read or written in 32-bit units.
Address: \(\quad\) <DMAn_base> \(+0414_{\mathrm{H}}+40_{\mathrm{H}} \times\) Ch. No. \(m\)
( \(m=0\) to 31 in RH850/F1KH-D8, \(m=0\) to 31 in RH850/F1KM-S4, \(m=0\) to 15 in RH850/F1KM-S1) Value after reset: \(\quad 00000000_{H}\)
```

Table 8.40 PDMAnDRDAm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RDA[31:0] | Reload destination address |
|  |  | Specifies the destination address to be reloaded to the DMA destination address register |
|  | when the reload function 1 or reload function 2 is used. |  |

## CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. ( $\times$ denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

| Data Size | RDA3 | RDA2 | RDA1 | RDA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $\times$ | $\times$ | $\times$ | $\times$ |
| 16 bits | $\times$ | $\times$ | $\times$ | 0 |
| 32 bits | $\times$ | $\times$ | 0 | 0 |
| 64 bits | $\times$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

### 8.9.2.7 PDMAnDRTCm — DMAC Reload Transfer Count Register

Access: This register can be read or written in 32-bit units.
Address: $\quad$ <DMAn_base> $+0418_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. m
( $\mathrm{m}=0$ to 31 in RH850/F1KH-D8, $\mathrm{m}=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

Table 8.41 PDMAnDRTCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | RARC[15:0] | Reload address reload count <br> Specifies the value to be reloaded to the address reload count in the transfer count register at <br> the timing of reload when the reload function 2 is used. |
| 15 to 0 | RTRC[15:0] | Reload transfer count <br> Specifies the value to be reloaded to the transfer count in the transfer count register at the <br> timing of reload when the reload function 1 is used. |

### 8.9.2.8 PDMAnDCENm — DMAC Channel Operation Enable Setting Register

Access: This register can be read or written in 32-bit units.
Address: $\quad$ <DMAn_base> $+0420_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. m
( $\mathrm{m}=0$ to 31 in RH850/F1KH-D8, $\mathrm{m}=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | DTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 8.42 PDMAnDCENm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DTE | Channel operation enable |
|  | Specifies whether to enable or disable the transfer operation of the channel. If the |  |
|  | PDMAnDCENm.DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the |  |
|  | PDMAnDTCTm.MLE bit is 0, this bit is automatically cleared when DMA transfer is completed. |  |
|  |  | In addition, if 0 is written to the PDMAnDCENm.DTE bit during DMA transfer, the DMA |
|  | transfer is suspended. If 1 is written to the PDMAnDCENm.DTE bit during suspension, the |  |
|  | suspension is cleared and the DMA transfer resumes. |  |
|  | 0: Channel operation is disabled/Channel suspended |  |
|  | 1: Channel operation is enabled/Channel suspension cleared |  |
|  |  |  |

### 8.9.2.9 PDMAnDCSTm — DMAC Transfer Status Register

Access: This register is a read-only register that can be read in 32-bit units.
Address: <DMAn_base> $+0424_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. m
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 8.43 PDMAnDCSTm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | Reserved | When read, the value after reset is returned. |
| 11 | ERWR | DMA Transfer Error occurring cycle <br> This bit is updated at the same time as setting of the DMA transfer error flag (PDMAnDCSTm.ER), indicating in which cycle of read or write the DMA transfer error occurred. This bit is not updated when a new DMA transfer error occurs after the PDMAnDCSTm.ER bit has been set. If the PDMAnDCSTm.ER bit is cleared, this bit is also cleared to 0 . <br> 0: DMA transfer error occurs in the read cycle. <br> 1: DMA transfer error occurs in the write cycle. |
| 10, 9 | Reserved | When read, the value after reset is returned. |
| 8 | CY | DMA cycle execution state <br> This bit shows whether a DMA cycle is ongoing in this channel. <br> 0 : DMA cycle is not ongoing. <br> 1: DMA cycle is ongoing. |
| 7 | ER | Transfer error flag <br> This bit is set when DMA transfer error is generated. If this bit is 1 and the PDMAnDTCTm.ESE bit is set, a DMA cycle is not executed even when a DMA transfer request is generated. <br> 0 : No DMA transfer error is generated <br> 1: DMA transfer error is generated |
| 6, 5 | Reserved | When read, the value after reset is returned. |
| 4 | TC | Transfer completion flag <br> This bit is set at the completion of the last transfer and indicates that the DMA transfer is complete. If the PDMAnDTCTm.MLE bit is 0 and this bit is 1 , a DMA cycle is not executed when a DMA transfer request is generated. <br> 0 : DMA transfer is incomplete <br> 1: DMA transfer is complete |
| 3, 2 | Reserved | When read, the value after reset is returned. |

Table 8.43 PDMAnDCSTm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 1 | DR | Hardware DMA transfer request status |
|  |  | This bit shows whether there is a hardware DMA transfer request (PDMAnDMARQ) from the DTFR. |
|  |  | This bit changes regardless of the value of the PDMAnDCENm.DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request has been selected in the transfer request selection bit (PDMAnDTCTm.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR. |
|  |  | 0 : There is no hardware DMA transfer request |
|  |  | 1: There is a hardware DMA transfer request |
| 0 | SR | Software DMA transfer request flag |
|  |  | This bit shows whether there is a software DMA transfer request. This bit is automatically cleared when executing the DMA transfer. A user can set this bit by writing 1 to the PDMAnDCSTSm.SRS bit in the DMAC transfer status set register (PDMAnDCSTSm). In addition, a user can clear this bit by writing 1 to the PDMAnDCSTCm.SRC bit in the DMAC transfer status clear register (PDMAnDCSTCm), but if this is done, the ongoing DMA transfer is aborted and cannot be resumed. |
|  |  | 0 : There is no software DMA transfer request |
|  |  | 1: There is a software DMA transfer request |

### 8.9.2.10 PDMAnDCSTSm — DMAC Transfer Status Set Register

Access: This register can be read or written in 32-bit units.
Address: $\quad$ <DMAn_base> $+0428_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. m
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

Table 8.44 PDMAnDCSTSm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SRS | Software DMA transfer request flag <br>  |
|  | A user can set the software DMA transfer request flag (PDMAnDCSTm.SR) by writing 1 to this <br> bit. When read, this bit is always read as 0. |  |

### 8.9.2.11 PDMAnDCSTCm — DMAC Transfer Status Clear Register

Access: This register can be read or written in 32-bit units.
Address: <DMAn_base> $+042 \mathrm{C}_{\mathrm{H}}+40_{H} \times$ Ch. No. $m$
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

Table 8.45 PDMAnDCSTCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ERC | Transfer error flag clear <br> The DMA transfer error flag (PDMAnDCSTm.ER) can be cleared by writing 1 to this bit. When <br> read, this bit is always read as 0. |
| 6,5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | TCC | Transfer completion flag clear <br> The transfer completion flag (PDMAnDCSTm.TC) can be cleared by writing 1 to this bit. When <br> read, this bit is always read as 0. |
| 3 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SRC | Software DMA transfer request flag clear <br> The software DMA transfer request flag (PDMAnDCSTm.SR) can be cleared by writing 1 to <br> this bit. When read, this bit is always read as 0. |

### 8.9.2.12 PDMAnDTFRm — DTFR Setting Register

Access: This register can be read or written in 32-bit units.
Address: <DMAn_base> $+0430_{H}+40_{H} \times$ Ch. No. $m$
( $\mathrm{m}=0$ to 31 in RH850/F1KH-D8, $\mathrm{m}=0$ to 31 in RH850/F1KM-S4, $\mathrm{m}=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

Table 8.46 PDMAnDTFRm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 1 | REQSEL[6:0] | Hardware DMA transfer source selection <br> Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. <br> 000_0000: Select the DMACTRG[0] input : <br> 111_1111: Select the DMACTRG[127] input |
| 0 | REQEN | Hardware DMA transfer source selection enable <br> This bit enables/disables the hardware DMA transfer source selection. <br> 0: Hardware DMA transfer source selection is disabled. <br> 1: Hardware DMA transfer source selection is enabled. <br> If this bit is 0 , even when the hardware DMA transfer source selected by the PDMAnDTFRm.REQSEL[6:0] bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated. |

### 8.9.2.13 PDMAnDTFRRQm — DTFR Transfer Request Status Register

Access: This register is a read-only register that can be read in 32-bit units.
Address: $\quad$ <DMAn_base> $+0434_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. m
( $\mathrm{m}=0$ to 31 in RH850/F1KH-D8, $\mathrm{m}=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

Table 8.47 PDMAnDTFRRQm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | DRQ | Hardware DMA transfer request status |
|  |  | This bit indicates that a hardware DMA transfer request exists or is retained. |
|  | - This bit indicates whether a hardware DMA transfer request is retained or not. When the |  |
|  | DMA transfer request acceptance signal from the DMAC is asserted, this bit is automatically |  |
|  | cleared. A user can clear this bit by writing 1 to the PDMAnDTFRRQCm.DRQC bit. |  |
|  |  | This bit changes regardless of the value of the PDMAnDTFRm.REQEN bit when a hardware |
|  | DMA transfer request from the outside is generated. |  |
|  | 0: There is no hardware DMA transfer request |  |
|  | 1: There is a hardware DMA transfer request |  |
|  |  |  |

### 8.9.2.14 PDMAnDTFRRQCm — DTFR Transfer Request Clear Register

Access: This register can be read or written in 32-bit units.
Address: $\quad$ <DMAn_base> $+0438_{\mathrm{H}}+40_{\mathrm{H}} \times$ Ch. No. m
( $m=0$ to 31 in RH850/F1KH-D8, $m=0$ to 31 in RH850/F1KM-S4, $m=0$ to 15 in RH850/F1KM-S1)
Value after reset: $\quad 00000000_{H}$

Table 8.48 PDMAnDTFRRQCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DRQC | Hardware DMA transfer request clear |
|  |  | A user can clear the PDMAnDTFRRQm.DRQ bit by writing 1 to this bit. |
|  | When read, this bit is always read as 0. |  |

### 8.10 DMA Trigger Factor Select Registers

The following registers are used to select a DMA Trigger Factor.

### 8.10.1 List of DMA Trigger Factor Select Register Address

The DMA Trigger Factor Select Register addresses are listed in the table below.
Table 8.49 List of DMA Trigger Factor Select Register (RH850/F1KH-D8)

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| SL_DMAC | DMA trigger factor select register of TAUD0 | DTFSEL_TAUD0 | FFC0 2000 $H_{H}$ |
|  | DMA trigger factor select register of TAUB0 | DTFSEL_TAUB0 | FFC0 2004 |
|  | DMA trigger factor select register of TAUB1 | DTFSEL_TAUB1 | FFC0 2008 $H_{H}$ |

Table 8.50 List of DMA Trigger Factor Select Register (RH850/F1KM-S4)

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| SL_DMAC | DMA trigger factor select register of TAUD0 | DTFSEL_TAUD0 | FFC0 2000 |
|  | DMA trigger factor select register of TAUB0 | DTFSEL_TAUB0 | FFCO 2004 |
|  | DMA trigger factor select register of TAUB1 | DTFSEL_TAUB1 | FFC0 2008 |

Note: DTFSEL_TAUB1 is not supported on 100-pin and 144-pin products.

Table 8.51 List of DMA Trigger Factor Select Register (RH850/F1KM-S1)

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| SL_DMAC | DMA trigger factor select register of TAUD0 | DTFSEL_TAUD0 | FFCO 2000 |
|  | DMA trigger factor select register of TAUB0 | DTFSEL_TAUB0 | FFCO 2004 |

### 8.10.2 DTFSEL_TAUD0/DTFSEL_TAUB0/DTFSEL_TAUB1 — DMA Trigger Factor Select Register

When 16 or 17 DMA Trigger Factors are assigned to one DMA Trigger Number, this register selects which DMA Trigger Factor is enabled.

Table 8.52 DTFSEL_TAUD0/DTFSEL_TAUB0/DTFSEL_TAUB1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 25 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | REQSEL6*2 | $\begin{aligned} & \text { RH850/F1KH-D8: } \\ & \text { DMA Trigger Factor selection } \\ & \text { 0: TAUB1REQSEL5 } \\ & \text { 1: RSCANFDRF15 } \\ & \text { RH850/F1KM-S4, RH850/F1KM-S1: } \end{aligned}$ <br> When read, the value after reset is returned. When writing, write the value after reset |
| 23 to 20 | REQSEL5[3:0] | DMA Trigger Factor selection of TAUD0REQSEL5/TAUB0REQSEL5/TAUB1REQSEL5.** |
| 19 to 16 | REQSEL4[3:0] | DMA Trigger Factor selection of TAUD0REQSEL4/TAUB0REQSEL4/TAUB1REQSEL4.** |
| 15 to 12 | REQSEL3[3:0] | DMA Trigger Factor selection of TAUD0REQSEL3/TAUB0REQSEL3/TAUB1REQSEL3.** |
| 11 to 8 | REQSEL2[3:0] | DMA Trigger Factor selection of TAUD0REQSEL2/TAUB0REQSEL2/TAUB1REQSEL2.** |
| 7 to 4 | REQSEL1[3:0] | DMA Trigger Factor selection of TAUD0REQSEL1/TAUB0REQSEL1/TAUB1REQSEL1.** |
| 3 to 0 | REQSEL0[3:0] | DMA Trigger Factor selection of TAUD0REQSEL0/TAUB0REQSEL0/TAUB1REQSEL0.*1 |

Note 1. For Detail, see Table 8.53, DMA Trigger Factor Selection of TAUDOREQSELj/TAUB0REQSELj/TAUB1REQSELj (RH850/F1KH-D8), Table 8.54, DMA Trigger Factor Selection of TAUDOREQSELj/TAUB0REQSELj/TAUB1REQSELj (RH850/F1KM-S4) or Table 8.55, DMA Trigger Factor Selection of TAUD0REQSELj/TAUB0REQSELj (RH850/F1KM-S1).
Note 2. This bit is only supported for DTFSEL_TAUB1. For DTFSEL_TAUD0 and DTFSEL_TAUB0, when writing, write the value after reset.

NOTE
For details on DMA Trigger Factors, see Section 8.1.4, DMA Trigger Factors.

Table 8.53 DMA Trigger Factor Selection of TAUDOREQSELj/TAUB0REQSELj/TAUB1REQSELj (RH850/F1KH-D8)

## CAUTION

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by DTFSEL_TAUDO/DTFSEL_TAUB0/DTFSEL_TAUB1.

Figure 8.10 Configuration Diagram of DTFSEL_TAUDO

Figure 8.11 Configuration Diagram of DTFSEL_TAUB1 (RH850/F1KH-D8)

Figure 8.12 Configuration Diagram of DTFSEL_TAUB1 (RH850/F1KM-S4)

## Section 9A Reset Controller of RH850/F1KH-D8

## 9A. 1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:
Table 9A. 1 Reset Sources and Reset Targets

| Reset Source | Symbol | RH850/F1KH-D8 |
| :--- | :--- | :--- |
| External reset | RESET | $\checkmark$ |
| Power-On Clear | POCRES | $\checkmark$ |
| Watchdog timer reset | WDTA0RES | $\checkmark$ |
|  | WDTA1RES | $\checkmark$ |
|  | WDTA2RES | $\checkmark$ |
| Clock monitor reset | CLMA0RES | $\checkmark$ |
|  | CLMA1RES | $\checkmark$ |
|  | CLMA2RES | $\checkmark$ |
| Low-voltage indicator reset | CLMA3RES | $\checkmark$ |
| Software reset | LVIRES | $\checkmark$ |
| Debugger reset | SWRES | $\checkmark$ |
| Core voltage monitor reset | DBRES | $\checkmark$ |
| Transition to DeepSTOP mode | CVMRES | $\checkmark$ |

## 9A.1.1 Reset Sources

Reset levels and reset sources are shown below.
Various reset sources are assigned to the different levels of the reset.
Table 9A. 2 Reset Sources and Reset Targets

| Reset Level | Reset Source | Clock Generation (except PLL)/RealTime Clock/CVM/LVI | Always-On area (AWO area) Modules*1 | Isolated area (ISO area) Modules*2 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Power-On Clear (POCRES) | Reset | Reset | Reset |
|  | Debugger reset ( $\overline{\text { DBRES }}$ ) |  |  |  |
| 2 | External reset ( $\overline{\text { RESET }}$ ) | Not reset target*3 | Reset | Reset |
|  | Watchdog timer reset (WDTAORES, WDTA1RES, WDTA2RES) |  |  |  |
|  | Clock monitor reset ( $\overline{\text { CLMA0RES }}$, $\overline{\text { CLMA1RES }}$ |  |  |  |
|  | CLMA2RES , CLMA3RES ) |  |  |  |
|  | Core voltage monitor reset ( CVMRES ) |  |  |  |
|  | Low voltage indicator reset ( $\overline{\text { LVIRES }}$ ) |  |  |  |
|  | Software reset (SWRES) |  |  |  |
| 3 | Reset by DeepSTOP mode | Not reset target | Not reset target | Reset |

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.
Note 2. PLL is included.
Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.
Reset level 1: Initializes the entire microcontroller.
Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.
Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

If each reset is generated, local RAM data and global RAM data are not guaranteed to retaine.
If each reset is generated, retention RAM data can be retained as long as the power-supply voltage (REG0VCC) does not fall below the RAM retention voltage (VVLVI).

In this case, data value writing to retention RAM address will be before or after writing.

## 9A.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.
The configuration of the reset generation circuits is shown in the figure below.

Note 1. Real-time clock is excluded.

Figure 9A. 1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.
According to the reset source, the two reset generation circuits output the Always-On area (AWO area) reset signal (AWORES), Isolated area (ISO area) reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and RESETOUT signal.

The AWORES, ISORES, CLKRTRES, and RESETOUT signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

## 9A.1.3 Reset Output ( RESETOUT )

When a reset source of reset level 1 or 2 is generated, a reset output signal ( $\overline{\text { RESETOUT }}$ ) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see Section 2A.11.1.1, P8_6: RESETOUT .

## 9A.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in Figure 9A.2, Block Diagram of the Reset Controller.

## 9A.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.
Table 9A. 3 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| Reset | Register access clock | CPUCLK_UL |

## 9A. 2 Configuration

## 9A.2.1 Block Diagram

Block diagram of reset circuits are shown below.

Figure 9A. 2 Block Diagram of the Reset Controller

## (1) Reset Signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)

AWORES is generated by all reset sources except the transition to DeepSTOP mode.
AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.

- Isolated area (ISO area) reset (ISORES)

ISORES is generated by all reset sources. ISORES resets all modules (including PLL) in the Isolated area (ISO area).

- CLKRTRES

CLKRTRES is generated by the power-on clear or debugger reset sources.
CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.
The power-up reset (PURES) is caused by the power-on clear and debugger reset sources.
Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a
CLMA0RES reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a
CLMA1RES reset, the MainOSC that was the target for CLMA1 monitoring is reset.
The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

## (2) Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see Section 9A.1.4, Reset Flag.

## (3) On-Chip Module Resets

## (a) Watchdog Timer Resets

The watchdog timers can generate three types of resets: WDTA0RES, WDTA1RES and WDTA2RES.
For details, see Section 9A.4.6, Watchdog Timer (WDTA) Reset

## (b) Clock Monitor Resets

The clock monitors can generate four resets: $\overline{\text { CLMA0RES }}, \overline{\text { CLMA1RES }}, \overline{\text { CLMA2RES }}$, and CLMA3RES.
For details, see Section 9A.4.8, Clock Monitor (CLMA) Reset.

## (c) Debugger Reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset
PURES. For details, see Section 9A.4.9, Debugger Reset.

## (4) Software Controlled Reset (SWRES)

A software reset SWRES can be generated by use of the software reset register SWRESA.
For details, see Section 9A.4.7, Software Reset.

## (5) Reset Output Signal

During reset and after release from the reset, port P8_6 outputs low level as $\overline{\text { RESETOUT }}$ function.
For details, see Section 2A.11.1.1, P8_6: RESETOUT.

## (6) Power Supply Monitoring

The following power supply detection circuits observe the level of the external power supply REG0VCC and REG1VCC.

## (a) Low-Voltage Indicator

The low-voltage indicator (LVI) generates the LVIRES reset, if the voltage level of REG0VCC drops below a certain level. The level can be adjusted and the $\overline{\text { LVIRES }}$ can be masked.

For details, see Section 9A.4.3, Low-Voltage Indicator (LVI) Reset.

## (b) Power-On Clear

The power-on clear circuit (POC) continuously compares the power supply voltage REG0VCC and REG1VCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.

For details, see Section 9A.4.2, Power-On Clear (POC) Reset.

## (c) Core Voltage Monitor

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)

For details, see Section 9A.4.4, Core Voltage Monitor (CVM) Reset.

## (7) Masking of Reset Sources in Debugging Mode

The following reset sources can be masked during debugging:
Table 9A. 4 Reset Sources to be Masked during Debugging

| Reset Source | Maskable/Non-maskable |
| :---: | :---: |
| Power-on clear (POCRES) | - |
| Debugger reset ( $\overline{\text { DBRES }}$ ) | - |
| External reset ( $\overline{\mathrm{RESET}}$ ) | $\checkmark$ |
| Low-voltage indicator reset ( $\overline{\text { LVIRES }}$ ) | $\checkmark$ |
| Clock monitor reset ( $\overline{\text { CLMAORES }}, \overline{\text { CLMA1RES }}$, $\overline{\text { CLMA2RES }}, \overline{\text { CLMA3RES }}$ ) | $\checkmark$ |
| Watchdog timer reset (WDTA0RES, WDTA1RES, WDTA2RES) | $\checkmark$ |
| Core voltage monitor reset ( $\overline{\text { CVMRES }}$ ) | $\checkmark$ |
| Software reset (SWRES) | $\checkmark$ |
| Reset by DeepSTOP mode | - |

## 9A. 3 Registers

This section contains a description of all registers of the reset controller.

## 9A.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:
Table 9A. 5 Reset Controller Registers Overview

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| RESCTL | Reset flag registers |  |  |
|  | Reset factor register | RESF | FFF8 0760 ${ }_{\text {H }}$ |
|  | Reset factor clear register | RESFC | FFF8 0768 ${ }_{\text {H }}$ |
|  | Redundant reset factor register | RESFR | FFF8 0860 ${ }_{\text {H }}$ |
|  | Redundant reset factor clear register | RESFCR | FFF8 0868 ${ }_{\text {H }}$ |
|  | Software reset control register |  |  |
|  | Software reset register | SWRESA | FFF8 0A04 ${ }_{\text {H }}$ |

NOTES

1. For the LVI related, RAM store related, and CVM related registers, see Section 11A, Supply Voltage Monitor of RH850/F1KH-D8.
2. As for the protection registers, see Section 5, Write-Protected Registers.

## 9A.3.2 Details of Reset Flag Registers

## 9A.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.
For example, if a clock monitor reset CLMA0RES occurs after a watchdog timer reset WDTA0RES, RESF reads $00000_{000 \text { A }_{\text {H }} \text {. }}$

Note 1. For details, see Figure 9A.4, When RESET is Released before the Flash Sequence is Completed, When $\overline{\text { RESET }}$ is released before Execution of Flash Sequence.

Table 9A. 6 RESF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | Reserved | When read, the value after reset is returned. |
| 14 | RESF14 | CLMA3 reset flag <br> 0 : No reset occurred <br> 1: Reset has occurred |

## 9A.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.
In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

| Access: <br> Address: |  |  | This register is a read-only register that can be read in 32-bit unitsFFF8 $0860_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $00000200_{\mathrm{H}} / 00000300^{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

## 9A.3.3 Details of Software Reset Control Register

## 9A.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see Section 5, Write-Protected Registers.

## 9A. 4 Functional Description

## 9A.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.
RESF and RESFR are initialized by a power-up reset PURES (POCRES or DBRES ) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFCR).

Each reset source can set the corresponding flag independently from other reset sources.

## 9A.4.2 Power-On Clear (POC) Reset

The power-on clear circuit (POC) constantly compares the power supply voltage REG0VCC and REG1VCC with the internal reference voltage VPOC. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

If REG0VCC or REG1VCC falls below the internal reference voltage (REG0VCC < VPOC or REG1VCC < VPOC), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level VPOC, see Section 47A, Electrical Characteristics of RH850/F1KH-D8.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level VPOC.

The following figure illustrates the timing of a POCRES.

Note: Delay:
When the REGOVCC and REG1VCC exceeds the VPOC, the POCRES is released after certain delay. When the REGOVCC and REG1VCC falls below the VPOC, the POCRES is asserted after certain delay.
See Section 47A, Electrical Characteristics of RH850/F1KH-D8 for the delay time.

Figure 9A. 3 POC Reset Timing
(1) Overview of CPU System Startup after Power-On Clear

Note 1. The timing of releasing the $\overline{\operatorname{RESET}}$ pin depends on the external circuit of the microcontroller.
If the $\overline{\text { RESET }}$ pin is low level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 1 . If the $\overline{R E S E T}$ pin is high level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 0 .

Figure 9A.4 When $\overline{\text { RESET }}$ is Released before the Flash Sequence is Completed

Figure 9A. 5 When $\overline{\text { RESET }}$ is Released after the Flash Sequence is Completed

## 9A.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REG0VCC with the LVI internal reference voltage VLVIn.

When setting the LVI detection voltage and releasing the LVIRESMK, if REG0VCC falls below the internal reference voltage (REG0VCC < VLVIn), the internal reset signal $\overline{\text { LVIRES }}$ is generated.

Additionally, the LVIRES flags (bits RESF.RESF6 and RESFR.RESFR6) are set.
After that, even if REG0VCC exceeds VLVIn, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.

Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.

- Power-up reset PURES (POCRES or DBRES )

For details on the LVI functions, see Section 11A, Supply Voltage Monitor of RH850/F1KH-D8.

The following figure illustrates the timing of a $\overline{\text { LVIRES }}$ and bits RESF.RESF6 and RESFR.RESFR6.

Note: Delay:
When REGOVCC falls below VLVIn, $\overline{\text { LVIRES }}$ is asserted and the VLVIn reset flags (RESF.RESF6 and RESFR.RESFR6) are set after a certain delay. After that, when REGOVCC exceeds VLVIn, $\overline{\text { LVIRES }}$ is released after a certain delay.
See Section 47A, Electrical Characteristics of RH850/F1KH-D8 for the delay time.

Figure 9A. 6 LVI Reset Timing

## 9A.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.
The reset CVMRES is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the CVMRES flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.

Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.

- Power-up reset PURES (POCRES or DBRES )

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once $\overline{\text { CVMRES }}$ is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ( $\overline{\text { RESET }}$ ) input. Release the external reset ( $\overline{\text { RESET }}$ ) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see Section 11A, Supply Voltage Monitor of RH850/F1KH-D8.

Figure 9A. 7 CVM Reset Timing

## 9A.4.5 External Reset ( RESET )

When a low level input is applied to the RESET pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the RESET pin is released. Bits RESF.RESF8 and RESFR.REFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.

Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.

- Power-up reset PURES (POCRES or DBRES )

The RESET pin includes an analog noise filter to prevent erroneous resets due to noise.
The following figure shows the timing when AWORES and ISORES are generated by the external reset. This figure also shows the effect of the noise filter.

Figure 9A. 8 External Reset ( $\overline{\text { RESET }}$ )

## 9A.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES, and the RESF.RESF11 and RESFR.RESFR11 bits for WDTA2RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2 or bits RESF.RESF11 and RESFR.RESFR11) are not cleared automatically, even if WDTA0RES (or WDTA1RES or WDTA2RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 and bits RESF.RESF11 and RESFR.RESFR11 are cleared as described below.

- WDTA0RES:

Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.

- WDTA1RES:

Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.

- WDTA2RES:

Setting the RESFC.RESFC11 bit to 1 clears the RESF.RESF11 bit. Setting the RESFCR.RESFCR11 bit to 1 clears the RESFR.RESFR11 bit.

- Power-up reset PURES (POCRES or DBRES )

## 9A.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1 .
SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.
RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.

Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.

- Power-up reset PURES (POCRES or DBRES )

## 9A.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- CLMA0RES, if a frequency abnormality in HS IntOSC is detected
- CLMA1RES , if a frequency abnormality in MainOSC is detected
- CLMA2RES , if a frequency abnormality in PLL0 is detected
- CLMA3RES , if a frequency abnormality in PLL1 is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets $\overline{\text { CLMA0RES }}$, $\overline{\text { CLMA1RES }, ~ C L M A 2 R E S ~}$, and CLMA3RES are generated.
In addition, flags CLMA0RES $\overline{\text { CLMA1RES }} \overline{\text { CLMA2RES }}$, and CLMA3RES (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, RESFR.RESFR5, RESF.RESF14, and RESFR.RESFR14) are set.

These flags are not cleared automatically. They are cleared as described below.

- CLMA0RES :

Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.
Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.

- CLMA1RES :

Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.
Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.

- CLMA2RES :

Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.

- CLMA3RES :

Setting the RESFC.RESFC14 bit to 1 clears the RESF.RESF14 bit.
Setting the RESFCR.RESFCR14 bit to 1 clears the RESFR.RESFR14 bit

- Power-up reset PURES (POCRES or DBRES )

## 9A.4.9 Debugger Reset

Debugger reset ( $\overline{\text { DBRES }}$ ) is generated via a debugger command. $\overline{\text { DBRES }}$ activates PURES, and therefore operates in the same way as the power-on clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization).

## Section 9BC Reset Controller of RH850/F1KM

## 9BC. 1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:
Table 9BC. 1 Reset Sources and Reset Targets (RH850/F1KM-S4)

| Reset Source | Symbol | RH850/F1KM-S4 |
| :--- | :--- | :--- |
| External reset | RESET | $\checkmark$ |

## 9BC.1.1 Reset Sources

Reset levels and reset sources are shown below.
Various reset sources are assigned to the different levels of the reset.
Table 9BC. 3 Reset Sources and Reset Targets

| Reset Level | Reset Source | Clock Generation (except PLL)/RealTime Clock/CVM/LVI | Always-On area (AWO area) Modules*1 | Isolated area (ISO area) Modules*2 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Power-On Clear (POCRES) | Reset | Reset | Reset |
|  | Debugger reset ( $\overline{\text { DBRES }}$ ) |  |  |  |
| 2 | External reset ( $\overline{\text { RESET }}$ ) | Not reset target*3 | Reset | Reset |
|  | Watchdog timer reset (WDTAORES, WDTA1RES) |  |  |  |
|  | Clock monitor reset ( $\overline{\text { CLMA0RES }}$, $\overline{\text { CLMA1RES }}$, |  |  |  |
|  | $\overline{\text { CLMA2RES }}$, $\overline{\text { CLMA3RES }}$ ) |  |  |  |
|  | Core voltage monitor reset ( CVMRES ) |  |  |  |
|  | Low voltage indicator reset ( $\overline{\text { LVIRES }}$ ) |  |  |  |
|  | Software reset (SWRES) |  |  |  |
| 3 | Reset by DeepSTOP mode | Not reset target | Not reset target | Reset |

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.
Note 2. PLL is included.
Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.
Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

If each reset is generated, local RAM data and global RAM data*1 are not guaranteed to retaine.
If each reset is generated, retention RAM data can be retained as long as the power-supply voltage (REGVCC) does not fall below the RAM retention voltage (VVLVI).
In this case, data value writing to retention RAM address will be before or after writing.
Note 1. The global RAM is not supported in RH850/F1KM-S1.

## 9BC.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.
The configuration of the reset generation circuits is shown in the figure below.

Note 1. Real-time clock is excluded.

Figure 9BC. 1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.
According to the reset source, the two reset generation circuits output the Always-On area (AWO area) reset signal (AWORES), Isolated area (ISO area) reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and RESETOUT signal.
The AWORES, ISORES, CLKRTRES, and $\overline{\text { RESETOUT }}$ signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

## 9BC.1.3 Reset Output ( RESETOUT )

When a reset source of reset level 1 or 2 is generated, a reset output signal ( $\overline{\text { RESETOUT }}$ ) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see Section 2B.11.1.1, P8_6: $\overline{\text { RESETOUT }}$ and Section 2C.11.1.1, P8_6: $\overline{\text { RESETOUT }}$.

## 9BC.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in Figure 9BC.2, Block Diagram of the Reset Controller.

## 9BC.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.
Table 9BC. 4 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| Reset | Register access clock | CPUCLK_UL |

## 9BC. 2 Configuration

## 9BC.2.1 Block Diagram

Block diagram of reset circuits are shown below.

Figure 9BC. 2 Block Diagram of the Reset Controller (RH850/F1KM-S4)

Figure 9BC. 3 Block Diagram of the Reset Controller (RH850/F1KM-S1)

## (1) Reset Signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)

AWORES is generated by all reset sources except the transition to DeepSTOP mode.
AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.

- Isolated area (ISO area) reset (ISORES)

ISORES is generated by all reset sources. ISORES resets all modules (including PLL) in the Isolated area (ISO area).

- CLKRTRES

CLKRTRES is generated by the power-on clear or debugger reset sources.
CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.
The power-up reset (PURES) is caused by the power-on clear and debugger reset sources.
Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a
CLMA0RES reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a
CLMA1RES reset, the MainOSC that was the target for CLMA1 monitoring is reset.
The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

## (2) Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see Section 9BC.1.4, Reset Flag.

## (3) On-Chip Module Resets

## (a) Watchdog Timer Resets

The watchdog timers can generate two types of resets: WDTA0RES and WDTA1RES.
For details, see Section 9BC.4.6, Watchdog Timer (WDTA) Reset.

## (b) Clock Monitor Resets

The clock monitors can generate four resets: $\overline{\text { CLMA0RES }}, \overline{\text { CLMA1RES }}, \overline{\text { CLMA2RES }}$, and $\overline{\text { CLMA3RES }}$
For details, see Section 9BC.4.8, Clock Monitor (CLMA) Reset.

## (c) Debugger Reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset PURES.
For details, see Section 9BC.4.9, Debugger Reset.

## (4) Software Controlled Reset (SWRES)

A software reset SWRES can be generated by use of the software reset register SWRESA.
For details, see Section 9BC.4.7, Software Reset.

## (5) Reset Output Signal

During reset and after release from the reset, port P8_6 outputs low level as $\overline{\text { RESETOUT }}$ function.
For details, see Section 2B.11.1.1, P8_6: RESETOUT and Section 2C.11.1.1, P8_6: RESETOUT .

## (6) Power Supply Monitoring

The following power supply detection circuits observe the level of the external power supply REGVCC.

## (a) Low-Voltage Indicator

The low-voltage indicator (LVI) generates the $\overline{\text { LVIRES }}$ reset, if the voltage level of REGVCC drops below a certain level. The level can be adjusted and the $\overline{\text { LVIRES }}$ can be masked.

For details, see Section 9BC.4.3, Low-Voltage Indicator (LVI) Reset.

## (b) Power-On Clear

The power-on clear circuit (POC) continuously compares the power supply voltage REGVCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.

For details, see Section 9BC.4.2, Power-On Clear (POC) Reset.

## (c) Core Voltage Monitor

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)

For details, see Section 9BC.4.4, Core Voltage Monitor (CVM) Reset.

## (7) Masking of Reset Sources in Debugging Mode

The following reset sources can be masked during debugging:
Table 9BC. 5 Reset Sources to be Masked during Debugging

| Reset Source | Maskable/Non-maskable |
| :---: | :---: |
| Power-on clear (POCRES) | - |
| Debugger reset ( $\overline{\text { DBRES }}$ ) | - |
| External reset ( $\overline{\text { RESET }}$ ) | $\checkmark$ |
| Low-voltage indicator reset ( $\overline{\text { LVIRES }}$ ) | $\checkmark$ |
| Clock monitor reset ( $\overline{\text { CLMA0RES }}$, $\overline{\text { CLMA1RES }}$, $\overline{\text { CLMA2RES }}$, $\overline{\text { CLMA3RES }}$ ) | $\checkmark$ |
| Watchdog timer reset (WDTA0RES, WDTA1RES) | $\checkmark$ |
| Core voltage monitor reset ( $\overline{\text { CVMRES }}$ ) | $\checkmark$ |
| Software reset (SWRES) | $\checkmark$ |
| Reset by DeepSTOP mode | - |

## 9BC. 3 Registers

This section contains a description of all registers of the reset controller.

## 9BC.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:
Table 9BC. 6 Reset Controller Registers Overview (RH850/F1KM-S4)

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| RESCTL | Reset flag registers |  |  |
|  | Reset factor register | RESF | FFF8 $0760_{\mathrm{H}}$ |
|  | Reset factor clear register | RESFC | FFF8 $0768_{\mathrm{H}}$ |
|  | Redundant reset factor register | RESFCR | FFF8 $0860_{\mathrm{H}}$ |
|  | Redundant reset factor clear register | FFF8 $0868_{\mathrm{H}}$ |  |
|  | Software reset control register | FWRESA |  |
|  | Software reset register |  |  |

Table 9BC. 7 Reset Controller Registers Overview (RH850/F1KM-S1)

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| RESCTL | Reset flag registers |  |  |
|  | Reset factor register | RESF | FFF8 0760 ${ }_{\text {H }}$ |
|  | Reset factor clear register | RESFC | FFF8 $0768_{\text {H }}$ |
|  | Redundant reset factor register | RESFR | FFF8 0860 ${ }_{\text {H }}$ |
|  | Redundant reset factor clear register | RESFCR | FFF8 0868 ${ }_{\text {H }}$ |
|  | Software reset control register |  |  |
|  | Software reset register | SWRESA | FFF8 0A04 ${ }_{\text {H }}$ |
|  | Cyclic RUN mode reset vector address register |  |  |
|  | Cyclic RUN mode RBASE register | CYCRBASE | FFF8 $3600_{\text {H }}$ |

NOTES

1. For the LVI related, RAM store related, and CVM related registers, see Section 11BC, Supply Voltage Monitor of RH850/F1KM.
2. As for the protection registers, see Section 5, Write-Protected Registers.

## 9BC.3.2 Details of Reset Flag Registers

## 9BC.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.
For example, if a clock monitor reset CLMA0RES occurs after a watchdog timer reset WDTA0RES, RESF reads $00000_{000 A_{H}}$.

Note 1. For details, see Figure 9BC.5, When RESET is Released before the Flash Sequence is Completed, When $\overline{\text { RESET }}$ is released before Execution of Flash Sequence.

Table 9BC. 8 RESF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | Reserved | When read, the value after reset is returned. |
| 14 | RESF14 | RH850/F1KM-S4: <br> CLMA3 reset flag <br> 0 : No reset occurred <br> 1: Reset has occurred <br> RH850/F1KM-S1: <br> When read, the value after reset is returned. |

## 9BC.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.
In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

Note 1. For details, see Figure 9BC.5, When $\overline{\operatorname{RESET}}$ is Released before the Flash Sequence is Completed, When RESET is released before Execution of Flash Sequence.

Table 9BC. 10 RESFR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | Reserved | When read, the value after reset is returned. |

## 9BC.3.3 Details of Software Reset Control Register

## 9BC.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see Section 5, Write-Protected Registers.

| Access: <br> Address: |  |  | This register is a write-only register that can be written in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 9BC. 12 SWRESA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When writing, write "0". |
| 0 | SWRESA | Software reset trigger |
|  |  | $0:$ No Software reset trigger is generated. |
|  |  | 1: Software reset trigger is generated. |

## 9BC.3.4 Details of Cyclic RUN Mode Reset Vector Address Register

CYCRBASE Register is supported in RH850/F1KM-S1.

## 9BC.3.4.1 CYCRBASE - Cyclic RUN Mode RBASE Register

This register is used to specify reset vector address (RBASE) of the CPU, when the CPU returns to Cyclic RUN mode from DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see Section 5, Write-Protected Registers.
Update of this register is only permitted when the chip is in RUN mode. Do not change the value in Cyclic RUN mode.
This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Table 9BC. 13 CYCRBASE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | CYCRBASE | Reset vector base address (RBASE) in Cyclic RUN mode. <br>  <br>  <br>  <br> 8 Specifies the RBASE value in Cyclic RUN mode. <br>  <br>  |
| Reserved | The default value is set to the start address of the retention RAM. |  |

## 9BC. 4 Functional Description

## 9BC.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.
RESF and RESFR are initialized by a power-up reset PURES (POCRES or DBRES ) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFCR).

Each reset source can set the corresponding flag independently from other reset sources.

## 9BC.4.2 Power-On Clear (POC) Reset

The power-on clear circuit (POC) constantly compares the power supply voltage REGVCC with the internal reference voltage VPOC. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

If REGVCC falls below the internal reference voltage (REGVCC < VPOC), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level VPOC, see Section 47B, Electrical Characteristics of RH850/F1KM-S4 and Section 47C, Electrical Characteristics of RH850/F1KM-S1.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level VPOC.

The following figure illustrates the timing of a POCRES.

Note: Delay:
When the REGVCC exceeds the VPOC, the POCRES is released after certain delay. When the REGVCC falls below the VPOC, the POCRES is asserted after certain delay.
See Section 47B, Electrical Characteristics of RH850/F1KM-S4 and Section 47C, Electrical Characteristics of RH850/F1KM-S1 for the delay time.

Figure 9BC. 4 POC Reset Timing
(1) Overview of CPU System Startup after Power-On Clear

Note 1. The timing of releasing the $\overline{\text { RESET }}$ pin depends on the external circuit of the microcontroller.
If the $\overline{\text { RESET }}$ pin is low level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 1 . If the $\overline{R E S E T}$ pin is high level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 0 .

Figure 9BC. 5 When $\overline{\text { RESET }}$ is Released before the Flash Sequence is Completed

Figure 9BC. 6 When $\overline{\text { RESET }}$ is Released after the Flash Sequence is Completed

## 9BC.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REGVCC with the LVI internal reference voltage VLVIn.

When setting the LVI detection voltage and releasing the LVIRESMK, if REGVCC falls below the internal reference voltage (REGVCC < VLVIn), the internal reset signal LVIRES is generated.

Additionally, the LVIRES flags (bits RESF.RESF6 and RESFR.RESFR6) are set.
After that, even if REGVCC exceeds VLVIn, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.

Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.

- Power-up reset PURES (POCRES or DBRES )

For details on the LVI functions, see Section 11BC, Supply Voltage Monitor of RH850/F1KM.

The following figure illustrates the timing of a $\overline{\text { LVIRES }}$ and bits RESF.RESF6 and RESFR.RESFR6.

Figure 9BC. 7 LVI Reset Timing

## 9BC.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.
The reset CVMRES is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the CVMRES flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.

Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.

- Power-up reset PURES (POCRES or DBRES )

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once CVMRES is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ( $\overline{\text { RESET }}$ ) input. Release the external reset ( $\overline{\text { RESET }}$ ) after the voltage level becomes lower than the high detection voltage.
For details on the CVM function, see Section 11BC, Supply Voltage Monitor of RH850/F1KM.

Figure 9BC. 8 CVM Reset Timing

## 9BC.4.5 External Reset ( $\overline{\text { RESET }}$ )

When a low level input is applied to the $\overline{\text { RESET }}$ pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the RESET pin is released. Bits RESF.RESF8 and RESFR.REFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.

Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.

- Power-up reset PURES (POCRES or DBRES )

The $\overline{\text { RESET }}$ pin includes an analog noise filter to prevent erroneous resets due to noise.
The following figure shows the timing when AWORES and ISORES are generated by the external reset. This figure also shows the effect of the noise filter.

Figure 9BC. 9 External Reset ( $\overline{\text { RESET }}$ )

## 9BC.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2) are not cleared automatically, even if WDTA0RES (or WDTA1RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 are cleared as described below.

- WDTA0RES:

Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.

- WDTA1RES:

Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.

- Power-up reset PURES (POCRES or DBRES )

## 9BC.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.
SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.
RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.

Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.

- Power-up reset PURES (POCRES or DBRES )

## 9BC.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text { CLMA0RES }}$, if a frequency abnormality in HS IntOSC is detected
- CLMA1RES, if a frequency abnormality in MainOSC is detected
- CLMA2RES, if a frequency abnormality in PLL0 is detected
- CLMA3RES , if a frequency abnormality in PLL1 is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets $\overline{\text { CLMA0RES }}$, $\overline{\text { CLMA1RES }}, \overline{\text { CLMA2RES }}$, and CLMA3RES are generated.
In addition, flags CLMA0RES $\overline{\text { CLMA1RES }} \overline{\text {, CLMA2RES }}$, and CLMA3RES (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, RESFR.RESFR5, RESF.RESF14, and RESFR.RESFR14) are set.

These flags are not cleared automatically. They are cleared as described below.

- CLMA0RES :

Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit. Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.

- CLMA1RES :

Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit. Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.

- CLMA2RES :
[RH850/F1KM-S4]
Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.
[RH850/F1KM-S1]
This is not supported.
- CLMA3RES :
[RH850/F1KM-S4]
Setting the RESFC.RESFC14 bit to 1 clears the RESF.RESF14 bit.
Setting the RESFCR.RESFCR14 bit to 1 clears the RESFR.RESFR14 bit.
[RH850/F1KM-S1]
Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.
- Power-up reset PURES (POCRES or DBRES )

## 9BC.4.9 Debugger Reset

Debugger reset ( $\overline{\text { DBRES }}$ ) is generated via a debugger command. $\overline{\text { DBRES }}$ activates PURES, and therefore operates in the same way as the power-on clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization).

## 9BC.4.10 Reset Vector Address of CPU

This function is supported in RH850/F1KM-S1.
The default value of reset vector base address (RBASE) of CPU is set to $00000000_{\mathrm{H}}$ at shipment. In Cyclic RUN mode, the reset vector base address is automatically switched to the address specified by the CYCRBASE register. After returning to the RUN mode, the reset vector base address automatically switches back to the default address.

For details about the RBASE register, see Section 3BC, CPU System of RH850/F1KM.

## Section 10A Power Supply Circuit of RH850/F1KH-D8

This section describes the power supply and power domains of the RH850/F1KH.

## 10A. 1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.
The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.
For operation of the device, the following voltages are required:

- Power supply voltages REG0VCC and REG1VCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltages EVCC and BVCC for the I/O ports.
- Power supply voltages A0VREF and A1VREF for the A/D converters and the separated I/O ports.

## 10A.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.
Table 10A. 1 Power Supply Pins

| Power Supply | Power Supply Pins | Power Supply for |
| :---: | :---: | :---: |
| Power supply for internal circuits | REGOVCC | - On-chip voltage regulators for the Always-On area (AWO area) <br> - Port group IPO <br> - MainOSC <br> - SubOSC <br> - POC (REGOVCC voltage detection) <br> - POC (REG1VCC voltage detection) <br> - LVI |

## Section 10B Power Supply Circuit of RH850/F1KM-S4

This section describes the power supply and power domains of the RH850/F1KM.

## 10B. 1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.
The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.
For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltages EVCC and BVCC*1 for the I/O ports.
- Power supply voltages A0VREF and A1VREF*1 for the A/D converters and the separated I/O ports.

Note 1. Not supported for the 100-pin devices.

## 10B.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.
Table 10B. 1 Power Supply Pins

Note: See Section 47B, Electrical Characteristics of RH850/F1KM-S4 for the voltage range of each power supply.
Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.
Note 2. Not supported for the 100-pin devices.

## 10B.1.2 Block Diagram of Power Domains

The figure below shows the overview of power supply circuit.

## Section 10C Power Supply Circuit of RH850/F1KM-S1

This section describes the power supply and power domains of the RH850/F1KM.

## 10C. 1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.
The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.
For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltage EVCC for the I/O ports.
- Power supply voltage A0VREF for the A/D converters and the separated I/O ports.

## 10C.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.
Table 10C. 1 Power Supply Pins

| Power Supply | Power Supply Pins | Power Supply for |
| :---: | :---: | :---: |
| Power supply for internal circuits | REGVCC | - On-chip voltage regulators for the Always-On area (AWO area) and Isolated area (ISO area) <br> - MainOSC <br> - POC / LVI |
|  | AWOVCL*1 |  |
|  | AWOVSS |  |
|  | ISOVCL*1 |  |
|  | ISOVSS |  |
| Power supply for I/O port | EVCC | - RESET <br> - FLMDO |
|  | EVSS | (100/80-pin devices) <br> - Port groups JP0, P0, P8, P9, P10, P11 (64/48-pin devices) <br> - Port groups JP0, P0, P8, P9, P10 |
| Power supply for A/D converters | AOVREF | - Analog circuits of ADCAO, port group APO |
|  | AOVSS |  |

Note: See Section 47C, Electrical Characteristics of RH850/F1KM-S1 for the voltage range of each power supply.
Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

## 10C.1.2 Block Diagram of Power Domains

The figure below shows the overview of power supply circuit.

Figure 10C. 1 Overview of Power Supply Circuit (100/80 Pins)

Figure 10C. 2 Overview of Power Supply Circuit (64/48 Pins)

## 10C.1.3 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.
Table 10C. 2 Functional Modules and Power Domain

| Power Domain | Functions |
| :--- | :--- |
| Always-On area (AWO area) | $\bullet$ STBC, Reset controller |
|  | - Retention RAM |
|  | - MainOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1 |

## Section 11A Supply Voltage Monitor of RH850/F1KH-D8

This section explains in general about the supply voltage monitor.
The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REG0VCC
- REG1VCC
- EVCC
- BVCC
- A0VREF
- A1VREF
- AWOVCL
- ISOVCL

The required power supply specification for power supply monitoring with external device is shown at Section
47A.4.5, Power Management Characteristics.

## 11A. 1 Overview

## 11A.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

Table 11A. 1 Supply Voltage Monitor Functions

| Function Name | Monitor Voltage | Signal Generated when Voltage Drops below Certain Level |
| :--- | :--- | :--- |
| Power-On Clear (POC) | REGOVCC | Internal reset signal |
|  | REG1VCC |  |
| Low-Voltage Indicator Circuit (LVI) | REGOVCC | Internal reset signal, interrupt request signal |
| Core Voltage Monitor (CVM) | Isolated area (ISO <br> area) voltage | Internal reset signal |
| RAM Retention Voltage Indicator (VLVI) | REGOVCC | - |

## NOTES

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

## 11A.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REG0VCC and REG1VCC. This ensures that the microcontroller only operates at or above power-on clear detection voltage (VPOC).

If REG0VCC or REG1VCC falls below the POC detection voltage (REG0VCC < VPOC, REG1VCC < VPOC), the internal reset signal (POCRES) is generated.

For details, see Section 9A.4.2, Power-On Clear (POC) Reset.

## 11A.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REG0VCC with the LVI reference voltage VLVIn. If REG0VCC falls below the reference voltage (REG0VCC < VLVIn), an internal reset signal or interrupt request signal is generated.

## 11A.1.3.1 LVI Reference Voltage

The LVI reference voltage VLVIn can be selected from three different levels by LVICNT.LVICNT[1:0].
If LVICNT.LVICNT[1:0] is set to $00_{\mathrm{B}}$, the LVI is disabled.
For the specification of the reference voltage level VLVIn, see Section 11A.2.2.1, LVICNT — LVI Control
Register.

## 11A.1.3.2 LVI Reset ( LVIRES )

When the LVI detection voltage is set and LVIRESMK is cleared, if REG0VCC falls below the reference voltage (REG0VCC < VLVIn), the internal reset signal LVIRES is generated.

For the specification of LVIRES generation, see Section 9A.4.3, Low-Voltage Indicator (LVI) Reset.

## 11A.1.3.3 LVI Interrupt (INTLVILIINTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1 , if REG0VCC falls below the reference voltage (REG0VCC (MIN) < VLVIn), the LVI interrupt INTLVIL is generated.

To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.
INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see Section 14, Stand-By Controller (STBC).

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1 , if REG0VCC exceeds the reference voltage (REG0VCC (MIN) > VLVIn), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.
The following figure illustrates the timing of INTLVIL/INTLVIH.

Note: Delay:
When REGOVCC falls below VLVIn, INTLVIL is generated after a certain delay.
After that, when REGOVCC exceeds VLVIn, INTLVIH is generated after a certain delay.
See Section 47A, Electrical Characteristics of RH850/F1KH-D8 for delay time.

Figure 11A. 1 INTLVIL/INTLVIH Generation Timing

## 11A.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.
(1) Using LVI as the Reset Source
a. Mask LVI reset. (LVICNT.LVIRESMK $=1)^{* 1}$
b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK $=1$, FEINTFMSK.LVIHFEIFMSK $=1$ )
c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1
d. Insert ample wait time by software (see Section 47A, Electrical Characteristics of RH850/F1KH-D8).
e. Unmask LVI reset. (LVICNT.LVIRESMK $=0)^{* 1}$
(2) Using LVI as the Interrupt Source (FEINT)
a. Mask LVI reset. (LVICNT.LVIRESMK $=1)^{* 1}$
b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)
c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1
d. Insert ample wait time by software (see Section 47A, Electrical Characteristics of RH850/F1KH-D8).
e. Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK $=0$, FEINTFMSK.LVIHFEIFMSK $=0$ )

Note 1. Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see Section 5, Write-Protected Registers.

## CAUTION

If REGOVCC is not stable around the LVI detection level (VLVIn), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.

For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REGOVCC being unstable, the software cannot detect which type of interrupt was generated last.

Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REGOVCC (min.) being greater than VLVIn, the software erroneously judges that REGOVCC (min.) < VLVIn.
Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REGOVCC.

## 11A.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.
Table 11A. 2 Clock Supply to the LVI

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| LVI | Register access clock | CPUCLK_UL |

## 11A.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area (ISO area) voltage (referred to as "core voltage" below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ( $\overline{\text { CVMRES }}$ ) is generated.
If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

## CAUTION

The CVM cannot detect drifts in the voltage of the Isolated area (ISO area) caused by the characteristics of the regulator, use conditions or the increase or decrease of voltage.

## 11A.1.4.1 CVM Reset ( $\overline{\text { CVMRES }}$ )

If the core voltage exceeds the specified level while high-voltage monitor is enabled (CVMDE.H_D_E = 1), then CVMRES is generated and the power supply to the Isolated area (ISO area) is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled (CVMDE.L_D_E = 1), CVMRES is generated.
