This flag indicates that an access error occurred when reading the RAM A.

## CAUTION

When this flag changes from 0 to 1 , the AERR bit in the FLXAnFREIR register is set to 1 .
This flag can be reset by the CHI command CLEAR_RAMS.

## (9) FLXAnFRMHDS.AMR

Message RAM Access Error Flag
Writing 0 has no effect on the bit value.
This bit is cleared when writing 1 to it.
This flag indicates that an access error occurred when reading the Message RAM.

## CAUTION

When this flag changes from 0 to 1 , the AERR bit in the FLXAnFREIR register is set to 1 . This flag can be reset by the CHI command CLEAR_RAMS.

### 25.2.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register

## Access: FLXAnFRLDTS is a read-only register that can be read in 32-bit units.

FLXAnFRLDTSL and FLXAnFRLDTSH are the read-only registers that can be read in 16 -bit units.
FLXAnFRLDTSLL, FLXAnFRLDTSLH, FLXAnFRLDTSHL, and FLXAnFRLDTSHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRLDTS: <FLXAn_base> + 0314 H ,
FLXAnFRLDTSL: <FLXAn_base> + 0314, FLXAnFRLDTSH: <FLXAn_base> + 0316 ,
FLXAnFRLDTSLL: <FLXAn_base> + 0314н, FLXAnFRLDTSLH: <FLXAn_base> + 0315н, FLXAnFRLDTSHL: <FLXAn_base> + 0316H, FLXAnFRLDTSHH: <FLXAn_base> + 0317H Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | LDTB[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | LDTA[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.75 FLXAnFRLDTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | Reserved | When read, the value after reset is returned. |
| 26 to 16 | LDTB[10:0] | Last Dynamic Transmission Channel B Flag |
| 15 to 11 | Reserved | When read, the value after reset is returned. |
| 10 to 0 | LDTA[10:0] | Last Dynamic Transmission Channel A Flag |

## (1) FLXAnFRLDTS.LDTB

Last Dynamic Transmission Channel B Flag
Stores the value of vSlotCounter[B] at the time of the last frame transmission on channel B in the dynamic segment of this node.
It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS of channel B.

## (2) FLXAnFRLDTS.LDTA

Last Dynamic Transmission Channel A Flag
Stores the value of vSlotCounter[A] at the time of the last frame transmission on channel A in the dynamic segment of this node.
It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS of channel A.

### 25.2.9.3 FLXAnFRFSR — FlexRay FIFO Status Register

```
Access: FLXAnFRFSR is a read-only register that can be read in 32-bit units.
FLXAnFRFSRL is a read-only register that can be read in 16-bit units.
FLXAnFRFSRLL and FLXAnFRFSRLH are the read-only registers that can be read in 8-bit units.
Address: FLXAnFRFSR: <FLXAn_base> + 0318н,
    FLXAnFRFSRL: <FLXAn_base> + 0318н,
    FLXAnFRFSRLL: <FLXAn_base> + 0318H, FLXAnFRFSRLH: <FLXAn_base> + 0319H
    Value after reset: }00000000\textrm{H
```

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.76 FLXAnFRFSR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 8 | RFFL[7:0] | Receive FIFO Fill Level Flag |
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | RFO | Receive FIFO Overrun Flag |
|  |  | 0: No receive FIFO overrun detected |
|  | 1: A receive FIFO overrun has been detected |  |
| 1 | RFCL | Receive FIFO Critical Level Flag |
|  | $0:$ Receive FIFO below critical level |  |
|  |  | 1: Receive FIFO critical level reached |
| 0 | RFNE | Receive FIFO Not Empty Flag |
|  | $0:$ Receive FIFO is empty |  |
|  |  | 1: Receive FIFO is not empty |

## (1) FLXAnFRFSR.RFFL

## Receive FIFO Fill Level Flag

Indicates the number of FIFO buffers filled with new data not yet read by the Host. Maximum value is 128. Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (2) FLXAnFRFSR.RFO

## Receive FIFO Overrun Flag

The flag is set to 1 by the CC when a receive FIFO overrun is detected.
When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, interrupt flag FLXAnFREIR.RFO is set to 1.
The flag is cleared by the next FIFO read access issued by the Host.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (3) FLXAnFRFSR.RFCL

## Receive FIFO Critical Level Flag

This flag is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRFCL.CL.
When FLXAnFRFSR.RFCL changes from 0 to 1 bit FLXAnFRSIR.RFCL is set to 1 , and if enabled, an interrupt is generated.
The flag is cleared by the CC as soon as FLXAnFRFSR.RFFL drops below FLXAnFRFCL.CL.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (4) FLXAnFRFSR.RFNE

## Receive FIFO Not Empty Flag

This flag is set to 1 by the CC when a received valid frame (data or null frame depending on rejection mask) was stored in the FIFO. In addition, interrupt flag FLXAnFRSIR.RFNE is set to 1 .
The bit is reset to 0 after the Host has read all messages from the FIFO.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

### 25.2.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register

Some constraints exist for the Message Handler regarding bus clock frequency, Message RAM configuration, and FlexRay bus traffic. To simplify software development, constraints violations are reported by setting flags in the FLXAnFRMHDF.

$$
\begin{array}{cl}
\text { Access: } & \text { FLXAnFRMHDF can be read or written in 32-bit units. } \\
& \text { FLXAnFRMHDFL can be read or written in 16-bit units. } \\
& \text { FLXAnFRMHDFLL and FLXAnFRMHDFLH can be read or written in 8-bit units. } \\
\text { Address: } & \text { FLXAnFRMHDF: <FLXAn_base> + 031C } \mathrm{H}_{\mathrm{H}}, \\
& \text { FLXAnFRMHDFL: <FLXAn_base> + 031C } \\
& \text { FLXAnFRMHDFLL: <FLXAn_base> }+031 C_{H}, \text { FLXAnFRMHDFLH: <FLXAn_base> }+031 D_{H} \\
\text { Value after reset: } & 00000000_{\mathrm{H}}
\end{array}
$$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.77 FLXAnFRMHDF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | WAHP | Write Attempt to Header Partition Flag <br> 0 : No write attempt to header partition <br> 1: Write attempt to header partition |
| 7 | TNSB | Transmission Not Started Channel B Flag <br> 0 : No transmission not started on channel B <br> 1: Transmission not started on channel $B$ |
| 6 | TNSA | Transmission Not Started Channel A Flag <br> 0 : No transmission not started on channel A <br> 1: Transmission not started on channel $A$ |
| 5 | TBFB | Temporary buffer Access Failure B Flag <br> 0 : No TBF B access failure <br> 1: TBF B access failure |
| 4 | TBFA | Temporary buffer Access Failure A Flag <br> 0: No TBF A access failure <br> 1: TBF A access failure |
| 3 | FNFB | Find Sequence Not Finished Channel B Flag <br> 0 : No find sequence not finished for channel $B$ <br> 1: Find sequence not finished for channel $B$ |
| 2 | FNFA | Find Sequence Not Finished Channel A Flag <br> 0 : No find sequence not finished for channel $A$ <br> 1: Find sequence not finished for channel $A$ |
| 1 | SNUB | Status Not Updated Channel B Flag <br> 0 : No overload condition occurred when updating MBS for channel B <br> 1: MBS for channel B not updated |

Table 25.77 FLXAnFRMHDF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | SNUA | Status Not Updated Channel A Flag |
|  |  | 0: No overload condition occurred when updating MBS for channel A |
|  | 1: MBS for channel A not updated |  |

(1) FLXAnFRMHDF.WAHP

Write Attempt to Header Partition Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Outside DEFAULT_CONFIG and CONFIG state this flag is set to 1 by the CC when the message handler tries to write message data into the header partition of the Message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (2) FLXAnFRMHDF.TNSB

Transmission Not Started Channel B Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.
(3) FLXAnFRMHDF.TNSA

Transmission Not Started Channel A Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (4) FLXAnFRMHDF.TBFB

Temporary buffer Access Failure B Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when a read or write access to TBF B requested by PRT (Protocol controller) B could not complete within the available time.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (5) FLXAnFRMHDF.TBFA

Temporary buffer Access Failure A Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when a read or write access to TBF A requested by PRT A could not complete within the available time.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (6) FLXAnFRMHDF.FNFB

Find Sequence Not Finished Channel B Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (7) FLXAnFRMHDF.FNFA

Find Sequence Not Finished Channel A Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (8) FLXAnFRMHDF.SNUB

Status Not Updated Channel B Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (9) FLXAnFRMHDF.SNUA

Status Not Updated Channel A Flag
Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1 .
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

### 25.2.9.5 FLXAnFRTXRQi — FlexRay Transmission Request $\mathbf{i}(i=1$ to 4$)$

The four registers reflect the state of the TXR flags of all configured message buffers. The flags are valid for transmit buffers only. If the number of configured message buffers is less than 128, the unused TXR flags are invalid.

Table 25.78 FLXAnFRTXRQi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TXRo | Transmission Request Flag o |

## (1) FLXAnFRTXRQi.TXRo $(0=(i-1) \times 32$ to $\mathrm{i} \times 32-1)$

Transmission Request Flag o
If the flag is set to 1 , the respective message buffer is ready for transmission or transmission of this message buffer is in progress.
In single-shot mode the flags are reset to 0 after transmission has completed.
This bit is cleared by the CHI command CLEAR_RAMS.

### 25.2.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i=1 to 4)

The four registers reflect the state of the ND flags of all configured message buffers. ND flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128, unused ND flags are invalid.

Table 25.79 FLXAnFRNDATi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | NDm | New Data Flag m |

## (1) FLXAnFRNDATi.NDm $(\mathrm{m}=(\mathrm{i}-1) \times 32$ to $\mathrm{i} \times 32-1)$

New Data Flag m
The flags are set to 1 when a valid received data frame matches the message buffer's filter configuration, independent of the payload length received or the payload length configured for that message buffer.
The flags are not set to 1 after reception of null frames except for message buffers belonging to the receive FIFO.
An ND flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the Output Buffer.
Cleared when leaving CONFIG state or when entering STARTUP state.
This bit is cleared by the CHI command CLEAR_RAMS.

### 25.2.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i (i=1 to 4)

The four registers reflect the state of the MBC flags of all configured message buffers. If the number of configured message buffers is less than 128 , unused MBC flags are invalid.

Table 25.80 FLXAnFRMBSCi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MBCm | Message Buffer Status Changed Flag m |

(1) FLXAnFRMBSCi.MBCm $(m=(i-1) \times 32$ to $i \times 32-1)$

Message Buffer Status Changed Flag m
Indicates whether the Message Handler has changed one of the status flags VFRA, VFRB, SEOA, SEOB, CEOA, CEOB, SVOA, SVOB, TCIA, TCIB, ESA, ESB, MLST, FTA, FTB in the header section (see Section 25.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register and Section 25.3.13.1, Header Partition) of the respective message buffer.
An MBC flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the Output Buffer.
Cleared when leaving CONFIG state or when entering STARTUP state.
This bit is cleared by the CHI command CLEAR_RAMS.

### 25.2.10 Input Buffer

Double buffer structure consisting of Input Buffer Host and Input Buffer Shadow. While the Host can write to Input Buffer Host, the transfer to the Message RAM is done from Input Buffer Shadow. The Input Buffer holds the header and data sections to be transferred to the selected message buffer in the Message RAM. It is used to configure the message buffers in the Message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the Message RAM from the Input Buffer, the Message Buffer Status as described in Section 25.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register is automatically reset to zero.

The header sections of message buffers belonging to the receive FIFO can only be (re)configured when the CC is in DEFAULT_CONFIG or CONFIG state. For those message buffers only the payload length configured and the data pointer need to be configured via FLXAnFRWRHS2.PLC and FLXAnFRWRHS3.DP. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask.

The data transfer between Input Buffer (IBF) and Message RAM is described in detail in Section 25.3.12.1, Reconfiguration of Message Buffers.

These registers cannot be written when the input data transfer function shown in Section 25.3.16.1, Input Data Transfer is used and the FLXAnFRITS.ITS bit is 1.

### 25.2.10.1 FLXAnFRWRDSx — FlexRay Write Data Section Register $x$ ( $x=1$ to 64)

This register holds the data wards to be transferred to the data section of the specified message buffer. The number of data words written to the Message RAM is defined by the payload length configured in FLXAnFRWRHS2.PLC bit.

Table 25.81 FLXAnFRWRDSx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | $M D[31: 0]$ | Message Data Bit |

## (1) FLXAnFRWRDSx.MD

## Message Data Bit

For information about the byte alignment of the message data in this register see Section 25.3.17, Byte Alignment.

## CAUTIONS

1. In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
2. When writing to FLXAnFRWRDSx, each 32-bit word has to be filled up by one 32-bit access OR two consecutive 16 -bit accesses OR four consecutive 8- bit accesses before the transfer from the Input Buffer to the Message RAM is started. If not all bytes of a 32- bit word have been written by the Host (8/16-bit access only), FLXAnFRWRDSx holds partly undefined data. Reset by the CHI command CLEAR_RAMS.

### 25.2.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1

| Access: |  |  | FLXAnFRWRHS1 can be read or written in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | FLXAnFRWRHS1L and FLXAnFRWRHS1H can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRWRHS1LL, FLXAnFRWRHS1LH, FLXAnFRWRHS1HL, and FLXAnFRWRHS1HH can be read or written in 8 -bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Address: FLXAnFRWRHS1: <FLXAn_base> + 0500 H, $^{\text {, }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | MBI | Message Buffer Interrupt Bit <br> 0 : The corresponding message buffer interrupt is disabled <br> 1: The corresponding message buffer interrupt is enabled |
| 28 | TXM | Transmission Mode Setting Bit <br> 0 : Continuous mode <br> 1: Single-shot mode |
| 27 | PPIT | Payload Preamble Indicator Transmit Bit <br> 0 : Payload Preamble Indicator is set to 0 <br> 1: Payload Preamble Indicator is set to 1 |
| 26 | CFG | Message Buffer Direction Configuration Bit <br> 0 : The corresponding buffer is configured as Receive Buffer <br> 1: The corresponding buffer is configured as Transmit Buffer |
| 25, 24 | CH[1:0] | Channel Filter Control Bit |
| 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | CYC[6:0] | Cycle Code Bit |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 0 | FID[10:0] | Frame ID Bit |

## (1) FLXAnFRWRHS1.MBI

Message Buffer Interrupt Enable Bit
This bit enables the message buffer interrupt.
After a dedicated receive buffer has been updated by the Message Handler, flag FLXAnFRSIR.RXI and /or FLXAnFRSIR.MBSI are set to 1 . After a transmission has completed flag FLXAnFRSIR.TXI is set to 1 .

## (2) FLXAnFRWRHS1.TXM

## Transmission Mode Setting Bit

This bit selects transmit mode of the corresponding message buffer. For transmit mode, see Section 25.3.9.3, Transmit Buffers.

## (3) FLXAnFRWRHS1.PPIT

## Payload Preamble Indicator Transmit Bit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames in transmit frames of the corresponding message buffer.
If the bit is set to 1 in a static message buffer, the respective message buffer holds network management information. If the bit is set to 1 in a dynamic message buffer the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the Host.

## (4) FLXAnFRWRHS1.CFG

Message Buffer Direction Configuration Bit
This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO the bit is not evaluated.
When not allocating an unused area of at least 32 bits at the start of the data partition, set this bit to 1 in the data section of the message buffer allocated immediately after the (last buffer of the) header partition so that the message buffer is specified as a transmit buffer.

## (5) FLXAnFRWRHS1.CH

## Channel Filter Control Bit

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

| $C H[1: 0]$ | Transmit Buffer Transmit Frame on | Receive Buffer Store Frame Received from |
| :--- | :--- | :--- |
| $00_{\mathrm{B}}$ | No transmission | Ignore frame |
| $01_{\mathrm{B}}$ | Channel A | Channel A |
| $10_{\mathrm{B}}$ | Channel B | Channel B |
| $11_{\mathrm{B}}$ | Both channels (static segment only) | Channel A or B (store first semantically valid frame; static segment only) |
| CAUTION |  |  |

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1 , no frames are transmitted and received frames are ignored (same function as $\mathrm{CH}={ }^{\circ} 00_{\mathrm{B}}$ ")

## (6) FLXAnFRWRHS1.CYC

Cycle Code Bit
The 7-bit cycle code determines the cycle set used for cycle counter filtering. For details about the configuration of the cycle code Section 25.3.8.2, Cycle Counter Filtering.

## (7) FLXAnFRWRHS1.FID

Frame ID Bit
Configures the frame ID of the selected message buffer. The frame ID defines the slot number for transmission/reception of the respective message.
Message buffers with frame ID $=0$ are considered as not valid.

### 25.2.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2

Access: FLXAnFRWRHS2 can be read or written in 32-bit units.
FLXAnFRWRHS2L and FLXAnFRWRHS2H can be read or written in 16-bit units.
FLXAnFRWRHS2LL, FLXAnFRWRHS2LH, and FLXAnFRWRHS2HL can be read or written in 8-bit units.
Address: FLXAnFRWRHS2: <FLXAn_base> + 0504 H ,
FLXAnFRWRHS2L: <FLXAn_base> + 0504н, FLXAnFRWRHS2H: <FLXAn_base> + 0506 ${ }_{\boldsymbol{н}}$,
FLXAnFRWRHS2LL: <FLXAn_base> + 0504н, FLXAnFRWRHS2LH: <FLXAn_base> + 0505 ${ }_{\mathrm{H}}$,
FLXAnFRWRHS2HL: <FLXAn_base> + 0506H
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | CRC[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.83 FLXAnFRWRHS2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | PLC[6:0] | Payload Length Configured Bit |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 0 | CRC[10:0] | Header CRC Bit (vRF!Header!HeaderCRC) |
|  |  | Receive Buffer: Configuration not required |
|  |  | Transmit Buffer: Header CRC is configured |

## (1) FLXAnFRWRHS2.PLC

## Payload Length Configured Bit

Length of data section (number of 2-byte words) as configured by the Host.
During static segment the static frame payload length as configured by FLXAnFRMHDC.SFDL defines the payload length for all static frames. If the payload length configured by FLXAnFRWRHS2.PLC is shorter than this value padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is " $0000_{\mathrm{H}}$ " (see Section 25.3.9.3, Transmit Buffers).

## (2) FLXAnFRWRHS2.CRC

Header CRC Bit (vRF!Header!HeaderCRC)
Setting of the receive buffer is not required.
Transmitting of the message buffer needs the header CRC calculation and setting.
For calculation of the header CRC the payload length of the frame send on the bus has to be considered. In static segment the payload length of all frames is configured by FLXAnFRMHDC.SFDL.

### 25.2.10.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3

```
            Access: FLXAnFRWRHS3 can be read or written in 32-bit units.
            FLXAnFRWRHS3L can be read or written in 16-bit units.
                            FLXAnFRWRHS3LL and FLXAnFRWRHS3LH can be read or written in 8-bit units.
Address: FLXAnFRWRHS3: <FLXAn_base> + 0508н,
                            FLXAnFRWRHS3L: <FLXAn_base> + 0508H,
                            FLXAnFRWRHS3LL: <FLXAn_base> + 0508H, FLXAnFRWRHS3LH: <FLXAn_base> + 0509H
    Value after reset: }0000000\mp@subsup{0}{H}{
```

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.84 FLXAnFRWRHS3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 0 | DP[10:0] | Data Pointer Bit |

(1) FLXAnFRWRHS3.DP

Data Pointer Bit
Configures the pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

### 25.2.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register

Configures how the message buffer in the Message RAM selected by register FLXAnFRIBCR is updated. When IBF Host and IBF Shadow are swapped, also mask bits FLXAnFRIBCM.LHSH, FLXAnFRIBCM.LDSH, and FLXAnFRIBCM.STXRH are swapped with bits FLXAnFRIBCM.LHSS, FLXAnFRIBCM.LDSS, and FLXAnFRIBCM.STXRS.

```
            Access: FLXAnFRIBCM can be read or written in 32-bit units.
                    FLXAnFRIBCML can be read or written in 16-bit units.
                    FLXAnFRIBCMH is a read-only register that can be read in 16-bit units.
                    FLXAnFRIBCMLL can be read or written in 8-bit units.
                    FLXAnFRIBCMHL is a read-only register that can be read in 8-bit units.
                    Address: FLXAnFRIBCM: <FLXAn_base> + 0510H,
                    FLXAnFRIBCML: <FLXAn_base> + 0510H, FLXAnFRIBCMH: <FLXAn_base> + 0512H,
                    FLXAnFRIBCMLL: <FLXAn_base> + 0510H, FLXAnFRIBCMHL: <FLXAn_base> + 0512H
                Value after reset: }00000000\mp@subsup{H}{H}{
```

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 25.85 FLXAnFRIBCM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 19 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | STXRS | Set Transmission Request Shadow Flag <br> 0: Reset TXR flag <br> 1: Set TXR flag, transmit buffer released for transmission (operation ongoing or finished) |
| 17 | LDSS | Load Data Section Shadow Flag <br> 0 : Data section is not updated <br> 1: Data section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished) |
| 16 | LHSS | Load Header Section Shadow Flag <br> 0 : Header section is not updated <br> 1: Header section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished) |
| 15 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | STXRH | Set Transmission Request Host Bit <br> 0: Reset TXR flag <br> 1: Set TXR flag, transmit buffer released for transmission |
| 1 | LDSH | Load Data Section Host Bit <br> 0 : Data section is not updated <br> 1: Data section selected for transfer from Input Buffer to the Message RAM |
| 0 | LHSH | Load Header Section Host Bit <br> 0 : Header section is not updated <br> 1: Header section selected for transfer from Input Buffer to the Message RAM |

## (1) FLXAnFRIBCM.STXRS

Set Transmission Request Shadow Flag

## (2) FLXAnFRIBCM.LDSS

Load Data Section Shadow Flag
(3) FLXAnFRIBCM.LHSS

Load Header Section Shadow Flag

## (4) FLXAnFRIBCM.STXRH

Set Transmission Request Host Bit
If this bit is set to 1 , the TXR flag for the selected message buffer is set in the FLXAnFRTXRQ1/2/3/4 registers to release the message buffer for transmission. In single-shot mode the flag is cleared by the CC after transmission has completed.
TXR is evaluated for transmit buffers only.
(5) FLXAnFRIBCM.LDSH

Set Load Data Section Host Bit
(6) FLXAnFRIBCM.LHSH

Set Load Header Section Host Bit

### 25.2.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped (see Section 25.3.12.2(1), Data Transfer from Input Buffer to Message RAM).

With this write operation the FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message into the IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0 .

FLXAnFRIBCR.IBSYS remains set to 1 , and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped.

Any write access to an Input Buffer register while both FLXAnFRIBCR.IBSYS and FLXAnFRIBCR.IBSYH are set to 1 will cause the error flag FLXAnFREIR.IIBA to be set to 1 .

## Access: FLXAnFRIBCR can be read or written in 32-bit units.

FLXAnFRIBCRL can be read or written in 16-bit units.
FLXAnFRIBCRH is a read-only register that can be read in 16-bit units.
FLXAnFRIBCRLL can be read or written in 8-bit units.
FLXAnFRIBCRLH, FLXAnFRIBCRHL, and FLXAnFRIBCRHH are the read-only registers that can be read in 8-bit
units.
Address: FLXAnFRIBCR: <FLXAn_base> + 0514 ${ }_{\mathrm{H}}$,
FLXAnFRIBCRL: <FLXAn_base> + 0514н, FLXAnFRIBCRH: <FLXAn_base> + 0516н,
FLXAnFRIBCRLL: <FLXAn_base> $+0514_{\mathrm{H}}$, FLXAnFRIBCRLH: <FLXAn_base> $+0515_{\mathrm{H}}$,
FLXAnFRIBCRHL: <FLXAn_base> $+0516_{\mathrm{H}}$, FLXAnFRIBCRHH: <FLXAn_base> $+0517_{\mathrm{H}}$ Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 25.86 FLXAnFRIBCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | IBSYS | Input Buffer Busy Shadow Flag |
|  |  | 0: Transfer between IBF Shadow and Message RAM completed |
|  |  | 1: Transfer between IBF Shadow and Message RAM in progress |
| 30 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | IBRS[6:0] | Input Buffer Request Shadow Flag |
| 15 | IBSYH | Input Buffer Busy Host Flag |
|  |  | 0: No request pending |
|  |  | 1: Request while transfer between IBF Shadow and Message RAM in progress |
| 14 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | IBRH[6:0] | Input Buffer Request Host Bit |

## (1) FLXAnFRIBCR.IBSYS

Input Buffer Busy Shadow Flag
Set to 1 after writing FLXAnFRIBCR.IBRH.
This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.
When the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0 .

## (2) FLXAnFRIBCR.IBRS

Input Buffer Request Shadow Flag
Number of the target message buffer actually updated/lately updated.

## (3) FLXAnFRIBCR.IBSYH

Input Buffer Busy Host Flag
Set to 1 by writing FLXAnFRIBCR.IBRH while FLXAnFRIBCR.IBSYS is still 1.
This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.
After the ongoing transfer between IBF Shadow and the Message RAM has completed, the FLXAnFRIBCR.IBSYH is set back to 0 .

## (4) FLXAnFRIBCR.IBRH

## Input Buffer Request Host Bit

Selects the target message buffer in the Message RAM for data transfer from Input Buffer.

### 25.2.11 Output Buffer

Double buffer structure consisting of Output Buffer Host and Output Buffer Shadow. Used to read out message buffers from the Message RAM. While the Host can read from Output Buffer Host, the Message Handler transfers the selected message buffer from Message RAM to Output Buffer Shadow. The data transfer between Message RAM and Output Buffer (OBF) is described in Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer.

These registers cannot be written when the output data transfer function shown in Section 25.3.16.2, Output Data Transfer, in Output Data Transfer is used and the FLXAnFROTS.OTS bit is 1.

### 25.2.11.1 FLXAnFRRDDSx — FlexRay Read Data Section Register $x$ ( $x=1$ to 64)

Holds the data words read from the data section of the addressed message buffer. This register holds the data wards to be transferred to the data section of the specified message buffer. The number of data words ( DWn ) read from the Message RAM is defined by the payload length configured in FLXAnFRRDHS2.PLC bit.

| Access: | FLXAnFRRDDSx is a read-only register that can be read in 32-bit units. |
| :---: | :---: |
|  | FLXAnFRRDDSxL and FLXAnFRRDDSxH are the read-only registers that can be read in 16-bit units. |
|  | FLXAnFRRDDSxLL, FLXAnFRRDDSxLH, FLXAnFRRDDSxHL, and FLXAnFRRDDSxHH are the read-only registers that can be read in 8 -bit units. |
| Address: | FLXAnFRRDDSx: <FLXAn_base> $+0600_{\mathrm{H}}+(\mathrm{x}-1) \times 4 \mathrm{H}$, |
|  | FLXAnFRRDDSxL: <FLXAn_base> $+0600_{\mathrm{H}}+(\mathrm{x}-1) \times 4_{\mathrm{H}}$, |
|  | FLXAnFRRDDSxH: <FLXAn_base> $+0600_{H}+(x-1) \times 4_{H}+2 \mathrm{H}$, |
|  | FLXAnFRRDDSxLL: <FLXAn_base> $+0600_{H}+(\mathrm{x}-1) \times 4 \mathrm{H}$, |
|  | FLXAnFRRDDSxLH: <FLXAn_base> $+0600_{H}+(x-1) \times 4_{H}+1_{H}$, |
|  | FLXAnFRRDDSxHL: <FLXAn_base> $+0600_{H}+(x-1) \times 4_{H}+2 \mathrm{H}$, |
|  | FLXAnFRRDDSxHH: <FLXAn_base> $+060 \mathrm{O}_{\mathrm{H}}+(\mathrm{x}-1) \times 4_{\mathrm{H}}+3_{\mathrm{H}}$, |
| fter reset: | $00000000_{\text {H }}$ |

Table 25.87 FLXAnFRRDDSx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | $\mathrm{MD}[31: 0]$ | Message Data |

## (1) FLXAnFRRDDSx.MD

Message Data Flag
For information about the byte alignment of the data words in this register see Section 25.3.17, Byte Alignment.

## CAUTION

In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused. Reset by the CHI command CLEAR_RAMS.

### 25.2.11.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1

> Access: FLXAnFRRDHS1 is a read-only register that can be read in 32-bit units.
> FLXAnFRRDHS1L and FLXAnFRRDHS1H are the read-only registers that can be read in 16-bit units.
> FLXAnFRRDHS1LL, FLXAnFRRDHS1LH, FLXAnFRRDHS1HL, and FLXAnFRRDHS1HH are the read-only registers that can be read in 8 -bit units.
> Address: FLXAnFRRDHS1: <FLXAn_base> $+0700_{H}$,
> FLXAnFRRDHS1L: <FLXAn_base> + 0700 ${ }_{\mathrm{H}}$, FLXAnFRRDHS1H: <FLXAn_base> + 0702 H ,
> FLXAnFRRDHS1LL: <FLXAn_base> + 0700н, FLXAnFRRDHS1LH: <FLXAn_base> + 0701н,

Table 25.88 FLXAnFRRDHS1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | Reserved | When read, the value after reset is returned. |
| 29 | MBI | Message Buffer Interrupt Flag |
| 28 | TXM | Transmission Mode Flag |
| 27 | PPIT | Payload Preamble Indicator Transmit Flag |
| 26 | CFG | Message Buffer Direction Configuration Flag |
| 25,24 | CH[1:0] | Channel Filter Control Flag |
| 23 | Reserved | When read, the value after reset is returned. |
| 22 to 16 | CYC[6:0] | Cycle Code |
| 15 to 11 | Reserved | When read, the value after reset is returned. |
| 10 to 0 | FID[10:0] | Frame ID |

## (1) FLXAnFRRDHS1.MBI

Message Buffer Interrupt Flag
Values as configured by the Host via FLXAnFRWRHS1.MBI.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0 .

## (2) FLXAnFRRDHS1.TXM

Transmission Mode Flag
Values as configured by the Host via FLXAnFRWRHS1.TXM.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0 .

## (3) FLXAnFRRDHS1.PPIT

Payload Preamble Indicator Transmit Flag
Values as configured by the Host via FLXAnFRWRHS1.PPIT.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0 .

## (4) FLXAnFRRDHS1.CFG

Message Buffer Direction Configuration Flag
Values as configured by the Host via FLXAnFRWRHS1.CFG.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0 .

## (5) FLXAnFRRDHS1.CH

Channel Filter Control Flag
Values as configured by the Host via FLXAnFRWRHS1.CH.
In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0 .

## (6) FLXAnFRRDHS1.CYC

Cycle Code
Values as configured by the Host via FLXAnFRWRHS1.CYC.
In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0 .

## (7) FLXAnFRRDHS1.FID

Frame ID
Values as configured by the Host via FLXAnFRWRHS1.FID
In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are holding the received frame ID.

### 25.2.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2 CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS2 is updated from data frames only.

| Access: |  |  | FLXAnFRRDHS2 is a read-only register that can be read in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | FLXAnFRRDHS2L and FLXAnFRRDHS2H are the read-only registers that can be read in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS2LL, FLXAnFRRDHS2LH, FLXAnFRRDHS2HL, and FLXAnFRRDHS2HH are the read-only registers that can be read in 8-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Address: |  |  | FLXAnFRRDHS2: <FLXAn_base> + 0704H, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS2L: <FLXAn_base> + 0704н, FLXAnFRRDHS2H: <FLXAn_base> + 0706н, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS2LL: <FLXAn_base> + 0704H, FLXAnFRRDHS2LH: <FLXAn_base> + 0705\%, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS2HL: <FLXAn_base> + 0706H, FLXAnFRRDHS2HH: <FLXAn_base> + 0707H |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 25.89 FLXAnFRRDHS2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | Reserved | When read, the value after reset is returned. |
| 30 to 24 | PLR[6:0] | Payload Length Received Flag (vRF!Header!Length) |
| 23 | Reserved | When read, the value after reset is returned. |
| 22 to 16 | PLC[6:0] | Payload Length Configured Flag |
| 15 to 11 | Reserved | When read, the value after reset is returned. |
| 10 to 0 | CRC[10:0] | Header CRC Flag (vRF!Header!HeaderCRC) |

## (1) FLXAnFRRDHS2.PLR

Payload Length Received Flag (vRF!Header!Length)
Payload length (vRF!Header!Length) value updated from received data frames (exception: if message buffer belongs to the receive FIFO FLXAnFRRDSH2.PLR is also updated from received null frames).

## (2) FLXAnFRRDHS2.PLC

## Payload Length Configured Flag

Length of data section (number of 2-byte words) as configured by the Host.

## (3) FLXAnFRRDHS2.CRC

Header CRC Flag (vRF!Header!HeaderCRC)
Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames
Transmit Buffer: Header CRC configured by the Host

## (4) Data Storage

When a message is stored into a message buffer the following behavior with respect to payload length received and payload length configured is implemented:

- FLXAnFRRDHS2.PLR > FLXAnFRRDHS2.PLC:

The payload data stored in the message buffer is truncated to the payload length configured if FLXAnFRRDHS2.PLC even or else truncated to FLXAnFRRDHS2.PLC +1 .

- FLXAnFRRDHS2.PLR $\leq$ FLXAnFRRDHS2.PLC:

The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by FLXAnFRRDHS2.PLC are filled with undefined data.

- FLXAnFRRDHS2.PLR = zero:

The message buffer's data section is filled with undefined data

- FLXAnFRRDHS2.PLC = zero:

Message buffer has no data section configured. No data is stored into the message buffer's data section.

## CAUTIONS

1. The Message RAM is organized in 4-byte words. When received data is stored into a message buffer's data section, the number of 2-byte data words written into the message buffer is FLXAnFRRDHS2.PLC rounded to the next even value.
2. FLXAnFRRDHS2.PLC should be configured identical for all message buffers belonging to the receive FIFO. Header 2 is updated from data frames only.
For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS2 is updated from data frames only.

### 25.2.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3 CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS3 is updated from data frames only.

| Access: |  |  | FLXAnFRRDHS3 is a read-only register that can be read in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | FLXAnFRRDHS3L and FLXAnFRRDHS3H are the read-only registers that can be read in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS3LL, FLXAnFRRDHS3LH, FLXAnFRRDHS3HL, and FLXAnFRRDHS3HH are the read-only registers that can be read in 8-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Address: |  |  | FLXAnFRRDHS3: <FLXAn_base> + 0708H, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS3L: <FLXAn_base> + 0708н, FLXAnFRRDHS3H: <FLXAn_base> + 070Aн, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS3LL: <FLXAn_base> + 0708\%, FLXAnFRRDHS3LH: <FLXAn_base> + 0709 ${ }_{\text {H }}$, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRRDHS3HL: <FLXAn_base> + 070A H FLXAnFRRDHS3HH: <FLXAn_base> + 070B ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 25.90 FLXAnFRRDHS3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | Reserved | When read, the value after reset is returned. |
| 29 | RES | Reserved Bit Indicator Flag (vRF!Header!Reserved) |
| 28 | PPI | Payload Preamble Indicator (vRF!Header!PPIndicator) |
| 27 | NFI | Null Frame Indicator Flag (vRF!Header!NFIndicator) |
|  |  | 0: Up to now no data frame has been stored into the respective message buffer |
|  |  | 1: At least one data frame has been stored into the respective message buffer |
| 26 | SYN | Sync Frame Indicator Flag (vRF!Header!SyFIndicator) |
|  |  | 1: The received frame is not a sync frame |
| 25 | RCI | 0: The received frame is a sync frame |
| 24 |  | Received on Channel Indicator Flag (vSS!Channel) |
|  |  | 0: Frame received on channel B |
|  |  | 1: Frame received on channel A |
| 23,22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | RCC[5:0] | Receive Cycle Counter (vRF!Header!CycleCount) |
| 15 to 11 | Reserved | When read, the value after reset is returned. |
| 10 to 0 | DP[10:0] | Data Pointer Flag |

## (1) FLXAnFRRDHS3.RES

Reserved Bit Flag (vRF!Header!Reserved)
Reflects the state of the received reserved bit. The reserved bit is transmitted as 0 .

## (2) FLXAnFRRDHS3.PPI

Payload Preamble Indicator Flag (vRF!Header!PPIndicator)
The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

- $0=$ The payload segment of the received frame does not contain a network management vector nor a message ID
- 1 = Static segment: Network management vector in the first part of the payload

Dynamic segment: Message ID in the first part of the payload

## (3) FLXAnFRRDHS3.NFI

Null Frame Indicator Flag (vRF!Header!NFIndicator)
Is set to 1 after storage of the first received data frame.

## (4) FLXAnFRRDHS3.SYN

Sync Frame Indicator Flag (vRF!Header!SyFIndicator)
A sync frame is marked by the sync frame indicator.

## (5) FLXAnFRRDHS3.SFI

Startup Frame Indicator Flag (vRF!Header!SuFIndicator)
A startup frame is marked by the startup frame indicator.

## (6) FLXAnFRRDHS3.RCI

Received on Channel Indicator Flag (vSS!Channel)
Indicates the channel from which the received data frame was taken to update the respective receive buffer.

## (7) FLXAnFRRDHS3.RCC

Receive Cycle Counter (vRF!Header!CycleCount)
Cycle counter value updated from received data frame.

## (8) FLXAnFRRDHS3.DP

Data Pointer Flag
Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.
The bit value is the same as that set in the FLXAnFRWRHS3.DP bit.

### 25.2.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.
If only one channel (A or B) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel- specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the Host updates a message buffer via Input Buffer, all FLXAnFRMBS flags are reset to zero independent of which FLXAnFRIBCM bits are set or not.

For details about receive/transmit filtering see Section 25.3.8, Filtering and Masking, Section 25.3.9, Transmit Process and Section 25.3.10, Receive Process.

Whenever the Message Handler changes one of the flags FLXAnFRMBS.VFRA, FLXAnFRMBS.VFRB, FLXAnFRMBS.SEOA, FLXAnFRMBS.SEOB, FLXAnFRMBS.CEOA, FLXAnFRMBS.CEOB, FLXAnFRMBS.SVOA, FLXAnFRMBS.SVOB, FLXAnFRMBS.TCIA, FLXAnFRMBS.TCIB, FLXAnFRMBS.ESA, FLXAnFRMBS.ESB, FLXAnFRMBS.MLST, FLXAnFRMBS.FTA, FLXAnFRMBS.FTB the respective message buffer's MBC flag in registers FLXAnFRMBSC1/2/3/4 is set.

|  |  | 1: Valid frame received on channel A |

## (1) FLXAnFRMBS.RESS

## Reserved Bit Status Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit.
The reserved bit is transmitted as 0 .
For receive buffers (FLXAnFRWRHS1.CFG $=0$ ) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

## (2) FLXAnFRMBS.PPIS

## Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.
For receive buffers (FLXAnFRWRHS1.CFG $=0$ ) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

- $0=$ PPI indicator set to 0

The payload segment of the received frame does not contain a network management vector or a message ID

- 1 = PPI indicator set to 1

Static segment: Network management vector at the beginning of the payload
Dynamic segment: Message ID at the beginning of the payload

## (3) FLXAnFRMBS.NFIS

Null Frame Indicator Status Flag (vRF!Header!NFIndicator)
If set to 0 the payload segment of the received frame contains no usable data.
For receive buffers (FLXAnFRWRHS1.CFG $=0$ ) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

## (4) FLXAnFRMBS.SYNS

## Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.
For receive buffers (FLXAnFRWRHS1.CFG $=0$ ) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

## (5) FLXAnFRMBS.SFIS

Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator)
The startup frame indicator specifies a startup frame.
For receive buffers (FLXAnFRWRHS1.CFG $=0$ ) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

## (6) FLXAnFRMBS.RCIS

Received on Channel Indicator Status Flag (vSS!Channel)
Indicates the channel on which the frame was received.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

## (7) FLXAnFRMBS.CCS

Cycle Count Status Flag
Actual cycle count when status was updated.

## (8) FLXAnFRMBS.FTB

Frame Transmitted on Channel B Flag
Indicates that this node has transmitted a data frame in the configured slot on channel B.

## CAUTION

The FlexRay protocol specification requires that FLXAnFRMBS.FTB can only be reset by the Host.
Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where the bit is set to 1 .

## (9) FLXAnFRMBS.FTA

Frame Transmitted on Channel A Flag
Indicates that this node has transmitted a data frame in the configured slot on channel A.

## CAUTION

The FlexRay protocol specification requires that FLXAnFRMBS.FTA can only be reset by the Host.
Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where this bit is set to 1 .

## (10) FLXAnFRMBS.MLST

## Message Lost Flag

The flag is set in case the Host did not read the message before the message buffer was updated from a received data frame.
Not affected by reception of null frames except for message buffers belonging to the receive FIFO. The flag is reset to 0 by a Host write to the message buffer via IBF or when a new message is stored into the message buffer after the message buffers ND flag was reset to 0 by reading out the message buffer via OBF.

## (11) FLXAnFRMBS.ESB

Empty Slot Channel B Flag
In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

## (12) FLXAnFRMBS.ESA

## Empty Slot Channel A Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

## (13) FLXAnFRMBS.TCIB

Transmission Conflict Indication Channel B Flag (vSS!TxConflictB)
A transmission conflict indication is set to 1 if a transmission conflict has occurred on channel B.

## (14) FLXAnFRMBS.TCIA

Transmission Conflict Indication Channel A Flag (vSS!TxConflictA)
A transmission conflict indication is set if a transmission conflict has occurred on channel A.

## (15) FLXAnFRMBS.SVOB

Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB)
A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on the slot assigned to channel B.

## (16) FLXAnFRMBS.SVOA

## Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on the slot assigned to channel A.

## (17) FLXAnFRMBS.CEOB

Content Error Observed on Channel B Flag (vSS!ContentErrorB)
A content error was observed in the slot assigned to channel B.

## (18) FLXAnFRMBS.CEOA

Content Error Observed on Channel A Flag (vSS!ContentErrorA)
A content error was observed in the slot assigned to channel A.
(19) FLXAnFRMBS.SEOB

Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB)
A syntax error was observed in the assigned slot on channel B.

## (20) FLXAnFRMBS.SEOA

Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA)
A syntax error was observed in the assigned slot on channel A.

## (21) FLXAnFRMBS.VFRB

Valid Frame Received on Channel B Flag (vSS!ValidFrameB)
A valid frame indication is set if a valid frame was received on channel B.

## (22) FLXAnFRMBS.VFRA

Valid Frame Received on Channel A Flag (vSS!ValidFrameA)
A valid frame indication is set if a valid frame was received on channel A.

### 25.2.11.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register

Configures how the Output Buffer is updated from the message buffer in the Message RAM selected by FLXAnFROBCR.OBRS.

Mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to the register internal storage when a Message RAM transfer is requested by FLXAnFROBCR.REQ.

When OBF Host and OBF Shadow are swapped, mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register internal storage to keep them attached to the respective Output Buffer transfer.

The data transfer between Output Buffer and Message RAM is described in detail in Section 25.3.12.2(2), Data
Transfer from Message RAM to Output Buffer.

## CAUTION

After the transfer of the header section from the Message RAM to OBF Shadow has completed, the message buffer status changed flag MBC of the selected message buffer in the FLXAnFRMBSC1/2/3/4 registers is cleared. After the transfer of the data section from the Message RAM to OBF Shadow has completed, the new data flag ND of the selected message buffer in the FLXAnFRNDAT1/2/3/4 registers is cleared.

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | RDSH | Read Data Section Host Flag |
|  |  | 0: Data section is not read |
|  |  | 1: Data section selected for transfer from Message RAM to Output Buffer |
| 16 | RHSH | Read Header Section Host Flag |
|  |  | 0: Header section is not read |
|  |  | 1: Header section selected for transfer from Message RAM to Output Buffer |
| 15 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 25.92 FLXAnFROBCM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | RDSS | Read Data Section Shadow Bit |
|  |  | 0: Data section is not read |
|  | 1: Data section selected for transfer from Message RAM to Output Buffer |  |
| 0 | RHSS | Read Header Section Shadow Bit |
|  | 0: Header section is not read |  |
|  | 1: Header section selected for transfer from Message RAM to Output Buffer |  |

(1) FLXAnFROBCM.RDSH

Read Data Section Host Flag
(2) FLXAnFROBCM.RHSH

Read Header Section Host Flag

## (3) FLXAnFROBCM.RDSS

Read Data Section Shadow Bit

## (4) FLXAnFROBCM.RHSS

Read Header Section Shadow Bit

### 25.2.11.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register

After setting bit FLXAnFROBCR.REQ to 1 while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1, FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. When the transfer between the Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCM.OBSYS back to 0 .

By setting bit FLXAnFROBCR.VIEW to 1 while FLXAnFROBCR.OBSYS is 0, OBF Host and OBF Shadow are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register FLXAnFROBCM internal storage to keep them attached to the respective Output Buffer transfer.
FLXAnFROBCR.OBRH signals the number of the message buffer currently accessible by the Host.
If bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are set to 1 with the same write access while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0 .

Any write access to FLXAnFROBCR[15:8] while FLXAnFROBCR.OBSYS is set to 1 will cause the error flag FLXAnFREIR.IOBA to be set to 1 . n this case, this write access has no effect and the Output Buffer will not be changed.

The data transfer between Output Buffer and Message RAM is described in detail in Section 25.3.12.2(2), Data
Transfer from Message RAM to Output Buffer.
Access: FLXAnFROBCR can be read or written in 32-bit units.
FLXAnFROBCRL can be read or written in 16-bit units.
FLXAnFROBCRH is a read-only register that can be read in 16-bit units.
FLXAnFROBCRLL and FLXAnFROBCRLH can be read or written in 8-bit units.
FLXAnFROBCRHL is a read-only register that can be read in 8-bit units.
Address: FLXAnFROBCR: <FLXAn_base> + 0714
FLXAnFROBCRL: <FLXAn_base> + 0714 H, FLXAnFROBCRH: <FLXAn_base> + 0716 H ,
FLXAnFROBCRLL: <FLXAn_base> + 0714н, FLXAnFROBCRLH: <FLXAn_base> + 0715 ${ }_{\text {н }}$,
FLXAnFROBCRHL: <FLXAn_base> $+0716_{\text {H }}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 25.93 FLXAnFROBCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | OBRH[6:0] | Output Buffer Request Host Flag |
| 15 | OBSYS | Output Buffer Busy Shadow Flag |
|  |  | 0: No transfer in progress |
|  | 1: Transfer between Message RAM and OBF Shadow in progress |  |
| 14 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | REQ | Request Message RAM Transfer Bit |
|  |  | 0: No request |
|  |  | 1: Transfer to OBF Shadow requested |
| 8 | View Shadow Buffer Bit |  |
|  |  | 0: No action |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | OBRS[6:0] | Output Buffer Request Shadow Bit |

## (1) FLXAnFROBCR.OBRH

Output Buffer Request Host Flag
Number of message buffer currently accessible by the Host via FLXAnFRRDHS1 to FLXAnFRRDHS3, FLXAnFRMBS, and FLXAnFRRDDS1 to FLXAnFRRDDS64.
By writing FLXAnFROBCR.VIEW to 1 OBF Shadow and OBF Host are swapped and the transferred message buffer is accessible by the Host.

## (2) FLXAnFROBCR.OBSYS

Output Buffer Busy Shadow Flag
Set to 1 after setting bit FLXAnFROBCR.REQ. When the transfer between the Message RAM and OBF Shadow has completed, FLXAnFROBCR.OBSYS is set back to 0 .

## (3) FLXAnFROBCR.REQ

Request Message RAM Transfer Bit
Only writeable while FLXAnFROBCR.OBSYS $=0$.
Requests transfer of message buffer addressed by FLXAnFROBCR.OBRS from Message RAM to OBF Shadow.

## (4) FLXAnFROBCR.VIEW

View Shadow Buffer Bit
Only writeable while FLXAnFROBCR.OBSYS $=0$.
Toggles between OBF Shadow and OBF Host.

## (5) FLXAnFROBCR.OBRS

Output Buffer Request Shadow Bit
Only writeable while FLXAnFROBCR.OBSYS $=0$.
Number of source message buffer to be transferred from the Message RAM to OBF Shadow.
If the number of the first message buffer of the receive FIFO is written to this register the Message Handler transfers the message buffer addressed by the GET Index (GIDX, see Section 25.3.11, FIFO Function) to OBF Shadow.

### 25.2.12 Data Transfer Control Register

### 25.2.12.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register

## Access: FLXAnFRITC can be read or written in 32-bit units.

FLXAnFRITCL and FLXAnFRITCH can be read or written in 16-bit units.
FLXAnFRITCLL, FLXAnFRITCLH, and FLXAnFRITCHL can be read or written in 8 -bit units.
Address: FLXAnFRITC: <FLXAn_base> + $0800_{\mathrm{H}}$,
FLXAnFRITCL: <FLXAn_base> + 0800 ${ }_{\mathrm{H}}$, FLXAnFRITCH: <FLXAn_base> + 0802 ,
FLXAnFRITCLL: <FLXAn_base> + 0800н, FLXAnFRITCLH: <FLXAn_base> + 0801н,
FLXAnFRITCHL: <FLXAn_base> + 0802 ${ }_{\text {H }}$
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 25.94 FLXAnFRITC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | ITM[6:0] | Input queue Table Max Bit <br> These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue. |
| 15 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | IQEIE | Input Queue Empty Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 8 | IQFIE | Input Queue Full Interrupt Enable Bit <br> 0 : Disabled <br> 1: Enabled |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | IQHR | Input Queue Halt Request Bit <br> 0 : Input queue run request <br> 1: Input queue halt request |
| 0 | ITE | Input Transfer Enable Bit <br> 0 : Operation Disable request <br> 1: Operation Enable request |

## (1) FLXAnFRITC.ITM

## Input queue Table Max Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0 .
These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.
Valid values are $00_{\mathrm{H}}$ (1 queue entry) to $7 \mathrm{~F}_{\mathrm{H}}$ ( 128 queue entries).
Note that each entry requires two long words in the input pointer table.

## (2) FLXAnFRITC.IQEIE

## Input Queue Empty Interrupt Enable Bit

This bit controls the input queue empty interrupt.

- 0: Disabled

No interrupt will be requested and the input queue empty interrupt line will be released.

- 1: Enabled

Input queue empty interrupt will be asserted when FLXAnFRITS.IQEIS is 1.

## (3) FLXAnFRITC.IQFIE

## Input Queue Full Interrupt Enable Bit

This bit controls the input queue full interrupt.

- 0: Disabled

No interrupt will be requested and the input queue full interrupt line will be released.

- 1: Enabled

Input queue full interrupt will be asserted when FLXAnFRITS.IQFIS is 1.

## (4) FLXAnFRITC.IQHR

Input Queue Halt Request Bit
The IQHR bit should not be set to 1 when FLXAnFRITS.ITS is 0 .
This bit requests a halt of the input queue.
The status of the halt request is shown in the FLXAnFRITS.IQH register.
Refer to Section 25.3.16.1(5), Halting the Input Queue about usage of this bit.

- 0 : Input queue run request

The input queue resumes their operation.

- 1: Input queue halt request

The input queue gets halted. An active input transfer will be completed but no further transfer request will start.

## (5) FLXAnFRITC.ITE

## Input Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFRIBCR.IBSYS is 0 .
The user should only set this bit to 0 when FLXAnFRITC.IQHR 0 . Otherwise committed input transfers get lost.
This bit controls the operation mode of the input transfer queue.
The operation status of the input transfer queue function is shown in FLXAnFRITS.ITS.
Refer to Section 25.3.16.1(1), Activation and Deactivation about usage of this bit.

- 0: Operation Disable request

The input transfer queue gets disabled when it becomes empty.

- 1: Operation Enable request

The input transfer queue gets enabled. Input data structures are transferred to the FlexRay internal message RAM.

### 25.2.12.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register

| Access: | FLXAnFROTC can be read or written in 32-bit units. |
| :---: | :--- |
|  | FLXAnFROTCL and FLXAnFROTCH can be read or written in 16-bit units. |
|  | FLXAnFROTCLL, FLXAnFROTCLH, and FLXAnFROTCHL can be read or written in 8 -bit units. |
| Address: | FLXAnFROTC: <FLXAn_base> + 0804H, |
|  | FLXAnFROTCL: <FLXAn_base> $+0804_{\mathrm{H}}$, FLXAnFROTCH: <FLXAn_base> + 0806 |

Value after reset: $\quad 00000000^{H}$

Table 25.95 FLXAnFROTC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | FTM[4:0] | FIFO Table Max Bit <br> Configures the number of FIFO entries the output transfer handler is capable to maintain in the local RAM/global RAM. |
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | FWIE | FIFO transfer Warning Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 10 | OWIE | Output transfer Warning Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 9 | FIE | FIFO transfer Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 8 | OIE | Output transfer Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OTCS | Output Transfer Condition Select Bit <br> 0 : New data only mode <br> 1: New data and status changed mode |
| 0 | OTE | Output Transfer Enable Bit <br> 0: Operation Disable request <br> 1: Operation Enable request |

## (1) FLXAnFROTC.FTM

## FIFO Table Max Bit

The user can only write to these bits when FLXAnFROTS.OTS is 0 .
Configures the number of FIFO entries the output transfer handler is capable to maintain in the local RAM/global
RAM.
Valid values are $00_{\mathrm{H}}$ ( 1 FIFO entry) to $1 \mathrm{~F}_{\mathrm{H}}$ (32 FIFO entries).

## (2) FLXAnFROTC.FWIE

FIFO transfer Warning Interrupt Enable Bit
This bit controls the FIFO transfer warning interrupt.

- 0: Disabled

No interrupt will be requested and the FIFO transfer warning interrupt line will be released.

- 1: Enabled

FIFO transfer warning interrupt will be asserted when FLXAnFROTS.FWIS is 1.

## (3) FLXAnFROTC.OWIE

Output transfer Warning Interrupt Enable Bit
This bit controls the output transfer warning interrupt.

- 0: Disabled

No interrupt will be requested and the output transfer warning interrupt line will be released.

- 1: Enabled

Output transfer warning interrupt will be asserted when FLXAnFROTS.OWIS is 1.

## (4) FLXAnFROTC.FIE

FIFO transfer Interrupt Enable Bit
This bit controls the FIFO transfer interrupt.

- 0: Disabled

No interrupt will be requested and the FIFO transfer interrupt line will be released.

- 1: Enabled

FIFO transfer interrupt will be asserted when FLXAnFROTS.FIS is 1.

## (5) FLXAnFROTC.OIE

Output transfer Interrupt Enable Bit
This bit controls the output transfer interrupt.

- 0: Disabled

No interrupt will be requested and the output transfer interrupt line will be released.

- 1: Enabled

Output transfer interrupt will be asserted when FLXAnFROTS.OTIS is 1.

## (6) FLXAnFROTC.OTCS

Output Transfer Condition Select Bit
The user can only write to this bit when FLXAnFROTS.OTS is 0 . This bit controls the output transfer condition.

- 0: New data only mode

The ND bits in the FLXAnFRNDATi registers are used to detect a transfer condition for dedicated receive buffer

- 1: New data and status changed mode

The ND bits in the FLXAnFRNDATi registers and the MBC bits in the FLXAnFRMBSCi register are used to detect a transfer condition for dedicated transmit and receive buffer

## (7) FLXAnFROTC.OTE

## Output Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFROBCR.OBSYS is 0 .
This bit controls the operation mode of the output transfer function.
The operation status of the output buffer transfer function is shown in FLXAnFROTS.OTS.
Refer to Section 25.3.16.2(2), Output Transfer Data Structure about usage of this bit.

- 0: Operation Disable request

The output buffer transfer gets disabled.
An active message buffer transfer will be completed but no further transfer will start.

- 1: Operation Enable request

The output buffer transfer gets enabled. Message buffers are transferred from the FlexRay internal message RAM to output data structures.

The user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

### 25.2.12.3 FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register

Table 25.96 FLXAnFRIBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ITA[31:0] | Input Table Address Bit |
|  |  | These bits configure the base address of the input pointer table. |

## (1) FLXAnFRIBA.ITA

Input Table Address Bit
The user can only write to this bit when FLXAnFRITS.ITS is 0 .
The address should be 32 bit aligned, thus the bits FLXAnFRIBA.ITA[1:0] are always 0 .
These bits configure the base address of the input pointer table.
The table is used for the input transfer queue transferring message buffers from the local RAM/global RAM into the FlexRay internal message RAM.
The size of the input queue is configured in FLXAnFRITC.ITM.
Note that each entry requires two long words in the input pointer table.

### 25.2.12.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register

Table 25.97 FLXAnFRFBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FTA[31:0] | FIFO pointer Table Address Bit |
|  |  | These bits configure the base address of the FIFO pointer table. |

## (1) FLXAnFRFBA.FTA

FIFO pointer Table Address Bit
The user can only write to this bit when FLXAnFROTS.OTS is 0 .
The address should be 32 bit aligned, thus the bits FLXAnFRFBA.FTA[1:0] are always 0 .
These bits configure the base address of the FIFO pointer table.
The table is used for message buffers transferred from the FlexRay internal FIFO to the local RAM/global RAM. The size of the FIFO is configured in FLXAnFROTC.FTM.

### 25.2.12.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register

Table 25.98 FLXAnFROBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OTA[31:0] | Output pointer Table Address Bit |
|  |  | These bits configure the base address of the output pointer table. |

## (1) FLXAnFROBA.OTA

Output pointer Table Address Bit
The user can only write to this bit when FLXAnFROTS.OTS is 0 .
The address should be 32 bit aligned, thus the bits FLXAnFROBA.OTA[1:0] are always 0 .
These bits configure the base address of the output pointer table.
The table is used for message buffers transferred from the FlexRay internal message RAM to the local RAM/global RAM.
The size of the table depends on the utilization of the FlexRay internal message RAM and can have up to 128 entries.

### 25.2.12.6 FLXAnFRIQC — FlexRay Input Queue Control Register

Access: FLXAnFRIQC is a write-only register that can be written in 32-bit units.
FLXAnFRIQCL is a write-only register that can be written in 16-bit units.
FLXAnFRIQCLL is a write-only register that can be written in 8 -bit units.
Address: FLXAnFRIQC: <FLXAn_base> + 0814H,
FLXAnFRIQCL: <FLXAn_base> + 0814 H ,
FLXAnFRIQCLL: <FLXAn_base> + 0814 ${ }_{H}$
Value after reset: $00000000_{\mathrm{H}}$

Table 25.99 FLXAnFRIQC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | Reserved | When writing, write the value after reset. |
| 6 to 0 | IMBNR[6:0] | Input Message Buffer NumbeR Bit |
|  |  | Message buffer number added to the input queue |

## (1) FLXAnFRIQC.IMBNR

Input Message Buffer NumbeR Bit
The user can only write to this bit when FLXAnFRITS.IQFP is 0 .
The user cannot write to this register when FLXAnFRITS.ITS is 0 or when FLXAnFRITC.ITE is 0 .
These bits are read as 0 .
This value specifies the message buffer added to the input queue.
The number has to be identical to FLXAnFRWRHS4.IMBNR (see Section 25.3.16.1(3), Input Pointer Table) of the input pointer table.
The address to the input data structure has to be provided in the input pointer table at the put index (FLXAnFRITS.IPIDX) before writing to this register.
Writing to this register increments the input put index (FLXAnFRITS.IPIDX).

### 25.2.12.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register

Table 25.100 FLXAnFRUIR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | UIDX[7:0] | User requested Input index Bit <br> Input pointer table index requested for input transfer |

## (1) FLXAnFRUIR.UIDX

User requested Input index Bit
The user can only write to this bit when FLXAnFRITS.UIRP is 0 .
The user should not write to this register when FLXAnFRITS.ITS is 0 .
The user should not write to this register when FLXAnFRITS.UIRP is 1.
The user should not write to this register when FLXAnFRITS.IQH is 1.
The user should only write FLXAnFRITC.ITM + 1 to this register.
This value specifies the input pointer table index for the user requested input transfer.
The address to the input data structure has to be provided in the input pointer table at the index UIDX before writing to this register.
When writing to this register, the requested input data structure will be transferred from input data structure position to the FlexRay internal message RAM.
In opposite to queued input transfers the related DA flag in the FLXAnFRDA register is not influenced by the user input transfer.

### 25.2.12.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register

Table 25.101 FLXAnFRUOR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | URDS | User request Read Data Section Bit |
|  |  | 0: Data section is not transferred |
|  | 1: Data section is transferred |  |
| 8,7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | UMBNR[6:0] | User requested output Message Buffer NumbeR Bit |
|  |  | Message buffer number requested for output transfer |

## (1) FLXAnFRUOR.URDS

User request Read Data Section Bit
The user can only write to this bit when FLXAnFROTS.UORP is 0 .
The user should not write to this register when FLXAnFROTS.OTS is 0 .
The user should not write to this register when FLXAnFROTS.UORP is 1.

- 0: Data section is not transferred

The data section of the message buffer selected by the bits UMBNR is not requested

- 1: Data section is transferred

The data section of the message buffer selected by the bits UMBNR is requested

## (2) FLXAnFRUOR.UMBNR

User requested output Message Buffer NumbeR Bit
The user can only write to this bit when FLXAnFROTS.UORP is 0 .
The user should not write to this register when FLXAnFROTS.OTS is 0 .
The user should not write to this register when FLXAnFROTS.UORP is 1.
The user should restrict UMBNR to dedicated receive and transmit buffers when the FlexRay module is not in the CONFIG state.

When writing to this register, the header sections and optionally the data section (configurable by URDS) of the requested message buffer will be transferred from the FlexRay internal message RAM to the output data structure position defined by the output structure data pointer in the output pointer table.

### 25.2.12.9 FLXAnFRAHBC — FlexRay H-Bus Configuration Register

In this product, this register is not used because FLXAnFRAHBC.HPROT[3:0] has no function.

$$
\begin{aligned}
\text { Access: } & \text { FLXAnFRAHBC can be read or written in 32-bit units. } \\
& \text { FLXAnFRAHBCL can be read or written in 16-bit units. } \\
& \text { FLXAnFRAHBCLL can be read or written in 8-bit units. } \\
\text { Address: } & \text { FLXAnFRAHBC: <FLXAn_base> + 0840 } \\
& \text { FLXAnFRAHBCL: <FLXAn_base> }+0840_{\mathrm{H}}, \\
& \text { FLXAnFRAHBCLL: <FLXAn_base> }+0840_{\mathrm{H}} \\
\text { Value after reset: } & 00000000_{\mathrm{H}}
\end{aligned}
$$

Table 25.102 FLXAnFRAHBC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | HPROT[3:0] | No function |

### 25.2.13 Data Transfer Status Register

### 25.2.13.1 FLXAnFRITS — FlexRay Input Transfer Status Register

| Access: |  |  | FLXAnFRITS can be read or written in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | FLXAnFRITSL can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRITSH is a read-only register that can be read in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRITSLL, FLXAnFRITSHL, and FLXAnFRITSHH are the read-only registers that can be read in 8 -bit units. FLXAnFRITSLH can be read or written in 8-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Address: FLXAnFRITS: <FLXAn_base> + 0820 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRITSL: <FLXAn_base> + 0820 н $^{\text {, FLXAnFRITSH: }}$ <FLXAn_base> + 0822 ${ }_{\text {H }}$, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRITSLL: <FLXAn_base> + 0820 ${ }_{\text {H }}$, FLXAnFRITSLH: <FLXAn_base> + 0821 ${ }_{\text {H }}$, |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | FLXAnFRITSHL: <FLXAn_base> + 0822н, FLXAnFRITSHH: <FLXAn_base> + 0823н |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | $00000000_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - |  | IGIDX[6:0] |  |  |  |  |  | - | IPIDX[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|  | - | - | - | IQFP | - | - | IQEIS | IQFIS | - | - | - | - | - | UIRP | IQH | ITS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R |

Table 25.103 FLXAnFRITS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 24 | IGIDX[6:0] | Input queue Get Index Bit <br> Represents the get index of the input pointer table |
| 23 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | IPIDX[6:0] | Input queue Put Index Bit <br> Represents the put index of the input pointer table |
| 15 to 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | IQFP | Input Queue Full condition Pending Bit <br> 0 : Entries in the input queue are available <br> 1: All entries in the input queue are occupied |
| 11, 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | IQEIS | Input Queue Empty Interrupt Status Bit <br> 0 : No input queue empty condition detected <br> 1: Input queue empty condition detected |
| 8 | IQFIS | Input Queue Full Interrupt Status Bit <br> 0 : No input queue full condition detected <br> 1: Input queue full condition detected |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | UIRP | User Input transfer Request Pending Bit <br> 0 : No user input transfer request pending <br> 1: User input transfer request pending |

Table 25.103 FLXAnFRITS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | IQH | Input Queue Halted Bit |
|  |  | $0:$ Input queue not halted |
|  |  | 1: Input queue halted |
| 0 | ITS | Input Transfer Status Bit |
|  | $0:$ Disabled |  |
|  |  | 1: Enabled |

## (1) FLXAnFRITS.IGIDX

Input queue Get Index Bit
These bits are only valid when FLXAnFRITS.IQH is 1.
These bits indicate the input pointer index the input queue handler will transfer next.
Valid values are $00_{\mathrm{H}}$ to FLXAnFRITC.ITM.
The get index is incremented when the input data structure has been transferred from the local RAM/global RAM and the related DA flag in the FLXAnFRDA register is cleared.
The index is set to $00_{\mathrm{H}}$ when FLXAnFRITS.ITS changes from 0 to 1 .

## (2) FLXAnFRITS.IPIDX

Input queue Put Index Bit
These bits indicate the index where the next input data structure pointer in the input pointer table should be stored. Valid values are $00_{\mathrm{H}}$ to FLXAnFRITC.ITM.
After reaching the maximum value the put index continues from $00_{\mathrm{H}}$.
The index is incremented when writing to FLXAnFRIQC.IMBNR.
The index is set to $00_{\mathrm{H}}$ when FLXAnFRITS.ITS changes from 0 to 1 .

## (3) FLXAnFRITS.IQFP

Input Queue Full condition Pending Bit
This bit indicates that the input queue is full.
There should be no further input transfer requests, by writing to FLXAnFRIQC.IMBNR, as long as FLXAnFRITS.IQFP is 1 .
[Clearing condition]
This bit is cleared when there is one free entry in the input queue.
[Setting condition]
This bit is set when all entries in the input queue are occupied.

## (4) FLXAnFRITS.IQEIS

Input Queue Empty Interrupt Status Bit
Writing 0 has no effect on the bit value.
If enabled in FLXAnFRITC.IQEIE the input queue empty interrupt is generated when FLXAnFRITS.IQEIS is 1.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRITS.IQEIS.
This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1 .
[Setting condition]
This bit is set when all pending input transfers have been processed and consequently the input queue becomes empty.

## (5) FLXAnFRITS.IQFIS

Input Queue Full Interrupt Status Bit
Writing 0 has no effect on the bit value.
If enabled in FLXAnFRITC.IQFIE the input queue full interrupt is generated when FLXAnFRITS.IQFIS is 1.
This flag is intended as interrupt status flag. It does not indicate the current input queue status; for this status refer to
FLXAnFRITS.IQFP.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRITS.IQFIS.
This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1 .
[Setting condition]
This bit is set when all entries in the input queue are occupied.

## (6) FLXAnFRITS.UIRP

User Input transfer Request Pending Bit
This bit indicates that a user input transfer is still pending.
There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1 .
[Clearing condition]
This bit is cleared when the user input transfer request is processed by the input transfer handler.
[Setting condition]
This bit is set when writing to FLXAnFRUIR.UIDX.

## (7) FLXAnFRITS.IQH

Input Queue Halted Bit
This bit indicates the status of the input queue.
There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1 .
[Clearing condition]
This bit is cleared when FLXAnFRITC.IQHR is set to 0 .
[Setting condition]
This bit is set immediately when the FLXAnFRITC.IQHR is set to 1 and there is no ongoing input transfer.
This bit is set only after an ongoing input transfer has been completed and FLXAnFRITC.IQHR is set to 1 .

## (8) FLXAnFRITS.ITS

Input Transfer Status Bit
This bit indicates the status of the input queue handler.
While this bit is 1 , there can be no read or write access to the address area <FLXAn_base> $+0400_{\mathrm{H}}$ to <FLXAn_base> $+05 \mathrm{FF}_{\mathrm{H}}$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD register.
The input transfer queue indices and related status flags are set to 0 when FLXAnFRITS.ITS changes from 0 to 1 .
[Clearing condition]
This bit is cleared immediately when FLXAnFRITC.ITE is set to 0 and there are no pending input transfers.
This bit is cleared after all pending requests have been processed and FLXAnFRITC.ITE is 0 .
[Setting condition]
This bit is set when FLXAnFRITC.ITE is set to 1 .

### 25.2.13.2 FLXAnFROTS — FlexRay Output Transfer Status Register

## Access: FLXAnFROTS can be read or written in 32-bit units. <br> FLXAnFROTSL can be read or written in 16 -bit units.

FLXAnFROTSH is a read-only register that can be read in 16-bit units.
FLXAnFROTSLL, FLXAnFROTSHL, and FLXAnFROTSHH are the read-only registers that can be read in 8 - bit units.
FLXAnFROTSLH can be read or written in 8-bit units.
Address: FLXAnFROTS: <FLXAn_base> + 0824 H ,
FLXAnFROTSL: <FLXAn_base> + 0824н, FLXAnFROTSH: <FLXAn_base> + 0826н,
FLXAnFROTSLL: <FLXAn_base> + 0824н, FLXAnFROTSLH: <FLXAn_base> + 0825н,
FLXAnFROTSHL: <FLXAn_base> + 0826 , FLXAnFROTSHH: <FLXAn_base> + 0827 ${ }_{H}$

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R/W | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

Table 25.104 FLXAnFROTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 to 24 | FFL[5:0] | FIFO Fill Level Bit |
|  |  | Represent the number of unprocessed output FIFO structures |
| 23 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | FGIDX[4:0] | FIFO Get Index Bit |
|  |  | Represent the get index in the FIFO pointer table |
| 15 | FWP | FIFO transfer Warning condition Pending Bit |
|  |  | 0: No FIFO transfer warning condition pending |
|  |  | 1: FIFO transfer warning condition pending |
| 14 | OWP | Output transfer Warning condition Pending |
|  |  | 0 : No output transfer warning condition pending |
|  |  | 1: Output transfer warning condition pending |
| 13 | FDA | FIFO Data Available Bit |
|  |  | 0: No available FIFO structures |
|  |  | 1: FIFO structures available at current FLXAnFROTS.FGIDX index |
| 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | FWIS | FIFO transfer Warning Interrupt Status Bit |
|  |  | 0 : No FIFO transfer warning condition detected |
|  |  | 1: FIFO transfer warning condition detected |
| 10 | OWIS | Output transfer Warning Interrupt Status Bit |
|  |  | 0: No output transfer warning condition detected |
|  |  | 1: Output transfer warning condition detected |
| 9 | FIS | FIFO transfer Interrupt Status Bit |
|  |  | 0: No FIFO structure updated in local RAM/global RAM |
|  |  | 1: FIFO structure updated in local RAM/global RAM |

Table 25.104 FLXAnFROTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 8 | OTIS | Output transfer Interrupt Status Bit |
|  |  | 0: No output structure updated in local RAM/global RAM |
|  |  | 1: Output structure updated in local RAM/global RAM |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | UORP | User Output transfer Request Pending Bit |
|  |  | 0: No user output transfer request pending |
|  |  | 1: User output transfer request pending |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | OTS | Output Transfer Status Bit |
|  |  | 0: Disabled |
|  |  | 1: Enabled |

## (1) FLXAnFROTS.FFL

## FIFO Fill Level Bit

These bits indicate the number of available output FIFO structures in the local RAM/global RAM. Valid values are $00_{\mathrm{H}}$ to FLXAnFROTC.FTM + 1 .
The value $00_{\mathrm{H}}$ indicates that the FIFO is empty.
The value FLXAnFROTC.FTM + 1 indicates that the FIFO is full and no further FIFO transfers will be done.
The FIFO fill level is incremented when a FIFO data structure has been transferred from the FlexRay internal FIFO into the local RAM/global RAM.
The FIFO fill level is decremented when the user releases a FIFO data structure in the local RAM/global RAM by writing 1 to FLXAnFROTS.FDA.
The FIFO fill level is set to $00_{\mathrm{H}}$ when the bit FLXAnFROTS.OTS changes from 0 to 1 .

## (2) FLXAnFROTS.FGIDX

## FIFO Get Index Bit

These bits indicate the index where the current output data structure pointer in the FIFO pointer table is available for reading.
Valid values are $00_{\mathrm{H}}$ to FLXAnFROTC.FTM.
After reaching the maximum value the get index continues from $00_{\mathrm{H}}$.
The index is incremented when a FIFO data structure is released by writing 1 to FLXAnFROTS.FDA.
The index is set to $00_{\mathrm{H}}$ when FLXAnFROTS.OTS changes from 0 to 1 .

## (3) FLXAnFROTS.FWP

FIFO transfer Warning condition Pending Bit
This bit indicates the FIFO transfer warning condition.
[Clearing condition]
This bit is cleared when there are free output data structures (FLXAnFROTS.FFL $\leq$ FLXAnFROTC.FTM).
This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1 .
[Setting condition]
This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

## (4) FLXAnFROTS.OWP

Output transfer Warning condition Pending Bit
This bit indicates the output transfer warning condition.
[Clearing condition]
This bit is cleared, when all output structure pointers that have a pending output handler transfer condition detected are released (for dedicated transmit and receive message buffers or a user output transfer request).
[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1 ).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

## (5) FLXAnFROTS.FDA

## FIFO Data Available Bit

Writing 0 has no effect on the bit value.
When this bit is 1 , the next valid output data structure is available.
The related data structure pointer is in the FIFO pointer table at FLXAnFROTS.FGIDX.
Writing 1 to FLXAnFROTS.FDA

- increments FLXAnFROTS.FGIDX and
- decrements the FIFO fill level (FLXAnFROTS.FFL)

If there are still unprocessed data structures FLXAnFROTS.FDA remains 1.
[Clearing condition]
This bit is cleared when writing 1 to FLXAnFROTS.FDA and the FIFO fill level becomes $00_{\mathrm{H}}$. This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1 .
[Setting condition]
This bit is set when there is at least one FIFO data structure available in the local RAM/global RAM.

## (6) FLXAnFROTS.FWIS

FIFO transfer Warning Interrupt Status Bit
Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.FWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.FWIS is 1.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.FWIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.
[Setting condition]
This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

## (7) FLXAnFROTS.OWIS

Output transfer Warning Interrupt Status Bit
Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.OWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.OWIS is 1 .
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.OWIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1 .
[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1 ).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

## (8) FLXAnFROTS.FIS

FIFO transfer Interrupt Status Bit
Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.FIE the FIFO transfer interrupt is generated when FLXAnFROTS.FIS is 1.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.FIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1 .
[Setting condition]
This bit is set when a FIFO data structure is updated by the transfer handler or the FFL bit changes from $00_{\mathrm{H}}$ to $01_{\mathrm{H}}$.

## (9) FLXAnFROTS.OTIS

Output transfer Interrupt Status Bit
Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.OIE the output transfer interrupt is generated when FLXAnFROTS.OTIS is 1.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.OTIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1 .
[Setting condition]
This bit is set when an output data structure is updated by the transfer handler (from a dedicated transmit or receive message buffer or by a user output transfer request).

## (10) FLXAnFROTS.UORP

User Output transfer Request Pending Bit
This bit indicates that a user output transfer is still pending.
There should be no further write access to FLXAnFRUOR.UMBNR when this bit is 1 .
[Clearing condition]
This bit is cleared when the user output transfer request is processed by the output transfer handler.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1 .
[Setting condition]
This bit is set when writing to FLXAnFRUOR.UMBNR.

## (11) FLXAnFROTS.OTS

Output Transfer Status Bit
This bit indicates the status of the output transfer handler.
While this bit is 1, there should be no read or write access to the address area <FLXAn_base> $+0600_{\mathrm{H}}$ to <FLXAn_base> + 07FF ${ }_{\text {H }}$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD register.
While this bit is 1, the user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.
The output hander transfer indices and related status flags are set to 0 when FLXAnFROTS.OTS changes from 0 to 1 .

## [Clearing condition]

This bit is cleared immediately when FLXAnFROTC.OTE is set to 0 and there are no ongoing output transfers.
This bit is cleared after an ongoing transfer has been completed and FLXAnFROTC.OTE is 0 .
[Setting condition]
This bit is set when FLXAnFROTC.OTE is set to 1 .

### 25.2.13.3 FLXAnFRAES — FlexRay Access Error Status Register

Table 25.105 FLXAnFRAES Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | MAE | Multiple Access Errors Bit |
|  |  | 0: No multiple access errors occurred |
|  | 1: Multiple access errors occurred |  |
| 10 | FAE | FIFO transfer Access Error Bit |
|  |  | 0: No access error occurred during FIFO transfer |
|  | 1: Access error occurred during FIFO transfer |  |
| 9 | OAE | Output transfer Access Error Bit |
|  |  | 0: No access error occurred during output transfer |
|  |  | 1: Access error occurred during output transfer |
| 8 |  | Input transfer Access Error Bit |
|  | 0: No access error occurred during input transfer |  |
|  |  | 1: Access error occurred during input transfer |
| 7 to 0 | Error Index Bit |  |
|  |  | Data structure pointer index number |

## (1) FLXAnFRAES.MAE

Multiple Access Errors Bit
Writing 0 has no effect on the bit value.
This bit indicates that there were multiple access errors during a data transfer.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.MAE.
[Setting condition]
This bit is set when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE are set and

- an access to an protected address occurred during a FIFO data transfer or
- an access to an protected address occurred during an output data transfer or
- an access to an protected address occurred during an input data transfer

## (2) FLXAnFRAES.FAE

FIFO transfer Access Error Bit
Writing 0 has no effect on the bit value.
This bit indicates that there was an access error during a FIFO data transfer.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.FAE.
[Setting condition]
This bit is set when a local RAM/global RAM access error was detected during a FIFO transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

## (3) FLXAnFRAES.OAE

Output transfer Access Error Bit
Writing 0 has no effect on the bit value.
This bit indicates that there was an access error during a output data transfer.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.OAE.
[Setting condition]
This bit is set when a local RAM/global RAM access error was detected during an output transfer and the bits FLXAnFRAES.FAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

## (4) FLXAnFRAES.IAE

## Input transfer Access Error Bit

Writing 0 has no effect on the bit value.
This bit indicates that there was an access error during an input data transfer.
[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.IAE.
[Setting condition]
This bit is set when a local RAM/global RAM access error was detected during an output transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.FAE and FLXAnFRAES.MAE are 0.

## (5) FLXAnFRAES.EIDX

## Error Index Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1. When the bit FLXAnFRAES.FAE is 1, FLXAnFRAES.EIDX holds the used FIFO put index when the access error has occurred.
When the bit FLXAnFRAES.OAE is 1, FLXAnFRAES.EIDX holds the input pointer table get index used when an access error occurred during an input transfer or when the user request an input transfer.
When the bit FLXAnFRAES.IAE is 1, FLXAnFRAES.EIDX holds the used input pointer table get index when the access error has occurred.
These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changed from 0 to 1 .

### 25.2.13.4 FLXAnFRAEA — FlexRay Access Error Address Register

## Access: FLXAnFRAEA is a read-only register that can be read in 32-bit units.

FLXAnFRAEAL and FLXAnFRAEAH are the read-only registers that can be read in 16-bit units.
FLXAnFRAEALL, FLXAnFRAEALH, FLXAnFRAEAHL, and FLXAnFRAEAHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRAEA: <FLXAn_base> + 082C $\mathrm{H}_{\mathrm{H}}$,
FLXAnFRAEAL: <FLXAn_base> + 082C $\mathrm{C}_{\mathrm{H}}$, FLXAnFRAEAH: <FLXAn_base> + 082E $\mathrm{E}_{\mathrm{H}}$,
FLXAnFRAEALL: <FLXAn_base> + 082C ${ }_{\mathrm{H}}$, FLXAnFRAEALH: <FLXAn_base> + 082Dн,
FLXAnFRAEAHL: <FLXAn_base> + 082E $\mathrm{H}_{\mathrm{H}}$, FLXAnFRAEAHH: <FLXAn_base> $+082 \mathrm{~F}_{\mathrm{H}}$
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AEA[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | AEA[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.106 FLXAnFRAEA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | AEA[31:0] | Access Error Address Bit |
|  |  | Address in the local RAM/global RAM when an access error has occurred |

## (1) FLXAnFRAEA.AEA

## Access Error Address Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1. These bits indicate the address of the access error indicated in the FLXAnFRAES register.
These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changed from 0 to 1 .

### 25.2.13.5 FLXAnFRDAi - FlexRay Message Data Available Register i ( $\mathbf{i}=\mathbf{0}$ to $\mathbf{3}$ )

Access: FLXAnFRDAi can be read or written in 32-bit units.
FLXAnFRDAiL and FLXAnFRDAiH can be read or written in 16-bit units.
FLXAnFRDAiLL, FLXAnFRDAiLH, FLXAnFRDAiHL, and FLXAnFRDAiHH can be read or written in 8 -bit units.
Address: FLXAnFRDAx: <FLXAn_base> $+0830 \mathrm{H}+\mathrm{i} \times 4 \mathrm{H}$,
FLXAnFRDAxL: <FLXAn_base> $+0830_{H}+\mathrm{i} \times 4_{\mathrm{H}}$,
FLXAnFRDAxH: <FLXAn_base> $+0830_{\mathrm{H}}+\mathrm{i} \times 4_{\mathrm{H}}+2_{\mathrm{H}}$,
FLXAnFRDAxLL: <FLXAn_base> $+0830_{\mathrm{H}}+\mathrm{i} \times 4 \mathrm{H}$,
FLXAnFRDAxLH: <FLXAn_base> $+0830_{\mathrm{H}}+\mathrm{i} \times 4_{\mathrm{H}}+1_{\mathrm{H}}$,
FLXAnFRDAxHL: <FLXAn_base> $+0830_{\mathrm{H}}+\mathrm{i} \times 4_{\mathrm{H}}+2_{\mathrm{H}}$,
FLXAnFRDAxHH: <FLXAn_base> $+0830_{H}+i \times 4_{H}+3_{H}$
Value after reset: 0000 0000H

Table 25.107 FLXAnFRDAi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DAb | Data Available Bit |
|  |  | 0: No data available for destination |
|  | 1: Data available for destination |  |

## (1) FLXAnFRDAi.DAb (b = i $\times 32$ to $(\mathbf{i}+1) \times 32-1)$

## Data Available Bit b

The user should not write a 1 to bits that are 0 .
To maintain the status of input transfers, the user cannot clear bits related to input transfers.
This register is used for input and output transfers.
Each flag corresponds to a FlexRay message buffer.
[Clearing condition]
Input transfer:
This bit is cleared when the input data structure has been transferred from the local RAM/global RAM. The data structure and the data structure pointer can be changed when the related flag is 0 .

Output transfer:
This bit is cleared by writing 1 to it.
[Setting condition]
Input transfer:
This bit is set when the corresponding message buffer number has been written to FLXAnFRIQC.IMBNR.
As long as this bit is 1 , the input data structure and the data structure pointer corresponding to this input transfer request cannot be changed.

Output transfer:
This bit is set when the output data structure corresponding to this message buffer has been updated. As long as this bit is 1 , the data structure is stable; no further update of the data structure will be done by the output handler. While this bit is 1 , the application is allowed to change the output data structure pointer in the output pointer table for this message buffer number.

### 25.3 Functional Description

This chapter describes the FlexRay implementation together with the related FlexRay protocol features. More information about the FlexRay protocol itself can be found in the FlexRay protocol specification.

### 25.3.1 FlexRay Module Operation Control

### 25.3.1.1 FlexRay Module Enable

After hardware reset or after the FlexRay module has been disabled (following Section 25.3.1.2, FlexRay Module Disable) the FlexRay module is in the reset state (FLXAnFROS.OS is 0 ) and the clocks of the FlexRay core module are disabled.

Figure 25.3 FlexRay Enable Flow

### 25.3.1.2 FlexRay Module Disable

The FlexRay module can be disabled at any time. However, it is recommended to disable the FlexRay module using the FLXAnFROC.OE register only when the FlexRay module is in HALT, CONFIG or DEFAULT_CONFIG state.
Resetting the FlexRay module in any other state will terminate any ongoing FlexRay communication.
If the data transfer function is used, it is also required to disable this function before disabling the FlexRay module (see Section 25.3.16.1(1), Activation and Deactivation for suspending input transfer function and Section 25.3.16.2(2), Output Transfer Data Structure for suspending output transfer).

The following flow should be executed to disable the FlexRay module.

Figure 25.4 FlexRay Disable Flow

### 25.3.2 Communication Cycle

Communication on FlexRay networks is based on frames and symbols. The wakeup symbol (WUS) and the collision avoidance symbol (CAS) are transmitted outside the communication cycle to setup the time schedule. Frames and media access test symbols (MTS) are transmitted inside the communication cycle.

A FlexRay communication cycle consists of the following elements:

- Static Segment
- Dynamic Segment (optional)
- Symbol Window (optional)
- Network Idle Time (NIT)

Static segment, dynamic segment, and symbol window form the Network Communication Time (NCT). For each communication channel the slot counter starts at 1 and counts up until the end of the dynamic segment is reached. Both channels share the same arbitration grid which means that they use the same synchronized macrotick.

Figure 25.5 Structure of Communication Cycle

### 25.3.2.1 Static Segment

The Static Segment is characterized by the following features:

- Time slots of fixed length (optionally protected by bus guardian)
- Start of frame transmission at action point of the respective static slot
- Payload length same for all frames on both channels

## Parameters:

Number of Static Slots (FLXAnFRGTUC7.NSS)
Static Slot Length (FLXAnFRGTUC7.SSL)
Payload Length Static (FLXAnFRMHDC.SFDL)
Action Point Offset (FLXAnFRGTUC9.APO)

### 25.3.2.2 Dynamic Segment

The Dynamic Segment is characterized by the following features:

- All controllers have bus access (no bus guardian protection possible)
- Variable payload length and duration of slots, different for both channels
- Start of transmission at minislot action point

## Parameters:

Number of Minislots (FLXAnFRGTUC8.NMS) Minislot Length (FLXAnFRGTUC8.MSL)
Minislot Action Point Offset (FLXAnFRGTUC9.MAPO)
Start of Latest Transmit (last minislot) (FLXAnFRMHDC.SLT)

### 25.3.2.3 Symbol Window

During the symbol window only one media access test symbol (MTS) may be transmitted per channel. MTS symbols are send in NORMAL_ACTIVE state to test the bus guardian.

The symbol window is characterized by the following features:

- Send single symbol
- Transmission of the MTS symbol starts at the symbol windows action point

## Parameters:

Symbol Window Action Point Offset (FLXAnFRGTUC9.APO) (same as for static slots)
Network Idle Time Start Position (FLXAnFRGTUC4.NIT)

### 25.3.2.4 Network Idle Time (NIT)

During network idle time the CC performs the following tasks:

- Calculate clock correction terms (offset and rate)
- Distribute offset correction over multiple macroticks after offset correction start
- Perform cluster cycle related tasks

## Parameters:

Network idle time start position configuration bit (FLXAnFRGTUC4.NIT)
Offset correction start position configuration bit (FLXAnFRGTUC4.OCS)

### 25.3.2.5 Configuration of NIT Start and Offset Correction Start

Figure 25.6 Configuration of NIT Start and Offset Correction Start

The number of macroticks per cycle gMacroPerCycle is assumed to be m . It is configured by programming FLXAnFRGTUC2.MPC $=\mathrm{m}$.

The static/dynamic segment starts with macrotick 0 and ends with macrotick n:
$\mathrm{n}=$ static segment length + dynamic segment offset + dynamic segment length -1 MT
$\mathrm{n}=\mathrm{gNumberOfStaticSlots} \mathrm{o} \mathrm{gdStaticSlot}+$ dynamic segment offset +gNumberOfMinislots o gdMinislot -1 MT The static segment length is configured by FLXAnFRGTUC7.SSL and FLXAnFRGTUC7.NSS.

The dynamic segment length is configured by FLXAnFRGTUC8.MSL and FLXAnFRGTUC8.NMS. The dynamic segment offset is:

If gdActionPointOffset $\leq$ gdMinislotActionPointOffset: dynamic segment offset $=0$ MT
Else if gdActionPointOffset > gdMinislotActionPointOffset:
dynamic segment offset $=$ gdActionPointOffset - gdMinislotActionPointOffset
The NIT starts with macrotick $\mathrm{k}+1$ and ends with the last macrotick of cycle $\mathrm{m}-1$. It has to be configured by setting FLXAnFRGTUC4.NIT $=\mathrm{k}$.

For the FlexRay module the offset correction start is required to be FLXAnFRGTUC4.OCS $\geq$ FLXAnFRGTUC4.NIT + $1=\mathrm{k}+1$.

The length of symbol window results from the number of macroticks between the end of the static/dynamic segment and the beginning of the NIT. It can be calculated by the number of macroticks $(k-n)$.

### 25.3.3 Communication Modes

The FlexRay Protocol Specification defines the Time-Triggered Distributed (TT-D) mode.

### 25.3.3.1 Time-Triggered Distributed (TT-D)

In TT-D mode the following configurations are possible:

- Pure static: Minimum 2 static slots + symbol window (optional)
- Mixed static/dynamic: Minimum 2 static slots + dynamic segment + symbol window (optional)

A minimum of two coldstart nodes needs to be configured for distributed time-triggered operation. Two fault-free coldstart nodes are necessary for the cluster startup. Each startup frame must be a sync frame, therefore all coldstart nodes are sync nodes.

### 25.3.4 Clock Synchronization

In TT-D mode, distributed clock synchronization is used. Each node individually synchronizes itself to the cluster by observing the timing of received sync frames from other nodes.

### 25.3.4.1 Global Time

Activities in a FlexRay node, including communication, are based on the concept of a global time. It is the clock synchronization mechanism that differentiates the FlexRay cluster from other node collections with independent clock mechanisms. The global time is a vector of two values: the cycle (cycle counter) and the cycle time (macrotick counter).

## Cluster definitions:

- Macrotick (MT) = basic unit of time measurement in a FlexRay network, a macrotick consists of an integer number of microticks ( $\mu \mathrm{T}$ )
- Cycle length = duration of a communication cycle in units of macroticks (MT)

### 25.3.4.2 Local Time

Internally, nodes time their behavior with microtick resolution. Microticks are time units derived from the oscillator clock tick of the specific node. Therefore microticks are controller-specific units. They may have different duration in different controllers. The precision of a node's local time difference measurements is a microtick ( $\mu \mathrm{T}$ ).

Node definitions:

- Oscillator clock $\rightarrow$ prescaler $\rightarrow$ microtick ( $\mu \mathrm{T}$ )
- $\mu \mathrm{T}=$ basic unit of time measurement in a CC, clock correction is done in units of $\rightarrow \mu \mathrm{T}$
- Cycle counter + macrotick counter = nodes local view of the global time

### 25.3.4.3 Synchronization Process

Clock synchronization is performed by means of sync frames. Only preconfigured nodes (sync nodes) are allowed to send sync frames. In a two-channel cluster a sync node has to send its sync frame on both channels.

For synchronization in FlexRay the following constraints have to be considered:

- Max. one sync frame per node in one communication cycle
- Max. 15 sync frames per cluster in one communication cycle
- Every node has to use a preconfigured number of sync frames (FLXAnFRGTUC2.SNM) for clock synchronization
- Minimum of two sync nodes required for clock synchronization and startup

For clock synchronization the time difference between expected and observed arrival time of sync frames received during the static segment is measured. In a two channel cluster the sync node has to be configured to send sync frames on both channels. The calculation of correction terms is done during NIT (offset: every cycle, rate: every odd cycle) by using an FTM algorithm. For details see the FlexRay protocol specification v2.1, chapter 8.

## (1) Offset (Phase) Correction

- Only deviation values measured and stored in the current cycle used
- For a two channel node the smaller value will be taken
- Calculation during NIT of every communication cycle
- Offset correction value calculated in even cycles used for error checking only
- Checked against limit values
- Correction value is a signed integer number of $\mu \mathrm{Ts}$
- Correction done in odd numbered cycles, distributed over the macroticks beginning at offset correction start up to cycle end (end of NIT) to shift nodes next start of cycle (MTs lengthened/shortened)

## (2) Rate (Frequency) Correction

- Pairs of deviation values measured and stored in even/odd cycle pair used
- For a two channel node the average of the differences from the two channels is used
- Calculated during NIT of odd numbered cycles
- Cluster drift damping is performed using global damping value
- Checked against limit values
- Correction value is a signed integer number of $\mu \mathrm{Ts}$
- Distributed over macroticks comprising the next even/odd cycle pair (MTs lengthened/shortened)

## (3) Sync Frame Transmission

Sync frame transmission is only possible from buffer 0 and 1 . Message buffer 1 may be used for sync frame transmission in case that sync frames should have different payloads on the two channels. In this case bit FLXAnFRMRC.SPLM has to be programmed to 1.

Message buffers used for sync frame transmission have to be configured with the key slot ID and can be (re)configured in DEFAULT_CONFIG or CONFIG state only. For nodes transmitting sync frames FLXAnFRSUCC1.TXSY must be set to 1 .

## (4) External Clock Synchronization

During normal operation, independent clusters can drift significantly. If synchronous operation across independent clusters is desired, external synchronization is necessary; even though the nodes within each cluster are synchronized. This can be accomplished with synchronous application of host-deduced rate and offset correction terms to the clusters.

- External offset/rate correction value is a signed integer
- External offset/rate correction value is added to calculated offset/rate correction value
- Aggregated offset/rate correction term (external + internal) is not checked against configured limits

### 25.3.5 Error Handling

The implemented error handling concept is intended to ensure that, in case of a lower layer protocol error in one single node, communication between non-affected nodes can be maintained. In some cases, higher layer program activity is required for the CC to resume normal operation. A change of the error handling state will set FLXAnFREIR.PEMC to 1 and may trigger an interrupt to the Host if enabled. The actual error mode is signaled by FLXAnFRCCEV.ERRM.

Table 25.108 Error Modes of the POC (Degradation Model)

| Error Mode | Activity |
| :--- | :--- |
| ACTIVE | Full operation, State: NORMAL_ACTIVE |
|  | The CC is fully synchronized and supports the cluster wide clock synchronization. The host is <br> informed of any error condition(s) or status change by interrupt (if enabled) or by reading the <br> error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. |
| PASSIVE | Reduced operation, State: NORMAL_PASSIVE, CC self rescue allowed |
|  | The CC stops transmitting frames and symbols, but received frames are still processed. Clock |
|  | synchronization mechanisms are continued based on received frames. No active contribution <br> to the cluster wide clock synchronization. The host is informed of any error condition(s) or <br> status change by interrupt (if enabled) or by reading the error and status interrupt flags from <br> registers FLXAnFREIR and FLXAnFRSIR. |
| Operation halted, State: HALT, CC self rescue not allowed |  |
|  | The CC stops frame and symbol processing, clock synchronization processing, and the <br> COMM_HALT |
|  | error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. The bus drivers |
| are disabled. |  |

### 25.3.5.1 Clock Correction Failed Counter

When the Clock Correction Failed Counter reaches the "maximum without clock correction passive" limit defined by FLXAnFRSUCC3.WCP, the POC transits from NORMAL_ACTIVE to NORMAL_PASSIVE state. When it reaches the "maximum without clock correction fatal" limit defined by FLXAnFRSUCC3.WCF, it transits from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

The Clock Correction Failed Counter FLXAnFRCCEV.CCFC allows the Host to monitor the duration of the inability of a node to compute clock correction terms after the CC passed protocol startup phase. It will be incremented by one at the end of any odd communication cycle during which either the missing offset correction FLXAnFRSFS.MOCS or the missing rate correction FLXAnFRSFS.MRCS flag is set to 1 .

The Clock Correction Failed Counter is reset to zero at the end of an odd communication cycle if neither the missing offset correction FLXAnFRSFS.MOCS nor the missing rate correction FLXAnFRSFS.MRCS flag is set to 1 .

The Clock Correction Failed Counter stops incrementing when the "maximum without clock correction fatal" value FLXAnFRSUCC3.WCF is reached (i.e. incrementing the counter at its maximum value will not cause it to wrap around back to zero). The Clock Correction Failed Counter is initialized to zero when the CC enters READY state or when NORMAL_ACTIVE state is entered.

## CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set to 1.

### 25.3.5.2 Passive to Active Counter

The passive to active counter controls the transition of the POC from NORMAL_PASSIVE to NORMAL_ACTIVE state. FLXAnFRSUCC1.PTA defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state. If FLXAnFRSUCC1.PTA is set to zero the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

### 25.3.5.3 HALT Command

If the Host wants to stop FlexRay communication of the local node it can bring the CC into HALT state by asserting the HALT command. This can be done by writing FLXAnFRSUCC1.CMD $=$ " $0110_{\mathrm{B}}$ ". In order to shut down communication on an entire FlexRay network, a higher layer protocol is required to confirm that all nodes apply the HALT command at the same time.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.
When called in NORMAL_ACTIVE or NORMAL_PASSIVE state the POC transits to HALT state at the end of the current cycle. When called in any other state FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " = command_not_accepted and bit FLXAnFREIR.CNA is set to 1 . If enabled an interrupt to the Host is generated.

### 25.3.5.4 FREEZE Command

In case the Host detects a severe error condition it can bring the CC into HALT state by asserting the FREEZE command. This can be done by writing FLXAnFRSUCC1.CMD = "0111 "". The FREEZE command triggers the entry of the HALT state immediately regardless of the actual POC state.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

## CAUTION

When the communication is stopped by the FREEZE or READY command and the communication is restarted as Leading ColdStart, the startup frame is not transmitted on cycle0 depending on the internal condition of the FlexRay module. This case occurs when the Startup frame is set in one of the slot 1 to slot 7.

This does not occur in ColdStart after a hardware reset.
Even if this occurs, the second trial of ColdStart will succeed. ColdStart time becomes longer, but ColdStart will not be affected by the occurrence.

To avoid this, allocate the Startup/Sync frame in the static slot 8 or higher.

### 25.3.6 Communication Controller States

### 25.3.6.1 Communication Controller State Diagram

Figure 25.7 Overall State Diagram of FlexRay Communication Controller

State transitions are controlled by reset, FLXAnFR0RXDA, FLXAnFR0RXDB, by the POC state machine, and by the CHI Command Vector FLXAnFRSUCC1.CMD.

The CC transits from all states to HALT state after application of the FREEZE command (FLXAnFRSUCC1.CMD $=$ "0111 ${ }^{\text {" }}$ ).

Table 25.109 State Transitions of FlexRay Overall State Machine

| T\# | Condition | From | To |
| :---: | :---: | :---: | :---: |
| 1 | Reset | All States | DEFAULT_CONFIG |
| 2 | Command CONFIG, FLXAnFRSUCC1.CMD = "0001 ${ }_{\text {B }}$ " | DEFAULT_CONFIG | CONFIG |
| 3 | Unlock sequence followed by command READY, FLXAnFRSUCC1.CMD = "0010 ${ }^{\text {" }}$ | CONFIG | READY |
| 4 | Command CONFIG, FLXAnFRSUCC1.CMD = "0001 ${ }^{\text {" }}$ | READY | CONFIG |
| 5 | Command WAKEUP, FLXAnFRSUCC1.CMD = "0011 ${ }_{\text {B }}$ " | READY | WAKEUP |
| 6 | Complete transmission of wakeup pattern or received WUP or received frame header or wakeup collision detection or command READY, FLXAnFRSUCC1.CMD $=$ " $0010_{\mathrm{B}}$ " | WAKEUP | READY |
| 7 | Command RUN, FLXAnFRSUCC1.CMD $=$ " $0100{ }_{\text {B }}$ " | READY | STARTUP |
| 8 | Successful STARTUP | STARTUP | NORMAL_ACTIVE |
| 9 | Clock Correction Failed counter reached Maximum Without Clock Correction Passive limit configured by FLXAnFRSUCC3.WCP | NORMAL_ACTIVE | NORMAL_PASSIVE |
| 10 | Number of valid correction terms reached the Passive to Active limit configured by FLXAnFRSUCC1.PTA | NORMAL_PASSIVE | NORMAL_ACTIVE |
| 11 | Command READY, FLXAnFRSUCC1.CMD $=$ " $0010{ }_{\text {B }}$ " | STARTUP, <br> NORMAL_ACTIVE, <br> NORMAL_PASSIVE | READY |
| 12 | Clock Correction Failed counter reached Maximum <br> Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to 1 or command HALT, FLXAnFRSUCC1.CMD = "0110B" | NORMAL_ACTIVE | HALT |
| 13 | Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to 1 or command HALT, FLXAnFRSUCC1.CMD = "0110B" | NORMAL_PASSIVE | HALT |
| 14 | Command FREEZE, FLXAnFRSUCC1.CMD $=$ "0111 ${ }^{\text {" }}$ | All States | HALT |
| 15 | Command CONFIG, FLXAnFRSUCC1.CMD $=$ "0001 ${ }_{\mathrm{B}}$ " | HALT | DEFAULT_CONFIG |

### 25.3.6.2 DEFAULT_CONFIG State

In DEFAULT_CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state.

The CC enters this state

- When the reset is applied (HW reset or SW reset)
- When exiting from HALT state

To leave DEFAULT_CONFIG state the Host has to write FLXAnFRSUCC1.CMD $=$ " $0001_{\mathrm{B}}$ ". The CC then transits to CONFIG state.

### 25.3.6.3 CONFIG State

In CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state. This state is used to initialize the CC configuration.

The CC enters this state

- When exiting from DEFAULT_CONFIG state
- When exiting from READY state

When the state has been entered via HALT and DEFAULT_CONFIG state, the Host can analyze status information and configuration. Before leaving CONFIG state the Host has to confirm that the configuration is fault-free.

To leave CONFIG state, the Host has to perform the unlock sequence as described is Section 25.2.3.3,
FLXAnFRLCK - FlexRay Lock Register. Directly after unlocking the CONFIG state the Host has to write FLXAnFRSUCC1.CMD to enter the next state.

## CAUTION

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from CONFIG to READY state.

When the CC is in CONFIG state it is also possible to bring the CC into a power saving mode by halting the module clocks (bus clock and sample clock). To do this the Host has to confirm that all Message RAM transfers have finished before turning off the clocks.

### 25.3.6.4 READY State

After unlocking CONFIG state and writing FLXAnFRSUCC1.CMD $=$ " $0010_{\mathrm{B}}$ ", the CC enters READY state. From this state the CC can transit to WAKEUP state and perform a cluster wakeup or to STARTUP state to perform a coldstart or to integrate into a running cluster.

The CC enters this state

- When exiting from CONFIG, WAKEUP, STARTUP, NORMAL_ACTIVE, or NORMAL_PASSIVE state by writing FLXAnFRSUCC1.CMD $=$ " $0010_{\mathrm{B}}$ " (READY command).

The CC exits from this state

- To CONFIG state by writing FLXAnFRSUCC1.CMD $=$ "0001 ${ }_{\mathrm{B}}$ " (CONFIG command)
- To WAKEUP state by writing FLXAnFRSUCC1.CMD = "0011 ${ }_{\mathrm{B}} "$ (WAKEUP command)
- To STARTUP state by writing FLXAnFRSUCC1.CMD = "0100 ${ }_{\mathrm{B}}$ " (RUN command)

Internal counters and the CC status flags are reset when the CC enters STARTUP state.

## CAUTION

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from READY to STARTUP state.

### 25.3.6.5 WAKEUP State

The description below is intended to help configuring wakeup for the FlexRay IP-module. A detailed description of the wakeup procedure together with the respective SDL diagrams can be found in the FlexRay protocol specification v2.1, section 7.1.

The CC enters this state

- When exiting from READY state by writing FLXAnFRSUCC1.CMD = "0011呙" (WAKEUP command).

The CC exits from this state to READY state

- After complete non-aborted transmission of wakeup pattern (WUP)
- After WUP reception
- After detecting a WUP collision
- After reception of a frame header
- By writing FLXAnFRSUCC1.CMD = "0010B" (READY command)

The cluster wakeup must precede the communication startup in order to ensure that all nodes in a cluster are awake. The minimum requirement for a cluster wakeup is that all bus drivers are supplied with power. A bus driver has the ability to wake up the other components of its node when it receives a wakeup pattern on its channel. At least one node in the cluster needs an external wakeup source.

The Host completely controls the wakeup procedure. It is informed about the state of the cluster by the bus driver and the CC and configures bus guardian (if available) and CC to perform the cluster wakeup. The CC provides to the Host the ability to transmit a special wakeup pattern on each of its available channels separately. The CC needs to recognize the wakeup pattern only during WAKEUP state.

Wakeup may be performed on only one channel at a time. The Host has to configure the wakeup channel while the CC is in CONFIG state by writing FLXAnFRSUCC1.WUCS. The CC ensures that ongoing communication on this channel is not disturbed. The CC cannot guarantee that all nodes connected to the configured channel awake upon the transmission of the wakeup pattern, since these nodes cannot give feedback until the startup phase. The wakeup procedure enables single-channel devices in a two-channel system to trigger the wakeup, by only transmitting the wakeup pattern on the single channel to which they are connected. Any coldstart node that deems a system startup necessary will then wake the remaining channel before initiating communication startup.

The wakeup procedure tolerates any number of nodes simultaneously trying to wakeup a single channel and resolves this situation such that only one node transmits the pattern. Additionally the wakeup pattern is collision resilient, so even in the presence of a fault causing two nodes to simultaneously transmit a wakeup pattern, the resulting collided signal can still wake the other nodes.

After wakeup the CC returns to READY state and signals the change of the wakeup status to the Host by setting flag FLXAnFRSIR.WST. The wakeup status vector can be read from FLXAnFRCCSV.WSV. If a valid wakeup pattern was received also either flag FLXAnFRSIR.WUPA or flag FLXAnFRSIR.WUPB is set to 1 .

Figure 25.8 Structure of POC State WAKEUP

Table 25.110 State Transitions WAKEUP

| T\# | Condition | From | To |
| :--- | :--- | :--- | :--- |
| enter | Host commands change to WAKEUP state by writing <br> FLXAnFRSUCC1.CMD = "0011_" (WAKEUP command) | READY | WAKEUP |
| 1 | CHI command WAKEUP triggers wakeup FSM to transit to <br> WAKEUP_LISTEN state | WAKEUP_STANDBY | WAKEUP_LISTEN |
| 2 | Received WUP on wakeup channel selected by bit <br> FLXAnFRSUCC1.WUCS or frame header on either available <br> channel | WAKEUP_LISTEN | WAKEUP_STANDBY |
| 3 | Timer event | WAKEUP_LISTEN | WAKEUP_SEND |
| 4 | Complete, non-aborted transmission of wakeup pattern | WAKEUP_SEND | WAKEUP_STANDBY |
| 5 | Collision detected | WAKEUP_SEND | WAKEUP_DETECT |
| 6 | Wakeup timer expired or WUP detected on wakeup channel <br> selected by bit FLXAnFRSUCC1.WUCS or frame header <br> received on either available | WAKEUP_DETECT | WAKEUP_STANDBY |
| exit | Wakeup completed (after T2 or T4 or T6) or Host commands <br> change to READY state by writing FLXAnFRSUCC1.CMD $=$ | WAKEUP |  |

The WAKEUP_LISTEN state is controlled by the wakeup timer and the wakeup noise timer. The two timers are controlled by the ListenTimeout (FLXAnFRSUCC2.LT bit) and ListenTimeoutNoise (FLXAnFRSUCC2.LTN bit) values. ListenTimeout enables a fast cluster wakeup in case of a noise free environment, while ListenTimeoutNoise enables wakeup under more difficult conditions regarding noise interference.

In WAKEUP_SEND state the CC transmits the wakeup pattern on the configured channel and checks for collisions. After return from wakeup the Host has to bring the CC into STARTUP state by CHI command RUN.

In WAKEUP_DETECT state the CC attempts to identify the reason for the wakeup collision detected in WAKEUP_SEND state. The monitoring is bounded by the expiration of listen timeout as configured by
FLXAnFRSUCC2.LT. Either the detection of a wakeup pattern indicating a wakeup attempt by another node or the reception of a frame header indicating ongoing communication, causes the direct transition to READY state. Otherwise WAKEUP_DETECT is left after expiration of listen timeout; in this case the reason for wakeup collision is unknown.

The Host has to be aware of possible failures of the wakeup and act accordingly. It is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal time it takes another coldstart node to become awake and to be configured.

The FlexRay Protocol Specification recommends that two different CCs shall awake the two channels.

## (1) Host Activities

The host must coordinate the wakeup of the two channels and must decide whether, or not, to wake a specific channel. The sending of the wakeup pattern is initiated by the Host. The wakeup pattern is detected by the remote BDs and signaled to their local Host.

## Wakeup procedure controlled by Host (single-channel wakeup):

- Configure the CC in CONFIG state
- Select wakeup channel by programming FLXAnFRSUCC1.WUCS
- Check local BDs whether a WUP was received
- Activate BD of selected wakeup channel
- Command CC to enter READY state
- Command CC to start wakeup on the configured channel by writing FLXAnFRSUCC1.CMD = "0011 ${ }_{\mathrm{B}}$ "
- CC enters WAKEUP
- CC returns to READY state and signals status of wakeup attempt to the Host
- Wait predefined time to allow the other nodes to wakeup and configure themselves
- Coldstart node:
- In a dual channel cluster wait for WUP on the other channel
- Reset coldstart inhibit flag FLXAnFRCCSV.CSI by writing FLXAnFRSUCC1.CMD = "1001B" (ALLOW_COLDSTART command)
- Command CC to enter startup by writing FLXAnFRSUCC1.CMD $=$ " $0100_{\mathrm{B}}$ " (RUN command)

## Wakeup procedure triggered by BD:

- Wakeup recognized by BD
- BD triggers power-up of Host (if required)
- BD signals wakeup event to Host
- Host configures its local CC
- If necessary, Host commands wakeup of second channel and waits predefined time to allow the other nodes to wakeup and configure themselves
- Host commands CC to enter STARTUP state by writing FLXAnFRSUCC1.CMD = "0100 ${ }_{\mathrm{B}}$ " $($ RUN command $)$

## (2) Wakeup Pattern (WUP)

The wakeup pattern (WUP) is composed of at least two wakeup symbols (WUS). Wakeup symbol and wakeup pattern are configured by registers FLXAnFRPRTC1 and FLXAnFRPRTC2.

- Single channel wakeup, wakeup symbol may not be sent on both channels at the same time
- Wakeup symbol collision resilient for at least two sending nodes (two overlapping wakeup symbols always recognizable)
- Wakeup symbol must be configured identical in all nodes of a cluster
- Wakeup symbol transmit low time configured by FLXAnFRPRTC2.TXL
- Wakeup symbol idle time used to listen for activity on the bus, configured by FLXAnFRPRTC2.TXI
- A wakeup pattern composed of at least two Tx-wakeup symbols needed for wakeup
- Number of repetitions configurable by FLXAnFRPRTC1.RWP (2 to 63 repetitions)
- Wakeup symbol receive window length configured by FLXAnFRPRTC1.RXW
- Wakeup symbol receive low time configured by FLXAnFRPRTC2.RXL
- Wakeup symbol receive idle time configured by FLXAnFRPRTC2.RXI

Figure 25.9 Timing of Wakeup Pattern

### 25.3.6.6 STARTUP State

The description below is intended to help configuring startup for the FlexRay module. A detailed description of the startup procedure together with the respective SDL diagrams can be found in the FlexRay protocol specification v2.1, section 7.2.

Any node entering STARTUP state that has coldstart capability should confirm that both channels attached have been awakened before initiating coldstart.

It cannot be assumed that all nodes and stars need the same amount of time to become completely awake and to be configured. Since at least two nodes are necessary to start up the cluster communication, it is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal amount of time it takes another coldstart node to become awake, to be configured and to enter startup. It may require several hundred milliseconds (depending on the hardware used) before all nodes and stars are completely awakened and configured.

Startup is performed on all channels synchronously. During startup, a node only transmits startup frames. Startup frames are both sync frames and null frames during startup.

A fault-tolerant, distributed startup strategy is used to ensure that all nodes are synchronized initially. In general, a node may enter NORMAL_ACTIVE state via (see Figure 25.10, State Diagram Time — Triggered Startup):

- Coldstart path initiating the schedule synchronization (LeadingColdstart node)
- Coldstart path joining other coldstart nodes (FollowingColdstart node)
- Integration path integrating into an existing communication schedule (all other nodes)

A coldstart attempt begins with the transmission of a collision avoidance symbol (CAS). Only a coldstart node that had transmitted the CAS transmits frames in the first four cycles after the CAS, it is then joined firstly by the other coldstart nodes and afterwards by all other nodes.

A coldstart node has bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY set to 1 . Message buffer 0 holds the key slot ID which defines the slot number where the startup frame is send. In the frame header of the startup frame the startup frame indicator bit is set to 1 .

In clusters consisting of three or more nodes, at least three nodes shall be configured to be coldstart nodes. In clusters consisting of two nodes, both nodes must be coldstart nodes. At least two fault-free coldstart nodes are necessary for the cluster to startup.

Each startup frame must also be a sync frame; therefore each coldstart node will also be a sync node. The number of coldstart attempts is configured by FLXAnFRSUCC1.CSA.

A non-coldstart node requires at least two startup frames from distinct nodes for integration. It may start integration before the coldstart nodes have finished their startup. It will not finish its startup until at least two coldstart nodes have finished their startup.

Both non-coldstart nodes and coldstart nodes start passive integration via the integration path as soon as they receive sync frames from which to derive the TDMA schedule information. During integration, the node has to adapt its own clock to the global clock (rate and offset) and has to make its cycle time consistent with the global schedule observable at the network. Afterwards, these settings are checked for consistency with all available network nodes. The node can only leave the integration phase and actively participate in communication when these checks are passed.

Figure 25.10 State Diagram Time - Triggered Startup

## (1) Coldstart Inhibit Mode

In coldstart inhibit mode the node is prevented from initializing the TDMA communication schedule. If bit FLXAnFRCCSV.CSI is set to 1 , the node is not allowed to initialize the cluster communication, i.e. entering the coldstart path is prohibited. The node is allowed to integrate to a running cluster or to transmit startup frames after another coldstart node started the initialization of the cluster communication.

The coldstart inhibit bit FLXAnFRCCSV.CSI is set to 1 whenever the POC enters READY state. The bit has to be cleared under control of the Host by CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = "1001B")

## (2) Startup Timeouts

The CC supplies two different $\mu \mathrm{T}$ timers supporting two timeout values, startup timeout and startup noise timeout. The two timers are started when the CC enters the COLDSTART_LISTEN state. The expiration of either of these timers causes the node to leave the initial sensing phase (COLDSTART_LISTEN state) with the intention of starting up communication.

## CAUTION

The startup and startup noise timers are identical with the wakeup and wakeup noise timers and use the same configuration values FLXAnFRSUCC2.LT and FLXAnFRSUCC2.LTN.

## (a) Startup Timeout

The startup timeout limits the listen time used by a node to determine if there is already communication between other nodes or at least one coldstart node actively requesting the integration of others. The startup timer is configured by programming FLXAnFRSUCC2.LT (see Section 25.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2).

The startup timeout is:
pdListenTimeout $=$ FLXAnFRSUCC2.LT
The startup timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Both channels reaching idle state while in COLDSTART_LISTEN state

The startup timer is stopped:

- If communication channel activity is detected on one of the configured channels while the node is in the COLDSTART_LISTEN state
- When the COLDSTART_LISTEN state is left

Once the startup timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The timer status is kept for further processing by the startup state machine.

## (b) Startup Noise Timeout

At the same time the startup timer is started for the first time (transition from STARTUP_PREPARE state to COLDSTART_LISTEN state), the startup noise timer is started. This additional timeout is used to improve reliability of the startup procedure in the presence of noise. The startup noise timeout is configured by programming FLXAnFRSUCC2.LTN
(see Section 25.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2).
The startup noise timeout is:
pdListenTimeout $\times$ gListenNoise $=$ FLXAnFRSUCC2.LT $\times($ FLXAnFRSUCC2.LTN +1$)$
The startup noise timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Reception of correctly decoded headers or CAS symbols while the node is in COLDSTART_LISTEN state

The startup noise timer is stopped when the COLDSTART_LISTEN state is left.
Once the startup noise timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The status is kept for further processing by the startup state machine. Since the startup noise timer won't be restarted when random channel activity is sensed, this timeout defines the fall-back solution that guarantees that a node will try to start up the communication cluster even in the presence of noise.

## (3) Path of Leading Coldstart Node (Initiating Coldstart)

When a coldstart node enters COLDSTART_LISTEN, it listens to its attached channels.
If no communication is detected, the node enters the COLDSTART_COLLISION_RESOLUTION state and commences a coldstart attempt. The initial transmission of a CAS symbol is succeeded by the first regular cycle. This cycle has the number zero.

From cycle zero on, the node transmits its startup frame. Since each coldstart node may perform a coldstart attempt, it may occur that several nodes simultaneously transmit the CAS symbol and enter the coldstart path. This situation is resolved during the first four cycles after CAS transmission.

As soon as a node that initiates a coldstart attempt receives a CAS symbol or a frame header during these four cycles, it re-enters the COLDSTART_LISTEN state. Thereby, only one node remains in this path. In cycle four, other coldstart nodes begin to transmit their startup frames.

After four cycles in COLDSTART_COLLISION_RESOLUTION state, the node that initiated the coldstart enters the COLDSTART_CONSISTENCY_CHECK state. It collects all startup frames from cycle four and five and performs the clock correction. If the clock correction does not deliver any errors and it has received at least one valid startup frame pair, the node leaves COLDSTART_CONSISTENCY_CHECK and enters NORMAL_ACTIVE state.

The number of coldstart attempts that a node is allowed to perform is configured by FLXAnFRSUCC1.CSA. The number of remaining coldstarts attempts can be read from FLXAnFRCCSV.RCA. The number of remaining coldstart attempts is reduced by one for each attempted coldstart. A node may enter the COLDSTART_LISTEN state only if this value is larger than one and it may enter the COLDSTART_COLLISION_RESOLUTION state only if this value is larger than zero. If the number of coldstart attempts is one, coldstart is inhibited but integration is still possible.

## (4) Path of Following Coldstart Node (Responding to Leading Coldstart Node)

When a coldstart node enters the COLDSTART_LISTEN state, it tries to receive a valid pair of startup frames to derive its schedule and clock correction from the leading coldstart node.

As soon as a valid startup frame has been received the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_COLDSTART_CHECK state is entered.

In INTEGRATION_COLDSTART_CHECK state it is confirmed that the clock correction can be performed correctly and that the coldstart node from which this node has initialized its schedule is still valid. The node collects all sync frames and performs clock correction in the following double-cycle. If clock correction does not signal any errors and if the node continues to receive sufficient frames from the same node it has integrated on, the COLDSTART_JOIN state is entered.

In COLDSTART_JOIN state following coldstart nodes begin to transmit their own startup frames and continue to do so in subsequent cycles. Thereby, the leading coldstart node and the nodes joining it can check if their schedules agree with each other. If the clock correction signals any error, the node aborts the integration attempt. If a node in this state sees at least one valid startup frame during all even cycles in this state and at least one valid startup frame pair during all double cycles in this state, the node leaves COLDSTART_JOIN state and enters NORMAL_ACTIVE state. Thereby it leaves STARTUP at least one cycle after the node that initiated the coldstart.

## (5) Path of Non-Coldstart Node

When a non-coldstart node enters the INTEGRATION_LISTEN state, it listens to its attached channels.
As soon as a valid startup frame has been received, the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_CONSISTENCY_CHECK state is entered.

In INTEGRATION_CONSISTENCY_CHECK state the node verifies that the clock correction can be performed correctly and that enough coldstart nodes (at least 2) are sending startup frames that agree with the node's own schedule. Clock correction is activated, and if any errors are signaled, the integration attempt is aborted.

During the first even cycle in this state, either two valid startup frames or the startup frame of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

During the first double-cycle in this state, either two valid startup frame pairs or the startup frame pair of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

If after the first double-cycle less than two valid startup frames are received within an even cycle, or less than two valid startup frame pairs are received within a double-cycle, the startup attempt is aborted.

Nodes in this state need to see two valid startup frame pairs for two consecutive double-cycles each to be allowed to leave STARTUP and enter NORMAL_OPERATION. Consequently, they leave startup at least one double-cycle after the node that initiated the coldstart and only at the end of a cycle with an odd cycle number.

### 25.3.6.7 NORMAL_ACTIVE State

As soon as the node that transmitted the first CAS symbol (resolving the potential access conflict and entering STARTUP via coldstart path) and one additional node have entered the NORMAL_ACTIVE state, the startup phase for the cluster has finished. In the NORMAL_ACTIVE state, all configured messages are scheduled for transmission. This includes all data frames as well as the sync frames. Rate and offset measurement is started in all even cycles (even/odd cycle pairs required).

In NORMAL_ACTIVE state the CC supports regular communication functions

- The CC performs transmissions and reception on the FlexRay bus as configured
- Clock synchronization is running
- The Host interface is operational

The CC exits from that state to

- HALT state by writing FLXAnFRSUCC1.CMD $=$ " $0110_{\mathrm{B}}$ " (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "0111s" (FREEZE command, immediately)
- HALT state due to change of the error state from ACTIVE to COMM_HALT
- NORMAL_PASSIVE state due to change of the error state from ACTIVE to PASSIVE
- READY state by writing FLXAnFRSUCC1.CMD = "0010 ${ }_{\mathrm{B}}$ " (READY command)

### 25.3.6.8 NORMAL_PASSIVE State

NORMAL_PASSIVE state is entered from NORMAL_ACTIVE state when the error state changes from ACTIVE to PASSIVE.

In NORMAL_PASSIVE state, the node is able to receive all frames (node is fully synchronized and performs clock synchronization). Contrary to the NORMAL_ACTIVE state, the node does not actively participate in communication, i.e. neither symbols nor frames are transmitted.

## In NORMAL_PASSIVE state

- The CC performs reception on the FlexRay bus
- The CC does not transmit any frames or symbols on the FlexRay bus
- Clock synchronization is running
- The Host interface is operational

The CC exits from this state to

- HALT state by writing FLXAnFRSUCC1.CMD $=$ " $0110_{\mathrm{B}}$ " (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "0111 ${ }_{\mathrm{B}} "($ FREEZE command, immediately $)$
- HALT state due to change of the error state from PASSIVE to COMM_HALT
- NORMAL_ACTIVE state due to change of the error state from PASSIVE to ACTIVE. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA - 1
- To READY state by writing FLXAnFRSUCC1.CMD = "0010 $0_{\mathrm{B}}$ " (READY command)

### 25.3.6.9 HALT State

In this state all communication (reception and transmission) is stopped.
The CC enters this state

- By writing FLXAnFRSUCC1.CMD = "0110B" (HALT command) while the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state
- By writing FLXAnFRSUCC1.CMD = "0111 ${ }_{\mathrm{B}}$ " (FREEZE command) from all states
- When exiting from NORMAL_ACTIVE state because the clock correction failed counter reached the "maximum without clock correction fatal" limit and FLXAnFRSUCC1.HCSE is set to 1
- When exiting from NORMAL_PASSIVE state because the clock correction failed counter reached the "maximum without clock correction fatal" limit and FLXAnFRSUCC1.HCSE is set to 1

The CC exits from this state to DEFAULT_CONFIG state

- By writing FLXAnFRSUCC1.CMD = "0001B" (CONFIG command)

When the CC enters HALT state, all configuration and status data is maintained for analyzing purposes.
When the Host writes FLXAnFRSUCC1.CMD = "0110 ${ }_{\mathrm{B}}$ " (HALT command), the CC sets bit FLXAnFRCCSV.HRQ to 1 and enters HALT state at the next end of cycle.

When the Host writes FLXAnFRSUCC1.CMD = "0111B" (FREEZE command), the CC enters HALT state immediately and sets bit FLXAnFRCCSV.FSI to 1.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

### 25.3.7 Network Management

The accrued Network Management (NM) vector can be read from registers FLXAnFRNMV1 to FLXAnFRNMV3. The CC performs a bit-wise OR operation over all NM vectors out of all received valid NM frames with the Payload Preamble Indicator (PPI) bit set. Only static frames may be configured to hold NM information. The CC updates the NM vector at the end of each cycle.

The length of the NM vector can be configured from 0 to 12 bytes by FLXAnFRNEMC.NML. The NM vector length must be configured identically in all nodes of a cluster.

To configure a transmit buffer to send FlexRay frames with the PPI bit set as 1, bit PPIT in the header section of the respective transmit buffer has to be set to 1 via FLXAnFRWRHS1.PPIT. In addition the Host has to write the NM information to the data section of the respective transmit buffer.

The evaluation of the NM vector has to be done by the application running on the Host.
Section 25.3.17, Byte Alignment, for byte alignment of the received NM vector in registers FLXAnFRNMV1 to FLXAnFRNMV3.

## CAUTIONS

1. In case a message buffer is configured for transmission/reception of network management frames, the payload length configured in header 2 of that message buffer should be equal or greater than the length of the NM vector configured by FLXAnFRNEMC.NML.
2. When the CC transits to HALT state, the cycle count is not incremented and therefore the NM vector is not updated. In this case FLXAnFRNMV1 to FLXAnFRNMV3 holds the value from the cycle before.

### 25.3.8 Filtering and Masking

Filtering is done by comparison of the configuration of assigned message buffers against actual slot and cycle counter values and channel ID (channel A, B). A message buffer is only updated/transmitted if the required matches occur.

Filtering is done on:

- Slot Counter
- Cycle Counter
- Channel ID

The following filter combinations for acceptance/transmit filtering are allowed:

- Slot Counter + Channel ID
- Slot Counter + Cycle Counter + Channel ID

All configured filters must match in order to store a received message in a message buffer.

## CAUTION

For the FIFO the acceptance filter is configured by the FIFO Rejection Filter (FLXAnFRFRF) and the FIFO Rejection Filter Mask (FLXAnFRFRFM).

A message will be transmitted in the time slot corresponding to the configured frame ID on the configured channel(s). If cycle counter filtering is enabled the configured cycle filter value must also match.

### 25.3.8.1 Slot Counter Filtering

Every transmit and receive buffer contains a frame ID stored in the header section. This frame ID is compared against the actual slot counter value in order to assign receive and transmit buffers to the corresponding slot.

If two or more message buffers are configured with the same frame ID and channel ID, and if they have a matching cycle counter filter value for the same slot, then the message buffer with the lowest message buffer number is used.

### 25.3.8.2 Cycle Counter Filtering

Cycle counter filtering is based on the notion of a cycle set. For filtering purposes, a match is detected if any one of the elements of the cycle set is matched. The cycle set is defined by the cycle code field in header section 1 of each message buffer.

If message buffer 0 or 1 is configured to hold the startup/sync frame or the single slot frame by bits
FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM, cycle counter filtering for message buffer 0 or 1 shall be disabled.

## CAUTION

Sharing of a static time slot via cycle counter filtering between different nodes of a FlexRay network is not allowed.

The set of cycle numbers belonging to a cycle set is determined as described in Table 25.111, Definition of Cycle Set.

Table 25.111 Definition of Cycle Set

| Cycle Code | Matching Cycle Counter Values |
| :--- | :--- |
| Ob000000x | all Cycles |
| Ob000001c | every second Cycle at (Cycle Count) mod2 $=\mathrm{c}$ |
| Ob00001cc | every fourth Cycle at (Cycle Count) mod4 $=\mathrm{cc}$ |
| Ob0001ccc | every eighth Cycle at (Cycle Count) mod8 $=$ ccc |
| Ob001cccc | every sixteenth Cycle at (Cycle Count) mod16 $=$ cccc |
| Ob01ccccc | every thirty-second Cycle at (Cycle Count) mod32 $=$ ccccc |
| Ob1cccccc | every sixty-fourth Cycle at (Cycle Count) mod64 $=$ cccccc |

Table 25.112, Examples for Valid Cycle Sets below gives some examples for valid cycle sets to be used for cycle counter filtering.

Table 25.112 Examples for Valid Cycle Sets

| Cycle Code | Matching Cycle Counter Values |
| :--- | :--- |
| Ob0000011 | $1-3-5-7-\ldots .63$ |
| Ob0000100 | $0-4-8-12-\ldots .-60$ |
| Ob0001110 | $6-14-22-30-\ldots .62$ |
| $0 b 0011000$ | $8-24-40-56$ |
| Ob0100011 | $3-35$ |
| $0 b 1001001$ | 9 |

The received message is stored only if the cycle counter value of the cycle during which the message is received matches an element of the receive buffer's cycle set. Channel ID and frame ID must also be met.

The content of a transmit buffer is transmitted on the configured channel(s) when an element of the cycle set matches the current cycle counter value. Channel ID and frame ID must also match.

### 25.3.8.3 Channel ID Filtering

There is a 2-bit channel filtering field (CH) located in the header section of each message buffer in the Message RAM. It serves as a filter for receive buffers, and as a control field for transmit buffers (see Table 25.113, Channel Filtering Configuration).

Table 25.113 Channel Filtering Configuration

| $C H[1: 0]$ | Transmit Buffer Transmit Frame | Receive Buffer Store Valid Receive Frame |
| :--- | :--- | :--- |
| $00_{B}$ | no transmission | ignore frame |
| $01_{B}$ | on channel A | received on channel $A$ |
| $10_{B}$ | on channel B | received on channel B |
| $11_{B}$ | on both channels (static segment only) | received on channel A or B (store first semantically <br> valid frame, static segment only) |

The contents of a transmit buffer is transmitted on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a transmit buffer may be set up for transmission on both channels ( $\mathrm{CH}=" 11_{\mathrm{B}}$ ").

Valid received frames are stored if they are received on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a receive buffer may be setup for reception on both channels ( $\mathrm{CH}=$ " $11_{\mathrm{B}}$ ").

## CAUTION

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1 , no frames are transmitted and received frames are ignored (same function as $\mathrm{CH}=$ " 00 B ").

### 25.3.8.4 FIFO Filtering

For FIFO filtering registers FLXAnFRFRF and FLXAnFRFRFM are used. The FIFO filter consists of channel filter FLXAnFRFRF.CH, frame ID filter FLXAnFRFRF.FID, and cycle counter filter FLXAnFRFRF.CYF. Registers FLXAnFRFRF and FLXAnFRFRFM can be configured in DEFAULT_CONFIG or CONFIG state only. The filter configuration in the header section of message buffers belonging to the FIFO is ignored.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected.

A valid received frame is stored in the FIFO if channel ID, frame ID, and cycle counter are not rejected by the configured rejection filter and rejection filter mask, and if there is no matching dedicated receive buffer.

### 25.3.9 Transmit Process

### 25.3.9.1 Static Segment

For the static segment, if there are several messages pending for transmission, the message with the frame ID corresponding to the next sending slot is selected for transmission.

The data section of transmit buffers assigned to the static segment can be updated until the end of the preceding time slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

### 25.3.9.2 Dynamic Segment

In the dynamic segment, if several messages are pending, the message with the highest priority (lowest frame ID) is selected next. In the dynamic segment different slot counter sequences on channel A and channel B are possible (concurrent sending of different frame IDs on both channels).

The data section of transmit buffers assigned to the dynamic segment can be updated until the end of the preceding slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

The start of latest transmit configured by FLXAnFRMHDC.SLT defines the maximum minislot value allowed before inhibiting new frame transmission in the dynamic segment of the current cycle.

### 25.3.9.3 Transmit Buffers

FlexRay message buffers can be configured as transmit buffers by programming bit CFG in the header section of the respective message buffer to 1 via FLXAnFRWRHS1.

There exist the following possibilities to assign a transmit buffer to the CC channels:

- Static segment: channel A or channel B, channel A and channel B
- Dynamic segment: channel A or channel B

Message buffers 0 and 1 are dedicated to holding the startup frame, the sync frame, or the designated single slot frame as configured by FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM. In this case, it can be reconfigured in DEFAULT_CONFIG or CONFIG state only. This ensures that any node transmits at most one startup/sync frame per communication cycle. Transmission of startup/sync frames from other message buffers is not possible.

All other message buffers configured for transmission in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see Section 25.3.12.1, Reconfiguration of Message Buffers). Due to the organization of the data partition in the Message RAM (reference by data pointer), reconfiguration of the configured payload length and the data pointer in the header section of a message buffer may lead to erroneous configurations.

If a message buffer is reconfigured (header section updated) during runtime, it may happen that this message buffer is not send out in the respective communication cycle.

The CC does not have the capability to calculate the header CRC. The Host is supposed to provide the header CRCs for all transmit buffers. If network management is required, the Host has to set the PPIT bit in the header section of the respective message buffer to 1 and write the network management information to the data section of the message buffer (see Section 25.3.7, Network Management).

The payload length field configures the payload length in 2-byte words. If the configured payload length of a static transmit buffer is shorter than the payload length configured for the static segment by FLXAnFRMHDC.SFDL, the CC generates padding bytes to ensure that frames have proper physical length. The padding pattern is " $0000_{\mathrm{H}}$ ".

## CAUTION

In case of an odd payload length (PLC $=1,3,5, \ldots$ ) the application has to write zero to the last 16 bit of the message buffers data section to ensure that the padding pattern is " $0000_{\mathrm{H}}$ ".

Each transmit buffer provides a transmission mode flag TXM that allows the Host to configure the transmission mode for the transmit buffer. If this bit is set, the transmitter operates in the single-shot mode. If this bit is cleared, the transmitter operates in the continuous mode.

In single-shot mode the CC resets the respective TXR flag to 0 after transmission has completed. Now the Host may update the transmit buffer.
In continuous mode, the CC does not reset the respective transmission request flag TXR to 0 after successful transmission. In this case a frame is sent out each time the filter criteria match. The TXR flag can be reset to 0 by the Host by writing the respective message buffer number to the FLXAnFRIBCR register while bit FLXAnFRIBCM.STXRH is set to 0 .

If two or more transmit buffers meet the filter criteria simultaneously, the transmit buffer with the lowest message buffer number will be transmitted in the respective slot.

### 25.3.9.4 Frame Transmission

The following steps are required to prepare a message buffer for transmission:

- Configure the transmit buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Write the data section of the transmit buffer via FLXAnFRWRDSx
- Transfer the configuration and message data from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR
- If configured in register FLXAnFRIBCM, the transmission request flag TXR for the respective message buffer will be set as soon as the transfer has completed, and the message buffer is ready for transmission.
- Check whether the message buffer has been transmitted by checking the respective TXR bit (TXR $=0$ ) in the FLXAnFRTXRQ1/2/3/4 registers (single-shot mode only).

After transmission has completed, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 register is reset to 0 (singleshot mode), and, if bit MBI in the header section of the message buffer is set to 1 , flag FLXAnFRSIR.TXI is set to 1 . If enabled, an interrupt is generated.

### 25.3.9.5 Null Frame Transmission

If in static segment the Host does not set the transmission request flag to 1 before transmit time, the CC transmits a null frame with the null frame indication bit set to 0 and the payload data set to zero.

In the following cases the CC transmits a null frame:

- If the message buffer with the lowest message buffer number matching the filter criteria does not have its transmission request flag set $(\mathrm{TXR}=0)$ to 1 .
- No transmit buffer configured for the slot has a cycle counter filter that matches the current cycle. In this case, no message buffer status FLXAnFRMBS is updated.

Null frames are not transmitted in the dynamic segment.

### 25.3.10 Receive Process

### 25.3.10.1 Dedicated Receive Buffers

A portion of the FlexRay message buffers can be configured as dedicated receive buffers by programming bit CFG in the header section of the respective message buffer to 0 via FLXAnFRWRHS1.

The following possibilities exist to assign a receive buffer to the CC channels:

- Static segment: channel A or channel B,
channel A and channel B (the CC stores the first semantically valid frame)
- Dynamic segment: channel A or channel B

The CC transfers the payload data of valid received messages from the shift register of the FlexRay channel protocol controller (channel A or B) to the receive buffer with the matching filter configuration. A receive buffer stores all frame elements except the frame CRC.

All message buffers configured for reception in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see Section 25.3.12.1, Reconfiguration of Message Buffers). If a message buffer is reconfigured (header section updated) during runtime it may happen that in the respective communication cycle a received message is lost.

If two or more receive buffers meet the filter criteria simultaneously, the receive buffer with the lowest message buffer number is updated with the received message.

### 25.3.10.2 Frame Reception

The following steps are required to prepare a dedicated message buffer for reception:

- Configure the receive buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Transfer the configuration from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR

Once these steps are performed, the message buffer functions as an active receive buffer and participates in the internal acceptance filtering process which takes place every time the CC receives a message. The first matching receive buffer is updated from the received message.

If a valid payload segment was stored in the data section of a message buffer, the respective ND flag in the
FLXAnFRNDAT1/2/3/4 registers is set to 1 , and, if bit MBI in the header section of that message buffer is set to 1 , flag FLXAnFRSIR.RXI is set to 1 . If enabled, an interrupt is generated.

In case that bit ND was already set to 1 when the Message Handler updates the message buffer, bit FLXAnFRMBS.MLST of the respective message buffer is set to 1 and the unprocessed message data is lost.

If no frame, a null frame, or a corrupted frame was received in a slot, the data section of the message buffer configured for this slot is not updated. In this case only the respective message buffer status FLXAnFRMBS is updated.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 registers is set to 1 , and if bit MBI in the header section of that message buffer is set, flag FLXAnFRSIR.MBSI is set to 1. If enabled an interrupt is generated.

If the payload length of a received frame PLR is longer than the value programmed by PLC in the header section of the respective message buffer, the data field stored in the message buffer is truncated to that length.

To read a receive buffer from the Message RAM via the Output Buffer, proceed as described in Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer.

## CAUTION

The ND and MBC flags are automatically cleared by the Message Handler when the payload data and the header of a received message have been transferred to the Output Buffer, respectively.

### 25.3.10.3 Null Frame Reception

The payload segment of a received null frame is not copied into the matching dedicated receive buffer. If a null frame has been received, only the message buffer status FLXAnFRMBS of the matching message buffer is updated from the received null frame. All bits in header 2 and 3 of the matching message buffer remain unchanged. They are updated from received data frames only.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 register is set to 1 , and if bit MBI in the header section of that message buffer is set to 1 , flag FLXAnFRSIR.MBSI is set to 1 . If enabled, an interrupt is generated.

### 25.3.11 FIFO Function

### 25.3.11.1 Description

A portion of the message buffers can be configured as a cyclic First-In-First-Out (FIFO) buffer. The group of message buffers belonging to the FIFO is contiguous in the register map starting with the message buffer referenced by FLXAnFRMRC.FFB and ending with the message buffer referenced by FLXAnFRMRC.LCB. Up to 127 message buffers can be assigned to the FIFO.

Every valid incoming message not matching with any dedicated receive buffer but passing the programmable FIFO filter is stored into the FIFO. In this case frame ID, payload length, receive cycle count, and the message buffer status FLXAnFRMBS of the addressed FIFO message buffer are overwritten with frame ID, payload length, receive cycle count, and the status from the received frame. Bit FLXAnFRSIR.RFNE shows that the FIFO is not empty, bit FLXAnFRSIR.RFCL is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRSIR.RFCL, bit FLXAnFREIR.RFO shows that a FIFO overrun has been detected. If enabled, interrupts are generated.

If null frames are not rejected by the FIFO rejection filter, the null frames will be treated like data frames when they are stored into the FIFO.

There are two index registers associated with the FIFO. The PUT Index Register (PIDX) is an index to the next available location in the FIFO. When a new message has been received it is written into the message buffer addressed by the PIDX register. The PIDX register is then incremented and addresses the next available message buffer. If the PIDX register is incremented past the highest numbered message buffer of the FIFO, the PIDX register is loaded with the number of the first (lowest numbered) message buffer in the FIFO chain. The GET Index Register (GIDX) is used to address the next message buffer of the FIFO to be read. The GIDX register is incremented after transfer of the contents of a message buffer belonging to the FIFO to the Output Buffer. The PUT Index Register and the GET Index Register are not accessible by the Host.

The FIFO is completely filled when the PUT index (PIDX) reaches the value of the GET index (GIDX). When the next message is written to the FIFO before the oldest message has been read, both PUT index and GET index are incremented and the new message overwrites the oldest message in the FIFO. This will set FIFO overrun flag FLXAnFREIR.RFO to 1.

A FIFO non empty status is detected when the PUT index (PIDX) differs from the GET index (GIDX). In this case flag FLXAnFRSIR.RFNE is set to 1 . This indicates that there is at least one received message in the FIFO. The FIFO empty, FIFO not empty, and the FIFO overrun states are explained in Figure 25.11, FIFO Status: Empty, Not Empty, Overrun for a three message buffer FIFO.

The programmable FlexRay FIFO Rejection Filter (FLXAnFRFRF) defines a filter pattern for messages to be rejected. The FIFO filter consists of channel filter, frame ID filter, and cycle counter filter. If bit FLXAnFRFRF.RSS is set to 1, all messages received in the static segment are rejected by the FIFO. If bit FLXAnFRFRF.RNF is set to 1 , received null frames are not stored in the FIFO.

The FlexRay FIFO Rejection Filter Mask (FLXAnFRFRFM) specifies which bits of the frame ID filter in the FIFO Rejection Filter register are marked "don't care" for rejection filtering.

Figure 25.11 FIFO Status: Empty, Not Empty, Overrun

### 25.3.11.2 Configuration of the FIFO

(Re)configuration of message buffers belonging to the FIFO is only possible when the CC is in DEFAULT_CONFIG or CONFIG state. While the CC is in DEFAULT_CONFIG or CONFIG state, the FIFO function is not available.

For all message buffers belonging to the FIFO the payload length configured should be programmed to the same value via FLXAnFRWRHS2.PLC. The data pointer to the first 32-bit word of the data section of the respective message buffer in the Message RAM has to be configured via FLXAnFRWRHS3.DP.

All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask. The values configured in the header sections of the message buffers belonging to the FIFO are, with exception of DP and PLC, irrelevant.

## CAUTIONS

1. It is recommended to program the MBI bits of the message buffers belonging to the FIFO to 0 via FLXAnFRWRHS1.MBI to avoid generation of interrupts.
2. If the payload length of a received frame is longer than the value programmed by FLXAnFRWRHS2.PLC in the header section of the respective message buffer, the data field stored in a message buffer of the FIFO is truncated to that length.

### 25.3.11.3 Access to the FIFO

## (1) When the Output Buffer is Used:

For FIFO access outside DEFAULT_CONFIG and CONFIG state, the Host has to trigger a transfer from the Message RAM to the Output Buffer by writing the number of the first message buffer of the FIFO (referenced by FLXAnFRMRC.FFB) to the register FLXAnFROBCR. The Message Handler then transfers the message buffer addressed by the GET Index Register (GIDX) to the Output Buffer. After this transfer the GET Index Register (GIDX) is incremented.

## (2) When the Data Transfer Function is Used:

The message received in FIFO can be transferred to the local RAM/global RAM by using the output data transfer function. For the output data transfer function, see Section 25.3.16.2, Output Data Transfer.

### 25.3.12 Message Handling

The Message Handler controls data transfers between the Input/Output Buffer and the Message RAM and between the Message RAM and the two Temporary buffers.

Access to the message buffers stored in the Message RAM is done under control of the Message Handler state machine. This avoids conflicts between accesses of the two FlexRay channel protocol controllers and the Host to the Message RAM.

Frame IDs of message buffers assigned to the static segment have to be in the range from 1 to FLXAnFRGTUC7.NSS. Frame IDs of message buffers assigned to the dynamic segment have to be in the range from FLXAnFRGTUC7.NSS + 1 to 2047.

Received messages with no matching dedicated receive buffer (static or dynamic segment) are stored in the receive FIFO (if configured) if they pass the FIFO rejection filter.

Access of the Host to the message buffer contents using the input or output buffer function is described in this subsection. Access to the message buffer contents using the data transfer function is mentioned in Section 25.3.16, Usage of Data Transfer.

### 25.3.12.1 Reconfiguration of Message Buffers

In case that an application needs to operate with more than 128 different messages, static and dynamic message buffers may be reconfigured during FlexRay operation. This is done by updating the header section of the respective message buffer via Input Buffer registers FLXAnFRWRHS1 to FLXAnFRWRHS3.

Reconfiguration has to be enabled via control bits FLXAnFRMRC.SEC in the Message RAM Configuration register.
If a message buffer has not been transmitted/updated from a received frame before reconfiguration starts, the respective message is lost.

The point in time when a reconfigured message buffer is ready for transmission/reception according to the reconfigured frame ID depends on the actual state of the slot counter when the update of the header section has completed. Therefore it may happen that a reconfigured message buffer is not transmitted/updated from a received frame in the cycle where it was reconfigured.

The Message RAM is scanned according to Table 25.114, Scan of Message RAM below.
Table 25.114 Scan of Message RAM

| Start of Scan in Slot | Scan for Slots |
| :--- | :--- |
| 1 | $2 \ldots 15,1$ (next cycle) |
| 8 | $16 \ldots 23,1$ (next cycle) |
| 16 | $24 \ldots 31,1$ (next cycle) |
| 24 | $32 \ldots 39,1$ (next cycle) |
| $\ldots$ | $\ldots$ |

A Message RAM scan is terminated with the start of NIT regardless whether it has completed or not. The scan of the Message RAM for slots 2 to 15 starts at the beginning of slot 1 of the actual cycle. The scan of the Message RAM for slot 1 is done in the cycle before by checking in parallel to each scan of the Message RAM whether there is a message buffer configured for slot 1 of the next cycle.

The number of the first dynamic message buffer is configured by FLXAnFRMRC.FDB. In case a Message RAM scan starts while the CC is in dynamic segment, the scan starts with the message buffer number configured by FLXAnFRMRC.FDB.

In case a message buffer should be reconfigured to be used in slot 1 of the next cycle, the following has to be considered:

- If the message buffer to be reconfigured for slot 1 is part of the "Static Buffers", it will only be found if it is reconfigured before the last Message RAM scan in the static segment of the actual cycle evaluates this message buffer.
- If the message buffer to be reconfigured for slot 1 is part of the "Static + Dynamic Buffers", it will be found if it is reconfigured before the last Message RAM scan in the actual cycle evaluates this message buffer.
- The start of NIT terminates the Message RAM scan. In case the Message RAM scan has not evaluated the reconfigured message buffer until this point in time, the message buffer will not be considered for the next cycle.

## CAUTION

Reconfiguration of message buffers may lead to the loss of messages and therefore has to be used very carefully. In worst case (reconfiguration in consecutive cycles) it may happen that a message buffer is never transmitted/updated from a received frame.

### 25.3.12.2 Host Access to Message RAM

The message transfer between Input Buffer and Message RAM as well as between Message RAM and Output Buffer is triggered by the Host by writing the number of the target/source message buffer to be accessed to FLXAnFRIBCR or FLXAnFROBCR register.

The FLXAnFRIBCM and FLXAnFROBCM registers can be used to write/read header and data section of the selected message buffer separately.

If bit FLXAnFRIBCM.STXR is set to 1 , the transmission request flag TXR of the selected message buffer is automatically set to 1 after the message buffer has been updated. If bit FLXAnFRIBCM.STXR is reset to 0 , the transmission request flag TXR of the selected message buffer is reset. This can be used to stop transmission from message buffers operated in continuous mode.

Input Buffer (IBF) and Output Buffer (OBF) are configured as a double buffer structure. One half of this double buffer structure is accessible by the Host (IBF Host/OBF Host), while the other half (IBF Shadow/OBF Shadow) is accessed by the Message Handler for data transfers between IBF/OBF and Message RAM.

Figure 25.12 Host Access to Message RAM

## (1) Data Transfer from Input Buffer to Message RAM

To configure/update a message buffer in the Message RAM, the Host has to write the data to FLXAnFRWRDSx and the header to FLXAnFRWRHS1 to FLXAnFRWRHS3. The specific action is selected by configuring the FlexRay Input Buffer Command Mask FLXAnFRIBCM.

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped (see Figure 25.13, Double Buffer Structure Input Buffer).

Figure 25.13 Double Buffer Structure Input Buffer

In addition the bits in the FLXAnFRIBCM and FLXAnFRIBCR registers are also swapped to keep them attached to the respective IBF section (see Figure 25.14, Swapping of FLXAnFRIBCM and FLXAnFRIBCR Bits).

Figure 25.14 Swapping of FLXAnFRIBCM and FLXAnFRIBCR Bits

With this write operation bit FLXAnFRIBCR.IBSYS is set to 1 . The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message to IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, bit FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0 , FLXAnFRIBCR.IBSYS remains set to 1 , and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS and the command mask flags are also swapped.

## Example of 8/16/32-bit Host Access Sequence:

Configure/update n-th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1 to FLXAnFRWRHS3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

Configure/update ( $\mathrm{n}+1$ )th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1 to FLXAnFRWRHS3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

## CAUTION

Any write access to IBF while FLXAnFRIBCR.IBSYH is 1 will set error flag FLXAnFREIR.IIBA to 1 . In this case the write access has no effect.

Table 25.115 Assignment of FLXAnFRIBCM Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 18 | r | STXRS | Set Transmission Request Shadow ongoing or finished |
| 17 | r | LDSS | Load Data Section Shadow ongoing or finished |
| 16 | r | LHSS | Load Header Section Shadow ongoing or finished |
| 2 | r/w | STXRH | Set Transmission Request Host |
| 1 | r/w | LDSH | Load Data Section Host |
| 0 | r/w | LHSH | Load Header Section Host |

Table 25.116 Assignment of FLXAnFRIBCR Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 31 | r | IBSYS | IBF Busy Shadow, signals ongoing transfer from IBF Shadow to Message RAM |
| 22 to 16 | r | IBRS | IBF Request Shadow, number of message buffer from which a message is currently <br> being transferred or was last transferred |
| 15 | r | IBSYH | IBF Busy Host, transfer request pending for message buffer referenced by IBRH |
| 6 to 0 | r/w | IBRH | IBF Request Host, number of message buffer from which a message is to be <br> transferred next |

## (2) Data Transfer from Message RAM to Output Buffer

To read a message buffer from the Message RAM, the Host has to write to register FLXAnFROBCR to trigger the data transfer as configured in FLXAnFROBCM. After the transfer has completed, the Host can read the transferred data from FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS.

Figure 25.15 Double Buffer Structure Output Buffer

OBF Host and OBF Shadow as well as bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS, FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH and bits FLXAnFROBCR.OBRS, FLXAnFROBCR.OBRH are swapped under control of bits FLXAnFROBCR.VIEW and FLXAnFROBCR.REQ.

Writing bit FLXAnFROBCR.REQ to 1 copies bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS and bits FLXAnFROBCR.OBRS to an internal storage (see Figure 25.16, Swapping of FLXAnFROBCM and FLXAnFROBCR Bits).

After setting FLXAnFROBCR.REQ to 1, FLXAnFROBCR.OBSYS is set to 1, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. After the transfer between the Message RAM and OBF Shadow has completed, the FLXAnFROBCR.OBSYS bit is set back to 0. Bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW can only be set to 1 while FLXAnFROBCR.OBSYS is 0 .

Figure 25.16 Swapping of FLXAnFROBCM and FLXAnFROBCR Bits

OBF Host and OBF Shadow are swapped by setting bit FLXAnFROBCR.VIEW to 1 while bit FLXAnFROBCR.OBSYS is 0 (see Figure 25.15, Double Buffer Structure Output Buffer).

In addition bits FLXAnFROBCR.OBRH and bits FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH are swapped with the registers internal storage thus assuring that the message buffer number stored in FLXAnFROBCR.OBRH and the mask configuration stored in FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH matches the transferred data stored in OBF Host (see Figure 25.16, Swapping of FLXAnFROBCM and FLXAnFROBCR Bits).

Now the Host can read the transferred message buffer from OBF Host while the Message Handler may transfer the next message from the Message RAM to OBF Shadow.

If bits REQ and VIEW are set to 1 with the same write access while FLXAnFROBSYS is 0 , FLXAnFROBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host.

When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0 .

## Example of an 8/16/32-bit Host Access to a Single Message Buffer:

If a single message buffer has to be read out, two separate write accesses to FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are necessary:

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS
- Request transfer of message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of and 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).
- Wait until FLXAnFROBCR.OBSYS is reset
- Toggle OBF Shadow and OBF Host by writing FLXAnFROBCR.VIEW = 1
- Read out transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

## Example of an 8/16/32-bit Host Access Sequence:

Request transfer of 1st message buffer to OBF Shadow

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 1st message buffer
- Request transfer of 1st message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of an 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).

Toggle OBF Shadow and OBF Host to read out 1st transferred message buffer and request transfer of 2nd message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 2nd message buffer
- Toggle OBF Shadow and OBF Host and start transfer of 2nd message buffer to OBF Shadow simultaneously by writing FLXAnFROBCR.OBRS of 2nd message buffer, FLXAnFROBCR.REQ, and FLXAnFROBCR.VIEW (in case of and 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW).
- Read out 1st transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Demand access to last requested message buffer without request of another message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Demand access to last transferred message buffer by writing FLXAnFROBCR.VIEW
- Read out last transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Table 25.117 Assignment of FLXAnFROBCM Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 17 | r | RDSH | Data Section available for Host access |
| 16 | r | RHSH | Header Section available for Host access |
| 1 | r/w | RDSS | Read Data Section Shadow |
| 0 | r/w | RHSS | Read Header Section Shadow |

Table 25.118 Assignment of FLXAnFROBCR Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 22 to 16 | r | OBRH | OBF Request Host, number of message buffer available for Host access |
| 15 | r | OBSYS | OBF Busy Shadow, signals ongoing transfer from Message RAM to OBF Shadow |
| 9 | r/w | REQ | Request Transfer from Message RAM to OBF Shadow |
| 8 | r/w | VIEW | View OBF Shadow, swap OBF Shadow and OBF Host |
| 6 to 0 | r/w | OBRS | OBF Request Shadow, number of message buffer from which a message is to be <br> transferred next |

### 25.3.12.3 FlexRay Protocol Controller Access to Message RAM

The two Temporary buffers (TBF A, B) are used to buffer the data for transfer between the two FlexRay Protocol Controllers and the Message RAM.

Each Temporary buffer is build up as a double buffer, able to store two complete FlexRay messages. There is always one buffer assigned to the corresponding Protocol Controller while the other one is accessible by the Message Handler.

If, for example, the Message Handler writes the next message to be sent to Temporary buffer Tx, the FlexRay Channel Protocol Controller can access Temporary buffer Rx to store the message it is actually receiving. During transmission of the message stored in Temporary buffer Tx, the Message Handler transfers the last received message stored in Temporary buffer Rx to the Message RAM (if it passes acceptance filtering) and updates the respective message buffer.

Data transfers between the Temporary buffers and the shift registers of the FlexRay Channel Protocol Controllers are done in words of 32 bit. This enables the use of a 32 bit shift register independent of the length of the FlexRay messages.

Figure 25.17 Access to Temporary Buffers

### 25.3.13 Message RAM

To avoid conflicts between Host access to the Message RAM and FlexRay message reception/transmission, the Host cannot directly access the message buffers in the Message RAM. These accesses are handled via the Input and Output Buffers. The Message RAM is able to store up to 128 message buffers depending on the configured payload length.

The Message RAM is able to store up to 2048 32-bit words. To achieve the required flexibility with respect to different numbers of data bytes per FlexRay frame ( 0 to 254), the Message RAM has a structure as shown in Figure 25.18, Configuration Example of Message Buffers in the Message RAM.
When specifying in the data section of the message buffer allocated immediately after the header partition that the message buffer is a receive buffer (FLXAnFRWRHS1.CFG bit $=0$ ) or a receive FIFO buffer, configure an unused area of at least 32 bits at the start of the data partition. This means that the data partition can start from the message RAM word No. calculated by ((Value set by FLXAnFRMRC.LCB[7:0] bits +1$) \times 4)+1$.

When specifying in the data section of the message buffer allocated immediately after the header partition that the message buffer is a transmit buffer (FLXAnFRWRHS1.CFG bit $=1$ ), the data partition can start from the message RAM word No. calculated by ((Value set by FLXAnFRMRC.LCB[7:0] bits +1$) \times 4$ ).

Figure 25.18 Configuration Example of Message Buffers in the Message RAM

## Header Partition

Stores header sections of the configured message buffers:

- Supports a maximum of 128 message buffers
- Each message buffer has a header section of four 32 bit words
- Header 3 of each message buffer holds the 11-bit data pointer to the respective data section in the data partition

## Data Partition

Flexible storage of data sections with different length. Some maximum values are:

- 30 message buffers with 254 byte data section each
- Or 56 message buffers with 128 byte data section each
- Or 128 message buffers with 48 byte data section each

## CAUTION

Header partition + data partition may not occupy more than 2048 32-bit words.

### 25.3.13.1 Header Partition

The elements used for configuration of a message buffer as well as the actual message buffer status are stored in the header partition of the Message RAM as listed in Table 25.119, Header Section of a Message Buffer in the Message RAM below. Configuration of the header sections of the message buffers is done via IBF (FLXAnFRWRHS1 to FLXAnFRWRHS3). Read access to the header sections is done via OBF (FLXAnFRRDHS1 to FLXAnFRRDHS3 + FLXAnFRMBS). The data pointer has to be calculated by the user to define the starting point of the data section for the respective message buffer in the data partition of the Message RAM. The data pointer should not be modified during runtime. For message buffers belonging to the receive FIFO (re)configuration is possible in DEFAULT_CONFIG or CONFIG state only.

The header section of each message buffer occupies four 32-bit words in the header partition of the Message RAM. The header of message buffer 0 starts with the first word in the Message RAM.

For transmit buffers the Header CRC has to be calculated by the Host.
Payload Length Received PLR, Receive Cycle Count RCC, Received on Channel Indicator RCI, Startup Frame Indicator SFI, Sync Frame Indicator SYN, Null Frame Indicator NFI, Payload Preamble Indicator PPI, and Reserved Bit RES are updated from received valid data frames only.

Table 25.119 Header Section of a Message Buffer in the Message RAM

| Bit Word | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 |  |  | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Message Buffer Status (MBS) |  |
| $\square$ | unused |

## (1) Header Section 1 (Word 0)

Write access via FLXAnFRWRHS1, read access via FLXAnFRRDHS1:

- Frame ID
- Slot counter filtering configuration
- Cycle Code
- Cycle counter filtering configuration
- CH
- Channel filtering configuration
- CFG
- Message buffer direction configuration: receive/transmit
- PPIT
- Payload Preamble Indicator Transmit
- TXM
- Transmit mode configuration: single-shot/continuous
- MBI
- Message buffer receive/transmit interrupt enable
(2) Header Section 2 (Word 1)

Write access via FLXAnFRWRHS2, read access via FLXAnFRRDHS2:

- Header CRC
- Transmit Buffer: Configured by the Host (calculated from frame header)
- Receive Buffer: Updated from received frame
- Payload Length Configured
- Length of data section (2-byte words) as configured by the Host
- Payload Length Received
- Length of payload segment (2-byte words) stored from received frame

## (3) Header Section 3 (Word 2)

Write access via FLXAnFRWRHS3, read access via FLXAnFRRDHS3:

- Data Pointer
- Pointer to the beginning of the corresponding data section in the data partition

Read access via FLXAnFRRDHS3, valid for receive buffers only, updated from received frames:

- Receive Cycle Count
- Cycle count from received frame
- RCI
- Received on Channel Indicator
- SFI
- Startup Frame Indicator
- SYN
- Sync Frame Indicator
- NFI
- Null Frame Indicator
- PPI
- Payload Preamble Indicator
- RES
- Reserved bit

## (4) Message Buffer Status FLXAnFRMBS (Word 3)

Read access via FLXAnFRMBS, updated by the CC at the end of the configured slot.

- VFRA
- Valid Frame Received on channel A

## - VFRB

- Valid Frame Received on channel B
- SEOA
- Syntax Error Observed on channel A
- SEOB
- Syntax Error Observed on channel B
- CEOA
- Content Error Observed on channel A

## - CEOB

- Content Error Observed on channel B

## - SVOA

- Slot boundary Violation Observed on channel A
- SVOB
- Slot boundary Violation Observed on channel B
- TCIA
- Transmission Conflict Indication channel A
- TCIB
- Transmission Conflict Indication channel B
- ESA
- Empty Slot Channel A
- ESB
- Empty Slot Channel B
- MLST
- Message Lost
- FTA
- Frame Transmitted on Channel A
- FTB
- Frame Transmitted on Channel B
- Cycle Count Status
- Actual cycle count when status was updated
- RCIS
- Received on Channel Indicator Status
- SFIS
- Startup Frame Indicator Status
- SYNS
- Sync Frame Indicator Status
- NFIS
- Null Frame Indicator Status
- PPIS
- Payload Preamble Indicator Status

## - RESS

- Reserved bit Status

### 25.3.13.2 Data Partition

The data partition of the Message RAM stores the data sections of the message buffers configured for reception/transmission as defined in the header partition. The number of data bytes for each message buffer can vary from 0 to 254. To optimize the data transfer between the shift registers of the two FlexRay Protocol Controllers and the Message RAM as well as between the Host interface and the Message RAM, the physical width of the Message RAM is set to 4 bytes.

The data partition starts after the last word of the header partition. When configuring the message buffers in the Message RAM the user has to confirm that the data pointers point to addresses within the data partition.
Table 25.120, Example for Structure of the Data Partition in the Message RAM below shows an example how the data sections of the configured message buffers can be stored in the data partition of the Message RAM.

The beginning and the end of a message buffer's data section is determined by the data pointer and the payload length configured in the message buffer's header section, respectively. This enables a flexible usage of the available RAM space for storage of message buffers with different data length.

If the size of the data section is an odd number of 2-byte words, the remaining 16 bits in the last 32-bit word are unused (see Table 25.120, Example for Structure of the Data Partition in the Message RAM below).

Table 25.120 Example for Structure of the Data Partition in the Message RAM

| Bit Word | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 25.3.13.3 Message Data Integrity Check

There is a data integrity checking mechanism implemented in the FlexRay core to ensure the integrity of the data stored in the related RAM. Each RAM has a checksum generator/checker attached as shown in Figure 25.19, Checksum Generation and Check.

When data is written to a RAM, the local checksum generator generates the checksum. The checksum is stored together with the respective data word. The checksum is checked each time a data word is read from a RAM.

If a checksum error is detected, the respective access error flag is set. The access error flags FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, FLXAnFRMHDS.ATBF2 and the faulty message buffer indicators
FLXAnFRMHDS.FMBD, FLXAnFRMHDS.MFMB, FLXAnFRMHDS.FMB are located in the FlexRay Message Handler Status register. These single access error flags control the error interrupt flag FLXAnFREIR.AERR.

Figure 25.19, Checksum Generation and Check shows the data paths between the Input Buffer, Temporary Buffer and Message RAM.

Figure 25.19 Checksum Generation and Check

When an access error has been detected the following actions will be performed:

## In all cases:

- The respective access error flag in FLXAnFRMHDS register is set
- The access error flag FLXAnFREIR.AERR is set and, if enabled, a module interrupt to the Host will be generated.

## Additionally in specific cases:

(1) Access Error during Data Transfer from Input Buffer 1, 2 to Message RAM When Reading Header Section of Respective Message Buffer from Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.
- Transmit buffer: Transmission request for the respective message buffer is not set.

## (2) Access Error during Scan of Header Sections in Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Ignore message buffer (message buffer is skipped).

## (3) Access Error during Data Transfer from Message RAM to Temporary Buffer 1, 2:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Frame not transmitted, frames already in transmission are invalidated by setting the frame CRC to zero.
(4) Access Error during Data Transfer from Temporary Buffer 1, 2 to Message RAM When Reading Header Section of Respective Message Buffer from Message RAM:
- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.

## (5) Access Error during Data Transfer from Message RAM to Output Buffer:

- The access error flag FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

## (6) Access Error during a Data Transfer from Temporary Buffer 1, 2 to Protocol Controller 1, 2:

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- Frames already in transmission are invalidated by setting the frame CRC to zero.

## (7) Access Error during Data Transfer from Temporary Buffer 1, 2 to Message RAM When Reading Temporary Buffer RAM 1, 2:

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

## (8) Access Error during Data Read of Temporary Buffer RAM 1, 2:

- When an access error occurs while the Message Handler read a frame with network management information (PPI = 1) from the Temporary Buffer RAM 1, 2, the corresponding network management vector registers FLXAnFRNMV1 to 3 are not updated from this frame.

### 25.3.13.4 Host Handling of Access Errors

Access error caused by temporary bit flips can be fixed by:
(1) Self-Healing

Access errors located in the Data Section of Message RAM, Temporary Buffer RAM A or Temporary Buffer RAM B are overwritten with the next write access to the disturbed bit(s) caused by Host access or by FlexRay communication.

## (2) CLEAR_RAMS Command

The POC command CLEAR_RAMS initializes the message RAM to zero, when called in the DEFAULT_CONFIG or CONFIG state.

## (3) Temporary Unlocking of Header Section

An access error in the header section of a locked message buffer can be fixed by a transfer from the Input Buffer to the locked buffer Header Section. For this transfer, the write access to the FLXAnFRIBCR (specifying the message buffer number) must be immediately preceded by the unlock sequence normally used to leave CONFIG state (see Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register).

For that single transfer the respective message buffer header is unlocked, regardless whether it belongs to the FIFO or whether its locking is controlled by FLXAnFRMRC.SEC, and will be updated with new data.

### 25.3.14 Module Interrupt

In general, interrupts provide a close link to the protocol timing as they are triggered almost immediately when an error or status change is detected by the CC, a frame is received or transmitted, a configured timer interrupt is activated, or a stop watch event occurred. This enables the Host to react very quickly on specific error conditions, status changes, or timer events. On the other hand too many interrupts can cause the Host to miss deadlines required for the application. Therefore the CC supports enable/disable controls for each individual interrupt source separately.

An interrupt request may be triggered when

- An error was detected
- A status flag is set to 1
- A timer reaches a preconfigured value
- A message transfer from Input Buffer to Message RAM or from Message RAM to Output Buffer has completed
- A message transfer from the local RAM/global RAM to Message RAM or from Message RAM to local RAM/global RAM has completed
- A stop watch event occurred

Tracking status and generating interrupts when a status change or an error occurs are two independent tasks. Regardless of whether an interrupt is enabled or not, the corresponding status is tracked and indicated by the CC. The Host has access to the actual status and error information by reading registers FLXAnFREIR, FLXAnFRSIR, FLXAnFROS, FLXAnFROTS and FLXAnFRITS.

The general purpose interrupt lines to the Host, FlexRay Interrupt 0, FlexRay Interrupt 1, are controlled by the enabled interrupts in FLXAnFREIES and FLXAnFRSIES. In addition each of the two interrupt lines can be enabled/disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

The input data transfer interrupt lines to the Host, FlexRay input queue empty interrupt, FlexRay input queue full interrupt, are controlled by the enabled interrupts in FLXAnFRITS. In addition each of the input data transfer interrupts can be enabled/disabled separately by programming the related bits in FLXAnFRITC.

The output data transfer interrupt lines to the Host, FlexRay FIFO transfer warning interrupt, FlexRay output transfer warning interrupt, FlexRay FIFO transfer interrupt, FlexRay output transfer interrupt, are controlled by the enabled interrupts in FLXAnFROTS. In addition each of the output data transfer interrupts can be enabled/disabled separately by programming the related bits in FLXAnFROTC.

The three timer interrupts lines to the Host are controlled by the enabled interrupts in FLXAnFROS. In addition each of the interrupt lines can be enabled/disabled separately by programming bit FLXAnFROC.T0IE, FLXAnFROC.T1IE and FLXAnFROC.T2IE.

When a transfer between IBF/OBF and the Message RAM has completed bit FLXAnFRSIR.TIBC or FLXAnFRSIR.TOBC is set to 1 .

A stop watch event may be triggered via input pin FLXAnSTPWT.

### 25.3.15 Assignment of FlexRay Configuration Parameters

Table 25.121 FlexRay Configuration Parameters

| Parameter | Bit (Field) |
| :---: | :---: |
| pKeySlotusedForStartup | FLXAnFRSUCC1.TXST |
| pKeySlotUsedForSync | FLXAnFRSUCC1.TXSY |
| gColdStartAttempts | FLXAnFRSUCC1.CSA |
| pAllowPassiveToActive | FLXAnFRSUCC1.PTA |
| pWakeupChannel | FLXAnFRSUCC1.WUCS |

### 25.3.16 Usage of Data Transfer

A mechanism is implemented to allow storage of FlexRay messages directly into the local RAM/global RAM (user RAM) and have transfers between the FlexRay internal message RAM and the local RAM/global RAM and vice versa with minimum CPU support. The data in the local RAM/global RAM should be indexed by data structure pointers located in data pointer tables stored in the local RAM/global RAM.

Data transfer from the local RAM/global RAM to the FlexRay internal message RAM (input transfer) needs to be initiated by the application. These transfers can be used to configure message buffers or to update transmit data.

A data transfer from the FlexRay internal message RAM to the local RAM/global RAM (output transfer) is initiated automatically by a reception into a receive message buffer or FlexRay internal FIFO or by a change in the slot status. It can be initiated also by a specific user transfer request.

The input and output data transfer can be activated independently. When the input data transfer is activated the application should not directly access message buffers using the FlexRay input buffer. When the output data transfer is activated the application should not directly access message buffers using the FlexRay output buffer.

### 25.3.16.1 Input Data Transfer

When the automatic input data transfer function is enabled, committed input data structures are transferred from the local RAM/global RAM to the FlexRay internal message RAM with minimum CPU support.

## (1) Activation and Deactivation

The input data transfer function should be activated before usage. The activation of the input transfer handler initializes the input queue put index (FLXAnFRITS.IPIDX) and get index (FLXAnFRITS.IGIDX) to 0 . Also the interrupt status flags in the FLXAnFRITS register (IQEIS and IQFIS) are set to 0 .

Figure 25.20 Input Transfer Enable Flow

A deactivation request of the input transfer function can be made at any time. The input queue put index and the input queue status are maintained independently from the input transfer function state.

Before the transfer function gets disabled (status indicated by FLXAnFRITS.ITS), user requested input transfers and all committed input transfers will be completed.

Figure 25.21 Input Transfer Disable Flow

## (2) Input Data Structure

The application has to reserve a location in the local RAM/global RAM to provide the content for message buffer configuration (input data structure).

The location of this input data structure needs to be defined by an input data structure pointer also located in the local RAM/global RAM.

Figure 25.22 Input Data Structure

In general the input data structure consists of two sections, the header and the data section.
The header section consists of FLXAnFRWRHS1, FLXAnFRWRHS2, FLXAnFRWRHS3 and the data section pointer.
For bit alignment and bit function in the header section, see Section 25.3.13.1, Header Partition.
Depending on the settings in the control field (FLXAnFRWRHS4) located in the input pointer table, the data structure pointer is a reference to the address of FLXAnFRWRHS1 or FLXAnFRWRDS1. The data structure pointer has to be aligned to a 32 bit address.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid header section. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 0 a header section is not required. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid data section. The pointer to the data section is a reference to the address of the first payload long word (FLXAnFRWRDS1) and has to be aligned to a 32 bit address.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 0 a data section is not required. The data section pointer is not evaluated by the input handler.

The byte order for the FlexRay payload data in the input data structure is determined by FLXAnFROC.BEC. For information about the payload data alignment within the data section refer to Section 25.3.13.2, Data Partition and

## Section 25.3.17, Byte Alignment.

The length of the data section and the size to be allocated in the local RAM/global RAM depends on the configuration of the bits DSL in the address related to FLXAnFRWRHS4.

For the transfer into the FlexRay core internal message RAM the number of 16 bit words configured by FLXAnFRWRHS2.PLC is used. The application has to ensure, that a proper number of data words is provided in the local RAM/global RAM. In case the buffer is configured by FLXAnFRWRHS2.PLC to hold an odd payload length, the application has to write zero to the last 16 bit of the payload section to ensure that the padding data is all zero.

## (3) Input Pointer Table

To transfer data from the input data structures located in the local RAM/global RAM to the FlexRay internal message RAM the related input data structure pointer and control field needs to be added to the input pointer table which is located in the local RAM/global RAM.

The location of the first element of this table is identified by the input pointer table base address (FLXAnFRIBA.ITA). This base address has to be aligned to a 32 bit address.

The maximum number of input requests that can be queued is defined by the Input queue Table Max register (FLXAnFRITC.ITM).

Each Input pointer table entry requires two long words. The required address range of the input pointer table for the queued transfer requests can be calculated by

Input pointer table size $($ byte $)=((($ FLXAnFRITC.ITM +1$) \times 2) \times 4)$

## Equation 1

The input pointer entry for the user requested input transfer should be added after the end of the input pointer table.
The pointer table index related to this entry and hence the number to be written to FLXAnFRUIR.UIDX, is FLXAnFRITC.ITM +1 . The address in the input pointer table related to the user requested input transfer (user input address) can be calculated by

User input address $=$ FLXAnFRIBA.ITA + Input pointer table size

## Equation 2

Figure 25.23 Input Pointer Table

The input pointer table holds the control field FLXAnFRWRHS4 and the pointers to the local RAM/global RAM location where the message buffer content (header section and/or data section) is stored.

The application has to write FLXAnFRWRHS4 and the input data structure pointer at the addresses in the input pointer table related to the put index position before a transfer request is initiated.

## FLXAnFRWRHS4:

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | INV | STR | LDS | LHS | - |  |  |  | NR |  |  |  |

Table 25.122 FLXAnFRWRHS4 Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 22 | Reserved | When read, an undefined value is read. When writing, always write 0. |
| 21 to 16 | DSL[5:0] | Data Section Length Bit <br> Specifies the length of the data section in terms of 32 bit values. |
| 15 to 12 | Reserved | When read, an undefined value is read. When writing, always write 0. |
| 11 | INV | Invalidate entry Bit |
|  |  | 0: The data structure is valid and will be transferred to the FlexRay internal message RAM. |
|  |  | 1: The data structure is invalid. FlexRay internal message RAM is not updated using this |
| input pointer entry. |  |  |

Note that the LHS bit should not be set for protected message buffers.
The bit LDS defines if the data section of the message buffer selected by the bits IMBNR should be updated.
If LDS is set to $1($ DSL +1$) 32$ bit words of payload data are transferred from the local RAM/global RAM to the message buffer selected by the bits IMBNR.
If LDS is set to 0 no payload data is transferred from the local RAM/global RAM.
Note that the payload transferred is independent from the configured payload length (bits PLC in the address related to FLXAnFRWRHS2).
The bit INV can be used to invalidate a committed data structure. This bit should be only used to cancel the transfer of committed data structures when the input queue is halted (see Section 25.3.16.2(5), Transfer Function of Dedicated Message Buffers).
When this bit is set to 1 the message buffer number IMBNR is not updated. When the bit is set to 0 the message buffer number IMBNR is updated.

## (4) Transfer Function of Input Data Structure

To use the input data structure transfer function the input transfer has to be activated (see Section 25.3.16.1(1), Activation and Deactivation). The activation process requires the setup of the input pointer table (see Section 25.3.16.1(3), Input Pointer Table) in order to specify the source location (input data structures) for the data structures to be transferred. When the input transfer gets enabled the get index pointer is initialized to zero.

All FlexRay internal message buffers can be updated using the input transfer queue which is built in the input pointer table. The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. For that purpose the application has to maintain a put index for the input pointer table that indicates where the pointer has to be written to.

To commit this table entry to the input handler, the application has to write the target message buffer number to the input queue control register (FLXAnFRIQC.IMBNR). Afterwards the application has to increment the application internal put index.

By writing to the input queue control register the data available flag (FLXAnFRDAi.DA[IMBNR]) is automatically set to 1 . The input transfer handler also maintains the put index pointer in the status register (FLXAnFRITS.IPIDX).

In case the input queue gets full (number of queued input transfer requests is equal to the input queue table size)
FLXAnFRITS.IQFP and FLXAnFRITS.IQFIS are set to 1 . The input queue full condition pending flag
(FLXAnFRITS.IQFP) changes from 1 to 0 when there are entries in the input queue available, whereby the input queue full interrupt status flag (FLXAnFRITS.IQFIS) needs to be cleared by the application.

The application cannot make any further write access to the bit IMBNR in the FLXAnFRIQC register as long as the bit IQFP in the FLXAnFRITS register is 1.

In case the input queue gets empty (number of queued input transfer requests changes to zero) FLXAnFRITS.IQEIS is set to 1 . The input queue empty interrupt status flag (FLXAnFRITS.IQEIS) needs to be cleared by the application.

The transfer of the input data structures to the FlexRay message RAM is controlled by a get index pointer which is handled inside the FlexRay module and flagged in FLXAnFRITS.IGIDX. Note that the index is referring to the input entry and not the address offset in the input pointer table.

If the input queue is not empty, the transfer handler reads out the input pointer table entry of the transfer queue and starts the transfer of the input data structure from the address the input pointer is referring to. When all required data words are transferred to the FlexRay module, the data available flag for the transferred message buffer number is set to 0 and the get index in the transfer handler is incremented by one.

In case of an invalidated data structure (see Section 25.3.16.1(5), Halting the Input Queue) no FlexRay internal message buffer is updated and the related data available flag is automatically set to 0 . The change of the data available flag can be used to confirm the cancellation a transmit request.

Figure 25.24 Input Pointer Table

Receive message buffers can be also configured using the input data transfer by setting up the required header sections and mark only the header section (FLXAnFRWRHS4.LDS $=0$, FLXAnFRWRHS4.LHS $=1$ ) to be updated in the FlexRay module.

## (5) Halting the Input Queue

Committed data structures cannot be removed, but can be invalidated or updated when the input queue is halted.
To cancel data structures already committed to the input queue, the queue can be halted by writing a 1 to FLXAnFRITC.IQHR.

After the ongoing input transfer has been completed the queue is halted and FLXAnFRITS.IQH changes from 0 to 1 .
To invalidate an entry of the input queue FLXAnFRWRHS4.INV has to be set to 1. All other bits in FWRHS4 should be unchanged.

Following flow shall be used to analyze whether a committed message has been already transferred to the FlexRay internal message RAM or not.

Figure 25.25 Input Table Analysis

In case the message buffer was already transferred to the FlexRay internal message RAM, the user input transfer request can be used to bypass the actual queue and update the required message buffer (see Section 25.3.16.1(6), Transfer Function of User Requested Input Transfers).

## (6) Transfer Function of User Requested Input Transfers

To use this function the input transfer has to be activated (see Section 25.3.16.1(1), Activation and Deactivation).

The application is capable, by using FLXAnFRUIR.UIDX, to request a transfer of an input data structure. The user input transfer request is serviced first.

The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. The table entry for the user input transfer request should be added after the end of the input pointer table (see Section 25.3.16.1(3), Input Pointer Table).

To commit this table entry to the input handler, the application has to write the index (FLXAnFRITC.ITM +1 ) to the user input transfer request register (FLXAnFRUIR.UIDX).

By writing to the user input transfer request register, the user input transfer request pending flag (FLXAnFRITS.UIRP) is automatically set to 1 .

As long this flag is 1 the application should not make any further user input transfer requests.
The user input transfer request pending flag (FLXAnFRITS.UIRP) changes from 1 to 0 when the requested input transfer is completed. As next the pending transfers are processed.

### 25.3.16.2 Output Data Transfer

When the output data transfer function is enabled, received messages (either in dedicated message buffers or in the FlexRay receive FIFO) are transferred to the local RAM/global RAM by the output data handler. The output data handler can also transfer the message buffer content to the local RAM/global RAM on application request. When enabled the output handler is also capable to initiate a transfer when the message buffer status has changed.

## (1) Activation and Deactivation

The output data transfer function should be activated before usage. The activation of the output transfer hander will initialize the FIFO put and get index pointer and FIFO fill level (FLXAnFROTS.FGIDX and FLXAnFROTS.FFL) to zero, set the bits FLXAnFROTS.FDA, FLXAnFROTS.OWP, FLXAnFROTS.FWP and FLXAnFROTS.UORP to 0. Also the interrupt status flags (FLXAnFROTS.OTIS, FLXAnFROTS.FIS, FLXAnFROTS.OWIS and FLXAnFROTS.FWIS) are set to 0 .

The activation has no influence to the data available flags (FLXAnFRDAi.DA) which are related to the dedicated buffers; these flags have to be cleared by the application.

Figure 25.26 Output Transfer Enable Flow

A deactivation request of the output data transfer function can be made at any time. An ongoing transfer will be completed and the completion of this transfer will be flagged. During this time FLXAnFROTS.OTS remains 1.

When FLXAnFROTS.OTS changes from 1 to 0 , the output transfer function is deactivated. The data available status flags and the FIFO get index are still maintained when the output transfer function is disabled.

Figure 25.27 Output Transfer Disable Flow

## (2) Output Transfer Data Structure

The data in the local RAM/global RAM is stored in an output data structure. The location of the output data structures are determined by output data structure pointers also located in the local RAM/global RAM. The output data structure and indexing is visualized in Figure 25.28, Output Data Structure.

Figure 25.28 Output Data Structure

The output data structure consists of two sections, the header and data section. The header section consists of FLXAnFRRDHS1, FLXAnFRRDHS2, FLXAnFRRDHS3, FLXAnFRMBS and the data section pointer.
FLXAnFRRDHS1 is the first element of the structure and has to be aligned to a 32 bit address. The data structure pointer is a reference to the address of FLXAnFRRDHS1. For information about the bit alignment and bit function within the header section refer to Section 25.3.13.1, Header Partition.

FLXAnFRRDDS1 is the first element of the data section. The data section pointer is a reference to the address of FLXAnFRRDDS1 and has to be aligned to a 32 bit address. The byte order for the FlexRay payload data in the output data structure is determined by the bit BEC in the FLXAnFROC register. For information about the payload data alignment within the data section refer to Section 25.3.13.2, Data Partition.

The length of the data section as well as the total structure size to be allocated in the local RAM/global RAM depends on the configured payload length (FLXAnFRRDHS2.PLC) of the related message buffer. In case the configured payload length is an odd number of words or the received payload length (FLXAnFRRDHS2.PLR) is smaller than the configured payload length, the remaining data words in the local RAM/global RAM are unused and cannot be used by the application.

The output data structure is identical for all three kinds of output transfers. In case only the header section is transferred the data section pointer is not evaluated by the output handler and the data section remains unchanged.

## (3) Output Pointer Table

For the output data transfer function the application needs to set up an output pointer table in the local RAM/global RAM. The location of the first element of this table should be programmed into the output pointer table base address (FLXAnFROBA.OTA). This base address has to be aligned to a 32 bit address.

The size of the output pointer table is defined by the maximum of: the last configured dedicated message buffer and the highest message buffer number which will be used for the user output transfer request.

The output pointer table holds pointers (output data structure pointers) to the local RAM/global RAM location where a memory space is reserved for the target message buffer content (header section and data section).

There is a fixed linear relationship between the address of the entries in the output pointer table and the number of the related message buffers (see Figure 25.29, Output Data Structure and Indexing): the output pointer table starts with the entry for message buffer number 0 at the address configured in FLXAnFROBA.OTA and continues in ascending order for each following message buffer number, by 32 bit aligned address (e.g. message buffer 1 at address OTA +4 , message buffer 2 at address OTA +8 , etc.) for all possible message buffers.

When a set ND bit is the only transfer condition (FLXAnFROTC.OTCS is set to 0 ) only message buffers configured as a dedicated receive buffer or that will be used for user output transfer requests need have valid pointer entries.

When a set ND bit or a set MBC bit is the transfer condition (FLXAnFROTC.OTCS is set to 1 ) all dedicated receive buffer and dedicated transmit buffers need to have valid pointer entries.

## (4) FIFO Output Pointer Table

The FlexRay module internal FIFO can be extended by a queued buffer structure in the local RAM/global RAM.
If the FlexRay module internal FIFO is used the application needs to setup the FIFO output pointer table. The location of the first element of this table is identified by the FIFO pointer table base address (FLXAnFRFBA.FTA). This base address has to be aligned to a 32 bit address.

The size of the FIFO pointer table and hence the maximum number of messages that can be added to the queue, is defined by FIFO Table Max (FLXAnFROTC.FTM).

The FIFO pointer table holds pointers (output data structure pointers) to the local RAM/global RAM location where a memory space is reserved the target message buffer content (header section and data section). For each table entry a data pointer shall be configured in this table.

## (5) Transfer Function of Dedicated Message Buffers

To use this transfer function the output transfer has to be activated (see Section 25.3.16.2(1), Activation and Deactivation). The activation process requires to setup the output pointer table (see Section 25.3.16.2(3), Output Pointer Table) in order to specify the destination location (output data structures) for the data to transfer.
Figure 25.29, Output Data Structure and Indexing shows how the output pointer table references the output data structures.

Figure 25.29 Output Data Structure and Indexing

With FLXAnFROTC.OTCS the output transfer condition can be selected between the "New data only mode" and the "New data and status changed mode".

In the "New data only mode" an output data transfer is initiated when a valid FlexRay data frame has been stored into a dedicated receive buffer which causes the related ND flag in the FLXAnFRNDATi register to set. The ND flag in the FLXAnFRNDATi register is automatically set to 0 during the transfer procedure. The header section is also transferred and hence the MBC flag in the FLXAnFRMBSCi register is set to 0 .

In the "New data and status changed mode" an output data transfer is initiated as described in the "New data only mode". In addition an output data transfer is initiated when only the message buffer status has been changed which causes the related MBC flag in the FLXAnFRMBSCi register to be set. In this case only the header section is transferred. The MBC flag in the FLXAnFRMBSCi register is automatically set to 0 during the transfer procedure.

After transferring the message buffer data from the FlexRay internal message RAM to the output data structure the corresponding data available flag in the FLXAnFRDAi ( $\mathrm{i}=0$ to 3 ) registers is set to 1 . The update of the output data structure is also flagged by the setting of the output transfer interrupt status flag (FLXAnFROTS.OTIS).

As long as the data available flag remains 1 the corresponding output data structure will not be updated. In the case

- the data available flag is 1 and a valid received message was stored or
- when FLXAnFROTC.OTCS is 1 and the message buffer status was updated,
the output transfer warning interrupt flag (FLXAnFROTS.OWIS) is set to 1 notifying the application that new data is available but the output data structure transfer cannot be processed. In addition FLXAnFROTS.OWP is set to 1 that continuously flags that status of the output transfer warning condition.
If a valid receive message in the FlexRay internal message RAM is overwritten by an additional receive message, the message lost flag (FLXAnFRMBS.MLST) is set to 1. This flag can be evaluated after the message buffer has been transferred into an output data structure.

Following sections are giving a guidance how output data structures can be handled.

## (a) Data Section Copy Method

One option is to copy the information from the output data structure to a different location of the local RAM/global RAM and then release the output data structure by clearing the related data available flag. The application should use the copied information for further processing.

## (b) Data Structure Pointer Method

A different option is to modify the output data structure pointer in the output pointer table and to release the output data structure by clearing the related data available flag. The changed output data pointer should refer to a free data structure. The application should use the old data structure for further processing.

## (c) Data Section Pointer Method

A third option is to modify the data section pointer in the output data structure and to release the output data structure by clearing the related data available flag. The changed data section pointer should refer to a free memory area. The application should use the old data section for further processing by forwarding the data section pointer.

## (6) Transfer Function of FIFO Message Buffers

To use this buffer transfer function the output transfer has to be activated (see Section 25.3.16.2(1), Activation and Deactivation). The activation process requires the set up of the FIFO pointer table (see Section 25.3.16.2(4), FIFO Output Pointer Table) in order to specify a location in the local RAM/global RAM reserved for the storage of the required output data structures.

A FIFO data transfer is initiated when a valid FlexRay data frame has been stored in the FlexRay internal FIFO.
After transfers from the internal FIFO to the output data structure, the FIFO interrupt status flag (FLXAnFROTS.FIS) and FLXAnFROTS.FDA are set to 1 . The bit FLXAnFROTS.FIS can be used as an interrupt source. The bit FLXAnFROTS.FDA indicates that the FIFO is not empty.

Up to FLXAnFROTS.FTM output structures configured in the FLXAnFROTC register can be queued.
The transfer to the extended FIFO buffer structure is controlled by index pointers. This put index is controlled by the FIFO transfer handler and is incremented after transferring a message to the output data structure.

The FIFO reception handler also maintains a get index which is flagged in FLXAnFROTS.FGIDX. The value of this get index is known by the application by either reading the status or maintaining a software variable. The get index (the value after a reset is zero) is incremented by one when the application releases the oldest entry of the FIFO queue by writing 1 to FLXAnFROTS.FDA. By comparing the put index and the get index the FIFO handler knows about the current fill level of the queued buffer structure.

The current FIFO fill level is flagged in FLXAnFROTS.FFL. When FLXAnFROTS.FDA is 1, there is at least one entry in the FIFO queue.

In case the queued buffer structure in the local RAM/global RAM is full (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1), no further transfers are initialized, new messages remain in the FlexRay internal FIFO and the FIFO transfer warning interrupt status flag (FLXAnFROTS.FWIS) is set to 1 .

In case the FlexRay internal FIFO structure becomes full, messages in the FlexRay internal FIFO structure may get overwritten. The related status flags and configuration registers of the FlexRay core module can be used to generate desired warning notifications.

Figure 25.30 FIFO Pointer Table

## (7) Transfer Function of User Output Transfer Requests

To use this transfer function the output transfer has to be activated (see Section 25.3.16.2(1), Activation and Deactivation). The activation process requires to setup the output pointer table (see Section 25.3.16.2(3), Output Pointer Table) in order to specify the location in the local RAM/global RAM reserved for the transfer of the data (output data structures).

The application is capable, by using FLXAnFRUOR.UMBNR, to request a transfer of dedicated message buffer to an output data structure. Except in CONFIG state, message buffers which are part of the FlexRay internal FIFO should not be requested.

The header section is always transferred to the output data structure. The transfer of the data section can be enabled by setting FLXAnFRUOR.URDS to 1 . The selected message buffer content is stored in the output data structure location determined by the pointers in the output pointer table.

The data available status and transfer blocking by the DA bits in the FLXAnFRDAi register is also used for the user requested transfers. Therefore the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) should be released before making the transfer request.

After writing to FLXAnFRUOR.UMBNR, the bit FLXAnFROTS.UORP is set to 1 to indicate that there is a pending user transfer request. When the transfer has been processed the bit FLXAnFROTS.UORP is set to 0 , the bit FLXAnFROTS.OTIS is set to 1 and the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) is set to 1.

User output transfer requests cannot be queued. The application should check the bit FLXAnFROTS.UORP before writing to FLXAnFRUOR.UMBNR.

User output transfer requests should not be made for message buffers which are pending in the input transfer queue.

Figure 25.31 User Output Transfer Request Flow

Note that it may be possible that the data structure addressed by a user request is being updated due to a receive message buffer update (which causes the bit DA in the FLXAnFRDAi register being set).

This set DA flags inhibits the user output transfer request. Therefore polling FLXAnFROTS.UORP is not a secure method to identify when the transfer of a requested message buffer has been completed. The bits FLXAnFROTS.OTIS or the DA bit in the FLXAnFRDAi register can be used instead. The exact flow depends on the software architecture.

### 25.3.16.3 Data Structure Transfer Scheduling

Cyclically the different types of transfer requests are checked. In order to guarantee a certain transfer time the different types of transfers have different priorities.

Use requested input transfers have highest priority followed by the transfer of data structures committed into the active input transfer queue. No new output transfer will be started as long as there is a pending input transfer request.

The three output transfer request types are checked in a specific order:

## (1) All Dedicated Message Buffers in Ascending Order

When FLXAnFROTC.OTCS is set to 0 , set flags in the FLXAnFRNDATi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

When FLXAnFROTC.OTCS is set to 1 , set flags in the FLXAnFRNDATi register or set flags in the FLXAnFRMBSCi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0 ).

## (2) FlexRay Internal FIFO

When the FlexRay internal FIFO is not empty and there is a free destination area, one FIFO message is transferred into the output data structure addressed by the FIFO pointer table.

## (3) User Output Request

If there is a pending user output transfer request, one message buffer is transferred into the corresponding output data structure.

The check sequence is suspended when an input transfer occurs.

### 25.3.16.4 Behavior in Case of Data Transfer Access Error

The memory areas accessed by the data transfer function may be protected by a memory protection unit (MPU). When the MPU flags an access to a protected address caused by an input or output transfer, an access error event is generated and the related bit in the FLXAnFRAES register is set.

The ongoing transfer is immediately terminated but succeeding transfers are processed and may generate further access errors. Any following access errors are only flagged in FLXAnFRAES.MAE. The other status flags are not updated.

## (1) Access Error during Input Transfer

When an access error occurs during an input transfer:

- The ongoing transfer is immediately terminated. The FlexRay internal message RAM will not be updated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.IAE is set to 1
- The input pointer table index is flagged in FLXAnFRAES.EIDX
- In case of an normal input transfer, the related DA flag in the FLXAnFRDAi register is set to 0
- In case of an user input transfer, request FLXAnFRITS.UIRP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. In addition the application needs to clear the input access error flag (FLXAnFRAES.IAE).

## (2) Access Error during Output Transfer

When an access error occurs during an output transfer:

- The ongoing transfer is immediately terminated but the update of the data structure may have started.
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.OAE is set to 1
- The output pointer table index is flagged in FLXAnFRAES.EIDX
- In case of an normal output transfer, the related DA flag in the FLXAnFRDAi register remains 0 and no output transfer, interrupt is generated
- In case of an user output transfer request FLXAnFROTS.UORP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. The data structure in the local RAM/global RAM cannot be treated as valid.

In addition the application needs to clear the output access error flag (FLXAnFRAES.OAE).
The FlexRay module internal transfer of the message buffer is completed before the local RAM/global RAM access error is detected. The output transfer will not be re-initiated. To avoid loss of data, the application can perform a user output transfer request of this message buffer to a correct local RAM/global RAM location.

## (3) Access Error during FIFO Transfer

When an access error occurs during an FIFO transfer:

- The ongoing transfer is immediately terminated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.FAE is set to 1
- The FIFO pointer table index is flagged in FLXAnFRAES.EIDX
- The FIFO index pointer are not changed and hence the FIFO status flags are unchanged

With the given status information the application is able to identify and correct the faulty data structure. In addition the application needs to clear the FIFO access error flag (FLXAnFRAES.FAE).
The data in the local RAM/global RAM cannot be treated as valid and is not released to the application. The message cannot be recovered.

### 25.3.16.5 Behaviors in Case of RAM Read Errors

The FlexRay internal message RAM has an ECC checking mechanism. In case an uncorrectable RAM read error occurs, the application has to analyze the status in the FLXAnFRMHDS register and react as described in
Section 25.3.16.3, Data Structure Transfer Scheduling. The input and output transfer handler reacts also on these errors detected in the message RAM when the error is related to an active transfer.

In addition, the Temporary Buffer RAM A and Temporary Buffer RAM B have an ECC checking mechanism as well. An uncorrectable RAM read errors does not impact the data transfer functionality but have to be handled as described in Section 25.3.13.1(4), Message Buffer Status FLXAnFRMBS (Word 3).

In all cases, data causing a read error is never transferred to the local RAM/global RAM. If there is no recovery available in the application, the message is lost.

## (1) Read Error during Transfer from TBF to MBF

This internal transfer is done for each valid FlexRay message received.
A read error can only occur when reading the header section in the FlexRay Message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

For dedicated receive message buffers, the related ND flag in the FLXAnFRNDATi register will not get set. Consequently the affected message buffer will not be transferred to the output data structure.

For the FlexRay internal FIFO buffers, the ND flag in the FLXAnFRNDATi register is not set but the FlexRay internal FIFO put index is incremented. Due to this, a transfer procedure from the FlexRay internal FIFO buffer to the output buffer is started. However, if the read error is still present in the header section, updating of the output data structure will not start (see Section 25.3.16.5(2), Read Error during Transfer from MBF to OBF); thus the data in the local RAM/global RAM remains correct.

Note that the correction or any other reconfiguration of FIFO related to message buffers while there are pending FIFO transfers may result in incorrect data in the local RAM/global RAM. It is strongly recommended to deactivate the output data transfer before starting the reconfiguration and flush the FlexRay internal FIFO before reactivation of the output data transfer.

## (2) Read Error during Transfer from MBF to OBF

This internal transfer is done for every output data transfer (dedicated reception, FIFO, user requested).
A read error can occur in the header and data section (see read error flags in FLXAnFRMHDS). In both cases the message gets lost. If the error is located in the header section, the message buffer needs to be re-configured. If the error is located in the data section, the error is corrected with the next data section update.

When a read error occurs during the transfer from the message RAM to the output buffer, the output data structure will not be updated and the data available will not be set to 1 . The FIFO put index and the FIFO fill level are not changed also.

In case of user output transfer request, FLXAnFROTS.UORP is set to 0 even if there was no update of the output data structure.

## (3) Read Error during Transfer from IBF to MBF

This internal transfer is done for every input data transfer.
A read error can occur only when there is no update of the header section requested (the bit LHS in FLXAnFRWRHS4 is set to 0 ) due to the reading of the header section from the message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

When a read error occurs during the input data transfer, the actually transferred message in the input queue gets lost.

## (4) Message RAM Read Errors

Read errors when reading the header section are flagged in the FLXAnFRMHDS register.
Depending on the buffer type and set buffer protection, a reconfiguration of the message buffer may not be possible.
The input transfer function cannot be used to reconfigure a locked message buffer using the method described in

## Section 25.3.13.4(3), Temporary Unlocking of Header Section.

Before reconfiguring a locked buffer, the user should disable the input transfer function and the output transfer function.

### 25.3.16.6 Data Transfer Timings

The transfer timing between the local RAM/global RAM and the FlexRay internal message buffers is composed of two elements. The first element is the FlexRay core internal transfer time between the interface buffer and the message RAM. The second element is the transfer time required between the local RAM/global RAM and the interface buffer.

The concept of the input- and output handler allows only one active transfer between the local RAM/global RAM and input buffer as well as only one active transfer between the input buffer and the message RAM. In case two requests are made at the same time, the input transfer task is handled at first.

Due to this concept constrains the calculation of transfer times does not consider a parallel transfer but the worst case scenario whereby an output transfer is started only after all input transfers are completed.

## (1) FlexRay Core Internal Transfer Time

The number of clock cycles required for a transfer is given in FlexRay core module clock cycles (bus clock). The transfer time differs between the input and output transfer.

The time required for a transfer between the interface buffer and the FlexRay internal message RAM is given by [ERAY_ADD]

$$
\text { cycles }_{\text {req_MHD[PL] }}=(\text { numberOfConcurrentTasks }) \times\left(\text { setupTime }+\left(\text { DataWords }_{\text {req }[P L]}\right)+75\right)
$$

## Equation 3

The number of data words ( 32 bit) can be calculated by

$$
\text { DataWords } r_{r e q[P L]}=4+\text { floor }\left(\frac{P L C+1}{2}\right)
$$

## Equation 4

Whereby 4 is the number of header section words ( 32 bit ) which needs to be always accessed even if the header section is not updated.

As there can be in total three parallel tasks in the FlexRay internal message handler but the number of concurrent tasks is unknown, not only for a worst case consideration the number of concurrent tasks must be set to 3 . Beside the setup time and the number of words to be transferred a message handler internal delay time of 75 bus clock cycles must be added. The maximum number of payload to be transferred is in worst case 64.

The worst case for an input transfer is different from the worst case for an output transfer. For an input transfer the setup time required is 6 bus clock cycles and therefore

$$
\text { cycles }_{\text {req_MHD input }[64]=3 \times(6+68+75)=447}
$$

## Equation 5 Message Hander Internal Input Transfer Time (Worst Case)

For an output transfer the setup time required is 2 bus clock cycles and therefore

$$
\text { cycles }_{\text {req_M }_{\text {-MD output }[64]}}=3 \times(2+68+75)=435
$$

## Equation 6 Message Handler Internal Output Transfer Time (Worst Case)

## (2) System Bus Transfer Time

The number of bus clock cycles required for a transfer is given in bus clock cycles and is identical for all kind of transfers between the local RAM/global RAM and the FlexRay module.

The time required by the transfer handler for a transfer between the local RAM/global RAM and the FlexRay interface buffer is given by

$$
\text { cycles }_{\text {req_}_{-} S B[P L]}=\text { throughput } \times\left(\text { systemTime }+\left(\text { DataWords } s_{\text {re }[P L]}\right)+\text { setupTime }\right)
$$

## Equation 7 General System Bus Transfer Time Formula

The number of payload words ( 32 bit ) can be calculated by using Equation 4.
The throughput depends on the utilization of the system bus and depends on the application. However, the data transfer handler has the highest priority for accessing the local RAM/global RAM and the data throughput factor can be assumed as XXXX even in worst case scenarios. The system time (read of the data pointer from local RAM/global RAM) can be set to 1 in all cases. The transfer setup time can be set to 3 in all cases.

Therefore the system bus transfer time (given in bus clock cycles) is given by

$$
\text { cycles }_{\text {req_SB[64] }}=\text { throughput } \times(2+68)+3=X X X X \times(2+68)+3
$$

## Equation 8 System Bus Transfer Time (Worst Case)

In addition to the system bus transfer time a FlexRay module internal processing time needs to be taken into account. The number of clock cycles required for the internal processing time required is given in FlexRay core module clock cycles (bus clock) and is different between input transfers and output transfers but can be treated as constants.

$$
\text { cycles }_{\text {req_THD input }=2+4=6}
$$

## Equation 9

Whereby 2 cycles are required to initiate the FlexRay module internal transfer from the input buffer to the message RAM. In addition 4 internal processing cycles are required.

$$
\text { cycles }_{\text {req_THD output }=3+4=7}
$$

## Equation 10

Whereby 3 cycles are required to initiate the FlexRay module internal transfer from the input buffer to the message RAM. In addition 4 internal processing cycles are required.

## (3) Summary Required Input Transfer Time

The worst case time (as a function of the transferred payload) required to transfer data between the local RAM/global RAM to the FlexRay internal message buffer can be calculated by

$$
\begin{aligned}
& t_{-} \text {input }_{[P L]}=t_{-} c h i \times\left(\text { cycles }_{\text {req_THD_input }+ \text { cycles }_{\text {req_M }_{-}}{ }^{\text {M }} \text { input }[P L]}\right)+t_{-} \text {sys } \times\left(\text { cycles }_{\text {req_SB }[P L]}\right) \\
& t_{-} \text {input }_{[P L]}=t_{-} \text {chi } \times\left(6+3 \times\left[81+\text { DataWords }_{[P L]}\right]\right)+t_{-} \text {sys } \times\left({\text { throughput } \left.\times\left[2+\text { DataWords }_{[P L]}\right]+3\right), ~(6)}\right.
\end{aligned}
$$

## Equation 11 Input transfer time

With

$$
t_{-} s y s=(f(\text { sysclk }))^{-1}
$$

and.

$$
t_{-} c h i=\left(f\left(c l k p 2_{-} f l x\right)\right)^{-1}
$$

## (4) Summary Required Output Transfer Time

The worst case time (as a function of the transferred payload) required to transfer data from the FlexRay internal message buffer to the local RAM/global RAM can be calculated by

$$
\begin{aligned}
& t_{-} \text {output }_{[P L]}=t_{-} c h i \times\left(\text { cycles }_{\text {req_THD_output } \left.+ \text { cycles }_{\text {req_M }^{-M D_{-} o u t p u t ~}[P L]}\right)+t_{-} \text {sys } \times\left(\text { cycles }_{\text {req_SB }[P L]}\right)}\right) \\
& t_{-} \text {output }_{[P L]}=t_{-} \text {chi } \times\left(7+3 \times\left[77+\text { DataWords }_{[P L]}\right]\right)+t_{-} \text {sys } \times\left({\text { throughput } \left.\times\left[2+\text { DataWords }_{[P L]}\right]+3\right), ~(2)}\right.
\end{aligned}
$$

## Equation 12 Output Transfer Time

With

$$
t_{-} s y s=(f(s y s c l k))^{-1}
$$

and.

$$
t_{-} c h i=\left(f\left(c l k p 2_{-} f l x\right)\right)^{-1}
$$

### 25.3.17 Byte Alignment

The alignment of the bytes received by the FlexRay protocol and the alignment of the bytes required by the application may be different. The FlexRay module provides with FLXAnFROC.BEC a byte alignment function to support different byte ordering styles.

Figure 25.32, Byte Alignment on the FlexRay Bus shows the payload byte alignment in a FlexRay frame.

Figure 25.32 Byte Alignment on the FlexRay Bus

### 25.3.17.1 Little Endian Alignment

When FLXAnFROC.BEC is 0 , the byte alignment is set to Little Endian.

## (1) FLXAnFRNMVm ( $m=1$ to 3 )

The byte alignment of the NMV bytes is as below.

## (2) FLXAnFRWRDSx ( $x=1$ to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.
FLXAnFRWRDSx.MD[7:0] = Data Dax-4 $^{4}$
FLXAnFRWRDSx.MD[15:8] = Data $_{4 x-3}$
FLXAnFRWRDSx.MD[23:16] = Data $_{4 x-2}$
FLXAnFRWRDSx.MD[31:24] = Data $_{4 x-1}$
Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[7:0], FLXAnFRWRDSx.MD [15:8], FLXAnFRWRDSx.MD [23:16], FLXAnFRWRDSx.MD [31:24] with the most significant bit (MSB) transmitted first.

## (3) FLXAnFRRDDSx (x=1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.
FLXAnFRRDDSx.MD[7:0] $=$ Data $_{4 x-4}$
FLXAnFRRDDSx.MD[15:8] = Data ${ }_{4 x-3}$
FLXAnFRRDDSx.MD[23:16] = Data $_{4 x-2}$
FLXAnFRRDDSx.MD[31:24] = Data $_{4 x-1}$
Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[7:0], FLXAnFRRDDSx.MD [15:8],
FLXAnFRRDDSx.MD [23:16], FLXAnFRRDDSx.MD [31:24] with the most significant bit (MSB) received first.

### 25.3.17.2 Big Endian Alignment

When FLXAnFROC.BEC is 1 , the byte alignment is set to Big Endian.

## (1) FLXAnFRNMVm (m = 1 to 3 )

The byte alignment of the NMV bytes is as below.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 |  |  | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| FLXAnFRN MV1 | Data 0 |  |  |  |  |  |  |  | Data 1 |  |  |  |  |  |  |  | Data 2 |  |  |  |  |  |  |  | Data 3 |  |  |  |  |  |  |  |  |
| FLXAnFRN MV2 | Data 4 |  |  |  |  |  |  |  | Data 5 |  |  |  |  |  |  |  | Data 6 |  |  |  |  |  |  |  | Data 7 |  |  |  |  |  |  |  |  |
| FLXAnFRN MV3 | Data 8 |  |  |  |  |  |  |  | Data 9 |  |  |  |  |  |  |  | Data 10 |  |  |  |  |  |  |  | Data 11 |  |  |  |  |  |  |  |  |

## (2) FLXAnFRWRDSx ( $x=1$ to 64 )

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.
FLXAnFRWRDSx.MD[7:0] = Data $_{4 x-1}$
FLXAnFRWRDSx.MD[15:8] = Data $_{4 x-2}$
FLXAnFRWRDSx.MD[23:16] = Data $_{4 x-3}$
FLXAnFRWRDSx.MD[31:24] = Data ${ }_{4 x-4}$
Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[31:24], FLXAnFRWRDSx.MD[23:16], FLXAnFRWRDSx.MD[15:8], FLXAnFRWRDSx.MD[7:0] with the most significant bit (MSB) transmitted first.
(3) FLXAnFRRDDSx ( $x=1$ to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.
FLXAnFRRDDSx.MD[7:0] = Data $_{4 x-1}$
FLXAnFRRDDSx.MD[15:8] = Data $_{4 x-2}$
FLXAnFRRDDSx.MD[23:16] = Data $_{4 x-3}$
FLXAnFRRDDSx.MD[31:24] $=$ Data $_{4 x-4}$
Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[31:24], FLXAnFRRDDSx.MD[23:16], FLXAnFRRDDSx.MD[15:8], FLXAnFRRDDSx.MD[7:0] with the most significant bit (MSB) received first.

### 25.4 Detection and Correction of Errors in FlexRay RAM

For details of ECC, see Section 40A.2.6, ECC for Peripheral RAM, Section 40B.2.6, ECC for Peripheral RAM, Section 40C.2.5, ECC for Peripheral RAM.

## Section 26 Ethernet AVB (ETNB)

This section contains a generic description of the Ethernet AVB (ETNB).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ETNB.

## CAUTION

Read URAM in this manual as local RAM/global RAM/retention RAM.
Read AXI BUS in this manual as H-Bus.

### 26.1 Features of RH850/F1KH, RH850/F1KM ETNB

### 26.1.1 Number of Units

This microcontroller has the following number of ETNB units.
Each ETNB unit has single channel interface.
Table $26.1 \quad$ Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 176 Pins | RH850/F1KH-D8 233 Pins | RH850/F1KH-D8 324 Pins |
| :---: | :---: | :---: | :---: |
| Number of Units | 1 | 1 | 2 |
| Name | ETNBn ( $\mathrm{n}=0$ ) | ETNBn ( $\mathrm{n}=0$ ) | ETNBn ( $\mathrm{n}=0,1$ ) |

Table 26.2 Number of Units (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Product Name | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| Number of Units | - | - | 1 | 1 | 1 |
| Name | - | - | ETNBn $(\mathrm{n}=0)$ | ETNBn $(\mathrm{n}=0)$ | ETNBn $(\mathrm{n}=0)$ |

Table 26.3 Number of Units (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| Number of Units | - | - | - | - |
| Name | - | - | - | - |

Table 26.4 Index (RH850/F1KH-D8)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual ETNB units are identified by the index " n "; for example, ETNBnCCC $(\mathrm{n}=0$ <br>  <br> 1) is the AVB-DMAC mode register. |

Table 26.5 Index (RH850/F1KM-S4)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual ETNB units are identified by the index " n "; for example, ETNBnCCC $(\mathrm{n}=0$ <br> is the AVB-DMAC mode register. |

### 26.1.2 Register Base Addresses

ETNB base addresses are listed in the following table.
ETNB register addresses are given as an offset from the base addresses.
Table 26.6 Register Base Addresses (RH850/F1KH-D8)

| Base Address Name | Base Address |
| :--- | :--- |
| <ETNB0_base> | FFD6 E000 |
| <ETNB1_base> | FFD6 E800 |

Table 26.7 Register Base Address (RH850/F1KM-S4)

| Base Address Name | Base Address |
| :--- | :--- |
| <ETNB0_base> | FFD6 E000 |

### 26.1.3 Clock Supply

The ETNB clock supply is shown in the following table.
Table 26.8 Clock Supply (RH850/F1KH-D8)

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| ETNBn | clk_chi*1,*2$^{n n}$ | Register access clock*1,*2 |

Note 1. ETNB clocks can be stoped by OPBTO.ETNBnEN, refer to Section 44.9.2, OPBTO - Option Byte 0.
Note 2. ETNB clocks is more than 15 MHz .

Table 26.9 Clock Supply (RH850/F1KM-S4)

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| ETNBn | clk_chi*1,*2 | CPUCLK_L |
|  | Register access clock*1,*2 | CPUCLK_L |

Note 1. ETNB clocks can be stoped by OPBTO.ETNBnEN, refer to Section 44.9.2, OPBTO - Option Byte 0.
Note 2. ETNB clocks is more than 15 MHz .

### 26.1.4 Interrupt Requests

ETNB interrupt requests are listed in the following table.
Table 26.10 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| ETNB0 |  | Data related interrupt | 315 |
| INTETNB0DATA | Error related interrupt | 316 | - |
| INTETNB0ERR | Management related interrupt | 317 | - |
| INTETNB0MNG | MAC interrupt | 318 | - |
| INTETNB0MAC |  | Data related interrupt | 377 |
| ETNB1 | Error related interrupt | 378 | - |
| INTETNB1DATA | Management related interrupt | 379 | - |
| INTETNB1ERR | MAC interrupt | 380 | - |
| INTETNB1MNG |  |  | - |
| INTETNB1MAC |  |  |  |

Table 26.11 Interrupt Requests (RH850/F1KM-S4)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| ETNB0 |  |  | Data related interrupt |
| INTETNBODATA | Error related interrupt | 315 |  |
| INTETNBOERR | Management related interrupt | 316 | - |
| INTETNBOMNG | MAC interrupt | 317 | - |
| INTETNBOMAC | 318 | - |  |

### 26.1.5 Reset Sources

ETNB reset sources are listed in the following table. ETNB is initialized by these reset sources.
Table 26.12 Reset Sources (RH850/F1KH-D8)

| Unit Name | Reset Source |
| :--- | :---: |
| ETNBn | All reset sources (ISORES) |
| Table 26.13 | Reset Sources (RH850/F1KM-S4) |
| Unit Name | Reset Source |
| ETNBn | All reset sources (ISORES) |

### 26.1.6 External Input/Output Signals

External input/output signals of ETNB are listed below.
Table 26.14 ETNBn Input/Output Signals (RH850/F1KH-D8)

| Unit Signal Name |  | Description |
| :--- | :--- | :--- |
| ETNB0 | Alternative Port Pin Signal |  |
| AVB_TX_CLK | MII transmit clock signal | ETNBOTXCLK |
| AVB_RX_CLK | MII receive clock signal | ETNB0RXCLK |
| AVB_TX_EN | MII transmit data enable signal | ETNB0TXEN |
| AVB_TXD[3:0] | MII transmit data signal | ETNB0TXD[3:0] |
| AVB_RX_DV | MII receive data valid signal | ETNB0RXDV |
| AVB_RXD[3:0] | MII receive data signal | ETNB0RXD[3:0] |
| AVB_RX_ER | MII receive error signal | ETNB0RXERR |
| AVB_MDC | PHY management clock signal | ETNB0MDC |
| AVB_MDIO | PHY management transfer data signal | ETNB0MDIO |
| AVB_LINK | PHY link status signal | ETNB0LINK |
| ETNB1 | MII transmit clock signal | ETNB1TXCLK |
| AVB_TX_CLK | MII receive clock signal | ETNB1RXCLK |
| AVB_RX_CLK | MII transmit data enable signal | ETNB1TXEN |
| AVB_TX_EN | MII transmit data signal | ETNB1TXD[3:0] |
| AVB_TXD[3:0] | MII receive data valid signal | ETNB1RXDV |
| AVB_RX_DV | MII receive data signal | ETNB1RXD[3:0] |
| AVB_RXD[3:0] | MII receive error signal | ETNB1RXERR |
| AVB_RX_ER | PHY management clock signal | ETNB1MDIO |
| AVB_MDC | PHY management transfer data signal |  |
| AVB_MDIO | PHY link status signal |  |
| AVB_LINK | ETNBK |  |

Note: In RH850/F1KH, there is no TXERR pin. It is recommended to connect to EVSS or BVSS via a resistor for TXERR of PHY.

Table 26.15 ETNBn Input/Output Signals (RH850/F1KM-S4)

| Unit Signal Name |  | Description |
| :--- | :--- | :--- |
| ETNB0 | Alternative Port Pin Signal |  |
| AVB_TX_CLK | MII transmit clock signal | ETNB0TXCLK |
| AVB_RX_CLK | MII transmit data enable signal | ETNBORXCLK |
| AVB_TX_EN | MII transmit data signal | ETNB0TXEN |
| AVB_TXD[3:0] | MII receive data valid signal | ETNB0TXD[3:0] |
| AVB_RX_DV | MII receive data signal | ETNBORXDV |
| AVB_RXD[3:0] | MII receive error signal | ETNBORXD[3:0] |
| AVB_RX_ER | PHY management clock signal | ETNBORXERR |
| AVB_MDC | PHY management transfer data signal | ETNBOMDC |
| AVB_MDIO | PHY link status signal | ETNBOLINK |
| AVB_LINK |  |  |

Note: In RH850/F1KM, there is no TXERR pin. It is recommended to connect to EVSS or BVSS via a resistor for TXERR of PHY.

### 26.2 Overview

### 26.2.1 Functional Overview

Table 26.16, Specifications of ETNB lists the specifications of the ETNB.
Table 26.16 Specifications of ETNB

| Item | Description |
| :---: | :---: |
| Protocol | Flow control conforming with the IEEE 802.3x standard |
| Communication interface | MII |
| Transfer speed | - 100 Mbps <br> - $10 \mathrm{Mbps}^{* 1}$ |
| Transfer mode | - Full-duplex mode |
| AVB function | - Conforming with the following standards stipulated for IEEE 802.1BA. <br> - IEEE 802.1AS (time synchronization protocol) <br> - IEEE 802.1Qav (real-time transfer) <br> * IEEE 802.1Qat should be supported by software. <br> - Descriptor management system <br> - IEEE 1722 (AVTP presentation timestamp) |

Note 1. Not available for the AVB function.

### 26.2.2 Block Diagram

Figure 26.1, Block Diagram of ETNB is a block diagram of the ETNB.

Figure 26.1 Block Diagram of ETNB

### 26.3 Registers

### 26.3.1 List of Registers

The following table lists the ETNB registers.
For details about <ETNBn_base>, see Section 26.1.2, Register Base Address.

| Table 26.17 | List of Registers |  |  |
| :---: | :---: | :---: | :---: |
| Module Name | Register Name | Abbreviation | Address |
| ETNBn | AVB-DMAC mode register | ETNBnCCC | <ETNBn_base> + 0000 ${ }_{\text {H }}$ |
|  | Descriptor base address table register | ETNBnDBAT | <ETNBn_base> + 0004 ${ }_{\text {H }}$ |
|  | Descriptor base address load request register | ETNBnDLR | <ETNBn_base> + 0008 ${ }_{\text {H }}$ |
|  | AVB-DMAC status register | ETNBnCSR | <ETNBn_base> + 000C ${ }_{\text {H }}$ |
|  | Current descriptor address register q ( $q=0$ to 21) | ETNBnCDARq | <ETNBn_base> $+0010_{\mathrm{H}}+\mathrm{q} \times 4_{\mathrm{H}}$ |
|  | Error status register | ETNBnESR | <ETNBn_base> + 0088 ${ }_{\text {H }}$ |
|  | Receive configuration register | ETNBnRCR | <ETNBn_base> + 0090 ${ }_{\text {H }}$ |
|  | Receive queue configuration register $\mathrm{i}(\mathrm{i}=0$ to 4) | ETNBnRQCi | <ETNBn_base> + 0094 ${ }_{\text {H }}+\mathrm{i} \times 4_{\text {H }}$ |
|  | Receive padding configuration register | ETNBnRPC | <ETNBn_base> + 00B0 ${ }_{\text {H }}$ |
|  | Unread frame counter stop level configuration register | ETNBnUFCS | <ETNBn_base> + 00COH |
|  | Unread frame counter register i ( $\mathrm{i}=0$ to 4) | ETNBnUFCVi | <ETNBn_base> $+00 \mathrm{C} 4_{\mathrm{H}}+\mathrm{i} \times 4_{\mathrm{H}}$ |
|  | Unread frame counter decrement register i (i=0 to 4) | ETNBnUFCDi | <ETNBn_base> + 00E0 ${ }_{\text {H }}+\mathrm{i} \times 4_{\mathrm{H}}$ |
|  | Separation filter offset register | ETNBnSFO | <ETNBn_base> + 00FCC ${ }_{\text {H }}$ |
|  | Separation filter pattern register i ( $\mathrm{i}=0$ to 31) | ETNBnSFPi | <ETNBn_base> $+0100_{\mathrm{H}}+\mathrm{i} \times 4_{\mathrm{H}}$ |
|  | Separation filter mask register i $\mathrm{i}=0,1$ ) | ETNBnSFMi | <ETNBn_base> + 01C0 ${ }_{H}+\mathrm{i} \times 4_{\mathrm{H}}$ |
|  | Transmit configuration register | ETNBnTGC | <ETNBn_base> + 0300 ${ }_{\text {H }}$ |
|  | Transmit configuration control register | ETNBnTCCR | <ETNBn_base> + 0304 ${ }_{\text {H }}$ |
|  | Transmit status register | ETNBnTSR | <ETNBn_base> + 0308 ${ }_{\text {H }}$ |
|  | Timestamp FIFO access register 0 | ETNBnTFA0 | <ETNBn_base> + 0310 ${ }_{\text {H }}$ |
|  | Timestamp FIFO access register 1 | ETNBnTFA1 | <ETNBn_base> + 0314 ${ }_{\text {H }}$ |
|  | Timestamp FIFO access register 2 | ETNBnTFA2 | <ETNBn_base> + 0318 ${ }_{\text {H }}$ |
|  | CBS increment value register c ( $c=0,1$ ) | ETNBnCIVRc | <ETNBn_base> $+0320_{\mathrm{H}}+\mathrm{c} \times 4_{\mathrm{H}}$ |
|  | CBS decrement value register $\mathrm{c}(\mathrm{c}=0,1)$ | ETNBnCDVRc | <ETNBn_base> $+0328_{\mathrm{H}}+\mathrm{c} \times 4_{\mathrm{H}}$ |
|  | CBS upper limit register $\mathrm{c}(\mathrm{c}=0,1)$ | ETNBnCULc | <ETNBn_base> $+0330_{\mathrm{H}}+\mathrm{c} \times 4_{\mathrm{H}}$ |
|  | CBS lower limit register $\mathrm{C}(\mathrm{c}=0,1)$ | ETNBnCLLc | <ETNBn_base> $+0338_{\mathrm{H}}+\mathrm{c} \times 4_{\mathrm{H}}$ |
|  | Descriptor interrupt control register | ETNBnDIC | <ETNBn_base> + 0350 ${ }_{\text {H }}$ |
|  | Descriptor interrupt status register | ETNBnDIS | <ETNBn_base> + 0354 ${ }_{\text {H }}$ |
|  | Error interrupt control register | ETNBnEIC | <ETNBn_base> + 0358 ${ }_{\text {H }}$ |
|  | Error interrupt status register | ETNBnEIS | <ETNBn_base> + 035C ${ }_{\text {H }}$ |
|  | Receive interrupt control register 0 | ETNBnRIC0 | <ETNBn_base> + 0360 ${ }_{\text {H }}$ |
|  | Receive interrupt status register 0 | ETNBnRIS0 | <ETNBn_base> + 0364 ${ }_{\text {H }}$ |
|  | Receive interrupt control register 1 | ETNBnRIC1 | <ETNBn_base> + 0368 ${ }_{\text {H }}$ |
|  | Receive interrupt status register 1 | ETNBnRIS1 | <ETNBn_base> + 036C ${ }_{\text {H }}$ |
|  | Receive interrupt control register 2 | ETNBnRIC2 | <ETNBn_base> + 0370 ${ }_{\text {H }}$ |
|  | Receive interrupt status register 2 | ETNBnRIS2 | <ETNBn_base> + 0374 ${ }_{\text {H }}$ |
|  | Transmit interrupt control register | ETNBnTIC | <ETNBn_base> + 0378 ${ }_{\text {H }}$ |
|  | Transmit interrupt status register | ETNBnTIS | <ETNBn_base> + 037C ${ }_{\text {H }}$ |
|  | Interrupt summary status register | ETNBnISS | <ETNBn_base> + 0380 ${ }_{\text {H }}$ |
|  | gPTP configuration control register | ETNBnGCCR | <ETNBn_base> + 0390 ${ }_{\text {H }}$ |

Table 26.17 List of Registers

| Module Name | Register Name | Abbreviation | Address |
| :---: | :---: | :---: | :---: |
| ETNBn | gPTP maximum transit time register | ETNBnGMTT | <ETNBn_base> + 0394 ${ }_{\text {H }}$ |
|  | gPTP presentation time comparison register | ETNBnGPTC | <ETNBn_base> + 0398 ${ }_{\text {H }}$ |
|  | gPTP timer increment register | ETNBnGTI | <ETNBn_base> + 039C ${ }_{\text {H }}$ |
|  | gPTP timer offset register i ( $\mathrm{i}=0$ to 2 ) | ETNBnGTOi | <ETNBn_base> + 03A0 ${ }_{\text {H }}+\mathrm{i} \times 4_{\mathrm{H}}$ |
|  | gPTP interrupt control register | ETNBnGIC | <ETNBn_base> + 03ACH |
|  | gPTP interrupt status register | ETNBnGIS | <ETNBn_base> + 03B0 ${ }_{\text {H }}$ |
|  | gPTP timer capture register i ( $\mathrm{i}=0$ to 2) | ETNBnGCTi | <ETNBn_base> + 03B8 ${ }_{\text {H }}+\mathrm{i} \times 4_{\text {H }}$ |
|  | E-MAC mode register | ETNBnECMR | <ETNBn_base> + 0500 ${ }_{\text {H }}$ |
|  | Receive frame length register | ETNBnRFLR | <ETNBn_base> + 0508 ${ }_{\text {H }}$ |
|  | E-MAC status register | ETNBnECSR | <ETNBn_base> + 0510 ${ }_{\text {H }}$ |
|  | E-MAC interrupt permission register | ETNBnECSIPR | <ETNBn_base> + 0518 ${ }_{\text {H }}$ |
|  | PHY interface register | ETNBnPIR | <ETNBn_base> + 0520 ${ }_{\text {H }}$ |
|  | PHY LINK status register | ETNBnPLSR | <ETNBn_base> + 0528 ${ }_{\text {H }}$ |
|  | Auto PAUSE frame time parameter register | ETNBnAPFTP | <ETNBn_base> + 0554 ${ }_{\text {H }}$ |
|  | Manual PAUSE frame register | ETNBnMPR | <ETNBn_base> + 0558 ${ }_{\text {H }}$ |
|  | PAUSE frame transmit counter | ETNBnPFTCR | <ETNBn_base> + 055C ${ }_{\text {H }}$ |
|  | PAUSE frame receive counter | ETNBnPFRCR | <ETNBn_base> + 0560 ${ }_{\text {H }}$ |
|  | MAC address high register | ETNBnMAHR | <ETNBn_base> + $05 \mathrm{CO}_{\mathrm{H}}$ |
|  | MAC address low register | ETNBnMALR | <ETNBn_base> + 05C8 ${ }_{\text {H }}$ |
|  | Transmit retry over counter register | ETNBnTROCR | <ETNBn_base> + 0700 ${ }_{\text {H }}$ |
|  | Late collision detect counter register | ETNBnCDCR | <ETNBn_base> + 0708H |
|  | Lost carrier counter register | ETNBnLCCR | <ETNBn_base> + 0710 ${ }_{\text {H }}$ |
|  | CRC error frame receive counter register | ETNBnCEFCR | <ETNBn_base> + 0740 ${ }_{\text {H }}$ |
|  | Frame receive error counter register | ETNBnFRECR | <ETNBn_base> + 0748 ${ }_{\text {H }}$ |
|  | Too-short frame receive counter register | ETNBnTSFRCR | <ETNBn_base> + 0750 ${ }_{\text {H }}$ |
|  | Too-long frame receive counter register | ETNBnTLFRCR | <ETNBn_base> + 0758 ${ }_{\text {H }}$ |
|  | Residual-bit frame receive counter register | ETNBnRFCR | <ETNBn_base> + 0760 ${ }_{\text {H }}$ |
|  | Multicast address frame receive counter register | ETNBnMAFCR | <ETNBn_base> + 0778 ${ }_{\text {H }}$ |
|  | Communication interface control register | ETNBnIFCTL | <ETNBn_base> + 1000 ${ }_{\text {H }}$ |

### 26.3.2 ETNBnCCC - AVB-DMAC Mode Register

The ETNBnCCC register specifies the operating mode of the AVB-DMAC.

Access: ETNBnCCC can be read or written in 32-bit units.
ETNBnCCCL and ETNBnCCCH can be read or written in 16-bit units.
ETNBnCCCLL, ETNBnCCCLH, ETNBnCCCHL, ETNBnCCCHH can be read or written in 8-bit units.
Address: ETNBnCCC: <ETNBn_base> $+0000_{\mathrm{H}}$
ETNBnCCCL: <ETNBn_base> $+0000_{\mathrm{H}}$
ETNBnCCCH: <ETNBn_base> + 0002н
ETNBnCCCLL: <ETNBn_base> $+0000_{\text {H }}$
ETNBnCCCLH: <ETNBn_base> + 0001 ${ }_{\text {H }}$
ETNBnCCCHL: <ETNBn_base> $+0002^{H}$
ETNBnCCCHH: <ETNBn_base> + 0003 ${ }_{\text {H }}$
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | FCE | LBME | - | - | - | BOC | - | - | CS | 1:0] |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R/W | R | R | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 26.18 ETNBnCCC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | FCE | Flow Control Enable <br> 0: Flow control disabled <br> 1: Flow control enabled |
| 24 | LBME | Loopback Mode Enable <br> 0: Normal operation <br> 1: Loopback mode is enabled. |
| 23 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | BOC | Byte Order Configuration <br> 0 : Big endian <br> The first byte is the 8 lower-order bits (URAM[7:0]) <br> 1: Little endian <br> The first byte is the 8 higher-order bits (URAM[31:24]) |
| 19, 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17, 16 | CSEL[1:0] | gPTP Clock Select <br> $00_{\mathrm{B}}$ : gPTP is not in use. <br> $01_{\mathrm{B}}$ : Peripheral bus clock (clk_chi) <br> $10_{\mathrm{B}}$ : Ethernet transmission clock (ETNBnTXCLK) <br> $11_{\mathrm{B}}$ : Setting prohibited |
| 15 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 26.18 ETNBnCCC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 8 | DTSR | Data Transmission Suspend Request |
|  |  | $0:$ Normal operation |
|  |  | $1:$ Requests suspension |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | OPC[1:0] | Operating Mode Configuration |
|  |  | $00_{\mathrm{B}}:$ Reset mode |
|  | $01_{\mathrm{B}}:$ Configuration mode |  |
|  | $10_{\mathrm{B}}:$ Operation mode |  |
|  | $11_{\mathrm{B}}:$ Standby mode |  |

## FCE (Flow Control Enable) Bit

This bit enables the flow control support of MAC.
When flow control is enabled, the MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached ETNBnRCR.RFCL).

## LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.
In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

## CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For details about the pin control, see Section 2A, Pin Function of RH850/F1KH-D8, Section 2B, Pin Function of RH850/F1KM-S4.

## BOC (Byte Order Configuration) Bit

This bit specifies the assignment of the first byte of received Ethernet frames when it is allocated to the URAM.
This setting of this register does not affect the descriptor format and filter parameters of the URAM. Writing to this bit is only possible when the current operating mode is configuration mode.

Figure 26.2, Data of Ethernet Frame Received to Figure 26.4, When ETNBnCCC.BOC $=1$ show how data from frames received via the Ethernet connection are stored in the URAM.

Figure 26.2 Data of Ethernet Frame Received

Figure 26.3 When ETNBnCCC.BOC $=0$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| DPTR+8 | Data8 |  |  |  |  |  |  |  | Data9 |  |  |  |  |  |  |  | Data10 |  |  |  |  |  |  |  | Data11 |  |  |  |  |  |  |  |

Figure 26.4 When ETNBnCCC. $\mathrm{BOC}=1$

## CSEL[1:0] (gPTP Clock Select) Bits

These bits select the clock source for the gPTP timer.
Writing to these bits is only possible when the current operating mode is configuration mode.

## DTSR (Data Transmission Suspend Request) Bit

This bit can suspend access to the URAM.
The access is suspended on completion of the transfer of the frame currently being transferred.
This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity.

## CAUTION

The transmission and reception queues are not processed while access is suspended. Change neither the AVB-DMAC settings nor the mode until the suspend request is given by ETNBnCCC.DTSR and later the value of ETNBnCSR.DTS is updated.

## OPC[1:0] (Operating Mode Configuration) Bits

These bits specify the operating mode.
For the operating modes, see Section 26.4.1.1, Operating Modes.
Writing to this bit is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request.

### 26.3.3 ETNBnDBAT — Descriptor Base Address Table Register

The ETNBnDBAT register is used to set the base address of the descriptor table.

Table 26.19 ETNBnDBAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TA[31:0] | Descriptor Base Table Address |
|  |  | Base address of the descriptor table in the URAM |

## CAUTION

The setting of this bit must be a multiple of four (Bit 0 and bit 1 must be set to " 0 ").

## TA[31:0] (Descriptor Base Table Address) Bits

These bits specify the base address of the descriptor table in the URAM.
For the structure of the descriptor base address table, see Section 26.4.3, Descriptors.
Writing to this bit is only possible when the current operating mode is configuration mode.

### 26.3.4 ETNBnDLR — Descriptor Base Address Load Request Register

The ETNBnDLR register is used to issue a request to load the values from the descriptor base address table register (ETNBnDBAT) for each queue to the current descriptor address register q (ETNBnCDARq).

| Access: |  |  | This register can be read or written in 32-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 26.20 ETNBnDLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | LBA1 | Base Address Load Request (Tx1: Network Control) |
|  |  | 0: No load request is issued. |
|  | 1: When written: A request for loading the corresponding base address is issued. |  |
|  | When read: The given base address is being loaded. |  |
| 0 | LBA0 | Base Address Load Request (Tx0: Best Effort) |
|  | 0: No load request is issued. |  |
|  | 1: When written: A request for loading the corresponding base address is issued. |  |
|  | When read: The given base address is being loaded. |  |

## LBAq (q = 0 to 21) (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded. Setting this bit to 1 issues a request for loading the descriptor base address for the queue q .
If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0 .

For transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

### 26.3.5 ETNBnCSR — AVB-DMAC Status Register

The ETNBnCSR register is used to indicate the operating mode in which the AVB-DMAC is running and communications states.

Table 26.21 ETNBnCSR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | Reserved | When read, the value after reset is returned. |
| 20 | RPO | Receive Process Status <br> 0 : Normal operation <br> 1: Reception is in progress. |
| 19 | TPO3 | Transmit Process Status 3 (Stream Class A) <br> 0 : Normal operation <br> 1: Transmission is in progress. |
| 18 | TPO2 | Transmit Process Status 2 (Stream Class B) <br> 0: Normal operation <br> 1: Transmission is in progress. |
| 17 | TPO1 | Transmit Process Status 1 (Network Control) <br> 0: Normal operation <br> 1: Transmission is in progress. |
| 16 | TPOO | Transmit Process Status 0 (Best Effort) <br> 0: Normal operation <br> 1: Transmission is in progress. |
| 15 to 9 | Reserved | When read, the value after reset is returned. |
| 8 | DTS | Data Transmission Suspended Status <br> 0: Normal operation <br> 1: Transmission is suspended. |
| 7 to 4 | Reserved | When read, the value after reset is returned. |
| 3 to 0 | OPS[3:0] | Operating Mode Status <br> 0001 : Reset <br> $0010_{\mathrm{B}}$ : Configuration mode <br> $0100_{\mathrm{B}}$ : Operation mode <br> $1000_{\mathrm{B}}$ : Standby mode <br> Other settings are prohibited. |

## RPO (Receive Process Status) Bit

This bit indicates whether a reception queue contains an unread received frame.
This bit being set to 1 indicates that a received frame is yet to be stored in the URAM.
[Clearing conditions]

- The current operating mode changes from operation mode.
- Received frames in the reception FIFO all being stored in the URAM.
[Setting condition]
- A received frame being stored in the reception FIFO (but not yet in the URAM)

## TPO3 (Transmit Process Status 3) Bit

This bit indicates whether a class A stream is being transmitted.
This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.
[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ3) is set to 0 )
[Setting condition]
- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ3))

## TPO2 (Transmit Process Status 2) Bit

This bit indicates whether a class B stream is being transmitted.
This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.
[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ2) is set to 0)
[Setting condition]
- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ2))

## TPO1 (Transmit Process Status 1) Bit

This bit indicates whether a network control is being transmitted.
When this bit is set to 1 , the AVB-DMAC is fetching data in the URAM or E-MAC is transmitting data.
[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ1) is set to 0 )
[Setting condition]
- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ1))

## TPOO (Transmit Process Status 0) Bit

This bit indicates whether a best effort is being transmitted.
When this bit is set to 1 , the AVB-DMAC is fetching data in the URAM or E-MAC is transmitting data.

## [Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ0) is set to 0 )
[Setting condition]
- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ0))

## DTS (Data Transmission Suspend Status) Bit

This bit indicates whether access to the URAM is enabled.
[Clearing conditions]

- The current operating mode is not operating mode.
- The data transmission suspend request bit in the AVB-DMAC mode register (ETNBnCCC.DTSR) being 0 .

## [Setting condition]

- Access to the URAM not proceeding while the data transmission suspend request bit (ETNBnCCC.DTSR) in the AVB-DMAC mode register is 1 (if the URAM is being accessed, this bit is set to 1 on completion of access).

## OPS[3:0] (Operating Mode Status) Bits

These bits indicate the current operating mode.
For the operating modes, see Section 26.4.1.1, Operating Modes.

### 26.3.6 ETNBnCDARq — Current Descriptor Address Register q (q = 0 to 21)

The ETNBnCDARq register indicates the current descriptor address.

Table 26.22 ETNBnCDARq Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CDA[31:0] | Current Descriptor Address |
|  |  | The address of the current descriptors for the transmission queues |

## CDA[31:0] (Current Descriptor Address) Bits

ETNBnCDAR0 to ETNBnCDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while ETNBnCDAR4 to ETNBnCDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, contents of this bits are changed to (ETNBnDBAT $+\mathrm{q} \times 8$ ).
Also, when the descriptor base address load request register (ETNBnDLR) issues a load request, the contents of the corresponding register are changed to the descriptor base address table register (ETNBnDBAT).
[Conditions for Updating]

- These bits are set to 0 when the operating mode is not operation mode.
- This register is updated when a descriptor to a queue is processed.

### 26.3.7 ETNBnESR — Error Status Register

The ETNBnESR register indicates the state of error by the AVB-DMAC.

| Access: | This register is a read-only register that can be read in 32-bit units. |
| ---: | :--- |
| Address: | $<E T N B n \_$base $>+0088_{\mathrm{H}}$ |
| Value after reset: | $00000000_{\mathrm{H}}$ |

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | EIL | ET[3:0] |  |  |  | - | - | - | EQN[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 26.23 ETNBnESR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 13 | Reserved | When read, the value after reset is returned. |
| 12 | EIL | Error Information Lost |
|  |  | $0:$ No loss of error information |
|  |  | 1: Lost of error information detected |
| 11 to 8 | ET[3:0] | Error Type |
|  |  | $0000_{\mathrm{B}}:$ Read descriptor from URAM |
|  |  | $0001_{\mathrm{B}}:$ Write descriptor to URAM |
|  |  | $0010_{\mathrm{B}}:$ Interpret read descriptor |
|  |  | $0011_{\mathrm{B}}:$ Tx-Buffer is corrupted |
|  |  | $0100_{\mathrm{B}}:$ Read data from URAM |
|  |  | $011_{\mathrm{B}}:$ Write data or timestamp to URAM |
|  |  | $0111_{\mathrm{B}}:$ Received FIFO is corrupted |
|  |  | $1000_{\mathrm{B}}:$ Frame size error during reception detected |
|  |  | $1001_{\mathrm{B}}:$ Frame size error during transmission detected |
|  |  | $1010_{\mathrm{B}}:$ Tx-Buffer overflow |
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 to 0 | EQN[4:0] |  |

## EIL Error Information Lost Bit

This bit indicates that error information detected by Ethernet AVB is lost because the previous reported error has not been processed by CPU.
[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 0 when CPU writes 0 to the queue error flag (ETNBnEIS.QEF) of the error interrupt status register.
- This bit is set to 1 when the set condition of the queue error flag (ETNBnEIS.QEF) is fulfilled while the queue error flag (ETNBnEIS.QEF) is 1.

## ET[3:0] Error Type Bits

These bits indicate details about the transfer stage which was handled when Ethernet AVB has detected an error.
When a fault relates to the read descriptor (ETNBnESR.ET $=0000_{\mathrm{B}}$ or $0010_{\mathrm{B}}$ ), the CPU needs to correct the faulty descriptor so that the related queues can continue processing. If a queue halts at a faulty descriptor, ETNBnCDARq.CDA ( $q=$ ETNBnESR.EQN) directly checks the faulty descriptor.

When the fault is related to descriptor writing (ETNBnESR.ET = 0001 ${ }_{\mathrm{B}}$ ), CPU needs recognize the not-updated or incorrectly updated descriptor in queue ETNBnESR.EQN. The write problem is not influencing how Ethernet AVB processes the descriptor chain.

When the fault is related to the Tx-Buffer (ETNBnESR.ET = 0011 ${ }_{\mathrm{B}}$ ) CPU needs to clean-up the Tx-Buffer to correct the buffer control configuration.

All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction. For the details of the error processing, Section 26.4.2.3, Checking Integrity.

The CPU can only evaluate these bits when the queue error flag (ETNBnEIS.QEF) is 1.
[Changing condition]
These bits are updated when the queue error flag (ETNBnEIS.QEF) setting conditions are satisfied and ETNBnEIS.QEF is 0 .

## EQN[4:0] Error Queue Number Bits

These bits indicate the queue number which was handled when Ethernet AVB has detected an error. A fault reported for ETNBnESR.EQN $=0$ to 3 is related to transmit queue $t=0$ to 3 .

From ETNBnESR.EQN $=4$ the fault is related to receive queue $r=$ ETNBnESR.EQN -4 . The CPU can only evaluate these bits when the queue error flag (ETNBnEIS.QEF) is 1.

The CPU can not evaluate these bits when the error type bit (ETNBnESR.ET) of the error status register is $0011_{\mathrm{B}}$ or $0111_{B}$.
[Changing condition]
These bits are updated when the set condition of the queue error flag (ETNBnEIS.QEF) is fulfilled and the queue error flag (ETNBnEIS.QEF) is 0

### 26.3.8 ETNBnRCR — Receive Configuration Register

The ETNBnRCR register is used to configure receive-relating settings of the AVB-DMAC.

Table 26.24 ETNBnRCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 28 to 16 | RFCL[12:0] | Receive FIFO Warning Level Recommended value: $1800^{\text {H }}$ |
| 15 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | ETS2 | Timestamp Enable (Stream) <br> 0 : Timestamp is disabled. <br> 1: Timestamp is enabled. <br> Recommended value: 0 |
| 4 | ETSO | Timestamp Enable (Best Effort) <br> 0 : Timestamp is disabled. <br> 1: Timestamp is enabled. <br> Recommended value: 0 |
| 3, 2 | ESF[1:0] | Stream Filtering Select <br> Settings for reception queues 2 to 17 <br> $00_{\mathrm{B}}$ : Filtering is disabled. Frames are processed in queue 0 (best effort). <br> $01_{\mathrm{B}}$ : The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching stream frames are processed in queue 0 (best effort). <br> $10_{\mathrm{B}}$ : The separation filter is enabled for AVB stream frames. <br> Non-matching stream frames are discarded. <br> $11_{\mathrm{B}}$ : The separation filter is enabled for AVB stream frames. <br> Non-matching stream frames are handled with queue 0 (best effort). <br> Recommended value: $10_{B}$ or $11_{B}$ |
| 1 | ENCF | Network Control Filtering Enable <br> Setting for reception queue 1 (network control) <br> 0 : Network control is disabled. <br> 1: Network control is enabled. |
| 0 | EFFS | Error Frame Enable <br> 0: Error frames are disabled. <br> 1: Error frames are enabled. <br> Recommended value: 0 |

## RFCL[12:0] (Receive FIFO Warning Level) Bits

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

## CAUTION

In the case of this LSI chip, set these bits to 1800 H .

## ETS2 (Timestamp Enable (Stream)) Bit

This bit enables timestamp information included in reception queues 2 to 17.
Writing to this bit is only possible when the current operating mode is configuration mode. Set this bit to 1 when use the extended descriptor.

## ETS0 (Timestamp Enable (Best Effort)) Bit

This bit enables timestamp information included in reception queue 0 .
Writing to this bit is only possible when the current operating mode is configuration mode. Set this bit to 1 when use the extended descriptor.

## ESF[1:0] (Stream Filtering Select) Bits

These bits select separation filtering to reception queues 2 to 17 .
The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.
When the value is $00_{\mathrm{B}}$, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).
When the value is $01_{B}$, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is $10_{\mathrm{B}}$, the separation filter is enabled for AVB stream frames; frames from non- matching streams are discarded.

When the value is $11_{\mathrm{B}}$, the separation filter is enabled for AVB stream frames; frames from non- matching streams are processed in reception queue 0 (best effort).

For separation filtering, see Section 26.4.4.1(1), Separation Filtering.
Writing to this bit is only possible when the current operating mode is configuration mode.

## ENCF (Enable Network Control Filtering) Bit

Enables the AVB network control frame for reception queue 1.
When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort). Writing to this bit is only possible when the current operating mode is configuration mode.

## EFFS (Enable Error Frame) Bit

Enables or disables the reception of frames that have been classified as error frames by the E-MAC. Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MSC).
Writing to this bit is only possible when the current operating mode is configuration mode.

### 26.3.9 ETNBnRQCi - Receive Queue Configuration Register i (i=0 to 4)

The ETNBnRQCi register configures the settings of receive queue ( $\mathrm{r}=0+\mathrm{i} \times 4$ to $3+\mathrm{i} \times 4$ ). ${ }^{* 1}$

```
Access: ETNBnRQCi can be read or written in 32-bit units
    ETNBnRQCiL and ETNBnRQCiH can be read or written in 16-bit units.*2
    ETNBnRQCiLL, ETNBnRQCiLH, ETNBnRQCiHL, ETNBnRQCiHH can be read or written in 8-bit units.*2
Address: ETNBnRQCi: <ETNBn_base> + 0094H+i + 4 H
    ETNBnRQCiL: <ETNBn_base> + 0094H}+\mathbf{i}\times\mp@subsup{4}{\textrm{H}}{
    ETNBnRQCiH: <ETNBn_base> + 0094H +i < 4H+2H
    ETNBnRQCiLL: <ETNBn_base> + 0094H}+\textrm{i}\times\mp@subsup{4}{H}{
    ETNBnRQCiLH: <ETNBn_base> + 0094H}+i\times4H+1
    ETNBnRQCiHL: <ETNBn_base> + 0094H}+\textrm{i}\times\mp@subsup{4}{H}{}+2
    ETNBnRQCiHH: <ETNBn_base> + 0094H +i }\times4\mp@subsup{4}{H}{}+\mp@subsup{3}{\textrm{H}}{
    Value after reset: }00000000\textrm{H
```

Note 1. The ETNBnRQC4 register corresponds to reception queues from 16 and 17.
Note 2. The ETNBnRQC4 register corresponds to ETNBnRQC4, ETNBnRQC4L, ETNBnRQC4LL, and ETNBnRQC4LH only.
Note 3. The ETNBnRQC4 register corresponds to RSM16[1:0], UFCC16[1:0], RSM17[1:0], and UFCC17[1:0] only and bits from 16 to 31 are reserved bits.

Table 26.25 ETNBnRQCi Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29, 28 | UFCCr[1:0] | Unread Frame Counter Configuration (Receive Queue $3+i \times 4$ ) <br> These bits set the unread frame counter used in reception queue $3+i \times 4$. |
| 27, 26 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 25, 24 | RSMr[1:0] | Receive Synchronous Mode (Receive Queue $3+i \times 4$ ) <br> $00_{\mathrm{B}}$ : Mode with write-back <br> Other than $0_{\mathrm{B}}$ : Setting prohibited |
| 23, 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21, 20 | UFCCr[1:0] | Unread Frame Counter Configuration (Receive Queue $2+i \times 4$ ) <br> These bits set the unread frame counter used in reception queue $2+i \times 4$. |
| 19, 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17, 16 | RSMr[1:0] | Receive Synchronous Mode (Receive Queue $2+i \times 4$ ) <br> $00_{\mathrm{B}}$ : Mode with write-back <br> Other than $00_{B}$ : Setting prohibited |
| 15, 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13, 12 | UFCCr[1:0] | Unread Frame Counter Configuration (Receive Queue $1+i \times 4$ ) <br> These bits set the unread frame counter used in reception queue $1+i \times 4$. |

Table 26.25 ETNBnRQCi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 11,10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9,8 | RSMr[1:0] | Receive Synchronous Mode (Receive Queue $1+\mathrm{i} \times 4)$ <br> $00_{\mathrm{B}}:$ Mode with write-back <br> Other than $00_{\mathrm{B}}:$ Setting prohibited |
| 7,6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5,4 | UFCCr[1:0] | Unread Frame Counter Configuration (Receive Queue $0+\mathrm{i} \times 4)$ <br>  <br> 3,2 |
| 1,0 | Reserved | Whese bits set the unread frame counter used in reception queue $0+\mathrm{i} \times 4$. |

UFCCr[1:0] ( $r=0$ to 17) Unread Frame Counter Configuration Bits
These bits set the unread frame counter for reception queue r.
With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter stop level configuration register (ETNBnUFCS) to set the warning level and stop level of the unread frame counter.

Set the pattern number ( 0 to 3 ) set in the unread frame counter stop level configuration register (ETNBnUFCS) in these bits.

When the value is $00_{\mathrm{B}}$, the stop function is disabled.
Writing to the bits is only possible when the current operating mode is configuration mode.

## RSMr[1:0] ( $r=0$ to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode. Set $00_{\mathrm{B}}$ in these bits.
For receive synchronous mode, see Section 26.4.4.3(3), Mode with Write-Back.
Writing to the bits is only possible when the current operating mode is configuration mode.

### 26.3.10 ETNBnRPC - Receive Padding Configuration Register

The ETNBnRPC register is used to set padding for received frames.

Table 26.26 ETNBnRPC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | DCNT[7:0] | Stored Data Counter <br> These bits specify the amount of data to be stored with the descriptor. The setting is in words. <br> l.e. 1 in the counter indicates 1 word (4 bytes). |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 8 | PCNT[2:0] | Stored Padding Counter <br> These bits indicate the amount of padding to be stored in data areas for descriptors. <br> The setting is in words. <br> l.e. 1 in the counter indicates 1 word (4 bytes). |
| 7 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| CAUTION |  |  |

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

## DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data ( 1 to 255 ) to be stored following the padding. Counting by one indicates one word ( 4 bytes). For example, when these bits are set to 47 , the amount of data is 47 words ( $=188$ bytes).

When these bits are 0 , all received data is stored following the initial padding.
Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see
Section 26.4.4.3(2)(c), Padding.

## PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding (1 to 7) to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1 , the amount of padding is one word ( $=4$ bytes).

Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see Section 26.4.4.3(2)(c), Padding.

### 26.3.11 ETNBnUFCS — Unread Frame Counter Stop Level Configuration Register

The ETNBnUFCS register sets the stop levels for unread frames.

Table 26.27 ETNBnUFCS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 to 24 | SL3[5:0] | Stop Level 3 |
|  |  | Unread frame count stop level 3 |
| 23, 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 to 16 | SL2[5:0] | Stop Level 2 |
|  |  | Unread frame count stop level 2 |
| 15, 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 8 | SL1[5:0] | Stop Level 1 |
|  |  | Unread frame count stop level 1 |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | SLO[5:0] | Stop Level 0 |
|  |  | Unread frame count stop level 0 |
|  |  | The write value should be 0 . |

## SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.
One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0 , the stop function is disabled. The level to be used is specified by the receive queue configuration register $i$ (ETNBnRQCi) ( $i=0$ to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

### 26.3.12 ETNBnUFCVi — Unread Frame Counter Register i (i=0 to 4)

The ETNBnUFCVi register indicates the number of unread frames in reception queues $r(r=0+i \times 4$ to $3+i \times 4) .{ }^{* 1}$

| Access: <br> Address: |  |  | This register is a read-only register that can be read in 32-bit units.$\text { <ETNBn_base> }+00 \mathrm{C} 4_{\mathrm{H}}+\mathrm{i} \times 4_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $0000000 O_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | $\mathrm{CVr}[5: 0](\mathrm{r}=3+\mathrm{i} \times 4)^{* 2}$ |  |  |  |  |  | - | - | $\mathrm{CVr}[5: 0](\mathrm{r}=2+\mathrm{i} \times 4)^{\star 2}$ |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | $\mathrm{CVr}[5: 0](\mathrm{r}=1+\mathrm{i} \times 4)^{\star 2}$ |  |  |  |  |  | - | - | $\mathrm{CVr}[5: 0](\mathrm{r}=0+\mathrm{i} \times 4)^{\star 2}$ |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note 1. The ETNBnUFCV4 register corresponds to reception queues from 16 to 17.
Note 2. The ETNBnUFCV4 register corresponds to CV16[5:0] and CV17[5:0] only and bits from 16 to 31 are reserved bits.

Table 26.28 ETNBnUFCVi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | Reserved | When read, the value after reset is returned. |
| 29 to 24 | CVr[5:0] | Unread Frame Count $3+4 \times \mathrm{i}$ <br> Number of unread frames in reception queue $3+4 \times \mathrm{i}$ |
| 23,22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | CVr[5:0] | Unread Frame Count $2+4 \times \mathrm{i}$ <br>  <br> 15,14 <br> 13 to 8 <br> Reserved <br> CVr[5:0] <br> 5 to 0 |
| Reserved | When read, the value after reset is returned. |  |

## CVr[5:0] ( $r=0$ to 17) Unread Frame Count $r$ Bits

These bits indicate the number of unread frames in reception queue $r$.
The number of unread frames is decremented by the value that is written to the unread frame counter decrement register i (ETNBnUFCDi).

For a description of how to use unread frames, refer to Section 26.4.4.4, Unread Frame Counters.
[Conditions for Updating]

- The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (ETNBnDLR) issues a base address load request.
- The number is incremented when data received in reception queue $r$ are stored normally. The maximum increment is $3 \mathrm{~F}_{\mathrm{H}}$. If the value exceeds $3 \mathrm{~F}_{\mathrm{H}}$, incrementation will not proceed.)
- The number is decremented by the value written to the unread frame counter decrement register i (ETNBnUFCDi).

### 26.3.13 ETNBnUFCDi — Unread Frame Counter Decrement Register i (i=0 to 4)

The ETNBnUFCDi register is used to decrement unread counters of reception queues $r(r=0+i \times 4$ to $3+i \times 4) .{ }^{* 1}$

Note 1. The ETNBnUFCD4 register corresponds to reception queues from 16 to 17.
Note 2. The ETNBnUFCD4 register corresponds to ETNBnUFCD4, ETNBnUFCD4L, ETNBnUFCD4LL, and ETNBnUFCD4LH only.
Note 3. The ETNBnUFCD4 register corresponds to DV16[5:0] and DV17[5:0] only and bits from 16 to 31 are reserved bits.

Table 26.29 ETNBnUFCDi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 to 24 | DVr[5:0] | Unread Frame Decrement Value $3+4 \times i$ <br> Unread frame decrement value for reception queue $3+4 \times i$ |
| 23,22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 to 16 | DVr[5:0] | Unread Frame Decrement Value $2+4 \times i$ <br> Unread frame decrement value for reception queue $2+4 \times i$ |
| 15,14 | Reserved | WVr[5:0] |
| 13 to 8 | Reserved | Unread Frame Decrement Value $1+4 \times i$ <br> Unread frame decrement value for reception queue $1+4 \times i$ |
| 5,6 | DVr[5:0] | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | Unread Frame Decrement Value $0+4 \times \mathrm{i}$ |  |

## DVr[5:0] ( $r=0$ to 17) Unread Frame Decrement Value $r$ Bits

These bits set the decrement value for unread frames in reception queue $r$. The value of an unread frame counter register $\mathrm{i}(\mathrm{ETNBnUFCVi})(\mathrm{i}=0$ to 4$)$ is decremented by the value set in the corresponding bits of this register.

Write $3 \mathrm{~F}_{\mathrm{H}}$ to these bits to reset the unread counters in reception queue r . These bits are always read as 0 .

### 26.3.14 ETNBnSFO - Separation Filter Offset Register

The ETNBnSFO register sets an offset into frames for use by the separation filter.

Table 26.30 ETNBnSFO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | FBP[5:0] | First Byte Position |

## FBP[5:0] First Byte Position Bits

These bits set the position of the first byte of Ethernet frames in the separation filter.
When these bits are 0, the separation filter starts from the top of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 26.2, Data of Ethernet Frame Received, in Section 26.3.2, ETNBnCCC - AVB-DMAC Mode Register.

Writing to the bits is only possible when the current operating mode is configuration mode.
For separation filtering, see Section 26.4.4.1(1), Separation Filtering.
CAUTION
Received frames having fewer bytes than the setting of these bits +8 bytes do not match the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (ETNBnRCR.ESF).

### 26.3.15 ETNBnSFPi — Separation Filter Pattern Register i (i=0 to 31)

The ETNBnSFPi register configures the pattern of the separation filter used for reception queues 2 to 17 .

Table 26.31 ETNBnSFPi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FPs[63:0] | Separation Filter Pattern |
|  |  | These bits set the pattern of the separation filter. |
|  |  | The 64-bit filter pattern is set for each queue. |

## FPs[63:0] (s = 0 to 15) Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).
Each queue has space of 64-bit. Reception queue 2 (Stream 0) uses ETNBnSFP0 and ETNBnSFP1. Reception queue 17 (Stream 15) uses ETNBnSFP30 and ETNBnSFP31.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (ETNBnSFMi), data from received frames match the value defined in these bits.

ETNBnSFPi.FPs[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while ETNBnSFPi.FPs[63:56] (where i is the odd number) are used for the byte at the address specified by the separation filter offset register $($ ETNBnSFO $)+7$.

Writing to the bits is only possible when the current operating mode is configuration mode.
For separation filtering, see Section 26.4.4.1(1), Separation Filtering.

### 26.3.16 ETNBnSFMi - Separation Filter Mask Register i (i=0 or 1)

The ETNBnSFMi register sets the mask value of the separation filter used for reception queue 2 to 17 .

Table 26.32 ETNBnSFMi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CFM[63:0] | Separation Filter Mask |
|  |  | These bits set the mask value for the separation filter. |

## CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

ETNBnSFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while ETNBnSFM1.CFM[63:56] are used for the separation filter offset register (ETNBnSFO) +7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern- matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode. For separation filtering, see Section 26.4.4.1(1), Separation Filtering.

### 26.3.17 ETNBnTGC - Transmit Configuration Register

The ETNBnTGC register configures the transmission-relating settings of the AVB-DMAC.

Table 26.33 ETNBnTGC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21, 20 | TBD3[1:0] | Transmit FIFO Size (Stream Class A) <br> Number of frames to be fetched from transmission queue 3 (for stream class A) <br> CAUTION: Write 2 to these bits. |
| 19, 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17, 16 | TBD2[1:0] | Transmit FIFO Size (Stream Class B) <br> Number of frames to be fetched from transmission queue 2 (for stream class B) <br> CAUTION: Write 2 to these bits. |
| 15, 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13, 12 | TBD1[1:0] | Transmit FIFO Size (Network Control) <br> Number of frames to be fetched from transmission queue 1 (for network control) <br> CAUTION: Write 2 to these bits. |
| 11, 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9, 8 | TBD0[1:0] | Transmit FIFO Size (Best Effort) <br> Number of frames to be fetched from transmission queue 0 (for best effort) <br> CAUTION: Write 2 to these bits. |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5, 4 | TQP[1:0] | Transmit Queue Priority <br> 00: Non-AVB mode <br> 01: AVB mode 1 <br> 10: Setting prohibited <br> 11: AVB mode 2 |
| 3 | TSM3 | Transmit Synchronous Mode (Stream Class A) <br> 0: With write-back <br> 1: Setting prohibited |
| 2 | TSM2 | Transmit Synchronous Mode (Stream Class B) <br> 0 : With write-back <br> 1: Setting prohibited |

Table 26.33 ETNBnTGC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | TSM1 | Transmit Synchronous Mode (Network Control) |
|  |  | $0:$ With write-back |
|  | 1: Setting prohibited |  |
| 0 | TSM0 | Transmit Synchronous Mode (Best Effort) |
|  | $0:$ With write-back |  |
|  | 1: Setting prohibited |  |

## TBDt[1:0] ( $\mathbf{t}=\mathbf{0}$ to 3) Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues. Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2 (" $10_{\mathrm{B}}$ ").

## TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.
$00_{\mathrm{B}}$ : Non-AVB mode: Q3 $\rightarrow$ Q2 $\rightarrow$ Q1 $\rightarrow$ Q0
011 $:$ AVB mode 1: Q3 (CBS) $\rightarrow$ Q2 (CBS) $\rightarrow$ Q1 $\rightarrow$ Q0
$10_{\mathrm{B}}$ : Setting prohibited
11 : AVB mode 2: Q1 $\rightarrow$ Q3 (CBS) $\rightarrow$ Q2 (CBS) $\rightarrow$ Q0
For the credit-based shaping (CBS) algorithm, see Section 26.4.6, CBS (Credit-Based Shaping).
The CBS algorithm is invalidated in non-AVB mode (i.e. when the value is " $00_{\mathrm{B}}$ ").
Writing to the bits is only possible when the current operating mode is configuration mode.

## TSM0 to TSM3 Transmit Synchronous Mode Bits

These bits set Transmit synchronous mode.
Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to 0 .

### 26.3.18 ETNBnTCCR — Transmit Configuration Control Register

The ETNBnTCCR register controls transmission by the AVB-DMAC and is used to make related settings.

```
Access: ETNBnTCCR can be read or written in 32-bit units.
    ETNBnTCCRL can be read or written in 16-bit units.
    ETNBnTCCRLL, ETNBnTCCRLH can be read or written in 8-bit units.
Address: ETNBnTCCR: <ETNBn_base> + 0304H
    ETNBnTCCRL: <ETNBn_base> + 0304H
    ETNBnTCCRLL: <ETNBn_base> + 0304H
    ETNBnTCCRLH: <ETNBn_base> + 0304H}+\mp@subsup{1}{H}{
Value after reset: }0000000\mp@subsup{0}{\textrm{H}}{
```

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 26.34 ETNBnTCCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | TFR | Timestamp FIFO Release <br> 0: (Not operating) <br> 1: Releases the oldest entry in the timestamp FIFO. |
| 8 | TFEN | Timestamp FIFO Enable <br> 0: Recording of transmission timestamps in the timestamp FIFO is disabled. <br> 1: Recording of transmission timestamps in the timestamp FIFO is enabled. |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | TSRQ3 | Transmit Start Request (Queue 3 (Stream Class A)) <br> 0 : Transmission queue is empty or stopped. <br> 1: When written: A transmission start request is issued. <br> When read: Wait for transmission process to fetch is performed. |
| 2 | TSRQ2 | Transmit Start Request (Queue 2 (Stream Class B)) <br> 0 : Transmission queue is empty or stopped. <br> 1: When written: A transmission start request is issued. <br> When read: Wait for transmission process to fetch is performed. |
| 1 | TSRQ1 | Transmit Start Request (Queue 1 (Network Control)) <br> 0 : Transmission queue is empty or stopped. <br> 1: When written: A transmission start request is issued. <br> When read: Wait for transmission process to fetch is performed. |
| 0 | TSRQ0 | Transmit Start Request (Queue 0 (Best Effort)) <br> 0 : Transmission queue is empty or stopped. <br> 1: When written: A transmission start request is issued. <br> When read: Wait for transmission process to fetch is performed. |

## TFR Timestamp FIFO Release Bit

This bit makes the timestamp FIFO release the oldest entry.
For a description of how to use the timestamp FIFO, see Section 26.4.5.4, Timestamping in Transmission.

## TFEN Timestamp FIFO Enable Bit

This bit enables storage in the timestamp FIFO.
When it is set, timestamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see Section 26.4.5.2(2), Configuration of Transmission Frame Data Descriptors).

When 0 is set in this bit, all timestamp FIFO entries are invalidated.
For a description of how to use the timestamp FIFO, see Section 26.4.5.4, Timestamping in Transmission.

## TSRQt (t = 0 to 3) Transmit Start Request (Queue t) Bit

This bit issues a request to start transmission for transmission queue $t$.
When read, this bit being set to 1 indicates that transmission queue $t$ has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see Section 26.4.5.1, Transmission Modes.
Writing to this bit is only possible when the current operating mode is configuration mode.
Only 1 can be written to the bit. Writing 0 to the bit has no effect.
[Conditions for Updating]
The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, or when a descriptor with defective data is processed.

### 26.3.19 ETNBnTSR — Transmit Status Register

The ETNBnTSR register indicates the state of transmission by the AVB-DMAC.

Table 26.35 ETNBnTSR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | Reserved | When read, the value after reset is returned. |
| 10 to 8 | TFFL[2:0] | Timestamp FIFO Count Number of timestamp FIFOs |
| 7 to 4 | Reserved | When read, the value after reset is returned. |
| 3, 2 | CCS1[1:0] | CBS Counter Status 1 (Class A) <br> $00_{\mathrm{B}}$ : The current credit value is within the range. <br> $01_{\mathrm{B}}$ : The current credit value is less than or equal to the lower limit. <br> $10_{\mathrm{B}}$ : The current credit value is greater than or equal to the upper limit. <br> 11 ${ }_{\mathrm{B}}$ : (Reserved) |
| 1, 0 | CCSO[1:0] | CBS Counter Status 0 (Class B) <br> $00_{\mathrm{B}}$ : The current credit value is within the range. <br> $01_{\mathrm{B}}$ : The current credit value is less than or equal to the lower limit. <br> $10_{\mathrm{B}}$ : The current credit value is greater than or equal to the upper limit. <br> $11_{\mathrm{B}}$ : (Reserved) |

## TFFL[2:0] Timestamp FIFO Count Bits

These bits indicate the number of timestamps in the timestamp FIFO.
The value 0 indicates it is empty and the value 2 indicates it is full (values 3 to 7 are reserved).
[Conditions for Updating]

- The bits are set to 0 when the operating mode is not operation mode or when the timestamp FIFO enable bit in the transmit configuration control register $($ ETNBnTCCR.TFEN $)=0$.
- When the timestamp FIFO enable bit (ETNBnTCCR.TFEN) is 1 and these bits are not 2 , the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E- MAC (for DESCR.TSR, see
Section 26.4.5.2(2), Configuration of Transmission Frame Data Descriptors).
The value of these bits is decremented if it is not 0 when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).

## CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1 . If the calculated credit value is outside the range specified by CBS upper limit register c (ETNBnCULc) and CBS lower limit register c (ETNBnCLLc), it falls outside the range for CBS.
[Conditions for Updating]

- The bits are set to $00_{\mathrm{B}}$ when the operating mode is not operation mode.
- When the determined credit value is within the range, $00_{\mathrm{B}}$ is set.
- If the determined credit value is lower than the CBS lower limit register c (ETNBnCLLc), $01_{\mathrm{B}}$ is set.
- If the determined credit value is higher than the upper limit register c (ETNBnCULc), $10_{\mathrm{B}}$ is set.

### 26.3.20 ETNBnTFA0 - Timestamp FIFO Access Register 0

ETNBnTFA0 indicates the nano seconds portion of the timestamp value.

Table 26.36 ETNBnTFA0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TSV[31:0] | Timestamp Value |

## TSV[79:0] Timestamp Value Bits

These 80 bits consist of ETNBnTFA0.TSV[31:0], ETNBnTFA1.TSV[63:32], and ETNBnTFA2.TSV[79:64], which together indicate the oldest timestamp value stored in the timestamp FIFO.

Once the timestamp FIFO is full, no further timestamp values are stored.
[Conditions for Updating]

- The bits are set to $00000000_{\mathrm{H}}$ when the operating mode is not operation mode.
- The register is updated whenever a value is stored in the timestamp FIFO (when the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) changes from 0 to 1).
- The register is updated when the oldest entry is released (when the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR) is set to 1 ).

### 26.3.21 ETNBnTFA1 - Timestamp FIFO Access Register 1

The ETNBnTFA1 register indicates the lower seconds portion of the timestamp value.

Access: This register is a read-only register that can be read in 32-bit units.
Address: <ETNBn_base> + 0314H
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TSV[63:48] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TSV[47:32] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 26.37 ETNBnTFA1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TSV[63:32] | Timestamp Value |

TSV[63:32] Timestamp Value Bits
For details, see Section 26.3.20, ETNBnTFAO - Timestamp FIFO Access Register 0.

### 26.3.22 ETNBnTFA2 - Timestamp FIFO Access Register 2

The ETNBnTFA2 register indicates the timestamp tag and the higher seconds portion of the timestamp value.

Table 26.38 ETNBnTFA2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | Reserved | When read, the value after reset is returned. |
| 25 to 16 | TST[9:0] | Timestamp Tag |
| 15 to 0 | TSV[79:64] | Timestamp Value |

## TST[9:0] Timestamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the timestamp values (timestamp FIFO access register 0 to 2 (ETNBnTFA0 to 2)) which can be placed in the FIFO.

For transmit frame tagging, Section 26.4.5.4, Timestamping in Transmission.
[Conditions for Updating]

- The bits are set to $000_{\mathrm{H}}$ when the operating mode is not operation mode.
- The bits are updated when a value is stored in the timestamp FIFO (when the value of the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) changes from 0 to 1 ).
- The bits are updated when the oldest entry has been released (1 is set in the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR)).

## TSV[79:64] Timestamp Value Bits

For details, see Section 26.3.20, ETNBnTFA0 - Timestamp FIFO Access Register 0.

### 26.3.23 ETNBnCIVRc - CBS Increment Value Register c (c=0 or 1)

The ETNBnCIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B) and the ETNBnCIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Table 26.39 ETNBnCIVRc Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CIV[31:0] | CBS Increment Value |
|  |  | Setting value: 1 to $65535\left(00000001_{\mathrm{H}}\right.$ to $\left.0000 \mathrm{FFFF}_{\mathrm{H}}\right)$ |

## CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.
Set a value in the range from 1 to $65535\left(00000001_{\mathrm{H}}\right.$ to $\left.0000 \mathrm{FFFF}_{\mathrm{H}}\right)$.
The value to be written to these bits depends on the Ethernet bit rate and clk_chi (peripheral bus clock).
For details, see Section 26.4.6, CBS (Credit-Based Shaping).

### 26.3.24 ETNBnCDVRc - CBS Decrement Value Register c (c = or 1)

The ETNBnCDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).
The ETNBnCDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Table 26.40 ETNBnCDVRc Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CDV[31:0] | CBS Decrement Value |
|  |  | Setting value: -1 to -65536 (FFFF FFFF |
|  |  | to FFFF $0000_{H}$ ) |

## CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.
Set a negative value from -1 to -65536 ( FFFF $_{\text {FFFF }}^{H}$ to FFFF $0000_{H}$ ).
The value to be written to these bits depends on the Ethernet bit rate and clk_chi (peripheral bus clock).
For details, see Section 26.4.6, CBS (Credit-Based Shaping).

### 26.3.25 ETNBnCULc - CBS Upper Limit Register c (c = or 1)

The ETNBnCUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The ETNBnCUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Table 26.41 ETNBnCULc Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ULV[31:0] | CBS Upper Limit |
|  |  | Upper limit on CBS values |

## ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.
The setting is a limiting value for error detection and does not normally affect operation of the algorithm. Write a positive value to these bits.

For details, see Section 26.4.6, CBS (Credit-Based Shaping).

### 26.3.26 ETNBnCLLc - CBS Lower Limit Register c (c = or 1)

The ETNBnCLL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The ETNBnCLL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Table 26.42 ETNBnCLLc Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | LLV[31:0] | CBS Lower Limit |
|  |  | Lower limit on CBS values |

## LLV[31:0] CBS Lower Limit Bits

These bits set the lower limit for credit values calculated by using the CBS algorithm.
The setting is a limiting value for error detection and does not normally affect operation of the algorithm. Write a negative value to these bits.

For details, see Section 26.4.6, CBS (Credit-Based Shaping).

### 26.3.27 ETNBnDIC - Descriptor Interrupt Control Register

The ETNBnDIC register is used to control descriptor interrupts 1 to 15 .

Table 26.43 ETNBnDIC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | DPE15 | Descriptor Interrupt Enable 15 <br> 0: Disabled <br> 1: Enabled |
| 14 | DPE14 | Descriptor Interrupt Enable 14 <br> 0: Disabled <br> 1: Enabled |
| 13 | DPE13 | Descriptor Interrupt Enable 13 <br> 0: Disabled <br> 1: Enabled |
| 12 | DPE12 | Descriptor Interrupt Enable 12 <br> 0 : Disabled <br> 1: Enabled |
| 11 | DPE11 | Descriptor Interrupt Enable 11 <br> 0 : Disabled <br> 1: Enabled |
| 10 | DPE10 | Descriptor Interrupt Enable 10 <br> 0: Disabled <br> 1: Enabled |
| 9 | DPE9 | Descriptor Interrupt Enable 9 <br> 0: Disabled <br> 1: Enabled |
| 8 | DPE8 | Descriptor Interrupt Enable 8 <br> 0: Disabled <br> 1: Enabled |
| 7 | DPE7 | Descriptor Interrupt Enable 7 <br> 0: Disabled <br> 1: Enabled |
| 6 | DPE6 | Descriptor Interrupt Enable 6 <br> 0: Disabled <br> 1: Enabled |

Table 26.43 ETNBnDIC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 5 | DPE5 | Descriptor Interrupt Enable 5 |
|  |  | 0: Disabled |
|  | 1: Enabled |  |
| 4 | DPE4 | Descriptor Interrupt Enable 4 |
|  |  | $0:$ Disabled |
|  | 1: Enabled |  |
| 3 | DPE3 | Descriptor Interrupt Enable 3 |
|  |  | $0:$ Disabled |
|  |  | 1: Enabled |
| 2 | DPE2 | Descriptor Interrupt Enable 2 |
|  |  | 0: Disabled |
|  |  | Descriptor Interrupt Enable 1 |
| 1 | DPE1 | 0: Disabled |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 |  |  |

## DPEi (i=1 to 15) Descriptor Interrupt Enable Bits

When interrupts are allowed, and if an interrupt source occurs (descriptor interrupt status bit of the descriptor interrupt status register $($ ETNBnDIS 1 to 15$)=1$ ), an interrupt is generated.

### 26.3.28 ETNBnDIS — Descriptor Interrupt Status Register

The ETNBnDIS register indicates the state of descriptor interrupts.

Table 26.44 ETNBnDIS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | DPF15 | Descriptor Interrupt Status 15 <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 14 | DPF14 | Descriptor Interrupt Status 14 <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 13 | DPF13 | Descriptor Interrupt Status 13 <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 12 | DPF12 | Descriptor Interrupt Status 12 <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 11 | DPF11 | Descriptor Interrupt Status 11 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 10 | DPF10 | Descriptor Interrupt Status 10 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 9 | DPF9 | Descriptor Interrupt Status 9 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 8 | DPF8 | Descriptor Interrupt Status 8 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 7 | DPF7 | Descriptor Interrupt Status 7 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 6 | DPF6 | Descriptor Interrupt Status 6 <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |

Table 26.44 ETNBnDIS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 5 | DPF5 | Descriptor Interrupt Status 5 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 4 | DPF4 | Descriptor Interrupt Status 4 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 3 | DPF3 | Descriptor Interrupt Status 3 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 2 | DPF2 | Descriptor Interrupt Status 2 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 1 | DPF1 | Descriptor Interrupt Status 1 <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## DPFi (i=1 to 15) Descriptor Interrupt Status Bits

When DESCR.DIE is 1 to $15\left(0001_{\mathrm{B}}\right.$ to $\left.1111_{\mathrm{B}}\right)$, the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.
When DESCR.DIE is 0 , the descriptor interrupt is not generated. Only 0 can be written to these bits.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 after a descriptor with DESCR.DIE set to the corresponding number from 1 to $15\left(0001_{\mathrm{B}}\right.$ to $1111_{\mathrm{B}}$ ) is processed.

### 26.3.29 ETNBnEIC - Error Interrupt Control Register

The ETNBnEIC register controls the AVB-DMAC-related error interrupts.

Table 26.45 ETNBnEIC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | TFFE | Timestamp FIFO Full-Error Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 7 | CULE1 | CBS Upper Limit Error Interrupt Enable (Class A) <br> 0: Disabled <br> 1: Enabled |
| 6 | CULE0 | CBS Upper Limit Error Interrupt Enable (Class B) <br> 0: Disabled <br> 1: Enabled |
| 5 | CLLE1 | CBS Lower Limit Error Interrupt Enable (Class A) <br> 0 : Disabled <br> 1: Enabled |
| 4 | CLLE0 | CBS Lower Limit Error Interrupt Enable (Class B) <br> 0: Disabled <br> 1: Enabled |
| 3 | SEE | Separation Error interrupt Enable <br> 0: Disabled <br> 1: Enabled |
| 2 | QEE | Queue Error interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 1 | MTEE | MAC Transmission Error interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 0 | MREE | MAC Reception Error interrupt Enable <br> 0: Disabled <br> 1: Enabled |

## TFFE Timestamp FIFO Full-Error Interrupt Enable Bits

When the timestamp FIFO is full (the timestamp FIFO full error interrupt status bits of the error interrupt status register $(E T N B n E I S . T F F F)=1)$ and the interrupt is enabled, the interrupt is issued.

## CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)

When the CBS of Class A reached the upper limit value (CBS upper limit error interrupt status bit (Class A) $(E T N B n E I S . C U L F 1)=1)$ and the interrupt is enabled, an interrupt occurs.

## CULEO CBS Upper Limit Error Interrupt Enable Bit (Class B)

When the CBS of Class B reached the upper limit value (CBS upper limit error interrupt status bit (Class B) $(E T N B n E I S . C U L F 0)=1)$ and the interrupt is enabled, an interrupt occurs.

## CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)

When the CBS of Class A reached the lower limit value (CBS lower limit error interrupt status bit (Class A) $(E T N B n E I S . C L L F 1)=1)$ and the interrupt is enabled, an interrupt occurs.

## CLLEO CBS Lower Limit Error Interrupt Enable Bit (Class B)

When the CBS of Class B reached the lower limit value (CBS lower limit error interrupt status bit (Class B) (ETNBnEIS.CLLF0)=1) and the interrupt is enabled, an interrupt occurs.

## SEE Separation Error interrupt Enable Bit

When the separation error flag (ETNBnEIS.SEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

## QEE Queue Error interrupt Enable Bit

When the queue error flag (ETNBnEIS.QEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

## MTEE MAC Transmission Error interrupt Enable Bit

When the MAC transmission error flag (ETNBnEIS.MTEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

## MREE MAC Reception Error interrupt Enable Bit

When the MAC reception error flag (ETNBnEIS.MREF) is set to 1 and the interrupt is enabled, an interrupt occurs.

### 26.3.30 ETNBnEIS — Error Interrupt Status Register

The ETNBnEIS register indicates the states of AVB-DMAC-related error interrupts.

Table 26.46 ETNBnEIS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | QFS | Queue Full Error Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 15 to 9 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | TFFF | Timestamp FIFO Full Error Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 7 | CULF1 | CBS Upper Limit Error Interrupt Status (Class A) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 6 | CULFO | CBS Upper Limit Error Interrupt Status (Class B) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 5 | CLLF1 | CBS Lower Limit Error Interrupt Status (Class A) <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 4 | CLLFO | CBS Lower Limit Error Interrupt Status (Class B) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 3 | SEF | Separation Error Flag <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 2 | QEF | Queue Error Flag <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 1 | MTEF | MAC Transmission Error Flag <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |

Table 26.46 ETNBnEIS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | MREF | MAC Reception Error Flag |
|  |  | 0: The interrupt is not pending. |
|  | 1: The interrupt is pending. |  |

## QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue $r$ full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register $2($ ETNBnRIS2 $)=1$ ).
[Conditions for Changing]

- If the receive queue r full interrupt status bit (ETNBnRIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (ETNBnRIC2.QFEr) are updated, this bit is also updated.
- If the receive FIFO full interrupt status bit (ETNBnRIS2.RFFF) and the receive FIFO full interrupt enable bit (ETNBnRIC2.RFFE) are updated, this bit is also updated.

## TFFF Timestamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission timestamp has been discarded due to the timestamp FIFO being full (i.e. has reached the overrun state).
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is set to 1 and the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) is set to 2.

## CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (ETNBnCUL1.ULV in the CBS upper limit register c (ETNBnCULc)).
Only 0 can be written to the bit.

## [Conditions for Changing]

- This bit is set to 0 when the operating mode is not operation mode.
- This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (ETNBnTSR.CCS1) change from $00_{\mathrm{B}}$ (within the range) to $10_{\mathrm{B}}$ (indicating a value equal to or higher than the upper limit).

## CULFO CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (ETNBnCUL0.ULV in the CBS upper limit register c (ETNBnCULc)).
Only 0 can be written to the bit.

## [Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 0 (Class B) (ETNBnTSR.CCSO) bit in the transmit status register changes from $00_{\mathrm{B}}$ (within the range) to $10_{\mathrm{B}}$ (indicating a value over the upper limit).

## CLLF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (ETNBnCLL1.LLV in CBS lower limit register c (ETNBnCLLc)).
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (ETNBnTSR.CCS1) changes from $00_{\mathrm{B}}$ (within the range) to $01_{\mathrm{B}}$ (indicating a value less than the lower limit).

## CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (ETNBnCLL0.LLV in the CBS lower limit register c (ETNBnCLLc)).
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (ETNBnTSR.CCSO) changes from $00_{\mathrm{B}}$ (within the range) to $01_{\mathrm{B}}$ (indicating a value less than the lower limit).

## SEF Separation Error Flag

This bit indicates that a received frame was discarded because it has not matched any configured separation filter for AVB stream data frames.
The CPU can only write 0 to this bit.
[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 1 when a valid AVB stream data frame was received by MAC but discarded because the separation filter select bits in the receive configuration register (ETNBnRCR.ESF) are $10_{\mathrm{B}}$ and no separation filter has matched.

## QEF Queue Error Flag

This bit indicates that an error has been detected while processing reception or transmit queue. Detail about the detected error is indicated by the error status register (ETNBnESR).

For the details of the error processing, Section 26.4.2.3, Checking Integrity.
The CPU can only write 0 to this bit.
[Changing condition]

- This bit is set to 0 when the operating mode changes from operation mode.
- This bit is set to 1 when a state of error is detected.

## MTEF MAC Transmission Error Flag

This bit indicates that the MAC has detected a fault during transmission. For detail the MAC registers have to be checked.
The CPU can only write 0 to this bit.
[Changing condition]

- This bit is set to 0 when the operating mode changes from operation mode.
- This bit is set to 1 when MAC detects an error during frame transmission.

## MREF MAC Reception Error Flag

This bit indicates that the MAC has detected a fault during reception.
For detail the MAC registers have to be checked.
NOTE
When the storage of faulty received frames (ETNBnRCR.EFFS) is enabled, the MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information CPU can identify corrupted frames in URAM.

The CPU can only write 0 to this bit.
[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 1 when E-MAC detects an error during frame reception.

### 26.3.31 ETNBnRIC0 — Receive Interrupt Control Register 0

The ETNBnRIC0 register controls the AVB-DMAC receive interrupts.

Table 26.47 ETNBnRICO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | FRE17 | Receive Frame Interrupt Enable 17 (Stream 15) <br> 0: Disabled <br> 1: Enabled |
| 16 | FRE16 | Receive Frame Interrupt Enable 16 (Stream 14) <br> 0: Disabled <br> 1: Enabled |
| 15 | FRE15 | Receive Frame Interrupt Enable 15 (Stream 13) <br> 0 : Disabled <br> 1: Enabled |
| 14 | FRE14 | Receive Frame Interrupt Enable 14 (Stream 12) <br> 0 : Disabled <br> 1: Enabled |
| 13 | FRE13 | Receive Frame Interrupt Enable 13 (Stream 11) <br> 0: Disabled <br> 1: Enabled |
| 12 | FRE12 | Receive Frame Interrupt Enable 12 (Stream 10) <br> 0: Disabled <br> 1: Enabled |
| 11 | FRE11 | Receive Frame Interrupt Enable 11 (Stream 9) <br> 0: Disabled <br> 1: Enabled |
| 10 | FRE10 | Receive Frame Interrupt Enable 10 (Stream 8) <br> 0: Disabled <br> 1: Enabled |
| 9 | FRE9 | Receive Frame Interrupt Enable 9 (Stream 7) <br> 0: Disabled <br> 1: Enabled |
| 8 | FRE8 | Receive Frame Interrupt Enable 8 (Stream 6) <br> 0: Disabled <br> 1: Enabled |

Table 26.47 ETNBnRIC0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | FRE7 | Receive Frame Interrupt Enable 7 (Stream 5) <br> 0: Disabled <br> 1: Enabled |
| 6 | FRE6 | Receive Frame Interrupt Enable 6 (Stream 4) <br> 0: Disabled <br> 1: Enabled |
| 5 | FRE5 | Receive Frame Interrupt Enable 5 (Stream 3) <br> 0: Disabled <br> 1: Enabled |
| 4 | FRE4 | Receive Frame Interrupt Enable 4 (Stream 2) <br> 0: Disabled <br> 1: Enabled |
| 3 | FRE3 | Receive Frame Interrupt Enable 3 (Stream 1) <br> 0: Disabled <br> 1: Enabled |
| 2 | FRE2 | Receive Frame Interrupt Enable 2 (Stream 0) <br> 0: Disabled <br> 1: Enabled |
| 1 | FRE1 | Receive Frame Interrupt Enable 1 (Network Control) <br> 0: Disabled <br> 1: Enabled |
| 0 | FREO | Receive Frame Interrupt Enable 0 (Best Effort) <br> 0: Disabled <br> 1: Enabled |

## FREr (r = 0 to 17) Receive Frame Interrupt Enable Bits

When interrupts are allowed, and if an interrupt source occurs (receive interrupt status bit in the receive interrupt status register $($ ETNBnRIS0.FRF0 to 17) $=1$ ), an interrupt is generated.

### 26.3.32 ETNBnRISO — Receive Interrupt Status Register 0

The ETNBnRIS0 register indicates the states of the AVB-DMAC receive interrupts.

Table 26.48 ETNBnRISO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | FRF17 | Receive Frame Interrupt Status 17 (Stream 15) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 16 | FRF16 | Receive Frame Interrupt Status 16 (Stream 14) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 15 | FRF15 | Receive Frame Interrupt Status 15 (Stream 13) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 14 | FRF14 | Receive Frame Interrupt Status 14 (Stream 12) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 13 | FRF13 | Receive Frame Interrupt Status 13 (Stream 11) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 12 | FRF12 | Receive Frame Interrupt Status 12 (Stream 10) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 11 | FRF11 | Receive Frame Interrupt Status 11 (Stream 9) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 10 | FRF10 | Receive Frame Interrupt Status 10 (Stream 8) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 9 | FRF9 | Receive Frame Interrupt Status 9 (Stream 7) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 8 | FRF8 | Receive Frame Interrupt Status 8 (Stream 6) <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |

Table 26.48 ETNBnRISO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | FRF7 | Receive Frame Interrupt Status 7 (Stream 5) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 6 | FRF6 | Receive Frame Interrupt Status 6 (Stream 4) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 5 | FRF5 | Receive Frame Interrupt Status 5 (Stream 3) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 4 | FRF4 | Receive Frame Interrupt Status 4 (Stream 2) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 3 | FRF3 | Receive Frame Interrupt Status 3 (Stream 1) <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 2 | FRF2 | Receive Frame Interrupt Status 2 (Stream 0) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 1 | FRF1 | Receive Frame Interrupt Status 1 (Network Control) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 0 | FRFO | Receive Frame Interrupt Status 0 (Best Effort) <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |

## FRFr ( $\mathrm{r}=0$ to 17) Receive Frame Interrupt Status Bits

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data is queued for CPU processing.
Only 0 can be written to the bit.
[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register i (ETNBnUFCDi) ( $\mathrm{i}=0$ to 4), and this decrements the value of unread frame counter register i (ETNBnUFCVi) ( $\mathrm{i}=0$ to 4 ) to 0 .
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1 .

### 26.3.33 ETNBnRIC1 — Receive Interrupt Control Register 1

The ETNBnRIC1 register controls AVB-DMAC receive interrupts.

Table 26.49 ETNBnRIC1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RFWE | Receive FIFO Warning Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 30 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## RFWE Receive FIFO Warning Interrupt Enable Bit

If the reception FIFO reaches the warning level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)) with the corresponding interrupt enabled, an interrupt is issued.

### 26.3.34 ETNBnRIS1 — Receive Interrupt Status Register 1

The ETNBnRIS1 register indicates the states of AVB-DMAC receive interrupts.

Table 26.50 ETNBnRIS1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RFWF | Receive FIFO Warning Interrupt Status |
|  |  | $0:$ The interrupt is not pending. |
|  | 1: The interrupt is pending. |  |
| 30 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)).
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the reception FIFO reaches the set caution level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)).

### 26.3.35 ETNBnRIC2 — Receive Interrupt Control Register 2

The ETNBnRIC2 register controls AVB-DMAC receive interrupts.

Table 26.51 ETNBnRIC2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | RFFE | Receive FIFO Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 30 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | QFE17 | Receive Queue 17 (Stream 15) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 16 | QFE16 | Receive Queue 16 (Stream 14) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 15 | QFE15 | Receive Queue 15 (Stream 13) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 14 | QFE14 | Receive Queue 14 (Stream 12) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 13 | QFE13 | Receive Queue 13 (Stream 11) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 12 | QFE12 | Receive Queue 12 (Stream 10) Full Interrupt Enable <br> 0: Disabled <br> 1: Enabled |
| 11 | QFE11 | Receive Queue 11 (Stream 9) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 10 | QFE10 | Receive Queue 10 (Stream 8) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 9 | QFE9 | Receive Queue 9 (Stream 7) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |

Table 26.51 ETNBnRIC2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | QFE8 | Receive Queue 8 (Stream 6) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 7 | QFE7 | Receive Queue 7 (Stream 5) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 6 | QFE6 | Receive Queue 6 (Stream 4) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 5 | QFE5 | Receive Queue 5 (Stream 3) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 4 | QFE4 | Receive Queue 4 (Stream 2) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 3 | QFE3 | Receive Queue 3 (Stream 1) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 2 | QFE2 | Receive Queue 2 (Stream 0) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 1 | QFE1 | Receive Queue 1 (Network Control) Full Interrupt Enable <br> 0 : Disabled <br> 1: Enabled |
| 0 | QFE0 | Receive Queue 0 (Best Effort) Full Interrupt Enable <br> 0: Disabled <br> 1: Enabled |

## RFFE Receive FIFO Full Interrupt Enable Bit

When interrupts are allowed, and if the reception FIFO becomes full (the reception FIFO full interrupt status bit $($ ETNBnRIS2.RFFF $)=1$ in receive interrupt status register 2), an interrupt is generated.

## QFEr (r = 0 to 17) Receive Queue r Full Interrupt Enable Bits

When interrupts are allowed, and if a receive queue ( 0 to 17 ) becomes full (the receive queue $r$ full interrupt status bit (ETNBnRIS2.QFF0 to 17 ) $=1$ in receive interrupt status register 2), an interrupt is generated.

### 26.3.36 ETNBnRIS2 — Receive Interrupt Status Register 2

The ETNBnRIS2 register indicates the states of the AVB-DMAC receive interrupts.

Table 26.52 ETNBnRIS2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | RFFF | Receive FIFO Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending |
| 30 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | QFF17 | Receive Queue 17 (Stream 15) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 16 | QFF16 | Receive Queue 16 (Stream 14) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 15 | QFF15 | Receive Queue 15 (Stream 13) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 14 | QFF14 | Receive Queue 14 (Stream 12) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 13 | QFF13 | Receive Queue 13 (Stream 11) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 12 | QFF12 | Receive Queue 12 (Stream 10) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 11 | QFF11 | Receive Queue 11 (Stream 9) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 10 | QFF10 | Receive Queue 10 (Stream 8) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 9 | QFF9 | Receive Queue 9 (Stream 7) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |

Table 26.52 ETNBnRIS2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | QFF8 | Receive Queue 8 (Stream 6) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 7 | QFF7 | Receive Queue 7 (Stream 5) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 6 | QFF6 | Receive Queue 6 (Stream 4) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 5 | QFF5 | Receive Queue 5 (Stream 3) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 4 | QFF4 | Receive Queue 4 (Stream 2) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 3 | QFF3 | Receive Queue 3 (Stream 1) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 2 | QFF2 | Receive Queue 2 (Stream 0) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 1 | QFF1 | Receive Queue 1 (Network Control) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 0 | QFF0 | Receive Queue 0 (Best Effort) Full Interrupt Status <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |

## RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.
When receiving a frame is not possible, the frame will be discarded.
Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the reception FIFO cannot hold received frame data.

## QFFr (r = 0 to 17) Receive r Full Interrupt Status Bits

When a received frame is dropped due to non-availability of empty descriptor, ETNBnRIS2.QFFr is correctly set to 1 .
Additionally, when ETNBnUFCVi.CVr reached the configured stop level (ETNBnUFCS.SLj), the queue full flag (ETNBnRIS2.QFFr) is set to 1 even before any further received frame is dropped.

## CAUTION

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see Section 26.4.4.3(1)(b), Storing Frame Data as Divided Frames) an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.
[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when reception queue $r$ has no space available for storage.
- A bit is set to 1 when the unread frame counter (unread frame counter register i (ETNBnUFCVi) (i=0 to 4)) reaches the set level for stopping.

### 26.3.37 ETNBnTIC - Transmit Interrupt Control Register

The ETNBnTIC register controls the AVB-DMAC transmit interrupts.

Table 26.53 ETNBnTIC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | TFWE | Timestamp FIFO Warning Interrupt Enable |
|  |  | 0: Disabled |
|  | 1: Enabled |  |
| 8 | TFUE | Timestamp FIFO Update Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 7 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

TFWE Timestamp FIFO Warning Interrupt Enable Bit
When the timestamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

## TFUE Timestamp FIFO Update Interrupt Enable Bit

When the timestamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

### 26.3.38 ETNBnTIS - Transmit Interrupt Status Register

The ETNBnTIS register indicates the states of the AVB-DMAC transmit interrupts.

Table 26.54 ETNBnTIS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11,10 | Reserved | When read, an undefined value is returned. When writing, write the value after reset. |
| 9 | TFWF | Timestamp FIFO Warning Interrupt Status |
|  |  | 0: The interrupt is not pending. |
|  | 1: The timestamp FIFO has reached the warning level. |  |
| 8 | TFUF | Timestamp FIFO Update Interrupt Status |
|  |  | 0: The interrupt is not pending. |
|  |  | 1: The timestamp FIFO has been updated. |

| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 3 to 0 | Reserved | When read, an undefined value is returned. When writing, write the value after reset. |

## TFWF Timestamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission timestamp FIFO has reached the warning level.
Only 0 can be written to the bit.

## [Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode, when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is 0 , or when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).
- The bits are set to " 1 " after a frame including DESCR.TSR set has been transmitted and one entry has already been stored (the transmit status register timestamp FIFO count bit (ETNBnTSR.TFFL) is set to " 1 ") in the timestamp FIFO.

## TFUF Timestamp FIFO Update Interrupt Status Bit

This bit indicates that the transmission timestamp FIFO has been updated.
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode, when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is 0 , or when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).
- The bit is set to 1 when the timestamp FIFO enable bit (ETNBnTCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

### 26.3.39 ETNBnISS — Interrupt Summary Status Register

The ETNBnISS register gives a summary of the states of AVB-DMAC-related interrupts.

Table 26.55 ETNBnISS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | DPS15 | Descriptor Interrupt 15 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 30 | DPS14 | Descriptor Interrupt 14 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 29 | DPS13 | Descriptor Interrupt 13 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 28 | DPS12 | Descriptor Interrupt 12 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 27 | DPS11 | Descriptor Interrupt 11 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 26 | DPS10 | Descriptor Interrupt 10 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 25 | DPS9 | Descriptor Interrupt 9 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 24 | DPS8 | Descriptor Interrupt 8 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 23 | DPS7 | Descriptor Interrupt 7 Summary <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 22 | DPS6 | Descriptor Interrupt 6 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |

Table 26.55 ETNBnISS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 21 | DPS5 | Descriptor Interrupt 5 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 20 | DPS4 | Descriptor Interrupt 4 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 19 | DPS3 | Descriptor Interrupt 3 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 18 | DPS2 | Descriptor Interrupt 2 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 17 | DPS1 | Descriptor Interrupt 1 Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 16 to 14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | CGIS | gPTP Interrupt Summary <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 12 | RFWS | Receive FIFO Warning Interrupt Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 11, 10 | Reserved | When read, an undefined value is returned. When writing, write the value after reset. |
| 9 | TFWS | Timestamp FIFO Warning Interrupt Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 8 | TFUS | Timestamp FIFO Update Interrupt <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 7 | MS | E-MAC Interrupt Summary <br> 0 : The interrupt is not pending. <br> 1 : The interrupt is pending. |
| 6 | ES | Error Interrupt Summary <br> 0 : The interrupt is not pending. <br> 1: The interrupt is pending. |
| 5 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | Reserved | When read, an undefined value is returned. When writing, write the value after reset. |

## DPSi (i=1 to 15) Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (ETNBnDIC.DPE1 to ETNBnDIC.DPE15) and descriptor interrupt status flag (ETNBnDIS.DPF1 to ETNBnDIS.DPF15) are both 1.

## CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (ETNBnGIC and ETNBnGIS) is 1.

## RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (ETNBnRIC1.RFWE) and receive FIFO warning interrupt status flag (ETNBnRIS1.RFWF) are both 1.

## TFWS Timestamp FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the timestamp FIFO warning interrupt enable bit (ETNBnTIC.TFWE) and timestamp FIFO warning interrupt status flag (ETNBnTIS.TFWF) are both 1.

## TFUS Timestamp FIFO Update Interrupt Summary Bit

This bit is set to 1 when the timestamp FIFO update interrupt enable bit (ETNBnTIC.TFUE) and timestamp FIFO update interrupt status flag (ETNBnTIS.TFUF) are both 1.

## MS E-MAC Interrupt Summary Bit

This bit is set to 1 when an E-MAC interrupt is issued.

## ES Error Interrupt Summary Bit

This bit is set to 1 when any of the valid bits in the error interrupt status register (ETNBnEIS) is 1 or the queue full error interrupt status bit (ETNBnEIS.QFS) in the error interrupt status register (ETNBnEIS) is 1.

### 26.3.40 ETNBnGCCR — gPTP Configuration Control Register

The ETNBnGCCR register is used to set and control the gPTP (generalized precision time protocol).

```
Access: ETNBnGCCR can be read or written in 32-bit units.
    ETNBnGCCRL can be read or written in16-bit units.
    ETNBnGCCRLL, ETNBnGCCRLH can be read or written in 8-bit units.
Address: ETNBnGCCR: <ETNBn_base> + 0390H
    ETNBnGCCRL: <ETNBn_base> + 0390H
    ETNBnGCCRLL: <ETNBn_base> + 0390H
    ETNBnGCCRLH: <ETNBn_base> + 0390 H}+\mp@subsup{1}{H}{
Value after reset: }0000003\mp@subsup{C}{H}{
```

Table 26.56 ETNBnGCCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1,0 | TCR[1:0] | Timer Control Request |
|  |  | $00_{\mathrm{B}}:$ Timer control is not requested. |
|  | $01_{\mathrm{B}}:$ gPTP/AVTP presentation time reset |  |
|  | $10_{\mathrm{B}}:$ Setting prohibited |  |
|  | $11_{\mathrm{B}}:$ Captures the value set in the TCSS bit. |  |

## TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (ETNBnGCTi.CTV)).

These bits should still be controlled when timer control is not being requested (ETNBnGCCR.TCR $=00_{\mathrm{B}}$ ).

## LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (ETNBnGMTT). Only 1 can be written to the bit.
[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP maximum transit time configuration register (ETNBnGMTT) is loaded.

## LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (ETNBnGPTC). Only 1 can be written to the bit.
[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP presentation time comparison register (ETNBnGPTC) is loaded.

## LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (ETNBnGTI).
Only 1 can be written to the bit.
[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP timer increment configuration register (ETNBnGTI) is loaded.

## LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (ETNBnGTOi).
Only 1 can be written to the bit.

## [Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of gPTP timer offset configuration register i (ETNBnGTOi) is loaded.

## TCR[1:0] Timer Control Request Bits

These bits issue requests for controlling the gPTP timer.
Writing to the bits is only possible when the current operating mode is operation mode.
Do not write to the bits when the gPTP timer clock select bit in the AVB-DMAC mode register is $00_{\mathrm{B}}$.
[Conditions for Changing]
The bits are set to $00_{\mathrm{B}}$ when the operating mode is not operation mode and on completion of the requested processing.

### 26.3.41 ETNBnGMTT — gPTP Maximum Transit Time Configuration Register

The ETNBnGMTT register sets the maximum time for transitions of the gPTP timer.

| Access: <br> Address: |  |  | This register can be read or written in 32-bit units. <br> <ETNBn_base> + 0394H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $00000000_{H}$ |  |  | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | MTTV[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 26.57 ETNBnGMTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MTTV[31:0] | Maximum Transit Time |
|  |  | The maximum transition time for addition to the presentation time |

## MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.
Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (ETNBnGCCR.LMTT) to 1.

## CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (ETNBnGCCR.LMTT) is 1.

### 26.3.42 ETNBnGPTC - gPTP Presentation Time Comparison Register

The ETNBnGPTC register sets a value for comparison with presentation times in the gPTP timer.

| Access: <br> Address: |  |  | This register can be read or written in 32-bit units. <br> <ETNBn_base> + 0398н |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $00000000_{H}$ |  |  | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit | 31 | 30 | 29 | 28 | 27 |  |  |  |  |  |  |  |  |  |  |  |
|  | PTCV[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | PTCV[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 26.58 ETNBnGPTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | PTCV[31:0] | Presentation Time Comparison Value |
|  |  | Value for comparison with the gPTP presentation times |

## PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.
Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (ETNBnGCCR.LPTC) to 1.

## CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (ETNBnGCCR.LPTC) is 1 .
Do not write the range of " $x-1$ to $x+1$ " to the bits. ( $x$ is a value of ETNBnGTI.TIV[27:0])

### 26.3.43 ETNBnGTI — gPTP Timer Increment Configuration Register

The ETNBnGTI register sets the increment for the gPTP timer.

| Access: <br> Address: |  |  | This register can be read or written in 32-bit units. <ETNBn_base> + 039CH |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | TIV[27:16] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TIV[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 26.59 ETNBnGTI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 28 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 27 to 0 | TIV[27:0] | gPTP Timer Increment Value <br> Increment for the gPTP timer |

## TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAV mode register (ETNBnCCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (ETNBnGCCR.LTI) to 1.

## CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (ETNBnGCCR.LTI) is 1.
Do not write 0 to all bits.

### 26.3.44 ETNBnGTOi - gPTP Timer Offset Configuration Register i (i=0 to 2)

The ETNBnGTOi register sets an offset value for the gPTP timer.
The offset value is added to the combination of bits 0 to 31 in ETNBnGTO0, 32 to 63 in ETNBnGTO1, and 64 to 79 in ETNBnGTO2, which together make up the gPTP timer.

Table 26.60 ETNBnGTOi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TOV[95:0] | Timer Offset Value |
|  |  | Offset value for the gPTP timer |

## TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in ETNBnGTO0.TOV[31:0], ETNBnGTO1.TOV[63:32], and ETNBnGTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1 .

## CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (ETNBnGCCR.LTO) is 1.
Write 0000н to ETNBnGTO2.TOV[95:80].
Set a value in the range from 0 to $10^{9}-1\left(00000000^{\text {H }}\right.$ to 3 B9A C9FF ) in ETNBnGTOO.TOV[31:0].

### 26.3.45 ETNBnGIC - gPTP Interrupt Control Register

The ETNBnGIC register is used to control gPTP-related interrupts.

Table 26.61 ETNBnGIC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | PTME | Presentation Time Match Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 1,0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

## PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1 , setting of the presentation time match interrupt flag in the gPTP interrupt status register (ETNBnGIS.PTMF) to 1 leads to generation of that interrupt.

### 26.3.46 ETNBnGIS - gPTP Interrupt Status Register

The ETNBnGIS register indicates the state of the gPTP-related interrupt.

Table 26.62 ETNBnGIS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | PTMF | Presentation Time Match Interrupt Flag |
|  | 0: The interrupt is not pending. |  |
|  | 1: The interrupt is pending. |  |

$1,0 \quad$ Reserved When read, the value after reset is returned. When writing, write the value after reset.

## PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (ETNBnGPTC).
Only 0 can be written to the bit.
[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (ETNBnGPTC).

### 26.3.47 ETNBnGCTi - gPTP Timer Capture Register i (i=0 to 2 )

The ETNBnGCTi registers form an 80-bit register that captures the gPTP timer value.

Table 26.63 ETNBnGCTi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CTV[95:0] | gPTP Timer Capture |
|  |  | Value Captured timer value |

## CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of ETNBnGCT0.CTV[31:0], ETNBnGCT1.CTV[63:32] and ETNBnGCT2.CTV[79:64], which together indicate captured timer values.

When $00_{\mathrm{B}}$ (value of the gPTP timer) or $01_{\mathrm{B}}$ (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS), the corresponding 80-bit values are stored in these bits.

When $10_{\mathrm{B}}$ (AVTP presentation time) is selected by the timer capture source select bits (ETNBnGCCR.TCSS), the corresponding 32-bit values are stored in these bits (ETNBnGCT0.CTV[31:0]).

Actual writing of the timer value specified by the timer capture source select bits (ETNBnGCCR.TCSS) proceeds when $11_{\mathrm{B}}$ (timer capture request) is written to the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR).

Do not read the value while the value of the timer control request bits (ETNBnGCCR.TCR) is $11_{\mathrm{B}}$ because this indicates that storage is still in progress.

## CAUTION

Write 0000 to ETNBnGCT2.CTV[95:80].

### 26.3.48 ETNBnECMR — E-MAC Mode Register

ETNBnECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while the transmission and reception functions are enabled (i.e. while the RE or TE bit in this register is 1 ).

Table 26.64 ETNBnECMR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | TRCCM | Counter Clear Mode <br> 0 : Writing to the counter register leads to the register being cleared to 0 . <br> 1: Reading from the counter register leads to the register being cleared to 0. |
| 25, 24 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | RCSC | Checksum Calculation <br> 0 : Checksums are not automatically calculated. <br> 1: Checksums are automatically calculated. |
| 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | DPAD | Data Padding <br> 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. <br> 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed. |
| 20 | RZPF | PAUSE Frame Reception with Time $=0$ <br> 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. <br> 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled. |
| 19 | ZPF | PAUSE Frame Usage with TIME $=0$ Enable <br> - PAUSE frame usage with TIME $=0$ enable (in full-duplex mode) <br> 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. <br> 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled. |

Table 26.64 ETNBnECMR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 18 | PFR | PAUSE Frame Receive Mode <br> 0: PAUSE frames are not transferred to the AVB-DMAC. <br> 1: PAUSE frames are transferred to the AVB-DMAC. |
| 17 | RXF | Reception Flow Control Operation Mode <br> 0 : Flow control for the receiving port (reception of PAUSE frame) is disabled. <br> 1: Flow control for the receiving port (reception of PAUSE frame) is enabled. |
| 16 | TXF | Transmission Flow Control Operation Mode <br> 0 : Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). <br> 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required). |
| 15 to 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | RE | Reception Enable <br> 0 : Reception is disabled. <br> 1: Reception is enabled. |
| 5 | TE | Transmission Enable <br> 0 : Transmission is disabled. <br> 1: Transmission is enabled. |
| 4 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DM | When Ethernet AVB is used, this bit must be set to 1 (the value after reset is 0 ). |
| 0 | PRM | Promiscuous Mode <br> 0: Normal operation <br> 1: Promiscuous mode operation |

## TRCCM Counter Clear Mode Bit

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

## RCSC Checksum Calculation Bit

Setting this bit to 1 enables automatic calculation of checksums for the data field in received frames.
Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

## DPAD Data Padding Control Bit

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.
When this bit is set to 1 , data are transmitted without padding; when it is set to 0 , data are padded to make up 60-byte units for transmission.

## RZPF (PAUSE Frame Reception with Time = 0) Bit

This bit is set to 0 , received PAUSE frames with the Timer value 0 are discarded.
This bit is set to 1 , release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0 .

## ZPF (PAUSE Frame Usage with TIME = 0 Enable) Bit

- PAUSE frame usage with TIME = 0 enable (In full-duplex mode)

When this bit is set to 0 , the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.
When this bit is set to " 1 ", if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0 .

## PFR PAUSE Frame Receive Mode Bit

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

## RXF (Operating Mode for Flow Control in Reception) Bit

This bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see Section 26.3.57, ETNBnPFRCR

- PAUSE Frame Receive Counter.

Setting this bit to 0 disables PAUSE frame detection.

## TXF (Operating Mode for Flow Control in Transmission) Bit

This bit enables or disables flow control in transmission. Setting this bit to 0 disables PAUSE frame detection.

## RE Reception Enable Bit

When this bit is switched from the receive function enabled $(\mathrm{RE}=1)$ to the receive function disabled $(\mathrm{RE}=0)$, and if there is a frame is being received, the receive function remains enabled until the reception of the frame finishes.

## TE Transmission Enable Bit

When this bit is switched from the transmit function enabled $(T E=1)$ to the transmit function disabled ( $\mathrm{TE}=0$ ), and if there is a frame being transmitted, the transmit function remains enabled until the transmission of the frame finishes.

## DM Duplex Mode Bit

This bit selects full-duplex operation.

## PRM Promiscuous Mode Bit

This bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

### 26.3.49 ETNBnRFLR — Receive Frame Length Register

The ETNBnRFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI.
This register must not be changed while reception is enabled (while the reception enable bit (ETNBnECMR.RE) in the E-MAC mode register is set to " 1 ").

Table 26.65 ETNBnRFLR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 to 0 | RFL[17:0] | Receive Frame Length |
|  |  | Setting value Check value |
|  |  | 00000\%: 1,518 bytes |
|  |  | : |
|  |  | 005EE H: $^{1,518}$ bytes |
|  |  | 005EFH: 1,519 bytes |
|  |  | 005F0н: 1,520 bytes |
|  |  | : |
|  |  | 1FFFFF: 131,071 bytes |
|  |  | 20000\%: 131,072 bytes |
|  |  | : $\quad$ : |
|  |  | 3FFFF ${ }_{\text {H: }}$ 131,072 bytes |

## RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

## CAUTION

The prepared descriptor data size is just the specified value (ETNBnRFLR.RFL[17:0]).
Therefore descriptor data size must be more than ETNBnRFLR.RFL[17:0] + 8 if you will receive such the long frame.

### 26.3.50 ETNBnECSR - E-MAC Status Register

The ETNBnECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits that generate an interrupt, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ETNBnECSIPR) described in Section 26.3.51, ETNBnECSIPR - E-MAC Interrupt Permission

## Register

Table 26.66 ETNBnECSR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | LCHNG | Link signal change bit |
|  |  | 0: Change of Link status signal (AVB_LINK) is not detected. |
|  |  | 1: Change of Link status signal (AVB_LINK) is detected. |
| 1 | Reserved | When read, an undefined value is read. When writing, write the value after reset. |
| 0 | ICD | Illegal Carrier Detection |
|  |  | 0: PHY-LSI has not detected an illegal carrier on the line. |
|  |  | 1: PHY-LSI has detected an illegal carrier on the line. |

## LCHNG: Link Signal Change Bit

This bit indicates a transition of the link status signal (AVB_LINK) input from the PHY-LSI from high to low or low to high.

However, signal changes may also be detected at times when the link status signal (AVB_LINK) function is selected.
To check the current link state, refer to the link status pin state bit in the PHY status register (ETNBnPLSR.LINK).
Writing 1 to this bit clears it to 0 .

## ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0 .

### 26.3.51 ETNBnECSIPR — E-MAC Interrupt Permission Register

The ETNBnECSIPR register instructs permission of interrupt sources reported by the ETNBnECSR register. The bits can permit interrupts corresponding to the ETNBnECSR bits.

| Access: | This register can be read or written in 32-bit units. |
| ---: | :--- |
| Address: | <ETNBn_base> $+0518_{\mathrm{H}}$ |
| Value after reset: | $00000000_{\mathrm{H}}$ |

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | LINKIM | - | ICDIP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

Table 26.67 ETNBnECSIPR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | LINKIM | LINK Interrupt Mask |
|  |  | 0: Interrupts by the LINKI setting prohibited. |
|  | 1: Interrupts by the LINKI setting permitted. |  |
| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ICDIP | False Carrier Detect Interrupt Enable |
|  | $0:$ Interrupts by the ICD bit setting prohibited. |  |
|  |  | 1: Interrupt by the ICD bit setting permitted. |

## LINKIM: Link Signal Change Interrupt Enable Bit

When this bit is set to " 1 " and the link signal change bit (ETNBnECSR.LCHNG) in the E-MAC status register is set to " 1 ", an interrupt occurs.

## ICDIP IIlegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ETNBnECSR.ICD) in the E-MAC status register to 1 .

### 26.3.52 ETNBnPIR — PHY Interface Register

The ETNBnPIR register provides a means of access to the PHY-LSI internal registers via the MII.

| Access: <br> Address: |  |  | This register can be read or written in 32-bit units. <ETNBn_base> + 0520н |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | MDI | MDO | MMD | MDC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | - | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 26.68 ETNBnPIR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | MDI | MII Management Data-In <br> Indicates the level of the ETNBnMDIO pin. |
| 2 | MDO | MII Management Data-Out <br>  <br>  <br> 1 |
|  | Stores data to output from the ETNBnMDIO pin. |  |
| 0 | MII Management Mode |  |
|  | O: Read direction is specified. |  |
|  | 1: Write direction is specified. |  |

## MDI MII Management Data-In Bit

This bit indicates the level of the ETNBnMDIO pin.

## MDO MII Management Data-Out Bit

This bit stores data to output from the ETNBnMDIO pin.
The ETNBnMDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

## MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

## MDC MII Management Data Clock Bit

Values set in this bit are output on the ETNBnMDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see Section 26.4.12, Connection to PHY-LSI.

### 26.3.53 ETNBnPLSR — PHY LINK Status Register

The ETNBnPLSR register is used to check the status of PHY LINK pins.

Access: This register is a read-only register that can be read in 32-bit units.
Address: <ETNBn_base> + 0528н
Value after reset: $00000000_{\mathrm{H}}$

Table 26.69 ETNBnPLSR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | LINK | When read, this bit returns the state of the ETNBnLINK pin. |

### 26.3.54 ETNBnAPFTP - Auto PAUSE Frame Time Parameter Register

The ETNBnAPFTP register is used to set the value for the TIME parameter of automatically generated PAUSE frame. When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

Note 1. The bit-period changes relative to the transfer speed.
100 Mbps : 1 bit-period $=10 \mathrm{~ns}$
10 Mbps : 1 bit-period = 100 ns
Note 2. When setting the Transmission flow control operation mode bit (ETNBnECMR.TXF) in the E-MAC mode register to " 1 ", set this register value other than $00000000_{\mathrm{H}}$.

## APFTP[15:0] Auto Pause Frame Time Parameter

These bit configure the time parameter value for the transmit of Auto Pause Frame. The unit of the setting value is 512 bit-period.

### 26.3.55 ETNBnMPR — Manual PAUSE Frame Register

The ETNBnMPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

Table 26.71 ETNBnMPR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | MP[15:0] | Manual PAUSE <br> These bits set the TIME parameter value of a manual PAUSE frame.* ${ }^{* 1}$ <br> 0000н: Setting prohibited <br> 0001н: $1 \times 512$ bit-period <br> 0002н: $2 \times 512$ bit-period <br> FFFF ${ }_{\text {н }}: 65535 \times 512$ bit-period |

Note 1. The bit-period changes relative to the transfer speed.
100 Mbps: 1 bit-period $=10 \mathrm{~ns}$
10 Mbps : 1 bit-period $=100 \mathrm{~ns}$

## MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames. The unit for the setting is 512 bit periods.

### 26.3.56 ETNBnPFTCR — PAUSE Frame Transmit Counter

The ETNBnPFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Table 26.72 ETNBnPFTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | PFTXC[15:0] | PAUSE Frame Transmit Counter |
|  |  | These bits indicates the number of transmitted PAUSE frames. |

## PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).
The bits are cleared to 0 when they are read.
If counting up and clearing of the counter coincide, clearing the counter takes priority.

### 26.3.57 ETNBnPFRCR — PAUSE Frame Receive Counter

The ETNBnPFRCR register is a counter that indicates the number of times PAUSE frames have been received.

Table 26.73 ETNBnPFRCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. |
| 15 to 0 | PFRXC[15:0] | PAUSE Frame Receive Counter |
|  |  | Counter for counting the number of received PAUSE frames |

## PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ETNBnECMR = 1).

The bits are cleared to 0 when they are read.
If counting up and clearing the counter coincide, clearing the counter takes priority.

### 26.3.58 ETNBnMAHR — MAC Address High Register

The ETNBnMAHR register specifies the 32 higher-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

This register must not be changed while transmission or reception is enabled (E-MAC mode register reception enable bit (ETNBnECMR.RE) is set to " 1 " or transmission enable bit (ETNBnECMR.TE) is set to " 1 ").

Table 26.74 ETNBnMAHR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MA[47:16] | MAC Address Bits 47 to 16 |
|  |  | These bits are used to set the 32 higher-order bits of the MAC address. |

## MA[47:16] MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the MAC address.
For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set $01234567_{\mathrm{H}}$ in the this register.

### 26.3.59 ETNBnMALR — MAC Address Low Register

The ETNBnMALR register specifies the 16 lower-order bits of the 48 -bit MAC address. The settings in this register are normally made in the initialization process after a reset.

This register must not be changed while transmission or reception is enabled (E-MAC mode register reception enable bit (ETNBnECMR.RE) is set to " 1 " or transmission enable bit (ETNBnECMR.TE) is set to " 1 ").

Table 26.75 ETNBnMALR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | MA[15:0] | MAC Address Bits 15 to 0 |
|  |  | These bits are used to set the 16 lower-order bits of the MAC address. |

## MA[15:0] MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the MAC address.
For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set $89 \mathrm{AB}_{\mathrm{H}}$ in the ETNBnMALR register.

### 26.3.60 ETNBnTROCR — Transmit Retry Over Counter Register

In this product, this register is not used because a half-duplex mode is not supported.
It shall be retained the value after reset.
The ETNBnTROCR register is a counter that indicates the number of frames the module was unable to transmit in 16 attempts at transmission including the first attempt and retries. When 16 attempts to transmit a frame fail, this register is incremented by 1 . Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.76 ETNBnTROCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | TROC[15:0] | Transmit Retry Over Counter <br>  <br>  <br>  <br>  <br>  <br> These bits indicate the number of frames the module was unable to transmit in 16 attempts at |

## TROC[15:0] Transmit Retry Over Counter Bits

These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.61 ETNBnCDCR — Late Collision Detect Counter Register

In this product, this register is not used because a half-duplex mode is not supported.
It shall be retained the value after reset.
The ETNBnCDCR register is a counter that indicates the number of all late collisions that occurred on the line after the start of data transmission. Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.77 ETNBnCDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | COSDC[15:0] | Late Collision Detect Counter |

## COSDC[15:0] Collision Detect Counter Bits

These bits indicate the number of all late collisions after the start of data transmission.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.62 ETNBnLCCR — Lost Carrier Counter Register

In this product, this register is not used because a half-duplex mode is not supported.
It shall be retained the value after reset.
The ETNBnLCCR register is a counter that indicates the number of times the carrier was lost during data transmission. Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.78 ETNBnLCCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | LCC[15:0] | Lost Carrier Counter |

## LCC[15:0] Lost Carrier Counter Bits

These bits indicate the number of times the carrier was lost during data transmission.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.63 ETNBnCEFCR — CRC Error Frame Receive Counter Register

The ETNBnCEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.79 ETNBnCEFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | CEFC[15:0] | CRC Error Frame Counter |
|  |  | These bits indicate the number of CRC error frames received. |

## CEFC[15:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.
The bits are cleared to " 0 " when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to " 1 ".

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.64 ETNBnFRECR — Frame Receive Error Counter Register

The ETNBnFRECR register is a counter that indicates the number of frame receive errors were generated by input on the ETNBnRXERR pin from the PHY-LSI. Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.80 ETNBnFRECR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | FREC[15:0] | Frame Receive Error Counter |
|  |  | These bits indicate the number of errors during frame reception. |

## FREC[15:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.65 ETNBnTSFRCR — Too-Short Frame Receive Counter Register

The ETNBnTSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.81 ETNBnTSFRCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | TSFRC[15:0] | Too-Short Frame Receive Counter |
|  |  | These bits indicate the number of frames received with a length of less than 64 bytes. |

## TSFRCR[15:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.66 ETNBnTLFRCR — Too-Long Frame Receive Counter Register

The ETNBnTLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (ETNBnRFLR). Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.82 ETNBnTLFRCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | TLFC[15:0] | Too-Long Frame Receive Counter |
|  |  | These bits indicate the number of frames received with a length exceeding the value in |
|  | ETNBnRFLR. |  |

## TLFRCR[15:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in ETNBnRFLR.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.67 ETNBnRFCR — Residual-Bit Frame Receive Counter Register

The ETNBnRFCR register is a counter that indicates the number of received frames containing "residual bits" (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.83 ETNBnRFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | RFC[15:0] | Residual-Bit Frame Receive Counter |
|  |  | These bits indicate the number of received frames containing residual bits. |

## RFC[15:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.68 ETNBnMAFCR — Multicast Address Frame Receive Counter Register

The ETNBnMAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches $0000 \mathrm{FFFF}_{\mathrm{H}}$.

Table 26.84 ETNBnMAFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | MAFC[15:0] | Multicast Address Frame Counter |
|  |  | These bits indicate the number of multicast frames that have been received. |

## MAFC[15:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.
The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1 .

When ETNBnECMR.TRCCM $=0$, they are cleared to 0 by the writing of any value to this register.

### 26.3.69 ETNBnIFCTL — Communication Interface Control Register

The ETNBnIFCTL register specifies the communication interface.

Access: This register can be read or written in 32-bit units.
Address: <ETNBn_base> + 1000 ${ }_{\text {н }}$
Value after reset: $00000000_{\mathrm{H}}$

Table 26.85 ETNBnIFCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | IFS | This bit selects the communication interface. |
|  | 0: MII mode |  |
|  | 1: Setting prohibited |  |

### 26.4 Operation

The Ethernet AVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. The information is referred to as descriptors. The AVB- DMAC reads data for transmission from the storage area for data to be transmitted and writes received data to the storage area for received data according to the information described in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

### 26.4.1 AVB-DMAC Operating Modes

Figure 26.5, Operating Mode of AVB-DMAC illustrates the operating modes of the AVB-DMAC.
Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset)
- Configuration of the operating mode configuration bits (ETNBnCCC.OPC) in the AVB-DMAC mode register

The current operating mode can be determined by reading the operating mode status bits in the AVB- DMAC status register (ETNBnCSR.OPS).

Figure 26.5 Operating Mode of AVB-DMAC

### 26.4.1.1 Operating Modes

(1) Reset Mode

After a hardware reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

NOTE
When the operating mode transfers to reset mode all registers, except the ETNBnIFCTL register, are initialized to their reset values.
(2) Configuration Mode

In configuration mode, various settings for the AVB-DMAC can be made.
The operating functions are stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.
(3) Operation Mode

In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.
In operation mode, do not set E-MAC again.
(4) Standby Mode

In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used.

### 26.4.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (ETNBnCCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVBDMAC status register (ETNBnCSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (ETNBnCCC.OPC) (Figure 26.6, Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)).
For transitions from operation mode to configuration mode, follow the procedure in Figure 26.7, Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode) because any transmission and reception in progress will be executed before the transition to configuration mode.

Figure 26.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

Figure 26.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (ETNBnCSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

## NOTES

When the operating mode shifts to configuration mode, all status registers are cleared. We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (ETNBnCSR.RPO) and the transmit process status bits (ETNBnCSR.TPOO to 3 ) in the AVB-DMAC status register are set to 0 .
5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (ETNBnCCC.OPC) to initiate the transition to configuration mode.

### 26.4.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.
(1) Hardware Reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

### 26.4.2 Common Control for Transmission and Reception

### 26.4.2.1 Initialization Procedure

Figure 26.8, Outline of the Initialization Procedure shows the overall initialization procedure in outline.

Figure 26.8 Outline of the Initialization Procedure

## (1) Initializing the Receiver Section

Before starting reception, follow the procedure below.
Set the operating mode to operation mode or standby mode, and do not enable reception until the settings for the AVBDMAC are completed.

Figure 26.9 Procedure for Initializing the Receiver Section

## (2) Initializing the Transmitter Section

Figure 26.10, Procedure for Initializing the Transmitter Section illustrates initialization of the transmitter section.

Figure 26.10 Procedure for Initializing the Transmitter Section
(3) Configuration the E-MAC Block

Figure 26.11, Procedure for Configuration the E-MAC Block illustrates configuration of the E-MAC block.

Figure 26.11 Procedure for Configuration the E-MAC Block
(4) Configuration of the Message Handler Section

Figure 26.12, Configuration of the Message Handler Section illustrates configuration the message handler section.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see
Section 26.4.3, Descriptors, and Section 26.4.6, CBS (Credit-Based Shaping).

Figure 26.12 Configuration of the Message Handler Section

### 26.4.2.2 Scheduling Reception and Transmission

The AVB-DMAC normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

Figure 26.13, Schematic View of AVB-DMAC Operations in Transmission and Reception is a schematic view of AVB-DMAC operations in transmission and reception.

Figure 26.13 Schematic View of AVB-DMAC Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

## (1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) has no effect.

Figure 26.14 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (ETNBnTGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) are $00_{\mathrm{B}}$ or $01_{\mathrm{B}}$, the priority order is $\mathrm{Q} 3 \rightarrow \mathrm{Q} 2 \rightarrow \mathrm{Q} 1 \rightarrow \mathrm{Q} 0$.

When the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) are $11_{\mathrm{B}}$, the priority order is $\mathrm{Q} 1 \rightarrow \mathrm{Q} 3 \rightarrow \mathrm{Q} 2 \rightarrow \mathrm{Q} 0$.

### 26.4.2.3 Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

## (1) Concept of Integrity Checking in Reception

The purpose of receive integrity check is to prevent error frames from being stored in the URAM.
If an error frame is stored, information to identify the frame as an error frame is appended to the data from the frame in the URAM.

## CAUTION

If a special descriptor chain is to be used for header/data separation on reception, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

## (2) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.
Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

## (3) Items for Monitoring in Both Reception and Transmission

## (a) Errors in Access to the URAM for Reading of Descriptors

The same descriptor may be processed again because the current descriptor address (ETNBnCDARq.CDA) is not changed.

If this problem occurs in a divided frame, the sequence may be broken.

- In reception
- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.
- In transmission
- The transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0 .
- The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI- Bus.

## (b) Illegal Configuration of a Descriptor by an Application

The same descriptor may be processed again because the current descriptor address (ETNBnCDARq.CDA) is not changed.

If this problem occurs in a divided frame, the sequence may be broken.

- In reception
- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.
- In transmission
- The transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0 .
- The frame will be lost from the transmission FIFO.

## (c) Errors in Access to the URAM for Writing of Descriptors

As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been disengaged.
Errors in access to write descriptors to the URAM are detected from the response signal of the AXI- Bus.

## (4) Items for Monitoring in Reception

## (a) Errors in Access to the URAM for Writing of Data or Timestamps

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- When an access error occurs in a divided frame, the descriptor sequence may be damaged and queues may be unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

## (b) Errors in Access for Reading from the Reception FIFO

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- When an access error occurs in a divided frame, the descriptor sequence may be damaged and queues may be unusable.
- Errors of this type are detected by the ECC checker for the reception FIFO.

## (c) Damaged Data in the Reception FIFO

- Received frames are all invalidated.
- All frames stored in reception FIFO are discarded. At this time, the number of frames and queue information cannot be captured.

If damaged data in the reception FIFO is an error due to the reception FIFO, this is detected by the AVB-DMAC.

## (5) Items for Monitoring in Transmission

## (a) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor: As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
- The current descriptor address (ETNBnCDARq.CDA) is not updated.
- The transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0 .

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

## (b) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

## (c) Errors in Access for Reading of the Transmission FIFO

The AVB-DMAC is incapable of detecting an error in reading of the transmission FIFO, resulting in the transmission of a broken frame.

Errors of this type are detected by the ECC checker for the transmission FIFO.

## (d) Frame size error during transmission

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1997 or more bytes. Such frames are cut out and transmitted.

## (e) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an unexpected frame data may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVBDMAC.

### 26.4.3 Descriptors

### 26.4.3.1 Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.
The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without using the AVB-DMAC.

Figure 26.15, Example of URAM Memory Map shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Respective descriptors can generate interrupts after completion of processing. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see Section 26.4.4.2, Setting Up Reception Descriptors, and Section 26.4.5.2, Setting Up Transmission Descriptors.

Figure 26.15 Example of URAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the URAM.
Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP timestamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the URAM.
The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the residual bytes in the data area are set as unused bytes.

## CAUTION

AVB-DMAC will store the data area pointed by descriptor for specified data size, even if there is no enough space.

### 26.4.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames.
Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see Section 26.4.3.6, Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 26.16, Outline of the Basic Descriptor Chains shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

Figure 26.16 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in Section 26.4.4.2, Setting Up Reception Descriptors, and Section 26.4.5.2, Setting Up Transmission Descriptors.

### 26.4.3.3 Descriptor Base Address Table

Concerning the base address table to be written in the URAM, set the address of the top descriptor of respective queues. Entries 0 to 3 are used to access transmission queues 0 to 3 . Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0 .

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. The link descriptor does not need to be updated because it does not change even after descriptor processing, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.
The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (ETNBnDBAT).
Figure 26.17, Example of a Base Address Table for Reception and Transmission Queues shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains of a topology.

Figure 26.17 Example of a Base Address Table for Reception and Transmission Queues

## CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

### 26.4.3.4 Descriptor Chain Processing

When a descriptor is currently being processed or the queue for a descriptor is active, the current descriptor is a descriptor to be processed. The current descriptor address for use by a queue q can be checked in the current descriptor address register $q$ (ETNBnCDARq).

The current descriptor is stored in a register or descriptor as described below.

- In the descriptor base address table registers for all q queues (ETNBnDBAT) (ETNBnDBAT.TA $+8 \times \mathrm{q}$ ) when the operating mode shifts to operation mode.
- In the descriptor base address table register (ETNBnDBAT) (ETNBnDBAT.TA $+8 \times \mathrm{q})$ when a base address load request is issued for a queue $q$ by setting the corresponding bit (ETNBnDLR.LBAq) in the descriptor base address load request register.
- It is set to DESCR.DPTR when a link descriptor (LINK, LINKFIX) is processed.

After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue ( 8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

### 26.4.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 26.18, Method of Descriptor Interrupt Generation illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (ETNBnDIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (ETNBnDIS.DPFi) being set.

Figure 26.18 Method of Descriptor Interrupt Generation

### 26.4.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 26.86, Summary of Descriptor Types is a summary of the descriptor types available for the AVB-DMAC. Entries under "Name" are the names of the descriptor types and the values under "DT" are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

## Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- The descriptor cannot be changed by hardware (AVB-DMAC).

## Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes the descriptor and subsequently changes the descriptor type.

## Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception). Do not write the value to the descriptor type (DESCR.DT) field.

Hardware does not process the descriptor type. The current descriptor address (ETNBnCDARq.CDA) is not changed even when the queue is of a descriptor type of this setting.

Table 26.86 Summary of Descriptor Types

| Name | DT | Description | Reception | Transmission |
| :---: | :---: | :---: | :---: | :---: |
| Frame data |  |  |  |  |
| FSTART | 5 | Frame Start <br> The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor. | SW | HW |
| FMID | 4 | Frame Middle <br> The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor. | SW | HW |
| FEND | 6 | Frame End <br> The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor. | SW | HW |
| FSINGLE | 7 | Frame Single <br> The descriptor points to valid data for a complete frame. | SW | HW |
| Chain control |  |  |  |  |
| LINK | 8 | Link <br> Defines the next descriptor in the chain. | HW | HW |
| LINKFIX | 9 | Fixed Link <br> Defines the next descriptor in the chain, but not changed by AVB-DMAC after processing. | SW | SW |
| EOS | 10 | End Of Set <br> Control element to split descriptor chain. Chain stops and waits for user interaction. | HW | HW |
| HW/SW arbitration |  |  |  |  |
| FEMPTY | 12 | Frame Empty <br> A descriptor related to frame data but not containing valid data for a frame | HW | SW |
| FEMPTY_IS | 13 | Frame Empty Incremental Start <br> A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an "incremental data area" in the URAM. | HW | Invalid |
| FEMPTY_IC | 14 | Frame Empty Incremental Continue <br> A descriptor related to frame data but not containing valid data for a frame Data indicated by the pointer are for storage in an incremental data area in the URAM. | HW | Invalid |
| FEMPTY_ND | 15 | Frame Empty No Data Storage <br> A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM. | HW | Invalid |
| LEMPTY | 2 | Link Empty <br> A link descriptor for processing by the AVB-DMAC | SW | SW |
| EEMPTY | 3 | EOS Empty <br> An EOS descriptor for processing by the AVB-DMAC | SW | SW |
| DT0 | 0 | Reserved | Invalid | Invalid |
| DT1 | 1 | Reserved | Invalid | Invalid |
| DT11 | 11 | Reserved | Invalid | Invalid |

## (1) Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "-" in the figure).

## (2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)

- Extended descriptor (usable only in reception)

|  | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 26.87 Contents of Frame Data Descriptors (DESCR)

| Bit Name | Function |
| :---: | :---: |
| DT[3:0] | Descriptor Type |
|  | 5: FSTART |
|  | 4: FMID |
|  | 6: FEND |
|  | 7: FSINGLE |
|  | For details, see Section 26.4.4.2, Setting Up Reception Descriptors, and Section 26.4.5.2, Setting Up Transmission Descriptors. |
| DIE[3:0] | Descriptor Interrupt Enable |
|  | $0000_{\mathrm{B}}$ : Descriptor interrupt is disabled. |
|  | $0001_{\mathrm{B}}$ to $1111_{\mathrm{B}}$ : The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi). |
| - | Content Control |
|  | For details, see Section 26.4.4.2, Setting Up Reception Descriptors, and Section 26.4.5.2, Setting Up Transmission Descriptors. |
| DS[11:0] | Data Size |
|  | Size of the data area/frame data for the descriptor (in bytes) |
| DPTR[31:0] | Descriptor Pointer |
|  | Pointer to the data area for the descriptor |
|  | Register an address on a 32-bit boundary. |
| TS[79:0] | Timestamp |
|  | Timestamp of the received frame (only available in extended descriptors) |
| CAUTION |  |

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).
The upper reserved bits of TS[79:0] are set to $0000_{\mathrm{H}}$ after the time stamp is stored.

## (3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor

- Extended descriptor (usable only in reception)

Table 26.88 Contents of Hardware/Software Arbitration Descriptors (DESCR)

| Bit Name | Function |
| :---: | :---: |
| DT[3:0] | Descriptor Type <br> 12: FEMPTY <br> 13: FEMPTY_IS <br> 14: FEMPTY_IC <br> 15: FEMPTY_ND <br> For details, see Table 26.86, Summary of Descriptor Types. |
| DIE[3:0] | Descriptor Interrupt Enable <br> $0000_{\mathrm{B}}$ : Descriptor interrupt is disabled. <br> $0001_{\mathrm{B}}$ to $1111_{\mathrm{B}}$ : The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi). |
| - | Content Control <br> For details, see Section 26.4.4.2, Setting Up Reception Descriptors, and Section 26.4.5.2, Setting Up Transmission Descriptors. |
| DS[11:0] | Data Size <br> Size of the data area/frame data for the descriptor (in bytes) |
| DPTR[31:0] | Descriptor Pointer <br> Pointer to the data area for the descriptor Register an address on a 32-bit boundary. |
| TS[79:0] | Timestamp <br> Timestamp of the received frame (only available in extended descriptors) |
| CAUTION |  |

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).
When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.
In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

## (4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

Table 26.89 Contents of Link Descriptors (DESCR)

| Bit Name | Function |
| :--- | :--- |
| DT[3:0] | Descriptor Type |
|  | 8: LINK |
|  | 9: LINKFIX |
|  | For details, see Table 26.86, Summary of Descriptor Types. |
| DIE[3:0] | Descriptor Interrupt Enable |
|  | $0000_{\mathrm{B}}:$ |
|  | $0001_{\mathrm{B}}$ Descriptor interrupt is disabled. |
|  | Content Control |

|  | Transmission Descriptors. |
| DPTR[31:0] | Descriptor Pointer |
|  | Pointer to the data area for the descriptor |
|  |  |
|  |  |

## CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).
When the descriptor is an extended descriptor, it has a 12-byte unused area.

## (5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

Table 26.90 Contents of Other Descriptors (DESCR)

| Bit Name | Function |
| :--- | :--- |
| DT[3:0] | Descriptor Type |
|  | 10: EOS |
| 12: FEMPTY (only for transmission) |  |
| 2: LEMPTY |  |
| 3: EEMPTY |  |
| For details, see Table 26.86, Summary of Descriptor Types. |  |
| DIE[3:0] | Descriptor Interrupt Enable |
|  | $0000_{\mathrm{B}}:$ |
|  | $0001_{\mathrm{B}}$ to $1111_{\mathrm{B}}:$ |
|  |  |

## CAUTION

When the descriptor is an extended descriptor, it has a 12-byte unused area.

## (6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Frames divided based on a frame data structure can also be supported.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

Figure 26.19, Mapping of Frame Data shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

Figure 26.19 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVBDMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between frame data. In reception, an "incremental data area" can be used to prevent empty spaces. For incremental data areas, see Section 26.4.4.3(2), Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

## (7) How to Use Chain Control Descriptors

## (a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see Section 26.4.3.2, Using Descriptor Chains in Queues)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.
After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). Take care, however, to check the current descriptor address register q (ETNBnCDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

## (b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQq) is cleared.

In reception, when the frame currently received is one divided for storage (e.g., received data whose frames are the FMID type or FEND type for storage), the data is not fully stored and the receive queue full interrupt (ETNBnRIS2.QFFr) is generated.

## (8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

## (a) FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

## (b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

## (c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

## (9) Synchronization between Descriptor Access by Hardware and Software

In primary HW/SW synchronization, the descriptor type (DESCR.DT) allocated to the URAM is usable. This makes it possible to minimize access by the AVB-DMAC to the SFR via the CPU, leading to higher performance.

Basic concepts of synchronization:

- Descriptor sets are allocated so that it is exclusively used by hardware or software, depending on the direction of transmission (see Table 26.86, Summary of Descriptor Types).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type assigned to hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

### 26.4.3.7 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.
They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Make an access to frame data in units of 128-byte blocks maximum.
- Design the descriptor chains in ways that minimize parallelism of processing.

This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.

- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

### 26.4.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.
Create descriptors that define the amounts of frame data to be stored and the locations. After the E- MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the timestamp is also stored. For a description of how to set up descriptors for use in reception, see Section 26.4.4.2, Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see Section 26.4.4.1(1), Separation

## Filtering.

Figure 26.20, Mechanism of General Reception Queue Selection shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

Figure 26.20 Mechanism of General Reception Queue Selection

### 26.4.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

## Detection of an Error During Reception by the E-MAC

- Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (ETNBnRCR.EFFS). If error frames are to be stored (ETNBnRCR.EFFE $=1$ ), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of timestamps for reception queue 0 (best effort) is enabled (the timestamp enable bit in the receive configuration register ETNBnRCR.ETS0 $=1$ ), timestamps are stored even for error frames.
- The separation filter is unable to determine where the frame data should be stored.

## Receive Frame Failure in the Separation Filter

- Whether discarding error frames or storing in reception queue 0 (best effort) depends on the stream filtering select bit (ETNBnRCR.ESF) in the receive configuration register.

The flowchart in Figure 26.21, Mechanism of Reception Queue Selection shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E- MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

Figure 26.21 Mechanism of Reception Queue Selection

## Notes on the Meanings of Entries in the Flowchart

- "Condition for determining network control frames"

The Ethernet destination address (DA) is 01:80:C2:00:00:0E.
The Ethernet type (ET) is 88:F7.

- "Condition for determining IEEE 1722 frames"

The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.
The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00. The Ethernet type (ET) is 22:F0.

- "Condition for separation filter determination"

See Section 26.4.4.1 (1), Separation Filtering.

Figure 26.22, Data Bytes of Ethernet Frames Used in Classification shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

| Data bytes | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Network type | DA1 | DA2 | DA3 | DA4 | DA5 | DA6 | SA1 | SA2 | SA3 | SA4 | SA5 | SA6 | ET1 | ET2 | ... | ... | $\ldots$ | $\ldots$ | ... | $\ldots$ |
| Stream type | DA1 | DA2 | DA3 | DA4 | DA5 | DA6 | SA1 | SA2 | SA3 | SA4 | SA5 | SA6 | VL1 | VL2 | - | - | ET1 | ET2 | ... | ... |

Figure 26.22 Data Bytes of Ethernet Frames Used in Classification

## (1) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (ETNBnSFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (separation filter mask configuration register $\mathrm{i}(\mathrm{ETNBnSFMi}$.CFM)$)$, which limits the separation filter processing to a bit mask that can be set to the lower number of bytes or can be set appropriately.

## Examples

To use one byte in separation, set separation filter mask configuration register 0 (ETNBnSFM0.CFM) to $000000 \mathrm{FF}_{\mathrm{H}}$ and separation filter mask configuration register 1 (ETNBnSFM1.CFM) to $00000000_{\mathrm{H}}$.

To use seven bytes in separation, set separation filter mask configuration register 0 (ETNBnSFM0.CFM) to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ and separation filter mask configuration register 1 (ETNBnSFM1.CFM) to 00FF FFFF ${ }_{H}$.

## CAUTION

If bits at some positions are set to $0 b$ in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to Ob. Only those bits in which the separation filter pattern configuration register i (ETNBnSFPi.FPs) setting is equal to the separation filter mask configuration register i (ETNBnSFMi.CFM) are sorted by matching with received data.

Figure 26.23, Separation Filtering shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

Figure 26.23 Separation Filtering

## (2) Stream Separation

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of "Talker" and "Listener". A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various $\mathrm{A} / \mathrm{V}$ streams are identified by 8 -byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.
The stream ID is a general pattern of the AVB network for identifying one stream. Figure 26.24, IEEE 1722 Frame Layout and Stream ID shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

Figure 26.24 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (ETNBnSFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (ETNBnSFMi) and separation filter pattern (ETNBnSFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in Figure 26.24, IEEE 1722 Frame Layout and Stream ID, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set ETNBnSFM0.CFM to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ and ETNBnSFM1.CFM to FFFF FFFFF $_{\text {H }}$.
- To divide streams from respective talkers into individual queues, set ETNBnSFM0.CFM to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ and ETNBnSFM1.CFM to $0000 \mathrm{FFFF}_{\mathrm{H}}$. This excludes the unique ID from the filter condition.

### 26.4.4.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in Section 26.4.3, Descriptors.
This section describes memory operations that are especially required in handling reception queues.

## (1) Reception Descriptor Types

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.
Table 26.91, Descriptor Types in Reception shows the descriptor types used in reception.
Table 26.91 Descriptor Types in Reception

| Descriptor Type (DESCR.DT) | Operation | Write-back |
| :---: | :---: | :---: |
| Frame Start (FSTART) | No data is stored in receive queues. <br> The ETNBnRIS2.QFFr bit indicates that queue $r$ is full and the received frame is not stored. <br> This descriptor is used again for processing of the next reception, if any. | Not changed |
| Frame Middle (FMID) | Same as FSTART | Not changed |
| Frame End (FEND) | Same as FSTART | Not changed |
| Frame Single (FSINGLE) | Same as FSTART | Not changed |
| Link (LINK) | Processing proceeds to the descriptor specified by DESCR.DPTR. | LEMPTY |
| Fixed Link (LINKFIX) | Same as LINK | Not changed |
| End Of Set (EOS) | A stop point defined by software has been reached. <br> A frame of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. ETNBnRIS2.QFFr indicates that the frame has been lost. <br> If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. <br> In either case, processing shifts to the next descriptor in the chain. | EEMPTY |
| Frame Empty (FEMPTY) | The descriptor can be used to store received data. <br> Up to DESCR.DS bytes are stored in the descriptor data area. <br> For details, see Section 26.4.4.3(1), Storing Frame Data in the Descriptor Data Area. | FSTART, FMID, FEND, or FSINGLE |
| Frame Empty Incremental Start (FEMPTY_IS) | The descriptor can be used to store received data. <br> All data for the frame are stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see Section 26.4.4.3(2), Incremental Data Areas. | FEND or FSINGLE |
| Frame Empty Incremental Continue (FEMPTY_IC) | The descriptor can be used to store received data. <br> The remaining bytes of frame data are stored in the descriptor's data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. <br> For details, see Section 26.4.4.3(2), Incremental Data Areas. | FEND or FSINGLE |
| Frame Empty No Data storage (FEMPTY_ND) | The descriptor can be used to store received data. <br> Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0 . <br> For details, see Section 26.4.4.3(1)(c), No Data are Stored. | FSTART, FMID, FEND or FSINGLE |
| Link Empty (LEMPTY) | Same as FSTART | Not changed |
| EOS Empty (EEMPTY) | Same as FSTART | Not changed |

## (2) Configuration of Reception Frame Data Descriptors

Figure 26.25, Configuration of Descriptor for a Received Frame shows the configuration of descriptors for use with reception queues. The reception- specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in Table 26.92, Configuration of a Received Descriptor.
For the other fields and the descriptor types, see Section 26.4.3.6, Descriptor Type.

Figure 26.25 Configuration of Descriptor for a Received Frame
Table 26.92 Configuration of a Received Descriptor

| Bit Name | Function |
| :---: | :---: |
| MSC | MAC Status Code <br> These bits indicate errors in reception detected by the E-MAC. <br> In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. <br> Details of the bits are as follows. <br> MSC[7]: Received frame has a multicast address. <br> MSC[6]: Fixed to 0 <br> MSC[5]: Fixed to 0 <br> MSC[4]: Received frame has residual bits. <br> MSC[3]: Received frame is too long*1 <br> MSC[2]: Received frame is too short <br> MSC[1]: Error in frame reception*2 <br> MSC[0]: Received frame has a CRC error. |
| PS | Padding Selection <br> These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the ETNBnRPC register. <br> $00_{\mathrm{B}}$ : Padding is not to be inserted. <br> $01_{\mathrm{B}}$ : Padding data may be inserted. This depends on the ETNBnRPC settings. Other settings are prohibited. |
| El | Error Indication <br> This bit indicates the detection of an error in frame data while a frame was being stored. <br> The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted. <br> 0 : No error <br> 1: Error is detected |
| TR | Truncation Indication <br> This bit will be set if received data is more than 4092 bytes, and received data will be truncate to 4092 bytes. These bits are set to the same value within all frame data descriptors for a divided frame. <br> 0 : Data have not been truncated. <br> 1: Data have been truncated. |

Note 1. "Received frame is too long" is set when MAC receive the frame that length is more than ETNBnRFLR configuration value.
Note 2. "Error in frame reception" is set when MAC detect AVB_RX_DV = 1 and AVB_RX_ER = 1 while reception.

## CAUTION

The ETNBnRCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

### 26.4.4.3 Reception Processing

After initialization, the AVB-DMAC becomes able to select a proper reception queue and store it in the descriptor data area in the URAM. Received data is stored into the URAM as long as the descriptor data area capacity suffices.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in
Section 26.4.4.1(1), Separation Filtering. The frames are sorted, truncated, or discarded by the separation filter on reception by the MAC before stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Timestamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler executes storing in the reception queue (see

## Section 26.4.2.2, Scheduling Reception and Transmission).

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

## (1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
- In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
- In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

## (a) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY_ND descriptor is stored in place of the FSINGLE descriptor after processing.

Also, the FEMPTY_IS and FEMPTY_IC descriptors, which always hold the full frame data for the reception FIFO, are stored in place of the FSINGLE descriptor after processing.

## (b) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

## CAUTION

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, handle each storage element separately, and allocate the descriptor type, intending software, after processing.

Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

## (c) No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0 . This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS $=0$ is for the unique identification of the descriptor after writing.

## (2) Incremental Data Areas

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as $\mathrm{A} / \mathrm{V}$ codec modules). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an "incremental data area" function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY_IC) in the descriptor chain to store receive data. Figure 26.27, Reception Queue Using a Common Incremental Data Area shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.
The hardware and software synchronization strategy and performance are also not changed.
It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

Figure 26.26 A Reception Queue Using Individual Descriptor Data Areas

Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas and Figure 26.27, Reception Queue Using a Common Incremental Data Area show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header ((which is treated as one descriptor outside of the range of this example) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so even if the synchronization is off before EOS, AVB-DMAC handles the next descriptor chain as normal. The EOS is not required because the incremental descriptor always stores all data being processed while an incremental data area is in use.

Figure 26.27 Reception Queue Using a Common Incremental Data Area

As Figure 26.27, Reception Queue Using a Common Incremental Data Area shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area that has no empty storage areas between frame data. All empty spaces are allocated to the end of the incremental data areas. Incremental data areas are limited to multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced.
DESCR.DS can be read to check for such empty spaces.
It is not possible to directly control the amount of received data to be stored from the incremental descriptor (FEMPTY_IS, FEMPTY_IC) because other descriptors (FEMPTY and FEMPTY_ND) are also applicable with DESCR.DS. All received data in the chain are always stored in an incremental descriptor.

## (a) Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC) means that a storage area for the maximum of N times the capacity must be prepared.

As Figure 26.27, Reception Queue Using a Common Incremental Data Area shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The DPTR in FEMPTY_IC descriptor indicates the address of next store data.

## (b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

## (c) Padding

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area. The value $00000000_{\mathrm{H}}$ is always used in padding.
Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (ETNBnRPC.PCNT). This padding is repeatedly inserted in accord with the value in the stored data counter (ETNBnRPC.DCN) (from one to 255 32-bit words). When the stored data counter (ETNBnRPC.DCNT) reaches 0 , however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32-bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received from the E-MAC, while B indicates frame data already stored in the descriptor data area (32-bit word units).

Figure 26.28 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

## (3) Mode with Write-Back

Constructing a descriptor chain requires software (see Figure 26.29, Flow of Reception Descriptor Processing (with Write-Back)).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (ETNBnDLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

Figure 26.29 Flow of Reception Descriptor Processing (with Write-Back)

## (4) Support for Reception Timestamps

Capturing reception timestamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception timestamp be appended; this depends on the application. The AVB-DMAC supports reception timestamps based on the gPTP timer by storing timestamps that have been captured when the frame delimiter (SDF) for a received frame starts in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see Section 26.4.7.1, gPTP Timer.

When timestamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, timestamps are always stored for reception queue 1 (Network Control). Timestamps for reception queue 0 (best effort) and reception queue $r$ ( $r \geq 2$; for stream data) can be selected by the timestamp enable bits in the receive configuration register (ETNBnRCR.ETS0 or ETNBnRCR.ETS2).

### 26.4.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (ETNBnUFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (ETNBnRQCi.UFCCr) to select from among the four stop levels for each unread frame counter. The 0 setting disables the stop functions. For how to set this up, see Figure 26.30, Overview of an Unread Frame Counter.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this may unread frame counter may fail in synchronization as described in Section 26.4.4.4(1), Unread Frame (UFC) Synchronization Failure.

Figure 26.30 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is not established, the current unread frame counter value (ETNBnUFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. When the unread frame counter stop function activates, the receive queue full interrupt flag in the receive interrupt status register 2 (ETNBnRIS2.QFFr) is set.

Set the unread frame counter stop level configuration register (ETNBnUFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

## (1) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value

When the value of a counter in an unread frame counter register i (ETNBnUFCVi) ( $\mathrm{i}=0$ to 4 ) reaches 63, synchronization can fail.
The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to 63 .

- A queue not having enough space for a descriptor or the associated data

In this case, the corresponding receive queue full interrupt flag (ETNBnRIS2.QFFr) in receive interrupt status register 2 is set.
If an unread frame counter reaches its stop level write-back mode (ETNBnRQCi.RSM[1:0] $=00_{B}$ ), the receive queue full interrupt flag (ETNBnRIS2.QFFr) in the receive interrupt status register 2 is set. Software must respond to this.

- A problem occurring during access to memory

The unread frame counter may set flags to frames over the number of frames actually usable for a descriptor chain, and consequently, it causes synchronization to fail. To retrieve the correct starting point for operations, use the descriptor base address load request (ETNBnDLR.LBAq) for the given queue.

### 26.4.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see Section 26.4.3, Descriptors).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. Descriptors are retaining information about tags of transmit frames, too. The tag information is used to maintain the relationships between state information and timestamps for the software and the AVB- DMAC. After completion of transmission of frames, information about the statuses and timestamps of transmitted frames are accessible.

### 26.4.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode

Selection of the transmit configuration register transmission queue priority (ETNBnTGC.TQP[1:0] bits set to $01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ).

- Non-AVB transmission mode

Selection of the transmit configuration register transmission queue priority (ETNBnTGC.TQP[1:0] bits set to $00_{B}$ ).

## (1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

## (a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and high-priority queues are reserved for SRP traffic.

The AVB-DMAC supports four traffic classes: SR Class A, SR Class B, Network Control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to Network Control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for Class A and Class B).
- Q1 is for low-bandwidth Network Control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*1, MVRPDU*2, best effort (BE), etc.)

Note 1. MSRPDU: Multiple Stream Registration Protocol Data Unit
Note 2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by ETNBnTGC.TQP[1:0] = 01 ${ }_{B}$ ), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (ETNBnTGC.TQP[1:0] = $11_{B}$ ) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting (ETNBnTGC.TQP[1:0] $=00_{B}$ ) is for non-AVB-mode transmission.

Table 26.93 Default and Alternative Priority Orders in AVB Transmission Mode

| Priority Schemes (AVB Mode) | Priority Order of Queues |
| :--- | :--- |
| AVB mode 1 (Default) | Q3 $($ SR Class A) $>$ Q2 $($ SR Class B) $>$ Q1 $($ NC $)>$ Q0 (BE) |
| AVB mode 2 (Alternative) | Q1 $($ NC $)>$ Q3 $($ SR Class A) $>$ Q2 $($ SR Class $B)>$ Q0 $(B E)$ |

## (b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under Section 8.6.8, Transmission selection, of the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the Class A and Class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues.
For the CBS algorithm, see Section 26.4.6, CBS (Credit-Based Shaping).
When all the following conditions are determined as True, an SR queue (Q3 or Q2) is selected and transmitted at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 26.31, Flow of Selection for Transmission in AVB Mode 1 (Default) and Figure 26.32, Flow of Selection for Transmission in AVB Mode 2 (Alternative) are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

Figure 26.31 Flow of Selection for Transmission in AVB Mode 1 (Default)

Figure 26.32 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

## (2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR Class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP[1:0]) are $00_{\mathrm{B}}$ ), data is fetched for transmission in a strict order of priority (Q3 $>$ Q2 $>$ Q1 $>$ Q0).

Figure 26.33, Flow of Selection for Transmission in Non-AVB Mode shows the flow of selection in non-AVB transmission mode.

Figure 26.33 Flow of Selection for Transmission in Non-AVB Mode

## (3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.
The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration $t$ bits in the transmit control register (ETNBnTGC.TBDt). The maximum number of clusters required can be determined from the maximum length of frames for transmission from the queue $t$.

## General Usage Examples:

Q0: Frames containing up to 1500 bytes $\rightarrow 1500 / 128=11.7 \rightarrow 12$ clusters
Q1: Frames containing up to 1024 bytes $\rightarrow 1024 / 128=8.0 \rightarrow 8$ clusters
Q3: Frames containing up to 1996 bytes $\rightarrow 1996 / 128=15.6 \rightarrow 16$ clusters
Q4: Frames containing up to 1996 bytes $\rightarrow 1996 / 128=15.6 \rightarrow 16$ clusters
When the depth of all transmission queues is 2 , the following number of clusters is required.
$2 \times(12+8+16+16)+16=2 \times 52+16=120$

### 26.4.5.2 Setting Up Transmission Descriptors

## (1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.
Table 26.94, Descriptor Types in Transmission shows the descriptor types used in transmission.
Table 26.94 Descriptor Types in Transmission

| Descriptor Type <br> (DESCR.DT) | Operation | Write-back |  |
| :--- | :--- | :--- | :--- |
| Frame Start (FSTART) | The AVB-DMAC fetches the first of the data for the divided frame and proceeds to <br> processing of the next descriptor. | FEMPTY |  |
| Frame Middle (FMID) | The AVB-DMAC fetches the second or subsequent data for the divided frame and <br> proceeds to processing of the next descriptor. | FEMPTY |  |
| Frame End (FEND) | The AVB-DMAC fetches the last of the data for the divided frame. <br> When the frame of data that has been fetched to the transmission FIFO is ready for <br> transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next <br> descriptor. | FEMPTY |  |
| Frame Single (FSINGLE) | The AVB-DMAC fetches the frame of data. <br> When the frame of data that has been fetched to the transmission FIFO is ready for <br> transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next <br> descriptor. | FEMPTY |  |
| Processing proceeds to the descriptor specified by DESCR.DPTR. | LEMPTY |  |  |
| Fixed Link (LINKFIX) | Same as LINK Not changed <br> End Of Set (EOS) This is a transmission stop point defined by software <br> This leads to clearing of the transmit start request bit (ETNBnTCCR.TSRQt), which <br> stops transmission. <br> When the ETNBnTCCR.TSRQt is again set to 1 (a new transmission start request is <br> issued), processing proceeds to the next descriptor. <br> Fink Empty (LEMPTY) Same as FEMPTY EEMPTY <br> Same as FEMPTY Not changed |  |  |

## (2) Configuration of Transmission Frame Data Descriptors

Figure 26.34, Configuration of Descriptor for a Transmitted Frame shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in
Table 26.95, Configuration of a Transmission Descriptor.
For the other fields and the descriptor types, see Section 26.4.3.6, Descriptor Type.

Figure 26.34 Configuration of Descriptor for a Transmitted Frame

Table 26.95 Configuration of a Transmission Descriptor

| Bit Name | Function |
| :--- | :--- |
| TSR | Timestamp Store Request |
|  | This bit specifies whether the transmission timestamp is to be stored within the EthernetAVB module. |
|  | 0: The timestamp FIFO within the EthernetAVB module does not retain a transmission timestamp. |
|  | 1: The timestamp FIFO within the EthernetAVB module retains a transmission timestamp. |
|  | Only control this bit while the current DESCR.DT is FEND or FSINGLE. |
| TAG | Frame Tag |
|  | This TAG field is used to associate each frame data with a timestamp. Frame TAG is not required but is |
|  | recommended. |
|  | Only control this bit while the current DESCR.DT is FEND or FSINGLE. |

For the timestamp FIFO function, see Section 26.4.5.4, Timestamping in Transmission.

### 26.4.5.3 Transmission

## (1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) starts the transfer of frames to the corresponding transmission queue.

The descriptor to the current descriptor address of the queue (ETNBnCDARq.CDA) is read first.
If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in Section 26.4.3, Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue that is currently being processed in the descriptor base address load request register, ETNBnDLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 26.35, Descriptor Processing During Transmission shows descriptor processing during transmission.

Figure 26.35 Descriptor Processing During Transmission

## (2) Examples of Descriptor Usage

## (a) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as HW/SW synchronization stop points.
Create descriptor chains that have FEMTPY descriptors at the stop points.
Figure 26.36, Software Flow for Immediate Frame Transmission shows the flow for software implementing this pattern.

Figure 26.36 Software Flow for Immediate Frame Transmission

Figure 26.37, Software and AVB-DMAC Operations for Immediate Frame Transmission shows software and AVB-DMAC operations for immediate frame transmission.

Figure 26.37 Software and AVB-DMAC Operations for Immediate Frame Transmission

## (b) Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

Start by creating a descriptor chain that has a FEMPTY descriptor at its stop point.
Figure 26.38, Software Flow for Frame Set Transmission with Changing of the Active Descriptor
Chain shows the software flow in this pattern.

Figure 26.38 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 26.39, SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain shows software and AVB-DMAC operations for frame set transmission.

Figure 26.39 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

## (c) Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified into the active chain and shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMTPY descriptors at the stop points.
Figure 26.40, Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain shows the flow for software implementing this pattern.

Figure 26.40 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 26.41, SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain shows software and AVB-DMAC operations for frame set transmission.

Figure 26.41 SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

### 26.4.5.4 Timestamping in Transmission

Transmission timestamps are important in satisfying the requirements for time synchronization of the IEEE 802.1AS standard. This information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of timestamps for transmitted frames. The timestamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the timestamp storage request field (DESCR.TSR) is set to 1 , selecting storage of a timestamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the timestamp. To make identification and association easy, the values of timestamp are stored together with tag numbers. The timestamp FIFO is accessible at any time.

Figure 26.42, Mechanism to Support Transmission Timestamps shows the mechanism supporting transmission timestamping.

Figure 26.42 Mechanism to Support Transmission Timestamps

The method of using this function is described below:

1. Secure space in the URAM for the frame requiring timestamping.

Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the timestamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. The timestamp storage request field (DESCR.TSR) is 1 , so it recognizes that transmitting this frame also requires storage of the timestamp.
3. The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling. 3a: The frame tag field (DESCR.TAG) and timestamp storage request field (DESCR.TSR) are stored with the fetched data.)
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler determines the time to transmit frame 1.
5. Transmission of frame 1 starts.

5a: The information relating to frame 1 is stored in the timestamp FIFO.
6. The gPTP timestamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag in the timestamp FIFO. On completion of the transmission, an interrupt is generated. For this to happen, the descriptor interrupt control register (ETNBnDIC) must be set beforehand.
7. The entry can now be read from the timestamp FIFO.

Use the timestamp FIFO for the time synchronization of frames with IEEE 802.1AS compliance.
Timestamping can also be used with other frames, but take care not to allow the timestamp FIFO to overflow. When the FIFO is full, further timestamps supplied to it are lost.

Figure 26.43 Flow of Transmission Timestamping

## (1) Ending Transmission

Figure 26.44, Procedures for Ending Transmission shows the procedure for ending transmission.

Figure 26.44 Procedures for Ending Transmission

### 26.4.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (ETNBnTGC.TQP) is 01B or 11B), transmission queues Q3 and Q2 are respectively assigned to Class A and Class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see Section 8.6 .8 or Section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the "right" to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue $t$ in the AVB-DMAC status register (ETNBnCSR.TPOt) being clear ( 0 ). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidth.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

```
portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.
bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.
idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the
    credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total
    bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from
    the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.
    idleSlope = bandwidthFraction }\times\mathrm{ portTransmitRate
sendSlope: Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the
    credit value is decreasing. (in bits per second).
    The value of sendSlope is defined as follows: sendSlope = idleSlope - portTransmitRate
```

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

```
maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port
maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed
hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit =
    maxInterferenceSize > (idleSlope / portTransmitRate)
loCredit: Minimum credit value (negative number). Can be calculated by using the following equation: loCredit =
    maxFrameSize }\times\mathrm{ (sendSlope / portTransmitRate)
```

Figure 26.45, CBS (Credit-Based Shaping) Operation shows how the CBS algorithm works and the meaning of the above parameters.

Figure 26.45 CBS (Credit-Based Shaping) Operation

Figure 26.46, CBS (Credit-Based Shaping) Operation in the AVB-DMAC shows the implementation of CBS in the AVB-DMAC.

Figure 26.46 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The above implementation is based on "credit counters" for the respective traffic classes (SR Class A and Class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number
The credit is incremented by this amount every peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).
CBS decrement value (CDV): Signed negative number
The credit is decremented by this amount every peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.
CIV $=$ idleSlope $\times$ Mfactor
CDV $=$ sendSlope $\times$ Mfactor
Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.
CIV $=($ portTransmitRate/CHI_freq $) \times$ bwFraction $\times$ Mfactor
CDV $=($ portTransmitRate $/$ CHI_freq $) \times($ bwFraction -1$) \times$ Mfactor
CHI_freq is the frequency of the peripheral bus clock. The credit counters are driven by the peripheral bus clock, so calculating the slope parameters for CBS requires (1/CHI_freq).

Use software to prepare Mfactor for the CBS parameters. All queues for the same Class must have the same CBS parameters. Mfactor for a specified Class c can be changed during operation, unless transmission is pending for that Class (i.e. the transmit process status bit in the AVB-DMAC status register $($ ETNBnCSR.TPOt $)=0$ ). At that time, the credit counter values for Class A and Class B are 0 .

Note that the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers c (ETNBnCIVRc) and the CBS decrement value registers c (ETNBnCDVRc). These are treated as dynamic settings since they should be updated when streams are registered or erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers c (ETNBnCULc) (the upper limit registers for Classes A and B) and CBS lower limit registers c (ETNBnCLLc) (the lower limit registers for Classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

CUL $=$ hiCredit $\times$ Mfactor $=$ maxInterferenceSize $\times$ bwFraction $\times$ Mfactor
CLL $=$ loCredit $\times$ Mfactor $=$ maxFrameSize $\times($ bwFraction -1$) \times$ Mfactor

## Example:

Assume that portTransmitRate $=100 \mathrm{Mbps}$, CHI_freq $=60 \mathrm{MHz}$ and bwFraction $=3 \%$.
Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.
idleSlope $=($ portTransmitRate/CHI_freq $) \times$ bwFraction $=100 / 60(\mathrm{Mbps} / \mathrm{MHz}) \times 3 \%=0.050$ of a bit per peripheral bus clock cycle
sendSlope $=$ idleSlope $-($ portTransmitRate $/$ CHI_freq $)=-1.616$ bits per peripheral bus clock cycle Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

CIV $=$ idleSlope $\times$ Mfactor $=5.0$
CDV $=$ sendSlope $\times$ Mfactor $=-161.6$

### 26.4.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for Class A and Class B are calculated as follows.

## <Conditions>

- Class A maximum value (hiCredit_max_classA)
classA bwFraction $\cong 100 \%$
Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.
hiCredit_max_classA $\cong$ maxInterferenceSize for Class A = Interference due to one max. sized
frame $=$ header + max. size payload + CRC (2000 bytes) + preamble ( 8 bytes) + IFG (12 bytes) + processing_delay ( $\cong 80$ bytes $) \cong 2100$ bytes
- Class B maximum value (hiCredit_max_classB)
classB bwFraction $\cong 100 \%$
Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the Class A transmission queue and other transmission queues.
hiCredit_max_classB $\cong$ maxInterferenceSize for Class B = Interference due to two max-size frames $=2 \times$ hiCredit_max_classA $\cong 4200$ bytes
hiCredit_max_classA $=16800$
hiCredit_max_classB $=33600$
The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:
Mfactor_max_classA $=2^{31}-1 /$ hiCredit_max_classA $\cong 127826$ and
Mfactor_max_classB $=2^{31}-1 /$ hiCredit_max_classB $\cong 63913$.
A high degree of accuracy can be achieved even with a low bandwidth. In Class B, bandwidthFraction $=0.05 \%$ and the bandwidth error < 0.1 \%.
The maximum value of CIV is calculated from the following equation.
CIV $=$ idleSlope $\times$ Mfactor $=($ portTransmitRate $/$ CHI_freq $) \times$ bandwidthFraction $\times$ Mfactor
When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to $100 \%$ ):
CIV_max_classA $=($ portTransmitRate $/$ CHI_freq $) \times$ Mfactor_max_classA and
CIV_max_classB $=($ portTransmitRate $/$ CHI_freq $) \times$ Mfactor_max_classB.
Table 26.96, Example of Maximum Values for Class A and Class B CIV Parameters shows examples of values for portTransmitRate and peripheral clock frequency. Note that the values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of CIV $\leq 65535$ applies to both Class A and Class B.

Table 26.96 Example of Maximum Values for Class A and Class B CIV Parameters

| portTransmitRate | clk_chi[MHz] | CIV_max_classA | CIV_max_classB |
| :--- | :--- | :--- | :--- |
| 100 Mbps | 50 | 255652 | 127826 |
| 100 Mbps | 60 | 213043 | 106521 |

### 26.4.6.2 Credit Incrementation During Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CSB credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit.
Figure 26.47, Credit Operations during IFGs illustrates credit operations during IFGs.

Figure 26.47 Credit Operations during IFGs

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR Class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR Classes does not exceed $100 \%$ of portTransmitRate. This is described in Section 35.2.2.8.4 of IEEE 802.1Q.

### 26.4.6.3 Example

The case of a Class A $48-\mathrm{kHz}$ stereo audio stream among Ethernet frames is described as an example.
After every Class A measurement interval ( $125 \mu \mathrm{~s}$ ), 80 octets consisting of two sets of six 32-bit samples plus a 32octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8 -octet preamble, 14-octet IEEE 802.3 header, 4 -octet IEEE 802.1Q priority/VID Tag, 4 -octet CRC, and 12 -octet IFG) are also added. Accordingly, the total frame size is $80+42=122$, and one such frame is transmitted after every class measurement interval.
This represents a total bandwidth of about 7.8 Mbits per second (122 octets $\times 8$ bits per octet $\times 8000$ frames per second) for this class. If the E-MAC is assumed to run at 100 Mbps (portTransmitRate), this is equivalent to the allocation of about 7.8 \% of the total bandwidth to each Class A queue. If other traffic classes are to share the total transmission bandwidth, checking that this 7.8 \% allocation does not lead to the total allocation of bandwidth being greater than $100 \%$ of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size must not include the IFG. For this case, therefore, we obtain an 80 -bit payload +30 -bit overhead $=110$-octet measurement interval for the class $\rightarrow$ the total bandwidth for the class $=7.04 \mathrm{Mbps}=7.04 \%$ of portTransmitRate.

Figure 26.48 Example of CBS Settings

## Given that:

- the E-MAC runs at 100 Mbps , so portTransmitRate $=100 \mathrm{Mbps}$ and
- Peripheral bus clock (operating clock for the credit counter) frequency $=60 \mathrm{MHz}$, securing a bandwidth of 7.04 Mbits/sec for Class A requires configuring the CBS parameters as follows.
- bandwidthFraction $=7.04 \%$
- idleSlope $=($ portTransmitRate $/$ CHI_freq $) \times$ bandwidthFraction $\cong 0.1173$ bits per peripheral bus clock cycle
- sendSlope $=$ idleSlope $-($ portTransmitRate $/$ CHI_freq $) \cong-1.5493$ bits per peripheral bus clock cycle

When Mfactor $=100$, the parameters are as follows.

- CIV $=$ idleSlope $\times$ Mfactor $=11.7333$ bits per peripheral bus clock cycle
- $\mathrm{CDV}=$ sendSlope $\times$ Mfactor $=-154.9333$ bits per peripheral bus clock cycle

These are the final values for setting in the ETNBnCIVR1 and ETNBnCDVR1 registers.

### 26.4.7 IEEE802.1: gPTP

### 26.4.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. Figure 26.49, Definitions of gPTP Timer Bits and
Related Bits shows the definitions of bits for the timer and in related registers. gPTP timer will start after ETNBnCCC.CSEL configure and transit to operation mode.

Figure 26.49 Definitions of gPTP Timer Bits and Related Bits

The higher-order 32 bits indicate seconds. For the next 32 bits, counting by one corresponds to the passage of 1 ns . The lower-order 20 bits are a fractional value (less than 1 ns ). Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32 -bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns , are not readable. They are only used within the AVB-DMAC to maintain accuracy in time measurement.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to $01_{\mathrm{B}}$. These bits are set to $00_{\mathrm{B}}$ on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment register (ETNBnGTI.TIV) is added to the value of the gPTP timer every clock cycle.

After setting a value in the gPTP timer increment register (ETNBnGTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (ETNBnGCCR.LTI). If this bit is not set to 1 , new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the gPTP timer offset register (ETNBnGTOi.TOV). After setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (ETNBnGCCR.LTO). If this bit is not set to 1 , new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. When adding an offset, take care that it does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture register (ETNBnGCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to $11_{\mathrm{B}}$ initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) returns to $00_{\mathrm{B}}$.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

### 26.4.7.2 Free-Running Operation

The IEEE 802.1 AS standard for timing and synchronization does not prescribe the physical adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a freerunning timer.

As a free-running timer, the timer counts the local time in seconds or nanoseconds. The gPTP timer increment register (ETNBnGTI.TIV) is set to 1 ns (the setting value $=00100000_{\mathrm{H}}$ ) and the gPTP timer offset register (ETNBnGTOi.TOV) is set to 0 . The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

### 26.4.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value (in the gPTP timer offset registers, ETNBnGTOi.TOV) to correct for offsets from the theoretical value (at start-up, etc.). The sum of the timer value and the offset register is the "corrected timer" value.

Note that only the nanoseconds portion of the gPTP timer offset registers (ETNBnGTOi.TOV[31:0]) is valid.
The following equation gives a method of calculating the increment (ETNBnGTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable $d$ is the deviation ( $\mathrm{d}=10^{-6}$ for 1 ppm ).

$$
\text { ETNBnGTI.TIV }=\text { round }\left(\frac{2^{20} G H z}{f_{G P T P}} \times(1+d)\right)
$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (ETNBnGTI.TIV). After calculating the new offset value, re-set the gPTP timer offset register (ETNBnGTOi.TOV).

### 26.4.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the timestamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured timestamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the timestamp FIFO. The timestamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to the SDF notification and the asynchronous interface between the timer modules must also be taken into account.

### 26.4.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation timestamps

The 32-bit AVTP timestamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP timestamp enable bit in the frame is 1 . The AVTP timestamp field is generated from the pPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.
AVTP timestamp $=\left(\right.$ gPTP_seconds $\times 10^{9}+$ gPTP_nanoseconds $)$ modulo $2^{32}$
The AVTP presentation time can be read from the gPTP timer capture register (ETNBnGCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to $11_{\mathrm{B}}$ initiates the capture. The value is obtained by adding the maximum transit time defined in the gPTP maximum transit time register (ETNBnGMTT.MTTV) to the corrected timer value. The AVTP presentation time wraps around approximately every four seconds.

## CAUTION

The AVTP presentation time captured in ETNBnGCTi.CTV is only valid when the corrected timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected timer value must be adjusted during the synchronization procedure so that the corrected gPTP clock is physically adjusted to match the time kept by the Grandmaster clock.

### 26.4.9 Flow Control

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.
(1) PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (ETNBnMPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.
(2) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the operation mode for flow control in reception in the E-MAC mode register (ETNBnECMR.RXF) is set to " 1 ". The number of received PAUSE frames is counted.
(3) PAUSE Frames with the Timer Value 0

The setting of the 0-time PAUSE frame enable bit (ETNBnECMR.ZPF) enables or disables the reception and transmission of PAUSE frames with the TIME parameter value 0 .

- When control of PAUSE frames with the TIME parameter value 0 is enabled

A PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the Receive FIFO Warning Level bits (ETNBnRCR.RFCL[12:0]) while the time indicated by the TIME parameter value has not elapsed.
Reception of a PAUSE frame with the TIME parameter value 0 leads to release from the transmission standby state.

- When control of PAUSE frames with the TIME parameter value 0 is disabled PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

### 26.4.10 Interrupts

The EthernetAVB module has three EI level interrupts from the AVB-DMAC and one EI level interrupt from the EMAC.

Table 26.97, EthernetAVB Interrupts lists interrupts.
Table 26.97 EthernetAVB Interrupts

| Interrupt Source Name |
| :--- |
| Transmit/receive data management interrupt |
| Error management interrupt |
| Other management (FIFO caution level, etc.) interrupt |
| E-MAC interrupt |

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (38 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as three of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (ETNBnDIS)
- Error interrupt status register (ETNBnEIS)
- Receive interrupt status register (ETNBnRIS0 to 2)
- Transmit interrupt status register (ETNBnTIS)
- gPTP interrupt status register (ETNBnGIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ETNBnISS) and the queue full error interrupt status bit in the error interrupt status register (ETNBnEIS.QFS). This reduces the load on the CPU.

### 26.4.10.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the following interrupt sources are generated:

- Receive frame interrupt in the receive interrupt status register 0 (ETNBnRIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (ETNBnDIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt summary bits in the interrupt summary status register (ETNBnISS.DPSi) or the receive FIFO warning interrupt summary bit (ETNBnISS.RFWS).

### 26.4.10.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Timestamp FIFO full error interrupt in the error interrupt status register (ETNBnEIS.TFFF)
- CBS limitation interrupts in the error interrupt status register (ETNBnEIS.CULF1, ETNBnEIS.CULF0, ETNBnEIS.CLLF1, ETNBnEIS.CLLF0)
- Separation Error in the error interrupt status register (ETNBnEIS.SEF)
- Queue Error in the error interrupt status register (ETNBnEIS.QEF)
- MAC Transmission Error in the error interrupt status register (ETNBnEIS.MTEF)
- MAC Reception Error in the error interrupt status register (ETNBnEIS.MREF)
- Receive FIFO full interrupt in the receive interrupt status register 2 (ETNBnRIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (ETNBnRIS2.QFFr)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.ES).

### 26.4.10.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.
(1) Reception related interrupt

Receive FIFO warning interrupt in the receive interrupt status register 1 (ETNBnRIS1.RFWF)
(2) Transmission related interrupts

Timestamp FIFO warning interrupt in the transmit interrupt status register (ETNBnTIS.TFWF) Timestamp FIFO update interrupt in the transmit interrupt status register (ETNBnTIS.TFUF)
(3) gPTP related interrupts

AVTP presentation time match interrupt in the gPTP interrupt status register (ETNBnGIS.PTMF)
The general error interrupt state can be checked by reading the receive FIFO warning error interrupt status bit in the interrupt summary status register (ETNBnISS.RFWS), the timestamp FIFO warning interrupt status bit (ETNBnISS.TFWS), the timestamp FIFO update interrupt status bit (ETNBnISS.TFUS), and the gPTP Interrupt Summary (ETNBnISS.CGIS).

### 26.4.10.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.
The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ETNBnISS.MS).

### 26.4.11 Flows of Operations

### 26.4.11.1 Flow of E-MAC Initialization

Figure 26.50, Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation) shows the flow of E-MAC initialization (for AVB mode and full-duplex operation).

Figure 26.68 MII Fame Receive Timing (Reception Error (2))

### 26.4.12.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via ETNBnPIR in this LSI. ETNBnPIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3 $\mu$.

## (1) MII Management Frame Format

Figure 26.69, MII Management Frame Format shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in (2), MII Register Access Procedure.

| Access Type | MII Management Frame |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE |  |
| Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 |  |  |
| Read | $1 . .1$ | 01 | 10 | 00001 | RRRRR | Z0 $^{* 1}$ | D..D |  |  |
| Write | $1 . .1$ | 01 | 01 | 00001 | RRRRR | 10 | D..D | X |  |

## Remark:

PRE: 32 consecutive 1 s
ST: Write of 01B indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of $00001_{\mathrm{B}}$ if the PHY-LSI address is 1 (sequential write starting with the MSB). This bit changes depending on the PHY-LSI register address.
REGAD: Write of $0001_{\mathrm{B}}$ if the register address is 1 (sequential write starting with the MSB). This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: $10_{B}$ written
(b) Read: Bus release (notation: ZO) performed

DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read

IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Note 1. The 2nd bit of TA only the ETNBnPIR.MDC bit should be written and ETNBnPIR.MMD should remain 0 .

Figure 26.69 MII Management Frame Format

## (2) MII Register Access Procedure

The program accesses MII registers via ETNBnPIR. Access is implemented by a combination of 1-bit- unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 26.70, 1-Bit Data Write Flowchart to
Figure 26.73, Independent Bus Release Flowchart (IDLE in Write in Figure 26.69) show the MII register access timing. The timing will differ depending on the PHY-LSI type.

Figure 26.70 1-Bit Data Write Flowchart

Figure 26.72 1-Bit Data Read Flowchart

Figure 26.73 Independent Bus Release Flowchart (IDLE in Write in Figure 26.69)

### 26.4.13 Usage Notes

### 26.4.13.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 26.74, Data Subject to Checksum Calculation shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 26.75, Data after Checksum Data Addition shows schematics of Ethernet frames to which the checksum data has been added.

## CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

Figure 26.74 Data Subject to Checksum Calculation

Schematic of an Ethernet frame (without VLANtag)

Schematic of an Ethernet frame (with VLANtag)

Figure 26.75 Data after Checksum Data Addition

### 26.4.13.2 Rx-FIFO Read Error May Not be Flagged when Using FEMPTY_ND Descriptor

After reading the last byte targeted to the FEMPTY_ND descriptor, there can be up to 3 bytes read from Rx-FIFO targeted to the next descriptor of the same frame. Rx-FIFO read errors of not stored data due to FEMPTY_ND are neither flagged in DESCR.EI nor by ETNBnEIS.QEF as per target specification.

When external ECC logic flags detect Rx-FIFO read error related to last byte targeted to FEMPTY_ND descriptor, data in the next descriptor may be corrupted without notification.

The issue is limited to implementations where Rx-FIFO error information is provided to Ethernet AVB and also to applications using FEMPTY_ND descriptor.

The issue only occurs when the first byte saved in the descriptor following FEMPTY_ND is not a multiple of 4 bytes inside the received frame.

Use a FEMPTY descriptor to store unwanted data if consistent error flagging is required.

### 26.4.13.3 When Trying to Release Non-Existing Timestamp FIFO Entry, New FIFO Update Flag May be Lost

When SW releases an entry of timestamp FIFO by writing ETNBnTCCR.TFR while this FIFO is empty (ETNBnTSR.TFFL is set to 0 ), flagging of next FIFO update may be inconsistent. The next timestamp is correctly stored in FIFO and the fill level is incremented to 1 but ETNBnTIS.TFUF is not set to 1 .

The issue is limited to applications releasing FIFO entries without checking if there are entries available.
Do not release not existing FIFO entries.

### 26.4.13.4 gPTP Compare May Fail for Range of Compare Values

When the comparison value (ETNBnGPTC.PTCV) is in the range of $[x-1$ to $x+1]$ ( $x$ is the configured increment value in ETNBnGTI.TIV), it may happen that a comparison match is not detected when Timer wraps around.

The issue is limited to applications using the AVTP comparison function. Do not configure comparison values inside the critical range.

### 26.4.13.5 UFC Stop Level Triggers ETNBnRIS2.QFFr Even No Received Frame is Lost

When a received frame is dropped due to non-availability of empty descriptor, ETNBnRIS2.QFFr is correctly set to 1 .
Additionally, when ETNBnUFCVi.CVr reached the configured stop level (ETNBnUFCS.SLj), the queue full flag (ETNBnRIS2.QFFr) is set to 1 even before any further received frame is dropped.

The issue is limited to applications using unread frame counter with stop level function.
Such application gets information about lost received frames which in fact might not have lost.

### 26.4.13.6 ETNBnRIS0.FRFr may be lost when Data Processing Stops Close to or Below the Configured Warning Level.

When SW decrements UFC counter value (CV) to WL-1, resulting CV can still be WL due to recent new storage completion, ETNBnRIS0.FRFr is set to 0 .

Any further reception will set ETNBnRIS0.FRFr as normal.
The issue is limited to applications using a single frame interrupt triggered by ETNBnRIS0.FRFr and not be able to process each interrupt in time.

The missing interrupt due to this effect is automatically recovered by the next frame reception as usual.

### 26.4.13.7 Notes on Using the Intelligent Checksum Function

The checksum calculation using the intelligent checksum function is not affected by the padding insertion specified by the receive data padding configuration register (ETNBnRPC). This is because the checksum calculation is performed when transferring the receive data from E-MAC to AVB-DMAC, while the padding of the receive data is performed when transferring the receive data from AVB-DMAC to the receive buffer in memory.

### 26.4.13.8 Receive Frame Interrupt and Descriptor Interrupt may be issued before Completion of Writing Data

When receive frame interrupt is issued, the software should check that the descriptor type is updated correctly before processing the frame data.

The descriptor type is shown in the descriptor field DESCR.DT (the address of the current descriptor is shown by the register ETNBnCDARq). If DESCR.DT is not yet updated by the DMA hardware (e.g. from FEMPTY to FEND), then the write of data to the memory is not completed. In that case the software should repeat checking the descriptor type until an update has happened.

Alternatively the software can use the Unread Frame Counter (UFC) value to compare with its processed descriptors to confirm there is no missing descriptor from the last received interrupt.

### 26.5 Detection and Correction of Errors in Ethernet AVB RAM

For details of ECC, see Section 40A.2.6, ECC for Peripheral RAM, Section 40B.2.6, ECC for Peripheral RAM.

## Section 27 Single Edge Nibble Transmission (RSENT)

This section contains a generic description of the Renesas single edge nibble transmission (RSENT).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RSENT.

### 27.1 Features of RH850/F1KH, RH850/F1KM RSENT

### 27.1.1 Number of Units

This microcontroller has the following number of RSENT units.
Each RSENT unit has single channel interface.
Table $27.1 \quad$ Number of Units (RH850/F1KH-D8)

|  | RH850/F1KH-D8 | RH850/F1KH-D8 | RH850/F1KH-D8 |
| :--- | :--- | :--- | :--- |
| Product Name | 176 Pins | 233 Pins | 324 Pins |
| Number of Units | 2 | 2 | 2 |
| Name | RSENTn $(\mathrm{n}=0,1)$ | RSENTn $(\mathrm{n}=0,1)$ | RSENTn $(\mathrm{n}=0,1)$ |

Table 27.2 Number of Units (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Product Name | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| Number of Units | 1 | 2 | 2 | 2 | 2 |
| Name | RSENTn $(\mathrm{n}=1)$ | RSENTn $(\mathrm{n}=0,1)$ | RSENTn $(\mathrm{n}=0,1)$ | RSENTn $(\mathrm{n}=0,1)$ | RSENTn $(\mathrm{n}=0,1)$ |

Table 27.3 Number of Units (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |

Table 27.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual RSENT units are identified by the index " n "; for example, RSENTnTSPC <br> $(\mathrm{n}=0,1)$ indicates the RSENTn time stamp register. |

### 27.1.2 Register Base Addresses

RSENTn base addresses are listed in the following table.
RSENTn register addresses are given as offsets from the base addresses.
Table 27.5 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <RSENT0_base> | FFCF $0000_{\mathrm{H}}$ |
| <RSENT1_base> | FFCF $0100_{\mathrm{H}}$ |

### 27.1.3 Clock Supply

The RSENTn clock supply is shown in the following table.
Table 27.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| RSENTn | SENT Commutation Clock | CKSCLK_IPERI2 | Commutation clock |
|  | Register Access Clock (PCLK) | CPUCLK_L | Bus clock |

Note: Commutation clock must be either 16 MHz or in the range of 32 MHz to 40 MHz and register access clock frequency can be in the range 16 MHz to 60 MHz .

### 27.1.4 Interrupt Requests

RSENTn interrupt requests are listed in the following table.
Table 27.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| RSENT0 |  |  | RSENT status interrupt |
| INTSENT0SI | RSENT receive interrupt | 347 | - |
| INTSENTORI | 348 | 123 |  |
| RSENT1 | RSENT status interrupt | 349 | - |
| INTSENT1SI | RSENT receive interrupt | 350 | 124 |
| INTSENT1RI |  |  |  |

### 27.1.5 Reset Sources

RSENTn reset sources are listed in the following table. RSENTn is initialized by these reset sources.
Table 27.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| RSENTn | All reset sources (ISORES) |

### 27.1.6 External Input/Output Signals

External input/output signals of RSENT are listed below.
Table 27.9 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| RSENT0 | RSENT Receive Data Input | SENTORX |
| sent_rx | RSENT SPC Extension Output | SENT0SPCO |
| sent_spc | RSENT Receive Data Input | SENT1RX |
| RSENT1 | RSENT SPC Extension Output | SENT1SPCO |
| sent_rx |  |  |

### 27.2 Overview

## Overview of Functions

The RSENT interface supports the following standard specification (SAE J2716 version APR2016) functions (with extensions for support of 8 nibble data):

- Triple speed expansion Tick Time: Clock cycle ( $1 \mu \mathrm{~s}$ to $90 \mu \mathrm{~s}$ )
- Variable data transmission rate
- up to 74.9 kbps (based on 8 nibble data at 3us clock rate)
- up to 224.7 kbps (based on 8 nibble data at 1us clock rate)
- Unidirectional communication: Between the sensor and MCU
- Bidirectional communication: Between the sensor and MCU (supported in SPC mode)
- Single edge data transmission: Coded by the temporal distance of two serially-detected falling edges on a data line
- Transmission frame with up to 8 data nibbles and additionally status and communications nibbles
- Data transmission protected with CRC is available.
- CRC data can be read with the RSENTnSRXD.SCRC and RSENTnFRXD.FCRC bits.
- Calibration phase in each data frame (RSENTnCPL.CPLV bits)
- Multiple sensors can connect to the RSENT channel that has the standard expansion function.

Received data from sensors is detected by software or DMA.

- The timestamp function: Master or slave can be selected for the RSENT module. (RSENTnTSPC.TMS bit)
- The RSENT circuit consists of the following functions:
- Data receive part
- Clock recovery
- Register group

### 27.2.1 Block Diagram

The following figure shows a block diagram of the RSENT module.

Figure 27.1 Block Diagram of RSENT

### 27.3 Registers

### 27.3.1 List of Registers

RSENT registers are listed in the following table.
For details about <RSENTn_base>, see Section 27.1.2, Register Base Addresses.
Table 27.10 List of Registers

| Module Name | Register Name | Abbreviation | Address |
| :--- | :--- | :--- | :--- |
| RSENTn | RSENT timestamp register | RSENTnTSPC | <RSENTn_base> + 0000 |

### 27.3.2 RSENTnTSPC — RSENT Timestamp Register

Table 27.11 RSENTnTSPC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 16 | TMS | Timestamp Mode Selection |
|  |  | 0: Master mode |
|  |  | 1: Slave mode |
| 15 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 14 to 8 | TTM[6:0] | Timestamp Tick Multiplier |
|  |  | $0000000_{\mathrm{B}}: 1$ |
|  |  | $000001_{\mathrm{B}}: 2$ |
|  |  | $0000010_{\mathrm{B}}: 3$ |
|  |  | $111111_{\mathrm{B}}: 128$ |
| 7 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 6 to 0 | TTPV[6:0] | Timestamp Tick Prescaler Value |
|  |  | $0000000_{\mathrm{B}}: 1$ |
|  |  | $0000001_{\mathrm{B}}: 2$ |
|  |  | $0000010_{\mathrm{B}}: 3$ |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |

## RSENTnTSPC.TMS (Timestamp Mode Selection)

This bit defines the timestamp counter synchronization mode.
For information about the timestamp clock settings, see Section 27.4.2.1, Timestamp.
When this bit is set to 0 , the timestamp counter operates in master mode.
When writing $00000000_{\mathrm{H}}$ to RSENTnTSC, the timestamp counter is cleared. In addition all RSENT timestamp counters operating as slave of RSENT are also cleared. For master-slave interconnection, see Section 27.4.2.1(2),

## Timestamp Counter Operation.

When this bit is set to 1 , the timestamp counter operates in slave mode.
The timestamp counter is only cleared when writing $00000000_{\mathrm{H}}$ to the timestamp counter of RSENT module that operates in master mode.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as the RSENT module that operates in master mode.

The CPU should not set this bit to 1 for RSENT module that operates in master mode.

## RSENTnTSPC.TTM (Timestamp Tick Multiplier)

These bits define the multiplication value of the $1-\mu$ s time tick used for the timestamp counter. For timestamp clock configuration, see Section 27.4.2.1, Timestamp.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\text {B }}$ ).

## RSENTnTSPC.TTPV (Timestamp Tick Prescaler Value)

These bits define the prescaler value to generate a $1-\mu$ s clock tick.
For timestamp clock configuration, see Section 27.4.2.1, Timestamp.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 ${ }_{B}$ ).
The CPU should configure this value in such a way that, based on the supplied communication clock, a $1-\mu$ s clock tick is generated.

### 27.3.3 RSENTnTSC — RSENT Timestamp Counter

Table 27.12 RSENTnTSC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TS[31:0] | Timestamp counter value |

## RSENTnTSC.TS (Timestamp)

These bits indicate the current timestamp counter value.
The CPU can only write desired values to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001B).
When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS = 1), writing to this register has no effect when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either $011_{\mathrm{B}}$ or $101_{\mathrm{B}}$ ).
The timestamp counter is incremented on every timestamp counter tick (as configured in the RSENTnTSPC.TTPV and RSENTnTSPC.TTM bits) when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either $011_{\mathrm{B}}$ or $101_{\mathrm{B}}$ ).
When the timestamp counter is configured to operate in master mode (RSENTnTSPC.TMS $=0$ ), the CPU writes $00000000_{\mathrm{H}}$ to these bits and RSENTnTSC.TS is set to $00000000_{\mathrm{H}}$.

When the slave mode setting is made for the timestamp counter of channel $n$ (RSENTnTSPC.TMS $=1$ ), writing to the timestamp counter of the channel that is the master for channel $n$ leads to the RSENTnTSC.TS bits being set to 0000 0000 ${ }_{\mathrm{H}}$.

For timestamp mode selection, see Section 27.4.2.1, Timestamp.

### 27.3.4 RSENTnCC — RSENT Communication Configuration Register

Table 27.13 RSENTnCC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 12 | SOPC | SPC Output Polarity Control <br> 0 : SPC pulse active high <br> 1: SPC pulse active low |
| 11 | FCM | Frame Check Method <br> 0 : Check against next calibration pulse <br> 1: Check against previous calibration pulse |
| 10 | SCCD | Slow Channel CRC Check <br> 0 : Slow channel CRC check enabled <br> 1: Slow channel CRC check disabled |
| 9 | FCCD | Fast Channel CRC Check <br> 0 : Fast channel CRC check enabled <br> 1: Fast channel CRC check disabled |
| 8 | DCF | Data nibble CRC Format <br> 0: SAE J2716 2010/2016 format <br> 1: pre SAE J2716 2010 format |
| 7, 6 | SMF[1:0] | Serial Message Format $00_{\mathrm{B}}$ : No serial message extraction $01_{\mathrm{B}}$ : Short serial message format $10_{\mathrm{B}}$ : Enhanced serial message format $11_{\mathrm{B}}$ : Setting prohibited |
| 5 | PPTC | Pause Pulse Type Configuration <br> 0: Pause pulse for variable message length <br> 1: Pause pulse for fixed message length |
| 4 | PPC | Pause Pulse Configuration <br> 0 : Pause pulse absent <br> 1: Pause pulse present |

Table 27.13 RSENTnCC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 3 to 1 | NDN[2:0] | Number of Data Nibbles |
|  |  | $000_{\mathrm{B}}: 1$ data nibble |
|  | $001_{\mathrm{B}}: 2$ data nibbles |  |
|  | $010_{\mathrm{B}}: 3$ data nibbles |  |
|  | $011_{\mathrm{B}}: 4$ data nibbles |  |
|  | $100_{\mathrm{B}}: 5$ data nibbles |  |
|  | $101_{\mathrm{B}}: 6$ data nibbles |  |
|  |  | $110_{\mathrm{B}}: 7$ data nibbles |
|  | $111_{\mathrm{B}}: 8$ data nibbles |  |
|  |  | SPC Mode Enable |
|  |  | $0:$ SPC mode disabled |
|  |  | $1:$ SPC mode enabled |

## RSENTnCC.SOPC (SPC Output Polarity Control)

When this bit is set to 0 , the SPC pulse is sent as an active high signal. The default output value is low level. When this bit is set to 1 , the SPC pulse is sent as an active low signal. The default output value is high level. For SPC operation, see also Section 27.4.4, SPC Function.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 ${ }^{\text {B }}$ ).

NOTE
Any change to this bit from the default value becomes effective on the output value when entering the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are 101B). When entering RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ), the output level is set to the default value (low level).

## RSENTnCC.FCM (Frame Check Method)

When this bit is set to 0 , the current calibration pulse is compared to the next received calibration pulse.
The buffer update mechanism is operating according to the preferred option as described in SAE J2716 2016. When this bit is set to 1 , the current calibration pulse is compared to the previously received calibration pulse. The buffer update mechanism is operating according to the second option as described in SAE J2716 2016 which should be only used if extra latency to process the second calibration pulse cannot be tolerated. For buffer update timings, see also Section 27.4.3.2(3), Fast Channel Message Reception.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

## RSENTnCC.SCCD (Slow Channel CRC Check Disable)

When this bit is set to 1 , the CRC check for the slow channel is disabled. In this case, messages are stored in the slow channel message reception buffer with the received CRC.
When this bit is set to 1 , the RSENTnCS.SCS bit is not set.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

## RSENTnCC.FCCD (Fast Channel CRC Check Disable)

When this bit is set to 1 , the CRC check for the fast channel is disabled. In this case, messages are stored in the fast channel message reception buffer with the received CRC.
When this bit is set to 1 , the RSENTnCS.FCS bit is not set.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

## RSENTnCC.DCF (Data Nibble CRC Format)

This bit selects between the SAE J2716 2016 data nibble CRC format and the legacy format.
When this bit is set to 0 the recommended CRC implementation according to SAE J2716 2016 Section 5.4.2.2 is selected.
When this bit is set to 1 the legacy CRC implementation according to SAE J2716 2008 (refer to SAE J2716 2016
Section 5.4.2.1) is selected.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode
$\left(\right.$ RSENTnMST.OMS $\left.=001_{B}\right)$

## RSENTnCC.SMF (Serial Message Format)

These bits define the serial message format expected to be received for automatic extraction.
When these bits are set to $00_{\mathrm{B}}$, no serial message is extracted and the status and communications nibbles are stored in the RSENTnSRXD register.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).
The CPU shall set these bits to $00_{\mathrm{B}}$ when RSENTnCC.SPCE is set to 1 and more than one sensor is connected to the RSENT module.

## RSENTnCC.PPTC (Pause Pulse Type Configuration)

This bit defines the pause pulse type.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 ${ }^{\text {B }}$ ).
The CPU should not set this bit to 1 when the RSENTnCC.PPC bit is set to 0 .

## RSENTnCC.PPC (Pause Pulse Configuration)

This bit defines the presence or absence of the pause pulse.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 ${ }^{\text {B }}$ ).

## RSENTnCC.NDN (Number of Data Nibbles)

These bits define the number of data nibbles included in an SENT message.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 ${ }_{\mathrm{B}}$ ).

## RSENTnCC.SPCE (SPC Mode Enable)

This bit enables the SPC mode.
For details about SPC mode operation, see also Section 27.4.4, SPC Function.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 ${ }^{\text {B }}$ ).

### 27.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register

Table 27.14 RSENTnBRP Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 27 to 24 | TTF[3:0] | ```Time Tick Decimal Fraction \(0000_{\mathrm{B}}: 0.0 \mu \mathrm{~s}\) \(0001_{\mathrm{B}}: 0.1 \mu \mathrm{~s}\) \(0010_{\mathrm{B}}: 0.2 \mu \mathrm{~s}\) \(1000_{\mathrm{B}}: 0.8 \mu \mathrm{~s}\) \(1001_{\mathrm{B}}: 0.9 \mu \mathrm{~s}\) Other than above: Setting prohibited``` |
| 23 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 22 to 16 | TTI[6:0] | Time Tick Integer $0000000_{\mathrm{B}}: 1 \mu \mathrm{~s}$ $0000001_{\mathrm{B}}: 2 \mu \mathrm{~s}$ $0000010_{\mathrm{B}}: 3 \mu \mathrm{~s}$ $1011000_{\mathrm{B}}: 89 \mu \mathrm{~s}$ $1011001_{B}: 90 \mu \mathrm{~s}$ <br> Other than above: Setting prohibited |
| 15 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 14 to 8 | SCDV[6:0] | Sample Clock Division Value $0000000_{\mathrm{B}}: 1$ <br> $0000001_{\mathrm{B}}: 2$ <br> $0000010_{\mathrm{B}}: 3$ <br> $1111110_{B}: 127$ $1111111^{B}: 128$ |
| 7 to 5 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |

Table 27.14 RSENTnBRP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 4 to 0 | SCMV[4:0] | Sample Clock Multiplication Value |
|  |  | $00000_{\mathrm{B}}: 1$ |
|  | $00001_{\mathrm{B}}: 2$ |  |
| $00010_{\mathrm{B}}: 3$ |  |  |
|  |  | $11110_{\mathrm{B}}: 31$ |
|  |  | $11111_{\mathrm{B}}: 32$ |

## RSENTnBRP.TTF (Time Tick Decimal Fraction)

These bits define the decimal part of the tick length in $0.1-\mu$ s granularity.
For tick length configuration, see Section 27.4.2.2(2), RX and SPC Tick Settings.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\text {B }}$ ).

## RSENTnBRP.TTI (Time Tick Integer)

These bits define the integer part of the tick length.
For tick length configuration, see Section 27.4.2.2(2), RX and SPC Tick Settings.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001B).

## RSENTnBRP.SCDV (Sample Clock Division Value)

These bits define the division value for the sample clock generation logic. For RSENTnBRP settings, see Section 27.4.2.2(1), RX BRP Setting. The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

## RSENTnBRP.SCMV (Sample Clock Multiplication Value)

These bits define the multiplication value for the sample clock generation logic.
For RSENTnBRP settings, see Section 27.4.2.2(1), RX BRP Setting.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001B).

### 27.3.6 RSENTnIDE — RSENT Interrupt/DMA Enable Register

| Access: <br> Address: |  |  | This register can be read or written in 32-bit units. <RSENTn_base> + 0018H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 | NRIE | No Response Error Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 6 | CVIE | Calibration Pulse Length Variation Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 5 | CLIE | Calibration Pulse Length Error Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 4 | FNIE | Fast Channel Nibble Count Error Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 3 | FEIE | Fast Channel Nibble Encoding Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 2 | FMIE | Fast Channel Message Lost Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 1 | FCIE | Fast Channel CRC Error Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |

Table 27.15 RSENTnIDE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | FRIE | Fast Channel Receive Interrupt Enable |
|  |  | $0:$ Interrupt disabled |
|  |  | 1: Interrupt enabled |

## RSENTnIDE.SEIE (Slow Channel Encoding Error Interrupt Enable)

This bit enables the generation of the slow channel encoding error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.SMIE (Slow Channel Message Lost Interrupt Enable)

This bit enables the generation of the slow channel message lost interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.SCIE (Slow Channel CRC Error Interrupt Enable)

This bit enables the generation of the slow channel CRC error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{B}$ ).

## RSENTnIDE.NRIE (No Response Error Interrupt Enable)

This bit enables the generation of the no response error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ). The CPU should not set this bit when the SPC mode is disabled (RSENTnCC.SPCE set to 0).

## RSENTnIDE.CVIE (Calibration Pulse Length Variation Error Interrupt Enable)

This bit enables the generation of the calibration pulse length variation error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\text {B }}$ ).

## RSENTnIDE.CLIE (Calibration Pulse Length Error Interrupt Enable)

This bit enables the generation of the calibration pulse length error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.FNIE (Fast Channel Nibble Count Error Interrupt Enable)

This bit enables the generation of the fast channel nibble count error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.FEIE (Fast Channel Nibble Encoding Error Interrupt Enable)

This bit enables the generation of the fast channel nibble encoding error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.FMIE (Fast Channel Message Lost Interrupt Enable)

This bit enables the generation of the fast channel message lost interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.FCIE (Fast Channel CRC Error Interrupt Enable)

This bit enables the generation of the fast channel CRC error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## RSENTnIDE.FRIE (Fast Channel Receive Interrupt Enable)

This bit enables the generation of the fast channel receive interrupt.
The fast channel receive interrupt can be also used to notify a DMA request.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

### 27.3.7 RSENTnMDC — RSENT Mode Control Register

Table 27.16 RSENTnMDC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 2 to 0 | OMC[2:0] | Operation Mode Control |
|  | $000_{\mathrm{B}}:$ RESET |  |
|  | $001_{\mathrm{B}}:$ CONFIGURATION |  |
|  | $011_{\mathrm{B}}:$ OPERATION IDLE |  |
|  | $101_{\mathrm{B}}:$ OPERATION ACTIVE |  |
|  | Other than above: Setting prohibited |  |

## RSENTnMDC.OMC (Operation Mode Control)

These bits are used to control the operation mode of the RSENT module.

- $000_{\mathrm{B}}$ : RESET

In RESET mode, the mode can only be changed to CONFIGURATION mode.

- 001 ${ }_{\mathrm{B}}$ : CONFIGURATION

In CONFIGURATION mode, the mode can only be changed to RESET mode or OPERATION ACTIVE mode.

- 011 $1_{\mathrm{B}}$ : OPERATION IDLE

In OPERATION IDLE mode, the mode can be changed to OPERATION ACTIVE mode, CONFIGURATION mode, or RESET mode.

- 101 ${ }_{\mathrm{B}}$ : OPERATION ACTIVE

In OPERATION ACTIVE mode, the mode can be changed to OPERATION IDLE mode, CONFIGURATION mode, or RESET mode. However, it is recommended to process to the OPERATION IDLE mode first.
For the recommended methods to change between operation modes, see Section 27.4.3.1, Changing Operation Modes.

- Other than above: Setting prohibited

The CPU should not write any other value than listed above into this register.
The CPU should follow the mode change flows as shown in Section 27.4.3.1, Changing Operation Modes.

### 27.3.8 RSENTnSPCT — RSENT SPC Transmission Register

Table 27.17 RSENTnSPCT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 6 to 0 | TLL[6:0] | Length of the Trigger Low Phase in Ticks |
|  | $0000000_{\mathrm{B}}: 1$ tick |  |
| $0000001_{\mathrm{B}}: 2$ ticks |  |  |
| $0000010_{\mathrm{B}}: 3$ ticks |  |  |
| $:$ |  |  |
|  | $111110_{\mathrm{B}}: 127$ ticks |  |
|  | $1111111_{\mathrm{B}}: 128$ ticks |  |

## RSENTnSPCT.TLL (Trigger Low Length)

These bits define the length of the SPC trigger pulse.
When the CPU writes to these bits, an SPC trigger pulse with the configured length is sent starting from the next SPC trigger tick. In case RSENTnCS.NRS is set by the RSENT module following a write to these bits, no SPC trigger pulse is sent.
For details about SPC communication, see Section 27.4.4, SPC Function.
The CPU can only write to these bits if the RSENT module is in the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are $101_{\mathrm{B}}$ ) and SPC communication is enabled (RSENTnCC.SPCE is $1_{\mathrm{B}}$ ).
It is important to note that two consecutive write access might not cause a no response error as the previous request might not have started yet.
After writing to this register, the CPU should wait for at least one SPC trigger tick before writing again to this register.

### 27.3.9 RSENTnMST — RSENT Mode Status Register

Table 27.18 RSENTnMST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | Reserved | When read, the value after reset is read. |
| 2 to 0 | OMS[2:0] | Operation Mode |
|  |  | $000_{\mathrm{B}}:$ RESET |
|  | $001_{\mathrm{B}}:$ CONFIGURATION |  |
|  | $011_{\mathrm{B}}:$ OPERATION IDLE |  |
|  | $101_{\mathrm{B}}:$ OPERATION ACTIVE |  |
|  | Other than above: Reserved |  |

## RSENTnMST.OMS (Operation Mode Status)

These bits indicate the current operation mode. These bits are read only.
These bits are updated after a mode change request is made in the RSENTnMDC.OMC register.

- 000 B : RESET mode

When in RESET mode, all registers are set to their reset values and write access to all registers except the RSENTnMDC register is disabled.
When in RESET mode, SENT communication is disabled.

- 001 ${ }_{\text {B }}$ : CONFIGURATION mode

When in CONFIGURATION mode, write access to the timestamp registers (RSENTnTSPC and RSENTnTSC
register), configuration registers (RSENTnCC and RSENTnBRP register), RSENTnIDE register, and mode control register (RSENTnMDC.OMC) is enabled.
When in CONFIGURATION mode, SENT communication is disabled.
When entering CONFIGURATION mode, all status registers and receive buffer registers are set to their reset values.

- 011 ${ }_{\mathrm{B}}$ : OPERATION IDLE mode

In OPERATION IDLE mode, no reception or SPC trigger transmission is possible.
When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

- 1018: OPERATION ACTIVE mode

In OPERATION ACTIVE mode, reception and SPC trigger transmission are possible.

- Other than above: Reserved

### 27.3.10 RSENTnCS — RSENT Communication Status Register

Table 27.19 RSENTnCS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | Reserved | When read, the value after reset is read. |
| 10 | SES | Slow channel Encoding Error Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 9 | SMS | Slow Channel Message Lost Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 8 | SCS | Slow Channel CRC Error Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 7 | NRS | No Response Error Interrupt Status <br> 0: Not detected <br> 1: Detected |
| 6 | CVS | Calibration Pulse Length Variation Error Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 5 | CLS | Calibration Pulse Length Error Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 4 | FNS | Fast Channel Nibble Count Error Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 3 | FES | Fast Channel Nibble Encoding Error Interrupt Status <br> 0: Not detected <br> 1: Detected |
| 2 | FMS | Fast Channel Message Lost Interrupt Status <br> 0 : Not detected <br> 1: Detected |
| 1 | FCS | Fast Channel CRC Error Interrupt Status <br> 0: Not detected <br> 1: Detected |

Table 27.19 RSENTnCS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | FRS | Fast Channel Receive Interrupt Status |
|  |  | $0:$ Not detected |
|  | 1: Detected |  |

## RSENTnCS.SES (Slow Channel Encoding Error Status)

This bit represents the slow channel encoding error status.
This bit is read only.
In the short serial message format (RSENTnCC.SMF $=01_{\mathrm{B}}$ ), this bit is set when the sequence on serial start bit (bit \#3)

In the enhanced serial message format ( RSENTnCC.SMF $=10_{\mathrm{B}}$ ), this bit is set when following the reception of a start sequence ("0111 $1110_{\mathrm{B}}$ ") on the serial data bit 3 , bit 13 or bit 18 are not received as " 0 ".
When this bit is set in the short serial message format the received communication and status nibble is used to assemble a serial message.
When this bit is set in the enhanced serial message format the RSENT module checks the presence of a new start sequence at the same time and uses the received communication and status nibble to assemble a serial message.
This bit is cleared when writing 1 to RSENTnCSC.SEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.SMS (Slow Channel Message Lost Status)

This bit represents the slow channel message lost status.
This bit is read only.
This bit is set when there is an attempt to update the slow channel message reception buffer, but the previous message has not been read yet.
This bit is cleared when writing 1 to RSENTnCSC.SEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.SCS (Slow Channel CRC Error Status)

This bit represents the slow channel CRC error status.
This bit is read only.
This bit is set when a CRC error is detected on the slow channel and the slow channel CRC detection is enabled (RSENTnCC.SCCD is set to 0 ).
This bit is cleared when writing 1 to RSENTnCSC.SCC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.NRS (No Response Error Status)

This bit represents the no response error status.
This bit is read only.
This bit is set when

- The CPU writes to the RSENTnSPCT.TLL bits and
- SPC mode enabled (RSENTnCC.SPCE set to 1 ) and
- No complete response was received from the sensor for the previous SPC trigger.

This bit is set after 4 PCLK +5 clkc (Maximum time) from the CPU writes to the RSENTnSPCT.TLL.
This bit is cleared when writing 1 to RSENTnCSC.NRC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.CVS (Calibration Pulse Length Variation Error Status)

This bit represents the calibration pulse length variation error status.
This bit is read only.
When RSENTnCC.PPTC is 0 , then this bit is set when two successive calibration pulses differ by more than 1.5625 \%. When RSENTnCC.PPTC is 1 , this bit is never set. In this mode (pause pulse with fixed message length), the CPU needs to check the variation of the ratio of calibration pulse to message length by reading the RSENTnCPL and RSENTnML registers.
This bit is cleared when writing 1 to RSENTnCSC.CVC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.CLS (Calibration Pulse Length Error Status)

This bit represents the calibration pulse length error status.
This bit is read only.
This bit is set when the measured calibration pulse length is less than 42 clock ticks or more than 70 clock ticks (deviation of $25 \%$ from nominal length).
This bit is cleared when writing 1 to RSENTnCSC.CLC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.FNS (Fast Channel Nibble Count Error Status)

This bit represents the fast channel nibble count error status.
This bit is read only.
This bit is set when there is an unexpected number of falling edges between two calibration pulses.
This bit is cleared when writing 1 to RSENTnCSC.FNC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.FES (Fast Channel Nibble Encoding Error Status)

This bit represents the fast channel nibble encoding error status.
This bit is read only.
This bit is set when on the fast channel a measured nibble period is less than 12 clock ticks or more than 27 clock ticks. This bit is cleared when writing 1 to RSENTnCSC.FEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.FMS (Fast Channel Message Lost Status)

This bit represents the fast channel message lost status.
This bit is read only.
This bit is set when the fast channel message reception buffer is updated, but the previous messages in the foreground and background buffer have not been read yet.
This bit is cleared when writing 1 to RSENTnCSC.FMC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.FCS (Fast Channel CRC Error Status)

This bit represents the fast channel CRC error status.
This bit is read only.
This bit is set when a CRC error is detected on the fast channel and the fast channel CRC detection is enabled (RSENTnCC.FCCD is set to 0 ).
This bit is cleared when writing 1 to RSENTnCSC.FCC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## RSENTnCS.FRS (Fast Channel Receive Status)

This bit represents the fast channel receive status.
This bit is read only.
This bit is set when the fast channel message reception buffer was updated.
This bit is cleared when the CPU reads the RSENTnFRXD or RSENTnEFRD1 register.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

### 27.3.11 RSENTnCSC — RSENT Communication Status Clear Register

Table 27.20 RSENTnCSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |
| 10 | SEC | Slow Channel Encoding Error Clear <br> 0 : - <br> 1: Clear |
| 9 | SMC | Slow Channel Message Lost Clear <br> $0:-$ <br> 1: Clear |
| 8 | SCC | Slow Channel CRC Error Clear <br> 0: - <br> 1: Clear |
| 7 | NRC | No Response Error Clear 0: - <br> 1: Clear |
| 6 | CVC | Calibration Pulse Length Variation Error Clear $0:-$ <br> 1: Clear |
| 5 | CLC | Calibration Pulse Length Error Clear $0:-$ <br> 1: Clear |
| 4 | FNC | Fast Channel Nibble Count Error Clear <br> 0: - <br> 1: Clear |
| 3 | FEC | Fast Channel Nibble Encoding Error Clear <br> 0: - <br> 1: Clear |
| 2 | FMC | Fast Channel Message Lost Clear <br> 0: - <br> 1: Clear |
| 1 | FCC | Fast Channel CRC Error Clear <br> 0: - <br> 1: Clear |
| 0 | Reserved | When read, the value after reset is read. When writing, write the initial value after reset. |

## RSENTnCSC.SEC (Slow Channel Encoding Error Clear)

Writing 1 sets RSENTnCS.SES to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.SMC (Slow Channel Message Lost Clear)

Writing 1 sets RSENTnCS.SMS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.SCC (Slow Channel CRC Error Clear)

Writing 1 sets RSENTnCS.SCS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.NRC (No Response Error Clear)

Writing 1 sets RSENTnCS.NRS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.CVC (Calibration Pulse Length Variation Error Clear)

Writing 1 sets RSENTnCS.CVS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.CLC (Calibration Pulse Length Error Clear)

Writing 1 sets RSENTnCS.CLS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.FNC (Fast Channel Nibble Count Error Clear)

Writing 1 sets RSENTnCS.FNS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.FEC (Fast Channel Nibble Encoding Error Clear)

Writing 1 sets RSENTnCS.FES to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.FMC (Fast Channel Message Lost Clear)

Writing 1 sets RSENTnCS.FMS to 0 . Writing 0 has no effect. This bit is always read as 0 .

## RSENTnCSC.FCC (Fast Channel CRC Error Clear)

Writing 1 sets RSENTnCS.FCS to 0 . Writing 0 has no effect. This bit is always read as 0 .

### 27.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register

Table 27.21 RSENTnSRTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | STS[31:0] | Slow Channel Receive Timestamp |

## RSENTnSRTS.STS (Slow Channel Timestamp)

These bits are read only.
These bits are updated when the slow channel message reception buffer is updated with the timestamp counter value of the last frame provided to the slow channel message.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 $1_{B}$ (CONFIGURATION).

### 27.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register

| Access: <br> Address: |  |  | This register is a read-only register that can be read in 32-bit units. <RSENTn_base> + 0034 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | SND | - | SCRC[5:0] |  |  |  |  |  | - | - | - | SMGC | IDD[19:16] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | IDD[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.22 RSENTnSRXD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | SND | Slow Channel New Data |
|  |  | 0: Slow channel frame data is not updated since last read. |
|  | 1: Slow channel frame data is updated since last read. |  |
| 30 | Reserved | When read, the value after reset is read. |
| 29 to 24 | SCRC[5:0] | Slow Channel CRC Data |
| 23 to 21 | Reserved | When read, the value after reset is read. |
| 20 | SMGC | Slow Channel Configuration Bit Data |
| 19 to 0 | IDD[19:0] | Slow Channel Data / ID Information |

## RSENTnSRXD.SND (Slow Channel New Data)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel message reception buffer is updated.
This bit is cleared automatically whenever it is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

## RSENTnSRXD.SCRC (Slow Channel CRC)

These bits are representing the slow channel CRC data.
These bits are read only.
These bits are updated when the slow channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001B (CONFIGURATION).

## RSENTnSRXD.SMGC (Slow Channel Configuration Bit)

This bit represents the slow channel configuration bit.
This bit is read only.
This bit is updated when the slow channel message reception buffer is updated.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

## RSENTnSRXD.IDD (ID/Data)

These bits are representing the slow channel data and ID information.
The alignment within this register depends on the message format. For details, see Section 27.4.3.2(5), Slow

## Channel Message Reception.

These bits are read only.
These bits are updated when the slow channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001B (CONFIGURATION).

### 27.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register

Table 27.23 RSENTnCPL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | Reserved | When read, the value after reset is read. |
| 16 to 0 | CPLV[16:0] | Calibration Pulse Length Value of Received Message |

## RSENTnCPL.CPLV (Calibration Pulse Length Value)

These bits are used by the CPU to calculate the ratio of two consecutive calibration pulses or the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.
For details, refer to Section 5.3.3 of the SAE J2716 2016 specification.
These bits are read only.
In modes other than pause pulse with fixed message length mode (RSENTnCC.PPTC $=1_{\mathrm{B}}$ ) or SPC mode (RSENTnCC.SPCE $=1_{B}$ ), these bits are invalid and should not be used.
Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time $\times$ the number of ticks between calibration pulses) based on the sample clock ( $\mathrm{f}_{\text {SAMPLE }}=16 \mathrm{MHz}$ ). These bits are cleared when the RSENTnMST.OMS bits are changed to 001в (CONFIGURATION).

### 27.3.15 RSENTnML — RSENT Message Length Register

Table 27.24 RSENTnML Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | Reserved | When read, the value after reset is read. |
| 20 to 0 | MLV[20:0] | Message Length Value of Received Message |

## RSENTnML.MLV (Message Length Value)

These bits are used by the CPU to calculate the ratio of the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.
These bits are read only.
In modes other than pause pulse with fixed message length, these bits are invalid and should not be used.
These bits are updated with the measured message length in sample clock ticks when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### 27.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register

Table 27.25 RSENTnFRTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FTS[31:0] | Fast Channel Receive Timestamp |

## RSENTnFRTS.FTS (Fast Channel Receive Timestamp)

These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### 27.3.17 RSENTnFRXD — RSENT Fast Channel Receive Data Register

Table 27.26 RSENTnFRXD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | SNDM | Slow Channel New Data Mirror |
|  |  | $0:$ Slow channel frame data is not updated since last read. |
|  |  | 1: Slow channel frame data is updated since last read. |
| 30 | FND | Fast Channel New Data |
|  |  | 0: Fast channel frame data is not updated since last read. |
|  | 1: Fast channel frame data is updated since last read. |  |
| 29,28 | FCCN[1:0] | Fast Channel Communication Nibble |
| 27 to 24 | FCRC[3:0] | Fast Channel CRC Data |
| 23 to 0 | ND[23:0] | Fast Channel Nibble Data |

## RSENTnFRXD.SNDM (Slow Channel New Data Mirror)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel message reception buffer is updated.
This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

## RSENTnFRXD.FND (Fast Channel New Data)

This bit indicates that the fast channel message reception buffer is holding data that has not been read. This bit is read only.
This bit is set when the fast channel message reception buffer is updated.
This bit is cleared automatically whenever RSENTnFRXD or RSENTnEFRD1 is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{B}$ (CONFIGURATION).

## RSENTnFRXD.FCCN (Fast Channel Communication Nibble)

These bits are representing the fast channel communication nibble bits [1:0].
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## RSENTnFRXD.FCRC (Fast Channel CRC)

These bits are representing the fast channel CRC data.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001B (CONFIGURATION).

## RSENTnFRXD.ND (Fast Channel Nibble Data)

These bits are representing the fast channel nibble data.
The alignment of the nibble data depends on nibble count. For details, see Section 27.4.3.2(3), Fast Channel Message Reception.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001B (CONFIGURATION).

### 27.3.18 RSENTnCPLM — RSENT Calibration Pulse Length Mirror Register

Table 27.27 RSENTnCPLM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | Reserved | When read, the value after reset is read. |
| 16 to 0 | CPLVM[16:0] | Calibration Pulse Length Value (Mirror) of Received Message |

## RSENTnCPLM.CPLVM (Calibration Pulse Length Value (Mirror))

These bits are mirror bit of the RSENTnCPL.CPLV.
These bits are read only.
In modes other than pause pulse with fixed message length mode (RSENTnCC.PPTC $=1_{\mathrm{B}}$ ) or SPC mode (RSENTnCC.SPCE $=1_{B}$ ), these bits are invalid and should not be used.
Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time $\times$ the number of ticks between calibration pulses) based on the sample clock ( $\mathrm{f}_{\text {SAMPLE }}=16 \mathrm{MHz}$ ).
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

### 27.3.19 RSENTnMLM — RSENT Message Length Mirror Register

Table 27.28 RSENTnMLM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | Reserved | When read, the value after reset is read. |
| 20 to 0 | MLVM[20:0] | Message Length Value (Mirror) of Received Message |

## RSENTnMLM.MLVM (Message Length Value (Mirror))

These bits are mirror bit of the RSENTnML.MLV.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 27.3.20 RSENTnFRTSM — RSENT Fast Channel Receive Timestamp Mirror Register

Table 27.29 RSENTnFRTSM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FTSM[31:0] | Fast Channel Receive Timestamp (Mirror) |

RSENTnFRTSM.FTSM (Fast Channel Receive Timestamp (Mirror))
These bits are mirror bit of the RSENTnFRTS.FTS.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### 27.3.21 RSENTnEFRDO — RSENT Expanded Fast Channel Receive Data Register 0

Table 27.30 RSENTnEFRDO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | Reserved | When read, the value after reset is read. |
| 7 | SNDM | Slow Channel New Data (Mirror) |
|  |  | 0: Slow channel frame data is not updated since last read. |
|  | 1: Slow channel frame data is updated since last read. |  |
| 6 | FND | Fast Channel New Data |
|  |  | 0: Fast channel frame data is not updated since last read. |
|  |  | 1: Fast channel frame data is updated since last read. |
| 5 to 4 | FCCN[1:0] | Fast Channel Communication Nibble Bits [1:0] |
| 3 to 0 | FCRC[3:0] | Fast Channel CRC Data |

## RSENTnEFRD0.SNDM (Slow Channel New Data (Mirror))

This bit indicates that the slow channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel message reception buffer is updated.
This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## RSENTnEFRD0.FND (Fast Channel New Data)

This bit indicates that the fast channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the fast channel message reception buffer is updated.
This bit is cleared automatically whenever RSENTnFRXD or RSENTnEFRD1 is read.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## RSENTnEFRD0.FCCN (Fast Channel Communication Nibble)

These bits are representing the fast channel communication nibble bits [1:0].
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 $1_{B}$ (CONFIGURATION).

## RSENTnEFRD0.FCRC (Fast Channel CRC)

These bits are representing the fast channel CRC data.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

### 27.3.22 RSENTnEFRD1 — RSENT Expanded Fast Channel Receive Data Register 1

Table 27.31 RSENTnEFRD1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ND[31:0] | Fast Channel Nibble Data |

## RSENTnEFRD1.ND (Nibble Data)

These bits are representing the fast channel nibble data.
The alignment of the nibble data depends on nibble count. For details, see Section 27.4.3.2(3), Fast Channel

## Message Reception.

These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001B (CONFIGURATION).

### 27.4 Operation

### 27.4.1 Modes of Operation

The RSENT module can be in one of the following modes:

- RESET mode
- CONFIGURATION mode
- OPERATION IDLE mode
- OPERATION ACTIVE mode

The CPU should follow the mode change flows as shown in Section 27.4.3.1, Changing Operation Modes.
The current operation mode status can be seen in the RSENTnMST.OMS bits.
Figure 27.2, Transition between Operation Modes shows the possible transitions between the channel modes:

Figure 27.2 Transition between Operation Modes

### 27.4.1.1 RESET Mode

This mode is the initial mode that the RSENT module automatically enters after the hardware reset (MCU reset) is cleared. Its purpose is to provide a clean reset of the registers in the RSENT module.

The RESET mode is also entered after the RSENTnMDC.OMC bits have been set to $000_{\mathrm{B}}$. In this state, all, configuration, control (except RSENTnMDC.OMC bits), and status registers are set to their reset value. Any on-going transmission or reception process is stopped immediately and the interface pins of the RSENT module are set to their default values.

Read access to all registers is possible in this state. Write access is limited to the RSENTnMDC register.

### 27.4.1.2 CONFIGURATION Mode

The CONFIGURATION mode is entered after the RSENTnMDC.OMC bits have been set to $001_{\mathrm{B}}$.
The interface pins of the RSENT module are set to their default values.
Regarding the output polarity setting of SENTnSPCO pin and the timing that becomes effective, please refer to the explanation of "RSENTnCC.SOPC (SPC Output Polarity Control)" in Section 27.3.4, RSENTnCC — RSENT Communication Configuration Register.

In this state, all status registers (RSENTnCS) and the receive buffer registers (RSENTnSRTS, RSENTnSRXD, RSENTnCPL, RSENTnML, RSENTnFRTS, and RSENTnFRXD) are set to their default value.

Read access to all registers is possible in this state.
Write access is limited to both timestamp registers (RSENTnTSPC and RSENTnTSC) and configuration registers (RSENTnCC, RSENTnBRP, RSENTnIDE, RSENTnMDC, and RSENTnCSC).

### 27.4.1.3 OPERATION IDLE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to $011_{\mathrm{B}}$.
In OPERATION IDLE mode, no reception and transmission are done.
When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

Read access to all registers is possible in this state.
Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, and RSENTnCSC.

### 27.4.1.4 OPERATION ACTIVE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to $101_{\mathrm{B}}$.
In OPERATION ACTIVE mode, transmission and reception can take place.
Frame reception and status flagging starts after a valid calibration pulse (including the falling edge at the beginning) was detected.

Read access to all registers is possible in this state.
Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, RSENTnSPCT, and RSENTnCSC.

### 27.4.1.5 Register Behavior in Operation Modes

Table 27.32, Register Behavior in Operation Modes shows the register behavior when the RSENT module transitions to the indicated operation modes. The table also gives an overview about the access restriction in each operation mode.

Table 27.32 Register Behavior in Operation Modes

| Register Name | Symbol | MCU Reset <br> Change | RESET |  | CONFIGURATION |  | OPERATION IDLE |  | OPERATION ACTIVE |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Change | R/W | Change | R/W | Change | R/W | Change | R/W |
| Timestamp register | RSENTnTSPC | $00000000{ }_{H}$ | $00000000_{H}$ | R | Unchanged | R/W | Unchanged | R | Unchanged | R |
| Timestamp counter register | RSENTnTSC | 00000000 H | $00000000{ }_{H}$ | R | Unchanged | R/W | Unchanged | $\begin{aligned} & \mathrm{R} / \mathrm{W} \\ & * 1 \end{aligned}$ | Unchanged | $\begin{array}{\|l\|l} \mathrm{R} / \mathrm{W} \\ * 1 \end{array}$ |
| Communication configuration register | RSENTnCC | $0000000 \mathrm{H}_{\mathrm{H}}$ | $00000000_{\text {H }}$ | R | Unchanged | R/W | Unchanged | R | Unchanged | R |
| Baud rate prescaler register | RSENTnBRP | 00000000 H | $00000000{ }_{\text {H }}$ | R | Unchanged | R/W | Unchanged | R | Unchanged | R |
| Interrupt/DMA enable register | RSENTnIDE | 0000 0000н | 0000 0000н | R | Unchanged | R/W | Unchanged | R/W | Unchanged | R/W |
| Mode control register | RSENTnMDC | 00000000 H | 00000000 H | R/W | Unchanged | R/W | Unchanged | R/W | Unchanged | R/W |
| SPC transmission register | RSENTnSPCT | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | Unchanged | R | Unchanged | R | Unchanged | R/W |
| Mode status register | RSENTnMST | $00000000{ }_{\text {H }}$ | $00000000{ }_{\text {H }}$ | R | 0000 0001H | R | 0000 0003 ${ }^{\text {H }}$ | R | $00000005^{\text {H }}$ | R |
| Communication status register | RSENTnCS | 00000000 H | $00000000{ }_{\text {H }}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Communication status clear register | RSENTnCSC | $00000000_{\text {H }}$ | $00000000^{H}$ | R | Unchanged | R/W | Unchanged | R/W | Unchanged | R/W |
| Slow channel receive timestamp register | RSENTnSRTS | $00000000_{\text {H }}$ | $00000000_{H}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Slow channel receive data register | RSENTnSRXD | 00000000 H | $00000000_{\text {H }}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Calibration pulse length register | RSENTnCPL | $00000000{ }_{H}$ | $00000000{ }_{H}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Message length register | RSENTnML | $00000000{ }_{\text {H }}$ | $00000000{ }_{\text {H }}$ | R | 0000 0000 ${ }^{\text {H }}$ | R | Unchanged | R | Unchanged | R |
| Fast channel receive timestamp register | RSENTnFRTS | $00000000_{\text {H }}$ | $00000000_{H}$ | R | $00000000_{\text {H }}$ | R | Unchanged | R | Unchanged | R |
| Fast channel receive data register | RSENTnFRXD | 00000000 H | 00000000 H | R | 0000 0000 ${ }^{\text {H }}$ | R | Unchanged | R | Unchanged | R |
| Calibration pulse length mirror register | RSENTnCPLM | $00000000_{\text {H }}$ | $00000000_{H}$ | R | $00000000_{H}$ | R | Unchanged | R | Unchanged | R |
| Message length mirror register | RSENTnMLM | 00000000 H | $00000000{ }_{\text {H }}$ | R | 0000 0000 ${ }^{\text {H }}$ | R | Unchanged | R | Unchanged | R |
| Fast channel receive timestamp mirror register | RSENTnFRTS <br> M | 00000000 H | $00000000_{H}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Expanded fast channel receive data register 0 | RSENTnEFRD <br> 0 | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | $00000000^{H}$ | R | Unchanged | R | Unchanged | R |
| Expanded fast channel receive data register 1 | RSENTnEFRD <br> 1 | $0000000 \mathrm{H}_{\mathrm{H}}$ | $00000000_{\text {H }}$ | R | $00000000^{H}$ | R | Unchanged | R | Unchanged | R |

Note 1. Means write restriction exists.

### 27.4.2 Clock Configuration

### 27.4.2.1 Timestamp

## (1) Timestamp Clock Configuration

RSENT incorporates the timestamp counter.
The minimum required resolution of the timestamp is $1 \mu \mathrm{~s}$. Depending on the applied communication frequency (clkc), the user should configure the RSENTnTSPC.TTPV bits to achieve the $1-\mu$ s resolution. The input frequency is divided by the configured timestamp prescaler value RSENTnTSPC.TTPV.

Depending on the configured tick lengths, the resolution can be decreased by configuring the RSENTnTSPC.TTM bits. The already divided input frequency is divided further by the value of the RSENTnTSPC.TTM bits.

Figure 27.3 Timestamp Counter Clock Generation

## (2) Timestamp Counter Operation

The timestamp counter value can be initialized to any value by writing to the RSENTnTSC.TS bits only when the RSENT module is in CONFIGURATION mode.

When timestamp counters are configured to operate in master mode (RSENTnTSPC.TMS $=0$ ), the CPU can reset the timestamp counter by writing $00000000_{\mathrm{H}}$ to the RSENTnTSC.TS bits when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode.

When timestamp counters are configured to operate in slave mode (RSENTnTSPC.TMS = 1), the timestamp counter is cleared when the CPU writes $00000000_{\mathrm{H}}$ to the RSENTnTSC.TS bits of the channel set in the master when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode. The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as master RSENT module. When timestamp counter synchronization occurs, the internal timestamp counter prescalers are also synchronized.

The current timestamp counter value can be read from the RSENTnTSC.TS bits.
When the RSENT module is in OPERATION ACTIVE mode, each received message is stored with its related timestamp. Timestamp values are taken for fast channel and slow channel data.

The timestamp value is captured when the calibration pulse is detected.
The timestamp value for the fast channel is stored in the RSENTnFRTS.FTS or RSENTnFRTSM.FTSM register field when the fast channel message reception buffer is updated.

The timestamp value for the slow channel is stored in the RSENTnSRTS.STS bits. The timestamp value for the slow channel is identical to the timestamp value of the last fast channel message contributing to the slow channel message.

In case timestamp counter synchronization is required, the following flow should be used.

Figure 27.4 Timestamp Counter Synchronization

Further synchronization can be done as long as master RSENT module is in either OPERATION ACTIVE or OPERATION IDLE state.

### 27.4.2.2 Communication Clock Configuration

## (1) RX BRP Setting

Use the formula below to obtain the settings for RSENTnBRP.SCDV and RSENTnBRP.SCMV in accord with $\mathrm{f}_{\text {communication }}$ to be used (the frequency of the clkc clock) so that the sample clock frequency is 16 MHz (for example, if the settings are for RSENTnBRP.SCDV $=4 /$ RSENTnBRP.SCMV $=6$, replace this with RSENTnBRP.SCDV $=$ 2/RSENTnBRP.SCMV = 3). The input clock (clkc clock) is frequency-divided according to the settings of RSENTnBRP.SCDV and RSENTnBRP.SCM to generate the sample clock.

Set fommunication (the frequency of the clkc clock) so that it falls within the range from 32 to 40 MHz (or at precisely 16 MHz ). Use the formula below to obtain the values for RSENTnBRP.SCDV and RSENTnBRP.SCM such that the sample clock frequency becomes 16 MHz .

$$
\begin{gathered}
f_{\text {SAMPLE }}=16 \mathrm{MHz}=f_{\text {COMMUNICATION }} \times \frac{\text { Sample Clock Multiplication Value }(\text { RSENTnBRP.SCMV }+1)}{\text { Sample Clock Division Value }(\text { RSENTnBRP.SCDV }+1)} \\
\text { Where Sample Clock Multiplication Value }=2\left(\text { RSENTnBRP.SCMV }=5^{\prime} d 1\right) \\
\text { Sample Clock Division Value }=5\left(\text { RSENTnBRP.SCDV }=7^{\prime} d 4\right), \\
f_{\text {COMMUNICATION }}=40 \mathrm{MHz} \\
f_{\text {SAMPLE }}=40 \times 2 / 5=16 \mathrm{MHz}
\end{gathered}
$$

## (2) RX and SPC Tick Settings

The used tick length in RX and SPC function can be configured with the RSENTnBRP.TTI and RSENTnBRP.TTF bits. Tick lengths from $1.0 \mu \mathrm{~s}$ to $90.0 \mu$ s with a resolution of $0.1 \mu \mathrm{~s}$ can be configured.

The RSENTnBRP.TTI holds the integer part of the tick length and the RSENTnBRP.TTF bits hold the fractional part of the tick length. The tick length is then calculated by:

$$
\begin{aligned}
& T_{\text {TICK }}=T_{\text {RSENTnBRP.TTI }}+T_{\text {RSENTnBRP.TTF }} \\
& \text { Where RSENTnBRP.TTI }=0, \text { RSENTnBRP.TTF }=3 \\
& T_{\text {TICK }}=1+0.3=1.3 \mu \mathrm{~s}
\end{aligned}
$$

### 27.4.3 RSENT Operation

### 27.4.3.1 Changing Operation Modes

Once initialization has been completed in CONFIGURATION mode, operation can be enabled by entering OPERATION ACTIVE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION ACTIVE and waiting for the RSENTnMST.OMS to transition to OPERATION ACTIVE.

Once in OPERATION ACTIVE mode the RSENT module begins to receive messages or SPC communication can be started depending on the configuration.

Figure 27.5, Communication Enable Flow shows the communication enabled flow assuming that the RSENT module is in RESET mode:

Figure 27.5 Communication Enable Flow

To leave OPERATION ACTIVE mode, communication should be disabled first by entering OPERATION IDLE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION IDLE and waiting for the RSENTnMST.OMS bits to transition to OPERATION IDLE.

However, when the SPC mode is enabled (RSENTnCC.SPCE set to 1 ) and the SPC trigger transmission has not been requested after the previous SPC communication has been completed (e.g. successful reception for the previous SPC trigger transmission), the RSENT module can directly enter the CONFIGURATION mode.

The transition between OPERATION ACTIVE and OPERATION IDLE depends on the setting of the
RSENTnCC.SPCE bit.

## (1) RSENTnCC.SPCE $=0$

In case a reception is currently ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the receive buffer was updated or error was flagged (see Section 27.4.3.2(3), Fast Channel Message Reception).

In case no reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place immediately.

## (2) RSENTnCC.SPCE $=1$

In case a reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

In case a no response error is flagged, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place at the same time as the error flagging.

The mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the sequence of making a SPC trigger and receiving the response has been completed. This means when a response was already received, the transition takes place immediately. When the response is still pending, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

CONFIGURATION mode can be entered by writing CONFIGURATION to the RSENTnMDC.OMC bits and waiting for the RSENTnMST.OMS to transition to CONFIGURATION.

Once CONFIGURATION mode is entered, the remaining status and message information stored in the RSENT module is lost since status and message information is cleared in CONFIGURATION mode.

Figure 27.6, Communication Disable Flow shows the communication disable flow assuming that the RSENT module is in OPERATION ACTIVE mode.

Figure 27.6 Communication Disable Flow

### 27.4.3.2 Message Reception

SENT message reception is composed of the calibration pulse reception followed by the data nibble pulse reception.

Figure 27.7 SENT Received Message Structure

## (1) Calibration Pulse Reception

Within the calibration pulse reception phase the internally generated clock tick is adjusted to the transmit clock speed.
In addition, the calibration pulse is used to end the previous message and perform message diagnostics. The RSENT module supports automatic calibration pulse length diagnostics in variable message length modes (RSENTnCC.PPTC = 0 ). In case the calibration pulse ratio check fails, the calibration pulse length variation error flag (RSENTnCS.CVS) is set to 1 .

## (2) Data Nibble Reception

The receive function of the RSENT module is a straightforward capture and compare function. The RSENT module receives sensor information encoded by the temporal distance of two consecutive falling edges on the data line. The temporal distance (the Number of Clock Ticks) is captured and compared against a set of values to determine the actual nibble value. The data encoding is illustrated in Table 27.33, Data Nibble Encoding below.

Table 27.33 Data Nibble Encoding

| Nibble Period (Number of Clock Ticks) | Nibble Value (Binary) |
| :--- | :--- |
| 12 | $0000_{\mathrm{B}}$ |
| 13 | $0001_{\mathrm{B}}$ |
| 14 | $0010_{\mathrm{B}}$ |
| 15 | $0011_{\mathrm{B}}$ |
| 16 | $0100_{\mathrm{B}}$ |
| 17 | $0101_{\mathrm{B}}$ |
| 18 | $0110_{\mathrm{B}}$ |
| 19 | $0111_{\mathrm{B}}$ |
| 20 | $1000_{\mathrm{B}}$ |
| 21 | $1001_{\mathrm{B}}$ |
| 22 | $1010_{\mathrm{B}}$ |
| 23 | $1011_{\mathrm{B}}$ |
| 24 | $1100_{\mathrm{B}}$ |
| 25 | $1101_{\mathrm{B}}$ |
| 27 | $1110_{\mathrm{B}}$ |

The received data nibbles are composed into an SENT message which is then stored in the fast channel message reception buffer.

Any other received nibble period during the reception of data nibbles will cause a fast channel nibble encoding error.

## (3) Fast Channel Message Reception

Messages received on the fast message channel are stored in a receive buffer.
A fast channel message reception buffer is composed of the calibration pulse length register (RSENTnCPL), the message length register (RSENTnML), the fast channel receive timestamp register (RSENTnFRTS), and the fast channel receive data register (RSENTnFRXD).

All registers are placed on successive addresses that allows transferring the register content into memory using DMA.
The RSENT module is equipped with a double receive buffer structure that allows the storage of two complete SENT messages including the related timestamp and message length information. Message decoding and assembling are done in a separate register stage.

Figure 27.8 Fast Channel Message Reception Buffer

The first received message is placed into the message buffer that can be accessed by the CPU. This buffer (except the RSENTnFRXD.SNDM and RSENTnEFRD0.SNDM bit) is not updated any more until the RSENTnFRXD or RSENTnEFRD1 register was read.

When a new message is placed into a receive buffer, the RSENTnFRXD.FND and RSENTnEFRD0.FND bit is set. At the same time, the RSENTnCS.FRS bit is set and, if enabled, a receive interrupt request is generated.

When the foreground receive buffer is holding an unprocessed message (the RSENTnFRXD.FND and RSENTnEFRD0.FND bit is 1), any further incoming message is placed in the background buffer. The background buffer is updated with any further incoming messages. In case an unprocessed background message buffer message is overwritten, the RSENTnCS.FMS bit is set to 1 .

When the CPU reads the RSENTnFRXD or RSENTnEFRD1 register and there is valid data in the background buffer, the data previously located in the background buffer becomes available in the receive buffer and is accessible by the CPU. If enabled, a new interrupt request for fast channel data is generated and RSENTnCS.FRS is set.

When the RSENTnFRXD.FND and RSENTnEFRD0.FND/RSENTnCS.FRS bit is not set, the data in the receive buffer is not defined and the CPU should not access the receive buffer.

Figure 27.9 Fast Channel Message Reception Buffer Update Timing

The update timing of the receive buffer depends on the applied configuration as depicted in Figure 27.10, Buffer Update in Variable Message Length Mode and Preferred Check Method to Figure 27.13, Buffer Update in SPC Mode.

The RSENTnFRTS register is updated with the current timestamp counter register value when the calibration pulse is detected.

The data alignment in the RSENTnFRXD register depends on the nibble data count (RSENTnCC.NDN).
Table 27.34 Data Nibble Alignment in RSENTnFRXD Register

| RSENTnFRXD |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RSENTnCC.NDN | $23: 20$ | $19: 16$ | $15: 12$ | $11: 8$ | $7: 4$ | 3:0 |
| $000_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Undefined | Nibble 1 |
| $001_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 |
| $010_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 |
| $011_{\mathrm{B}}$ | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 |
| $100_{\mathrm{B}}$ | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 |
| $101_{\mathrm{B}}$ | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 | Nibble 6 |

Table 27.35 Data Nibble Alignment in RSENTnEFRD1 Register

| RSENTnEFRD1 |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RSENTnCC.NDN | $31: 28$ | $27: 24$ | $23: 20$ | $19: 16$ | $15: 12$ | $11: 8$ | $7: 4$ | $3: 0$ |
| $000_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Nibble 1 |
| $001_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 |
| $010_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 |
| $011_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 |
| $100_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 |
| $101_{\mathrm{B}}$ | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 | Nibble 6 |
| $110_{\mathrm{B}}$ | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 | Nibble 6 | Nibble 7 |
| $111_{\mathrm{B}}$ | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 | Nibble 6 | Nibble 7 | Nibble 8 |

(a) SAE Operation with Variable Message Length and Preferred Check Method (RSENTnCC.SPCE $=0$, RSENTnCC.PPTC $=0$, RSENTnCC.FCM $=0$ )

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the preferred option in the J2716 2016 specification. In this mode, message diagnostics is done after the calibration pulse was received following a message.

If this check is passed, the message reception buffer is updated.
If this check is not passed, the message reception buffer is not updated and RSENTnCS.CVS is set to 1 .

Figure 27.10 Buffer Update in Variable Message Length Mode and Preferred Check Method
(b) SAE Operation with Variable Message Length and Optional Check Method (RSENTnCC. SPCE $=0$, RSENTnCC.PPTC $=0$, RSENTnCC.FCM $=1$ )

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the optional frame check method as described in the J2716 2016 specification. In this mode, the calibration pulse of the current frame is compared to the calibration pulse of the last valid preceding frame.

If this check is passed, the message reception buffer is updated.
If this check is not passed, the message reception buffer is not updated and RSENTnCS.CVS is set to 1 .

Figure 27.11 Buffer Update in Variable Message Length Mode and Optional Check Method

## (c) SAE Operation with Fixed Message Length (RSENTnCC.SPCE $=0$, RSENTnCC.PPTC $=1$ )

In this mode, the RSENT module does not perform the check for calibration pulse and message length ratio according to the preferred option in the J2716 2016 specification. In this mode, the RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples.

The message buffer is updated at the beginning of the following calibration pulse irrespective of the values in the RSENTnCPL and RSENTnML registers. The CPU needs to calculate the ratio and either accept or discard the message.

Figure 27.12 Buffer Update in Fixed Message Length Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

## (d) SPC Operation (RSENTnCC.SPCE = 1)

In this operation mode, sensor data transmission is done following a SPC master trigger pulse. Within SAE SENT communication, the calibration pulse or pause pulse is terminating the previous message. In SPC communication, the sensor is only sending data following a SPC trigger request. An end pulse sent by the sensor is terminating the message. The message buffer is updated at the beginning of the end pulse.

Figure 27.13 Buffer Update in SPC Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.
The RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples. The CPU needs to calculate the ratio of calibration pulses and/or message length and either accept or discard the message.

In case of variable message length mode, the RSENT module cannot perform this check because the receive timing of the next calibration pulse depends on the next SPC trigger timing.

## (4) Fast Channel Reception Flow

In Figure 27.14, Fast Channel Reception Flow, the recommended reception flow for the fast channel message reception buffer is shown.

When using a polling or event driven method, the CPU should only read the setting of the RSENTnCS.FRS bit to check the availability of new fast channel data

Figure 27.14 Fast Channel Reception Flow

In any case, the CPU should keep the order in reading the receive buffer registers as shown in the flow. The RSENTnFRXD or RSENTnEFRD0 register should be the last register to be accessed.

The handling of the slow channel message reception buffer is described in Section 27.4.3.2(6), Slow Channel Reception Flow.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU In case the variation check fails, the CPU must discard the received message.

## (5) Slow Channel Message Reception

The RSENT module supports extraction of the slow message out of the fast channel messages by using the bits 3 and 2 out of the status and communication nibble. In order to enable the slow channel extraction, the CPU should set the RSENTnCC.SMF bits to the expected serial message format.

When no serial message extraction is selected (RSENTnCC.SMF $=00_{B}$ ), the RSENTnSRXD register becomes part of the fast channel message reception buffer structure (including background buffer) and RSENTnSRTS register should be ignored. The status and communications nibbles is placed in the RSENTnSRXD.IDD bits. Furthermore no slow channel new data and slow channel message lost flags are generated.

In order to receive the slow channel serial message, all fast channel serial messages contributing to a slow channel serial message must be received successfully and the received slow channel serial message must comply with the selected serial message format.

A message lost on the fast channel does not impact the reception on the slow channel.
A slow channel message reception buffer is composed of the slow channel receive timestamp register (RSENTnSRTS) and the slow channel receive data register (RSENTnSRXD).

In opposite to the fast channel message reception buffer, the slow channel message reception buffer does not support a double receive buffer structure; only a single receive buffer structure is available.

Message decoding and assembling is done in a separate register stage.

Figure 27.15 Slow Channel Message Reception Buffer

The slow channel message reception buffer is updated at the same time as the fast channel message reception buffer that holds the last status and communication nibble required for the slow channel message. The RSENTnSRXD.SND bit is set to 1 at the same time.

Further updates to the buffer are not carried out until after the RSENTnSRXD.SND bit has been read.
When the receive buffer is holding an unprocessed message (RSENTnSRXD.SND is 1), any further incoming message is lost (the slow channel message reception buffer is not updated) and RSENTnCS.SMS is set to 1 .

When the CPU reads the RSENTnSRXD register, RSENTnSRXD.SND is automatically cleared.
The RSENTnSRTS register is updated with the current timestamp counter register value of the last frame contributing to the slow channel message.

Figure 27.16 Slow Channel Message Reception Buffer Update Timing

The data alignment in the RSENTnSRXD register depends on the slow channel message format (RSENTnCC.SMF) and the received configuration bit.

Table 27.36 Data Alignment in RSENTnSRXD Register

| RSENTn CC.SMF | RSENTnSRXD. SMGC | RSENTnSRXD. IDD[19:16] | RSENTnSRXD. IDD[15:12] | RSENTnSRXD. IDD[11:8] | RSENTnSRXD. IDD[7:4] | RSENTnSRXD. IDD[3:0] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $00_{B}$ | Undefined | Undefined | Undefined | Undefined | Undefined | Status and communication nibble |
| $01_{B}$ | Undefined | Undefined | Undefined | Message ID[3:0] | DATA[7:4] | DATA[3:0] |
| $10_{B}$ | 0 | Message ID[7:4] | Message ID[3:0] | DATA[11:8] | DATA[7:4] | DATA[3:0] |
| $10_{\text {B }}$ | 1 | Message ID[3:0] | DATA[15:12] | DATA[11:8] | DATA[7:4] | DATA[3:0] |

## (6) Slow Channel Reception Flow

In Figure 27.17, Slow Channel Reception Flow, the recommended reception flow for the slow channel message reception buffer is shown. When the slow channel receive data is required, this process should be executed as part of the fast channel reception flow.

Figure 27.17 Slow Channel Reception Flow

In any case, the CPU should keep the order in reading the slow channel message reception buffer registers as shown in the flow. The RSENTnSRXD.SND bit should be accessed as last.

## (7) DMA Flow

In case of DMA usage, the start address for the DMA usage and the number of transfers define which part of the receive buffer will be transferred. The RSENTnFRXD or RSENTnEFRD1 register should be the last register to be accessed using a 32 bit access method.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU In case the variation check fails, the CPU must discard the received message.

Figure 27.18 DMA Reception Flow

Figure 27.19 DMA Reception Flow (Data nibbles are 6 or less)

In the software processing, when the transferred data set, the CPU should check the status of the transferred RSENTnFRXD.SNDM bit. If this bit is set to 1 , then the user needs to read the slow channel message reception buffer if needed.

## (8) Error Flagging

The message lost error flag (RSENTnCS.SMS or RSENTnCS.FMS) is set when a new message's diagnostics pass before the previous message is read.

The SPC communication error (shown in RSENTnCS.NRS) is flagged when the CPU writes to RSENTnSPCT.TLL before/during response reception.

The timing at which the fast channel reception error flags (RSENTnCS.CVS, RSENTnCS.CLS, RSENTnCS.FNS, RSENTnCS.FES, and RSENTnCS.FCS) and the slow channel reception error flags (RSENTnCS.SCS, and RSENTnCS.SES) are updated varies with the setting of bits in the communications configuration register (RSENTnCC.SPCE, RSENTnCC.FCM, RSENTnCC.PPC, and RSENTnCC.PPTC).
Table 27.37, Timing to Set Error Flag (RSENTnCC.SPCE $=0$ ) and Table 27.38, Timing to Set Error Flag (RSENTnCC.SPCE =1) list the timings with which the error flags corresponding to each setting are updated.

In case a nibble encoding error or calibration pulse length error is detected, message reception is terminated immediately. No further error flagging for this message is done. Message decoding starts again after a calibration pulse without calibration length error (RSENTnCS.CLS) is detected.

Table 27.37 Timing to Set Error Flag (RSENTnCC.SPCE $=0$ )

| RSENTnCC.SPCE | 0 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RSENTnCC.FCM | 0 |  |  |  | 1 |  |  |  |
| RSENTnCC.PPC | 0 |  | 1 |  | 0 |  | 1 |  |
| RSENTnCC.PPTC | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| RSENTnCS.FCS | EC | X | EC | IM | IM | X | IM | IM |
| RSENTnCS.FES | EC | X | EC | IM | IM | X | IM | IM |
| RSENTnCS.FNS | EC | X | EC | - | - | X | - | - |
| RSENTnCS.SCS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.SES | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CLS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CVS | EC | X | EC | - | EC | X | EC | - |

Note: EC: End of calibration pulse (on the falling edge of a valid calibration pulse)
IM: Immediately upon detection (immediately when the error is detected)
—: Error flag not detected
X: Setting prohibited

NOTE
When RSENTnCC.PPC and RSENTnCC.PPTC are 1, the mode is pause pulse with fixed message length.
When this mode, this diagnostic can be used as the receiver does not need to wait for the next calibration pulse to diagnose the current received frame, so RSENTnCS.FNS and RSENTnCS.CVS are not set.

Table 27.38 Timing to Set Error Flag (RSENTnCC.SPCE =1)

| RSENTnCC.SPCE <br> RSENTnCC.FCM | 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 |  |  |  | 1 |  |  |  |
| RSENTnCC.PPC | 0 |  | 1 |  | 0 |  | 1 |  |
| RSENTnCC.PPTC | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| RSENTnCS.FCS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.FES | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.FNS | - | X | - | - | - | X | - | - |
| RSENTnCS.SCS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.SES | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CLS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CVS | - | X | - | - | - | X | - | - |

Note: IM: Immediately upon detection (immediately when the error is detected)
—: Error flag not detected
X : Setting prohibited

NOTE
In case the sensor stops communication, no buffer update or status update for last message takes place. The SW should take care of this by timeout checks.
SPC mode is a communication of only one frame that is start the SPC trigger to the starting point. The Error flags are immediately set when they are detected. So RSENTnCS.FNE and RSENTnCS.CVS are not set.

When a transition to OPERATION IDLE is configured in RSENTnMDC.OMC and an error for the calibration or the fast channel reception is detected in the message in which the mode transition was requested, the error is not flagged and the message is aborted.
In case of a fast channel encoding error or a calibration pulse length error the OPERATION IDLE mode is entered immediately.
In case of a fast channel nibble count error, fast channel CRC error, or fast channel calibration pulse variation error the OPERATION IDLE state is entered at the end of the next status and communications nibble.

RERSENTnCS.FNS is only set after a valid calibration pulse was detected and all following nibbles have a valid length ( $\geq 12$ ticks and $\leq 27$ ticks) or no nibble was received between two valid calibration pulses.
RSENTnCS.FES is only set if the nibble with an encoding error occurred in the communication and status nibble, CRC nibble or in one of the expected data nibbles.
If SPC is enabled (RSENTnCC.SPCE = 1), RSENTnCS.CLS is set if a calibration pulse was expected but the pulse length does not meet the calibration pulse range. If SPC is disabled (RSENTnCC.SPCE $=0$ ), RSENTnCS.CLS is set only after a valid calibration pulse has been received and a calibration pulse was expected but the pulse length does not meet the calibration pulse range.

During re-synchronization additional error flags might be set which is not affecting the reception of the following frame.

### 27.4.4 SPC Function

The RSENT module supports an extension of the J2716 specification known as SPC, whereby the RSENT module can pull down the RX line to initiate SENT message transmission.

The user can configure the polarity of the sent_spc port.
The text below describes the behavior of the sent_spc port with the default settings of RSENTnCC.SOPC. When the value of RSENTnCC.SOPC after a reset is changed, the sent_spc port operates with inverted polarity.

The user can enable or disable the SPC extension by setting the RSENTnCC.SPCE bit. When the RSENTnCC.SPCE bit is set to 0 , SPC is disabled. The sent_spc port is driven low by the RSENT module, allowing normal SENT reception to take place. When the RSENTnCC.SPCE bit is set to 1 , SPC is enabled and the sent_spc port can be driven high by the RSENT module to request a frame transmission by the sensor.

The transmission function of the RSENT module is a straightforward PWM function. The purpose of this function is to communicate in direction to the sensor by the output sent_spc. With the sent_spc output, the RSENT module can pull down the signal line by an external transistor.

The signal line will be held low for a configured length of tick time specified in the RSENTnSPCT.TLL bits.
The Tick time is configured with the RSENTnBRP.TTI bits and the RSENTnBRP.TTF bits which are equal to the transmission tick time. For details, see Section 27.4.2.2(2), RX and SPC Tick Settings.

In a single sensor system, this function can be used to trigger data transmission from the sensor. Further data can be sent to the sensor by varying the trigger pulse length. In a multi sensor system, this function can be used to address a dedicated sensor and request a data transmission.

Once RSENT SPC initialization is complete, transmission can be triggered by writing the trigger pulse width to the RSENTnSPCT.TLL register. When a transmission is triggered, the trigger pulse with the configured length is sent. Then a frame reception is expected. After frame reception was done, a new trigger pulse can be sent.

Writing to RSENTnSPCT.TLL requests a SPC trigger transmission. After writing to RSENTnSPCT.TLL, the CPU should read RSENTnCS.NRS to check whether the previous request was completed or not.

In case RSENTnCS.NRS is set, no SPC trigger is sent and any potentially ongoing reception at this time is aborted. The CPU should clear RSENTnCS.NRS by writing 1 to RSENTnCSC.NRC. The CPU can write again to RSENTnSPCT.TLL to request a SPC trigger transmission.

In case RSENTnCS.NRS is not set, the CPU should set a reception timeout counter in software. If a reception occurs before the timeout counter elapses, the user should process the received slow and fast channel data as shown in the fast channel reception flow (Figure 27.14, Fast Channel Reception Flow) and slow channel reception flow (Figure 27.17, Slow Channel Reception Flow).

When the timeout counter elapses without any successful reception, the addressed sensor seems not to send any valid response. The CPU should analyze the RSENTnCS register to analyze the reason for no successful reception. A new request can be made considering that when RSENTnCS.NRS gets set no SPC trigger is sent.

Purpose of the timeout function is to define a timeout window for response reception in software.
Figure 27.20, Transmission Flow shows a transmission flow with a timeout function implemented in software. The timeout function is optional and can be omitted if not needed.

Figure 27.20 Transmission Flow

### 27.4.5 Interrupts and Checks

The RSENT module provides two interrupt lines.
The successful fast channel receive interrupt notifies the CPU that the fast channel message reception buffer was updated and is holding a set of valid received data. Also, the reception status bit is set (RSENTnCS.FRS).

The status interrupt notifies the CPU that at least one of the error flags or message lost flags in the RSENTnCS register is set.

Whether a status flag in the RSENTnCS register is contributing to the generation of an interrupt event or not can be set individually.

The execution of the CRC checks can be disabled for the slow channel and fast channel individually. In case a check is disabled, the CRC of the received message is not checked and the related error flag is never set.

Figure 27.21 Interrupt Structure

Table 27.39, Status Flag Influence to Receive Buffer Behavior gives an overview about the relationship between set status flags and the buffer update.

Table 27.39 Status Flag Influence to Receive Buffer Behavior

| RSENTnCS | Fast Channel Message <br> Reception Buffer | Slow Channel Message Reception Buffer |
| :--- | :--- | :--- |
| FRS | Updated | Updated if all status and communications nibbles of slow channel messages are <br> received and RSENTnCS.SES $=0$ and RSENTnCS.SCS $=0$ |
| FCS | Not updated | Receive process aborted. Search for new start condition |
| FMS | Message lost | Not impacted |
| FES | Not updated | Receive process aborted. Search for new start condition |
| FNS | Not updated | Receive process aborted. Search for new start condition |
| CLS | Not updated | Receive process aborted. Search for new start condition |
| CVS | Not updated | Receive process aborted. Search for new start condition |
| NRS | Not impacted | Receive process aborted. Search for new start condition |
| SCS | Not impacted | Not updated |
| SMS | Not impacted | Receive process aborted. Search for new start condition |
| SES |  |  |

## Section 28 Reserved

## Section 29 Window Watchdog Timer (WDTA)

This section contains a generic description of the Window Watchdog Timer (WDTA).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of WDTA.

### 29.1 Features of RH850/F1KH, RH850/F1KM WDTA

### 29.1.1 Number of Units

This microcontroller has the following number of WDTA units.
Each WDTA unit has single channel interface.
Table 29.1 Number of Units (RH850/F1KH-D8)

|  | RH850/F1KH-D8 | RH850/F1KH-D8 | RH850/F1KH-D8 |
| :--- | :--- | :--- | :--- |
| Product Name | 176 Pins | 233 Pins | 324 Pins |
| Number of Units | 3 | 3 | 3 |
| Name | WDTAn $(\mathrm{n}=0$ to 2$)$ | WDTAn $(\mathrm{n}=0$ to 2$)$ | WDTAn ( $\mathrm{n}=0$ to 2) |

Table 29.2 Number of Units (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Product Name | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| Number of Units | 2 | 2 | 2 | 2 | 2 |
| Name | WDTAn $(\mathrm{n}=0,1)$ | WDTAn $(\mathrm{n}=0,1)$ | WDTAn $(\mathrm{n}=0,1)$ | WDTAn $(\mathrm{n}=0,1)$ | WDTAn $(\mathrm{n}=0,1)$ |

Table 29.3 Number of Units (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |

Table 29.4 Index (RH850/F1KH-D8)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual window watchdog timer units are identified by the index " n ": for example, <br> WDTAnWDTE $(\mathrm{n}=0$ to 2$)$ is the WDTAn enable register. |
| Table 29.5 | Index (RH850/F1KM-S4, RH850/F1KM-S1) |
| Index | Description |
| n | Throughout this section, the individual window watchdog timer units are identified by the index " $\mathrm{n} ":$ for example, <br> WDTAnWDTE $(\mathrm{n}=0,1)$ is the WDTAn enable register. |

### 29.1.2 Register Base Addresses

WDTAn base addresses are listed in the following table.
WDTAn register addresses are given as offsets from the base addresses.
Table 29.6 Register Base Addresses (RH850/F1KH-D8)

| Base Address Name | Base Address |
| :--- | :--- |
| <WDTA0_base> | FFED $0000_{\mathrm{H}}$ |
| <WDTA1_base> | FFED $1000_{\mathrm{H}}$ |
| <WDTA2_base> | FFED $2000_{\mathrm{H}}$ |

Table 29.7 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <WDTAO_base> | FFED $0000_{\mathrm{H}}$ |
| <WDTA1_base> | FFED $1000_{\mathrm{H}}$ |

### 29.1.3 Clock Supply

The WDTAn clock supply is shown in the following table.
Table 29.8 Clock Supply (RH850/F1KH-D8)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| WDTA0 | WDTATCKI | CKSCLK_AWDTA | Timer count clock |
|  | Register access clock | CPUCLK_L | Bus clock |
| WDTA1 | WDTATCKI | LS IntOSC $f_{\text {RL }}$ | Timer count clock |
|  | Register access clock | CPUCLK_L | Bus clock |
| WDTA2 | WDTATCKI | LS IntOSC $f_{\text {RL }}$ | Timer count clock |
|  | Register access clock | CPUCLK_L | Bus clock |

Table 29.9 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| WDTAO | WDTATCKI | CKSCLK_AWDTA | Timer count clock |
|  | Register access clock | CPUCLK_L | Bus clock |
| WDTA1 | WDTATCKI | LS IntOSC $\mathrm{f}_{\text {RL }}$ | Timer count clock |
|  | Register access clock | CPUCLK_L | Bus clock |

### 29.1.4 Interrupt Requests

WDTAn interrupt requests are listed in the following table.
Table 29.10 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| WDTA0 | WDTA0 75\% interrupt | 40 | - |
| INTWDTAn | WDTA1 75\% interrupt | 41 | - |
| WDTA1 |  |  |  |
| INTWDTAn | WDTA2 75\% interrupt | 42 | - |
| WDTA2 |  |  |  |

Table 29.11 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |  |  |
| :--- | :--- | :--- | :--- | :---: | :---: |
| WDTA0 | WDTA0 75\% interrupt | 40 | - |  |  |
| INTWDTAn |  | 41 | - |  |  |
| WDTA1 | WDTA1 75\% interrupt |  |  |  |  |
| INTWDTAn |  |  |  |  |  |

Table 29.12 Interrupt Request (FE Level Non-Maskable Interrupt) (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Name | DMA Trigger Number |  |
| :--- | :--- | :--- | :--- | :--- |
| WDTA0 | WDTA0 FENMI interrupt <br> (in the WDTA error detection mode with an NMI request) | WDTAONMI | - |  |
| WDTAnTNMI | WDTA1 FENMI interrupt <br> (in the WDTA error detection mode with an NMI request) | WDTA1NMI | - |  |
| WDTA1 |  |  |  |  |
| WDTAnTNMI | WDTA2 FENMI interrupt <br> (in the WDTA error detection mode with an NMI request) | WDTA2NMI | - |  |
| WDTA2 |  |  |  |  |

Table 29.13 Interrupt Request (FE Level Non-Maskable Interrupt) (RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Name | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| WDTAO | WDTAO FENMI interrupt <br> (in the WDTA error detection mode with an NMI request) | WDTAONMI | - |
| WDTAnTNMI | WDTA1 FENMI interrupt <br> (in the WDTA error detection mode with an NMI request) | WDTA1NMI | - |
| WDTA1 |  |  |  |

### 29.1.5 Reset Sources

WDTAn reset sources are listed in the following table. WDTAn is initialized by these reset sources.
Table 29.14 Reset Sources (RH850/F1KH-D8)

| Unit Name | Reset Source |
| :--- | :--- |
| WDTA0 | Reset sources (AWORES) |
| WDTA1 | All reset sources (ISORES) |
| WDTA2 | All reset sources (ISORES) |

Note: WDTA1 and WDTA2 are stopped in STOP mode.

Table 29.15 Reset Sources (RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| WDTA0 | Reset sources (AWORES) |
| WDTA1 | All reset sources (ISORES) |

Note: WDTA1 is stopped in STOP mode.

### 29.1.6 Internal Input/Output Signals

The internal input/output signals of WDTA are listed in the following table.
Table 29.16 Internal Input/Output Signals (RH850/F1KH-D8)

| Unit Signal Name | Description | Connection |
| :--- | :--- | :--- |
| WDTAnTRES | Watchdog timer reset | Reset controller (WDTAORES) |
| WDTAnTRES | Watchdog timer reset | Reset controller (WDTA1RES) |
| WDTAnTRES | Watchdog timer reset | Reset controller (WDTA2RES) |

Table 29.17 Internal Input/Output Signals (H850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Connection |
| :--- | :--- | :--- |
| WDTAnTRES | Watchdog timer reset | Reset controller (WDTAORES) |
| WDTAnTRES | Watchdog timer reset | Reset controller (WDTA1RES) |

### 29.1.7 State in RUN Mode and Stand-by Modes

The state of the WDTA in respective RUN mode and stand-by modes are listed in the following table.
Table 29.18 States in Respective RUN Mode and Stand-by Modes (RH850/F1KH-D8)

| Run Mode/Stand-by Mode | State of WDTA0 | State of WDTA1 | State of WDTA2 |
| :--- | :--- | :--- | :--- |
| RUN mode (HALT state) | Operation enabled | Operation enabled | Operation enabled |
| STOP mode | Operation enabled | Operation stopped | Operation stopped |
| DeepSTOP mode | Operation enabled | Power off | Power off |
| Cyclic RUN mode | Operation enabled | Operation prohibited | Operation prohibited |
| Cyclic STOP mode | Operation enabled | Operation stopped | Operation stopped |

Table 29.19 States in Respective RUN Mode and Stand-by Modes (H850/F1KM-S4, RH850/F1KM-S1)

| Run Mode/Stand-by Mode | State of WDTAO | State of WDTA1 |
| :--- | :--- | :--- |
| RUN mode (HALT state) | Operation enabled | Operation enabled |
| STOP mode | Operation enabled | Operation stopped |
| DeepSTOP mode | Operation enabled | Power off |
| Cyclic RUN mode | Operation enabled | Operation prohibited |
| Cyclic STOP mode | Operation enabled | Operation stopped |

### 29.2 Overview

### 29.2.1 Functional Overview

WDTA has the following functions:

- Selection of the operation mode after reset, by using the option bytes

Enabling/disabling of WDTA, starting/stopping of the counter after reset, setting of the counter overflow time, and enabling/disabling of the VAC function can be selected. WDTA startup options to be set by the option bytes are described in Table 29.20, WDTA Start-Up Options (RH850/F1KH-D8) and Table 29.21, WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S1).

- WDTA trigger function

Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter. Activation codes include fixed activation codes and variable activation codes (VAC function). In a variable activation code, a different value from the previous time (variable value) is written to the WDTA trigger register, which causes the counter to be restarted.

- 75\% interrupt request signal

An interrupt request signal can be generated when the WDTA counter reaches $75 \%$ of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).

- Window function

The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register during a period other than the window-open period causes an error.

- WDTA error detection function

When an error is detected, a non-maskable interrupt request or an internal reset is generated.
For details about the error sources, see Section 29.5.3, WDTA Error Detection.

Table 29.20 WDTA Start-Up Options (RH850/F1KH-D8)

| Start-Up Option | Function | Description | Option Byte |
| :---: | :---: | :---: | :---: |
| OPWDEN | WDTA setting | Enables/disables the WDTA. <br> 0 : WDTA is disabled <br> 1: WDTA is enabled | - WDTAO: OPBT0.WDT0_0 <br> - WDTA1: OPBT0.WDT1_0 <br> - WDTA2: OPBT0.WDT2_0 |
| OPWDOVF[2:0] | Overflow interval time reset value setting | Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0]. | WDTA0/WDTA1/WDTA2: OPBTO.WDT_[2:0] |
| OPWDRUN | Start mode setting | Specifies the start mode. <br> 0 : Software trigger start mode <br> 1: Default start mode <br> For details, see Section 29.5.1, WDTA after Reset Release. | - WDTAO: OPBTO.WDT0_1 <br> - WDTA1: OPBT0.WDT1_1 <br> - WDTA2: OPBT0.WDT2_1 |
| OPWDVAC | Variable activation code selection | Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. <br> 0: WDTAnWDTE (fixed) <br> 1: WDTAnEVAC (variable) <br> When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (ACH). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see Section 29.5.2, WDTA Trigger and Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used. | - WDTAO: OPBTO.WDTO_3 <br> - WDTA1: OPBT0.WDT1_3 <br> - WDTA2: OPBT0.WDT2_3 |

Table 29.21 WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S1)

| Start-Up Option | Function | Description | Option Byte |
| :---: | :---: | :---: | :---: |
| OPWDEN | WDTA setting | Enables/disables the WDTA. <br> 0 : WDTA is disabled <br> 1: WDTA is enabled | - WDTAO: OPBT0.WDT0_0 <br> - WDTA1: OPBT0.WDT1_0 |
| OPWDOVF[2:0] | Overflow interval time reset value setting | Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0]. | WDTA0/WDTA1: OPBTO.WDT_[2:0] |
| OPWDRUN | Start mode setting | Specifies the start mode. <br> 0 : Software trigger start mode <br> 1: Default start mode <br> For details, see Section 29.5.1, WDTA after Reset Release. | - WDTAO: OPBT0.WDT0_1 <br> - WDTA1: OPBT0.WDT1_1 |
| OPWDVAC | Variable activation code selection | Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. <br> 0 : WDTAnWDTE (fixed) <br> 1: WDTAnEVAC (variable) <br> When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed ( $\mathrm{AC}_{H}$ ). When WDTAnEVAC is selected, the activation code to be written to the register is variable. <br> For details, see Section 29.5.2, WDTA Trigger and Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used. | - WDTAO: OPBTO.WDT0_3 <br> - WDTA1: OPBT0.WDT1_3 |
| NOTE |  |  |  |

For the option byte settings, see Section 44.9, Option Bytes.

### 29.2.2 Block Diagram

Figure 29.1, Block Diagram of the Window Watchdog Timer A shows the main components of the WDTA.

Figure 29.1 Block Diagram of the Window Watchdog Timer A

### 29.3 Registers

### 29.3.1 List of Registers

WDTA registers are listed in the following table.
For details about <WDTAn_base>, see Section 29.1.2, Register Base Addresses.
Table 29.22 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| WDTAn | WDTA enable register | WDTAnWDTE | <WDTAn_base> + 00000 |
|  | WDTA enable VAC register | WDTAnEVAC | <WDTAn_base> + 0004 |
|  | WDTA reference value register | WDTAnREF | <WDTAn_base> + 0008 |
|  | WDTA mode register | WDTAnMD | <WDTAn_base>+000C $H$ |

### 29.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA trigger register when the VAC function is not used (start-up option OPWDVAC $=0$ ).
Writing $\mathrm{AC}_{H}$ to this register generates a WDTA trigger and starts or restarts the WDTA counter.
See Section 29.5.2, WDTA Trigger, for details.
The behavior of this register depends on the setting of the start-up option (OPWDVAC), see Table 29.25,

## WDTAnWDTE Behavior.

WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

Access: This register can be read or written in 8-bit units.
Address: <WDTAn_base> $+0000_{\text {H }}$
Value after reset: The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See Table 29.24, Values of WDTAnRUN7 after Reset.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | WDTAnRUN[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0/1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 29.23 WDTAnWDTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | WDTAnRUN[7:0] | Writing the fixed activation code $\left(A C_{H}\right)$ generates the WDTA trigger and starts/restarts the |
|  |  | WDTAn counter. Writing a value other than $A C_{H}$ generates an error. The WDTAn cannot be |
|  | stopped once it is started. |  |
|  | See Table 29.25, WDTAnWDTE Behavior, when reading from or writing to these bits. |  |

The WDTAnRUN7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is disabled (OPWDVAC = 0). Table 29.24, Values of WDTAnRUN7 after Reset lists the values of the WDTAnRUN7 bit after reset according to the start-up options.

Table 29.24 Values of WDTAnRUN7 after Reset

| Start-Up Options |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| OPWDEN | OPWDVAC | OPWDRUN | Start Mode | Value of WDTAnRUN7 after Reset |
| 1 | 0 | 1 | Default start | 1 |
|  |  | 0 | Software trigger start | 0 |

The behavior of WDTAnWDTE during read/write accesses depends on the OPWDVAC setting, as shown in Table 29.25, WDTAnWDTE Behavior.

Table 29.25 WDTAnWDTE Behavior

| OPWDVAC | Description | WDTAnWDTE |  |
| :---: | :---: | :---: | :---: |
|  |  | Read | Write |
| 0 | The VAC function is disabled. WDTAnWDTE is enabled. | $2 \mathrm{C}_{\mathrm{H}}$ is returned (in software trigger start mode, before the activation of WDTAn). <br> $A C_{H}$ is returned (after the activation of WDTAn). | WDTA trigger Write $A C_{H}{ }^{* 1}$. |
| 1 | The VAC function is enabled. WDTAnWDTE is disabled. | $2 \mathrm{C}_{\mathrm{H}}$ is returned. | Writing is ignored. |

Note 1. Any other write value will cause an error.

### 29.3.3 WDTAnEVAC - WDTA Enable VAC Register

This register is the WDTA trigger register when the VAC function is used (start-up option OPWDVAC $=1$ ).
Writing a correct activation code to this register generates a WDTA trigger and starts or restarts the WDTA counter. For details, see Section 29.5.2, WDTA Trigger. For details about the activation codes when the VAC function is used, see Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used.

The behavior of this register depends on the setting of the start-up option (OPWDVAC). See Table 29.28, WDTAnEVAC Behavior.

WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | <WDTAn_base> + 0004H | Value after reset: | The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See Table 29.27, Values |
| :--- |
|  |
|  |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | WDTAnEVAC[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0/1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 29.26 WDTAnEVAC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | WDTAnEVAC [7:0] | Writing a variable activation code generates the WDTA trigger and starts/restarts the WDTAn <br> counter. Writing an incorrect activation code generates an error. The WDTAn cannot be <br> stopped once it is started. |
|  |  | See Table 29.28, WDTAnEVAC Behavior, when reading from or writing to these bits. |

The WDTAnEVAC7 bit is only valid if WDTA is enabled (OPWDEN = 1 ) and the VAC function is enabled (OPWDVAC = 1). Table 29.27, Values of WDTAnEVAC7 after Reset lists the values of the WDTAnEVAC7 bit after reset according to the start-up options.

Table 29.27 Values of WDTAnEVAC7 after Reset

| Start-Up Options |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| OPWDEN | OPWDVAC | OPWDRUN | Start Mode |  |
| 1 | 1 | 1 | Default start | 1 |
|  |  | 0 | Software trigger start | 0 |

The behavior of WDTAnEVAC during read/write accesses depends on the OPWDVAC setting, as shown in Table 29.28, WDTAnEVAC Behavior.

Table 29.28 WDTAnEVAC Behavior

| OPWDVAC | Description | WDTAnEVAC |  |
| :---: | :---: | :---: | :---: |
|  |  | Read | Write |
| 0 | The VAC function is disabled. WDTAnEVAC is disabled. | $2 \mathrm{C}_{\mathrm{H}}$ is returned. | Writing is ignored. |
| 1 | The VAC function is enabled. WDTAnEVAC is enabled. | $2 \mathrm{C}_{\mathrm{H}}$ is returned (in software trigger start mode, before the activation of WDTAn). <br> The variable activation code written last is read (after the activation of WDTAn). | Write the variable activation code*1 For details, see Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used. |

Note 1. Any other write value will cause an error.

### 29.3.4 WDTAnREF — WDTA Reference Value Register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation. See Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used.

If the VAC function is disabled $(O P W D V A C=0)$, reading this register returns $00_{\mathrm{H}}$. WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

| Access: | This register is a read-only register that can be read in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ WDTAn_base $>+0008_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | WDTAnREF[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 29.29 WDTAnREF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | WDTAnREF[7:0] | Reference value for activation code calculation for the VAC function. |

### 29.3.5 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, $75 \%$ interrupt enable/disable, the error mode, and the window-open period.

The value of this register can be updated only once after reset release and before the first trigger is generated. The updated value will be effective after a maximum of $3 x$ Timer count clock cycles once the WDTA trigger register is written.

Updating this register after the first WDTA trigger is generated generates an error, but an error does not occur if the same value has been written to it.

WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | <WDTAn_base> $+000 C_{H}$ |
| Value after reset: | The initial value depends on the start-up options (OPWDOVF[2:0]). See Table 29.21, WDTA Start-Up Options. |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | WDTAnOVF[2:0] |  |  | WDTAnWIE | WDTAnERM | WDTAnWS[1:0] |  |
| Value after reset | 0 | *1 | *1 | *1 | 0 | 1 | 1 | 1 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The WDTAnOVF[2:0] value after reset can be set by the start-up options OPWDOVF[2:0].
Table 29.30 WDTAnMD Register Contents

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |
| 6 to 4 | WDTAnOVF[2:0] | Selects the overflow interval time. |  |  |  |
|  |  | WDTAn OVF2 | WDTAn OVF1 | WDTAn OVFO | Overflow Interval Time |
|  |  | 0 | 0 | 0 | $2^{9} /$ WDTATCKI |
|  |  | 0 | 0 | 1 | $2{ }^{10} /$ WDTATCKI |
|  |  | 0 | 1 | 0 | $2{ }^{11} /$ WDTATCKI |
|  |  | 0 | 1 | 1 | $22^{12}$ / WDTATCKI |
|  |  | 1 | 0 | $0$ | $2{ }^{13} /$ WDTATCKI |
|  |  | 1 | 0 | 1 | $2{ }^{14}$ / WDTATCKI |
|  |  | 1 | 1 | 0 | $2{ }^{15} /$ WDTATCKI |
|  |  | 1 | 1 | 1 | $2{ }^{16} /$ WDTATCKI |
| 3 | WDTAnWIE | Enables/disables the 75\% interrupt request INTWDTAn. <br> 0 : INTWDTAn is disabled. <br> 1: INTWDTAn is enabled. |  |  |  |
| 2 | WDTAnERM | Specifies the error mode. <br> 0: NMI request mode <br> 1: Reset mode |  |  |  |
| 1, 0 | WDTAnWS[1:0] | Selects the window-open period. |  |  |  |
|  |  | WDTAn WS1 | wDTAn wso | Window-Open Period |  |
|  |  | 0 | 0 | 25\% |  |
|  |  | 0 | 1 | 50\% |  |
|  |  | 1 | 0 | 75\% |  |
|  |  | 1 | 1 | 100\% |  |

### 29.4 Interrupt Sources

WDTA checks the status of the WDTA counter value, detects illegal accesses to the WDTA-related registers, and generates an interrupt request. The following are WDTA interrupt requests:
(1) INTWDTAn (WDTA timer count 75\% interrupt request)

An interrupt request signal is generated at $75 \%$ of the counter overflow time of the WDTA timer.
An interrupt request signal can be enabled or disabled by using the WDTA mode register (WDTAnMD).
(2) WDTAnTNMI (WDTA error detection interrupt)

Detection of a WDTA error to generation of an NMI interrupt request. The WDTA mode register (WDTAnMD) can be used to switch between an NMI interrupt and a reset. For details about WDTA errors, see Section 29.5.3, WDTA Error Detection.

### 29.5 Functions

### 29.5.1 WDTA after Reset Release

### 29.5.1.1 Start Modes

There are two start modes (software start mode and default start mode) when WDTAn starts after reset release. The start mode can be selected by the start-up option.

The start mode selection is listed in Table 29.31, Start Modes.
Table 29.31 Start Modes

| Start-Up Option <br> OPWDRUN | Start Mode | Description |
| :--- | :--- | :--- |
| 0 | Software trigger | - The WDTA counter stops $\left(0000_{\mathrm{H}}\right)$ after reset release. |
|  |  | $\bullet$ Writing an activation code to the WDTA trigger register starts WDTA. |
| 1 | Default | The WDTA counter starts after reset release. |

### 29.5.1.2 WDTA Settings after Reset Release

(1) Table 29.32, WDTA Settings after Reset Release shows the WDTA settings after reset release.

Table 29.32 WDTA Settings after Reset Release

| Function | Setting | Remark |
| :---: | :---: | :---: |
| WDTA enable/disable | Specified by start-up options |  |
| Start mode |  |  |
| VAC function |  |  |
| WDTA overflow interval time | Specified by start-up options | Modification is possible only once by the setting of the WDTA mode register (WDTAnMD). |
| 75\% interrupt mode | 75\% interrupt disabled |  |
| Behavior on error detection | Reset generation |  |
| Window-open period | 100\% |  |

The setting of the WDTA mode register (WDTAnMD) is enabled behind a maximum of 3 x Timer count clock cycles when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE and WDTAnEVAC). Perform the WDTAnMD register setting before a WDTA trigger is generated.

Setting of WDTA by using WDTAnMD is possible only once. If the value set to WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value is set.

### 29.5.1.3 Default Start Mode Timing

The default start mode timing and the changes to the WDTA settings are illustrated in Figure 29.2, Timing Diagram of WDTA Start in Default Start Mode.

Figure 29.2 Timing Diagram of WDTA Start in Default Start Mode

The timing diagram shown in Figure 29.2, Timing Diagram of WDTA Start in Default Start Mode shows the following behaviors:
(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

Example: Overflow interval time after reset release $=2{ }^{16} /$ WDTATCKI $\left(\right.$ OPWDOVF[2:0] $\left.=111_{B}\right)$
(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.
(3) Write to the WDTA trigger register before the WDTA counter overflows.

The WDTAnMD setting is applied by the generation of a WDTA trigger behind a maximum of 3 x Timer count clock.

Example: Overflow interval time after a WDTA trigger is generated $=2^{13} /$ WDTATCKI

### 29.5.1.4 Software Trigger Start Mode Timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in Figure 29.3, Timing Diagram of WDTA Start in Software Trigger Start Mode.

Figure 29.3 Timing Diagram of WDTA Start in Software Trigger Start Mode

The timing diagram shown in Figure 29.3, Timing Diagram of WDTA Start in Software Trigger Start Mode shows the following behaviors:
(1) The WDTA counter value remains $0000_{\mathrm{H}}$ until the first trigger is generated after reset release. The overflow interval time is set by start-up options, but this setting has no effect because the counter is not operating.
(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.
(3) The WDTA counter starts by the generation of a WDTA trigger.

After the generation of a WDTA trigger behind a maximum of 3 x Timer count clock, the overflow interval time specified in WDTAnMD and other settings are applied.

### 29.5.2 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) and the WDTA enable VAC register (WDTAnEVAC) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- Setting the WDTA mode specified by the WDTAnMD register (only for the first WDTA trigger after reset release)

The WDTA trigger register, which generates a WDTA trigger, is specified by the start-up option OPWDVAC.
Table 29.33, WDTA Trigger Registers and Activation Codes lists the WDTA trigger registers and activation codes.

Table 29.33 WDTA Trigger Registers and Activation Codes

| Type of Activation Code | Trigger Register | Activation Code |
| :--- | :--- | :--- |
| Fixed | WDTAnWDTE | $\mathrm{AC}_{\mathrm{H}}$ |
| $($ OPWDVAC $=0)$ |  |  |
| Variable WDTAnEVAC <br> $($ OPWDVAC $=1)$  | For details, see Section 29.5.2.1, Calculating an Activation Code when the |  |

## CAUTION

- When successively writing the processing to clear WDTA, the clear processing below is not acknowledged for the following period:
" $12 \times$ CPU clock ${ }^{\star 1}$ cycles $+6 \times$ WDT clock ${ }^{* 2}$ cycles"
- After writing the processing to clear WDTA and then changing to standby mode during the above-mentioned period, the clear processing below is not acknowledged for the following period after return from stand-by mode:
" $6 \times$ CPU clock $^{* 1}$ cycles $+3 \times$ WDT clock $^{* 2}$ cycles"

```
    Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTL and CKSC_CPUCLKD_CTL
    Note 2. WDT clock: Clock selected by CKSC_AWDTAD_CTL is used for WDTAO.
    LS IntOSC is used for WDTA1 and WDTA2.
```

### 29.5.2.1 Calculating an Activation Code when the VAC Function is Used

Use the following expression to calculate the variable activation code (ExpectWDTE) to be set in the WDTA trigger register (WDTAnEVAC) when the VAC function is used, by using the WDTA reference value register (WDTAnREF):

ExpectWDTE $=$ AC $_{H}-$ WDTAnREF (previous)

Note that the value in the WDTAnREF register is updated every time a start-code is written to the trigger register WDTAnEVAC. Use the following expression to calculate the updated value of the WDTAnREF register:

WDTAnREF (following) $=($ rotate the value of ExpectWDTE to the left by 1 bit $)$
Table 29.34, Expected Variable Activation Code Development lists the variable activation codes according to the number of WDTA triggers.

Table 29.34 Expected Variable Activation Code Development

| No $^{* 1}$ | WDTAnREF (Previous) | ExpectWDTE $\left(\mathrm{AC}_{H}-\right.$ WDTAnREF) |  | WDTAnREF (Following) |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 00000000 | $00_{H}$ | 10101100 | $A C_{H}$ | 01011001 |  |
| 1 | 01011001 | $59_{H}$ | 01010011 | $53_{H}$ | 10100110 | $A_{H}$ |
| 2 | 10100110 | $\mathrm{~A}_{\mathrm{H}}$ | 00000110 | $06_{H}$ | 00001100 | $0 C_{H}$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |

Note 1. Number of triggers after reset

NOTE
Writing an incorrect activation code generates an error.

### 29.5.3 WDTA Error Detection

WDTA detects an error, including generation of the WDTA count overflow or illegal operations.
The following events are detected as errors:

- WDTA counter overflow
- Incorrect activation code is written to the WDTA trigger register
- Writing to the trigger register at a time outside the window-open period
- When the setting value in the WDTA mode register (WDTAnMD) is changed after the first WDTA trigger is generated
- When the value of the WDTA mode register (WDTAnMD) is changed twice before the first WDTA trigger is generated*1

Note 1. In this case, WDTAnRES is generated regardless setting of WDTA error mode bit (WDTAnMD.WDTAnERM).

### 29.5.3.1 WDTA Error Mode

When a WDTA error is detected, either an NMI interrupt or a reset is generated according to the setting of the WDTA error mode bit (WDTAnMD.WDTAnERM). The error mode bit after reset release is set to the reset mode.

- WDTAnMD.WDTAnERM $=0$ : NMI mode
- WDTAnMD.WDTAnERM = 1: Reset mode

Figure 29.4, Timing Diagram of WDTA NMI Request or Reset Generation shows the reset or NMI request generation when the counter overflows and default start mode is selected.

Figure 29.4 Timing Diagram of WDTA NMI Request or Reset Generation

The timing diagram shown in Figure 29.4, Timing Diagram of WDTA NMI Request or Reset Generation shows the following behaviors:
(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.
(2) WDTAnMD is set before a WDTA trigger is generated.

In this case, $2{ }^{16} /$ WDTATCKI is set for the overflow interval time.
(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.
(4) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated.
The counter value remains until a system reset is performed.
(5) When the system is reset, the counter is cleared and stops until reset release.

### 29.5.4 75\% Interrupt Request Signals

When the WDTA counter reaches $75 \%$ of the time set for the overflow interval, the interrupt request INTWDTAn is generated.

This function can be enabled or disabled by the WDTAnMD.WDTAnWIE register.
Figure 29.5, Timing Diagram of WDTA 75\% Interrupt Request Signals shows the 75\% interrupt request generated under following conditions:

- Default start mode is selected.
- 75\% interrupt request is enabled after the first WDTA trigger is generated
- WDTA overflow interval time is $2^{16} /$ WDTATCKI

Figure 29.5 Timing Diagram of WDTA 75\% Interrupt Request Signals
(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.
(2) WDTAnMD is set before a WDTA trigger is generated. In this case, $2^{16} / \mathrm{WDTATCKI}$ is set for the overflow interval time.
(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.
(4) When the WDTA counter reaches $75 \%$ of the overflow interval timer, interrupt request INTWDTAn is generated.
(5) The WDTA trigger restarts counting.
(6) When the WDTA counter reaches $75 \%$ of the overflow interval timer, interrupt request INTWDTAn is generated.
(7) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

### 29.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set. If the window-open period is set to the value less than $100 \%$, the generation of a WDTA trigger not in the window-open period causes an error. The windowopen period after reset release is $100 \%$. The period is set to the value by the WDTAnMD.WDTAnWS[1:0] setting after the first WDTA trigger is generated.
Figure 29.6, Timing Diagram of WDTA Window Function shows the behavior of the window function under the following conditions.

- Default start mode is selected.
- $25 \%$ window-open period is enabled after the first WDTA trigger is generated (WDTAnWS[1:0] $=00_{B}$ )
- WDTA overflow interval time is $2^{16} /$ WDTATCKI

Figure 29.6 Timing Diagram of WDTA Window Function
(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.
(2) WDTAnMD is set before a WDTA trigger is generated. In this case, $2^{16} / \mathrm{WDTATCKI}$ is set for the overflow interval time.
(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.
(4) During the window-open period, the WDTA trigger restarts counting.
(5) During the window-closed period, an error is detected by the WDTA trigger. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.
(6) When the system is reset, the counter is cleared and stops until reset release.

## Section 30 OS Timer (OSTM)

This section contains a generic description of the OS Timer (OSTM).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of OSTM.

### 30.1 Features of RH850/F1KH, RH850/F1KM OSTM

### 30.1.1 Number of Units

This microcontroller has the following number of units of the OSTM.
Each OSTM unit has single channel interface.
Table 30.1 Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 <br> 176 Pins | RH850/F1KH-D8 <br> 233 Pins | RH850/F1KH-D8 <br> 324 Pins |
| :--- | :--- | :--- | :--- |
| Number of Units | 10 | 10 | 10 |
| Name | OSTMn $(\mathrm{n}=0$ to 9$)$ | OSTMn $(\mathrm{n}=0$ to 9$)$ | OSTMn $(\mathrm{n}=0$ to 9$)$ |

Table 30.2 Number of Units (RH850/F1KM-S4)

| Product Name | RH850/F1KM-S4 <br> 100 Pins | RH850/F1KM-S4 <br> 144 Pins | RH850/F1KM-S4 <br> 176 Pins | RH850/F1KM-S4 <br> 233 Pins | RH850/F1KM-S4 <br> 272 Pins |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Number of Units | 5 | 5 | 5 | 5 | 5 |
| Name | OSTMn ( $\mathrm{n}=0$ to 4) | OSTMn ( $\mathrm{n}=0$ to 4) | OSTMn ( $\mathrm{n}=0$ to 4) | OSTMn ( $\mathrm{n}=0$ to 4) | OSTMn ( $\mathrm{n}=0$ to 4) |

Table 30.3 Number of Units (RH850/F1KM-S1)

| RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 <br> Product Name | RH8 <br> 48 Pins |
| :--- | :--- | :--- | :--- | :--- |
| 64 Pins |  |  |  |  |

Table 30.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual OSTM units are identified by the index " n "; for example, OSTMnCNT is the <br> OSTM counter register. |

### 30.1.2 Register Base Addresses

OSTM base addresses are listed in the following table.
OSTM register addresses are given as offsets from the base addresses.
Table 30.5 Register Base Addresses (RH850/F1KH-D8)

| Base Address Name | Base Address |
| :--- | :--- |
| <OSTM0_base> | FFD7 $0000_{\mathrm{H}}$ |
| <OSTM1_base> | FFD7 $0100_{\mathrm{H}}$ |
| <OSTM2_base> | FFD7 $0200_{\mathrm{H}}$ |
| <OSTM3_base> | FFD7 $0300_{\mathrm{H}}$ |
| <OSTM4_base> | FFD7 $0400_{\mathrm{H}}$ |
| <OSTM5_base> | FFD7 $1000_{\mathrm{H}}$ |
| <OSTM6_base> | FFD7 $1100_{\mathrm{H}}$ |
| <OSTM7_base> | FFD7 $1200_{\mathrm{H}}$ |
| <OSTM8_base> | FFD7 $1300_{\mathrm{H}}$ |
| <OSTM9_base> | FFD7 $1400_{\mathrm{H}}$ |

Table 30.6 Register Base Addresses (RH850/F1KM-S4)

| Base Address Name | Base Address |
| :--- | :--- |
| <OSTM0_base> | FFD7 $0000_{\mathrm{H}}$ |
| <OSTM1_base> | FFD7 $0100_{\mathrm{H}}$ |
| <OSTM2_base> | FFD7 $0200_{\mathrm{H}}$ |
| <OSTM3_base> | FFD7 $0300_{\mathrm{H}}$ |
| <OSTM4_base> | FFD7 $0400_{\mathrm{H}}$ |

Table 30.7 Register Base Address (RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <OSTM0_base> | FFD7 $0000_{\mathrm{H}}$ |

### 30.1.3 Clock Supply

The OSTM clock supply is shown in the following table.
Table 30.8 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| OSTMn | PCLK | CPUCLK_L | Timer count clock |
|  | Register access clock | CPUCLK_L | Bus clock |

### 30.1.4 Interrupt Requests

OSTM interrupt requests are listed in the following table.
Table 30.9 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| OSTM0 |  | OSTM0 interrupt | 84 (INTOSTM0) |
| OSTMTINT |  | - |  |
| OSTM5 | OSTM5 interrupt | 314 (INTOSTM5) | - |
| OSTMTINT |  |  |  |

Table 30.10 Interrupt Request (RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
| OSTM0 | OSTM0 interrupt | 84 (INTOSTMO) | - |

Table 30.11 Interrupt Requests (FE Level Maskable Interrupt Request) (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Name | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| OSTM0 |  |  |  |
| OSTMTINT | OSTM0 interrupt | INTOSTMO_FE | - |
| OSTM1 |  |  |  |
| OSTMTINT | OSTM1 interrupt | INTOSTM1_FE | - |
| OSTM2 |  |  |  |
| OSTMTINT | OSTM2 interrupt | INTOSTM2_FE | - |
| OSTM3 |  |  |  |
| OSTMTINT | OSTM3 interrupt | INTOSTM3_FE | - |
| OSTM4 |  |  |  |
| OSTMTINT | OSTM4 interrupt | INTOSTM4_FE | - |
| OSTM5 |  |  |  |
| OSTMTINT | OSTM5 interrupt | INTOSTM5_FE | - |
| OSTM6 |  |  |  |
| OSTMTINT | OSTM6 interrupt | INTOSTM6_FE | - |
| OSTM7 |  |  |  |
| OSTMTINT | OSTM7 interrupt | INTOSTM7_FE | - |
| OSTM8 |  |  |  |
| OSTMTINT | OSTM8 interrupt | INTOSTM8_FE | - |
| OSTM9 |  |  |  |
| OSTMTINT | OSTM9 interrupt | INTOSTM9_FE | - |

Table 30.12 Interrupt Requests (FE Level Maskable Interrupt Request) (RH850/F1KM-S4)

| Unit Interrupt Signal | Description | Interrupt Name | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| OSTM0 OSTM0 interrupt INTOSTM0_FE - <br> OSTMTINT OSTM1 interrupt INTOSTM1_FE - <br> OSTM1 OSTM2 interrupt INTOSTM2_FE - <br> OSTMTINT    <br> OSTM2 INTOSTM3_FE -  <br> OSTMTINT OSTM3 interrupt INTOSTM4_FE - <br> OSTM3    <br> OSTMTINT OSTM4 interrupt  OSTMTINT |  |  |  |

Table 30.13 Interrupt Request (FE Level Maskable Interrupt Request) (RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Name | DMA Trigger Number |  |
| :--- | :--- | :--- | :--- | :---: |
|  |  |  |  |  |
| OSTM0 |  |  |  |  |
| OSTMTINT | OSTM0 interrupt | INTOSTMO_FE | - |  |

### 30.1.5 Reset Sources

OSTM reset sources are listed in the following table. OSTM is initialized by these reset sources.
Table 30.14 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| OSTMn | All reset sources (ISORES) |

### 30.2 Overview

OSTM is a 32-bit timer/counter.
It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

### 30.2.1 Functional Overview

OSTM has the following features.

- Two operating modes
- Interval timer mode
- Free-run compare mode
- OSTMTINT interrupt

### 30.2.2 Block Diagram

The following block diagram shows the main components of OSTM.

Figure 30.1 Block Diagram of OSTM

### 30.2.3 Count Clock

The count clock used by OSTM is PCLK.

### 30.2.4 Interrupt Sources (OSTMTINT)

An OSTMTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This is illustrated in the following figure.

Figure 30.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

### 30.3 Registers

### 30.3.1 List of Registers

OSTM registers are listed in the following table.
For details about <OSTMn_base>, see Section 30.1.2, Register Base Addresses.
Table 30.15 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| OSTMn | OSTMn compare register | OSTMnCMP | <OSTMn_base $>+00_{H}$ |
|  | OSTMn counter register | OSTMnCNT | <OSTMn_base> $+04_{H}$ |
|  | OSTMn count enable status register | OSTMnTE | <OSTMn_base> $+10_{H}$ |
|  | OSTMn count start trigger register | OSTMnTS | <OSTMn_base>+14 |
|  | OSTMn count stop trigger register | OSTMnTT | <OSTMn_base> $+18_{H}$ |
|  | OSTMn control register | OSTMnCTL | <OSTMn_base> $+20_{H}$ |
|  | OSTMn emulation register | OSTMnEMU | <OSTMn_base> $+24_{H}$ |

### 30.3.2 OSTMnCMP — OSTMn Compare Register

This register stores the start value of the down-counter or the value with which the counter is compared, depending on the operation mode.
Address: <OSTMn_base> $+00_{H}$ Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OSTMnCMP[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | OSTMnCMP[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/w | R/w | R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.16 OSTMnCMP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OSTMnCMP[31:0] | $\bullet$ In interval timer mode: start value of the down-counter |
|  |  | $\bullet$ In free-run compare mode: compare value |

### 30.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

Access: This register is a read-only register that can be read in 32-bit units.
Address: <OSTMn_base> + 04H
Value after reset: $\quad$ FFFF FFFF $_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OSTMnCNT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | OSTMnCNT[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 30.17 OSTMnCNT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OSTMnCNT[31:0] | Timer counter value |

Table 30.18, Correspondence among Operating Mode, Counting Direction, and Start Value lists the correspondence among the OSTM operating mode, counting direction, and start value. The start value indicates the value to be read after the operating mode is changed.

Table 30.18 Correspondence among Operating Mode, Counting Direction, and Start Value

| Timer Operating Mode | OSTMnCTL.OSTMnMD1 | Counting Direction | Start Value |
| :--- | :--- | :--- | :--- |
| Interval timer mode | $0^{* 1}$ | Down | FFFF FFFF $_{H}$ |
| Free-run compare mode | 1 | Up | $00000000_{\mathrm{H}}$ |

Note 1. Value after reset.

### 30.3.4 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access: This register is a read-only register that can be read in 8-bit units.
Address: <OSTMn_base> + 10H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OSTMnTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 30.19 OSTMnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | OSTMnTE | Indicates whether the counter is enabled or disabled: |
|  | 0: Counter disabled |  |
|  | 1: Counter enabled |  |
|  | This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. |  |
|  | Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0. |  |

## NOTE

If the counter is disabled, the counter value retains its value.
If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 00000000 H if it is in free-run compare mode.

### 30.3.5 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

Access: This register is a write-only register that can be written in 8 -bit units.
Address: <OSTMn_base> + 14H
Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OSTMnTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | w |

Table 30.20 OSTMnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | OSTMnTS | Starts the counter: |
|  | $0:$ This setting is invalid. |  |
|  | 1: Starts the counter and sets OSTMnTE.OSTMnTE $=1$. |  |

- In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1.
In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE $=1$.

### 30.3.6 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

Access: This register is a write-only register that can be written in 8-bit units.
Address: <OSTMn_base> + 18
Value after reset: $00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OSTMnTT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 30.21 OSTMnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | OSTMnTT | Stops the counter: |
|  | $0:$ This setting is invalid. |  |
|  | 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit. |  |

### 30.3.7 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMTINT interrupt requests when counting starts.

Although this register is readable and writable, this register can only be written when OSTMnTS.OSTMnTE $=0$.

### 30.3.8 OSTMnEMU — OSTMn Emulation Register

This register controls operation in combination with SVSTOP.

Access: This register can be read or written in 8-bit units.
Only proceed with writing while the counter is stopped (OSTMnTE.OSTMnTE $=0$ and EPC.SVSTOP $=0$ ).
Address: <OSTMn_base> + 24H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OSTMnSVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 30.23 OSTMnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | OSTMnSVSDIS | When EPC.SVSTOP = 0 |
|  |  | Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on) regardless of the value of this bit (0/1). |
|  |  | When EPC.SVSTOP = 1 |
|  |  | 0 : The count clock is stopped when the debugger acquires control of the microcontroller (at breakpoints and so on). |
|  |  | 1: Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 30.4 Operation

### 30.4.1 Starting and Stopping OSTM

OSTM is started and stopped as follows:

## Starting the Timer

OSTM is started by the following setting.

- Setting the OSTMnTS.OSTMnTS bit to 1

The OSTMnTE.OSTMnTE status bit is set to 1 .
The counter starts to count up or down in accordance with the settings for operating mode. For details, see
Section 30.4.2, Interval Timer Mode and Section 30.4.3, Free-Run Compare Mode.

## Stopping the Timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops OSTM.
This also clears the OSTMnTE.OSTMnTE status bit.

### 30.4.2 Interval Timer Mode

In interval timer mode, OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

### 30.4.2.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMTINT interrupt request is generated when the counter underflows (reaches $00000000_{\mathrm{H}}$ ).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 $=0$.
New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next $00000000_{\mathrm{H}}$ is reached. Then the counter continues with the new value.

## OSTMTINT Period

The periods of OSTMTINT is:

- OSTMTINT generation period $=$ count clock period $\times($ OSTMnCMP +1$)$

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

Figure 30.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:
(1) The counter starts counting when OSTMnTS.OSTMnTS $=1$. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register indicates the counter value.
(2) When the counter reaches $00000000_{\mathrm{H}}$, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.
(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

## Forced Restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS $=1$ during counting.
The counter loads the start value from the OSTMnCMP register and continues to count down.
The following figure shows the timing in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

Figure 30.4 Timing Diagram of Forced Restart in Interval Timer Mode

The timing diagram above shows the following operations:
(1) The counter is started and stopped as described under Figure 30.3, Timing Diagram of OSTM in Interval Timer Mode.
(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 $=1$, an OSTMTINT interrupt request is generated when counting starts.

### 30.4.2.2 Operation when OSTMnCMP $=0000 \mathbf{0 0 0 0}_{H}$

When OSTMnCMP $=00000000_{\mathrm{H}}$, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1 .

The following figure shows operations of $\operatorname{OSTM}$ when $\mathrm{OSTMnCMP}=00000000_{\mathrm{H}}$, and counter-start interrupts are enabled.

Figure 30.5 Timing Diagram when OSTMnCMP $=00000000$ н in Interval Timer Mode

The timing diagram above shows the following operations:
(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value $00000000_{\mathrm{H}}$ is retained in OSTMnCMP.
(2) The OSTMTINT interrupt request is continuously asserted.
(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

### 30.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

## Setting Procedure

(1) Set the start value of the counter in the OSTMnCMP register.
(2) Select interval timer mode by setting the OSTMnCTL.OSTMnMD1 bit to 0 .
(3) Enable or disable interrupts when counting starts (OSTMnCTL.OSTMnMD0).

### 30.4.3 Free-Run Compare Mode

### 30.4.3.1 Basic Operation in Free-Run Compare Mode

In free-run compare mode, the counter counts up from $00000000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}$. When the value of the OSTMnCMP register matches the current counter value, an OSTMTINT interrupt request is output.
In free-run compare mode, set OSTMnCTL.OSTMnMD1 $=1$.
New values can be written to the OSTMnCMP register at any time.
The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 $=1$ ).

Figure 30.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:
(1) The counter starts counting when OSTMnTS.OSTMnTS $=1$.

The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from $00000_{000}{ }_{H}$ to $\operatorname{FFFF} \mathrm{FFFF}_{\mathrm{H}}$. The OSTMnCNT register indicates the counter value.
When OSTMnCTL.OSTMnMD0 $=1$, an OSTMTINT interrupt request is generated at the start of counting.
(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.
(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.
(4) Counting by the counter restarts from $00000000_{\mathrm{H}}$ when $\mathrm{OSTMnTS} . \mathrm{OSTMnTS}=1$.

## OSTMTINT Period

The OSTMTINT generation period is different depending on the starting time. If OSTMnCMP is rewritten during operation, the period is changed according to the size of the new and old compare values.

Table 30.24 OSTMTINT Generation Timing
$\left.\begin{array}{l|l|l|l|l}\hline \begin{array}{l}\text { Old Value for } \\ \text { Comparison }\end{array} & \begin{array}{l}\text { New Value for } \\ \text { Comparison }\end{array} & \begin{array}{l}\text { Counter Value at } \\ \text { Time of Rewriting }\end{array} & \text { Period of OSTMTINT Generation }\end{array} \quad \begin{array}{l}\text { Label in } \\ \text { Timing } \\ \text { Diagram }\end{array}\right]$

## Forced Restart

Forced restarting of the counter does not proceed if the OSTMnTS.OSTMnTS bit is set during counting. The counter ignores the attempted setting and continues counting.

### 30.4.3.2 Operation when OSTMnCMP $=00000000^{\boldsymbol{H}}$

The following figure shows the operation of OSTM when $\mathrm{OSTMnCMP}=00000000_{\mathrm{H}}$, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

Figure 30.7 Timing Diagram when OSTMnCMP $=0000$ 0000н in Free-Run Compare Mode

The timing diagram above shows the following operations.
(1) Once the counter starts, it counts up from $00000000_{\mathrm{H}}$ to $\operatorname{FFFF} \mathrm{FFFF}_{\mathrm{H}}$.
(2) An OSTMTINT interrupt request is generated when counting starts.
(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP $=00000000_{\mathrm{H}}$ as shown above, OSTMTINT is generated over two clock cycles.
(4) An OSTMTINT interrupt request is generated for each clock cycle ( $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}+1$ ).

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

### 30.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

## Setting Procedure

(1) Set the compare value in the OSTMnCMP register.
(2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit to 1.
(3) Enable or disable interrupts when counting starts by the OSTMnCTL.OSTMnMD0 bit.

## Section 31 Timer Array Unit B (TAUB)

This section contains a generic description of the timer array unit B (TAUB).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUB.

### 31.1 Features of RH850/F1KH, RH850/F1KM TAUB

### 31.1.1 Number of Units and Channels

This microcontroller has the following number of TAUB units and channels.
Table 31.1 Number of Units (RH850/F1KH-D8)

|  | RH850/F1KH-D8 | RH850/F1KH-D8 | RH850/F1KH-D8 |
| :--- | :--- | :--- | :--- |
| Product Name | 176 Pins | 233 Pins | 324 Pins |
| Number of Units | 2 | 2 | 2 |
| Name | TAUBn $(\mathrm{n}=0,1)$ | TAUBn $(\mathrm{n}=0,1)$ | TAUBn $(\mathrm{n}=0,1)$ |

Table $31.2 \quad$ Number of Units (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |
| :--- | :--- | :--- | :--- | :--- | :--- |

Table 31.7 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual TAUB units are identified by the index " n "; for example, TAUBnTOM is the <br> TAUBn channel output mode register. |
| m | The TAUB has 16 channels. Throughout this section, the individual channels are identified by the index " m ", thus a <br> certain channel is denoted as $\mathrm{CHm}(\mathrm{m}=0$ to 15$)$. |
| The even numbered channels $(\mathrm{m}=0,2,4,6,8,10,12,14)$ are denoted as CHm_even. <br> The odd numbered channels $(\mathrm{m}=1,3,5,7,9,11,13,15)$ are denoted as CHm_odd. |  |

### 31.1.2 Register Base Addresses

TAUBn base addresses are listed in the following table.
TAUBn register addresses are given as offsets from the base addresses.
Table 31.8 Register Base Addresses (RH850/F1KH-D8)

| Name | Base Address |
| :--- | :--- |
| <TAUB0_base> | FFE3 $0000_{H}$ |
| <TAUB1_base> | FFE3 $1000_{H}$ |
| Table 31.9 | Register Base Addresses (RH850/F1KM-S4) |
| Name | Base Address |
| <TAUB0_base> | FFE3 $0000_{H}$ |
| <TAUB1_base> | FFE3 $1000_{H}$ |

Table 31.10 Register Base Address (RH850/F1KM-S1)

| Name | Base Address |
| :--- | :--- |
| <TAUBO_base> | FFE3 $0000_{\mathrm{H}}$ |

### 31.1.3 Clock Supply

The TAUBn clock supply is shown in the following table.
Table 31.11 TAUBn Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| TAUBn | PCLK | CKSCLK_IPERI2 | Timer count clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI2 | Bus clock |

### 31.1.4 Interrupt Requests

TAUBn interrupt requests are listed in the following table.
Table 31.12 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Name | Description | Interrupt Number | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| TAUB0 |  |  |  |
| INTTAUBOIO | Channel 0 interrupt | 142 | 33 to 38 |
| INTTAUB011 | Channel 1 interrupt | 143 | 33 to 38 |
| INTTAUB012 | Channel 2 interrupt | 144 | 33 to 38 |
| INTTAUB013 | Channel 3 interrupt | 145 | 33 to 38 |
| INTTAUB014 | Channel 4 interrupt | 146 | 33 to 38 |
| INTTAUB0I5 | Channel 5 interrupt | 147 | 33 to 38 |
| INTTAUB0I6 | Channel 6 interrupt | 148 | 33 to 38 |
| INTTAUB017 | Channel 7 interrupt | 149 | 33 to 38 |
| INTTAUB0I8 | Channel 8 interrupt | 150 | 33 to 38 |
| INTTAUB0I9 | Channel 9 interrupt | 151 | 33 to 38 |
| INTTAUB0I10 | Channel 10 interrupt | 152 | 33 to 38 |
| INTTAUB0I11 | Channel 11 interrupt | 153 | 33 to 38 |
| INTTAUB0I12 | Channel 12 interrupt | 154 | 33 to 38 |
| INTTAUB0I13 | Channel 13 interrupt | 155 | 33 to 38 |
| INTTAUB0114 | Channel 14 interrupt | 156 | 33 to 38 |
| INTTAUB0115 | Channel 15 interrupt | 157 | 33 to 38 |
| TAUB1 |  |  |  |
| INTTAUB1I0 | Channel 0 interrupt | 256 | 52 to 57 |
| INTTAUB1I1 | Channel 1 interrupt | 257 | 52 to 57 |
| INTTAUB1I2 | Channel 2 interrupt | 258 | 52 to 57 |
| INTTAUB1I3 | Channel 3 interrupt | 259 | 52 to 57 |
| INTTAUB1I4 | Channel 4 interrupt | 260 | 52 to 57 |
| INTTAUB1I5 | Channel 5 interrupt | 261 | 52 to 57 |
| INTTAUB1I6 | Channel 6 interrupt | 262 | 52 to 57 |
| INTTAUB1I7 | Channel 7 interrupt | 263 | 52 to 57 |
| INTTAUB1I8 | Channel 8 interrupt | 264 | 52 to 57 |
| INTTAUB1I9 | Channel 9 interrupt | 265 | 52 to 57 |
| INTTAUB1I10 | Channel 10 interrupt | 266 | 52 to 57 |
| INTTAUB1I11 | Channel 11 interrupt | 267 | 52 to 57 |
| INTTAUB1I12 | Channel 12 interrupt | 268 | 52 to 57 |
| INTTAUB1I13 | Channel 13 interrupt | 269 | 52 to 57 |
| INTTAUB1I14 | Channel 14 interrupt | 270 | 52 to 57 |
| INTTAUB1I15 | Channel 15 interrupt | 271 | 52 to 57 |

Table 31.13 Interrupt Requests (RH850/F1KM-S4)

| Unit Interrupt Name | Description | Interrupt Number | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| TAUBO |  |  |  |
| INTTAUBOIO | Channel 0 interrupt | 142 | 33 to 38 |
| INTTAUB0I1 | Channel 1 interrupt | 143 | 33 to 38 |
| INTTAUB012 | Channel 2 interrupt | 144 | 33 to 38 |
| INTTAUB013 | Channel 3 interrupt | 145 | 33 to 38 |
| INTTAUB014 | Channel 4 interrupt | 146 | 33 to 38 |
| INTTAUB015 | Channel 5 interrupt | 147 | 33 to 38 |
| INTTAUB0I6 | Channel 6 interrupt | 148 | 33 to 38 |
| INTTAUB0I7 | Channel 7 interrupt | 149 | 33 to 38 |
| INTTAUB018 | Channel 8 interrupt | 150 | 33 to 38 |
| INTTAUB019 | Channel 9 interrupt | 151 | 33 to 38 |
| INTTAUB0I10 | Channel 10 interrupt | 152 | 33 to 38 |
| INTTAUB0I11 | Channel 11 interrupt | 153 | 33 to 38 |
| INTTAUB0I12 | Channel 12 interrupt | 154 | 33 to 38 |
| INTTAUB0I13 | Channel 13 interrupt | 155 | 33 to 38 |
| INTTAUB0I14 | Channel 14 interrupt | 156 | 33 to 38 |
| INTTAUB0I15 | Channel 15 interrupt | 157 | 33 to 38 |
| TAUB1 |  |  |  |
| INTTAUB1I0 | Channel 0 interrupt | 256 | 52 to 57 |
| INTTAUB1I1 | Channel 1 interrupt | 257 | 52 to 57 |
| INTTAUB1I2 | Channel 2 interrupt | 258 | 52 to 57 |
| INTTAUB1I3 | Channel 3 interrupt | 259 | 52 to 57 |
| INTTAUB114 | Channel 4 interrupt | 260 | 52 to 57 |
| INTTAUB1I5 | Channel 5 interrupt | 261 | 52 to 57 |
| INTTAUB116 | Channel 6 interrupt | 262 | 52 to 57 |

| INTTAUB0I13 | Channel 13 interrupt | 155 | 33 to 38 |
| INTTAUB0I14 | Channel 14 interrupt | 156 | 33 to 38 |
| INTTAUB0I15 | Channel 15 interrupt | 157 | 33 to 38 |

### 31.1.5 Reset Sources

TAUBn reset sources are listed in the following table. TAUBn is initialized by these reset sources.
Table 31.15 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| TAUBn | All reset sources (ISORES) |

### 31.1.6 External input/output Signals

External input/output signals of TAUBn are listed below.
Table 31.16 External Input/Output Signals (RH850/F1KH-D8)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| TAUB0 |  |  |
| TAUBTTINO | Channel 0 input*1 | TAUBOIO |
| TAUBTTIN1 | Channel 1 input*1 | TAUB0I1 |
| TAUBTTIN2 | Channel 2 input*1 | TAUBOI2 |
| TAUBTTIN3 | Channel 3 input*1 | TAUB013 |
| TAUBTTIN4 | Channel 4 input*1 | TAUB014 |
| TAUBTTIN5 | Channel 5 input*1 | TAUB015 |
| TAUBTTIN6 | Channel 6 input*1 | TAUB0I6 |
| TAUBTTIN7 | Channel 7 input*1 | TAUB0I7 |
| TAUBTTIN8 | Channel 8 input*1 | TAUB0I8 |
| TAUBTTIN9 | Channel 9 input*1 | TAUB019 |
| TAUBTTIN10 | Channel 10 input*1 | TAUB0110 |
| TAUBTTIN11 | Channel 11 input*1 | TAUB0111 |
| TAUBTTIN12 | Channel 12 input*1 | TAUB0112 |
| TAUBTTIN13 | Channel 13 input*1 | TAUB0113 |
| TAUBTTIN14 | Channel 14 input*1 | TAUB0114 |
| TAUBTTIN15 | Channel 15 input*1 | TAUB0115 |
| TAUBTTOUT0 | Channel 0 output | TAUB000 |
| TAUBTTOUT1 | Channel 1 output | TAUB001 |
| TAUBTTOUT2 | Channel 2 output | TAUB002 |
| TAUBTTOUT3 | Channel 3 output | TAUB003 |
| TAUBTTOUT4 | Channel 4 output | TAUB004 |
| TAUBTTOUT5 | Channel 5 output | TAUB005 |
| TAUBTTOUT6 | Channel 6 output | TAUB006 |
| TAUBTTOUT7 | Channel 7 output | TAUB007 |
| TAUBTTOUT8 | Channel 8 output | TAUB008 |
| TAUBTTOUT9 | Channel 9 output | TAUB009 |
| TAUBTTOUT10 | Channel 10 output | TAUB0010 |
| TAUBTTOUT11 | Channel 11 output | TAUB0011 |
| TAUBTTOUT12 | Channel 12 output | TAUB0012 |
| TAUBTTOUT13 | Channel 13 output | TAUB0013 |
| TAUBTTOUT14 | Channel 14 output | TAUB0014 |
| TAUBTTOUT15 | Channel 15 output | TAUB0015 |

Table 31.16 External Input/Output Signals (RH850/F1KH-D8)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| TAUB1 |  |  |
| TAUBTTINO | Channel 0 input*1 | TAUB1I0 |
| TAUBTTIN1 | Channel 1 input*1 | TAUB1I1 |
| TAUBTTIN2 | Channel 2 input*1 | TAUB1I2 |
| TAUBTTIN3 | Channel 3 input*1 | TAUB1I3 |
| TAUBTTIN4 | Channel 4 input*1 | TAUB1I4 |
| TAUBTTIN5 | Channel 5 input*1 | TAUB1I5 |
| TAUBTTIN6 | Channel 6 input*1 | TAUB1I6 |
| TAUBTTIN7 | Channel 7 input*1 | TAUB1I7 |
| TAUBTTIN8 | Channel 8 input* ${ }^{1}$ | TAUB1I8 |
| TAUBTTIN9 | Channel 9 input*1 | TAUB1I9 |

### 31.1.7 TAUBn Input Selection

The output from port TAUBnIm ( $\mathrm{n}=0,1, \mathrm{~m}=0$ to 15 ) can be input to TAUBTTINm ( $\mathrm{m}=0$ to 15 ) as shown in the following figure.

Figure 31.1 TAUBn Input/Output and Interrupt Request Signals

The following table shows the input signals to several TAUBn inputs.
Table 31.19 TAUBn Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Input Signal | Function | Settings |
| :---: | :---: | :---: |
| TAUBTTIN[m] | Port TAUBnı[m] | SELB_TAUBnI[m] = 0 |
|  | Port TAUBnl[m + 1] | SELB_TAUBnI[m] = 1 |
| TAUBTTIN[m + 1] | Port TAUBnI[m + 1] | SELB_TAUBnl $[\mathrm{m}+1]=0$ |
|  | Port TAUBnI[m] | SELB_TAUBnl[m + 1] = 1 |

Note: $m=0,2,4,6,8,10,12,14$

### 31.1.7.1 List of Registers

Input signal selection register is listed in the following table.
Table 31.20 List of Registers (RH850/F1KH-D8)

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| TAUBn input selection registers |  |  |  |
| SL_TAUBn | TAUBTTINm input signal selection register | SELB_TAUB0I | FFE3 2000 |
|  | TAUBTTINm input signal selection register | SELB_TAUB1I $^{\text {FFE3 } 3000_{H}}$ |  |

Table 31.21 List of Registers (RH850/F1KM-S4)

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.24 SELB_TAUB1I Register Contents

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 15 to 0 | SELB_TAUB1Im ( $m=0$ to 15) | Selection of TAUBTTINm input signal |  |  |  |
|  |  | TAUB Input | Bit[m+1] | Bit[m] | Input signal |
|  |  | TAUBTTIN[m] | x | 0 | Selection of port TAUB11[m] |
|  |  |  | x | 1 | Selection of port TAUB1[ [m + 1] |
|  |  | TAUBTTIN[ $m+1]$ | 0 | x | Selection of port TAUB1[ $\mathrm{m}+1$ ] |
|  |  |  | 1 | x | Selection of port TAUB11[m] |

NOTE: $\quad m=0,2,4,6,8,10,12,14$

## CAUTION

Do not change the input signal of the each channel during the timer counting.

### 31.2 Overview

### 31.2.1 Functional Overview

The TAUB has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUB is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUBnCNTm and a 16-bit data register TAUBnCDRm to hold the count start value and compare value.

It also contains several control and status registers.
Independent and synchronous operation
Every channel can operate either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels. The synchronous operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

### 31.2.2 Terms

In this section, the following terms are used:

## Independent channel operation function/synchronous channel operation function

TAUB has 16 channels, and provides an independent channel operation function whereby individual channels operate independently and a synchronous channel operation function whereby multiple channels operate in combination.

- The independent channel operation function can be used by any channel independently of all other channels.
- The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

## Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a "channel group".
A channel group has one master channel and one or more slave channels.

## Upper/lower channel

Depending on the channel number m , a channel with a smaller number or with a larger number is referred to as "upper" or "lower" channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

## Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel. Channel 0 is the highest channel and channel 15 is the lowest channel.

The following describes the functional blocks:

## Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels. Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of $2^{0}$ to $2^{15}$.

## Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

## Controller

The controller controls the main operations of the counter:

- Operating mode (selected with the TAUBnCMORm.TAUBnMD[4:0] bits)
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm) When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

## Trigger selector

The counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit.

## Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation functions. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

### 31.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 31.25 Functional List of TAUB Operations

| Operation Function | Setting Example |
| :--- | :--- | :--- |
| Independent Channel Operation Functions | Section 31.12 |
| Interval Timer Function | Section 31.12.1 |
| TAUBTTINm Input Interval Timer Function | Section 31.12.2 |
| Clock Divide Function | Section 31.12.3 |

### 31.2.4 TAUB I/O and Interrupt Request Signals

Figure 31.2 TAUB Input/Output and Interrupt Request Signals

### 31.2.5 Block Diagram

The following figure shows the main components of the TAUB.

Figure 31.3 Block Diagram of the TAUB

The prefix "TAUBn" has been omitted from the register names for the sake of clarity in the above figure.

### 31.2.6 Description of Blocks

The following describes the functional blocks:

## Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels. Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of $2^{0}$ to $2^{15}$.

## Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

## Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUBnCMORm.TAUBnMD[4:0])
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm) When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

## Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm $=1$ ), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Input of TAUBTTINm valid edge
- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit

## Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used if multiple channels like synchronous operation functions are used. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

## TAUBnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

### 31.3 Registers

### 31.3.1 List of Registers

TAUB registers are listed in the following table.
For details about <TAUBn_base>, see Section 31.1.2, Register Base Addresses.
Table 31.26 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| TAUBn prescaler registers |  |  |  |
| TAUBn | TAUBn prescaler clock select register | TAUBnTPS | <TAUBn_base> + $240_{\text {H }}$ |
| TAUBn control registers |  |  |  |
| TAUBn | TAUBn channel data register | TAUBnCDRm | <TAUBn_base> $+0_{H}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUBn channel counter register | TAUBnCNTm | <TAUBn_base> + $80_{\text {H }}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUBn channel mode OS register | TAUBnCMORm | <TAUBn_base> $+200_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUBn channel mode user register | TAUBnCMURm | <TAUBn_base> $+\mathrm{CO}_{\mathrm{H}}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUBn channel status register | TAUBnCSRm | <TAUBn_base> $+140_{\text {H }}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUBn channel status clear trigger register | TAUBnCSCm | <TAUBn_base> $+180_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUBn channel start trigger register | TAUBnTS | <TAUBn_base> + 1 ${ }_{\text {C }}{ }_{\text {H }}$ |
|  | TAUBn channel enable status register | TAUBnTE | <TAUBn_base> + $1 \mathrm{CO}_{\mathrm{H}}$ |
|  | TAUBn channel stop trigger register | TAUBnTT | <TAUBn_base> + 1C8 ${ }_{\text {H }}$ |
| TAUBn output registers |  |  |  |
| TAUBn | TAUBn channel output enable register | TAUBnTOE | <TAUBn_base> + 5 $\mathrm{C}_{\mathrm{H}}$ |
|  | TAUBn channel output register | TAUBnTO | <TAUBn_base> + 58 ${ }_{\text {H }}$ |
|  | TAUBn channel output mode register | TAUBnTOM | <TAUBn_base> + 248 $_{\text {H }}$ |
|  | TAUBn channel output configuration register | TAUBnTOC | <TAUBn_base> + $24 \mathrm{C}_{\mathrm{H}}$ |
|  | TAUBn channel output active level register | TAUBnTOL | <TAUBn_base> + 040 ${ }_{\text {H }}$ |
|  | TAUBn channel dead time output enable register | TAUBnTDE | <TAUBn_base> + $250_{\text {H }}$ |
|  | TAUBn channel dead time output level register | TAUBnTDL | <TAUBn_base> + 54 ${ }_{\text {H }}$ |
| TAUBn reload data registers |  |  |  |
| TAUBn | TAUBn channel reload data enable register | TAUBnRDE | <TAUBn_base> + 260 ${ }_{\text {H }}$ |
|  | TAUBn channel reload data mode register | TAUBnRDM | <TAUBn_base> + $264_{\text {H }}$ |
|  | TAUBn channel reload data control channel select register | TAUBnRDS | <TAUBn_base> + $268_{\text {H }}$ |
|  | TAUBn channel reload data control register | TAUBnRDC | <TAUBn_base> + $26 \mathrm{C}_{\mathrm{H}}$ |
|  | TAUBn channel reload data trigger register | TAUBnRDT | <TAUBn_base> + 44 ${ }_{\text {H }}$ |
|  | TAUBn channel reload status register | TAUBnRSF | <TAUBn_base> + 48 ${ }_{\text {H }}$ |
| TAUBn emulation register |  |  |  |
| TAUBn | TAUBn emulation register | TAUBnEMU | <TAUBn_base> + 290 ${ }_{\text {H }}$ |

### 31.3.2 Details of TAUBn Prescaler Registers

### 31.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register

This register specifies the clocks CK0, CK1, CK2, and CK3 for all channels of the PCLK prescaler.

Table 31.27 TAUBnTPS Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 15 to 12 | TAUBnPRS3[3:0] | Specifies the CK3 clock. |  |
|  |  | TAUBnPRS3[3:0] | CK3 clock |
|  |  | $0000{ }_{\text {B }}$ | PCLK/2 ${ }^{0}$ |
|  |  | 0001 B | PCLK/2 ${ }^{1}$ |
|  |  | $0010{ }_{\text {B }}$ | PCLK/2 ${ }^{2}$ |
|  |  | 0011 ${ }_{\text {B }}$ | PCLK/2 ${ }^{3}$ |
|  |  | 0100 ${ }_{\text {B }}$ | PCLK/2 ${ }^{4}$ |
|  |  | 0101 ${ }_{\text {B }}$ | PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ | PCLK/2 ${ }^{6}$ |
|  |  | $0111_{B}$ | PCLK/2 ${ }^{7}$ |
|  |  | 1000 B | PCLK/2 ${ }^{8}$ |
|  |  | 1001 B | PCLK/2 ${ }^{9}$ |
|  |  | 1010 $^{\text {B }}$ | PCLK/2 ${ }^{10}$ |
|  |  | $1011_{\text {B }}$ | PCLK/2 ${ }^{11}$ |
|  |  | $1100{ }_{\text {B }}$ | PCLK/2 ${ }^{12}$ |
|  |  | 1101B | PCLK/2 ${ }^{13}$ |
|  |  | $1110_{B}$ | PCLK/2 ${ }^{14}$ |
|  |  | $1111_{\text {B }}$ | PCLK/2 ${ }^{15}$ |
|  |  | These bits can only be rewritten when all counters using CK3 are stopped (TAUBnTE.TAUBnTEm = 0). |  |

Table 31.27 TAUBnTPS Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 11 to 8 | TAUBnPRS2[3:0] | Specifies the CK |  |
|  |  | TAUBnPRS2[3:0] | CK2 clock |
|  |  | $0_{0000}$ | PCLK/2 ${ }^{0}$ |
|  |  | $0001_{B}$ | PCLK/2 ${ }^{1}$ |
|  |  | $0010{ }^{\text {¢ }}$ | PCLK/2 ${ }^{2}$ |
|  |  | $0011_{B}$ | PCLK/2 ${ }^{3}$ |
|  |  | $0^{0100}{ }_{\text {в }}$ | PCLK/2 ${ }^{4}$ |
|  |  | $0101_{B}$ | PCLK/2 ${ }^{5}$ |
|  |  | $0110^{\text {B }}$ | PCLK/2 ${ }^{6}$ |
|  |  | 0111 ${ }_{\text {B }}$ | PCLK/2 ${ }^{7}$ |
|  |  | $1000{ }_{B}$ | PCLK/2 ${ }^{\text {8 }}$ |
|  |  | 1001 ${ }_{\text {B }}$ | PCLK/2 ${ }^{9}$ |
|  |  | $1010_{B}$ | PCLK/210 |
|  |  | $1011^{\text {b }}$ | PCLK/211 |
|  |  | $1100_{B}$ | PCLK/212 |
|  |  | 1101 ${ }^{\text {b }}$ | PCLK/213 |
|  |  | 1110 ${ }^{1}$ | PCLK/214 |
|  |  | $1111_{B}$ | PCLK/215 |

|  |  | These bits can (TAUBnTE.TAU | itten when all counters using CK2 are stopped |
| :---: | :---: | :---: | :---: |
| 7 to 4 | TAUBnPRS1[3:0] | Specifies the CK |  |
|  |  | TAUBnPRS1[3:0] | CK1 clock |
|  |  | $0000{ }_{\text {B }}$ | PCLK/2 ${ }^{0}$ |
|  |  | 0001 B | PCLK/2 ${ }^{1}$ |
|  |  | $0010_{B}$ | PCLK/2 ${ }^{2}$ |
|  |  | $0011_{B}$ | PCLK/2 ${ }^{3}$ |
|  |  | 0100 ${ }_{\text {B }}$ | PCLK/24 |
|  |  | 0101 ${ }_{\text {B }}$ | PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ | PCLK/2 ${ }^{6}$ |
|  |  | 0111 ${ }_{\text {B }}$ | PCLK/27 |
|  |  | $100 \mathrm{~B}_{\text {B }}$ | PCLK/2 ${ }^{\text {8 }}$ |
|  |  | 1001B | PCLK/2 ${ }^{9}$ |
|  |  | 1010 ${ }^{\text {B }}$ | PCLK/2 ${ }^{10}$ |
|  |  | 1011 ${ }_{\text {B }}$ | PCLK/2 ${ }^{11}$ |
|  |  | $1100_{B}$ | PCLK/2 ${ }^{12}$ |
|  |  | $1101_{B}$ | PCLK/2 ${ }^{13}$ |
|  |  | 1110 ${ }_{\text {в }}$ | PCLK/2 ${ }^{14}$ |
|  |  | 1111 ${ }^{\text {B }}$ | PCLK/2 ${ }^{15}$ |

These bits can only be rewritten when all counters using CK1 are stopped (TAUBnTE.TAUBnTEm = 0).

Table 31.27 TAUBnTPS Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 3 to 0 | TAUBnPRS0[3:0] | Specifies the CK |  |
|  |  | TAUBnPRSO[3:0] | CKO clock |
|  |  | 0000 B | PCLK/2 ${ }^{0}$ |
|  |  | 0001 B | PCLK/2 ${ }^{1}$ |
|  |  | 0010 ${ }^{\text {B }}$ | PCLK/2 ${ }^{2}$ |
|  |  | $0011{ }_{\text {B }}$ | PCLK/2 ${ }^{3}$ |
|  |  | 0100 ${ }_{\text {B }}$ | PCLK/2 ${ }^{4}$ |
|  |  | $0101_{B}$ | PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ | PCLK/2 ${ }^{6}$ |
|  |  | $0111_{\text {B }}$ | PCLK/2 ${ }^{7}$ |
|  |  | $1000{ }_{B}$ | PCLK/2 ${ }^{8}$ |
|  |  | 1001 B | PCLK/2 ${ }^{9}$ |
|  |  | 1010 ${ }_{\text {B }}$ | PCLK/2 ${ }^{10}$ |
|  |  | $1011{ }_{\text {B }}$ | PCLK/2 ${ }^{11}$ |
|  |  | $1100{ }_{B}$ | PCLK/2 ${ }^{12}$ |
|  |  | $1101_{B}$ | PCLK/2 ${ }^{13}$ |
|  |  | 1110 ${ }_{\text {B }}$ | PCLK/2 ${ }^{14}$ |
|  |  | $1111{ }_{\text {B }}$ | PCLK/2 ${ }^{15}$ |

These bits can only be rewritten when all counters using CKO are stopped (TAUBnTE.TAUBnTEm = 0).

NOTE
The TAUBn clock input PCLK is specified in the first part of this section, Section 31.1.3, Clock Supply.

### 31.3.3 Details of TAUBn Control Registers

### 31.3.3.1 TAUBnCDRm — TAUBn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operation mode specified in TAUBnCMORm.TAUBnMD[4:1].

Access: This register can be read or written in 16-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUBn_base> + m $\times$ 4 $_{\text {H }}$
Value after reset: $\quad 0000_{H}$

Table 31.28 TAUBnCDRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnCDR[15:0] | Data register for the capture/compare value. |

### 31.3.3.2 TAUBnCNTm - TAUBn Channel Counter Register

This register is the channel $m$ counter register.

Table 31.29 TAUBnCNTm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnCNT[15:0] | 16-bit counter value. |

The read value depends on the counter, the operation mode change, and the values of the TAUBnTS.TAUBnTSm and TAUBnTT.TAUBnTTm bits.

The initial counter read value depends on the operation mode and how the counter was stopped:

- by a reset
- by a counter stop trigger (TAUBnTT.TAUBnTTm = 1)

The following table lists the initial counter read values after the counter has stopped (TAUBnTE.TAUBnTEm $=0$ ) and re-enabled ( $\mathrm{TAUBnTS} \cdot \mathrm{TAUBnTSm}=1$ ).

The table also contains the counter read value one count after the counter is enabled (TAUBnTS.TAUBnTSm $=1$ ) for modes where the counter waits for a start trigger.

Table 31.30 TAUBnCNTm Read Values after Re-Enabling Counter

|  |  | TAUBnCNTm |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Mode Name | Count Method (Up/Down) | Start <br> Value*1 | After Stop Trigger | After One Count |
| Interval timer mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | - |
| Judge mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | - |
| Capture mode | Count up | $0000{ }_{\text {H }}$ | Stop value | - |
| Event count mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | - |
| One-count mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | $\mathrm{FFFF}_{\mathrm{H}}$ |
| Capture and one-count mode | Count up | $0000{ }_{H}$ | Stop value | Capture value + 1 (TAUBnCDRm) |
| Judge and one-count mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | TAUBnCNTm value - 1 |
| Count-up/-down mode | Count up/down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | - |
| Pulse one-count mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | $0000{ }_{\text {H }}$ |
| Count capture mode | Count up | $0000{ }_{H}$ | Stop value | - |
| Gate count mode | Count down | $\mathrm{FFFF}_{\mathrm{H}}$ | Stop value | Stop value |
| Capture and gate count mode | Count up | $0^{0000}{ }_{H}$ | Stop value | Stop value |

Note 1. The value set for TAUBnCNTm when operation mode is changed after reset release

### 31.3.3.3 TAUBnCMORm - TAUBn Channel Mode OS Register

This register controls channel moperation.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped
(TAUBnTE. TAUBnTEm = 0).
Address: $\quad$ <TAUBn_base> $+200_{H}+m \times 4_{H}$
Value after reset: $\quad 0000_{H}$

| Bit | $15 \quad 14$ | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R/W | R/W R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

Table 31.31 TAUBnCMORm Register Contents

Table 31.31 TAUBnCMORm Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 to 8 | TAUBnSTS[2:0] | Selects the external start trigger: |  |  |  |  |
|  |  | TAUBn STS2 | TAUBn STS1 | $\begin{aligned} & \text { TAUBn } \\ & \text { STSO } \end{aligned}$ | Description |  |
|  |  | 0 | 0 | 0 | Software trigger |  |
|  |  | 0 | 0 | 1 | Valid edge of the TAUBTTINm input signal. <br> TAUBnCMURm.TAUBnTIS[1:0] specifies the valid edge. |  |
|  |  | 0 | 1 | 0 | Valid edge of the TAUBTTINm input signal is used as the start trigger and the reverse edge is used as the stop trigger. |  |
|  |  | 0 | 1 | 1 | Setting prohibited |  |
|  |  | 1 | 0 | 1 | INTTAUBnIm is the start trigger of the master channel |  |
|  |  | 1 | 1 | 0 | INTTAUBnIm of upper channel ( $\mathrm{m}-1$ ) is the start trigger regardless of master setting |  |
|  |  | 1 | 1 | 1 | Dead-time output signal of the TAUBTTOUTm generation unit |  |
|  |  | 1 | 1 | 1 | Up/down output trigger signal of the master channel. |  |
| 7, 6 | TAUBnCOS[1:0] | Specifies when the capture register TAUBnCDRm and the overflow flag TAUBnCSRm.TAUBnOVF of channel $m$ are updated. <br> These bits are only valid if channel $m$ is in capture function. <br> The bits must be fixed to $01_{B}$ in Capture mode and Capture and gate count mode. |  |  |  |  |
|  |  | TAUBn TAUBn  <br> COS1 COS0 T |  | TAUBnCDRm |  | TAUBnCSRm.TAUBnOVF |
|  |  | 0 | 0 | Updated upon detection of a TAUBTTINm input valid edge. |  | Updated (cleared or set) upon detection of a TAUBTTINm input valid edge: <br> - If a counter overflow has occurred since the last valid edge detection, TAUBnCSRm.TAUBnOVF is set. <br> - If no counter overflow has occurred since the last valid edge detection, TAUBnCSRm.TAUBnOVF is cleared. |
|  |  | 0 | 1 |  |  | Set upon counter overflow and cleared by setting TAUBnCSCm. TAUBnCLOV to 1 . |
|  |  | 1 | $0 \quad$ Upd | Updated upon detection of a TAUBTTINm input valid edge and upon counter overflow: <br> - TAUBTTINm input valid edge: Counter value is written to TAUBnCDRm <br> - Overflow: FFFF $_{H}$ is written to TAUBnCDRm. The next TAUBTTINm input valid edge detection is ignored. |  | Not set. |
|  |  | 1 | $1 \quad \text { inp }$ |  |  | Set upon counter overflow and cleared by setting TAUBnCSCm.TAUBnCLOV to 1 . |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |

Table 31.31 TAUBnCMORm Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 to 0 | TAUBnMD[4:0] | Specifies the operation mode. For details, refer to the settings for individual functions. |  |  |  |  |  |
|  |  | TAUBn MD4 | TAUBn MD3 | TAUBn MD2 | TAUBn MD1 | TAUBn MDO | Description |
|  |  | 0 | 0 | 0 | 0 | 1/0 | Interval timer mode |
|  |  | 0 | 0 | 0 | 1 | 1/0 | Judge mode |
|  |  | 0 | 0 | 1 | 0 | 1/0 | Capture mode |
|  |  | 0 | 0 | 1 | 1 | 0 | Event count mode |
|  |  | 0 | 1 | 0 | 0 | 1/0 | One-count mode |
|  |  | 0 | 1 | 0 | 1 | 1/0 | Setting prohibited |
|  |  | 0 | 1 | 1 | 0 | 0 | Capture and one-count mode |
|  |  | 0 | 1 | 1 | 1 | 1/0 | Judge and one-count mode |
|  |  | 1 | 0 | 0 | 0 | 0 | Setting prohibited |
|  |  | 1 | 0 | 0 | 1 | 0 | Count-up/-down mode |
|  |  | 1 | 0 | 1 | 0 | 1/0 | Pulse one-count mode |
|  |  | 1 | 0 | 1 | 1 | 1/0 | Count capture mode |
|  |  | 1 | 1 | 0 | 0 | 0 | Gate count mode |
|  |  | 1 | 1 | 0 | 1 | 0 | Capture and gate count mode |
|  |  | Mode |  |  | Role of TAUBnMD0 Bit |  |  |
|  |  | Interval timer mode Capture mode Count capture mode |  |  | Specifies whether INTTAUBnIm is output at the beginning of count operation (when a start trigger is entered) or not. <br> 0 : INTTAUBnIm is not output. <br> 1: INTTAUBnIm is output. |  |  |
|  |  | Event count mode Count-up/-down mode |  |  | This bit should be set to 0 (INTTAUBnIm signal is not output at the beginning of count operation). |  |  |
|  |  | One-count mode <br> Pulse one-count mode |  |  | Enables/disables start trigger detection during counting. <br> 0 : Disables detection. <br> 1: Enables detection. <br> CAUTION: • In one-count mode, INTTAUBnIm signal is not output at the beginning of count operation. <br> - In pulse one-count mode, INTTAUBnIm signal is output at the beginning of count operation. |  |  |
|  |  | Gate count mode |  |  | This bit should be set to 0 (start trigger detection during counting is disabled). |  |  |
|  |  | Capture and one-count mode Capture and gate count mode |  |  | This bit should be set to 0 . <br> CAUTION: INTTAUBnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled. |  |  |
|  |  | Judge mode <br> Judge and one-count mode |  |  | Specifies INTTAUBnIm output timing. <br> 0 : When TAUBnCNTm $\leq$ TAUBnCDRm <br> 1: When TAUBnCNTm > TAUBnCDRm |  |  |

### 31.3.3.4 TAUBnCMURm — TAUBn Channel Mode User Register

This register specifies the type of valid edge detection used for the TAUBTTINm input.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ TAUBn_base $>+\mathrm{CO}_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUBnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.32 TAUBnCMURm Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |
| 1, 0 | TAUBnTIS[1:0] | Specifies the valid edge of the TAUBTTINm input signal: |  |  |
|  |  | TAUBn TIS1 | $\begin{aligned} & \text { TAUBn } \\ & \text { TISO } \end{aligned}$ | Description |
|  |  | 0 | 0 | Falling edge |
|  |  | 0 | 1 | Rising edge |
|  |  | 1 | 0 | Rising and fa <br> Start trigg <br> Stop trigg |
|  |  | 1 | 1 | Rising and fa Start trigg Stop trigg |
|  |  | - Edge detection for TAUBTTINm input signals is performed based on the operation clock selected by TAUBnCMORm.TAUBnCKS[1:0]. |  |  |

### 31.3.3.5 TAUBnCSRm - TAUBn Channel Status Register

This register indicates the count direction and the overflow status of the counter for channel m .

Access: This register is a read-only register that can be read in 8 -bit units.
Address: <TAUBn_base> + 140 $+\mathrm{m} \times \mathrm{4}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

Table 31.33 TAUBnCSRm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | TAUBnCSF | Indicates the count direction: <br> 0 : Counts up <br> 1: Counts down <br> The read value of this bit is only valid in the following mode: <br> - Up/Down Count mode |
| 0 | TAUBnOVF | Indicates the counter overflow status: <br> 0 : No overflow occurred <br> 1: Overflow occurred <br> This bit is used only in the following modes: <br> - Capture mode <br> - Capture and one-count mode <br> The function of this bit depends on the setting of control bits TAUBnCMORm.TAUBnCOS[1:0]. |

### 31.3.3.6 TAUBnCSCm - TAUBn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUBnCSRm.TAUBnOVF of channel $m$.

| Access: | This register is a write-only register that can be written in 8 -bit units. It is always read as $00_{\mathrm{H}}$ |
| ---: | :--- |
| Address: | $<$ TAUBn_base> $+180_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAUBnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 31.34 TAUBnCSCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAUBnCLOV | 0: No function |
|  |  | 1: Clears the overflow flag TAUBnCSRm.TAUBnOVF |

### 31.3.3.7 TAUBnTS - TAUBn Channel Start Trigger Register

This register enables the counter for each channel.

Access: This register is a write-only register that can be written in 16 -bit units. It is always read as $0000_{\mathrm{H}}$

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TS15 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TS14 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TS13 } \end{array}$ | $\begin{gathered} \text { TAUBn } \\ \text { TS12 } \end{gathered}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TS11 } \end{array}$ | $\begin{gathered} \text { TAUBn } \\ \text { TS10 } \end{gathered}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { TS09 } \end{aligned}$ | $\begin{gathered} \text { TAUBn } \\ \text { TS08 } \end{gathered}$ | $\begin{array}{\|c\|c} \hline \text { TAUBn } \\ \text { TS07 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TS06 } \end{array}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { TS05 } \end{aligned}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TS04 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TS03 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TS02 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TS01 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TS00 } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Table 31.35 TAUBnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTSm | Enables the counter for channel $\mathrm{m}:$ |
|  | $0:$ No function |  |
|  | 1: Enables the counter and sets TAUBnTE.TAUBnTEm $=1$. |  |
|  | TAUBnTE.TAUBnTEm = 1 only enables the counter. Whether the counter starts depends on |  |
|  | the selected operation mode. |  |

### 31.3.3.8 TAUBnTE - TAUBn Channel Enable Status Register

This register indicates whether counter is enabled or disabled.

```
Access: This register is a read-only register that can be read in 16-bit units.
Address: <TAUBn_base> \(+1 \mathrm{CO}_{\mathrm{H}}\)
Value after reset: \(\quad 000 \mathbf{H}_{H}\)
```

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{\|c} \text { TAUBn } \\ \text { TE15 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TE14 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TE13 } \end{array}$ | $\begin{array}{\|c} \text { TAUBn } \\ \text { TE12 } \end{array}$ | $\begin{array}{\|c} \text { TAUBn } \\ \text { TE11 } \end{array}$ | $\begin{array}{\|l\|} \hline \text { TAUBn } \\ \text { TE10 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TE09 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TE08 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TE07 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TE06 } \end{array}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { TE05 } \end{aligned}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TE04 } \end{array}$ | $\begin{array}{\|l\|} \hline \text { TAUBn } \\ \text { TE03 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TE02 } \end{array}$ | $\begin{array}{\|l\|} \hline \text { TAUBn } \\ \text { TE01 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TE00 } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 31.36 TAUBnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTEm | Indicates whether counter for channel $m$ is enabled or disabled: |
|  | $0:$ Counter disabled |  |
|  | 1: Counter enabled |  |
|  | Setting TAUBnTS.TAUBnTSm to 1 sets this bit to 1. |  |
|  | Setting TAUBnTT.TAUBnTTm to 1 resets this bit to 0. |  |

### 31.3.3.9 TAUBnTT - TAUBn Channel Stop Trigger Register

This register stops the counter for each channel.

Access: This register is a write-only register that can be written in 16 -bit units. It is always read as $0000_{H}$.
Address: <TAUBn_base> + 1С8н
Value after reset: $\quad 0000_{H}$

| Bit | $15 \quad 14$ |  | $13 \quad 12$ |  | $11 \quad 10$ |  | 8 |  | 6 |  | $5 \quad 4$ |  | 2 |  | 10 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TT15 } \end{array}$ | $\begin{gathered} \text { TAUBn } \\ \text { TT14 } \end{gathered}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TT13 } \end{array}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { TT12 } \end{aligned}$ | TAUBn TT11 | $\begin{aligned} & \text { TAUBn } \\ & \text { TT10 } \end{aligned}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { TTOO } \end{aligned}$ | $\begin{gathered} \text { TAUBn } \\ \text { TT08 } \end{gathered}$ | $\begin{array}{\|c\|} \hline \text { TAUBn } \\ \text { TT07 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { TTO6 } \end{array}$ | $\begin{gathered} \text { TAUBn } \\ \text { TTO5 } \end{gathered}$ | $\begin{array}{\|l\|} \hline \text { TAUBn } \\ \text { TT04 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TTO3 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TT02 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUBn } \\ \text { TTO1 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUBn } \\ \text { TTOO } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | w | w | W | w | w | w | W | W | w | w | W | w | w | W | w | W |

Table 31.37 TAUBnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTTm | Stops the counter of channel $m:$ |
|  | $0:$ No function |  |
|  | 1: Stops the counter and resets TAUBnTE.TAUBnTEm. |  |
|  | TAUBnCNTm, TAUBnTO.TAUBnTOm, and TAUBTTOUTm all retain the values they had |  |
| before the counter was stopped. |  |  |

### 31.3.4 Details of TAUBn Simultaneous Rewrite Registers

### 31.3.4.1 TAUBnRDE — TAUBn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUBnCDRm/TAUBnTOLm.

| Address: |  |  | This register can be read or written in 16 -bit units. It can only be written when TAUBnTE. TAUBnTEm $=0$. <TAUBn_base> + 260 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | 0000 ${ }^{\text {H }}$ |  |  | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |  |
| Bit | 15 | 14 | 13 | 12 | 11 |  |  |  |  |  |  |  |  |  |  | 0 |
|  | TAUBn RDE15 | $\begin{aligned} & \text { TAUBn } \\ & \text { RDE14 } \end{aligned}$ | TAUBn RDE13 | TAUBn RDE12 | TAUBn RDE11 | TAUBn RDE10 | TAUBn RDE09 | TAUBn RDE08 | TAUBn RDE07 | $\left\lvert\, \begin{aligned} & \text { TAUBn } \\ & \text { RDE06 } \end{aligned}\right.$ | $\begin{aligned} & \text { TAUBn } \\ & \text { RDEE05 } \end{aligned}$ | TAUBn RDE04 | TAUBn RDE03 | TAUBn RDE02 | TAUBn RDE01 | TAUBn RDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.38 TAUBnRDE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnRDEm | Enables/disables simultaneous rewrite of the data register of channel $\mathrm{m}:$ |
|  |  | $0:$ Disables simultaneous rewrite |
|  | 1: Enabled simultaneous rewrite |  |

### 31.3.4.2 TAUBnRDS - TAUBn Channel Reload Data Control Channel Select Register

This register selects the control channel for simultaneous rewrite.

Access: This register can be read or written in 16 -bit units. It can only be written when TAUBnTE.TAUBnTEm $=0$.
Address: <TAUBn_base> + 268H
Value after reset: $\quad 0000_{\mathrm{H}}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{\|l} \text { TAUBn } \\ \text { RDS15 } \end{array}$ | $\begin{array}{\|l\|l} \text { TAUBn } \\ \text { RDS14 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { RDS13 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { RDS12 } \end{array}$ | $\begin{array}{\|l\|l\|} \text { TAUBn } \\ \text { RDS11 } \end{array}$ | $\begin{array}{\|l\|l\|l\|} \text { TAUBn } \\ \text { RDS10 } \end{array}$ | $\begin{array}{\|l\|l\|l\|} \hline \text { TAUBn } \\ \text { RDS09 } \end{array}$ | $\begin{array}{\|l\|l\|l\|} \hline \text { TAUBn } \\ \text { RDS08 } \end{array}$ | $\begin{array}{\|l\|l} \hline \text { TAUBn } \\ \text { RDS07 } \end{array}$ | $\begin{array}{\|l} \text { TAUBn } \\ \text { RDSO6 } \end{array}$ | $\begin{array}{\|l\|l} \text { TAUBn } \\ \text { RDS05 } \end{array}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { RDS04 } \end{aligned}$ | $\begin{array}{\|l} \text { TAUBn } \\ \text { RDSO3 } \end{array}$ | TAUBn \|RDS02 | TAUBn RDS01 | $\begin{array}{\|l\|l} \text { TAUBn } \\ \text { RDSOO } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.39 TAUBnRDS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnRDSm | Specifies which channel is controlled for the simultaneous rewrite trigger: |
|  |  | 0: Master channel |
|  | 1: Another upper channel |  |

### 31.3.4.3 TAUBnRDM - TAUBn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: This register can be read or written in 16 -bit units. It can only be written when TAUBnTE.TAUBnTEm $=0$.
Address: <TAUBn_base> + 264 ${ }_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUBn RDM15 | TAUBn RDM14 | TAUBn RDM13 | TAUBn RDM12 | TAUBn RDM11 | TAUBn RDM10 | TAUBn RDM09 | TAUBn RDM08 | TAUBn RDM07 | TAUBn | TAUBn RDM05 | TAUBn RDM04 | TAUBn RDM03 | TAUBn RDM02 | TAUBn RDM01 | TAUBn RDM00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.40 TAUBnRDM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnRDMm | Selects when the signal that triggers simultaneous rewrite is generated: |
|  | $0:$ When the master channel counter starts counting |  |
|  | 1: At the top of a triangle wave cycle |  |
|  | These bits only apply when TAUBnRDE.TAUBnRDEm $=1$ and TAUBnRDS.TAUBnRDSm $=0$. |  |

### 31.3.4.4 TAUBnRDC - TAUBn Channel Reload Data Control Register

This register specifies the channel that generates the INTTAUBnIm signal that triggers simultaneous rewrite.

Table 31.41 TAUBnRDC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnRDCm | Specifies whether the channel generates a simultaneous rewrite trigger signal or not. |
|  | $0:$ Does not operate as a simultaneous rewrite trigger channel. |  |
|  | 1: Operates as a simultaneous rewrite trigger channel. |  |
|  | These bits only apply when TAUBnRDE.TAUBnRDEm $=1$ and TAUBnRDS.TAUBnRDSm $=1$. |  |

### 31.3.4.5 TAUBnRDT - TAUBn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 16 -bit units. It is always read as $0000_{H}$.
Address: <TAUBn_base> + 044 н
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUBn RDT15 | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { RDT14 } \end{array}$ | TAUBn RDT13 | $\begin{array}{\|l\|l\|} \text { TAUBn } \\ \text { RDT12 } \end{array}$ | TAUBn RDT11 | $\begin{array}{\|l\|l} \text { TAUBn } \\ \text { RDT10 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUBB } \\ \text { RDT09 } \end{array}$ | TAUBn RDT08 | TAUBn RDT07 | TAUBn RDT06 | TAUBn RDT05 | TAUBn RDT04 | TAUBn RDT03 | TAUBn RDT02 | TAUBn RDT01 | TAUBn RDTOO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | w | w | w | w | w | w | w | w | W | w | w | W | W | W | W | W |

Table 31.42 TAUBnRDT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnRDTm | Triggers the simultaneous rewrite enabling state: |
|  |  | 0: No function. Writing 0 is ignored (the operation is not affected). |
|  | 1: The simultaneous rewrite enabling flag (TAUBnRSFm) is set to 1 1. The system waits for |  |
| the simultaneous rewrite trigger. |  |  |
|  | These bits only apply when: |  |
|  | - TAUBnRDE.TAUBnRDEm = 1 |  |

### 31.3.4.6 TAUBnRSF - TAUBn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.
Access: This register is a read-only register that can be read in 16-bit units.
Address:
Value after reset:

Table 31.43 TAUBnRSF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnRSFm | Indicates the simultaneous rewrite status: |
| $0:$ Indicates simultaneous rewrite is completed due to the generation of the simultaneous |  |  |
| rewrite trigger. |  |  |
| 1: Indicates the simultaneous rewrite trigger waiting state when simultaneous rewrite is |  |  |
| enabled (TAUBnRDTm $=1$ ). |  |  |

### 31.3.5 Details of TAUBn Output Registers

### 31.3.5.1 TAUBnTOE — TAUBn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Table 31.44 TAUBnTOE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTOEm | Enables/disables independent channel output mode: |
|  |  | $0:$ Disables independent channel output mode (controlled by software) |
|  | 1: Enables independent channel output mode |  |

### 31.3.5.2 TAUBnTO - TAUBn Channel Output Register

This register specifies and reads the level of TAUBTTOUTm.

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | $<$ TAUBn_base $>+58_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

$$
\text { Value after reset: } \quad 0000_{\mathrm{H}}
$$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.45 TAUBnTO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTOm | Specifies/reads the level of TAUBTTOUTm: |
|  | $0:$ Low |  |
|  | 1: High |  |
|  | Only TAUBnTOm bits for which Independent Channel Output function is disabled |  |
|  | (TAUBnTOEm $=0$ ) can be written. |  |

### 31.3.5.3 TAUBnTOM — TAUBn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read or written in 16 -bit units. It can only be written when the counter is stopped
(TAUBnTE. TAUBnTEm = 0).
Address: <TAUBn_base> + 248 ${ }_{\text {H }}$
Value after reset: $\quad 0000_{H}$

Table 31.46 TAUBnTOM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTOMm | Specifies the channel output mode: |
|  |  | 0: Independent channel output mode |
|  | 1: Synchronous channel output mode |  |

### 31.3.5.4 TAUBnTOC — TAUBn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUBnTOMm.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped
(TAUBnTE.TAUBnTEm = 0).
Address: <TAUBn_base> + 24 $\mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

Table 31.47 TAUBnTOC Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 15 to 0 | TAUBnTOCm | Specifies the output mode: |  |  |
|  |  | 0 : Operation mode 1 |  |  |
|  |  | 1: Operation mode 2 |  |  |
|  |  | The output mode also depends on TAUBnTOM.TAUBnTOMm, as can be seen in the following table. |  |  |
|  |  | TOMm | TOCm | Description |
|  |  | 0 | 0 | Toggle mode: Toggles when INTTAUBnIm occurs. |
|  |  |  | 1 | Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm. |
|  |  | 1 | 0 | Synchronous channel operation mode 1: |
|  |  |  |  | Set when INT occurs on the master channel and reset when INT occurs on the slave channel. |
|  |  |  | 1 | Synchronous channel operation mode 2: |
|  |  |  |  | Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up. |

### 31.3.5.5 TAUBnTOL - TAUBn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUBnTO.TAUBnTOm).

| Address: |  |  | This register can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $0000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { TOL15 } \end{array}$ | $\begin{aligned} & \text { TAUBn } \\ & \text { TOL14 } \end{aligned}$ | TAUBn TOL13 | TAUBn <br> TOL12 | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { TOI } 11 \end{array}$ | $\left\|\begin{array}{l} \text { TAUBn } \\ \text { TOL10 } \end{array}\right\|$ | $\begin{array}{\|l\|l} \text { TAUBn } \\ \text { TOL09 } \end{array}$ | $\left\|\begin{array}{c\|c\|} \text { TAUBn } \\ \text { TOI } 08 \end{array}\right\|$ | TAUBn TOL07 | $\left\lvert\, \begin{array}{\|c\|} \text { TAUBn } \\ \text { TOL06 } \end{array}\right.$ | TAUBn TOL05 | TAUBn TOL04 | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { TOL03 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUBn } \\ \text { TOL02 } \end{array}$ | $\left\lvert\, \begin{aligned} & \text { TAUBn } \\ & \text { TOL01 } \end{aligned}\right.$ | $\begin{array}{\|l\|l\|l\|l\|} \text { TAUBn } \\ \text { TOLOO } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.48 TAUBnTOL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTOLm | Specifies the output logic of the channel m output bit (TAUBnTO.TAUBnTOm): |
|  | 0: Positive logic (active high) |  |
|  | 1: Negative logic (active low) |  |
|  | The setting of these bits applies to all channel output modes other than independent channel |  |
|  |  | output mode controlled by software and independent channel output mode 1. |

### 31.3.6 Details of TAUBn Dead Time Output Registers

### 31.3.6.1 TAUBnTDE - TAUBn Channel Dead Time Output Enable Register

This register enables/disables dead time operation for each channel.

| Access: |  |  | This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: <TAUBn_base> |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | 0000 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

### 31.3.6.2 TAUBnTDL - TAUBn Channel Dead Time Output Level Register

This register selects the phase period to which dead time is added.

Access: This register can be read or written in 16-bit units.
Address: <TAUBn_base> + 54H
Value after reset: $\quad 0000_{H}$

Table 31.50 TAUBnTDL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUBnTDLm | Selects the phase period to which dead time is added: |
|  | 0: Positive phase period |  |
| 1: Negative phase period |  |  |
|  | These bits only apply when: |  |
|  | • TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm, |  |
|  | TAUBnTDE.TAUBnTDEm $=1$ |  |

### 31.3.7 TAUBn Emulation Register

### 31.3.7.1 TAUBnEMU — TAUBn Emulation Register

This register controls SVSTOP operations.

Access: This register can be read or written in 8-bit units.
Write to this register only when the counter is stopped (TAUBnTE.TAUBnTEm $=0$ ) and when EPC.SVSTOP $=0$.
Address: <TAUBn_base> $+290_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUBnSVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 31.51 TAUBnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | TAUBnSVSDIS | (When EPC.SVSTOP = 0) |
|  |  | Regardless of the value of this bit (1/0), the count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). |
|  |  | (When EPC.SVSTOP = 1) |
|  |  | 0 : The count clock stops when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). |
|  |  | 1: The count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 31.4 General Operating Procedure

The following describes the general operation procedure for the TAUBn:
After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUBTTOUTm is also initialized and outputs a low level.

1. Set the TAUBnTPS register to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUBn function:

- Set the operation mode
- Set the channel output mode
- Set any other control bits

3. Enable the counter by setting the TAUBnTS.TAUBnTSm bit to 1 .

The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUBnTT.TAUBnTTm bit to 1 . The counter can be forcibly restarted by setting the TAUBnTS.TAUBnTSm bit to 1 .
5. Stop the function by setting the TAUBnTT.TAUBnTTm bit to 1 .

NOTE

- A detailed description of the required control bits and the operation of the individual functions is given below.
- Section 31.12, Independent Channel Operation Functions
- Section 31.14, Synchronous Channel Operation Functions
- The function can be changed while the counter is stopped (TAUBnTE.TAUBnTEm=0).

### 31.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.
These rules are detailed in Section 31.5.1, Rules of Synchronous Channel Operation Function.
Two special features for synchronous channel operation are detailed in the following:

- Section 31.5.2, Simultaneous Start and Stop of Synchronous Channel Counters
- Section 31.6, Simultaneous Rewrite

### 31.5.1 Rules of Synchronous Channel Operation Function

## Number of master and slave channels

- Only even channels (CH0, CH2, CH4, ...) can be set as master channels. Any channel apart from CH 0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.

Example: If CH2 is a master channel, CH 3 and the lower channels ( $\mathrm{CH} 3, \mathrm{CH} 4, \mathrm{CH} 5, \ldots$ ) can be set as slave channels.

- If multiple master channels are used, a range of slave channels that includes another master channel cannot be set for a given master channel.
Example: If CH0 and CH4 are master channels, CH 1 to CH 3 can be set as slave channels for CH 0 , but CH 5 to CH 15 cannot.

## Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the same value to the TAUBnCMORm.TAUBnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave channel usage and operation clocks are illustrated in Figure 31.4, Grouping of the Channels and Assignment of Operation Clocks.

Figure 31.4 Grouping of the Channels and Assignment of Operation Clocks

### 31.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit.

### 31.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUBnTS.TAUBnTSm bits of the channels must be set at the same time.
- To simultaneously stop synchronized channels, the TAUBnTT.TAUBnTTm bits of the channels must be set at the same time.

Setting the TAUBnTS.TAUBnTSm bits to 1 sets the corresponding TAUBnTE.TAUBnTEm bits to 1 , enabling counting. The exact time that it starts depends on the operation mode.

### 31.6 Simultaneous Rewrite

### 31.6.1 Introduction

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUBnCDRm and TAUBnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUBnIm being issued on the upper channel specified by TAUBnRDC.TAUBnRDCm

There are three methods for simultaneous rewrite. These are listed in the following table, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 31.52 Simultaneous Rewrite Methods and when They are Triggered

| Method | Trigger | TAUBnRDE. <br> TAUBnRDEm | TAUBnRDS. <br> TAUBnRDSm | TAUBnRDM. <br> TAUBnRDMm |
| :--- | :--- | :--- | :--- | :--- |
| - | No simultaneous rewrite | 0 | 0 | 0 |
| A | The master channel (re)starts counting | 1 | 0 | 0 |
| B | Counting is started in the master channel. The master channel starts <br> counting down at the peak of triangular wave of the corresponding slave <br> channel. | 1 | 0 | 1 |
| C1 | INTTAUBnIm is generated on an upper channel specified by <br> TAUBnRDC.TAUBnRDCm | 1 | 1 | $0 / 1$ |

The following table lists which of these three methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in Section 31.13, Independent Channel Simultaneous Rewrite Functions and Section 31.14, Synchronous Channel Operation Functions.

Table 31.53 Channel Functions and the Methods They Use for Simultaneous Rewrite

| Descriptions | A | B |
| :--- | :--- | :--- |

| A/D Conversion Trigger Output Function Type 2 |  | $\checkmark$ |

Note: $\checkmark$ : Available, (Blank): Unavailable

### 31.6.2 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite.
The three main blocks (Initial settings, Start counter \& count operation, and Simultaneous rewrite) are explained afterwards.

Figure 31.5 General Procedure for Simultaneous Rewrite

### 31.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUBnRDE.TAUBnRDEm $=1$.
- To select the type of simultaneous rewrite, set TAUBnRDM.TAUBnRDMm and TAUBnRDS.TAUBnRDSm according to the values in Table 31.52, Simultaneous Rewrite Methods and when They are Triggered.
- Specify a simultaneous rewrite trigger channel by using TAUBnRDC.TAUBnRDCm. (Prerequisite: TAUBnRDS.TAUBnRDSm has been set to the upper channel.)

### 31.6.2.2 Start Counter and Count Operation

- To start all the TAUBnCNTm counters in the channel group, set the corresponding TAUBnTS.TAUBnTSm bits to 1 . TAUBnTOL.TAUBnTOLm and the values in the data registers (TAUBnCDRm) are written to the corresponding TAUBnTOL.TAUBnTOLm buffer (TAUBnTOL.TAUBnTOLm buf) and data buffer registers (TAUBnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1 sets the reload flag (TAUBnRSF.TAUBnRSFm) to 1 , enabling simultaneous rewrite. TAUBnRSF.TAUBnRSFm remains at 1 until simultaneous rewrite has taken place.
- When the specified trigger for simultaneous rewrite is detected, the TAUBnRSF.TAUBnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1). If it is, simultaneous rewrite is carried out. Otherwise, simultaneous rewrite is not carried out, and the system awaits the next simultaneous rewrite trigger detection.

### 31.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then written to the corresponding counters and the values are applied the next time the counter starts or restarts.
- When simultaneous rewrite is finished, the TAUBnRSF.TAUBnRSFm bit is set to 0 , and the system awaits the next simultaneous rewrite trigger.

### 31.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUBnRDE.TAUBnRDEm, TAUBnRDS.TAUBnRDSm, TAUBnRDM.TAUBnRDMm, and TAUBnRDC.TAUBnRDCm cannot be changed while the counter is in operation (TAUBnTE. TAUBnTEm $=1$ ).
- TAUBnTOL.TAUBnTOLm can only be rewritten during operation in PWM output function or triangle PWM output function. For all other output functions, TAUBnTOL.TAUBnTOLm must be written before the counter starts. If it is rewritten in another function mode, TAUBTTOUTm outputs an invalid wave.
- When a simultaneous rewrite trigger is issued on an upper channel (TAUBnRDS.TAUBnRDSm = 1), the TAUBnRDC.TAUBnRDCm bit controls all the lower channels. This means that if the TAUBnRDC.TAUBnRDCm bits of CH2 and CH7 are set to 1 and the TAUBnRDC.TAUBnRDCm bits of other channels are set to $0, \mathrm{CH} 2$ and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger generation channel (TAUBnRDE.TAUBnRDEm and TAUBnRDS.TAUBnRDSm = 1) but no upper channel is set (TAUBnRDC.TAUBnRDC[15:0] = 0), simultaneous rewrite cannot take place.

### 31.6.4 Types of Simultaneous Rewrite

In the following section, the three simultaneous rewrite methods are explained using timing diagrams.

### 31.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A)

Figure 31.6 Simultaneous Rewrite when the Master Channel (Re)Starts Counting

## Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

## Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer and the value of TAUBnTOL.TAUBnTOLm is copied to the TAUBnTOL.TAUBnTOLm buffer.
(2) The TAUBnCDRm and TAUBnTOL.TAUBnTOLm registers can be written at any time.
(3) CH 0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0 )
(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.
(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.
(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

### 31.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B)

Figure 31.7 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel

## Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

## Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer.
(2) The TAUBnCDRm and TAUBnTOL registers can be written at any time.
(3) Simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm $=0$ ).
(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.
(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.
(6) Simultaneous rewrite takes place at the start timing of the top of the triangular cycle. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.
(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

### 31.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1)

Figure 31.8 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm

## Setting:

CH1 is an upper channel used counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C 1 is applied. The TAUBnRDC register specifies a channel which generates simultaneous rewrite triggers.

## Description:

(1) When TAUBnTS.TAUBnTSm is set to 1 , the TAUBnCDRm value is copied to the TAUBnCDRm buffer.
(2) The TAUBnCDRm register is always ready to write.
(3) By setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1 , the status flag is set (TAUBnRSF.TAUBnRSFm = 1) to enable simultaneous rewrite.
(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.
(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches $0000_{\mathrm{H}}$. The TAUBnCDRm values are loaded into the corresponding TAUBnCDRm buffers.
(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUBnCDRm register can be rechanged.

### 31.7 Channel Output Modes

The output of the TAUBTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUBnTOE.TAUBnTOEm = 0)

When controlled by software, the value written in the output register bit (TAUBnTO.TAUBnTOm) is sent to the output pin (TAUBTTOUTm).

- By TAUB signals (TAUBnTOE.TAUBnTOEm = 1)

When controlled by TAUB signals, the output level of TAUBTTOUTm is set or reset or toggled by internal signals. The value of TAUBnTO.TAUBnTOm is updated accordingly to reflect the value of TAUBTTOUTm.

- Independently (TAUBnTOM.TAUBnTOMm = 0)

In case of independent operation, the output of the TAUBTTOUTm pin is only affected by settings of channel m.
Therefore, independent channel operation should be selected (TAUBnTOM.TAUBnTOMm $=0$ ).

- Synchronously (TAUBnTOM.TAUBnTOMm = 1)

In case of synchronous operation, the output of the TAUBTTOUTm pin is affected by settings of channel $m$ and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUBnTOM.TAUBnTOMm = 1).

The TAUBnTO.TAUBnTOm bit can always be read to determine the current value of TAUBTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

## Control bits

The settings of the control bits required to select a specific channel output mode are listed in Table 31.54, Channel Output Modes.

The channel output modes are described in details below.

- Section 31.7.2, Channel Output Modes Controlled Independently by TAUBn Signals
- Section 31.7.3, Channel Output Modes Controlled Synchronously by TAUBn Signals

## Batch operation of TAUBnTOm bit

Whether a set value is reflected to the TAUBnTOm bit or not is controlled by the TAUBnTOE.TAUBnTOEm bit.
The TAUBnTOm setting is written only to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit $=0$ when a write to the TAUBnTO register is attempted. No TAUBnTOm setting is reflected to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit $=1$.

NOTE
The TAUBnTO.TAUBnTOm bit is placed so that its bit number corresponds to a channel number.

## Output logic

Positive logic or negative logic of the output is specified by control bit TAUBnTOL.TAUBnTOLm.
The value of TAUBnTOL.TAUBnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. If TAUBnTOL.TAUBnTOLm is changed after the counter starts, the output of TAUBTTOUTm is undefined.

## See Section 31.6, Simultaneous Rewrite.

The various channel output modes and the channel output control bits are listed in Table 31.54, Channel Output Modes.

Table 31.54 Channel Output Modes

| Channel Output Mode | TAUBnTOE. TAUBnTOEm | TAUBnTOM. TAUBnTOMm | TAUBnTOC. TAUBnTOCm | TAUBnTDE. TAUBnTDEm |
| :---: | :---: | :---: | :---: | :---: |
| By software |  |  |  |  |
| Independent channel output mode controlled by software | 0 | X |  |  |
| By TAUB signals, independently |  |  |  |  |
| Independent channel output mode 1 | 1 | 0 | 0 | 0 |
| Independent channel output mode 2 |  |  | 1 |  |
| By TAUB signals, synchronously |  |  |  |  |
| Synchronous channel output mode 1 | 1 | 1 | 0 | 0 |
| Synchronous channel output mode 2 |  |  | 1 | 0 |
| Synchronous channel output mode 2 with dead time output |  |  |  | 1 |

- All combinations not listed in this table are forbidden.
- Bits marked with an $x$ can be set to any value.

NOTE
The following bits cannot be changed during count operation (TAUBnTE.TAUBnTEm = 1):

- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

### 31.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUBTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUBnTOE.TAUBnTOEm $=0$ ).
(1) Set TAUBnTO.TAUBnTOm to specify the initial level of the TAUBTTOUTm output.
(2) Set channel output mode according to Table 31.54, Channel Output Modes, and the output logic using the TAUBnTOL.TAUBnTOLm bit.
(3) Start the counter (TAUBnTS.TAUBnTSm = 1)

Figure 31.9 General Procedure for Specifying a TAUBTTOUTm Channel Output Mode

### 31.7.2 Channel Output Modes Controlled Independently by TAUBn Signals

This section lists the channel output modes that are controlled independently by TAUBn signals. The control bits used to specify a mode are listed in Table 31.54, Channel Output Modes.

### 31.7.2.1 Independent Channel Output Mode 1

## Set/reset conditions

In this output mode, TAUBTTOUTm toggles when INTTAUBnIm is detected. The value of TAUBnTOL.TAUBnTOLm is ignored.

## Prerequisites

There are no prerequisites other than those shown in Table 31.54, Channel Output Modes.

### 31.7.2.2 Independent Channel Output Mode 2

## Set/reset conditions

In this output mode, TAUBTTOUTm is set when INTTAUBnIm occurs at the time of count start, and reset when INTTAUBnIm occurs due to a match between TAUBnCNTm and TAUBnCDRm.

## Prerequisites

There are no prerequisites other than those shown in Table 31.54, Channel Output Modes.

### 31.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals

This section lists the channel output modes that are controlled synchronously by TAUBn signals. The control bits used to specify a mode are listed in Table 31.54, Channel Output Modes.

### 31.7.3.1 Synchronous Channel Output Mode 1

## Set/reset conditions

In this output mode, INTTAUBnIm of master channel serves as a set signal and INTTAUBnIm of the slave channel as a reset signal. If INTTAUBnIm of the master channel and INTTAUBnIm of the slave channel are generated at the same time, INTTAUBnIm of the slave channel (reset signal) has priority over INTTAUBnIm (set signal) of the master channel, i.e., the master channel is ignored.

## Prerequisites

There are no prerequisites other than those shown in Table 31.54, Channel Output Modes.

### 31.7.3.2 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is triangular wave PWM output at TAUBTTOUTm. For details, see Section 31.14.5, Triangle PWM Output Function.

## Set/reset conditions

TAUBnCNTm of the slave channel counts down and up alternatively. When it passes $0001_{\mathrm{H}}$ it generates an interrupt, causing TAUBTTOUTm to toggle.

## Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUBTTOUTm should be set to 0 before the function starts.

### 31.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUBTTOUTm. The set/reset conditions are shown in Figure
31.10, Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output.

## Set/reset conditions

Figure 31.10 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUBnTDL.TAUBnTDLm $=0$ for rising edges and TAUBnTDL.TAUBnTDLm = 1 for falling edges.

## Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel

The master channel should be set to interval timer mode.

- One even slave channel

The even slave channel should be set to count-up/-down mode.

- One odd slave channel (even channel + 1)

The odd slave channel should be set to one-count mode.
The values of the following bits should be the same for the odd channel and the even channel:

- TAUBnTOE.TAUBnTOEm
- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

### 31.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUBnTS.TAUBnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

## CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

### 31.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Upl-Down Mode, and Count Capture Mode

The counter starts operating at the next count clock after TAUBnTS.TAUBnTSm is set to 1 . The value of data register is also loaded when the counter starts.

Figure 31.11 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

NOTE
Make sure to set TAUBnCMORm.TAUBnMD0 to 0 when using the count-up/-down mode.

### 31.8.2 Event Count Mode

The value of data register is loaded as soon as TAUBnTS.TAUBnTSm is set to 1 . The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

Figure 31.12 Start Timing in Event Count Mode

### 31.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUBTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

Figure 31.13 Count Start Timing in Other Operating Modes

### 31.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUBnIm is generated using the TAUBnCMORm.TAUBnMD0 bit. The generation of INTTAUBnIm when the TAUBnCMORm.TAUBnMD0 bit starts counting and the effect to TAUBTTOUTm depend on the selected function. For details, refer to the description of TAUBnCMORm.TAUBnMD0 of each function.

Figure 31.14 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMDO $=0$ )

Figure 31.15 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMDO $=1$ )

### 31.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $\mathrm{FFFF}_{\mathrm{H}}$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel.
Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches $0000_{\mathrm{H}}$ at the same time as the first channel overflows (TAUBnCNTm $=\mathrm{FFFF}_{\mathrm{H}}$ ).
- Set TAUBnCDRm of the second channel to $\mathrm{FFFF}_{\mathrm{H}}$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUBTTINm input.
- The trigger detection settings (TAUBnCMORm.TAUBnSTS[2:0] and TAUBnCMURm.TAUBnTIS[1:0]) must be identical for both channels.

## Result:

The down-counter of the second channel reaches $0000_{\mathrm{H}}$ at exactly the same time as the up-counter of the first channel overflows ( $\mathrm{TAUBnCNTm}=\mathrm{FFFF}_{\mathrm{H}}$ ). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 31.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the TAUBTTINm input interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input pulse interval measurement function exceeds $\mathrm{FFFF}_{\mathrm{H}}$.

Figure 31.16 Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

## Timing diagram

Figure 31.17 Interrupt Generation by Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

### 31.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm width measurement) can detect the overflow when TAUBnCNTm of the TAUBTTINm input signal width measurement function exceeds $\mathrm{FFFF}_{\mathrm{H}}$.

Figure 31.18 Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

## Timing diagram

Figure 31.19 Interrupt Generation by Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

### 31.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUBnIm of the interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input position detection function exceeds $\mathrm{FFFF}_{\mathrm{H}}$.

Figure 31.20 Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

## Timing diagram

Figure 31.21 Interrupt Generation by Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

### 31.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm input period count detection) can detect the overflow when TAUBnCNTm of the TAUBTTINm input period count detection function exceeds $\mathrm{FFFF}_{\mathrm{H}}$.

Figure 31.22 Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (TAUBTTINm Input Period Count Detection)

Timing diagram

Figure 31.23 Interrupt Generation by Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

### 31.11 TAUBTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

Figure 31.24 Basic Edge Detection Timing

Figure 31.24, Basic Edge Detection Timing is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will be generated.

### 31.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUB. For a general overview of independent channel operation functions, see Section 31.2, Overview.

### 31.12.1 Interval Timer Function

### 31.12.1.1 Overview

## Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

When the counter reaches $0000_{\mathrm{H}}$, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1 . The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

## Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal output when TAUBnCMORm.TAUBnMD0 is set to 1 .

### 31.12.1.2 Equations

INTTAUBnIm cycle $=$ count clock cycle $\times($ TAUBnCDRm +1$)$
TAUBTTOUTm square wave cycle $=$ count clock cycle $\times($ TAUBnCDRm +1$) \times 2$

### 31.12.1.3 Block Diagram and General Timing Diagram

Figure 31.25 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.26 General Timing Diagram for Interval Timer Function

### 31.12.1.4 Register Settings

(1) TAUBnCMORm

Table 31.55 Contents of the TAUBnCMORm Register for Interval Timer Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |

| 11 | TAUBnMAS | Write $\mathrm{O}_{\mathrm{B}}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000{ }_{\text {B }}$. |
| 7, 6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000{ }_{\text {b }}$. |
| 0 | TAUBnMD0 | 0: INTTAUBnIm is not generated and TAUBTTOUTm does not toggle at operation start. <br> 1: INTTAUBnIm is generated and TAUBTTOUTm toggles at operation start or restart. |

## (2) TAUBnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.56 Contents of the TAUBnCMURm Register for Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode

Table 31.57 Control Bit Settings for Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $0_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $0_{B}$. |
| TAUBnTOL.TAUBnTOLm | Write $0_{B}$. |
| TAUBnTDE.TAUBnTDEm | Write $0_{B}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{B}$. |
| NOTE |  |

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm $=0$. TAUBTTOUTm can then be controlled independently of the interrupts.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0 .

Table 31.58 Simultaneous Rewrite Settings for Interval Timer Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |

### 31.12.1.5 Operating Procedure for Interval Timer Function

Table 31.59 Operating Procedure for Interval Timer Function

### 31.12.1.6 Specific Timing Diagrams

(1) TAUBnCDRm $=0000$ н, count clock $=$ PCLK/2

Figure 31.27 TAUBnCDRm $=0000_{\mathrm{H}}$, Count Clock $=$ PCLK/2

- TAUBnCDRm $=0000_{\mathrm{H}}$, and the count clock = PCLK/2, the TAUBnCDRm value is written to TAUBnCNTm every count clock, meaning that TAUBnCNTm is always $0000_{\mathrm{H}}$.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.
(2) TAUBnCDRm $=0000_{\mathrm{H}}$, count clock $=$ PCLK

Figure 31.28 TAUBnCDRm $=0000_{\mathrm{H}}$, Count Clock $=$ PCLK

- TAUBnCDRm $=0000_{\mathrm{H}}$, and the count clock $=$ PCLK, the TAUBnCDRm value is written to TAUBnCNTm every PCLK clock, meaning that TAUBnCNTm is always $0000_{\mathrm{H}}$.
- INTTAUBnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
TAUBTTOUTm is toggled every PCLK clock.
(3) Operation stop and restart (TAUBnCMORm TAUBnMDO = 1)

Figure 31.29 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 $=1$

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 .
- TAUBnCNTm and TAUBTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1.
(4) Operation stop and restart (TAUBnCMORm.TAUBnMD0 $=0$ )

Figure 31.30 Operation Stop and Restart, TAUBnCMORm.TAUBnMDO $=0$
(5) Forced restart (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.31 Forced Restart Operation, TAUBnCMORm.TAUBnMD0 $=1$

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 1 , an interrupt at start or restart is generated and the output TAUBTTOUTm toggles.
(6) Forced restart (TAUBnCMORm.TAUBnMD0 $=0$ )

Figure 31.32 Forced Restart Operation (TAUBnCMORm.TAUBnMD0 $=0$ )

- The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle.

### 31.12.2 TAUBTTINm Input Interval Timer Function

### 31.12.2.1 Overview

## Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals or when a valid TAUBTTINm input edge is detected.

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.
INTTAUBnIm is generated when the counter reaches $0000_{\mathrm{H}}$ or by an effective TAUBTTINm input edge.
TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.
The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting
TAUBnTS.TAUBnTSm to 1 . The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The type of edge used as the trigger is specified using the TAUBnCMURm.TAUBnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 31.12.2.2 Block Diagram and General Timing Diagram

Figure 31.33 Block Diagram for TAUBTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1).
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01 ${ }_{\mathrm{B}}$ )

Figure 31.34 General Timing Diagram for TAUBTTINm Input Interval Timer Function

## (3) Channel output mode

This function does not use channel output mode.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Interval Timer Function. Therefore, these registers must be set to 0 .

Table 31.62 Simultaneous Rewrite Settings for TAUBTTINm Input Interval Timer Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |

### 31.12.2.4 Operating Procedure for TAUBTTINm Input Interval Timer Function

Table 31.63 Operating Procedure for TAUBTTINm Input Interval Timer Function

|  | Operation | Status of TAUBn |
| :---: | :---: | :---: |

|  | Set TAUBnTT.TAUBnTTm to 1 <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm stop and retain their current values. |

### 31.12.2.5 Specific Timing Diagrams

The timing diagrams in Section 31.12.1, Interval Timer Function apply, and in addition the counter can also be restarted by an effective TAUBTTINm input edge.

Figure 31.35 Counter Triggered by Rising TAUBTTINm Input Edge (TAUBnCMURm.TAUBnTIS[1:0] = 018), TAUBnCMORm.TAUBnMDO = 1

- If an effective TAUBTTINm input edge is detected, an interrupt INTTAUBnIm is generated. In this example, the effective edge is a rising edge (TAUBnCMURm.TAUBnTIS[1:0] $=01_{\mathrm{B}}$ ).

### 31.12.3 Clock Divide Function

### 31.12.3.1 Overview

## Summary

This function is used as a frequency divider. The frequency of the input signal TAUBTTINm is divided by a factor related to TAUBnCDRm, and an interrupt INTTAUBnIm is generated.

## Prerequisites

- TAUBTTINm must have a fixed frequency
- The operation mode must be set to interval timer mode, see Table 31.64, Contents of the TAUBnCMORm Register for Clock Divide Function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value, using TAUBTTINm as the count clock.

When the counter value reaches $0000_{\mathrm{H}}$, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm $=1$, which in turn sets TAUBnTE.TAUBnTEm $=0$. TAUBnCNTm stops but retain their values. The function can be restarted by setting TAUBnTS.TAUBnTSm $=1$. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.

## Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated.
NOTE
The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits.

### 31.12.3.2 Block Diagram and General Timing Diagram

Figure 31.36 Block Diagram for Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01 ${ }_{\mathrm{B}}$ )

Figure 31.37 General Timing Diagram for Clock Divide Function

### 31.12.3.3 Register Settings

(1) TAUBnCMORm

Table 31.64 Contents of the TAUBnCMORm Register for Clock Divide Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $1_{\text {B }}$. |
| 11 | TAUBnMAS | Write $0_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000{ }_{\mathrm{B}}$. |
| 7, 6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $000 \mathrm{~B}_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | 0: INTTAUBnIm not generated at operation start <br> 1: Generates INTTAUBnIm at operation start |

## (2) TAUBnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 31.65 Contents of the TAUBnCMURm Register for Clock Divide Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Falling edge detection |
|  |  | 01: Rising edge detection |
|  |  | 10: Rising and falling edge detection |
|  |  | 11: Setting prohibited |

## (3) Channel output mode

This function does not use channel output mode.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Clock Divide Function. Therefore, these registers must be set to 0 .

Table 31.66 Simultaneous Rewrite Settings for Clock Divide Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |

### 31.12.3.4 Operating Procedure for Clock Divide Function

Table 31.67 Operating Procedure for Clock Divide Function

### 31.12.3.5 Specific Timing Diagrams

(1) $\mathrm{TAUBnCDRm}=\mathbf{0 0 0 0}_{\mathrm{H}}$

Figure 31.38 TAUBnCDRm $=0000_{\mathrm{H}}$, TAUBnCMORm.TAUBnMDO $=1$, TAUBnCMURm.TAUBnTIS[1:0] $=01_{\mathrm{B}}$

- If TAUBnCDRm is $0000_{\mathrm{H}}$, TAUBnCNTm is also always $0000_{\mathrm{H}}$.
- INTTAUBnIm is generated every count clock.

Figure 31.38, TAUBnCDRm $=0000 \mathrm{H}, \mathrm{TAUBnCMORm} . \mathrm{TAUBnMD0}=1$,
TAUBnCMURm.TAUBnTIS[1:0] = 01B is an image of the operation timing. Actually, there is a delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn.

## (2) Operation restart

Figure 31.39 Operation Restart (TAUBnCMORm.TAUBnMDO $=1$, TAUBnCMURm.TAUBnTIS[1:0] $=01_{B}$ )

## (3) Forced restart

Figure 31.40 Forced Restart (TAUBnCMORm.TAUBnMD0 $=1$, TAUBnCMURm.TAUBnTIS[1:0] $=01_{\mathrm{B}}$ )

To forcibly restart the counter.

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- The value of TAUBnCDRm is written to TAUBnCNTm and the count operation restarts.

### 31.12.4 External Event Count Function

### 31.12.4.1 Overview

## Summary

This function is used as an event timer. It generates an interrupt (INTTAUBnIm) when a specific number of valid edges of TAUBTTINm input are detected.

## Prerequisites

- The operation mode must be set to event count mode, see Table 31.68, Contents of the TAUBnCMORm Register for External Event Count Function
- TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When the counter starts, the current value of TAUBnCDRm is written to TAUBnCNTm.

When an effective TAUBTTINm input edge is detected, the value of TAUBnCNTm reduces by 1 . TAUBnCNTm retains this value until a valid TAUBTTINm input edge is detected or the counter is restarted.

When effective edges are detected (TAUBnCDRm + 1) times, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues to operate.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 . The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1 . The counter can also be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

## Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] $=00_{\mathrm{B}}$, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] $=01_{\mathrm{B}}$, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = $10_{\mathrm{B}}$, rising and falling edges trigger the counter.

### 31.12.4.2 Equations

Number of valid edges, detected before INTTAUBnIm is generated $=$ TAUBnCDRm +1

### 31.12.4.3 Block Diagram and General Timing Diagram

Figure 31.41 Block Diagram for External Event Count Function

The following settings apply to the general timing diagram.

- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01 ${ }_{\mathrm{B}}$ )

Figure 31.42 General Timing Diagram for External Event Count Function

### 31.12.4.4 Register Settings

(1) TAUBnCMORm

Table 31.68 Contents of the TAUBnCMORm Register for External Event Count Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |

| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Falling edge is detected. |
|  |  | 01: Rising edge is detected. |
|  | 10: Both edges are detected. |  |
|  | 11: Setting prohibited |  |

## (3) Channel output mode

The channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the External Event Count Function.

Therefore, these registers must be set to 0 .
Table 31.70 Simultaneous Rewrite Settings for External Event Count Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |

### 31.12.4.5 Operating Procedure for External Event Count Function

Table 31.71 Operating Procedure for External Event Count Function

|  | Operation | Status of TAUBn |
| :---: | :---: | :---: |
|  | Set the TAUBnCMORm and TAUBnCMURm registers as described in Table 31.68, Contents of the TAUBnCMORm Register for External Event Count Function and Table 31.69, Contents of the TAUBnCMURm Register for External Event Count Function <br> Set the value of the TAUBnCDRm register | Channel operation is stopped. |
|  | Set TAUBnTS.TAUBnTSm to 1. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value and waits for detection of the TAUBTTINm input edge. |
|  | Detection of TAUBTTINm edges. <br> The value of TAUBnCDRm can be changed at any time. <br> The TAUBnCNTm register can be read at any time. | TAUBnCNTm performs count-down operation each time a TAUBTTINm input edge is detected. When effective edges are detected (TAUBnCDRm +1 ) times: <br> - TAUBnCNTm loads the TAUBnCDRm value and continues count operation <br> - INTTAUBnIm is generated. <br> Afterwards, this procedure is repeated. |
|  | Set TAUBnTT.TAUBnTTm to 1. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm stops and retains its current value. |

### 31.12.4.6 Specific Timing Diagrams

(1) TAUBnCDRm $=0000_{\mathrm{H}}$

Figure 31.43 TAUBnCDRm $=0000_{\mathrm{H}}, \mathrm{TAUBnCMURm} . \operatorname{TAUBnTIS[1:0]}=01_{\mathrm{B}}$

- If $0000_{\mathrm{H}}=$ TAUBnCDRm, $0000_{\mathrm{H}}$ is loaded to TAUBnCNTm every time a valid TAUBTTINm input edge is detected.

This means, INTTAUBnIm is generated every time a valid TAUBTTINm input edge is detected.

## (2) Operation stop and restart

Figure 31.44 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 .
- TAUBnCNTm stops and the current value is retained. TAUBTTINm continues and TAUBnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1 . TAUBnCNTm loads the TAUBnCDRm value and restarts count operation.
(3) Forced restart

Figure 31.45 Forced Restart (TAUBnCMURm.TAUBnTIS[1:0] $=01_{B}$ )

A forced restart applies the new TAUBnCDRm value to TAUBnCNTm immediately.

- The counter can be restarted (without stopping it first), by setting TAUBnTS.TAUBnTSm to 1 during operation.
- The value of TAUBnCDRm is loaded to TAUBnCNTm and the counter awaits the next valid TAUBTTINm input edge.

### 31.12.5 One-Pulse Output Function

### 31.12.5.1 Overview

## Summary

This function generates an interrupt (INTTAUBnIm) when a valid TAUBTTINm input edge is detected and subsequently, in a specific interval. TAUBTTINm input signal pulses that occur within the defined interval are ignored.

## Prerequisites

- The operation mode must be set to pulse one-count mode. (See Table 31.72, Contents of the TAUBnCMORm Register for One-Pulse Output Function).
- Trigger detection must be disabled during counting (TAUBnCMORm.TAUBnMD0 $=0$ ).

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input edge is detected. The value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from the TAUBnCDRm value, and an interrupt is generated.

When the counter reaches $0001_{\mathrm{H}}$ an interrupt is generated. The counter stops at $0000_{\mathrm{H}}$ and awaits the next effective TAUBTTINm input edge.

When the counter is counting down, further TAUBTTINm input signals are ignored, i.e. the counter does not reset.
The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

## Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] $=00_{\mathrm{B}}$, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] $=01_{\mathrm{B}}$, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = $10_{\mathrm{B}}$, rising and falling edges trigger the counter.

### 31.12.5.2 Equations

Interval between TAUBTTINm and INTTAUBnIm $=$ count clock cycle $\times$ TAUBnCDRm

### 31.12.5.3 Block Diagram and General Timing Diagram

Figure 31.46 Block Diagram for One-Pulse Output Function

The following settings apply to the general timing diagram.

|  | Set TAUBnTT.TAUBnTTm to 1. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm stops and retains its current value. |

### 31.12.6 TAUBTTINm Input Pulse Interval Measurement Function

### 31.12.6.1 Overview

## Summary

This function captures the count value and uses this value and the overflow bit TAUBnCSRm.TAUBnOVF to measure the interval of the TAUBTTINm input signal.

## Prerequisites

TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter TAUBnCNTm starts counting up from $0000_{\mathrm{H}}$. When a valid TAUBTTINm edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter resets to $0000_{\mathrm{H}}$ and subsequently continues operation.

If the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$ before a valid TAUBTTINm edge is detected, it overflows to $0000_{\mathrm{H}}$. The counter is reset to $0000_{\mathrm{H}}$ and subsequently continues operation. The values transferred to TAUBnCDRm and
TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].
Table 31.76 Effects of an Overflow

| TAUBnCMORm. TAUBnCOS[1:0] | When Overflow Occurs |  | When a Valid TAUBTTINm Input is then Detected |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TAUBnCDRm | TAUBnCSRm. TAUBnOVF | TAUBnCDRm, TAUBnCNTm | TAUBnCSRm. TAUBnOVF |
| 00 | Unchanged | 0 | TAUBnCNTm loaded to TAUBnCDRm | 1 |
| 01 |  | 1 |  |  |
| 10 | Set to $\mathrm{FFFF}_{\mathrm{H}}$ | 0 | TAUBnCNTm set to 0 , TAUBnCDRm unchanged | Unchanged |
| 11 |  | 1 |  |  |

If TAUBnCMORm.TAUBnCOS[0] is 1 , the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV $=1$.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the interval of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

The function can be stopped by setting TAUBnTT.TAUBnTTm $=1$, which in turn sets TAUBnTE.TAUBnTEm $=0$. TAUBnCNTm stops but retains its value. While the function is stopped, TAUBTTINm input valid edge detection and TAUBnCNTm capture are not performed.

The counter is reset to $0000_{\mathrm{H}}$ and subsequently continues operation.

## Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0 , the interrupt at start or restart is not generated.
NOTE
When TAUBnCMORm.TAUBnCOS[1:0] $=10_{\mathrm{B}}$ or $11_{\mathrm{B}}$, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 31.12.6.2 Equations

TAUBTTINm input pulse interval $=$ count clock cycle $\times$
$\left[\left(\right.\right.$ TAUBnCSRm. $\left.\mathrm{TAUBnOVF} \times\left(\mathrm{FFFF}_{\mathrm{H}}+1\right)\right)+$ TAUBnCDRm capture value +1$]$

### 31.12.6.3 Block Diagram and General Timing Diagram

Figure 31.48 Block Diagram for TAUBTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00 ${ }_{\mathrm{B}}$ )
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] $=00_{\mathrm{B}}$ )

## (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0 .

Table 31.79 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Measurement Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |

### 31.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

Table 31.80 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

### 31.12.6.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] $=00_{B}$

Figure 31.50 TAUBnCMORm.TAUBnCOS[1:0] $=00$ в, TAUBnCMORm.TAUBnMD0 $=0$,
TAUBnCMURm.TAUBnTIS[1:0] $=00_{\mathrm{B}}$

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is loaded to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1 .
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0 .
(2) TAUBnCMORm.TAUBnCOS[1:0] $=01_{B}$

Figure 31.51 TAUBnCMORm.TAUBnCOS[1:0] $=01_{\mathrm{B}}$, TAUBnCMORm.TAUBnMD0 $=0$, TAUBnCMURm.TAUBnTIS[1:0] = 00B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command. (TAUBnCSCm.TAUBnCLOV bit $=1$ )
(3) TAUBnCMORm.TAUBnCOS[1:0] $=1 \mathbf{1 0}_{\mathrm{B}}$

 TAUBnCMURm.TAUBnTIS[1:0] $=00_{\text {B }}$
- When an overflow occurs, TAUBnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$ and TAUBnCSRm.TAUBnOVF remains 0 .
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0 , but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
(4) $\operatorname{TAUBnCMORm.TAUBnCOS[1:0]~}=11_{B}$

Figure 31.53 TAUBnCMORm.TAUBnCOS[1:0] $=11_{\mathrm{B}}$, TAUBnCMORm.TAUBnMD0 $=0$,
TAUBnCMURm.TAUBnTIS[1:0] = 00B

- When an overflow occurs, TAUBnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$, and TAUBnCSRm.TAUBnOVF is set to 1 .
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0 , but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1 .
(5) When rising and falling edge detection are selected (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.54 TAUBnCMORm.TAUBnMD0 $=1$
Setting TAUBnCMURm.TAUBnTIS[1:0] to $10_{\mathrm{B}}$ (detection of both edges selected) measures the TAUBTTINm rising and falling edge intervals.
(6) Operation stop and operation restart (TAUBnCMORm.TAUBnMD0 $=0$ )

Figure 31.55 Operation Stop and Operation Restart (TAUBnCMORm. $\operatorname{TAUBnMDO}=0$ )

Setting TAUBnTT.TAUBnTTm to 1 clears TAUBnTE.TAUBnTEm to 0 , which stops the count operation. At this time, TAUBnCNTm retains the status and stops.

When TAUBnTE.TAUBnTEm retains 0 (operation stopped), TAUBTTINm input is ignored (edge detection is ignored and capture operation is not performed).

Setting TAUBnTS.TAUBnTSm to 1 clears the counter to $0000_{\mathrm{H}}$ and restarts count-up operation.

### 31.12.7 TAUBTTINm Input Signal Width Measurement Function

### 31.12.7.1 Overview

## Summary

This function measures the width of a TAUBTTINm signal by starting counting on one edge of the TAUBTTINm signal and capturing the counter value on the opposite edge.

## Prerequisites

TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 .
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm start edge is detected, the counter TAUBnCNTm starts counting up from $0000_{\mathrm{H}}$. When a valid TAUBTTINm stop edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter retains its value (TAUBnCDRm +1 ) and awaits the next valid TAUBTTINm input start edge.

If the counter reaches $\mathrm{FFFF}_{H}$ before a valid TAUBTTINm stop edge is detected, it overflows. The counter is reset to $0000_{\mathrm{H}}$ and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 31.81 Effects of an Overflow

| TAUBnCMORm. TAUBnCOS[1:0] | When Overflow Occurs |  | When a Valid TAUBTTINm Input Stop Edge is Detected |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TAUBnCDRm | TAUBnCSRm. TAUBnOVF | TAUBnCDRm, TAUBnCNTm | TAUBnCSRm. TAUBnOVF |
| 00 | Unchanged | 0 | TAUBnCNTm written to TAUBnCDRm | 1 |
| 01 |  | 1 |  |  |
| 10 | Set to $\mathrm{FFFF}_{\mathrm{H}}$ | 0 | TAUBnCNTm stops counting TAUBnCDRm unchanged | Unchanged |
| 11 |  | 1 |  |  |

If TAUBnCMORm.TAUBnCOS[0] = 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the width of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

This function cannot be forcibly restarted.
NOTE
When TAUBnCMORm.TAUBnCOS[1] = 1, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 31.12.7.2 Equations

TAUBTTINm input signal width $=$ count clock cycle $\times$
$\left[\left(\right.\right.$ TAUBnCSRm.OVF $\left.\times\left(\mathrm{FFFF}_{\mathrm{H}}+1\right)\right)+$ TAUBnCDRm capture value +1$]$

### 31.12.7.3 Block Diagram and General Timing Diagram

Figure 31.56 Block Diagram for TAUBTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection $=$ high width measurement (TAUBnCMURm.TAUBnTIS[1:0] $=11_{\mathrm{B}}$ )
- When a valid TAUBTTINm input is detected after an overflow, TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] $=00_{B}$ )

Figure 31.57 General Timing Diagram for TAUBTTINm Input Signal Width Measurement Function

### 31.12.7.4 Register Settings

(1) TAUBnCMORm

Table 31.82 Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output = CK2
11: Prescaler output = CK3

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{\mathrm{B}}$. |
| 11 | TAUBnMAS | Write $0_{\mathrm{B}}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $010_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | See Table 31.81, Effects of an Overflow |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0110_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $0_{\mathrm{B}}$. |

## (2) TAUBnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.83 Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 10: Rising and falling edge detection (low width measurement) |
|  |  | 11: Rising and falling edge detection (high width measurement) |

## (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0 .

Table 31.84 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |
| TAUBnRDC.TAUBnRDCm |  |

### 31.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

Table 31.85 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

|  | Operation | Status of TAUBn |
| :---: | :---: | :---: |
|  | Set the TAUBnCMORm and TAUBnCMURm registers as described in Table 31.82, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function and Table 31.83, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function <br> The TAUBnCDRm register functions as a capture register. | Channel operation is stopped. |
|  | Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. <br> When a TAUBTTINm start edge is detected, TAUBnCNTm start edge to count up. |
|  | The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. <br> TAUBnCSCm.TAUBnCLOV bit can be set to 1 . | TAUBnCNTm starts to count up from $0000_{\mathrm{H}}$. When a TAUBTTINm valid edge is detected: <br> - TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and retains its value <br> - INTTAUBnIm is then generated. <br> - The count stops at the value transferred to TAUBnCDRm +1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. <br> Afterwards, this procedure is repeated. |
|  | Set TAUBnTT.TAUBnTTm to 1. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values. |

### 31.12.7.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] $=00_{B}$

Figure 31.58 TAUBnCMORm.TAUBnCOS[1:0] $=00_{\mathrm{B}}$, TAUBnCMORm.TAUBnMD0 $=0$, TAUBnCMURm.TAUBnTIS[1:0] = 11B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.
(2) TAUBnCMORm.TAUBnCOS[1:0] $=01_{B}$

Figure 31.59 TAUBnCMORm.TAUBnCOS[1:0] $=01_{\mathrm{B}}$, TAUBnCMORm. $\operatorname{TAUBnMD0}=0$, TAUBnCMURm.TAUBnTIS[1:0] = 11 ${ }_{\text {B }}$

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command (The TAUBnCSCm.TAUBnCLOV bit = 1 ).
(3) TAUBnCMORm.TAUBnCOS[1:0] $=1 \mathbf{1 0}_{\mathrm{B}}$

Figure 31.60 TAUBnCMORm.TAUBnCOS[1:0] $=10_{\mathrm{B}}$, TAUBnCMORm. $\operatorname{TAUBnMD0}=0$, TAUBnCMURm.TAUBnTIS[1:0] = 11 ${ }_{\mathrm{B}}$

- When an overflow occurs, TAUBnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$ and TAUBnCSRm.TAUBnOVF remains 0 .
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
(4) $\operatorname{TAUBnCMORm.TAUBnCOS[1:0]~}=11_{B}$

Figure 31.61 TAUBnCMORm.TAUBnCOS[1:0] = 11в, TAUBnCMORm.TAUBnMD0 $=0$, TAUBnCMURm.TAUBnTIS[1:0] = 11 $1_{B}$

- When an overflow occurs, TAUBnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$, and TAUBnCSRm.TAUBnOVF is set to 1 .
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1 .
(5) When an overflow occurs (high width measurement)

Figure 31.62 When an Overflow Occurs

When a capture trigger is input after the counter value has overflowed, the counter value is transferred to TAUBnCDRm and at the same time TAUBnCSRm.TAUBnOVF is set to 1 .

TAUBnCSRm.TAUBnOVF is kept at 1 until the next capture trigger occurs.
If the next capture trigger is not accompanied by an overflow, TAUBnCSRm.TAUBnOVF is cleared to 0 .
TAUBTTINm input signal width (example when TAUBnCSRm.TAUBnOVF is 1 and TAUBnCDRm is a)
$=$ count clock cycle $\times\left(\left(10000_{\mathrm{H}} \times\right.\right.$ TAUBnCSRm.TAUBnOVF $)+($ TAUBnCDRm capture value +1$\left.)\right)$
$=$ count clock cycle $\times\left(\left(10000_{\mathrm{H}} \times 1\right)+(\mathrm{a}+1)\right)$
$=$ count clock cycle $\times\left(10000_{\mathrm{H}}+\mathrm{a}+1\right)$

### 31.12.8 TAUBTTINm Input Position Detection Function

### 31.12.8.1 Overview

## Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUBTTINm signal.

## Prerequisites

TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm $=1$, enabling count operation. The counter starts to count from $0000_{\mathrm{H}}$. When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The count operation continues.

When the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$, the counter restarts from $0000_{\mathrm{H}}$.
NOTE
The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.

## Conditions

If the TAUBnCMORm.MD0 bit is set to 0 , the first interrupt after a start or restart is not generated.

### 31.12.8.2 Equations

```
Function duration at a TAUBTTINm input pulse =
count clock cycle }\times(\mathrm{ TAUBnCDRm capture value + 1)
```

### 31.12.8.3 Block Diagram and General Timing Diagram

Figure 31.63 Block Diagram for TAUBTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00 ${ }_{\mathrm{B}}$ )

Figure 31.64 General Timing Diagram for TAUBTTINm Input Position Detection Function

## (3) Channel output mode

The channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Position Detection Function. Therefore, these registers must be set to 0 .

Table 31.88 Simultaneous Rewrite Settings for TAUBTTINm Input Position Detection Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | $0:$ Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | $0:$ When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |
| TAUBnRDC.TAUBnRDCm |  |

### 31.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function

Table 31.89 Operating Procedure for TAUBTTINm Input Position Detection Function

### 31.12.8.6 Specific Timing Diagrams

(1) Operation stop and restart

Figure 31.65 Operation Stop and Restart (TAUBnCMORm.TAUBnMDO $=0$, TAUBnCMURm.TAUBnTIS[1:0] $=00 \mathrm{~B}$ )

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from $0000_{\mathrm{H}}$.

### 31.12.9 TAUBTTINm Input Period Count Detection Function

### 31.12.9.1 Overview

## Summary

This function measures the cumulative width of a TAUBTTINm input signal.

## Prerequisites

TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter awaits a valid TAUBTTINm input edge.

When a valid TAUBTTINm input start edge is detected, the counter starts to count from $0000_{\mathrm{H}}$.
When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter stops and retains its value (TAUBnCDRm +1 ) until the next valid TAUBTTINm input start edge is detected.

When a next valid TAUBTTINm input start edge is detected, the counter restarts from the value retained while stopping.
If the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$, the counter restarts from $0000_{\mathrm{H}}$.
NOTES

1. The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.
2. As this function is to measure the TAUBTTINm input signal width, setting TAUBnTS.TAUBnTSm to 1 is disabled while TAUBnTE. $\operatorname{TAUBnTEm~=~} 1$.

## Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = $10_{\mathrm{B}}$, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11 ${ }_{\mathrm{B}}$, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

### 31.12.9.2 Equations

Cumulative TAUBTTINm input width $=$ count clock cycle $\times($ TAUBnCDRm capture value +1$)$

### 31.12.9.3 Block Diagram and General Timing Diagram

Figure 31.66 Block Diagram for TAUBTTINm Input Period Count Detection Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement) |
|  |  | 11: Rising and falling edge detection (High width measurement) |

## (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Period Count Detection Function. Therefore, these registers must be set to 0 .

Table 31.92 Simultaneous Rewrite Settings for TAUBTTINm Input Period Count Detection Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | $0:$ Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | $0:$ When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |

### 31.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function

Table 31.93 Operating Procedure for TAUBTTINm Input Period Count Detection Function

|  | Operation | Status of TAUBn |
| :---: | :---: | :---: |
|  | Set the TAUBnCMORm and TAUBnCMURm registers as described in Table 31.90, Contents of the <br> TAUBnCMORm Register for TAUBTTINm Input Period Count Detection Function and Table 31.91, Contents of the TAUBnCMURm Register for the TAUBTTINm Input Period Count Detection Function <br> The TAUBnCDRm register functions as a capture register. | Channel operation is stopped. |
|  | Set TAUBnTS.TAUBnTSm to 1. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. |
|  | Detection of TAUBTTINm edges. <br> The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. | When a TAUBTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUBnCNTm starts to count up from the stop value. <br> When TAUBnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUBnCDRm and INTTAUBnIm is generated. <br> Counting stops at the "value transferred to TAUBnCDRm + 1" value and TAUBnCNTm waits for detection of the TAUBTTINm start edge. <br> When TAUBnCNTm reaches FFFF $_{\mathrm{H}}$, the counter restarts from $0000_{\mathrm{H}}$. <br> Afterwards, this procedure is repeated. |
|  | Set TAUBnTT.TAUBnTTm to 1. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm stops and retains its current value. |

### 31.12.9.6 Specific Timing Diagrams

### 31.12.9.7 Operation stop and restart

Figure 31.68 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 11 ${ }_{\mathrm{B}}$ )

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 .
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from $0000_{\mathrm{H}}$.

### 31.12.10 TAUBTTINm Input Pulse Interval Judgment Function

### 31.12.10.1 Overview

## Summary

This function outputs the result of a comparison between the count value (TAUBnCNTm) and the value in the channel data register (TAUBnCDRm) when a TAUBTTINm input pulse occurs. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true.

## Prerequisites

TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid edge is detected or TAUBnTS.TAUBnTSm is set to 1 , the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. TAUBnCNTm reloads the value of TAUBnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches $0000_{\mathrm{H}}$ before a TAUBTTINm valid edge is detected, TAUBnCNTm overflows and is set to $\mathrm{FFFF}_{\mathrm{H}}$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

## Conditions

The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:

- If TAUBnCMORm.TAUBnMD0 $=0$, INTTAUBnIm is generated when TAUBnCNTm $\leq$ TAUBnCDRm.
- If TAUBnCMORm.TAUBnMD0 $=1$, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.

|  | 11: Setting prohibited |  |

## (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Judgment Function. Therefore, these registers must be set to 0 .

Table 31.96 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Judgment Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), sets these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |
| TAUBnRDC.TAUBnRDCm |  |

### 31.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

Table 31.97 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

|  | Operation | Status of TAUBn |
| :---: | :---: | :---: |
|  | Set the TAUBnCMORm and TAUBnCMURm registers as described in Table 31.94, Contents of the <br> TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Judgment Function and Table 31.95, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Judgment Function <br> Set the value of the TAUBnCDRm register | Channel operation is stopped. |
|  | Set TAUBnTS.TAUBnTSm to 1. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. |
|  | The following register can be changed at any time: TAUBnCDRm register | When TAUBnCMORm.TAUBnMD0 $=0$ <br> If TAUBnCNTm $\leq$ TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. <br> When TAUBnCMORm.TAUBnMD0 $=1$ <br> If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. If a TAUBTTINm input edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. <br> Afterwards, this procedure is repeated. |
|  | Set TAUBnTT.TAUBnTTm to 1. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm stops and retains its current value. |

### 31.12.11 TAUBTTINm Input Signal Width Judgment Function

### 31.12.11.1 Overview

## Summary

This function compares the count value (TAUBnCNTm) for the high or low level width of a TAUBTTINm input signal and the TAUBnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUBnIm.

## Prerequisites

TAUBTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm input start edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid stop edge is detected, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. The counter TAUBnCNTm retains its value until the next TAUBTTINm valid start edge is detected, regardless of the result of the comparison.

If the counter reaches $0000_{\mathrm{H}}$ before a valid TAUBTTINm stop edge is detected, TAUBnCNTm overflows and is set to $\mathrm{FFFF}_{\mathrm{H}}$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

## Conditions

- The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:
- If TAUBnCMORm.TAUBnMD0 $=0$, INTTAUBnIm is generated when TAUBnCNTm $\leq$ TAUBnCDRm.
- If TAUBnCMORm.TAUBnMD0 $=1$, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.
- The TAUBnCMURm.TAUBnTIS[1:0] bits specify the type of width measurement:
- For high width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = $11_{\mathrm{B}}$ ) the start edge is a rising TAUBTTINm edge and the stop edge is a falling TAUBTTINm edge.
- For low width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = $10_{\mathrm{B}}$ ) the start edge is a falling TAUBTTINm edge and the stop edge is a rising TAUBTTINm edge.
- Setting TAUBnTS.TAUBnTSm to 1 is prohibited during operation.

### 31.12.11.2 Block Diagram and General Timing Diagram

Figure 31.71 Block Diagram for TAUBTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated when TAUBnCNTm $\leq$ TAUBnCDRm (TAUBnCMORm.TAUBnMD0 $=0$ )
- TAUBTTINm valid start edge = rising edge, TAUBTTINm valid stop edge = falling edge (TAUBnCMURm.TAUBnTIS[1:0] = 11 ${ }_{\mathrm{B}}$ )

|  |  | Set the TAUBnCMORm and TAUBnCMURm registers as described in Table 31.98, Contents of the <br> TAUBnCMORm Register for TAUBTTINm Input Signal Width Judgment Function and Table 31.99, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Judgment Function <br> Set the value of the TAUBnCDRm register | Channel operation is stopped. |
|  |  | Set TAUBnTS.TAUBnTSm to 1. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. |
|  |  | The following register can be changed at any time: <br> - TAUBnCDRm register | If a TAUBTTINm start edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. <br> When TAUBnCMORm.TAUBnMD0 $=0$ <br> If TAUBnCNTm $\leq$ TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. <br> When TAUBnCMORm.TAUBnMD0 $=1$ <br> If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. <br> Afterwards, this procedure is repeated. |
|  |  | Set TAUBnTT.TAUBnTTm to 1. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm stops and retains its current value. |

### 31.12.12 Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

### 31.12.12.1 Overview

## Summary

This function measures the width of an individual TAUBTTINm input signal. An interrupt is generated if the TAUBTTINm input width is longer than $\mathrm{FFFF}_{\mathrm{H}}+1$.

## Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $\mathrm{FFFF}_{\mathrm{H}}$.

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm $=1$, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. FFFF $_{H}$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.
When the next TAUBTTINm input start edge is detected, TAUBnCNTm loads $\mathrm{FFFF}_{\mathrm{H}}$ and starts to count down.
If the counter reaches $0000_{\mathrm{H}}$ before a stop edge is detected, an interrupt is generated.

## Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] $=10_{\mathrm{B}}$, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = $11_{\mathrm{B}}$, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE
The counter cannot be restarted during operation.

### 31.12.12.2 Block Diagram and General Timing Diagram

Figure 31.73 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = $11_{\mathrm{B}}$ )

Figure 31.74 General Timing Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | $0:$ Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | $0:$ When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |
| TAUBnRDC.TAUBnRDCm |  |

### 31.12.12.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

Table 31.105 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

### 31.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

### 31.12.13.1 Overview

## Summary

This function measures the cumulative width of a TAUBTTINm input signal. An interrupt is generated and an overflow interrupt can be output if the cumulative TAUBTTINm input width is longer than FFFFF $_{\text {. }}$.

## Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $\mathrm{FFFF}_{\mathrm{H}}$

## Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm $=1$, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. FFFF $_{H}$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUBTTINm input start edge and then continues to count down from the current value.

When the counter reaches $0000_{\mathrm{H}}$ an interrupt is generated. $\mathrm{FFFF}_{\mathrm{H}}$ is written to TAUBnCNTm and the counter continues to count down until a TAUBTTINm input stop edge is detected.

## Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10 ${ }_{\mathrm{B}}$, the TAUBTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11 $1_{\mathrm{B}}$, the TAUBTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE
The counter cannot be restarted during operation.

| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.107 Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement) |
|  |  | 11: Rising and falling edge detection (High width measurement) |

## (3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

## (4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection). Therefore, these registers must be set to 0 .

Table 31.108 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 0: Disables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm $=0$ ), set these bits to 0 |
| TAUBnRDM.TAUBnRDMm |  |
| TAUBnRDC.TAUBnRDCm |  |

### 31.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Table 31.109 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

### 31.13 Independent Channel Simultaneous Rewrite Functions

The following describes functions that carry out simultaneous rewrite:

### 31.13.1 Simultaneous Rewrite Trigger Generation Function Type 1

### 31.13.1.1 Overview

## Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals. The upper channel is for generating the simultaneous rewrite trigger (TAUBnRDC.TAUBnRDCm = 1), and the lower channels are for conducting simultaneous rewrite when triggered from the upper channel (TAUBnRDC.TAUBnRDCm $=0$ ).

## Prerequisites

- Two (or more) channels that are lower than the channel used as the upper channel, each with simultaneous rewrite enabled (TAUBnRDE.TAUBnRDEm = 1)
- The operation mode of the upper channel must be set to interval timer mode, see Table 31.110, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1.
- For the operation modes that can be set to the lower channels, see Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite.
- In this function, TAUBTTOUTm is not used for all the channels.

## Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) of the upper and lower channel(s) to 1 . This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of the data register buffer of the upper channel (TAUBnCDRm buf) is written to the counter (TAUBnCNTm) and the counter starts to count down from this value.
The counter(s) of the lower channel(s) start to count as specified by their selected operating modes.
When a counter reaches $0000_{\mathrm{H}}$, an interrupt is generated from the channel.
The corresponding TAUBnCNTm then reloads the current TAUBnCDRm buffer value and subsequently continues operation.

If the channel where the interrupt occurs is specified as the trigger channel for simultaneous rewrite (TAUBnRDC.TAUBnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUBnRSF.TAUBnRSFm $=1$ ).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

## Condition

- The channel which is monitored for INTTAUBnIm is specified by setting TAUBnRDC.TAUBnRDCm $=1$ for the corresponding channel. The TAUBnRDC.TAUBnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.

### 31.13.1.2 Equations

Simultaneous rewrite trigger generation cycle $=$ count clock cycle $\times($ TAUBnCDRm +1$)$
To control simultaneous rewrite, the following condition must be satisfied:

## [For PWM]

TAUBnCDRm $=[($ value of TAUBnCDRm of master channel subject to simultaneous rewrite +1$) \times$ number of interrupts] - 1

## [For triangle PWM]

TAUBnCDRm $=[($ value of TAUBnCDRm of master channel subject to simultaneous rewrite +1$) \times 2 \times$ number of interrupts] - 1

That is, the ratio of TAUBnCDRm +1 and value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

Note that the cycle for the triangle PWM is twice the cycle for the PWM

### 31.13.1.3 Block Diagram and General Timing Diagram

Figure 31.77 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 1

### 31.13.1.4 Register Settings for The Upper Channel

(1) TAUBnCMORm for the upper channel

Table 31.110 Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $\mathrm{O}_{\mathrm{B}}$. |
| 11 | TAUBnMAS | Write $0_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000{ }_{\text {B }}$. |
| 7, 6 | TAUBnCOS[1:0] | Write $00{ }_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $1_{\text {B }}$. |

(2) TAUBnCMURm for the upper channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.111 Contents of the TAUBnCMURm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for the upper channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function. However, it can be used in independent channel output mode controlled by software.
(4) Simultaneous rewrite for the upper channel

Table 31.112 Simultaneous Rewrite Settings for the Upper Channel in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 1: Selects an upper channel as the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The signal that controls simultaneous rewrite is loaded when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 1: Channel is monitored for an INTTAUBnIm signal that is used as the simultaneous rewrite <br> trigger |

### 31.13.1.5 Register Settings for the Lower Channel(s)

(1) TAUBnCMORm for the lower channel(s)

For the TAUBnCMORm register of the lower channels, follow the TAUBnCMORm register settings for the operation mode that can be set. (See Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite)

## (2) TAUBnCMURm for the lower channel(s)

For the TAUBnCMURm register of the lower channels, follow the TAUBnCMURm register settings for the operation mode that can be set. (See Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite)

## (3) Channel output mode for the lower channel(s)

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite.

## (4) Simultaneous rewrite for the lower channel(s)

Table 31.113 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 1: Selects an upper channel as the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The signal that controls simultaneous rewrite is loaded when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | $0:$ Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 31.114 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

### 31.14 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the Timer Array Unit B. For a general overview of synchronous channel operation, see Overview.

### 31.14.1 PWM Output Function

### 31.14.1.1 Overview

## Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the pulse width (duration) of the TAUBTTOUTm to be set. The pulse cycle is set in the master channel. The pulse width is set in the slave channel.

## Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see Table 31.115, Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function.
- The operation mode of the slave channel(s) must be set to one-count mode, see Table 31.118, Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function.
- TAUBTTOUTm is not used for the master channel of this function.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 1.

## Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm $=1$, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) toggles, which realizes a PWM output.

- Master channel:

When the counter of the master channel reaches $0000_{\mathrm{H}}$, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter loads the TAUBnCDRm value and counts down.

- Slave channel:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. The TAUBTTOUTm signal is set to the active level.

When the counter reaches $0000_{\mathrm{H}}$, i.e. duty time has elapsed, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset to the inactive level. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next INTTAUBnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

## Conditions

Set Simultaneous rewrite with this function. Please see Section 31.6, Simultaneous Rewrite.

### 31.14.1.2 Equations

Pulse cycle $=($ TAUBnCDRm $($ master $)+1) \times$ count clock cycle
Duty cycle [\%] = (TAUBnCDRm (slave) $/($ TAUBnCDRm (master) +1$)) \times 100$

> - Duty cycle $=0 \%$
> TAUBnCDRm (slave) $=0000_{\mathrm{H}}$

- Duty cycle = 100\%

TAUBnCDRm (slave) $\geq$ TAUBnCDRm (master) +1

### 31.14.1.3 Block Diagram and General Timing Diagram

Figure 31.79 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

Figure 31.80 General Timing Diagram for PWM Output Function

NOTE

- The interval between the start of the count and an interrupt being generated is the value of corresponding TAUBnCDRm + 1 .
- TAUBTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUBnIm of the master channel.

### 31.14.1.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Table 31.115 Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $1_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000_{B}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{B}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_{B}$. |
| 0 | TAUBnMD0 | Write $1_{B}$. |

(2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.116 Contents of the TAUBnCMURm Register for the Master Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for the master channel

The channel output mode is not used by this function.

## (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.117 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. |
|  | 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

NOTE
When used in TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel operating in Section 31.13.1, Simultaneous Rewrite Trigger Generation Function Type 1.
Configure the operation following the conditions below.

- The channel set to Simultaneous Rewrite Trigger Output Function Type 1: TAUBnRDCm =1, TAUBnRDSm = 1 The setting value of TAUBnCDRm to this channel is as follows.
$=(($ setting value of TAUBnCDRm of the master channel subject to simultaneous rewrite +1$) \times$ number of interrupts $)-1$
- Master channel: TAUBnRDCm $=0$, TAUBnRDSm $=1$
- Slave channel: TAUBnRDCm $=0$, TAUBnRDSm $=1$

Although the value of duty exceeds $100 \%$ when the setting value of TAUBnCDRm (slave) $>$ the setting value of TAUBnCDRm (master) +1 , the output will be aggregated to $100 \%$.

### 31.14.1.5 Register Settings for the Slave Channel(s)

(1) TAUBnCMORm for the slave channel(s)

Table 31.118 Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output = CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $0_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $100_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0100_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $1_{\mathrm{B}}$. |

## (2) TAUBnCMURm for the slave channel(s)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.119 Contents of the TAUBnCMURm Register for the Slave Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

(3) Channel output mode for the slave channel(s)

Table 31.120 Control Bit Settings for Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{\mathrm{B}}$. |
| TAUBnTOM.TAUBnTOMm | Write $1_{\mathrm{B}}$. |
| TAUBnTOC.TAUBnTOCm | Write $0_{\mathrm{B}}$. |
| TAUBnTOL.TAUBnTOLm | $0:$ Positive logic |
|  | 1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $0_{\mathrm{B}}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{\mathrm{B}}$. |

## (4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.121 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. |
|  | 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.1.6 Operating Procedure for PWM Output Function

Table 31.122 Operating Procedure for PWM Output Function

|  |  | Operation | Status of TAUBn |
| :---: | :---: | :---: | :---: |
|  | Initial channel setting | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.1.4, Register Settings for the Master Channel. <br> Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.1.5, Register Settings for the Slave Channel(s). <br> Set the values of the TAUBnCDRm registers of all channels | Channel operation is stopped. |
|  |  | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0 . | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. <br> INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) is set. |
|  |  | TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. <br> TAUBnRDT.TAUBnRDTm can be changed during operation. | TAUBnCNTm of the master channel loads TAUBnCDRm and counts down. When the counter reaches $0000_{H}$ : <br> - INTTAUBnIm (master) is generated <br> - TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation <br> - TAUBnCNTm (slave) loads the TAUBnCDRm value and counts down <br> - TAUBTTOUTm (slave) is set to the active level When TAUBnCNTm (slave) reaches 0000 <br> - The counter of TAUBnCNTm (slave) stops. <br> - INTTAUBnIm (slave) is generated <br> - TAUBTTOUTm (slave) is set to the inactive level |
|  |  | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

### 31.14.1.7 Specific Timing Diagrams

(1) Duty cycle $=0 \%$

Figure 31.81 TAUBnCDRm (slave) $=000 \mathrm{H}_{\mathrm{H}}$,
Positive Logic (TAUBnTOL.TAUBnTOLm (slave) $=0$ )

- Every time the master channel generates an interrupt (INTTAUBnIm), $0000_{\mathrm{H}}$ is written to TAUBnCNTm (slave). As a result, a slave channel interrupt (INTTAUBnIm) is generated at the same time and TAUBTTOUTm remains inactive.
- TAUBnCNTm (slave) generates an interrupt every time the value of TAUBnCDRm is loaded.
(2) Duty cycle $=100 \%$

Figure 31.82 TAUBnCDRm (slave) $\geq$ TAUBnCDRm (master) +1 ,
Positive Logic (TAUBnTOL.TAUBnTOLm (slave) $=0$ )

If the value TAUBnCDRm (slave) is higher than the value TAUBnCDRm (master), the counter of the slave channel cannot reach $0000_{\mathrm{H}}$ and cannot generate interrupts. The TAUBTTOUTm remains at active state.
(3) Operation stop and restart

Figure 31.83 Operation Stop and Restart, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) $=0$ )

- The counter can be stopped by setting TAUBnTT.TAUBnTTm of the master and slave channel(s) to 1 , which in turn sets TAUBnTE.TAUBnTEm to 0 .
- TAUBnCNTm and TAUBTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm of master and slave channel(s) to 1. TAUBnCNTm of master and slave channel reload the current values of TAUBnCDRm and start to count down from these values.
(4) Operation stop and restart (Slave output, Initialization)

Figure 31.84 Operation Stop and Restart (Slave Output, Initialization)

When TAUBnTOE.TAUBnTOEm of the slave channel is set to 0 while TAUBnTE.TAUBnTEm $=0$ and the inactive level of TAUBTTOUTm is written in the TAUBnTO.TAUBnTOm, the output level of TAUBTTOUTm (slave channel) becomes active when INTTAUBnIm is issued when the count operation is started after restart.

### 31.14.2 One-Shot Pulse Output Function

### 31.14.2.1 Overview

## Summary

This function outputs a signal pulse with a defined pulse width and a specific delay time compared to an external input signal pulse by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

## Prerequisites

- Two channels
- The operation mode of the master channel must be set to one-count mode, see Table 31.123, Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function
- The operation mode of the slave channel must be set to pulse one-count mode, see Table 31.126, Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel must be set to independent channel output mode 2.
- TAUBTTINm (master) has to be detected while TAUBnCNTm (master) and TAUBnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUBTTINm (slave).

## Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) for master and slave channels to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

- Master channel:

When the next valid TAUBTTINm input edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm. The counter starts to count down from this value. If TAUBnCMORm.TAUBnMD0 $=0$, a trigger (TAUBTTINm) which is detected within the delay time is ignored.
When the counter of the master channel reaches $0000_{\mathrm{H}}$, INTTAUBnIm is generated. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next valid TAUBTTINm input edge.

- Slave channel:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel. The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. An interrupt is generated and the TAUBTTOUTm signal is set.
When the counter reaches $0001_{\mathrm{H}}$, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter remains at $0000_{\mathrm{H}}$ and awaits the next INTTAUBnIm of the master channel.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1 .

The counter of the master channel can be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

## NOTES

1. If a forced restart of the counter is executed during operation, the width of the output signal does not correspond to the value of TAUBnCDRm (slave).
2. The TAUBTTINm input signal is sampled at the frequency of the operating clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of $\pm 1$ operation clock cycle.

## Conditions

- If TAUBnCMORm.TAUBnMD0 of the master channel is set to 0 , during counting detected TAUBTTINm input edges are ignored.
- Simultaneous rewrite can be used with this function. Please see Section 31.6, Simultaneous Rewrite.

### 31.14.2.2 Equations

Delay from trigger input to pulse output

$$
=(\text { TAUBnCDRm }(\text { master })+1) \times \text { count clock cycle }
$$

Pulse width $=($ TAUBnCDRm (slave) $) \times$ count clock cycle

### 31.14.2.3 Block Diagram and General Timing Diagram

Figure 31.85 Block Diagram for One-Shot Pulse Output Function

The following settings apply to the general basic diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00 ${ }_{\mathrm{B}}$ )

Figure 31.86 General Timing Diagram for One-Shot Pulse Output Function

### 31.14.2.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Table 31.123 Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $1_{\mathrm{B}}$. |
| $\mathbf{1 0}$ to 8 | TAUBnSTS[2:0] | Write $001_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0100_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | 0: Disables start trigger detection during counting |
|  |  | 1: Enables start trigger detection during counting |

(2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.124 Contents of the TAUBnCMURm Register for the Master Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Falling edge detection |
|  |  | 01: Rising edge detection |
|  |  | 10: Rising and falling edge detection |
|  |  | 11: Setting prohibited |

## (3) Channel output mode for the master channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.
(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.125 Simultaneous Rewrite Settings for the Master Channel of the One-Shot Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | $0:$ The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | $0:$ Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.2.5 Register Settings for the Slave Channel

(1) TAUBnCMORm for the slave channel

Table 31.126 Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output $=$ CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCSO | Write $0_{\mathrm{B}}$. |
| 11 | TAUBnMAS | Write $0_{\mathrm{B}}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $100_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $1010_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | 0: Disables start trigger detection during counting |
|  |  | 1: Enables start trigger detection during counting |
|  | The value of the MDO bit of the master and slave channels must be identical. |  |

(2) TAUBnCMURm for the slave channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUBnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.127 Contents of the TAUBnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | $00:$ Not used, so set to 00. |

(3) Channel output mode for the slave channel

Table 31.128 Control Bit Settings for Independent Channel Output Mode 2

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | 1: Enables independent channel output mode |
| TAUBnTOM.TAUBnTOMm | 0: Independent channel output |
| TAUBnTOC.TAUBnTOCm | 1: Operating mode 2 |
| TAUBnTOL.TAUBnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUBnTDE.TAUBnTDEm | $0:$ Disables dead time operation |
| TAUBnTDL.TAUBnTDLm | $0:$ When dead time operation is disabled (TAUBnTDE.TAUBnTDEm $=0$ ), set these bits to 0 |

## (4) Simultaneous rewrite for the slave channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.129 Simultaneous Rewrite Settings for the Slave Channel of the One-Shot Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 31.130 Operating Procedure for One-Shot Pulse Output Function

### 31.14.2.7 Specific Timing Diagrams

(1) $\operatorname{TAUBnCDRm}$ (master) $=0000_{\mathrm{H}}$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 31.87 TAUBnCDRm (Master) $=0000_{H}$

- When a valid TAUBTTINm input edge is detected, the value $0000_{\mathrm{H}}$ is written to TAUBnCNTm (master). The counter is set to $0000_{\mathrm{H}}$ for one count and returns to $\mathrm{FFFF}_{\mathrm{H}}$.
Thus, the slave channel starts to count down one count clock later to TAUBTTINm (master).
(2) TAUBnCDRm (slave) $=0000_{H}$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00 ${ }_{\mathrm{B}}$ )

Figure 31.88 TAUBnCDRm (Slave) $=0000_{\mathrm{H}}$

- TAUBTTOUTm remains at inactive state, because the pulse width is zero.

## (3) TAUBnCMORm.TAUBnMD0 $=0$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00 ${ }_{\mathrm{B}}$ )

Figure 31.89 TAUBnCMORm.TAUBnMDO $=0$

- Even when an effective edge is input to TAUBTTINm while the counter of the master channel counts down, the counter continues counting down.

## (4) TAUBnCMORm.TAUBnMD0 $=1$

The following settings apply to this diagram.

- Start trigger detection enabled during counting (TAUBnCMORm.TAUBnMD0 = 1)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] $=00_{B}$ )

Figure 31.90 TAUBnCMORm.TAUBnMDO $=1$

- If a valid TAUBTTINm input edge is detected while the counter of the master channel counts down, TAUBnCNTm reloads the value of TAUBnCDRm. The counter restarts to count down.
This means the delay for INTTAUBnIm generation interval is extended by the value of TAUBnCNTm at the time when a valid TAUBTTINm input edge is detected.

## (5) Operation stop and restart

Figure 31.91 Stopping and Restarting the Operation

Setting TTm of the master and slave channels to 1 clears TAUBnTE.TAUBnTEm to 0 , thereby stopping the count operation. If this happens, TAUBnCNTm and TAUBTTOUTm stop operation with the values retained.
Setting TAUBnTS.TAUBnTSm of the master and slave channels to 1 concurrently sets TAUBnTE.TAUBnTEm to 1 . When the start trigger is detected while the TAUBnTE.TAUBnTEm is set to 1 , the TAUBnCDRm value is transferred to TAUBnCNTm and the operation restarts.

## (6) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 $=0$ )
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 31.92 Input Interval of TAUBTTINm $\leq$ Delay Time + Pulse Width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached $0001_{\mathrm{H}}$ or exactly when $0001_{\mathrm{H}}$ is reached ${ }^{* 1}$, the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUBnCDRm (slave) is reloaded. An interrupt is generated and TAUBTTOUTm toggles. If TAUBnCNTm (master) has started to count down while the TAUBnCNTm (slave) is still counting*2, TAUBTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

### 31.14.3 Delay Pulse Output Function

### 31.14.3.1 Overview

## Summary

This function outputs two signals. The reference signal has a defined pulse width and pulse cycle specified using the master channel and slave channel 1.
Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by amount specified in slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1 .

The duty cycle of the delay signal is specified using slave channel 3.

- The delay is specified in slave channel 2.

## Prerequisites

- Four channels
- The operation mode of the master channel must be set to interval timer mode, see Table 31.131, Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function.
- The operation mode of slave channels 1 and 2 must be set to one-count mode, see Table 31.134, Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function and Table 31.138, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function.
- The operation mode of slave channel 3 must be set to pulse one-count mode, see Table 31.141, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function
- TAUBTTOUTm is not used for the master channel and slave channel 2
- The channel output mode of slave channel 1 must be set to synchronous channel output mode 1 .
- The channel output mode of slave channel 3 must be set to independent channel output mode 1.

## Description

The counters of the channel group are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm to 1 , enabling count operation.

- Master channel:

The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value. INTTAUBnIm is generated on the master channel.
When the counter of the master channel reaches $0000_{\mathrm{H}}$, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter reloads the TAUBnCDRm value and counts down.

- Slave channels 1 and 2:

When the slave channels 1 and 2 detect an interrupt from the master channel, they start to count down from the current value of TAUBnCDRm. The TAUBTTOUTm signal (slave 1 ) is set.

- Slave channel 1:

When the counter of slave channel 1 reaches $0000_{\mathrm{H}}$ (duty time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next INTTAUBnIm of the master channel.

- Slave channel 2:

When the counter of slave channel 2 reaches $0000_{\mathrm{H}}$, delay time has elapsed and INTTAUBnIm is generated. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next INTTAUBnIm of the master channel. INTTAUBnIm (slave channel 2) triggers the counter of slave channel 3

- Slave channel 3:

When slave channel 3 detects an interrupt from slave channel 2, it starts to count down from the current value of TAUBnCDRm. INTTAUBnIm is generated and the TAUBTTOUTm signal (slave 3) is set.
When the counter of slave channel 3 reaches $0001_{\mathrm{H}}$, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset.
The output from slave channel 3 is the delayed PWM pulse.
The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

## Conditions

Simultaneous rewrite can be used with this function. Please see Section 31.6, Simultaneous Rewrite.

### 31.14.3.2 Equations

Pulse cycle $=($ TAUBnCDRm $($ master $)+1) \times$ count clock cycle
Duty width $1=($ TAUBnCDRm (slave 1$)) \times$ count clock cycle
Delay $=($ TAUBnCDRm $($ slave 2$)+1) \times$ count clock cycle
Duty width $2=($ TAUBnCDRm (slave 3$)) \times$ count clock cycle
Where the setting of the delay is within the following range:
$0000_{\mathrm{H}} \leq$ TAUBnCDRm (slave 2 ) $<$ TAUBnCDRm (master)
NOTES

1. The output waveform of TAUBTTOUTm (slave 3) is the output waveform of TAUBTTOUTm (slave 1 ) delayed for the delay generated by slave 2. It cannot be delayed for more than the pulse cycle.
2. When INTTAUBnIm of slave 2 occurs while slave 3 is counting, slave 3 restarts the operation. Therefore, the output waveform of TAUBTTOUTm (slave 3) retains the active level. (In this case, TAUBTTOUTm (slave 3) cannot output the waveform of the delayed basic pulse of TAUBTTOUTm (slave 1).)

### 31.14.3.3 Block Diagram and General Timing Diagram

Figure 31.93 Block Diagram for Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

Figure 31.94 General Timing Diagram for Delay Pulse Output Function

### 31.14.3.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Table 31.131 Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output $=$ CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $1_{\mathrm{B}}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $1_{\mathrm{B}}$. |

(2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.132 Contents of the TAUBnCMURm Register for the Master Channel of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for the master channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by the master channel of this function.

## (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.133 Simultaneous Rewrite Settings for the Master Channel of the Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.3.5 Register Settings for Slave Channel 1

(1) TAUBnCMORm for slave channel 1

Table 31.134 Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output $=$ CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $0_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $100_{B}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{B}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0100_{B}$. |
| 0 | TAUBnMD0 | Write $1_{B}$. |

## (2) TAUBnCMURm for slave channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.135 Contents of the TAUBnCMURm Register for the Slave Channel 1 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

(3) Channel output mode for slave channel 1

Table 31.136 Control Bit Settings for Slave Channel 1 of the Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $1_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $0_{B}$. |
| TAUBnTOL.TAUBnTOLm | $0:$ Positive logic |
|  | 1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $0_{B}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{B}$. |

## (4) Simultaneous rewrite for slave channel 1

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.137 Simultaneous Rewrite Settings for Slave Channel 1 of the Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.3.6 Register Settings For Slave Channel 2

(1) TAUBnCMORm for slave channel 2

Table 31.138 Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $0_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $100_{B}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{B}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0100_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $1_{\mathrm{B}}$. |

(2) TAUBnCMURm for slave channel 2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.139 Contents of the TAUBnCMURm Register for the Slave Channel 2 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for slave channel 2

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

## (4) Simultaneous rewrite for slave channel 2

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.140 Simultaneous Rewrite Settings for Slave Channel 2 of the Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.3.7 Register Settings for Slave Channel 3

(1) TAUBnCMORm for slave channel 3

Table 31.141 Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{\mathrm{B}}$. |
| 11 | TAUBnMAS | Write $0_{\mathrm{B}}$. |
| 70 to 8 | TAUBnSTS[2:0] | Write $101_{\mathrm{B}}$. |
| 5 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 4 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TAUBnMD[4:1] | Write $1010_{\mathrm{B}}$. |

(2) TAUBnCMURm for slave channel 3

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.142 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for slave channel 3

Table 31.143 Control Bit Settings for Independent Channel Output Mode 2

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $0_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $1_{B}$. |
| TAUBnTOL.TAUBnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $0_{B}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{B}$. |

## (4) Simulta00neous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.144 Simultaneous Rewrite Settings for Slave Channel 3 of the Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: The master channel is the control channel for simultaneous rewrite |
| TAUBnRDM.TAUBnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.3.8 Operating Procedure for Delay Pulse Output Function

Table 31.145 Operating Procedure for Delay Pulse Output Function

|  | Operation |
| :---: | :---: |
|  | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.3.4, Register Settings for the Master Channel. |
|  | Slave channel 1: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.3.5, Register Settings for Slave Channel 1. |
|  | Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.3.6, Register Settings For Slave Channel 2. |
|  | Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.3.7, Register Settings for Slave Channel 3. |
|  | Set the values of the TAUBnCDRm registers of all channels |

| Status of TAUBn |
| :--- |
| Channel operation is stopped. |
|  |

|  |  | Operation | Status of TAUBn |
| :---: | :---: | :---: | :---: |
| $\xrightarrow{\longrightarrow}$ |  | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master channel and slave channels 1 and 2 start. <br> INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave 1 ) is set. |
|  |  | TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. <br> TAUBnRDT.TAUBnRDTm can be changed during operation. | TAUBnCNTm of the master channel and slave channels 1 and 2 load TAUBnCDRm and count down. <br> When the counter of the master channel reaches $0000_{\mathrm{H}}$ : <br> - INTTAUBnIm (master) is generated <br> - TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation <br> - TAUBnCNTm (slave 1 and slave 2) reload the TAUBnCDRm value and start counting down <br> - TAUBTTOUTm (slave 1 ) is set <br> When TAUBnCNTm (slave 1) reaches $0000_{\mathrm{H}}$ : <br> - INTTAUBnIm (slave 1 ) is generated <br> - TAUBTTOUTm (slave 1 ) is reset <br> When TAUBnCNTm (slave 2) reaches $0000_{\text {н }}$ : <br> - INTTAUBnIm (slave 2) is generated <br> - INTTAUBnIm (slave 3) is generated <br> - TAUBTTOUTm (slave 3 ) is set <br> - TAUBnCNTm (slave 3) reloads the TAUBnCDRm value and starts counting down <br> When TAUBnCNTm (slave 3) reaches 0001 ${ }_{\mathrm{H}}$ : <br> - INTTAUBnIm (slave 3) is generated <br> - TAUBTTOUTm (slave 3 ) is reset |
|  |  | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

### 31.14.3.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) $=100 \%$

The following values apply to the figure below.

- $\operatorname{TAUBnCDRm}$ (master) $=000 \mathrm{~A}_{\mathrm{H}}$
- TAUBnCDRm (slave 1 ) $=000 \mathrm{~B}_{\mathrm{H}}$
- TAUBnCDRm (slave 2 ) $=0000_{\mathrm{H}}$
- TAUBnCDRm (slave 3 ) $=000 \mathrm{~B}_{\mathrm{H}}$

Figure 31.95 Duty Cycle (Slave 3) $=100 \%$

- If the value of TAUBnCDRm (slave 1 and 3) is higher than the value of TAUBnCDRm (master), the counter of slave channel 1 cannot reach $0000_{\mathrm{H}}$ and cannot generate interrupt request signals. TAUBTTOUTm of channels 1 and 3 remain in the active state.

## (2) TAUBTTOUTm (slave 1) $=$ TAUBTTOUTm (slave 3)

The following values apply to the figure below.

- TAUBnCDRm (master) $=000 \mathrm{~A}_{\mathrm{H}}$
- TAUBnCDRm (slave 1 ) $=0005_{\mathrm{H}}$
- TAUBnCDRm (slave 2 ) $=0000_{\mathrm{H}}$
- TAUBnCDRm (slave 3 ) $=0005_{\mathrm{H}}$

Figure 31.96 TAUBTTOUTm (Slave 1) $=$ TAUBTTOUTm (Slave 3)

- If TAUBnCDRm (slave 2 ) $=0000_{\mathrm{H}}$, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1 . The reference pulse and the delay pulse are output with a delay of one clock count.

### 31.14.4 AD Conversion Trigger Output Function Type 1

### 31.14.4.1 Overview

## Summary

This function is identical to Section 31.14.1, PWM Output Function except that TAUBTTOUTm is not output.
This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

### 31.14.4.2 Block Diagram and General Timing Diagram

Figure 31.97 Block Diagram for AD Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

Figure 31.98 General Timing Diagram for AD Conversion Trigger Output Function Type 1

### 31.14.5 Triangle PWM Output Function

### 31.14.5.1 Overview

## Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master channel generates a carrier cycle from two pulse cycles. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slaves counter.

## Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see Table 31.146, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function.
- The operation mode of the slave channel(s) must be set to up down count mode, see Table 31.150, Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function.
- The channel output mode of the master channel must be set to independent channel output mode 1.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
- If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 0 , TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0 . (recommended)
- If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 1 , TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnOEm is 0 .

## Functional description

The counters are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 for every channel. This in turn sets TAUBnTE.TAUBnTEm, enabling count operation. The current values of TAUBnCDRm (master and slave) are written to TAUBnCNTm (master and slave) and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1 , an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:

When the counter of the master channel reaches $0000_{\mathrm{H}}$ (pulse cycle time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then reloads the TAUBnCDRm value and counts down.

- Slave channel:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel:

- If the slave counter currently counts down, it changes count direction.
- If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

When the counter of the slave channel reaches $0001_{\mathrm{H}}$ while counting up or down, INTTAUBnIm is generated and the TAUBTTOUTm (slave) signal is set or reset.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.
TAUBTTOUTm can be switched between positive and negative phase setting TAUBnTOL.TAUBnTOLm during operation.

The counters can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

## Conditions

Simultaneous rewrite can be used with this function. Please see Section 31.6, Simultaneous Rewrite.

### 31.14.5.2 Equations

Pulse cycle $=($ TAUBnCDRm (master) +1$) \times$ count clock cycle
$0000_{\mathrm{H}} \leq$ TAUBnCDRm (master) $<$ FFFF $_{\mathrm{H}}$
Carrier cycle (down/up) $=($ TAUBnCDRm $($ master $)+1) \times 2 \times$ count clock cycle
Duty cycle $=$
$[($ TAUBnCDRm (master) $+1-$ TAUBnCDRm (slave) $) /($ TAUBnCDRm (master) +1$)] \times 100$

- Duty cycle $=100 \%$

TAUBnCDRm (slave) $=0000_{\mathrm{H}}$

- Duty cycle $=0 \%$

TAUBnCDRm (slave) $\geq$ TAUBnCDRm (master) +1

### 31.14.5.3 Block Diagram and General Timing Diagram

Figure 31.99 Block Diagram for Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.100 General Timing Diagram for Triangle PWM Output Function

### 31.14.5.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Table 31.146 Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output $=$ CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{\mathrm{B}}$. |
| 11 | TAUBnMAS | Write $1_{\mathrm{B}}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | 0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start |
|  |  | 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start |

(2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.147 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | $00:$ Not used, so set to 00. |

## (3) Channel output mode for the master channel

Table 31.148 Control Bit Settings for Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $0_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $0_{B}$. |
| TAUBnTOL.TAUBnTOLm | Write $0_{B}$. |
| TAUBnTDE.TAUBnTDEm | Write $0_{B}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{B}$. |

## (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.149 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. <br> 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | $0:$ Does not use the channel to generate the simultaneous rewrite trigger. |

NOTE
If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

### 31.14.5.5 Register Settings for the Slave Channel(s)

(1) TAUBnCMORm for the slave channel(s)

Table 31.150 Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output $=$ CK3
The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $0_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $111_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $1001_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $0_{B}$. |

## (2) TAUBnCMURm for the slave channel(s)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.151 Contents of the TAUBnCMURm Register for the Slave Channel of the Triangle PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

(3) Channel output mode for the slave channel(s)

Table 31.152 Control Bit Settings for Synchronous Channel Output Mode 2

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $1_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $1_{B}$. |
| TAUBnTOL.TAUBnTOLm | $0:$ Positive logic |
|  | 1: Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $0_{B}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{B}$. |

## (4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.153 Simultaneous Rewrite Settings for the Slave Channel of the Triangle PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. |
|  | 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. | | TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting and the corresponding slave channel is at the peak of a triangular wave |
| :--- | :--- |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.5.6 Operating Procedure for Triangle PWM Output Function

Table 31.154 Operating Procedure for Triangle PWM Output Function

|  |  | Operation | Status of TAUBn |
| :---: | :---: | :---: | :---: |
|  |  | Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.5.4, Register Settings for the Master Channel <br> Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in Section 31.14.5.5, Register Settings for the Slave Channel(s) <br> Set the values of the TAUBnCDRm registers of all channels | Channel operation is stopped. |
|  |  | Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. <br> TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. <br> INTTAUBnIm (master) is generated on the master channel when TAUBnCMORm.TAUBnMD0 set to 1. |
|  |  | TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. <br> TAUBnRDT.TAUBnRDTm can be changed during operation. | TAUBnCNTm of the master and slave channels loads TAUBnCDRm and counts down. When the counter of the master channel reaches $0000_{\mathrm{H}}$ : <br> - INTTAUBnIm (master) is generated <br> - TAUBTTOUTm (master) toggles <br> - TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation. <br> - TAUBnCNTm (slave) reloads the TAUBnCDRm value or counts in the reverse direction. <br> When TAUBnCNTm of the slave $=0001_{H}$ : <br> - INTTAUBnIm (slave) is generated <br> - TAUBTTOUTm (slave) is set (in count-down status) or reset (in count-up status) |
|  |  | Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. <br> TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0. | TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. <br> TAUBnCNTm and TAUBTTOUTm stop and retain their current values. |

### 31.14.5.7 Specific Timing Diagrams

## (1) Duty cycle $=0 \%$

The following settings apply to the general timing diagram.

- Master channel:
- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 $=1$ )
- TAUBnCDRm $=\mathrm{a}=5_{\mathrm{H}}$
- Slave channel:
- TAUBnCDRm $=6_{\mathrm{H}}$

Figure 31.101 TAUBnCDRm (Slave) $\geq$ TAUBnCDRm (Master) +1

- If TAUBnCDRm (slave) $\geq$ TAUBnCDRm (master) +1 , INTTAUBnIm of slave channel is not generated during counting down. The set signal is never detected, so TAUBTTOUTm remains at low state.
(2) Duty cycle $=100 \%$

The following settings apply to the general timing diagram.

- Master channel:
- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- TAUBnCDRm $=\mathrm{a}=5_{\mathrm{H}}$
- Slave channel:
- TAUBnCDRm $=0_{\text {B }}$

Figure 31.102 TAUBnCDRm (Slave) $=0000 \mathrm{H}$

- If TAUBnCDRm (slave) $=0000_{\mathrm{H}}$, INTTAUBnIm of slave channel is not generated during counting up. The reset signal is never detected, so TAUBTTOUTm remains at high state.

### 31.14.6 Triangle PWM Output Function with Dead Time

### 31.14.6.1 Overview

## Summary

This function generates multiple triangle PWM outputs with a defined dead time by using a master and two or more slave channels. The resulting PWM signals with the dead time are output via TAUBTTOUTm of the slave channels 2 and 3. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master generates a carrier cycle. The first pulse controls the down status and the second pulse controls the up status of the slaves counter.

An interrupt on slave 2 causes TAUBTTOUTm of the slave channels to be set or reset.
Depending on the settings of TAUBnTDL.TAUBnTDLm, delay time is added to positive or negative logic side of the signal (i.e. whether TAUBTTOUTm is set or reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

## Prerequisites

- Three channels. Select an even channel CH (a) and an odd channel CH $(a+1)$ for slave channel 2 and 3 respectively.
- The operation mode of the master channel must be set to interval timer mode, see Table 31.156, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even-numbered channel (a), and slave channel 3 is an odd-numbered channel ( $a+1$ ). Slave channel 1 can be used as a separate timer (independent function).
- The operation mode of slave channel 2 must be set to up down mode, see Table 31.160, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time
Furthermore, slave channel 2 must be an even channel
- The operation mode of slave channel 3 must be set to one-count mode, see Table 31.164, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time
Furthermore, slave channel 3 must be an odd channel
- The channel output mode of the master channel must be set to independent channel output mode 1
- The channel output mode of the slave channels 2 and 3 must be set to synchronous channel output mode 2 .
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
- If the TAUBnCMORm.MD0 (master) bit is set to 0 , TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0 . (recommended)
- If the TAUBnCMORm.MD0 (master) bit is set to 1 , TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnTOEm is 0 .

NOTE
Slave channel 1 is not used for Triangle PWM Output Function with Dead Time. Slave channel 1 can be used as a separate timer (independent function).

## Functional description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1 . This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current values of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1 , an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:

When the counter of the master channel reaches $0000_{\mathrm{H}}$, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. The counter reloads the TAUBnCDRm value and counts down.

- Slave channel 2:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel 2 :

- If the slave counter currently counts down, it changes count direction.
- If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.
When the counter value of slave channel 2 reaches $0001_{\mathrm{H}}$, INTTAUBnIm is generated.

## - Slave channel 3:

INTTAUBnIm of slave channel 2 triggers the counter of slave channel 3 . The current value of TAUBnCDRm (slave 3 ) is written to TAUBnCNTm (slave 3) and the counter starts to count down from this TAUBnCDRm value. When the counter reaches $0000_{\mathrm{H}}$, INTTAUBnIm is generated. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next INTTAUBnIm of slave channel 2.

The TAUBnTDL.TAUBnTDLm settings of the corresponding channel specify whether it is set/reset immediately, or after dead time has elapsed, as shown in Table 31.155, Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2.

The TAUBnTOL.TOLm settings specify whether set corresponds to a high signal (TAUBnTOL.TAUBnTOLm $=0$ ) or a low signal (TAUBnTOL.TAUBnTOLm = 1).

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0 . TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

TAUBnCDRm value of slave channel 2 can be set to $0000_{\mathrm{H}}$ to output $100 \%$ TAUBTTOUTm.
NOTE
If a forced restart is executed during operation, TAUBTTOUTm is not output as a triangle PWM signal.

## Conditions

Simultaneous rewrite can be used with this function. Please see Section 31.6, Simultaneous Rewrite.
TAUBnTOL.TAUBnTOLm and TAUBnTDL.TAUBnTDLm bits should be set before the counter starts, and slave channels 2 and 3 should have opposite TAUBnTOL.TAUBnTOLm settings or opposite TAUBnTDL.TAUBnTDLm settings.

Table 31.155 Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2

| TAUBnTDL.TAUBnTDLm | Count Direction of Slave Channel 2 <br> when Interrupt is Generated | TAUBTTOUTm Set/Reset Timing |
| :--- | :--- | :--- |

### 31.14.6.2 Equations

TAUBnCDRm (slave 2$)) \times 2+($ TAUBnCDRm (slave 3$)+1)] \times$ count clock cycle

### 31.14.6.3 Block Diagram and General Timing Diagram

Figure 31.103 Block Diagram for Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Slave channel 2:
- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 $=0$ )
- TAUBnTDL.TAUBnTDLm $=0$
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Enables start trigger detection during counting (TAUBnCMORm.TAUBnMD0 = 1)
- TAUBnTDL.TAUBnTDLm $=1$
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)

Figure 31.104 General Timing Diagram for Triangle PWM Output Function with Dead Time

### 31.14.6.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Table 31.156 Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical. |
| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $1_{B}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $000{ }_{B}$. |
| 7, 6 | TAUBnCOS[1:0] | Write 00 B . |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0000{ }_{\text {B }}$. |
| 0 | TAUBnMD0 | 0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start <br> 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start |

(2) TAUBnCMURm for the master channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.157 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | $00:$ Not used, so set to 00. |

## (3) Channel output mode for the master channel

Table 31.158 Control Bit Settings for Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $0_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $0_{B}$. |
| TAUBnTOL.TAUBnTOLm | Write $0_{B}$. |
| TAUBnTDE.TAUBnTDEm | Write $0_{B}$. |
| TAUBnTDL.TAUBnTDLm | Write $0_{B}$. |

## (4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.159 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. |
|  | 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts |
|  | counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

NOTE
If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

### 31.14.6.5 Register Settings for Slave Channel 2

(1) TAUBnCMORm for slave channel 2

Table 31.160 Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical. |
| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | TAUBnCCS0 | Write $0_{B}$. |
| 11 | TAUBnMAS | Write $\mathrm{O}_{\mathrm{B}}$. |
| 10 to 8 | TAUBnSTS[2:0] | Write $111_{\text {B }}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00{ }_{\text {B }}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $1001{ }_{\text {B }}$. |
| 0 | TAUBnMD0 | Write $\mathrm{O}_{\mathrm{B}}$. |

## (2) TAUBnCMURm for slave channel 2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.161 Contents of the TAUBnCMURm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for slave channel 2

Table 31.162 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{B}$. |
| TAUBnTOM.TAUBnTOMm | Write $1_{B}$. |
| TAUBnTOC.TAUBnTOCm | Write $1_{B}$. |
| TAUBnTOL.TAUBnTOLm | $0:$ Positive logic |
|  | $1:$ Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $1_{B}$. |
| TAUBnTDL.TAUBnTDLm | $0:$ Dead time is added to the positive phase |
|  | $1:$ Dead time is added to the negative phase |

## CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the odd channel.

## (4) Simultaneous rewrite for slave channel 2

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.163 Simultaneous Rewrite Settings for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. |
|  | 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.6.6 Register Settings for Slave Channel 3

(1) TAUBnCMORm for slave channel 3

Table 31.164 Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUBnCKS[1:0] | Operation Clock Selection |
|  |  | $00:$ Prescaler output $=$ CK0 |
|  | $01:$ Prescaler output $=$ CK1 |  |
|  | $10:$ Prescaler output $=$ CK2 |  |
|  | $11:$ Prescaler output $=$ CK3 |  |

The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| :--- | :--- | :--- |
| 12 | TAUBnCCS0 | Write $0_{\mathrm{B}}$. |
| 11 | TAUBnMAS | Write $0_{\mathrm{B}}$. |
| $\mathbf{1 0}$ to 8 | TAUBnSTS[2:0] | Write $110_{\mathrm{B}}$. |
| 7,6 | TAUBnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUBnMD[4:1] | Write $0100_{\mathrm{B}}$. |
| 0 | TAUBnMD0 | Write $1_{\mathrm{B}}$. |

## (2) TAUBnCMURm for slave channel 3

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 31.165 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUBnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel output mode for slave channel 3

Table 31.166 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
| :--- | :--- |
| TAUBnTOE.TAUBnTOEm | Write $1_{\mathrm{B}}$. |
| TAUBnTOM.TAUBnTOMm | Write $1_{\mathrm{B}}$. |
| TAUBnTOC.TAUBnTOCm | Write $1_{\mathrm{B}}$. |
| TAUBnTOL.TAUBnTOLm | $0:$ Positive logic |
|  | $1:$ Negative logic |
| TAUBnTDE.TAUBnTDEm | Write $1_{\mathrm{B}}$. |
| TAUBnTDL.TAUBnTDLm | $0:$ Dead time is added to the positive phase |
|  | $1:$ Dead time is added to the negative phase |

## CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the even channel.

## (4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 31.167 Simultaneous Rewrite Settings for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
| :--- | :--- |
| TAUBnRDE.TAUBnRDEm | 1: Enables simultaneous rewrite |
| TAUBnRDS.TAUBnRDSm | 0: Selects master channel for simultaneous rewrite triggers. |
|  | 1: Selects upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUBnRDM.TAUBnRDMm | 1: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting and the corresponding slave channel is at the peak of a triangular wave |
| TAUBnRDC.TAUBnRDCm | 0: Does not use the channel to generate the simultaneous rewrite trigger. |

### 31.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 31.168 Operating Procedure for Triangle PWM Output with Dead Time

### 31.14.6.8 Specific Timing Diagrams

## (1) Duty cycle = 0\%

The following settings apply to the diagram below.

- Slave channel 2 :
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.105 TAUBnCDRm (Slave 2 ) $\geq$ TAUBnCDRm (Master) +1

- If TAUBnCDRm (slave 2 ) $\geq$ TAUBnCDRm (master), the counter of slave channel cannot reach $0000_{\mathrm{H}}$ during counting down. Therefore TAUBTTOUTm cannot toggle, i.e. it remains at its initial state. The interrupt from slave channel 2 occurs during count up, therefore it is a reset signal.

## (2) Duty cycle $=100 \%$

The following settings apply to the diagram below.

- Slave channel 2:
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.106 TAUBnCDRm (Slave 2) $=0000_{H}$

- If TAUBnCDRm (slave 2 ) $=0000_{\mathrm{H}}$ the counter of slave channel cannot reach $0001_{\mathrm{H}}$ while counting up and therefore cannot generate an INTTAUBnIm while counting up.
- The set conditions for a channel in which TAUBnTDL.TAUBnTDLm $=0$ are met after dead time has elapsed. TAUBTTOUTm toggles but remains in the new state because the reset conditions are never satisfied for such a channel.
- Slave channel 3 in the above diagram is set when the counter starts.

However, the reset conditions for a channel in which TAUBnTDL.TAUBnTDLm $=1$ are never satisfied so TAUBTTOUTm remains in its initial state for such a slave channel.
(3) TAUBTTOUTm (slave 2) $=\mathbf{0 \%}$ and TAUBTTOUTm (slave 3 ) $\geq \mathbf{0 \%}$

The following settings apply to the diagram below.

- Slave channel 2 :
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.107 TAUBnCDRm (Master) $=0005 \mathrm{H}$, TAUBnCDRm (Slave 2) $=0005$ н TAUBnCDRm (Slave 3) $=0004$ н

- When the counter of slave channel 2 reaches $0000_{\mathrm{H}}$ after detecting that the counter reached $0001_{\mathrm{H}}$, INTTAUBnIm (slave 2 ) is generated. The counter of slave channel 3 starts to count down.
- If another INTTAUBnIm (slave 2) is generated while the counter of slave channel 3 is still counting down, the value of TAUBnCDRm (slave 3) is reloaded and the counter restarts counting down from this value.
- In the diagram above, the first interrupt on channel 2 occurs while the counter is counting down, and the second while it is counting up.
- After the first interrupt, a slave for which TAUBnTDL.TAUBnTDLm $=0$ waits for dead time to elapse before setting. However, if another interrupt occurs on slave 2, before the dead time has elapsed, the counter is counting up, so the signal acts as a reset signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm $=0$ always remains inactive.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 is set and reset as normal when the corresponding INTTAUBnIm is generated.
(4) TAUBTTOUTm (slave 2) $>\mathbf{0 \%}$ and TAUBTTOUTm (slave 3) $\mathbf{= 1 0 0 \%}$

The following settings apply to the diagram below.

- Slave channel 2:
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.108 TAUBnCDRm (Master) $=0005_{\mathrm{H}}$, TAUBnCDRm (Slave 2) $=0001_{\mathrm{H}}$ TAUBnCDRm (Slave 3) $=0004_{\mathrm{H}}$ PWM Signal Width (Negative Phase) $\geq$ Carrier Cycle

- After the second interrupt on slave channel 2, a slave for which TAUBnTDL.TAUBnTDLm $=1$ is reset after the dead time has elapsed. However if another interrupt occurs on slave 2 before the dead time has elapsed, slave channel 3 is restarted, and then if an interrupt on slave channel 3 is generated, the counter is counting up, so the signal acts as a setting signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 1 always remains active.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm $=0$ is set and reset as normal when the corresponding INTTAUBnIm is generated.

## (5) Inhibited INTTAUBnIm to set TAUBTTOUTm positive phase period

The following settings apply to the diagram below.

- Slave channel 2 :
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.109 TAUBnCDRm (Master) $=0005 \mathrm{H}$, TAUBnCDRm (Slave 2$)=0005 \mathrm{H}$, TAUBnCDRm $(S l a v e ~ 3)=0001_{\mathrm{H}}$ PWM Signal Width (Positive Phase) $=0$

- The counter of slave channel 3 reaches $0000_{\mathrm{H}}$ and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm $=0$ (slave channel 2 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, this reset signal is given priority if TAUBnTOL.TAUBnTOLm $=0$ (if TAUBnTOL.TAUBnTOLm $=1$, the set signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm $=0$ remains in the value after reset.

## (6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period

The following settings apply to the diagram below.

- Slave channel 2:
- Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
- Negative logic (TAUBnTOL.TAUBnTOLm = 1)

Figure 31.110 TAUBnCDRm (Master) $=0005_{\mathrm{H}}$, TAUBnCDRm (Slave 2) $=0001_{\mathrm{H}}, \mathrm{TAUBnCDRm}($ Slave 3$)=0001_{\mathrm{H}}$ PWM Signal Width (Negative Phase) = Carrier Cycle

- The counter of slave channel 3 reaches $0000_{\mathrm{H}}$ and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 1 (slave 3 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the set signal is given priority if TAUBnTOL.TAUBnTOLm $=1$ (if TAUBnTOL.TAUBnTOLm $=0$, the reset signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm $=1$ remains in the value after reset.
(7) Slave 2 TAUBnCDRm $=0000_{\text {н }}$ (Duty cycle $=100 \%$ )

Figure 31.111 Slave 2 TAUBnCDRm $=0000$ н $($ Duty cycle $=100 \%)$

When rewriting (slave channel 2) TAUBnCDRm $\neq 0000_{\mathrm{H}}$ to (slave channel 2 ) TAUBnCDRm $=0000_{\mathrm{H}}$ ( $100 \%$ output), set the negative phase side at the start of the carrier cycle, and set the positive phase side after dead time is secured.

When rewriting (slave channel 2) TAUBnCDRm $=0000_{\mathrm{H}}\left(100 \%\right.$ output) to (slave channel 2) TAUBnCDRm $\neq 0000_{\mathrm{H}}$, reset the positive phase side at the end of the carrier cycle, and reset the negative phase side after dead time is secured.

### 31.14.7 A/D Conversion Trigger Output Function Type 2

### 31.14.7.1 Overview

## Summary

This function is identical to Section 31.14.5, Triangle PWM Output Function, except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

### 31.14.7.2 Block Diagram and General Timing Diagram

Figure 31.112 Block Diagram for A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

Figure 31.113 General Timing Diagram for A/D Conversion Trigger Output Function Type 2

## Section 32 Timer Array Unit D (TAUD)

This section contains a generic description of the timer array unit D (TAUD).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUD.

### 32.1 Features of RH850/F1KH, RH850/F1KM TAUD

### 32.1.1 Number of Units and Channels

This microcontroller has the following number of TAUD units and channels.
Table 32.1 Number of Units (RH850/F1KH-D8)

|  | RH850/F1KH-D8 | RH850/F1KH-D8 | RH850/F1KH-D8 |
| :--- | :--- | :--- | :--- |
| Product Name | 176 Pins | 233 Pins | 324 Pins |
| Number of Units | 1 | 1 | 1 |
| Name | TAUDn $(\mathrm{n}=0)$ | TAUDn $(\mathrm{n}=0)$ | TAUDn $(\mathrm{n}=0)$ |

Table 32.2 Number of Units (RH850/F1KM-S4)

|  | TAUDn channel output mode register. |

### 32.1.2 Register Base Address

TAUDn base address is listed in the following table.
TAUDn register addresses are given as an offset from the base address.
Table 32.8 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <TAUDO_base> | FFE2 $0000_{\mathrm{H}}$ |

### 32.1.3 Clock Supply

The TAUDn clock supply is shown in the following table.
Table 32.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| TAUDn | PCLK | CKSCLK_IPERI1 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI1 | Bus clock |

### 32.1.4 Interrupt Requests

TAUDn interrupt requests are listed in the following table.
Table 32.10 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| TAUD0 |  |  |  |
| INTTAUDOIO | Channel 0 interrupt | 8, 132 | 0 to 3, 17, 18 |
| INTTAUDOI1 | Channel 1 interrupt | 48 | 0 to 3, 17, 18 |
| INTTAUD012 | Channel 2 interrupt | 9, 158 | 0 to 3, 17, 18 |
| INTTAUDOI3 | Channel 3 interrupt | 49 | 0 to 3, 17, 18 |
| INTTAUD014 | Channel 4 interrupt | 10, 133 | 0 to 3, 17, 18 |
| INTTAUDOI5 | Channel 5 interrupt | 50 | 0 to 3, 17, 18 |
| INTTAUD016 | Channel 6 interrupt | 11, 134 | 0 to 3, 17, 18 |
| INTTAUD017 | Channel 7 interrupt | 51 | 0 to 3, 17, 18 |
| INTTAUD018 | Channel 8 interrupt | 12, 135 | 0 to 3, 17, 18 |
| INTTAUD019 | Channel 9 interrupt | 52 | 0 to 3, 17, 18 |
| INTTAUD0I10 | Channel 10 interrupt | 13, 159 | 0 to 3, 17, 18 |
| INTTAUD0I11 | Channel 11 interrupt | 53 | 0 to 3, 17, 18 |
| INTTAUD0I12 | Channel 12 interrupt | 14, 160 | 0 to 3, 17, 18 |
| INTTAUD0I13 | Channel 13 interrupt | 54 | 0 to 3, 17, 18 |
| INTTAUD0I14 | Channel 14 interrupt | 15, 161 | 0 to 3, 17, 18 |
| INTTAUD0I15 | Channel 15 interrupt | 55 | 0 to 3, 17, 18 |

### 32.1.5 Reset Sources

TAUDn reset sources are listed in the following table. TAUDn is initialized by these reset sources.
Table 32.11 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| TAUDn | All reset sources (ISORES) |

### 32.1.6 External Input/Output Signals

External input/output signals of TAUDn are listed below.
Table 32.12 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| TAUD0 |  |  |
| TAUDTTINO | Channel 0 input*1 | TAUDOIO |
| TAUDTTIN1 | Channel 1 input*1 | TAUD0I1 |
| TAUDTTIN2 | Channel 2 input*1 | TAUDOI2 |
| TAUDTTIN3 | Channel 3 input*1 | TAUD013 |
| TAUDTTIN4 | Channel 4 input*1 | TAUD014 |
| TAUDTTIN5 | Channel 5 input*1 | TAUD0I5 |
| TAUDTTIN6 | Channel 6 input*1 | TAUD0I6 |
| TAUDTTIN7 | Channel 7 input*1 | TAUD0I7 |
| TAUDTTIN8 | Channel 8 input*1 | TAUD018 |
| TAUDTTIN9 | Channel 9 input*1 | TAUD019 |
| TAUDTTIN10 | Channel 10 input*1 | TAUD0110 |
| TAUDTTIN11 | Channel 11 input*1 | TAUD0111 |
| TAUDTTIN12 | Channel 12 input*1 | TAUD0112 |
| TAUDTTIN13 | Channel 13 input*1 | TAUD0113 |
| TAUDTTIN14 | Channel 14 input*1 | TAUD0114 |
| TAUDTTIN15 | Channel 15 input*1 | TAUD0115 |
| TAUDTTOUT0 | Channel 0 output | TAUD000 |
| TAUDTTOUT1 | Channel 1 output | TAUD001 |
| TAUDTTOUT2 | Channel 2 output | TAUD002 |
| TAUDTTOUT3 | Channel 3 output | TAUD003 |
| TAUDTTOUT4 | Channel 4 output | TAUD004 |
| TAUDTTOUT5 | Channel 5 output | TAUD005 |
| TAUDTTOUT6 | Channel 6 output | TAUD006 |
| TAUDTTOUT7 | Channel 7 output | TAUD007 |
| TAUDTTOUT8 | Channel 8 output | TAUD008 |
| TAUDTTOUT9 | Channel 9 output | TAUD009 |
| TAUDTTOUT10 | Channel 10 output | TAUD0010 |
| TAUDTTOUT11 | Channel 11 output | TAUD0011 |
| TAUDTTOUT12 | Channel 12 output | TAUD0012 |
| TAUDTTOUT13 | Channel 13 output | TAUD0013 |
| TAUDTTOUT14 | Channel 14 output | TAUD0014 |
| TAUDTTOUT15 | Channel 15 output | TAUD0015 |

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see Section 2A.12, Noise Filter \& Edge/Level Detector, Section 2B.12, Noise Filter \& Edge/Level Detector and Section 2C.12, Noise Filter \& Edge/Level Detector.

### 32.1.7 Internal Input/Output Signals

The internal input/output signals of TAUDn are listed below.
Table 32.13 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Connected to |
| :--- | :--- | :--- |
| TAUDnTSSTm | Simultaneous channel start trigger input | PIC |
| TAUDnTUDCm $(m=0,2,8)$ | TAUD master up/down signal output | PIC |

### 32.1.8 TAUDO Input Selection

The output from port TAUD0Im ( $\mathrm{m}=0$ to 15 ) can be input to TAUDTTINm ( $\mathrm{m}=0$ to 15 ) as shown in the following figure.

Figure 32.1 Selection of Signals Input to TAUDO

The following table shows the method of selecting input signals to several TAUD0 inputs.
Table 32.14 TAUDO Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Input Signal | Function | Settings |
| :--- | :--- | :--- |
| TAUDTTIN $[\mathrm{m}]$ | Port TAUDOI $[\mathrm{m}]$ | SELB_TAUDOI $[\mathrm{m}]=0$ |
|  | Port TAUDOI $[\mathrm{m}+1]$ | SELB_TAUDOI $[\mathrm{m}]=1$ |
| TAUDTTIN $[\mathrm{m}+1]$ | Port TAUDOI $[\mathrm{m}+1]$ | SELB_TAUDOI $[\mathrm{m}+1]=0$ |
|  | Port TAUDOI $[\mathrm{m}]$ | SELB_TAUDOI $[\mathrm{m}+1]=1$ |

### 32.1.8.1 List of Registers

Input signal selection register is listed in the following table.
Table 32.15 List of Register

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| TAUDn input selection register |  |  |  |
| SL_TAUDn | TAUDTTINm input signal selection register | SELB_TAUDOI | FFE2 4000 |

### 32.1.8.2 SELB_TAUDOI — TAUDTTINm Input Signal Selection Register

This register selects the TAUDTTINm input signals.

Do not change the input signal of each channel during the timer counting.

### 32.2 Overview

### 32.2.1 Functional Overview

The TAUD has the following functions:

- 16 channels
- 16 -bit counter and 16 -bit data register per channel
- Independent channel operation
- Synchronous channel operation (master and slave operation)
- Generation of different types of output signal
- Real-time output
- Counter can be triggered by external signal
- Interrupt generation

The Timer Array Unit D is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUDnCNTm and a 16-bit data register TAUDnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

## Independent and synchronous operation

Every channel can operate in different operation modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, its operation mode and functions are not affected by those of other channels. When a channel is operated synchronously it is either a master or a slave. A master channel can have multiple slaves, and the state of one channel affects that of the other channels. For example, this means that one channel can control when another starts to count, is reset, etc.

### 32.2.2 Terms

In this section, the following terms are used.

## Independent / synchronous channel operation

Independent or synchronous channel operation describes the dependency of channels on each other:

- If a channel operates independently of all other channels, this is called independent channel operation.
- If a channel operates depending on other channels, this is called synchronous channel operation.

## Channel group

In synchronous channel operation, all channels that depend on each other are referred to as a "channel group".
A channel group has one master channel and one or more slave channels.

## Operation mode

An operation mode can be selected for every channel m . The operation mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operation mode.
Examples are "Capture Mode", "Event Count Mode", and "Interval Timer Mode".

## Channel output mode

The channel output mode defines the operation of TAUDTTOUTm

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

Examples are "Independent Channel Output Mode 1" and "Synchronous Channel Output Mode 2 with Dead Time Output".

## Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

## Upper / lower channel

Depending on the channel number m , a channel with a smaller number or with a larger number is referred to as "upper" or "lower" channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:
For channel 5, channel 3 is an upper channel and channel 9 is a lower channel.

### 32.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 32.17 Functional List of TAUD Operations

| Operation Function | Example |
| :---: | :---: |
| Independent Channel Operation Functions | Section 32.12 |
| Interval Timer Function | Section 32.12.1 |

### 32.2.4 TAUD I/O and Interrupt Request Signals

Figure 32.2 TAUD I/O and Interrupt Request Signals

### 32.2.5 Block Diagram

Figure 32.3, Block Diagram of the TAUD shows the main components of the TAUD.

Figure 32.3 Block Diagram of the TAUD

The module name "TAUDn" has been omitted from the register names for the sake of clarity in the above figure.

### 32.2.6 Description of Blocks

The following describes the functional blocks:

## Prescaler block

The prescaler block provides up to four clock signals (CK0 to CK3) that can be used as count clocks for all channels.
Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of $2^{0}$ to $2^{15}$. The fourth count clock CK3 can be adjusted more precisely by using BRG to set an additional division factor that is not a power of 2.

## Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- INTTAUDnIm from master channel
- TAUDTTINm input signal valid edge

## Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUDnCMORm.TAUDnMD[4:0])
- Counter start enable (TAUDnTS.TAUDnTSm) and counter stop (TAUDnTT.TAUDnTTm) When counter start is enabled, status flag TAUDnTE.TAUDnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

## Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUDnTE.TAUDnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUDnTSSTm
- TAUDTTINm input signal valid edge
- INTTAUDnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUDTTOUTm generation unit.

## Simultaneous rewrite controller

Simultaneous rewrite control is a function that can be used in synchronous operating modes. The data registers (TAUDnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

## TAUDnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

### 32.3 Registers

### 32.3.1 List of Registers

TAUD registers are listed in the following table.
For details about <TAUDn_base>, see Section 32.1.2, Register Base Address.
Table 32.18 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| TAUDn prescaler registers |  |  |  |
| TAUDn | TAUDn prescaler clock select register | TAUDnTPS | <TAUDn_base> + 240 ${ }_{\text {H }}$ |
|  | TAUDn prescaler baud rate setting register | TAUDnBRS | <TAUDn_base> + $244_{\text {H }}$ |
| TAUDn control registers |  |  |  |
| TAUDn | TAUDn channel data register | TAUDnCDRm | <TAUDn_base> + m $\times 4_{\text {H }}$ |
|  | TAUDn channel counter register | TAUDnCNTm | <TAUDn_base> + 80 ${ }_{\text {H }}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUDn channel mode OS register | TAUDnCMORm | <TAUDn_base> $+200_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUDn channel mode user register | TAUDnCMURm | <TAUDn_base> + $\mathrm{CO}_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUDn channel status register | TAUDnCSRm | <TAUDn_base> $+140_{H}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUDn channel status clear trigger register | TAUDnCSCm | <TAUDn_base> $+180_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUDn channel start trigger register | TAUDnTS | <TAUDn_base> + 1C4 ${ }_{\text {H }}$ |
|  | TAUDn channel enable status register | TAUDnTE | <TAUDn_base> + 1 CO H |
|  | TAUDn channel stop trigger register | TAUDnTT | <TAUDn_base>+1退 |
| TAUDn output registers |  |  |  |
| TAUDn | TAUDn channel output enable register | TAUDnTOE | <TAUDn_base> + 5 $\mathrm{C}_{\mathrm{H}}$ |
|  | TAUDn channel output register | TAUDnTO | <TAUDn_base> + 58 ${ }_{\text {H }}$ |
|  | TAUDn channel output mode register | TAUDnTOM | <TAUDn_base> + $248_{\text {H }}$ |
|  | TAUDn channel output configuration register | TAUDnTOC | <TAUDn_base> + 24C ${ }_{\text {H }}$ |
|  | TAUDn channel output active level register | TAUDnTOL | <TAUDn_base> + 040 ${ }_{\text {H }}$ |
|  | TAUDn channel dead time output enable register | TAUDnTDE | <TAUDn_base> + 250 ${ }_{\text {H }}$ |
|  | TAUDn channel dead time output mode register | TAUDnTDM | <TAUDn_base> + 254 ${ }_{\text {H }}$ |
|  | TAUDn channel dead time output level register | TAUDnTDL | <TAUDn_base> + 54 ${ }_{\text {H }}$ |
|  | TAUDn channel real-time output register | TAUDnTRO | <TAUDn_base> + 4 $\mathrm{C}_{\mathrm{H}}$ |
|  | TAUDn channel real-time output enable register | TAUDnTRE | <TAUDn_base> + 258 ${ }_{\text {H }}$ |
|  | TAUDn channel real-time output control register | TAUDnTRC | <TAUDn_base> + 25C ${ }_{\text {H }}$ |
|  | TAUDn channel modulation output enable register | TAUDnTME | <TAUDn_base> + 50 ${ }_{\text {H }}$ |
| TAUDn reload data registers |  |  |  |
| TAUDn | TAUDn channel reload data enable register | TAUDnRDE | <TAUDn_base> + 260 ${ }_{\text {H }}$ |
|  | TAUDn channel reload data mode register | TAUDnRDM | <TAUDn_base> + 264 ${ }_{\text {H }}$ |
|  | TAUDn channel reload data control channel select register | TAUDnRDS | <TAUDn_base> + 268 ${ }_{\text {H }}$ |
|  | TAUDn channel reload data control register | TAUDnRDC | <TAUDn_base> + $26 \mathrm{C}_{\mathrm{H}}$ |
|  | TAUDn channel reload data trigger register | TAUDnRDT | <TAUDn_base> + 44 ${ }_{\text {H }}$ |
|  | TAUDn channel reload status register | TAUDnRSF | <TAUDn_base> + 48\% |
| TAUDn emulation register |  |  |  |
| TAUDn | TAUDn emulation register | TAUDnEMU | <TAUDn_base> + 290 ${ }_{\text {H }}$ |

### 32.3.2 Details of TAUDn Prescaler Registers

### 32.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescaler. CK3 is generated by dividing CK3_PRE by the factor specified in TAUDnBRS.

Table 32.19 TAUDnTPS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | TAUDnPRS3 [3:0] | Specifies CK3_PRE clock. |
|  |  | CK3_PRE clock is an input clock to BRG unit which supplies the CK3 operation clock to all channels. |
|  |  | TAUDnPRS3[3:0] CK3_PRE Clock |
|  |  | $0000{ }_{\text {B }}$ PCLK/2 ${ }^{0}$ |
|  |  | $0001{ }^{\text {B }}$ PCLK/2 ${ }^{1}$ |
|  |  | $0010_{B}$ PCLK/2 ${ }^{2}$ |
|  |  | 0011 ${ }_{\text {B }}$ PCLK/2 ${ }^{3}$ |
|  |  | 0100 ${ }_{\text {B }}$ PCLK/2 ${ }^{4}$ |
|  |  | 0101 ${ }_{\text {B }}$ PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ PCLK/2 ${ }^{6}$ |
|  |  | $0111_{\text {B }}$ |
|  |  | $1000{ }_{\text {B }}$ PCLK/2 ${ }^{8}$ |
|  |  | $1001_{B}$ PCLK/2 ${ }^{9}$ |
|  |  | $1010_{\mathrm{B}}$ PCLK/2 ${ }^{10}$ |
|  |  | $1011_{\mathrm{B}} \quad \mathrm{PCLK} / 2^{11}$ |
|  |  | $1100_{\mathrm{B}}$ PCLK/2 ${ }^{12}$ |
|  |  | $1101_{B}$ PCLK/2 ${ }^{13}$ |
|  |  | $1110_{\mathrm{B}} \mathrm{PCLK} / 2^{14}$ |
|  |  | 1111 ${ }_{\text {B }}$ PCLK/2 ${ }^{15}$ |
|  |  | The above bits are rewritable only when all the counters using CK3 are stopped (TAUDnTE.TAUDnTEm = 0). |

Table 32.19 TAUDnTPS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | TAUDnPRS2 [3:0] | Specifies the CK2 clock. |
|  |  | TAUDnPRS2[3:0] CK2 Clock |
|  |  | $0000{ }_{\text {B }}$ PCLK/2 ${ }^{\circ}$ |

|  |  | The above bits (TAUDnTE.TAU | counters using CKO are stopped |
| NOTE |  |  |  |
| The TAUDn clock input PCLK is specified in the first part of this section, Section 32.1.3, Clock Supply. |  |  |  |

### 32.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.
CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUDnTPS.TAUDnPRS3[3:0].

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ TAUDn_base $>+244_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

|  | TAUDnBRS[7:0] |  |  |  |  |  |  |  |

### 32.3.3 Details of TAUDn Control Registers

### 32.3.3.1 TAUDnCDRm — TAUDn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUDnCMORm.TAUDnMD[4:1]

Access: This register can be read or written in 16-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUDn_base> $+\mathrm{m} \times \mathrm{A}_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

Table 32.21 TAUDnCDRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnCDR [15:0] | Data register for capture/compare values |

### 32.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register

This is a channel $m$ counter register.

Table 32.22 TAUDnCNTm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnCNT [15:0] | 16-bit counter value |

A read value depends on a counter value, a changed operating mode, TAUDnTS.TAUDnTSm or TAUDnTT.TAUDnTTm bit value.

The initial read value of the counter depends on an operating mode and how the counter is stopped.

- Stop by a reset
- Stop by a counter stop trigger (TAUDnTT.TAUDnTTm = 1)

Table 32.23, TAUDnCNTm Read Values after Re-Enabling Counter lists the initial counter read values after the counter is stopped (TAUDnTE.TAUDnTEm $=0$ ) and re-enabled (TAUDnTS.TAUDnTSm $=1$ ).

The table also contains the counter read value one count after the counter is enabled (TAUDnTS.TAUDnTSm = 1) with the counter waiting for a start trigger.

Table 32.23 TAUDnCNTm Read Values after Re-Enabling Counter

| Mode Name | Count Method |
| :--- | :--- | :--- | :--- | :--- |
|  |  |

Note 1. The value set for TAUDnCNTm when the operating mode is changed after a reset is deasserted.

### 32.3.3.3 TAUDnCMORm - TAUDn Channel Mode OS Register

This register controls channel moperation.
Access: This register can be read or written in 16-bit units. Writable only when the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> $+200_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | TAUDn MAS | TAUDnSTS[2:0] |  |  | $\begin{aligned} & \text { TAUDnCOS } \\ & \text { [1:0] } \end{aligned}$ |  | - | TAUDnMD[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W |

Table 32.24 TAUDnCMORm Register Contents

Table 32.24 TAUDnCMORm Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 to 0 | TAUDnMD[4:0] | Specifies an operating mode. |  |  |  |  |  |
|  |  | TAUDn MD4 | TAUDn D3 | TAUDn MD2 | TAUDn MD1 | TAUDn MDO | Functional Description |
|  |  | 0 | 0 | 0 | 0 | 1/0 | Interval timer mode |
|  |  | 0 | 0 | 0 | 1 | 1/0 | Judge mode |
|  |  | 0 | 0 | 1 | 0 | 1/0 | Capture mode |
|  |  | 0 | 0 | 1 | 1 | 0 | Event count mode |
|  |  | 0 | 1 | 0 | 0 | 1/0 | One-count mode |
|  |  | 0 | 1 | 0 | 1 | 1/0 | Setting prohibited |
|  |  | 0 | 1 | 1 | 0 | 0 | Capture and one-count mode |
|  |  | 0 | 1 | 1 | 1 | 1/0 | Judge and one-count mode |
|  |  | 1 | 0 | 0 | 0 | 0 | Setting prohibited |
|  |  | 1 | 0 | 0 | 1 | 0 | Count-up/-down mode |
|  |  | 1 | 0 | 1 | 0 | 1/0 | Pulse one-count mode |
|  |  | 1 | 0 | 1 | 1 | 1/0 | Count capture mode |
|  |  | 1 | 1 | 0 | 0 | 0 | Gate count mode |
|  |  | 1 | 1 | 0 | 1 | 0 | Capture and gate count mode |
|  |  | Mode |  |  | Role of TAUDnMD0 Bit |  |  |
|  |  | Interval timer mode Capture mode Count capture mode |  |  | Specifies whether INTTAUDnIm is generated at the beginning of count operation (when a start trigger is entered) or not. <br> 0 : INTTAUDnIm is not generated. <br> 1: INTTAUDnIm is generated. |  |  |
|  |  | Event count mode Count-up/-down mode |  |  | This bit should be set to 0 (the INTTAUDnIm signal is not output at the beginning of count operation). |  |  |
|  |  | One-count mode <br> Pulse one-count mode |  |  | Enables/disables start trigger detection during counting. <br> 0 : Disables detection. <br> 1: Enables detection. <br> CAUTION: • INTTAUDnIm signal is not output at the beginning of count operation in one-count mode. <br> - INTTAUDnIm signal is output at the beginning of count operation in pulse onecount mode. |  |  |
|  |  | Gate count mode |  |  | This bit should be set to 0 (disables start trigger detection during counting). |  |  |
|  |  | Capture and one-count mode Capture and gate count mode |  |  | This bit should be set to 0 . <br> CAUTION: INTTAUDnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled. |  |  |
|  |  | Judge mode <br> Judge and one-count mode |  |  | Specifies INTTAUDnIm output timing. <br> 0 : When TAUDnCNTm $\leq$ TAUDnCDRm <br> 1: When TAUDnCNTm > TAUDnCDRm |  |  |

### 32.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUDTTINm input.
Access: This register can be read or written in 8-bit units.
Address: <TAUDn_base> $+\mathrm{CO}_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ Value after reset: $\quad 00_{H}$

Table 32.25 TAUDnCMURm Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |
| 1, 0 | TAUDnTIS[1:0] | Specifies a valid edge of TAUDTTINm input signal. |  |  |
|  |  | TAUDnTIS1 | TAUDnTISO | Functional Description |
|  |  | 0 | 0 | Falling edge |
|  |  | 0 | 1 | Rising edge |
|  |  | 1 | 0 | Detection of rising and falling edges (selects low width measurement) <br> Start trigger: Falling edge <br> Stop trigger (capture): Rising edge |
|  |  | 1 | 1 | Detection of rising and falling edges (selects high width measurement) <br> Start trigger: Rising edge <br> Stop trigger (capture): Falling edge |
|  |  | - Edge detection of TAUDTTINm input signal is based on the operation clock selected by TAUDnCMORm.TAUDnCKS[1:0]. |  |  |

### 32.3.3.5 TAUDnCSRm - TAUDn Channel Status Register

This register indicates the count direction and overflow status of channel $m$ counter.
Access: This register is a read-only register that can be read in 8-bit units.
Address: <TAUDn_base> $+140_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$
Value after reset: $\quad 0_{H}$

Table 32.26 TAUDnCSRm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | TAUDnCSF | Indicates a count direction. <br> 0 : Count-up <br> 1: Count-down <br> The read value of this bit is valid only in the following mode: <br> - Count-up/-down mode |
| 0 | TAUDnOVF | Indicates counter overflow status. <br> 0 : No overflow occurs. <br> 1: Overflow occurs. <br> This bit is used only in the following modes: <br> - Capture mode <br> - Capture and one-count mode <br> The function of this bit depends on the setting of control bit TAUDnCMORm.TAUDnCOS[1:0]. |

### 32.3.3.6 TAUDnCSCm - TAUDn Channel Status Clear Trigger Register

This is a trigger register for clearing the overflow flag TAUDnCSRm.TAUDnOVF of channel m.

| Access: | This register is a write-only register that can be written in 8 -bit units. It is always read as $00_{\mathrm{H}}$. |
| ---: | :--- |
| Address: | $<$ TAUDn_base $>+180_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAUDnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 32.27 TAUDnCSCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAUDnCLOV | 0: No function |
|  |  | 1: Clears overflow flag TAUDnCSRm.TAUDnOVF. |

### 32.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register

This register enables the counter operation of each channel.
Access: This register is a write-only register that can be written in 16 -bit units. It is always read as $0000_{\mathrm{H}}$.
Address: <TAUDn_base> + 1C4 $\mathrm{H}_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { TAUDn } \\ \text { TS15 } \end{gathered}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUDn } \\ \text { TS14 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUDn } \\ \text { TS13 } \end{array}$ | $\begin{gathered} \text { TAUDn } \\ \text { TS12 } \end{gathered}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUDn } \\ \text { TS11 } \end{array}$ | $\begin{gathered} \text { TAUDn } \\ \text { TS10 } \end{gathered}$ | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TS09 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TS08 } \end{array}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUDn } \\ \text { TS07 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TS06 } \end{array}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TS05 } \end{aligned}$ | $\begin{array}{\|c\|c\|} \hline \text { TAUDn } \\ \text { TS04 } \end{array}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TS03 } \end{aligned}$ | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TS02 } \end{array}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TS01 } \end{aligned}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TSOO } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | w | w | W | w | w | W | w | w | W | W | W | W | W | w | w | W |

Table 32.28 TAUDnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTSm | Enables the counter operation of channel m. |
|  | $0:$ No function |  |
|  | 1: Enables the counter operation and sets TAUDnTE.TAUDnTEm to 1. |  |
|  | The counter operation is only enabled when TAUDnTE.TAUDnTEm is set to 1. Whether |  |
|  |  |  |
|  |  |  |

### 32.3.3.8 TAUDnTE - TAUDn Channel Enable Status Register

This register enables/disables a counter operation.

| Access: | This register is a read-only register that can be read in 16 -bit units. |
| ---: | :--- |
| Address: | $<T A U D n_{-}$base> $+1 \mathrm{CO}_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

| Bit | $15 \quad 14 \quad 13$ |  |  | 12 | $11 \quad 10$ |  | 98 |  | 7 | 65 |  | 4 | 3 | 2 | 1 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 32.29 TAUDnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTEm | Enables/disables the counter operation of channel m. |
|  | $0:$ Disables counter operation. |  |
|  | 1: Enables counter operation. |  |
|  | This bit is set to 1 when trigger input of TAUDnTSSTm (synchronous channel start trigger |  |
| signal) is detected or when TAUDnTS.TAUDnTSm is set to 1 . This bit is set to 0 when |  |  |
| TAUDnTT.TAUDnTTm is set to 1. |  |  |

### 32.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register

This register stops the counter operation of each channel.
Access: This register is a write-only register that can be written in 16 -bit units. It is always read as 0000 н.
Address: <TAUDn_base> $+1 \mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 32.30 TAUDnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTTm | Stops the counter operation of channel m. |
|  | $0:$ No function |  |
|  | 1: Stops the counter operation and resets TAUDnTE.TAUDnTEm. |  |
|  | TAUDNCNTm, TAUDnTO.TAUDnTOm, and TAUDTTOUTm retain the values provided before |  |
|  | the counter is stopped. |  |

### 32.3.4 Details of TAUDn Simultaneous Rewrite Registers

### 32.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register

This register enables/disables simultaneous rewrite of TAUDnCDRm/TAUDnTOLm data register.

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | <TAUDn | n_base> | $+260_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | $0000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUD | TAUDn |
|  | RDE15 | RDE14 | RDE13 | RDE12 | RDE11 | RDE10 | RDE09 | RDE08 | RDE07 | RDE06 | RDE05 | RDE04 | RDE03 | RDE02 | RDE01 | RDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.31 TAUDnRDE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnRDEm | Enables/disables simultaneous rewrite of the data register of channel m. |
|  |  | 0: Disables simultaneous rewrite |
|  | 1: Enables simultaneous rewrite |  |

### 32.3.4.2 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register

This register selects a channel that controls simultaneous rewrite.
Access: This register can be read or written in 16 -bit units. Writable only while TAUDnTE.TAUDnTEm $=0$.
Address: <TAUDn_base> $+26_{\mathrm{H}}$
Value after reset: $\quad 0000_{\mathrm{H}}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.32 TAUDnRDS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnRDSm | Selects a channel that controls a simultaneous rewrite trigger. |
|  | $0:$ Master channel |  |
|  | 1: Another upper channel |  |

### 32.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register

This register selects the timing for generating a simultaneous rewrite control signal.

### 32.3.4.4 TAUDnRDC - TAUDn Channel Reload Data Control Register

This register specifies a channel which generates an INTTAUDnIm signal to trigger simultaneous rewrite.

| Access: <br> Address: |  |  | This register can be read$\begin{aligned} & \text { <TAUDn_base> + 26C } \mathrm{C}_{\mathrm{H}} \\ & 0000_{\mathrm{H}} \end{aligned}$ |  |  | or writte | $\text { in } 16-b$ | units. | ritable | nly while | TAUD | E.TAUD | DnTEm |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TAUDn RDC15 | TAUDn RDC14 | TAUDn RDC13 | $\left\lvert\, \begin{aligned} & \text { TAUDn } \\ & \text { RDC12 } \end{aligned}\right.$ | TAUDn RDC11 | TAUDn RDC10 | TAUDn RDC09 | TAUDn RDC08 | TAUDn RDC07 | TAUDn RDC06 | TAUDn RDC05 | TAUDn RDC04 | TAUDn RDC03 | TAUDn RDC02 | TAUDn RDC01 | TAUDn RDC00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.34 TAUDnRDC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnRDCm | Specifies whether the channel generates a simultaneous rewrite trigger signal or not. |
|  | $0:$ Does not operate as a simultaneous rewrite trigger channel. |  |
|  | 1: Operates as a simultaneous rewrite trigger channel. |  |
|  | These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and |  |
|  | TAUDnRDS.TAUDnRDSm $=1$. |  |

### 32.3.4.5 TAUDnRDT - TAUDn Channel Reload Data Trigger Register

This register triggers a simultaneous rewrite enabling state.
Access: This register is a write-only register that can be written in 16 -bit units. It is always read as $0000_{\mathrm{H}}$.
Address: <TAUDn_base> + 044 H
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUDn RDT15 | TAUDn RDT14 | TAUDn RDT13 | TAUDn RDT12 | TAUDn RDT11 | TAUDn RDT10 | TAUDn RDT09 | TAUDn RDT08 | TAUDn RDT07 | TAUDn RDT06 | TAUDn RDT05 | TAUDn RDT04 | TAUDn RDT03 | TAUDn RDT02 | TAUDn RDT01 | TAUDn RDT00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | w | W | w | w | W | w | w | w | W | W | W | W | W | W | W |

Table 32.35 TAUDnRDT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnRDTm | Triggers a simultaneous rewrite enabling state. |
|  | $0:$ No function |  |
|  | 1: The simultaneous rewrite enabling flag (TAUDnRSFm) is set to 1. The system waits for |  |
| a simultaneous rewrite trigger. |  |  |
|  | These bits only apply when: |  |
|  | • TAUDnRDE.TAUDnRDEm = 1 |  |

### 32.3.4.6 TAUDnRSF - TAUDn Channel Reload Status Register

This flag register indicates simultaneous rewrite status.

| Access: | This register is a read-only register that can be read in 16-bit units. |
| ---: | :--- |
| Address: | $<$ TAUDn_base $>+048_{H}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

| Bit | $15 \quad 14$ |  | 13 | $12 \quad 11$ |  | 10 | 8 |  | 6 |  | 5 | 43 |  | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUDn RSF15 | TAUDn RSF14 | TAUDn RSF13 | TAUDn RSF12 | TAUDn RSF11 | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { RSF10 } \end{array}$ | $\begin{array}{\|l\|l} \hline \text { TAUDn } \\ \text { RSF09 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { RSF08 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { RSF07 } \end{array}$ | $\begin{array}{\|l} \hline \text { TAUDn } \\ \text { RSF06 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { RSF05 } \end{array}$ | TAUDn RSF04 | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { RSF03 } \end{array}$ | TAUDn RSF02 | TAUDn RSF01 | $\begin{array}{\|l} \hline \text { TAUDn } \\ \text { RSF00 } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 32.36 TAUDnRSF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnRSFm | Indicates simultaneous rewrite status. |
|  |  | $0:$ Indicates that simultaneous rewrite has been completed due to the generation of |
| simultaneous rewrite trigger. |  |  |
|  | 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous |  |
| rewrite enabling state (TAUDnRDTm $=1$ ). |  |  |

### 32.3.5 Details of TAUDn Output Registers

### 32.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register

This register enables/disables the independent channel output mode controlled by software.

| Access: |  |  | This register can be read or written in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Address: |  |  | <TAUDn_base> + 5 $\mathrm{C}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | $0000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TAUDn | TAUD | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn | TAUDn |  |
|  | TOE15 | TOE14 | TOE13 | TOE12 | TOE11 | TOE10 | TOE09 | TOE08 | TOE07 | TOE06 | TOE05 | TOE04 | TOE03 | TOE02 | TOE01 | TOE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.37 TAUDnTOE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTOEm | Enables/disables the independent channel output function. |
|  |  | $0:$ Disables the independent timer output function (controlled by software). |
|  | 1: Enables the independent timer output function. |  |

### 32.3.5.2 TAUDnTO - TAUDn Channel Output Register

This register specifies and reads a TAUDTTOUTm level.
Access: This register can be read or written in 16-bit units.
Address: <TAUDn_base> + 58 ${ }_{H}$
Value after reset: $\quad 0000_{\mathrm{H}}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{\|c} \text { TAUDn } \\ \text { TO15 } \end{array}$ | $\begin{array}{\|c} \text { TAUDn } \\ \text { TO14 } \end{array}$ | $\begin{array}{\|c} \text { TAUDn } \\ \text { TO13 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUDn } \\ \text { TO12 } \end{array}$ | TAUDn TO11 | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TO10 } \end{array}$ | $\begin{gathered} \text { TAUDn } \\ \text { TO09 } \end{gathered}$ | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TO08 } \end{array}$ | $\begin{gathered} \text { TAUDn } \\ \text { TOO7 } \end{gathered}$ | $\begin{array}{\|c\|} \hline \text { TAUDn } \\ \text { TOO6 } \end{array}$ | $\begin{array}{\|c} \hline \text { TAUDn } \\ \text { TO05 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUDn } \\ \text { TO04 } \end{array}$ | $\left\lvert\, \begin{gathered} \text { TAUDn } \\ \text { TO03 } \end{gathered}\right.$ | $\begin{array}{\|c\|} \hline \text { TAUDn } \\ \text { TO02 } \end{array}$ | $\begin{array}{\|c\|} \hline \text { TAUDn } \\ \text { TO01 } \end{array}$ | $\begin{array}{\|c} \text { TAUDn } \\ \text { TOOO } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.38 TAUDnTO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTOm | Specifies and reads a TAUDTTOUTm level. |
|  | 0: Low level |  |
|  | 1: High level |  |
|  | Only TAUDnTOm bits for which Independent Channel Output function is disabled |  |
|  | (TAUDnTOEm $=0)$ can be written. |  |

### 32.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register

This register specifies the output mode of each channel.

| Access: |  |  | This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: |  |  | <TAUDn_base> + 248 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | 0000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | $\begin{array}{\|l\|} \text { TAUDn } \\ \text { TOM15 } \end{array}$ | TAUDn TOM14 | TAUDn TOM13 | $\begin{aligned} & \text { TAUDn } \\ & \text { TOM12 } \end{aligned}$ | $\left.\begin{array}{\|l\|} \text { TAUDn } \\ \text { TOM11 } \end{array} \right\rvert\,$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOM10 } \end{aligned}$ | TAUDn | $\begin{aligned} & \text { TAUD } \\ & \text { TOM08 } \end{aligned}$ | TAUDn TOM07 | $\begin{aligned} & \text { TAUDn } \\ & \text { TOM06 } \end{aligned}$ | TAUDn TOM05 | TAUDn TOM04 | TAUDn TOM03 | TAUDn TOM02 | TAUDn TOM01 | TAUDn TOM00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 32.39 | TAUDnTOM Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 0 | TAUDnTOMm |  | Specifies an output mode. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  | 0 : Independent channel operation |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 1: Synchronous channel operation |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 32.3.5.4 TAUDnTOC - TAUDn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUDnTOMm.

| Access: |  |  | This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: |  |  | <TAUDn_base> + $24 \mathrm{C}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | 0000H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | $\begin{aligned} & \text { TAUDn } \\ & \text { TOC15 } \end{aligned}$ | TAUDn TOC14 | $\begin{aligned} & \text { TAUDn } \\ & \text { TOC13 } \end{aligned}$ | $\left\|\begin{array}{l} \text { TAUDn } \\ \text { TOC12 } \end{array}\right\|$ | $\left\|\begin{array}{\|c} \text { TAUDn } \\ \text { TOC11 } \end{array}\right\|$ | TAUDn <br> TOC10 | $\begin{array}{\|l\|} \text { TAUDn } \\ \text { TOC09 } \end{array}$ | TAUDn TOC08 | TAUDn TOC07 | $\begin{array}{\|l\|} \text { TAUDn } \\ \text { TOC06 } \end{array}$ | $\left\lvert\, \begin{aligned} & \text { TAUDn } \\ & \text { TOC05 } \end{aligned}\right.$ | TAUDn TOC04 | TAUDn TOC03 | TAUDn TOC02 | TAUDn | TAUDn TOC00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/w | R/W | R/w | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.40 TAUDnTOC Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 15 to 0 | TAUDnTOCm | Specifies an output mode. <br> 0 : Operating mode 1 <br> 1: Operating mode 2 <br> As listed below, the output mode depends on the setting of TAUDnTOM.TAUDnTOMm. |  |  |
|  |  | TAUDnTOMm | TAUDnTOCm | Functional Description |
|  |  | 0 | 0 | Toggle mode: Toggle operation is conducted when INTTAUDnIm occurs. |
|  |  | 0 | 1 | Set/reset mode: Set when INTTAUDnIm occurs at the beginning of count operation, and reset when INTTAUDnIm is caused by detection of a match between TAUDnCNTm and TAUDnCDRm. |
|  |  | 1 | 0 | Synchronous channel operating mode 1: Set when INT occurs on master channels, and reset when INT occurs on slave channels. |
|  |  | 1 | 1 | Synchronous channel operating mode 2: Set when INTTAUDnIm occurs in count-down status, and reset when INTTAUDnIm occurs in count-up status. |

### 32.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register

This register specifies the output logic of channel output bit (TAUDnTO.TAUDnTOm).

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | <TAUDn_base> $+040_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL15 } \end{aligned}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL14 } \end{aligned}$ | TAUDn TOL 13 | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL12 } \end{aligned}$ | TAUDn TOL11 | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL10 } \end{aligned}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL09 } \end{aligned}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL08 } \end{aligned}$ | $\begin{array}{\|l\|l} \hline \text { TAUDn } \\ \text { TOL07 } \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { TOL06 } \end{array}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL05 } \end{aligned}$ | $\begin{array}{\|l\|l\|} \hline \text { TAUDn } \\ \text { TOL04 } \end{array}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL03 } \end{aligned}$ | $\begin{array}{\|l\|l} \hline \text { TAUDn } \\ \text { TOL02 } \end{array}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL01 } \end{aligned}$ | $\begin{aligned} & \text { TAUDn } \\ & \text { TOL00 } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.41 TAUDnTOL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTOLm | Specifies the output logic of channel m output bit (TAUDnTO.TAUDnTOm). |
|  | 0: Positive logic (active high) |  |
|  | 1: Negative logic (active low) |  |
|  | The setting of these bits applies to all channel output modes other than independent channel |  |
|  |  |  |
|  | output mode controlled by software and independent channel output mode 1 and independent |  |
| channel output mode 1 with real-time output. |  |  |

### 32.3.6 Details of TAUDn Dead Time Output Registers

### 32.3.6.1 TAUDnTDE - TAUDn Channel Dead Time Output Enable Register

This register enables/disables the dead time operation of every channel.

| Access: |  |  | This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE. TAUDnTEm = 0). |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address: |  |  | <TAUDn_base> + 250 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset: |  |  | 0000 ${ }^{\text {H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 32.45 TAUDnTRE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTREm | Enables or disables real-time output of channel $m$. |
|  | 0: Disables real-time output |  |
|  | 1: Enables real-time output. |  |
|  | These bit settings are applied only when TAUDnTOE.TAUDnTOEm $=1$. When |  |
|  | TAUDnTRE.TAUDnTREm $=0$, TAUDTTOUTm is not affected by real-time output. |  |
|  | When TAUDnTRE.TAUDnTREm $=1$, TAUDTTOUTm outputs the value of real-time output bit |  |
|  | TAUDnTRO.TAUDnTROm in response to a timer operation. |  |

### 32.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register

This register controls the real-time output trigger of each channel.

### 32.3.7.3 TAUDnTRO - TAUDn Channel Real-time Output Register

This register sets a value which is output to TAUDTTOUTm.

### 32.3.7.4 TAUDnTME - TAUDn Channel Modulation Output Enable Register

This register enables/disables modulation output for timer output and real-time output.

```
Access: This register can be read or written in 16-bit units.
Address: <TAUDn_base> + 050H
Value after reset: \(\quad 0000_{H}\)
```

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 32.48 TAUDnTME Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | TAUDnTMEm | Enables/disables modulation output for timer output and real-time output of channel m. |
|  | $0:$ Disables modulation |  |
|  | 1: Enables modulation |  |
|  | These bit settings are applied only when TAUDnTOE.TAUDnTOEm and |  |
|  | TAUDnTRE.TAUDnTREm $=1$. |  |

### 32.3.8 TAUDn Emulation Register

### 32.3.8.1 TAUDnEMU - TAUDn Emulation Register

This register controls SVSTOP operations.
Access: This register can be read or written in 8 -bit units.
Perform write operations when the counter is stopped (TAUDnTE.TAUDnTEm $=0$ ) and (EPC.SVSTOP $=0$ ).
Address: <TAUDn_base> $+290_{H}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUDnSVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 32.49 TAUDnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | TAUDnSVSDIS | When EPC.SVSTOP bit $=0$ : |
|  |  | Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0 ). |
|  |  | When EPC.SVSTOP bit = 1: |
|  |  | 0 : The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). |
|  |  | 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 32.4 Operating Procedure

The following lists the general operation procedure for the TAUDn.
After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUDTTOUTm is also initialized and outputs a low level.
(1) Set the TAUDnTPS and TAUDnBRS registers to specify the clock frequency of CK0 to CK3.
(2) Configure the desired TAUDn function:

- Set the operation mode
- Set the channel output mode
- Set any other control bits
(3) Enable the counter by setting the TAUDnTS.TAUDnTSm bit to 1.

The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
(4) If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUDnTT.TAUDnTTm bit to 1 . The counter can be forcibly restarted by setting the TAUDnTS.TAUDnTSm bit to 1 .
(5) Stop the function by setting the TAUDnTT.TAUDnTTm bit to 1 .

## NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in Section 32.12, Independent Channel Operation Functions and Section 32.15, Synchronous Channel Operation Functions.
2. The function can be changed while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

### 32.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels). Several rules apply to the settings of channels. These rules are detailed in Section 32.5.1, Rules of Synchronous Channel Operation.

Two special features for synchronous channel operation are detailed in the following:

- Section 32.5.2, Simultaneous Start and Stop of Synchronous Channel Counters
- Section 32.6, Simultaneous Rewrite

### 32.5.1 Rules of Synchronous Channel Operation

## Number of master and slave channels

- Only even channels (CH0, CH2, CH4, ...) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
Example: If CH2 is a master channel, CH 3 and the lower channels ( $\mathrm{CH} 3, \mathrm{CH} 4, \mathrm{CH} 5, \ldots$ ) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels.

Example: If CH0 and CH4 are master channels, CH 1 to CH 3 can be set as slave channels for CH 0 , but CH 5 to CH 15 cannot.

## Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the TAUDnCMORm.TAUDnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave usage and operation clocks are illustrated in Figure 32.4, Grouping of Channels and Assignment of Operatiion Clocks.

Figure 32.4 Grouping of Channels and Assignment of Operation Clocks

## Control trigger signal for master/slave channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

### 32.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

### 32.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUDnTS.TAUDnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUDnTT.TAUDnTTm bits of the channels should be set at the same time.

Setting to the TAUDnTS.TAUDnTSm bits to 1 also sets the corresponding TAUDnTE.TAUDnTEm bits to 1 , enabling counting. The count start timing depends on operating mode.

### 32.5.2.2 Simultaneous Start between the Units

Counters in different units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see Section 36.8, Simultaneous Start Trigger Function.

### 32.6 Simultaneous Rewrite

### 32.6.1 Overview of Operations

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUDnCDRm and TAUDnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUDnIm being issued on the upper channel specified by TAUDnRDC.TAUDnRDCm

There are four methods for simultaneous rewrite. These are listed in Table 32.50, Simultaneous Rewrite
Methods and when They are Triggered, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 32.50 Simultaneous Rewrite Methods and when They are Triggered

| Method | Simultaneous Rewrite Triggered when | TAUDnRDE. TAUDnRDEm | TAUDnRDS. TAUDnRDSm | TAUDnRDM. TAUDnRDMm |
| :---: | :---: | :---: | :---: | :---: |
| - | No simultaneous rewrite | 0 | 0 | 0 |
| A | The master channel (re)starts counting | 1 | 0 | 0 |
| B | Counting is started in the master channel. The master channel starts counting down at the peak of triangular cycle of the corresponding slave channel. | 1 | 0 | 1 |
| C1 | INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm | 1 | 1 | 0/1 |
| C2 | INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm that in turn is triggered by an external signal | 1 | 1 | 0/1 |

Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite lists which of these four methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in Section 32.14 Independent Channel Simultaneous Rewrite Functions, Section 32.15, Synchronous Channel Operation Functions, and Section 32.16, Synchronous Non-Complementary and Complementary Modulation Output Functions.

Table 32.51 Channel Functions and the Methods They Use for Simultaneous Rewrite

| Function | A | B | C1 | C2 | TAUDnTOL. <br> TAUDnTOLm |

### 32.6.2 How to Control Simultaneous Rewrite

Figure 32.5, General Procedure for Simultaneous Rewrite shows the general procedure for simultaneous rewrite. The three main blocks (initial settings, start and counter count operation, and simultaneous rewrite) are explained afterwards.

Figure 32.5 General Procedure for Simultaneous Rewrite

### 32.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel $m$, set TAUDnRDE.TAUDnRDEm $=1$
- To select the type of simultaneous rewrite, set TAUDnRDM.TAUDnRDMm and TAUDnRDS.TAUDnRDSm according to the values listed in Table 32.50, Simultaneous Rewrite Methods and when They are Triggered.
- Specify a simultaneous rewrite trigger channel by using TAUDnRDC.TAUDnRDCm. (Prerequisite: TAUDnRDS.TAUDnRDSm has been set to the upper channel.)

### 32.6.2.2 Start Counter and Count Operation

- To start all the TAUDnCNTm counters of the channel group, set the corresponding TAUDnTS.TAUDnTSm bits to 1 . The values of TAUDnTOL.TAUDnTOLm and the data registers (TAUDnCDRm) are loaded into the corresponding TAUDnTOL.TAUDnTOLm buffer (TAUDnTOL.TAUDnTOLm buf) and data buffer registers (TAUDnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 sets the reload flag (TAUDnRSF.TAUDnRSFm) to 1 , enabling simultaneous rewrite. TAUDnRSF.TAUDnRSFm remains set to 1 until simultaneous rewrite is completed.
- When the specified trigger for simultaneous rewrite is detected, the TAUDnRSF.TAUDnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1). If it is, simultaneous rewrite is carried out.
Otherwise the simultaneous rewrite is not carried out and waits for the next trigger detection.

### 32.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and are applied the next time the counter starts or restarts.
- When simultaneous rewrite is complete, the TAUDnRSF.TAUDnRSFm bit is set to 0 , and the system awaits the next simultaneous rewrite trigger.

### 32.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUDnRDE.TAUDnRDEm, TAUDnRDS.TAUDnRDSm, TAUDnRDM.TAUDnRDMm, and TAUDnRDC.TAUDnRDCm cannot be changed while the counter is in operation (TAUDnTE.TAUDnTEm = 1).
- TAUDnTOL.TAUDnTOLm can only be rewritten during operation with PWM output function or triangle PWM output function. For all other output functions, TAUDnTOL.TAUDnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUDTTOUTm outputs an invalid wave.
- When an upper channel is used as a channel issuing the simultaneous rewrite trigger (TAUDnRDS.TAUDnRDSm = 1), the TAUDnRDC.TAUDnRDCm bit controls all the lower channels. This means that if the TAUDnRDC.TAUDnRDCm bits of CH2 and CH7 are set to 1 and the TAUDnRDC.TAUDnRDCm bits of other channels are set to $0, \mathrm{CH} 2$ and CH 7 serve as simultaneous rewrite trigger generation channels. CH 2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger (TAUDnRDE.TAUDnRDEm and TAUDnRDS.TAUDnRDSm = 1) but no upper channel is set (TAUDnRDC.TAUDnRDC[15:0] = 0), simultaneous rewrite cannot take place.

### 32.6.4 Types of Simultaneous Rewrite

In the following section, the four simultaneous rewrite methods are explained using timing diagrams.

### 32.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A)

Figure 32.6 Simultaneous Rewrite when the Master Channel (Re)starts Counting

## Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

## Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer and TAUDnTOL.TAUDnTOLm value is copied to the TAUDnTOL.TAUDnTOLm buffer.
(2) The TAUDnCDRm and TAUDnTOL.TAUDnTOLm registers can be written at any time.
(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm $=0$ )
(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.
(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer and the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.
(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.
32.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B)

Figure 32.7 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel

## Setting:

CH0 is the master channel which performs counting down, and CH 1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

## Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.
(2) The TAUDnCDRm and TAUDnTOL registers can be written at any time.
(3) Simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm $=0$ ).
(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.
(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.
(6) Simultaneous rewrite takes place at the top of the triangular cycle. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer, the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.
(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

### 32.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1)

Figure 32.8 Simultaneous Rewrite When INTTAUDnIm Is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm

## Setting:

CH1 is an upper channel which performs counting down, CH 2 is a master channel, and CH 3 is the slave channel. The simultaneous rewrite method C 1 is applied. The TAUDnRDC register specifies a channel which generates simultaneous rewrite triggers.

## Description:

(1) When TAUDnTS.TAUDnTSm is set to 1 , TAUDnCDRm value is copied to the TAUDnCDRm buffer.
(2) The TAUDnCDRm register is always ready to write.
(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 , the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.
(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.
(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches $0000_{\mathrm{H}}$. The TAUDnCDRm values are loaded into the corresponding TAUDnCDRm buffers.
(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be rechanged.

### 32.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2)

Figure 32.9 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal

## Setting:

CH1 is an upper channel which performs counting up, CH2 is a master channel, and CH3 is the slave channel. The synchronous channel operation method C2 is applied. The TAUDnRDC register specifies which upper channel is monitored for an INTTAUDnIm trigger.

## Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer. However, as TAUDnCDR1 operates in capture mode, TAUDnCDR1 value is not copied to the TAUDnCDR1 buffer.
(2) The TAUDnCDRm register is always ready to write.
(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 , the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.
(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.
(5) Simultaneous rewrite is triggered by INT1 which is caused by external signal TIN1. The TAUDnCDRm values are written to the corresponding TAUDnCDRm buffers.
(6) The counters count down and await the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.
(7) An external signal occurs at TIN2 but simultaneous rewrite does not take place because it is disabled (TAUDnRSF.TAUDnRSFm $=0$ ).

### 32.7 Channel Output Modes

The output of the TAUDTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUDnTOE.TAUDnTOEm = 0)

When controlled by software, the value written in the output register bit (TAUDnTO.TAUDnTOm) is sent to the output pin (TAUDTTOUTm).

- By TAUD signals (TAUDnTOE.TAUDnTOEm = 1)

When controlled by TAUD signals, the output level of TAUDTTOUTm is set or reset or toggled by internal signals. The value of TAUDnTO.TAUDnTOm is updated accordingly to reflect the value of TAUDTTOUTm.

- Independently (TAUDnTOM.TAUDnTOMm = 0)

In case of independent operation, the output of the TAUDTTOUTm pin is only affected by settings of channel m.
Therefore, independent channel operation should be selected (TAUDnTOM.TAUDnTOMm $=0$ ).

- Synchronously (TAUDnTOM.TAUDnTOMm = 1)

In case of synchronous operation, the output of the TAUDTTOUTm pin is affected by settings of channel $m$ and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUDnTOM.TAUDnTOMm = 1).

The TAUDnTO.TAUDnTOm bit can always be read to determine the current value of TAUDTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

## Control bits

The settings of the control bits required to select a specific channel output mode are listed in Table 32.52, Channel Output Modes.

The channel output modes are described in details below.

- Section 32.7.2, Channel Output Modes Controlled Independently by TAUDn Signals
- Section 32.7.3, Channel Output Modes Controlled Synchronously by TAUDn Signals

## Batch operation of TAUDnTOm bit

Whether a set value is reflected to the TAUDnTOm bit or not is controlled by the TAUDnTOE.TAUDnTOEm bit.
The TAUDnTOm setting is written only to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit $=0$ when a write to the TAUDnTO register is attempted. No TAUDnTOm setting is reflected to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit $=1$.

NOTE
TAUDnTO.TAUDnTOm bit is placed so that its bit number corresponds to a channel number.

## Output logic

Positive logic or negative logic of the output is specified by control bit TAUDnTOL.TAUDnTOLm.
The value of TAUDnTOL.TAUDnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUDnTOL.TAUDnTOLm result in an undefined TAUDTTOUTm signal output.

## See Section 32.6, Simultaneous Rewrite.

The various channel output modes and the channel output control bits are listed in Table 32.52, Channel Output Modes.

Table 32.52 Channel Output Modes

| Channel Output Mode | TAUDn TOE. TAUDn TOEm | TAUDn TOM. TAUDn TOMm | TAUDn TOC. TAUDn TOCm | TAUDn TDE. TAUDn TDEm | TAUDn TRE. <br> TAUDn TREm | TAUDn TME. TAUDn TMEm | TAUDn TDM. TAUDn TDMm |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| By software |  |  |  |  |  |  |  |
| Independent channel output mode controlled by software | 0 | X |  |  |  |  |  |
| By TAUD signals, independently |  |  |  |  |  |  |  |
| Independent channel output mode 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| with real-time output |  |  |  |  | 1 |  |  |
| Independent channel output mode 2 |  |  | 1 |  | 0 |  |  |
| By TAUD signals, synchronously |  |  |  |  |  |  |  |
| Synchronous channel output mode 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| with non-complementary modulation output |  |  |  |  | 1 | X |  |
| Synchronous channel output mode 2 |  |  | 1 | 0 | 0 | 0 | 0 |
| with dead time output |  |  |  | 1 |  |  |  |
| with one-phase PWM output |  |  |  |  |  |  | 1 |
| with complementary modulation output |  |  |  |  | 1 | 1 | 0 |
| with non-complementary modulation output |  |  | 1 | 0 |  |  |  |

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTES

1. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1):

- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTRE.TAUDnTREm
- TAUDnTDM.TAUDnTDMm

2. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm $=1$ ) except in channel output modes with modulation output:

- TAUDnTME.TAUDnTMEm
- TAUDnTDL.TAUDnTDLm

### 32.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUDTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUDnTOE.TAUDnTOEm $=0$ ).
(1) Set TAUDnTO.TAUDnTOm to specify the initial level of the TAUDTTOUTm output.
(2) Set channel output mode according to Table 32.52, Channel Output Modes, and the output logic using the TAUDnTOL.TAUDnTOLm bit.
(3) Start the counter (TAUDnTS.TAUDnTSm = 1).

Figure 32.10 General Procedure for Specifying a TAUDTTOUTm Channel Output Mode

### 32.7.2 Channel Output Modes Controlled Independently by TAUDn Signals

This section lists the channel output modes that are controlled independently by TAUDn signals. The control bits used to specify a mode are listed in Table 32.52, Channel Output Modes.

### 32.7.2.1 Independent Channel Output Mode 1

## Set/reset conditions

In this output mode, TAUDTTOUTm toggles when INTTAUDnIm is detected. The value of TAUDnTOL.TAUDnTOLm is ignored.

## Prerequisites

There are no prerequisites other than those shown in Table 32.52, Channel Output Modes.

### 32.7.2.2 Independent Channel Output Mode 1 with Real-Time Output

In this output mode, the value of TAUDnTRO.TAUDnTROm bit of the trigger channel is output to TAUDTTOUTm. The trigger channel is specified by setting the corresponding TAUDnTRC.TAUDnTRCm bit to 1 . It controls all lower channels for which TAUDnTRC.TAUDnTRCm $=0$.

## Set/reset conditions

The value of TAUDnTRO.TAUDnTROm bit is sent to TAUDTTOUTm only when an INTTAUDnIm interrupt occurs on the trigger channel. The interrupt is generated either:

- at certain specified intervals or
- on detection of a valid TAUDTTINm input edge/counter start

The type of trigger is set using the TAUDnCMORm.TAUDnMD[4:1] bits.

## Prerequisites

Both the master and slave channels can be set as a trigger generation channel. A channel for which TAUDnTRC.TAUDnTRCm is set to 1 serves as a trigger generation channel regardless of the value of TAUDnTRE.TAUDnTREm.

If there is no channel for which TAUDnTRC.TAUDnTRCm is set to 1 or if TAUDnTRC.TAUDnTRC $0=0$, real-time output cannot take place.

This can be seen in Figure 32.11, Real-Time Output.

Figure 32.11 Real-Time Output

### 32.7.2.3 Independent Channel Output Mode 2

## Set/reset conditions

In this output mode, TAUDTTOUTm is set when INTTAUDnIm occurs at the time of count start, and reset when INTTAUDnIm occurs due to a match between TAUDnCNTm and TAUDnCDRm.

## Prerequisites

There are no prerequisites other than those shown in Table 32.52, Channel Output Modes.

### 32.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals

This section lists the channel output modes that are controlled synchronously by TAUDn signals. The control bits used to specify a mode are listed in Table 32.52, Channel Output Modes.

### 32.7.3.1 Synchronous Channel Output Mode 1

## Set/reset conditions

In this output mode, INTTAUDnIm of master channel serves as a set signal and INTTAUDnIm of the slave channel as a reset signal. If INTTAUDnIm of master channel and INTTAUDnIm of the slave channel are generated at the same time, INTTAUDnIm of the slave channel (reset signal) has priority over INTTAUDnIm (set signal) of master channel, i.e., the master channel is ignored.

## Prerequisites

There are no prerequisites other than those shown in Table 32.52, Channel Output Modes.

### 32.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

## Set/reset conditions

In this output mode, TAUDTTOUTm outputs the result of an AND operation between the PWM output and the realtime output bit (TAUDnTRO.TAUDnTROm) of a channel.

The phase period to which the dead time is added is specified using the TAUDnTDL.TAUDnTDLm bit; for positive phase set TAUDnTDL.TAUDnTDLm $=0$ and for negative phase set TAUDnTDL.TAUDnTDLm $=1$.

## Prerequisites

A set of at least three channels is required to generate the PWM output. The master channel and slave channel 1 generate a period, and slave channel 2 generates the duty cycle. In typical applications, five more slave channels are also used that operate in the same manner as slave channel 2.

Only the PWM output and the real-time output bit of the same channel can be combined.
TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed, its new value is applied upon detection of INTTAUDnIm on the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on the master channel.

### 32.7.3.3 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is a triangle PWM output at TAUDTTOUTm. For details, see Section 32.15.7, Triangle PWM Output Function.

## Set/reset conditions

TAUDnCNTm of the slave channel counts down and up alternatively. When it passes $0001_{\mathrm{H}}$ it generates an interrupt, causing TAUDTTOUTm to toggle.

## Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUDTTOUTm should be set to 0 before the function starts.

### 32.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in Figure
32.12, Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output.

## Set/reset conditions

Figure 32.12 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm $=0$ for rising edges and TAUDnTDL.TAUDnTDLm $=1$ for falling edges.

## Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel

The master channel should be set to interval timer mode.

- One even slave channel

The even slave channel should be set to count-up/-down mode.

- One odd slave channel (even channel + 1)

The odd slave channel should be set to one-count mode.
The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

### 32.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in Figure 32.13, Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output.

## Set/reset conditions

Figure 32.13 Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm $=0$ for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges

## Prerequisites

One-phase PWM output control requires a set of two channels:

- One even slave channel
- One odd slave channel (even channel + 1)

The odd slave channel should be set to one-count mode.
The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

### 32.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output

## Set/reset conditions

In this output mode, TAUDTTOUTm outputs a PWM signal, a high signal, or a low signal depending on the value of real-time output bit (TAUDnTRO.TAUDnTROm), the modulation output bit (TAUDnTME.TAUDnTMEm), and the output level bit (TAUDnTOL.TAUDnTOLm) of a pair of slave channels.

For details, see Section 32.16.3, Complementary Modulation Output Function.

## Prerequisites

A set of at least four channels is required for this mode. The master channel and slave channel 1 generate a period, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time. Slave channels 2 and 3 are a pair. In typical applications, four more channels are also used, which operates in the same manner as slave channels 2 and 3 respectively.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed during operation, its new value is applied upon detection of INTTAUDnIm at the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on an even slave channel.

### 32.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

The difference from synchronous channel output mode 1 with non-complementary modulation output is the PWM wave shape.

Mode 1 has a square wave while mode 2 has a triangular wave.

### 32.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUDnTS.TAUDnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

## CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

### 32.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-upl-down Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUDnTS.TAUDnTSm is set to 1 . The value of data register is also loaded when the counter starts.

Figure 32.14 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

NOTE
Make sure to set TAUDnCMORm.TAUDnMDO to 0 when using the count-up/-down mode.

### 32.8.2 Event Count Mode

The value of data register is loaded as soon as TAUDnTS.TAUDnTSm is set to 1 . The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

Figure 32.15 Start Timing in Event Count Mode

### 32.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUDTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

Figure 32.16 Count Start Timing in Other Operating Modes

### 32.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUDnIm is generated using the TAUDnCMORm.TAUDnMD0 bit. The generation of INTTAUDnIm when the TAUDnCMORm.TAUDnMD0 bit starts counting and the effect to TAUDTTOUTm depend on the selected function. For details, refer to the description of TAUDnCMORm.TAUDnMD0 of each function.

Figure 32.17 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 $=0$ )

Figure 32.18 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 1)

### 32.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $\mathrm{FFFF}_{\mathrm{H}}$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel.
Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches $0000_{\mathrm{H}}$ at the same time as the first channel overflows (TAUDnCNTm $=\mathrm{FFFF}_{\mathrm{H}}$ ).
- Set TAUDnCDRm of the second channel to $\mathrm{FFFF}_{\mathrm{H}}$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUDTTINm input.
- The trigger detection settings (TAUDnCMORm.TAUDnSTS[2:0] and TAUDnCMURm.TAUDnTIS[1:0]) must be identical for both channels.

## Result:

The down-counter of the second channel reaches $0000_{\mathrm{H}}$ at exactly the same time as the up-counter of the first channel overflows ( $\mathrm{TAUDnCNTm}=\mathrm{FFFF}_{\mathrm{H}}$ ). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 32.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the TAUDTTINm input interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input pulse interval measurement function exceeds $\mathrm{FFFF}_{\mathrm{H}}$.

Figure 32.19 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

## Timing diagram

Figure 32.20 Interrupt Generation via Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

### 32.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at measuring the TAUDTTINm width) can detect the overflow when TAUDnCNTm of the TAUDTTINm input signal width measurement function exceeds FFFF $_{\mathrm{H}}$.

Figure 32.21 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

Timing diagram

Figure 32.22 Interrupt Generation via Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

### 32.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUDnIm of the interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input position detection function exceeds $\mathrm{FFFF}_{\mathrm{H}}$.

Figure 32.23 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

## Timing diagram

Figure 32.24 Interrupt Generation via Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

### 32.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at detecting the TAUDTTINm input period count) can detect the overflow when TAUDnCNTm of the TAUDTTINm input period count detection function exceeds FFFF $_{\mathrm{H}}$.

Figure 32.25 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

Timing diagram

Figure 32.26 Interrupt Generation via Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

### 32.11 TAUDTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

Figure 32.27, Basic Edge Detection Timing shows when edge detection takes place.

Figure 32.27 Basic Edge Detection Timing

Figure 32.27, Basic Edge Detection Timing shows an operation timing image. Actually, a noise filter or synchronization circuit which is located between the TAUDnIm pin and TAUDn causes a delay time.

### 32.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the Timer Array Unit D. For a general overview of independent channel operation, see Section 32.2, Overview.

This section describes functions that generate interrupts at regular intervals or with a specified delay.

### 32.12.1 Interval Timer Function

### 32.12.1.1 Overview

## Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

## Prerequisites

- The operation mode must be set to Interval Timer Mode, see Table 32.53, Contents of the TAUDnCMORm Register for Interval Timer Function.
- The channel output mode must be set to Independent Channel Output Mode 1, see Section 32.7, Channel Output Modes.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is written to TAUDnCNTm and the counter starts to count down from this value.

When the counter reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and subsequently continues operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 , which in turn sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm stop but retain their values. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 . The counter can also be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.

## Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

### 32.12.1.2 Equations

INTTAUDnIm cycle $=$ count clock cycle $\times($ TAUDnCDRm +1$)$
TAUDTTOUTm square wave cycle $=$ count clock cycle $\times($ TAUDnCDRm +1$) \times 2$

### 32.12.1.3 Block Diagram and General Timing Diagram

Figure 32.28 Block Diagram of Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 $=1$ ).

Figure 32.29 General Timing Diagram of Interval Timer Function

### 32.12.1.4 Register Settings

(1) TAUDnCMORm

Table 32.53 Contents of the TAUDnCMORm Register for Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS [1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output $=$ CK2 <br> 11: Prescaler output $=$ CK3 |
| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Independent operation, set to 0. |
| 10 to 8 | TAUDnSTS[2:0] | 000: Triggers the counter by software. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. |
|  |  | 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation. |

## (2) TAUDnCMURm

Table 32.54 Contents of the TAUDnCMURm Register for Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode

Table 32.55 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | $0:$ Independent channel output |
| TAUDnTOC.TAUDnTOCm | $0:$ Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | $0:$ The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | $0:$ Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | $0:$ When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | $0:$ Disables real-time output |
| TAUDnTRE.TAUDnTREm | $0:$ When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRO.TAUDnTROm | $0:$ Disables modulation |
| TAUDnTRC.TAUDnTRCm |  |
| TAUDnTME.TAUDnTMEm |  |
| NOTE |  |

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting
TAUDnTOE.TAUDnTOEm $=0$. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see Section 32.7, Channel Output Modes.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the interval timer function. Therefore, these registers should be set to 0 .

Table 32.56 Simultaneous Rewrite Settings for Interval Timer Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.1.5 Operating Procedure for Interval Timer Function

Table 32.57 Operating Procedure for Interval Timer Function

|  |  | Operation | TAUDn Status |
| :---: | :---: | :---: | :---: |
|  |  | Set TAUDnCMORm and TAUDnCMURm registers as described in Table 32.53, Contents of the TAUDnCMORm Register for Interval Timer Function, and Table 32.54, Contents of the TAUDnCMURm Register for Interval Timer Function. <br> Set the value of TAUDnCDRm register. <br> Set channel output mode by setting the control bits as described in Table 32.55, Control Bit Settings in Independent Channel Output Mode 1. | Channel operation is stopped. |
|  |  | Set TAUDnTS.TAUDnTSm to 1. <br> TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is set to 1 and the counter starts. <br> The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 $=1$, INTTAUDnIm is generated and TAUDTTOUTm toggles. |
|  |  | The TAUDnCDRm register value can be changed at any time. <br> The TAUDnCNTm register can be read at all times. | TAUDnCNTm counts down. When the counter reaches $0000_{\text {н }}$ : <br> - The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. <br> - INTTAUDnIm is generated and TAUDTTOUTm toggles. |
|  |  | Set TAUDnTT.TAUDnTTm to 1. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

### 32.12.1.6 Specific Timing Diagrams

(1) TAUDnCDRm $=0000 \mathrm{H}$, count clock $=$ PCLK/2

Figure 32.30 TAUDnCDRm $=0000_{\mathrm{H}}$, Count Clock $=$ PCLK/2

- If TAUDnCDRm $=0000_{\mathrm{H}}$ and the count clock $=\mathrm{PCLK} / 2$, the TAUDnCDRm value is loaded into TAUDnCNTm every count clock, meaning that TAUDnCNTm is always $0000_{\mathrm{H}}$.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.
(2) TAUDnCDRm $=0000_{\mathrm{H}}$, count clock $=$ PCLK

Figure 32.31 TAUDnCDRm $=0000_{\mathrm{H}}$, Count Clock $=$ PCLK

- If TAUDnCDRm $=0000_{\mathrm{H}}$ and the count clock $=$ PCLK, the TAUDnCDRm value is loaded into TAUDnCNTm every PCLK clock, meaning that TAUDnCNTm is always $0000_{\mathrm{H}}$.
- INTTAUDnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
TAUDTTOUTm is toggled every PCLK clock.
(3) Operation Stop and Restart

Figure 32.32 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 . This sets TAUDnTE.TAUDnTEm to 0 .
- TAUDnCNTm and TAUDTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 .
(4) Forced Restart (TAUDnCMORm.TAUDnMD0 = 1)

Figure 32.33 Forced Restart Operation (TAUDnCMORm.TAUDnMDO $=1$ )

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1 , the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUDnCDRm value is reflected to TAUDnCNTm and counting starts. Execute a forced restart to reflect the changed TAUDnCDRm value immediately.
- When a forced restart is made, an interrupt (INTTAUDnIm) is generated and TAUDTTOUTm is inverted.
(5) Forced Restart (TAUDnCMORm.TAUDnMD0 $=0$ )

Figure 32.34 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 $=0$ )

- When a forced restart is made, an interrupt (INTTAUDnIm) is not generated and TAUDTTOUTm is not inverted.

### 32.12.2 TAUDTTINm Input Interval Timer Function

### 32.12.2.1 Overview

## Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals or when a valid TAUDTTINm input edge is detected. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

## Prerequisites

- The operating mode should be set to interval timer mode. See Table 32.58, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function.
- The channel output mode should be set to independent channel output mode 1. See Section 32.7, Channel Output Modes.

## Functional description

This function operates in an identical manner to the interval timer function (see Section 32.12.1, Interval Timer Function) except that this function is restarted by a valid TAUDTTINm input edge. The type of edge used as a trigger is specified using the TAUDnCMURm.TAUDnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 32.12.2.2 Equations

INTTAUDnIm cycle $=$ count clock cycle $\times($ TAUDnCDRm +1$)$
TAUDTTOUTm square wave cycle $=$ count clock cycle $\times($ TAUDnCDRm +1$) \times 2$

### 32.12.2.3 Block Diagram and General Timing Diagram

Figure 32.35 Block Diagram of TAUDTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 $=1$ ).
- Rising edge detection (TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$ )

Figure 32.36 General Timing Diagram of TAUDTTINm Input Interval Timer Function

### 32.12.2.4 Register Settings

(1) TAUDnCMORm

Table 32.58 Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS [1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output $=$ CK2 <br> 11: Prescaler output $=$ CK3 |
| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Independent operation. Set to 0. |
| 10 to 8 | TAUDnSTS[2:0] | 001: Valid TAUDTTINm input edge signal is used as an external start trigger. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. |
|  |  | 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation. |

## (2) TAUDnCMURm

Table 32.59 Contents of the TAUDnCMURm Register for TAUDTTINm Input Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  |  | 10: Detection of rising and falling edges |
|  |  | 11: Setting prohibited |

## (3) Channel Output Mode

Table 32.60 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | $0:$ Independent channel output |
| TAUDnTOC.TAUDnTOCm | $0:$ Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | $0:$ The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | $0:$ Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | $0:$ When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | $0:$ Disables real-time output |
| TAUDnTRE.TAUDnTREm | $0:$ When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRO.TAUDnTROm | $0:$ Disables modulation |
| TAUDnTRC.TAUDnTRCm |  |
| TAUDnTME.TAUDnTMEm |  |
| NOTE |  |

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting
TAUDnTOE.TAUDnTOEm $=0$. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see Section 32.7, Channel Output Modes.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm Input Interval Timer Function. Therefore, these registers should be set to 0 .

Table 32.61 Simultaneous Rewrite Settings for TAUDTTINm Input Interval Timer Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function

Table 32.62 Operating Procedure for TAUDTTINm Input Interval Timer Function

### 32.12.2.6 Specific Timing Diagrams

The timing diagrams in Section 32.12.1, Interval Timer Function apply, and in addition the counter can also be restarted by a valid TAUDTTINm input edge.

Figure 32.37 Counter Triggered by Rising TAUDTTINm Input Edge (TAUDnCMURm.TAUDnTIS[1:0] = 01B), TAUDnCMORm.TAUDnMD0 = 1

- If a valid TAUDTTINm input edge is detected, an interrupt is generated which causes TAUDTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$ )

### 32.12.3 Clock Divide Function

### 32.12.3.1 Overview

## Summary

This function is used as a frequency divider. The frequency of the input signal TAUDTTINm is divided by a factor related to TAUDnCDRm, and the resulting signal is output to TAUDTTOUTm.

## Prerequisites

- TAUDTTINm should have a fixed frequency.
- The operating mode should be set to interval timer mode. (See Table 32.63, Contents of the TAUDnCMORm Register for Clock Divide Function.)
- The channel output mode should be set to independent channel output mode 1. (See Section 32.7, Channel Output Modes.)

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value, using TAUDTTINm as a count clock.

When the counter value reaches $0000_{\mathrm{H}}$, INTTAUDnIm occurs and TAUDTTOUTm signal is toggled. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The value of TAUDnCDRm can be rewritten at any time. The changed value of TAUDnCDRm is applied when the counter starts to count down next time.

The counter can be stopped by setting TAUDnTT.TAUDnTTm $=1$. This sets TAUDnTE. TAUDnTEm $=0$. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The function can be restarted by setting TAUDnTS.TAUDnTSm = 1. The counter can also be forcibly restarted without making a stop by setting TAUDnTS.TAUDnTSm = 1 during operation (forced restart).

## Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details, see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

NOTE
TAUDTTINm input signals are sampled at the frequency of the operation clock set by TAUDnCMORm.TAUDnCKS[1:0] bits. Therefore, the TAUDTTOUTm output clock cycle has an error of $\pm 1$ operation clock cycle.

### 32.12.3.2 Equations

- When rising edge detection is selected:

TAUDTTOUTm frequency $=$ TAUDTTINm frequency/[(TAUDnCDRm +1$) \times 2]$

- When falling edge detection is selected:

TAUDTTOUTm frequency $=$ TAUDTTINm frequency/[(TAUDnCDRm +1$) \times 2]$

- When falling and rising edge detection is selected:

TAUDTTOUTm frequency $=$ TAUDTTINm frequency/(TAUDnCDRm +1 )

### 32.12.3.3 Block Diagram and General Timing Diagram

## Interval timer mode

Figure 32.38 Block Diagram of Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=1$ )
- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01 ${ }_{\mathrm{B}}$ )

Figure 32.39 General Timing Diagram of Clock Divide Function

### 32.12.3.4 Register Settings

(1) TAUDnCMORm

Table 32.63 Contents of the TAUDnCMORm Register for Clock Divide Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CKO |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13, 12 | TAUDnCCS[1:0] | 01: Valid TAUDTTINm input edge is used as a count clock. |
| 11 | TAUDnMAS | 0 : Independent operation. Set to 0. |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. <br> 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation. |

## (2) TAUDnCMURm

Table 32.64 Contents of the TAUDnCMURm Register for Clock Divide Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  |  | 10: Detection of rising and falling edges |
|  |  | 11: Setting prohibited |

## (3) Channel Output Mode

Table 32.65 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | $0:$ Independent channel output |
| TAUDnTOC.TAUDnTOCm | $0:$ Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | $0:$ The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | $0:$ Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | $0:$ When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | $0:$ Disables real-time output |
| TAUDnTRE.TAUDnTREm | $0:$ When real-time output is disabled (TAUDnTRE.TAUDnTREm $=0)$, set these bits to 0 |
| TAUDnTRO.TAUDnTROm | $0:$ Disables modulation |
| TAUDnTRC.TAUDnTRCm |  |

## (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the clock divide function. Therefore, these registers should be set to 0 .

Table 32.66 Simultaneous Rewrite Settings for Clock Divide Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |
| TAUDnRDC.TAUDnRDCm |  |

### 32.12.3.5 Operating Procedure for Clock Divide Function

Table 32.67 Operating Procedure for Clock Divide Function

### 32.12.3.6 Specific Timing Diagrams

(1) TAUDnCDRm $=0000_{\mathrm{H}}$
$\square$
Figure 32.40 TAUDnCDRm $=0000_{\mathrm{H}}$, TAUDnCMORm. $\operatorname{TAUDNMDO}=1$, TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$

- If TAUDnCDRm is $0000_{\mathrm{H}}$, TAUDnCNTm is always $0000_{\mathrm{H}}$.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

Figure 32.40, TAUDnCDRm $=\mathbf{0 0 0 0 H}$, TAUDnCMORm.TAUDnMD0 $=1$, TAUDnCMURm.TAUDnTIS[1:0] $=01 B$ shows an operation timing example. Actually, there is a delay from TINm detection until TOUTm output because of the delay time of a noise filter or synchronization circuit placed between the TAUDnIm pin and TAUDn.

## (2) Operation Restart

Figure 32.41 Operation Restart
(TAUDnCMORm.TAUDnMD0 $=1$, TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$ )

To reset the value of TAUDTTOUTm:

- Set TAUDnTOE.TAUDnTOEm $=0$ when the counter is stopped (TAUDnTE.TAUDnTEm $=0$ ).
- Then, write either 0 or 1 to TAUDnTO.TAUDnTOm to set the new start value of TAUDTTOUTm.
(3) Forced Restart

Figure 32.42 Forced Restart Operation
(TAUDnCMORm.TAUDnMDO $=1$, TAUDnCMURm.TAUDnTIS[1:0] $=01_{B}$ )

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm = 1 during operation.
- The value of TAUDnCDRm is written to TAUDnCNTm and the count operation restarts.
- TAUDTTOUTm restarts at the same level as before the forced restart.

### 32.12.4 External Event Count Function

### 32.12.4.1 Overview

## Summary

This function is used as an event timer, which generates an interrupt (INTTAUDnIm) when a specific number of valid TAUDTTINm input edges are detected.

## Prerequisites

- The operating mode should be set to the event count mode. (See Table 32.68, Contents of the TAUDnCMORm Register for External Event Count Function.)
- TAUDTTOUTm is not used with this function.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When the counter starts, the current value of TAUDnCDRm is loaded into TAUDnCNTm.

When a valid TAUDTTINm input edge is detected, the value of TAUDnCNTm decrements by 1 . TAUDnCNTm retains this value until a valid TAUDTTINm input edge is detected or the counter is restarted.

When the valid edge is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 . This sets TAUDnTE.TAUDnTEm to 0 . The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 . The counter can also be restarted without stopping it first (forced restart) by setting TAUDnTS.TAUDnTSm to 1 during operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

## Conditions

An edge type used as a trigger is specified by TAUDnCMURm.TAUDnTIS[1:0] bits.

- When TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$, falling edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$, rising edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = $10_{\mathrm{B}}$, both edges are counted.

### 32.12.4.2 Equations

Number of valid edges detected before INTTAUDnIm generation $=$ TAUDnCDRm +1

### 32.12.4.3 Block Diagram and General Timing Diagram

Figure 32.43 Block Diagram of External Event Count Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01 ${ }_{\mathrm{B}}$ )

Figure 32.44 General Timing Diagram of External Event Count Function

### 32.12.4.4 Register Settings

(1) TAUDnCMORm

Table 32.68 Contents of the TAUDnCMORm Register for External Event Count Function
\(\left.$$
\begin{array}{lll}\hline \text { Bit Position } & \text { Bit Name } & \text { Function } \\
\hline 15,14 & \text { TAUDnCKS[1:0] } & \begin{array}{rl}\text { Operation Clock Selection } \\

|  | 10: Both edges are detected. |  |
|  | 11: Setting prohibited. |  |

## (3) Channel Output Mode

The channel output mode is not used by this function.

## (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the external event count function. Therefore, these registers should be set to 0 .

Table 32.70 Simultaneous Rewrite Settings for External Event Count Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.4.5 Operating Procedure for External Event Count Function

Table 32.71 Operating Procedure for External Event Count Function

|  |  | Operation | TAUDn Status |
| :---: | :---: | :---: | :---: |
|  |  | Set TAUDnCMORm and TAUDnCMURm registers as described in Table 32.68, Contents of the TAUDnCMORm Register for External Event Count Function, and Table 32.69, Contents of the TAUDnCMURm Register for External Event Count Function. <br> Set the value of TAUDnCDRm register. | Channel operation is stopped. |
|  |  | Set TAUDnTS.TAUDnTSm to 1. <br> TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value and waits for TAUDTTINm input edge detection. |
|  |  | Detection of TAUDTTINm edge <br> The value of TAUDnCDRm is changeable at any time. <br> The TAUDnCNTm register can be read at any time. | TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When effective edges are detected (TAUDnCDRm + 1) times: <br> - TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. <br> - INTTAUDnIm is generated. <br> Afterwards, this procedure is repeated. |
|  |  | Set TAUDnTT.TAUDnTTm to 1. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm stops and retains its current value. |

### 32.12.4.6 Specific Timing Diagrams

(1) TAUDnCDRm $=000 \mathbf{H}_{\mathrm{H}}$

Figure 32.45 TAUDnCDRm $=0000_{\mathrm{H}}, \operatorname{TAUDnCMURm} \cdot \operatorname{TAUDnTIS[1:0]}=01_{B}$

- If $0000_{\mathrm{H}}=$ TAUDnCDRm, $0000_{\mathrm{H}}$ is loaded into TAUDnCNTm each time a valid TAUDTTINm input edge is detected.
In other words, INTTAUDnIm is generated each time a valid TAUDTTINm input edge is detected.
(2) Operation Stop and Restart

Figure 32.46 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$ )

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 . This sets TAUDnTE.TAUDnTEm to 0 .
- TAUDnCNTm stops and retains its current value. TAUDTTINm continues and TAUDnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 . TAUDnCNTm loads the TAUDnCDRm value and restarts count operation.
(3) Forced Restart

Figure 32.47 Forced Restart Operation (TAUDnCMURm.TAUDnTIS[1:0] = 01 ${ }_{\mathrm{B}}$ )

Once a forced restart is made, the changed TAUDnCDRm value is applied to TAUDnCNTm immediately.

- The counter can be restarted without making a stop by setting TAUDnTS.TAUDnTSm to 1 during operation.
- The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter awaits the next valid TAUDTTINm input edge.

### 32.12.5 Delay Count Function

### 32.12.5.1 Overview

## Summary

This function generates interrupts (INTTAUDnIm), which have a defined delay to the TAUDTTINm input signal. TAUDTTINm input signal pulses that occur within the delay period are ignored.

## Prerequisites

- The operating mode should be set to one-count mode. See Table 32.72, Contents of the TAUDnCMORm Register for Delay Count Function.
- TAUDTTOUTm is not used with this function.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches $0000_{\mathrm{H}}$, an interrupt is generated. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.
The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

## Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = $10_{\mathrm{B}}$, rising and falling edges trigger the counter.

### 32.12.5.2 Equations

Delay between TAUDTTINm and INTTAUDnIm $=$ count clock cycle $\times($ TAUDnCDRm +1$)$

### 32.12.5.3 Block Diagram and General Timing Diagram

Figure 32.48 Block Diagram of Delay Count Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.49 General Timing Diagram of Delay Count Function

### 32.12.5.4 Register Settings

(1) TAUDnCMORm

Table 32.72 Contents of the TAUDnCMORm Register for Delay Count Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |

## (2) TAUDnCMURm

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/w | R | R | R | R | R | R | R/W | R/W |

Table 32.73 Contents of the TAUDnCMURm Register for Delay Count Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  |  | 10: Detection of rising and falling edges |
|  | 11: Setting prohibited |  |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

## (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the delay count function. Therefore, these registers should be set to 0 .

Table 32.74 Simultaneous Rewrite Settings for Delay Count Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.5.5 Operating Procedure for Delay Count Function

Table 32.75 Operating Procedure for Delay Count Function

### 32.12.6 One-Pulse Output Function

### 32.12.6.1 Overview

## Summary

This function generates an interrupt (INTTAUDnIm) when a valid TAUDTTINm input edge is detected and at a defined interval afterward. TAUDTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

## Prerequisites

- The operation mode should be set to pulse one-count mode. (See Table 32.76, Contents of the TAUDnCMORm Register for One-Pulse Output Function.)
- The channel output mode should be set to independent channel output mode 2. (See Section 32.7, Channel Output Modes.)
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm $=1$, enabling count operation.

The counter starts when a valid TAUDTTINm input edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. An interrupt is generated and TAUDTTOUTm is set to active level.

When the counter reaches $0001_{\mathrm{H}}$, an interrupt is generated and TAUDTTOUTm is set to the inactive level. The counter stops at $0000_{\mathrm{H}}$ and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.
The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

## Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = $10_{\mathrm{B}}$, rising and falling edges trigger the counter.

### 32.12.6.2 Equations

Interval between TAUDTTINm and INTTAUDnIm = TAUDTTOUTm (timer output) width $=$ count clock cycle $\times$ TAUDnCDRm

|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | 0: Disables real-time output |
| TAUDnTRE.TAUDnTREm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRO.TAUDnTROm | 0: Disables modulation |
| TAUDnTRC.TAUDnTRCm |  |
| TAUDnTME.TAUDnTMEm |  |
| NOTE |  |

The channel output mode can also be set to channel output mode controlled by software by setting
TAUDnTOE.TAUDnTOEm $=0$. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see
Table 32.52, Channel Output Modes.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the One-Pulse Output Function. Therefore, these registers should be set to 0 .

Table 32.79 Simultaneous Rewrite Settings for One-Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.6.5 Operating Procedure for One-Pulse Output Function

Table 32.80 Operating Procedure for One-Pulse Output Function

### 32.12.7 TAUDTTINm Input Pulse Interval Measurement Function

### 32.12.7.1 Overview

## Summary

This function captures the count value and uses this value and the overflow bit TAUDnCSRm.TAUDnOVF to measure the interval of the TAUDTTINm input signals.

## Prerequisites

- The operating mode should be set to capture mode. See Table 32.82, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function.
- TAUDTTOUTm is not used with this function.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm $=1$, enabling count operation. The counter TAUDnCNTm starts to count up from $0000_{\mathrm{H}}$. When a valid TAUDTTINm edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter resets to $0000_{\mathrm{H}}$ and subsequently continues operation.

If the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$ before a valid TAUDTTINm edge is detected, it overflows to $0000_{\mathrm{H}}$. The counter is reset to $0000_{\mathrm{H}}$ and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 32.81 Effects of Overflow

| TAUDnCMORm. TAUDnCOS[1:0] | When Overflow Occurs |  | When a Valid TAUDTTINm Input is Detected |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TAUDnCDRm | TAUDnCSRm. TAUDnOVF | TAUDnCDRm, TAUDnCNTm | TAUDnCSRm. TAUDnOVF |
| 00 | Unchanged | 0 | TAUDnCNTm loaded into TAUDnCDRm | 1 |
| 01 |  | 1 |  |  |
| 10 | Set to $\mathrm{FFFF}_{\mathrm{H}}$ | 0 | TAUDnCNTm set to 0 , TAUDnCDRm unchanged | Unchanged |
| 11 |  | 1 |  |  |

When TAUDnCMORm.TAUDnCOS[0] = 1, the overflow bit (TAUDnCSRm.TAUDnOVF) can be cleared only by setting TAUDnCSCm.TAUDnCLOV $=1$.
The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the interval of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, the overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.
The function can be stopped by setting TAUDnTT.TAUDnTTm $=1$. This sets TAUDnTE. TAUDnTEm $=0$.
TAUDnCNTm stops but retains its value. While the function is stopped, valid TAUDTTINm input edge detection and TAUDnCNTm capture are not performed.

The counter is reset to $0000_{\mathrm{H}}$ and subsequently continues operation.

## Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated. For details, see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

## NOTE

When TAUDnCMORm.TAUDnCOS[1:0] $=10_{\mathrm{B}}$ or $11_{\mathrm{B}}$, the value of TAUDnCNTm is not loaded into TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 32.12.7.2 Equations

TAUDTTINm input pulse interval $=$ count clock cycle $\times\left[\left(\right.\right.$ TAUDnCSRm.TAUDnOVF $\left.\times\left(\mathrm{FFFF}_{\mathrm{H}}+1\right)\right)+$ TAUDnCDRm capture value +1 ]

### 32.12.7.3 Block Diagram and General Timing Diagram

Figure 32.52 Block Diagram of TAUDTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 $=0$ ).
- Falling edge detection (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 (TAUDnCMORm.TAUDnCOS[1:0] $=00_{\mathrm{B}}$ ).

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval measurement function. Therefore, these registers should be set to 0 .

Table 32.84 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Measurement Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |
| TAUDnRDC.TAUDnRDCm |  |

### 32.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

Table 32.85 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

|  |  | Operation | TAUDn Status |
| :---: | :---: | :---: | :---: |
|  |  | Set TAUDnCMORm and TAUDnCMURm registers as described in Table 32.82, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function, and Table 32.83, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Measurement Function. <br> The TAUDnCDRm register functions as a capture register. | Channel operation is stopped. |
|  |  | Set TAUDnTS.TAUDnTSm to 1. <br> TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to $0000_{\mathrm{H}}$. INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1 . |
|  |  | Detection of TAUDTTINm edge <br> The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV can be written to 1. (TAUDnCSRm.TAUDnOVF bit is cleared to 0. .) | TAUDnCNTm starts to count up from $0000_{\mathrm{H}}$. When a TAUDTTINm valid edge is detected: <br> - TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and returns to $0000_{\mathrm{H}}$. <br> - INTTAUDnIm is then generated. <br> Afterwards, this procedure is repeated. |
|  |  | Set TAUDnTT.TAUDnTTm to 1. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values. |

### 32.12.7.6 Specific Timing Diagrams: Overflow Operation

(1) TAUDnCMORm.TAUDnCOS[1:0] $=00_{\mathrm{B}}$

Figure 32.54 TAUDnCMORm.TAUDnCOS[1:0] $=00_{\mathrm{B}}$, TAUDnCMORm. $\mathrm{TAUDnMD0}=0$, TAUDnCMURm.TAUDnTIS[1:0] = 00в

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1 .
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0 .
(2) TAUDnCMORm.TAUDnCOS[1:0] $=01_{B}$

Figure 32.55 TAUDnCMORm.TAUDnCOS[1:0] $=01_{\mathrm{B}}$, TAUDnCMORm.TAUDnMD0 $=0$, TAUDnCMURm.TAUDnTIS[1:0] = 00в

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).
(3) TAUDnCMORm.TAUDnCOS[1:0] $=10_{\mathrm{B}}$

Figure 32.56 TAUDnCMORm.TAUDnCOS[1:0] $=10_{\mathrm{B}}, \mathrm{TAUDnCMORm} . \operatorname{TAUDnMD0}=0$,
TAUDnCMURm. $\operatorname{TAUDnTIS[1:0]=00}$ B $_{\text {B }}$

- When an overflow occurs, TAUDnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$ and TAUDnCSRm.TAUDnOVF remains 0 .
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0 , but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
(4) TAUDnCMORm.TAUDnCOS[1:0] $=11_{B}$

Figure 32.57 TAUDnCMORm.TAUDnCOS[1:0] = 11 $1_{\mathrm{B}}$, TAUDnCMORm.TAUDnMD0 = 0,
TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$

- When an overflow occurs, TAUDnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$ and TAUDnCSRm.TAUDnOVF is set to 1 .
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0 , but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

### 32.12.8 TAUDTTINm Input Signal Width Measurement Function

### 32.12.8.1 Overview

## Summary

This function measures the width of a TAUDTTINm signal, by starting the count at one edge of TAUDTTINm and capturing the count value at the other edge.

## Prerequisites

- The operating mode should be set to capture and one-count mode. See Table 32.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function.
- TAUDTTOUTm is not used with this function.
- TAUDnCMORm.TAUDnMD0 should be set to 0 .

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm $=1$, enabling count operation. When a valid TAUDTTINm start edge is detected, the counter TAUDnCNTm starts to count up from $0000_{\mathrm{H}}$. When a valid TAUDTTINm stop edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter retains its value (TAUDnCDRm +1 ) and awaits the next valid TAUDTTINm input start edge.

If the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$ before a valid TAUDTTINm stop edge is detected, it overflows. The counter is reset to $0000_{\mathrm{H}}$ and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 32.86 Effects of Overflow

| TAUDnCMORm. TAUDnCOS[1:0] | When Overflow Occurs |  | When a Valid TAUDTTINm Input Stop Edge is Detected |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TAUDnCDRm | TAUDnCSRm. TAUDnOVF | TAUDnCDRm, TAUDnCNTm | TAUDnCSRm. TAUDnOVF |
| 00 | Unchanged | 0 | TAUDnCNTm loaded into TAUDnCDRm | 1 |
| 01 |  | 1 |  |  |
| 10 | Set to $\mathrm{FFFF}_{\mathrm{H}}$ | 0 | TAUDnCNTm stops counting TAUDnCDRm unchanged | Unchanged |
| 11 |  | 1 |  |  |

When TAUDnCMORm.TAUDnCOS[0] = 1, overflow bit TAUDnCSRm.TAUDnOVF can be cleared only by setting TAUDnCSCm.TAUDnCLOV to 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the width of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

This function cannot be forcibly restarted.
NOTE

[^7]
### 32.12.8.2 Equations

TAUDTTINm input signal width $=$ count clock cycle $\times\left[\left(\right.\right.$ TAUDnCSRm.TAUDnOVF $\left.\times\left(\mathrm{FFFF}_{\mathrm{H}}+1\right)\right)+$ TAUDnCDRm capture value +1 ]

### 32.12.8.3 Block Diagram and General Timing Diagram

## Capture and one-count mode

Figure 32.58 Block Diagram of TAUDTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11 $1_{\mathrm{B}}$ )
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 . (TAUDnCMORm.TAUDnCOS[1:0] = $00_{\mathrm{B}}$ )

Figure 32.59 General Timing Diagram of TAUDTTINm Input Signal Width Measurement Function

### 32.12.8.4 Register Settings

## (1) TAUDnCMORm

Table 32.87 Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Independent operation, set to 0 . |
| 10 to 8 | TAUDnSTS[2:0] | 010: Valid edge of the TAUDTTINm input signal is used as an external start trigger and the reverse edge as a stop trigger. |
| 7, 6 | TAUDnCOS[1:0] | See Table 32.86, Effects of Overflow. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0110: Capture and one-count mode |
| 0 | TAUDnMD0 | 0 : Disables the start trigger during operation. |

## (2) TAUDnCMURm

Table 32.88 Contents of the TAUDnCMURm Register For TAUDTTINm Input Signal Width Measurement Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 10: Detection of rising and falling edges (low width measurement) |
|  |  | 11: Detection of rising and falling edges (high width measurement) |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input signal width measurement function. Therefore, these registers should be set to 0 .

Table 32.89 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Measurement Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |
| TAUDnRDC.TAUDnRDCm |  |

### 32.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

Table 32.90 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

### 32.12.8.6 Specific Timing Diagrams: Overflow Operation

(1) TAUDnCMORm.TAUDnCOS[1:0] $=00_{\mathrm{B}}$

Figure 32.60 TAUDnCMORm. TAUDnCOS[1:0] $=00_{\mathrm{B}}, \mathrm{TAUDnCMORm} . \mathrm{TAUDnMD0}=0$,
TAUDnCMURm.TAUDnTIS[1:0] = 11 ${ }_{\text {B }}$

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1 .
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0 .
(2) TAUDnCMORm.TAUDnCOS[1:0] $=01_{B}$

Figure 32.61 TAUDnCMORm.TAUDnCOS[1:0] $=01_{\mathrm{B}}$, TAUDnCMORm. TAUDnMD0 $=0$,
TAUDnCMURm.TAUDnTIS[1:0] = 11 ${ }_{B}$

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).
(3) TAUDnCMORm.TAUDnCOS[1:0] $=10_{B}$

Figure 32.62 TAUDnCMORm.TAUDnCOS[1:0] $=10_{\mathrm{B}}$, TAUDnCMORm. TAUDnMD0 $=0$, TAUDnCMURm.TAUDnTIS[1:0] = 11 ${ }_{\text {B }}$

- When an overflow occurs, TAUDnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$ and TAUDnCSRm.TAUDnOVF remains 0 .
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
(4) TAUDnCMORm.TAUDnCOS[1:0] $=11_{B}$

Figure 32.63 TAUDnCMORm.TAUDnCOS[1:0] $=11_{\mathrm{B}}$, TAUDnCMORm. TAUDnMD0 $=0$,
TAUDnCMURm.TAUDnTIS[1:0] = 11в

- When an overflow occurs, TAUDnCDRm is set to $\mathrm{FFFF}_{\mathrm{H}}$ and TAUDnCSRm.TAUDnOVF is set to 1 .
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

### 32.12.9 TAUDTTINm Input Position Detection Function

### 32.12.9.1 Overview

## Summary

This function measures the input signal duration by capturing the count value at the valid edge of TAUDTTINm.

## Prerequisites

- The operating mode should be set to count capture mode. (See Table 32.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function.)
- TAUDTTOUTm is not used with this function.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This sets TAUDnTE.TAUDnTEm = 1 , enabling count operation. The counter starts counting from $0000_{\mathrm{H}}$. When a valid TAUDTTINm input edge is detected, the current value of TAUDnCNTm is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The count operation continues.

When the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$, the counter restarts from $0000_{\mathrm{H}}$.
NOTE
The TAUDTTINm input signal is sampled at the frequency of the operation clock, specified by TAUDnCMORm.TAUDnCKS[1:0] bits.

## Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt does not occur at the beginning of operation or after restart. For details, see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

### 32.12.9.2 Equations

Functional duration at a TAUDTTINm input pulse $=$ count clock cycle $\times($ TAUDnCDRm capture value +1$)$

### 32.12.9.3 Block Diagram and General Timing Diagram

Figure 32.64 Block Diagram of TAUDTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.65 General Timing Diagram of TAUDTTINm Input Position Detection Function

### 32.12.9.4 Register Settings

(1) TAUDnCMORm

Table 32.91 Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |

Table 32.92 Contents of the TAUDnCMURm Register for TAUDTTINm Input Position Detection Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  |  | 10: Detection of rising and falling edges |
|  |  | 11: Setting prohibited |

## (3) Channel Output Mode

The channel output mode is not used by this function.

## (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input position detection function. Therefore, these registers should be set to 0 .

Table 32.93 Simultaneous Rewrite Settings for TAUDTTINm Input Position Detection Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function

Table 32.94 Operating Procedure for TAUDTTINm Input Position Detection Function

### 32.12.9.6 Specific Timing Diagrams

(1) Operation Stop and Restart

Figure 32.66 Operation Stop and Restart
(TAUDnCMORm.TAUDnMD0 $=0$, TAUDnCMURm.TAUDnTIS[1:0] $=00$ B $)$

- The counter can stop operating by setting TAUDnTT.TAUDnTTm to 1 . This sets TAUDnTE.TAUDnTEm to 0 .
- TAUDnCNTm stops and retains its current value.
- If the counter stops operating, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 . TAUDnCNTm restarts to count from $0000_{\mathrm{H}}$.

### 32.12.10 TAUDTTINm Input Period Count Detection Function

### 32.12.10.1 Overview

## Summary

This function measures the cumulative width of a TAUDTTINm input signal.

## Prerequisites

- The operating mode should be set to capture and gate count mode. (See Table 32.95, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function.)
- TAUDTTOUTm is not used with this function.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter awaits a valid TAUDTTINm input edge. When a valid TAUDTTINm input start edge is detected, the counter starts to count from $0000_{\mathrm{H}}$. When a valid TAUDTTINm input stop edge is detected, the current TAUDnCNTm value is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The counter stops and retains its value (TAUDnCDRm +1 ) until the next valid TAUDTTINm input start edge is detected.

When the next valid TAUDTTINm input start edge is detected, the counter restarts to count from the value retained when stopped.

If the counter reaches $\mathrm{FFFF}_{\mathrm{H}}$, the counter restarts from $0000_{\mathrm{H}}$. NOTES

1. TAUDTTINm input signal is sampled at the frequency of an operation clock set by the TAUDnCMORm.TAUDnCKS[1:0] bits.
2. As this function is to measure the TAUDTTINm input signal width, setting TAUDnTS.TAUDnTSm to 1 is disabled while TAUDnTE.TAUDnTEm = 1.

## Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] $=10_{\mathrm{B}}$, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11 $1_{\mathrm{B}}$, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

### 32.12.10.2 Equations

Cumulative TAUDTTINm input width $=$ count clock cycle $\times($ TAUDnCDRm capture value +1$)$

### 32.12.10.3 Block Diagram and General Timing Diagram

Figure 32.67 Block Diagram of TAUDTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_{\mathrm{B}}$ )

(2) TAUDnCMURm

Table 32.96 Contents of the TAUDnCMURm Register for TAUDTTINm Input Period Count Detection Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 10: Detection of rising and falling edges (low width measurement) |
|  |  | 11: Detection of rising and falling edges (high width measurement) |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input period count detection function. Therefore, these registers should be set to 0 .

Table 32.97 Simultaneous Rewrite Settings for TAUDTTINm Input Period Count Detection Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 0 : Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function

Table 32.98 Operating Procedure for TAUDTTINm Input Period Count Detection Function

### 32.12.10.6 Specific Timing Diagrams

(1) Operation stop and restart

Figure 32.69 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 118)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 . This sets TAUDnTE.TAUDnTEm to 0 .
- TAUDnCNTm stops and retains its current value.
- If the counter is stopped, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 . TAUDnCNTm restarts to count from $0000_{\mathrm{H}}$.

### 32.12.11 TAUDTTINm Input Pulse Interval Judgment Function

### 32.12.11.1 Overview

## Summary

This function outputs the result of a comparison between the count value (TAUDnCNTm) and the value in the channel data register (TAUDnCDRm) when a TAUDTTINm input pulse occurs. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true.

## Prerequisites

- The operating mode should be set to judge mode. See Table 32.99, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function.
- TAUDTTOUTm is not used with this function.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid edge is detected or TAUDnTS.TAUDnTSm is set to 1 , the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. TAUDnCNTm reloads the value of TAUDnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches $0000_{\mathrm{H}}$ before a TAUDTTINm valid edge is detected, TAUDnCNTm overflows and is set to $\mathrm{FFFF}_{\mathrm{H}}$. It then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

## Conditions

The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:

- If TAUDnCMORm.TAUDnMD0 $=0$, INTTAUDnIm is generated when TAUDnCNTm $\leq$ TAUDnCDRm.
- If TAUDnCMORm.TAUDnMD0 $=1$, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.

| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Independent operation, set to 0 . |
| 10 to 8 | TAUDnSTS[2:0] | 001: Valid edge of the TAUDTTINm input signal is used as an external start trigger. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0001: Judge mode |
| 0 | TAUDnMD0 | 0 : INTTAUDnlm is generated when TAUDnCNTm $\leq$ TAUDnCDRm <br> 1: INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm |

## (2) TAUDnCMURm

Table 32.100 Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Judgment Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  |  | 10: Detection of rising and falling edges |
|  |  | 11: Setting prohibited |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval judgment function. Therefore, these registers should be set to 0 .

Table 32.101 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Judgment Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |
| TAUDnRDC.TAUDnRDCm |  |

### 32.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

Table 32.102 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

### 32.12.12 TAUDTTINm Input Signal Width Judgment Function

### 32.12.12.1 Overview

## Summary

This function compares the count value (TAUDnCNTm) for the high or low level width of a TAUDTTINm input signal and the TAUDnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUDnIm.

## Prerequisites

- The operating mode should be set to judge and one-count mode. (See Table 32.103, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function.)
- TAUDTTOUTm is not used with this function.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm input start edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid stop edge is detected, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. The counter TAUDnCNTm retains its value until the next valid TAUDTTINm start edge is detected, regardless of the result of the comparison.

If the counter reaches $0000_{\mathrm{H}}$ before a valid TAUDTTINm stop edge is detected, TAUDnCNTm overflows and is set to FFFF $_{\mathrm{H}}$. The counter then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

## Conditions

- The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:
- If TAUDnCMORm.TAUDnMD0 $=0$, INTTAUDnIm is generated when TAUDnCNTm $\leq$ TAUDnCDRm.
- If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.
- The TAUDnCMURm.TAUDnTIS[1:0] bits specify a type of width measurement:
- For high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11 $1_{\mathrm{B}}$ ), TAUDTTINm rising edge is used as a start edge and TAUDTTINm falling edge as a stop edge.
- For low width measurement (TAUDnCMURm.TAUDnTIS[1:0] $=10_{\mathrm{B}}$ ), TAUDTTINm falling edge is used as a start edge and TAUDTTINm rising edge as a stop edge.
- Setting TAUDnTS.TAUDnTSm to 1 is prohibited during operation.

### 32.12.12.2 Block Diagram and General Timing Diagram

Figure 32.72 Block Diagram of TAUDTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated when TAUDnCNTm $\leq$ TAUDnCDRm (TAUDnCMORm.TAUDnMD0 $=0$ ).
- TAUDTTINm valid start edge = rising edge, TAUDTTINm valid stop edge = falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 11 ${ }_{\mathrm{B}}$ )

Figure 32.73 General Timing Diagram of TAUDTTINm Input Signal Width Judgment Function

|  |  | Set TAUDnTS.TAUDnTSm to 1. <br> TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. |
|  |  | The following register can be changed at any time: <br> - TAUDnCDRm register | Upon detection of a TAUDTTINm start edge, TAUDnCNTm starts count down from the value of TAUDnCDRm. <br> When TAUDnCMORm.TAUDnMD0 $=0$ <br> If TAUDnCNTm $\leq$ TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. <br> When TAUDnCMORm.TAUDnMD0 $=1$ <br> If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. <br> Afterwards, this procedure is repeated. |
|  |  | Set TAUDnTT.TAUDnTTm to 1. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm stops and retains its current value. |

### 32.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

### 32.12.13.1 Overview

## Summary

This function measures the width of an individual TAUDTTINm input signal. An interrupt is generated if the TAUDTTINm input width is longer than $\mathrm{FFFF}_{\mathrm{H}}+1$.

## Prerequisites

- The operation mode must be set to One-Count Mode (see Table 32.107, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)).
- TAUDTTOUTm is not used for this function.
- The value of TAUDnCDRm must be set to $\mathrm{FFFF}_{\mathrm{H}}$.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm $=1$, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $\mathrm{FFFF}_{\mathrm{H}}$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.
When the next TAUDTTINm input start edge is detected, TAUDnCNTm loads $\mathrm{FFFF}_{\mathrm{H}}$ and starts to count down.
If the counter reaches $0000_{\mathrm{H}}$ before a stop edge is detected, an interrupt is generated.

## Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] $=10_{\mathrm{B}}$, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11 $1_{\mathrm{B}}$, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE
The counter cannot be restarted during operation.

### 32.12.13.2 Block Diagram and General Timing Diagram

Figure 32.74 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges $=$ high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11 $1_{\mathrm{B}}$ )

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 10: Detection of rising and falling edges (low width measurement) |
|  |  | 11: Detection of rising and falling edges (high width measurement) |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used by this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the Overflow Interrupt Output Function (during TAUDTTINm Width Measurement). Therefore, these registers must be set to 0 .

Table 32.109 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |
| TAUDnRDC.TAUDnRDCm |  |

### 32.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

Table 32.110 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

### 32.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

### 32.12.14.1 Overview

## Summary

This function measures the cumulative width of a TAUDTTINm input signal. If the cumulative TAUDTTINm input width is longer than $\mathrm{FFFF}_{\mathrm{H}}$, an interrupt is generated and an overflow interrupt can be output.

## Prerequisites

- The operation mode must be set to Gate Count Mode, (see Table 32.111, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)).
- TAUDTTOUTm is not used with this function.
- The value of TAUDnCDRm must be set to $\mathrm{FFFF}_{\mathrm{H}}$.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm $=1$, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $\mathrm{FFFF}_{\mathrm{H}}$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUDTTINm input start edge and then continues to count down from the current value.

When the counter reaches $0000_{\mathrm{H}}$ an interrupt is generated. $\mathrm{FFFF}_{\mathrm{H}}$ is loaded to TAUDnCNTm and the counter continues to count down until a TAUDTTINm input stop edge is detected.

## Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] $=10_{\mathrm{B}}$, the TAUDTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11 $1_{\mathrm{B}}$, the TAUDTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE
The counter cannot be restarted during operation.

### 32.12.14.2 Block Diagram and General Timing Diagram

Figure 32.76 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges $=$ high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = $11_{\mathrm{B}}$ )

|  |  | The TAUDnCNTm register can be read at all times. | TAUDnCNTm counts down. When the counter reaches $0000_{\mathrm{H}}$ : <br> - INTTAUDnIm is generated. <br> - TAUDnCNTm loads the TAUDnCDRm value ( $\mathrm{FFFF}_{\mathrm{H}}$ ) and continues to count down. <br> When TAUDTTINm input stop edge is detected during count operation: <br> - TAUDnCNTm stops and retains the current value. <br> When TAUDTTINm input start edge is detected while the counter is stopped: <br> - TAUDnCNTm counts down from the stop value. Afterwards, this procedure is repeated. |
|  |  | Set TAUDnTT.TAUDnTTm to 1. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm stops and retains its current value. |

### 32.12.15 One-Phase PWM Output Function

### 32.12.15.1 Overview

## Summary

This function adds dead time to a TAUDTTINm input signal. The resulting PWM signal is output via TAUDTTOUTm of the channel and TAUDTTOUTm of upper channels.

## Prerequisites

- Each of two (or more) channels is enabled for dead time control (TAUDnTDE.TAUDnTDEm $=1$ ).
- The operating mode for the lower channel should be set to one-count mode. (See Table 32.116, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function.)
- Any operating mode can be set to upper channels.
- Channel output mode for upper and lower channels should be set to synchronous channel output mode 2 with onephase PWM output. (See Section 32.7, Channel Output Modes.)

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm $=1$, enabling count operation.
The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.
When the counter reaches $0000_{\mathrm{H}}$, an interrupt occurs. The counter is reset to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next valid TAUDTTINm input start edge.

Table 32.115 TAUDTTOUTm to which Dead Time is Added and State of TAUDTTINm

| TAUDnCMURm. TAUDnTIS[1:0] | TAUDnTOL. TAUDnTOLm | TAUDTTOUTm to which Dead Time is Added | TAUDnTDL. TAUDnTDLm | TAUDTTINm State when Added |
| :---: | :---: | :---: | :---: | :---: |
| 10 | 0 | TAUDTTOUTm low | 0 | High |
|  |  |  | 1 | Low |
|  | 1 | TAUDTTOUTm high | 0 | High |
|  |  |  | 1 | Low |
| 11 | 0 | TAUDTTOUTm low | 0 | Low |
|  |  |  | 1 | High |
|  | 1 | TAUDTTOUTm high | 0 | Low |
|  |  |  | 1 | High |

## Conditions

- TAUDnCMURm.TAUDnTIS[1:0] bits specify the type of width measurement:
- TAUDnCMURm.TAUDnTIS[1:0] = 10 $0_{\mathrm{B}}$ : Uses both edges as valid edges for detection (Low width measurement).
- TAUDnCMURm.TAUDnTIS[1:0] = 11 ${ }_{\mathrm{B}}$ : Uses both edges as valid edges for detection (High width measurement).
- The TAUDnTDL.TAUDnTDLm bit specifies the operation of TAUDTTOUTm for each channel when an interrupt or valid TAUDTTINm edge is detected on the lower channel:
- If TAUDnTDL.TAUDnTDLm = 0 , an interrupt is used as a TAUDTTOUTm set trigger and a valid TAUDTTINm edge as a TAUDTTOUTm reset trigger.
- If TAUDnTDL.TAUDnTDLm = 1, a valid TAUDTTINm edge is used as a TAUDTTOUTm set trigger and an interrupt as a TAUDTTOUTm reset trigger.
- This function cannot make a forced restart.

### 32.12.15.2 Block Diagram and General Timing Diagram

Figure 32.78 Block Diagram of One-Phase PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges $=$ high width measurement $\left(\right.$ TAUDnCMURm.TAUDnTIS[1:0] $\left.=11_{\mathrm{B}}\right)$

This setting considers a duty as an active high.

Figure 32.79 General Timing Diagram of One-Phase PWM Output Function

### 32.12.15.3 Register Settings for Lower Channels

|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time of the positive-phase width |
| TAUDnTRE.TAUDnTREm | 1: Adds dead time of the negative-phase width |
| TAUDnTRO.TAUDnTROm | 0: Disables real-time output |
| TAUDnTRC.TAUDnTRCm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTME.TAUDnTMEm | 0: Disables the operation as a real-time output trigger channel |
| CAUTION |  |

Set TAUDnTDL.TAUDnTDLm exclusively from upper channels.

## (4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the one-phase PWM output function. Therefore, these registers should be set to 0 .

Table 32.119 Simultaneous Rewrite Settings for One-Phase PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 0: Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.12.15.4 Register Settings for Upper Channels

### 32.13 Independent Channel Real-Time Functions

This section describes functions that output the value of the TAUDnTRO.TAUDnTROm bit in real time.

### 32.13.1 Real-Time Output Function Type 1

### 32.13.1.1 Overview

## Summary

This function outputs a value of the TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated at certain specified intervals.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm $=1$ ), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger
(TAUDnTRC.TAUDnTRCm = 0).

## Prerequisites

- Channels should use the TAUDTTOUTm control of other channels.
- The operating mode for the upper channel should be set to interval timer mode. (See Table 32.122, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See Section 32.7, Channel Output Modes.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

## Functional description

The counter of the upper channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of the data register of the upper channel (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.

When the counter of the upper channel reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1). TAUDnCNTm then reloads the TAUDnCDRm value to continue operation subsequently.

The TAUDTTOUTm signal changes only when an interrupt is generated, and when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.

## Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm $=0$ ) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1 ) and TAUDnTRC.TAUDnTRCm $=0$, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt after a start or restart is not output. For details, see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |

## (2) TAUDnCMURm for Upper Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.123 Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Upper Channels

Table 32.124 Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode. (The value after reset.) |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low |
| TAUDnTRC.TAUDnTRCm | 1: Real-time output is high |
| TAUDnTME.TAUDnTMEm | 1: Channel m generates a unique real-time output trigger |

## (4) Simultaneous Rewrite for Upper Channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 1 . Therefore, these registers should be set to 0 .

Table 32.125 Simultaneous Rewrite Settings for Real-Time Output Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 0 : Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | $0:$ When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

|  |  | Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1 . <br> TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0 . | [Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 is 1 , INTTAUDnIm is generated. |
|  |  | TAUDnCDRm and TAUDnTRO.TAUDnTROm can be changed at any time. <br> The TAUDnCNTm register can be read at any time. | TAUDnCNTm counts down. When the counter reaches 0000 н: <br> - The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. <br> - INTTAUDnIm is generated. <br> - TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROm. <br> Afterwards, this procedure is repeated. |
|  |  | Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm stops. Both TAUDnCNTm and TAUDTTOUTm retain their current values. |

### 32.13.1.7 Specific Timing Diagrams

Figure 32.82 TAUDnCDRm $=000 \mathbf{0 H}^{\boldsymbol{H}}, \mathrm{TAUDnCMORm}$. TAUDnMD0 $=1$

- The value of TAUDTTOUTm changes according to the setting of TAUDnTRO.TAUDnTROm with a delay of one PCLK cycle.

### 32.13.2 Real-Time Output Function Type 2

### 32.13.2.1 Overview

## Summary

This function outputs the value of TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm $=1$ ), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger
(TAUDnTRC.TAUDnTRCm = 0).

## Prerequisites

- Channels should use the TAUDTTOUTm control of the other channels.
- The operating mode for the upper channel should be set to capture mode. (See Table 32.128, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See Section 32.7, Channel Output Modes.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

## Functional description

The counter for upper channels is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This sets TAUDnTE.TAUDnTEm to 1 , enabling count operation. The counter starts to count up.

When a valid TAUDTTINm input edge is generated on one of upper channels, an interrupt occurs and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1).

The TAUDTTOUTm signal changes only when an interrupt is generated, and when TAUDTTOUTm value is different from the current value of TAUDnTRO.TAUDnTROm during the occurrence of the interrupt.

## Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm $=0$ ) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm $=0$, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt after a start or restart is not output. For details, see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

### 32.13.2.2 Block Diagram and General Timing Diagram

Figure 32.83 Block Diagram of Real-Time Output Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=0$ )

Figure 32.84 General Timing Diagram of Real-Time Output Function Type 2

### 32.13.2.3 Register Settings for Upper Channels

## (4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

### 32.13.2.5 Operating Procedure for Real-Time Output Function Type 2

Table 32.133 Operating Procedure for Real-Time Output Function Type 2

### 32.13.2.6 Specific Timing Diagrams

## (1) Operation Start and Stop

Figure 32.85 Operation Start and Stop (TAUDnCMORm.TAUDnMDO $=0$ )

- When TAUDnTS.TAUDnTSm is set to 1 , the counter starts counting up.
- When a valid input edge is detected, the current value of the counter is written to the data register (TAUDnCDRm) and an interrupt is generated.
- TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) and the counter resets and starts to count up again.
- The TAUDTTOUTm signal only changes when an interrupt is generated, and then only when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.
- If the counter is stopped (TAUDnTE.TAUDnTEm $=0$ ), valid input edges are ignored and no interrupt is generated.

### 32.14 Independent Channel Simultaneous Rewrite Functions

This section describes functions that carry out simultaneous rewrite.

### 32.14.1 Simultaneous Rewrite Trigger Generation Function Type 1

### 32.14.1.1 Overview

## Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm $=1$ ), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

## Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operating mode for the upper channel should be set to interval timer mode. (See Table 32.134, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1.)
- For the operating mode that can be set for lower channels, see Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite.
- TAUDTTOUTm is not used for any channel in this function.

## Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1 . This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of the data register buffer for upper channels (TAUDnCDRm buf) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value. The counter for lower channels start to count according to the selected operating mode.

Once the counter reaches $0000_{\mathrm{H}}$, an interrupt occurs on the channel. The current value of the corresponding TAUDnCDRm buffer is loaded into TAUDnCNTm to continue operation subsequently.

If the channel where an interrupt occurs is specified as a trigger channel for simultaneous rewrite (TAUDnRDC.TAUDnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

## Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit should be set to 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated. For details, see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

### 32.14.1.2 Equations

Simultaneous rewrite trigger generation cycle $=$ count clock cycle $\times($ TAUDnCDRm +1$)$
To control simultaneous rewrite, the following condition should be satisfied:
[PWM]
TAUDnCDRm $=[($ value of TAUDnCDRm of master channel subject to simultaneous rewrite +1$) \times$ number of interrupts] - 1
[Triangle PWM]
TAUDnCDRm $=[($ value of TAUDnCDRm of master channel subject to simultaneous rewrite +1$) \times 2 \times$ number of interrupts] - 1

That is, the ratio of TAUDnCDRm +1 and value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

For triangle PWM, remember that the cycle doubles.

### 32.14.1.3 Block Diagram and General Timing Diagram

Figure 32.86 Block Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=1$ )

Figure 32.87 General Timing Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

### 32.14.1.4 Register Settings for Upper Channels

(1) TAUDnCMORm for Upper Channels

Table 32.134 Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Independent operation. Set to 0. |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm not generated at the beginning of operation. |
|  |  | 1: INTTAUDnIm generated at the beginning of operation. |

(2) TAUDnCMURm for Upper Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.135 Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Upper Channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.
(4) Simultaneous Rewrite for Upper Channels

Table 32.136 Simultaneous Rewrite Settings for Upper Channels in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 1: Selects one of upper channels as simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Loads a simultaneous rewrite control signal when the master channel starts counting. |
| TAUDnRDC.TAUDnRDCm | 1: Monitors INTTAUDnIm signal which triggers a simultaneous rewrite on the channel. |

### 32.14.1.5 Register Settings for Lower Channels

(1) TAUDnCMORm for Lower Channels

TAUDnCMORm register for lower channels must follow the TAUDnCMORm register settings in the operating mode which can be set. (See Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite.)

## (2) TAUDnCMURm for Lower Channels

TAUDnCMURm register for lower channels must follow the TAUDnCMURm register settings in the operating mode which can be set. (See Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite.)

## (3) Channel Output Mode for Lower Channels

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see Table 32.50, Simultaneous Rewrite Methods and when They are Triggered.

## (4) Simultaneous Rewrite for Lower Channels

Table 32.137 Simultaneous Rewrite Settings for Lower Channels in Simultaneous Rewrite Trigger Generation Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 1: Selects one of upper channels as simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Loads a simultaneous rewrite control signal when the master channel starts counting. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

### 32.14.2 Simultaneous Rewrite Trigger Generation Function Type 2

### 32.14.2.1 Overview

## Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

## Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operation mode of the upper channel must be set to Capture Mode (see Table 32.139, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2).
- For the operation mode that can be set for a lower channel, see Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite.

## Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1 . This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter for the upper channel starts to count up, and then the counter for lower channels start to count according to the selected operating mode.

When a TAUDTTINm input edge occurs on the upper channel, an interrupt is generated. The trigger is detected by the lower channel(s), which then also generate an interrupt.

When TAUDnRDC.TAUDnRDCm $=1$ on the upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers.
The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

## Conditions

- The channel which is monitored for INTTAUDnIm is specified by setting TAUDnRDC.TAUDnRDCm $=1$ for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1 , an interrupt is generated when the function starts. For details see Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts.

### 32.14.2.2 Block Diagram and General Timing Diagram

Figure 32.88 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=1$ )
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )
- Upper channel (CH1) generates simultaneous rewrite trigger.

Figure 32.89 General Timing Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

### 32.14.2.3 Register Settings for Upper Channels

(1) TAUDnCMORm for Upper Channels

|  |  | Set TAUDnTT.TAUDnTTm to 1. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm stops and it retains its current value. |

### 32.15 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the timer array unit D. For a general overview of synchronous channel operation, see Section 32.2, Overview.

This section describes functions that generate PWM signals at regular intervals.

### 32.15.1 PWM Output Function

### 32.15.1.1 Overview

## Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty cycle of the TAUDTTOUTm to be set. The pulse cycle is set in the master channel. The duty cycle is set in the slave channel.

## Prerequisites

- Two channels
- The operating mode for the master channel should be set to interval timer mode. (See Table 32.146, Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function.)
- The operating mode for the slave channels should be set to one-count mode. (See Table 32.149, Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to Synchronous Channel Output Mode 1. (See Section 32.7, Channel Output Modes.)

## Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This sets TAUDnTE.TAUDnTEm $=1$, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm, and the counter starts counting down from the TAUDnCDRm value. If an INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set/reset, PWM output is made.

- Master channel:

When the master channel counter reaches $0000_{\mathrm{H}}$ and the pulse cycle time has passed, INTTAUDnIm is generated. The counter loads TAUDnCDRm value into TAUDnCNTm and counts down.

- Slave channel:

When INTTAUDnIm is generated on the master channel, the counter operation of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts counting down from the TAUDnCDRm value. TAUDTTOUTm signal is set to the active level.
When the counter reaches to $0000_{\mathrm{H}}$ (duty time has elapsed), INTTAUDnIm is generated and a TAUDTTOUTm signal is set to an inactive level. The counter is reset to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next INTTAUDnIm (start of the next pulse cycle) of the master channel.

The counter can stop operating by setting the TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 .

## Conditions

Set Simultaneous rewrite with this function. See Section 32.6, Simultaneous Rewrite.

### 32.15.1.2 Equations

Pulse cycle $=($ TAUDnCDRm $($ master $)+1) \times$ count clock cycle
Duty cycle [\%] = $($ TAUDnCDRm $($ slave $) /($ TAUDnCDRm $($ master $)+1)) \times 100$

- Duty cycle = 0\%

TAUDnCDRm (slave) $=0000_{\mathrm{H}}$

- Duty cycle = 100\%

TAUDnCDRm (slave) $\geq$ TAUDnCDRm (master) +1

### 32.15.1.3 Block Diagram and General Timing Diagram

Figure 32.90 Block Diagram of PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.91 General Timing Diagram of PWM Output Function

## NOTES

1. The interval between the start of the count and an interrupt being generated is the value of corresponding TAUDnCDRm +1 .
2. TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.1.4 Register Settings for the Master Channel

| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 1: INTTAUDnIm generated at the beginning of operation. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.147 Contents of the TAUDnCMURm Register for the Master Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Master Channel

The channel output mode is not used with this function.

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.148 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

## NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires a channel higher than the master channel that operates with Section 32.14.1, Simultaneous Rewrite Trigger Generation Function Type 1.

Conduct operation settings under the following conditions:

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1 TAUDnCDRm settings for this channel are as follows:
$=(($ TAUDnCDR setting for the master channel targeted for simultaneous rewrite +1$) \times$ interrupt count $)-1$
- Master channel: TAUDnRDCm $=0$, TAUDnRDSm $=1$
- Slave channel: TAUDnRDCm $=0$, TAUDnRDSm $=1$

If TAUDnCDRm (slave) setting > TAUDnCDRm (master) setting +1 , the duty value (which exceeds $100 \%$ ) is aggregated to be $100 \%$ output.

### 32.15.1.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Table 32.149 Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Start trigger during operation is valid. |

(2) TAUDnCMURm for Slave Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.150 Contents of the TAUDnCMURm Register for the Slave Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channels

Table 32.151 Control Bit Settings in Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic <br> 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | 0: Disables real-time output |
| TAUDnTRE.TAUDnTREm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRO.TAUDnTROm | 0: Disables modulation |
| TAUDnTRC.TAUDnTRCm |  |

## (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.152 Simultaneous Rewrite Settings for Slave Channels of PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.1.6 Operating Procedure for PWM Output Function

Table 32.153 Operating Procedure for PWM Output Function

### 32.15.1.7 Specific Timing Diagrams

(1) Duty cycle $=0 \%$

Figure 32.92 TAUDnCDRm (Slave) $=0000_{\mathrm{H}}$, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- Every time the master channel generates an interrupt (INTTAUDnIm), $0000_{\mathrm{H}}$ is loaded into TAUDnCNTm (slave). As a result, a slave channel interrupt (INTTAUDnIm) is generated at the same time and TAUDTTOUTm remains inactive.
- TAUDnCDRm value is loaded into TAUDnCNTm (slave) to generate an interrupt.
(2) Duty cycle $=100 \%$

Figure 32.93 TAUDnCDRm (Slave) $\geq$ TAUDnCDRm (Master) +1
Positive Logic $($ TAUDnTOL.TAUDnTOLm $($ Slave $)=0)$

- If TAUDnCDRm (slave) value is greater than TAUDnCDRm (master) value, the slave channel counter does not reach $0000_{\mathrm{H}}$ and consequently, no interrupt occurs. TAUDTTOUTm remains active.
(3) Operation Stop and Restart

Figure 32.94 Operation Stop and Restart
Positive Logic (TAUDnTOL.TAUDnTOLm $($ Slave $)=0)$

- The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 .
- TAUDnCNTm and TAUDTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm of master and slave channels to 1 . TAUDnCDRm values of the master and slave channels are loaded to TAUDnCNTm and start to count down from these values.

### 32.15.2 One-Shot Pulse Output Function

### 32.15.2.1 Overview

## Summary

This function outputs a signal pulse with a specific pulse width and delay time (both defined relative to an external input signal pulse) by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

## Prerequisites

- Two channels
- The operating mode for the master channel should be set to one-count mode. (See Table 32.154, Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function.)
- The operating mode for slave channels should be set to pulse one-count mode. (See Table 32.157, Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channel should be set to independent channel output mode 2. (See Section 32.7, Channel Output Modes.)
- TAUDTTINm (master) has to be detected while TAUDnCNTm (master) and TAUDnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUDTTINm (slave).

## Functional description

The counters are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1 for the master and slave channels. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:

When the next valid TAUDTTINm input edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm. The counter starts to count down from this value. If TAUDnCMORm.TAUDnMD0 $=0$, a trigger (TAUDTTINm) which is detected within the delay time is ignored.
When the counter of master channel reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated. The counter is reset to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next valid TAUDTTINm input edge.

- Slave channel:

INTTAUDnIm generated on master channel triggers the counter operation of slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave). The counter starts counting down from this value. An interrupt occurs and the TAUDTTOUTm signal is set.
When the counter reaches $0001_{\mathrm{H}}$, INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter stops at $0000_{\mathrm{H}}$ and waits for the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Setting TAUDnTS.TAUDnTSm to 1 while counting allows the counter to restart counting of master channel without making a stop (forced restart).

## Conditions

- If TAUDnCMORn.TAUDnMD0 of master channel is set to 0 , TAUDTTINm input edges detected during counting are ignored.
- Simultaneous rewrite can be used with this function. See Section 32.6, Simultaneous Rewrite.

### 32.15.2.2 Equations

Delay from trigger input to pulse output

$$
=(\text { TAUDnCDRm }(\text { master })+1) \times \text { count clock cycle }
$$

Pulse width $=($ TAUDnCDRm (slave $)) \times$ count clock cycle

### 32.15.2.3 Block Diagram and General Timing Diagram

Figure 32.95 Block Diagram of One-Shot Pulse Output Function

The following settings apply to the general timing diagram.

- Start trigger detection is disabled during counting (TAUDnCMORm.TAUDnMD0 $=0$ ).
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.96 General Timing Diagram of One-Shot Pulse Output Function

### 32.15.2.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.154 Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output $=$ CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.

| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| :--- | :--- | :--- |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to $\mathbf{8}$ | TAUDnSTS[2:0] | 001: Valid TAUDTTINm input edge signal is used as the start trigger |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 0: Disables detection of start trigger during count operation. <br>  |
|  |  | The value of the MD0 bits of the master and slave channels must be identical. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/w | R | R | R | R | R | R | R/W | R/W |

Table 32.155 Contents of the TAUDnCMURm Register for the Master Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  |  | 10: Detection of rising and falling edges |
|  |  | 11: Setting prohibited |

(3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.156 Simultaneous Rewrite Settings for the Master Channel of One-Shot Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.2.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Table 32.157 Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnlm of master channel is a start trigger. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1010: Pulse one-count mode |
| 0 | TAUDnMD0 | 0: Disables detection of start trigger during count operation. |
|  |  | 1: Enables start trigger detection while counting. |
|  |  | The MD0 bits of the master and slave channels must be identical. |

(2) TAUDnCMURm for Slave Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.158 Contents of the TAUDnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Slave Channel

Table 32.159 Control Bit Settings in Independent Channel Output Mode 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0 0 |
| TAUDnTDL.TAUDnTDLm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0 |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

## (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.160 Simultaneous Rewrite Settings for Slave Channels of One-Shot Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | $0:$ Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | $0:$ Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | $0:$ Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 32.161 Operating Procedure for One-Shot Pulse Output Function

### 32.15.2.7 Specific Timing Diagrams

(1) TAUDnCDRm (master) $=\mathbf{0 0 0 0}{ }_{H}$

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.97 TAUDnCDRm (Master) $=0000^{H}$

- When a valid TAUDTTINm input edge is detected, the value $0000_{\mathrm{H}}$ is written to TAUDnCNTm (master). The counter is set to $0000_{\mathrm{H}}$ for one count and returns to $\mathrm{FFFF}_{\mathrm{H}}$.
Thus the slave channel starts to count down one count clock later than TAUDTTINm (master).
(2) TAUDnCDRm (slave) $=\mathbf{0 0 0 0}_{\mathrm{H}}$

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.98 TAUDnCDRm (Slave) $=0000_{H}$

- TAUDTTOUTm remains inactive, because the pulse width is zero.

## (3) TAUDnCMORm.TAUDnMD0 $=1$

The following settings apply to this diagram.

- Enables start trigger detection while counting. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.99 TAUDnCMORm.TAUDnMD0 $=1$

- If a valid TAUDTTINm input edge is detected while the counter of the master channel counts down, TAUDnCNTm reloads the value of TAUDnCDRm. The counter restarts to count down.
This means the delay is extended by the value of TAUDnCNTm at the time when a valid TAUDTTINm input edge is detected.

## (4) Restarting the Master Channel while the Slave Channel is Counting

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.100 TAUDTTINm input interval $\leq$ Delay Time + Pulse Width +1

- If the master channel generates an interrupt before the counter of the slave channel has reached $0001_{\mathrm{H}}$ or exactly when $0001_{\mathrm{H}}$ is reached ${ }^{* 1}$, the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUDnCDRm (slave) is reloaded. An interrupt is generated and TAUDTTOUTm toggles. If TAUDnCNTm (master) has started to count down while the TAUDnCNTm (slave) is still counting*2, TAUDTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

### 32.15.3 Trigger Start PWM Output Function

### 32.15.3.1 Overview

## Summary

This function generates a PWM output using a master and a slave channel. It enables the pulse cycle (frequency) and the duty of the TAUDTTOUTm to be set. The pulse cycle is specified using the master channel. The duty is specified using the slave channel. The Trigger Start PWM Output Function is identical to PWM Output Function except that the master channel of this function can be reset by a valid TAUDTTINm input edge.

## Prerequisites

- Two channels
- The operation mode of the master channel must be set to Interval Timer Mode (see Table 32.162, Contents of the TAUDnCMORm Register for the Master Channel of the Trigger Start PWM Output Function).
- The operation mode of the slave channel must be set to One-Count Mode (see Table 32.165, Contents of the TAUDnCMORm Register for the Slave Channel of the Trigger Start PWM Output Function).
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode of the slave channel must be set to Synchronous Channel Output Mode 1 (see Section 32.6, Simultaneous Rewrite).

## Functional description

The counters (master and slave) are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1 . This in turn sets TAUDnTE.TAUDnTEm to 1 , enabling count operation. The current value of TAUDnCDRm is loaded to TAUDnCNTm, and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel, and a PWM output is realized by setting and resetting TAUDTTOUTm (slave).

- Master channel:

The current value of TAUDnCDRm is loaded to the counter (TAUDnCNTm), INTTAUDnIm is generated and the counter starts to count down from this value.
When the counter reaches $0000_{\mathrm{H}}$ and the pulse cycle time has elapsed, INTTAUDnIm is generated and the counters (master and slave) load the current TAUDnCDRm values.
If a valid TAUDTTINm input edge is detected, the counter of the master channel loads the current TAUDnCDRm value, restarts counting down and generates an interrupt.

- Slave channel:

When the slave detects an interrupt from the master channel, it starts to count down from the current value of TAUDnCDRm. The TAUDTTOUTm signal is set to the active level.
When the counter reaches $0000_{\mathrm{H}}$ (duty time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal is reset. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1 .

## Conditions

Simultaneous rewrite can be used with this function. See Section 32.6, Simultaneous Rewrite.

### 32.15.3.2 Equations

Pulse cycle $=($ TAUDnCDRm $($ master $)+1) \times$ count clock cycle
Duty cycle [\%] = [TAUDnCDRm (slave) $/($ TAUDnCDRm (master) +1$)] \times 100$

- Duty cycle $=0 \%$
TAUDnCDRm (slave) $=0000_{\mathrm{H}}$
- Duty cycle $=100 \%$

TAUDnCDRm (slave) $\geq$ TAUDnCDRm (master) +1

### 32.15.3.3 Block Diagram and General Timing Diagram

Figure 32.101 Block Diagram for Trigger Start PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] $=01_{\mathrm{B}}$ )
- Positive logic (TAUDnTOL.TAUDnTOLm (slave) = 0)

Figure 32.102 General Timing Diagram for Trigger Start PWM Output Function

## NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.3.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.162 Contents of the TAUDnCMORm Register for the Master Channel of the Trigger Start PWM Output Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |

## (3) Channel Output Mode for the Master Channel

The channel output mode is not used by this function.

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.164 Simultaneous Rewrite Settings for the Master Channel of the Trigger Start PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | $0:$ Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | $0:$ Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.3.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Table 32.165 Contents of the TAUDnCMORm Register for the Slave Channel of the Trigger Start PWM Output Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output = CK0 <br> 01: Prescaler output = CK1 <br> 10: Prescaler output = CK2 <br> 11: Prescaler output = CK3 <br> The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Start trigger during operation is valid. <br> The value of the TAUDnMD[0] bit of the master and slave channels must be identical. |

## (2) TAUDnCMURm for Slave Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.166 Contents of the TAUDnCMURm Register for the Slave Channel of the Trigger Start PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Slave Channel

Table 32.167 Control Bit Settings in Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic <br> 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | 0: Disables real-time output |
| TAUDnTRE.TAUDnTREm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRO.TAUDnTROm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTRC.TAUDnTRCm | 0: Disables modulation |
| TAUDnTME.TAUDnTMEm |  |

## (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.168 Simultaneous Rewrite Settings for the Slave Channel of the Trigger Start PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.3.6 Operating Procedure for Trigger Start PWM Output Function

Table 32.169 Operating Procedure for Trigger Start PWM Output Function

### 32.15.3.7 Specific Timing Diagrams

(1) Duty cycle $=0 \%$

Figure 32.103 TAUDnCDRm (Slave) $=0000_{\mathrm{H}}$,
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)
Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00 ${ }_{B}$ )

- Every time the master channel generates an interrupt (INTTAUDnIm), $0000_{\mathrm{H}}$ is written to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).
(2) Duty cycle $=100 \%$

Figure 32.104 TAUDnCDRm (Slave) $\geq$ TAUDnCDRm (Master) + 1,
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) $=0$ )
Falling Edge Detection (TAUDnCMURm.TIS[1:0] $=00_{B}$ )

- If the value TAUDnCDRm (slave) is higher than the value TAUDnCDRm (master), the counter of the slave channel cannot reach $0000_{\mathrm{H}}$ and cannot generate interrupts.
The TAUDTTOUTm remains at active state.
The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).
(3) TAUDTTINm Detection and Active Slave Counter

Figure 32.105 Positive Logic (TAUDnTOL.TAUDnTOLm $($ Slave $)=0)$
Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\text {B }}$ )

- If TAUDnCNTm (slave) reloads the value TAUDnCDRm (slave) while it is still counting down, TAUDTTOUTm remains unchanged and extends the duty.
The duty does not correspond to the value of the slave's data register.

### 32.15.4 Delay Pulse Output Function

### 32.15.4.1 Overview

## Summary

This function outputs two signals. The pulse width and pulse cycle of the reference signal are defined using the master channel and slave channel 1 . Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by the amount specified on slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1 . The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified on slave channel 2.

## Prerequisites

- Four channels
- The operating mode for the master channel should be set to interval timer mode. (See Table 32.170, Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function.)
- The operating mode for slave channels 1 and 2 should be set to one-count mode. (See Table 32.173, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Delay Pulse Output Function and Table 32.177, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Delay Pulse Output Function.)
- The operating mode for slave channel 3 should be set to pulse one-count mode. (See Table 32.180, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Delay Pulse Output Function.)
- TAUDTTOUTm is not used with the master channel and slave channel 2.
- The channel output mode for slave channel 1 should be set to synchronous channel output mode 1. (See Section 32.7, Channel Output Modes.)
- The channel output mode for slave channel 3 should be set to independent channel output mode 2. (See Section 32.7, Channel Output Modes.)

## Functional description

The counters of the channel group are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1 , enabling count operation.

- Master channel:

The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel.
When the counter value of master channel reaches $0000_{\mathrm{H}}$ and pulse cycle time has elapsed, INTTAUDnIm is generated. The TAUDnCDRm value is reloaded into the counter to perform counting down.

- Slave channels 1 and 2:

Slave channels 1 and 2 start to count down from the current TAUDnCDRm value when detecting an interrupt from the master channel. TAUDTTOUTm signal (slave 1 ) is set.

- Slave channel 1:

When the counter of slave channel 1 reaches $0000_{\mathrm{H}}$ (duty time has elapsed), INTTAUDnIm is generated and

TAUDTTOUTm signal is reset. The counter is reset to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next INTTAUDnIm of master channel.

- Slave channel 2:

When the counter of slave channel 2 reaches $0000_{\mathrm{H}}$ and delay time has elapsed, INTTAUDnIm is generated. The counter is reset to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next INTTAUDnIm of master channel.
Generating INTTAUDnIm (slave channel 2) triggers the counter of slave channel 3.

- Slave channel 3:

When slave channel 3 detects an interrupt from slave channel 2, its counter starts counting down from the current value of TAUDnCDRm. INTTAUDnIm is generated and the TAUDTTOUTm signal (slave channel 3 ) is set. When the counter of slave channel 3 reaches $0001_{\mathrm{H}}$, INTTAUDnIm is generated and the TAUDTTOUTm signal is reset.
The delayed PWM pulse is output from slave channel 3.
The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1 .

## Conditions

Simultaneous rewrite can be used with this function. See Section 32.6, Simultaneous Rewrite.

### 32.15.4.2 Equations

$$
\text { Pulse cycle }=(\text { TAUDnCDRm (master) }+1) \times \text { count clock cycle }
$$

Duty width $1=($ TAUDnCDRm (slave 1$)) \times$ count clock cycle
Delay width $=($ TAUDnCDRm $($ slave 2$)+1) \times$ count clock cycle
Duty width $2=($ TAUDnCDRm (slave 3$)) \times$ count clock cycle
However, the delay width shall be set within the following range:
$0000_{\mathrm{H}} \leq$ TAUDnCDRm (slave 2 ) $<$ TAUDnCDRm (master)
NOTES

1. The waveform of TAUDTTOUTm (slave 3) becomes the waveform made by delaying the waveform of TAUDTTOUTm (slave 1) by the quantity generated by slave 2 . It is impossible to make a delay longer than the pulse cycle.
2. If INTTAUDOIm of slave 2 is generated while slave 3 is counting, slave 3 restarts operation. Therefore, the waveform of TAUDTTOUTm (slave 3) is retained on the active level. In this case, TAUDTTOUTm (slave 3) cannot output the waveform generated by delaying the basic pulse of TAUDTTOUTm (slave 1).

### 32.15.4.3 Block Diagram and General Timing Diagram

Figure 32.106 Block Diagram of Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.107 General Timing Diagram of Delay Pulse Output Function
NOTE
TAUDTTOUTm of slave channel 1 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.4.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.170 Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.

| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| :--- | :--- | :--- |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 1: INTTAUDnIm generated at the beginning of operation. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.171 Contents of the TAUDnCMURm Register for the Master Channel of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | $00:$ Unused. Set to 00. |

(3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used for the master channel with this function.

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.172 Simultaneous Rewrite Settings for the Master Channel of Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0 : Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | $0:$ Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | $0:$ Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.4.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Table 32.173 Contents of the TAUDnCMORm Register for Slave Channel 1 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.

| 13,12 | TAUDnCCS[1:0] | $00:$ Uses an operation clock as a count clock |
| :--- | :--- | :--- |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Valid start trigger during operation |

(2) TAUDnCMURm for Slave Channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.174 Contents of the TAUDnCMURm Register for Slave Channel 1 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channel 1

Table 32.175 Control Bit Settings for Slave Channel 1 in Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

## (4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.176 Simultaneous Rewrite Settings for Slave Channel 1 of Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | $0:$ Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | $0:$ Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | $0:$ Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.4.6 Register Settings for Slave Channel 2

(1) TAUDnCMORm for Slave Channel 2

Table 32.177 Contents of the TAUDnCMORm Register for Slave Channel 2 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.

| 13,12 | TAUDnCCS[1:0] | $00:$ Uses an operation clock as a count clock |
| :--- | :--- | :--- |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Valid start trigger during operation |

(2) TAUDnCMURm for Slave Channel 2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.178 Contents of the TAUDnCMURm Register for Slave Channel 2 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

(3) Channel Output Mode for Slave Channel 2

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

## (4) Simultaneous Rewrite for Slave Channel 2

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.179 Simultaneous Rewrite Settings for Slave Channel 2 of Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.4.7 Register Settings for Slave Channel 3

(1) TAUDnCMORm for Slave Channel 3

Table 32.180 Contents of the TAUDnCMORm Register for Slave Channel 3 of the Delay Pulse Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.

| 13,12 | TAUDnCCS[1:0] | $00:$ Uses an operation clock as a count clock |
| :--- | :--- | :--- |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 101: INTTAUDnIm of upper channel $(\mathrm{m}-1)$ is a start trigger regardless of master setting. |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1010: Pulse one-count mode |
| 0 | TAUDnMD0 | 1: Valid start trigger during operation |

(2) TAUDnCMURm for Slave Channel 3

| Bit | 76 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channel 3

Table 32.182 Control Bit Settings in Independent Channel Output Mode 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic <br> 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | $0:$ Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | $0:$ When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | $0:$ Disables real-time output |
| TAUDnTRE.TAUDnTREm | $0:$ When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRO.TAUDnTROm | $0:$ Disables the operation as a real-time output trigger channel |
| TAUDnTRC.TAUDnTRCm | $0:$ Disables modulation |
| TAUDnTME.TAUDnTMEm |  |

## (4) Simultaneous Rewrite for Slave Channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.183 Simultaneous Rewrite Settings for Slave Channel 3 of Delay Pulse Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Master channel is simultaneous rewrite control channel. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.4.8 Operating Procedure for Delay Pulse Output Function

Table 32.184 Operating Procedure for Delay Pulse Output Function

|  | Operation | TAUDn Status |
| :---: | :---: | :---: |
|  | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.15.4.4, Register Settings for the Master Channel. | Channel operation is stopped. |
|  | Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.15.4.5, Register Settings for Slave Channel 1. |  |
|  | Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.15.4.6, Register Settings for Slave Channel 2. |  |
|  | Slave channel 3: Set the TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.15.4.7, Register Settings for Slave Channel 3. |  |
|  | Set the value of TAUDnCDRm register of every channel. |  |

Table 32.184 Operating Procedure for Delay Pulse Output Function

|  |  | Operation | TAUDn Status |
| :---: | :---: | :---: | :---: |

|  |  | TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. <br> TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCDRm value of master channel and slave channels 1 and 2 is loaded to TAUDnCNTm and count down. <br> When the counter of master channel reaches $0000_{\mathrm{H}}$ : <br> - INTTAUDnIm (master) is generated. <br> - TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. <br> - TAUDnCDRm value is reloaded into TAUDnCNTm (slave $1 / 2$ ) to count down. <br> - TAUDTTOUTm (slave 1 ) is set. <br> When TAUDnCNTm (slave 1) reaches $0000_{\mathrm{H}}$ : <br> - INTTAUDnIm (slave 1 ) is generated. <br> - TAUDTTOUTm (slave 1 ) is reset. <br> When TAUDnCNTm (slave 2) reaches $0000_{\mathrm{H}}$ : <br> - INTTAUDnIm (slave 2) is generated. <br> - INTTAUDnIm (slave 3) is generated. <br> - TAUDTTOUTm (slave 3 ) is set. <br> - TAUDnCDRm value is reloaded into TAUDnCNTm (slave 3) to count down operation. <br> When TAUDnCNTm (slave 3) reaches 0001 ${ }_{\mathrm{H}}$ : <br> - INTTAUDnIm (slave 3) is generated. <br> - TAUDTTOUTm (slave 3) is reset. |
|  |  | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

### 32.15.4.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) $=\mathbf{1 0 0 \%}$

The following values apply to Figure 32.108, Duty Cycle (Slave 3) $\mathbf{= 1 0 0 \%}$ :

- TAUDnCDRm (master) $=000 \mathrm{~A}_{\mathrm{H}}$
- TAUDnCDRm (slave 1 ) $=000 \mathrm{~B}_{\mathrm{H}}$
- TAUDnCDRm (slave 2 ) $=0000_{\mathrm{H}}$
- TAUDnCDRm (slave 3 ) $=000 \mathrm{~B}_{\mathrm{H}}$

Figure 32.108 Duty Cycle (Slave 3) $=100 \%$

- If the value of TAUDnCDRm (slaves 1 and 3 ) is higher than the value of TAUDnCDRm (master), the counter of the slave channel 1 cannot reach $0000_{\mathrm{H}}$ and cannot generate interrupts. TAUDTTOUTm of channels 1 and 3 remain in the active state.

## (2) TAUDTTOUTm (slave 1) = TAUDTTOUTm (slave 3)

The following values apply to Figure 32.109, TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3).

- TAUDnCDRm (master) $=000 \mathrm{~A}_{\mathrm{H}}$
- TAUDnCDRm (slave 1 ) $=0005_{\mathrm{H}}$
- TAUDnCDRm (slave 2 ) $=0000_{\mathrm{H}}$
- TAUDnCDRm (slave 3 ) $=0005_{\text {н }}$

Figure 32.109 TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)

- If TAUDnCDRm (slave 2 ) $=0000_{\mathrm{H}}$, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1 . The reference pulse and the delay pulse are output with a delay of one clock count.

### 32.15.5 Offset Trigger Output Function

### 32.15.5.1 Overview

## Summary

This function generates a PWM output using a master channel and a slave channel, enabling the pulse width (duration) of the TAUDTTOUTm to be set. The pulse cycle is set by detecting a valid input edge of master channel. The pulse width is specified on the slave channel.

## Prerequisites

- Two channels
- The operating mode for the master channel should be set to capture mode. (See Table 32.185, Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function.)
- The operating mode for slave channels should be set to one-count mode. (See Table 32.188, Contents of the TAUDnCMORm Register for the Slave Channel of the Offset Trigger Output Function.)
- The output mode for slave channels should be set to synchronous channel output mode 1. (See Section 32.7, Channel Output Modes.)
- TAUDTTOUTm is not used with the master channel of this function.

## Functional description

The counter can be enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The master channel counter (TAUDnCNTm) starts to count up from $0000_{\mathrm{H}}$.

- Master channel:

When a valid TAUDTTINm input edge is detected, the current value of the counter (TAUDnCNTm) is loaded into the data register of master channel (TAUDnCDRm). INTTAUDnIm is generated and the counter restarts to count up from $0000_{\mathrm{H}}$.

- Slave channel:

If INTTAUDnIm is generated on the master channel, the TAUDTTOUTm (slave) signal is set and the counter of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts to count down from this value.

When the counter reaches $0000_{\mathrm{H}}$ (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

### 32.15.5.2 Equations

Pulse width $=($ TAUDnCDRm (slave) $) \times$ count clock cycle
Duty cycle [\%] = [TAUDnCDRm (slave)/(TAUDnCDRm (master) +1 ) $] \times 100$

- Duty cycle $=0 \%$
TAUDnCDRm (slave) $=0000_{\mathrm{H}}$
- Duty cycle = 100\%

TAUDnCDRm (slave) $\geq$ TAUDnCDRm (master) +1

### 32.15.5.3 Block Diagram and General Timing Diagram

Figure 32.110 Block Diagram of Offset Trigger Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.111 General Timing Diagram of Offset Trigger Output Function

NOTE
TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.15.5.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.185 Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection |

00: Prescaler output = CKO
01: Prescaler output = CK1
10: Prescaler output $=$ CK2
11: Prescaler output = CK3
The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.

| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| :--- | :--- | :--- |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 001: Valid TAUDTTINm input edge signal is used as the start trigger |
| 7,6 | TAUDnCOS[1:0] | 11: Capture register is updated upon detection of a valid TAUDTTINm input edge or when a <br> counter overflow occurs: |

- Detection of valid TAUDTTINm input edge: The counter value is written into TAUDnCDRm.
- Occurrence of overflow: FFFFF $_{H}$ is written into TAUDnCDRm. A valid TAUDTTINm input edge to be detected next is ignored.
TAUDnCSRm.TAUDnOVF is set when a counter overflow occurs, and cleared by setting TAUDnCSCm. TAUDnCLOV = 1 .

| 5 | Reserved | When read, the value after reset is returned, When writing, write the value after reset. |
| :--- | :--- | :--- |
| 4 to 1 | TAUDnMD[4:1] | 0010: Capture mode |
| 0 | TAUDnMD0 | 1: INTTAUDnIm generated at the beginning of operation. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.186 Contents of the TAUDnCMURm Register for the Master Channel of the Offset Trigger Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Detection of falling edge |
|  |  | 01: Detection of rising edge |
|  | 10: Detection of rising and falling edges |  |
|  | 11: Setting prohibited |  |

## (3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

## (4) Simultaneous Rewrite for the Master Channel

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0 .

Table 32.187 Simultaneous Rewrite Settings for the Master Channel of Offset Trigger Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.15.5.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Table 32.188 Contents of the TAUDnCMORm Register for the Slave Channel of the Offset Trigger Output Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Enables start trigger detection while counting. |

(2) TAUDnCMURm for Slave Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.189 Contents of the TAUDnCMURm Register for the Slave Channel of the Offset Trigger Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channels

Table 32.190 Control Bit Settings in Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic <br> 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | 0: Disables real-time output |
| TAUDnTRE.TAUDnTREm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRO.TAUDnTROm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTRC.TAUDnTRCm | 0: Disables modulation |
| TAUDnTME.TAUDnTMEm |  |

## (4) Simultaneous Rewrite for Slave Channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0 .

Table 32.191 Simultaneous Rewrite Settings for Slave Channels of Offset Trigger Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | $0:$ Disables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm $=0$ ), set these bits to 0 |
| TAUDnRDM.TAUDnRDMm |  |

### 32.15.5.6 Operating Procedure for Offset Trigger Output Function

Table 32.192 Operating Procedure for Offset Trigger Output Function

### 32.15.5.7 Specific Timing Diagrams

## (1) Duty cycle $=0 \%$

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.112 TAUDnCDRm (Slave) $=0000_{\mathrm{H}}$

- When TAUDnCDRm (slave) $=0000_{\mathrm{H}}, 0000_{\mathrm{H}}$ is written to TAUDnCNTm every time the master channel generates an interrupt (INTTAUDnIm), and TAUDnCNTm cannot start to count. The TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The slave and the master channels generate interrupts in the same cycle.

## (2) Duty cycle $=100 \%$

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] $=00_{\mathrm{B}}$ )

Figure 32.113 TAUDnCDRm (Slave) $\geq$ TAUDnCDRm (Master) + 1

- If the value TAUDnCDRm (slave) is higher than the interval of valid input edges, the counter of the slave channel cannot reach $0000_{\mathrm{H}}$ and cannot generate interrupts. The TAUDTTOUTm remains at active state.

### 32.15.6 A/D Conversion Trigger Output Function Type 1

### 32.15.6.1 Overview

## Summary

This function is identical to Section 32.15.1, PWM Output Function, except that TAUDTTOUTm is not output.
This function is enabled by setting the channel output mode for the slave to independent channel output mode controlled by software.

### 32.15.6.2 Block Diagram and General Timing Diagram

Figure 32.114 Block Diagram of A/D Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

Figure 32.115 General Timing Diagram of A/D Conversion Trigger Output Function Type 1

### 32.15.7 Triangle PWM Output Function

### 32.15.7.1 Overview

## Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels respectively.

The master channel generates a carrier cycle. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slave counter.

## Prerequisites

- Two channels
- The operating mode for the master channels should be set to interval timer mode. (See Table 32.193, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function.)
- The operating mode for slave channels should be set to count-up/-down mode. (See Table 32.197, Contents of the TAUDnCMORm Register for the Slave Channel of the Triangle PWM Output Function.)
- The channel output mode for the master channel should be set to independent channel output mode 1. (See Section 32.7, Channel Output Modes.)
- The channel output mode for slave channels should be set to synchronous channel output mode 2. (See

## Section 32.7, Channel Output Modes.)

- The following settings allow the TAUDTTOUTm signal to be at high level during the down status of a carrier cycle.
- If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
- If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0 .

## Functional description

The counters are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for every channel. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current values of TAUDnCDRm (master and slave) are loaded into TAUDnCNTm (master and slave) and the counters start counting down from these values. When the TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1 , an interrupt is generated and TAUDTTOUTm signal of master toggles.

- Master channel:

When the counter of master channel reaches $0000_{\mathrm{H}}$ (pulse cycle time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and counts down.

- Slave channel:

If INTTAUDnIm is generated on the master channel, the counter of the slave channel is triggered.

- If the slave counter is counting down, the count direction changes.
- If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts to count down.

When the counter of the slave channel reaches $0001_{\mathrm{H}}$ while counting up or down, INTTAUDnIm is generated and the TAUDTTOUTm (slave) signal is set/reset.
The counter continues count-up/-down and waits for the next INTTAUDnIm of the master channel.

Setting TAUDnTOL.TAUDnTOLm allows TAUDTTOUTm signal switching between normal phase and reverse phase during operation.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm $=0$. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

## Conditions

This function enables simultaneous rewrite. See Section 32.6, Simultaneous Rewrite.

### 32.15.7.2 Equations

Pulse cycle $=($ TAUDnCDRm $($ master $)+1) \times$ count clock cycle
$0000_{\mathrm{H}} \leq$ TAUDnCDRm (master) $<$ FFFF $_{\mathrm{H}}$
Carrier cycle $($ down $/ u p)=($ TAUDnCDRm $($ master $)+1) \times 2 \times$ count clock cycle
Duty cycle 100 [\%] =
[(TAUDnCDRm (master) + 1 - TAUDnCDRm (slave))/(TAUDnCDRm (master) +1 )] $\times 100$

- Duty cycle = [\%]

TAUDnCDRm (slave) $=0000_{\mathrm{H}}$

- Duty cycle $=0 \%$

TAUDnCDRm (slave) $\geq$ TAUDnCDRm (master) +1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Master Channel

Table 32.195 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.196 Simultaneous Rewrite Settings for the Master Channel of Triangle PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. <br>  <br> 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and <br> the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |
| NOTE |  |

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.15.7.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Table 32.197 Contents of the TAUDnCMORm Register for the Slave Channel of the Triangle PWM Output Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 111: Up/down output trigger signal of master channel |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1001: Count-up/-down mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm not generated at the beginning of operation. |

(2) TAUDnCMURm for Slave Channels

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.198 Contents of the TAUDnCMURm Register for the Slave Channel of the Triangle PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | $00:$ Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channels

Table 32.199 Control Bit Settings in Synchronous Channel Output Mode 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic <br> 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

## (4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.200 Simultaneous Rewrite Settings for Slave Channels of Triangle PWM Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. <br> 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when the master channel starts to count <br> and the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.7.6 Operating Procedure for Triangle PWM Output Function

Table 32.201 Operating Procedure for Triangle PWM Output Function

### 32.15.7.7 Specific Timing Diagrams

## (1) Duty cycle $=0 \%$

The following settings apply to the general timing diagram.

- Master channel:
- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=1$ )
- TAUDnCDRm $=\mathrm{a}=5_{\mathrm{H}}$
- Slave channel:
- TAUDnCDRm $=6_{\mathrm{H}}$

Figure 32.118 TAUDnCDRm (Slave) $\geq$ TAUDnCDRm (Master) +1

- If TAUDnCDRm (slave) value $\geq$ TAUDnCDRm (master) value +1 , INTTAUDnIm of the slave channel is not generated while counting down. TAUDTTOUTm remains low because there is no set signal to be detected.
(2) Duty cycle $=100 \%$

The following settings apply to the general timing diagram.

- Master channel:
- INTTAUDnIm is generated at the beginning of operation.
(TAUDnCMORm.TAUDnMD0 = 1)
- TAUDnCDRm $=\mathrm{a}=5_{\mathrm{H}}$
- Slave channel:
- TAUDnCDRm $=0_{\mathrm{H}}$

Figure 32.119 TAUDnCDRm (Slave) $=0000_{\mathrm{H}}$

- If TAUDnCDRm (slave) $=0000_{\mathrm{H}}$, INTTAUDnIm of the slave channel is not generated while counting up.

TAUDTTOUTm remains high because there is no reset signal to be detected.

### 32.15.8 Triangle PWM Output Function with Dead Time

### 32.15.8.1 Overview

## Summary

This function generates multiple triangle PWM outputs with a predefined dead time added by using a master and two or more slave channels. The resulting PWM signals with dead time are output via TAUDTTOUTm of the slave channels 2 and 3, enabling the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels.

Carrier cycles are generated on the master channel. The first pulse controls the down status of the slave counter and the second one controls the up status.

An interrupt on slave 2 causes TAUDTTOUTm of slave channels to be set/reset. Depending on the settings of TAUDnTDL.TAUDnTDLm, delay time is added to positive or negative logic side of the signal (i.e., whether TAUDTTOUTm is set/reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- Three channels. For slave channels 2 and 3, select even channel CH (a) and odd channel CH (a+1).
- The operating mode for the master channel should be set to interval timer mode. (See Table 32.203, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time)
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even channel (a), and slave channel 3 is an odd channel $(a+1)$. Slave channel 1 can be used as a separate timer (independent function).
- The operating mode for slave channel 2 should be set to count-up/-down mode (See Table 32.207, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time). Slave channel 2 should be an even channel.
- The operating mode for slave channel 3 should be set to one-count mode (See Table 32.211, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time). Slave channel 3 should be an odd channel.
- The channel output mode for the master channel should be set to independent channel output mode 1. (See Section 32.7, Channel Output Modes)
- The output mode for slave channels 2 and 3 should be set to synchronous channel output mode 2 with dead time output. (See Section 32.7, Channel Output Modes)
- The following settings make a TAUDTTOUTm signal at high level during the down status of the carrier cycle:
- If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
- If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1 , TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0 .

NOTE
The triangle PWM output function with dead time does not use slave channel 1 . Slave channel 1 can be used as a separate timer (independent function).

## Functional description

The counter starts by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1 , an interrupt is generated and the master's TAUDTTOUTm signal is toggled.

- Master channel:

When the counter of the master channel reaches $0000_{\mathrm{H}}$, an INTTAUDnIm is generated and the TAUDTTOUTm signal is toggled. The TAUDnCDRm value is reloaded to continue counting down.

- Slave channel 2:

If INTTAUDnIm is generated on the master channel, the counter of slave channel 2 is triggered.

- If the slave counter is counting down, the counting direction changes.
- If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts counting down.

The counter continues to count down/up and waits for the next INTTAUDnIm of the master channel.
When the counter value of slave channel 2 reaches $0001_{\mathrm{H}}$, INTTAUDnIm is generated

- Slave channel 3:

If INTTAUDnIm is generated on slave channel 2, the counter of slave channel 3 is triggered. The current value of TAUDnCDRm (slave 3) is loaded into TAUDnCNTm (slave 3) and the counter starts to count down from the TAUDnCDRm value.
When the counter reaches $0000_{\mathrm{H}}$, INTTAUDnIm occurs. The counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next INTTAUDnIm of slave channel 2.
As described in Table 32.202, Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave
Channel 2, the set/reset timing (right after occurrence of an interrupt or after dead time has elapsed) depends on the TAUDnTDL.TAUDnTDLm setting of the corresponding channel.

The setting of TAUDnTOL.TAUDnTOLm also determines whether a high level signal (TAUDnTOL.TAUDnTOLm = 0 ) or a low level signal (TAUDnTOL.TAUDnTOLm = 1) is output from the corresponding channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

TAUDTTOUTm can be $100 \%$ output by setting the TAUDnCDRm value of slave channel 2 to $0000_{\mathrm{H}}$.

## Conditions

This function enables simultaneous rewrite. See Section 32.6, Simultaneous Rewrite.
TAUDnTOL.TAUDnTOLm and TAUDnTDL.TAUDnTDLm should be set before start of count operation. Slave channels 2 and 3 should have the opposite settings of TAUDnTDL.TAUDnTDLm.

Table 32.202 Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2

| TAUDnTDL. <br> TAUDnTDLm | Count Direction of Slave Channel 2 <br> upon Occurrence of Interrupt | TAUDTTOUTm Set/Reset Timing |
| :--- | :--- | :--- | | 0 | Down | Set after elapse of dead time |
| :--- | :--- | :--- |
|  | Up | Reset right after interrupt occurs |
| 1 | Down | Set right after interrupt occurs |
|  | Up | Reset after elapse of dead time |

### 32.15.8.2 Equations

Pulse cycle $=($ TAUDnCDRm $($ master $)+1) \times$ count clock cycle
$0000_{\mathrm{H}} \leq$ TAUDnCDRm (master) $<$ FFFF $_{\mathrm{H}}$
Carrier cycle $($ down $/ u p)=($ TAUDnCDRm $($ master $)+1) \times 2 \times$ count clock cycle
PWM signal width (normal phase) $=[($ TAUDnCDRm (master) $+1-$ TAUDnCDRm (slave 2) $) \times 2-($ TAUDnCDRm (slave 3) +1 )] $\times$ count clock cycle

PWM signal width (reverse phase) $=[($ TAUDnCDRm (master) $+1-$ TAUDnCDRm (slave 2$)) \times 2+($ TAUDnCDRm (slave 3) +1 )] $\times$ count clock cycle

### 32.15.8.3 Block Diagram and General Timing Diagram

Figure 32.120 Block Diagram of Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
- INTTAUDnIm is generated at the beginning of operation.
(TAUDnCMORm.TAUDnMD0 = 1)
- Slave channel 2 :
- INTTAUDnIm not generated at the beginning of operation.
(TAUDnCMORm.TAUDnMD0 $=0$ )
- TAUDnTDL.TAUDnTDLm $=0$
- Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3:
- Enables start trigger detection during counting (TAUDnCMORm.TAUDnMD0 = 1)
- TAUDnTDL.TAUDnTDLm $=1$
- Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.121 General Timing Diagram of Triangle PWM Output Function with Dead Time

### 32.15.8.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.203 Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output $=$ CK2 <br> 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.204 Contents of the TAUDnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Master Channel

Table 32.205 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.206 Simultaneous Rewrite Setting for the Master Channel of Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. <br> 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and <br> the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

If TAUDnRDS.TAUDnRDSm = 1 , it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.15.8.5 Register Settings for Slave Channel 2

(1) TAUDnCMORm for Slave Channel 2

Table 32.207 Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 111: Up/down output trigger signal of master channel |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1001: Count-up/-down mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm not generated at the beginning of operation. |

(2) TAUDnCMURm for Slave Channel 2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.208 Contents of the TAUDnCMURm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channel 2

Table 32.209 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set <br> by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase. |
| TAUDnTRE.TAUDnTREm | 1: Adds dead time to reverse phase. |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TREm $=0)$, set this bit to 0 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |
| CAUTION |  |

Set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

## (4) Simultaneous Rewrite for Slave Channel 2

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.210 Simultaneous Rewrite Settings for Slave Channel 2 of Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and <br>  <br> the corresponding slave channel is at the peak of a triangular wave cycle. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.8.6 Register Settings for Slave Channel 3

(1) TAUDnCMORm for Slave Channel 3

Table 32.211 Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13,12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 110: Dead time output signal of the TAUDTTOUTm generation unit |
| 7,6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Enables start trigger detection while counting. |

(2) TAUDnCMURm for Slave Channel 3

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.212 Contents of the TAUDnCMURm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for Slave Channel 3

Table 32.213 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel operation |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set <br> by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase. |
| TAUDnTRE.TAUDnTREm | 1: Adds dead time to reverse phase. |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables the operation as a real-time output trigger channel |
| TAUDnTME.TAUDnTMEm | 0: Disables modulation |
| CAUTION |  |

Set TAUDnTDL.TAUDnTDLm exclusively from even channels.

## (4) Simultaneous Rewrite for Slave Channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.214 Simultaneous Rewrite Settings for Slave Channel 3 of Triangle PWM Output Function with Dead Time

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. <br>  <br> TAUDnRDM.TAUDnRDMm <br>  <br> TAUDnRDC.TAUDnRDCm an upper channel outside the channel group for simultaneous rewrite triggers. |
| 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and <br> the corresponding slave channel is at the peak of a triangular wave cycle. |  |

### 32.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 32.215 Operating Procedure for Triangle PWM Output Function with Dead Time

### 32.15.8.8 Specific Timing Diagrams

## (1) Duty cycle $=0 \%$

The following settings apply to the general timing diagram in Figure 32.122, TAUDnCDRm (Slave 2 ) $\geq$
TAUDnCDRm (Master) + 1 .

- Slave channel 2:
- Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
- Negative logic (TAUDnTDL.TAUDnTDLm = 1)

Figure 32.122 TAUDnCDRm (Slave 2 ) $\geq$ TAUDnCDRm (Master) +1

- If TAUDnCDRm (slave 2) is greater than TAUDnCDRm (master), the counter of slave channel does not reach $0000_{\mathrm{H}}$ while counting down. Therefore, TAUDTTOUTm signal is not set/reset and remains in the initial state. This signal becomes a reset signal because an interrupt occurs on slave channel 2 during count-up operation.

## (2) Duty cycle $=100 \%$

The following settings apply to the general timing diagram in Figure 32.123, TAUDnCDRm (Slave) $=\mathbf{0 0 0 0 H}$.

- Slave channel 2:
- Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
- Negative logic (TAUDnTDL.TAUDnTDLm = 1)

Figure 32.123 TAUDnCDRm (Slave) $=0000_{\mathrm{H}}$

- If TAUDnCDRm (slave 2 ) $=0000_{\mathrm{H}}$, the slave channel counter does not reach $0001_{\mathrm{H}}$ while counting up. Therefore, no INTTAUDnIm is generated during count-up operation.
- The set conditions for a channel with TAUDnTDL.TAUDnTDLm $=0$ are met after elapse of dead time. TAUDTTOUTm is left in a newly set state even if a set/reset is made because no reset conditions are satisfied on such a channel.
- Slave channel 3 in the above diagram is set when the counter starts. However, TAUDTTOUTm is left in an initial state on the slave channel with TAUDnTDL.TAUDnTDLm $=1$ because no reset conditions are satisfied on that channel.

### 32.15.9 A/D Conversion Trigger Output Function Type 2

### 32.15.9.1 Overview

## Summary

This function is identical to Section 32.15.7, Triangle PWM Output Function, except that TAUDTTOUTm is not output.

This function is enabled by setting channel output mode for the slave to independent channel output mode controlled by software.

### 32.15.9.2 Block Diagram and General Timing Diagram

Figure 32.124 Block Diagram of A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
- INTTAUDnIm is generated at the beginning of operation.
(TAUDnCMORm.TAUDnMD0 = 1)

Figure 32.125 General Timing Diagram of A/D Conversion Trigger Output Function Type 2

### 32.15.10 Interrupt Request Signals Culling Function

### 32.15.10.1 Overview

## Summary

This function divides the number of interrupts of the master channel by a specified value using a slave channel.
The interrupt request signals culling function is a sub function of the following functions:

- PWM Output Function (See Section 32.15.1, PWM Output Function)
- Triangle PWM Output Function (See Section 32.15.7, Triangle PWM Output Function)
- Triangle PWM Output Function with Dead Time (See Section 32.15.8, Triangle PWM Output Function with Dead Time)

## Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode. (See Table 32.216, Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function)
- The operation mode of the slave channel must be set to Event Count Mode. (See Table 32.219, Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function)
- This function does not use TAUDTTOUTm.

## Functional description

The counters (master and slave) are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for both channels. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the master channel and slave channel (TAUDnCDRm) are written to the counter (TAUDnCNTm).

- Master channel:

When the counter of the master channel reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated and TAUDnCDRm value is reloaded to TAUDnCNTm.

- Slave channel:

Every time the master channel generates an INTTAUDnIm, the counter of the slave channel decrements by one. When the counter reaches $0000_{\mathrm{H}}$, it awaits the next interrupt from the master channel. This causes TAUDnCNTm (slave) to reload the value of TAUDnCDRm, and an INTTAUDnIm is generated.

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm of master and slave channels stops but retains its value.

## Conditions

This function enables simultaneous rewrite. See Section 32.6, Simultaneous Rewrite.

### 32.15.10.2 Equations

Interrupt division operator $=$ TAUDnCDRm (slave channel)

- One INTTAUDnIm is generated for the INTTAUDnIm count of the master channel defined by TAUDnCDRm (slave channel) +1 .

### 32.15.10.3 Block Diagram and General Timing Diagram

Figure 32.126 Block Diagram of Interrupt Request Signals Culling Function

The following settings apply to the general timing diagram.
Master channel:

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=1$ )

Figure 32.127 General Timing Diagram of Interrupt Request Signals Culling Function

### 32.15.10.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.216 Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDNCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm not generated at the beginning of operation. |
|  |  | 1: INTTAUDnIm generated at the beginning of operation. |

## (2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.217 Contents of the TAUDnCMURm Register for the Master Channel of the Interrupt Request Signals Culling Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.218 Simultaneous Rewrite Settings for the Master Channel of Interrupt Request Signals Culling Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
|  | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started |
| and the corresponding slave channel is at the peak of triangular wave. |  |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.10.5 Register Settings for the Slave Channel

(1) TAUDnCMORm for the Slave Channel

Table 32.219 Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 11: INTTAUDnIm of the master channel is used as the count clock |
| 11 | TAUDnMAS | 0 : Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0011: Event count mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm not generated at the beginning of operation. |

(2) TAUDnCMURm for the Slave Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.220 Contents of the TAUDnCMURm Register for the Slave Channel of the Interrupt Request Signals Culling Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Slave Channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite for the Slave Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.221 Simultaneous Rewrite Settings for the Slave Channel of Interrupt Request Signals Culling Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Selects a master channel for simultaneous rewrite triggers. |
|  | 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
|  | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started |
| and the corresponding slave channel is at the peak of triangular wave. |  |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |

### 32.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function

Table 32.222 Operating Procedure for Interrupt Request Signals Culling Function

### 32.15.10.7 Specific Timing Diagrams

(1) Interrupt count (master) = interrupt count (slave)

Figure 32.128 TAUDnCDRm (Slave) $=0000_{\mathrm{H}}$

- If TAUDnCDRm $=0000_{\mathrm{H}}$, the TAUDnCDRm value of the slave channel is loaded into TAUDnCNTm each time INTTAUDnIm of master channel is detected. In other words, TAUDnCNTm is always $0000_{\mathrm{H}}$.
- Therefore, an interrupt occurs on the master channel and simultaneously an interrupt occurs on slave channels.

### 32.16 Synchronous Non-Complementary and Complementary Modulation Output Functions

This section describes functions that generate 6-phase PWM output or triangle PWM output using a master channel and seven slave channels.

### 32.16.1 Non-Complementary Modulation Output Function Type 1

### 32.16.1.1 Overview

## Summary

This function outputs a PWM signal, a high-level signal, or a low-level signal from TAUDTTOUTm depending on the values of the real-time output bits (TAUDnTRO.TAUDnTROm) and the modulation output enable bits (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

## Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See Table 32.224, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1).
- The operating mode for slave channels 1 to 7 should be set to one-count mode (See Table 32.227, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1, and Table 32.230, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1).
- TAUDTTOUTm is not used with the master channel of this function.
- TAUDTTOUTm of slave channel 1 is not used with this function, but TAUDnTRC.TAUDnTRCm should be set to 1 (See Section 32.7, Channel Output Modes).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 1 with noncomplementary modulation output (See Section 32.7, Channel Output Modes).
- TAUDnCDRm of slave channel 1 should be set to $0000_{\mathrm{H}}$.

## Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This sets TAUDnTE.TAUDnTEm $=1$, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down. When the counter reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated.

- Slave channel 1:

Slave channel 1 is set as a channel that triggers real-time output (TAUDnTRC.TAUDnTRCm = 1). If an interrupt occurs on slave channel 1 (TAUDnCDRm is fixed to $0000_{\mathrm{H}}$ ), the value of real-time output bit (TAUDnTRO.TAUDnTROm) of the channel that monitors the interrupt on slave channel 1 is reflected to the TAUDTTOUTm output. After that, the counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and waits for the next interrupt of master channel.

- Slave channel 2 :

Slave channel 2 generates a PWM output. The master channel specifies a PWM output cycle and slave channel 2 specifies a duty cycle. After generating an interrupt, the counter returns to $\mathrm{FFFF}_{\mathrm{H}}$ and awaits the next interrupt from the master channel.

Slave channels 3 to 7 operate like slave channel 2.
As described in Table 32.223, TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0), a signal output from TAUDTTOUTm depends on the value of the real-time output bit (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of slave channel.

This function cannot use a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1 .

## Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm $=0$ ):
- If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
- If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
- If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
- If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1 , high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 32.223 TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)

| TAUDNTME.TAUDnTMEm | TAUDnTRO.TAUDnTROm | TAUDTTOUTm Output |
| :--- | :--- | :--- |
| 0 | 0 | Low level |
|  | 1 | High level |
| 1 | 0 | Low level |
|  | 1 | PWM (positive logic) |

- This function enables simultaneous rewrite. See Section 32.6, Simultaneous Rewrite.
- TAUDnCDRm value of slave channel 1 should be set to $0000_{\mathrm{H}}$ so that a real-time output is triggered at the same time with PWM generation on slave channels 2 to 7 .
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7 , TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0 .
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0 .

### 32.16.1.2 Equations

Slave channels 2 to 7 :
Pulse period $=[$ TAUDnCDRm (master) +1$] \times$ count clock cycle
Duty time $=[$ TAUDnCDRm (slave) $] \times$ count clock cycle

### 32.16.1.3 Block Diagram and General Timing Diagram

Figure 32.129 Block Diagram of Non-Complementary Modulation Output Function Type 1

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.130 General Timing Diagram of Non-Complementary Modulation Output Function Type 1
NOTE
TAUDTTOUTm of slave channel 2 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

### 32.16.1.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.224 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output $=$ CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 1: INTTAUDnIm is generated at the beginning of operation or at a restart time. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.225 Contents of the TAUDnCMURm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

(3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.226 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when <br> TAUDnRDS.TAUDnRDSm $=0$. |
| NOTE |  |

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires an upper channel higher than the master channel that operates with Section 32.14.1, Simultaneous Rewrite Trigger Generation Function Type 1.

Conduct operation settings under the following conditions.

- Simultaneous rewrite trigger output function type 1 setting channel: $\operatorname{TAUDnRDCm}=1$, TAUDnRDSm $=1$ In addition, TAUDnCDRm settings for this channel are as follows.
$=(($ TAUDnCDR setting for the master channel targeted for simultaneous rewrite +1$) \times$ Interrupt count $)-1$
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm $=0$, TAUDnRDSm $=1$

### 32.16.1.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Table 32.227 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Start trigger during operation is valid. |

(2) TAUDnCMURm for Slave Channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.228 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

## CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

## (4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.229 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. |
|  | 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master |
| channel for simultaneous rewrite triggers, regardless of the value of this bit, when |  |
|  | TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.1.6 Register Settings for Slave Channels 2 to 7

(1) TAUDnCMORm for Slave Channels 2 to 7

Table 32.230 Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 100: INTTAUDnIm of master channel is a start trigger. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Start trigger during operation is valid. |

(2) TAUDnCMURm for Slave Channels 2 to 7

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.231 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

(3) Channel Output Mode for Slave Channels 2 to 7

Table 32.232 Control Bit Settings in Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low. |
| TAUDnTRC.TAUDnTRCm | 1: Real-time output is high. |
| TAUDnTME.TAUDnTMEm | 0: Disper channel generates a real-time output trigger for channel m. |

## (4) Simultaneous Rewrite of Slave Channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.233 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when <br> TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1

Table 32.234 Operating Procedure for Non-Complementary Modulation Output Function Type 1

|  | Operation | TAUDn Status |
| :---: | :---: | :---: |
|  | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.16.1.4, Register Settings for the Master Channel. | Channel operation is stopped. |
|  | Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.16.1.5, Register Settings for Slave Channel 1. |  |
|  | Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.16.1.6, Register Settings for Slave Channels 2 to 7. |  |
|  | Set the value of TAUDnCDRm register of every channel. Set a pulse cycle with TAUDnCDRm of master channel, 0000 H in TAUDnCDRm of slave channel 1, and duty width with TAUDnCDRm of slave channels 2 to 7 . |  |
|  | Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1. |  |

Table 32.234 Operating Procedure for Non-Complementary Modulation Output Function Type 1

|  | Operation | TAUDn Status |
| :--- | :--- | :--- |
|  | Set TAUDnTS.TAUDnTSm of master and slave channels <br> to 1 simultaneously. | TAUDnTE.TAUDnTEm of master and slave channels is set <br> to 1 and the counter starts counting down. |

### 32.16.1.8 Specific Timing Diagrams

The following settings apply to the specific timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.131 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 1

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and master channel cycle.
According to the modified setting, modulation waveforms are output from TAUDTTOUTm.
A TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

### 32.16.2 Non-Complementary Modulation Output Function Type 2

### 32.16.2.1 Overview

## Summary

This function outputs a triangular PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output enable bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

## Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See Table 32.236, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2).
- The operating mode for slave channel 1 should be set to event count mode (See Table 32.240, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2).
- The operating mode for slave channels 2 to 7 should be set to count-up/-down mode (See Table 32.243, Contents of the TAUDnCMORm Register for Slave Channels 2 to $\mathbf{7}$ of Non-Complementary Modulation Output Function Type 2).
- The output mode for the master channel should be set to independent channel output mode 1. (See Section 32.7, Channel Output Modes.)
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See Section 32.7, Channel Output Modes).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with noncomplementary modulation output (See Section 32.7, Channel Output Modes).

## Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 . This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm).

- Master channel:

The counter of master channel starts to count down. When the counter reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated.

- Slave channel 1:

When slave channel 1 detects an interrupt from the master channel, the TAUDnCNTm value is decremented. When an interrupt from the master channel is detected (TAUDnCDRm +1 ) times, INTTAUDnIm is generated. Then, the TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.
Since slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm $=1$ ), if an interrupt occurs on slave channel 1, the real-time output bit (TAUDnTRO.TAUDnTROm) of the channel which monitors an interrupt on the corresponding channel is reflected to the TAUDTTOUTm output.

- Slave channel 2:

Once detecting an interrupt from the master channel, TAUDnCNTm counts in the reverse direction. When an interrupt is detected during count-up operation, TAUDnCDRm value is reloaded and then the counter starts to count down.
If TAUDnCNTm $=0001_{\mathrm{H}}$, an interrupt occurs and a PWM output signal is set/reset.
The combined use of the master channel and slave channel 2 generates a PWM output signal. The master channel generates a PWM output cycle and slave channel 2 generate a duty cycle.

Slave channels 3 to 7 operate like slave channel 2.
A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm) and a modulation output bit value (TAUDnTME.TAUDnTMEm) of the slave channel, as described in Table 32.235,
TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0).

This function cannot make a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

## Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
- If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
- If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm $=0$ ):
- If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
- If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1 , high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 32.235 TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)

| TAUDnTME.TAUDnTMEm | TAUDnTRO.TAUDnTROm | TAUDTTOUTm Output |
| :--- | :--- | :--- |
| 0 | 0 | Low level |
|  | 1 | High level |
| 1 | 0 | Low level |
|  | 1 | PWM (positive logic) |

- This function enables simultaneous rewrite. See Section 32.6, Simultaneous Rewrite.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7 , TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0 .
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0 .

### 32.16.2.2 Equations

Slave channels 2 to 7:
Carrier cycle (down/up) $=[$ TAUDnCDRm (master) +1$] \times 2 \times$ count clock cycle
Duty time $=[$ TAUDnCDRm (master) $+1-$ TAUDnCDRm (slave) $] \times 2 \times$ count clock cycle

### 32.16.2.3 Block Diagram and General Timing Diagram

Figure 32.132 Block Diagram of Non-Complementary Modulation Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.133 General Timing Diagram of Non-Complementary Modulation Output Function Type 2

### 32.16.2.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.236 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 1: Master channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0000: Interval timer mode |
| 0 | TAUDnMD0 | 0 : INTTAUDnIm is not generated at the beginning of operation or at a restart time. <br> 1: INTTAUDnIm is generated at the beginning of operation or at a restart time. |

## (2) TAUDnCMURm for the Master Channel

Table 32.237 Contents of the TAUDnCMURm Register for the Master channel of Non-Complementary Modulation Output Function Type 2

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Master Channel

Table 32.238 Control Bit Settings for the Master Channel in Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | $0:$ Independent channel output |
| TAUDnTOC.TAUDnTOCm | $0:$ Operating mode 1 (toggle mode with TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | $0:$ The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | $0:$ Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | $0:$ When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm | $0:$ Disables real-time output |
| TAUDnTRE.TAUDnTREm | $0:$ When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRO.TAUDnTROm | $0:$ Disables modulation |
| TAUDnTRC.TAUDnTRCm |  |

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.239 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br>  <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and <br> the corresponding slave channel is at the peak of a triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. |
| NOTE |  |

If TAUDnRDS.TAUDnRDSm = 1 , it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.16.2.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Table 32.240 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 11: INTTAUDnIm of the master channel is used as the count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 000: Trigger the counter using software. |
|  |  | 011: Triggers simultaneous rewrite. |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0011: Event count mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

(2) TAUDnCMURm for Slave Channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.241 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

## CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

## (4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.242 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started <br> and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when <br> TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.2.6 Register settings for slave channels 2 to 7

(1) TAUDnCMORm for Slave Channels 2 to 7

Table 32.243 Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0 : Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 111: The up/down output trigger signal of the master channel |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1001: Count-up/-down mode |
| 0 | TAUDnMD0 | 0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

(2) TAUDnCMURm for Slave Channels 2 to 7

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.244 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

(3) Output Mode for Slave Channels 2 to 7

Table 32.245 Control Bit Settings in Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low. |
| TAUDnTRC.TAUDnTRCm | 1: Real-time output is high. |
| TAUDnTME.TAUDnTMEm | 0: The upper channel generates the real-time output trigger for channel modulation |

## (4) Simultaneous Rewrite for Slave Channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.246 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br>  <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started <br> and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when |
|  | TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2

Table 32.247 Operating Procedure for Non-Complementary Modulation Output Function Type 2

|  | Operation | TAUDn Status |
| :---: | :---: | :---: |
|  | Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.16.2.4, Register Settings for the Master Channel. | Channel operation is stopped. |
|  | Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.16.2.5, Register Settings for Slave Channel 1. |  |
|  | Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in Section 32.16.2.6, Register settings for slave channels 2 to 7. |  |
|  | Set the value of TAUDnCDRm register of every channel. Set pulse cycle in TAUDnCDRm of master channel, and in TAUDnCDRm of slave channel 1, set the number of interrupts from master channel to be ignored before slave channel 1 generates a real-time output trigger. Set duty width in TAUDnCDRm of slave channels 2 to 7 . |  |
|  | Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1. |  |

Table 32.247 Operating Procedure for Non-Complementary Modulation Output Function Type 2

|  | Operation | TAUDn Status |
| :--- | :--- | :--- |
|  | Set TAUDnTS.TAUDnTSm of master and slave channels <br> to 1 simultaneously. | TAUDnTE.TAUDnTEm of master and slave channels is set <br> to 1 <br> and the counter starts counting down. |

### 32.16.2.8 Specific Timing Diagrams

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.134 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 2

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

### 32.16.3 Complementary Modulation Output Function

### 32.16.3.1 Overview

## Summary

This function outputs a triangle PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm with dead time added, depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels, and an output level bit value (TAUDnTDL.TAUDnTDLm). Three pairs of channels are typically used.

## Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See Table 32.249, Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function).
- The operating mode for slave channel 1 should be set to event count mode (See Table 32.253, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function).
- The operating mode for slave channels 2, 4 and 6 should be set to count-up/-down mode (See Table 32.256, Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function).
- The operating mode for slave channels 3, 5 and 7 should be set to one-count mode (See Table 32.260, Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function).
In addition, as the number of occurrences of an interrupt for slave channels 3,5 and 7 within the carrier cycle is not uniquely determined, do not use the interrupt as an interrupt source.
- The output mode for master channels should be set to independent channel output mode 1 (See Section 32.7, Channel Output Modes).
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See Section 32.7, Channel Output Modes).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with complementary modulation output (See Section 32.7, Channel Output Modes).

## Functional description

- Master channel:

The counter of the master channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) of the master channel is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.
When the counter of master channel reaches $0000_{\mathrm{H}}$, INTTAUDnIm is generated. This decrements the counter value of slave channel 1 by 1 and the counter of slave channel 2 starts to count in the opposite direction.

- Slave channel 1:

When the counter reaches $0000_{\mathrm{H}}$, slave channel 1 waits for the next interrupt from the master channel. And the TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1) and INTTAUDnIm is generated.
Slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1). The value of real-time output bit (TAUDnTRO.TAUDnTROm) of each channel is applied to the channel that detects the occurrence of an
interrupt on slave channel 1 by an interrupt. The real-time output bit value can be changed in any timing by application software but a new value is not applied until an interrupt occurs on slave channel 1.

- Slave channel 2:

When the slave channel 2 counter reaches $0001_{\mathrm{H}}$, the slave channel 3 counter starts counting down. When the slave channel 3 counter reaches $0000_{\mathrm{H}}$, an interrupt occurs.

- Slave channels 2 and 3:

The combined use of the master channel and slave channels 2 and 3 generates a PWM output signal. The master channel generates a PWM output cycle, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time.

- Slave channels 4 to 7:

Slave channels 4 and 6 operate like slave channel 2. Slave channels 5 and 7 operate like slave channel 3.
A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm), a modulation output bit value (TAUDnTME.TAUDnTMEm), and an output level bit value (TAUDnTDL.TAUDnTDLm) of the slave channel, as described in Table 32.248, TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function.

It is, however, prohibited that a high-level signal is output from both channel 2 and channel 3 (in order to prevent a motor driver short circuit).

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1 . This sets TAUDnTE.TAUDnTEm to 0 . TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1 .

## Conditions

- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 1 (TAUDnTOL.TAUDnTOLm $=0$ ):
- If TAUDnTRO.TAUDnTROm of one channel is set to 1, TAUDTTOUTm outputs the corresponding PWM of the channel.
- If TAUDnTRO.TAUDnTROm of both channels is set to 0 , TAUDTTOUTm of a pair outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 0 (TAUDnTOL.TAUDnTOLm $=0$ ):
- If TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm of the channel outputs a high-level signal.
- If TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm of the channel outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1 , high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic.

Table 32.248 TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm $=0$ ) for a Pair of Slave Channels of Complementary Modulation Output Function

| TAUDnTME.T AUDnTME02 | TAUDnTME.T AUDnTME03 | TAUDnTRO.T AUDnTRO02 | TAUDnTRO.T AUDnTRO03 | TAUDnTDL.T AUDnTDL02 | TAUDnTDL.T AUDnTDL03 | TAUDTTOUT2 Output | TAUDTTOUT3 Output |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | X | X | Low level | Low level |
|  |  | 0 | 1 | 1 | 0 | Low level | High level |
|  |  | 1 | 0 | 0 | 1 | High level | Low level |
|  |  | 1 | 1 | X | X | Setting prohibited | Setting prohibited |
| 1 | 1 | 0 | 0 | X | X | Low level | Low level |
|  |  | 0 | 1 | 1 | 0 | ~PWM | PWM |
|  |  | 1 | 0 | 0 | 1 | PWM | $\sim$ PWM |
|  |  | 1 | 1 | X | X | Setting prohibited | Setting prohibited |

NOTES

1. In the above table, PWM indicates a positive PWM signal and ~PWM indicates an inverted PWM signal (positive logic). PWM and $\sim P W M$ are set by TAUDnTDL.TAUDnTDLm.
2. Any settings not listed above are prohibited.

- If TAUDnTME.TAUDnTMEm is continuously set to 1 while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1 , full modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the first half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1 , first-half modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the second half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1 , second-half modulation is applied.
- Whether dead time is added to a normal or reverse phase PWM signal when two channels become high-level signal outputs simultaneously depends on a TAUDnTDL.TAUDnTDLm bit value.
- If TAUDnTDL.TAUDnTDLm $=0$, dead time is added to a normal phase PWM signal.
- If TAUDnTDL.TAUDnTDLm = 1, dead time is added to a reverse phase PWM signal.
- The operation defined by a TAUDnTDL.TAUDnTDLm bit value should be conducted by application software during operation. To modify TAUDnTDL.TAUDnTDLm, rewrite it during the period when TAUDnTRO.TAUDnTROm is $00_{\mathrm{B}}$.
- The TAUDnCDRm value of slave channel 1 should be set to the value to generate INTTAUDnIm of slave channel 1 at a carrier cycle (peak interrupt timing).
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7 :
- If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0 .
- If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0 .
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7 :
- If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0 .
- If TAUDnTDL.TAUDnTDLm is set to 1 , TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0 .
- This function enables simultaneous rewrite. See Section 32.6, Simultaneous Rewrite.

### 32.16.3.2 Equations

Pulse period $=($ TAUDnCDRm $($ master $)+1) \times$ count clock cycle
$0000_{\mathrm{H}} \leq$ TAUDnCDRm (master) $<$ FFFF $_{\mathrm{H}}$
Carrier cycle $($ down $/ u p)=($ TAUDnCDRm $($ master $)+1) \times 2 \times$ count clock cycle

For slave channels 2 and 3 :
PWM signal width (positive phase) $=[($ TAUDnCDRm $($ master $)+1-$ TAUDnCDRm (slave 2$) \times 2)-($ TAUDnCDRm (slave 3) +1 ) ] $\times$ count clock cycle

PWM signal width (negative phase) $=[($ TAUDnCDRm $($ master $)+1-$ TAUDnCDRm (slave 2$) \times 2)+($ TAUDnCDRm (slave 3$)+1)] \times$ count clock cycle

For slave channels 4 to 7:
Slave channels 4 and 6 are calculated in the same way as slave channel 2, whereas slave channels 5 and 7 are calculated as slave channel 3.

### 32.16.3.3 Block Diagram and General Timing Diagram

Figure 32.135 Block Diagram of Complementary Modulation Output Function

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Slave channel 1: TAUDnCDRm $=0001_{\mathrm{H}}$
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.136 General Timing Diagram of Complementary Modulation Output Function

### 32.16.3.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.249 Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output $=$ CK2 <br> 11: Prescaler output $=$ CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |

(2) TAUDnCMURm for the Master Channel

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.250 Contents of the TAUDnCMURm Register for the Master Channel of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode for the Master Channel

Table 32.251 Control Bit Settings in Independent Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 0: Independent channel output |
| TAUDnTOC.TAUDnTOCm | 0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0) |
| TAUDnTOL.TAUDnTOLm | 0: The setting is disabled in toggle mode (the value after reset). |
| TAUDnTDE.TAUDnTDEm | 0: Disables dead time operation |
| TAUDnTDM.TAUDnTDMm | 0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0 |
| TAUDnTDL.TAUDnTDLm |  |
| TAUDnTRE.TAUDnTREm | 0: Disables real-time output |
| TAUDnTRO.TAUDnTROm | 0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0 |
| TAUDnTRC.TAUDnTRCm | 0: Disables modulation |
| TAUDnTME.TAUDnTMEm |  |

## (4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.252 Simultaneous Rewrite Settings for the Master Channel of Complementary Modulation Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started <br> and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when <br> TAUDnRDS.TAUDnRDSm $=0$. |
| NOTE |  |

If TAUDnRDS. TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

### 32.16.3.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Table 32.253 Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUDnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output $=$ CK0 <br> 01: Prescaler output $=$ CK1 |
|  |  | 10: Prescaler output $=$ CK2 <br> 11: Prescaler output $=$ CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |

(2) TAUDnCMURm for Slave Channel 1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.254 Contents of the TAUDnCMURm Register for Slave Channel 1 of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

## CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

## (4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.255 Simultaneous Rewrite Settings for Slave Channel 1 of Complementary Modulation Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. <br> 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started <br> and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when |
|  | TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.3.6 Register settings for slave channels 2, 4, and 6

(1) TAUDnCMORm for Slave Channels 2, 4, and 6

Table 32.256 Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 111: Up/down output trigger signal of master channel |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 1001: Count-up/-down mode |
| 0 | TAUDnMD0 | 0 : INTTAUDnIm is not generated at the beginning of operation or at a restart time. |

(2) TAUDnCMURm for Slave Channels 2, 4, and 6

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUDnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.257 Contents of the TAUDnCMURm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Output mode for Slave Channels 2, 4, and 6

Table 32.258 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set |
|  | by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase. |
|  | 1: Adds dead time to reverse phase. |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low. |
| TAUDnTRC.TAUDnTRCm | 1: Real-time output is high. |
| TAUDnTME.TAUDnTMEm | 0: Upper channel generates a real-time output trigger for channel m. |

CAUTION
At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

## (4) Simultaneous Rewrite for Slave Channels 2, 4, and 6

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.259 Simultaneous Rewrite Settings for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. |
|  | 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: A simultaneous rewrite trigger signal is generated when master channel starts to count and <br>  <br>  <br> the corresponding slave channel is at the peak of a triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when |
|  | TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.3.7 Register settings for slave channels 3, 5, and 7

(1) TAUDnCMORm for Slave Channels 3, 5, and 7

Table 32.260 Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUDnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
|  |  | The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical. |
| 13, 12 | TAUDnCCS[1:0] | 00: Uses an operation clock as a count clock |
| 11 | TAUDnMAS | 0: Slave channel |
| 10 to 8 | TAUDnSTS[2:0] | 110: Dead time trigger |
| 7, 6 | TAUDnCOS[1:0] | 00: Unused. Set to 00. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUDnMD[4:1] | 0100: One-count mode |
| 0 | TAUDnMD0 | 1: Enables start trigger detection while counting. |

(2) TAUDnCMURm for Slave Channels 3, 5, and 7

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 32.261 Contents of the TAUDnCMURm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUDnTIS[1:0] | 00: Unused. Set to 00. |

## (3) Output Mode for Slave Channels 3, 5, and 7

Table 32.262 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

| Bit Name | Setting |
| :--- | :--- |
| TAUDnTOE.TAUDnTOEm | 1: Enables independent channel output mode |
| TAUDnTOM.TAUDnTOMm | 1: Synchronous channel output |
| TAUDnTOC.TAUDnTOCm | 1: Operating mode 2 |
| TAUDnTOL.TAUDnTOLm | 0: Positive logic |
|  | 1: Negative logic |
| TAUDnTDE.TAUDnTDEm | 1: Enables dead time operation. |
| TAUDnTDM.TAUDnTDMm | 0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set |
|  | by TAUDnTDL.TAUDnTDLm are satisfied. |
| TAUDnTDL.TAUDnTDLm | 0: Adds dead time to normal phase. |
|  | 1: Adds dead time to reverse phase. |
| TAUDnTRE.TAUDnTREm | 1: Enables real-time output. |
| TAUDnTRO.TAUDnTROm | 0: Real-time output is low. |
| TAUDnTRC.TAUDnTRCm | 1: Real-time output is high. |
| TAUDnTME.TAUDnTMEm | 0: Disper channel generates a real-time trigger for channel m. |

CAUTION
At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from even channels.

## (4) Simultaneous Rewrite for Slave Channels 3, 5, and 7

Both the master and slave channels should have the same simultaneous rewrite settings.
Table 32.263 Simultaneous Rewrite Settings for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

| Bit Name | Setting |
| :--- | :--- |
| TAUDnRDE.TAUDnRDEm | 1: Enables simultaneous rewrite. |
| TAUDnRDS.TAUDnRDSm | 0: Monitors master channel for simultaneous rewrite triggers. |
|  | 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers. |
| TAUDnRDM.TAUDnRDMm | 1: Simultaneous rewrite trigger signal is generated when master channel counter is started <br> and the corresponding slave channel is at the peak of triangular wave. |
| TAUDnRDC.TAUDnRDCm | 0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master <br> channel for simultaneous rewrite triggers, regardless of the value of this bit, when |
|  | TAUDnRDS.TAUDnRDSm $=0$. |

### 32.16.3.8 Operating Procedure for Complementary Modulation Output Function

Table 32.264 Operating Procedure for Complementary Modulation Output Function

Table 32.264 Operating Procedure for Complementary Modulation Output Function

|  |  | Operation | TAUDn Status |
| :---: | :---: | :---: | :---: |
| иo!̣eләdo れణısəy |  | Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. <br> TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down. |
|  |  | TAUDnCDRm, TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can be changed at any time. <br> TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. <br> TAUDnRDT.TAUDnRDTm can be changed during operation. | TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. TAUDnCDRm value of slave channel 1 is loaded and the counter waits for a master channel interrupt. When the counter of master channel reaches $0000_{\mathrm{H}}$ : <br> - INTTAUDnIm is generated. <br> - TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. <br> - TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for the next master channel interrupt. <br> - TAUDnCNTm of slave channels 2,4 , and 6 reloads the TAUDnCDRm value, or performs counting in opposite direction. <br> - At the same timing when the TAUDnCDRm value of slave channels 2,4 , and 6 is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. <br> - The counter of slave channel 1 waits for the next interrupt from the master channel when reaching $0000_{\mathrm{H}}$. When the interrupt is detected: <br> - TAUDnCDRm value is reloaded into TAUDnCNTm and the counter waits for the next master channel interrupt. <br> - INTTAUDnIm is generated. <br> - TAUDnTRO.TAUDnTROm is changeable. <br> - When the counter of slave channels 2, 4, and 6 reaches $0001_{\mathrm{H}}$ : <br> - INTTAUDnIm is generated. <br> - PWM output of slave channel $m$ is set/reset (when the specified condition of the channel output mode is matched). <br> - TAUDnCDRm value of slave channels 3,5 , and 7 is loaded into TAUDnCNTm to perform counting down. <br> - When the counter of slave channels 3,5 , and 7 reaches $0000_{\mathrm{H}}$ : <br> - INTTAUDnIm is generated. <br> - PWM output of slave channel $m$ is set/reset (when the specified condition of the channel output mode is matched). |
|  |  | Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. <br> TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0 . | TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. <br> TAUDnCNTm and TAUDTTOUTm stop and retain their current values. |

### 32.16.3.9 Specific Timing Diagrams

The following settings apply to the timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 $=0$ )
- Slave channel 1: TAUDnCDRm $=0001_{H}$
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

Figure 32.137 Specific Timing Diagram of Complementary Modulation Output Function

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

A modulated PWM output signal and TAUDnTRO.TAUDnTROm bit value are output from slave channels 2 and 3.
TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm settings are reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is specified by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

NOTE
Dead time is added to suppress simultaneous change of PWM edges of normal and reverse phases.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, TAUDnTRO.TAUDnTROm, and TAUDnTDL.TAUDnTDLm can be changed.

## Section 33 Timer Array Unit J (TAUJ)

This section contains a generic description of the timer array unit J (TAUJ).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUJ.

### 33.1 Features of RH850/F1KH, RH850/F1KM TAUJ

### 33.1.1 Number of Units and Channels

This microcontroller has the following number of TAUJ units and channels.
Table $33.1 \quad$ Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 <br> 176 Pins | RH850/F1KH-D8 <br> 233 Pins | RH850/F1KH-D8 <br> 324 Pins |
| :--- | :--- | :--- | :--- |
| Number of Units | 4 | 4 | 4 |
| Name | TAUJn <br> $(n=0$ to 3) | TAUJn <br> $(n=0$ to 3$)$ | TAUJn <br> $(n=0$ to 3$)$ |

Table 33.2 Number of Units (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |

Table 33.7 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual TAUJ units are identified by the index " n "; for example, TAUJnTOM is the |
| T | ThUJn channel output mode register. <br>  <br> certain channel is denoted as $\mathrm{CHm}(\mathrm{m}=0$ to 3$)$. |
|  | The even numbered channels $(\mathrm{m}=0,2)$ are denoted as CHm_even. |
|  | The odd numbered channels $(\mathrm{m}=1,3)$ are denoted as CHm_odd. |

### 33.1.2 Register Base Addresses

TAUJn base addresses are listed in the following table.
TAUJn register addresses are given as offsets from the base addresses.
Table 33.8 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <TAUJO_base> | FFE5 $0000_{\mathrm{H}}$ |
| <TAUJ1_base> | FFE5 $1000_{\mathrm{H}}$ |
| <TAUJ2_base> | FFE5 $0100_{\mathrm{H}}$ |
| <TAUJ3_base> | FFE5 $1100_{\mathrm{H}}$ |

### 33.1.3 Clock Supply

The TAUJn clock supply is shown in the following table.
Table 33.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| TAUJ0 | PCLK | CKSCLK_ATAUJ | Timer count clock |
|  | Register access clock | CPUCLK_L, CKSCLK_ATAUJ | Bus clock |
| TAUJ1 | PCLK | CKSCLK_IPERI1 | Timer count clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI1 | Bus clock |
|  | PCLK | CKSCLK_ATAUJ | Timer count clock |
|  | Register access clock | CPUCLK_L, CKSCLK_ATAUJ | Bus clock |
| TAUJ3 | PCLK | CKSCLK_IPERI1 | Timer count clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI1 | Bus clock |

### 33.1.4 Interrupt Requests

TAUJn interrupt requests are listed in the following table.
Table 33.10 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| TAUJO |  |  |  |
| INTTAUJOIO | Channel 0 interrupt | 80 | 21 |
| INTTAUJOI1 | Channel 1 interrupt | 81 | 80 |
| INTTAUJOI2 | Channel 2 interrupt | 82 | 81 |
| INTTAUJOI3 | Channel 3 interrupt | 83 | 22 |
| TAUJ1 |  |  |  |
| INTTAUJ1IO | Channel 0 interrupt | 168 | 46 |
| INTTAUJ1I1 | Channel 1 interrupt | 169 | 100 |
| INTTAUJ112 | Channel 2 interrupt | 170 | 47 |
| INTTAUJ1I3 | Channel 3 interrupt | 171 | 101 |
| TAUJ2 |  |  |  |
| INTTAUJ2IO | Channel 0 interrupt | 277 | 103 |
| INTTAUJ2I1 | Channel 1 interrupt | 278 | 104 |
| INTTAUJ2I2 | Channel 2 interrupt | 279 | 105 |
| INTTAUJ2I3 | Channel 3 interrupt | 280 | 106 |
| TAUJ3 |  |  |  |
| INTTAUJ3I0 | Channel 0 interrupt | 281 | 107 |
| INTTAUJ3I1 | Channel 1 interrupt | 282 | 108 |
| INTTAUJ3I2 | Channel 2 interrupt | 283 | 109 |
| INTTAUJ3I3 | Channel 3 interrupt | 284 | 110 |

### 33.1.5 Reset Sources

TAUJn reset sources are listed in the following table. TAUJn is initialized by these reset sources.
Table 33.11 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| TAUJ0 | All reset sources except the transition to DeepSTOP mode (AWORES) |
| TAUJ1 | All reset sources (ISORES) |
| TAUJ2 | All reset sources except the transition to DeepSTOP mode (AWORES) |
| TAUJ3 | All reset sources (ISORES) |

### 33.1.6 External Input/Output Signals

External input/output signals of TAUJn are listed below.
Table 33.12 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| TAUJO |  |  |
| TAUJTTIN0, TAUJTTIN1 | Channel 0, 1 input | TAUJOIO, TAUJOI1 |
| TAUJTTIN2 | Channel 2 input | TAUJOI2 or RTCAOOUT*1 or TAUJTTOUTO (TAUJ1)*1 |
| TAUJTTIN3 | Channel 3 input | TAUJOI3 or RTCAOOUT*1 ${ }^{1}$ or TAUJTTOUT0 (TAUJ1)*1 |
| TAUJTTOUT0 to TAUJTTOUT3 | Channel 0 to 3 output | TAUJ0O0 to TAUJ0O3 |
| TAUJ1 |  |  |
| TAUJTTIN0 to TAUJTTIN3 | Channel 0 to 3 input | TAUJ1I0 to TAUJ1I3 |
| TAUJTTOUTO to TAUJTTOUT3 | Channel 0 to 3 output | TAUJ1O0 to TAUJ1O3 |
| TAUJ2 |  |  |
| TAUJTTIN0, TAUJTTIN1 | Channel 0, 1 input | TAUJ2I0, TAUJ2I1 |
| TAUJTTIN2 | Channel 2 input | TAUJ212 or TAUJTTOUT0(TAUJ3)*1 |
| TAUJTTIN3 | Channel 3 input | TAUJ213 or TAUJTTOUT0(TAUJ3)*1 |
| TAUJTTOUT0 to TAUJTTOUT3 | Channel 0 to 3 output | TAUJ2O0 to TAUJ2O3 |
| TAUJ3 |  |  |
| TAUJTTIN0 to TAUJTTIN3 | Channel 0 to 3 input | TAUJ3I0 to TAUJ3I3 |
| TAUJTTOUTO to TAUJTTOUT3 | Channel 0 to 3 output | TAUJ3O0 to TAUJ3O3 |

Note 1. For details, see Section 33.1.8, TAUJO / TAUJ2 Input Selection.

### 33.1.7 Internal Input/Output Signals

The internal input/output signals of TAUJn are listed below.
Table 33.13 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Connected to |
| :--- | :--- | :--- |
| TAUJnTSSTm*1 | Simultaneous channel start trigger input | PIC |

Note 1. $\mathrm{n}=1$ only. TAUJOTSSTm is not connected to PIC.

### 33.1.8 TAUJO / TAUJ2 Input Selection

TAUJ0 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)
The $1-\mathrm{Hz}$ pulse output (RTCA0OUT) from RTCA0 and the output (TAUJTTOUT0) from TAUJ1 can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

Figure 33.1 Selection of Signals Input to TAUJO

## TAUJ2 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

The output from TAUJ3 (TAUJTTOUT0) can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

Figure 33.2 Selection of Signals Input to TAUJ2

The following table shows how to select signals input to the TAUJ.
Table 33.14 TAUJO Input Selections

| Input Signal | Function | Settings |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | SELB <br> TAUJOI3 | SELB <br> TAUJOI2 | SELB <br> TAUJOI1 | SELB <br> TAUJOIO |
| TAUJTTIN2 | Port TAUJOI2 | - | - | - | 0 |
|  | RTCA0OUT (Real-time clock 1-Hz output) | - | 0 | - | 1 |
|  | TAUJTTOUT0 (TAUJ1) | - | 1 | - | 1 |
| TAUJTTIN3 | Port TAUJOI3 | - | - | 0 | - |
|  | RTCA0OUT (Real-time clock 1-Hz output) | 0 | - | 1 | - |
|  | TAUJTTOUT0 (TAUJ1) | 1 | - | 1 | - |

Table 33.15 TAUJ2 Input Selections

| Input Signal |  | Settings |  |
| :--- | :--- | :--- | :--- |
|  | TAUJTTIN2 | SELB <br> TAUJ211 | SELB <br> TAUJ210 |
|  | Port TAUJ212 | - | 0 |
|  | TAUJTTOUT0 (TAUJ3) | - | 1 |

### 33.1.8.1 List of Registers

Input signal selection register is listed in the following table.
Table 33.16 List of Registers

| Module Name | Register Name | Symbol | Address |
| :--- | :--- | :--- | :--- |
| TAUJn input selection registers |  |  |  |
| SL_TAUJn | TAUJTTINm input signal selection register | SELB_TAUJOI | FFE5 4000 |
|  | TAUJTTINm input signal selection register | SELB_TAUJ2I | FFE5 4004 |

### 33.1.8.2 SELB_TAUJOI — TAUJTTINm Input Signal Selection Register

This register selects the TAUJ0 input signals.

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | FFE5 4000 |
| Value after reset: | 00 H |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SELB_TAUJOI3 | SELB_TAUJOI2 | SELB_TAUJOI1 | SELB_TAUJOIO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 33.17 SELB_TAUJOI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after |
|  |  | reset. |
| 3 | SELB_TAUJOI3 | Selection of TAUJTTIN3 input signal: |
|  |  | 0: RTCAOOUT |
|  | 1: TAUJTTOUT0 (TAUJ1) |  |
| 2 | SELB_TAUJOI2 | Selection of TAUJTTIN2 input signal: |
|  |  | 0: RTCAOOUT |
|  |  | 1: TAUJTTOUTO (TAUJ1) |
| 1 |  | SELB_TAUJOI1 |
|  |  | Selection of TAUJTTIN3 input signal: |
|  |  | 1: Timert TAUJOI3 |
|  |  | Selection of TAUJTTIN2 input signal: |
|  |  | 0: Port TAUJOI2 |
|  |  | 1: Timer Input |
|  |  |  |

### 33.1.8.3 SELB_TAUJ2I — TAUJTTINm Input Signal Selection Register

This register selects the input signals to several TAUJ2 inputs.

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | FFE5 4004 |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | SELB_TAUJ2I1 | SELB_TAUJ210 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/w | R/W |

Table 33.18 SELB_TAUJ2I Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing to these bits, write the value after |
|  |  | reset. |
| 1 | SELB_TAUJ2I1 | Selection of TAUJTTIN3 input signal: |
|  |  | 0: Port TAUJ2I3 |
|  | 1: TAUJTTOUT0 (TAUJ3) |  |
| 0 | SELB_TAUJ2IO | Selection of TAUJTTIN2 input signal: |
|  |  | 0: Port TAUJ2I2 |
|  | 1: TAUJTTOUT0 (TAUJ3) |  |

### 33.2 Overview

### 33.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUJ is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter TAUJnCNTm and a 32-bit data register TAUJnCDRm to hold the count start value or compare value.

It also contains several control and status registers.

## Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels.
The synchronous operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

### 33.2.2 Terms

In this section, the following terms are used.

## Independent channel operation function/synchronous operation channel operation function

TAUJ has 4 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented by using a combination of channels.

- The independent channel operation function can be used any channel independently of all other channels
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

## Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a "channel group".

A channel group has one master channel and one or more slave channels.

## Upper/lower channel

Based on the channel number m , a channel with a smaller channel number or higher channel number can be referred to as "upper" or "lower" channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2 , channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

### 33.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 33.19 Functional List of TAUJ Operations

| Operation Function | Example |
| :---: | :---: |
| Independent Channel Operation Functions | Section 33.12 |
| Interval Timer Function | Section 33.12.1 |
| TAUJTTINm Input Interval Timer Function | Section 33.12.2 |
| TAUJTTINm Input Pulse Interval Measurement Function | Section 33.12.3 |
| TAUJTTINm Input Signal Width Measurement Function | Section 33.12.4 |
| TAUJTTINm Input Position Detection Function | Section 33.12.5 |
| TAUJTTINm Input Period Count Detection Function | Section 33.12.6 |
| Overflow Interrupt Output Function (during TAUJTTINm Width Measurement) | Section 33.12.7 |
| Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection) | Section 33.12.8 |
| Synchronous Channel Operation Functions | Section 33.13 |
| PWM Output Function | Section 33.13.1 |

### 33.2.4 TAUJ I/O and Interrupt Request Signals

Figure 33.3 TAUJ I/O and Interrupt Request Signals

### 33.2.5 Block Diagram

The following figure shows the main components of the TAUJ.

Figure 33.4 Block Diagram of the TAUJ

The prefix "TAUJn" has been omitted from the register names for the sake of clarity in the above figure.

### 33.2.6 Description of Block Diagram

The following describes the functional blocks.

## Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.
Count clocks CK0 to CK2 are derived by dividing PCLK in the prescaler division factor of $2^{0}$ to $2^{15}$. The fourth count clock, CK3, is derived by dividing PCLK by a division factor that is not a power of 2 by using the baud rate generator.

## Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source.

- One of CK0 to CK3 clocks (selected by the clock selector)

## Controller

The controller controls the main operations of the counter.

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSm) and counter stop (TAUJnTT.TAUJnTTm)

When counter start is enabled, status flag TAUJnTE.TAUJnTEm is set.

## Trigger selector

The counter starts automatically when it is enabled (TAUJnTE.TAUJnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUJnTSSTm
- Valid edge of the TAUJTTINm input signal
- INTTAUJnIm from the master channel

## Simultaneous rewrite controller

Simultaneous rewrite control is enabled in synchronous operating modes. The data registers of all channels in a channel group (TAUJnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

## TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

### 33.3 Registers

### 33.3.1 List of Registers

TAUJ registers are listed in the following table.
For details about <TAUJn_base>, see Section 33.1.2, Register Base Addresses.
Table 33.20 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| TAUJn prescaler registers |  |  |  |
| TAUJn | TAUJn prescaler clock select register | TAUJnTPS | <TAUJn_base> + 90 ${ }_{\text {H }}$ |
|  | TAUJn prescaler baud rate setting register | TAUJnBRS | <TAUJn_base> + 94 ${ }_{\text {H }}$ |
| TAUJn control registers |  |  |  |
| TAUJn | TAUJn channel data register | TAUJnCDRm | <TAUJn_base> + m $\times 4_{\text {H }}$ |
|  | TAUJn channel counter register | TAUJnCNTm | <TAUJn_base> $+10_{H}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUJn channel mode OS register | TAUJnCMORm | <TAUJn_base> $+80_{H}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUJn channel mode user register | TAUJnCMURm | <TAUJn_base> + $2 \mathrm{O}_{\mathrm{H}}+\mathrm{m} \times 4_{\text {H }}$ |
|  | TAUJn channel status register | TAUJnCSRm | <TAUJn_base> $+30_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUJn channel status clear trigger register | TAUJnCSCm | <TAUJn_base> $+40_{H}+\mathrm{m} \times 4_{\mathrm{H}}$ |
|  | TAUJn channel start trigger register | TAUJnTS | <TAUJn_base> + 54 ${ }_{\text {H }}$ |
|  | TAUJn channel enable status register | TAUJnTE | <TAUJn_base> + 50 ${ }_{\text {H }}$ |
|  | TAUJn channel stop trigger register | TAUJnTT | <TAUJn_base> $+58_{\text {H }}$ |

TAUJn output registers

| TAUJn | TAUJn channel output enable register | TAUJnTOE | <TAUJn_base> + $60_{H}$ |
| :--- | :--- | :--- | :--- |
|  | TAUJn channel output register | TAUJnTO | <TAUJn_base> + $5 C_{H}$ |
|  | TAUJn channel output mode register | TAUJnTOM | <TAUJn_base> + $98_{H}$ |
|  | TAUJn channel output configuration register | TAUJnTOC | <TAUJn_base> + 9C ${ }_{H}$ |
|  | TAUJn channel output active level register | TAUJnTOL | <TAUJn_base> + $64_{H}$ |

| TAUJn reload data registers |  |  |  |
| :---: | :---: | :---: | :---: |
| TAUJn | TAUJn channel reload data enable register | TAUJnRDE | <TAUJn_base> + A0 ${ }_{\text {H }}$ |
|  | TAUJn channel reload data mode register | TAUJnRDM | <TAUJn_base> + A4H |
|  | TAUJn channel reload data trigger register | TAUJnRDT | <TAUJn_base> + 68 ${ }_{\text {H }}$ |
|  | TAUJn channel reload status register | TAUJnRSF | <TAUJn_base> + 6C ${ }_{\text {H }}$ |

| TAUJn emulation register |  |  |  |
| :--- | :--- | :--- | :--- |
| TAUJn | TAUJn emulation register | TAUJnEMU | $<{\text { TAUJn_base }>+A 8_{H}}^{l}$ |

### 33.3.2 Details of TAUJn Prescaler Registers

### 33.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3_PRE by the factor specified in TAUJnBRS.

Table 33.21 TAUJnTPS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | TAUJnPRS3[3:0] | Specifies a CK3_PRE clock. |
|  |  | The CK3_PRE clock is an input clock of the BRG unit which supplies CK3 operation clocks to all channels. |
|  |  | TAUJnPRS3[3:0] CK3_PRE Clock |
|  |  | $0000{ }^{\text {B }}$ ( PCLK/2 ${ }^{0}$ |
|  |  | $0001{ }^{\text {B }}$ |
|  |  | $0010_{\text {B }}$ PCLK/2 ${ }^{2}$ |
|  |  | $0011_{B}$ PCLK/2 ${ }^{3}$ |
|  |  | 0100 ${ }_{\text {B }}$ PCLK/2 ${ }^{4}$ |
|  |  | 0101 ${ }_{\text {B }}$ PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ PCLK/2 ${ }^{6}$ |
|  |  | 0111 ${ }_{\text {B }}$ PCLK/2 ${ }^{\text { }}$ |
|  |  | 1000 ${ }_{\text {B }}$ PCLK/2 ${ }^{8}$ |
|  |  | $1001{ }_{\text {B }}$ PCLK/2 ${ }^{9}$ |
|  |  | $1010_{\mathrm{B}}$ PCLK/2 ${ }^{10}$ |
|  |  | $1011_{B}$ PCLK/2 ${ }^{11}$ |
|  |  | $1100{ }_{\mathrm{B}} \mathrm{PCLK} / 2^{12}$ |
|  |  | $1101_{B}$ PCLK/2 ${ }^{13}$ |
|  |  | $1110_{\mathrm{B}}$ PCLK/2 ${ }^{14}$ |
|  |  | 1111 ${ }_{\text {B }}$ PCLK/2 ${ }^{15}$ |
|  |  | The above bits are rewritable only when all the counters using CK3 are stopped (TAUJnTE.TAUJnTEm = 0). |

Table 33.21 TAUJnTPS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | TAUJnPRS2[3:0] | Specifies a CK2 clock. |
|  |  | TAUJnPRS2[3:0] CK2 Clock |
|  |  | 0000 ${ }_{\text {B }}$ PCLK/2 ${ }^{\circ}$ |
|  |  | $0001{ }^{\text {B }}$ PCLK/2 ${ }^{1}$ |
|  |  | 0010 ${ }_{\text {B }}$ PCLK/2 ${ }^{2}$ |
|  |  | 0011 ${ }_{\text {B }}$ PCLK/2 ${ }^{3}$ |
|  |  | $0100{ }_{\text {B }}$ |
|  |  | 0101 ${ }_{\text {B }}$ PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ PCLK/2 ${ }^{6}$ |
|  |  | 0111 ${ }_{\text {B }}$ PCLK/2 ${ }^{7}$ |
|  |  | $1000{ }_{\text {B }}$ PCLK/2 ${ }^{8}$ |
|  |  | 1001 ${ }_{\text {B }}$ PCLK/2 ${ }^{9}$ |
|  |  | $1010_{B}$ PCLK/2 ${ }^{10}$ |
|  |  | $1011_{\mathrm{B}} \quad \mathrm{PCLK} / 2^{11}$ |
|  |  | $1100{ }_{B}$ PCLK/2 ${ }^{12}$ |
|  |  | $1101_{B}$ PCLK/2 ${ }^{13}$ |
|  |  | $1110_{\mathrm{B}}$ PCLK/2 ${ }^{14}$ |
|  |  | $1111_{\mathrm{B}} \quad \mathrm{PCLK} / 2{ }^{15}$ |
|  |  | The above bits are rewritable only when all the counters using CK2 are stopped (TAUJnTE.TAUJnTEm = 0). |
| 7 to 4 | TAUJnPRS1[3:0] | Specifies a CK1 clock. |
|  |  | TAUJnPRS1[3:0] CK1 Clock |
|  |  | $0000{ }^{\text {B }}$ P PCLK/2 ${ }^{\text { }}$ |
|  |  | 0001 B PCLK/2 ${ }^{1}$ |
|  |  | $0010_{B}$ PCLK/2 ${ }^{2}$ |
|  |  | $0011_{\text {B }} \quad$ PCLK/2 ${ }^{3}$ |
|  |  | 0100 ${ }_{\text {B }}$ PCLK/2 ${ }^{4}$ |
|  |  | 0101 ${ }_{\text {B }}$ PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ PCLK/2 ${ }^{6}$ |
|  |  | 0111 ${ }_{\text {B }}$ PCLK/2 ${ }^{7}$ |
|  |  | 1000 ${ }_{\text {B }}$ PCLK/2 ${ }^{8}$ |
|  |  | $1001_{\text {B }}$ PCLK/2 ${ }^{9}$ |
|  |  | $1010_{\mathrm{B}}$ PCLK/2 ${ }^{10}$ |
|  |  | $1011_{\mathrm{B}} \quad \mathrm{PCLK} / 2^{11}$ |
|  |  | $1100{ }_{B}$ |
|  |  | $1101_{B}$ PCLK/2 ${ }^{13}$ |
|  |  | $1110_{B} \quad \mathrm{PCLK} / 2^{14}$ |
|  |  | $1111_{\mathrm{B}}$ PCLK/2 ${ }^{15}$ |
|  |  | The above bits are rewritable only when all the counters using CK1 are stopped (TAUJnTE.TAUJnTEm = 0). |

Table 33.21 TAUJnTPS Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 3 to 0 | TAUJnPRS0[3:0] | Specifies a CKO clock. |  |
|  |  | TAUJnPRSO[3:0] | CKO Clock |
|  |  | 0000 ${ }_{\text {B }}$ | PCLK/2 ${ }^{0}$ |
|  |  | 0001 B | PCLK/2 ${ }^{1}$ |
|  |  | 0010 ${ }_{\text {B }}$ | PCLK/2 ${ }^{2}$ |
|  |  | $0011_{B}$ | PCLK/2 ${ }^{3}$ |
|  |  | $0100{ }_{\text {B }}$ | PCLK/2 ${ }^{4}$ |
|  |  | 0101B | PCLK/2 ${ }^{5}$ |
|  |  | 0110 ${ }_{\text {B }}$ | PCLK/2 ${ }^{6}$ |
|  |  | 0111 ${ }_{\text {B }}$ | PCLK/2 ${ }^{7}$ |
|  |  | 1000 B | PCLK/2 ${ }^{8}$ |
|  |  | 1001B | PCLK/2 ${ }^{9}$ |
|  |  | 1010 ${ }_{\text {B }}$ | PCLK/2 ${ }^{10}$ |
|  |  | 1011 ${ }_{\text {B }}$ | PCLK/2 ${ }^{11}$ |
|  |  | 1100 ${ }_{\text {B }}$ | PCLK/2 ${ }^{12}$ |
|  |  | 1101B | $\mathrm{PCLK} / 2^{13}$ |
|  |  | 1110 ${ }_{\text {B }}$ | PCLK/2 ${ }^{14}$ |
|  |  | $1111_{\text {B }}$ | PCLK/2 ${ }^{15}$ |
|  |  | The above bits (TAUJnTE.TAU | counters using CKO are stopped |
| NOTE |  |  |  |
| TAUJn clock input PCLK is defined in the first part of this section, Section 33.1.3, Clock Supply. |  |  |  |

### 33.3.2.2 TAUJnBRS - TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.
CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ TAUJ__base> $+94_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

|  | TAUJnBRS[7:0] |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/w | R/W | R/W |

Table 33.22 TAUJnBRS Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 7 to 0 | TAUJnBRS[7:0] | Specifies a CK3_PRE clock division factor for generating CK3. |  |
|  |  | TAUJnBRS[7:0] | CK3 Clock |
|  |  | $00000000{ }_{B}$ | CK3_PRE/ 1 |
|  |  | $00000001_{B}$ | CK3_PRE/2 |
|  |  | $00000010_{B}$ | CK3_PRE / 3 |
|  |  | $00000011_{\text {B }}$ | CK3_PRE / 4 |
|  |  | ... | ... |
|  |  | 1111 1110 ${ }_{\text {B }}$ | CK3_PRE / 255 |
|  |  | 1111 1111 ${ }_{\text {B }}$ | CK3_PRE / 256 |

### 33.3.3 Details of TAUJn Control Registers

### 33.3.3.1 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

Access: This register can be read or written in 32-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUJn_base> $+0_{H}+m \times 4_{H}$
Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUJnCDR[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/w |

Table 33.23 TAUJnCDRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TAUJnCDR[31:0] | Data register for capture/compare values |

### 33.3.3.2 TAUJnCNTm - TAUJn Channel Counter Register

This is a channel m counter register.

Table 33.24 TAUJnCNTm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TAUJnCNT[31:0] | 32-bit counter value |

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counter is stopped (TAUJnTE.TAUJnTEm $=0$ ) and reenabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUJnTS.TAUJnTSm = 1) with the counter waiting for a start trigger.

Table 33.25 TAUJnCNTm Read Values after Re-Enabling Counter

| Mode Name | Count Method (Up/Down) | TAUJnCNTm |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Start Value*1 | After Stop Trigger | After One Count |
| Interval timer mode | Count down | FFFF FFFFF ${ }_{\text {H }}$ | Stop value | - |
| Capture mode | Count up | 0000 0000 ${ }_{\text {H }}$ | Stop value | - |
| One-count mode | Count down | FFFF $^{\text {FFFF }}$ H | Stop value | FFFF FFFF ${ }_{\text {H }}$ |
| Capture and one-count mode | Count up | 0000 0000 ${ }_{\text {H }}$ | Stop value | Capture value + 1 (TAUJnCDRm) |
| Count capture mode | Count up | 0000 0000 ${ }_{\text {H }}$ | Stop value | - |
| Gate count mode | Count down | FFFF FFFF ${ }_{\text {H }}$ | Stop value | Stop value |
| Capture and gate count mode | Count up | $00000000^{\text {H }}$ | Stop value | Stop value |

Note 1. The value set for TAUJnCNTm when operating mode is changed after a reset is deasserted

### 33.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel moperation.
Access: This register can be read or written in 16-bit units.
Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).
Address: <TAUJn_base> $+80_{H}+m \times 4_{H}$
Value after reset: $\quad 0000_{H}$

Table 33.26 TAUJnCMORm Register Contents

Table 33.26 TAUJnCMORm Register Contents

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 7, 6 | TAUJnCOS[1:0] | Specifies the timing for updating capture register TAUJnCDRm and overflow flag TAUJnCSRm.TAUJnOVF of channel $m$. <br> These bits are only valid if channel $m$ is for capture function. <br> The bits must be fixed to $01_{B}$ in Capture mode and Capture and gate count mode. |  |  |  |
|  |  | $\begin{aligned} & \text { TAUJn } \\ & \text { COS1 } \end{aligned}$ | $\begin{aligned} & \text { TAUJn } \\ & \text { cOSO } \end{aligned}$ | TAUJnCDRm | TAUJnCSRm.TAUJnOVF |
|  |  | 0 | 0 | Updated when valid edge of TAUJTTINm input is detected. | Updated (cleared or set) when valid edge of TAUJTTINm input is detected. <br> - Set TAUJnCSRm. <br> TAUJnOVF if a counter overflow has occurred since the last valid edge was detected. <br> - Clear TAUJnCSRm. <br> TAUJnOVF if no counter overflow has occurred since the last valid edge was detected. |
|  |  | 0 | 1 |  | Set when a counter overflow occurs and cleared by setting <br> TAUJnCSCm.TAUJnCLOV to 1. |
|  |  | 1 | 0 | Updated when valid edge of TAUJTTINm input is detected and when a counter overflow occurs. <br> - Detection of valid edge of TAUJTTINm input: The counter value is written into TAUJnCDRm. <br> - Occurrence of overflow: FFFF FFFFH is loaded into TAUJnCDRm. Detection of the next valid edge of TAUJTTINm is ignored. | No setting |
|  |  | 1 | 1 |  | Set when a counter overflow occurs and cleared by setting <br> TAUJnCSCm.TAUJnCLOV to 1. |

5 Reserved When read, the value after reset is returned. When writing, write the value after reset.

Table 33.26 TAUJnCMORm Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 to 0 | TAUJnMD[4:0] | Specifies an operating mode. |  |  |  |  |  |
|  |  | TAUJn MD4 | TAUJn MD3 | TAUJn MD2 | TAUJn MD1 | TAUJn MDO | Functional Description |
|  |  | 0 | 0 | 0 | 0 | 1/0 | Interval timer mode |
|  |  | 0 | 0 | 0 | 1 | 1/0 | Setting prohibited |
|  |  | 0 | 0 | 1 | 0 | 1/0 | Capture mode |
|  |  | 0 | 0 | 1 | 1 | 0 | Setting prohibited |
|  |  | 0 | 1 | 0 | 0 | 1/0 | One-count mode |
|  |  | 0 | 1 | 0 | 1 | 1/0 | Setting prohibited |
|  |  | 0 | 1 | 1 | 0 | 0 | Capture and one-count mode |
|  |  | 0 | 1 | 1 | 1 | 1/0 | Setting prohibited |
|  |  | 1 | 0 | 0 | 0 | 0 | Setting prohibited |
|  |  | 1 | 0 | 0 | 1 | 0 | Setting prohibited |
|  |  | 1 | 0 | 1 | 0 | 1/0 | Setting prohibited |

|  |  | 1 | 1 | 0 | 0 | 0 | Gate count mode |
|  |  | 1 | 1 | 0 | 1 | 0 | Capture and gate count mode |
|  |  | Mode |  |  | Role of TAUJnMD0 Bit |  |  |
|  |  | Interval timer mode Capture mode Count capture mode |  |  | Specifies whether INTTAUJnIm is generated at the beginning of count operation (when a start trigger is entered) or not. <br> 0 : INTTAUJnIm is not generated. <br> 1: INTTAUJnIm is generated. |  |  |
|  |  | One-count mode |  |  | Enables/disables start trigger detection during counting. <br> 0 : Disables detection. <br> 1: Enables detection. <br> CAUTION: In one-count mode, INTTAUJnIm signal is not output at the beginning of count operation. |  |  |
|  |  | Capture and one-count mode Gate count mode Capture and gate count mode |  |  | This bit should be set to 0 . <br> CAUTION: INTTAUJnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled. |  |  |

### 33.3.3.4 TAUJnCMURm - TAUJn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUJTTINm input.
Access: This register can be read or written in 8-bit units.
Address: <TAUJn_base> $+2 \mathrm{O}_{\mathrm{H}}+\mathrm{m} \times 4_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

Table 33.27 TAUJnCMURm Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |
| 1, 0 | TAUJnTIS[1:0] | Specifies a valid edge of TAUJTTINm input signal. |  |  |
|  |  | TAUJnTIS1 | TAUJnTISO | Functional Description |
|  |  | 0 | 0 | Falling edge |
|  |  | 0 | 1 | Rising edge |
|  |  | 1 | 0 | Detection of falling and rising edges (selection of low width measurement) <br> Start trigger: Falling edge <br> Stop trigger (capture): Rising edge |
|  |  | 1 | 1 | Detection of falling and rising edges (selection of high width measurement) <br> Start trigger: Rising edge <br> Stop trigger (capture): Falling edge |

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

### 33.3.3.5 TAUJnCSRm - TAUJn Channel Status Register

This register indicates the overflow status of channel m.

| Access: | This register is a read-only register that can be read in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ TAUJn_base> $+30_{H}+m \times 4_{H}$ |
| Value after reset: | $0 X_{H}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAUJnOVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | - | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 33.28 TAUJnCSRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | Reserved | When read, an undefined value is returned. |
| 0 | TAUJnOVF | Indicates the counter overflow status: |
|  | $0:$ No overflow occurs |  |
|  | 1: Overflow occurs |  |
|  |  | This bit is used only in the following modes: |
|  | - Capture mode |  |
|  |  | Capture and one-count mode |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |

### 33.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.
Access: This register is a write-only register that can be written in 8 -bit units. It is always read as $00_{\mathrm{H}}$.
Address: <TAUJn_base> $+40_{H}+m \times 4{ }_{H}$
Value after reset: $\quad 0 \mathrm{OH}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 0 | TAUJnCLOV | 0: No function |
|  |  | 1: Clears the overflow flag TAUJnCSRm.TAUJnOVF |

### 33.3.3.7 TAUJnTS - TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.
Access: This register is a write-only register that can be written in 8-bit units. It is always read as $00_{\mathrm{H}}$.
Address: <TAUJn_base> + 54 H Value after reset: $\quad 00_{\mathrm{H}}$

Table 33.30 TAUJnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 to 0 | TAUJnTSm | Enables the counter operation for channel $\mathrm{m}:$ |
|  | $0:$ No function |  |
|  | 1: Enables the counter operation and sets TAUJnTE.TAUJnTEm $=1$. |  |
|  |  | Only the counter operation is enabled even if TAUJnTE.TAUJnTEm $=1$. |
|  |  | Whether the counter is started or not depends on the selected operating mode. |

### 33.3.3.8 TAUJnTE - TAUJn Channel Enable Status Register

This register indicates whether a counter operation is enabled.
Access: This register is a read-only register that can be read in 8-bit units.
Address: <TAUJn_base> + 50 H
Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 33.31 TAUJnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. |
| 3 to 0 | TAUJnTEm | Indicates whether channel m's counter operation is enabled. |
|  | 0: Counter operation is disabled |  |
|  | 1: Counter operation is enabled |  |
|  |  | This bit is set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger |
|  | signal) is detected or when TAUJnTS.TAUJnTSm is set to 1. |  |
|  | This bit is reset to 0 when TAUJnTT.TAUJnTTm is set to 1. |  |

### 33.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.
Access: This register is a write-only register that can be written in 8 -bit units. It is always read as $00_{\mathrm{H}}$.
Address: <TAUJn_base> + 58 H Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

### 33.3.4 Details of TAUJn Simultaneous Rewrite Register

### 33.3.4.1 TAUJnRDE - TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

Access: This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm $=0$.
Address: <TAUJn_base> $+\mathrm{AO}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | TAUJnRDE03 | TAUJnRDE02 | TAUJnRDE01 | TAUJnRDE00 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 33.33 TAUJnRDE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnRDEm | Enables/disables simultaneous rewrite of the data register of channel $\mathrm{m}:$ |
|  |  | 0: Disables simultaneous rewrite |
|  | 1: Enabled simultaneous rewrite |  |

### 33.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.
Access: This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm $=0$.
Address: <TAUJn_base> + A4 H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnRDMm | Specifies when the signal that triggers simultaneous rewrite is generated: |
|  | 0: When the master channel counter starts counting |  |
|  | 1: No function |  |

These bits only apply when TAUJnRDE.TAUJnRDEm = 1.

### 33.3.4.3 TAUJnRDT - TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.
Access: This register is a write-only register that can be written in 8-bit units. It is always read as $00_{\mathrm{H}}$.
Address: <TAUJn_base> + 68 ${ }_{\text {H }}$
Value after reset: $\quad 00_{H}$

Table 33.35 TAUJnRDT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |

### 33.3.5 Details of TAUJn Output Registers

### 33.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read or written in 8-bit units.
Address: <TAUJn_base> $+60_{H}$
Value after reset: $\quad 00_{H}$

| Bit | 76 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOEm | Enables/disables independent channel output function: |
|  |  | $0:$ Disables independent timer output function (controlled by software) |
|  | 1: Enables independent timer output function |  |

### 33.3.5.2 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTTOUTm.

Access: This register can be read or written in 8-bit units.
Address: <TAUJn_base> $+5 \mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOm | Specifies and reads the level of TAUJTTOUTm: |
|  | 0: Low |  |
|  | 1: High |  |

Only TAUJnTOm bits for which Independent Channel Output function is disabled (TAUJnTOEm = 0) can be written.

### 33.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.
Access: This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 98н
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOMm | Specifies the channel output mode: |
|  | 0: Independent channel output mode |  |
|  | 1: Synchronous channel output mode |  |
|  |  |  |
|  |  | The output mode depends on the settings of channel output control |
|  |  |  |
|  |  |  |

### 33.3.5.4 TAUJnTOC - TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.
Access: This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> $+9 \mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 33.40 TAUJnTOC Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |
| 3 to 0 | TAUJnTOCm | Specifies the output mode: <br> 0 : Operation mode 1 (= Toggle mode) <br> 1: No function |  |  |
|  |  | This bit must be set to 0 for all output modes except independent channel output mode controlled by software. |  |  |
|  |  | TAUJnTOMm | TAUJnTOCm | Functional Description |
|  |  | 0 | 0 | Toggle mode: Toggling proceeds when INTTAUJnIm occurs. |
|  |  | 0 | 1 | No function |
|  |  | 1 | 0 | Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel. |
|  |  | 1 | 1 | No function |

### 33.3.5.5 TAUJnTOL - TAUJn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | $<$ TAUJn_base $>+64_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 33.41 TAUJnTOL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | TAUJnTOLm | Specifies the output logic of the channel m output bit (TAUJnTO.TAUJnTOm): |
|  | 0: Positive logic (active high) |  |
|  | 1: Negative logic (active low) |  |

These bits apply in all channel output modes except independent channel output mode controlled by software and independent channel output mode 1.

### 33.3.6 TAUJn Emulation Register

### 33.3.6.1 TAUJnEMU — TAUJn Emulation Register

This register controls operation by SVSTOP.

| Access: | This register can be read or written in 8-bit units. |
| :--- | :--- |
|  | A write should be performed when counters are stopped (TAUJnTE.TAUJnTEm $=0$ ) and (EPC.SVSTOP = 0 ). |
| Address: | $<T A U J n \_b a s e>+A 8 H$ |
| after reset: | 00 H |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TAUJn SVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 33.42 TAUJnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | TAUJnSVSDIS | When EPC. SVSTOP bit $=0$ : |
|  |  | Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). |
|  |  | When EPC.SVSTOP bit = 1: |
|  |  | 0 : The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). |
|  |  | 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 33.4 Operating Procedure

The following lists the general operation procedure for the TAUJn:
After a reset is deasserted, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

1. Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUJn function:

- Set the operation mode
- Set any other control bits

3. Enable the counter by setting the TAUJnTS.TAUJnTSm bit to 1 .

The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1 . The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSm bit to 1 .
5. Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1 .

NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in Section 33.12, Independent Channel Operation Functions and Section 33.13, Synchronous Channel Operation Functions.
2. The function can be changed while the counter is stopped (TAUJnTE.TAUJnTEm $=0$ ).

### 33.5 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.
These rules are detailed in Section 33.5.1, Rules of Synchronous Channel Operation Function.
The synchronous channel operation function are detailed in the following section.

## - Section 33.13, Synchronous Channel Operation Functions

### 33.5.1 Rules of Synchronous Channel Operation Function

## Number of master and slave channels

- Only even channels (CH0, CH2) can be set as master channels. Any channel other than CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.

Example: If CH2 is a master channel, CH 3 can be set as slave channel.

- If two master channels are used, slave channels cannot cross the master.

Example: If CH0 and CH2 are master channels, CH1 can be set as slave channel for CH0, but CH3 cannot.

## Operation clock

- The same operation clock should be set for the master channel and the synchronized slave channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave usage and operation clocks are illustrated in Figure 33.5, Grouping of Channels and Assignment of Operation Clocks.

Figure 33.5 Grouping of Channels and Assignment of Operation Clocks

### 33.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

### 33.5.2.1 Simultaneous Start and Stop within a TAUJ Unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTm bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSm bits sets the corresponding TAUJnTE.TAUJnTEm bits to 1 , enabling counting. The count start timing of the counter depends on the operating mode.

### 33.5.2.2 Simultaneous Start between TAUJ Units

Counters in different TAUJ units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see Section 36.8, Simultaneous Start Trigger Function.

### 33.6 Simultaneous Rewrite

### 33.6.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter \& count operation, and Simultaneous rewrite) are explained afterwards.

Figure 33.6 General Procedure for Simultaneous Rewrite

### 33.6.1.1 Initial Settings

- To enable simultaneous rewrite in channel $m$, set TAUJnRDE. TAUJnRDEm $=1$.
- To select simultaneous rewrite when the master channel starts counting, set TAUJnRDM.TAUJnRDMm.

### 33.6.1.2 Start Counter and Count Operation

- To start all the TAUJnCNTm counters in the channel group, set the corresponding TAUJnTS.TAUJnTSm bits to 1 . The values of TAUJnTOL.TAUJnTOLm and the data registers (TAUJnCDRm) are loaded into the corresponding TAUJnTOL.TAUJnTOLm buffer (TAUJnTOL.TAUJnTOLm buf) and data buffer registers (TAUJnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUJnRDT.TAUJnRDTm) to 1 sets the reload flag (TAUJnRSF.TAUJnRSFm) to 1, enabling simultaneous rewrite. TAUJnRSF.TAUJnRSFm remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the TAUJnRSF.TAUJnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

### 33.6.1.3 Simultaneous Rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm $=$ 1), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is complete, the TAUJnRSF.TAUJnRSFm bit is set to 0 , and the system awaits the next simultaneous rewrite trigger.

### 33.6.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- TAUJnRDE.TAUJnRDEm and TAUJnRDM.TAUJnRDMm cannot be changed while the counter is in operation (TAUJnTE.TAUJnTEm = 1).
- TAUJnTOL.TAUJnTOLm can be rewritten only during operation using the PWM output function. For all other functions, TAUJnTOL.TAUJnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUJTTOUTm outputs an invalid waveform.

### 33.6.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure with PWM output function is described in the following figure.

Figure 33.7 Simultaneous Rewrite with PWM Output Function

## Setting:

CH0 is a master channel of PWM output function, and CH1 is a slave channel of PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

## Description:

(1) When TAUJnTS.TAUJnTSm = 1 is set, the value of TAUJnCDRm is copied to the TAUJnCDRm buffer and the value of TAUJnTOL.TAUJnTOLm is copied to the TAUJnTOL.TAUJnTOLm buffer.
(2) The TAUJnCDRm and TAUJnTOL.TAUJnTOLm registers can be written at any time.
(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUJnRSF.TAUJnRSFm $=$ $0)$.
(4) The reload data trigger bit (TAUJnRDT.TAUJnRDTm) is set to 1 which sets the status flag (TAUJnRSF.TAUJnRSFm = 1), enabling simultaneous rewrite.
(5) Simultaneous rewrite is triggered when CH0 restarts counting, because simultaneous rewrite is enabled. The TAUJnCDRm value is loaded into the TAUJnCDRm buffer and the TAUJnTOL.TAUJnTOLm value is loaded into the TAUJnTOL.TAUJnTOLm buffer.
(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUJnCDRm and TAUJnTOL.TAUJnTOLm can be changed again.

### 33.7 Channel Output Modes

The output of the TAUJTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)

When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent to the output pin (TAUJTTOUTm).

- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)

When controlled by TAUJ signals, the output level of TAUJTTOUTm is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTTOUTm.

- Independently (TAUJnTOM.TAUJnTOMm = 0)

In case of independent operation, the output of the TAUJTTOUTm pin is only affected by settings of channel m . Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm $=0$ ).

- Synchronously (TAUJnTOM.TAUJnTOMm = 1)

In case of synchronous operation, the output of the TAUJTTOUTm pin is affected by settings of channel $m$ and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

## Control bits

The settings of the control bits required to select a specific channel output mode are listed in Table 33.43, Channel Output Modes.

The channel output modes are described in details below.

- Section 33.7.2, Channel Output Modes Controlled Independently by TAUJn Signals
- Section 33.7.3, Channel Output Modes Controlled Synchronously by TAUJn Signals

## Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.
The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit $=0$ when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit $=1$.

NOTE
TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

## Output logic

Positive logic or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.
The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an undefined TAUJTTOUTm signal output.

See Section 33.6, Simultaneous Rewrite.
The various channel output modes and the channel output control bits are listed in Table 33.43, Channel Output Modes.

Table 33.43 Channel Output Modes

| Channel Output Mode | TAUJnTOE.TAUJnTOEm | TAUJnTOM.TAUJnTOMm |
| :---: | :---: | :---: |
| By software |  |  |
| Independent channel output mode controlled by software | 0 | x |
| By TAUJ signals, independently |  |  |
| Independent channel output mode 1 | 1 | 0 |
| By TAUJ signals, synchronously |  |  |
| Synchronous channel output mode 1 | 1 | 1 |

- All combinations not listed in this table are forbidden.
- Bits marked with an $x$ can be set to any value.

NOTE
The following bits cannot be changed during count operation (TAUJnTE.TAUJnTEm = 1):

- TAUJnTOM.TAUJnTOMm
- TAUJnTOC.TAUJnTOCm

### 33.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm $=0$ ).
(1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTTOUTm output.
(2) Set channel output mode according to Table 33.43, Channel Output Modes, and the output logic using the TAUJnTOL.TAUJnTOLm bit.
(3) Start the counter (TAUJnTS.TAUJnTSm = 1).

Figure 33.8 General Procedure for Specifying a TAUJTTOUTm Channel Output Mode

### 33.7.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in Table 33.43, Channel Output Modes.

### 33.7.2.1 Independent Channel Output Mode 1

## Set/reset conditions

In this output mode, TAUJTTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

## Prerequisites

There are no prerequisites other than those shown in Table 33.43, Channel Output Modes.

### 33.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in Table 33.43, Channel Output Modes.

### 33.7.3.1 Synchronous Channel Output Mode 1

## Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of the master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of the master channel, i.e., the master channel is ignored.

## Prerequisites

There are no prerequisites other than those shown in Table 33.43, Channel Output Modes.

### 33.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

## CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

### 33.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUJnTS.TAUJnTSm is set to 1 . The value of data register is also loaded when the counter starts.

Figure 33.9 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode

### 33.8.2 Other Operating Modes

In other operating modes, count clock cycle is irrelevant to start of counter operation. The counter operation start timing is triggered only upon detection of a valid edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

Figure 33.10 Count Start Timing in Other Operating Modes

### 33.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The generation of INTTAUJnIm when the TAUJnCMORm.TAUJnMD0 bit starts counting and the effect to TAUJTTOUTm depend on the selected function. For details, refer to the description of TAUJnCMORm.TAUJnMD0 of each function.

Figure 33.11 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMDO $=0$ )

Figure 33.12 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMDO $=1$ )

### 33.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches FFFF FFFFh and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operations in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel.
Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches $00000000_{\mathrm{H}}$ at the same time as the first channel overflows (TAUJnCNTm = FFFF FFFFH).
- Set TAUJnCDRm of the second channel to FFFF FFFFr.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUJTTINm input.
- The trigger detection settings (TAUJnCMORm.TAUJnSTS[2:0] and TAUJnCMURm.TAUJnTIS[1:0]) must be identical for both channels.

## Result:

The down-counter of the second channel reaches $00000000_{\mathrm{H}}$ at exactly the same time as the up-counter of the first channel overflows (TAUJnCNTm = FFFF $\mathrm{FFFF}_{\mathrm{H}}$ ). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

### 33.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

When the capture trigger is input simultaneously to TAUJTTINm of both channels, INTTAUJnIm of the interval timer function can detect the overflow when TAUJnCNTm of the TAUJTTINm input position detection function exceeds FFFF FFFFH. $_{\text {. }}$

Figure 33.13 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

Timing diagram

Figure 33.14 Interrupt Generation via Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

### 33.11 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

Figure 33.15 Basic Edge Detection Timing

Figure 33.15, Basic Edge Detection Timing shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

### 33.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUJ. For a general overview of independent channel operation functions, see Section 33.2, Overview.

### 33.12.1 Interval Timer Function

### 33.12.1.1 Overview

## Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

## Functional description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches $00000000_{\mathrm{H}}$, INTTAUJnIm is generated and the TAUJTTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues operation.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 , which in turn sets TAUJnTE.TAUJnTEm to 0 . TAUJnCNTm and TAUJTTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1 . The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.

## Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated, and therefore TAUJTTOUTm does not toggle. This results in a reverted TAUJTTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1 .

### 33.12.1.2 Equations

INTTAUJnIm cycle $=$ count clock cycle $\times($ TAUJnCDRm +1$)$
TAUJTTOUTm square wave cycle $=$ count clock cycle $\times($ TAUJnCDRm +1$) \times 2$

### 33.12.1.3 Block Diagram and General Timing Diagram

Figure 33.16 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).

Figure 33.17 General Timing Diagram for Interval Timer Function

### 33.12.1.4 Register Settings

(1) TAUJnCMORm

Table 33.44 Contents of the TAUJnCMORm register for Interval Timer Function

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUJnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output CKO <br> 01: Prescaler output CK1 <br> 10: Prescaler output CK2 <br> 11: Prescaler output CK3 |
| 13, 12 | TAUJnCCS[1:0] | Write $00{ }_{\mathrm{B}}$. |
| 11 | TAUJnMAS | Write $\mathrm{O}_{\mathrm{B}}$. |
| 10 to 8 | TAUJnSTS[2:0] | Write 000 B . |
| 7, 6 | TAUJnCOS[1:0] | Write $00{ }_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write $0000{ }_{\mathrm{B}}$. |
| 0 | TAUJnMD0 | 0: INTTAUJnIm is not generated and TAUJTTOUTm does not toggle when operation starts or restarts. <br> 1: Generates INTTAUJnIm and toggles TAUJTTOUTm when operation starts or restarts. |

(2) TAUJnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUJnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 33.45 Contents of the TAUJnCMURm register for Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel Output Mode

Table 33.46 Control Bit Settings in Independent Channel Output Mode 1

| Bit name | Setting |
| :--- | :--- |
| TAUJnTOE.TAUJnTOEm | Write $1_{B}$. |
| TAUJnTOM.TAUJnTOMm | Write $0_{B}$. |
| TAUJnTOC.TAUJnTOCm | Write $0_{B}$. |
| TAUJnTOL.TAUJnTOLm | Write $0_{B}$. |
| NOTE |  |

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm $=0$. TAUJTTOUTm can then be controlled independently of the interrupts. For details see Section 33.7, Channel Output Modes.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the interval timer function. Therefore, these registers must be set to 0 .

Table 33.47 Simultaneous Rewrite Settings for Interval Timer Function

| Bit Name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm $=0$ ), <br> set these bits to 0. |

### 33.12.1.5 Operating Procedure for Interval Timer Function

Table 33.48 Operating Procedure for Interval Timer Function

|  |  | Operation | Status of TAUJn |
| :---: | :---: | :---: | :---: |
|  |  | Set the TAUJnCMORm and TAUJnCMURm registers as described in Table 33.44, Contents of the TAUJnCMORm register for Interval Timer Function and Table 33.45, Contents of the TAUJnCMURm register for Interval Timer Function. <br> Set the value of the TAUJnCDRm register. <br> Set the channel output mode by setting the control bits as described in Table 33.46, Control Bit Settings in Independent Channel Output Mode 1. | Channel operation is stopped. |
|  |  | Set TAUJnTS.TAUJnTSm to 1. <br> TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 $=1$, INTTAUJnIm is generated and TAUJTTOUTm toggles. |
|  |  | The TAUJnCDRm register value can be changed at any time. <br> The TAUJnCNTm register can be read at all times. | TAUJnCNTm counts down. When the counter reaches $00000000_{\text {H: }}$ : <br> - TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. <br> - INTTAUJnIm is generated and TAUJTTOUTm toggles. |
|  |  | Set TAUJnTT.TAUJnTTm to 1. <br> TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. <br> TAUJnCNTm and TAUJTTOUTm stop and retain their current values. |

### 33.12.1.6 Specific Timing Diagrams

(1) TAUJnCDRm $=00000000_{\mathrm{H}}$, Count Clock $=$ PCLK/2

Figure 33.18 TAUJnCDRm $=00000000_{\mathrm{H}}$, Count Clock $=$ PCLK/2

- If TAUJnCDRm $=00000000_{\mathrm{H}}$ and the count clock $=$ PCLK/2, the TAUJnCDRm value is loaded to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always $00000000_{\mathrm{H}}$.
- INTTAUJnIm is generated every count clock, resulting in TAUJTTOUTm toggling every count clock.
(2) $\mathrm{TAUJnCDRm}=0000 \mathbf{0 0 0 0}_{\mathrm{H}}$, Count Clock $=$ PCLK

Figure 33.19 TAUJnCDRm $=0000$ 0000н , Count Clock $=$ PCLK

- If TAUJnCDRm $=00000000_{\mathrm{H}}$ and the count clock $=$ PCLK, the TAUJnCDRm value is loaded to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always $00000000_{\mathrm{H}}$.
- INTTAUJnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
TAUJTTOUTm is toggled every PCLK clock.
(3) Operation Stop and Restart

Figure 33.20 Operation Stop and Restart (TAUJnCMORm.TAUJnMDO = 1)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 , which in turn sets TAUJnTE.TAUJnTEm to 0 .
- TAUJnCNTm and TAUJTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1 .

## (4) Forced Restart

Figure 33.21 Forced Restart Operation (TAUJnCMORm.TAUJnMDO $=1$ )

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1 , the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUJnCDRm value is reflected to TAUJnCNTm and counting starts. Execute a forced restart to reflect the changed TAUJnCDRm value immediately.

### 33.12.2 TAUJTTINm Input Interval Timer Function

### 33.12.2.1 Overview

## Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when a valid TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave. Output of square waves is only supported for TAUJO.

## Description

This function operates in an identical manner to the interval timer function (see Section 33.12.1, Interval Timer Function), except that this function is restarted by a valid TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

### 33.12.2.2 Equations

INTTAUJnIm cycle $=$ count clock cycle $\times($ TAUJnCDRm +1$)$
TAUJTTOUTm square wave cycle $=$ count clock cycle $\times($ TAUJnCDRm +1$) \times 2$

### 33.12.2.3 Block Diagram and General Timing Diagram

Figure 33.22 Block Diagram for TAUJTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] $=01_{\mathrm{B}}$ )

Figure 33.23 General Timing Diagram for TAUJTTINm Input Interval Timer Function

### 33.12.2.4 Register Settings

(1) TAUJnCMORm

Table 33.49 Contents of the TAUJnCMORm register for TAUJTTINm Input Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUJnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output CK0 <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> 13,12 |
| 11 | TAUJ: Prescaler output CK1 |  |
| 10: Prescaler output CK2 |  |  |
| 11: Prescaler output CK3 |  |  |

## (2) TAUJnCMURm

Table 33.50 Contents of the TAUJnCMURm register for TAUJTTINm Input Interval Timer Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 00: Falling edge detection |
|  |  | 01: Rising edge detection |
|  |  | 10: Rising and falling edge detection |
|  | 11: Setting prohibited |  |

## (3) Channel Output Mode

Table 33.51 Control Bit Settings for Independent Channel Output Mode 1

| Bit name | Setting |
| :--- | :--- |
| TAUJnTOE.TAUJnTOEm | Write $1_{B}$. |
| TAUJnTOM.TAUJnTOMm | Write $0_{B}$. |
| TAUJnTOC.TAUJnTOCm | Write $0_{B}$. |
| TAUJnTOL.TAUJnTOLm | Write $0_{B}$. |
| NOTE |  |

The channel output mode can also be set to channel output mode controlled by software by setting
TAUJnTOE.TAUJnTOEm $=0$. TAUJTTOUTm can then be controlled independently of the interrupts. For details see Section 33.7, Channel Output Modes.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input interval timer function. Therefore, these registers must be set to 0 .

Table 33.52 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

| Bit Name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm $=0$ ), set these bits to 0. |

### 33.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function

Table 33.53 Operating Procedure for TAUJTTINm Input Interval Timer Function

|  |  | Operation | Status of TAUJn |
| :---: | :---: | :---: | :---: |
|  |  | Set the TAUJnCMORm and TAUJnCMURm registers as described in Table 33.49, Contents of the <br> TAUJnCMORm register for TAUJTTINm Input Interval Timer Function and Table 33.50, Contents of the TAUJnCMURm register for TAUJTTINm Input Interval Timer Function. <br> Set the value of the TAUJnCDRm register <br> Set the channel output mode by setting the control bits as described in Table 33.51, Control Bit Settings for Independent Channel Output Mode 1. | Channel operation is stopped. |

TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMDO $=1$, INTTAUJnIm is generated and TAUJTTOUTm toggles. |
|  |  | The values of the TAUJnCMURm.TAUJnTIS[1:0] and TAUJnCDRm registers can be changed at any time. The TAUJnCNTm register can be read at all times. <br> Detection of TAUJTTINm edge | TAUJnCNTm counts down. When the counter reaches 0000 0000 <br> - TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. <br> - INTTAUJnIm is generated and TAUJTTOUTm toggles. When a TAUJTTINm input valid edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. <br> Afterwards, this procedure is repeated. |
|  |  | Set TAUJnTT.TAUJnTTm to 1. <br> TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. <br> TAUJnCNTm and TAUJTTOUTm stop and retain their current values. |

### 33.12.2.6 Specific Timing Diagrams

The timing diagrams in Section 33.12.1, Interval Timer Function apply, and in addition the counter can also be restarted by a valid TAUJTTINm input edge.

Figure 33.24 Counter Triggered by Rising TAUJTTINm Input Edge (TAUJnCMURm.TAUJnTIS[1:0] = 018), TAUJnCMORm.TAUJnMD0 = 1

If a valid TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = $01_{\mathrm{B}}$ ).

### 33.12.3 TAUJTTINm Input Pulse Interval Measurement Function

### 33.12.3.1 Overview

## Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signals.

## Prerequisites

TAUJTTOUTm is not used for this function.

## Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1 . This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from $00000_{0000_{\mathrm{H}} .}$ When a valid TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to $00000000_{\mathrm{H}}$ and subsequently continues operation.

If the counter reaches FFFF $\mathrm{FFFF}_{\mathrm{H}}$ before a valid TAUJTTINm edge is detected, it overflows to $00000^{0000_{\mathrm{H}}}$. The counter is reset to $00000000_{\mathrm{H}}$ and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 33.54 Effects of an Overflow

| TAUJnCMORm. TAUJnCOS[1:0] | When Overflow Occurs |  | When a Valid TAUJTTINm Input is then Detected |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TAUJnCDRm | TAUJnCSRm. TAUJnOVF | TAUJnCDRm and TAUJnCNTm | TAUJnCSRm. TAUJnOVF |
| 00 | Unchanged | 0 | TAUJnCNTm loaded to TAUJnCDRm | 1 |
| 01 |  | 1 |  |  |
| 10 | Set to FFFF FFFFF ${ }_{\text {H }}$ | 0 | TAUJnCNTm set to 0, TAUJnCDRm unchanged | Unchanged |
| 11 |  | 1 |  |  |

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV $=1$.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm $=0$. TAUJnCNTm stops but retains its value. While the function is stopped, TAUJTTINm input valid edge detection and TAUJnCNTm capture are not performed.

Conditions
If the TAUJnCMORm.TAUJnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated. For details, see Section 33.9, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts. NOTE

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 33.12.3.2 Equations

TAUJTTINm input pulse interval $=$ count clock cycle $\times$
[(TAUJnCSRm.TAUJnOVF $\times\left(\right.$ FFFF $\left.\left.\mathrm{FFFF}_{\mathrm{H}}+1\right)\right)+$ TAUJnCDRm capture value +1 ]

### 33.12.3.3 Block Diagram and General Timing Diagram

## Capture Mode

Figure 33.25 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = $00_{\mathrm{B}}$ )
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = $00_{\mathrm{B}}$ ).

Figure 33.26 General Timing Diagram For TAUJTTINm Input Pulse Interval Measurement Function

### 33.12.3.4 Register Settings

### 33.12.3.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] $=00_{B}$

Figure 33.27 TAUJnCMORm.TAUJnCOS[1:0] = 00в, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00в

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0 .
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1 .
- If the next valid TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0 .
(2) TAUJnCMORm.TAUJnCOS[1:0] $=01_{B}$

Figure 33.28 TAUJnCMORm.TAUJnCOS[1:0] $=01_{\mathrm{B}}$, TAUJnCMORm.TAUJnMD0 $=0$,
TAUJnCMURm.TAUJnTIS[1:0] $=00_{\text {B }}$

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1 .
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).
(3) TAUJnCMORm.TAUJnCOS[1:0] $=10$ B

Figure 33.29 TAUJnCMORm.TAUJnCOS[1:0] = 10в, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00

- When an overflow occurs, TAUJnCDRm is set to FFFF $_{\text {FFFFF }}^{H}$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0 , but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
(4) TAUJnCMORm.TAUJnCOS[1:0] $=11_{B}$

Figure 33.30 TAUJnCMORm.TAUJnCOS[1:0] = 11в, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] $=00{ }_{B}$

- When an overflow occurs, TAUJnCDRm is set to $\operatorname{FFFF} \mathrm{FFFF}_{\mathrm{H}}$, and TAUJnCSRm.TAUJnOVF is set to 1 .
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0 , but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

### 33.12.4 TAUJTTINm Input Signal Width Measurement Function

### 33.12.4.1 Overview

## Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

## Prerequisites

TAUJTTOUTm is not used for this function.

## Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1 . This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. When a valid TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from $00000000_{\mathrm{H}}$. When a valid TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next valid TAUJTTINm input start edge.

If the counter reaches FFFF $_{\text {FFFF }}^{H}$ before a valid TAUJTTINm stop edge is detected, it overflows. The counter is reset to $00000000_{\mathrm{H}}$ and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 33.59 Effects of an Overflow

| TAUJnCMORm. TAUJnCOS[1:0] | When Overflow Occurs |  | When a Valid TAUJTTINm Input Stop Edge is Detected |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TAUJnCDRm | TAUJnCSRm. TAUJnOVF | TAUJnCDRm and TAUJnCNTm | TAUJnCSRm. TAUJnOVF |
| 00 | Unchanged | 0 | TAUJnCNTm is loaded to TAUJnCDRm. | 1 |
| 01 |  | 1 |  |  |
| 10 | Set to FFFFFFFFF ${ }_{H}$ | 0 | TAUJnCNTm stops counting, TAUJnCDRm unchanged | Unchanged |
| 11 |  | 1 |  |  |

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV to 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.
NOTE
When TAUJnCMORm.COS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

### 33.12.4.2 Equations

TAUJTTINm input signal width $=$ count clock cycle $\times$
[(TAUJnCSRm.TAUJnOVF $\times\left(\right.$ FFFF $\left.\left.\mathrm{FFFF}_{H}+1\right)\right)+$ TAUJnCDRm capture value +1 ]

### 33.12.4.3 Block Diagram and General Timing Diagram

## Capture \& One-Count

 Mode

Figure 33.31 Block Diagram for TAUJTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection $=$ high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11 $1_{\mathrm{B}}$ )
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = $00_{\mathrm{B}}$ ).

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (low width measurement) |
|  |  | 11: Rising and falling edge detection (high width measurement) |

## (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input signal width measurement function. Therefore, these registers must be set to 0 .

Table 33.62 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function

| Bit Name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm $=0$ ), set these bits to 0. |

### 33.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

Table 33.63 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

### 33.12.4.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] $=00_{B}$

Figure 33.33 TAUJnCMORm.TAUJnCOS[1:0] = 00 B , TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] $=11_{B}$

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0 .
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1 .
- Upon detection of the next valid TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0 .

## (2) TAUJnCMORm.TAUJnCOS[1:0] $=01_{B}$

Figure 33.34 TAUJnCMORm.TAUJnCOS[1:0] = 01в, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] $=11_{B}$

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).
(3) TAUJnCMORm.TAUJnCOS[1:0] $=10_{B}$

Figure 33.35 TAUJnCMORm.TAUJnCOS[1:0] = 10 B , TAUJnCMORm.TAUJnMD0 $=0$, TAUJnCMURm.TAUJnTIS[1:0] $=11_{B}$

- When an overflow occurs, TAUJnCDRm is set to FFFF $_{\text {FFFF }}^{H}$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
(4) TAUJnCMORm.TAUJnCOS[1:0] $=11_{B}$

Figure 33.36 TAUJnCMORm.TAUJnCOS[1:0] $=11_{\mathrm{B}}$, TAUJnCMORm.TAUJnMD0 $=0$, TAUJnCMURm. TAUJnTIS[1:0] $=11_{B}$

- When an overflow occurs, TAUJnCDRm is set to $\operatorname{FFFF}$ FFFFF $_{\mathrm{H}}$, and TAUJnCSRm.TAUJnOVF is set to 1 .
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

### 33.12.5 TAUJTTINm Input Position Detection Function

### 33.12.5.1 Overview

## Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUJTTINm signal.

## Prerequisites

TAUJTTOUTm is not used for this function

## Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm $=1$, enabling count operation. The counter starts to count from $00000000_{\mathrm{H}}$. When a valid TAUJTTINm input edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF FFFF $_{\mathrm{H}}$, the counter restarts from $00000_{0000_{H}}$
NOTE
The input TAUJTTINm is sampled at the frequency of the operation clock, specified by TAUJnCMORm.TAUJnCKS[1:0] bits.

## Conditions

If the TAUJnCMORm. TAUJnMD0 bit is set to 0 , the first interrupt after a start or restart is not generated.

### 33.12.5.2 Equations

Function duration at a TAUJTTINm input pulse $=$ count clock cycle $\times$ (TAUJnCDRm capture value +1 )

### 33.12.5.3 Block Diagram and General Timing Diagram

Figure 33.37 Block Diagram of TAUJTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 $=0$ ).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00 ${ }_{\mathrm{B}}$ )

|  |  | Set TAUJnTS.TAUJnTSm to 1. <br> TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is set to 1 and the counter starts. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMDO is set to 1. |
|  |  | The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. <br> The TAUJnCDRm and TAUJnCSRm registers can be read at any time. | TAUJnCNTm starts to count up from $00000000_{\mathrm{H}}$. When a TAUJTTINm valid edge is detected: <br> - TAUJnCNTm transfers (captures) its value to TAUJnCDRm. <br> - INTTAUJnIm is output. <br> - The counter value is not cleared to $00000000_{\mathrm{H}}$ and TAUJnCNTm continues count operation. <br> Afterwards, this procedure is repeated. <br> When TAUJnCNTm reaches FFFF FFFF ${ }_{H}$, the counter restarts from $00000000_{\mathrm{H}}$. |
|  |  | Set TAUJnTT.TAUJnTTm to 1. <br> TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0. | TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. <br> TAUJnCNTm stops and retains its current value. |

### 33.12.5.6 Specific Timing Diagrams

(1) Operation Stop and Restart

Figure 33.39 Operation Stop and Restart (TAUJnCMORm.TAUJnMDO $=0$, TAUJnCMURm.TAUJnTIS[1:0] $=00_{B}$ )

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 , which in turn sets TAUJnTE.TAUJnTEm to 0 .
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1 . TAUJnCNTm restarts to count from $00000000_{\mathrm{H}}$.

### 33.12.6 TAUJTTINm Input Period Count Detection Function

### 33.12.6.1 Overview

## Summary

This function measures the cumulative width of a TAUJTTINm input signal.

## Prerequisites

TAUJTTOUTm is not used for this function.

## Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1 . This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits a valid TAUJTTINm input edge.

When a valid TAUJTTINm input start edge is detected, the counter starts to count from $00000000_{\mathrm{H}}$.
When a valid TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next valid TAUJTTINm input start edge is detected.

When the next valid TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.
When the counter reaches FFFF FFFF $_{\mathrm{H}}$, the counter restarts from $00000_{0000_{\mathrm{H}} \text {. }}^{\text {. }}$
This function cannot be forcibly restarted.
NOTE
The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

## Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = $10_{\mathrm{B}}$, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11 $1_{\mathrm{B}}$, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

### 33.12.6.2 Equations

Cumulative TAUJTTINm input width $=$ count clock cycle $\times($ TAUJnCDRm capture value +1$)$

### 33.12.6.4 Register Settings

(1) TAUJnCMORm

Table 33.68 Contents of the TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUJnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output CK0 <br> 01: Prescaler output CK1 |
|  |  | 10: Prescaler output CK2 |
|  |  | 11: Prescaler output CK3 |

## (2) TAUJnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUJnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 33.69 Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement) |
|  |  | 11: Rising and falling edge detection (High width measurement) |

## (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input period count detection function. Therefore, these registers must be set to 0 .

Table 33.70 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function

| Bit Name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0 |

### 33.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function

Table 33.71 Operating Procedure for TAUJTTINm Input Period Count Detection Function

### 33.12.6.6 Specific Timing Diagrams

(1) Operation Stop and Restart

Figure 33.42 Operation Stop and Restart (TAUJnCMURm.TAUJnTIS[1:0] = 11B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 , which in turn sets TAUJnTE.TAUJnTEm to 0 .
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1 . TAUJnCNTm restarts to count from $00000000_{\mathrm{H}}$.

### 33.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

### 33.12.7.1 Overview

## Summary

This function measures the width of an individual TAUJTTINm input signal. An interrupt is generated if the TAUJTTINm input width is longer than FFFF $\mathrm{FFFF}_{\mathrm{H}}+1$.

## Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF $_{\mathrm{H}}$.

## Description

he counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1 . This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.
When the next TAUJTTINm input start edge is detected, TAUJnCNTm loads FFFF FFFF H and starts to count down.
If the counter reaches $00000000_{\mathrm{H}}$ before a stop edge is detected, an interrupt is generated.

## Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = $10_{\mathrm{B}}$, the TAUJTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] $=11_{\mathrm{B}}$, the TAUJTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE
The counter cannot be restarted during operation.

### 33.12.7.2 Block Diagram and General Timing Diagram

Figure 33.43 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 111 ${ }_{\mathrm{B}}$ )

Figure 33.44 General Timing Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

### 33.12.7.3 Register Settings

(1) TAUJnCMORm

Table 33.72 Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUJnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output = CK0 |
|  |  | 01: Prescaler output = CK1 |
|  |  | 10: Prescaler output = CK2 |
|  |  | 11: Prescaler output = CK3 |
| 13, 12 | TAUJnCCS[1:0] | Write 00 B . |
| 11 | TAUJnMAS | Write $\mathrm{O}_{\mathrm{B}}$. |
| 10 to 8 | TAUJnSTS[2:0] | Write 010 B . |
| 7, 6 | TAUJnCOS[1:0] | Write $00{ }_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write 0100 B . |
| 0 | TAUJnMD0 | Write $\mathrm{O}_{\mathrm{B}}$. |

## (2) TAUJnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUJnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 33.73 Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement) |
|  |  | 11: Rising and falling edge detection (High width measurement) |

## (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the overflow interrupt output function (during TAUJTTINm width measurement). Therefore, these registers must be set to 0 .

Table 33.74 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

| Bit name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm $=0$ ), set these bits to 0 |

### 33.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Table 33.75 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

### 33.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

### 33.12.8.1 Overview

## Summary

This function measures the cumulative width of a TAUJTTINm input signal. An interrupt is generated if the cumulative TAUJTTINm input width is longer than FFFF $\mathrm{FFFF}_{\mathrm{H}}$, and an overflow interrupt can be output.

## Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF $_{\mathrm{H}}$.

## Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1 . This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF $_{\mathrm{H}}$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUJTTINm input start edge and then continues to count down from the current value.

When the counter reaches $00000000_{\mathrm{H}}$ an interrupt is generated. FFFF $\mathrm{FFFF}_{\mathrm{H}}$ is loaded to TAUJnCNTm and the counter continues to count down until a TAUJTTINm input stop edge is detected.

## Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = $10_{\mathrm{B}}$, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = $11_{\mathrm{B}}$, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE
The counter cannot be restarted during operation.

### 33.12.8.2 Block Diagram and General Timing Diagram

Figure 33.45 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Rising and falling edge detection $=$ high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11 $1_{\mathrm{B}}$ )

Figure 33.46 General Timing Diagram For Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

### 33.12.8.3 Register Settings

(1) TAUJnCMORm

Table 33.76 Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | TAUJnCKS[1:0] | Operation Clock Selection |
|  |  | 00: Prescaler output CK0 |
|  |  | 01: Prescaler output CK1 |
|  |  | 10: Prescaler output CK2 |
|  |  | 11: Prescaler output CK3 |
| 13, 12 | TAUJnCCS[1:0] | Write 00 B . |
| 11 | TAUJnMAS | Write $\mathrm{O}_{\mathrm{B}}$. |
| 10 to 8 | TAUJnSTS[2:0] | Write 010 B . |
| 7, 6 | TAUJnCOS[1:0] | Write 00 B . |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write 1100 B . |
| 0 | TAUJnMD0 | Write $\mathrm{O}_{\mathrm{B}}$. |

## (2) TAUJnCMURm

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TAUJnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 33.77 Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 10: Rising and falling edge detection (Low width measurement) |
|  |  | 11: Rising and falling edge detection (High width measurement) |

## (3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

## (4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the Overflow Interrupt Output Function (During TAUJTTINm Input Period Count Detection). Therefore, these registers must be set to 0 .

Table 33.78 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

| Bit Name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 0: Disables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm $=0$ ), set these bits to 0. |

### 33.12.8.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Table 33.79 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

### 33.13 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the TAUJ. For a general overview of synchronous channel operation, see Section 33.2, Overview.

### 33.13.1 PWM Output Function

### 33.13.1.1 Overview

## Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTTOUTm to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

## Prerequisites

- Two channels
- The operation mode for the master channel should be set to the interval timer mode. (See Table 33.80, Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function.)
- The operation mode for the slave channel should be set to the one-count mode. (See Table 33.83, Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function.)
- TAUJTTOUTm is not used for the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1. (See Section 33.7, Channel Output Modes.)

## Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTSm) to 1 . This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set or reset to realize the PWM output.

- Master channel:

When the counter of the master channel reaches $00000000_{\mathrm{H}}$ and pulse cycle time has elapsed, INTTAUJnIm is generated. The TAUJnCDRm value is loaded to TAUJnCNTm, and the counter counts down.

- Slave channel(s):

INTTAUJnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDRm (slave) is loaded to TAUJnCNTm (slave) and the counter starts to count down from this value. The TAUJTTOUTm signal is set to the active level.
When the counter reaches $00000000_{\mathrm{H}}$, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTTOUTm signal is set to the inactive level. The counter returns to FFFF FFFF ${ }_{H}$ and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTEm to 0 . TAUJnCNTm and TAUJTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTSm to 1 .

## Conditions

Set Simultaneous rewrite with this function. Please see Section 33.6, Simultaneous Rewrite.

### 33.13.1.2 Equations

Pulse cycle $=($ TAUJnCDRm $($ master $)+1) \times$ count clock cycle
Duty cycle [\%] = $($ TAUJnCDRm $($ slave $) /($ TAUJnCDRm $($ master $)+1) \times 100$

- Duty cycle $=0 \%$

TAUJnCDRm (slave) $=00000000^{\mathrm{H}}$

- Duty cycle = 100\%

TAUJnCDRm (slave) $\geq$ TAUJnCDRm (master) +1

### 33.13.1.3 Block Diagram and General Timing Diagram

Figure 33.47 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

Figure 33.48 General Timing Diagram for PWM Output Function

NOTE

- The interval between the start of the count and an interrupt being generated is the value of corresponding TAUJnCDRm + 1 .
- TAUJTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUJnIm of the master channel.

### 33.13.1.4 Register Settings for the Master Channel

(1) TAUJnCMORm for the Master Channel

Table 33.80 Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUJnCKS[1:0] | Operation Clock Selection |

00: Prescaler output CKO
01: Prescaler output CK1
10: Prescaler output CK2
11: Prescaler output CK3
The value of the TAUJnCKS[1:0] bits of the master and slave channel(s) must be identical.

| 13,12 | TAUJnCCS[1:0] | Write $00_{\mathrm{B}}$. |
| :--- | :--- | :--- |
| 11 | TAUJnMAS | Write $1_{\mathrm{B}}$. |
| 10 to 8 | TAUJnSTS[2:0] | Write $000_{\mathrm{B}}$. |
| 7,6 | TAUJnCOS[1:0] | Write $00_{\mathrm{B}}$. |
| 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD[4:1] | Write $000 \mathrm{~B}_{\mathrm{B}}$. |
| 0 | TAUJnMD0 | Write $1_{\mathrm{B}}$. |

(2) TAUJnCMURm for the Master Channel

Table 33.81 Contents of the TAUJnCMURm Register for the Master Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 00: Not used, so set to 00. |

## (3) Channel Output Mode for the Master Channel

The channel output mode is not used by this function.

## (4) Simultaneous Rewrite for the Master Channel

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 33.82 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

| Bit name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 1: Enables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting. |

### 33.13.1.5 Register Settings for the Slave Channel(s)

(1) TAUJnCMORm for the Slave Channel(s)

Table 33.83 Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | TAUJnCKS[1:0] | Operation Clock Selection <br> 00: Prescaler output CK0 <br> 01: Prescaler output CK1 |
|  |  | 10: Prescaler output CK2 <br> 11: Prescaler output CK3 |
|  |  | The value of the TAUJnCKS[1:0] bits of the master and slave channel(s) must be identical. |
|  |  | Write $00_{\mathrm{B}}$. |
| 13,12 | TAUJnCCS[1:0] | Write $0_{\mathrm{B}}$. |
| 11 | TAUJnMAS | Write $100_{\mathrm{B}}$. |
| 7,6 | TAUJnSTS[2:0] 8 | Write $00_{\mathrm{B}}$. |
| 5 | TAUJnCOS[1:0] | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 1 | TAUJnMD0 | Write $0100_{\mathrm{B}}$. |
| 0 | Write $1_{\mathrm{B}}$. |  |

## (2) TAUJnCMURm for the Slave Channel(s)

Table 33.84 Contents of the TAUJnCMURm Register for the Slave Channel of the PWM Output Function

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | TAUJnTIS[1:0] | 00: Not used, so set to 00. |

(3) Channel Output Mode for the Slave Channel(s)

Table 33.85 Control Bit Settings for Synchronous Channel Output Mode 1

| Bit Name | Setting |
| :--- | :--- |
| TAUJnTOE.TAUJnTOEm | Write $1_{B}$. |
| TAUJnTOM.TAUJnTOMm | Write $1_{B}$. |
| TAUJnTOC.TAUJnTOCm | Write $0_{B}$. |
| TAUJnTOL.TAUJnTOLm | $0:$ Positive logic |
|  | 1: Negative logic |

(4) Simultaneous Rewrite for the Slave Channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.
Table 33.86 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

| Bit name | Setting |
| :--- | :--- |
| TAUJnRDE.TAUJnRDEm | 1: Enables simultaneous rewrite. |
| TAUJnRDM.TAUJnRDMm | 0: The simultaneous rewrite trigger signal is generated when the master channel starts <br> counting. |

### 33.13.1.6 Operating Procedure for PWM Output Function

Table 33.87 Operating Procedure for PWM Output Function

### 33.13.1.7 Specific Timing Diagrams

(1) Duty cycle $=0 \%$

Figure 33.49 TAUJnCDRm (slave) $=00000000 \mathrm{H}$, Positive Logic $($ TAUJnTOL.TAUJnTOLm (slave) $=0)$

- Every time the master channel generates an interrupt (INTTAUJnIm), $00000000_{\mathrm{H}}$ is loaded to TAUJnCNTm (slave). As a result, a slave channel interrupt (INTTAUJnIm) is generated at the same time and TAUJTTOUTm remains inactive.
- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.
(2) Duty cycle $=100 \%$

Figure 33.50 TAUJnCDRm (slave) $\geq$ TAUJnCDRm (master) +1 , Positive Logic (TAUJnTOL.TAUJnTOLm (slave) $=0$ )

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach $00000000_{\mathrm{H}}$. TAUJTTOUTm remains active.
(3) Operation Stop and Restart

Figure 33.51 Operation Stop and Restart, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1 . This sets TAUJnTE.TAUJnTEm to 0 .
- TAUJnCNTm and TAUJTTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm of master and slave channels to 1 . The TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

## Section 34 Real-Time Clock (RTCA)

This section contains a generic description of the Real-Time Clock (RTCA).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RTCA.

### 34.1 Features of RH850/F1KH, RH850/F1KM RTCA

### 34.1.1 Number of Units

This microcontroller has the following number of RTCA units.
Table 34.1 Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 <br> 176 Pins | RH850/F1KH-D8 233 Pins |  | RH850/F1KH-D8 324 Pins |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Number of Units | 1 | 1 |  | 1 |  |
| Name | RTCAn ( $\mathrm{n}=0$ ) | RTCAn ( $\mathrm{n}=0$ ) |  | RTCAn ( $\mathrm{n}=0$ ) |  |
| Table 34.2 | Number of Units (RH850/F1KM-S4) |  |  |  |  |
| Product Name | RH850/F1KM-S4 100 Pins | RH850/F1KM-S4 <br> 144 Pins | RH850/F1KM-S4 <br> 176 Pins | RH850/F1KM-S4 233 Pins | RH850/F1KM-S4 272 Pins |
| Number of Units | 1 | 1 | 1 | 1 | 1 |
| Name | RTCAn ( $\mathrm{n}=0$ ) | RTCAn ( $\mathrm{n}=0$ ) | RTCAn ( $\mathrm{n}=0$ ) | RTCAn ( $\mathrm{n}=0$ ) | RTCAn ( $\mathrm{n}=0$ ) |

Table $34.3 \quad$ Number of Units (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| Number of Units | 1 | 1 | 1 | 1 |
| Name | RTCAn $(\mathrm{n}=0)$ | RTCAn $(\mathrm{n}=0)$ | RTCAn $(\mathrm{n}=0)$ | RTCAn $(\mathrm{n}=0)$ |

Table 34.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual RTCA units are identified by the index "n"; for example, RTCAnCTLO ( $\mathrm{n}=0$ ) <br> is the RTCAn control register 0. |

### 34.1.2 Register Base Address

RTCAn base address is listed in the following table.
RTCAn register addresses are given as an offset from the base address.
Table 34.5 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <RTCAO_base> | FFE7 $8000_{\mathrm{H}}$ |

### 34.1.3 Clock Supply

The RTCAn clock supply is shown in the following table.
Table 34.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| RTCAn | RTCATCKI | CKSCLK_ARTCA | Macro clock |
|  | PCLK | CPUCLK_L | Module clock |
|  | Register access clock | CPUCLK_L | Bus clock |

### 34.1.4 Interrupt Requests

RTCAn interrupt requests are listed in the following table.
Table 34.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| RTCA0 | 1-second interval interrupt | 209 | - |
| INTRTCA01S | Alarm interrupt | 210 | - |
| INTRTCA0AL | Fixed interval interrupt | 211 | - |
| INTRTCA0R |  |  |  |

### 34.1.5 Reset Sources

RTCAn reset sources are listed in the following table. RTCAn is initialized by these reset sources.
Table 34.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| RTCAn | Power-up reset (PURES) |

### 34.1.6 External Input/Output Signals

External input/output signals of RTCAn are listed below.
Table 34.9 External Input/Output Signal (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| RTCA0 | 1-Hz pulse output | RTCA0OUT $^{\star 1}$ |
| RTCAT1HZ |  |  |

Note 1. RTCAOOUT is connected to TAUJO. For details, see Section 33, Timer Array Unit J (TAUJ).

## CAUTION

When port P8_6 is used as RTCA0OUT, port P8_6 pin outputs a low-level RESETOUT signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see Section 2A.11.1.1, P8_6: $\overline{\text { RESETOUT }}$, Section 2B.11.1.1, P8_6: $\overline{\text { RESETOUT }}$ and Section 2C.11.1.1, P8_6: RESETOUT.

### 34.2 Overview

### 34.2.1 Functional Overview

The Real-Time Clock (RTCA) has the following features:

- Count clock selection from 32 kHz to 4 MHz
- Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a sub-counter. The calendar covers 99 years. Leap years are handled by hardware automatically.
- One Hz pulse output function
- Fixed interval interrupt function
- Alarm interrupt function
- Clock error correction function if a $32.768-\mathrm{kHz}$ count clock is used

### 34.2.2 Block Diagram

The block diagram shows the main components of the RTCA.

Figure 34.1 Block Diagram of the RTCA

### 34.2.3 Description of Blocks

The Real-Time Clock RTCA provides information about the present time and date and can generate wake-up signals (interrupts, alarms). This information is derived from the count clock RTCATCKI.

## Sub-counter

RTCATCKI is the input to the sub-counter RTCAnSUBC. The sub-counter counts up from 0 until it reaches the compare value. The compare value is always defined as the frequency of RTCATCKI - 1 (in Hz). Thus, the sub-counter overflows after one second. It is then reset to 0 and triggers the seconds counter RTCAnSECC (and, if specified, the interrupt INTRTCA01S).
The sub-counter can generate a fixed interval interrupt every 0.25 seconds, 0.5 seconds, or 1 second, and a $1-\mathrm{Hz}$ output pulse.

## Time and date counters

The counters for minutes, hours, day of the week, day of the month, months, and years also count up. They have their own overflow limits. If all the lower counters overflow, the upper counter counts up.
The overflow limit of the counter for the day of the month (RTCAnDAYC) depends on the present month (28, 30, or 31 days) and (in February) on the year counter RTCAnYEARC (years $0,4,8,12$, etc. are considered leap years).
The hours counter RTCAnHOURC can be switched between 12- and 24-hour formats.
The counters for seconds, minutes, hours, day of the month, and months can generate a fixed interval interrupt upon overflow (INTRTCA0R).

The counters for minutes, hours, and day of the week can also generate an alarm interrupt (INTRTCA0AL), e.g. every Tuesday and Thursday at 10:32.

## Counter buffers

All counters can be read directly at any time. The clock signal used to access the read/write registers and the count clock are usually asynchronous. An overflow of the sub-counter during the read operation can make all read values obsolete. Therefore, reading the counters must be performed using a special procedure. For details, see

## Section 34.5.3, Reading Clock Counters.

For reasons of synchronization, the counters cannot be written directly.
For reading and writing, all counters are accompanied by buffer registers. The buffer registers provide a synchronized way for reading the counters and for setting time and date. When they are used, the operation of the sub-counter must first be suspended and then re-activated (see also Section 34.5.3, Reading Clock Counters and Section 34.5.2, Updating Clock Counters).

The RTCAnTIMEC and RTCAnCALC registers and their corresponding buffer registers can be used to check and set the time (hours, minutes and seconds) or the date (day of the week, day of the month, month, and year) with one read/write operation.

### 34.3 Registers

### 34.3.1 List of Registers

RTCA registers are listed in the following table.
<RTCAn_base> is defined in Section 34.1.2, Register Base Address.
Table 34.10 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| RTCA control registers |  |  |  |
| RTCAn | RTCA control register 0 | RTCAnCTLO | <RTCAn_base> + $00{ }_{\text {H }}$ |
|  | RTCA control register 1 | RTCAnCTL1 | <RTCAn_base> + $04_{\text {H }}$ |
|  | RTCA control register 2 | RTCAnCTL2 | <RTCAn_base> + $08{ }_{\text {H }}$ |
| RTCA sub-counter registers |  |  |  |
| RTCAn | RTCA sub-count register | RTCAnSUBC | <RTCAn_base> + $0 \mathrm{C}_{\mathrm{H}}$ |
|  | RTCA sub-count register read buffer | RTCAnSRBU | <RTCAn_base> + $10_{\text {H }}$ |
|  | RTCA clock error correction register | RTCAnSUBU | <RTCAn_base> + $38{ }_{\text {H }}$ |
|  | RTCA sub-counter compare register | RTCAnSCMP | <RTCAn_base> + 3C ${ }_{\text {H }}$ |
| RTCA clock counter and buffer registers |  |  |  |
| RTCAn | RTCA seconds count register | RTCAnSECC | <RTCAn_base> + 4 $\mathrm{C}_{\mathrm{H}}$ |
|  | RTCA seconds count buffer register | RTCAnSEC | <RTCAn_base> + 14 ${ }_{\text {H }}$ |
|  | RTCA minutes count register | RTCAnMINC | <RTCAn_base> + 50 ${ }_{\text {H }}$ |
|  | RTCA minutes count buffer register | RTCAnMIN | <RTCAn_base> + $18{ }_{\text {H }}$ |
|  | RTCA hours count register | RTCAnHOURC | <RTCAn_base> + 54 H $^{\text {}}$ |
|  | RTCA hours count buffer register | RTCAnHOUR | <RTCAn_base> + $1 \mathrm{C}_{\mathrm{H}}$ |
|  | RTCA day of the week count register | RTCAnWEEKC | <RTCAn_base> + 58 ${ }_{\text {H }}$ |
|  | RTCA day of the week count buffer register | RTCAnWEEK | <RTCAn_base> + $2 \mathrm{O}_{\mathrm{H}}$ |
|  | RTCA day of the month count register | RTCAnDAYC | <RTCAn_base> + 5 $\mathrm{C}_{\mathrm{H}}$ |
|  | RTCA day of the month count buffer register | RTCAnDAY | <RTCAn_base> + $24_{\text {H }}$ |
|  | RTCA month count register | RTCAnMONC | <RTCAn_base> + 60 ${ }_{\text {H }}$ |
|  | RTCA month count buffer register | RTCAnMONTH | <RTCAn_base> + $28{ }_{\text {H }}$ |
|  | RTCA year count register | RTCAnYEARC | <RTCAn_base> + 64 ${ }_{\text {H }}$ |
|  | RTCA year count buffer register | RTCAnYEAR | <RTCAn_base> + $2 \mathrm{C}_{\mathrm{H}}$ |
| RTCA special counter and buffer registers |  |  |  |
| RTCAn | RTCA time count register | RTCAnTIMEC | <RTCAn_base> + 68 ${ }_{\text {H }}$ |
|  | RTCA time count buffer register | RTCAnTIME | <RTCAn_base> + $30_{\text {H }}$ |
|  | RTCA calendar count register | RTCAnCALC | <RTCAn_base> + $6 \mathrm{C}_{\mathrm{H}}$ |
|  | RTCA calendar count buffer register | RTCAnCAL | <RTCAn_base> + $34_{\text {H }}$ |
| RTCA alarm time setting registers |  |  |  |
| RTCAn | RTCA alarm minute setting register | RTCAnALM | <RTCAn_base> + 40 ${ }_{\text {H }}$ |
|  | RTCA alarm hour setting register | RTCAnALH | <RTCAn_base> + 44 H |
|  | RTCA alarm day of the week setting register | RTCAnALW | <RTCAn_base> + 48 ${ }_{\text {H }}$ |
| RTCA emulation register |  |  |  |
| RTCAn | RTCA emulation register | RTCAnEMU | <RTCAn_base> + 74 ${ }_{\text {H }}$ |

### 34.3.2 Details of RTCA Control Registers

### 34.3.2.1 RTCAnCTLO — RTCA Control Register 0

This register controls the count operation of the sub-counter RTCAnSUBC, the format (12-hour/24-hour) of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH, and the operation mode.

Table 34.11 RTCAnCTLO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | RTCAnCE | Starts/stops the sub-counter RTCAnSUBC operation. <br> 0 : Stops the sub-counter operation. <br> All output pins and all status flags in control register RTCAnCTL2 are cleared. <br> 1: Starts the sub-counter operation. <br> The sub-counter counts up. |
| 6 | RTCAnCEST | Indicates the operation enabled/stopped status of the sub-counter: <br> 0 : Operation stopped status <br> 1: Operation enabled status <br> For details on how to use this status flag, see Section 34.5.1, Initial Setting of the RTCA. |
| 5 | RTCAnAMPM | Selects the format of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH: <br> 0 : 12-hour format ( 1 to $12, \mathrm{am} / \mathrm{pm}$ ) <br> 1: 24 -hour format ( 0 to 23 , military time) <br> For details on the format, see Table 34.23, 12- and 24-Hour Format. |
| 4 | RTCAnSLSB | Selects the operation mode: <br> 0: 32.768 kHz mode*1 <br> 1: Frequency selection mode <br> For details on the operation modes, see Section 34.4, Operation. <br> The operation mode must not be changed while sub-counter operation is enabled <br> (RTCAnCTLO.RTCAnCEST = 1). <br> For details on the initialization of RTCAn, see Section 34.5.1, Initial Setting of the RTCA. |
| 3 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Note 1. This setting not supported in the RH850/F1KM-S4 100-pin product and RH850/F1KM-S1 all products.

### 34.3.2.2 RTCAnCTL1 — RTCA Control Register 1

This register controls the interrupt request generation and the $1-\mathrm{Hz}$ pulse output.

Access: This register can be read or written in 8-bit or 1-bit units.
Address: <RTCAn_base> + 04 ${ }_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnEN1HZ | RTCAnENALM | RTCAnEN1S |  | Anct |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.12 RTCAnCTL1 Register Contents

### 34.3.2.3 RTCAnCTL2 - RTCA Control Register 2

This register contains status information and controls the data transfer from the sub-counter RTCAnSUBC to the dedicated sub-counter read buffer RTCAnSRBU and the operation setting of the clock counters (RTCAnSECC to RTCAnYEARC).
Access: This register can be read or written in 8-bit or 1-bit units.
Address: <RTCAn_base> + 08 ${ }_{H}$
Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnWUST | RTCAnWSST | RTCAnRSST | RTCAnRSUB | RTCAnWST | RTCAnWAIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R | R/W |

Table 34.13 RTCAnCTL2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | RTCAnWUST | Indicates whether RTCAnSUBU write operation has been completed: <br> 0 : RTCAnSUBU write completed <br> 1: RTCAnSUBU write in progress <br> The write operation ends with the next sub-counter overflow. <br> While the sub-counter operation is enabled (RTCAnCTLO.RTCAnCE $=1$ ) and if write operation to RTCAnSUBU is completed, this bit is set to 1. <br> See Section 34.5.5, Writing to RTCAnSUBU, for details. |
| 4 | RTCAnWSST | Indicates whether RTCAnSCMP write operation has been completed: <br> 0: RTCAnSCMP write completed <br> 1: RTCAnSCMP write in progress <br> The write operation ends with the next sub-counter overflow. <br> While the sub-counter operation is enabled (RTCAnCTLO.RTCAnCE =1) and if write operation to RTCAnSCMP is completed, this bit is set to 1 . <br> See Section 34.5.6, Writing to RTCAnSCMP, for details. |
| 3 | RTCAnRSST | Indicates whether the value of the sub-counter (RTCAnSUBC) has been transferred to the sub-count register read buffer (RTCAnSRBU): <br> 0 : Transfer in progress, or waiting for a transfer trigger <br> 1: Transfer completed <br> This bit is cleared (transfer is triggered) by RTCAnRSUB=1. This bit is automatically set when the transfer is completed. <br> See Section 34.5.4, Reading RTCAnSRBU, for details. |
| 2 | RTCAnRSUB | Triggers transfer of the value of the sub-counter (RTCAnSUBC) to the dedicated read buffer (RTCAnSRBU) or clears the transfer state of the sub-counter: <br> 0 : Transfer status (RTCAnRSST) is cleared. <br> 1: Transfer is triggered. <br> This bit is used to read the value of RTCAnSRBU when the sub-counter operation is enabled ( $R$ TCAnCTLO.RTCAnCE = 1). The value of RTCAnSUBC is synchronized with RTCATCKI and loaded to RTCAnSRBU. <br> For details, see Section 34.5.4, Reading RTCAnSRBU. |

Table 34.13 RTCAnCTL2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 1 | RTCAnWST | Indicates the status of all clock counters (RTCAnSECC to RTCAnYEARC): <br> 0 : All clock counters are running. <br> 1: All clock counters are stopped <br> The sub-counter is still running. <br> The clock counters must be stopped before reading or writing clock counter values during subcounter operation (RTCAnCTLO.RTCAnCE = 1). To stop the clock counters, set RTCAnWAIT $=1$. |
| 0 | RTCAnWAIT | Restarts/stops all clock counters (RTCAnSECC to RTCAnYEARC): <br> 0 : Restarts all clock counters either immediately or immediately after the clock counter write operation finishes. <br> 1: Stops all clock counters temporarily. The sub-counter is still running. <br> The clock counters must be stopped before reading or writing counter buffers during subcounter operation (RTCAnCTLO.RTCAnCE = 1). <br> CAUTION: Only one overflow can be held internally. When two overflows occur, the seconds counter is incremented only by one when it is restarted. Thus, the procedure must be completed within one second. |

### 34.3.3 Details of RTCA Sub-Counter Registers

### 34.3.3.1 RTCAnSUBC - RTCA Sub-Count Register

This counter counts the 1 -second reference time. It operates using the count clock RTCATCKI.

This register is initialized:

- When write operation is performed to the seconds count buffer register (RTCAnSEC) or to the time count buffer register (RTCAnTIME) and the value is reflected to the seconds count register.

Table 34.14 RTCAnSUBC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 0 | RTCAnSUBC[21:0] | Sub-counter value <br>  |

## NOTES

1. This sub-counter operates with RTCATCKI while the read operation is clocked by PCLK. Reading this sub-counter during operation (RTCAnCTLO.RTCAnCEST = 1) is asynchronous to RTCATCKI and can lead to wrong results. Use the sub-count register read buffer (RTCAnSRBU) to read the sub-counter value during operation. For details, see Section 34.5.4, Reading RTCAnSRBU.
2. The count-operation of this sub-counter depends on the selected operation mode. See Section 34.4, Operation, for details.

### 34.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer

This register is the read buffer for the sub-counter RTCAnSUBC.

Table 34.15 RTCAnSRBU Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 0 | RTCAnSRBU[21:0] | Sub-counter value at the time of the last RTCAnSUBC read. |
|  | When RTCAnCTL2.RTCAnRSUB is set to 1, the value of the RTCAnSUBC is loaded to the <br> read buffer in synchronization with RTCATCKI. |  |

NOTE
Perform RTCAnSRBU read according to the flow described in Section 34.5.4, Reading RTCAnSRBU.

### 34.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register

This register enables and specifies clock error correction. This register only applies in $32.768-\mathrm{kHz}$ mode ( RTCAnCTL0.RTCAnSLSB $=0$ ).

For details on clock error correction, see Section 34.4.4, Clock Error Correction.

```
Access: This register can be read or written in 8-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSUBU write must be completed (RTCAnCTL2.RTCAnWUST = 0).
- The write operation ends with the next sub-counter overflow.
Address: <RTCAn_base> \(+38_{\text {H }}\)
Value after reset: \(\quad 00_{H}\)
```

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RTCAnDEV | RTCAnF6 | RTCAnF[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.16 RTCAnSUBU Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | RTCAnDEV | Specifies how often clock error correction is performed per minute: |
|  |  | $0:$ Three times every minute (when RTCAnSECC equals 00, 20, and 40) |
|  |  | 1: Once every minute (when RTCAnSECC equals 00) |
| 6 | RTCAnF6 | Specifies whether the sub-counter value is incremented or decremented: |
|  |  | $0:$ Incremented (+ correction) |
|  |  | Incrementation value $=($ RTCAnF[5:0] value -1$) \times 2$ |
|  |  | 1: Decremented ( - correction) |
|  |  | Decrementation value $=($ inverted data of RTCAnF[5:0] value +1$) \times 2$ |
| 5 to 0 | RTCAnF[5:0] | Error correction value |

NOTES

1. When RTCAnF[5:1] $=00000_{\mathrm{B}}$, clock error correction is not performed.
2. Perform RTCAnSUBU write as described in

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.5, Writing to RTCAnSUBU.

### 34.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register

This register sets the compare value of the sub-counter RTCAnSUBC in frequency selection mode ( RTCAnCTL0.RTCAnSLSB = 1) .

When the sub-counter values matches the value of this register, an overflow signal is output to the seconds counter RTCAnSECC and the sub-counter is cleared.

Set the value for this register according to the frequency of the input clock RTCATCKI.

## Example

The following example illustrates the setting of RTCAnSCMP:

- RTCATCKI $=4 \mathrm{MHz}=4,000,000 \mathrm{~Hz}$
- RTCAnSCMP $=4,000,000-1=3,999,999($ decimal code $)=3$ D08FF $_{H}$
- The seconds counter RTCAnSECC is triggered when the sub-counter value changes from $3 \mathrm{D}_{\mathrm{D}} 08 \mathrm{FF}_{\mathrm{H}}$ to $0_{\mathrm{H}}$.

## NOTES

1. The operation of the RTCA cannot be guaranteed if a value of 3198 (decimal code) or lower is set in this register.
2. Perform RTCAnSCMP write as described in Section 34.5.1, Initial Setting of the RTCA and Section 34.5.6, Writing to RTCAnSCMP.

### 34.3.4 Details of RTCA Clock Counter and Buffer Registers

### 34.3.4.1 RTCAnSECC — RTCA Seconds Count Register

This register is the seconds counter. It counts seconds from 00 to 59 in BCD.
This register counts as follows.

- It is triggered by every overflow of the sub-counter RTCAnSUBC.

If the sub-counter overflows while the seconds counter is stopped (RTCAnCTL2.RTCAnWST $=1$ ), the seconds counter behaves as follows:

- If one sub-counter overflow occurs while the seconds counter is stopped, the overflow is held internally. The seconds counter is incremented by one when it is restarted.
- If two or more overflows occur while the seconds counter is stopped, the overflow count cannot be held internally. The seconds counter is incremented by one when it is restarted.
- If the seconds counter was updated while the seconds counter is stopped, the sub-counter overflow(s) are ignored.
- It outputs an overflow signal when the value changes from 59 to 00 . The overflow signal triggers the minutes counter (RTCAnMINC).

| Access: | This register is a read-only register that can be read in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base $>+4 \mathrm{C}_{\mathrm{H}}$ |
| Value after reset: | $0 \mathrm{O}_{\mathrm{H}}$ |

Table 34.18 RTCAnSECC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | RTCAnSECC[6:0] | Seconds in BCD |

## NOTES

1. Perform RTCAnSECC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the seconds count buffer register RTCAnSEC or to the clock time setting register RTCAnTIME. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters

### 34.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register

This register is a buffer register to read/write the seconds counter RTCAnSECC.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base $+14_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | RTCAnSEC[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.19 RTCAnSEC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnSEC[6:0] | Seconds in BCD |

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnSEC read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.4.3 RTCAnMINC — RTCA Minutes Count Register

This register is the minutes counter. It counts minutes from 00 to 59 in BCD.
This register counts as follows.

- It is triggered by every overflow of the seconds counter RTCAnSECC.
- It outputs an overflow signal when the value changes from 59 to 00 . The overflow signal triggers the hours counter (RTCAnHOURC).

Access: This register is a read-only register that can be read in 8-bit units.
Address: <RTCAn_base> $+50_{H}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | RTCAnMINC[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.20 RTCAnMINC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 | RTCAnMINC[6:0] | Minutes in BCD |

## NOTES

1. Perform RTCAnMINC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the minutes count buffer register RTCAnMIN or to the time count buffer register RTCAnTIME. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register

This register is a buffer register to read/write the minutes counter RTCAnMINC.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base> +18 H |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | RTCAnMIN[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/w | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.21 RTCAnMIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnMIN[6:0] | Minutes in BCD |

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnMIN read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.4.5 RTCAnHOURC - RTCA Hours Count Register

This register is the hours counter. It counts the hours in BCD. The count range depends on the selected hour format. See Table 34.23, 12- and 24-Hour Format.

This register counts as follows.

- It is triggered by every overflow of the minutes counter RTCAnMINC.
- It outputs an overflow signal when the value changes from 23 to 00 (in 24-hour format) or from 31 to 12 (in 12-hour format). The overflow signal triggers two counters:
- Day of the week counter (RTCAnWEEKC)
- Day of the month counter (RTCAnDAYC)

| Access: | This register is a read-only register that can be read in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base> $+54_{\mathrm{H}}$ |
| Value after reset: | 12 H |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnHOURC[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.22 RTCAnHOURC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | Reserved | When read, the value after reset is returned. |
| 5 to 0 | RTCAnHOURC[5:0] | Hours in BCD. |
|  |  | See Table 34.23, 12- and 24-Hour Format, for details. |

## NOTES

1. Perform RTCAnHOURC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the hours count buffer register RTCAnHOUR or to the time count buffer register RTCAnTIME. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

## 12- or 24-hour format

The count values of RTCAnHOURC depend on the selected hour format.
If 12 -hour format is selected (RTCAnCTL0.RTCAnAMPM $=0$ ), bit 5 in the RTCAnHOURC register is the am/pm indicator:

- RTCAnHOURC[5] $=0: \mathrm{am}$
- RTCAnHOURC[5] = 1: pm

The following table shows the count range of RTCAnHOURC in both 12- and 24-hour format.
Table 34.23 12- and 24-Hour Format

| 12-Hour Format (RTCAnAMPM $=0$ ) |  |  | 24-Hour Format (RTCAnAMPM = 1) |  |
| :---: | :---: | :---: | :---: | :---: |
| Time | RTCAnHOURC |  | Time | RTCAnHOURC |
| 0 am | $12_{\text {H }}$ |  | 0 | $00_{H}$ |
| 1 am | $01_{\text {H }}$ |  | 1 | $01_{H}$ |
| 2 am | 02 ${ }_{\text {H }}$ |  | 2 | $02_{H}$ |
| 3 am | $03_{\mathrm{H}}$ |  | 3 | $03_{\mathrm{H}}$ |
| 4 am | 04 ${ }_{\text {H }}$ |  | 4 | 04 ${ }_{\text {H }}$ |
| 5 am | $05_{\text {H }}$ |  | 5 | $05_{\text {H }}$ |
| 6 am | $06_{H}$ |  | 6 | $06_{H}$ |
| 7 am | $07_{\text {H }}$ |  | 7 | $07_{\text {H }}$ |
| 8 am | $08{ }_{\text {H }}$ |  | 8 | $08{ }_{\text {H }}$ |
| 9 am | $09_{\mathrm{H}}$ |  | 9 | $09_{\mathrm{H}}$ |
| 10 am | $10_{H}$ |  | 10 | $10_{H}$ |
| 11 am | $11_{\text {H }}$ |  | 11 | $11_{\text {H }}$ |
| 0 pm | $32_{\text {H }}$ | $\downarrow$ | 12 | $12_{\text {H }}$ |
| 1 pm | $21_{\text {H }}$ | pm indicator in 12-hour format: | 13 | $13_{\mathrm{H}}$ |
| 2 pm | $22_{\text {H }}$ | RTCAnHOUR.RTCAnHOUR[5] = 1 | 14 | $14_{\text {H }}$ |
| 3 pm | $23_{\mathrm{H}}$ |  | 15 | $15_{\text {H }}$ |
| 4 pm | $24_{\text {H }}$ |  | 16 | $16_{H}$ |
| 5 pm | $25_{\text {H }}$ |  | 17 | $17_{\mathrm{H}}$ |
| 6 pm | $26_{\text {H }}$ |  | 18 | $18_{\text {H }}$ |
| 7 pm | $27_{\mathrm{H}}$ |  | 19 | $19_{\mathrm{H}}$ |
| 8 pm | $28_{\text {H }}$ |  | 20 | $2 \mathrm{O}_{\mathrm{H}}$ |
| 9 pm | $29_{\text {H }}$ |  | 21 | $21_{H}$ |
| 10 pm | $30_{\text {H }}$ |  | 22 | $22_{\text {H }}$ |
| 11 pm | $31_{\text {H }}$ |  | 23 | $23_{H}$ |

### 34.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register

This register is a buffer register to read/write the hours counter RTCAnHOURC.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base> $+1 \mathrm{C}_{\mathrm{H}}$ |
| Value after reset: | $12_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnHOUR[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.24 RTCAnHOUR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | RTCAnHOUR[5:0] | Hours in BCD <br>  |
|  | See Table 34.23, 12- and 24-Hour Format, for details. |  |

NOTES

1. When writing this register, only the following decimal values in $B C D$ are allowed:

- 12-hour format (RTCAnCTLO.RTCAnAMPM = 0):

01 to 12 or 21 to 32

- 24-hour format (RTCAnCTLO.RTCAnAMPM = 1):

00 to 23
2. Perform RTCAnHOUR read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.4.7 RTCAnWEEKC - RTCA Day of the Week Count Register

This register is the day of the week counter. It counts from 0 to 6 .
This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.

Access: This register is a read-only register that can be read in 8-bit units.
Address: <RTCAn_base> + 58 ${ }_{H}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | RTCAnWEEKC[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.25 RTCAnWEEKC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | RTCAnWEEKC[2:0] | Day of the week |

NOTES

1. Perform RTCAnWEEKC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the day of the week count buffer register RTCAnWEEK or to the calendar count buffer register RTCAnCAL. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register

This register is a buffer register to read/write the day of the week counter RTCAnWEEKC.
There is no particular correspondence between the value of RTCAnWEEK and the day of the week. Set the correspondence according to the application to be used.

Example: 0 = Sunday, $1=$ Monday,.., 6 = Saturday

$$
\text { Access: } \quad \text { This register can be read or written in } 8 \text {-bit units. }
$$

Address: <RTCAn_base> + 20 $\mathrm{H}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | RTCAnWEEK[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 34.26 RTCAnWEEK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | RTCAnWEEK[2:0] | Day of the week |

NOTES

1. When writing this register, only decimal values between 0 and 6 in BCD are allowed.
2. Perform RTCAnWEEK read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register

This register is the day of the month counter. It counts from 01 to a maximum of 31 in BCD, depending on the value of the month counter (RTCAnMONC) and the year counter (RTCAnYEARC):

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

Years $0,4,8,12$, etc., are considered leap years.
This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.
- It outputs an overflow signal when the value changes from $28,29,30$, or 31 to 01 , depending on the current month and year. The overflow signal triggers the month counter (RTCAnMONC).

```
Access: This register is a read-only register that can be read in 8-bit units.
Address: <RTCAn_base> + 5C \(\mathrm{C}_{\mathrm{H}}\)
Value after reset: \(\quad 01_{H}\)
```

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnDAYC[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.27 RTCAnDAYC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | Reserved | When read, the value after reset is returned. |
| 5 to 0 | RTCAnDAYC[5:0] | Day of the month in BCD |

## NOTES

1. Perform RTCAnDAYC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the day of the month count buffer register RTCAnDAY or to the calendar count buffer register RTCAnCAL. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register

This register is a buffer register to read/write the day of the month counter RTCAnDAYC.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | <RTCAn_base> $+24_{H}$ |
| Value after reset: | $01_{H}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnDAY[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.28 RTCAnDAY Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | RTCAnDAY[5:0] | Day of the month in BCD |

NOTES

1. When writing this register, only decimal values between 01 and 31 in BCD are allowed:

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

2. Perform RTCAnDAY read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.4.11 RTCAnMONC — RTCA Month Count Register

This register is the month counter. It counts the month of the year, starting from 01 to 12 in BCD.
This register counts as follows.

- It is triggered by every overflow of the counter for the day of the month RTCAnDAYC.
- It outputs an overflow signal when the value changes from 12 to 01 . The overflow signal triggers the year counter (RTCAnYEARC).

Access: This register is a read-only register that can be read in 8-bit units.
Address: <RTCAn_base> $+60_{\mathrm{H}}$
Value after reset: $01_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | RTCAnMONC[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.29 RTCAnMONC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | Reserved | When read, the value after reset is returned. |
| 4 to 0 | RTCAnMONC[4:0] | Month of the year in BCD |

## NOTES

1. Perform RTCAnMONC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the month count buffer register RTCAnMONTH or to the calendar count buffer register RTCAnCAL. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write the month counter RTCAnMONC.

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base $>+28_{\mathrm{H}}$ |
| Value after reset: | $01_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | RTCAnMONTH[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 34.30 RTCAnMONTH Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | RTCAnMONTH[4:0] | Month of the year in BCD |

NOTES

1. When writing this register, only decimal values between 01 and 12 in BCD are allowed.
2. Perform RTCAnMONTH read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.4.13 RTCAnYEARC - RTCA Year Count Register

This register is the year counter. It counts years from 00 to a maximum of 99 in BCD.
Years $00,04,08, \ldots, 92$, and 96 (every four years) are considered leap years.
This register counts as follows.

- It is triggered by every overflow of the month counter RTCAnMONC.

| Access: | This register is a read-only register that can be read in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ RTCAn_base $>+64_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RTCAnYEARC[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.31 RTCAnYEARC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | RTCAnYEARC[7:0] | Year in BCD |

## NOTES

1. Perform RTCAnYEARC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the year count buffer register RTCAnYEAR or to the calendar count buffer register RTCAnCAL. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write the year counter RTCAnYEARC.

Access: This register can be read or written in 8-bit units.
Address: <RTCAn_base> + 2C $\mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RTCAnYEAR[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.32 RTCAnYEAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | RTCAnYEAR[7:0] | Year in BCD |

NOTES

1. When writing this register, only decimal values between 00 and 99 in BCD are allowed.
2. Perform RTCAnYEAR read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.5 Details of RTCA Special Counter and Buffer Registers

### 34.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables the RTCAnHOURC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

Table 34.33 RTCAnTIMEC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | RTCAnHOURC[5:0] | Hours in BCD. <br>  <br>  <br> 15 |
| 14 to 8 | Ree Table 34.23, 12- and 24-Hour Format, for details. |  |
| 7 | RTCAnMINC[6:0] | When read, the value after reset is returned. |
| 6 to 0 | RTCAnSEC in BCD |  |

## NOTES

1. Perform RTCAnTIMEC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the time count buffer register RTCAnTIME. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables the RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

Table 34.34 RTCAnTIME Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 22 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 to 16 | RTCAnHOUR[5:0] | Hours in BCD <br> See Table 34.23, 12- and 24-Hour Format, for details. <br> 15 |
| 14 to 8 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | Reserved | Minutes in BCD |
| 6 to 0 | RTCAnSEC[6:0] | When read, the value after reset is returned. When writing, write the value after reset. |

NOTE
Perform RTCAnTIME read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.5.3 RTCAnCALC - RTCA Calendar Count Register

This register enables the RTCAnYEARC, RTCAnMONC, RTCAnDAYC, and RTCAnWEEKC counters to be read simultaneously.

Table 34.35 RTCAnCALC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RTCAnYEARC[7:0] | Year in BCD |
| 23 to 21 | Reserved | When read, the value after reset is returned. |
| 20 to 16 | RTCAnMONC[4:0] | Month of the year in BCD |
| 15,14 | Reserved | When read, the value after reset is returned. |
| 13 to 8 | RTCAnDAYC[5:0] | Day of the month in BCD |
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 to 0 | RTCAnWEEKC[2:0] | Day of the week in BCD |

NOTES

1. Perform RTCAnCALC read according to the flow described in Section 34.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the clock time setting register RTCAnCAL. See

- Section 34.5.1, Initial Setting of the RTCA, and
- Section 34.5.2, Updating Clock Counters.

### 34.3.5.4 RTCAnCAL - RTCA Calendar Count Buffer Register

This register enables the RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

Table 34.36 RTCAnCAL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 24 | RTCAnYEAR[7:0] | Year in BCD |
| 23 to 21 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | RTCAnMONTH[4:0] | Month of the year in BCD |
| 15,14 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 13 to 8 | RTCAnDAY[5:0] | Day of the month in BCD |
| 7 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | RTCAnWEEK[2:0] | Day of the week in BCD |

NOTE
Perform RTCAnCAL read/write as described in

- Section 34.5.1, Initial Setting of the RTCA,
- Section 34.5.2, Updating Clock Counters, and
- Section 34.5.3, Reading Clock Counters.

### 34.3.6 Details of RTCA Alarm Time Setting Registers

### 34.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies the minute of the alarm interrupt.
For details and example settings, see Section 34.4.3, Alarm Interrupt Function.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | <RTCAn_base> $+40_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | RTCAnALM[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.37 RTCAnALM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnALM[6:0] | Minute of the alarm interrupt in BCD |

## NOTES

1. If decimal values outside the range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When the setting of RTCAnALM is changed during sub-counter operation (RTCAnCTLO.RTCAnCEST $=1$ ), a glitch may be output to INTRTCAOAL. Implement appropriate interrupt mask processing procedures.

### 34.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies the hour of the alarm interrupt.
For details and example settings, see Section 34.4.3, Alarm Interrupt Function.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | <RTCAn_base> $+44_{\mathrm{H}}$ |
| Value after reset: | $12_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RTCAnALH[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.38 RTCAnALH Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | RTCAnALH[5:0] | Hour of the alarm interrupt in BCD |

NOTES

1. If decimal values outside the following range are set, no alarm interrupt request will be generated:

- 12-hour format (RTCAnCTLO.RTCAnAMPM = 0): 01 to 12 or 21 to 32
- 24-hour format (RTCAnCTLO.RTCAnAMPM = 1): 00 to 23

2. When the setting of RTCAnALH is changed during sub-counter operation (RTCAnCTLO.RTCAnCEST = 1), a glitch may be output to INTRTCAOAL. Implement appropriate interrupt mask processing procedures.

### 34.3.6.3 RTCAnALW — RTCA Alarm Day of the Week Setting Register

This register specifies the day(s) of the week of the alarm interrupt.

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | <RTCAn_base $>+48 \mathrm{H}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | RTCAnALW[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.39 RTCAnALW Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | RTCAnALW[6:0] | Specifies day of the week $m(m=0$ to 6$)$ as a day, when an alarm interrupt request is generated: |
|  |  | 0 : No alarm interrupt request is generated on day m. |
|  |  | 1: Alarm interrupt request is generated on day $m$ at the time set using RTCAnALM and RTCAnALH. |
|  |  | The bits of this register correspond to the count value of the day of the week counter (RTCAnWEEKC). |

NOTE
When the setting of RTCAnALW is changed during sub-counter operation (RTCAnCTLO.RTCAnCE $=1$ ), a glitch may be output to INTRTCAOAL. Implement appropriate interrupt mask processing procedures.

## Example

If Sunday is RTCAnWEEK $=0$, Monday is RTCAnWEEK $=1$, Tuesday is RTCAnWEEK $=2, \ldots$, Saturday is RTCAnWEEK = 6:

- To set the alarm for Sunday, set RTCAnALW $=00000001_{\mathrm{B}}$.
- To set the alarm for Monday and Wednesday, set RTCAnALW $=00001010^{\text {B }}$.
- To set the alarm for Tuesday, Thursday, and Saturday, set RTCAnALW $=01010100_{\mathrm{B}}$.

For more examples, see Section 34.4.3, Alarm Interrupt Function.

### 34.3.7 RTCA Emulation Register

### 34.3.7.1 RTCAnEMU — RTCA Emulation Register

This register controls operation by SVSTOP.

$$
\text { Access: } \begin{array}{l}\text { This register can be read or written in 8-bit or 1-bit units. } \\ \\ \text { A write should be performed when EPC.SVSTOP }=0 . \\ \text { Address: } \quad<\mathrm{RTCAn} \text {.base }>+74_{\mathrm{H}} \\ \text { Value after reset: } \\ \quad 00_{\mathrm{H}}\end{array} .
$$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RTCAnSVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 34.40 RTCAnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | RTCAnSVSDIS | When the EPC.SVSTOP bit is set to 0: |
|  |  | Count clock is supplied when the debugger gains microcontroller control (at a breakpoint, etc.) regardless of the value of this bit. |
|  |  | When the EPC.SVSTOP bit is set to 1: |
|  |  | 0 : Count clock is stopped when the debugger gains microcontroller control (as at a breakpoint). |
|  |  | 1: Count clock continues to be supplied when the debugger gains microcontroller control (at a breakpoint, etc.). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 34.4 Operation

The RTCA provides two operation modes:

- Frequency selection mode
- 32.768-kHz mode

The operation mode that can be used depends on the available input clock RTCATCKI. The operation mode specifies the sub-counter compare value that is used to trigger the seconds counter and thus all subsequent counters. Clock error correction is only possible in $32.768-\mathrm{kHz}$ mode.

The following table provides an overview of the properties of the two operation modes.
Table 34.41 RTCA Operation Mode Overview

|  |  |  | $32.768-\mathrm{kHz}$ Mode |  |
| :--- | :--- | :--- | :--- | :---: |
|  | Frequency Selection Mode | Clock Correction Disabled | Clock Correction Enabled |  |
| Allowed input <br> clock RTCATCKI | Any frequency from 32 kHz to <br> 4 MHz | 32.768 kHz | Any frequency from 32.76180000 kHz to <br> 32.77420000 kHz |  |
| Sub-counter <br> RTCAnSUBC <br> operation | $\bullet$ Counter overflow at value of |  |  |  |
| RTCAnSCMP |  |  |  |  |$\quad$ Counter overflow at 7FFF | RTCAnSCMP must be set to |
| :--- |
| RTCATCKI-1 (in Hz) |

The operation mode is selected by control bit RTCAnCTL0.RTCAnSLSB. For details on how to set the operation mode during RTCA initialization, see Section 34.5.1, Initial Setting of the RTCA.

## CAUTIONS

1. The input clock RTCATCKI must not be outside the allowed frequency range.
2. The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTLO.RTCAnCEST = 1).

### 34.4.1 Clock Counter Format

The clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on the valid data range, the number of bits for a digit differs. For example, the tens digit of the month of the year counter has only one bit (for 0 and 1 ) whereas the tens digit of the minutes counter has 3 bits (for 0 to 5 ).

The following table lists the decimals 0 to 59 in binary and BCD.
Table 34.42 Example of BCD Code - Seconds or Minutes Counter (0 to 59)

| Decimal | Binary | BCD |
| :--- | :--- | :--- |
| 0 | 000000 | 0000000 |
| 1 | 000001 | 0000001 |
| 2 | 000010 | 0000010 |
| 3 | 000011 | 0000011 |
| 4 | 000100 | 0000100 |
| 5 | 000101 | 0000101 |
| 6 | 000110 | 0000110 |
| 7 | 000111 | 0000111 |
| 8 | 001000 | 0001000 |
| 10 | 001001 | 0001001 |
| 11 | 001010 | 0010000 |
| 58 | 001011 | 0010001 |
| 59 | 001100 | 0010010 |

### 34.4.2 Fixed Interval Interrupt Function

Interrupt INTRTCA0R can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

The fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

### 34.4.3 Alarm Interrupt Function

Interrupt INTRTCA0AL can be specified to occur at a certain time on one or several days of the week. This interrupt can be used as a wake-up signal.

The alarm interrupt function is enabled and disabled by bit RTCAnCTL1.RTCAnENALM.
The alarm setting is specified by the following control registers:

- RTCAnALW selects the weekday(s).

The allocation of bits to weekdays is defined by the day of the week count buffer register RTCAnWEEK.

- RTCAnALH and RTCAnALM specify the hour and minute in BCD.

## Examples

The following tables show some exemplary settings of the alarm control registers for both 12-hour and 24-hour format. In this example, Sunday is RTCAnWEEK $=0$, Monday is RTCAnWEEK $=1$, Tuesday is RTCAnWEEK $=2, \ldots$, Saturday is RTCAnWEEK $=6$ :

Table 34.43 Alarm Setting in 12-Hour Format (RTCAnCTLO.RTCAnAMPM = 0)

| Alarm Setting Time | RTCAnALW | RTCAnALH | RTCAnALM |
| :--- | :--- | :--- | :--- |
| Sunday 7:00 am | $01_{\mathrm{H}}$ | $07_{\mathrm{H}}$ | $00_{\mathrm{H}}$ |
| Sunday, Monday 12:15 pm | $03_{\mathrm{H}}$ | $32_{\mathrm{H}}$ | $15_{\mathrm{H}}$ |
| Monday, Wednesday, Friday 5:30 pm | $2 \mathrm{~A}_{\mathrm{H}}$ | $25_{\mathrm{H}}$ | $30_{\mathrm{H}}$ |
| Daily, $10: 45 \mathrm{pm}$ | $7 \mathrm{~F}_{\mathrm{H}}$ | $30_{\mathrm{H}}$ | $45_{\mathrm{H}}$ |

Table 34.44 Alarm Setting in 24-Hour Format (RTCAnCTLO.RTCAnAMPM = 1)

| Alarm Setting Time | RTCAnALW | RTCAnALH | RTCAnALM |
| :--- | :--- | :--- | :--- |
| Sunday 7:00 | $01_{\mathrm{H}}$ | $07_{\mathrm{H}}$ | $00_{\mathrm{H}}$ |
| Sunday, Monday 12:15 | $03_{\mathrm{H}}$ | $12_{\mathrm{H}}$ | $15_{\mathrm{H}}$ |
| Monday, Wednesday, Friday $17: 30$ | $2 \mathrm{~A}_{\mathrm{H}}$ | $17_{\mathrm{H}}$ | $30_{\mathrm{H}}$ |
| Daily, $22: 45$ | $7 \mathrm{~F}_{\mathrm{H}}$ | $22_{\mathrm{H}}$ | $45_{\mathrm{H}}$ |

### 34.4.4 Clock Error Correction

## CAUTION

This is not supported in the RH850/F1KM-S4 100-pin product and RH850/F1KM-S1 all products.

Clock error correction compensates for deviations of the oscillator from the nominal clock rate. With clock error correction input clock rates from 32.76180 kHz to 32.77420 kHz are possible.

The clock error correction function is only available in $32.768-\mathrm{kHz}$ operation mode. In this operation mode, a nominal clock rate of 32.768 kHz is expected and the sub-counters overflow value is fixed to $7 \mathrm{FFF}_{\mathrm{H}}$.

The following figures illustrate the clock error when the input clock rate deviates from the nominal clock.

## RTCATCKI $=32.768 \mathbf{k H z}$

Figure 34.2, RTCATCKI $=32.768$ kHz, No Clock Error Correction Required shows the timing diagram if RTCATCKI matches the nominal clock rate of 32.768 kHz . No clock error correction is required.

Counting from 0 to 32767 ( 0 to $7 \mathrm{FFF}_{\mathrm{H}}$ ) with a $32.768-\mathrm{kHz}$ clock is exactly equal to one second.

Figure 34.2 RTCATCKI $=32.768$ kHz, No Clock Error Correction Required

## RTCATCKI = 32.769 kHz

Figure 34.3, RTCATCKI $=32.769$ kHz, No Clock Error Correction Enabled shows the timing diagram if RTCATCKI deviates from the nominal clock rate of 32.768 kHz . In this example, RTCATCKI is connected to a $32.769-\mathrm{kHz}$ oscillator. Clock error correction is not enabled.

Counting from 0 to 32767 ( 0 to $7 \mathrm{FFF}_{\mathrm{H}}$ ) with a $32.769-\mathrm{kHz}$ clock is equal to approximately 0.99997 seconds (32768/32769). A "+ error" (faster than $32.768-\mathrm{kHz}$ ) occurs. In one month, RTCA deviates approximately -79 seconds from the real time.

Error $=(32768 / 32769-1) \times 60(\mathrm{~s}) \times 60(\mathrm{~min}) \times 24(\mathrm{~h}) \times 30(\mathrm{~d})$

Figure 34.3 RTCATCKI $=32.769$ kHz, No Clock Error Correction Enabled

Clock error correction is performed by stretching/reducing the 1-second period of the sub-counter at regular intervals. The sub-counter's upper limit of $7 \mathrm{FFF}_{\mathrm{H}}$ is increased or decreased by setting the following parameters in register RTCAnSUBU:

- A correction value greater than one
- An operator (add/subtract)
- An interval (20 or 60 seconds)

The corrected overflow value becomes effective every 20 or 60 seconds, so that on the average RTCAnSECC is triggered exactly every second.

### 34.4.4.1 Setting the Correction Value and the Operator

The correction value and operator are specified by the RTCAnF6, RTCAnF[5:0] bits of the RTCAnSUBU register:

- RTCAnF6 specifies whether the overflow value is incremented or decremented.
- RTCAnF[5:0] specifies the correction value.

The correction values are calculated as follows:
Table 34.45 Correction Value Settings

| RTCAnF6 | Increment/Decrement | Correction Value |
| :--- | :--- | :--- |
| 0 | Increment | $($ Value of RTCAnF[5:0] -1) $\times 2$ |
| 1 | Decrement | (Inverted value of RTCAnF[5:0] +1) $\times 2$ |

Some examples are given in the following table:
Table 34.46 Correction Value Examples

| RTCAnF6 | RTCAnF[5:0] | Correction Value | Count Limit of RTCAnSUBC |
| :--- | :--- | :--- | :--- |
| 0 | $15_{H}$ | $\left(15_{H}-1\right) \times 2=40$ | $32768+40=32808$ |
| 1 | $15_{H}$ | $\left(15_{H}+1\right) \times 2$ | $32768-86=32682$ |
|  |  | $=\left(2 A_{H}+1\right) \times 2$ |  |

### 34.4.4.2 Impact of the Repetition Interval

The correction value set by RTCAnF6, RTCAnF[5:0] does not change the count limit of RTCAnSUBC every second. The repetition interval at which the correction value becomes effective is specified by bit RTCAnDEV.

This bit also influences the size of the correctable frequency range and the correction accuracy.
The following table summarizes the RTCAnDEV settings.
Table 34.47 Setting of Bit RTCAnSUBU.RTCAnDEV

| RTCAnDEV | Count Limit of RTCAnSUBC is <br> Changed | Frequency Range that can be Corrected | Correction Accuracy |
| :--- | :--- | :--- | :--- |
| 0 | Every 20 seconds <br> when RTCAnSECC $=00,20$, or 40 | 32.76180000 to 32.77420000 kHz |  |
| 1 | Every 60 seconds   <br> when RTCAnSECC $=00$ 32.76593333 to 32.77006667 kHz Three times higher than for <br> RTCAnDEV $=0$ |  |  |

### 34.4.4.3 Sample Settings

The frequencies that can be corrected, as well as the setting values of bits RTCAnDEV, RTCAnF6, and RTCAnF[5:0], are listed in the following table.

Table 34.48 Correctable Frequency Range when RTCAnDEV $=0$

| Input Clock Frequency | RTCAnF6 | RTCAnF[5:0] | Correction Value of RTCAnSUBC |
| :---: | :---: | :---: | :---: |
| - | 0 | 000000 | No correction |
| - | 0 | 000001 | No correction |
| 32.76810000 kHz | 0 | 000010 | Once every 20 s, RTCAnSUBC count value + 2 |
| 32.76820000 kHz | 0 | 000011 | Once every 20 s, RTCAnSUBC count value + 4 |
| 32.76830000 kHz | 0 | 000100 | Once every 20 s, RTCAnSUBC count value +6 |
| : | : | : | : |
| 32.77400000 kHz | 0 | 111101 | Once every 20 s, RTCAnSUBC count value + 120 |
| 32.77410000 kHz | 0 | 111110 | Once every 20 s, RTCAnSUBC count value + 122 |
| $\begin{aligned} & 32.77420000 \mathrm{kHz} \\ & \text { (upper limit) } \end{aligned}$ | 0 | 111111 | Once every 20 s, <br> RTCAnSUBC count value + 124 |
| - | 1 | 000000 | No correction |
| - | 1 | 000001 | No correction |
| $\begin{aligned} & 32.76180000 \mathrm{kHz} \\ & \text { (lower limit) } \\ & \hline \end{aligned}$ | 1 | 000010 | Once every 20 s, RTCAnSUBC count value - 124 |
| 32.76190000 kHz | 1 | 000011 | Once every 20 s, <br> RTCAnSUBC count value - 122 |
| 32.76200000 kHz | 1 | 000100 | Once every 20 s , RTCAnSUBC count value - 120 |
| : | : | : | : |
| 32.76770000 kHz | 1 | 111101 | Once every 20 s, <br> RTCAnSUBC count value - 6 |
| 32.76780000 kHz | 1 | 111110 | Once every 20 s, RTCAnSUBC count value - 4 |
| 32.76790000 kHz | 1 | 111111 | Once every 20 s, RTCAnSUBC count value - 2 |

Table 34.49 Correctable Frequency Range when RTCAnDEV $=1$

| Input Clock Frequency | RTCAnF6 | RTCAnF[5:0] | Correction Value of RTCAnSUBC |
| :---: | :---: | :---: | :---: |
| - | 0 | 000000 | No correction |
| - | 0 | 000001 | No correction |
| 32.76803333 kHz | 0 | 000010 | Once every 60 s, RTCAnSUBC count value + 2 |
| 32.76806667 kHz | 0 | 000011 | Once every 60 s , RTCAnSUBC count value + 4 |
| 32.76810000 kHz | 0 | 000100 | Once every 60 s, RTCAnSUBC count value + 6 |

| 32.76796667 kHz | 1 | 111111 | Once every 60 s, RTCAnSUBC count value - 2 |

### 34.5 Procedures for Setup, Writing and Reading

The following subsections provide flow charts that illustrate the procedures for RTCA setup and for reading and writing the RTCA clock counters.

### 34.5.1 Initial Setting of the RTCA

The RTCA must be stopped before setting the initial setting value of each counter.

### 34.5.1.1 RTCA Stop Procedure

Stop the RTCA according to the following flow.

Figure 34.4 RTCA Stop Procedure

### 34.5.1.2 RTCA Initialization Procedure

Perform the initial setting of the RTCA according to the following flow:

Figure 34.5 RTCA Initial Setup Procedure

## CAUTION

The internal clock counter is synchronized with RTCATCKI.
In addition, two RTCATCKI periods are required before the clock counter starting behind END of the above flow.
Therefore, PCLK must be continuously supplied until the completion of the initial setting.
Check that RTCAnCTLO.RTCAnCEST $=1$, when the supply of PCLK is stopped after setting the initial setting value of RTCA.

### 34.5.2 Updating Clock Counters

The clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while the sub-counter is running.
To update the clock counter when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE $=1$ ), follow the flowchart shown below.

Figure $34.6 \quad$ Updating Clock Counter Values

## CAUTIONS

1. The internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before the clock counter updating behind END of the above flow. Therefore, PCLK must be continuously supplied until the completion of the clock counter updating.
Check that RTCAnCTL2.RTCAnWST $=0$ before stopping the supply of PCLK after the completion of clock counter updating.
2. The update procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:
3. Only one sub-counter overflow can be held internally and increment the seconds counter after restarting the clock counters if the value is held.
4. If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.

### 34.5.3 Reading Clock Counters

There are two methods to read the clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

The advantages and disadvantages of the two methods are summarized in the following table.
Table 34.50 Comparison of the Two Read Methods

|  | Advantage | Disadvantage |
| :--- | :--- | :--- |
| Reading count buffer It is unnecessary to read clock counters several <br> registers times because the clock counters are read <br> synchronously.A program wait state occurs between setting <br> RTCAnCTL2.RTCAnWAIT = 1 and completion of <br> data transfer. |  |  |
| Reading count registers | Program wait state does not occur. | If the sub-counter increments, the clock counters <br> must be read several times because they are read <br> asynchronously to RTCATCKI. |

### 34.5.3.1 Procedure for Reading Count Buffer Registers

The following operations are necessary:

1. Stop all clock counters (RTCAnCTL2.RTCAnWAIT = 1). The value of the clock counters is transferred to the corresponding count buffer registers.
2. Read the count buffer registers.

A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT $=1$ and completion of data transfer.
The maximum delay is three PCLK periods plus two RTCATCKI periods. For example, if the RTCA operates with PCLK $=40 \mathrm{MHz}$ and RTCATCKI $=32.768 \mathrm{kHz}$, the delay is about $61 \mu \mathrm{~s}$.

To read the count buffer register when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST $=1$ ), follow the flowchart shown below.

Figure 34.7 Reading Clock Count Buffer Registers

## CAUTIONS

1. The internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before resuming counter behind END of the above flow.
Therefore, PCLK must be continuously supplied until the counter resuming.
Check that RTCAnCTLO.RTCAnCEST = 1 first to stop the supply of PCLK after count buffer register reading.
2. The reading procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more.
3. Only one sub-counter overflow can be held internally. If there is a value held internally when the clock counter restarts, the seconds counter will be incremented by 1.
4. If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.

### 34.5.3.2 Procedure for Reading Counter Registers Directly

To ensure that the sub-counter did not overflow while reading the counters, the seconds counter RTCAnSECC must be read twice in the beginning and at the end of the procedure. The first read value is compared with the second read value.

- First read value = second read value:

No overflow of sub-counter occurred during counter read operation.

- First read value $\neq$ second read value:

Overflow of the sub-counter occurred during counter read operation. The counters must be read again to get the current counter values.

To read the counter register directly when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE $=1$ ), follow the flowchart shown below.

Figure 34.8 Reading Clock Counter Registers

NOTE
The procedure must be completed within one second.

### 34.5.4 Reading RTCAnSRBU

RTCAnSRBU is the read buffer register for the sub-counter.
When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE $=1$ ), read RTCAnSRBU according to the following flow.

Figure 34.9 Reading the RTCAnSRBU Register

### 34.5.5 Writing to RTCAnSUBU

RTCAnSUBU is the clock error correction register for the sub-counter.
When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE $=1$ ), write to RTCAnSUBU according to the flow described below.

Figure 34.10 Writing to the RTCAnSUBU Register

NOTE
While the sub-counter operation is enabled (RTCAnCTLO.RTCAnCE $=1$ ), the status flag RTCAnCTL2.RTCAnWUST is set when RTCAnSUBU is written to. It is cleared when the write operation to RTCAnSUBU is completed. This is synchronous with the next RTCAnSUBC overflow.
RTCAnCTL2.RTCAnWUST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWUST = 1 at the beginning of this flow).

### 34.5.6 Writing to RTCAnSCMP

RTCAnSCMP is the sub-counter compare register.
When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE $=1$ ), write to RTCAnSCMP according to the flow described below.

Figure 34.11 Writing the RTCAnSCMP Register

NOTE
While the sub-counter operation is enabled (RTCAnCTLO.RTCAnCE $=1$ ), the status flag RTCAnCTL2.RTCAnWSST is set when RTCAnSCMP is written to. It is cleared when the write operation to RTCAnSCMP is completed. This is synchronous with the next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWSST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWSST = 1 at the beginning of this flow).

### 34.6 Timing Diagrams

### 34.6.1 Timing of Counter Start

The following diagram illustrates the counter start after setting the time in the buffer registers.

Figure 34.12 Counter Start Timing

The timing diagram above shows the following:
(1) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME $=00103045_{\mathrm{H}}$. Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.
(2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE $=1$.
(3) When the second rising edge of RTCATCKI occurs, the buffer register values are loaded to the corresponding count registers.
(4) When the next rising edge of RTCATCKI occurs, count up of the sub-counter starts.

### 34.6.2 Timing of Clock Counter Update while Counter Is Enabled

The following diagram illustrates the counter restart after setting the time in the buffer registers.

Figure 34.13 Clock Counter Update Timing

The timing diagram above shows the following:
(1) Trigger the clock counters stop (RTCAnCTL2.RTCAnWAIT $=1$ ).
(2) RTCAnCTL2.RTCAnWST is set to 1 after the second rising edge of RTCATCKI and the third rising edge of PCLK, and the counter clock stops. The sub-counter continues counting.
(3) RTCAnCTL2.RTCAnWST = 1 can be readable.
(4) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME to $00103045_{\mathrm{H}}$. Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.
(5) Trigger the clock counters restart (RTCAnCTL2.RTCAnWAIT $=0$ ).
(6) When the second rising edge of RTCATCKI occurs, the values of the buffer registers are loaded to the corresponding count registers. Write operation to RTCAnSECC is performed and RTCAnSUBC is cleared.
(7) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnWST is set to 0 .
(8) Clock counter operation is resumed.

### 34.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

The following diagram illustrates the timing when reading the sub-counter read buffer RTCAnSRBU.

Figure 34.14 Timing when Reading the Sub-Counter Read Buffer Register Value

The timing diagram above shows the following:
(1) Setting RTCAnRSUB $=1$ triggers loading of the sub-counter value to RTCAnSRBU.
(2) When the second rising edge of RTCATCKI occurs, the value of RTCAnSUBC is loaded to RTCAnSRBU.
(3) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

## Section 35 Encoder Timer (ENCA)

This section contains a generic description of the Encoder Timer (ENCA).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ENCA.

### 35.1 Features of RH850/F1KH, RH850/F1KM ENCA

### 35.1.1 Number of Units

This microcontroller has the following number of ENCA units.
Table $35.1 \quad$ Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 176 Pins | RH850/F1KH-D8 233 Pins |  | RH850/F1KH-D8 324 Pins |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Number of Units | 1 | 1 |  | 1 |  |
| Name | ENCAn ( $\mathrm{n}=0$ ) | ENCAn ( $\mathrm{n}=0$ ) |  | ENCAn ( $\mathrm{n}=0$ ) |  |
| Table 35.2 | Number of Units (RH850/F1KM-S4) |  |  |  |  |
| Product Name | RH850/F1KM-S4 100 Pins | RH850/F1KM-S4 144 Pins | RH850/F1KM-S4 176 Pins | RH850/F1KM-S4 233 Pins | RH850/F1KM-S4 272 Pins |
| Number of Units | 1 | 1 | 1 | 1 | 1 |
| Name | ENCAn ( $\mathrm{n}=0$ ) | ENCAn ( $\mathrm{n}=0$ ) | ENCAn ( $\mathrm{n}=0$ ) | ENCAn ( $\mathrm{n}=0$ ) | ENCAn ( $\mathrm{n}=0$ ) |

Table 35.3 Number of Units (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |

Table 35.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual ENCA units are identified by the index "n"; for example, ENCAnCTL $(\mathrm{n}=0)$ <br> is the ENCAn control register. |

### 35.1.2 Register Base Address

ENCAn base address is listed in the following table.
ENCAn register addresses are given as an offset from the base address.
Table 35.5 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <ENCAO_base> | FFE8 $0000_{\mathrm{H}}$ |

### 35.1.3 Clock Supply

The ENCAn clock supply is shown in the following table.
Table 35.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| ENCAn | PCLK | CKSCLK_IPERI1 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI1 | Bus clock |

### 35.1.4 Interrupt Requests

ENCAn interrupt requests are listed in the following table.
Table 35.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| ENCAO |  |  | Overflow interrupt |
| ENCATIOV | Underflow interrupt | 85 | - |
| ENCATIUD | Capture/compare match interrupt 0 | 86 | - |
| ENCATINT0 | Capture/compare match interrupt 1 | 88 | - |
| ENCATINT1 | Encoder clear interrupt | 89 | - |
| ENCATIEC |  |  | - |

### 35.1.5 Reset Sources

ENCAn reset sources are listed in the following table. ENCAn is initialized by these reset sources.
Table 35.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| ENCAn | All reset sources (ISORES) |

### 35.1.6 External Input/Output Signals

External input/output signals of ENCAn are listed below.
Table 35.9 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name |  | Description |
| :--- | :--- | :--- |
| ENCA0 | ENCAn capture trigger input $0^{* 1}$ | ENCAOTIN0 |
| ENCATTIN0 | ENCAn capture trigger input $1^{* 1}$ | ENCAOTIN1 |
| ENCATTIN1 | ENCAn encoder input $0^{\star 1}$ | ENCA0E0 |
| ENCAnE0 | ENCAn encoder input $1^{* 1}$ | ENCA0E1 |
| ENCAnE1 | ENCAn encoder clear input*1 | ENCAOEC |
| ENCAnEC |  |  |

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see Section 2A.12, Noise Filter \& Edge/Level Detector, Section 2B.12, Noise Filter \& Edge/Level Detector and Section 2C.12, Noise Filter \& Edge/Level Detector.

### 35.1.7 Internal Input/Output Signals

Input/output signals to be connected between ENCA and PIC are listed below.
Table 35.10 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Connected to |
| :--- | :--- | :--- |
| ENCATSST | Simultaneous start trigger | PIC |
| ENCATTIN1 | ENCAn capture trigger input 1 | PIC |

### 35.2 Overview

### 35.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

### 35.2.2 Block Diagram

Figure 35.1 ENCA Block Diagram

### 35.3 Registers

### 35.3.1 List of Registers

ENCA registers are listed in the following table.
<ENCAn_base> is defined in Section 35.1.2, Register Base Address
Table $35.11 \quad$ List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| ENCAn | ENCAn capture/compare register 0 | ENCAnCCR0 | <ENCAn_base> |
|  | ENCAn capture/compare register 1 | ENCAnCCR1 | <ENCAn_base> + 04 ${ }_{\text {H }}$ |
|  | ENCAn counter register | ENCAnCNT | <ENCAn_base> + 08 ${ }_{\text {H }}$ |
|  | ENCAn status flag register | ENCAnFLG | <ENCAn_base> $+0 \mathrm{C}_{\mathrm{H}}$ |
|  | ENCAn status flag clear register | ENCAnFGC | <ENCAn_base> + 10 ${ }_{\text {H }}$ |
|  | ENCAn timer enable status register | ENCAnTE | <ENCAn_base> + 14 ${ }_{\text {H }}$ |
|  | ENCAn timer start trigger register | ENCAnTS | <ENCAn_base> $+18_{\text {H }}$ |
|  | ENCAn timer stop trigger register | ENCAnTT | <ENCAn_base> + 12 $\mathrm{H}_{\text {H }}$ |
|  | ENCAn I/O control register 0 | ENCAnIOCO | <ENCAn_base> + $20_{\text {H }}$ |
|  | ENCAn control register | ENCAnCTL | <ENCAn_base> $+40_{\text {H }}$ |
|  | ENCAn I/O control register 1 | ENCAnIOC1 | <ENCAn_base> + 44 ${ }_{\text {H }}$ |
|  | ENCAn emulation register | ENCAnEMU | $<E N C A n \_$base $>+48_{\text {H }}$ |

### 35.3.2 ENCAnCTL — ENCAn Control Register

This register is used to configure various operation settings of the Encoder Timer.

Table 35.12 ENCAnCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | ENCAnCME | Encoder Clear Mask Enable <br> This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used. <br> 0: Disables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register <br> 1: Enables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register. <br> This bit is valid only when ENCAnCRM1 $=0$. <br> When this bit is set to " 1 ", setting ENCAnECM1 to " 1 " is prohibited. |
| 14 | ENCAnMCS | Encoder Mask Clear Select <br> This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCATINT1 when the compare function is used. <br> This bit is valid only when ENCAnCRM1 $=0$. <br> 0 : Masking of compare-match interrupt detection is canceled when the ENCAnCCR1 register is written. <br> 1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed. <br> - Timer counter clear operation accompanying encoder clear input <br> - Timer counter clear operation upon compare-match between ENCAnCNT and ENCAnCCRO when ENCAnECMO = 1 <br> - Loading from ENCAnCCRO to the timer counter upon underflow detection when ENCAnLDE = 1 |
| 13 to 10 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | ENCAnCRM1 | ENCAnCCR1 Register Mode <br> 0 : ENCAnCCR1 used as compare register. <br> 1: ENCAnCCR1 used as capture register. |
| 8 | ENCAnCRMO | ENCAnCCRO Register Mode <br> 0: ENCAnCCRO used as compare register. <br> 1: ENCAnCCR0 used as capture register. |
| 7 | ENCAnCTS | ENCAnCCR1 Capture Trigger Select <br> This is a trigger selection bit for the capture operation to the ENCAnCCR1 register. <br> This bit is valid only when ENCAnCRM1 $=1$. <br> 0 : Uses ENCATTIN1 of capture trigger 1 signal as the capture trigger for the ENCAnCCR1 register. <br> 1: The counter clear signal selected with ENCAnSCE is used as the capture trigger for the ENCAnCCR1 register. |
| 6, 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 35.12 ENCAnCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 4 | ENCAnLDE | ENCAn Counter Load Enable <br> This bit is used to enable/disable setting value loading to the counter upon underflow occurrence. <br> This bit is valid only when ENCAnCRMO $=0$. <br> When ENCAnCRMO = 1, loading of the ENCAnCCRO register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit. <br> 0 : Disables loading of ENCAnCCRO register setting value to counter upon occurrence of a counter underflow. <br> 1: Enables loading of ENCAnCCRO register setting value to counter upon occurrence of a counter underflow. |
| 3 | ENCAnECM1 | Encoder Clear Mode 1 <br> This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR1 setting value. <br> This bit is valid only when ENCAnCRM1 $=0$. <br> 0 : Does not clear the counter to $0000_{\mathrm{H}}$ upon match of timer counter value and ENCAnCCR1 setting value. <br> 1: Clears the counter to $0000_{\mathrm{H}}$ upon match of timer counter value and ENCAnCCR1 setting value if the next count is a down-count. |
| 2 | ENCAnECMO | Encoder Clear Mode 0 <br> This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCRO setting value. <br> This bit is valid only when ENCAnCRMO $=0$. <br> 0 : Does not clear the counter to $0000_{\mathrm{H}}$ upon match of timer counter value and ENCAnCCRO setting value. <br> 1: Clears the counter to $0000_{\mathrm{H}}$ upon match of timer counter value and ENCAnCCRO setting value if the next count is an up-count. |
| 1, 0 | ENCAnUDS[1:0] | Up/down Count Selection 1 and 0 <br> These are the counter up/down control bits using ENCAnE0 and ENCAnE1. <br> 00: Upon detection of valid edge of ENCAnE0, <br> - down-count when ENCAnE1 = H, <br> - up-count when ENCAnE1 = L <br> 01: Upon detection of valid edge of ENCAnE0, up-count, Upon detection of valid edge of ENCAnE1, down-count <br> 10: At rising edge of ENCAnE0, down-count At falling edge of ENCAnE0, up-count However, count operation is performed only when ENCAnE1 = L. <br> 11: Detection of both edges of ENCAnE0, ENCAnE1. <br> The count operation is determined based on the combination of the detected edge and level. |

### 35.3.3 ENCAnIOCO — ENCAn I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

| Access: | This register can be read or written in 8-bit units. |
| ---: | :--- |
| Address: | <ENCAn_base> $+20_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | ENCAnTIS[3:2] |  | ENCAnTIS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 35.13 ENCAnIOCO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 3, 2 | ENCAnTIS[3:2] | Input Edge Selection for Capture Trigger 1 <br> These bits are valid only when ENCAnCTL.ENCAnCRM1 = 1 and ENCAnCTL.ENCAnCTS = 0. <br> All other settings of ENCAnCRM1 and ENCAnCTS are invalid. <br> 00: No edge detection <br> 01: Rising edge detection <br> 10: Falling edge detection <br> 11: Both edges detection |
| 1, 0 | ENCAnTIS[1:0] | Input Edge Selection for Capture Trigger 0 <br> These bits are valid only when ENCAnCTL.ENCAnCRMO $=1$. <br> 00: No edge detection <br> 01: Rising edge detection <br> 10: Falling edge detection <br> 11: Both edges detection |

### 35.3.4 ENCAnIOC1 - ENCAn I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.

Table 35.14 ENCAnIOC1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1,0 | ENCAnEIS[1:0] | Encoder Edge Input Selection 1 and 0 |
|  | These are the encoder input edge selection bits. |  |
|  | These bits are valid when ENCAnUDS1, ENCAnUDSO $=00_{\mathrm{B}}$ or $01_{\mathrm{B}}$, and are invalid when |  |
|  | ENCAnUDS1, ENCAnUDS0 $=10_{\mathrm{B}}$ or $11_{\mathrm{B}}$. |  |
|  | $00:$ No edge detection |  |
|  | $01:$ Rising edge detection |  |
|  | $10:$ Falling edge detection |  |
|  | $11:$ Both edges detection |  |

### 35.3.5 ENCAnFLG - ENCAn Status Flag Register

This register holds the status flags of the timer counter of ENCAn.

| Access: | This register is a read-only register that can be read in 8-bit units. |
| ---: | :--- |
| Address: | <ENCAn_base> $+0 \mathrm{C}_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | ENCAnCSF | ENCAnUDF | ENCAnOVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 35.15 ENCAnFLG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | Reserved | When read, the value after reset is returned. |
| 2 | ENCAnCSF | Counter Status Flag <br> This bit reflects the current timer counter operation. <br> 0 : Timer counter in up-count status <br> 1: Timer counter in down-count status |
| 1 | ENCAnUDF | Underflow Flag <br> This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. <br> 0 : This flag is cleared upon any of the following events: <br> - " 1 " is written to ENCAnFGC.ENCAnCLUD <br> - The flag is cleared to 0 by setting ENCAnTS bit to " 1 " when ENCAnTE $=0$ or by setting the simultaneous start trigger input (ENCATSST signal) to "High". <br> 1: This flag is set to " 1 " upon occurrence of an underflow during the encoder timer count operation. |
| 0 | ENCAnOVF | Overflow Flag <br> This bit reflects the occurrence of an overflow during the timer counter operation. <br> This bit is cleared to 0 at the start of count operation. <br> 0 : This flag is cleared upon any of the following events: <br> - " 1 " is written to ENCAnFGC.ENCAnCLOV <br> - The flag is cleared to 0 by setting ENCAnTS bit to " 1 " when ENCAnTE $=0$ or by setting the simultaneous start trigger input (ENCATSST signal) to "High". <br> 1: This flag is set to " 1 " upon occurrence of an overflow during the encoder timer count operation. |

### 35.3.6 ENCAnFGC - ENCAn Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.
Access: This register is a write-only register that can be written in 8-bit units.
This register always returns 0 when read.
Address: <ENCAn_base> +10 H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | ENCAnCLUD | ENCAnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

Table 35.16 ENCAnFGC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When writing, write the value after reset. |
| 1 | ENCAnCLUD | Underflow Flag Clear |
|  |  | This bit clears the underflow flag. |
|  | 0: Writing is ignored. |  |
|  | 1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection). |  |
| 0 | ENCAnCLOV | Overflow Flag Clear |
|  | This bit clears the overflow flag. |  |
|  | $0:$ Writing is ignored. |  |
|  | 1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection). |  |
|  |  |  |

### 35.3.7 ENCAnCCRO - ENCAn Capture/Compare Register 0

This register is a 16 -bit capture/compare register 0 .

Access: This register can be read or written in 16-bit units.
When this register functions as a capture register, only reading is possible. Write operation is ignored.
When this register functions as a compare register, reading and writing is possible.
Address: <ENCAn_base> $+00_{H}$
Value after reset: $\quad 0000_{\mathrm{H}}$

Table 35.17 ENCAnCCR0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 0 | ENCAnCCR0[15:0] | Capture/Compare Register 0 |
|  |  | Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the ENCAnLDE bit in ENCA control register ENCAnCTL for details. |
|  |  | - If ENCAnCTL.ENCAnCRMO = 0: ENCAnCCRO is a compare register. Set the value to be compared with the timer counter value. |
|  |  | - If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCRO is a capture register. The captured timer counter value is stored. |

### 35.3.8 ENCAnCCR1 — ENCAn Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.
Access: This register can be read or written in 16-bit units.
When this register functions as a capture register, only reading is possible. Write operation is ignored.
When this register functions as a compare register, reading and writing is possible.
Address: <ENCAn_base> $+04_{\mathrm{H}}$
Value after reset: $\quad 0000_{H}$

Table 35.18 ENCAnCCR1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 0 | ENCAnCCR1[15:0] | Capture/Compare Register 1 |
|  |  | During capture operation, the capture trigger to this register differs according to the ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control register ENCAnCTL for details. |
|  |  | - If ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is a compare register. Set the value to be compared with the timer counter value. |
|  |  | - If ENCAnCTL.ENCAnCRM1 = 1: ENCAnCCR1 is a capture register. The captured timer counter value is stored. |

### 35.3.9 ENCAnCNT — ENCAn Counter Register

This register is the 16 -bit timer counter register.

### 35.3.10 ENCAnTE — ENCAn Timer Enable Status Register

This register indicates the operating status of ENCAn.

| Access: | This register is a read-only register that can be read in 8-bit units. |
| ---: | :--- |
| Address: | <ENCAn_base $>+14_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ENCAnTE |

| R/W | R | R | R | R | R | R | R | R |

Table 35.20 ENCAnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | ENCAnTE | Timer Status Enable |
|  |  | This is a status bit that indicates the operation enabled/stopped status of ENCAn. |
|  | This bit is cleared to 0 when " 1 " is written to ENCAnTT.ENCAnTT. |  |
|  | This bit is set to " 1 " when "1" is written to ENCAnTS.ENCAnTS, or when the input signal of |  |
|  | ENCATSST is set to High level. |  |
|  | $0:$ Operation stopped status |  |
|  | 1: Operation enabled status |  |

### 35.3.11 ENCAnTS — ENCAn Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.
Access: This register is a write-only register that can be written in 8-bit units.
It is always read as 00 . This register can be written only when ENCAnTE.ENCAnTE is 0.
Address: <ENCAn_base> $+18_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ENCAnTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 35.21 ENCAnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | ENCAnTS | Timer Start Trigger |
|  |  | This is the trigger bit that sets the ENCAn to the operation enabled state. |
|  | $0:$ Writing is ignored. |  |
|  | 1: The ENCAn is set to the operation enabled state by setting ENCAnTE. ENCAnTE $=1$. |  |

### 35.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.
Access: This register is a write-only register that can be written in 8-bit units.
It is always read as $00_{\mathrm{H}}$.
Address: <ENCAn_base> $+1 \mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ENCAnTT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | w |

Table 35.22 ENCAnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | ENCAnTT | Timer Stop Trigger |
|  |  | This is the trigger bit that sets the ENCAn to the operation stopped state. |
|  | $0:$ Writing is ignored. |  |
|  | 1: Clears ENCAnTE.ENCAnTE to "0", to set the ENCAn to the count operation stopped |  |
|  | state. |  |

### 35.3.13 ENCAnEMU — ENCAn Emulation Register

This register controls operations by SVSTOP.
Access: This register can be read or written in 8-bit units.
Writing to this register should be performed in the counter operation stopped status (ENCAnTE.ENCAnTE $=0$ and EPC.SVSTOP = 0).

Address: <ENCAn_base> + 48 $_{\mathrm{H}}$
Value after reset: $\quad 00_{\mathrm{H}}$

Table 35.23 ENCAnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ENCAnSVSDIS | - When EPC.SVSTOP bit $=0$ : <br> The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0 ). <br> - When EPC.SVSTOP bit = 1 : <br> 0 : The count clock is stopped when the debugger assumes control of the microcontroller (at a break point, etc.). <br> 1: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 35.4 Operation

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

### 35.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.
The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

Figure 35.2 Timer Counter Initial Value Setting/Start/Stop

## (1) Timer Counter Initial Value Setting

The initial value of the ENCAn counter register (ENCAnCNT) can be set in the counter operation stopped status (ENCAnTE = 0).

## (2) Timer Counter Startup

By writing " 1 " to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to " 1 ", the count operation is enabled, and counting operation is performed upon detection of the valid edge of the encoder input.

## (3) Overflow Operation

An overflow occurs when up-counting is performed when the counter value is $\mathrm{FFFF}_{\mathrm{H}}$. If the counter value changes from $\mathrm{FFFF}_{\mathrm{H}}$ to $0000_{\mathrm{H}}$, an overflow interrupt (ENCATIOV) is generated, and the overflow flag (ENCAnOVF) is set to " 1 ". The overflow flag (ENCAnOVF) is cleared to " 0 " when " 1 " is set to the overflow flag clear bit (ENCAnCLOV). For details about the operation, see Section 35.6.1, Overflow Occurrence and Overflow Flag Clear Operation.

## (4) Underflow Operation

An underflow occurs when down-counting is performed when the counter value is $0000_{\mathrm{H}}$. If the counter value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCAnUDF) is set to " 1 ". The underflow flag (ENCAnUDF) is cleared to " 0 " when " 1 " is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see Section 35.6.2, Underflow Occurrence and Underflow Flag Clear Operation.

## (5) Timer Counter Stop

By writing " 1 " to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to " 0 ", and the count operation is stopped. At this time, the timer counter is not reset to $0000_{\mathrm{H}}$ and holds the value before count operation stop.

### 35.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of ENCAnUDS1, ENCAnUDS0.

### 35.4.2.1 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=\mathbf{0 0}_{\mathrm{B}}$

Table 35.24 When ENCAnUDS1, ENCAnUDS0 Bits $=00_{B}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnEO Pin | ENCAnE1 Pin | Count Operation |
| 0 | 0 | Rising edge | High level | Down |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |
|  |  | Rising edge | Low level | Up |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |

The valid edge for ENCAnE0 is specified by setting ENCAnEIS1, ENCAnEIS0.
Up/down count operation is performed when the valid edges and levels of ENCAnE0 and ENCAnE1 match.
The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits $=00_{B}$.

Figure 35.3 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=00_{B}$

### 35.4.2.2 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=01_{B}$

Table 35.25 When the ENCAnUDS1, ENCAnUDS0 Bits $=01_{B}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 0 | 1 | Low level | Rising edge | Down |
|  |  |  | Falling edge |  |
|  |  |  | Rising and falling edges |  |
|  |  | High level | Rising edge |  |
|  |  |  | Falling edge |  |
|  |  |  | Rising and falling edges |  |
|  |  | Rising edge | Low level | Up |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |
|  |  | Rising edge | High level |  |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |
|  |  | Simultaneous input |  | Hold |

The valid edges for ENCAnE0 and ENCAnE1 are specified by setting ENCAnEIS1, ENCAnEIS0.
Up/down count operation is performed when the valid edges and levels of the ENCAnE0 and ENCAnE1 pins match, and the count is held when the valid edges overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits $=01_{\mathrm{B}}$.

Figure 35.4 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=01_{B}$

### 35.4.2.3 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=10_{\mathrm{B}}$

Table 35.26 When the ENCAnUDS1, ENCAnUDS0 Bits $=10_{B}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 1 | 0 | Rising edge | Low level | Down |
|  |  | Rising edge | Falling edge |  |
|  |  | Falling edge | Low level | Up |
|  |  | Falling edge | Falling edge |  |
|  |  | Low level | Rising edge | Hold |
|  |  | Rising edge | Rising edge |  |
|  |  | High level | Rising edge |  |
|  |  | Falling edge | Rising edge |  |
|  |  | Low level | Falling edge |  |
|  |  | Rising edge | High level |  |
|  |  | High level | Falling edge |  |
|  |  | Falling edge | High level |  |

The valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1, ENCAnEIS0) is invalid.
The following timing chart shows the count operation when the ENCAnUDS1, ENCAnUDS0 bits $=10_{\mathrm{B}}$.

Figure 35.5 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in ENCAnCTL Register $=10_{\mathrm{B}}$

### 35.4.2.4 When ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=11_{B}$

Table 35.27 When ENCAnUDS1, ENCAnUDS0 Bits $=11_{B}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 1 | 1 | Low level | Falling edge | Down |
|  |  | Rising edge | Low level |  |
|  |  | High level | Rising edge |  |
|  |  | Falling edge | High level |  |
|  |  | Rising edge | High level | Up |
|  |  | High level | Falling edge |  |
|  |  | Falling edge | Low level |  |
|  |  | Low level | Rising edge |  |
|  |  | Simultaneous input |  | Hold |

Valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1, ENCAnEIS0) is invalid.
The counter value is held when the valid edges of ENCAnE0 and ENCAnE1 overlap.
The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits $=11_{\mathrm{B}}$.

Figure 35.6 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register $=11_{\mathrm{B}}$

### 35.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to $0000_{\mathrm{H}}$ by encoder clear input (ENCAnEC).
Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS1, and ENCAnECS0 bits of the ENCAnIOC1 register.

Table 35.28 Timer Counter Clear Control by Encoder Input

| Clearing method | ENCAnSCE | ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnECS1, ENCAnECS0 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $(1)$ | 0 | Invalid | Invalid | Invalid | Valid |
| $(2)$ | 1 | Valid | Valid | Valid | Invalid |

### 35.4.3.1 Clearing Method when ENCAnSCE $=0$

- Upon detection of the valid edge of ENCAnEC, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operation clock.
- The valid edge of ENCAnEC is specified by the setting of the ENCAnECS1 and ENCAnECS0 bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCAnSCE $=0$, see the timing chart in Section 35.6.19, Capture
Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0 .

### 35.4.3.2 Clearing Method when ENCAnSCE $=1$

- When the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs are detected, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs by the settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS1 and ENCAnECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

Table 35.29 Clearing Conditions of the Timer Counter

| Counter Clear Condition Setting |  | Encoder Pin Input Level |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnEC | ENCAnE1 | ENCAnE0 |
| 0 | 0 | 0 | Low | Low | Low |
| 0 | 0 | 1 | Low | Low | High |
| 0 | 1 | 0 | Low | High | Low |
| 0 | 1 | 1 | Low | High | High |
| 1 | 0 | 0 | High | Low | Low |
| 1 | 0 | 1 | High | Low | High |
| 1 | 1 | 0 | High | High | Low |
| 1 | 1 | 1 | High | High |  |

### 35.4.4 Functions of ENCAnCCR0

### 35.4.4.1 Compare Function

- When ENCAnCRM0 $=0$, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCAnECM0 $=1$, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 35.30 Compare Function of ENCAnCCRO

| ENCAnCCRO Function | Compare Match Clear <br> Control | Timer Counter Clearing Upon Compare Match <br> with ENCAnCCR0 |  |
| :--- | :--- | :--- | :--- |
|  | ENCAnECMO |  |  |
|  | 0 |  | Does not clear (continues count operation). |
| (Compare) | Down-count |  |  |
|  | 1 | Up-count | Clears timer counter to $0000_{\mathrm{H} .}$ |
|  |  | Down-count | Does not clear (continues count operation). |

## When ENCAnLDE =1

- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (ENCATIUD) is output.

NOTE
For the timing chart when ENCAnLDE = 1, see Section 35.6.8, Using the ENCAnLDE Function Immediately after Startup to Section 35.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input.

### 35.4.4.2 Capture Function

- When ENCAnCRM0 $=1$, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCAnCCRO.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

NOTE
For details about capture operation for ENCAnCCRO, see the timing charts in Section 35.6.14, Capture Operation between Count Clocks (ENCAnCCRO) and Section 35.6.17, Encoder Operation when Compare Match Clear Control is Disabled.

### 35.4.5 Functions of ENCAnCCR1

### 35.4.5.1 Compare Function

- When ENCAnCRM1 $=0$, the ENCAnCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (ENCATINT1) is output.
- When ENCAnECM1 = 1, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 35.31 Compare Function of ENCAnCCR1

| ENCAnCCR1 <br> Function | Compare Match Clear <br> Control | Next Count <br> Operation | Timer Counter Clearing Upon Compare Match <br> with ENCAnCCR1 |
| :--- | :--- | :--- | :--- |
| ENCAnCRM1 | ENCAnECM1 |  | Does not clear (continues count operation). |
| 0 | 0 |  |  |
| $($ Compare) | 1 | Up-count | Does not clear (continues count operation). |
|  |  | Down-count | Clears timer counter to $0000_{\mathrm{H} .}$ |

## Compare match interrupt mask function

- When ENCAnCME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCAnCME $=1$ and $\operatorname{ENCAnMCS}=0$, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCAnCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME $=1$ and $\operatorname{ENCAnMCS}=1$, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer counter value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When $\operatorname{ENCAnCME}=1$, ENCAnMCS $=1$ and $\operatorname{ENCAnLDE}=1$, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCAnECM1 to " 1 " is prohibited when enabling the compare 1 match interrupt mask function.

Table 35.32 Compare Match Interrupt Mask Function of ENCAnCCR1
\(\left.$$
\begin{array}{l|l|l|l}\hline \begin{array}{l}\text { ENCAnCCR1 } \\
\text { Function }\end{array} & \begin{array}{l}\text { Compare 1 } \\
\text { Match Interrupt Mask }\end{array} & \text { Interrupt Mask Cancel Trigger }\end{array}
$$ \quad \begin{array}{l}Compare 1 Match Interrupt Output upon <br>

Compare Match with ENCAnCCR1\end{array}\right]\)| Outputs compare 1 match interrupt upon |
| :--- |
| each compare match. |

### 35.4.5.2 Capture Function

When ENCAnCRM1 = 1, the ENCAnCCR1 register functions as a dedicated capture register.
NOTE
For details about capture operation to ENCAnCCR1, see the timing chart in Section 35.6.13, Capture Operation between Count Clocks (ENCAnCCR1).

The operations for each of the ENCAnCTS settings are shown in the table below.
Table 35.33 Operations for Each of the ENCAnCTS Settings

| ENCAnCCR1 <br> Function | Capture Trigger <br> Selection |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| ENCAnCRM1 | ENCAnCTS | Capture Trigger Signal | Timer Counter Clearing | Interrupt Occurrence |
| 1 <br> (Capture) | 0 | Capture trigger 1 input <br> (ENCATTIN1) | Does not clear timer <br> counter. | (1) Capture 1 interrupt <br> (ENCATINT1) |
|  | 1 | Encoder clear input <br> (set with ENCAnSCE) | Clears timer counter. | (1) Capture 1 interrupt <br> (ENCATINT1) <br> (2) Encoder clear interrupt <br> (ENCATIEC) |

NOTE
For details about the timing chart when ENCAnCTS $=0$ or ENCAnCTS $=1$, see the following:
Section 35.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin), Section 35.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin), Section 35.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin), Section 35.6.11, Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin) and Section 35.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input.

### 35.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the value of the timer counter and the ENCAnCCR0/1 setting value, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in the ENCAnCTL register, is detailed in the following table.

Table 35.34 Timer Counter Clearing Operation upon Compare Register Match
$\begin{array}{llll}\hline \begin{array}{l}\text { ENCAnECM1 and } \\
\text { ENCAnECM0 }\end{array} & \begin{array}{l}\text { Next Count } \\
\text { Operation }\end{array} & \begin{array}{l}\text { Timer Counter Clearing upon Compare } \\
\text { Match with ENCAnCCR1 }\end{array} & \begin{array}{l}\text { Timer Counter Clearing upon Compare Match } \\
\text { with ENCAnCCR0 }\end{array} \\
\hline 00 & \text { Up-count } & \begin{array}{l}\text { Does not clear } \\
\text { (continues count operation). }\end{array} & \begin{array}{l}\text { Does not clear } \\
\text { (continues count operation). }\end{array} \\$\cline { 2 - 4 } \& Down-count \& \(\left.$$
\begin{array}{l}\text { Does not clear } \\
\text { (continues count operation). }\end{array}
$$ \& $$
\begin{array}{l}\text { Does not clear } \\
\text { (continues count operation). }\end{array}
$$ <br>
\hline 01 \& Up-count \& \begin{array}{l}Does not clear <br>

(continues count operation).\end{array} \& Clears timer counter to 0000\end{array}\right]\)| Does not clear |
| :--- |
|  |

### 35.4.6 Startup/Stop of Timer Counter

### 35.4.6.1 Startup of Timer

The timer operation can be started by setting the ENCAnTS bit to " 1 ".
PIC setting enables simultaneous start with other timers. For details, see Section 36.8, Simultaneous Start
Trigger Function.

### 35.4.6.2 Stop of Timer

When the ENCAnTT bit is set to " 1 ", the ENCAnTE bit becomes " 0 " and the timer stops.

### 35.5 ENCAn Setting Sequences

### 35.5.1 ENCAn Setting Procedure

The ENCAn setting procedure is described below.
Table 35.35 ENCAn Setting Procedure

| Initial Setting | Action | Setting status |
| :---: | :---: | :---: |
| Initial setting | Reset deassertion | Power-on status, operation stopped status. (Writing to each register is enabled) |
| ENCAn initial setting | Perform the following initial settings. <br> - Setting for counter <br> - Setting for counter clear <br> - Setting for ENCAnCCR0 register <br> - Setting for ENCAnCCR1 register | This is the count operation stopped status. <br> The value of the ENCAnTE bit indicating the operating status is 0 . |
|  | Perform the counter initial value settings. <br> - Set any 16-bit value to ENCAnCNT register. (When, after setting this register, the ENCAnTS bit is set to " 1 ", the counter operation starts from the set count value.) | The set value is set as the initial value of the counter register. |
| Operation start | Perform the counter operation start setting. <br> - Set the ENCAnTS bit to "1". | This is the counter operation starts status. <br> The value of the ENCAnTE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit. |
| Operating | Only those registers whose setting can be changed during operation can be rewritten. <br> - ENCAnCCRO register setting. <br> - ENCAnCCR1 register setting. <br> - ENCAnIOCO register setting. | The count operation set with the initial setting is performed, and up/down counting is performed according to ENCAnE0 and ENCAnE1 pins. |
| Operation stop | Perform the counter operation stop setting during operation. <br> - Set the ENCAnTT bit to " 1 ". | This is the counter operation stopped status. <br> The value of the ENCAnTE bit indicating the operating status is 0 . |
| ENCAn stop | Reset | The setting registers are initialized. |

### 35.5.1.1 Initial Setting Procedure for the Counter

Set the count operation method according to ENCAnE0 and ENCAnE1 pin input.

Set the valid edge of ENCAnE0 and ENCAnE1 pin input.
Valid only when ENCAnUDS[1:0] bits $=00_{\mathrm{B}}$ and ENCAnUDS[1:0] bits $=01_{\mathrm{B}}$. Invalid when ENCAnUDS[1:0] bits $=10_{\mathrm{B}}$ and ENCAnUDS[1:0] bits $=11_{\mathrm{B}}$.

Figure 35.7 Initial Setting Procedure for the Counter

### 35.5.1.2 Initial Setting Procedure for Counter Clear

Figure 35.8 Initial Setting Procedure for Counter Clear

### 35.5.1.3 Setting Procedure for ENCAnCCRO Register

Set the application of the ENCAnCCRO register.
(0: For compare, 1: For capture)

Set the clear operation upon match between the value of the ENCAnCCRO register and the count value.

Set whether or not to load the value of ENCAnCCRO to the counter upon underflow occurrence.

Set the valid edge of capture trigger 0 (ENCATTINO input).

Figure 35.9 Setting Procedure for ENCAnCCRO Register

### 35.5.1.4 Setting Procedure for ENCAnCCR1 Register

Figure 35.10 Setting Procedure for ENCAnCCR1 Register

### 35.6 Timing Chart

### 35.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the counter value is $\mathrm{FFFF}_{\mathrm{H}}$. Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCAnOVF) is set to 1 . When the overflow clear bit (ENCAnCLOV) is set to 1 , the overflow flag (ENCAnOVF) is cleared to 0 .

The operations of overflow occurrence and overflow flag clearing are described below.

Figure 35.11 Settings of Overflow Occurrence and Overflow Flag Clear
(1) The count value is counted up from $\mathrm{FFFE}_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$.
(2) When the count value changes from $\mathrm{FFFF}_{\mathrm{H}}$ to $0000_{\mathrm{H}}$, an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1 .
(3) By setting the ENCAnCLOV bit in the ENCAnFGC register to 1 by the overflow flag clearing method, the overflow flag is cleared to 0 . The overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0 , or setting the input signal of ENCATSST (simultaneous start trigger input) to "High".

### 35.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the counter value is $0000_{\mathrm{H}}$.
Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCAnUDF) is set to 1 . When the underflow clear bit (ENCAnCLUD) is set to 1 , the underflow flag (ENCAnUDF) is cleared to 0 .

The operations of underflow occurrence and underflow flag clearing are described below.

Figure 35.12 Settings of Underflow Occurrence and Underflow Flag Clear
(1) The count value is counted down from $0001_{\mathrm{H}}$ to $0000_{\mathrm{H}}$.
(2) When the count value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1 .
(3) By setting the ENCAnCLUD bit in the ENCAnFGC register to 1 by the underflow flag clearing method, the underflow flag is cleared to 0 . The underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0 , or by setting the input signal of ENCATSST (simultaneous start trigger) to "High".

### 35.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 35.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

## Setting conditions

- ENCAnCRM1 bit in the ENCAnCTL register = 1
(Select the ENCAnCCR1 register as capture.)
- ENCAnCTS bit in the ENCAnCTL register = 1
(Select the ENCAnEC pin input as capture trigger input.)
- ENCAnECS1 and ENCAnECS0 bits in the ENCAnIOC1 register $=01_{\mathrm{B}}$ (Select the ENCAnEC pin input as rising edge detection.)
(1) Capture operation is performed by the rising edge of the ENCAnEC pin input trigger.
(2) Clearing is performed by the ENCAnEC pin input and the count value is set to $0000_{\mathrm{H}}$.
(3) The counter value $\left(0002_{\mathrm{H}}\right)$ is captured in the ENCAnCCR1 register by the rising edge of the ENCAnEC pin input.
(4) At the same time, a clear interrupt (ENCATIEC) and capture interrupt (ENCATINT1) due to the ENCAnEC pin input are output.

### 35.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 35.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)
(1) An up-count from $\mathrm{FFFD}_{H}$ is continuously performed.
(2) When an overflow occurs if the count value is $\mathrm{FFFF}_{\mathrm{H}}$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The counter value is cleared to $0000_{\mathrm{H}}$.
(3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCATIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output (An overflow does not occur. Clear operation is performed by the encoder clear input).
(4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

### 35.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 35.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)
(1) A down-count from $0002_{\mathrm{H}}$ is continuously performed.
(2) When an underflow occurs if the count value is $0000_{\mathrm{H}}$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at $0000_{\mathrm{H}}$.
(3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCATIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output (An underflow does not occur. Clear operation is performed by the encoder clear input).
(4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.
(5) When a further down-count is performed after the counter value changes to $0000_{\mathrm{H}}$ by clear operation by the encoder clear input, the counter value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, and an underflow occurs.
(6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 35.6.6 Overflow Operation Immediately after Startup

Figure 35.16 Overflow Operation Immediately after Startup
(1) When the ISORES value changes from " 0 " to " 1 ", the status changes from "reset asserted" to "reset deasserted".
(2) The timer counter is set to $\mathrm{FFFF}_{\mathrm{H}}$ as the initial value.
(3) ENCAnTS is set to " 1 ", and operation starts. ENCAnTE changes to " 1 ", which indicates that operation is enabled.
(4) When an up-count is performed from $\mathrm{FFFF}_{\mathrm{H}}$ which is the initially set count value, the counter value changes from $\mathrm{FFFF}_{\mathrm{H}}$ to $0000_{\mathrm{H}}$, and an overflow occurs immediately after operation starts.
(5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCATIOV) is output, and the overflow flag (ENCAnOVF) is set.

### 35.6.7 Underflow Operation Immediately after Startup

Figure 35.17 Underflow Operation Immediately after Startup
(1) When the ISORES value changes from " 0 " to " 1 ", the status changes from "reset asserted" to "reset deasserted".
(2) The timer counter is set to $0000_{\mathrm{H}}$ as the initial value.
(3) ENCAnTS is set to " 1 ", and operation starts. ENCAnTE changes to " 1 ", which indicates that operation is enabled.
(4) When a down-count is performed from $0000_{\mathrm{H}}$ which is the initially set count value, the counter value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, and an underflow occurs immediately after operation starts.
(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 35.6.8 Using the ENCAnLDE Function Immediately after Startup

Figure 35.18 Using the ENCAnLDE Function Immediately after Startup
(1) When the ISORES value changes from " 0 " to " 1 ", the status changes from "reset asserted" to "reset deasserted".
(2) The load enable bit (ENCAnLDE) is set to " 1 ", capture/compare register 0 (ENCAnCCR0) is set to 3C5A , and the timer counter is set to the initial value $0000_{\mathrm{H}}$.
(3) ENCAnTS is set to " 1 ", and operation starts. ENCAnTE changes to " 1 ", which indicates that operation is enabled.
(4) When a down-count is performed from $0000_{\mathrm{H}}$ which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to " 1 ", the ENCAnCCR0 value, $3 C 5 A_{H}$, is loaded to the timer counter (ENCATINT0 is not output during loading).
(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-count operation from the loaded value ( $3 \mathrm{C} 5 \mathrm{~A}_{\mathrm{H}}$ ) continues).
(6) After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and ENCATINT0 is output.

### 35.6.9 ENCAnLDE Function (Loading Count Value)

(1) <When ENCAnLDE $=0>$

Figure 35.19 ENCAnLDE Function (when ENCAnLDE $=0$ )
(1) ENCAnLDE is set to " 0 " (even if an underflow occurs, the ENCAnCCR0 value is not loaded).
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When a further down-count is performed after the counter value changes to $0000_{\mathrm{H}}$, an underflow occurs.
(4) Because ENCAnLDE is set to " 0 ", the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.
(5) Operation changes to underflow operation (counter value: $0000_{\mathrm{H}} \rightarrow \mathrm{FFFF}_{\mathrm{H}}$ ).
(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
(2) <When ENCAnLDE = 1>

Figure 35.20 ENCAnLDE Function (when ENCAnLDE = 1)
(1) ENCAnLDE is set to " 1 " (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When a further down-count is performed after the counter value changes to $0000_{\mathrm{H}}$, an underflow occurs.
(4) An underflow interrupt is output, and the underflow flag is set.
(5) Because ENCAnLDE is set to " 1 ", the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3 \mathrm{C} 5 \mathrm{~A}_{\mathrm{H}}$.
(6) After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches the ENCAnCCR0 value on a count clock, a compare match interrupt (ENCATINT0) is output.

### 35.6.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCRO Register

Figure 35.21 Conflict between ENCAnLDE Function and Rewrite of ENCAnCCRO Register
(1) The ENCAnCCR0 register is currently set to $5555_{\mathrm{H}}$.
(2) ENCAnLDE is currently set to " 1 ".
(3) A down-count is performed ( $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$ ), and an underflow occurs.
(4) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
(5) When an underflow occurs, the ENCAnCCR0 register value is changed from $5555_{\mathrm{H}}$ to $\mathrm{AAAA}_{\mathrm{H}}$.
(6) Additionally, when an underflow occurs, the ENCAnCCR0 value before the rewrite was performed (5555 H ) is set in ENCAnCNT.

### 35.6.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 35.22 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input
(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01 ${ }_{\mathrm{B}}$, $\mathrm{ENCAnLDE}=1$, and ENCAnCCR0 $=$ 5555 .
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When the count value becomes $0000_{\mathrm{H}}$, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.
(4) Because a count clear is performed when the count value reaches $0000_{\mathrm{H}}$, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when
the count value is $0000_{\mathrm{H}}$. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.
(5) After the count value is cleared to $0000_{\mathrm{H}}$ by clear operation by the encoder clear input, a down-count is performed and an underflow occurs.
(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
(7) Because ENCAnLDE $=$ " 1 ", if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.
(8) After the ENCAnCCR0 value is set to ENCAnCNT, a compare match is detected according to the count clock. If the ENCAnCNT value matches the ENCAnCCR0 value, a compare match interrupt (ENCATINT0) is output.

### 35.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

Figure 35.23 Up-count after Conflict between ENCAnLDE Function and Encoder Clear
(1) The values are set as follows: ENCAnCTS $=0$, ENCAnECS[1:0] $=01_{\mathrm{B}}$, $\mathrm{ENCAnLDE}=1$, and ENCAnCCR0 $=$ 5555 .
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When the count value becomes $0000_{\mathrm{H}}$, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.
(4) Because a count clear is performed when the count value reaches $0000_{\mathrm{H}}$, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when
the count value is $0000_{\mathrm{H}}$. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.
(5) After the count value is cleared to $0000_{\mathrm{H}}$ by clear operation by the encoder clear input, an up-count is performed.
(6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

### 35.6.13 Capture Operation between Count Clocks (ENCAnCCR1)

Figure 35.24 Capture Operation between Count Clocks (ENCAnCCR1)
(1) The values are set as follows: ENCAnCRM1 = 1, and ENCAnTIS[3:2] $=01_{\mathrm{B}}$.
(2) An up-count is performed.
(3) The rising edge of the ENCATTIN1 input is detected, and the count value is captured in ENCAnCCR1.
(4) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

### 35.6.14 Capture Operation between Count Clocks (ENCAnCCRO)

Figure 35.25 Capture Operation between Count Clocks (ENCAnCCRO)
(1) The values are set as follows: ENCAnCRM0 $=1$, and ENCAnTIS[1:0] $=01_{\mathrm{B}}$.
(2) A down-count is performed.
(3) The rising edge of the ENCATTIN0 input is detected, and the count value is captured in ENCAnCCR0.
(4) An interrupt (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

### 35.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

Figure 35.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS $=0$
(1) The values are set as follows: $\operatorname{ENCAnCCR} 0=4444_{\mathrm{H}}, \mathrm{ENCAnCRM} 0=0$, $\mathrm{ENCAnCRM} 1=1$, ENCAnECM[1:0] $=01_{\mathrm{B}}$, and ENCAnCTS $=0$.
(2) A down-count is performed.
(3) The rising edge of the ENCATTIN1 input is detected, and the ENCAnCNT value ( $4444_{\mathrm{H}}$ ) is captured in the ENCAnCCR1 register.
(4) An interrupt signal (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.
(5) When a compare match occurs between ENCAnCNT (counted down from $4445_{\mathrm{H}}$ to $4444_{\mathrm{H}}$ ) and ENCAnCCR0 $\left(4444_{\mathrm{H}}\right)$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.
(6) The count operation changes to up-count.
(7) When ENCAnCNT is counted up from $4443_{\mathrm{H}}$ to $4444_{\mathrm{H}}$, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 $\left(01_{\mathrm{B}}\right)$, and the ENCAnCNT value changes to $0000_{\mathrm{H}}$.
(8) When ENCAnCNT changes to $4444_{\mathrm{H}}$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

### 35.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

Figure 35.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS =1
(1) The values are set as follows: ENCAnCCR0 $=4444_{\mathrm{H}}, \mathrm{ENCAnCRM} 0=0$, ENCAnCRM1 $=1$, ENCAnECM[1:0] $=01_{\mathrm{B}}$, and ENCAnCTS $=1$.
(2) A down-count is performed.
(3) When a compare match occurs between ENCAnCNT (counted down from $4445_{\mathrm{H}}$ to $4444_{\mathrm{H}}$ ) and ENCAnCCR0 $\left(4444_{\mathrm{H}}\right)$, a compare/capture interrupt (ENCATINT0) is output.
(4) The count operation changes to up-count.
(5) When ENCAnCNT is counted up from $4443_{\mathrm{H}}$ to $4444_{\mathrm{H}}$, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (018), and the ENCAnCNT value changes to $0000_{\mathrm{H}}$.
(6) When ENCAnCNT changes to $4444_{\mathrm{H}}$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.
(7) After the count value is cleared, an up-count is performed, and the count value changes to $0001_{\mathrm{H}}$. At this point, the ENCAnCNT value $\left(0001_{\mathrm{H}}\right)$ is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to $0000_{\mathrm{H}}$.
(8) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

### 35.6.17 Encoder Operation when Compare Match Clear Control is Disabled

Figure 35.28 Encoder Operation when Compare Match Clear Control is Disabled
(1) The values are set as follows: ENCAnCCR1 $=4446_{\mathrm{H}}, \mathrm{ENCAnCRM} 0=1, \mathrm{ENCAnCRM} 1=0$, ENCAnECM[1:0] $=00_{\mathrm{B}}$, and ENCAnCTS $=0$.
(2) A down-count is performed.
(3) When the rising edge of ENCATTIN0 is detected, the ENCAnCNT value (4444 $)$ is captured in ENCAnCCR0.
(4) An interrupt signal (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.
(5) The count operation changes to up-count.
(6) When ENCAnCNT changes to $4446_{\mathrm{H}}$, a compare match with ENCAnCCR1 is detected.
(7) A compare match interrupt (ENCATINT1) with ENCAnCCR1 is output.

### 35.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1

### 35.6.18.1 Accompanying Capture Operation

Figure 35.29 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE $=1$
(1) The values are set as follows: $\operatorname{ENCAnSCE}=1$, ENCAnCTS $=1$, ENCAnUDS[1:0] =11 , ENCAnACL = 0, ENCAnBCL $=0$, and ENCAnZCL $=1$.
(2) An up-count is performed.
(3) The count value is not cleared upon the rising edge of ENCAnEC.
(4) When ENCAnE0, ENCAnE1 and ENCAnEC reach the set clear level, the count value is cleared. The count value is captured in ENCAnCCR1 at the time of the clearing.
(5) At the time of the clearing, an interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.
35.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL $=1, \mathrm{ENCAnBCL}=0, \mathrm{ENCAnZCL}=1$, and ENCAnUDS[1:0] = 11 $1_{\text {B }}$ )

Figure 35.30 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count
35.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 ${ }_{\mathrm{B}}$ )

Figure 35.31 Clearing Timing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count
35.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL $=1, \mathrm{ENCAnBCL}=0, \mathrm{ENCAnZCL}=1$, and ENCAnUDS[1:0] = 11 $1_{\mathrm{B}}$ )

Figure 35.32 Clearing Timing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count
35.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL $=1, \mathrm{ENCAnBCL}=0, \mathrm{ENCAnZCL}=1$, and ENCAnUDS[1:0] = 11 $1_{\text {B }}$ )

Figure 35.33 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

### 35.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

Figure 35.34 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE $=0$
(1) The values are set as follows: $\operatorname{ENCAnSCE}=0$, ENCAnCTS $=1$, and ENCAnECS[1:0] $=01_{B}$.
(2) An up-count is performed.
(3) The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ( $\mathrm{AAAB}_{H}$ ) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is cleared to $0000_{\mathrm{H}}$.
(4) A capture interrupt 1 (ENCATINT1) to the ENCAnCCR1 register and an encoder clear interrupt (ENCATIEC) by ENCAnEC are output.
(5) After the count value is cleared, an up-count is performed, and the count value changes to $0001_{\mathrm{H}}$.

## Section 36 Motor Control

This section contains a generic description of the Motor Control.
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the Motor Control.

### 36.1 Features of RH850/F1KH, RH850/F1KM Motor Control

### 36.1.1 Number of Units

Motor control function comprises the timer motor control units (TAPA) and the peripheral interconnection unit (PIC) to connect the TAPA unit to peripheral timers, and generates motor control waveforms by using a combination of peripheral timers and A/D converters.

This microcontroller has the following number of TAPA and PIC units.
Table $36.1 \quad$ Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 176 Pins | RH850/F1KH-D8 233 Pins | RH850/F1KH-D8 324 Pins |
| :---: | :---: | :---: | :---: |
| TAPA |  |  |  |
| Number of Units | 1 | 1 | 1 |
| Name | TAPAn ( $\mathrm{n}=0$ ) | TAPAn ( $\mathrm{n}=0$ ) | TAPAn ( $\mathrm{n}=0$ ) |
| PIC |  |  |  |
| Number of Units | 1 | 1 | 1 |
| Name | PICO | PICO | PICO |

Table 36.2 Number of Units (RH850/F1KM-S4)

| Product Name | RH850/F1KM-S4 100 Pins | RH850/F1KM-S4 144 Pins | RH850/F1KM-S4 <br> 176 Pins | RH850/F1KM-S4 233 Pins | RH850/F1KM-S4 272 Pins |
| :---: | :---: | :---: | :---: | :---: | :---: |

Table 36.4 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the unit of a timer and A/D converter used by TAPA and the motor control function is <br> identified by the index " n "; for example, TAPAnCTLO $(\mathrm{n}=0)$ is TAPAn control register 0. |
| m | The channel of a used timer and A/D converter is identified by the index " $m$ ". For example, the TAUDn channel is <br> described as CHm. |
| x | The scan group of an A/D converter is identified by the index " x " $(\mathrm{x}=1$ to 3$)$. |
| j | The scan trigger number of an A/D converter is identified by the index " j " $(\mathrm{j}=0$ to 2$)$. |

The following table lists the values indicated by the indices of each product.
Table 36.5 Indices of Products (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Indices of Each Product |
| :---: |
| All Products |
| $m=0$ to 15 |
| $(e . g$. TAUDn $)$ |
| $x=1$ to 3 |
| $j=0$ to 2 |

### 36.1.2 Register Base Addresses

Base addresses of TAPAn and PIC0 are listed in the following table.
Register addresses of TAPAn and PIC0 are given as offsets from the base addresses.
Table 36.6 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <TAPAO_base> | FFE9 $0000_{\mathrm{H}}$ |
| <PICO_base> | FFDD $0000_{\mathrm{H}}$ |

### 36.1.3 Clock Supply

The TAPAn and PIC0 clock supplies are listed in the following table.
Table 36.7 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| TAPAn | PCLK | CKSCLK_IPERI1 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI1 | Bus clock |
| PIC0 | PCLK | CKSCLK_IPERI1 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERII | Bus clock |

### 36.1.4 Interrupt Requests

TAPAn interrupt requests are listed in the following table.
Table 36.8 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :--- | :--- | :--- | :--- |
| TAPAO |  |  |  |
| INTTAPAOIPEKO | Peak interrupt 0 | 16,116 | - |
| INTTAPAOIVLYO | Valley interrupt 0 | 17,117 | - |

### 36.1.5 Reset Sources

Reset sources of TAPAn and PIC0 are listed in the following table. TAPAn and PIC0 are initialized by these reset sources.

Table 36.9 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| TAPAn | All reset sources (ISORES) |
| PIC0 | All reset sources (ISORES) |

### 36.1.6 External Input/Output Signals

External output signals of TAPAn and PIC0 are listed below.
Table 36.10 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| PICO |  |  |
| TOUTU | Motor control output U phase (positive) | TAPAOUP |
| TOUTUB | Motor control output U phase (negative) | TAPAOUN |
| TOUTV | Motor control output V phase (positive) | TAPAOVP |
| TOUTVB | Motor control output V phase (negative) | TAPAOVN |
| TOUTW | Motor control output W phase (positive) | TAPAOWP |
| TOUTWB | Motor control output W phase (negative) | TAPAOWN |
| TAPAO |  |  |
| TAPATHASIN | Motor control output Hi-Z control input | TAPAOESO |
| CAUTION |  |  |

For the port pins that are used as TAPAOUP, TAPAOUN, TAPAOVP, TAPAOVN, TAPAOWP and TAPAOWN, set the output driver strength to high (PDSCn_m = 1).

### 36.1.7 Internal Output Signals

The internal output signals of TAPAn and PIC0 are listed below.
Table 36.11 Internal Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Connected to |
| :---: | :---: | :---: |
| TAPAO |  |  |
| TAPATHZOUT0 | TAPAOUP/TAPAOUN output buffers Hi-Z control output*1 | Port |
| TAPATHZOUT1 | TAPAOVP/TAPAOVN output buffers Hi-Z control output*1 | Port |
| TAPATHZOUT2 | TAPAOWP/TAPAOWN output buffers Hi-Z control output*1 | Port |
| TAPATADOUT0 | A/D trigger signal 0 output*2 | ADCA0 hardware trigger expansion |
| TAPATADOUT1 | A/D trigger signal 1 output*2 | ADCAO hardware trigger expansion |
| PICO |  |  |
| TAPATHASIN | TAPA0 asynchronous Hi-Z control signal*1,*3 | TAPAO |
| TAPATSIMO | TAUD master channel interrupt signal (TAUDO: INTTAUDOIO,INTTAUDOI2, INTTAUDOI8) | TAPAO |
| TAPATUDCM0 | TAUD master up/down signal <br> (TAUD0: TAUDOUDC0, TAUDOUDC2, TAUDOUDC8) | TAPAO |
| TAPATCDENS0 | TAUD slave 0 match detect*4 <br> (ADCA0 hardware trigger expansion: ADOPA1ADCATTINOO) | TAPAO |
| TAPATCDENS1 | TAUD slave 1match detect ${ }^{* 4}$ <br> (ADCAO hardware trigger expansion: ADOPA2ADCATTINOO) | TAPAO |

Note 1. See Section 36.4.6, TAPAO Hi-Z Control Input Selection for details.
Note 2. These signals can be used to as a trigger source to start the A/D converter. See Table 38.78, List of AID Conversion Hardware Triggers.
Note 3. This input signal is passed through a noise filter. See Section 2A.12, Noise Filter \& Edge/Level Detector, Section 2B.12, Noise Filter \& Edge/Level Detector, Section 2C.12, Noise Filter \& Edge/Level Detector, Section 2A.13, Description of Port Noise Filter \& Edge/Level Detection, Section 2B.13, Description of Port Noise Filter \& Edge/Level Detection, and Section 2C.13, Description of Port Noise Filter \& Edge/Level Detection.
Note 4. These signals are selected by the H/W trigger selection bit of the ADCAO A/D converter. See Table 38.78, List of A/D Conversion Hardware Triggers.

### 36.2 Overview

### 36.2.1 Functional Overview

The motor control function provides the following functions by combining the motor control unit (TAPA) and Timer Array Unit D (TAUDn) or A/D (ADCAn):

- Asynchronous Hi-Z control function

Hi-Z control for TAUDn output can be performed by using pin input or error signals.

- Interrupt signal output function

Request signals for two types of interrupts, peak interrupts and valley interrupts, can be output by the INTn signals output by TAUDn.

- A/D conversion start trigger selection function

An A/D conversion start trigger can be output by the INTn signals output by TAUDn.
Additionally, the motor control function provides also the following functions by combining the motor control unit (TAPA) and the peripheral interconnection (PIC):

- Timer simultaneous start trigger function

The respective channels of TAUD0 and TAUJ1, and the ENCAn timer can be started simultaneously.

- Trigger and pulse width measuring function

Measurement of trigger periods can be performed by inputting ENCAn interrupt signals to TAUDn or TAUJ1.

- A/D trigger encoder capture function

The value of the ENCAn counter can be captured at the A/D conversion start trigger timing.

- Three-phase PWM output with dead time / High-accuracy triangle PWM output with dead time Three-phase PWM output with dead time can be performed by TAUDn.
- Delay pulse output with dead time

Delay pulses (with dead time) for the cycle timing can be output.

### 36.2.2 Basic Structure of Motor Control

The peripheral block configuration of the motor control function is shown below.

Figure 36.1 Configuration of Motor Control

TAUDn and PIC are used to generate the motor control output signals (three-phase PWM output signals with dead time).

The timer control unit (TAPA) performs Hi-Z control for the motor control output.
Additionally, PIC can provide functions specific to the motor by combining respective channels of TAUDn and TAUJ1, ENCAn, and TAPA.

### 36.2.3 Block Diagram

Figure 36.2 TAPA Peripheral Block Diagram

NOTE
For the PIC peripheral block diagram, see the respective section describing each function.

### 36.2.4 Definition of Terms

Peak and valley interrupts - Peak and valley of timer counter
In this document, the period from a TAUD counting-up status to generation of INT from the master channel is defined as a peak period, and this INT is defined as a peak interrupt.

In contrast, the period from a TAUD counting-down status to generation of INT from the master channel is defined as a valley period, and this INT is defined as a valley interrupt.

Figure 36.3 Peak and Valley Interrupts

### 36.3 Registers

### 36.3.1 List of Registers

The registers of TAPAn and PIC0 are listed in the following table.
For details about <TAPAn_base> and <PIC0_base>, see Section 36.1.2, Register Base Addresses.
Table 36.12 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| TAPAn | TAPA control register 0 | TAPAnCTLO | <TAPAn_base> + $20_{\text {H }}$ |
|  | TAPA control register 1 | TAPAnCTL1 | <TAPAn_base> + $24_{\text {H }}$ |
|  | TAPA flag register | TAPAnFLG | <TAPAn_base> + $00_{\text {H }}$ |
|  | TAPA asynchronous Hi-Z control write enable register | TAPAnACWE | <TAPAn_base> + $04_{\text {H }}$ |
|  | TAPA asynchronous Hi-Z control start trigger register | TAPAnACTS | <TAPAn_base> + 08 H |
|  | TAPA asynchronous Hi-Z control stop trigger register | TAPAnACTT | <TAPAn_base> + $0 \mathrm{C}_{\mathrm{H}}$ |
|  | TAPA Hi-Z start trigger register | TAPAnOPHS | <TAPAn_base> + $14_{\text {H }}$ |
|  | TAPA Hi-Z stop trigger register | TAPAnOPHT | <TAPAn_base> + $18_{\text {H }}$ |
|  | TAPA emulation register | TAPAnEMU | <TAPAn_base> + $28{ }_{\text {H }}$ |
| PIC0 | Simultaneous start trigger control register | PICOSST | <PICO_base> + 04 ${ }_{\text {H }}$ |
|  | Simultaneous start control register 0 | PICOSSER0 | <PICO_base> + $10_{\text {H }}$ |
|  | Simultaneous start control register 2 | PICOSSER2 | <PICO_base> + 18 ${ }_{\text {H }}$ |
|  | Hi-Z output control register 0 | PICOHIZCENO | <PICO_base> + 80 ${ }_{\text {H }}$ |
|  | A/D conversion trigger output control register 400 | PIC0ADTEN400 | <PICO_base> + 90 ${ }_{\text {H }}$ |
|  | A/D conversion trigger output control register 401 | PIC0ADTEN401 | <PICO_base> + 94 ${ }_{\text {H }}$ |
|  | A/D conversion trigger output control register 402 | PIC0ADTEN402 | <PICO_base> + 98 ${ }_{\text {H }}$ |
|  | Timer I/O control register 200 | PICOREG200 | <PICO_base> + $\mathrm{CO}_{\mathrm{H}}$ |
|  | Timer I/O control register 201 | PICOREG201 | <PIC0_base> + C4 ${ }_{\text {H }}$ |
|  | Timer I/O control register 202 | PICOREG202 | <PICO_base> + $\mathrm{C8}_{\mathrm{H}}$ |
|  | Timer I/O control register 203 | PICOREG203 | <PICO_base> + $\mathrm{CC}_{\mathrm{H}}$ |
|  | Timer I/O control register 30 | PICOREG30 | <PICO_base> + E8 ${ }_{\text {H }}$ |
|  | Timer I/O control register 31 | PICOREG31 | <PICO_base> + EC ${ }_{\text {H }}$ |
| NOTE |  |  |  |

For details about PIC-related registers, see the respective section describing each function.

### 36.3.2 TAPAnCTLO - TAPA Control Register 0

This register is used to set up the asynchronous Hi-Z control function.
The values of this register can be rewritten only when TAPAnFLG.TAPAnACE is 0 and TAUDnTEm for the corresponding TAUD's master channel is 0 .

| Access: | This register can be read or written in 16-bit units. |
| ---: | :--- |
| Address: | <TAPAn_base> $+20_{\mathrm{H}}$ |
| Value after reset: | $0000_{\mathrm{H}}$ |

| Bit | $15 \quad 14$ |  | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | TAPAn DCM | TAPAn DCN | TAPAn DCP | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R |

Table 36.13 TAPAnCTLO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 5 | Reserved | When read, the value after reset is returned. <br> When writing, write the value after reset. |
| 4 | TAPAnDCM | Clear Condition Configuration <br> This control bit specifies the clear conditions for Hi-Z control output. <br> 0: Enables manipulation of TAPAnOPHT0 regardless of the TAPATHASIN signal input <br> level. <br> 1: Enables manipulation of TAPAnOPHT0 only if the TAPATHASIN signal input is inactive. |
| 3,2 | TAPAnDCN, | Hi-Z Input Edge Selection <br>  |
|  |  | These are control bits that specify the valid edge of TAPATHASIN. |

### 36.3.3 TAPAnCTL1 - TAPA Control Register 1

This register is used to specify the $\mathrm{A} / \mathrm{D}$ conversion trigger.

> Access: This register can be read or written in 8-bit units.

Address: <TAPAn_base> + 24 н
Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  | TAPAn ATS1 | TAPAn ATSO | Description |
|  |  | 0 | 0 | INT signal while the triangle wave is falling (counting down) |
|  |  | 0 | 1 | INT signal while the triangle wave is rising (counting up) |
|  |  | 1 | 0 | INT signal while the triangle wave is rising (counting up) or falling (counting down) |
|  |  | 1 | 1 | INT signal and valley interrupt INTTAPAOIVLYO signal while the triangle wave is rising (counting up) or falling (counting down) |

### 36.3.4 TAPAnFLG - TAPA Flag Register

This flag register is for asynchronous Hi-Z control.

Access: This register is a read-only register that can be read in 16-bit units.
Address: <TAPAn_base> + 00н
Value after reset: $\quad 0000_{H}$

Table 36.15 TAPAnFLG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 11 | Reserved | When read, the value after reset is returned. |
| 10 | TAPAnHOF2 | W phase Hi-Z Control Monitor |
|  |  | This bit is used to monitor the Hi-Z control status. |
|  | 0: The present output of TAPAnTHZOUT2 is high level |  |
|  | 1: The present output TAPAnTHZOUT2 is low level. |  |
| 9 | TAPAnHOF1 | V phase Hi-Z Control Monitor |
|  |  | This bit is used to monitor the Hi-Z control status. |
|  | 0: The present output of TAPAnTHZOUT1 is high level |  |
|  | 1: The present output TAPAnTHZOUT1 is low level. |  |
| 8 | TAPAnHOF0 | U phase Hi-Z Control Monitor |
|  |  | This bit is used to monitor the Hi-Z control status. |
|  |  | 0: The present output of TAPAnTHZOUTO is high level |
|  |  | 1: The present output TAPAnTHZOUT0 is low level. |
|  |  |  |

| 7 to 1 | Reserved | When read, the value after reset is returned. |
| :--- | :--- | :--- |
| 0 | TAPAnACE | Asynchronous Hi-Z Control Enable |
|  | $0:$ Indicates that the asynchronous Hi-Z control is stopped. |  |
|  | 1: Indicates that the asynchronous Hi-Z control is enabled. |  |
|  | The conditions for setting or clearing this bit are as follows: |  |
|  | Clear condition: Writing 1 to TAPAnACTT while TAPAnACWE $=1$ |  |
|  | Set condition: Writing 1 to TAPAnACTS while TAPAnACWE $=1$ |  |

### 36.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register

This register is used to enable writing for asynchronous Hi-Z control.

### 36.3.6 TAPAnACTS — TAPA Asynchronous Hi-Z Control Start Trigger Register

This register is used to enable the start trigger for asynchronous Hi-Z control.

Access: This register is a write-only register that can be written in 8 -bit units. This register is always read as $00_{\mathrm{H}}$.
Address: <TAPAn_base> +0 0 $_{H}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAPAnACTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.17 TAPAnACTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnACTS | Asynchronous Hi-Z Control Start Trigger |
|  |  | This bit enables the start trigger for asynchronous Hi-Z control. |
|  | The setting of this bit is valid only when TAPAnACWE $=1$. |  |
|  | $0:$ Writing 0 is ignored (no function). |  |
|  | 1: Enables asynchronous Hi-Z control when TAPAnACWE is 1. |  |

### 36.3.7 TAPAnACTT — TAPA Asynchronous Hi-Z Control Stop Trigger Register

This bit enables the stop trigger for asynchronous Hi-Z control.

Access: This register is a write-only register that can be written in 8 -bit units. This register is always read as $00_{H}$.
Address: <TAPAn_base> + $0 \mathrm{C}_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAPAnACTT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | w |

Table 36.18 TAPAnACTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnACTT | Asynchronous Hi-Z Control Stop Trigger |
|  |  | This bit enables the stop trigger for asynchronous Hi-Z control. |
|  | The setting of this bit is valid only when TAPAnACWE $=1$. |  |
|  | $0:$ Writing 0 is ignored (no function). |  |
|  | 1: Disables asynchronous Hi-Z control when TAPAnACWE is 1. |  |

### 36.3.8 TAPAnOPHS — TAPA Hi-Z Start Trigger Register

This software trigger register is used to start Hi-Z control for motor control output pins.

Access: This register is a write-only register that can be written in 8 -bit units. This register is always read as $00^{H}$.
Address: <TAPAn_base> $+14_{H}$
Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAPAnOPHSO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.19 TAPAnOPHS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnOPHSO | Hi-Z Control Start Trigger |
|  |  | This bit starts Hi-Z control for motor control output pins. |
|  | $0:$ Writing 0 is ignored (no function). |  |
|  | 1: Starts Hi-Z control. |  |

### 36.3.9 TAPAnOPHT — TAPA Hi-Z Stop Trigger Register

This software trigger register is used to stop Hi-Z control for motor control output pins.

Access: This register is a write-only register that can be written in 8 -bit units. This register is always read as $00_{\mathrm{H}}$.
Address: <TAPAn_base> + 18H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TAPAnOPHTO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.20 TAPAnOPHT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | TAPAnOPHTO | Hi-Z Control Stop Trigger |
|  |  | This bit stops Hi-Z control for motor control output pins. |
|  | $0:$ Writing 0 is ignored (no function). |  |
|  |  | 1: Stops Hi-Z control. Whether the setting of this bit is valid or invalid depends on the |
|  |  | setting of TAPAnCTLO.TAPAnDCM. |

### 36.3.10 TAPAnEMU — TAPA Emulation Register

This register controls SVSTOP for emulation.

| Access: | This register can be read or written in 8 -bit units. (when EPC.SVSTOP $=0$, rewritten only) |
| ---: | :--- |
| Address: | <TAPAn_base> $+28_{\mathrm{H}}$ |
| Value after reset: | Reading this register returns always $00_{\mathrm{H}}$. |

Table 36.21 TAPAnEMU Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | TAPAnSVSDIS | This bit is used to control disabling of SVSTOP. |
|  | $0:$ SVSTOP is valid. (Sets Hi-Z control output to low level when SVSTOP $=1$ is input). |  |
|  | 1: SVSTOP is invalid. (Hi-Z control output level does not change according to the level of |  |
| 6 to 0 | Reserved | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |

### 36.4 Asynchronous Hi-Z Control Function

If the operation of the timer motor control function controlled by the MCU becomes abnormal, the rotation of the external motor also becomes abnormal. This function can forcibly set the motor control output to the Hi-Z state upon detection of abnormal motor operation, independent of MCU control.

### 36.4.1 Overview

This function forcibly stops TAPAn output through asynchronous Hi-Z control.

- When the TAPATHASIN signal becomes active, the levels of the motor control output pins are set to Hi-Z, and motor control output is forcibly stopped.
- Motor control output in a Hi-Z state can be resumed by writing the Hi-Z stop trigger register (TAPAnOPHT0).
- The Hi-Z state of motor control output can also be specified by writing the Hi-Z control start trigger register (TAPAnOPHS).
- Setting PIC can enable or disable Hi-Z control input when an error occurs.

### 36.4.2 System Configuration Example

A system configuration example is shown below, where an external error detection signal (the TAPA0ESO signal) is used for Hi-Z control of the motor control outputs (TAPA0UP / TAPA0UN / TAPA0VP / TAPA0VN / TAPA0WP / TAPA0WN).

When valid edges of the external error detection signal are detected, the level of the motor control outputs is set to Hi-Z.
Because the microcontroller might freeze when an error occurs, external error detection signals are continuously processed so that the motor control timer outputs can be set to Hi-Z even if no clock is supplied.

Note that an error is detected only when the valid edge of the error detection signal is detected. Therefore, no error is detected if the output level is fixed and the signal level does not change.

Figure 36.4 System Configuration Example of Asynchronous Hi-Z Control for Pin Input

### 36.4.3 Basic Operation

Hi-Z control for motor control output pins can be started as follows:

- Detecting the valid edge of asynchronous Hi-Z control signal (TAPATHASIN)
- Setting the start trigger bit TAPAnOPHS.TAPAnOPHS0 of the Hi-Z control signal

The levels of the motor control output pins are set to Hi-Z until the stop trigger bit of the Hi-Z control signal (TAPAnOPHT.TAPAnOPHT0) is set. Note that whether the setting of TAPAnOPTH0 is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.
(1) Operation when TAPAnCTLO.TAPAnDCM $=0$, TAPAnDCP $=1$, and TAPAnDCN $=0$

The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.
The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0, regardless of the level of TAPATHASIN.
(2) Operation when TAPAnCTLO.TAPAnDCM $=1$, TAPAnDCP $=1$, and TAPAnDCN $=0$

The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.
Writing 1 to the stop trigger bit (TAPAnOPHT.TAPAnOPHT0) of the Hi-Z control signal is ignored while TAPATHASIN is active (high level because TAPAnCTL0.TAPAnDCP is 1 ).

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0 after TAPATHASIN becomes inactive (low level because TAPAnCTL0.TAPAnDCP is 1).

### 36.4.4 Asynchronous Hi-Z Control Using Software Trigger

$\mathrm{Hi}-\mathrm{Z}$ control for motor control output is possible by using the $\mathrm{Hi}-\mathrm{Z}$ control start trigger bit
TAPAnOPHS.TAPAnOPHS0 and Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0.
(1) Function of Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHSO

| TAPAnDCM | Function |
| :--- | :--- |
| $0 / 1$ | Writing 1 to TAPAnOPHSO starts Hi-Z control and forcibly stops the motor control output (Hi-Z output). |

(2) Function of Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHTO

Whether the Hi-Z control stop trigger is valid or invalid depends on the conditions below:

| TAPAnDCM | Function |
| :--- | :--- |
| 0 | Writing 1 to TAPAnOPHTO stops Hi-Z control and restarts motor control output. |
| 1 | If TAPATHASIN is inactive, writing 1 to TAPAnOPHTO stops Hi-Z control and restarts motor control output. |
|  | If TAPATHASIN is active, writing 1 to TAPAnOPHTO is ignored. |

(3) Operation when TAPAnCTLO.TAPAnDCM $=1, \mathrm{TAPAnDCP}=1$, and TAPAnDCN $=0$

The motor control output (Hi-Z output) is forcibly stopped when 1 is written to TAPAnOPHS0.
After that, the level of the motor control output remains Hi-Z even if the rising edge of TAPATHASIN is detected.
Writing to TAPAnOPHT0 is ignored while TAPATHASIN is active (high level because TAPAnDCN is 0 and TAPAnDCP is 1 ).

After detection of the falling edge of TAPATHASIN, the motor control output restarts when 1 is written to TAPAnOPHT0 while TAPATHASIN is inactive (low level because TAPAnDCN is 0 and TAPAnDCP is 1).

### 36.4.5 Operating Procedure

The operating procedure for the asynchronous input Hi-Z control function is shown below:

|  |  | Operation | Status of TAPA |
| :---: | :---: | :---: | :---: |
|  |  | Set up the TAPAnCTLO register. <br> Specify TAPAnDCP and TAPAnDCN to select the input edge. <br> Specify TAPAnDCM to select the clear mode. | Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0) |
| $\left\lvert\, \begin{aligned} & \stackrel{\rightharpoonup}{\nwarrow} \\ & \underset{\sim}{0} \\ & \underset{\sim}{\sim} \\ & \hline \end{aligned}\right.$ |  | Set up the TAPAnACWE register. Set TAPAnACWE to 1. <br> Set up the TAPAnACTS register. Set TAPAnACTS to 1. | Writing to TAPAnACTS is enabled. <br> Asynchronous Hi-Z control enabled (TAPAnFLG.TAPAnACE = 1) |
|  |  | $\mathrm{Hi}-\mathrm{Z}$ control for the timer function outputs can be started by controlling the following: <br> - TAPAnOPHS register <br> - Asynchronous Hi-Z control signal (TAPATHASIN) <br> Hi-Z control for the timer function outputs can be stopped by controlling the following: <br> - TAPAnOPHT register <br> (If TAPAnDCM is 1 , control by the TAPAnOPHT register is enabled only while TAPATHASIN is inactive.) <br> The TAPA operating status can always be read using the TAPAnFLG register. | Hi-Z control for the motor control output pins is started by detecting the valid edge of the asynchronous Hi-Z control signal (TAPATHASIN) or by setting the Hi-Z control start trigger bit TAPAnOPHSO to 1. <br> Hi-Z control for the motor control output pins is stopped by setting the Hi-Z control stop trigger bit TAPAnOPHTO to 1 according to the operation mode specified by the TAPAnDCM bit. |
|  | ¢ | Set up the TAPAnACWE register. Set TAPAnACWE to 1. <br> Set up the TAPAnACTT register. Set TAPAnACTT to 1. | Writing to TAPAnACTT is enabled. <br> Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0) |

### 36.4.6 TAPAO Hi-Z Control Input Selection

In order to stop the motor control output in case of errors, error events are selected in PIC and the level of the motor control output is set to $\mathrm{Hi}-\mathrm{Z}$ in TAPA0, as shown in the diagram below.

The TAPA function can be stopped by setting TAPA0ACTT $=01_{\mathrm{H}}$ after setting PICOHIZCEN0 $=00_{\mathrm{H}}$ or TAPA0ACWE $=01_{\mathrm{H}}$.

Figure 36.5 Hi-Z Control Block Diagram

Switching into a Hi-Z state can be performed by the following:

- TAPA0ESO pin input
- A/D converter ADCA0 error signal ADCA0ERR

## - RH850/F1KH-D8

Window Watchdog Timer WDTA1 non maskable interrupt WDTA1NMI and Window Watchdog Timer WDTA2 non maskable interrupt WDTA2NMI
RH850/F1KM-S4, RH850/F1KM-S1
Window Watchdog Timer WDTA1 non maskable interrupt WDTA1NMI
For details about these signals, see the respective descriptions.

### 36.4.7 Registers

### 36.4.7.1 PICOHIZCENn - Hi-Z Output Control Register $\mathbf{n}(\mathbf{n}=\mathbf{0})$

The PIC0HIZCENn register selects the Hi-Z output control signal of TAPAn.

| Access: | This register can be read or written in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ PICO_base> $+80_{\mathrm{H}}$ |
| Value after reset: | $0 O_{\mathrm{H}}$ |

| 0 | PICOHIZCENnO | Selects whether to enable or disable Hi-Z output control by the TAPAOESO pin input. <br> 0 : Disable <br> 1: Enable |

### 36.5 INT Signal Output Selection Function

### 36.5.1 Configuration of the INT Signal Output Selection Function

This function generates the peak interrupt INTTAPA0IPEK0 and valley interrupt INTTAPA0IVLY0 by using the TAPATSIM0 signal, which is connected to the INT signal on the TAUD's triangular carrier cycle generation channel (master) and TAPATUDCM0 signal, which is connected to the counter up/down signal.

For the connection destination of TAPATSIM0, see Section 36.1.7, Internal Output Signal.

Figure 36.6 Basic Timing of Signals for the INT Signal Output Selection Function

Triangular carrier cycles are generated on the master channel.
The INT signal generated on the master channel in each half triangular carrier cycle is input to TAPAn as the TAPATSIM0 signal. TAPAn generates the INTTAPA0IPEK0 signal (peak interrupt) during high level of the TAPATUDCM0 signal and the INTTAPA0IVLY0 signal (valley interrupt) during low level of the TAPATUDCM0 signal by using the TAPATSIM0 and TAPATUDCM0 input signals.

## CAUTION

The peak interrupt INTTAPAOIPEKO and valley interrupt INTTAPAOIVLYO are generated regardless of the function of the master channel of TAUD.

When not using these peak and valley interrupts, mask them by using the ICTAPAnIPEKO and ICTAPAnIVLY0 registers, respectively.

### 36.5.2 Block Diagram

TAUDn and TAPAn are connected in the registers shown below by the INT signal output selection function.

Figure 36.7 Connection of the INT Signals

### 36.5.3 Registers

### 36.5.3.1 PICOREG2n0 - Timer I/O Control Register 2n0 ( $\mathrm{n}=0$ )

This register selects the TAPA0 input.
Access: This register can be read or written in 32-bit units.
Address: PICOREG200: FFDD 00CO ${ }_{\mathrm{H}}$
Value after reset: $\quad 00000000$ +

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 36.23 PICOREG2n0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | Reserved | $* 1$ |
| 25,24 | PICOREG2n025 | Select the TAUDn channel used by TAPATSIM0 and TAPATUDCM0. |
|  | PICOREG2n024 | 00: Not selected |
|  |  | 01: TAUD0 channel 0 selected |
|  |  | 10: TAUD0 channel 2 selected |
|  |  | 11: TAUD0 channel 8 selected |
| 23 to 0 | Reserved | $* 1$ |

Note 1. Some of the bits defined as 0 in the PICOREG2n0 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

### 36.6 A/D Converter Conversion Trigger Selection Function

This function outputs the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1 from the TAPATCDENS0 and TAPATCDENS1 signals, which are connected to a compare match interrupt based on the triangular carrier cycle of TAUD, or a valley interrupt signal (INTTAPAOIVLY0).

### 36.6.1 Configuration of AID Converter Conversion Trigger Selection Function

Table 36.24 Signals Used for TAPATADOUT Generation

| Output Signal | Slave Match Detection Signal | Valley Interrupt Signal |
| :--- | :--- | :--- |
| TAPATADOUT0 | TAPATCDENS0 | INTTAPAOIVLY0 |
| TAPATADOUT1 | TAPATCDENS1 | INTTAPAOIVLY0 |

Table 36.25 Operation of TAPATADOUT1 According to the Setting of TAPAnCTL1.TAPAnATS[3:2]

| TAPAnATS3 | TAPAnATS2 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Outputs the INT signal from TAPATADOUT1 while the triangle wave is falling (counting down). |
| 0 | 1 | Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up). |
| 1 | 0 | Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up) or <br> falling (counting down). |
| 1 | Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) <br> and valley interrupt INTTAPAOIVLY0 from TAPATADOUT1. |  |
| Table 36.26 | Operation of TAPATADOUT0 According to the Setting of TAPAnCTL1.TAPAnATS[1:0] |  |

### 36.6.2 Block Diagram

Figure 36.8 Block Diagram of A/D Conversion Trigger Selection Function

NOTE
See Section 38.3.4.1, ADCAnSGTSELx — Scan Group x Start Trigger Control Register for details on the settings of the ADCA0SGTSEL register.

### 36.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode

Figure 36.9 TAPAnATS[1:0] bits $=00_{\mathrm{B}}$ : Output INT Signal while the Triangle Wave is Falling (Counting Down)

While the triangle wave is falling (counting down), the signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

In this case, no $\mathrm{A} / \mathrm{D}$ converter conversion trigger signal is output while the triangle wave is rising (counting up).

Figure 36.10 TAPAnATS[1:0] bits = 10 B : Output INT Signal while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)

The signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

Figure 36.11 TAPAnATS[1:0] bits = 11 : Output of INT Signal and Valley Interrupt while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)

The signals TAPATCDENS0 and TAPATCDENS1 and valley interrupt INTTAPA0IVLY0 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

### 36.6.4 Operating Procedure for AID Converter Conversion Trigger Selection Function

The operating procedure for the $\mathrm{A} / \mathrm{D}$ converter conversion trigger selection function is shown below.

|  |  | Operation | Status of TAUD and TAPA |
| :---: | :---: | :---: | :---: |
|  |  | Initialize TAUD. <br> Specify the timer operation mode. <br> Set up the TAPAnCTL1 register. <br> Specify TAPAnATS[1:0] (TAPATADOUT0 setting). <br> Specify TAPAnATS[3:2] (TAPATADOUT1 setting). <br> Set up the PICOADTEN4nj and PICOREG2n0 registers according to the signal to be used. <br> Specify PICOADTEN4nj (TAPATCDENS0 or TAPATCDENS1 setting). <br> Specify PICOREG2n0 (INTTAPAOIVLY0 setting). | TAUD and TAPA stop the operation. |
|  |  | Start the TAUD operation. | TAUD starts the count operation. |
|  |  | TAUD operates according to the setting of each function. | The A/D conversion trigger selection function outputs either TAPATADOUT0 according to the setting of TAPAnATS[1:0] or TAPATADOUT1 according to the setting of TAPAnATS[3:2], based on the interrupt TAPATCDENS1 or TAPATCDENS0, which is input from TAUD, and the valley interrupt INTTAPAOIVLYO, which is generated by TAPA. |
|  |  | Stop the TAUD operation. | TAUD stops the count operation. |

### 36.7 ADCA Trigger Selection Function

### 36.7.1 Functional Overview

This function generates ADCA hardware trigger signals by using TAUDn channel output.

### 36.7.2 Configuration

Figure 36.12 Block Diagram of ADCA Trigger Selection Function

### 36.7.3 Registers

### 36.7.3.1 PICOADTEN4nj - A/D Conversion Trigger Output Control Register 4nj <br> ( $\mathrm{n}=\mathbf{0}, \mathrm{j}=0$ to 2)

This register selects an ADCA0 start trigger source from TAUDn channel m. (m = 0 to 15 )

Access: This register can be read or written in 16-bit units.
Address: <PICO_base> $+90_{\mathrm{H}}+4 \times \mathrm{j}$
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/w | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 36.27 PICOADTEN4nj Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PICOADTEN4nj15 to | Sets a trigger source of $\mathrm{CHm}(\mathrm{m}=0$ to 15) in the TAUDn timer. |
|  | PICOADTEN4nj00 | 0: A/D trigger source of CHm in the TAUDn timer is disabled. |
|  |  | 1: A/D trigger source of CHm in the TAUDn timer is enabled. |

### 36.7.4 Example of Operation

(1) Initial setting: Set the function of each channel of the TAUD0 to be used.
(2) Setting of the $\mathrm{A} / \mathrm{D}$ conversion trigger output control register 4nj (PICOADTEN4nj):

Setting the bits of A/D conversion trigger output control register 4nj ((PICOADTEN4nj) to 1 enables selection of an interrupt request signal from each channel of the TAUD0 as the trigger of the A/D conversion scan group.

- Register setting should be performed when A/D conversion is stopped.
(3) Setting of the $\mathrm{A} / \mathrm{D}$ conversion trigger selection control register (ADCA0SGTSELx):

Setting the bits corresponding to each trigger to 1 enables to use the signal generated by executing the logical OR of each trigger as the start trigger of the $\mathrm{A} / \mathrm{D}$ conversion scan group.

- Register setting should be performed when the A/D conversion is stopped.
(4) Enabling of TAUD0 timer operation

Each channel of the TAUD0 timer set in (1) starts.

### 36.7.5 Setup Flow

Figure 36.13 Setup Flow ( $=0$ to 2 )

### 36.8 Simultaneous Start Trigger Function

### 36.8.1 Functional Overview

The timers (TAUD0, TAUJ1, ENCA0) can be simultaneously started in any combination.

### 36.8.2 Configuration

Table 36.29 PICOSSER0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PICOSSER015 to | Enable a simultaneous start trigger for the CHm in the TAUDO. |
|  | PICOSSER000 | $0:$ Simultaneous start trigger is disabled. |
|  |  | 1: Simultaneous start trigger is enabled. |

### 36.8.3.2 PICOSSER2 — Simultaneous Start Control Register 2

The PIC0SSER2 register enables a start trigger for ENCA0 and TAUJ1.

Table 36.30 PICOSSER2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | Reserved | When read, the value after reset is returned. <br> When writing, write the value after reset. |
| 14 | PICOSSER214 | Enables a simultaneous start trigger for the ENCA0 timer. |
|  |  | 0: Simultaneous start trigger is disabled. |
|  | 1: Simultaneous start trigger is enabled. |  |
| 13 to $\mathbf{4}$ | Reserved | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 3 to 0 | PICOSSER203 to | Set a simultaneous start trigger for the CHm in the TAUJ1 timer. |
|  | PICOSSER200 | 0: Simultaneous start trigger is disabled. |
|  |  | 1: Simultaneous start trigger is enabled. |

### 36.8.3.3 PICOSST — Simultaneous Start Trigger Control Register

Access: This register is a write-only register that can be written in 8-bit units.
Address: <PICO_base> + 04H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | SYNCTRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.31 PICOSST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When writing, write the value after reset. |
| 0 | SYNCTRG | Generates a start trigger for the timer whose simultaneous start is enabled. When read, this bit |
|  |  | is always read as 0. |
|  | 0: Disabled. |  |
|  | 1: Simultaneous start trigger is generated (the pulse in the width of 1PCLK is output). |  |

### 36.8.4 Example of Operation

(1) Operation example of timer configuration:

The timers that operates in operation mode to be selected can be simultaneously started in any combinations.
(2) Simultaneous start enable:

Setting the relevant bits in the PIC0SSER0 and PIC0SSER2 registers of the target timers to be simultaneously started to 1 enables these timers to simultaneously start.
(3) Start trigger output:

Writing 1 to the SYNCTRG bit in the PICOSST register enables the target timers set in (2) to simultaneously start.
(4) Repeating (2) and (3) for the channels that have not started yet enables the different target timers to simultaneously start in multiple batches.

### 36.8.5 Setup Flow

Figure 36.15 Setup Flow

### 36.9 Trigger \& Pulse Width Measuring Function

### 36.9.1 Functional Overview

This function allows measurement of trigger periods by inputting the trigger signal output from ENCA0 to TAUJ1 and TAUD0.

### 36.9.2 Configuration

(1) Configuration

Table 36.32 Configuration of Trigger \& Pulse Width Measuring Function

| Configuration/Timer Function | Timer |
| :--- | :--- |
| Configuration of Timer | ENCAO, TAUD0, TAUJ1 |

Table 36.33 Setting Functions of TAUJ1/TAUD0 Channels

| TAU | Channels | Functions Name |  | Target Trigger of <br> Pulse Width Measurement |
| :--- | :--- | :--- | :--- | :--- |
|  | 00 | TINm input pulse interval measurement function | S | ENCATOIEC*2 |

|  |  | 0 | 0 | 1 | DT out |
|  |  | Other than above |  |  | Setting |
| 5 to 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |

Table 36.34 PICOREG31 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | PICOREG3101 | Selects a TIN input signal to CH1 of TAUJ1. |
|  |  | 0: CH1 of TAUJ1 is not used for trigger width measurement. |
|  | 1: DT output signal of ENCATOIEC |  |
| 0 | PICOREG3100 | Selects a TIN input signal to CH0 of TAUJ1. |
|  |  | 0: CH0 of TAUJ1 is not used for trigger width measurement. |
|  | 1: DT output signal of ENCATOIEC |  |

### 36.9.4 Example of Operation

The trigger and pulse width measurement function is achieved by combining the ENCA0 trigger signals (ENCATOIEC, ENCAT0EQ0, ENCAT0EQ1) and the following functions of TAUD0 and TAUJ1.

- TAUDTTINm input pulse interval measurement function (TAUD0)
- TAUJTTINm input pulse interval measurement function (TAUJ1)

Also, the following function of PIC is used to convert the trigger signal input to TINm into a level-sensitive toggle signal.

- DT circuit

The trigger and pulse width measurement function implements measurement of the ENCA0 output trigger signal interval using the TAUDTTINm input pulse interval measurement function of TAUD0 and the TAUJTTINm input pulse interval measurement function of TAUJ1.

## (1) TAUDTTINm Input Pulse Interval Measurement Function, TAUJTTINm Input Pulse Interval Measurement Function

When the valid TINm edge of TAUD0 or TAUJ1 is detected, the CNTm value is captured into CDRm and CNTm is cleared.

## CAUTION

Set both edges (rising and falling edges) of TINm to be detected as valid (TAUDOCMURm.TAUDOTIS[1:0] = 10B, TAUJ1CMURm.TAUJ1TIS[1:0] = 10B) for this function.

For details of the TAUD and TAUJ functions, see the corresponding sections.

## (2) DT Circuit

The DT circuit is used to convert the trigger signal output from ENCA0 into a level-sensitive toggle signal.
As shown in Figure 36.17, Operation of DT Circuit, the output signal is toggled upon each input trigger signal generation.

Figure 36.17 Operation of DT Circuit
PIC provides input signal conversion and signal connection to TAUD0 and TAUJ1 to measure the generation interval of trigger signals from ENCA0.

The timing chart of the trigger and pulse width measurement function is shown below.

Figure 36.18 Operation Example of the Function of Trigger and Pulse Width Measurement ( $m=0$ to $2, k=0,1$ )
(1) The following signals are output from ENCA0 as triggers:

- ENCATOIEC (interrupt trigger signal output when timer counter value is cleared by ENCA0EC input)
- ENCAT0EQ0 (trigger signal output according to timing of a match of timer counter value and value of compare register 0)
- ENCAT0EQ1 (trigger signal output according to timing of a match of timer counter value and value of compare register 1)
(2) The trigger signal output from ENCA0 is converted to a level-sensitive toggle signal by the DT circuit and is output to TINm of TAUD0 and TAUJ1.
(3) By setting both TINm edges (rising and falling edges) of TAUD0 and TAUJ1 as valid, the CNTm value is captured into CDRm at the TINm toggle timing and cleared to $0000_{\mathrm{H}}$. This operation is repeated.
The first captured value (shown as "a" in the figure) from the start of operation indicates the interval from the start of TAUJ operation until trigger input.
(4) When an overflow occurs, the count value $\mathrm{FFFF}_{\mathrm{H}}\left(\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}\right.$ for TAUJ) is captured but the count value is not captured at the first trigger after the overflow.
With the above operation, the trigger generation interval can be measured.
The following table shows the combinations of the trigger signals and measurement timers, and the bit settings of the pertinent PIC registers for setting the signal paths and the I/O selection registers. Appropriately set these bits according to the trigger signal to be measured and the measurement timer to be used.

Table 36.35 Combinations of Trigger Signals and Measurement Timers

| Interrupt Trigger Signal | Measurement Timer | PIC Register Bit Setting |  |
| :--- | :--- | :--- | :--- |
| ENCATOIEC | TAUJ1 CH0 | PICOREG3100 $=1$ |  |
|  | TAUJ1 CH1 | PIC0REG3101 $=1$ |  |
| ENCAT0EQ0 | TAUD0 CH0 | PIC0REG3109 $=0$ |  |
|  | TAUD0 CH2 | PIC0REG3110 $=1$ |  |
| ENCAT0EQ1 | PIC0REG3112 $=1$ | PIC0REG3109 $=0$ |  |
|  | TAUD0 CH0 | PIC0REG3113 $=0$ | PIC0REG3110 $=0$ |
|  | TAUD0 CH1 | PICOREG3107 $=0$ | PIC0REG3111 $=1$ |

### 36.9.5 Setup Flow

The setup flow in this section shows the general setup flow to measure the pulse interval, which applies to all the following combinations. For the combinations of the trigger signals and measurement timers, see Table 36.35,
Combinations of Trigger Signals and Measurement Timers.

| Encoder Timer | Trigger Signal | Measurement Timer |
| :--- | :--- | :--- |
| ENCA0 | ENCATOIEC | TAUJ1 CH0, TAUJ1 CH1 |
|  | ENCAT0EQ0 | TAUD0 CH0, TAUD0 CH2 |
|  | ENCAT0EQ1 | TAUD0 CH0, TAUD0 CH1 |

Note 1. Change the settings depending on the combination of the trigger signal to be measured and measurement timer to be used.

Figure 36.19 Setup Flow

Note 1. Change the settings depending on the combination of the trigger signal to be measured and measurement timer to be used.

Figure 36.20 Setup Flow (Cont'd)

### 36.9.6 Setting Examples for Operation Functions

This section provides example settings for each register.
The setup example shown in this section describes how to set up measurement of the pulse interval for all the combinations below. For the combinations of the trigger signals and measurement timers, see Table 36.35,
Combinations of Trigger Signals and Measurement Timers.

| Encoder Timer | Trigger Signal | Measurement Timer |
| :--- | :--- | :--- |
| ENCA0 | ENCATOIEC | TAUJ1 CH0, TAUJ1 CH1 |
|  | ENCAT0EQ0 | TAUD0 CH0, TAUD0 CH2 |
|  | ENCAT0EQ1 | TAUD0 CH0, TAUD0 CH1 |

Table 36.36 ENCAO Setting

| Register | Bit Position | Bit Name | Setting Value | Note |
| :---: | :---: | :---: | :---: | :---: |
| ENCAOCTL | 15 | ENCAOCME | Don't care | Enables or disables compare match interrupt detection mask |
|  | 14 | ENCAOMCS | Don't care | Selects a cancelation trigger for compare match interrupt detection mask |
|  | 13 to 10 |  | 0 | Fixed to 0 |
|  | 9 | ENCAOCRM1 | Don't care | Selects the ENCA0CCR1 register function |
|  | 8 | ENCAOCRMO | Don't care | Selects the ENCA0CCR0 register function |
|  | 7 | ENCAOCTS | Don't care | Selects trigger for capture operation of ENCAOCCR1. |
|  | 6, 5 |  | 0 | Fixed to 0 |
|  | 4 | ENCAOLDE | Don't care | Enables or disables reload operation when underflow is generated |
|  | 3 | ENCA0ECM1 | Don't care | Enables or disables clearing of the counter on compare match of ENCAOCCR1 |
|  | 2 | ENCAOECMO | Don't care | Enables or disables clearing of the counter on compare match of ENCAOCCRO |
|  | 1, 0 | ENCAOUDS[1:0] | Don't care | Selects the counter up/down control by ENCAOEO and ENCA0E1 |
| ENCAOIOCO | 7 to 4 |  | 0 | Fixed to 0 |
|  | 3, 2 | ENCAOTIS[3:2] | Don't care | Selects the valid edge for capture trigger 1 (ENCAOI1) |
|  | 1, 0 | ENCAOTIS[1:0] | Don't care | Selects the valid edge for capture trigger 0 (ENCAOIO) |
| ENCAOIOC1 | 7 | ENCAOSCE | Don't care | Enables encoder special-clear |
|  | 6 | ENCAOZCL | Don't care | Selects the clear level of $Z$ phase for a encoder special-clear |
|  | 5 | ENCAOBCL | Don't care | Selects the clear level of B phase for a encoder special-clear |
|  | 4 | ENCAOACL | Don't care | Selects the clear level of A phase for a encoder special-clear |
|  | 3, 2 | ENCA0ECS[1:0] | Don't care | Selects encoder clear input (Z phase) edge |
|  | 1, 0 | ENCA0EIS[1:0] | Don't care | Selects encoder input (A or B phase) edge |

Table 36.37 TAUJ1 Setting ( $k=0,1$ )
TAUJ1 (TAUJTTINm Input Pulse Interval Measurement Function)

| Register | Bit Position | Bit Name | Setting Value | Note |
| :--- | :--- | :--- | :--- | :--- |
| TAUJ1CMORk | 15,14 | TAUJ1CKS[1:0] | Don't care | Operation Clock Setting |
|  | 13,12 | TAUJ1CCS[1:0] | 00 |  |
|  | 11 | TAUJ1MAS | 0 |  |
|  | $10,9,8$ | TAUJ1STS[2:0] | 001 |  |
|  | 7,6 | TAUJ1COS[1:0] | 11 |  |
|  | 5 |  | 0 | Fixed to 0 |
| TAUJ1CMURk | 1,0 | TAU, 0,1 | TAUJ1MD[4:1] | 0010 |
| NOTE |  |  |  |  |

When TAUJ1CMORk is used for the TAUDTTINm input pulse interval measurement function, the TAUJ1CKS[1:0] (operating clock selection) and TAUJ1MDO (INTm output control at the start of counting) bits can be set arbitrarily.
Although the TAUJ1COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see Section 33, Timer Array Unit J (TAUJ).
For TAUJ common registers (TAUJ1TOE, TAUJ1TO, TAUJ1TOM, TAUJ1TOC, TAUJ1TOL, TAUJ1RDE, and TAUJ1RDM), only set the bits corresponding to the used channels to 0 .

Table 36.38 TAUDO Setting ( $\mathrm{m}=0$ to 2 )
TAUDO (TAUDTTINm Input Pulse Interval Measurement Function)

| Register | Bit Position | Bit Name | Setting Value | Note |
| :--- | :--- | :--- | :--- | :--- |
| TAUDOCMORm | 15,14 | TAUDOCKS[1:0] | Don't care | Operation Clock Setting |
|  | 13,12 | TAUDOCCS[1:0] | 00 |  |
|  | 11 | TAUDOMAS | 0 |  |
|  | 10 to 8 | TAUDOSTS[2:0] | 001 |  |
|  | 7,6 | TAUDOCOS[1:0] | 11 |  |
|  | 5 |  | 0 | Fixed to 0 |
| TAUD to 1 | TAUDOMD[4:1] | 0010 |  |  |
| NOTE | 0 | TAUDOMD0 | Don't care |  |

When TAUDOCMORm is used for the TAUDTTINm input pulse interval measurement function, the TAUD0CKS[1:0] (operating clock selection) and TAUDOMDO (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUDOCOS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see Section 32, Timer Array Unit D (TAUD).
For TAUD common registers (TAUDOTOE, TAUDOTO, TAUDOTOM, TAUDOTOC, TAUDOTOL, TAUDOTDE, TAUDOTDM, TAUDOTDL, TAUDOTRE, TAUDOTRO, TAUDOTRC, TAUDOTME, TAUDORDE, TAUDORDS, TAUDORDM, and TAUDORDC), only set the bits corresponding to the used channels to 0 .

| 36.39 PIC Setting |  |  | Setting Value | Note |
| :---: | :---: | :---: | :---: | :---: |
| Register | Bit Position | Bit Name |  |  |
| PICOREG31 | 13, 12 | PICOREG3113 | 0 | Selects the DT output signal from ENCAT0EQ0 as TAUDOTTIN2 input signal |
|  |  | PICOREG3112 | 1 |  |
|  | 11 | PICOREG3111 | 1 | Selects the signal selected with PICOREG3106 to PICOREG3108 (DT output signal from ENCAT0EQ1) as TAUD0TTIN1 input signal |
|  | 10, 9 | PICOREG3110 | 1 | Selects the DT output signal from ENCATOEQ0 as TAUDOTTINO input signal |
|  |  | PICOREG3109 | 0 |  |
|  | 8 to 6 | PICOREG3108 | 0 | Selects the DT output signal from ENCAT0EQ1 as TAUDOTTIN1 or TAUDOTTINO input signal |
|  |  | PICOREG3107 | 0 |  |
|  |  | PICOREG3106 | 1 |  |
|  | 1 | PIC0REG3101 | 1 | Selects the DT output signal from ENCATOIEC as TAUJ1TTIN1 input signal |
|  | 0 | PICOREG3100 | 1 | Selects the DT output signal from ENCATOIEC as TAUJ1TTINO input signal |

### 36.10 A/D Trigger Encoder Capture Function

### 36.10.1 Functional Overview

The value of the encoder counter synchronized with A/D conversion can be obtained by using an A/D conversion trigger signal as a capture signal of ENCA0.

### 36.10.2 Configuration

(1) Configuration

Table 36.40 Configuration of A/D Trigger Encoder Capture Function

| A/D Converter | Encoder Timer |
| :--- | :--- |
| ADCAO | ENCAO |

## (2) Block Diagram

Figure 36.21 Block Diagram of A/D Trigger Encoder Capture Function

## CAUTION

1. It takes ENCAO one additional clock cycle to capture the input signal of the ADCAOTRGO, ADCAOTRG1, and ADCAOTRG2 pins compared with the number of clock cycles it takes to capture the input signal of the ENCAOTIN1 pin when using CKSCLK_IPERI1, and three additional clock cycles when using CKSCLK_AADCA. Be sure to take this into account when configuring your system.
2. Configure the edge detection function by using the edge detection function registers of the digital noise filter, which are FCLAOCTLO_ADCO,
FCLA0CTL1_ADC0, and FCLA0CTL2_ADC0 (see Section 2A.12.1.4, Input Pins that Incorporate Digital Filter Type D, Section 2B.12.1.4, Input Pins that Incorporate Digital Filter Type D and Section 2C.12.1.4, Input Pins that Incorporate Digital Filter Type D for details), and specify "rising edge" for edge detection of the ENCAOTIN1 capture trigger input of ENCAO (ENCAOIOCO.ENCAOTIS [3:2] = 018). Do not set ENCAOIOCO.ENCAOTIS [3:2] to 10 B (falling edge) or $11_{\mathrm{B}}$ (both edges).
3. ADCAOTRG0-2 are selected by ADCAOSGTSEL1-3 signal shown in Figure 36.8, Block Diagram of A/D Conversion Trigger Selection Function.

### 36.10.3 Registers

### 36.10.3.1 PICOREG30 - Timer I/O Control Register 30

Access: This register can be read or written in 32-bit units.
Address: <PICO_base> + E8H
Value after reset: 0000 0000

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 36.41 PICOREG30 Register Contents

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 5 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |
| 4 to 2 | PICOREG3004 to | Selects an input signal to ENCATTIN1. |  |  |  |
|  | PICOREG3002 | $\begin{aligned} & \text { PICOREG } \\ & 3004 \end{aligned}$ | $\begin{array}{\|l} \text { PICOREG } \\ 3003 \end{array}$ | $\begin{aligned} & \text { PICOREG } \\ & 3002 \end{aligned}$ | Input Signal |
|  |  | 0 | 0 | 0 | Capture is not perfo |
|  |  | 0 | 1 | 0 | ADCAOTRG2 |
|  |  | 0 | 1 | 1 | ADCA0TRG1 |
|  |  | 1 | 0 | 0 | ADCAOTRG0 |
|  |  | Other than above |  |  | Setting prohibited |
| 1, 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |

### 36.10.4 Example of Operation

The $A / D$ trigger encoder capture function is implemented by connecting $A / D$ conversion trigger signal ADCAnTRGi ( $n$ $=0, \mathrm{i}=0$ to 2 ) to ENCA0.

## CAUTION

When using this function, the ENCAO interrupt signal ENCATINT1 should not be selected as the A/D converter trigger. If selected, the correct operation cannot be performed because the following loop occurs: ADCAnTRG1 generation $\rightarrow$ ENCA0 capture operation $\rightarrow$ ENCATINT1 generation by capture operation $\rightarrow$ ADCAnTRG1 generation.

The following shows a timing chart of the A/D trigger encoder capture function using the ADCA0TRG1 as a trigger.

Figure 36.22 Operation Example of Trigger Encoder Capture Function
(1) When ADCA0TRG1 is selected as ENCA0 capture trigger 1 signal ENCATTIN1, the valid ADCA0TRG1 is input to ENCA0 as the ENCATTIN1 signal and ENCA0 is captured.
(2) When a hardware trigger signal (ADCA0TRG0, ADCA0TRG2) other than ADCA0TRG1 is generated, the ENCATTIN1 signal is not generated and ENCA0 is not captured.

### 36.10.5 Setup Flow

The setup flow in this section shows the general setup flow to perform the capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal.

Figure 36.23 Setup Flow

### 36.10.6 Setting Examples for Operation Functions

This section provides example settings for each register.
The setup example shown in this section describes how to set up capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal. Change the settings depending on the hardware trigger to perform the capture operation.

Table 36.42 ENCAn Setting

| Register | Bit Position | Bit Name | Setting Value | Remark |
| :---: | :---: | :---: | :---: | :---: |
| ENCAnCTL | 15 | ENCAnCME | 0 | Disables compare match interrupt detection masking |
|  | 14 | ENCAnMCS | 0 | Selects release trigger for compare match interrupt detection masking |
|  | 13 to 10 |  | 0 | Fixed to 0 |
|  | 9 | ENCAnCRM1 | 1 | Sets the ENCAnCCR1 register for capture operation |
|  | 8 | ENCAnCRMO | Don't care | Selects the function of ENCAnCCRO register |
|  | 7 | ENCAnCTS | 0 | Selects ENCATTIN1 as trigger for capture operation |
|  | 6,5 |  | 0 | Fixed to 0 |
|  | 4 | ENCAnLDE | Don't care | Enables or disables reload operation when ENCAnCCRO register underflow occurs |
|  | 3 | ENCAnECM1 | Don't care | Enables or disables clearing of the counter on compare match of ENCAnCCR1 register |
|  | 2 | ENCAnECM0 | Don't care | Enables or disables clearing of the counter on compare match of ENCAnCCRO register |
|  | 1,0 | ENCAnUDS[1:0] | Don't care | Select the counter up/down control by ENCAnE0 and ENCAnE1 |
| ENCAnIOCO | 7 to 4 |  | 0 | Fixed to 0 |
|  | 3, 2 | ENCAnTIS[3:2] | $\begin{aligned} & \hline 0^{\star 1} \\ & 1^{\star 1} \end{aligned}$ | Select the valid edge of capture trigger 1 (ENCATTIN1) for the rising edge detection |
|  | 1, 0 | ENCAnTIS[1:0] | Don't care | Select the valid edge of capture trigger 0 (ENCATTINO) |
| ENCAnIOC1 | 7 | ENCAnSCE | Don't care | Enables encoder special-clear |
|  | 6 | ENCAnZCL | Don't care | Selects the clear level (input level) of Z phase for encoder specialclear |
|  | 5 | ENCAnBCL | Don't care | Selects the clear level (input level) of B phase for encoder specialclear |
|  | 4 | ENCAnACL | Don't care | Selects the clear level (input level) of A phase for encoder specialclear |
|  | 3, 2 | ENCAnECS[1:0] | Don't care | Select encoder clear input ( $Z$ phase) edge |
|  | 1, 0 | ENCAnEIS[1:0] | Don't care | Select encoder input (A or B phase) edge |
| PICOREG30 | 4 | PICOREG3004 | Don't care | Selects ADCA0 trigger signal of ENCATTIN1 |
|  | 3 | PICOREG3003 | Don't care |  |
|  | 2 | PICOREG3002 | Don't care |  |

Note 1. Change the setting depending on the hardware trigger to perform the capture operation.

NOTE
Bits ENCAOCRM1 and ENCAOCTS in ENCAOCTL are fixed: ENCAOCRM1 = 1 (ENCAOCCR1 register function) and ENCAOCTS $=0$ (trigger source of capture to the ENCAOCCR1 register). All the other bits can be set arbitrarily.

### 36.11 Three-Phase PWM Output with Dead Time

### 36.11.1 Functional Overview

This feature generates each of the set signals (active level timing signals) and clear signals (inactive level timing signals) once or less per cycle and then uses the results to output a three-phase PWM waveform with dead time.

For the PWM output feature of TAUD, only the clear timing used during each cycle is specified by specifying the duty value, but for the feature described here, the set timing can also be specified, which makes more flexible PWM output with dead time possible.

### 36.11.2 Configuration

The unit and channel configuration for this feature is shown below. $(\mathrm{n}=0)$
Table 36.43 Configuration of Three-Phase PWM Output with Dead Time

| Timer | Timer Motor Control Function |
| :--- | :--- |
| TAUD0 $\mathrm{CH} 2, \mathrm{CH} 4$ to CH 15 (used channels fixed) | TAPA0 |

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm $\rightarrow$ INTTAUDnIm (TAUDn channel m interrupt)
- TINm $\rightarrow$ TAUDTTINm (TAUDn channel m input)
- TOUTm $\rightarrow$ TAUDTTOUTm (TAUDn channel m output)
- CDRm $\rightarrow$ TAUDnCDRm (TAUDn channel $m$ data register)
- CNTm $\rightarrow$ TAUDnCNTm (TAUDn channel $m$ counter register)

## (1) TAUDn Configuration

Because CH10, CH12, and CH14 are only used for TOUTm, these channels can be used for features that do not use TOUTm (m = 10, 12, 14).

Table 36.44 TAUDn Configuration

| CH | Function Name | M/S | CDR Setting | Description |
| :---: | :---: | :---: | :---: | :---: |
| 2 | PWM output ( CH 2 is the master channel for CH 4 to CH 9.$)$ | M | Cycle |  |
| 4 |  | S | Duty (U phase signal setting) |  |
| 5 |  | S | Duty (U phase signal clearing) |  |
| 6 |  | S | Duty (V phase signal setting) |  |
| 7 |  | S | Duty (V phase signal clearing) |  |
| 8 |  | S | Duty (W phase signal setting) |  |
| 9 |  | S | Duty (W phase signal clearing) |  |
| 10 | Any feature that does not use TOUT10 | S |  | TOUT10: U phase output |
| 11 | One-phase PWM output | S | Dead time (U phase) | TOUT11: UB phase output |
| 12 | Any feature that does not use TOUT12 | S |  | TOUT12: V phase output |
| 13 | One-phase PWM output | S | Dead time (V phase) | TOUT13: VB phase output |
| 14 | Any feature that does not use TOUT14 | S |  | TOUT14: W phase output |
| 15 | One-phase PWM output | S | Dead time (W phase) | TOUT15: WB phase output |

Note: M: Master channel, S: Slave channel

## (2) Block Diagram

Note 1. SR flip-flop circuit
Note 2. For the connection destination, see Figure 36.25, Block Diagram: Motor Output Buffer Control.

Figure 36.24 Block Diagram: Three-Phase PWM Output with Dead Time

Note 1. Some of the bits defined as 0 in the PICOREG2n2 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

### 36.11.3.2 PICOHIZCENn - Hi-Z Output Control Register $\mathbf{n}(\mathrm{n}=0)$

The PICOHIZCENn register selects the Hi-Z output control input signal of TAPAn.

## Access: This register can be read or written in 8-bit units

Address: <PICO_base> + 80H
Value after reset: $\quad 00_{\vdash}$

Table 36.46 PICOHIZCENn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | PICOHIZCENn6 | Selects whether to enable or disable Hi-Z output control by the INTADCAOERR interrupt signal. <br> 0: Disable <br> 1: Enable |
| 5 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

| 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PICOHIZCENnO | Selects whether to enable or disable Hi-Z output control by the TAPAnESO pin input. <br> 0: Disable <br> 1: Enable |

### 36.11.4 Operation Example

This example shows how to generate each of the set signals and clear signals once or less per cycle and then use the results to output a three-phase PWM waveform with dead time.

This is achieved by combining the following TAUD features:

- PWM output
- One-phase PWM output

In addition, the following peripheral interconnections are used to create the PWM waveform supplied from the set and clear signals generated during PWM output to the input TINm signal ( $\mathrm{m}=11,13$, or 15 ) of one-phase PWM output:

- SR flip-flop circuit

Three-phase PWM output is achieved by assigning the one-phase PWM output with dead time achieved using the above features to the $\mathrm{U}, \mathrm{V}$, and W phases. Therefore, the set and clear signals of PWM output can be freely specified for each PWM phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

### 36.11.4.1 Pwm Output

PWM output uses a combination of $\mathrm{CH} 2, \mathrm{CH} 4$, and CH 5 .
By specifying the cycle for CDR02, the U phase set value for CDR04, and the U phase clear value for CDR05, a set/clear signal is generated for the SR flip-flop circuit that generates the input TIN11 signal of one-phase PWM output from INT04 and INT05.

Instead of CH4 and CH5, which are used for the above described U phase set/clear signal generation, the V phase uses CH6 and CH7, and the W phase uses CH8 and CH9.

### 36.11.4.2 One-Phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.
By specifying the dead time value for CDR11, a one-phase PWM signal with dead time is output for the TIN11 input.
Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM signal with dead time, while the W phase uses CH14 and CH15.

## CAUTION

Specify the same clock for each TAUDn channel that uses the PWM output and one-phase PWM output features.

For details about the TAUD functions, see Section 32, Timer Array Unit D (TAUD).

### 36.11.4.3 SR Flip-Flop Circuit

The PWM waveform supplied to input TIN11 of one-phase PWM output is generated by using the U phase set signal generated by CH4 of TAUD and the U phase clear signal generated by CH5.

Figure 36.26 SR Flip-Flop Circuit Operation Timing Chart (U phase example)
(1) When a signal is input to input S , output Q goes to the high level at the rising edge of S .
(2) When a signal is input to input $R$, output $Q$ goes to the low level at the rising edge of $R$.
(3) If a signal is input to input $S$ while output Q is at the high level, output Q is not affected.
(4) If a signal is input to input $R$ while output $Q$ is at the low level, output $Q$ is not affected.
(5) If a signal is input to input $S$ and input $R$ at the same time, input $R$ is prioritized and output $Q$ goes to the low level at the rising edge of R .

The V phase uses INT06 and INT07 as input to supply a PWM waveform to TIN13, and the W phase uses INT08 and INT09 as input to supply a PWM waveform to TIN15.

The output change timing of the PWM waveform generated during one-phase PWM output is based on PWM output.
The active level output timing set signal and inactive level output timing clear signal of PWM are generated during PWM output. By inputting these signals to the SR flip-flop circuit, a PWM signal that can be changed at any time is generated.
A one-phase PWM signal is output by generating a positive or negative PWM waveform and then adding dead time to it according to changes in the generated PWM signal.

PIC is used to set/clear signal generated during PWM output as the TIN input for one-phase PWM output through the SR flip-flop circuit.

Figure 36.27 Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time
Figure 36.27, Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time shows a typical example of three-phase PWM output with dead time.

By appropriately setting up the set/clear signal output timing, PWM output that extends across carrier cycles (point (1)) and other types of output are also possible.

In this example, ADCA0TRG0 and ADCA0TRG1 (which are at the bottom) use the CNT and INT signals of CH10 and CH12, which are not used for one-phase PWM output, and the A/D trigger signal is output by performing type-1 A/D trigger output.

In this way, because only the TOUTm signal that performs signal output for the channel performing positive phase output is used during one-phase PWM output, any feature that uses CNTm, CDRm, or INTm can be specified. For details, see Section 32, Timer Array Unit D (TAUD) (m = 10, 12, or 14).

The following figures show timing charts for outputting a three-phase PWM signal with dead time.

Figure 36.28 Example of One-Phase PWM (U phase, UB phase) Output with Dead Time

An operation example of the timer configuration for performing the $U$ phase PWM output in Figure 36.28, Example of One-Phase PWM (U phase, UB phase) Output with Dead Time is provided below.
(1) By simultaneously starting timers, CH2 (the carrier cycle timer), CH 4 (the U phase set signal output timing timer), and CH5 (the U phase clear signal output timing timer) are started simultaneously.
The CH11 timer is also enabled, but until a TIN11 edge is detected, which is the count start timing, counting is not performed.
(2) For CH4 and CH5, when there is a CH2 underflow, the settings from CDR04 and CDR05 are reloaded to CNT04 and CNT05.
(3) When there is a CH4 underflow, the U phase set timing signal (INT04) is generated.
(4) When there is a CH5 underflow, the U phase clear timing signal (INT05) is generated.
(5) The peripheral interconnections supply the output of the SR flip-flop circuit that uses INT04 (the set timing signal) and INT05 (the clear timing signal) as input to the input TIN11 signal of one-phase PWM output.
(6) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

Figure 36.29 Example of One-Phase PWM (V phase, VB phase) Output with Dead Time

An operation example of the timer configuration for performing the $V$ phase PWM output in Figure 36.29, Example of One-Phase PWM (V phase, VB phase) Output with Dead Time is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.
(1) If the setting of CH7 (the V phase clear signal output timing timer), which generates the V phase clear timing signal (INT07), is greater than the CH2 (the carrier cycle timer) setting.
(2) Before a V phase clear timing signal (INT07) is generated by a CH 7 underflow, a CH 2 (carrier cycle timer) underflow occurs, and the CH7 setting is reloaded.
(3) It causes the V phase clear timing signal (INT07) not to be generated, resulting in consecutive generation of the V phase set timing signal (INT06).
(4) In this case, because the V phase set timing signal (INT06) is ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform. Therefore, a PWM waveform that extends across carrier cycles is output.
(5) The PWM output is changed at the timing of the next V phase clear timing signal (INT07).

Figure 36.30 Example of One-Phase PWM (W phase, WB phase) Output with Dead Time

An operation example of the timer configuration for performing the W phase PWM output in Figure 36.30, Example of One-Phase PWM (W phase, WB phase) Output with Dead Time is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.
(1) If the setting of CH9 (the W phase clear signal output timing timer), which generates the W phase clear timing signal (INT09), is less than the CH8 (the W phase set signal output timing timer) setting.
(2) Before a W phase set timing signal (INT08) is generated by a CH8 underflow, a CH9 (W phase clear signal output timing timer) underflow occurs, and the W phase clear timing signal (INT09) is generated.
(3) This results in consecutive W phase clear timing signals (INT09) being generated.
(4) In this case, because the consecutively generated W phase clear timing signals (INT09) are ignored by the SR flipflop circuit, there is no effect on the PWM output waveform.
(5) The PWM output is changed at the timing of the next W phase set timing signal (INT08).

### 36.11.5 Setup Flow

Figure 36.31 Setup Flow (Active High Example)

Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.
Note 3. If initialization processing is not performed, the SR flip-flop circuit enters the timer-stopped state, and the timer restart output pulse might be output at an unintended level.

Figure 36.32 Setup Flow (Active High Example) (continued)

### 36.11.6 Setting Examples for Operation Functions

This section provides example settings for each register.

### 36.11.6.1 TAUDn Settings (Active High Example)

Table 36.47 TAUDn: CH2-related (PWM Output Master Channel*1)

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMOR2 | 15,14 | TAUDnCKS[1:0] | Don't care*² | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 1 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 000 |  |
| 7,6 | TAUDnCOS[1:0] | 00 | Fixed to 0 |  |
|  | 5 |  | 0 |  |
| TAUDnCMUR2 | 1,0 | TAUDnMD[4:1] | 0000 |  |

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see Section 32, Timer Array Unit D (TAUD).

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.48 TAUDn: CH 4 to $\mathrm{CH} 9-r e l a t e d ~(P W M ~ O u t p u t ~ S l a v e ~ C h a n n e l * 1) ~(~ m ~=~ 4 ~ t o ~ 9) ~$

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnCMORm | 15, 14 | TAUDnCKS[1:0] | Any*2 | Operation clock setting |
|  | 13, 12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 100 |  |
|  | 7, 6 | TAUDnCOS[1:0] | 00 |  |
|  | 5 |  | 0 | Fixed to 0 |
|  | 4 to 1 | TAUDnMD[4:1] | 0100 |  |
|  | 0 | TAUDnMD0 | 1 |  |
| TAUDnCMURm | 1, 0 | TAUDnTIS[1:0] | 00 |  |

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE
For the TAUDnCMORm register used during PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).

Table 36.49 TAUDn: CH11, CH13, and CH15-related (One-phase PWM Output) ( $m=11,13$, or 15 )

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*1 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 001 |  |
|  | 7,6 | TAUDnCOS[1:0] | 00 | Fixed to 0 |
|  | 4 to 1 | TAUDnMD[4:1] | 0100 |  |
| TAUDnCMURm | 1,0 | TAUDnMD0 | 1 |  |

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE
For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. $\mathrm{CH} 10, \mathrm{CH} 12$, and CH 14 can be used with any feature that does not use TOUTm output (such as A/D trigger output). For details, see Section 32, Timer Array Unit D (TAUD).

Table 36.50 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTOE | 15 to 10 | TAUDnTOE15 to TAUDnTOE10 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 9 to 4 | TAUDnTOE09 to TAUDnTOE04 | 0 | These are fixed to 0 because TOUT09 to TOUT04 are not used. |
|  | 3 | TAUDnTOE03 | Don't care |  |
|  | 2 | TAUDnTOE02 | 0 | This is fixed to 0 because TOUT02 is not used. |
|  | 1, 0 | TAUDnTOE01 TAUDnTOE00 | Don't care |  |
| TAUDnTO | 15 to 10 | TAUDnTO15 to TAUDnTO10 | $0^{\star 1}$ | Output a low-level signal to TOUT15 to TOUT10. |
|  | 9 to 4 | TAUDnTO09 to TAUDnTO04 | 0 | Output a low-level signal to TOUT09 to TOUT04. |
|  | 3 | TAUDnTO03 | Don't care |  |
|  | 2 | TAUDnTO02 | 0 | Output a low-level signal to TOUT02. |
|  | 1, 0 | TAUDnTO01 | Don't care |  |
|  |  | TAUDnTO00 |  |  |
| TAUDnTOM | 15 to 4 | TAUDnTOM15 to TAUDnTOM04 | 1 | Synchronous operation mode |
|  | 3 | TAUDnTOM03 | Don't care |  |
|  | 2 | TAUDnTOM02 | 0 | Independent operation mode |
|  | 1, 0 | TAUDnTOM01 TAUDnTOM00 | Don't care |  |

Table 36.50 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTOC | 15 to 10 | TAUDnTOC15 to TAUDnTOC10 | 1 | Synchronous operation mode 2 |
|  | 9 to 4 | TAUDnTOC09 to TAUDnTOC04 | 0 | Synchronous operation mode 1 |
|  | 3 | TAUDnTOC03 | Don't care |  |
|  | 2 | TAUDnTOC02 | 0 | Operation mode 1 |
|  | 1, 0 | TAUDnTOC01 | Don't care |  |
|  |  | TAUDnTOC00 |  |  |
| TAUDnTOL | 15 to 4 | TAUDnTOL15 to TAUDnTOL04 | $0^{* 1}$ | Positive logic output (active high) |
|  | 3 | TAUDnTOL03 | Don't care |  |
|  | 2 | TAUDnTOL02 | 0 | Positive logic output (active high) |
|  | 1, 0 | TAUDnTOL01 | Don't care |  |
|  |  | TAUDnTOLO0 |  |  |
| TAUDnTDE | 15 to 10 | TAUDnTDE15 to TAUDnTDE10 | 1 | Enable dead time control.*2 |
|  | 9 to 4 | TAUDnTDE09 to TAUDnTDE04 | 0 | Disable dead time control. |
|  | 3 | TAUDnTDE03 | Don't care |  |
|  | 2 | TAUDnTDE02 | 0 | Disable dead time control. |
|  | 1, 0 | TAUDnTDE01 | Don't care |  |
|  |  | TAUDnTDE00 |  |  |
| TAUDnTDM | 15 to 10 | TAUDnTDM15 to TAUDnTDM10 | 1 | Output dead time upon detecting a TINm input edge at a lower odd channel. |
|  | 9 to 4 | TAUDnTDM09 to TAUDnTDM04 | 0 | Invalid because dead time control is disabled. |
|  | 3 | TAUDnTDM03 | Don't care |  |
|  | 2 | TAUDnTDM02 | 0 | Invalid because dead time control is disabled. |
|  | 1, 0 | TAUDnTDM01 | Don't care |  |
|  |  | TAUDnTDM00 |  |  |
| TAUDnTDL | 15 | TAUDnTDL15 | 1*1 | Dead time is in the negative segment of the W phase output |
|  | 14 | TAUDnTDL14 | 0*1 | Dead time is in the positive segment of the W phase output |
|  | 13 | TAUDnTDL13 | $1^{* 1}$ | Dead time is in the negative segment of the V phase output |
|  | 12 | TAUDnTDL12 | 0*1 | Dead time is in the positive segment of the V phase output |
|  | 11 | TAUDnTDL11 | $1^{* 1}$ | Dead time is in the negative segment of the $U$ phase output |
|  | 10 | TAUDnTDL10 | 0*1 | Dead time is in the positive segment of the $U$ phase output |
|  | 9 to 4 | TAUDnTDL09 to TAUDnTDL04 | 0 | Invalid because dead time control is disabled. |
|  | 3 | TAUDnTDL03 | Don't care |  |
|  | 2 | TAUDnTDL02 | $0$ | Invalid because dead time control is disabled. |

|  |  | TAUDnTDL00 |  |  |
| TAUDnTRE | 15 to 4 | TAUDnTRE15 to TAUDnTRE04 | 0 | Stop real-time output. |
|  | 3 | TAUDnTRE03 | Don't care |  |
|  | 2 | TAUDnTRE02 | 0 | Stop real-time output. |
|  | 1, 0 | TAUDnTRE01 <br> TAUDnTRE00 | Don't care |  |

Table 36.50 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTRO | 15 to 4 | TAUDnTRO15 to TAUDnTRO04 | 0 | Invalid because real-time output is disabled. |
|  | 3 | TAUDnTRO03 | Don't care |  |
|  | 2 | TAUDnTRO02 | 0 | Invalid because real-time output is disabled. |
|  | 1, 0 | TAUDnTRO01 | Don't care |  |
|  |  | TAUDnTRO00 |  |  |
| TAUDnTRC | 15 to 4 | TAUDnTRC15 to TAUDnTRC04 | 0 | Do not use this channel to generate the real-time output trigger. |
|  | 3 | TAUDnTRC03 | Don't care |  |
|  | 2 | TAUDnTRC02 | 0 | Do not use this channel to generate the real-time output trigger. |
|  | 1, 0 | TAUDnTRC01 | Don't care |  |
|  |  | TAUDnTRC00 |  |  |
| TAUDnTME | 15 to 4 | TAUDnTME15 to TAUDnTME04 | 0 | Disable modulation output for timer output and real-time output. |
|  | 3 | TAUDnTME03 | Don't care |  |
|  | 2 | TAUDnTME02 | 0 | Disable modulation output for timer output and real-time output. |
|  | 1, 0 | TAUDnTME01 TAUDnTME00 | Don't care |  |
| TAUDnRDE | 15 | TAUDnRDE15 | 0 | Disable simultaneous rewriting. |
|  | 14 | TAUDnRDE14 | Don't care |  |
|  | 13 | TAUDnRDE13 | 0 | Disable simultaneous rewriting. |
|  | 12 | TAUDnRDE12 | Don't care |  |
|  | 11 | TAUDnRDE11 | 0 | Disable simultaneous rewriting. |
|  | 10 | TAUDnRDE10 | Don't care |  |
|  | 9 to 4 | TAUDnRDE09 to TAUDnRDE04 | 1 | Enable simultaneous rewriting. |
|  | 3 | TAUDnRDE03 | Don't care |  |
|  | 2 | TAUDnRDE02 | 1 | Enable simultaneous rewriting. |
|  | 1, 0 | TAUDnRDE01 TAUDnRDE00 | Don't care |  |
| TAUDnRDS | 15 | TAUDnRDS15 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
|  | 14 | TAUDnRDS14 | Don't care |  |
|  | 13 | TAUDnRDS13 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
|  | 12 | TAUDnRDS12 | Don't care |  |
|  | 11 | TAUDnRDS11 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
|  | 10 | TAUDnRDS10 | Don't care |  |
|  | 9 to 4 | TAUDnRDS09 to TAUDnRDS04 | 0 | Enable simultaneous rewriting by using a master channel. |
|  | 3 | TAUDnRDS03 | Don't care |  |
|  | 2 | TAUDnRDS02 | $0$ | Enable simultaneous rewriting by using a master channel. |
|  | 1, 0 | TAUDnRDS01 <br> TAUDnRDS00 | Don't care |  |

Table 36.50 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnRDM | 15 | TAUDnRDM15 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 14 | TAUDnRDM14 | Don't care |  |
|  | 13 | TAUDnRDM13 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 12 | TAUDnRDM12 | Don't care |  |
|  | 11 | TAUDnRDM11 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 10 | TAUDnRDM10 | Don't care |  |
|  | 9 to 4 | TAUDnRDM09 to TAUDnRDM04 | 0 | Load the signal when the master channel starts counting. |
|  | 3 | TAUDnRDM03 | Don't care |  |
|  | 2 | TAUDnRDM02 | 0 | Load the signal when the master channel starts counting. |
|  | 1, 0 | TAUDnRDM01 | Don't care |  |
|  |  | TAUDnRDM00 |  |  |
| TAUDnRDC | 15 | TAUDnRDC15 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 14 | TAUDnRDC14 | Don't care |  |
|  | 13 | TAUDnRDC13 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 12 | TAUDnRDC12 | Don't care |  |
|  | 11 | TAUDnRDC11 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 10 | TAUDnRDC10 | Don't care |  |
|  | 9 to 4 | TAUDnRDC09 to TAUDnRDC04 | 0 | Do not use this channel to generate the simultaneous rewrite trigger. |
|  | 3 | TAUDnRDC03 | Don't care |  |
|  | 2 | TAUDnRDC02 | 1 | Do not use this channel to generate the simultaneous rewrite trigger. |
|  | 1, 0 | TAUDnRDC01 TAUDnRDC00 | Don't care |  |

Note 1. Change the setting according to the used system.
Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see Section 32, Timer Array Unit D (TAUD).

### 36.11.6.2 PIC Settings

Table 36.51 PIC Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| PICOREG2n2 | 27 | PICOREG2n227 | 1 | Select the input selected by the PIC0REG2n204 bit. |
|  | 23 | PICOREG2n223 | 1 | Select the input selected by the PICOREG2n203 bit. |
|  | 19 | PICOREG2n219 | 1 | Select the input selected by the PIC0REG2n202 bit. |
|  | 3 | PICOREG2n204 | 1 | Select the set/clear output according to INTTAUDnI8 and <br> INTTAUDnI9. |

### 36.12 High-accuracy Triangle PWM Output with Dead Time

### 36.12.1 Functional Overview

Compared to the triangle PWM output with dead time of TAUD, this makes it possible to control the variable dead time areas near duties of $100 \%$ and $0 \%$. This makes more accurate triangle PWM output possible.

For the triangle PWM output with dead time feature of TAUD, it is not possible to output a UB phase dead time pulse, such as when transitioning to U phase $0 \%$ triangular wave output. (See Figure 36.33, Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time)

For this feature, a pulse is generated in combination with the TAUD timer output, and a pseudo dead time pulse is added.

Figure 36.33 Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time

### 36.12.2 Configuration

The unit and channel configuration for this feature is shown below. $(\mathrm{n}=0)$
Table 36.52 Configuration of Delay Pulse Output with Dead Time

| Timer | Timer Motor Control Function |
| :--- | :--- |
| TAUD0 CH2, CH4 to CH15 (used channels fixed) | TAPA0 |

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm $\rightarrow$ INTTAUDnIm (TAUDn channel m interrupt)
- TINm $\rightarrow$ TAUDTTINm (TAUDn channel minput)
- TOUTm $\rightarrow$ TAUDTTOUTm (TAUDn channel m output)
- $\mathrm{CDRm} \rightarrow$ TAUDnCDRm (TAUDn channel $m$ data register)
- $\mathrm{CNTm} \rightarrow$ TAUDnCNTm (TAUDn channel $m$ counter register)

## (1) TAUDn Configuration

Table 36.53 TAUD Configuration

| CH | Function Name | M/S*1 | CDR Setting | Description |
| :---: | :---: | :---: | :---: | :---: |
| 2 | Triangle PWM output with dead time ( CH 2 is the master channel for CH 4 to CH 9 .) | M | Cycle |  |
| 4 |  | S | Duty (U phase) |  |
| 5 |  | S | Dead time (U phase) |  |
| 6 |  | S | Duty (V phase) |  |
| 7 |  | S | Dead time (V phase) |  |
| 8 |  | S | Duty (W phase) |  |
| 9 |  | S | Dead time (W phase) |  |
| 10 | One-shot pulse output | M | Delay | Generate the pulse to be inserted into the variable dead time area for U phase PWM. |
| 11 |  | S | Pulse width |  |
| 12 | One-shot pulse output | M | Delay | Generate the pulse to be inserted into the variable dead time area for V phase PWM. |
| 13 |  | S | Pulse width |  |
| 14 | One-shot pulse output | M | Delay | Generate the pulse to be inserted into the variable dead time area for W phase PWM. |
| 15 |  | S | Pulse width |  |

Note 1. M: Master channel, S: Slave channel

### 36.12.3 Registers

### 36.12.3.1 PICOREG2n0 - Timer I/O Control Register 2n0 ( $\mathrm{n}=0$ )

This register selects TAUDn input.

Table 36.54 PICOREG2n0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | Reserved | $* 1$ |
| 18 | PICOREG2n018 | Select the TIN input signal to TAUDTTIN10, TAUDTTIN12, and TAUDTTIN14. |
|  |  | $0:$ Setting prohibited |
|  |  | 1: Select TAUDTTOUT2. |
| 17 to 0 | Reserved | $* 1$ |

Note 1. Some of the bits defined as 0 in the PICOREG2n0 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

### 36.12.3.2 PICOREG2n1 - Timer I/O Control Register 2n1 $(\mathrm{n}=0)$

This register selects the logic of a combination circuit.

### 36.12.4 Operation Example

This is achieved by combining the following TAUD features:

- Triangle PWM output with dead time
- One-shot pulse output

In addition, the following PIC is also used because the pulse to be inserted into the variable dead time area is generated for the positive or negative phase:

- Combination circuit (PFN001, PFN023, and PFN045)

In addition, the following peripheral interconnections are also used because the pulse to be inserted into the variable dead time area is combined with the triangle PWM output waveform:

- Logical operation circuit (FN0i) (i=0 to 5)

A high-accuracy triangle PWM signal with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

### 36.12.4.1 Triangle PWM Output with Dead Time

A triangle PWM signal with dead time is output from TOUT04 and TOUT05 by using CH2, CH4, and CH5 in combination.

### 36.12.4.2 One-shot Pulse Output

A CDR11 pulse for which the width is delayed by the delay time (CDR10) from the valid edge of the TIN10 (TOUT02) signal of CH10 is output as TOUT11 by using CH10 and CH11 in combination.

This pulse is used as the variable dead time area pulse used near duties of $100 \%$ and $0 \%$.

## CAUTION

Specify each CDR setting for one-shot pulse output such that the following condition is satisfied: CDR05 $\geq$ (CDR10 + CDR11)
If a value that does not satisfy the above condition is specified, the output waveform might be affected. To minimize this effect, in addition to satisfying the above setting condition, leave CDR11 set to $000 \mathrm{H}_{\mathrm{H}}$ until the variable dead time area pulse is required.
Detect both rising and falling edges as the valid TIN10 (TOUT02) edge, and set TAUDnTOL11 to 1 (active low). Specify the same operation clock for each TAUDn channel used for outputting a triangle PWM signal with dead time or a one-shot pulse.

For details about the TAUD functions, see Section 32, Timer Array Unit D (TAUD).

### 36.12.4.3 U phase Combination Circuit (PFN001)

This circuit generates a variable dead time area pulse (FN00 A, FN01 A) for adding a generated one-shot pulse to a generated triangle PWM signal with dead time.

Figure 36.35 Block Diagram Excerpt (PFNOO1, FNOO, and FNO1)

The table below shows the relationships between combination circuit input (UIN, U2) and output (UO1, UO2).
Table 36.59 U and UB Phase Combination Circuit (PFN001) I/O Table

- UO1 (U phase variable dead time area pulse) output

|  |  | UO1 |  |
| :--- | :--- | :--- | :--- |
| UIN <br> (TOUTO2) | U2 <br> (TOUT11) | PICOREG2n117, 16 $=10_{\mathrm{B}}$ <br> U phase output active high <br> (TAUDnTOL04 $=0$ ) | PICOREG2n117, 16 $=11_{\mathrm{B}}$ <br> U phase output active low <br> (TAUDnTOL04 = 1) |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 1 |
| 1 | 1 | 1 | 0 |

- UO2 (UB phase variable dead time area pulse) output

|  |  | UO2 |  |
| :--- | :--- | :--- | :--- |
| UIN <br> (TOUT02) | U2 <br> (TOUT11) | PICOREG2n119, 18 $=10_{B}$ <br> UB phase output active high <br> (TAUDnTOLO5 $=0)$ | PICOREG2n119, 18 $=11_{B}$ <br> UB phase output active low <br> (TAUDnTOLO5 $=1)$ |
| 0 | 0 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 0 |
| NOTE |  |  |  |

The PICOREG2n116, PICOREG2n117, PICOREG2n118, and PICOREG2n119 settings change depending on the active $U$ phase and UB phase levels of the generated triangle PWM signal with dead time.

### 36.12.4.4 Logical Operation Circuit (FNOi) (i=0 or 1)

This circuit combines an output triangle PWM signal with dead time (TOUT04, TOUT05) with combination circuit output (UO1 and UO2 of PFN001) and generates a PWM signal to which a variable dead time area pulse has been added.

The combination logic for the logical operation circuit is switched according to the PIC0REG2n3 register setting. (Bits 0 to 2 are specified for $U$ phase output, and bits 4 to 6 are specified for UB phase output.)
Set up the logical operation circuit as shown in the table below. The combined signal is output from the TAPAnUP and TAPAnUM pins according to the specified combination logic.

Table 36.60 Logical Operation Circuit (FNOi) (i=0 or 1) Settings and TAPAnUP and TAPAnUM Pin Output

- U phase output (TOUT04)

| Active Level | PICOREG2n302 to 00 | TAPAnUP Pin Output Waveform |
| :--- | :--- | :--- |
| Active high <br> (TAUDnTOL04 $=0)$ | $100_{B}$ | AND of FN00 B (TOUT04) and FN00 A (UO1) |
| Active low <br> $($ TAUDnTOL04 $=1)$ | $101_{B}$ | OR of FN00 B (TOUT04) and FN00 A (UO1) |

- UB phase output (TOUT05)

| Active Level | PIC0REG2n306 to 04 | TAPAnUM Pin Output |
| :--- | :--- | :--- |
| Active high <br> $($ TAUDnTOL05 $=0)$ | $100_{\mathrm{B}}$ | AND of FN01 B (TOUT05) and FN01 A (UO2) |
| Active low <br> $($ TAUDNTOL05 $=1)$ | $101_{\mathrm{B}}$ | OR of FNO1 B (TOUT05) and FN01 A (UO2) |

Because the above makes variable dead time control possible to ensure output accuracy near duties of 0\% and 100\% even for TAUD, a more accurate triangle PWM signal can be output than that output using the TAUD feature for outputting a triangle PWM signal with dead time.
For the V/VB phase and W/WB phase, the used channels and register bits differ, but the settings are the same, as shown in Figure 36.34, Block Diagram: High-Accuracy Triangle PWM Output with Dead Time.
The peripheral interconnections provide a connection for adding the pulse generated during one-shot pulse output to the PWM signal generated during output of a triangle PWM signal with dead time by using the combination circuit and logical operation circuit of the peripheral interconnections.
The following figures show timing charts for outputting a high-accuracy triangle PWM signal with dead time.

Note 1. The variable dead time area pulse uses a sawtooth wave and is therefore expanded on one side, unlike a pulse that uses a triangle wave, which is expanded on both sides.

Note 2. Because the variable dead time area pulse is expanded on one side, the length of the one-phase PWM output cycle for the variable dead time area increases by $1 / 2$ the added variable dead time area pulse width.

Figure 36.36 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0\%, UB Phase: 100\%) (when TAUDnTOL04 $=0$ (Active High) and TAUDnTOL05 $=0$ (Active High))

An operation example in which the system transitions to a $U$ phase of $0 \%$ and UB phase of $100 \%$ in the timer configuration for performing the U phase PWM output shown in Figure 36.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0\%, UB Phase: 100\%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = $\mathbf{0}$ (Active High)) is provided below. Output of a triangle PWM signal with dead time is active high.
(1) When timer operation is started, output of a triangle PWM with dead time is started by the CH2, CH4, and CH5 channels of TAUDn.
(2) A triangle PWM waveform with dead time is generated from TOUT04 and TOUT05.
(3) A U phase duty output value of $0 \%$ is specified for CDR04.
(4) Due to the setting in (3), TOUT04 output is the inactive level, and TOUT05 output is the active level. However, no variable dead time area pulse is output during this operation.
(5) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 when specifying the $0 \%$ U phase duty in (3).
For this example, the CDR11 setting is fixed to $0000_{\mathrm{H}}$ until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.
(6) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.
(7) The pulse output in (6) is converted to a variable dead time area pulse for the $U$ phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).
(8) The pulse generated in (7) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).
(9) By later changing the CDR11 setting, which specifies the width of the variable dead time area pulse, the desired variable dead time area pulse can be added.

Figure 36.37 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100\%, UB Phase: 0\%) (when TAUDnTOLO4 $=0$ (Active High) and TAUDnTOL05 $=0$ (Active High))

An operation example in which the system transitions to a $U$ phase of $100 \%$ and UB phase of $0 \%$ in the timer configuration for performing the U phase PWM output shown in Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100\%, UB Phase: 0\%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = $\mathbf{0}$ (Active High)) is provided below. Output of a triangle PWM signal with dead time is active high.
(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same.
(2) A U phase duty output value of $100 \%\left(C D R 04=0000_{\mathrm{H}}\right)$ is specified for CDR04.
(3) Due to the setting in (2), TOUT04 output is the active level, and TOUT05 output is the inactive level. However, no variable dead time area pulse is output during this operation.
(4) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 one cycle after specifying the $100 \%$ U phase duty setting in (2).
For this example, the CDR11 setting is fixed to $0000_{\mathrm{H}}$ until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.
(5) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.
(6) The pulse output in (5) is converted to a variable dead time area pulse for the $U$ phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).
(7) The pulse generated in (6) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

## CAUTION

If the $100 \% U$ phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the variable dead time area pulse is affected by the amount shown by (2) for the last PWM signal output from TOUT04 and shown by feature specification (1), as shown in Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100\%, UB Phase: 0\%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 $=0$ (Active High)).
To cancel this effect, the CDR11 setting is delayed one cycle.

Figure 36.38 Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse

Figure 36.39 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100\%, UB Phase: 0\%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))

An operation example in which the system transitions to a $U$ phase of $100 \%$ and UB phase of $0 \%$ in the timer configuration for performing the U phase PWM output shown in Figure 36.39, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100\%, UB Phase: 0\%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = $\mathbf{1}$ (Active Low)) is provided below. Output of a triangle PWM signal with dead time is active low.
(1) The timer operation from the start of timer operation until the output of a triangle PWM with dead time is the same as in Figure 36.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0\%, UB Phase: 100\%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High)). However, an active low PWM signal is output from TOUT04 and TOUT05.
(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the $U$ phase (FN00 A) and UB phase (FN01 A).
(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

Figure 36.40 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0\%, UB Phase: 100\%) (when TAUDnTOL04 $=0$ (Active Low) and TAUDnTOL05 $=0$ (Active Low))

An operation example in which the system transitions to a $U$ phase of $0 \%$ and UB phase of $100 \%$ in the timer configuration for performing the U phase PWM output shown in Figure 36.40, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0\%, UB Phase: 100\%) (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOLO5 = $\mathbf{0}$ (Active Low)) is provided below. Output of a triangle PWM signal with dead time is active low.
(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same as in Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100\%, UB Phase: 0\%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High)). However, an active low PWM signal is output.
(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).
(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

## CAUTION

If the $100 \% \cup$ phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the last PWM signal output from TOUT04 is adversely affected due to the feature specifications.
To cancel this effect, the CDR11 setting is delayed one cycle.
For details, see Figure 36.38, Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse

### 36.12.5 Setup Flow

> | One-shot pulse output channel register settings |  |
| :--- | :--- |
| Master channel (delay) $(\mathrm{CH} 10, \mathrm{CH} 12, \mathrm{CH} 14)$ settings |  |
| TAUDnCDRm register | $\leftarrow \mathrm{xxxx}_{\mathrm{H}}$ (carrier cycle) |
| TAUDnCMORm register | $\leftarrow \mathrm{xx00100100001000}_{\mathrm{B}}$ |
| TAUDnCMURm register | $\leftarrow 00000010_{\mathrm{B}}$ |
| Slave channel 2 (pulse) $(\mathrm{CH} 11, \mathrm{CH} 13, \mathrm{CH} 15$ ) settings |  |
| TAUDnCDRm register | $\leftarrow \mathrm{xxxx}_{\mathrm{H}}$ (variable dead time |
|  | area pulse width) |
|  | $\leftarrow \mathrm{xx00} 010000010100_{\mathrm{B}}$ |
| TAUDnCMORm register | $\leftarrow 00000000_{\mathrm{B}}$ |

Note 1. Change settings according to the active level of the PWM signal to be output.

Figure 36.41 Setup Flow (Active High Example)

Page 3668 of 4535

Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 36.42 Setup Flow (Active High Example) (continued)

### 36.12.6 Setting Examples for Operation Functions

This section provides example settings for each register.

### 36.12.6.1 TAUDn Settings (active high example)

Table 36.61 TAUDn: CH2-related (Master Channel Used To Output A Triangle PWM Signal with Dead Time*1)

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMOR2 | 15,14 | TAUDnCKS[1:0] | Don't care*² | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 1 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 000 |  |
| 7,6 | TAUDnCOS[1:0] | 00 |  |  |
| TAUDnCMUR2 | 1,0 |  | 0 | At the start of operation, output INTm and toggle TOUTm. |

Note 1. The master channel and slave channel names are defined for TAUD triangle PWM output with dead time. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE
For the TAUDnCMORm register of the master channel used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).
For this feature, set TAUDnMD0 to 1.

Table 36.62 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Triangle PWM Signal with Dead Time ${ }^{\star 1}$ ) $(\mathrm{m}=4,6$, or 8 )

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*² | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 111 |  |
| 7,6 | TAUDnCOS[1:0] | 00 |  |  |
|  | 5 |  | 0 |  |
| TAUDnCMURm | 1,0 | ta 1 | TAUDnMD[4:1] | 1001 |

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.63 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Triangle PWM Signal with Dead Time ${ }^{\star 1}$ ) $(\mathrm{m}=5,7$, or 9$)$

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 110 |  |
|  | 7,6 | TAUDnCOS[1:0] | 00 |  |
|  | 5 |  | 0 |  |
| TAUDnCMURm | 1,0 | TAUDnMD[4:1] | 0100 |  |

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3 , which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.64 TAUDn: CH10, CH12, and CH14-related (Master Channel used to Output a One-shot Pulse*1) ( $\mathrm{m}=10$, 12, or 14)

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 1 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 001 |  |
|  | 7,6 | TAUDnCOS[1:0] | 00 |  |
|  | 4 to 1 | TAUDnMD[4:1] | 0100 | Disable start triggers during counting. |
| TAUDnCMURm | 1,0 | TAUDnMD0 | 0 | Detect both rising and falling edges as valid. |

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.65 TAUDn: $\mathrm{CH} 11, \mathrm{CH} 13$, and $\mathrm{CH} 15-$ related (Slave Channel used to Output a One-Shot Pulse ${ }^{\star 1}$ ) $(\mathrm{m}=11$, 13, or 15)

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 100 |  |
|  | 7,6 | TAUDnCOS[1:0] | 00 |  |
|  | 5 |  | 0 | TASable start triggers during counting. |
|  | Th to 1 | TAUDNMD[4:1] | 1010 |  |

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel. Specify the same clock setting as for the master channel $(\mathrm{CH} 2)$ used to output a triangle PWM signal with dead time.

## NOTE

For the TAUDnCMORm register used during one-shot pulse output, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMDO can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).
For this feature clear TAUDnMDO to 0 .

Table 36.66 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTOE | 15 | TAUDnTOE15 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 14 | TAUDnTOE14 | 0 |  |
|  | 13 | TAUDnTOE13 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 12 | TAUDnTOE12 | 0 |  |
|  | 11 | TAUDnTOE11 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 10 | TAUDnTOE10 | 0 |  |
|  | 9 to 4 | TAUDnTOE09 to | 0 | Disable the timer. |
|  |  | TAUDnTOE04 | 1 | Enable the timer. |
|  | 3 | TAUDnTOE03 | Don't care |  |
|  | 2 | TAUDnTOE02 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 1, 0 | TAUDnTOE01 | Don't care |  |
|  |  | TAUDnTOE00 |  |  |

| Table 36.66 Common TAUDn Channel Settings |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Register | Bit Position | Bit Name | Setting | Remark |
| TAUDnTO | 15 | TAUDnTO15 | $1^{* 1}$ | Output a high-level signal to TOUT15. |

| TAUDnTDM | 15 to 9 | TAUDnTDM15 to TAUDnTDM09 | 0 |  |
|  | 3 | TAUDnTDM03 | Don't care |  |
|  | 2 | TAUDnTDM02 | 0 | Invalid because dead time control is disabled. |
|  | 1, 0 | TAUDnTDM01 | Don't care |  |
|  |  | TAUDnTDM00 |  |  |
| TAUDnTDL | 15 to 10 | TAUDnTDL15 to TAUDnTDL10 | 0 | Invalid because dead time control is disabled. |
|  | 9 | TAUDnTDL09 | $1^{\text {*1 }}$ | Dead time is in the negative segment of the W phase output |
|  | 8 | TAUDnTDL08 | $0^{\star 1}$ | Dead time is in the positive segment of the W phase output |
|  | 7 | TAUDnTDL07 | $1^{* 1}$ | Dead time is in the negative segment of the V phase output |
|  | 6 | TAUDnTDL06 | $0^{\star 1}$ | Dead time is in the positive segment of the V phase output |
|  | 5 | TAUDnTDL05 | $1^{* 1}$ | Dead time is in the negative segment of the $U$ phase output |
|  | 4 | TAUDnTDL04 | 0*1 | Dead time is in the positive segment of the $U$ phase output |
|  | 3 | TAUDnTDL03 | Don't care |  |
|  | 2 | TAUDnTDL02 | 0 | Invalid because dead time control is disabled. |
|  | 1,0 | TAUDnTDL01 | Don't care |  |
|  |  | TAUDnTDL00 |  |  |
| TAUDnTRE | 15 to 4 | TAUDnTRE15 to TAUDnTRE04 | 0 | Disable real-time output. |
|  | 3 | TAUDnTRE03 | Don't care |  |
|  | 2 | TAUDnTRE02 | 0 | Disable real-time output. |
|  | 1, 0 | TAUDnTRE01 | Don't care |  |
|  |  | TAUDnTRE00 |  |  |
| TAUDnTRO | 15 to 4 | TAUDnTRO15 to TAUDnTRO04 | 0 | Invalid because real-time output is disabled. |
|  | 3 | TAUDnTRO03 | Don't care |  |
|  | 2 | TAUDnTRO02 | $0$ | Invalid because real-time output is disabled. |
|  | 1, 0 | TAUDnTRO01 TAUDnTROOO | Don't care |  |

Table 36.66 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnTRC | 15 to 4 | TAUDnTRC15 to <br> TAUDnTRC04 | 0 | Do not use this channel to generate the real-time output <br> trigger. |
|  |  |  | TAUDnTRC03 | Don't care |

## Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see Section 32, Timer Array Unit D (TAUD).

### 36.12.6.2 PIC Settings (Active High Example)

Table 36.67 PIC Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| PICOREG2n0 | 18 | PICOREG2n018 | 1 | Select the TOUT signal of CH 2 of TAUDn. |

### 36.13 Delay Pulse Output with Dead Time

### 36.13.1 Functional Overview

This feature outputs a three-phase PWM with dead time that is later than the cycle timing by an amount equal to the delay amount.

Unlike the function of three-phase PWM output with dead time, a PWM signal that has a reset in the next cycle can be output.

### 36.13.2 Configuration

The unit and channel configuration for this feature is shown below. ( $\mathrm{n}=0, \mathrm{~m}=0$ to 15 )
Table 36.68 Configuration of Delay Pulse Output with Dead Time

| Timer | Timer Motor Control Function |
| :--- | :--- |
| TAUD0 CH2 to CH15 (used channels fixed) | TAPA0 |

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm $\rightarrow$ INTTAUDnIm (TAUDn channel m interrupt)
- $\mathrm{TINm} \rightarrow$ TAUDTTINm (TAUDn channel m input)
- TOUTm $\rightarrow$ TAUDTTOUTm (TAUDn channel m output)
- $\mathrm{CDRm} \rightarrow$ TAUDnCDRm (TAUDn channel $m$ data register)
- $\mathrm{CNTm} \rightarrow$ TAUDnCNTm (TAUDn channel $m$ counter register)

### 36.13.2.1 TAUDn Configuration

Because the CDRm value of CH3 does not affect TOUT0 to TOUT15, the INTm signal of CH3 can also be used for other purposes such as $\mathrm{A} / \mathrm{D}$ conversion trigger generation.

Table 36.69 TAUDn configuration

| CH | Function Name | $\mathrm{M} / \mathrm{S}^{* 1}$ | CDR Setting | Description |
| :---: | :---: | :---: | :---: | :---: |
| 2 | Delay pulse output function <br> ( CH 2 is the master channel for CH 3 to CH 9 .) | M | Cycle |  |
| 3 |  | S |  | Reserved |
| 4 |  | S | Delay (U phase) |  |
| 5 |  | S | Pulse width (U phase) |  |
| 6 |  | S | Delay (V phase) |  |
| 7 |  | S | Pulse width (V phase) |  |
| 8 |  | S | Delay (W phase) |  |
| 9 |  | S | Pulse width (W phase) |  |
| 10 | Any feature that does not use TOUTm | S |  | TOUT: U phase output |
| 11 | One-phase PWM output | S | Dead time (U phase) | TOUT: UB phase output |
| 12 | Any feature that does not use TOUTm | S |  | TOUT: V phase output |
| 13 | One-phase PWM output | S | Dead time (V phase) | TOUT: VB phase output |
| 14 | Any feature that does not use TOUTm | S |  | TOUT: W phase output |
| 15 | One-phase PWM output | S | Dead time (W phase) | TOUT: WB phase output |

Note 1. M: Master channel, S: Slave channel

Figure 36.43 Block Diagram: Delay Pulse Output with Dead Time

### 36.13.3 Registers

### 36.13.3.1 PICOREG2n2 - Timer I/O Control Register 2n2 ( $\mathrm{n}=0$ )

This register selects CHm input signals of the TAUDn timer. This section describes the bits to be used in the delay pulse output with dead time.

Table 36.70 PICOREG2n2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | Reserved | *1 |
| 27 | PICOREG2n227 | Select the TIN input signal to TAUDTTIN15. |
|  |  | PICOREG2n227 Input Signal |
|  |  | 1 Signal selected by the PICOREG2n204 bit |
|  |  | Other than above Setting prohibited |
| 26 to 24 | Reserved | *1 |
| 23 | PICOREG2n223 | Select the TIN input signal to TAUDTTIN13. |
|  |  | PICOREG2n223 Input Signal |
|  |  | 1 Signal selected by the PICOREG2n203 bit |
|  |  | Other than above Setting prohibited |
| 22 to 20 | Reserved | *1 |
| 19 | PICOREG2n219 | Select the TIN input signal to TAUDTTIN11. |
|  |  | PICOREG2n219 Input Signal |
|  |  | 1 Signal selected by the PICOREG2n202 bit |
|  |  | Other than above Setting prohibited |
| 18 to 5 | Reserved | *1 |
| 4 | PICOREG2n204 | Select the signal supplied to TAUDTTIN15. <br> 0: Select TAUDTTOUT9. <br> 1: Setting prohibited |
| 3 | PICOREG2n203 | Select the signal supplied to TAUDTTIN13. <br> 0: Select TAUDTTOUT7. <br> 1: Setting prohibited |

Table 36.70 PICOREG2n2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 2 | PICOREG2n202 | Select the signal supplied to TAUDTTIN11. |
|  |  | $0:$ Select TAUDTTOUT5. |
|  | 1: Setting prohibited |  |
| 1,0 | Reserved | $\star 1$ |

Note 1. Some of the bits defined as 0 in the PICOREG2n2 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

### 36.13.3.2 PICOHIZCENn - Hi-Z Output Control Register $\mathbf{n}(\mathbf{n}=0)$

This register selects the Hi-Z output control input signal of TAPAn.

Access: This register can be read or written in 8-bit units.
Address: PICOHIZCENO: FFDD 0080 ${ }_{\text {H }}$
Value after reset: $\quad 00_{H}$

| Bit | 7 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | PICOHIZCENn6 | - | - | - | PICOHIZCENn2 | - | PICOHIZCENnO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R | R/W | R | R/w |

Table 36.71 PICOHIZCENn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | PICOHIZCENn6 | Select whether to enable or disable Hi-Z output control by the INTADCAOERR interrupt signal. <br> 0: Disable <br> 1: Enable |
| 5 to 3 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | PICOHIZCENn2 | RH850/F1KH-D8 <br> Selects whether to enable or disable Hi-Z output control by the WDTA1NMI and the WDTA2NMI interrupt signal. |

0: Disable
1: Enable
RH850/F1KM-S4, RH850/F1KM-S1
Select whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal.
0: Disable
1: Enable

| 1 | Reserved | When read, the value after reset is returned. <br> When writing, write the value after reset. |
| :--- | :--- | :--- |
| 0 | PICOHIZCENn0 | Select whether to enable or disable Hi-Z output control by the TAPAnESO pin input. |
|  | 0: Disable |  |
|  | 1: Enable |  |

### 36.13.4 Operation Example

This is achieved by combining the following TAUD features:

- Delay pulse output function
- One-phase PWM output

The delay pulse output feature generates a PWM signal that is later than the cycle timing by an amount equal to the delay amount. Next, a one-phase PWM signal to which dead time has been added is output for the delayed PWM signal by one-phase PWM output feature.

A delay pulse with dead time is output by assigning the PWM output achieved using the above features to the $\mathrm{U}, \mathrm{V}$, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference between phases is the assigned channel, only one phase (the U phase) is described below.

### 36.13.4.1 Delay Pulse Output Function

By using a combination of CH 2 , CH 4 , and CH 5 , a basic PWM signal for one-phase PWM is output from TOUT05 delayed by the amount specified by CH 4 with respect to the cycle specified by CH2.

Note that CH3 is a reserved timer for achieving this feature, so do not use it for other features.

## CAUTION

Do not specify a delay amount that exceeds the cycle.

### 36.13.4.2 One-phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.
By specifying the dead time value for CDR11, a one-phase PWM with dead time is output for the TIN11 input.
Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM with dead time, while the W phase uses CH14 and CH15.

## CAUTION

Specify the same clock for each TAUDn channel that uses the delay pulse output and one-phase PWM output features.

For details about the TAUD functions, see Section 32, Timer Array Unit D (TAUD).

The differences between the delay pulse output with dead time and the three-phase PWM output with dead time are described below.

Figure 36.44 PWM Output by Outputting a Delay Pulse with Dead Time

In Figure 36.44, PWM Output by Outputting a Delay Pulse with Dead Time, PWM waveform A is supposed to be output before cycle A ends, but because the delay timing is too long, the PWM clear position is after the end of cycle A. Next, PWM waveform B, which is for cycle B, is output.

The operations shown below occur when an attempt is made to achieve the operations shown in Figure 36.44, PWM Output by Outputting a Delay Pulse with Dead Time by the three-phase PWM output with dead time.

Figure 36.45 Output of a Three-Phase PWM Signal with Dead Time (1)

Figure 36.45, Output of a Three-Phase PWM Signal with Dead Time (1) shows an example in which the output PWM signal does not end before carrier cycle A because the set timing for outputting a three-phase PWM signal with dead time is delayed and the clear timing is after the end of the carrier cycle.

For cycle A, the set timing of PWM waveform A is the same as that in the figure on the previous page, but because the clear timing is after the end of cycle A, a reload operation occurs in cycle A before PWM waveform A is cleared, and the clear timing for PWM waveform A does not occur.

In addition, the set timing of PWM waveform B for cycle B is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle B , and a waveform that combines PWM waveform A and PWM waveform $B$ is output.

Figure 36.46 Output of a Three-Phase PWM Signal with Dead Time (2)

Figure 36.46, Output of a Three-Phase PWM Signal with Dead Time (2) shows an example of outputting a three-phase PWM signal with dead time in which counter operation for which the clear timing is longer than cycle $A$ is continued in cycle B, and PWM output A is cleared at the beginning of cycle B.

The output of PWM waveform A for cycle A is the same as the output of a delay pulse with dead time, but because the clear timing is used at the beginning of cycle B, the clear timing of PWM output B, which is supposed to be output during cycle B , does not occur.
In addition, the set timing of PWM waveform C for cycle C is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle C , and a waveform that combines PWM waveform B and PWM waveform C is output.

In this way, it is possible to achieve freer PWM output timing when outputting a delay pulse with dead time than when outputting a three-phase PWM signal with dead time.

The peripheral interconnections provide a connection for using the PWM output timing of delay pulse output as input for one-phase PWM output.

Figure 36.47, Output of a Delay Pulse with Dead Time shows a timing chart for outputting a delay pulse with dead time.

Figure 36.47 Output of a Delay Pulse with Dead Time

The output of a delay pulse with dead time shown in Figure 36.47, Output of a Delay Pulse with Dead Time is described below.
(1) CH 2 (the carrier cycle timer) and CH4 (the delay timing timer) are started simultaneously by starting timers simultaneously.
CH5 (the PWM duty timer) and CH11 (the dead time timer) are also enabled, but no counting operations are performed until the edges of INT04, which indicates the count start timing for CH5, and TIN11, which indicates the count start timing for CH11, are detected.
Because CH3 does not affect PWM output for this function, the channel is not described.
(2) For CH4, when there is a CH2 underflow, the settings from CDR04 are reloaded to CNT04.
(3) The CH4 underflow generates the delay timing signal (INT04).
(4) When INT04 is generated, the settings from CDR05 are reloaded to CNT05, and then the CH5 (the PWM duty timer) operation starts.
(5) At this time, INT05 is generated and the TOUT05 output level changes to the active level.
(6) Due to the CH5 underflow, INT05 is generated again, and TOUT05 changes to the inactive level. TOUT05, which is changed by the CH4 and CH5 underflow, is supplied to the TIN11 input of one-phase PWM output.
(7) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

### 36.13.5 Setup Flow

Note 1. For this feature, the slave channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.
Note 2. Specify a feature that does not use TOUTm.

Figure 36.48 Setup Flow (Active High Example)

Note 1. Change settings according to the active level of the PWM to be output.

Figure 36.49 Setup Flow (Active High Example) (continued)

Note 1. Specify the selection register and output port to use after specifying the initial settings for PIC and the timers.
Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 36.50 Setup Flow (Active High Example) (continued)

### 36.13.6 Setting Examples for Operation Functions

This section provides example settings for each register.

### 36.13.6.1 TAUDn Settings

Table 36.72 TAUDn: CH2-related (Master Channel used to Output a Delay Pulse*1)

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMOR2 | 15,14 | TAUDnCKS[1:0] | Don't care*² | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 1 |  |
|  | TA to 8 | TAUDnSTS[2:0] | 000 |  |
| 7,6 | TAUDnCOS[1:0] | 00 | Fixed to 0 |  |
|  | 5 |  | 0 |  |
| TAUDnCMUR2 | 1,0 | TAUDnMD[4:1] | 0000 | Output INTm at the start of operation. |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.73 TAUDn: CH3-related (Slave Channel used to Output a Delay Pulse ${ }^{\star 1, \star 2}$ )

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMOR3 | 15,14 | TAUDnCKS[1:0] | Don't care*3 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 100 | Start trigger: INTm detection on the master channel |
| 7,6 | TAUDnCOS[1:0] | 00 |  |  |
|  | 5 |  | 0 | Fixed to 0 |
|  | TA to 1 | TAUDnMD[4:1] | 0100 |  |
| TAUDnCMUR3 | 1,0 | TAUDnTIS[1:0] | 00 |  |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the master channel and slave channel.
Note 3. For this feature, the channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.

NOTE
For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).

Table 36.74 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Delay Pulse ${ }^{\star 1}$ ) $(m=4,6$, or 8 )

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*² | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 100 | Start trigger: INTm detection on the master channel |
|  | 7,6 | TAUDnCOS[1:0] | 00 |  |
|  | 5 |  | 0 | Fixed to 0 |
| TAUDnCMURm | 1,0 | TAUDnMD[4:1] | 0100 |  |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the slave channel and master channel.

## NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).

Table 36.75 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Delay Pulse ${ }^{\star 1}$ ) $(\mathrm{m}=5,7$, or 9 )

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*2 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 101 | Start trigger: INTm detection on an upper channel |
|  | 7,6 | TAUDnCOS[1:0] | 00 |  |
|  | 5 |  | 0 | Fixed to 0 |
| TAUDnCMURm | 1,0 | TAUDnMD[4:1] | 1010 |  |

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see Section 32, Timer Array Unit D (TAUD).
Note 2. The same operation clock must be specified for the slave channel and master channel.

NOTE
For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).

Table 36.76 TAUDn: CH11, CH13, and CH15-related (One-Phase PWM Output) ( $\mathrm{m}=11$, 13, or 15 )

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| TAUDnCMORm | 15,14 | TAUDnCKS[1:0] | Don't care*1 | Operation clock setting |
|  | 13,12 | TAUDnCCS[1:0] | 00 |  |
|  | 11 | TAUDnMAS | 0 |  |
|  | 10 to 8 | TAUDnSTS[2:0] | 001 | Start trigger: Detection of a TINm-input valid edge |
|  | 7,6 | TAUDnCOS[1:0] | 00 |  |
|  | 5 |  | 0 | Fixed to 0 |
|  | 4 to 1 | TAUDnMD[4:1] | 0100 |  |
|  | 0 | TAUDnMD0 | 1 | Enable start triggers during counting. |
| TAUDnCMURm | 1,0 | TAUDnTIS[1:0] | 11 | Both rising and falling TINm edges are detected as valid. <br> (High width) |

Note 1. Specify the same operation clock settings as for the PWM output master channel ( CH 2 ).

## NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see Section 32, Timer Array Unit D (TAUD).
$\mathrm{CH} 10, \mathrm{CH} 12$, and CH 14 can be used with any feature that does not use TOUTm output (such as A/D trigger output).

Table 36.77 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTOE | 15 to 10 | TAUDnTOE15 to TAUDnTOE10 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 9 | TAUDnTOE09 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 8 | TAUDnTOE08 | 0 | This is fixed to 0 because TOUT08 is not used. |
|  | 7 | TAUDnTOE07 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 6 | TAUDnTOE06 | 0 | This is fixed to 0 because TOUT06 is not used |
|  | 5 | TAUDnTOE05 | 0 | Disable the timer. |
|  |  |  | 1 | Enable the timer. |
|  | 4 | TAUDnTOE04 | 0 | This is fixed to 0 because TOUT04 is not used |
|  | 3 | TAUDnTOE03 | 0 | This is fixed to 0 because TOUT03 is not used |
|  | 2 | TAUDnTOE02 | 0 | This is fixed to 0 because TOUT02 is not used. |
|  | 1, 0 | TAUDnTOE01 | Don't care |  |
|  |  | TAUDnTOE00 |  |  |
| TAUDnTO | 15 to 10 | TAUDnTO15 to TAUDnTO10 | $0^{* 1}$ | Output a low-level signal to TOUT15 to TOUT10. |
|  | 9 to 2 | TAUDnTO09 to TAUDnTO02 | 0 | Output a low-level signal to TOUT09 to TOUT02. |
|  | 1, 0 | TAUDnTO01 TAUDnTO00 | Don't care |  |

Table 36.77 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTOM | 15 to 10 | TAUDnTOM15 to TAUDnTOM10 | 1 | Synchronous operation mode |
|  | 9 to 4 | TAUDnTOM09 to TAUDnTOM04 | 0 | Independent operation mode |
|  | 3 | TAUDnTOM03 | 1 | Synchronous operation mode |
|  | 2 | TAUDnTOM02 | 0 | Independent operation mode |
|  | 1, 0 | TAUDnTOM01 | Don't care |  |
|  |  | TAUDnTOM00 |  |  |
| TAUDnTOC | 15 to 10 | TAUDnTOC15 to TAUDnTOC10 | 1 | Synchronous operation mode 2 |
|  | 9 to 4 | TAUDnTOC09 to | 1, 0, 1, | CH5, CH7, CH9: Operation mode 2 |
|  |  | TAUDnTOC04 | 0, 1, 0 | $\mathrm{CH} 4, \mathrm{CH} 6, \mathrm{CH} 8$ : Operation mode 1 |
|  | 3 | TAUDnTOC03 | 0 | Operation mode 1 |

|  | 1, 0 | TAUDnTRE01 TAUDnTRE00 | Don't care |  |

Table 36.77 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnTRO | 15 to 2 | TAUDnTRO15 to TAUDnTRO02 | 0 | Invalid because real-time output is disabled. |
|  | 1, 0 | TAUDnTRO01 | Don't care |  |
|  |  | TAUDnTRO00 |  |  |
| TAUDnTRC | 15 to 2 | TAUDnTRC15 to TAUDnTRC02 | 0 | Do not use this channel to generate the real-time output trigger. |
|  | 1, 0 | TAUDnTRC01 | Don't care |  |
|  |  | TAUDnTRC00 |  |  |
| TAUDnTME | 15 to 2 | TAUDnTME15 to TAUDnTME02 | 0 | Disable modulation output for timer output and real-time output. |
|  | 1, 0 | TAUDnTME01 | Don't care |  |
|  |  | TAUDnTME00 |  |  |
| TAUDnRDE | 15 | TAUDnRDE15 | 0 | Disable simultaneous rewriting. |
|  | 14 | TAUDnRDE14 | Don't care |  |
|  | 13 | TAUDnRDE13 | 0 | Disable simultaneous rewriting. |
|  | 12 | TAUDnRDE12 | Don't care |  |
|  | 11 | TAUDnRDE11 | 0 | Disable simultaneous rewriting. |
|  | 10 | TAUDnRDE10 | Don't care |  |
|  | 9 to 2 | TAUDnRDE09 to TAUDnRDE02 | 1 | Enable simultaneous rewriting. |
|  | 1, 0 | TAUDnRDE01 | Don't care |  |
|  |  | TAUDnRDE00 |  |  |
| TAUDnRDS | 15 | TAUDnRDS15 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
|  | 14 | TAUDnRDS14 | Don't care |  |
|  | 13 | TAUDnRDS13 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
|  | 12 | TAUDnRDS12 | Don't care |  |
|  | 11 | TAUDnRDS11 | 0 | Do not enable simultaneous rewriting by using another upper channel. |
|  | 10 | TAUDnRDS10 | Don't care |  |
|  | 9 to 2 | TAUDnRDS09 to TAUDnRDS02 | 0 | Enable simultaneous rewriting by using a master channel. |
|  | 1, 0 | TAUDnRDS01 | Don't care |  |
|  |  | TAUDnRDS00 |  |  |
| TAUDnRDM | 15 | TAUDnRDM15 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 14 | TAUDnRDM14 | Don't care |  |
|  | 13 | TAUDnRDM13 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 12 | TAUDnRDM12 | Don't care |  |
|  | 11 | TAUDnRDM11 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 10 | TAUDnRDM10 | Don't care |  |
|  | 9 to 2 | TAUDnRDM09 to TAUDnRDM02 | 0 | Load the signal when the master channel starts counting. |
|  | 1, 0 | TAUDnRDM01 TAUDnRDM00 | Don't care |  |

Table 36.77 Common TAUDn Channel Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :---: | :---: | :---: | :---: | :---: |
| TAUDnRDC | 15 | TAUDnRDC15 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 14 | TAUDnRDC14 | Don't care |  |
|  | 13 | TAUDnRDC13 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 12 | TAUDnRDC12 | Don't care |  |
|  | 11 | TAUDnRDC11 | 0 | Invalid because simultaneous rewriting is not enabled. |
|  | 10 | TAUDnRDC10 | Don't care |  |
|  | 9 to 2 | TAUDnRDC09 to TAUDnRDC02 | 0 | Do not use this channel to generate the simultaneous rewrite trigger. |
|  | 1, 0 | TAUDnRDC01 TAUDnRDC00 | Don't care |  |

Note 1. Change the setting according to the used system.
Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see Section 32, Timer Array Unit D (TAUD).

### 36.13.6.2 Peripheral Interconnections Settings

Table 36.78 Peripheral Interconnections Settings

| Register | Bit Position | Bit Name | Setting | Remark |
| :--- | :--- | :--- | :--- | :--- |
| PICOREG2n2 | 27 | PICOREG2n227 | 1 | Select the input selected by the PICOREG2n204 bit. |
|  | 23 | PICOREG2n223 | 1 | Select the input selected by the PIC0REG2n203 bit. |
|  | 19 | PICOREG2n219 | 1 | Select the input selected by the PIC0REG2n202 bit. |
| 4 | PICOREG2n204 | 0 | Select TAUDTTOUT9. |  |
|  | PICOREG2n203 | 0 | Select TAUDTTOUT7. |  |
|  | 2 | PICOREG2n202 | 0 | Select TAUDTTOUT5. |

## Section 37 PWM Output/Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of PWM-Diag.

### 37.1 Features of RH850/F1KH, RH850/F1KM PWM-Diag

### 37.1.1 Number of Units

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGA blocks that generate PWM signals, and a PWSA block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGA unit has single PWM channel interface. "Number of channels" is used with the same meaning as "number of units" in this section.

Table $37.1 \quad$ Number of Units (RH850/F1KH-D8)

| Product Name | RH850/F1KH-D8 176 Pins | RH850/F1KH-D8 233 Pins | RH850/F1KH-D8 324 Pins |
| :---: | :---: | :---: | :---: |
| PWBA |  |  |  |
| Number of Units | 1 | 1 | 1 |
| Name | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) |
| PWGA |  |  |  |
| Number of Units | 72 | 80 | 96 |
| Name | PWGAn $\text { (n = } 0 \text { to } 71 \text { ) }$ | PWGAn $\text { ( } \mathrm{n}=0 \text { to } 79 \text { ) }$ | PWGAn $\text { (n = } 0 \text { to } 95 \text { ) }$ |
| PWSA |  |  |  |
| Number of Units | 1 | 1 | 1 |
| Name | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) |

Table 37.2 Number of Units (RH850/F1KM-S4)

| Product Name | RH850/F1KM-S4 100 Pins | RH850/F1KM-S4 144 Pins | RH850/F1KM-S4 176 Pins | RH850/F1KM-S4 233 Pins | RH850/F1KM-S4 272 Pins |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PWBA |  |  |  |  |  |
| Number of Units | 1 | 1 | 1 | 1 | 1 |
| Name | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) |
| PWGA |  |  |  |  |  |
| Number of Units | 44 | 64 | 72 | 80 | 96 |
| Name | PWGAn $\text { ( } \mathrm{n}=0 \text { to } 13,$ <br> 16 to 23,26 to 47 ) | PWGAn $(\mathrm{n}=0 \text { to } 63)$ | PWGAn $\text { (n = } 0 \text { to } 71 \text { ) }$ | PWGAn $\text { ( } \mathrm{n}=0 \text { to } 79 \text { ) }$ | PWGAn $\text { (n = } 0 \text { to } 95 \text { ) }$ |
| PWSA |  |  |  |  |  |
| Number of Units | 1 | 1 | 1 | 1 | 1 |
| Name | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) |

Table 37.3 Number of Units (RH850/F1KM-S1)

| Product Name | RH850/F1KM-S1 48 Pins | RH850/F1KM-S1 <br> 64 Pins | RH850/F1KM-S1 80 Pins | RH850/F1KM-S1 100 Pins |

| PWBA |  |  |  |  |
| Number of Units | 1 | 1 | 1 | 1 |
| Name | PWBAn ( $\mathrm{n}=0$ ) | PWBAA ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) | PWBAn ( $\mathrm{n}=0$ ) |
| PWGA |  |  |  |  |
| Number of Units | 13 | 24 | 24 | 48 |
| Name | PWGAn $(\mathrm{n}=0 \text { to } 12)$ | PWGAn $(\mathrm{n}=0 \text { to } 23)$ | PWGAn $\text { (n = } 0 \text { to } 23 \text { ) }$ | PWGAn $\text { (n = } 0 \text { to 47) }$ |
| PWSA |  |  |  |  |
| Number of Units | 1 | 1 | 1 | 1 |
| Name | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) | PWSAn ( $\mathrm{n}=0$ ) |

Table 37.4 Indices (RH850/F1KH-D8)

| Index | Description |
| :---: | :---: |
| n | Throughout this section, individual units constituting the PWM-Diag function are identified by the index " n "; for example, PWBAnTE indicates the PWBAn status register. |
| m | The PWBA generation clock is identified by the index " $m$ "; for example, PWBAnBRSm ( $m=0$ to 3 ) indicates the PWMCLKm clock cycle configuration register. |
| $x, y$ | An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index " $x$, y"; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 94_95). |
| j | Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index "j"; for example, the PWSAnQUEj ( $\mathrm{j}=0$ to 7) register. |
| k | Sets of registers where each has the same function are identified by the index " $k$ "; for example, the SLPWGAk ( $k=$ 0 to 2) register. |
| z | An A/D conversion result correspond to PWSAnPVCRx_y register is identified by the index "z"; for example, PWSAnPWDDIRz (z = 00, 01, $\ldots, 95$ ). |
| h | Sets of registers where each has the same function are identified by the index "h"; for example, the PWGAINTFhk ( $\mathrm{h}=0,1$ ) register. |
| Table 37.5 | Indices (RH850/F1KM-S4) |
| Index | Description |
| n | Throughout this section, individual units constituting the PWM-Diag function are identified by the index " n "; for example, PWBAnTE indicates the PWBAn status register. |
| m | The PWBA generation clock is identified by the index " $m$ "; for example, PWBAnBRSm ( $m=0$ to 3 ) indicates the PWMCLKm clock cycle configuration register. |
| $x, y$ | An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index "x, y"; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 94_95). |
| j | Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index "j"; for example, the PWSAnQUEj ( $\mathrm{j}=0$ to 7) register. |
| k | Sets of registers where each has the same function are identified by the index " $k$ "; for example, the SLPWGAk ( $k=$ 0 to 2) register. |
| z | An A/D conversion result correspond to PWSAnPVCRx_y register is identified by the index "z"; for example, PWSAnPWDDIRz ( $z=00,01, \ldots, 95$ ). |
| h | Sets of registers where each has the same function are identified by the index " $h$ "; for example, the PWGAINTFhk ( $\mathrm{h}=0$ ) register. |

Table 37.6 Indices (RH850/F1KM-S1)

| Index | Description |
| :---: | :---: |
| n | Throughout this section, individual units constituting the PWM-Diag function are identified by the index " n "; for example, PWBAnTE indicates the PWBAn status register. |
| m | The PWBA generation clock is identified by the index " $m$ "; for example, PWBAnBRSm ( $m=0$ to 3 ) indicates the PWMCLKm clock cycle configuration register. |
| $x, y$ | An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index "x, y"; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 46_47). |
| j | Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index " j "; for example, the PWSAnQUEj ( $\mathrm{j}=0$ to 7 ) register. |
| k | Sets of registers where each has the same function are identified by the index " $k$ "; for example, the SLPWGAk ( $k=$ $0,1)$ register. |
| z | An A/D conversion result correspond to PWSAnPVCRx_y register is identified by the index " $z$ "; for example, PWSAnPWDDIRz ( $z=00,01, \ldots, 47$ ). |
| h | Sets of registers where each has the same function are identified by the index "h"; for example, the PWGAINTFhk $(\mathrm{h}=0)$ register. |

The following table shows values indicated by the indices of each product.
Table 37.7 Indices of Products (RH850/F1KH-D8)

| Indices of each product |  |  |
| :--- | :--- | :--- |
| 176 Pins | 233 Pins | 324 Pins |
| $x=00,02,,, 70$ | $x=00,02,,,, 78$ | $x=00,02,,, 94$ |
| $y=01,03,,, 71$ | $y=01,03,,, 79$ | $y=01,03,,, 95$ |
| $z=00,01,,, 71$ | $z=00,01,,, 79$ | $z=00,01,,,, 95$ |
| $j=0$ to 7 | $j=0$ to 7 | $j=0$ to 7 |
| $k=0$ to 2 | $k=0$ to 2 | $k=0$ to 2 |
| $h=0,1$ | $h=0,1$ | $h=0,1$ |

Table 37.8 Indices of Products (RH850/F1KM-S4)

| Indices of each Product |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| $\begin{aligned} & \hline x=00,02,,, 12, \\ & 16, \ldots, 22,26,,, 46 \\ & y=01,03,,, 13, \\ & 17, \ldots, 23,27,,, 47 \\ & z=00,01,,, 13,16, \ldots, \\ & 23,26,, \ldots, 47 \end{aligned}$ | $\begin{aligned} & x=00,02,,,, 62 \\ & y=01,03,,, 63 \\ & z=00,01, \ldots, 63 \end{aligned}$ | $\begin{aligned} & x=00,02,,,, 70 \\ & y=01,03,,, 71 \\ & z=00,01,,, 71 \end{aligned}$ | $\begin{aligned} & x=00,02,,, 78 \\ & y=01,03,,, 79 \\ & z=00,01,,, 79 \end{aligned}$ | $\begin{aligned} & \mathrm{x}=00,02, \ldots, 94 \\ & y=01,03, \ldots, 95 \\ & z=00,01, \ldots, 95 \end{aligned}$ |
| $\mathrm{j}=0$ to 7 | $\mathrm{j}=0$ to 7 | $\mathrm{j}=0$ to 7 | $\mathrm{j}=0$ to 7 | $\mathrm{j}=0$ to 7 |
| $\mathrm{k}=0,1$ | $\mathrm{k}=0,1$ | $\mathrm{k}=0$ to 2 | $\mathrm{k}=0$ to 2 | $\mathrm{k}=0$ to 2 |
| $\mathrm{h}=0$ | $\mathrm{h}=0$ | $\mathrm{h}=0$ | $\mathrm{h}=0$ | $\mathrm{h}=0$ |

Table 37.9 Indices of Products (RH850/F1KM-S1)

| Indices of each Product |  |  |  |  |
| :--- | :--- | :--- | :--- | :---: |
| 48 Pins | 64 Pins | 80 Pins | 100 Pins |  |
| $x=00,02,,, 12$ | $x=00,02,,, 22$ | $x=00,02,,, 22$ | $x=00,02,,, 46$ |  |
| $y=01,03,,, 13^{\star 1}$ | $y=01,03,,, 23$ | $y=01,03,,, 23$ | $y=01,03,,, 47$ |  |
| $z=00,01,,, 12$ | $z=00,01,,, 23$ | $z=00,01,,, 23$ | $z=00,01,,,, 47$ |  |
| $j=0$ to 7 | $j=0$ to 7 | $j=0$ to 7 | $j=0$ to 7 |  |
| $k=0$ | $k=0$ | $k=0$ | $k=0,1$ |  |
| $h=0$ | $h=0$ | $h=0$ | $h=0$ |  |

Note 1. Channels 0 to 12 are provided in PWM-Diag.

### 37.1.2 Register Base Addresses

PWM-Diag base addresses are listed in the following table.
PWM-Diag register addresses are given as offsets from the base addresses.
Table 37.10 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Base Address Name | Base Address |
| :--- | :--- |
| <PWBAn_base> | FFE7 $2800_{\mathrm{H}}$ |
| <PWGAn_base> | FFE7 $1000_{\mathrm{H}}+40_{\mathrm{H}} \times \mathrm{n}$ |
| <PWSAn_base> | FFE7 $0000_{\mathrm{H}}$ |
| <SLPW_base> | FFE7 $3000_{\mathrm{H}}$ |
| <PWGAINTF_base> | FFE7 $3100_{\mathrm{H}}$ |

### 37.1.3 Clock Supply

The PWM-Diag clock supply is shown in the following table.
Table 37.11 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| PWBAn | PCLK | CKSCLK_IPERI2 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI2 | Bus clock |
|  | PCLK | CKSCLK_IPERI2 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI2 | Bus clock |
| PWSAn | PCLK | CKSCLK_IPERI2 | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_IPERI2 | Bus clock |

### 37.1.4 Interrupt Requests

PWM-Diag interrupt requests are listed in the following table.
Regarding interrupt connection image, refer to Figure 37.1, PWGA Interrupt Connection Image (PWGA 96 Channels Embedded).

Table 37.12 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| PWGA_INT0 | PWGA0 interrupt | 92, 95 | - |
| PWGA_INT1 | PWGA1 interrupt | 92, 95 | - |
| PWGA_INT2 | PWGA2 interrupt | 92, 95 | - |
| PWGA_INT3 | PWGA3 interrupt | 92, 95 | - |
| PWGA_INT4 | PWGA4 interrupt | 92, 95 | - |
| PWGA_INT5 | PWGA5 interrupt | 92, 95 | - |
| PWGA_INT6 | PWGA6 interrupt | 92, 95 | - |
| PWGA_INT7 | PWGA7 interrupt | 92, 95 | - |
| PWGA_INT8 | PWGA8 interrupt | 92, 95 | - |
| PWGA_INT9 | PWGA9 interrupt | 92, 95 | - |
| PWGA_INT10 | PWGA10 interrupt | 92, 95 | - |
| PWGA_INT11 | PWGA11 interrupt | 92, 95 | - |
| PWGA_INT12 | PWGA12 interrupt | 92,95 | - |
| PWGA_INT13 | PWGA13 interrupt | 92, 95 | - |
| PWGA_INT14 | PWGA14 interrupt | 92, 95 | - |
| PWGA_INT15 | PWGA15 interrupt | 92, 95 | - |
| PWGA_INT16 | PWGA16 interrupt | 92, 95 | - |
| PWGA_INT17 | PWGA17 interrupt | 92,95 | - |
| PWGA_INT18 | PWGA18 interrupt | 92, 95 | - |
| PWGA_INT19 | PWGA19 interrupt | 92, 95 | - |
| PWGA_INT20 | PWGA20 interrupt | 92, 95 | - |
| PWGA_INT21 | PWGA21 interrupt | 92, 95 | - |
| PWGA_INT22 | PWGA22 interrupt | 92, 95 | - |
| PWGA_INT23 | PWGA23 interrupt | 92, 95 | - |
| PWGA_INT24 | PWGA24 interrupt | 92, 95 | - |
| PWGA_INT25 | PWGA25 interrupt | 92, 95 | - |
| PWGA_INT26 | PWGA26 interrupt | 92, 95 | - |
| PWGA_INT27 | PWGA27 interrupt | 92, 95 | - |

Table 37.12 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt Signal | Description | Interrupt Number | DMA Trigger Number |
| :---: | :---: | :---: | :---: |
| PWGA_INT28 | PWGA28 interrupt | 92, 95 | - |
| PWGA_INT29 | PWGA29 interrupt | 92, 95 | - |
| PWGA_INT30 | PWGA30 interrupt | 92,95 | - |
| PWGA_INT31 | PWGA31 interrupt | 92, 95 | - |
| PWGA_INT32 | PWGA32 interrupt | 93, 96 | - |
| PWGA_INT33 | PWGA33 interrupt | 93, 96 | - |
| PWGA_INT34 | PWGA34 interrupt | 93, 96 | - |
| PWGA_INT35 | PWGA35 interrupt | 93, 96 | - |
| PWGA_INT36 | PWGA36 interrupt | 93, 96 | - |
| PWGA_INT37 | PWGA37 interrupt | 93, 96 | - |

### 37.1.5 Reset Sources

PWM-Diag reset sources are listed in the following table. The individual PWM-Diag units are initialized by these reset sources.

Table 37.15 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| PWBAn | All reset sources (ISORES) |
| PWGAn |  |
| PWSAn |  |

### 37.1.6 External Input/Output Signals

External input/output signals of the PWM-Diag are listed below.
Table 37.16 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| PWGA_TOUTn (Unit: PWGA) | PWGA unit n output | PWGAnO |

## CAUTION

When port P8_6 is used as PWGA38O, port P8_6 pin outputs a low-level RESETOUT signal while a reset is asserted and continues to output a low level after the reset is deasserted.
For details, see Section 2A.11.1.1, P8_6: $\overline{\text { RESETOUT }}$, Section 2B.11.1.1, P8_6: $\overline{\text { RESETOUT }}$ and Section 2C.11.1.1, P8_6: RESETOUT .

### 37.1.7 Internal Output Signals

The I/O signals for connecting two PWM-Diag channels or a PWM-Diag and another function are listed below.
Table 37.17 Internal Output Signals (RH850/F1KH-D8)

| Unit Signal Name | Description | Connected to |
| :--- | :--- | :--- |
| PWBA0 |  | PWGA count clock 0 |
| PWMCLK0 | PWGA count clock 1 | PWGAn |
| PWMCLK1 | PWGA count clock 2 | PWGAn |
| PWMCLK2 | PWGA count clock 3 | PWGAn |
| PWMCLK3 | PWGAn trigger | PWSAn |
| PWGAn | A/D converter unit select signal |  |
| PWGA_TRGOUTn | A/D converter control signal | ADCA0, ADCA1 |
| PWSA0 | A/D conversion completion signal | PWSA0 |
| PWSA_ADTRG[1:0] | A/D conversion result signal | PWSA0 |
| PWSA_PVCR_VALUE[13:0] |  |  |

Table 37.18 Internal Output Signals (RH850/F1KM-S4)

| Unit Signal Name |  | Description |
| :--- | :--- | :--- |
| PWBA0 | PWGA count clock 0 | Connected to |
| PWMCLK0 | PWGA count clock 1 | PWGAn |
| PWMCLK1 | PWGA count clock 2 | PWGAn |
| PWMCLK2 | PWGA count clock 3 | PWGAn |
| PWMCLK3 | PWGAn trigger | PWGAn |
| PWGAn | A/D converter unit select signal | ADCA0, ADCA1 |
| PWGA_TRGOUTn | A/D converter control signal | ADCA0, ADCA1 |
| PWSA0 | A/D conversion completion signal | PWSA0 |
| PWSA_ADTRG[1:0] | A/D conversion result signal | PWSA0 |
| PWSA_PVCR_VALUE[13:0] |  |  |

Table 37.19 Internal Output Signals (RH850/F1KM-S1)

| Unit Signal Name | Description | Connected to |
| :--- | :--- | :--- |
| PWBA0 |  | PWGA count clock 0 |
| PWMCLK0 | PWGA count clock 1 | PWGAn |
| PWMCLK1 | PWGA count clock 2 | PWGAn |
| PWMCLK2 | PWGA count clock 3 | PWGAn |
| PWMCLK3 | PWGGAn |  |
| PWGAn | A/D converter unit select signal | PWCA |
| PWGA_TRGOUTn | A/D converter control signal | ADCA0 |
| PWSA0 | A/D conversion completion signal | PWSA0 |
| PWSA_ADTRG[0] | A/D conversion result signal | PWSA0 |
| PWSA_PVCR_VALUE[13:0] |  |  |

### 37.1.8 Functional Overview

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGA), A/D conversion trigger select function (PWSA), and A/D converter (ADCA).

## PWBA

- Clock divider

PWBA generates a PWMCLKm count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGA.
The cycle of the PWMCLKm count clock signal can be calculated from the setting of the PWBAnBRSm register by the equation below.
(When the PWBAnBRSm = 1 to 2047)
PWMCLKm count clock cycle $=($ PWBAnBRSm value $\times 2) \times$ PCLK cycle
(When the PWBAnBRSm $=0$ )
PWMCLKm count clock cycle $=$ PCLK cycle
In addition, PWBA can control operation when the on-chip debugger is in use by using the PWBAnEMU register.

## PWGA

PWGA outputs PWM waveforms and A/D conversion trigger to PWSA by using the clock PWMCLKm input from PWBA.

- PWM waveform output PWGA_TOUTn

This generator outputs PWM waveforms from the PWGA_TOUTn pin. The PWM cycle is controlled by the match timing of PWGAnCNT register value and the PWGA_PERIOD input value. PWGA_PERIOD input value can be set by PWGAPRD and PWGAPRDSLk register setting. Set the high-level period of PWM output in the PWGAnCSDR and PWGAnCRDR registers.

The PWM waveform cycle and duty can be calculated by the equations below.
PWM waveform cycle $=($ PWGA_PERIOD +1$) \times$ PWMCLKm count clock cycle
When PWGAnCRDR[11:0] > PWGAnCSDR[11:0],
High-level period of PWM waveform =
(PWGAnCRDR register value - PWGAnCSDR register value) $\times$ PWMCLKm count clock cycle
PWM waveform duty (\%) = High-level period of PWM waveform/PWM waveform cycle $\times 100=($ PWGAnCRDR register value - PWGAnCSDR register value) $/($ PWGA_PERIOD +1$) \times 100$

Note that the PWM output is fixed to the low level when the PWGAnCRDR register value is equal to the PWGAnCSDR register value.

When $1 \mathrm{xxx}_{\mathrm{H}}$ or the value higher than PWGA_PERIOD is set in the PWGAnCRDR register (i.e. bit 12 is set to 1 ), the PWM output is fixed to the high level.

- A/D conversion trigger output PWGA_TRGOUTn

The A/D conversion trigger signal PWGA_TRGOUTn for PWSA is generated when the PWGAnCTDR register value and the PWGAnCNT register value match and its timing can be set by PWGAnOCL.
The output enable/disable of PWGA_TRGOUTn is controlled by PWGAnTCR register. The timing can be calculated by the equation below.
A/D conversion trigger signal generation timing $=$ PWGAnCTDR register value $\times$ PWMCLKm count clock cycle

- PWGA interrupt request signal PWGA_INTn

PWGA generates the interrupt request signal PWGA_INTn at the falling edge of the PWM output PWGA_TOUTn. When the PWM output is fixed to the low level, PWGA_INTn is generated when the PWGAnCRDR register value and the PWGAnCNT register value match; when the PWM output is fixed to the high level, it is generated when the PWGAnCNT register value and the PWGA_PERIOD input value match.

## PWSA

PWSA transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGA_TRGOUTn from the PWM generator (PWGA).

- A/D conversion control by PWSA

PWSA outputs the information required for the A/D conversion, which is set in the corresponding PWSAnPVCRx_y register for the channel number of the trigger input from PWGAn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) to the A/D converter.
At the same timing, A/D conversion trigger (PWSA_ADTRG) is output to ADCA0 or ADCA1. (A maximum of eight input trigger signal PWGA_TRGOUTn data received during A/D conversion are stored and kept in PWSAnQUE.)
The setting information to be output to the A/D converter is kept until the next trigger is generated. When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSA triggers the next $\mathrm{A} / \mathrm{D}$ conversion based on the data stored in the PWSAnQUE register.

- Queuing of A/D conversion triggers from PWGA

The A/D conversion trigger signal (PWGA_TRGOUTn) input from PWGAn is stored in the PWSAnQUEj register as a channel number. The PWSAnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGA_TRGOUTn received during A/D conversion in a queue structure.
A PWSA queue full interrupt occurs in the following states, when the queue of the PWSAnQUEj register becomes full

- A trigger number is written to PWSAnQUE7
- A trigger number has already been written to PWSAnQUE7 and cannot be written when PWGA_TRGOUTn is input.
- Storing A/D conversion result

The A/D conversion result is stored in PWSAnPWDDIRz register.

## ADCA

A/D conversion is executed upon receipt of information required for $A / D$ conversion and $A / D$ conversion trigger from PWSA.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the $\mathrm{A} / \mathrm{D}$ conversion, it is reported to the PWSA.
For the basic operation of the A/D converter, see Section 38, A/D Converter (ADCA).
For the A/D converter operation with the PWM-Diag function, see Section 38.4.7.1, A/D Conversion with PWMDiag Enabled.

### 37.1.9 Block Diagram

The following figure shows an example of connecting the LED control circuit combining the PWM-Diag and the A/D converter.

Figure 37.2 Example of Connecting the LED Control Circuit using the PWM-Diag and the A/D Converter

### 37.2 Registers

### 37.2.1 List of Registers

PWM Output/Diagnostic registers are listed in the following table.
<PWBAn_base>, <PWSAn_base>, and <PWGAn_base> are defined in Section 37.1.2, Register Base

## Addresses.

Table 37.20 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| PWBAn | PWMCLKm cycle configuration register | PWBAnBRSm | <PWBAn_base> + 0004H $\times$ m |
|  | PWMCLKm enable status register | PWBAnTE | <PWBAn_base> + 0010 ${ }_{\text {H }}$ |
|  | PWMCLKm start trigger register | PWBAnTS | <PWBAn_base> + 0014 ${ }_{\text {H }}$ |
|  | PWMCLKm stop trigger register | PWBAnTT | <PWBAn_base> $+0018_{\text {H }}$ |
|  | PWBA emulation register | PWBAnEMU | <PWBAn_base> + 001C ${ }_{\text {H }}$ |
| PWGAn | PWM output set condition register | PWGAnCSDR | <PWGAn_base> + 0000 ${ }_{\text {H }}$ |
|  | PWM output reset condition register | PWGAnCRDR | <PWGAn_base> $+0004_{\text {H }}$ |
|  | PWGA_TRGOUTn generation condition register | PWGAnCTDR | <PWGAn_base> + 0008 ${ }_{\text {H }}$ |
|  | Buffer register reload trigger register | PWGAnRDT | <PWGAn_base> + 000C ${ }_{\text {H }}$ |
|  | Buffer register reload status register | PWGAnRSF | <PWGAn_base> + 0010 ${ }_{\text {H }}$ |
|  | PWM cycle count register | PWGAnCNT | <PWGAn_base> + 0014 ${ }_{\text {H }}$ |
|  | PWGA_TRGOUTn control register | PWGAnTCR | <PWGAn_base> + 0018 ${ }_{\text {H }}$ |

### 37.2.1.1 PWBAnBRSm — PWMCLKm Cycle Configuration Register

This register sets the clock cycle of PWMCLKm.

Access: This register can be read or written in 16 -bit units.
Address: <PWBAn_base> + 0004 $\times$ m
Value after reset: $\quad 0000_{H}$

Table 37.21 PWBAnBRSm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 11 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 0 | PWBAnBRSm[10:0] | Register for setting the clock cycle of PWMCLKm. <br> - PWBAnBRSm = 0: PWMCLKm = PCLK <br> $-\mathrm{PWBAnBRSm}=1: \mathrm{PWMCLKm}=\mathrm{PCLK} /(2 \times 1)$ <br> $-\mathrm{PWBAnBRSm}=2: \mathrm{PWMCLKm}=\mathrm{PCLK} /(2 \times 2)$ <br> - PWBAnBRSm = $\mathrm{n}:$ PWMCLKm $=$ PCLK $/(2 \times n)(\mathrm{n}=1$ to 2047 $)$ |

These bits can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).

### 37.2.1.2 PWBAnTE — PWMCLKm Enable Status Register

This is a status register that indicates the output status of PWMCLKm ( $\mathrm{m}=0$ to 3 ).

Access: This register is a read-only register that can be read in 8-bit units.
Address: <PWBAn_base> + 0010н
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PWBAnTE3 | PWBAnTE2 | PWBAnTE1 | PWBAnTEO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 37.22 PWBAnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When read, the value after reset is returned. |
| 3 | PWBAnTE3 | A status flag indicating the operation status of PWMCLK3 |
|  |  | $0:$ Not operating |
|  | 1: Operating |  |
| 2 | PWBAnTE2 | A status flag indicating the operation status of PWMCLK2 |
|  |  | $0:$ Not operating |
|  |  | 1: Operating |
| 1 |  | A status flag indicating the operation status of PWMCLK1 |
|  | $0:$ Not operating |  |
|  |  | 1: Operating |
| 0 | PWBAnTE0 status flag indicating the operation status of PWMCLK0 | $0:$ Not operating |
|  |  | 1: Operating |
|  |  |  |

### 37.2.1.3 PWBAnTS — PWMCLKm Start Trigger Register

This register is a start trigger register for PWMCLKm ( $\mathrm{m}=0$ to 3 ).

Access: This register is a write-only register that can be written in 8-bit units.
Address: <PWBAn_base> + 0014н
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PWBAnTS3 | PWBAnTS2 | PWBAnTS1 | PWBAnTS0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | w | W | w | w |

Table 37.23 PWBAnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 | PWBAnTS3 | Start Trigger for PWMCLK3 |
|  | $0:$ Writing 0 has no effect. |  |
|  | 1: Starts the output of PWMCLK3. |  |
| 2 | PWBAnTS2 | Start Trigger for PWMCLK2 |
|  | $0:$ Writing 0 has no effect. |  |
|  | 1: Starts the output of PWMCLK2. |  |
| 1 |  | Start Trigger for PWMCLK1 |
|  | $0:$ Writing 0 has no effect. |  |
|  |  | 1: Starts the output of PWMCLK1. |
| 0 | PWBAnTS0 | Start Trigger for PWMCLK0 |
|  | $0:$ Writing 0 has no effect. |  |
|  |  | 1: Starts the output of PWMCLK0. |

### 37.2.1.4 PWBAnTT — PWMCLKm Stop Trigger Register

This register is a stop trigger register for PWMCLKm ( $\mathrm{m}=0$ to 3 ).

Access: This register is a write-only register that can be written in 8 -bit units.
Address: <PWBAn_base> + 0018H
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PWBAnTT3 | PWBAnTT2 | PWBAnTT1 | PWBAnTTO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | w | w | w | W |

Table 37.24 PWBAnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | Reserved | When writing, write the value after reset. |
| 3 | PWBAnTT3 | Stop Trigger for PWMCLK3 |
|  |  | 0: Writing 0 has no effect. |
|  | 1: Stops the output of PWMCLK3. |  |
| 2 | PWBAnTT2 | Stop Trigger for PWMCLK2 |
|  |  | $0:$ Writing 0 has no effect. |
|  |  | 1: Stops the output of PWMCLK2. |
| 1 |  | Stop Trigger for PWMCLK1 |
|  |  | 0: Writing 0 has no effect. |
|  |  | 1: Stops the output of PWMCLK1. |
| 0 | SWBAnTT0 | Strigger for PWMCLK0 |
|  |  | 0: Writing 0 has no effect. |
|  |  | 1: Stops the output of PWMCLK0. |

### 37.2.1.5 PWBAnEMU — PWBA Emulation Register

This register sets the operation during emulation.

Access: This register can be read or written in 8-bit units.
Address: <PWBAn_base> $+001 \mathrm{C}_{\mathrm{H}}$
Value after reset: $00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PWBAnSVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 37.25 PWBAnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | PWBAnSVSDIS | (When the EPC.SVSTOP bit $=0$ ) |
|  |  | The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0). |
|  |  | (When the EPC.SVSTOP bit = 1) |
|  |  | 0 : The count clock is stopped when the debugger is controlling the microcontroller (by using break points, etc.). |
|  |  | 1: The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.). |
|  |  | This bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0). |
| 6 to 0 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

### 37.2.1.6 PWGAnCTL — PWGA Control Register

PWGAnCTL is used to select the count clock from PWBA and setting output condition of PWGA_TRGOUTn.

```
Access: This register can be read or written in 8-bit units.
Address: <PWGAn_base> \(+0020_{\mathrm{H}}\)
```

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PWGAnOCL | - | PWGAnTCUT[1:0] |  | - | - | PWGAnCKS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R/W | R | R | R/W | R/W |

Table 37.26 PWGAnCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | PWGAnOCL | This bit select the PWGA_TRGOUTn output condition related with PWGA_TOUTn. <br> 0: PWGA_TRGOUTn output at the condition of high level of PWGA_TOUTn <br> 1: PWGA_TRGOUTn output at the condition of both high and low level of PWGA_TOUTn |
| 6 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 5, 4 | PWGAnTCUT[1:0] | These bits select the update timing of PWGAnTCBR register. <br> 00: No update <br> 01: Update at rising edge of PWGA_TOUTn at the condition of PWGAnTCBR rewrite in progress (PWGAnRSFT = 1) <br> 10: Update at falling edge of PWGA_TOUTn at the condition of PWGAnTCBR rewrite in progress (PWGAnRSFT = 1) <br> 11: Update immediately (PWGAnTCBR rewrite request trigger of PWGAnRDTT $=1$ setting is invalid) |
| 3, 2 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | PWGAnCKS[1:0] | Count Clock Enable Input PWMCLK3 to PWMCLK0 Select <br> 00: Uses PWMCLK0 as count clock <br> 01: Uses PWMCLK1 as count clock <br> 10: Uses PWMCLK2 as count clock <br> 11: Uses PWMCLK3 as count clock <br> These bits can only be rewritten when the PWGAn operation is stopped (SLPWGAk.SLPWGA[31:0] = 0). |

### 37.2.1.7 PWGAnCNT — PWM Cycle Count Register

This is a count register.

Access: This register is a read-only register that can be read in 16 -bit units.
Address: <PWGAn_base> + 0014
Value after reset: $\quad 0 F F F_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PWGAnCNT[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.27 PWGAnCNT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | Reserved | When read, the value after reset is returned. |
| 11 to 0 | PWGAnCNT[11:0] | 12-bit counter value |

### 37.2.1.8 PWGAnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGA_TOUTn output.

| Access: <br> Address: |  |  | This register can be read or written in 16 -bit units. <PWGAn_base> + 0000 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - |  |  |  |  |  | GGAn | DR[11 |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 37.28 PWGAnCSDR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | PWGAnCSDR[11:0] | These bits set the setting condition for PWM output. |
|  |  | The set value is reflected to the PWGAnCSBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding $C H=1$ ) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). |
| NOTE |  |  |

In case of changing PWM period by PWGAPRD and PWGAPRDSLk registers, the setting of PWGAnCSDR > PWGA_PERIOD is prohibited.

### 37.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGA_TOUTn output.

| Access: <br> Address: |  |  | This register can be read or written in 16-bit units. <PWGAn_base> + 0004 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - |  |  |  |  |  | PWG | CRD | 12:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 37.29 | PWGAnCRDR Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 13 | Reserved |  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 12 to 0 | PWGAnCRDR[12:0] |  |  | The set value is reflected to the PWGAnCRBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). |  |  |  |  |  |  |  |  |  |  |  |  |

### 37.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGA_TRGOUTn.

| Access: <br> Address: |  |  | This register can be read or written in 16-bit units. <PWGAn_base> + 0008н |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - |  |  |  |  |  | GAn | DR[11 |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 37.30 | PWGAnCTDR Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 12 | Reserved |  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 11 to 0 | PWGAnCTDR[11:0] |  |  | These bits set the A/D conversion trigger generation condition for PWSAn. <br> The set value is reflected to the PWGAnCTBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). |  |  |  |  |  |  |  |  |  |  |  |  |

### 37.2.1.11 PWGAnTCR — PWGA_TRGOUTn Control Register

This register controls enable/disable of PWGA_TRGOUTn.

PWGAnTOE bit has to be set before count operation. In addition, in case of PWGAnTCUT=01B or 10B, PWGAnTOE bit has to be set before PWGAnTCBR rewrite request.

### 37.2.1.12 PWGAnCSBR — PWGAnCSDR Buffer Register

This is a buffer register for the PWGAnCSDR register.

| Access: <br> Address: |  |  | <PWGAn_base> + 0024H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $0000{ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | PWGAnCSBR[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.32 PWGAnCSBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | Reserved | When read, the value after reset is returned. |
| 11 to 0 | PWGAnCSBR[11:0] | The PWGAnCSDR register value is reflected to this register at the start of PWGAn operation <br> (SLPWGAk.SLPWGA of the corresponding $\mathrm{CH}=1$ ) or when a simultaneous rewrite is |
|  |  | performed (PWGAnRDT.PWGAnRDT $=1$ ). <br>  |
|  | When the value matches the PWGAnCNT register value, the pin output is driven high. |  |

### 37.2.1.13 PWGAnCRBR — PWGAnCRDR Buffer Register

This is a buffer register for the PWGA_TOUTn reset condition.

Access: This register is a read-only register that can be read in 16-bit units.
Address: <PWGAn_base> + 0028н
Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | PWGAnCRBR[12:0] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.33 PWGAnCRBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 13 | Reserved | When read, the value after reset is returned. |
| 12 to 0 | PWGAnCRBR[12:0] | The PWGAnCRDR register value is reflected to this register at the start of PWGAn operation <br> (SLPWGAk.SLPWGA of the corresponding $C H=1$ ) or when a simultaneous rewrite is |
|  |  | performed (PWGAnRDT.PWGAnRDT $=1$ ). <br> When the value matches the PWGAnCNT register value, the pin output is driven low. |

### 37.2.1.14 PWGAnCTBR — PWGAnCTDR Buffer Register

This is a buffer register for the PWGA_TRGOUTn generation condition.

|  |  |  | This register is a read-only register that can be read in 16-bit units. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | $000 \mathrm{O}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - |  |  |  |  |  | GA | R[ |  |  |  |  |  |
| reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.34 PWGAnCTBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | Reserved | When read, the value after reset is returned. |
| 11 to 0 | PWGAnCTBR[11:0] | The PWGAnCTDR register value is reflected to this register at the start of PWGAn operation <br> (SLPWGAK.SLPWGA of the corresponding $\mathrm{CH}=1$ ) or when a simultaneous rewrite is <br> performed (PWGAnRDT.PWGAnRDT $=1$ ). <br>  |
|  |  | When the value matches the PWGAnCNT register value, a trigger is transmitted to PWSAn. |

### 37.2.1.15 PWGAnTCBR — PWGAnTCR Buffer Register

This is a buffer register for the PWGAnTCR register.

Access: This register is a read-only register that can be read in 8-bit units.
Address: <PWGAn_base> $+001 C_{H}$
Value after reset: $\quad 01_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | PWGAnTOBE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R |

Table 37.35 PWGAnTCBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | Reserved | When read, the value after reset is returned. |
| 0 | PWGAnTOBE | The PWGAnTCR register value is reflected to this register at the update timing selected by |
|  |  | PWGAnCTRL.TCUT[1:0]. |
|  | 0: Output disable of PWGA_TRGOUTn. |  |
|  | 1: Output enable of PWGA_TRGOUTn. |  |

### 37.2.1.16 PWGAnRSF — Buffer Register Reload Status Register

This register is a status register for simultaneous rewrite control.

Access: This register is a read-only register that can be read in 8-bit units.
Address: <PWGAn_base> $+0010_{\mathrm{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | PWGAnRSFT | PWGAnRSF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 37.36 PWGAnRSF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | PWGAnRSFT | PWGAnTCBR Rewrite Control Status <br> 0: PWGAnTCBR rewrite is enabled. This value indicates the completion of PWGAnTCBR rewrite after the generation of a PWGAnTCBR rewrite trigger signal. In case of PWGAnTCUT $=00_{B}$ or $11_{B}$, this bit shows always " 0 ". <br> 1: PWGAnTCBR rewrite is in progress. This value indicates the waiting state for completion. |
| 0 | PWGAnRSF | Compare Buffer Register Simultaneous Rewrite Control Status <br> 0 : Compare buffer register simultaneous rewrite is enabled. This value indicates the completion of compare buffer register simultaneous rewrite after the generation of a compare buffer register simultaneous rewrite trigger signal. <br> 1: Compare buffer register simultaneous rewrite is in progress. This value indicates the waiting state for completion. |

### 37.2.1.17 PWGAnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

Access: This register is a write-only register that can be written in 8-bit units.
Address: <PWGAn_base> $+000 \mathrm{C}_{\boldsymbol{H}}$
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | PWGAnRDTT | PWGAnRDT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | w | w |

Table 37.37 PWGAnRDT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When writing, write the value after reset. |
| 1 | PWGAnRDTT | PWGAnTCBR Rewrite Request Trigger |
|  |  | $0:$ Writing 0 does not work as a function. |
|  |  | 1: Triggers the rewrite request for PWGAnTCBR, and sets PWGAORSF.PWGA0RSFT to 1. |
|  | In case of PWGAnTCUT $=00_{\mathrm{B}}$ or $11_{\mathrm{B}}$, write to this bit "1" is invalid. |  |
| 0 | PWGAnRDT | Compare Buffer Register Simultaneous Rewrite Request Trigger |
|  |  | $0:$ Writing 0 does not work as a function. |
|  |  | 1: Triggers the simultaneous rewrite request for the compare registers (PWGAnCSDR, |
|  |  | PWGAnCRDR, and PWGAnCTDR), and sets PWGAnRSF.PWGAnRSF to 1. |

### 37.2.1.18 SLPWGAk — PWGA Synchronous Trigger Register (k=0 to 2)

This register triggers start and stop for multiple channels simultaneously.

| Access: <br> Address: |  |  | This register can be read or written in 32-bit units. <SLPW_base> $+\mathrm{k} \times \mathrm{4}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset: |  |  | 00000 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | SLPWGA[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | SLPWGA[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 37.38 SLPWGAk Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SLPWGA[31:0] | Trigger start and stop to multiple channels simultaneously. |
|  | $0:$ Stops the corresponding channels. |  |
|  | 1: Starts the corresponding channels. |  |
|  | The bits correspond to the following channels. |  |
| SLPWGA0.SLPWGA[31:0]: PWGA31 - PWGA0 |  |  |
|  | SLPWGA1.SLPWGA[31:0]: PWGA63 - PWGA32 |  |
|  | SLPWGA2.SLPWGA[31:0]: PWGA95 - PWGA64 |  |

### 37.2.1.19 PWGAPRD — PWGA Period Setting Register

This register is used to set the PWGA counter period.

Access: This register can be read or written in 16-bit units.
Address: <SLPW_base> + 000C ${ }_{H}$
Value after reset: $\quad 0000_{H}$

Table 37.39 PWGAPRD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | PWGAPRD[11:0] | These bits set the PWGA counter period. (= PWGA_PERIOD) <br>  |
|  | The period of PWGA_TOUTn can be flexible changed by setting this register when <br> PWGAPRDSLk is set to 1. If PWGAPRDSLk is set to 0, PWGA_PERIOD value is FFF . |  |

PWGAPRD register setting change is prohibited during count operation.

### 37.2.1.20 PWGAPRDSLk — PWGA Period Selection Register (k=0 to 2)

This register is used to select the PWGA counter period either 12bit free-running or PWGAPRD register setting.

### 37.2.1.21 PWSAnCTL — PWSA Control Register

This register is used to control operations of PWSA.

Access: This register can be read or written in 8-bit units.
Address: <PWSAn_base> $+0000_{\text {H }}$
Value after reset: $00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PWSAnARSE | - | - | - | - | - | - | PWSAnENBL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R/W |

Table 37.41 PWSAnCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | PWSAnARSE | A/D conversion result storing control |
|  |  | 0: Storing the ADCAnPWDDIR register to PWSAnPWDDIRz register is disabled |
|  |  | 1: Storing the ADCAnPWDDIR register to PWSAnPWDDIRz register is enabled. |
| 6 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PWSAnENBL | Operation Permission Control |
|  |  | 0: Operation is prohibited (initial state). |
|  | Writing 0 initializes PWSAnSTR, PWSAnQUEj, PWSAnOWE and PWSAnWFLG. |  |
|  |  | 1: Operation is enabled. |

## NOTE

PWSAnARSE setting has to be changed during the state of trigger has not been input (PWSAnQUE0 $=7 \mathrm{~F}_{\mathrm{H}}$ ) and condition of not input the trigger from PWGA.

### 37.2.1.22 PWSAnSTR — Trigger Queue Status Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSAnQUEj register.

| Access: | This register is a read-only register that can be read in 8 -bit units. |
| ---: | :--- |
| Address: | $<$ PWSAn_base> $+0004_{\mathrm{H}}$ |
| Value after reset: | $00_{\mathrm{H}}$ |

Table 37.42 PWSAnSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When read, the value after reset is returned. |
| 1 | PWSAnQFL | Indicates the queuing state of the A/D conversion trigger. |
|  | 0: Some PWSAnQUEj registers do not store a channel number. |  |
|  | 1: All of the PWSAnQUEj registers store a channel number. |  |
| 0 | PWSAnQNE | Bit indicating that there is a trigger in the trigger queue |
|  | 0: A channel number is not stored in a PWSAnQUEj register, or A/D conversion is in |  |
|  | progress while only PWSAnQUE0 stores a channel number. |  |
|  | 1: The number of the channel waiting for conversion is stored in $\mathrm{j}=1$ and subsequent |  |
|  | PWSAnQUEj registers. |  |

### 37.2.1.23 PWSAnSTC - Trigger Queue Status Clear Register

This register clears the status of the PWSAnSTR register.

```
Access: This register is a write-only register that can be written in 8-bit units.
Address: <PWSAn_base> + 0008H
Value after reset: }00\mp@subsup{0}{H}{
```

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | PWSAnCLFL | PWSAnCLNE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

Table 37.43 PWSAnSTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | Reserved | When writing, write the value after reset. |
| 1 | PWSAnCLFL | PWSAnQFL Clear |
|  |  | 0: PWSAnQFL retains the status (Writing 0 has no effect). |
|  | 1: PWSAnQFL is cleared to 0. |  |
| 0 | PWSAnCLNE | PWSAnQNE Clear |
|  |  | 0: PWSAnQNE retains the status (Writing 0 has no effect). |
|  | 1: PWSAnQNE is cleared to 0. |  |

### 37.2.1.24 PWSAnQUEj — Trigger Queue Register ( $\mathrm{j}=0$ to 7)

This register stores the channel number that received the trigger from PWGAn.

$$
\text { Access: } \quad \text { This register is a read-only register that can be read in 8-bit units. }
$$

Address: <PWSAn_base> $+0020_{\mathrm{H}}+\mathrm{j} \times \mathrm{H}_{\mathrm{H}}$
Value after reset: $\quad 7 \mathrm{~F}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | PWSAnQUEj[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R |

Table 37.44 PWSAnQUEj Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | Reserved | When read, the value after reset is returned. |
| 6 to 0 PWSAnQUEj[6:0] | These bits hold the channel number (0 to 95) of the PWGA for which a trigger was generated <br> in order from PWSAnQUE0 to PWSAnQUE7. |  |
|  |  | After the A/D conversion of PWSAnQUE0 is completed, the values in PWSAnQUE1 to <br> PWSAnQUE7 shift to PWSAnQUEO to PWSAnQUE6. |
|  |  |  |

## NOTE

If a trigger occurs simultaneously for multiple channels, the trigger with the smaller channel number has priority.

### 37.2.1.25 PWSAnPVCRx_y — PWM-Diag Mode A/D Setting Register

This register is used to set the corresponding A/D converter for each channel.
Two consecutive channels are set such as PWSA0PVCR02_03, and the 16 higher-order bits of each register correspond to an odd-numbered channel while the 16 lower-order bits correspond to an even- numbered channel.

At the generation of a trigger, the set value is transmitted to the ADCAnPWDVCR register of the $\mathrm{A} / \mathrm{D}$ converter.
For the ADCAnPWDVCR register, see Section 38, AID Converter (ADCA).

Table 37.45 PWSAnPVCRx_y Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 12 | PWSAnSLADx | RH850/F1KM-S4 100-pin products: |
|  |  | RH850/F1KM-S1 all products: |
|  |  | When writing, write the value after reset. |
|  |  | RH850/F1KH-D8 all products, |
|  |  | RH850/F1KM-S4 144/176/233/272-pin products: |
|  |  | ADCA Select (even-numbered channel) |
|  |  | 0 : Output to ADCAO. |
|  |  | 1: Output to ADCA1. |
| 11 | PWSAnVRDTx[11] | This bit indicates the set value of the ADCAnPWDVCR.MPXE bit*1. (even-numbered channel) |
| 10 to 8 | PWSAnVRDTx[10:8] | These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits ${ }^{* 1}$. (even-numbered channel) |
| 7, 6 | PWSAnVRDTx[7:6] | These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits. (even-numbered channel) |
| 5 to 0 | PWSAnVRDTx[5:0] | These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits. (even-numbered channel) |

Note 1. These bits are only supported for ADCAO.

### 37.2.1.26 PWSAnPWDDIRz — PWM-Diag Data Supplementary Information Register

This register stores the A/D conversion result correspond to PWSAnPVCRx_y register.

| Valu |  | ss: | This register is <PWSAn_bas $00000000_{\mathrm{H}}$ | ead- $020$ | nly registe $H+Z \times 4 H$ | that can | be re | $\text { in } 32$ | units. |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | $29 \quad 28$ | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | PWSAn MPXE | PW | AnMPXV[2:0] | - | PWSAn OWE | PWSAn WFLG | - | - | - |  |  | WS | [5:0] |  |  |
| Value after reset | 0 | 0 | $0 \quad 0$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | $\mathrm{R} \quad \mathrm{R}$ | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | $13 \quad 12$ | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | PWSAnPWDDR[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 00 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | $\mathrm{R} \quad \mathrm{R}$ | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.46 PWSAnPWDDIRz Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | PWSAnMPXE | This bit mirrors PWSAnVRDTx[11] or PWSAnVRDTy[27] |
| 30 to 28 | PWSAnMPXV[2:0] | These bits mirror PWSAnVRDTx[10:8] or PWSAnVRDTy[26:24] |
| 27 | Reserved | When read, the value after reset is returned. |
| 26 | PWSAnOWE | This bit indicates overwrite error flag of the A/D conversion result storing. Set timing is same as PWSAnPWDDR stored timing at the condition of PWSAnWFLG $=1$. <br> 0 : An overwrite error is not detected. <br> 1: An overwrite error is detected <br> Setting condition: <br> PWSAnWFLG $=1$, and new A/D conversion result is written to PWSAnPWDDR[15:0] <br> Clearing condition: <br> Reading this register, or clearing the PWSAnENBL bit. |
| 25 | PWSAnWFLG | This bit indicates write flag of the A/D conversion result storing. Set timing is same as PWSAnPWDDR stored timing. <br> 0 : This register is read, or A/D conversion is not finished. <br> 1: The A/D conversion result is stored (not read yet). <br> Setting condition: <br> The A/D conversion result is written to PWSAnPWDDR[15:0] <br> Clearing condition: <br> Reading this register, or clearing the PWSAnENBL bit. |
| 24 to 22 | Reserved | When read, the value after reset is returned. |
| 21 to 16 | PWSAnID[5:0] | These bits mirror PWSAnVRDTx[5:0] or PWSAnVRDTy[21:16] |
| 15 to 0 | PWSAnPWDDR[15:0] | These bits indicate the A/D conversion result which is sent by ADC_PWDDRn[15:0] pins from ADCAn. <br> The data format is same as ADCAnPWDTSNDR.PWDDR[15:0]. |

### 37.2.1.27 PWSAnEMU — PWSA Emulation Control Register

This register is used to set the operation for emulation.

> Access: This register can be read or written in 8-bit units.

Address: <PWSAn_base> + 000CH
Value after reset: $\quad 00_{H}$

Table 37.47 PWSAnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PWSAnSVSDIS | (When the EPC.SVSTOP bit $=0$ ) |
|  |  | The operation continues when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0 ). |
|  |  | (When the EPC.SVSTOP bit = 1) |
|  |  | 0 : When the debugger is controlling the microcontroller (by using break points, etc.); |
|  |  | - The output state to A/D is retained, the ADC_CONV_ENDn input at a break point is internally retained, and PWSAnQUEj is updated after break release. |
|  |  | - The PWGA_TRGOUTn input is accepted even at a break, and INTQFULL is also output. |
|  |  | - Reading and writing to the register is possible. |
|  |  | 1: The operation continues when the debugger is controlling the microcontroller (by using break points, etc.). |
|  |  | The above bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0), the operation of all channels PWGAn has stopped (SLPWGAk.SLPWGA), and no trigger has been generated from any of the channels PWGAn (PWSAnQUEO is the value after reset). |

### 37.2.1.28 PWGAINTFhk — PWGA Interrupt Factor Register (k=0 to 2)

These registers contain information about which PWGAn interrupt (PWGA_INTn) has been generated without depending on PWGAINTMSKhk setting. Regarding block diagram image, see Figure 37.1, PWGA Interrupt Connection Image.

Table 37.48 PWGAINTFhk Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | PWGAINTFhk | PWGA_INTn interrupt occurrence |
|  | $[31: 0]$ | $0:$ No interrupt occurred |
|  | 1: interrupt has occurred |  |
|  | The bits correspond to the following channels. |  |
|  | PWGAINTFh0[31:0]: PWGA31 - PWGA0 |  |
|  | PWGAINTFh1[31:0]: PWGA63 - PWGA32 |  |
|  |  | PWGAINTFh2[31:0]: PWGA95 - PWGA64 |

### 37.2.1.29 PWGAINTMSKhk — PWGA Interrupt Mask Register (k = 0 to 2)

These registers mask PWGAn interrupt output to INTC2 by each channels. Regarding block diagram image, see Figure 37.1, PWGA Interrupt Connection Image.

### 37.2.1.30 PWGAINTFChk — PWGA Interrupt Factor Clear Register (k=0 to 2)

These registers clear the bits of PWGA interrupt factor register (PWGAINTFhk). Regarding block diagram image, see Figure 37.1, PWGA Interrupt Connection Image.

Table 37.50 PWGAINTFChk Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | PWGAINTFChk | PWGAINTFhk[31:0] flag clear |
|  | $[31: 0]$ | $0:-$ |
|  |  | $1:$ Clear |

The bits correspond to the following channels.
PWGAINTFCh0[31:0]: PWGA31 - PWGA0
PWGAINTFCh1[31:0]: PWGA63 - PWGA32
PWGAINTFCh2[31:0]: PWGA95 - PWGA64

### 37.3 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.

Figure 37.3 PWM-Diag Operating Procedure

Procedures for compare buffer register simultaneous rewrite of PWGA are illustrated below.
The described term "compare register" indicates PWGAnCSDR, PWGAnCRDR, or PWGAnCTDR.
In addition, the described term "buffer register" indicates PWGAnCSBR, PWGAnCRBR, or PWGAnCTBR.

Note 1. Indicates the transition by hardware.

Figure 37.4 Compare Buffer Register Simultaneous Rewrite Procedure

Procedures for PWGAnTCBR register rewrite of PWGA are illustrated below.

Figure 37.5 PWGAnTCBR Register Rewrite Procedure

### 37.4 Operation Waveform of PWM-Diag

### 37.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output

### 37.4.1.1 Basic Operation Waveform of PWGA

The basic operation waveforms of PWGA are illustrated below.

Figure 37.6 Basic Waveform

### 37.4.1.2 Operation Waveform when Compare Buffer Register Simultaneous Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when compare buffer register simultaneous rewrite for PWGA is executed.

Figure 37.7 Waveform when Compare Buffer Register Simultaneous Rewrite is Executed (PWGAnOCL = 0)

Compare buffer register simultaneous rewrite is executed by re-setting the PWGAnCSDR and PWGAnCRDR registers, then setting either the PWGAnRDT or SLPWGAk register.

Moreover, if the relationship between set values in one interval is PWGAnCSDR > PWGAnCRDR, a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

In case of PWGAnOCL = 1, PWGAn_TRGOUTn is also occurred at the timing of "TRGOUT does not occur" in
Figure 37.7, Waveform when Compare Buffer Register Simultaneous Rewrite is Executed (PWGAnOCL = 0).

### 37.4.1.3 Operation Waveform when PWGAnTCBR Register Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when PWGAnTCBR register rewrite for PWGA is executed. PWGAnTCBR register rewrite is executed by re-setting the PWGAnTCR register after setting of PWGAnRDTT.

The update timing of PWGAnTCBR register requested by PWGAnRDTT is depended on PWGAnTCUT setting.

Figure 37.8 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL $=0$, PWGAnTCUT $=01_{B}$ )

PWGAn_TRGOUTn is not occurred at the timing of "TRGOUT does not occur" in Figure 37.8, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL $=0$, PWGAnTCUT $=01 B$ ) because PWGAnTOBE $=0$ even if PWGAnOCL $=1$.

Figure 37.9 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 10B)

PWGAn_TRGOUTn is not occurred at the timing of "TRGOUT does not occur" in Figure 37.9, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL $=0$, PWGAnTCUT $=10 \mathrm{~B}$ ) because PWGAnTOBE $=0$ even if PWGAnOCL $=1$.

Figure 37.10 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT $=11_{B}$ )

PWGAn_TRGOUTn is not occurred at the timing of "TRGOUT does not occur" in Figure 37.10, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 11B) because PWGAnTOBE $=0$ even if PWGAnOCL $=1$.

### 37.4.1.4 Operation Waveform when Stopping and Restarting PWGA Operation

The following figure illustrates the operation waveforms when stopping and restarting PWGA operation.

Figure 37.11 Stopping and Resuming Operation (1)

After the setting of SLPWGA has been changed from 1 to 0 , PWGAnCNT stops operation because PWGA_INTn is generated.

After PWGA_INTn has been generated, by changing the setting of SLPWGA from 0 to 1 , PWGAnCNT resumes counting from $000_{\mathrm{H}}$.

Figure 37.12 Stopping and Resuming Operation (2)

After the setting of SLPWGA has been changed from 1 to 0 , if the setting of SLPWGA is changed from 0 to 1 before PWGA_INTn is generated, operations of SLPWGA become invalid, and PWGAnCNT continues counting.

### 37.4.1.5 Waveforms of PWGA Operation with Specific Settings

The following figures illustrate the waveforms of PWGA operation with specific settings.
When PWGAnOCL is set to 0 and PWGAnCSBR is equal to PWGAnCRBR, PWGA_TOUTn is fixed to the low level and PWGA_TRGOUTn does not become valid as illustrated.

When PWGAnOCL is set to 1, PWGA_TRGOUTn occurs at the timing PWGAnCNT matches PWGAnCTBR regardless of PWGA_TOUTn level.

Figure 37.13 PWGA_TOUTn = 0\% Output Waveform

Figure 37.14 PWGA_TOUTn $=100 \%$ Output Waveform

### 37.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA

An example of the PWSA operation is shown below.

Note 1. QUEO indicates the PWGA_TRG number while the A/D conversion is executed. The initial value (while the A/D conversion is not executed) is $7 \mathrm{~F}_{\mathrm{H}}$.

Figure 37.15 Example of PWSA Operation
(1) Triggers occur simultaneously in channels 0 and 1 of PWGA. Channel 0 with the smaller channel number is stored in PWSAnQUE0, and channel 1 with the larger channel number is stored in PWSAnQUE1. The lower 16 bits data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the $\mathrm{A} / \mathrm{D}$ converter.
The A/D converter whether ADCA0 or ADCA1 is selected by PWSAnSLAD00 bit of PWSAnPVCR00_01. This example shows that ADCA0 is selected when PWSAnSLAD00 is 0 .
At this time, as the A/D conversion for channel 1 is in the waiting state, the PWSAnSTR.PWSAnQNE bit is set.
(2) On completion of $A / D$ conversion executed in step (1), the result of $A / D$ conversion is stored in the lower 16 bits of PWSAnPWDDIR00. The higher 16 bits of PWSAnPWDDIR00 mirrors the information of PWSAnPVCR00_01[15:0]. The channel number of PWSAnQUE1 shifts to PWSAnQUE0 and PWSAnQUE1 enters the empty state.
After that, as similar to step (1), the upper 16-bit data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. This example shows that ADCA1 is selected when PWSAnSLAD01 is 1.
(3) On completion of $A / D$ conversion executed in step (2), the result of $A / D$ conversion is stored in the lower 16 bits of PWSAnPWDDIR01. The higher 16 bits of PWSAnPWDDIR01 mirrors the information of PWSAnPVCR00_01[31:16]. PWSAnQUE0 enters the empty state.

### 37.5 PWM-Diag Related Function in A/D Converter (ADCA)

This section describes the A/D converter used in the PWM-Diag function.

### 37.6 ADCA Registers when the PWM-Diag Function is Used

- Before starting PWSA operation, the A/D converter must be set using the following register.
- PWM-Diag scan group control register (ADCAnPWDSGCR)
- When the PWM-Diag is running, the PWSAnPVCRx_y value corresponding to the channel under conversion is set in the following register of the $\mathrm{A} / \mathrm{D}$ converter.
- PWM-Diag virtual channel register (ADCAnPWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
- PWM-Diag data register (ADCAnPWDTSNDR)
- PWM-Diag data supplementary information register (ADCAnPWDDIR, PWSAnPWDDIRz*1)
- When $\mathrm{A} / \mathrm{D}$ conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
- Upper limit/lower limit error register (ADCAnULER)
- The scan end flag of the PWM-Diag scan group can be cleared using the following register.
- PWM-Diag scan end flag clear register (ADCAnPWDSGSEFCR)

Note 1. PWSAnPWDDIRz register is in PWSA.

## Section 38 A/D Converter (ADCA)

This section contains a generic description of the A/D Converter (ADCA).
The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ADCA.

### 38.1 Features of RH850/F1KH, RH850/F1KM ADCA

### 38.1.1 Number of Units and Channels

This microcontroller has the following number of ADCA units.
Table 38.1 Number of Units (RH850/F1KH-D8)

|  | RH850/F1KH-D8 | RH850/F1KH-D8 | RH850/F1KH-D8 |
| :--- | :--- | :--- | :--- |
| Product Name | 176 Pins | 233 Pins | 324 Pins |

Table $38.2 \quad$ Number of Units (RH850/F1KM-S4)

|  | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 | RH850/F1KM-S4 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Product Name | 100 Pins | 144 Pins | 176 Pins | 233 Pins | 272 Pins |
| Number of Units | 1 | 2 | 2 | 2 | 2 |
| Name | ADCAn $(\mathrm{n}=0)$ | ADCAn $(\mathrm{n}=0,1)$ | ADCAn $(\mathrm{n}=0,1)$ | ADCAn $(\mathrm{n}=0,1)$ | ADCAn $(\mathrm{n}=0,1)$ |

Table 38.3 Number of Units (RH850/F1KM-S1)

|  | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 | RH850/F1KM-S1 |
| :--- | :--- | :--- | :--- | :--- |
| Product Name | 48 Pins | 64 Pins | 80 Pins | 100 Pins |
| Number of Units | 1 | 1 | 1 | 1 |
| Name | ADCAn $(\mathrm{n}=0)$ | ADCAn $(\mathrm{n}=0)$ | ADCAn $(\mathrm{n}=0)$ | ADCAn $(\mathrm{n}=0)$ |

An ADCAn unit has the same number of physical channels as the number of $\mathrm{A} / \mathrm{D}$ input pins and the same number of virtual channels as the number of addresses where the results of $\mathrm{A} / \mathrm{D}$ conversion will be stored. The numbers of channels on individual products are as listed below.

Table 38.4 Unit Configurations and Physical Channels (RH850/F1KH-D8)

| Unit Name <br> ADCAn | RH850/F1KH-D8 <br> 176 Pins | RH850/F1KH-D8 <br> 233 Pins | RH850/F1KH-D8 <br> 324 Pins |  |
| :--- | :--- | :--- | :--- | :--- |
| ADCA0 | 12-bit pins for <br> conversion* | 16 | 16 | 16 |
|  | 10-bit pins for <br> conversion | 18 | 18 | 18 |
| ADCA1 | 12-bit pins for <br> conversion*1 | 16 | 16 | 16 |
|  | 10-bit pins for <br> conversion*2 | 8 | 20 | 20 |

Note 1. When 10-bit mode is selected, this pin can be used for 10-bit conversion.
Note 2. When 12 -bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

Table 38.5 Unit Configurations and Physical Channels (RH850/F1KM-S4)

| Unit Name <br> ADCAn | RH850/F1KM-S4 <br> 100 Pins | RH850/F1KM-S4 <br> 144 Pins | RH850/F1KM-S4 <br> 176 Pins | RH850/F1KM-S4 <br> 233 Pins | RH850/F1KM-S4 <br> 272 Pins |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ADCA0 | 12-bit pins for <br> conversion*1 | 16 | 16 | 16 | 16 | 16 |
| 10-bit pins for <br> conversion*2 | 16 | 18 | 18 | 18 | 18 |  |
| ADCA1 | 12-bit pins for <br> conversion*1 | - | 8 | 16 | 16 | 16 |
| 10-bit pins for <br> conversion*2 | - | 4 | 8 | 20 | 20 |  |

Note 1. When 10-bit mode is selected, this pin can be used for 10 -bit conversion.
Note 2. When 12 -bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

Table $38.10 \quad$ Indices (RH850/F1KH-D8)

| Index | Description |
| :---: | :---: |
| n | Throughout this section, the individual ADCA units are identified by the index " n "; for example, ADCAnPWDVCR ( $\mathrm{n}=0,1$ ) indicates the PWM-Diag virtual channel register. |
| m | Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index "m"; for example, ANInm. |
| j | Throughout this section, the individual virtual channels of ADCAn are identified by the index " j "; for example, ADCAnVCRj indicates the virtual channel register. |
| x | Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index " $x$ "; for example, ADCAnSGSTCRx indicates the scan group $x$ start control register ( $x=1$ to 3 ). |
| k | Throughout this section, the individual physical channel numbers for $T \& H$ are identified by the index " $k$ "; for example, THkE ( $k=0$ to 5 ) is T\&H enable bit of the T\&H enable register (ADCAnTHER). |

Table 38.11 Indices (RH850/F1KM-S4)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual ADCA units are identified by the index " n "; for example, ADCAnPWDVCR <br> $(\mathrm{n}=0,1)$ indicates the PWM-Diag virtual channel register. |
| m | Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the <br> index " $m$ "; for example, ANInm. |
| j | Throughout this section, the individual virtual channels of ADCAn are identified by the index " j "; for example, <br> ADCAnVCRj indicates the virtual channel register. |
| x | Throughout this section, the individual scan groups $(\mathrm{SG})$ of ADCAn are identified by the index " x "; for example, <br> ADCAnSGSTCRx ( $\mathrm{x}=1$ to 3 ) indicates the scan group x start control register. |
| k | Throughout this section, the individual physical channel numbers for T\&H are identified by the index " k "; for <br> example, THkE $(\mathrm{k}=0$ to 5$)$ is $T \& H$ enable bit of the $T \& H$ enable register (ADCAnTHER). |

Table 38.12 Indices (RH850/F1KM-S1)

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual ADCA units are identified by the index " n "; for example, ADCAnPWDVCR <br> $(\mathrm{n}=0)$ indicates the PWM-Diag virtual channel register. |
| m | Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the <br> index " $m$ "; for example, ANInm. |
| j | Throughout this section, the individual virtual channels of ADCAn are identified by the index " j "; for example, <br> ADCAnVCRj indicates the virtual channel register. |
| k | Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index " x "; for example, <br> ADCAnSGSTCRx ( $\mathrm{x}=1$ to 3 ) indicates the scan group x start control register. |

Page 3759 of 4535

The following table shows values indicated by the indices of each product.
Table 38.13 Indices of Products (RH850/F1KH-D8)

| Indices of Each Product |  |  |
| :---: | :---: | :---: |
| RH850/F1KH-D8 <br> 176 Pins | RH850/F1KH-D8 233 Pins | RH850/F1KH-D8 <br> 324 Pins |

| $\mathrm{j}=00$ to 19*1 (ADCAO) | $\mathrm{j}=00$ to $28{ }^{* 1}$ (ADCA0) | $\mathrm{j}=00$ to 36 (ADCA0) | $\mathrm{j}=00$ to 49 (ADCA0) |
| $x=1$ to 3 (ADCA0) | $x=1$ to 3 (ADCA0) | $x=1$ to 3 (ADCA0) | $x=1$ to 3 (ADCAO) |
| $\mathrm{k}=0,2,4$ (ADCAO) | $\mathrm{k}=0,2,4$ (ADCAO) | $\mathrm{k}=0,2,4$ (ADCA0) | $\mathrm{k}=0$ to 5 (ADCAO) |

Note 1. $\mathrm{j}=33$ to 35 are supported only in diagnosis of T\&H circuit.

### 38.1.2 Register Base Addresses

ADCAn base addresses are listed in the following table.
ADCAn register addresses are given as offsets from the base addresses.
Table 38.16 Register Base Addresses (RH850/F1KH-D8)

| Base Address Name | Base Address |
| :--- | :--- |
| <ADCAO_base> | FFF2 $0000_{\mathrm{H}}$ |
| <ADCA1_base> | FFD6 $\mathrm{DOOO}_{\mathrm{H}}$ |

Table 38.17 Register Base Addresses (RH850/F1KM-S4)

| Base Address Name | Base Address |
| :--- | :--- |
| <ADCAO_base> | FFF2 $0000_{H}$ |
| <ADCA1_base> | FFD6 D000 |
| Table 38.18 $\quad$ Register Base Address (RH850/F1KM-S1) |  |
| Base Address Name | Base Address |
| <ADCAO_base> | FFF2 $0000_{H}$ |

### 38.1.3 Clock Supply

The ADCAn clock supply is shown in the following table.
Table 38.19 Clock Supply (RH850/F1KH-D8)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| ADCA0 | ADCLK | CKSCLK_AADCA | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_AADCA | Bus clock |
| ADCA1 | ADCLK | CKSCLK_IADCA | Module clock |
|  | Register access clock | CPUCLK_L | Bus clock |

Table 38.20 Clock Supply (RH850/F1KM-S4)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| ADCA0 | ADCLK | CKSCLK_AADCA | Module clock |
|  | Register access clock | CPUCLK_L, CKSCLK_AADCA | Bus clock |
| ADCA1 | ADCLK | CKSCLK_IADCA | Module clock |
|  | Register access clock | CPUCLK_L | Bus clock |

Table 38.21 Clock Supply (RH850/F1KM-S1)

| Unit Name | Unit Clock Name | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| ADCA0 | ADCLK | CKSCLK_AADCA | Module clock |
|  | Register access clock | CPUCLK_L | Bus clock |
|  |  | CKSCLK_AADCA |  |

### 38.1.4 Interrupt Requests

ADCAn interrupt requests are listed in the following table.
Table 38.22 Interrupt Requests (RH850/F1KH-D8)

| Unit Interrupt <br> Signal | Description | Interrupt Number | DMA Trigger | Other Trigger <br> Sumber |
| :--- | :--- | :--- | :--- | :--- |

| INT_SG3 | Scan group 4 (SG4) A/D conversion end signal | - | 7 | - |  |  |  |  |  |  |
| ADC_CONV_END0 |  |  |  |  |  |  |  |  |  |  |

### 38.1.5 Reset Sources

ADCAn reset sources are listed in the following table. ADCAn is initialized by these reset sources.
Table 38.25 Reset Sources (RH850/F1KH-D8)

| Unit Name | Reset Source |
| :--- | :--- |
| ADCA0 | Reset sources other than transition to DeepSTOP mode (AWORES) |
| ADCA1 | All reset sources (ISORES) |

Table 38.26 Reset Sources (RH850/F1KM-S4)

| Unit Name | Reset Source |
| :--- | :--- |
| ADCA0 | Reset sources other than transition to DeepSTOP mode (AWORES) |
| ADCA1 | All reset sources (ISORES) |

Table 38.27 Reset Sources (RH850/F1KM-S1)

| Unit Name | Reset Source |
| :--- | :--- |
| ADCAO | Reset sources other than transition to DeepSTOP mode (AWORES) |

### 38.1.6 External Input/Output Signals

External input/output signals of ADCAn are listed below.
Table 38.28 ADCAO Analog Input Signals (RH850/F1KH-D8)

| Unit Signal Name | Alternative Port Pin Signal | Resolution | T\&H | RH850/ <br> F1KH-D8 <br> 176 Pins | RH850/ <br> F1KH-D8 <br> 233 Pins | RH850/ <br> F1KH-D8 <br> 272 Pins | RH850/ <br> F1KH-D8 <br> 324 Pins |

Note 1. The track and hold circuit $(T \& H)$ for $\operatorname{ANIOm}(m=01,03,05)$ is only included on RH850/F1KM-S1 devices with 100 pins.

Table 38.31 ADCA0 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| ADCA0 |  | External trigger pin (scan group 1)*1 |
| ADCAOTRG0 | External trigger pin (scan group 2)*1 | ADCAOTRG0 |
| ADCAOTRG1 | External trigger pin (scan group 3)*1 | ADCA0TRG1 |
| ADCAOTRG2 | External analog multiplexer (MPX) output pin 0 | ADCA0TRG2 |
| ADCAOSEL0 | External analog multiplexer (MPX) output pin 1 | ADCA0SEL0 |
| ADCAOSEL1 | External analog multiplexer (MPX) output pin 2 | ADCA0SEL1 |
| ADCAOSEL2 | ADCA0SEL2 |  |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see Section 2A.12, Noise Filter \& Edge/Level Detector, Section 2B.12, Noise Filter \& Edge/Level Detector and Section 2C.12, Noise Filter \& Edge/Level Detector.

## CAUTION

- When port P8_6 is used as ADCA0I8S, port P8_6 pin outputs a low-level RESETOUT signal while a reset is asserted and continues to output a low level after the reset is deasserted.
For details, see Section 2A.11.1.1, P8_6: $\overline{\text { RESETOUT }}$, Section 2B.11.1.1, P8_6: $\overline{\text { RESETOUT }}$ and Section 2C.11.1.1, P8_6: RESETOUT.
- The RH850/F1KH-D8 and RH850/F1KM-S4 do not have ANIO28 (ADCAOI12S) and ANIO29 (ADCAOI13S) pins, so do not attempt writing to the corresponding bits or controlling the signals.
For descriptions in this section that mention ANIO28 (ADCA0I12S) and ANIO29 (ADCAOI13S), read them as stating that ANI028 (ADCA0I12S) and ANI029 (ADCAOI13S) are not supported.

Table 38.32 ADCA1 Analog Input Signals (RH850/F1KH-D8)

Table 38.34 ADCA1 External Input/Output Signals (RH850/F1KH-D8)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| ADCA1 | External trigger pin (scan group 1)*1 | ADCA1TRG0 |
| ADCA1TRG0 | External trigger pin (scan group 2)*1 | ADCA1TRG1 |
| ADCA1TRG1 | External trigger pin (scan group 3)*1 | ADCA1TRG2 |
| ADCA1TRG2 |  |  |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see Section 2A.12, Noise Filter \& Edge/Level Detector.

Table 38.35 ADCA1 External Input/Output Signals (RH850/F1KM-S4)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| ADCA1 | External trigger pin (scan group 1)*1 | ADCA1TRG0 |
| ADCA1TRG0 | External trigger pin (scan group 2)*1 | ADCA1TRG1 |
| ADCA1TRG1 | External trigger pin (scan group 3)*1 | ADCA1TRG2 |
| ADCA1TRG2 |  |  |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see Section 2B.12, Noise Filter \& Edge/Level Detector

### 38.2 Overview

### 38.2.1 Functional Overview

ADCA has the following features.

- 10-bit/12-bit resolution
- Successive approximation conversion method
- Number of A/D input channels

A/D conversion is available for a maximum of 34 ADCA0 channels and 36 ADCA1 channels. Additionally, ADCA0 supports the connection of an external analog multiplexer (MPX) to extend the number of analog input channels.

- Internal track and hold (T\&H) circuit ANI000 to ANI005 (ADCA0I0 to ADCA0I5) of ADCA0 include the track and hold circuit. The track and hold circuit can sample up to 6 channels of analog input simultaneously.
- A/D conversion control by scan groups

The A/D conversion channel or conversion mode (scan mode) can be set for each scan group.

- Two scan modes

Multi-cycle scan mode: Specified number of scans are executed.
Continuous scan mode: Scans are executed repeatedly and continuously.

- Asynchronous/synchronous suspend and resume function

A processing for a scan group can be interrupted to run the processing for another scan group.

- Start/Stop trigger for each scan group

Software, hardware, and external trigger can start processing of each scan group.
Software can stop processing of each scan group.

- Scan end interrupt and DMA transfer are supported.

For each scan group, an interrupt request to INTC can be issued or DMA transfer can be started, each time a processing for the virtual channel indicated by the end virtual channel pointer ends, or a virtual channel ends.

- A/D conversion channel repeat function

A/D conversion is performed for the same channel two or four times sequentially, and the result is stored in the data register.

- Abundant safety functions

Abundant safety functions are provided, such as A/D converter diagnosis, diagnosis of the channel multiplexer, diagnosis of open pins, diagnosis of the T\&H circuit, 8 pairs of upper limit/lower limit check for the A/D converter and have error flag register for each virtual channel, overwrite check for data registers, and read and clear function for data registers.

- Shortest A/D conversion time per channel
$1.15 \mu \mathrm{~s}$ (when MPX is not used)
$2.30 \mu \mathrm{~s}$ (when MPX is used)
- Configurable stabilization time for MPX analog input

Stabilization time can be selected by 8 patterns of counter setting for each physical channel.
Min. 1us
Max. 250us

NOTE

- Physical channel (ANInm)

Each A/D input channel of ADCAO and ADCA1 units is called a physical channel. The physical channel of each unit is represented as ANIOm ( $m=0$ to 27,30 to 35 ) for ADCAO and ANI1m ( $m=0$ to 35 ) for ADCA1.
In RH850/F1KH, RH850/F1KM, the alternative port pins for 12-bit resolution A/D input channel and 10-bit resolution A/D input channel are represented as ADCAnIm and ADCAnImS, respectively. In this section, the physical channels and the corresponding alternative port pins are listed together.

- Virtual channel (ADCAnVCRj)

ADCA0 has a maximum of 50 virtual channels, and ADCA1 has a maximum of 36 virtual channels. The virtual channel specifies the physical channel to be scanned.
Scans are executed in sequence from the smallest virtual channel number. The scan order can be arbitrarily-specified by using virtual channels. In addition, the scanned result is stored in the data register (ADCAnDRj) corresponding to the virtual channel.

- Scan group (SGx)

ADCA has three scan groups (SG1, SG2, SG3) and one PWM-Diag group (SG4). A/D conversion is executed in scan group unit. The channel to be scanned can be selected for each group by specifying the scan range, that is, the conversion start virtual channel and the conversion end virtual channel.

### 38.2.2 Block Diagram

The block diagram of ADCA0 is shown in Figure 38.1, ADCA0 Block Diagram. The block diagram of ADCA1 is shown in Figure 38.2, ADCA1 Block Diagram.
(1) Configuration of ADCAO

Figure 38.1 ADCAO Block Diagram
(2) Configuration of ADCA1

Figure 38.2 ADCA1 Block Diagram

## (3) Configuration of External Trigger Input Pins

An external trigger input pin is a hardware trigger source to activate ADCAn.
The configuration of external trigger input pins is shown below.

Note 1. For the condition setting to accept a trigger from an external trigger input pin, see Section 2A.12, Noise Filter \& Edge/Level Detector, Section 2B.12, Noise Filter \& Edge/Level Detector and Section 2C.12, Noise Filter \& Edge/Level Detector

Note 2. For the hardware trigger sources, see Table 38.78, List of AID Conversion Hardware Triggers.

Figure 38.3 Internal Connection Diagram of External Trigger Input Pins

## (4) Configuration of External Analog Multiplexer (MPX)

The external analog multiplexer (MPX) can be connected to any input signal pins ADCA0I0 to ADCA0I19S. An example of the external analog multiplexer connection is shown below.

Note: The T\&H function is disabled when the external analog multiplexer (MPX) is used
Note 1. For the analog input of each product, see Table 38.28, ADCA0 Analog Input Signals (RH850/F1KH-D8), Table 38.29, ADCAO Analog Input Signals (RH850/F1KM-S4), Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1).

Note 2. The RH850/F1KH-D8 and RH850/F1KM-S4 do not have ADCAOI12S (ANIO28) and ADCAOI13S (ANIO29) pins.

Figure 38.4 Example of External Analog Multiplexer Connection

## (5) Virtual Channel

The virtual channel specifies the physical address to be scanned.
The virtual channel is controlled by the ADCAnVCRj register.
A usage example of the virtual channel is shown below.

Figure $38.5 \quad$ Usage Example of Virtual Register

### 38.3 Registers

### 38.3.1 List of Registers

The ADCA registers are listed in the following table.
For details about <ADCAn_base>, see Section 38.1.2, Register Base Addresses.
Table 38.36 List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| ADCA specific registers (virtual channel) |  |  |  |
| ADCAn | Virtual channel register j | ADCAnVCRj | <ADCAn_base> + $\mathrm{j} \times 4 \mathrm{H}$ |
|  | PWM-Diag virtual channel register | ADCAnPWDVCR | <ADCAn_base> + 0F4H |
|  | Data register j | ADCAnDRj | <ADCAn_base> $+100_{H}+\mathrm{j} \times 2_{\text {H }}$ |
|  | Data supplementary information register j | ADCAnDIRj | <ADCAn_base> + $200_{H}+\mathrm{j} \times 4_{H}$ |
|  | PWM-Diag data register | ADCAnPWDTSNDR | <ADCAn_base> + 178 ${ }_{\text {H }}$ |
|  | PWM-Diag data supplementary information register | ADCAnPWDDIR | <ADCAn_base> + 2 F 4 H |
| ADCA specific registers (control) |  |  |  |
| ADCAn | A/D force halt register | ADCAnADHALTR | <ADCAn_base> + 300 ${ }_{\text {H }}$ |
|  | A/D control register | ADCAnADCR | <ADCAn_base> + 304H |
|  | MPX current register | ADCAnMPXCURR | <ADCAn_base> + $30 \mathrm{C}_{\mathrm{H}}$ |
|  | T\&H sampling start control register | ADCAnTHSMPSTCR | <ADCAn_base> + 314 |
|  | T\&H control register | ADCAnTHCR | <ADCAn_base> + 318 ${ }_{\text {H }}$ |
|  | T\&H group A hold start control register | ADCAnTHAHLDSTCR | <ADCAn_base> + 31 $\mathrm{H}_{\mathrm{H}}$ |
|  | T\&H group B hold start control register | ADCAnTHBHLDSTCR | <ADCAn_base> + 320н |
|  | T\&H group A control register | ADCAnTHACR | <ADCAn_base> + 324H |
|  | T\&H group B control register | ADCAnTHBCR | <ADCAn_base> + 328H |
|  | T\&H enable register | ADCAnTHER | <ADCAn_base> + 32CH |
|  | T\&H group select register | ADCAnTHGSR | <ADCAn_base> + 330 ${ }^{\text {H }}$ |
|  | Sampling control register | ADCAnSMPCR | <ADCAn_base> + 380 H $^{\text {l }}$ |
|  | MPX stabilization time selection register 0 | ADCAnMPXSTBTSELR0 | <ADCAn_base> + 5FOH |
|  | MPX stabilization time selection register 1 | ADCAnMPXSTBTSELR1 | <ADCAn_base> + 5F4H |
|  | MPX stabilization time selection register 2 | ADCAnMPXSTBTSELR2 | <ADCAn_base> + 5F8H |
|  | MPX stabilization time selection register 3 | ADCAnMPXSTBTSELR3 | <ADCAn_base> + 5FCH |
|  | MPX stabilization time selection register 4 | ADCAnMPXSTBTSELR4 | <ADCAn_base> + 600 H |
|  | MPX stabilization time setting register 0 | ADCAnMPXSTBTR0 | <ADCAn_base> + 610 ${ }^{\text {H }}$ |
|  | MPX stabilization time setting register 1 | ADCAnMPXSTBTR1 | <ADCAn_base> + 614 ${ }_{\text {H }}$ |
|  | MPX stabilization time setting register 2 | ADCAnMPXSTBTR2 | <ADCAn_base> + 618 ${ }_{\text {H }}$ |
|  | MPX stabilization time setting register 3 | ADCAnMPXSTBTR3 | <ADCAn_base> + 61 ${ }_{\text {H }}$ |
|  | MPX stabilization time setting register 4 | ADCAnMPXSTBTR4 | <ADCAn_base> + 620 ${ }_{\text {H }}$ |
|  | MPX stabilization time setting register 5 | ADCAnMPXSTBTR5 | <ADCAn_base> + 624H |
|  | MPX stabilization time setting register 6 | ADCAnMPXSTBTR6 | <ADCAn_base> + 628 ${ }_{\text {H }}$ |
|  | MPX stabilization time setting register 7 | ADCAnMPXSTBTR7 | <ADCAn_base> + 62CH |

Table $38.36 \quad$ List of Registers

| Module Name | Register Name | Symbol | Address |
| :---: | :---: | :---: | :---: |
| ADCA specific registers (safety-related) |  |  |  |
| ADCAn | Safety control register | ADCAnSFTCR | <ADCAn_base> + 334 ${ }_{\text {H }}$ |
|  | Upper limit/lower limit table register 0 | ADCAnULLMTBR0 | <ADCAn_base> + 338 ${ }^{\text {H }}$ |
|  | Upper limit/lower limit table register 1 | ADCAnULLMTBR1 | <ADCAn_base> + 33C ${ }_{\text {H }}$ |
|  | Upper limit/lower limit table register 2 | ADCAnULLMTBR2 | <ADCAn_base> + 340 H |
|  | Error clear register | ADCAnECR | <ADCAn_base> + 344 ${ }_{\text {H }}$ |
|  | Upper limit/lower limit error register | ADCAnULER | <ADCAn_base> + 348 ${ }^{\text {H }}$ |
|  | Overwrite error register | ADCAnOWER | <ADCAn_base> + $34 \mathrm{C}_{\mathrm{H}}$ |
|  | Upper limit/lower limit error VC flag register 0 | ADCAnULEVCFR0 | <ADCAn_base> + 540 |
|  | Upper limit/lower limit error VC flag register 1 | ADCAnULEVCFR1 | <ADCAn_base> + 544 ${ }_{\text {H }}$ |
|  | Upper limit/lower limit table register 3 | ADCAnULLMTBR3 | <ADCAn_base> + 564 |
|  | Upper limit/lower limit table register 4 | ADCAnULLMTBR4 | <ADCAn_base> + 568H |
|  | Upper limit/lower limit table register 5 | ADCAnULLMTBR5 | <ADCAn_base> + 56C ${ }_{\text {H }}$ |
|  | Upper limit/lower limit table register 6 | ADCAnULLMTBR6 | <ADCAn_base> + 570 ${ }_{\text {H }}$ |
|  | Upper limit/lower limit table register 7 | ADCAnULLMTBR7 | <ADCAn_base> + 574 H |
| Scan group (SG) specific registers |  |  |  |
| ADCAn | Scan group x start control register | ADCAnSGSTCRx | <ADCAn_base> + $\mathrm{x} \times 40_{\mathrm{H}}+400_{\mathrm{H}}$ |
|  | PWM-Diag scan stop control register | ADCAnPWDSGSTPCR | <ADCAn_base> + 504H |
|  | PWM-Diag scan group control register | ADCAnPWDSGCR | <ADCAn_base> + 508H |
|  | Scan group x control register | ADCAnSGCRx | <ADCAn_base> + $\mathrm{x} \times 40_{\mathrm{H}}+408_{\mathrm{H}}$ |
|  | Scan group x start virtual channel pointer | ADCAnSGVCSPx | <ADCAn_base> + $\mathrm{x} \times 40_{\mathrm{H}}+40 \mathrm{C}_{\mathrm{H}}$ |
