

be differences between the SAR levels of various telephones and at various positions, they all meet the government requirement for safe exposure. The FCC has granted an Equipment Authorization for this model phone with all reported SAR levels evaluated as in compliance with the FCC RF emission guidelines.

SAR information on this model telephone is on file with the FCC and can be found at <http://www.fcc.gov/oe/ea/>. Click FCC ID Search and search on IVGSRNP2400 or IVGRNP2400.

Additional information on Specific Absorption Rates (SAR) can be found on the Cellular Telecommunications Industry Association (CTIA) Website at <http://www.ctia.org/>.

The only authorized headsets that may be utilized with the SpectraLink 8002, e340/h340/i640 Wireless Telephone are those obtainable from Polycom or its reseller partners.

RNP2400 — The highest recorded SAR is held to ear 0.166 W/kg

SNP2400 — The highest record SAR is 0.061 W/kg Head, 0.0379 W/kg body.

NOTES AND WARNINGS

- HAC—This equipment is Hearing Aid Compatible (HAC).
- Handset Operation Normal Position—Hold the handset as you would any other telephone, with the earpiece to your ear and speak into the microphone. The internal antenna is then positioned properly.
- Handset Operation Body-Worn Position—To maintain compliance with RF energy exposure guidelines, if you wear a handset on your body when transmitting, always use the handset with a Polycom-supplied accessory as described in the user guide for this handset. Polycom supplies belt clips, holsters and lanyards for body-worn operation. Use of accessories not supplied by Polycom may cause the handset emissions to exceed RF energy exposure guidelines.
- The user should not make changes or modifications not expressly approved by Polycom. Any such changes could void the user's authority to operate the equipment.
- Warning—The earpiece/mouthpiece region on the handset can attract and retain small objects.

Your WLAN Handset is a low-power radio transmitter and receiver. When it is ON, it receives and also sends out radio frequency (RF) signals. In August 1996, the Federal Communications Commissions (FCC) adopted RF exposure guidelines with safety levels for hand-held wireless telephones. Those guidelines are consistent with the safety standards previously set by both U.S. and international standards bodies:

- ANSI C95.1 (1992) American National Standards Institute
- NCRP—Report 86 (1986) National Council on Radiation Protection and Measurements
- ICNIRP (1996) International Commission on Non-ionizing Radiation Protection
- DHWC—Safety Code 6 Department of Health and Welfare Canada

Those standards were developed by independent scientific organizations through periodic and thorough evaluation of scientific studies. The standards include a substantial safety margin designed to assure the safety of all persons, regardless of age and health. The exposure standard for wireless mobile phones employs a unit of measurement known as the Specific Absorption Rate, or SAR. The SAR limit set by the FCC is 1.6 W/kg. Tests for SAR are conducted using standard operating positions specified by the FCC with the telephone transmitting at its highest certified power level in all tested frequency bands. Although the SAR is determined at the highest certified power level, the actual SAR level of the telephone while operating can be well below the maximum value. This is because the telephone is designed to operate at multiple power levels so as to use only the power required to reach the network. In general, the closer you are to a wireless Base Station antenna, the lower the power output. Before a telephone model is available for sale to the public, it must be tested and certified to the FCC that it does not exceed the limit established by the government-adopted requirement for safe exposure. The tests are performed in positions and locations (e.g., at the ear and worn on the body) as required by the FCC for each model. While there may

This Class A digital apparatus complies with Canadian ICES-003.
Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

EUROPEAN NATIONAL RESTRICTIONS

Most EU and other European countries have made the 2.4 GHz bands available for the use of wireless LANs. Table 1 provides an overview of the regulatory requirements in general that are applicable for the 2.4 GHz bands.

Certain countries have additional restrictions and/or requirements. However, the requirements for any country may evolve. Polycom recommends that you check with local authorities for the latest status of their national regulations for 2.4 GHz wireless LANs.

Table 1. Overview of Regulatory Requirements for Wireless LANs

Frequency Band (MHz)	Max Power Level (EIRP) (mW)	Indoor and Outdoor
2400–2483.5	100	X

The following countries have additional requirements or restrictions.

France

For 2.4 GHz, the output power is restricted to 10 mW EIRP when the product is used outdoors in the band 2454–2483.5 MHz. There are no restrictions when used in other parts of the 2.4 GHz band. Check <http://www.arcep.fr/> for more details.
