Maryland State Police Medevac Communications

NEW IC-R75 HF RECEIVER

Cutting edge technology for today's serious DX'er, yet easy & affordable for a casual listener.

A large display and well spaced keys, knobs & dials helps make it easy to work the compact 'R75.

Hear MORE of what's out there. Pick up more amateur, marine and shortwave broadcasts. The new 'R75 covers from **0.03 – 60.0 MHz*** – wider than most other HF receivers.

Pull out the weak signals. The IC-R75 sports a remarkable arsenal of signal detection weapons, ready for your command: A **triple conversion** receive system rejects image and spurious signals. An **automatic notch filter** reduces interference by minimizing "beat" and "howl" signals. Use **Twin Passband Tuning (PBT)** to zero in on signals by shaping the IF passband. ICOM's all new **Synchronous AM detection (S-AM)** technology reduces signal fading in AM broadcasts. Optional **Digital Signal Processing (DSP)** noise reduction in the AF stage converts analog SSB, AM and FM signals to crisp, clear audio output (you'll hear the difference on the 'R75's **large front mounted speaker**). Further tailor the 'R75 to meet your listening needs by installing **up to two optional filters.**

There's much more. Plan to test drive a surprisingly affordable new IC-R75 at your authorized ICOM dealer's showroom soon.

ICOM brings you the BEST in wide band receivers

Computer not included.

IC-PCR1000

The original "World in a Little Black Box". 100% PC hardware external. Impressive 0.01 –1300 MHz* wide band reception, all modes. Listen to your favorite broadcasts while working in foreground applications. Designed for Windows® 3.1 or 95.

"The PCR1000 has something to intrigue and satisfy everyone. This is a fun product." – *QST, 7/98*

IC-R8500 The expert's choice.

0.5 – 2000 MHz*; commercial grade; all mode; IF shift; noise blanker; audio peak filter (APF); 1000 memory channels; built-in CI-V command control and RS-232C port for PC remote control with ICOM software for Windows®.

"If you want a receiver that is both a superior world band radio and a solid scanner, the new Icom IC-R8500 is the best choice."

– *Passport to World Band Radio, 1998*

IC-R10 (left) Advanced performance and features.

0.5 – 1300 MHz*; all mode; alphanumeric backlit display; attenuator; 7 different scan modes; beginner mode; 1000 memory channels; band scope; includes AA Ni-Cds and charger.

IC-R2 (right) Excellent audio, tiny package.

0.5 – 1300 MHz*; AM, FM, WFM; easy band switching; CTCSS decode; 400 memory channels; priority watch; MIL SPEC 810 C/D/E; weather resistant; includes 2 AA Ni-Cds and charger.

IC-PCR100 A little different look, a little fewer features, a little lower price.

Enjoy 0.01 – 1300 MHz* wide band reception on AM, FM and WFM. Outstanding performance. Designed for Windows® 95 or 98. Download the full version software today: <www.icomamerica.com>

Computer not included.

*Cellular frequencies blocked: unblocked versions available only to FCC approved users.

Monitoring Times

Vol. 18, No. 8 August 1999

Cover Story

When Minutes Matter

***By* Alan Henney**

In 1968 Adam Cowley, founder of Maryland's shock trauma system, documented the importance of beginning emergency medical treatment within the "golden hour." Two years later the Maryland State Police agreed to make one helicopter available for medical transport, and thus began one of the most extensive medevac programs in the country.

Today, more than 4,000 patients are flown each year by eleven helicopters operating out of eight bases. The article beginning on page 8 provides a comprehensive communications profile of this modern, state-run medevac system.

Cover photo: MSP Trooper helicopter flies out a crash victim from US Route 301 in 1995. Photo by Tom Yeatman.

CONTENTS

Building Your Own Weather Station 16

By Ken Reitz

Radio and an interest in weather have always seemed to go together, whether it's for purposes of radio propagation or as a severe weather spotter. Although you can set up your own satellite receiving station to see weather patterns from space (see July *MT*), a simple home weather station can be very effective in charting your local weather. *MT*'s comprehensive *Guide to Weather Broadcasts* on page 19 completes the radio connection.

The New VOA: The Audience Weighs In 20

By Mark B. Lewis

In the spring of 1998 the Voice of America made its biggest change in 50 years with its 24-hour *VOA News Now*. A year later, what is the audience assessment of the new approach? Methods of program delivery have also undergone a radical change.

Improvements to the Sony 2010 22

By Steve Johnston

The Sony ICF-2010 has been one of the most successful portable shortwave radios in history. But that doesn't mean there isn't room for a few simple improvements. Here are four simple projects for better portability, better sound, increased AM filter options, and an adjustable attenuator for use with an external antenna.

Sneak Preview:

The Uniden BC245XLT TrunkTracker II is a huge leap forward in scanner technology. Thanks to "The Scanning Report" (p.26), *MT* readers get a head start in understanding the features and functions of this much-anticipated scanner. Next month Rich Barnett will cover the 245's innovative approach to scanner programming.

WASHINGTON WHISPERS

By Fred Maia, W5YI
fmaia@cwixmail.com

• **"Rock and a Hard Place Department."** Radio and TV stations find themselves in a quandary. The Emergency Alert System (EAS), a digital data network that links stations together in times of severe weather or other emergencies, has been in place for a couple of years.

It replaced the tone-based Emergency Broadcast System (EBS.) But the company that holds the patent on EAS, Quad Dimension, wants royalty payments from all users.

Stations don't want to pay hundreds of dollars annually for a system they thought they had already bought, and many have therefore ignored the legal notices. The FCC requires these stations to use EAS, and they'll be heavily fined if they don't. Either way, station owners appear to lose money. The Society of Broadcast Engineers is working on an amicable solution.

• **The United States is not the only country that has problems with low-power unlicensed broadcast stations.** Israeli air traffic controllers (ATCs) staged a one hour strike on May 25th to protest increased ground-to-air communication system interference by pirate radio stations in the area.

The ATCs closed Ben Gurion International Airport for the hour and urged pirate radio station operators to stop interfering with control tower frequencies, otherwise they would cause an air disaster. There have already been several near collisions.

The police say that there are about 100-150 pirate radio stations in Israel with most of them concentrated around Tel Aviv where the airport is situated. The micropower stations make high profits and cost little to operate. They return to the air quickly from a different location once they are raided. To add to the problem, the Israeli justice system seldom sends station owners to jail and the fines are small.

A meeting between the ministers of police, communications and transport was held to discuss the issue.

• **Telecommunications regulatory agencies all over the world are looking at ways to reduce the requirement for ham operators to learn high speed Morse code.** International Amateur Radio law requires unspecified manual telegraphy proficiency when operating on the high frequency ham bands below 30 MHz.

Germany has converted their Class "A" beginning license, which requires 6 word-per-minute (wpm) code proficiency, to a full privilege Class "1" license. Argentina has reduced their 10 wpm General Class and 15 wpm Superior class to 7 wpm. Canada is proposing to let their no-code "Basic" ham operators use the entire 10-meter HF band once they pass 5 wpm.

Now comes word that the United Kingdom will introduce a 100-watt all band/all privilege Amateur Radio license this fall for Class "B" (code free) operators who pass a 5 wpm telegraphy exam. New Zealand is considering doing away with all Morse examinations. Applicants will be able to upgrade to HF privileges by simply proving that they have completed 25 CW (code) contacts.

And the United States could be next! The Federal Communications Commission is considering whether to reduce the top 20 wpm code speed to just 5 wpm. And the current six license class structure could be reduced to only three. The FCC decision could come at any time ...even before the next issue of *Monitoring Times*!

The next step will be to eliminate the Morse code knowledge requirement entirely. This is expected to happen in a couple of years.

• **The U.S. is in danger of running out of area codes and phone numbers.** The United States now has almost twice as many area codes as in 1991. Industry officials project the need for 30 new codes a year unless changes are made. The goal is to postpone the scrapping of our 10-digit system, with three digits for the area code and seven for the local number. Adding additional digits would require a prohibitive overhaul of our telephone system.

But there really is no shortage. The bottom line is that of the nearly one billion allocated phone numbers, nearly two-thirds are still unused! There are already four numbers allotted for every man, woman and child in the country.

The FCC intends to do something about it. See the PCS Front Line column on page 80 for the details.

• **The FCC is investigating the $3 billion "10-10" dial-around phone industry.** These services allow callers to choose a long distance company for individual calls by "dialing around" their current long distance carrier. There have been complaints that charges by 10-10 services exceed those advertised.

• **It is back to square one for the FCC's campaign to crack down on telephone "slamming."** MCI Worldcom challenged the FCC's ruling in federal court that would have allowed consumers a 30 day "no pay" period while phone customers challenged disputed "slamming" ...the practice of illegally changing long distance service from one carrier to another without permission.

MCI wanted the rules suspended to give the commission more time to consider an industry plan to address the problem. AT&T, MCI WorldCom, Sprint and associations representing smaller long-distance companies support creating a third-party group to handle consumers' slamming complaints. The FCC received a record 20,000 slamming complaints in 1998.

• **Does a private (or public) e-mail letter that contains annoying content violate federal law?** A section of the Communications Decency Act of 1996 says it is a federal crime to transmit a "...communication which is obscene, lewd, lascivious, filthy or indecent with intent to annoy, abuse, threaten or harass another person."

ApolloMedia, the San Francisco owner of <**http://www.annoy.com**> believes the law violates free speech and is therefore unconstitutional. Annoy.com lets people post their opinions anonymously to public officials. The site is well done but some of the content is very rough indeed!

A California district appeals court upheld the law after interpreting it to ban only obscene material ...defined as smut which portrays sexual activity in a disgusting manner. It was left to local juries to determine – based on community standards – when indecent content crosses the line. ApolloMedia appealed that ruling.

By refusing to issue an opinion, on April 19th the U.S. Supreme Court, unanimously affirmed the lower courts ruling. Annoy.com says it will continue to do business.

DEDICATED TO THE SCANNING AND SHORTWAVE ENTHUSIAST.

WE'RE MORE THAN JUST SOFTWARE!

NEW!! JUST RELEASED! VERSION 7.5

SCANCAT GOLD for Windows "SE"

Since 1989, The Recognized Leader in Computer Control

Once you use SCANCAT with YOUR radio, you'll NEVER use your radio again WITHOUT SCANCAT!

SCANCAT supports almost ALL computer controlled radios by: AOR, DRAKE, KENWOOD, ICOM, YAESU and JRC (NRD) Plus PRO-2005/6/35/42 (with OS456/535), Lowe HF-150, and Watkins-Johnson.

NOW SUPPORTS AOR AR16B - AR2008 & TEN-TEC RX320

SCANCAT GOLD FOR WINDOWS "SE"
(Surveillance-Enhanced)

FEATURES

- **Selective Sound Recording using PC-compatible sound card. "Point & Shoot" playback by individual hits.**
- Demographic search for frequency co-ordination and 2-way Usage Analysis.
- Detailed logging to ASCII type files with DATE, TIME, Sig Str, Air Time.
- 6 New sweep Analysis Functions.
- Exclusive "MACRO" control by frequency of Dwell, Hang, Resume, Sig. Treshhold and even 6 separate programmable, audible alarms.
- Command line options for TIMED ON/OFF (Unattended) logging/searches.
- Run as many as 6 different CI-V addressable radios as "Master/Slave".
- New! Scheduling/Recording Functions.

With Scancat Gold for Windows "SE," your spectrum never looked so good! Load virtually "any" database and Scancat "SE" will examine your database, plot each and every frequency, no matter what the range...and "paint" the entire analysis on your screen.

SEVERAL GRAPHICAL ANALYSIS MODES AVAILABLE

- By Signal Strength per frequency in a "histograph".
- By Signal Strength plotted in individual dots.
- By Number of hits per frequency in a "histograph".
- ***IF THAT ISN'T ENOUGH, try this...Multicolored, 3-D "Spatial-Landscape".***

SCANCAT GOLD "SE"...**$159.95** + S & H* UPGRADE SCANCAT GOLD V7.5 "SE"...**$59.95** + S & H*

SCANCAT'S WINDOWS FEATURES

- Unattended Logging of frequencies.
- Scan Create Disk Files.
- Spectrum Analysis to Screen OR Printer.
- Supports PerCon, Mr. Scanner, and Betty Bearcat CD Roms.
- Scan VHF & HF Icom's Simultaneously.
- LINK up to 100 Disk files or ranges.
- MULTIPLE search filters for DiskFile Scanning.
- New -- Programmable Favorite Frequency "Quick Buttons".
- Search by CTCSS & DCS tones with OS456/535 or DC440 (ICOM only).
- INCLUDES several large shortwave and VHF/UHF databases.

SCANCAT GOLD FOR WINDOWS (NON-"SE").....**$99.95** + S & H* UPGRADE TO V7.5 .....**$29.95** + S & H*

All the features you EXPECT from a true Windows application such as:

- VERSATILE "Functional" spectrum analysis. NOT just a "pretty face". Spectrum is held in memory for long term accumulation. Simply "mouse over" to read frequency of spectrum location. "CLICK" to immediately tune your receiver. You can even accumulate a spectrum from scanning DISKFILES of random frequencies!
- DIRECT scanning of most DBASE, FOXPRO, ACCESS, BTRIEVE files WITHOUT "importing".
- UNIQUE database management system with moveable columns. Even SPLIT columns into doubles or triples for easy viewing of ALL important data on one screen.
- Exclusive 'SLIDE RULE' tuner. Click or 'skate' your mouse over our Slide-Tuner to change frequencies effortlessly! OR use our graphical tuning knob.

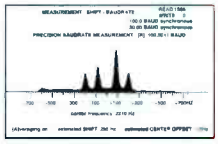
*$5 U.S. $7.50 FOREIGN

HOKA CODE-3 USA Version

"The Standard Against Which All Future Decoders Will Be Compared"

Many radio amateurs and SWLs are puzzled! Just what are all those strange signals you can hear but not identify on the Short Wave Bands? A few of them such as CW, RTTY, Packet and Amtor you'll know - but what about the many other signals?

There are some well known CW/RTTY Decoders but then there is CODE-3. It's up to you to make the choice, but it will be easy once you see CODE-3. CODE-3 has an exclusive auto-classification module that tells YOU what you're listening to AND automatically sets you up to start decoding. No other decoder can do this on ALL the modes listed below - and most more expensive decoders have no means of identifying ANY received signals! Why spend more money for other decoders with FEWER features? CODE-3 works on any IBM-compatible computer with MS-DOS with at least 640kb of RAM, and a CGA monitor. CODE-3 includes software, a complete audio to digital FSK converter with built-in 115V ac power supply, and a RS-232 cable, ready to use.



Simulated Speed Measurement Module

CODE-3 is the most sophisticated decoder available for ANY amount of money.

26 Modes included in STANDARD package include:

- Morse ★
- RTTY/Baudot/Murray ★
- Sitor CCIR 625/476-4 ARQ - Navtex ★
- AX25 Packet ★
- Facsimile all RPM (up to 16 gray shades at 1024 x 768 pixels ★
- Autospec - Mk's I & II
- DUP-ARQ Artrac
- Twinplex
- ASCII ★
- ARQ6-90/98
- SI-ARQ/ARQ-S
- SWED-ARQ-ARQ-SWE
- ARQ-E/ARQ1000 Duplex
- ARQ-N-ARQ1000 Duplex Variant
- ARQ-E3-CCIR519 Variant
- POL-ARQ 100 Baud Duplex ARQ
- TDM242/ARQ-M2/4-242
- TDM342/ARQ-M2/4
- FEC-A FEC100A/FEC101
- FEC-S • FEC1000 Simplex
- Sports Info 300 baud ASCII
- Hellschreiber-Synch/Asynch ★
- Sitor • RAW (Normal Sitor but without Synch.
- ARQ6-70
- Baudot F788N
- Pactor ★
- WEFAX ★

EXTRA OPTIONS

	REG. PRICE
Piccolo	$85.00
Coquelet	$85.00
4 special ARQ & FEC systems: TORG-10/11, ROU-FEC/ RUM-FEC, HC-ARQ (ICRC) and HNG-FEC	$115.00
SYNOP decoder	$85.00

- All modes in typical baud rates with possibility of changing to any desired value of speed and shift.
- User can save incoming data to disk in either ASCII or raw bit form.

Historic QSLs in good hands

The Committee to Preserve Radio Verifications (QSLs) was established in 1986 to give a home to private QSL collections and rescue some radio history that might not be valued by the family of an elderly or deceased hobbyist. Until recently, this growing, computer-indexed collection has been housed at the Christian Science Monitor's Boston headquarters.

The collection now has a new and very appropriate home at the Library of American Broadcasting (LAB) on the campus of the University of Maryland in College Park. Some of the LAB's holdings include the Arthur Godfrey collection, more than 3,000 books, 25,000 photographs, and thousands of pamphlets, recordings, commercials, and scripts. LAB operates in conjunction with its sister project, the National Public Broadcasting archives.

Curator Charles Howell says, "We ... are honored to serve as your repository. The Committee for the Preservation of Radio Verifications QSL Collection is an outstanding example of the impact that dedicated individuals can have in preserving the radio heritage of our nation and indeed the world."

The CPRV collection currently contains about 30,000 QSLs, 40 percent of which date from before 1949. Recent significant additions have been the collections of Hank Holbrook, Howard Kemp, and Alvin Sizer.

For information on how to participate in the preservation program, contact Jerry Berg, CPRV chairman, 38 Eastern Ave, Lexington, MA 02421, (781) 861-8481.

CIA Encryption Challenge

Jim Sanborn is an artist who believes "it's important that every piece of artwork holds one's attention for as long as possible." He's succeeded in holding the attention of at least one CIA employee for as much as 400 hours with his sculpture entitled "Kryptos." The sculpture, etched with 865 characters, was erected outside the CIA cafeteria in 1990, but it was

only in February of this year that David Stein, a CIA physicist, deciphered all but 97 of the letters on the left side of the puzzle.

The first of June, Jim Gillogly, a California computer scientist for Mentat, Inc., solved the exact same section in about 9 days, using a software program he had written.

Retired CIA cryptographer Ed Scheidt taught the artist how to encode his message. Sanborn

BULLETIN BOARD

(See www.grove-ent.com/hmpgmt.html for more events and club info)

Aug 14, 15: Waseca, MN, Special Event Station
A special event station will operate from the Waseca County Fairgrounds using vintage E.F. Johnson transmitters, using SSB, AM, and CW. HF operation planned for 0800 and 2100 CDT on 3885, 7290, 14286, 21400, 29000 kHz AM. SSB operation on 3900, 7260, 14250, 21350, 28400 kHz. CW operation on 3700, 7125, 14050, 21150, 28050 kHz. Callsign WA0CJU/9ALD (Edgar Johnson's call)

Aug 15: Lexington, KY
Bluegrass Amateur Radio Society is sponsoring the Central Kentucky ARRL hamfest and computer show at the National Guard Armory adjacent to the Lexington, KY, airport. For more information contact John Barnes KS4GL, *KS4GL@juno.com* or call 606-253-1178 evenings. Dealer sales, indoor fleamarket, forums, refreshments. 8am-4pm; admission $6.

Aug 20, 21, 22: York, PA, Special Event Station
A station to celebrate the 250th birthday of York County, PA, will be operated by the York Co ARC Aug 20-22 on 7.250, 14.250, 21.250 and 28.500 MHz. The first 2,500 QSLs of these or *any* contact with club station WKY3ORK between Feb 10, 1999, to Dec 31, 1999, will receive a gold parchment award displaying the history of York Co. and signed by four commissioners. Send your QSL or photocopy of your logs with 3 IRC (or $3 US) to KC3TL, Pete deVolpi, 408 Hillside Ave, New Cumberland, PA 17070-3036.

Aug 21: Longview, WA
Lower Columbia A.R.A. / 8th Annual Ham Radio, Computer, & Electronic Equipment Swap Meet / LCARA, POB 906, Longview, WA, 98632. Bob Morehouse, KB7ADO, (360) 425-6076 eves. Location: Cowlitz Co. Expo Center; Talk-in on 147.26+, pl 114.8. 9am-1pm. Admission $3. RVs $12. Email to *KB7ADO@aol.com* or see flyer at: **www.qsl.net/nc7p/**

Aug 21, 22: Huntsville, AL
The annual, friendly Huntsville Hamfest is located at the Von Braun Center's South hall; flea market, dealers, seminars, VE testing, banquet, and much more. For more information, call (205) 534-7175, write to Huntsville Hamfest, P.O. Box 12534, Huntsville, AL 35815, visit **http://www.hamfest.org**, or email to Scotty Neustadter, W4WW, *scotty@airnet.net*

Aug 22: St. Charles, MO
Hamfest 1999, sponsored by the St Charles ARC, will be located at Blanchette Park in St Charles, 6:30am to 1pm; talk-in 146.67. Demonstrations by ATV, AMSAT, and Bob Heil (tentative). Flea market, free admission, free forums, food concessions. Contact Ken Kieser 314-428-4383 *kfeiser@aol.com* or visit **http://www.qth.com/wb0hsi/**

Sept 3-5: Bridgeport, WV
National Radio Club convention at the Holiday Inn (304-842-5411). Convention registration $35 to host William Swiger, One Casey Lane, Bridgeport, WV 26330, 304-842-4635.

ODXA Essay Contest
To celebrate the 25th anniversary of the Ontario DX Association, radio listeners around the world; listeners of international shortwave, mediumwave, FM, scanning, amateur radio; listeners of all ages and levels of experience; all are invited to participate in a special essay contest..

The up to 1000 word essay is to be on "Radio in my life." Tell about the importance of radio to you, how it has contributed to your life, why you love radio...

All essays will be published in a booklet to be available at Radio Fest 99, September 24-25 in Oakville, Canada. All entrants will receive a complimentary copy of the booklet. First prize will be a portable shortwave radio.

Entries must be submitted by e-mail or by printed *typewritten* copy and received no later than September 1, 1999. E-mail to: dxontario@compuserve.com or mail to: Ontario DX Association, P.O. Box 161, Station A, Willowdale, Ontario M2N 5S8, Canada

says the puzzle is layers on top of layers, and all parts must be solved before discovering the final solution. The sculpture itself is also multilayered, created out of granite, quartz, lodestone, copper and water.

Presumably CIA computers could uncover the full text in a matter of hours or days, but this is an off-hours challenge to anyone wanting to undertake it. You, too, can try your hand at it; both parts of the encoded text can be found at **ABCNews.com**, or better yet, go to **http://www.und.nodak.edu/org/crypto/crypto/general.crypt.info/Kryptos/**. The only copy of the solution is locked in a CIA safe.

Illegal to Sell Cell-Capable Radios?

A hobbyist named Frank put up his Radio Shack Pro-2022 scanner with full 800 MHz coverage for sale through the internet auction site eBay Inc. He freely disclosed in his ad that the radio had cellular coverage and that monitoring cellular frequencies is illegal.

Three days later, eBay canceled the auction, saying, "The item you have listed does not appear to be consistent with eBay guidelines," – i.e., selling illegal items. Says Frank, "I thought it was legal to sell a radio that is capable, but illegal to listen to the band. Especially since it was manufactured for the USA in 1993, before the law of 1994. – The same with cordless phone freq... It is illegal to listen to cordless phones, but almost every radio receives 40-50 MHz."

According to Chapter 119 of the US Criminal Code, you may not send through the mail, send or carry in interstate or foreign commerce, manufacture, assemble, possess or sell, or place any advertisement for any device whose design renders it primarily useful for the purpose of surreptitious interception of protected communications. The critical word here is *primarily*. eBay of course has the right to play it safe!

World's largest ground plane

Liberty Labs of Kimbalton, Iowa, has finished construction of the world's largest ground plane for antenna calibration. It measures 80 meters long by 50 meters wide, about the same amount of land as a football field. It cost half a million dollars to build but can be rented for a couple of days (with their technical staff to assist) for far less than it would cost to build your own antenna test chamber.

Satellite access to networks

Congress is very close to revising communications law and copyright protections to allow satellite broadcasters to provide local news, weather, and sports broadcasts, and they have clarified the conditions under which satellite customers may be permitted to receive programming from distant network affiliates. Both houses have passed what the Senate is calling the Home Viewers Improvement Act; minor differences in the two bills remain to be resolved. Some viewers now receiving distant network affiliates were due to have network programming cut off on June 30th.

Quechuan Indians turn to shortwave

In one of the most remote, impassable regions of the Andes mountains live thousands of Quechua people who rely upon radio for news, personal messages, and entertainment. The Quechua people make up nearly 62 percent of the population of Bolivia, and they have long dreamed of having their own radio station. Finally, they do.

According to an article in *Radio World* by station director Eldon Porter, Radio Mosoj Chaski began broadcasting exclusively in Quechua on April 12 from Cochabamba, Bolivia, using the frequency 3310 kHz. The transmitter, built by Omnitronix (800-446-6648) in North Wales, Pennsylvania, is the first 10 kW solid state tropical band transmitter in the world.

Industry study finds potential link to cancer

"We're now in gray area ... the best thing to do is let the public know about the findings so that they can make their own judgment," said George Carlo, in a commendable statement. Carlo is chairman of the industry-funded Wireless Technology Research group which found possible connections both in biological tests and statistical analysis between cellular phone use and cancer.

Elizabeth Jacobsen of the Food and Drug Administration told the *Washington Post*, "These results seem to have been done well – the question now is 'okay, we've got a result. What do we do with it?'" The results indicate the need for more study, but no regulatory action is planned at this time, she said.

"Communications" is compiled by Rachel Baughn, editor, from clippings submitted by our readers. When Minutes Matter

Maryland State Police Helicopters

By Alan Henney

"It's in Montgomery County," proclaims dispatcher Steven Risso seconds after answering the phone. To Risso's left, lifting the headset to his ear, sits Maryland state trooper Sgt. Tony Galloway. For a moment, the dimly lit room is silent except for the clicking of Galloway's computer keyboard as he retrieves the map grid for the accident scene. Galloway hits the speed dial button to Trooper 8's hangar and feeds the landing zone location and coordinates to the waiting air crew.

Meanwhile, Risso has completed the medevac request form and adjusts his telephone headset, "Hi, it's SysCom," he says to the nurse at Suburban Hospital, "Trooper 8 is en route to Rockville for an auto accident, they'll see you in about 10 minutes." Moments later Trooper 8 is airborne and the helicopter's location, along with seven other helicopters, is tracked on a blurry projection TV screen across the room.

More than 8,000 public safety helicopter missions each year begin in a similar manner at this communications facility operated by the Maryland Institute for Emergency Medical Service Systems (MIEMSS) on the campus of University of Maryland at Baltimore. When this center, known as SysCom (systems communication), receives a request, usually from one of the county's "central alarms," it dispatches a helicopter from one of eight Maryland bases. SysCom also helps coordinate flights for other area medevac providers (listed elsewhere in this article).

How It All Started

Maryland was the first and remains one of the few states to operate such an extensive medevac program. The program's foundation is based on research conducted by the late R. Adams Cowley, a trauma surgeon and founder of Maryland's shock trauma system. In 1968, Cowley evaluated the effects of sustained uncorrected shock in trauma patients. Cowley discovered that if internal bleeding were stopped and the underlying shock was reversed within the first hour – what he eventually dubbed the "golden hour" – patient survival rates increased significantly.

In 1961 Cowley opened the nation's first shock-trauma center at the University of Maryland campus in Baltimore, but many patients couldn't get there in time.

Cowley looked for faster ways to bring hospital-like care to the critically injured within that first hour. He considered military-style mobile operating rooms and tractor trailers that could meet ambulances halfway. But the most viable solution was modeled after the army's success in Korea and Vietnam where battlefield casualties were flown by helicopters staffed by medics to front-line MASH units.

The Maryland State Police acquired its first aircraft in 1954. It was a Stinson L-5 airplane based at Rutherford Field in Woodlawn. In 1960 the agency purchased its first helicopter, a piston-powered Hiller H-12E helicopter, for airborne surveillance and transport only.

It wasn't until the late 1960s that Cowley approached the state police with an idea. In a television interview, Cowley said he initially faced reluctance when he proposed that the state police helicopter take on medical missions. That reluctance turned to support when the project received federal funds.

Fire fighters help load trauma patient into a Maryland State Police Trooper helicopter. N92MD - Aerospatiale SA365N-1 Dauphin.

The Federal Highway Safety Act of 1968 paved way for what would become the first civilian medevac program in the country. On June 2, 1969, the Maryland State Police in conjunction with the University of Maryland Hospital received a federal grant for a project entitled "Helicopter Patrol."

It officially began on March 18, 1970, with a

Maryland State Police Trooper (flying as Trooper 2) on display at Hyattsville VFD's open house. N61MD - 1993 Eurocopter AS 365 N2 Dauphin.

single Bell Jet Ranger 206A helicopter based at the Valley MSP barrack for 10 hours during the day. At other hours it was available on an on-call basis from the 175th National Guard hangar at Glenn L. Martin State Airport. The helicopter flew all of its patients to what would eventually become the University of Maryland's Shock Trauma Center in Baltimore. The Jet Rangers would become the helicopter used to provide medevac services in Maryland for the next 25 years.

The first year the helicopter flew 197 patients. About 88 percent of them survived. The project was a success. That success allowed the program to expand to its current size of eight bases with 11 helicopters. More than 4,000 patients are flown each year. In its first 25 years the aviation division flew 61,000 patients, and 152,000 police missions, for a total of almost 140,000 flight hours.

The program has had three fatal crashes – all Bell Jet Rangers – each of which killed the onboard pilot and paramedic. The most recent crash, on Jan. 19, 1986, led to new safety procedures, stricter standards for pilots, an airborne flight-following system for the helicopters, and the purchase of the American EuroCopter (Aerosptable) SA365N1 and SA365N2 Dauphin helicopters. The Dauphins cost $5.5 million each and their high-pitched, high-powered whine distinguishes them from the traditional helicopter sound.

The Dauphin helicopters offer increased range and speed over the Jet Rangers. The Dauphin travels at about 180 mph, compared with the Jet Ranger's 115 mph. The Dauphin's range is 500 miles, 300 miles more than the Jet Ranger. The Dauphin can lift more than the older helicopters, enabling the crew to transport as many as six people plus extra medical equipment. Two patients can be transported side by side in the Dauphin, unlike the stacked configuration that was sometimes used in the Jet Ranger. The first of 11 Dauphins was placed in service on May 18, 1989.

Patients have never been charged for the air transport. Budget cuts in the late 1980s eventually led to the creation of a motor vehicle tag fee in October 1991. Approximately 70 percent of the aviation division's $16 million operating budget now comes from this $8 annual motor vehicle registration tax which also supports area-wide trauma centers and the EMS communication system.

The MSP aviation division consists of 159 total personnel, including 44 trooper/flight paramedics, 56 uniform and civilian pilots and 59 additional support staff.

Delaware State Police Trooper 2 searches surf for missing swimmer who drowned off Rehoboth Beach, De. Paramedics and lifeguards tried to resuscitate the man without success after he was pulled from the ocean about an hour later. Aug. 23, 1998. N165SP - 1989 Bell 206L-3 (Long Ranger III).

MSP Trooper Helicopter Radio Controller

Just what frequencies has the Maryland State Police programmed into the radios of its Trooper helicopters? During the Jet Ranger days the answer was simple – most of the MSP channels, several med channels and, in what little channel space remained, a few local police and fire frequencies. Although the helicopter radio system, which was controlled by a Global Wulfsberg Systems C-1000 Communications Management Controller, was user-programmable, it was limited to only 30 preprogrammed channels.

Preprogrammed channel plans varied somewhat throughout the state to accommodate communication with various agencies. On a regular basis scanner listeners heard a helicopter pilot or medic come up on a jurisdiction's primary fire or police channel only to have the dispatcher refer the crew to a "working" frequency which hadn't been preprogrammed. After the helicopter crew finally entered that frequency into its radio, all too often they were missing the repeater input, or even worse, a coded squelch tone.

The Global Wulfsberg Systems C-5000 Communications Management Controller has eliminated much of the radio confusion in the MSP helicopters. The $5,100 controller holds 350 preprogrammed memory channels. No longer does the pilot have to be a scanner enthusiast to find a frequency. Each channel can include independent transmit/receive frequencies and CTCSS/DCS, a three-digit channel number plus room for an eight-character channel descriptor. The C-5000 can be programmed using a hand-held programmer or through the keypad.

One of the original US Park Police helicopters lands near Riverdale, Md, on the northbound lanes of the Baltimore-Washington Parkway at the Riverdale Road exit to evaluate victims injured in a crash involving a tour bus and a car. July 30, 1980.

The C-5000 does for the civilian helicopter what large-scale integrated equipment has long done for the military. The C-5000 interfaces with and simultaneously provides a single tuner for up to three transceiver systems and eliminates the need for separate tuners for each radio. Each transceiver system can consist of up to three radios, allowing operation of nine radios by a single C-5000 controller. Two independent microphone inputs and two independent balanced audio outputs allow simultaneous use of two radios from a single control.

The C-5000 incorporates three digital voice recorders which allow playback of the last 15 to 20 seconds of a conversation from each of the three transceiver systems. The C-5000 is capable of simulcast, cross-band relay, relay/simulcast, repeater and cross-band full duplex operation across as many as three channels simultaneously. In addition, the C-5000 can interface with the most common types of commercial or military voice encryption equipment including Motorola DVP/DES, GE's Voice Guards, Transcript International KY-58, and others.

The C-5000's screen displays two lines of information which explain the mode of operation using bluish white electroluminescent lighting. On the keypad, 12 push-buttons carry numerals and letter codes which represent the available functions.

Global Wulfsberg Systems manufactures more than 90 percent of the aviation community's FM radios. Global Wulfsberg radios such as the RT-138F, RT-30, RT-406F Flexcomm, and the TR-9600F Flitecomm are a familiar sight in many public safety helicopter panels.

Table 1 is the channel plan used throughout Maryland by the Trooper helicopters. Next to the frequency is the mode; "s" for simplex, "d" for duplex, or "r" for repeater. In the case of duplex or repeater operation, UHF inputs are the standard offset (5 MHz higher for 450-470 or 3 MHz higher for 470-512 MHz). Listed to the right of the CTCSS/DCS tone is the eight-character channel tag that appears on the C-5000's display.

Each of the state's 23 counties has been numbered in alphabetic order for EMS reporting purposes (same number used in the channel tag). The list starts with Maryland State Police (MSP) channels, followed by county law enforcement, fire, and EMS channels for each of the state's counties. Miscellaneous federal, state and municipal police departments are then listed followed by state police frequencies for West Virginia (WVSP), Virginia (VSP), Delaware (DSP), and Pennsylvania (PSP). Selected county frequencies for those adjacent states are then included along with the standard med channels.

The long-awaited UNIDEN BC245XLT is HERE!

This hand-held communications marvel has stunned the scanner marketplace with its dual trunking capabilities! Imagine scanning through conventional channels as well as both Motorola and GE-Ericsson EDACS channels simultaneously, stopping to hear any communications—your choice—on any of these systems!

With land, sea, and air frequency coverage of 29-54, 108-174, 406-512, and 806-956 MHz (less cellular), and 300 memory channels in 10 banks, this potent Bearcat even offers a nine-pin cable connector to permit downloading of computer databases. The information-packed LCD display is backlit for easy night viewing.

Factory pre-programmed search ranges target active police, fire/emergency, air, marine, and weather channels. Standard features included:

- individual channel lockout
- search
- channel-selectable delay
- data skip
- 10 priority channels
- three-day memory backup without batteries or power
- and lightning-fast Turbo Scan.

Identical in appearance to BC235XLT, shown above

This is the new scanner standard by which all others will be compared. Order now!

Maryland State Police Trooper helicopter lands on school ball field to fly out burn victim. N57MD - 1988 Aerospatiale SA365N-1 Dauphin.

TABLE 3: WASHINGTON [DC] HOSPITAL CENTER MEDSTAR HELICOPTER CHANNEL PRESETS

By contrast to the MSP Trooper helicopters, the two MedSTAR helicopters use the Flexcomm RT series transceivers, with the three individual channel plans listed below. (* denotes channels selected at power-up.)

Medevac Services in Maryland and Nearby Areas

Some of the better known medevac services in Maryland and adjacent states appear in an uncut version of this article, available for download at a modest price on the Grove website at **www.grove-ent.com/MTARTICLES**. Much of the aircraft description comes from the **www.landings.com** webpage – an excellent reference for such purposes. Check the Seaox Air-Medical homepage, **www.seaox.com/listing.html**, for a list of medevac services by state. The common helipad frequency, 123.05, is standard among most services listed.

Special thanks to those who contributed to this listing: Allen Cole, Ben Sager, Chuck Byam, Mary Ann Himes, Clinton Burley, Dave Milsted, Dave Purcell, David Clark, Duane K. Spencer, E. Nevin Steffy, George R. Thomas, Greg Guise, Jack McCartan, Jim Burke, John Wilson, Joseph Cardani, Pete A. Piringer, Peter Vieth, Spencer Stevenson, Steven Risso, Thomas E. Brandt, Wolfgang Boernert.

A keep-it-simple guide to

Building Your Own Weather Station

By Ken Reitz KS4ZR

Inexpensive simplicity. With this weather station I can read barometric pressure; current temperature; yesterday's high and this morning's low. Don't forget to calibrate your barometer with the one at your local airport.

Weather and radio have been a natural combination since the dawn of the wireless age. In the earliest part of this century weather reports were routine traffic traded between ships and shore stations. Hobbyists tuning in were the first to know when bad weather was on the way.

Today a national network of radio stations peppers the whole country for the sole purpose of disseminating weather information to the public. Billions of dollars a year trade hands in the field of weather related electronics. With the availability of The Weather Channel, NOAA Weather Radio and the Internet, more and more Americans are becoming interested in meteorology.

Setting Up Your Own Weather Station

Until recently, having sophisticated weather instruments that not only recorded daily weather statistics but could chart them in a customized data base, was reserved only for government and educational institutions. The rapid development of computer technology has made it possible for individuals to have their own dream weather station for less than the price of a good scanner radio.

These systems are widely available from many mail order catalog companies, including Radio Shack (see chart 1) and it's a good idea to shop for price. There may be as much as $200 difference between nearly identical systems. Look to discount electronic catalogs for good deals, but pay attention to shipping fees and what's not specifically included.

Still, you don't have to invest a lot of money to have a very useful home weather station. Most hardware and discount stores sell inexpensive "weather stations" which consist typically of three analog gauges indicating temperature, barometric pressure and relative humidity (see photo). These units cost around $20-30. While not weather service grade, they are useful for home purposes.

These units are shipped with the barometer uncalibrated. To calibrate your barometer call your local airport and get the current official barometric pressure reading (they may call it the altimeter reading). There is an adjustment on the back of the barometer which may be turned by hand to make the needle read the proper pressure. Once that's set it's ready to operate.

When you take a reading tap the glass with your finger to make sure it's reading the current pressure. Look for a barometer with a resettable pointer. This is a needle on the inside of the glass which is turned freely by a knob on the front of the gauge. When you line up the pointer with the current reading, the pointer stays where you set it while the barometer rises or falls. On your next reading you'll be able to see if the pressure is going up or down relative to where pointer was. Now reset the pointer by lining it up with the new reading.

It's good practice to recalibrate your barometer in the summer and in the winter to be as accurate as possible. It's particularly important to recalibrate it when a tropical system is headed your way. If you're a ham and you need to give barometric readings to a hurricane watch net, you must have a recently calibrated barometer or your information is useless.

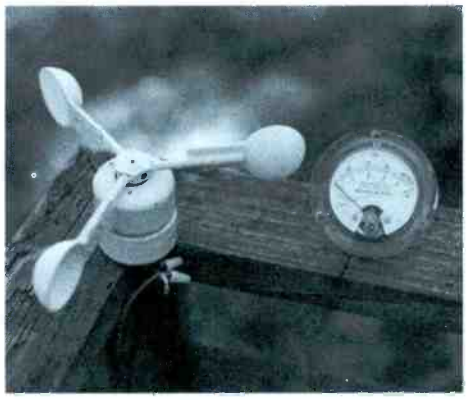
The cheapest item you can buy for your weather station is a rain gauge. Every department and hardware store sells them, typically under $5. They might not be as accurate as those at the National Weather Service (NWS), but they will give you an adequate reading. Place your rain gauge in the open, away from sheltering building and trees. Empty and record the results after every rainfall. For measuring snow, use a yard stick and take measurements immediately after the snow storm subsides. Measure at least three separate locations in an open, unprotected area and determine the average of the three for your "official" measurement.

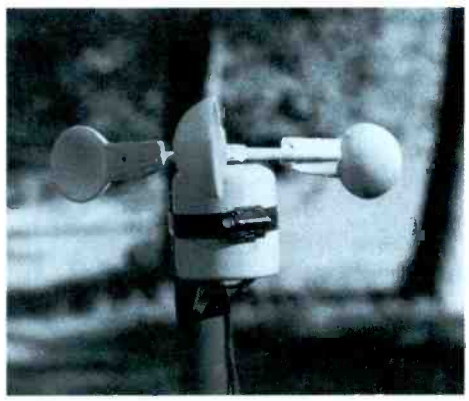
The next cheapest item you'll buy for your weather station is a digital indoor/outdoor minimum/maximum reading thermometer. Once again the micro chip comes to the rescue and makes possible an inexpensive but very accurate weather instrument. Radio Shack has such a thermometer which it routinely discounts in its sales catalogs for around $15. Wireless remote reading thermometers cost roughly twice that. Just remember when you're installing it to put the sensor out of direct view of the sun.

Wind Speed and Direction

A wind speed indicator, or anemometer, and a wind direction indicator are useful weather instruments to have at home. The most important is the wind direction indicator. If you're familiar with the normal wind patterns at your location you can make your own local forecasts by watching the barometer and wind direction. Measuring wind speed is more fun than important.

The cheapest and most effective wind direction device is the old fashioned windsock. A common sight at all airports, they are typically a long nylon cloth tube fixed at one end to a hoop which is hung by a harness on a post in the ground. The wind fills the windsock and rotates it to show wind direction. Many discount stores sell colorful windsocks in the flag and banner department. A good one will last years and typically cost $10-20. The cheapest alternative is to take a few strips of plastic surveyor's tape about 4' long and tack them to the top of a six foot 2 x 4





stuck in the ground. The fluttering strips will show you where the wind's coming from.

Learning to read the movement of the windsock can turn it into a relative wind speed indicator as well. But, whether a wind is 10-15 mph or 15-20 mph isn't as relevant as knowing from which direction the wind is blowing.

There are several designs for building your own anemometers, two of which are listed in chart 4. Fair Radio Sales (listed in the Catalog Companies section of Chart 1), sells the dc motor and voltmeter required for the project and has a schematic in their catalog for building an anemometer. The key with this type of anemometer is that the motor must have smooth bearings that turn easily. Cheap motors will typically have sleeve bearings which will not work as well.

That's the easy part. Building the wind cups to drive the motor may prove a lot more difficult. I've used everything from metal ladles with the handles cut off, to plastic tablespoons. It's a great place to be creative and you can while away weeks trying to come up with a design which won't take a hurricane to actually move!

CHART 1: RESOURCES

Electronic Weather Station Manufacturers
Davis Instruments
3465 Diablo Avenue, Hayward, CA 94545-2778; 800-678-3669

Catalog Companies
Wind & Weather
The Albion Street Water Tower
P.O. Box 3230, Mendocino, CA 95460; 800-922-9463
www.windandweather.com
Professional and consumer grade weather instruments and many other weather related items.
Fair Radio Sales Co.
P.O. Box 1105, Lima, OH 45802; 419-223-2196
www.fairradio.com
Electronic surplus. Has dc motor and voltmeter for wind speed indicator.
Damark International
7101Winnetka Avenue N., Minneapolis, MN 55440-9437; 800-827-6767
www.damark.com
Discount catalog company often sells brand name electronic weather stations at deeply discounted prices.

Weather Facsimile Program and Modem
Tigertronics, Inc.
P.O. Box 5210, Grants Pass, OR 97527; 800-822-9722
www.tigertronics.com

With your instruments in place you can easily calculate the wind chill (winter) or heat index (summer) using charts 2 and 3. For an accurate reading you'll have to be able to read the outside relative humidity and be able to estimate wind speed.

Eyes in the Sky

Using home electronics to capture weather satellite imagery used to provide primitive results at best. Unless you were using very expensive professional equipment or had the skill to "homebrew" your own receiving gear, grainy facsimile reproductions were the best you could expect. Now, with the combination of sensitive receiving equipment and top grade consumer computers with laser printers, professional reproductions in your own home are typical.

Again, many companies make outstanding consumer weather satellite reception equipment all of which is readily available. And, if you shop

HOW YOU CAN HELP YOUR COMMUNITY:

JOIN SKYWARN!

The public safety and welfare of each community entails jobs we can all do. The National Weather Service provides a valuable public service by training interested citizens in the skills necessary to be useful in the event of a weather emergency. Called the SkyWarn program, training classes usually start before the beginning of the severe weather season in the spring.

While many SkyWarn members are amateur radio operators, it's not a requirement. All you need is an interest in weather and a desire to know more. Those who are hams can participate in other related activities such as the Amateur Radio Emergency Service (ARES) which often work closely with the SkyWarn program in establishing an emergency communications service in the event that weather disrupts normal communications modes.

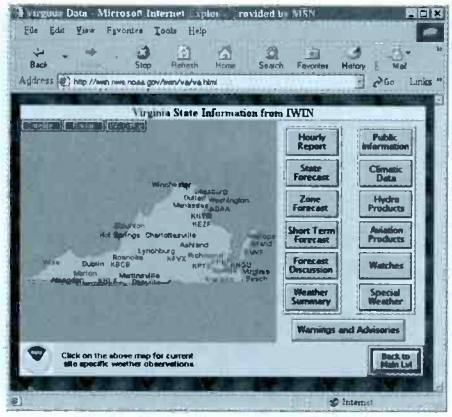
Some SkyWarn groups establish an official SkyWarn amateur radio station which uses a call sign assigned by the FCC. The 2 x 3 call starts with WX followed by the call district number where the weather service office (WSO) is located (0-9) and the three letter NWS WSO identifier. So, if you hear the call sign WX4AKQ on the air, that means a severe weather condition exists in the eastern Virginia region served by the Wakefield, Virginia, WSO.

To learn more about SkyWarn's Severe Storm Spotters program, or to find out when classes will be held in your area, call your local NWS field office. If you have access to the Internet go to **www.skywarn.net**.

around, you'll pick up some good bargains. Still, these systems aren't cheap.

If buying and setting up your own weather satellite receiving system seems too expensive or difficult, similar results can be had by using a very inexpensive modem and your current shortwave radio. Readily available programs allow you to tune in satellite imagery and weather charts transmitted by the NWS for ships at sea (see chart 4).

The cheapest way to access the most weather information is via the Internet. Forget the commercial sites; go right to the source of the information on NOAA's Interactive Weather Information Network (IWIN) at **http://iwin.nws.noaa.gov/iwin/main.html**. At this site



State Information via the Interactive Weather Information Network shows forecasts, data and watches, satellite and radar imagery, and current weather information at the local airport for any listed location.

you'll be given a choice of options depending on your computer's capabilities.

Once you have the graphics version you want, you will see a map of the U.S. on which various states may be in different colors depending on the types of weather advisories being issued at that moment. By clicking on your state you'll see your own IWIN page. You may want to book mark this page so that you can go directly to it when you need to have updated weather information for your region in a hurry.

Among the information options available are "Warnings and Advisories," "State and Zone Forecasts," satellite and radar imagery, and much more. The most interesting is the "Forecast Discussion" area. Here you'll be able to eavesdrop on the weather forecasters as they swap info and ideas about what's happening and what may be about to happen. The discussions are in text and each forecaster has his or her own style of writing. It's an excellent opportunity to get some insight into how daily and long term forecasts are made. You'll have to get used to reading their weather shorthand.

Get Started!

Once you get your minimum/maximum reading thermometer, barometer and rain gauge set up you should consider getting a small book in which you can make weather notes. I've kept an unofficial weather journal for the last seven years and have recorded record lows (-18 degrees F), highs (102 degrees F), barometric pressure (a high of 30.85 inches and a low of 29.25 inches), single rainfall (8" during remnants of Hurricane Fran), and single snowfall (15 inches). From my handwritten entries I can get monthly and yearly rainfall data, average temperature highs and lows, etc.

So, put your weather station together, sign up for a SkyWarn class (see sidebar) and you'll add a new and interesting facet to your radio hobby.

The NEW VOA

The Audience Weighs In

By Mark B. Lewis

The Voice of America is engaged in a serious journalistic gamble with its audience and its future. At the same time, America's principal international radio station is chalking up an impressive success story.

Of these two developments, consider first the gamble causing nervousness among the broadcasters and upsetting foreign listeners:

In the spring of 1998, VOA trumpeted "the first change in format in two decades" when it changed its English language news format to a faster-paced, CNN-like presentation of news and features. *VOA News Now* was initiated as a new, 24-hour, all news program available on both shortwave and satellite.

A quickened pace means that news and features are tighter and shorter, not read faster. "Think short and write short" is the axiom. VOA still adheres to the practice of reading the news at 13-15 lines a minute.

How is the new program doing?

Initial negative reactions from listeners around the world suggested that new is not always better nor an improvement. Resistance to change, of course, is not unusual for long-time radio listeners. And positive reactions now have begun to come in; the overall pattern is now one of "mixed reactions," according to VOA's Audience Mail Unit.

Former VOA Director Evelyn S. Lieberman announced the debut of the new program with a flourish. It was her first big programmatic change since taking over in March 1997.

"*VOA News Now*," she declared, "will follow the sun, so that everywhere in the world listeners will have access to live radio news as day breaks in their region." There was a promise that the new format will not mean the elimination of some of VOA's most popular programs.

Four months later, Lieberman got bad news from VOA's audience mail unit. The report said:

"An overwhelming majority of the letters from listeners have been negative. Many listeners liken the 24-hour format to that of an audio CNN, others complain of a lack of variety and of missing individual English programs."

The major disapproving reactions to the new format can be summarized like this: The news is "too abbreviated." "News, news, news – we get enough news around the clock. Some of your best programs have been terminated"... "The new format and contents are the same as those of all other radio stations. Boring. I can't consider you as the Voice of America anymore. Goodby to you"... "The mediocrity of CNN-by-radio is not what we need"... "It's simply not worthwhile to switch on for a parsimonious four minutes of science."

In more colorful language: "It's like you took off *McNeil-Lehrer* and substituted with *Oprah*"... "This new program is like listening to *Ted Mack's Amateur Hour* with boring interviews like the one I just heard called 'The Last Day of School.'"

The News Hour Rationale

Why did Lieberman shift to the faster-paced format? She justified the change as a response to surveys of foreign listeners. The surveys "forced us to rethink." According to VOA, there is a trend in its research indicating that listeners to English broadcasts want an average of 30 minutes of listening.

Listeners made it clear, Lieberman said, that they want programming that is shorter and tailored to their needs. The faster-paced format is ideal for today's faster-paced listeners, she claimed. "Times and technology are changing, and so must we." Whether the surveys asked listeners if they want and need 24 hours of news around the clock in English is not known, and the rhetoric did not address this question.

A little over a year ago, former VOA Director Evelyn S. Lieberman took a big gamble with the biggest program format change in 50 years.

Yet, Lieberman may have a point. The faster-paced format may be right for the listening span of listeners in certain areas of today's world where the pace of life as a whole has increased enormously. And she is certainly right about improved technology; satellite relays to VOA's overseas affiliates have improved the sound quality. Moreover, the new format may improve VOA's long-standing image of being slow and stodgy and in need of a "new sound." The BBC recently announced plans to start a 24-hour, all news network early next year for public radio stations in the U.S. with a format of shorter, tighter news items.

Positive reactions arriving at VOA from foreign listeners generally say they "like" the new format but offer no specific reasons. Nevertheless, VOA officials believe that, over time, *News Now* will develop "informed citizens of the world," and they regard the faster-paced format of shorter news items as especially appealing to youth. They may be right. However, it is too soon to tell whether less detail in shorter news and features may adversely affect their credibility. Foreign listeners have their backs up about shortened business news reports and science features, in particular. But some urge VOA to "stay focused on what you do best – news."

The new format has an important asset in the eyes of VOA editors. As the program is live all the time and flexible, fast-breaking news can be reported immediately. Gone are the days of more than 50 years of block programming, much of it on tape, when the program had to be interrupted for breaking news with "We interrupt this program for a bulletin from..."

VOA denies that its new format of tighter, shorter news and features presented by two anchors is an imitation of CNN or any other American broadcasting organization.

Popular VOA shows like *Press Conference USA, Encounter* and the one-hour *Talk to America* remain on the air. But popular American music programs via shortwave on the worldwide English network have taken a big hit since *VOA News Now* began. They have vanished or have been sharply cut, and foreign listeners are disappointed. Even some veteran VOA staffers regret what's happened to music, because they have always regarded American music as an

entry to VOA for new listeners.

As the new format of *VOA News Now* is reviewed and debated internally, VOA would do well to recall the opinion of legendary broadcaster Edward R. Murrow. He suggested that the listeners are the best critics and "the only judges" of what constitutes good radio. If the Murrow principle applies, VOA cannot ignore widespread negative audience reactions to *News Now*. While it's too soon to evaluate the new program fully, the Voice of America has taken a big gamble that will be resolved over time only by its listeners.

Catching New Audiences with Local Nets

The project with a brighter shine in the current VOA constellation is called the **Affiliates Network**. Remarkably, 1155 radio and television stations around the world, including the volatile Balkans, are now publicly affiliated with the Voice of America. They receive daily VOA news and features either in their local languages or in English for live broadcast to their local audiences. The material is attributed on the air to VOA. The latest member of the affiliates network is a station in Macedonia which joined on January 4, 1999.

To join the Affiliates Network, foreign stations must sign a contract with VOA, agreeing to use a specified number of hours of VOA news and features each day. Some of the affiliates are government-owned stations but most are privately-owned. The affiliates take the material live for direct, unedited broadcast on their air. They must use the news-related material within two hours.

Some stations have rejected affiliation; some want music but no news and features. Nevertheless, the VOA Affiliates Network has been a stunning organizational achievement, and 80 to 90 percent of the VOA affiliates are complying with their contracts, VOA claims. The VOA affiliate in Athens uses 20 hours of VOA programming a day. And affiliates in Finland and the Central Asian Republic of Kyrgydstan have just increased the number of hours they use *VOA News Now* each day.

Drawing on his successful experience in US network broadcasting, former VOA Program Director Sid Davis conceived and formally organized the satellite-affiliated network in 1992. The first affiliate was a big station in Sao Paulo, Brazil. Today, there are 96 affiliates in Uruguay, 83 in Bolivia, 66 in Chile. In Eastern Europe, 40 stations in Russia, 40 in Romania and 25 in Poland are VOA affiliates. In the Balkans, 30 stations in Yugoslavia had been

The 30 VOA affiliates in Yugoslavia were ordered by the Milosevic government in Belgrade, last November, not to rebroadcast any international news program, including VOA programming. Twenty-nine of them complied.

The VOA's busy news room

receiving VOA news in the Serbian language, and there are 50 affiliates in Bosnia and 10 in Croatia.

The Far East has 78 affiliates in Indonesia, 16 in Thailand. Currently, over 50 stations in China receive VOA tapes. On the African continent, 39 stations are VOA affiliates. Nigeria, Africa's most populous nation, currently has only one VOA affiliate.

VOA says 20 percent of its listeners are English-speaking, principally in Africa. According to VOA, an estimated worldwide audience of 83 million people listen weekly to its broadcasts of international, regional and US news in 52 languages.

Why have almost 1200 radio stations around the world (40 of them are also TV stations) become VOA "partners"? VOA's current Program Director, Myrna Whitworth, offers four reasons: VOA reports are respected and recognized as straight, objective news. VOA can provide programming not available to local stations. Identification of VOA by local stations improves their own visibility. And becoming a VOA affiliate doesn't cost a local station a cent.

The Affiliates Network is not without cost to American taxpayers. VOA not only provides the programming but also provides its affiliates with the equipment, if needed, to get the programming off the satellite – a satellite dish and receiver. A satellite package, including installation and shipping, costs between $4,000 and $5,000. If VOA feels that an affiliate is not complying with its contract, the satellite equipment is removed. This happened most recently with a station in Guatemala in 1996.

"Holes" in the Net

The Affiliates Network has its own difficulties. Whitworth, who effectively directed the project through its early years, is the first to acknowledge its major problem: How to verify that the affiliates are actually using the VOA news and features. "The monitoring system is imperfect," she says.

Surveys of what the affiliates are using are imprecise. United States Information Service posts abroad don't monitor affiliate stations daily. VOA language service chiefs are in daily contact with program managers of the affiliates, but they can't be certain of what's being broadcast on local air.

VOA's regional offices around the world can help monitor, according to Whitworth, and they're being encouraged to do so. There is an Affiliates Office in Prague and another planned for Africa in the Ivory Coast.

They might examine two other issues: Are the affiliates carrying the news from VOA even when the news might not please or might contradict local governments? Are any of the VOA affiliates so politically partisan that listeners would tie VOA to that political view? – a realistic issue in Africa and in Serbian affiliates.

The 30 VOA affiliates in Yugoslavia were ordered by the Milosevic government in Belgrade, last November, not to rebroadcast any international news program, including VOA programming. Twenty-nine of them complied. Milosevic shut down the best-known independent station and VOA affiliate in Belgrade, Radio B-92. VOA affiliates in Bosnia and Croatia continued to carry VOA programming during the war against the Milosovic government.

Affiliate stations can be shut down by war or local government decree or changes in the ownership of stations. War shut down the VOA affiliate in Sierre Leone and the manager fled. The affiliate in Liberia was gutted by rebel forces. On the other hand, the owner of VOA's affiliate in Kinshasa, Congo (formerly Zaire) created a larger network of more VOA affiliates in that country, and the owner of a big VOA affiliate in Mwanza, Tanzania, did the same thing in the last eight months.

There is a concern among foreign affairs specialists, including some who worked at VOA, that concentration on satellite relays to affiliates could result in the eventual replacement of medium wave and shortwave broadcasting by VOA. That would be a mistake, it is argued. Medium wave has the advantage of clear reception. Shortwave is central to the purpose of VOA, e.g., to communicate directly with audiences over the heads of their governments and media. Satellite gets into a country, too, but a dish is needed.

On balance, the VOA Affiliates Network is a plus for the United States in our overall shrinking communications program with the world. It extends VOA's reach, and it is certainly innovative. Although not all is bliss, the successful organization and growth of VOA's network of affiliates underscores its future potential.

Perhaps a similar forecast can be projected for VOA's new worldwide English program, *VOA News Now*. For now, it's a question-mark, even though more positive reactions from overseas listeners are reportedly on the rise. Time will tell.

The author is a retired Foreign Service Officer who served in the Middle East, India and Africa. He was a VOA correspondent in the Middle East and covered the White House for VOA during the Eisenhower presidency. He was Assistant Director of USIA in charge of African programs.

Improvements to the Sony ICF-2010 Receiver

by Steve Johnston, WD8DAS

The Sony ICF-2010 (ICF-2001D) AM/FM/SW/AIR receiver is one of the most successful portable communications radios in history. It combines handy operating features with solid performance in a portable package. In many respects it represents the modern version of the famous Zenith Trans-Oceanic portables of the 40s, 50s and 60s.

I bought my first Sony 2010 over ten years ago, mainly to take advantage of the benefits of synchronous AM detection. Over time I became "addicted" to listening to AM signals using sync detection, and today I often find it painful to listen to skywave AM signals on a typical envelope detector. The sync detector in the 2010 still holds a leadership position in its field. In fact, I was so impressed with the Sony sync detector that I went on to build add-on sync detectors for my other communications receivers.

This article describes four simple modifications for the ICF-2010 which can help this great radio become even more useful...

- A handy handle for the radio
- A "medium" AM bandwidth to supplement the existing "narrow" and "wide" bandwidths
- An adjustable attenuator/protection device for use when connecting an external antenna
- Replacement of the audio output coupling capacitor for better sound on the internal speaker

Get a handle on it!

The ICF-2010 is a portable radio, but unlike most portables, it has no built-in handle. The unit is shipped with a shoulder strap, but I never put it to use. Instead, I choose to pull the back cover off the radio and mount an aluminum handle on the top panel of the radio. Two holes drilled in the otherwise blank top of the radio provide simple attachment for a kitchen cabinet drawer-pull.

These handles, also known wire-pulls, are available in various sizes and in materials such as wood, plastic, and aluminum. My choice was a 4 by 1 inch aluminum pull, but feel free to pick what looks and feels good to you. Reinforce the mounting holes by providing washers under the screws to spread the pressure of the handle across a wider area of the plastic top. You can see the handle in **Photo 1**.

Medium Bandwidth Filter

I found the stock AM filter choices to be too wide when listening to stations suffering adjacent-channel interference, or too narrow for acceptable audio fidelity. The wide ceramic filter is identified as CFW1 and the narrow filter is marked as CFW2. Since the narrow filter is used for SSB, I considered the replacement of the wide filter with a device with tighter characteristics, but then I'd be stuck with the reduced audio response even when listening to strong stations in the clear.

I finally decided to add another filter with a response between the two stock filters which could be switched in as needed. Toko America (phone 847-635-3200) produces several lines of ceramic filters for

PHOTO 1: *Installing a handle makes the 2010 more portable.*

455 kHz IFs. The easiest to purchase seems to be the CFM2 line, which can be ordered in -6 dB bandwidths from 4 kHz to 10 kHz from Digi-Key Electronics at (phone 800-344-4539). I selected the 4 kHz device CFM2-455A (Digi-Key # TK-2330-ND). Cost is just a couple dollars each.

In my two 2010 receivers I tried two techniques to implement the additional filter. The first was to lift the circuit board off its mounts, remove the existing wide filter CFW1 from the main board, and connect it and the new "medium" filter to a DPDT (double pole double throw) toggle switch mounted through a blank area on the plastic top of the radio. The wipers of the switch were then connected to the empty filter connection on the board using miniature coax cable such as RG-174/U.

With the 2010 in "wide" mode, flipping the switch one way puts the stock filter in line, and the other way selects the new medium filter. This design is shown in **Figure 1**. It worked very well, but I had a nagging sense that a better way was possible.

My second 2010 was also modified to include the additional filter, but in this case I used diode-switching to parallel the new filter onto the existing board connections. In this way all three filters – wide, medium, and narrow – will be switched in the same fashion. This technique also offers better isolation between filters and stops filter "blow-by." This approach is shown in **Figure 2**.

Like the first plan, a DPDT toggle switch is mounted in a blank area on the top of the radio. Unlike the first design, this switch is switching direct current (dc) to activate the desired filter instead of radio frequency (RF).

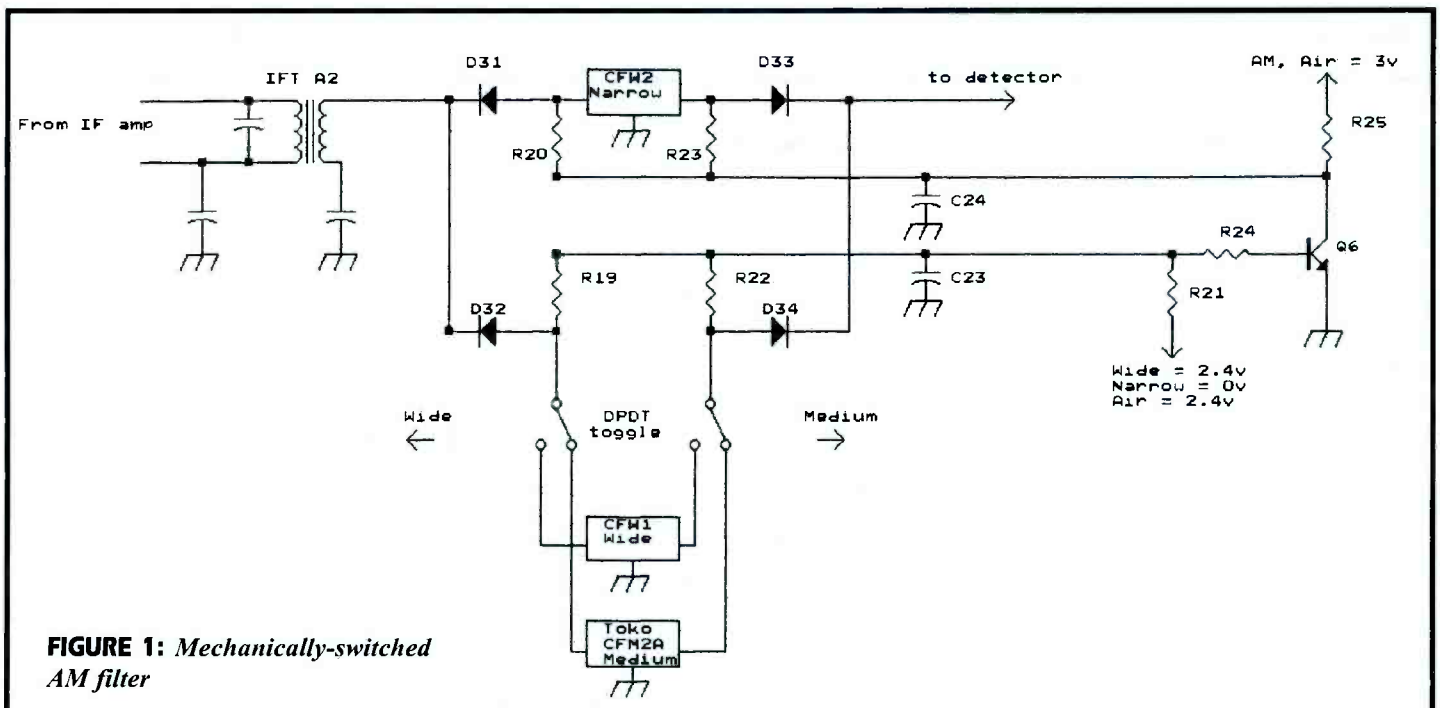

FIGURE 1: *Mechanically-switched AM filter*

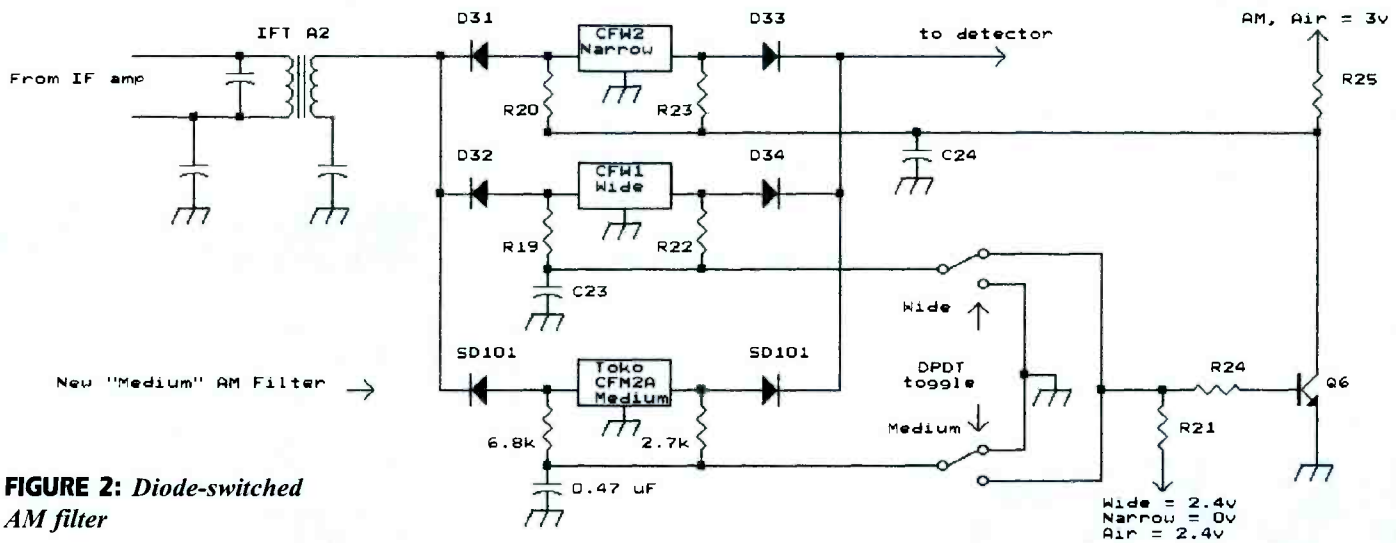

FIGURE 2: *Diode-switched AM filter*

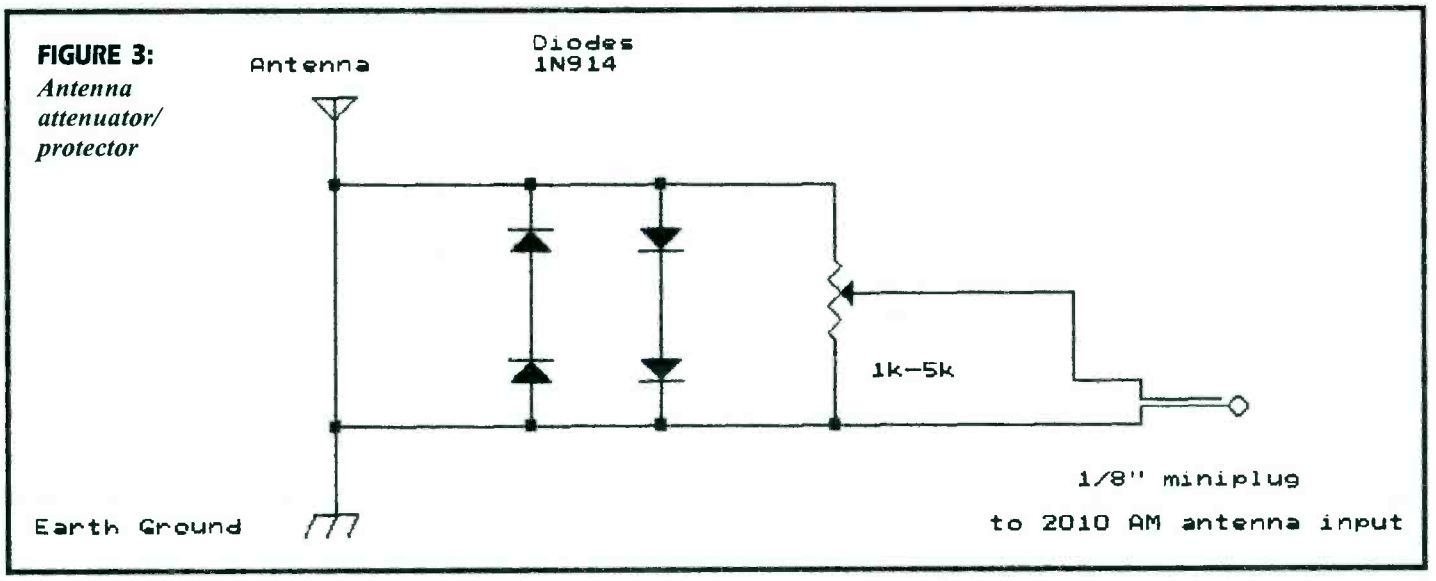

FIGURE 3: *Antenna attenuator/ protector*

The 2010 uses the equivalent of the common 1N914 switching diode to choose the stock filters. Some improvement is possible by replacing them with Schottky diodes such as the SD101A (available from Digi-Key as number SD1010A-ND). In my case I used the Schottky diodes to add the Toko 4 kHz filter. The tiny size of the Toko filter makes is possible to mount it directly to the main circuit board of the receiver. You don't even need to pull the board off its mounts!

As shown in Figure 2, the DC control signal which originally selected the wide filter now is routed to the top-panel toggle switch. The switch then sends it back down to forward-bias the desired filter, the new medium or stock wide. The deselected filter is firmly cut out of the circuit by applying ground to its diodes.

External Antenna Accessory

As a portable receiver, the ICF-2010 is designed for a sensitive antenna input which can be overloaded by the strong signals or even damaged by static discharges when using an external antenna. Early 2010s seemed to be particularly prone to this trouble.

My bedside 2010 is equipped with a short wire antenna running about 20 feet out the window to a nearby tree. Even this modest antenna can blow the doors off the radio in today's world of powerful signals, so I built a simple attenuator/protector out of a 1000 ohm potentiometer and a couple of back-to-back diodes. See **Figure 3** for details.

Adjust the potentiometer to the desired level – I almost always end up with the pot at mid-scale. Beyond its role as an adjustable level control, the resistance of the pot has the additional benefit of draining static charges which can accumulate on an antenna. The back-to-back diodes will clip any surges which might still make it through and protect the 2010's input stage.

More Bass from the Stock Speaker

The 2010 has a internal speaker of surprising quality and it produces a respectable sound. I found it possible to improve the already good distortion and bass output of the radio's output section by upgrading the speaker coupling capacitor C301 on the Jack Board from a polarized electrolytic 470 µF @ 6.3V to a 2200 µF @ 6.3V bi-polar electrolytic (Digi-Key's #P1148-ND just fits the space available). The increased capacitance helps the low-end response, and the bi-polar nature of the new cap helps the distortion.

Further improvements could undoubtedly be made by working backward through the audio chain, replacing the standard electrolytics with bi-polar units better suited to audio.

Summary

The ICF-2010 is clearly a favorite receiver. Part of the reason I've become so attached to the model is its versatile nature – I find it useful as a test receiver in the shop, a vacation/travel radio, a receiver to accompany low-power portable ham transmitters, as well as a quality medium- and shortwave broadcast receiver. If you, too, are a 2010 enthusiast, I believe you'll be pleased with the mods described in this article.

Big Savings on Radio Scanners

COMMUNICATIONS ELECTRONICS INC.

Now...Monitor trunked radio broadcasts

Save big on Bearcat 235XLT or BC895XLT trunk tracking radio scanners from CEI. Visit CEI on the web at **www.usascan.com** for our 30th anniversary special savings. To get your **free fax-on-demand catalog**, dial 734-663-8888 from the telephone handset on your fax machine for instructions. Get many free benefits such as extended warranty coverage on new scanners when you use your Communications Electronics Platinum Plus Master Card® issued by MBNA. No annual fee. Call 1-800-523-7666 anytime. Mention offer Q3KI to request yours today.

DISTRIBUTOR'S COUPON	EXPIRES 09/15/99	#9908M8

SAVE $125 on one **BC895XLT**

Save $125 when you purchase your Bearcat 895XLT scanner directly from Communications Electronics Inc., PO Box 1045, Ann Arbor MI 48106 USA. Telephone orders accepted. Call 1-800-USA-SCAN. Mention offer CEI8. TERMS: Good only in USA & Canada. Only one coupon is redeemable per purchase and only on specified product.

Bearcat®895XLT-A Radio Scanner

Mfg. suggested list price $729.95/**Special $319.95**
300 Channels • 10 banks • Built-in CTCSS • S Meter
Size: 10-1/2" Wide x 7-1/2" Deep x 3-3/8" High
Frequency Coverage: 29.000-54.000 MHz., 108.000-174 MHz., 216.000-512.000 MHz., 806.000-823.995 MHz., 849.0125–868.995 MHz., 894.0125-956.000 MHz.

The Bearcat 895XLT is superb for intercepting trunked communications transmissions (see BC235XLT description) with features like TurboScan™ to search VHF channels at 100 steps per second. This base and mobile scanner is also ideal for intelligence professionals because it has a Signal Strength Meter, RS232C Port to allow computer-control of your scanner via optional hardware and 30 trunking channel indicator annunciators to show you real-time trunking activity for an entire trunking system. Other features include ***Auto Store*** – Automatically stores all active frequencies within the specified bank(s). ***Auto Recording*** – This feature lets you record channel activity from the scanner onto a tape recorder. ***CTCSS Tone Board*** (Continuous Tone Control Squelch System) which allows the squelch to be broken during scanning only when a correct CTCSS tone is received. For maximum scanning enjoyment, order the following optional accessories: **PS001** Cigarette lighter power cord for temporary operation from your vehicle's cigarette lighter $14.95; **PS002** DC power cord - enables permanent operation from your vehicle's fuse box $14.95; **MB001** Mobile mounting bracket $14.95; **EX711** External speaker with mounting bracket & 10 feet of cable with plug attached $19.95. The BC895XLT comes with AC adapter, telescopic antenna, owner's manual and one year limited Uniden warranty.

Bearcat®3000XLT-A Radio Scanner

Mfg. suggested list price $699.95/**Special $329.95**
400 Channels • 20 banks • Twin Turbo Search/Scan
Frequency Transfer • VFO Control • Automatic Store
10 Priority Channels • Selectable Mode • Data Skip
Frequency step resolution 5, 12.5 & 25 KHz.
Size: 2-3/4" Wide x 1-1/2" Deep x 7-3/8" High
Frequency Coverage:
25.000-549.995 MHz., 760.000-823.995 MHz., 849.0125–868.995 MHz., 894.0125-1,300.000 MHz.

The Bearcat 3000XLT is the ideal handheld radio scanner for communications professionals. This handheld scanner scans at 100 channels per second and searches at a rate up to 300 steps per second. A selectable attenuator eliminates annoying intermodulation from adjacent frequencies in highly populated areas. Selectable AM, Wide FM and Narrow FM modes allow you to change the default receiving mode of the BC3000XLT. For maximum scanning pleasure, order the following optional accessories: **UA502** Cigarette lighter power cord for temporary operation from your vehicle's cigarette lighter $14.95; **LC3000** Deluxe swivel leather carrying case $49.95; **BP2500** rechargeable nickel-cadmium battery pack for up to five hours of dependable use $39.95; **ANTMMBNC** Magnetic mount scanner antenna with BNC jack and 12 feet of cable $29.95. **ANTSGBNC** Glass mount scanner antenna with BNC cable $29.95. The BC3000XLT comes with AC adapter, belt clip, flexible rubber antenna, earphone, owner's manual and one year limited Uniden warranty. Order today.

Bearcat®235XLT-A TrunkTracker

Mfg. suggested list price $429.95/**CEI price $269.95**
300 Channels • 10 banks • Trunk Scan and Scan Lists
Trunk Lockout • Trunk Delay• Extra battery & charger
10 Priority Channels • Programmed Service Search
Size: 2-1/2" Wide x 1-3/4" Deep x 6" High
Frequency Coverage:
29.000-54,000 MHz., 108-174 MHz., 406-512 MHz., 806-823.995 MHz., 849.0125–868.995 MHz., 894.0125-956.000 MHz.

The Bearcat TrunkTracker BC235XLT, is the world's first scanner capable of tracking a selected radio transmission as it moves across a trunked radio system. Now it's easy to monitor fleets and subfleets in analog trunked radio systems. The BC235XLT can also work as a conventional scanner. This 300-channel, programmable handheld scanner provides scanner users with uninterrupted monitoring capabilities of Type I, II, IIi and hybrid trunking systems. Now it's easy to continuously monitor conversations even though the message is switching frequencies. The BC235XLT comes with AC adapter, CRX120 battery charger, one rechargeable long life ni-cad battery packs, belt clip, flexible rubber antenna, earphone, owner's manual and one year limited Uniden warranty. The BC235XLT when ordered from CEI now features built-in attenuator feature. Not compatible with AGEIS, ASTRO, EDACS, ESAS and LTR systems. Call CEI at 1-800-USA-SCAN to order your Bearcat Trunktracker now.

NEW! RELM®MPV32-A Transceiver

Mfg. suggested list price $515.00/**Special $299.95**

Looking for a great hand-held two-way transceiver? Law enforcement depends on the RELM MPV32 transceiver for direct two-way communications with their fire or police department, civil defense agency or ham radio repeater. The MPV32 is our most popular programmable frequency agile five watt, 32 channel handheld transceiver that has built-in CTCSS. This feature may be programmed for any 50 standard EIA tones. Frequency range 136.000 to 174.000 MHz. The full function, DTMF compatible keypad also allows for DTMF Encode/Decode and programmable ANI. Weighing only 15.5 oz., it features programmable synthesized frequencies either simplex or half duplex in 2.5 KHz. increments. Other features include PC programming and cloning capabilities, scan list, priority channel, selectable scan delay, selectable 5 watt/1 watt power levels, liquid crystal display, time-out timer and much more. When you order the MPV32 from CEI, you'll get a complete package deal including antenna, 700 ma battery (add $20.00 to substitute a 1000 ma battery), battery charger, belt clip and user operating instructions. Other useful accessories are available. A heavy duty leather carrying case with swivel belt loop part **#LCMP** is $49.95; rapid charge battery charger, part **#BCMP** is $69.95; speaker/microphone, part **#SMMP** is $54.95; extra high capacity 1000 ma. ni-cad battery pack, part **#BPMP1** is $79.95; extra 700 ma. ni-cad battery pack, part **#BPMP7** is $59.95; cloning cable part **#CCMP** is $34.95; PC programming kit, part **#PCKIT030** is $224.95. A UHF version with a frequency range of 450-480 MHz. part **#MPU32** is on special for $299.95. Your RELM radio transceiver is ideal for many different applications since it can be programmed with just a screwdriver and programming instructions in less than 10 minutes. Programming is even faster with the optional PC kit. The programming instructions part **#PIMPV** is $19.00. Call 1-800-USA-SCAN to order.

Buy with confidence

It's easy to order from us. **Mail orders to:** Communications Electronics Inc., P.O. Box 1045, Ann Arbor, Michigan 48106 USA. Add $10.00 per weather station or radio product for UPS ground shipping, handling and insurance to the continental USA unless otherwise stated. The Bearcat 245 - What's it all About?

The Bearcat 245 is such a huge leap forward in scanner technology that we wonder why Uniden didn't call it the 2450. Then again, we wondered why they called the last model in the series the 235 as if it were a slight upgrade from the BC-230 portable. You can't argue with success, though. The 235, and its Radio Shack brethren the PRO-90 and PRO-91, have become one of the most well received designs in portable scanning history. And why shouldn't it? The 235 was the industry's first trunking scanner. It achieved what had been the Holy Grail of the hobby.

The 245's advancements are so numerous we'll cover the radio in two columns. This month, we'll take a look at all aspects of the radio other than its all-new SmartScanner technology, which is a completely unique take on scanner programming.

Note: This editor did participate in the development of some aspects of the scanner.

1. The Basics

The BC-245XLT is a 300 channel scanner nicknamed the "TrunkTracker II," which indicates that it's a second generation unit that now tracks two major trunking systems, Motorola and Ericsson. It is the exact same case (or "tool") as the BC-235 and it covers the same frequency ranges.

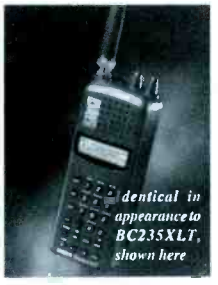
The display is new, as it has a RR icon and an "M" and an "E" icon to indicate the type of trunking you've selected (Motorola or Ericsson). The display also flashes "Bc-245" when you first turn on the device. When you are trunk scanning, the word "Id SCAN" scrolls across the display, rather than just "SCAN."

The radio comes complete with an updated trunking frequency guide that includes Ericsson systems and logical channel numbers (LCN's).

2. GE/Ericsson trunktracking

Ever since the first 235 hit the market customers in cities such as Denver, Hartford and Oakland have been asking, "where's the radio for us?" These cities and many others are served by EDACS trunked systems which the 235 could not track. The 245 does track EDACS and does so beautifully.

Following the convention of using the control channel (just as actual system radios do) to obtain instructions, the 245 locks onto the EDACS data signal and follows the action (excluding private and interconnect calls). Unlike Motorola trunking, you need to enter the EDACS system frequencies in a particular (logical channel number or LCN) order.



With the 245, EDACS trunking operates almost exactly the same as Motorola trunking. You can set delay, lockout groups, scan your Scan List, search the system, etc. The interface is very intuitive.

3. EDACS operation with either Decimal or AFS talkgroup programming

Uniden has added a terrific feature for EDACS operation that we like so much we wish there were a way to incorporate it into Motorola tracking. You can enter and search an EDACS trunking system at either the System, the Agency, or the Fleet level. It's called "AFS" mode and it's really a kick. The radio will also allow you to control EDACS trunking using the "decimal" convention as well. Talkgroups in decimal mode and AFS mode are available on the Internet and soon in many frequency guides.

The radio defaults to AFS mode. After you've entered the frequencies for an EDACS system in their proper order and you put the radio into Search mode, you'll begin to see and hear activity from talkgroups described on the display such as 02-011 or 08-042. This is known as "System Level" searching. Any group that is active on the system will be heard. Groups will range from 01-xxx through 15-xxx, although many systems do not use all the possible "Agency" groups.

What you'll soon discover is that, for the most part (it's not foolproof), one of these Agency groupings (from 1 to 15) will be comprised of the police department, one the fire department, one miscellaneous governmental services, etc. Each EDACS system manager can program the radios to his or her own liking, but the breakout by agency or type of service is quite typical.

What you'll next realize when operating the 245 is that, if the city police use a variety of 02 groups for example, then you can further break down the structure in a simple hierarchical way, such as:

02	POLICE Agency
02-01	POLICE Patrol fleet
02-011	POLICE Patrol East subfleet (or talkgroup - using the term interchangeably)
02-012	POLICE Patrol West subfleet

etc.

Thus, with the BC-245, you can EDACS trunk search at the system level (all talkgroups), or at any one of the levels shown above. By entering "02 decimal Enter" into the radio, you'll hear all of the 02 groups only. If this Agency level searching is too broad, you can enter 02-01 and then hear all the police patrol groups. If you enter 02-012, you'll hear only that specific Police Patrol West talkgroup. Remember, each EDACS system varies by the whim of the system manager, but this gives you the general idea.

4. Multiple-system trunktracking and conventional scanning

After super-scannists heard that the 245 would track EDACS systems, the next question on everyone's mind was, "Would it track more than one system?" The answer: a resounding "Yes!" The 245 will track up to 10 trunked systems at one time, in any combination of EDACS and Motorola systems. There's no limitation. And to answer your followup question, yes, the 245 will trunktrack and conventional scan at the same time.

Here's a quick breakdown of the answers to all the critical questions:

A. "Multi-track" up to 10 trunked systems at one time
B. These systems can be any mix of Motorola and EDACS, on any bands
C. You can either trunk scan or trunk search these systems at the same time (one or the other)
D. You can trunktrack and scan conventional frequencies at the same time
E. You can enter conventional frequencies in the same bank as a trunked system
F. The scanner remembers where each control channel is located for each programmed trunked system so that as the

radio moves from one bank to the next, there is no "down-time" as the radio searches for the control channel. It's practically instantaneous.

5. Motorola trunktracking on VHF, UHF, 800 and 900 MHz

It now doesn't matter which band you want to Trunktrack. While the 235 and 895 limited you to 800 MHz operation, the 245 will track EDACS and Motorola at VHF, UHF, 800 and 900 MHz. All Motorola systems outside of 800 MHz are Type II which means you'll never have to enter a fleet map (as you do with some older 800 MHz systems). When you press and hold the trunk key to assign a bank as a trunking bank, you go through a menu and select:
Type I 800 MHz
Type II 800 MHz (default)
Type II 900 MHz
Type II VHF
Type II UHF
EDACS

If you wish to trunktrack a Motorola VHF or UHF system (they're pretty rare outside of federal and military installations), you'll need to also enter the "base" and "offset" frequency which, like fleet maps, will quickly find their way to the Internet.

6. PC Up/downloadable, controllable, cloneable

The 245 comes equipped with an RS232C port on the side of the unit. The port is similar in look to what you see on a PCMCIA card. Uniden also supplies a cable which fits the radio and, on the other end, has a standard DB-9 connector which plugs right into the serial port of your PC.

With third-party software, you are able to completely program the scanner, just as you can with the BC-895. The command set is almost exactly the same for the 245 as it is for the 895, with a few additions to support the new features. Unlike other portable scanners which are only programmable, the 245 is fully controllable from your PC. And, even better, there is built-in functionality that allows you to clone the programming from one 245 to another!

7. Upgraded Service Search

There is now a new Service Search selection: Railroad. Once you select it (you see an RR icon on the display) the radio will begin scanning through the designated rail frequencies used in Canada and the U.S. Upon reception of a transmission the display will flip-flop between the frequency and the American Association of Railroads channel assignment. This is not a basic search at 5 kHz intervals in the 160 and 161 MHz band. The intervals are at the proper 15 kHz for the best performance. UHF rail channels are also included. All other service searches remain the same.

8. Auto Backlighting Upon Opening of the Squelch

If you press and hold the light key the radio will now enter the Auto Light mode. Whenever the squelch opens the display backlighting will light for 4 to 5 seconds. This of course is great for night operation, particularly in a mobile setting.

9. Motorola trunking status bit functionality

One of the few complaints the superbuffs had with the 235 was that you could not set the status bit for Motorola trunking systems. This topic has been covered by others in greater detail, but here's the gist of the problem: On Motorola systems there is a method by which specialized types of communications utilize unique talkgroup numbers. Thus, an emergency call on a trunked system will occur on a unique talkgroup from its primary assignment. To units within the radio system, this is transparent.

If you're in search mode with a 235, you'll hear the call; it will just show up on a different talkgroup number. However, if you've programmed the primary talkgroup number into your Scan List memory and you're scanning, you'll miss that call.

Not with the 245. The radio defaults to "Status Bit ON out of the box." (You'll need to turn it off if you're trying to figure out the proper fleet map of a Motorola Type I trunking system.)

---

10. 100 Talkgroups per trunked system.

The BC-235 provided five "Scan Lists" with 10 memory positions each for trunked system operation. The BC-245 doubles that with 10 X 10 trunked memories per system.

11. Priority in trunking mode

You can now set priority in your trunking banks, just as you do in your conventional ones. Here's how: After you've set up your Scan List, press the Priority key to activate it. The radio will default to setting the first "channel" in each of your Scan List as a priority.

Since each trunking bank holds 10 Scan Lists of 10 memory channels each, that means channel 1 (or 1-1), 11, 21, on through 91 are all default priorities. You can adjust which talkgroup in each List is the priority by pressing and holding the Priority key. It's very similar to conventional priority although there is no "interrupt" during the transmissions. Priorities are checked in between transmissions.

12. Frequency Find Mode

One of the best ways to demonstrate the necessity and power of a trunking scanner is to watch how frequencies change during a conversation. Motorola systems, which use "transmission trunking," change frequency only when there is a pause of approximately three seconds between replies (there is a "hang time" built in). Ericsson systems, however, change frequencies with each release of the microphone. This is known as "message" trunking.

Uniden has incorporated a fun and enlightening feature known as "frequency find" mode which vividly demonstrates the frequency hops. When a talkgroup is active in trunk mode, you can press the LIMIT key once to display the frequency on which that particular conversation is occurring. You can also press and hold the LIMIT key for two seconds and the scanner will alternately flash active talkgroups and frequencies during all trunked radio communications.

Maybe this radio should've been called the 24,500! We'll have more on the BC-245 in upcoming issues. The radio should be available this month.

Frequency and Talkgroup File - Florida

Brian Cathcart, otherwise known as the "Scannerdude," lives in South Florida and publishes some of the most comprehensive scanning guides you'll ever find. It's very complicated radio territory in Florida, with loads of trunking systems, but Brian makes it all understandable. You can find out more about Brian's publications by contacting him at *scannerdude@juno.com*. With his permission, here's just a snippet from one of his books:

(Note: "r" stands for repeater, "s" for simplex)

PALM BEACH COUNTY SHERIFF'S OFFICE

(all CTCSS 103.5 Hz unless otherwise noted)

CH1 - 154.845r	North "Alpha" zone (input 155.580)
CH2 - 154.725r	Central "Baker" zone (input 155.715)
CH3 - 154.815r	West "Delta" zone (input 155.550)
CH4 - 154.785r	South "Charlie" zone (input 155.520)
CH5 - 154.650r	Countywide tactical (input 155.610)
CH6 - 155.370s	Intercity channel
CH7 - 155.190r	PBIA Airport units (input 158.970)
CH8 - 153.875r	Simulcast of CH5 (input same as CH5)
CH9 - 153.980r	Future South dispatch channel (input 155.805)
CH10 - 158.850r	Main Jail (CTCSS 156.7, input 155.655)
CH11 - 158.850r	Courthouse (input 155.655)
CH12 - 155.730s	TAC1
CH13 - 155.835s	TAC2
CH14 - 155.850s	TAC3
Stockade	158.850s (CTCSS 127.3)
MDT ("Digi")	154.755r (input 155.490)
Radio Shop	453.550r

PALM BEACH COUNTY FIRE-RESCUE

(all CTCSS 71.9 Hz unless otherwise noted)

TAC 1 - 154.355r	Used by units out of station but not on call [input 151.205]
TAC 2 - 154.070r	Battalions 1, 2, 3-North (stations 33, 34), 6 [input 151.280]
TAC 3 - 154.385r	Brush fires, large incidents, and special events [input 151.475]
TAC 4 - 154.190r	Battalions 3-South (stations 31, 32, 35, 37, 38), 4, 5 [input 151.400]
TAC 5 - 154.145s	Fireground channel/Canal Point (Battalion 7) dispatch TAC 6 - 153.950s = Brush-fire fireground channel
TAC 7 - 154.265s	Intercity channel ("IC Fire")
TAC 8 - 155.340s	H.E.A.R. (Hospital Emergency Ambulance Radio) channel PBIA Airport Crash-Rescue/Airport Operations - 153.800r [input 151.040]
COMMAND 1 - 453.150r	Dispatch/Paging channel [DPL 271]
COMMAND 2 - 453.750r	Administration / COMMAND 1 back-up / Volunteer Division [DPL 271]

Palm Beach County is currently building an 800-MHz Motorola Astro APCO-25 digital trunked system. The Sheriff, Fire-Rescue, and County services will all use the system, but it will be run mostly in analog mode (except for sensitive Police communications). It is planned to be online in December of 2000.

West Palm Beach and Boynton Beach are currently the only agencies with trunked radio systems. Riviera Beach, Palm Beach, and Palm Beach Gardens all use the West Palm Beach trunked system. Here are some of the more active talkgroups:

WEST PALM BEACH (WPB) TRUNKED SYSTEM - Motorola Type II

Emergency Medical Allocations

This month's *Service Search* column takes an in-depth look at the new Emergency Medical and Special Emergency frequency allocations currently being licensed by the Federal Communications Commission. Scanner listeners should be listening for newly allocated splinter channels (VHF 7.5 kHz/UHF 6.25 kHz) to become active in their areas. (Frequencies MHz unless otherwise noted.)

Emergency Medical Allocations

150.7750	Mobile		
150.7825	Mobile	Bandwidth not to exceed 11.25 kHz	
150.7900	Mobile		
150.7975	Mobile		
150.8050	Mobile		
155.3250	Base or mobile		
155.3325	Base or mobile	Bandwidth not to exceed 11.25 kHz	
155.3400	Base or mobile		
155.3475	Base or mobile	Intersystem Mutual Aid/Bandwidth not to exceed 11.25 kHz

Globe Wireless Jumps the Morse Ship

In February of this year, the labor-saving Global Maritime Distress and Safety System (GMDSS) became compulsory on most large, oceangoing vessels. At that point, Morse code telegraphy (CW) became optional. Shippers took the opportunity to cut their payrolls, and Morse consoles ashore became rather quiet places.

In June, one of the last holdouts jumped ship. This was Globe Wireless, operator of an extensive, worldwide network of high-frequency (HF) coastal stations, many of them proud and historic facilities thus saved from the junk heap. According to several company insiders, CW had simply stopped paying its way, and the time had come.

At Globe's four remaining Morse stations (historic ones all), traffic lists and weather broadcasts abruptly stopped. It was announced, tersely, that all HF transmitters and receivers at all stations would shut down all Morse services on 12 July, 1999.

Predictably, this got the Internet rumor machine going, and next thing we knew Globe was supposedly axing its narrowband direct printing (NBDP) services as well. Had this been true, Telex, news, and weather, all in SITOR (Simplex Teleprinting Over Radio) would have closed.

But, at press time, I have been told by a number of sources, in and out of Globe, that this just isn't going to happen. The closures affect only straight CW, and the musical dits and dahs of these old callsigns will still be washing over the planet, albeit only as identifiers in SITOR sync markers.

GlobeEmail

Globe Wireless, a descendent of several other radio companies with a combined history back to 1912, continues to expand its electronic mail system. Right now it's all HF, though a recent merger with a satellite mail provider will probably lead to the addition of leased geosynchronous capability.

The GlobeEmail user sits at a standard personal computer, running plain old Windows software that looks like any office e-mail system. The shipside version appears to offer traditional, narrowband Telex as a choice, but on wideband channels the hardware can pass real e-mail, with a full character set and binary attachments. It moves at speeds up to 2400 baud, which is smoking for HF.

Higher speeds are gained with a hot-rod Globe implementation of Clover-II, itself a high-end descendant from the original mode developed by hams and perfected by HAL Communications, an Illinois company. Clover uses every trick in the computer programmer's book to optimize its transmission parameters, on the fly, in real time. For some years now it's been amazing people with its absolute refusal to give up in noisy conditions that would slow SITOR down to practically nothing. On the air, Clover is J2D (single-sideband audio-keyed data) emission, with a very distinctive trill sometimes called a "canary." The amateur versions are easily decoded with high-end hobby gear, but GlobeEmail probably is not.

The Globe network is evolving, but the accompanying tables show its locations and frequencies as of June. May you have fair seas until next month.

Globe Radio Network

Call	Name	Transmit location	Operator / Comments
8PO	Barbados Radio	Caribbean	Barbados External Telecom
A9M	Bahrain Radio	Arabian Gulf	Bahrain Telecom Co.
KEJ	Hawaii Radio	Kahalelani, HI	New station - 1995
KFS/KPH	Dixon Relay Station	Dixon, CA	Formerly Voice Of America
KFS	Palo Alto Radio	Palo Alto, CA	Moving to Dixon
KHF	Guam Radio	Agana, GM	Barrigada mountain site
KPH	San Francisco Radio	Rio Vista, CA	New site, near Dixon
HLF	Seoul Radio	Republic of Korea	New acquisition - 1998
LFI	Rogaland Radio	Norway	Replaces LGB for radiotelex
LSD836	Argentine Radio	Buenos Aires	New station - 1998
SAB	Goteberg Radio	Sweden	Telia Mobitel
VCT	Tors Cove Radio	Newfoundland, Canada	Stratos Mobile Networks
VIP	Perth Radio	Perth, Australia	Historic NASA tracking site
WCC	East Coast Radio	Delaware	Former Cape Cod Radio, MA
WLC	Rogers City Radio	Rogers City, MI	Great Lakes coverage
WNU	Slidell Radio	Pearl River, LA	First stn was United Fruit Co.
ZLA	Awanui Radio	New Zealand	Rebuilt old stn on historic site
ZSC	Cape Town Radio	South Africa	Telkom SA (RSA phone co.)
???	Planned	China	Mentioned on web page
???	Planned	Malta	Mentioned on web page
???	Planned	Philippines	Mentioned on web page

Published Globe Frequencies

The shore station transmits on the first of the duplex pair, the ship on the second. All are in kilohertz (kHz), NBDP or wideband digital.

		UK	United Kingdom
		Unid	Unidentified
		US	United States
		VHF	Very High Frequency, 30-300 MHz
		VIP	Very Important Person
		VOLMET	Flying weather, loosely from French

All transmissions are USB (upper sideband) unless otherwise indicated. All frequencies are in kHz (kilohertz) and all times are UTC (Coordinated Universal Time).

288.0 HH-Nondirectional radio beacon at Hoek van Holland lighthouse, in CW at 0916. (Ary Boender-Holland)

288.5 YM-Nondirectional radio beacon at IJmuiden lighthouse, in CW at 0917. (Boender-Holland)

296.0 GR-Nondirectional radio beacon at Goeree lighthouse, in CW at 0916. (Boender-Holland)

3195.0 "R"-Russian Navy single-letter CW channel marker, Ustinov, at 1810. (Takashi Yamaguchi-Japan)

3320.0 North Korean female numbers in powerful AM, using the Radio Pyongyang transmitter, couldn't find a parallel, at 1500. (Yamaguchi-Japan)

3322.0 R-Russian Navy single-letter CW channel marker, Ustinov, also loud-readable 2 kHz down on beat with Radio Pyongyang, at 2015. (Yamaguchi-Japan)

3535.0 Unid station repeating "SBID" in CW, over and over, at 1814. (Yamaguchi-Japan)

3595.0 4XZ, Haifa Radio, Israeli Navy, CW markers on new frequency, at 1723. (Yamaguchi-Japan)

4472.0 Palm Leaf-US military, working WAR 46, National Joint Alternate CP, and Moonbeam, at 0553. (Jeff Haverlah-TX)

4575.0 V-Russian Navy single-letter CW channel marker, Khiva, at 1959. (Yamaguchi-Japan)

4622.0 U7AF-Unknown station with CW markers at 1341. (Yamaguchi-Japan)

4646.0 V-Russian Navy single-letter CW channel marker, Khiva, at 1959. (Yamaguchi-Japan)

4660.0 Unid station with marker "VVV CQ 466.16" in CW, at 1600. (Yamaguchi-Japan)

4663.0 Tashkent Volmet-Uzbekistan, Russia, with flying weather, also on 10090, at 1710. (Yamaguchi-Japan)

4724.0 Lajes Global-US Air Force Global High Frequency System, Azores, in patch for an unknown station, at 0653. (Paul Bunyan-MO)

5245.0 MRC01-Royal Air Force, UK, air traffic control with many planes, at 1040. (Boender-Holland)

5422.0 Lincolnshire Poacher, British intelligence, Cyprus, parallel on 6485 and 8464, with numbers at 1900. (Yamaguchi-Japan)

5692.0 Rescue 1500-US Coast Guard HC-130, over Bermuda and making a patch to Atlantic Air Command Center via CAMSLANT Chesapeake. Said that the weather was deteriorating badly in a medical emergency aboard M/V *Dark Shield*, making it harder for parachute jumpers to reach the ship, at 0716. (Allan Stern-FL)

5696.0 Commsta Kodiak-US Coast Guard, Alaska, working Coast Guard 1703, a C-130 out of Sacramento, regarding arrival time, at 0704. (Perron-MD) Rescue 1500-US Coast Guard, in rescue with M/V *Dark Shield*, went to 5692 for the patch via CAMSLANT, at 0714. (Stern-FL)

6215.0 Unid-North Korean female numbers in powerful AM, a rare appearance on this international maritime calling and distress frequency, at 1400. (Yamaguchi-Japan)

6379.0 4XZ, Haifa Radio, Israeli Navy, with CW marker, also on 10046, at 1541. (Yamaguchi-Japan)

6485.0 Unid-Lincolnshire Poacher, British intelligence, Cyprus, with numbers at 1900. (Yamaguchi-Japan)

6575.0 HNC1-Mossad, Israel, a special deep-cover mission-specific broadcast on a frequency also used by Radio Pyongyang's European beam, at 1435. (Yamaguchi-Japan) *Never heard of HNC1. Very nice catch! -Hugh*

6658.0 VLB-Mossad, Israel, with abnormal callup "VLB54B26F26T5812" in phonetics for 5 minutes at 1445. MIW2-Mossad, another day at 1515. Also KPA2, Mossad, at 1715. (Yamaguchi-Japan)

6730.0 SAM 300-US Air Force VIP flight, in patch to US State Department Operations, then went to Mystic Star F-311 (11220), at 0244. (Perron-MD)

6880.0 Gronko 1-Possible callsign of Italian Navy aircraft near Canary Islands, with position report for Tavola 2, at 0204. Tavola 2 made radio checks in English with a US station who was using the NATO trigraph "3-G-Y," then made Italian chatter with Delfina, at 0222. (Perron-MD)

6885.0 Unid-"Numbers" station repeating "All stations this is Guangzhou. We are waiting for your messages" in powerful AM and Mandarin Chinese, also on 10750, at 1600. (Yamaguchi-Japan)

6900.0 Lincolnshire Poacher, British intelligence, Cyprus, numbers at 2000. (Yamaguchi-Japan)

6912.0 The Russian Man-Russian intelligence, numbers in powerful AM at 1615. (Yamaguchi-Japan) *Yeah, this network can throw some*

Utility World Loggings (continued)

serious photons around. -Hugh

6945.0 The Czech Lady-Russian intelligence Czech-speaking "voice" with numbers in AM, at 1250. (Boender-Holland)

6959.0 Unid-Lincolnshire Poacher, UK intelligence, Cyprus, with numbers and musical tune, at 2245. (Ben Loveless-MI)

6970.0 The Counting Station-US Central Intelligence Agency, with numbers in reduced-carrier AM, also on 9070, at 1800. (Yamaguchi-Japan)

6993.0 Air Force Two-US Air Force SAM 31681, a C-9C with the Vice-President and wife aboard, making patch to SAM CP via Andrews VIP, MD, at 0051. (Paul Bunyan-MO)

6998.0 ORA-Bogus callsign of unid CW station, with continuous loop repeating message, "ORA SOS SOS MASSACRI IN KOSOVO BT ORA," a strong and very professional-sounding signal, at 2250. (Geoff Halligey-UK) *Almost certainly our Italian bootlegger friend HWK7 again. -Hugh*

7002.0 "V"-Russian Navy single-letter CW channel marker, Khiva, at 1306. Went to 3658 kHz at 1400. (Yamaguchi-Japan)

7039.0 "C," "K"-Russian Navy single-letter CW channel markers, Moscow and Khabarovsk, loud but with a dirty, hummy signal and interfering with amateurs, at 1637. (Yamaguchi-Japan)

8020.0 "D-1-P" - Unid NATO trigraph, probably US military, with EAM, bad interference from data signal on channel, at 0601. (Haverlah-TX)

8037.0 N1G-US Army National Guard, control station for Wisconsin Guard net, working numerous stations, at 1818. Also 4857, 4957, and 5847. (Bunyan-MO)

8058.0 SAM 31681-US Air Force VIP flight, enroute to Lajes Air Base in the Azores, calling Andrews VIP, no answer, at 0250. (Bunyan-MO)

8188.0 Swedish Rhapsody station-Yet another weird European numbers station, in progress at 1237. (Boender-Holland)

8190.0 Architect-Royal Air Force, Upavon, UK, at 1245. (Boender-Holland)

8437.0 4XZ, Haifa Radio, Israeli Navy, with CW marker, also on 10046, at 2358. (Yamaguchi-Japan)

8453.0 FUG-French Navy, La Regine, France, with RTTY test at 1030. (Boender-Holland)

8465.0 VLB-Mossad, Israel, with abnormal callup " VLB16R54B28D1399" in phonetics for 5 minutes at 1445. VLB2-Mossad, Israel, different day, also on 5629, also at 1445. (Yamaguchi-Japan)

8495.0 "C," "K"-Russian Navy single-letter CW channel markers, Moscow and Khabarovsk. Once again, K was powerful but with a distinctive hum, at 2030. (Yamaguchi-Japan)

8574.0 LBG-Rogaland Radio, Norway, CW traffic list at 1022. (Boender-Holland)

8642.0 MGJ-RN Faslane, UK, with RTTY bulletins at 1028. (Boender-Holland)

8650.0 SPE42-Szcecin Radio, with CW marker at 1026. (Boender-Holland)

8743.0 HSA, Bangkok Radio, Thailand, weather in English and Thai, at 1222. (Yamaguchi-Japan)

8894.0 Niamey & Algiers-Both ground stations in the air route net AFI-2 (Africa MWARA), working aircraft at 0114 USB. (Perron-MD)

9016.0 Shado 404-US Air Force, attempting several urgent health and welfare patches into the Tinker AFB/Oklahoma City area after a huge tornado. McClellan tried many calls over commercial and Defense Switched Network before reporting the switch was probably down. McClellan wished Shado 404's crew all the best for their families, and went back to 8992 kHz, at 0224. (Haverlah-TX)

9023.0 SAM 60204-US Air Force VIP flight, along with SAM 90300, a C-20, both working Andrews VIP, MD, on Mystic Star F-467, at 1412. (Bunyan-MO)

9120.0 Nightwatch-US Strategic Command airborne CP, working Venus 7 on "Hotel Fox." (HF). Also did an unheard signal check on "Sierra," probably VHF, at 2045. (Bunyan-MO)

9251.0 Lincolnshire Poacher-numbers from British intelligence, Cyprus, in progress at 2143. (Boender-Holland)

9264.0 4XZ-Israeli Navy, Haifa, with CW marker at 0200. (John Maky-AR)

10202.0 SAM 56973-US Air Force, a C-137C with US first lady Hillary Clinton and daughter Chelsea aboard, working Andrews VIP enroute to Egypt, at 0333. (Bunyan-MO)

10240.0 The English Man-Weird English speaking numbers voice, from Russia in AM, at 2112. (Boender-Holland)

10352.0 CIO-Mossad, Israel, with abnormal callup "CIO33F46P14L1388" in phonetics for 5 minutes, at 0845. (Yamaguchi-Japan)

10536.0 CFH-Canadian Forces, Halifax, NS, with weather in RTTY at 0842. (Boender-Holland)

10596.0 1OYF-Unknown station, calling BBNZ in CW, then 5-letter code groups in Cyrillic Morse, at 1010. (Boender-Holland)

10780.0 JV 870-US Navy C-9 flight enroute Jacksonville, FL, getting weather from Cape Radio, Cape Canaveral, FL. Followed by a patch via the Cape to Patrick AFB Base Ops, who refused landing permission for gas 'n' go. Sent to MacDill, farther south, for fuel, then back up to Jacksonville. All this at 2302. (Stern-FL)

10871.0 "C," "S," "P"-Russian Navy single-letter CW channel markers, Moscow, Arkhangelsk, and Kaliningrad, at 0634. (Boender-Holland)

11175.0 Navy 49676-US NavyVP-3C, with CINCLANT (Commander in Chief, Atlantic) aboard, at 0208. JGO 85-US Joint Guard Operations aircraft, patch via Ascension to CP, at 0302. (Perron-MD) NATO 49-an E-3 AWACS, in patch via Thule to US Air Force, Europe, at 0400. (Perron-MD)

11270.0 The Russian Man-Russian intelligence numbers in AM, at 0820. (Boender-Holland)

11387.0 Bombay Volmet-India, flying weather at 1020. Calcutta Volmet-India, flying weather at 1035. (Yamaguchi-Japan)

11554.0 The Polytone Station, probably Russia, with weird tones at 0600. (Boender-Holland)

12178.7 WGY908-Federal Emergency Management Agency Alternate Net Control, Denver, CO, in signal checks with WWJ71 (Federal Highway Administration, WI), WWJ85 (FHWA, IA), and WWJ98 (FHWA, ID) on what they called "F-41," at 1501. Went to F-35 (11045.0) to check there too, at 1513. (Bunyan-MO)

12984.0 4XZ, Haifa Radio, Israeli Navy, with CW marker, also on 10046, at 0009. (Yamaguchi-Japan)

13024.5 ASK-Karachi Radio, Pakistan, with a hand-sent CW marker at 0748. (Yamaguchi-Japan)

13161.0 HLS-Seoul Radio, South Korea, with Beethoven's "Ode to Joy" between phone patches, at 0009. (Yamaguchi-Japan)

13454.0 The Polytone Station, probably Russia, with weird tones at 0620. (Boender-Holland)

14654.0 The Polytone Station, probably Russia, with weird tones at 0640. (Boender-Holland)

14750.0 CIO-Mossad, Israel, with abnormal callup "CIO33F46P14L1388" in phonetics for 5 minutes at 0745. (Yamaguchi-Japan)

14890.0 The Russian Man-Russian intelligence numbers in AM, at 0800. (Boender-Holland)

15016.0 Shark 75-US Air Force, probably a C-130, in patch to Raymond 9 (Air Combat Command, Howard AFB, Panama) to relay arrival weather from Lobo (Howard CP), at 2135. (Perron-MD) *I've read that this mission is moving to Puerto Rico.-Hugh*

15094.0 SAM 60203-US Air Force VIP flight, enroute to Hickam AFB, HI, in radio checks with Andrews VIP on F-382, then went to F-467 (9023), at 0339. (Bunyan-MO)

15650.0 The Counting Station- US Central Intelligence Agency, numbers in reduced-carrier AM, at 0104. (Gary Neal-TX)

15993.0 Unid-probably The Spanish Lady, Russian intelligence, with numbers in AM at 0107. (Neal-TX)

16193.2 RFQPA-French Air Force, Djibouti, with code groups for RFFUGO (French Air Force, Eascadachas, Orange) in ARQ-M2, at 0855. (Hall-RSA)

17463.0 Unid-FAPSI *(Russian government comm and intelligence office. -Hugh)* with RTTY numbers on "link 10163," at 0858. (Hall-RSA)

17474.7 GSLMDRS-Boustane, New Delhi, India, with code groups in ARQ, marked "Most Immediate to BEDEL (Cairo?) - AT ONCE," at 1520. (Hall-RSA)

18003.0 Reach 3076-US Air Force Air Mobility Command transport, with patch via Andrews to Hilda West (AMC control center at Scott AFB, IL), at 1730 (Bunyan-MO)

18006.0 Notebook-US Air Force, with secure data for Andrews Global, on this discrete frequency, at 1818. (Bunyan-MO)

18024.0 Militian?-Possible callsign of US military aircraft, passing data to Andrews Global on this discrete frequency plus 15097, 17973, and 18006. This might have had something to do with Operation Allied Force, which was just starting then, at 1915. (Bunyan-MO)

18026.7 YKJWL-Egyptian Embassy, Bamako, with Arabic ARQ traffic to MFA Cairo (routing code KDKTXKE), unlisted frequency for them, at 1650. (Hall-RSA)

18055.0 DFZG-Serbian MFA, Belgrade, encrypted messages in RTTY, at 1617. (Hall-RSA)

18360.0 RFGW-French MFA, Paris, with nine pages of code groups to embassies, in FEC-A, at 0630. (Hall-RSA)

18972.0 DFZG-MFA, Belgrade, encrypted messages in RTTY, at 0851. (Hall-RSA)

20556.6 P6Z-MFA, Paris, with message to all embassies in FEC-A, at 1615. (Hall-RSA)

Stan Scalsky Mike Chace

Robust Romania

This month we profile the Ministry of Foreign Affairs (MFA) of Romania, which transmits from the capital Bucharest to many of its embassies and consulates worldwide.

For many years the Romanians have used a relatively simple but interesting home-brewed system which has been named ROU-FEC (Forward Error Correction). ROU-FEC (also called RUM-FEC by some decoder manufacturers) is available as standard on all Hoka and Wavecomm decoders.

What makes ROU-FEC so interesting is its incredible robustness. One can tune in a relatively weak signal, accompanied by heavy static, fading and other disturbances, and still receive superb error-free text. The reason? Like most other FEC digital systems, ROU-FEC sends message data together with information that allows the received data to be checked for correctness. However, it also spreads each individual bit of data across a period of time, in a known pattern or interleave. Hence, a brief burst of noise may corrupt one portion of the message, but the decoder can still recover the message because the individual data bits are separated in time.

What makes ROU-FEC so different from other FEC systems is the length of the interleave – 128 bits to be precise. The drawback of separating the bits of a message over time? A time-lag in decoding, as a good decoder has to wait for each bit over a span of 128 bits. To make up for some of these delays, ROU-FEC sends data at the relatively fast speeds of 164.5 and 218.3 baud.

Facts and Frequencies

MFA Bucharest uses a "fictitious" or "tactical" callsign of V5G, which doesn't conform to International Telecommunications Union callsign assignments. V5G broadcasts to lists of embassies designated by two- or three-digit identifiers using 164.5 baud ROU-FEC.

These broadcasts, in Romanian and English, and frequently including news, occur daily on a number of frequencies and are easy to copy in the US and throughout the world. The embassies are more elusive, replying or sending their own traffic on separate frequencies invariably using 218.3 bd ROU-FEC.

Table 1 contains a list of commonly used frequencies for MFA Bucharest.

Table 2 shows a typical message from V5G to a list of embassies. Note the signature ":::::" lead-in to a new message.

Decoding the system

As a beginner, decoding ROU-FEC can be tricky for three main reasons. Firstly, remember the long interleave. On Hoka decoders, text won't appear on-screen for about 10 seconds after the signal is tuned-in, so don't expect instant results.

Secondly, ROU-FEC is sensitive to mark level (the "M" key for Hoka users). Most transmissions use the default M=0 setting.

Thirdly, a technique called bit-masking is often used, making a message in the clear look like scrambled garbage with the wrong mask selected. Hoka users fortunately have the ">" and "<" keys to increment or decrement the mask by 1 bit. Once you've tuned-in a ROU-FEC signal, here's a pretty foolproof method of making ROU-FEC work on Hoka decoders.

1. Listen for the transmission to go into idle condition denoted by the change from a rough, scrambled sound to a steady, repeating rhythm.
2. If you see no text being printed and the two-headed vertical arrow symbol in the upper left of the screen illuminated, you're set.
3. If you see a continuous stream of the letter "r" being printed, press the "M" key to select the correct mark level, and you're set.
4. If you see a continuous stream of a letter other than "r", the signal is being sent with a bit-mask. Press the ">" key to increase the bit-mask by one until the same result as 2) above is achieved. A bit-mask of 24 is most common, but 16, 15, 18, and 11 have also been used.
5. If none of the above produce clear text, the message is encrypted.

If you catch a signal in mid-stream, our advice is to first let text appear to remove the decoding delay, keep the mark level setting at 0, and then set the bit mask to 24. If no plain-text is seen, press M to set mark-level to 1, leaving the bit mask at 24. After the decoding delay, plain-text should be seen. If not, you'll have to cycle through all 32 bit-masks with mark level set to 0, and then again with it set to 1.

Happy monitoring!

Arne Skoog 1913-1999

Arne Skoog, a pioneer in international broadcasting and the DX community, passed away on June 7, 1999, in his beloved home province of Jamtland.

In 1948, Arne, then a young engineer at Radio Sweden, founded *Sweden Calling DXers* as a way of keeping listeners in touch with news in the world of international radio. Shortwave came into its own during the Second World War, and after the war shortwave listening became a popular hobby. But hobbyists needed access to the latest news, and Arne felt the best place for them to find out was on a shortwave station.

Many hobbyists say they remember Arne presenting *Sweden Calling DXers*, which is curious, since he never did. Arne wrote the scripts, which were read by colleagues, first by the English Service, and then in all of Radio Sweden's languages – except, ironically, Swedish.

Initially Arne gathered all his own news for the program, but soon listeners were writing in with material for the program. Almost immediately a written version of the program scripts was being mailed out to everyone who contributed. At its height there were between 1500 and 2000 names on the list, and they constituted a "Who's Who" of the shortwave community.

When Arne retired in 1978, on the program's 30th anniversary, George Wood (who wasn't even born in 1948) took over. But changing times and new Radio Sweden management led to radical changes with the introduction of satellite brodcasting in the 1980s.

The mailing list was discontinued, and the program became a twice-a-month English-only program called *MediaScan*, which concentrated more and more on satellite DXing and general Scandinavian media news.

Arne passionately objected to the changes and tried to find support to reverse them, but Arne was no Luddite fighting the advance of technology. An engineer at heart, he embraced the arrival of the personal computer, and while he had dismissed satellite broadcasting as inferior to shortwave, Arne hailed the arrival of broadcasting over the Internet.

Arne Skoog was also one of the founders of the Swedish DX Federation and the European DX Council.

In his retirement, Arne turned to his second pastime, violin-making, for which he was quite respected. He taught many courses in the skill.

Radio Sweden invites those who have been touched by the pioneer broadcaster and DXer to send their comments to its discussion board: Radio Sweden Talkback. (R. Sweden website via John Norfolk)

Merlin Network One Goes Bust

For one week in May, MNO cut back its extensive SW schedule to 24 hours, one frequency at a time. Then it was gone after May 28, except for one remaining paid program – ironically, not rock music and not British – the misogynistic Roy Masters' *Foundation for Human Understanding* also heard on American MW stations. Mike Barraclough observed this at 1600-1700 M-F only via Skelton 6175. MNO's satellite service is apparently continuing and they are talking about putting the network out on the internet.

We thought it would be interesting to see how and if Eric Wiltsher explained the drastic cuts – he had been such a promoter of SW, though always regarding it as secondary.

Then came word from Wiltsher via Voice of America *Communications World* that he was leaving Merlin, but his *Media Zoo*, mainly about satellites, would continue through June 30. SW will re-expand, but only with programs which are paid for. At press time nothing had come back.

It appears that MNO was greatly overextended, using up spare BBC transmitter time, and eventually it had to crash.

ANTARCTICA I received a nice full-data, signed QSL card and form letter from LRA36. The cover even had penguin stamps and a station cachet postmark. The schedule is listed as M-F 1800-2100 UT, Sa/Su 1700-1900 UT. However, Sunday June 6 I tuned by and found them up at 2215 with a soccer game relay (same one being carried by RAE-15345), announcements and ID at 2220, then open carrier to 2236 off. This is a good reason to check for extended operations on weekends (John Cobb, GA, *World Of Radio*) 15476

ARGENTINA New SW feeder outlet 5400.0 LSB heard at 1105-1210* with Feeling FM 100.7, Buenos Aires and the next day at 1058-1103 with R. Rivadavia. After 1211 back on 15820 (Takayuki Inoue Nozaki, Japan)

R. Fósil, Rosario, 6988.1v, previously on 6950, Sun 2200-0100/0200 Mon, says it's a "fun" station playing "fossilized music of the '70s" (Nicolás Eramo, Argentina, *Conexión Digital*)

BENGAL EAST and WEST [non] *Jiban Tarango* (English: "Wave of Life") is a pentecostal program from IBRA Radio in Stockholm, via Tashkent, Uzbekistan, 1330-1355, 240 kW 130° on 15470 (winters around 7400). Despite frequent references to the Qur'an and Islamic traditions, these are Christian programs, with an address in Calcutta (Dr. Hansjörg Biener, Germany, *BC-DX*)

BOLIVIA A recent addition to my Patepluma website is a 1 meter square military map of Bolivia that I purchased there in 1985. The map was scanned to 21 different jpeg files totaling about 10.5 megs. It is very detailed and should be a help to anyone DXing Bolivia. Go to my website at **http://www.swl.net/patepluma** and follow the link from the main menu (Don Moore)

CANADA 6070 - CFRX: Previous chief engineer Clive Eastwood says the CFRX transmitter is a Bauer 707 1 kW unit with 4-400C's in modulator and final stage. The 707 features a silicone oil-filled modulation transformer and overload relays that set a flag when one trips. The call letters CFRB stand for Canada's First Rogers Batteryless, as the table top radio that runs off AC mains is a Canadian invention (Bill Sitzman, *Cumbre DX*)

The recent temporary off-air spell of CFRX in early May has attracted some attention. I contacted Steve Canney, current president of the ODXA and QSL manager of the station (not a representative of CFRX or CFRB). Here are Steve's comments:

"If anyone wants info on CFRX, they can see it on our web page **www.durhamradio.com/odxa/cfrb.html** The antenna is a single vertical and isn't even near the big CFRB antennas. There used to be two phased verticals focusing on the northern parts of Ontario but that antenna died many years ago.

"For some reason, the circuitry for the voice IDer didn't kick in but it cut the CFRB audio, leaving an open carrier for about a week. That's like having the mic on and leaving the studio for a week! Ian (the site engineer) only goes out to the site on Tuesdays... Because CFRX isn't a big priority, they don't regularly monitor at the downtown location – even though they have an R-5000 receiver ... bought specifically to monitor CFRX. It takes people like us to call them, and even then, they wouldn't be rushing out there unless the site was on fire! (via John Grimley, *Cumbre DX*)

CENTRAL AFRICAN REPUBLIC R. MINURCA had transmitter trouble but resumed 9900 kHz with 500 watts from Bangui, in addition to low power on 9500 and 5900. Reports are wanted from anywhere abroad. 9900 was to be boosted to 1 kW in June, and hopefully to 20 kW in preparation for presidential elections tentatively scheduled for Sept. Reception reports will be confirmed with a QSL card (David Smith, Radio MINURCA, B.P. 2732, Bangui, Centrafrique or smith2.unep@un.org via Georges Lessard, DEVMEDIA, via Don Moore)

CHINA [non] CRI confirms Cuba frequencies. I (finally!) received a response from the China Radio International engineering department, for

All times UTC; All frequencies kHz; * before hr = sign on, * after hr = sign off; // = parallel programming; + = continuing but not monitored; 2 x freq = 2nd harmonic; A-99=summer season, Mar-Oct; [non] = Broadcast to or for the listed country, but not necessarily originating there.

an e-mail inquiry about the relay frequencies [5990, 9570]. "The two frequencies are testing via Cuba; we hope you send comments on the reception and programmings. Sincerely, English Service" (Maryanne Kehoe, GA, *Cumbre DX*)

COLOMBIA FARC clandestine Voz de la Resistencia, 6240 heard at 1515 and *2015-2100* with better signal in Popayán than in Cali (Yimber Gaviria, Colombia)

R. Patria Libre: On May 20, [Colombian media] quoted a Colombian army press release saying that the army had busted an ELN "communications center," including transmitter, studio equipment, tapes, coax cable, antenna wire and batteries, in the vicinity of the little town of Santa Ana, located in a mountainous area of northwestern Antioquia Department, in an area controlled during the past sesquidecade by the Carlos Alirio Buitrago guerilla front, which, in mid-May, was forced to disperse following an army onslaught. One day later, another cable identified the transmitter site as that of R. Patria Libre, the ELN radio station which was set up by the Spanish priest Manuel Pérez, who was the organization's leader at that time. It had been around 6250 (Henrik Klemetz, Sweden, NU via DSWCI *DX Window*)

COSTA RICA RFPI has given up on carrying Pacifica News, due to $2000 cost for affiliation required, and 3-4 hours of downloading it took to get the half-hour show. Instead, RPFI is starting its own production, *Progressive Network News*, M-F at 2200, repeated at 0130; includes Kosovo report and Chiapas news. RFPI-produced programs uploaded by 2300 weekdays to **http://www.rfpi.org/webcast.html** (RFPI *Mailbag*)

(Ulis Fleming) Notes from a visit here: 5119 - Radio Alajuela is still putting out a harmonic but it is much weaker than before.

6075 - Estereo 88 claimed to be on shortwave when I spoke to them, but I did not hear them during my entire stay in Costa Rica. The Director of Control Nacional de Radio tells me that he is unware of them having a license for shortwave.

6105 - Radio Universidad is operating irregularly with station personnel seemingly ignorant of the shortwave operation. Their signal is weak even in Costa Rica.

Radio Reloj is off shortwave for the moment. Reloj stopped using 6006 a few years ago due to an RFI complaint from a local shotgun-carrying woman. The same woman has now complained about 4831 so the station has taken it off as well. The station plans to return to shortwave soon. This per Melvin Murrillo, Director of Control Nacional de Radio (Ulis Fleming, *Cumbre DX*)

5954.1 - Radio Casino daily now, but always weak. Sign on with anthem at 1030 give or take a few minutes and always heard with a single male announcer. Always with local music programs from sign on until typical fade at 1050 or so. Usually on 5954.16 on my radio, but has been as high as 5954.3. Runs open carrier from shortly after 1000 until sign on (Hans Johnson, FL, *Cumbre DX*) Running less than 1 kW. They are only allowed to broadcast from 1030 to 0000 UT. On August 18th they will be celebrating their 54th anniversary (Ulis Fleming, *ibid.*)

CUBA RHC's *DXers Unlimited* was playing the tape backwards, at 0330 one Wed in May but was forwards at 0130 (George Thurman, TX, *Review Of International Broadcasting*) Dead giveaway station is still using reel-to-reel tape and no one is paying attention; any secret messages heard?

[non] For info on the administrative and programming crisis at Radio Martí visit **http://polisci.home.mindspring.com/crisis_at_radio_marti.html** (Armando F. Mastrapa, *rec.radio.shortwave* via John Norfolk, OK)

R. Martí, Delano, on new 21500 at 2100-2200 only; checked this around 2150 and Cuban bubble jamming had already attacked it. However, due to larger skip distances on higher bands, I expect Cuba cannot skywave-jam this; should have used this band long ago, but IBB can only be dragged kicking and screaming into 13m! I'm not really complaining, since that means less QRM to other stations (gh)

ECUADOR 4815v - Radio El Buen Pastor: Jim Travis & Jerry Adams reported that the Collins 820-D1 is now back to 1000 watts. The modulation is more consistent since they installed a CRL 440 AGC amplifier ahead of the 220 MHz STL. They also found the main filter capacitor in the 3200 V power supply disconnected! The three of us will have to find replacement servomotors for PA tuning and loading, as both indicated open windings. Collins built the rig as if it were a piece of aviation or military gear. Mechanical tuning would have been much simpler. All of the contractors which start the various power supplies are 24-Vdc, while most transmitters employ 120 or 240-Vac units, much more available at local electrical suppliers. The station's current schedule is 1200-1500 and 2200 to 0300 (Bill Sitzman, *Cumbre DX*)

ETHIOPIA [non] V. of Oromo Liberation, 15715 via Germany in Oromo/Amharic, 1700-1800 on Thu, Fri, Sun, or "SBO" in Oromo for *Sagalee Bilisumma Oromoo*, has RealAudio archive at **http://www.visafric.com/Dimtsi_hafash.htm** (BBC Monitoring)

FINLAND [non]. You can read YLE's weekly Latin news broadcast on the CBC's web site at: **http://www.cbc4kids.ca/general/whats-new/latin-news/mainlatin.html** Also includes an English translation and interesting comments. CBC Radio's overnight service carries YLE, which explains the connection. Example:

JACQUES CHIRAC FINNIAM VISITAVIT - Praesidens Francogalliae Jacques Chirac die Lunae in Finniam venit cum praesidente Martti Ahtisaari de rebus Europaeis collocuturus. Postridie eius diei Chirac diurnariis narravit Finniam et Francogalliam consultationes inituras esse, quibus systema defensionis Unionis Europaeae commune adumbraretur. Paavo Lipponen, primus minister Finniae, ait suam patriam, quamquam membrum consociationis NATO non esset, omnia sua ad Europam defendendam facere velle.

Nuntii Latini via YLE can be heard on SW near the end of the their 1/2 hour English broadcast, in the case of NAm, Saturdays at UT 1253 on 15400 & 17670. Also on CBC Radio Mondays at 3:53 AM local time. Also available in Real Audio at their website **http://www.yle.fi/fbc/latini/recitatio.html** (Ivan Grishin, Oshawa, *Review Of International Broadcasting*)

FRANCE RFI English service after 1200 on 15195 was noted with lots of audio artifacts; sounded nearly like a "Real Audio" feed. I hope that the usage of MPEG with low data rates for broadcast purposes will not escalate. These artificial noises are much more unpleasant than natural white noise, hum, crackling and so on (Kai Ludwig, Germany)

GERMANY Deutsche Welle revamps *DW Plus* magazine. The June 1999 issue contains extensive editorialisms telling readers that it is endeavouring "to inform you even more fully and vividly about DW-tv and DW-radio's programmes." There is a problem, however, in that there is absolutely no information given at all about DW's non-German shortwave programs! No schedules, no details, nothing! (Bob Padula, *Electronic DX Press*)

Deutsche Welle black-out. June 4 the DW radiohouse at Cologne suffered a complete main power failure, resulting in a loss of all transmissions for nearly 12 hours. The main power switching facilities in the basement caught fire after a short-circuit. Nobody was injured (Ostdeutscher Rundfunk Brandenburg via Kai Ludwig, Germany)

GREECE V. of Greece at 0000-0350 to NAm is on 12105 ex-15630, but still //11645, 9420, 7450 (Joe Hanlon, PA, *World Of Radio*)

IRAN [non] R. Iran of Tomorrow now has a web site site **http://www.ri-ot.com** with audio; broadcasts daily 1700-1730 on 5830 (A. Khatarmi)

ISRAEL Kol Israel changed beaming of 11605 in English at 0400 to favor WNAm at 334°, the same as in Hebrew on 15640 at 2115-0500. Additional changes in KI broadcasts to WNAm are expected in the next broadcast season beginning 1 November (George J. Poppin, Technical Monitor, San Francisco, *World Of Radio*)

KOSOVA [non] As from Friday 11th June, a Radio Netherlands transmitter in Flevo is carrying two hours of programming from Radio 21, the exiled Albanian-language station from Pristina, capital of Kosova. The transmissions are arranged in cooperation with Press Now, an organization set up to support the independent media in the former Yugoslavia. The transmitter will be on the air at 1827-2025 UTC on 9495 beamed to Eastern Europe. Radio Netherlands is *not* responsible for the content of these programmes. QSLs are not available. An English newscast is included at approximately 2015 (Andy Sennitt, *swprograms*, std disclaimer) Blocked here by WHRI, longtime user of 9495 (gh, OK)

LITHUANIA On May 7, Lithuanian Radio addied about an hour of broadcasts daily via the Sitkunai HF station in Central Lithuania. Broadcasts are compiled from 1st and 2nd Home Service programs, and are on the air Monday to Friday 1330-1435, Saturdays and Sundays 1330-1425. The frequency is 9555.

On April 1, 1999, the station installed a new 100 kW Continental 418F transmitter which replaced the old 50 kW unit. The new transmitter is now used for all HF broadcasts originating from Sitkunai, i.e. daily 0900-1200 (carrying Lithuanian Radio), Sat 1330-1325 (Lithuanian Radio), and Sun 1200-1425 (Universelles Leben and Lithuanian Radio).

Broadcasts before 1330 are beamed at 259 degrees via newly installed curtain antenna HR2/2/.5 (which is non-reversable), but after 1330 they are routed to the old curtain antenna HR4/4/.5 and beamed at 79 degrees (the old antenna is reversable and can operate both at 79 and 259 degrees). Because the old antenna can not handle 100 kW of power, the output power of the transmitter is reduced to 50 kW after 1330. Broadcasts starting at 1330 are meant for listeners in Russia and Belarus; therefore the majority of the programming is not in Lithuanian. (Sigitas Zilionis)

MALTA [non] Voice of Mediterranean on Suns via Santa Palombara, Italy, 11770 in English retimed to 0800-0900 (ex-0930) (Edwin Southwell, UKoGBaNI, DSWCI *SW News* via *BC-DX*) On usual 11770, and //via unID site 9815 (Rumen Pankov, Ivo Ivanov in *Panlview*, via *BC-DX*)

It was reported already a while ago, but I assume it is still the case, that VoM has no circuit outputs; they not even had a feed to the closed DW transmitters; instead the tapes were taken to the site and played there, according to a German press feature in some cases after a treatment with the scissors. So it is rather likely that 9815 originates from Prato Smeraldo too (Kai Ludwig, Germany)

MONGOLIA VOM 1500-1530 English is being heard here on the second harmonic, 19440 (Ian Wadman, UKOGBANI, June World DX Club *Contact*)

NAMIBIA NBC now has its own website at **http://natradio.imlt.org.na/** which is so personality-oriented that there are photos of the board members, profiles of the on-air personalities, but nothing about how you can actually tune them in! (Andy Sennitt, DSWCI *DX Window Caught in the Web*)

NEW ZEALAND [non] Whilst enjoying RNZI's classical music on *Cadenza*, at 0126 on 17675 (despite – not because of – the rolling fades some diehard SWLs say add to the experience), a far greater problem appeared out of nowhere: Dr Gene Scott. By 0127 R. Nederland's ID signal joined him to mess with RNZI. This was on the Yachtboy 400, which was connected to an external outdoor antenna, but not overloaded until this moment.

Unplugged it in favor of indoor reel-out antenna, and still the mix though somewhat lessened. Only by going to the whip alone did it disappear, but RNZI's signal level also dropped too much. This was doubtless mixing produced within the receiver, and I soon figured out the unwitting culprits: RN which had just opened Dutch on 11865 from Bonaire; and KAIJ 5810 Dallas, which when summed, equal 17675. Oh, for valve receivers! (gh)

NICARAGUA [non]. AWR Costa Rica, 15459.5, heard on a Sat until 2331* with program produced in Nicaragua; any further info? (Harald Kuhl, Denmark) Heard the same day, also on //13750 with Managua programs from 2300 including *Así es Nicaragua* from 2320. Address is Apartado Postal 92, Managua; or radventista@netport.com.ni (Yimber Gaviria, Colombia, *Noticias DX*)

PERÚ R. Amistad is a new SW station in Lima on 4655, heard at 2300-0500. Contact info: Sr. Manuel Mejía Barboza, Radio Amistad, Manzana I 11 Lote 6, Calle 22, Urbanización Mariscal Cáceres, San Juan de Lurigancho, Lima, Perú. Phone: 51-1-392-3640 E-mail to me and I will pass it on: alfca@mailexcite.com (Alfredo Cañote, Perú, *Conexión Digital*)

R. Sudamérica, 5523.3, 2230-2310 June 4, reactivated after sabotage of its equipment last December. Now using new Slogan: "Radio Sudamérica, la Inmortal" (Rafael Rodríguez R., Bogotá, Colombia)

6955.5 at 0430, Rdif. Paratón, Huarmaca, now here ex-6676 with chicha music and frequent timechecks, heard past 0530. Thanks to Peter Grenfell who alerted me after chasing pirates as usual (Paul Ormandy, Oamaru, New Zealand, *hard-core-dx*)

RUSSIA In mid-April, Pavel Mikhailov, the editor and presenter of VoR *DX Klub*, my DX friend since 70s was hospitalized after a heart attack. His program was missing the following four weeks (Rumen Pankov, Bulgaria, *BC-DX*)

The Voice of Russia will celebrate its 70th anniversary on October 29th. During the coming months they will be broadcasting special programs, "about the history of our radio station, our veterans and aspiring journalists, announcers and technicians. In our anniversary programs we'll be reading from your letters so that we all have a better chance to know what our listeners really think about our work. The winners will be awarded special prizes and souvenirs bearing our company's logo." More info, and an online contribution form, can be found at **http://www.vor.ru/forum/forum_eng.html** (Andy Sennitt, DSWCI *DX Window Caught in the Web*)

SEYCHELLES Government has a reclamation project in Mahé; flat new land to be created for housing in the bay where FEBA masts are located, affecting its broadcasting (FEBA via Worldwide DX Club via *BC-DX*)

SPAIN REE sked shows News in Catalan/Galician/Basque, which used to be several times a day, only at 2200-2230 Mon-Sat, on 7270, 7275, 9595, 9765-CR, 11880-CR, 15110-CR, 15170, 17575. And the special Spanish program for Equatorial Guinea is Mon-Sat 1600-1700 on 15375, 17755 (BBC Monitoring)

SRI LANKA Here are the actual REGISTRATIONS for the new IBB (US Int'l Broadcast Bureau) Iranawila relay. The project is much belated. The original test planned dates for November 1997 (!) The list shows up to four transmitters at a time. The station didn't carry tests with the regular program, except some rare tone tests.

At present a lot of the listed transmissions are coming from different IBB sites in A99, like from Ekala, the other Sri Lanka site; Germany, Morocco, Greece, Spain, Philippines, Thailand, and UKoGBaNI.

(IBB via Uwe Volk, *BC-DX*)

Clandestine: Voice of the Tigers: They have been on for a few months, 7460 at 0100-0230, 7382 at 1400-1530, all Tamil and unjammed. Probably 1-2 kW located in the north of the country. (Victor Goonetilleke, Sri Lanka, 4S7VK, UADX, via RN*MN* via *BC-DX*)

THAILAND Or Sor (Dusit Palace) 0330 sign-on, into usual weekday morning sequence of English-language nursery rhymes and children's songs performed by Singaporean or Malaysian-sounding choir. Station has a very eclectic taste in music. The King of Thailand is well known to be a jazz enthusiast, which probably explains the large amount of jazz played. Fair on approx 6149.5, but // 1332 and 104.0 MHz probably give useful reception over a larger radius, especially in the evening when the channel is swamped by Singapore on 6150. Usual sked remains 0330-0500 and 0900-1200 Tues-Sat and 0230-0500 Sun, but occasional minor variations often noted (Alan Davies, Bangkok, *Electronic DX Press*)

UKRAINE RUI, 9560, 0000-0058: English news, commentary, local pops, choral church music. Fair. Much weaker on //5905, 6020. 9560 covered by R. Budapest *0058 (Brian Alexander, PA, *World Of Radio*)

U K o G B a N I Radio Free London has been making it to Michigan on 15069. Try 03-05. Heard 15069kHz 0411-0530 clear IDs, British rock music, fading up and down, barely audible at 0230, 0540. Claimed 24 hour test, 70 watts. My first decent Euro-pirate reception. Also heard another night at 0300-0430 (Larry Russell, MI, MARE) Also my first Euro-pirate, faded in briefly at 0522-0530 on 15068.66 (Volodya Salmaniw, Victoria, BC) 15070 used to be a prime BBC frequency they were forced to vacate; helps to be illegal

UNITED NATIONS The 21st Session of the UN Committee on Information ended on May 14. Kensaku Hogen, Under-Secretary-General for Communications and Public Information, said in his closing statements that the UN Department of Public Information is committed to improving its international radio broadcasting capacity. The question of resources, however, is key. For the development of a shortwave radio broadcast capacity, the estimated cost would be at least $4 million a year for several years, to be provided from extrabudgetary sources. He added that so far no UN Member State has offered to contribute resources. A pilot project will not be launched before the question of its financing is resolved. The UN Committee on Information will meet again later this year for discussing a report about the improvement of the UN's internet activities (Harald Kuhl, Germany, *Cumbre DX*)

U S A 11900 - WWBS has changed their schedule so that they will reach Europe during the day. They are now testing at 1000-1200 UT on Sat and Sun. They are also being sued in a WGTG-type lawsuit. A local recording studio is claiming damages due to RFI from WWBS, but hasn't been able to demonstrate any loss. The station continues to run low power pending a resolution of the case (Hans Johnson (c) *Cumbre DX*)

Art Bell is suing WWCR and the Ted Gunderson program for defamation and slander during a Dec 1997 broadcast. Check out the court documents at **http://www.artbell.net/court/tenncomp.html** (Ulis Fleming, Hans Johnson, *Cumbre DX*) How can any radio station possibly police everything said on a presumably live call-in show or be held responsible for it? (gh) The suit also names Ted Gunderson, who leased airtime for his radio program on WWCR, and David Hinkson, a frequent guest on Gunderson's program for falsely stating that Mr. Bell had been indicted for child molestation (Kim Elliott, VOA *Communications World* via John Norfolk)

Following the resignation of Randi Steele from WBCQ, Al Weiner posted his own hate speech policy at **http://wbcq.net**. Discussing it on *Al Weiner Worldwide*, UT Sat 0000-0100 on 7415, Al made it clear that Brother Stair was OK, but some other programmers were pressing the boundary. Anita McCormick called in to say that it did not go far enough to satisfy her or Randi (gh)

WINB turned out to be the one on 13800, ex-13790; sked is now: 1500-2100 13800, 2100-2400 13790, 0000-0500 11950 (Gayle Van Horn)

Instead of *Spectrum* June 13, a pilot of Wayne Green's *You Can!* aired at 0300 UT Sun on the Omega Radio Network via WWCR 5070; see **http://waynegreen.com** (Chet Copeland, DC) I listened to the first few minutes. Nothing about ham or radio but Wayne pontificating that virtually everything in current society is fraudulent (gh)

World Of Radio on WWCR: Thu 2030 15685, Sat 1130 12160, Sun 0230 and 0630 5070, Mon 0501 3210, Tue 1230 15685.

VENEZUELA Ecos del Torbes: received an interesting E-mail from Bill Sitzman, who runs an engineering firm near Rochester, and says he is a big fan of EdT. He notes, "we have seen as high as 0.25 mv/m (250 microvolts) with an average of 0.1 mv/m on our Potomac Instruments FIM-41 field strength meter. The modulation is always loud and clear. We consider YVOC to be the jewel of the Tropical Band!" (Don Moore, NU via DSWCI *DX Window*)

VIETNAM The Voice of Vietnam finally has a proper official website of its own with current frequencies for the external service. To access the schedule in all languages go to **http://www.vov.org.vn/docs1/english/history/international.html** and click on the programme button, which actually leads to the frequency schedule. This site also functions as a Website for the VoV domestic services (Andy Sennitt, DSWCI *DX Window Caught in the Web*)

English program schedule; currently heard at 1700-1728 on 12070 via Russia; 1800-1828, 1900-1928, 2030-2058 on 13740 (Edwin Southwell, England)

Daily: *News and Current Affairs* followed Mon, Tue, Thu, Fri by *Press Review*. Final items are:

Mon - *Vietnam Land and People*
Tue - *Vietnam Culture and Sports*
Wed - *Letter Box & Talk of the Week*
Thu - *Vietnam Economy; Business Forum*
Fri - *Rural Vietnam*
Sat - *Weekly Review; Historical Events; Music*
Sun - *Sunday Show* (via Southwell)

YUGOSLAVIA BBCM heard 7200 go off the air at the precise moment that the Stubline site was bombed at 1108 UTC on 25th May – and the RTS domestic service has not been subsequently been heard on shortwave at all (Dave Kenny, June 7, *World Of Radio*)

Until the Next, Best of DX and 73 de Glenn!!

Hot August QSLs

Have you logged Belgium's RTBF yet? Radio-Television Belge de la Communaute Francaise was inaugurated February 1, 1999, and is the broadcasting organization of the French-speaking community in Belgium. RTBF aims at listeners in Africa and consists of relays from RTBF's domestic radio channels.

Transmitting via Deutsche Telekorn facilities in Juelich, Germany, RTBF continues to be easily heard with a distinctive native African instrument interval signal at sign on, followed by a French/English identification into French programming. The station's French website, with links to programming and frequencies, may be found at <**www.rtbf.be/**> Email <**relinr.r@rtbf.be**>

Bill Wilkins of Springfield, Missouri, verified RTBF in 22 days with an English report (RTBF returned his IRCs) while my French report received a response in 27 days with enclosures of one dollar and souvenir postcards. Station address: 1044 Brussels, Belgium. If you're looking for an interesting station to log which verifies promptly, tune in to RTBF!

RTBF broadcasts on the following French schedule; broadcasts may be one hour later in winter.

0257-0459	Monday-Friday	9490 kHz
0427-0459	Saturday/Sunday	9490
0500-0806	Sunday	17580
0500-0712	Monday-Friday	17580
0500-0959	Saturday	17580
0957-1206	Monday-Friday	21540
1000-1117	Saturday	21540
1057-1117	Sunday	21540
1457-1712	Sunday-Friday	17800
1557-1712	Saturday	17800

(*BBC Monitoring/BELRX002*)

ANTIGUA

Deutsche Welle, 9640 kHz. Full data card of Wertachtal transmitter site, form signature of Horst Scholz-Transmission Management. Received in 364 days after follow-up English reports from original report. (Randy Stewart, Springfield, MO)

ARGENTINA

RAE, 15345 kHz. Full data station logo card signed by Mrs. Perla Damurri. Received in 179 days after my original email report, with apology included within personal letter. Station address: C.C. 555, Correo Central, 1000 Buenos Aires, Argentina. (Cristian Mocanu, Romania/*Cumbre*)

BRAZIL

Radio Clube Paranaense, 6040 kHz. Full data personal letter signed by Vicente Mickasz-Superintendente. Received in 32 days for a Portuguese report and one dollar. Station address: Rua Rockefeller 1311, Prado Velho, 80230-130 Curitiba PA, Brazil. (Danielle Canonica, Switzerland)

Radio Marumby, 9665 kHz. Full data QSL certificate signed by Pb. Claudiney Nunes, Coordenador Radio e Journalismo. Received for a Portuguese report and one IRC. Station address: Gerencia Radio, Gides Mission Brios da Hora, Rua Joaquim Nunes 244, Caixia postal 4, CEP 88340.000 Cambori. (Mauno Ritola, Finland/*Cumbre*)

COASTAL RADIO

CW Station-WOO, 4387 kHz USB. Full data Ocean Gate Radio card signed by John R. Morgan. Received in 85 days for an English utility report, one dollar and souvenir postcard. Station address: P.O. Box 550, Manahawkin, NJ 080500. (Frank Hillton, Charleston, SC)

COSTA RICA

Radio For Peace Int'l, 15049 kHz. Verification letter via email from James Latham-Station Manager. Received in six days for an email report. Email: <**info@rfpi.org**> (Stewart, MO)

GREECE

Radio Free Iraq-via Kavala, Greece, 7110 kHz. Full data *Letter of Verification* on RFE/RL letterhead, signed by David Walcutt-Broadcast Operations Liaison. Received in 15 days for an English report and two mint stamps. Station address: c/o Radio Free Europe/Radio Liberty, 1201 Connecticut Ave., N.W., Washington, DC 20036. (Wilkins, MO)

LEBANON

High Adventure Radio, 11530 kHz. Full data paper QSL signed by Gary Hull, plus schedule. Received in 55 days for a taped report and one dollar. Report sent to Box 53379, Limassol, Cyprus; QSL mailed from Metulla, Adventure Radio, P.O. Box 77, Metulla, Israel, or via email to: <**radio98@hotmail.com**> (Stewart, MO)

MEDIUM WAVE

KTBK 1700 kHz AM. Full data QSL letter signed by Hubert (Hue) Beavers, noting first day of regularly scheduled operation with scanned photo of station tower under construction. Letter states they were on night power (700 watts) 5/8 wave antenna. Station address: 3632 Blossom Trail, Plano, TX 75074. (Patrick Griffith-NONNK, Federal Heights, CO)

WEZO 950 kHz AM. Partial data verification on letterhead, signed by David Lane-Chief Engineer. Received in 13 days for an AM report and SASE (used for reply). Station address: 500B Forman Bldg., Midtown Plaza, Rochester, NY 14604. (Harold Frodge, Midland, MI)

WPHT 1210 kHz AM. QSL card and letter signed by Sam A. Virgillo-Technician, plus key chain. Enclosed two QSL cards with photo of the old WCAU in 1950. Received in 21 days for a taped tentative report. Station address: City Avenue & Monument Rd., Philadelphia, PA 19131. (Patrick Martin, Seaside, OR)

WSAI, 1530 kHz. Partial data coverage map and letter signed by Dave Mason-Operations Manager. Received in 7 days for an AM report, three mint stamps and address label. Station address: 1111 St. Gregory St., Cincinnati, OH 45202. (Wilkins, MO)

WTTM 1680 kHz AM. Black and white certificate signed by Anthony A. Gervasi-Sr. Vice President. Received in 30 days for a taped report. Station address: 619 Alexander Rd.-Third Floor, Princeton, NJ 08540. (Martin, OR)

WXXI 1370 kHz AM. Sticker and partial data verification letter signed by Jeanne Fisher-Vice President. Received in 10 days for an AM report and a SASE (used for reply). Station address: 280 State St., Rochester, NY 14624. (Frodge, MI)

Radio One, Dar es Salaam, 1440 kHz AM. Full data card showing three lions. Received in 11 months, 52 days after email reminder to <**radio1@ipp.co.tz**> (the address on their web-page is incorrect). Card states you can use <**itv@intafrica.com**>, power is 10 kW into a n/d antenna. Station address: Box 4374, Dar-es-Salaam, Tanzania. (Martin Elbe, Denmark/*Hard Core DX*)

NORTHERN MARIANA ISLANDS

Voice of America via Tinian, 11995 kHz. Full data *National Archives* scenery card unsigned. Received in 38 days for an English report. Station address: 330 Independence Ave., S.W.-Room 4605, Washington, DC 20547. (Wilkins, MO)

PUERTO RICO

Armed Forces Radio & TV via Isabela, 6458.5 kHz. Partial data email letter from Wayne E. Eternicka-Broadcast Operations Specialist. Received in one day for an email report. I asked him to make the verie site-specific, and he kindly added a sentence to his form letter as, "this letter serves as confirmation of your May 8, 1999, reception of Armed Forces Radio and Television from our Puerto Rico location at 6458.5 kHz." Email address: <**eternicka@mediacen.navy.mil**>(Stewart, MO)

SOUTH AFRICA

Trans World Radio, 7215 kHz. Full data Sentech antenna card signed by Kathy Otto, plus schedule. Received in 7 weeks for an English report. Station address: Sentech (Pty) Ltd., Shortwave Services, Private Bag X06, Heneydew 2040, South Africa. (Wilkins, MO)

POCKET POWER!

New From ICOM! The Ultra-Compact R2!

Never before has so much scanning power been packed into such a tiny radio, and at such an affordable price! This six-ounce pocket monitoring post offers continuous 485 kHz-1300 MHz (less cellular) frequency coverage in AM, WFM, and NFM modes. The triple-conversion superheterodyne design assures high sensitivity and sharp selectivity, allowing up to 400 channels to be stored in 8 banks.

Other features include CTCSS tone squelch search and decode, signal-overload attenuator, tuning knob with selectable steps, noise blanker, priority, and multiple scan functions at a fast 30 channels per second. Sleep timer, automatic shutoff, earphone jack. Computer port allows second-radio cloning and database management. Two AA NiCd cells and charger included–or you can use replaceable alkalines!

Order WBR28 Only $219.95 Please add $12 UPS shipping or US Priority Mail

New! AOR AR16B

This new, 2-1/2" wide, receiving dynamo offers a wide 500 kHz-1300 MHz frequency coverage (less cellular), AM/WFM/NFM modes, and 500 memory channels in 5 banks. Select 12 different frequency steps from 1 to 100 kHz for the manual tuning dial or search mode, and scan or search at 20 steps per second.

Featuring excellent sensitivity (0.35 microvolts), signal strength indicator, backlit LCD display and keypad, loud and crisp audio, automatic squelch level, and computer interface capability, this tiny marvel even comes with high density NiMH rechargeable batteries and charger. Alkaline AA cells may be used as well.

Order WBR29 Only $219.95 Please add $12 UPS shipping or US Priority Mail

Full coverage units with voice descrambling (speech inversion) available to government agencies and cellular service providers only. Order WBR29-G for only $229.95.

How to Use the Shortwave Guide

Convert your time to UTC.

Broadcast time on ① and time off ② are expressed in Coordinated Universal Time (UTC) – the time at the 0 meridian near Greenwich, England. To translate your local time into UTC, first convert your local time to 24-hour format, then add (during Daylight Savings Time) 4,5,6, or 7 hours for Eastern, Central, Mountain or Pacific Times, respectively. Eastern, Central, and Pacific Times are already converted to UTC for you at the top of each page.

Note that all *dates*, as well as times, are in UTC; for example, a show which might air at 0030 UTC *Sunday* will be heard on *Saturday* evening in America (in other words, 8:30 pm Eastern, 7:30 pm Central, etc.).

Find the station you want to hear.

Look at the page which corresponds to the time you will be listening. On the top half of the page English broadcasts are listed by UTC time on ①, then alphabetically by country ③, followed by the station name ④. (If the station name is the same as the country, we don't repeat it, e.g., "Vanuatu, Radio" [Vanuatu].)

If a broadcast is not *daily*, the days of broadcast ⑤ will appear in the column following the time of broadcast, using the following codes:

Day Codes

s	Sunday
m	Monday
t	Tuesday
w	Wednesday
h	Thursday
f	Friday
a	Saturday

In the same column ⑤, irregular broadcasts are indicated "tent" and programming which includes languages besides English are coded "vl" (various languages).

Choose the most promising frequencies for the time, location and conditions.

The frequencies ⑥ follow to the right of the station listing; all frequencies are listed in kilohertz (kHz). Not all listed stations will be heard from your location and virtually none of them will be heard all the time on all frequencies.

Shortwave broadcast stations change some of their frequencies at least twice a year, in April and October, to adapt to seasonal conditions. But they can also change in response to short-term conditions, interference, equipment problems, etc. Our frequency manager coordinates published station schedules with confirmations and reports from her monitoring team and *MT* readers to make the Shortwave Guide up-to-date as of one week before publication.

To help you find the most promising signal for your location, immediately following each frequency we've included information on the target area ⑦ of the broadcast. Signals beamed toward your area will generally be easier to hear than those beamed elsewhere, even though the latter will often still be audible.

Target Areas

af:	Africa
al:	alternate frequency (occasional use only)
am:	The Americas
as:	Asia
au:	Australia
ca:	Central America
do:	domestic broadcast
eu:	Europe
me:	Middle East
na:	North America
om:	omnidirectional
pa:	Pacific
sa:	South America
va:	various

Consult the propagation charts.

To further help you find a strong signal, we've included a chart on page 60 which takes into account conditions affecting the audibility of shortwave broadcasts. Simply pick out the section of the chart for the region in which you live and find the line for the region in which the station you want to hear is located. The chart indicates the optimum frequencies (in megahertz-MHz) for a given time in UTC. (Users outside North America can use the same procedure in reverse to find best reception from North America.)

Choose a program or station you want to hear.

Some selected programs appear on the lower half of the page for prime listening hours – space does not permit 24-hour listings. Our program manager changes the stations and programming featured each month to reflect the variety available on shortwave, though BBC programs are almost always included.

Occasionally program listings will be followed by "See X 0000." This information indicates that the program is a rerun, and refers to a previous summary of the program's content. The capital letter stands for a day of the week, using the same day codes as in the frequency listing (see above), and the four digits represent a time in UTC.

GRUNDIG
Gives you the World

Grundig leads shortwave radio into the new Millennium!
When radio was introduced, back in the 1920's—to pluck voices and music out of thin air—people thought it was magic. With Grundig, it still is! No other manufacturer rivals Grundig for *"that European sound."* Voices have an *"in-the-room"* quality and clarity—even from half a world away.

German-engineered quality... German-engineered sound... when people think of shortwave, they think of Grundig. Grundig has specialized in shortwave since the late 1950's, and in North America, shortwave radios are all we sell.

Critics reviews of Grundig models include *Best of Category .. Superior Performance... Ergonomically Better... Superb Sound Quality... An Excellent Choice*

We listen, too.
We're very good at listening—to our customers. Our engineers design each model so it's easy, intuitive, and convenient to use. Critics call this *"great ergonomics!"* And Grundig models always deliver top performance for the price. Critics call this *"bang for the buck."*

GRUNDIG

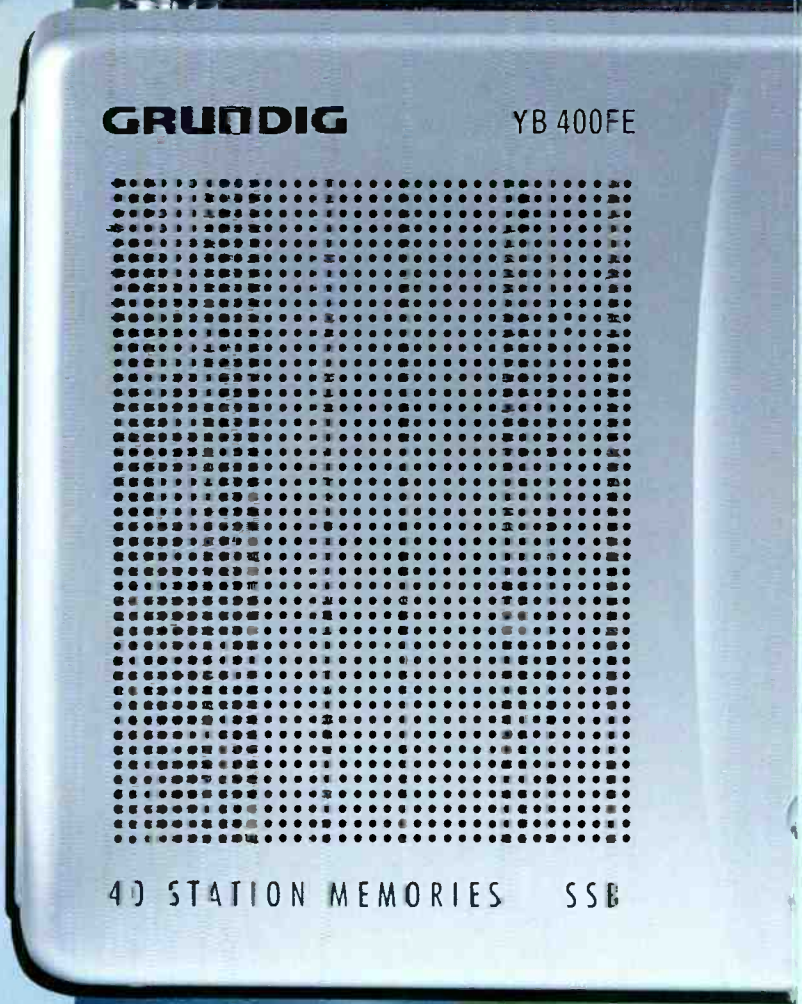
The Latest in Technology

Rated Best in Its Class.
Grundig's Yacht Boy 400PE has received rave reviews from the shortwave press for combining a wealth of sophisticated features in a sleek titanium-look package that doesn't cost a fortune. It incorporates features found on stationary shortwave systems that cost thousands, such as outstanding audio quality, precise 1 kHz increment tuning, up/down slewing, frequency scanning, signal strength indication, and single-sideband signal demodulation.

But the advantage mentioned most often in the reviews is its ease of use for the novice listener. In moments you can listen to foreign broadcasts beamed to North America.

Soon, you will be scanning the airwaves to tune in exotic music programs and sports events from faraway locales. The YB-400PE even picks up shortwave amateur (ham radio) broadcasts and shortwave aviation/military frequencies (cockpit-to-tower communications). The possibilities for family fun, education, and enjoyment are boundless.

For travel or home use, Grundig adds a dual-time travel clock with snooze and sleep timer. The FM band is stereophonic with your headphones. The lighted LCD panel is easy to read in the



Yacht Boy 400PE

The Best in Value!

dark. Comes with a form-fitting pouch, integral telescoping antenna and advanced external antenna on a compact reel, carry-strap, ac-adapter, earphones and complete instructions.

Made by Germany's Grundig.
World leader in shortwave radios, the 400PE measures just 7-3/4"L x 4-1/4"H x 1-1/4"W; weighs only 20 oz. It slips easily into your carry-on for travel and fits on a nightstand, office credenza or yacht cabin console. One-year warranty

Grundig's Yacht Boy 400PE Named Editor's Choice.
Passport To World Band Radio is regarded as the leading authority of the shortwave industry. Here's what their testing expert wrote about the Grundig Yacht Boy 400PE:

"Best performance for price size category, and among the choicest portables of any size, at any price."

"The 400's FM performance is right up there with the very best among world band radios."

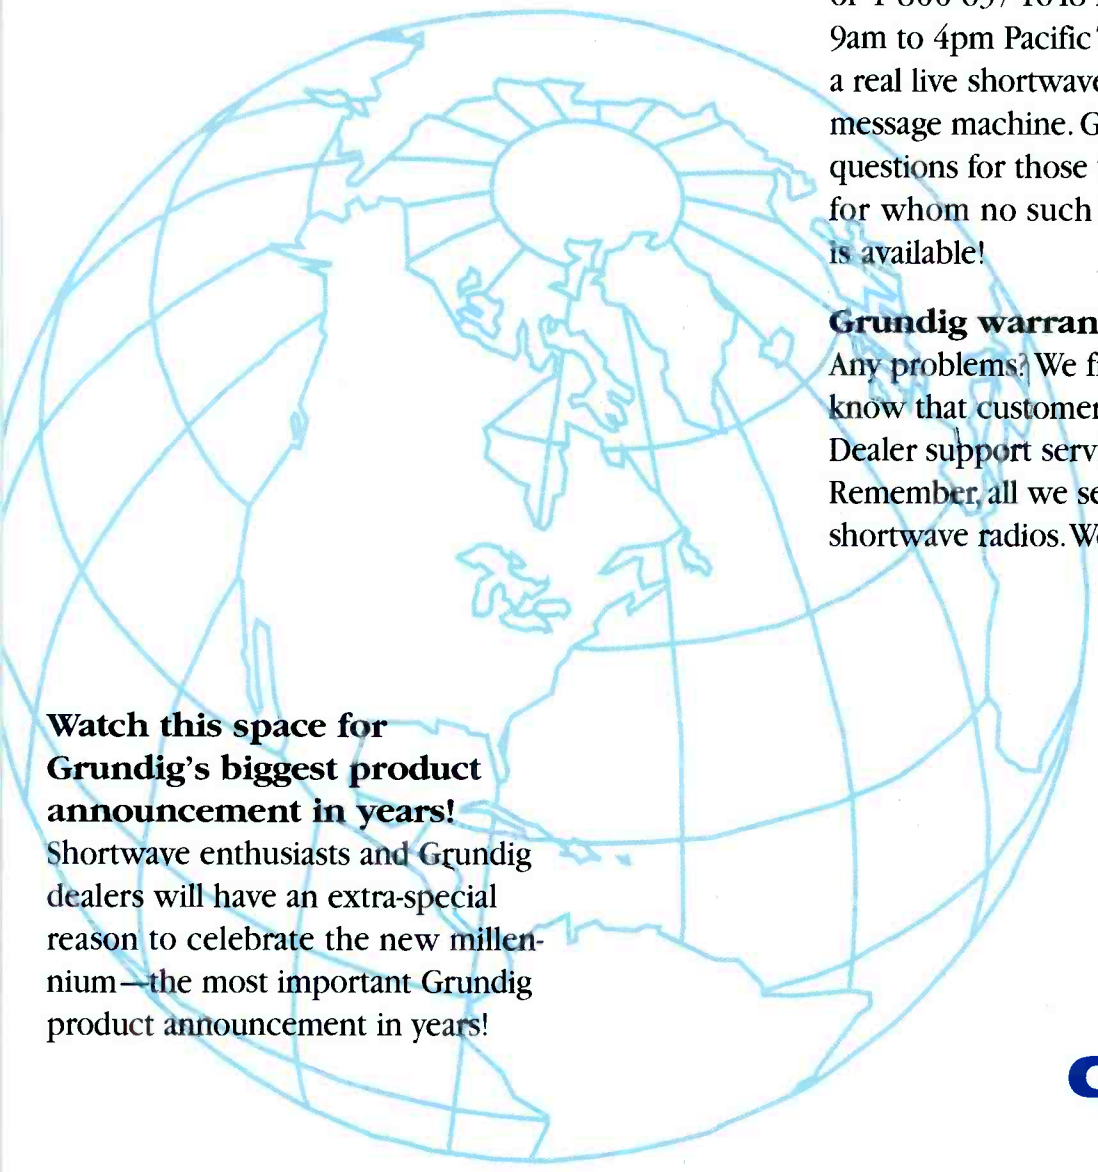
Please call our shortwave hotline and talk to the experts: 800-872-2228.

Grundig sets the standard for customer service.

Grundig supports the industry's only Toll-free Shortwave Hotline. Consumers and dealers can call 1-800-872-2228 in the United States or 1-800-637-1648 in Canada weekdays from 9am to 4pm Pacific Time. You can speak with a real live shortwave expert, not an automatic message machine. Grundig even answers questions for those who own other brands, for whom no such toll-free hotline service is available!

Grundig warranty service is the best.

Any problems? We fix them fast. Dealers know that customers will be taken care of! Dealer support service is first-rate, too. Remember, all we sell in North America are shortwave radios. We specialize! We do it best!



Watch this space for Grundig's biggest product announcement in years!

Shortwave enthusiasts and Grundig dealers will have an extra-special reason to celebrate the new millennium—the most important Grundig product announcement in years!

GRUNDIG

made for you

ELF/VLF/LF Propagation Modes - Part 2

All the transmissions in the basement of the spectrum are vertically polarized, except as noted last month in the case of the Clam Lake/Republic US Navy system where the antennas are horizontal. The LF broadcasters and the various naval transmitters worldwide use extremely high power; it is not unheard of for these stations to "pump" between .5 to 5 MW.

However, the antenna systems at these frequencies have a very low efficiency and the power that is finally radiated is very small. On a frequency of 100 kHz, even a quarter-wave vertical antenna would be about 2400 feet high! Obviously that's quite an impossible feat, so there is a great loss of power in the antenna, loading coil, and ground system of all these stations.

When we "cruise" this section of the spectrum, many assume that the signal received is via the groundwave propagation mode. In daylight, that is the mode of choice for a signal in the 200 to 500 kHz band to follow to reach your simple receiver and antenna. Distant stations in that band are not normally heard during the daytime, especially if the complete path is in daylight.

Marine and air navigation beacons can normally be heard from a distance of about 100 miles in daylight using simple antennas and receivers. Even if you increase the antenna size and operate from a very quiet location, you will not be receiving signals from much further beacons.

In the **10 to about 100 kHz** range, the signal strength of the signals received in daylight and at nighttime is approximately the same. The noise level varies depending on the time of day and the season, but most of the time if you hear a signal at night, you will also hear it during the day. There seems to be very little difference in reception in that part of the spectrum, and you will hear the various high power armed forces transmitters "chirping" away 24 hours a day.

Now let's look at propagation in the slice between **100 and 500 kHz**. I am excluding from this segment the ship/coastal station operations that are located in the 450 to 500 kHz – there are very few such operations left on the air since the advent of the satellite-based GMDSS (Global Maritime Distress & Safety System).

You will still find some very interesting stations here: ITU region 1 (European) broadcasters, lowfers, and air/marine navigation beacons. If you live on the East Coast of North America, chances are that in summer you will not hear the broadcasters. Maybe in the dead of night you might catch a few sentences between static crashes. But come winter, when the complete path between you and Europe becomes dark by mid to late afternoon in eastern North America, chances are that you will hear the Icelandic station on 189 kHz and the BBC on 198 kHz.

If you are participating in a DXpedition in a very RF quiet environment, you might also hear Algeria, Turkey, Germany, Ireland and a few others. If you live on the West Coast of North America, you might hear some Russian broadcast stations in the same frequency slice, but there are very few.

OPTIMUM WORKING FREQUENCIES (MHz)

For the Period 15 August to 14 September 1999 Flux=191 SSN=149

SUMMER HEAT: Sport and BBC Controversy

It's summer and we turn our attention to much loved leisure pursuits – like sports and criticizing the BBC.

LIVE SPORT

Sportsworld on *BBC World Service*, UTC Saturdays 1405 to 1700, Sundays 1605 to 1700
Grandstand on *Radio Australia*, UTC Saturdays 0210 to 0800, UTC Sundays 0305 to 0800
Radio Sport on *Radio New Zealand International (RNZI)*, UTC Saturdays and Sundays 0200 to 0500

Given the "sports crazy" nature of nearly all cultures, it would at first seem surprising that there isn't more time devoted to live sport by international broadcasters. But once one understands better the "big business" nature of sport all over the world, the reason becomes quite clear.

Broadcasting rights for sport are both aggressively and expensively pursued and jealously guarded. Since most international broadcasters remain tax-supported public service broadcasters, their ability to bid against more wealthy private broadcasters and pay increasingly exhorbitant rights fees are greatly restricted. Furthermore, the American private shortwave broadcasters survive by charging program producers for air time, not by paying for product. So they are not likely to be big players in this environment, either.

The rights retained by the **BBC**, the **Australian Broadcasting Corporation** and **Radio New Zealand** are largely legacies held from the days when they were virtually the sole broadcasting entities in their respective nations. Who knows how much longer they will be able to hold on to them? Fortunately for us, while they do, we can hear stirring descriptions of soccer, rugby, cricket and Aussie rules football matches – much of which is and will remain otherwise unavailable to us here in North America via any other media.

Even where broadcasters have an Internet presence and hold the radio broadcast rights, they usually have been effectively barred from broadcasting the same game descriptions over the Internet. Therefore, shortwave often remains the international listener's only point of access.

Although **Sportsworld** does as its name implies – cover sports all over the globe – its primary focus is on the British Isles. English and Scottish Premier League soccer is broadcast from August to May, rugby in winter, cricket in summer and full coverage of all the main national events, like Wimbledon tennis, the Oxford-Cambridge boat race and the various horse racing fixtures, among others.

Grandstand and **Radio Sport** are more finely focused on South Pacific sporting events. At this time of year, **Grandstand** features "The Match of the Day" in Australian Rules Football on Saturdays and the Australian Rugby League on Sundays. Their respective seasons will wrap up with a series of playoffs among the top eight teams in each, culminating in each sport's Grand Final held in late September.

Radio Sport concentrates almost exclusively on the New Zealand national passion – rugby in all its forms. Some attention is paid to cricket and a few other interests, but the clear preference is for rugby. The newest wrinkle is an international competition named the Super 12 League, comprised this year of teams from South Africa, Australia and New Zealand who play in a season running from February to May. If rugby's your game, then I would suggest that **RNZI** is your station.

For *BBC World Service* frequencies for your area, consult *MT's Shortwave Guide*. **Grandstand** on *Radio Australia* is broadcast on special frequencies: 9660, 12080, 17580 and 21725 kHz. If you live in North America, 17580 kHz has been giving best results. **Radio Sport** on *RNZI* has been heard consistently well in North America on 17675 kHz. *RNZI* also preempts regular programming for live coverage of key rugby and cricket matches. A schedule of these preemptions is regularly updated at <**http://www.rnzi.com**>.

Also, if you are somewhat confused as to the nature of these sports and their rules and league structures, there are numerous sites on the Internet that can serve to educate you. Simply utilize your favorite search engine to reach an omnibus site or access local newspapers in the country in which your interests lie.

Is The BBC "Dumbing Down"?

Much has been made lately, in some listener forums, about the changes that have been taking place at the *BBC World Service*. Some of the controversies, which seem to come one after another, have involved the transition to five regional streams followed by a change to three streams, reorganization of the news department, presentation of the news, the accents of the news readers, the adequacy of the director-general, the contracting for some programming from outside producers, the closing of language services, the redirection of resources from shortwave to the Internet and placement on local AM and FM stations. Through all of this lies the nagging suspicion on the part of some that within the BBC lies a conspiracy of some sort – either one of ill will or incompetence or both.

Yet, when I listen to the World Service I still hear comprehensive news coverage, insightful analysis, superior drama, wide ranging and topical documentaries and features. I happen to like some of the newer programs like **Jazzmatazz** and **The Works**. In short, I still hear what I've always heard from the BBC – unparalleled coverage of our world.

On top of that, there are more opportunities to listen. In addition to shortwave, I hear the BBC a couple of times a day on my local *NPR* affiliate and can access a live stream or archived programs via the Internet.

That is not to say that I don't have my own quibbles with the Beeb. I don't like shortwave frequencies leaving the air, by plan, in mid-program. Coordination between the BBC's program continuity people and *Merlin Communications*, the spun-off privatized entity that now owns and runs the transmitters, remains generally abysmal.

I, like others, miss several programs that were inexplicably dropped. The decision to seasonally and inconsistently shift the broadcast times of some programs also seems unnecessarily confusing and inconvenient. I think some of the new programs – like **Westway** – are ill-conceived and rather boring.

But none of this amounts to a giant "dumbing down" of the service. I never liked everything on the *World Service* and I don't now! What it all comes down to is that when I size up the whole situation I still hear what I've always heard – the best darn radio service on the planet. Isn't that the bottom line?

Next month, a column you can sing and hum to. Until then, good listening!

INTERNATIONAL SHORTWAVE BROADCASTERS (via satellite)

By Larry Van Horn, *MT* Assistant Editor

WRN One English to North America

Galaxy 5, 125 degrees West, transponder 6 (TBS) 3.820 GHz, V-Pol, audio subcarrier 6.80 MHz. WRN program details can be heard at 0625, 1525 and 1955 Eastern. Program information is also available on TBS Text page 204. You can reach WRN by email at online@wrn.org or through their website on the internet at http://www.wrn.org. Many programs can also be heard in Canada on CBC *English Overnight*. WRN is relayed 24 hours a day on many cable systems via the CSPAN Audio One Network. All times are U.S. Eastern Time and all programs in English.

ET	Station
0000	Radio Telefis Eireann (RTE) – Dublin, Ireland (Irish Collection)
0100	Swiss Radio International – Berne, Switzerland
0130	Monday-Friday: Channel Africa – Auckland Park, South Africa Saturday: *The Way Ahead and New Horizons* Sunday: Glenn Hauser's *World of Radio*
0200	Polish Radio – Warsaw, Poland
0230	Radio Vlaanderen International – Brussels, Belgium (Brussels Calling)
0300	Radio Australia – Melbourne, Australia
0400	Voice of Russia – Moscow, Russia
0430	Radio Canada International – Montreal, Canada (Monday-Friday) Saturday: *Network Plus and Health Watch* Sunday: United Nations Radio: *World in Review and Scope*
0500	Radio Prague – Prague, Czech Republic
0530	Radio Vlaanderen International – Brussels, Belgium (Brussels Calling)
0600	Swiss Radio International – Berne, Switzerland
0630	YLE Radio Finland – Helsinki, Finland
0700	Radio Australia – Melbourne, Australia
0800	Radio Telefis Eireann (RTE) – Dublin, Ireland
0900	Radio Prague – Prague, Czech Republic
0930	Radio Sweden – Stockholm, Sweden
1000	Monday-Saturday: Channel Africa – Auckland Park, South Africa Sunday: Voice of America *Communications World* – Washington, DC USA
1030	Radio Vlaanderen International – Brussels, Belgium (Brussels Calling)
1100	Radio France International – Paris, France
1200	Monday-Friday: *Caribbean Tempo* from CANA Radio Saturday: Glenn Hauser's *World of Radio* Sunday: *Norden This Week* and *Health Watch*
1215	Monday-Friday: Vatican Radio – Vatican City (World News)
1230	Radio Austria International – Vienna, Austria
1300	Monday-Friday: Radio Slovakia International – Bratislavia, Slovakia Saturday: Radio New Zealand International – Wellington, New Zealand Sunday: Radio Denmark – Copenhagen, Denmark (Copenhagen Calling)
1330	Radio Telefis Eireann (RTE) – Dublin, Ireland
1400	Radio Vlaanderen International – Brussels, Belgium (Brussels Calling)

2230	Radio Austria International – Vienna, Austria
2300	Polish Radio – Warsaw, Poland
2330	Radio Budapest – Budapest, Hungary

WRN Two Multi-Lingual to North America

Galaxy 5, 125 degrees West, transponder 6 (TBS) 3.820 GHz, V-Polarization, Audio subcarrier 6.2 MHz. Note that some programs listed below are subject to pre-emption without notice. All times are U.S. Eastern Time.

ET	Station
0000	World Radio Network from National Public Radio
0600	YLE Radio Finland – Helsinki, Finland (News in Finnish). On Saturdays a phone-in for children in Finnish until 0630.
0610	YLE Radio Finland – Helsinki, Finland (Easy listening music with announcements in Finnish and English)
0630	YLE Radio Finland – Helsinki, Finland (News of the past 24 hours in Finnish)
0700	Interval signal
0800	Raidio na Gaeltachta (News in Irish)
0900	Radio Prague – Prague, Czech Republic (Programming in Czech)
0927	Interval signal
1000	YLE Radio Finland – Helsinki, Finland (Regional broadcasts from various parts of Finland in Finnish)
1030	YLE Radio Finland – Helsinki, Finland (News in Finnish)
1100	YLE Radio Finland – Helsinki, Finland (Variable programming in Finnish–often light music)
1200	Radio Prague – Prague, Czech Republic (Programming in Spanish)
1300	Voice of Russia – Moscow, Russia (Russian Programming)
1400	Radio Vlaanderen International – Brussels, Belgium (Brussels Calling with Dutch programming)
1430	Identification tone
1630	Radio Austria International – Vienna, Austria (German Programming)
1700	Radio Budapest – Budapest, Hungary (Hungarian Programming)
1800	Polish Radio – Warsaw, Poland (Polish programming)
1830	YLE Radio Finland – Helsinki, Finland (Devotional programming in Finnish)
1855	YLE Radio Finland – Helsinki, Finland (News in Finnish)
1900	YLE Radio Finland – Helsinki, Finland (News of the past 24 hours in Finnish)
1925	YLE Radio Finland – Helsinki, Finland (News in Swedish)
1930	YLE Radio Finland – Helsinki, Finland (French programming)
1945	YLE Radio Finland – Helsinki, Finland (Light music in Finnish)
2030	YLE Radio Finland – Helsinki, Finland (Easy listening music). Announcements partially in English. Saturdays a phone-in for children in Finnish
2100	YLE Radio Finland – Helsinki, Finland (Documentaries and Theater of the Air in Finnish). Sunday: Classical music with a preview in English.
2200	YLE Radio Finland – Helsinki, Finland (English programming)
2230	Identification tone Friday: Voice of America *Communications World* – Washington, DC USA
2300	Interval signal
2330	Radio Austria International – Vienna, Austria (German programming)

WRN One English to Europe

Astra 1B, 19 degrees East, transponder 22 (VH-1) 11.538 GHz, V-Polarization, audio subcarrier 7.38 MHz. All programs in English and WRN program information can be heard daily at 0125 and 2025 UTC. Program information is also available on VH-1 Text page 222, 223, 224.

INTERNATIONAL SHORTWAVE BROADCASTERS / SCPC SERVICES

WRN Two Multi-Lingual to Europe

Hotbird-4, 13 degrees East, transponder 121 (Quantum TV) 10.933 GHz, H-Polarization, audio subcarrier 7.74 MHz.

WRN3 German to Europe

Astra 1B, 19 Grad Ost, Transponder 16 (Sky Movies), 11.436 GHz vertikal, Audio Tonunterträger 7.38 MHz und Astra Digital Radio (ADR) Astra 1C, Transponder 33 (ZDF), 10.964 GHz horizontal, auf Monokanal B, 7.56 MHz. Alle Programme auf Deutsch.

WRN to Eastern Europe, Middle East and Africa

WRN1 & 2 may be received throughout Africa and the Middle East via satellite on Intelsat 707 at 1 degree West.

The signal can be picked on DVB receivers such as those manufactured by Nokia, Humax etc). The service is on C-band and antennas of 3 meters in diameter are required. The receiver setting are as follows: 3.9115 GHz, Right-hand Circular-Pol, Symbol Rate 8.022 Mbaud, FEC 3/4, MPEG2. From the menu select audio stream "WRN1" and listen to the left channel for WRN1 and the right for WRN2.

In Africa WRN1 is available on the MultiChoice DSTV service which is available in many parts of Africa via the Panamsat 4 satellite at, 68.5 degrees East. Tune into audio channel 51 in Southern Africa and to and audio channel 25 in other parts of the continent. Contact a Multichoice dealer in your area for details of how to subscribe.

In North Africa and the Middle East WRN2 (which largely carries WRN1 Europe) and can tuned in via Eutelsat Hot Bird at 13 degrees East using a dish of 60 to 90 cm in diameter. The frequency is 10.933 GHz (horizontal polarization) audio subcarrier 7.74 MHz on Quantum 24 TV.

LOCAL RELAYS

WRN can be heard overnight in South Africa from 0000 to 0500 local time on SAfm 104-107 daily. SAfm is also available via an analogue satellite channel on Panamsat 4 (68 degrees East) 12.664 GHz (horizontal polarization) audio 7.2 MHz

WRN will soon be heard again in the Middle East on 954 kHz AM from 2000-0500 UTC. Further locals relays on FM are planned.

WRN One English to Asia-Pacific

AsiaSat-2, 100.5 degrees East, 4.000 GHz, Vertical-Polarization, MPEG2 DVB, Symbol Rate 28.125 Mbaud, FEC 3/4, Select "WRN" from audio menu.

WRN Two Multi-National to Asia-Pacific

AsiaSat-2, 100.5 degrees East, 4.000 GHz, Vertical-Polarization, MPEG2 DVB, Symbol Rate 28.125 Mbaud, FEC 3/4, Select "WRN" from audio menu and listen to the right hand audio channel.

Single Channel Per Carrier (SCPC) Services

By Robert Smathers
roberts@nmia.com

An SCPC transmitted signal is transmitted with its own carrier, thus eliminating the need for a video carrier to be present. Dozens of SCPC signals can be transmitted on a single transponder. In addition to a standard TVRO satellite system, an additional receiver is required to receive SCPC signals.

The frequency in the first column is the 1st IF (typical LNB frequency) and the second column frequency (in parentheses) is the 2nd IF (commercial receiver readout) for the SCPC listing. Both frequencies are in MHz.

GE-2 Transponder-Vertical 13 (C-band)

1178.70 (81.3)	NASA space shuttle audio

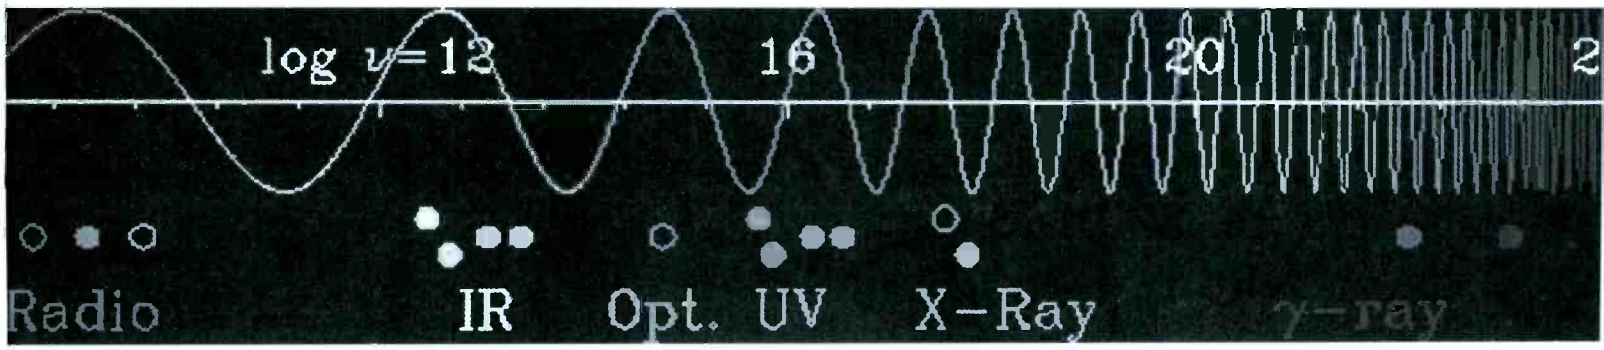
Grove invites you to join our search for . . .



SIGNALS FROM DEEP SPACE!

In the background hiss, amidst the noise, there it is! An unfamiliar—yet long sought—signal. It's just a pulse, but it's somehow different from the rest. It has the characteristics of artificial origin—it's the signal that scientists have been seeking for decades. Will you be the first human to see and hear it?

The coordinated Search for Extra-Terrestrial Intelligence (SETI) is one of man's most ambitious scientific undertakings, and is of incalculable historic importance. Join this visionary team of more than 1000 amateur scientists worldwide who are looking for radio signals arriving from the depths of space.

Grove provides everything you need to get started: a quality receiver (choose from models shown below), low-noise amplifier, feedhorn, power supply, interconnect cable, power/signal splitter, SETI League Technical Manual, full SETI League membership, shareware, newsletter, and e-mail privileges. All you need to supply is an empty TVRO dish and your computer.

Choose one of these fine receivers:

ICOM R8500 receiver

Order # WBR 1: $1,499.95

AOR AR5000 Plus

Order # WBR 12-P: $2,095.95

AOR AR7000

Order # WBR 8: $1,299.95

WiNRADiO WR1500e
Order # WBR5E: $549.95

WiNRADiO WR3100e
Order # WBR26E: $1,895.95

Complete your package from items listed below:

ACC 169	1300-1500 MHz feedhorn	$79.95
ACC 170	0.37 dB NF LNA	$179.95
BOK 109	SETI League Technical Manual	$10.00
CBL 10	50' RG-8/U low-loss cable with silver/gold-plated N connectors	$59.95
MBR 1	SETI League membership (FREE with full system order)	$50.00
PWR 21	120 VAC/15 VDC @ 500 mA power supply	$9.95
SPL 3	Power/Signal splitter	$39.95

For complete information on a receiver, visit our website: www.grove-ent.com/widebandreceivers.html or see Grove's printed catalog

Zinwell ZDX-9111 DVB Satellite Receiver

If you're not familiar with some of the brand names in the Digital Video Broadcast (DVB) receiver market, you're not alone. In the U.S. this is an emerging market segment in the field of satellite TV. However, many of these receivers have sold in the tens of thousands under various labels in Europe and Asia where the DVB standard is widely used. This month I'll take a look at the Zinwell ZDX-9111 DVB satellite receiver.

Unlike traditional analog C and Ku-band receivers, DVB receivers have a narrow focus. They cannot receive analog satellite signals; have no provision for an actuator (dish drive) motor; and cannot operate a polarizing motor on a feed horn, though they can operate the solid state switching of an LNBF (Low Noise Block-converted Feed horn). Most are capable of receiving only those signals which are transmitted via satellite in the MPEGII digital mode and unencrypted. They cannot receive General Instrument's DigicipherII MPEGII signals

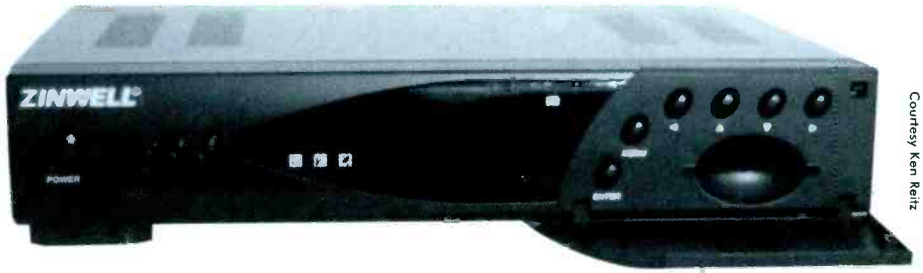
You may be asking, "Well, what can they receive?!" It turns out that there are hundreds of channels of unencrypted programming (known as "Free-To-Air" or FTA) on nearly every satellite which can be seen from any point in North America. Most programming is not of the cable TV variety, but the backhaul, niche and network programming which has always been the fun part of having a big dish.

The reason for the increased popularity of this type of transmission is price. Compressed digital transmission costs a fraction of old-style analog transmission, and that's important to marginally financed broadcasters involved with ethnic or niche programming.

Most DVB receivers have many features in common and share a very similar physical appearance. A look at the photos of the Zinwell product will remind many readers of similar DVB receivers I've reviewed in this column. Where these receivers tend to differ most is in the on-screen features controlled by the receiver's software. And, as with any new piece of electronic gear, there's a learning curve, during which every consumer learns the idiosyncracies of a particular piece of gear.

Elegantly Simple

The Zinwell receiver is smaller (14" w x 10" d x 3" h) than any similar receiver; is very lightweight (a scant 5-1/2 lbs); and, thanks to its solid state surface mount technology, runs very cool. The front panel controls are hidden behind a drop down door which also contains a slot for a smart card even though there is no internal provision for a smart card reader. On the back panel consumers will find a choice of signal ports with which to feed the TV: a channel 3/4 modulator, an S-video output, and an RCA jack for video output to your VCR.



Courtesy Ken Reitz

Zinwell MPEGII FTA digital receiver. Note drop down door with access to receiver function buttons. Smart card slot has no internal card reader.

My criteria for a good remote control is this: Can the receiver be operated from a distance, at odd angles or bounced off the walls and ceilings? This is particularly important on DVB receivers because the viewer is expected to enter the necessary data regarding reception parameters into the receiver via the remote control. This task is made very difficult if the remote doesn't perform well. The Zinwell remote control has the best transmitting capability of any that I've used. It's also well balanced and has a logical layout. The round rubber buttons have a very positive feel and are well spaced for adult fingers.

The Zinwell, like all MPEGII receivers, can receive MPEGII signals on either the C or Ku-band in linear or circular polarity. The difference here is how easy it is to tune. The user's manual is well written and easy to follow with an abundance of charts and diagrams explaining how to use the receiver and what all the buttons and ports are for. Once your system is up and running it won't take more than an hour to master entering the data needed to receive programming. Once entered it stays in the internal memory until rewritten.

Courtesy Ken Reitz

Back panel of Zinwell receiver shows lay out typical of most MPEGII receivers. The left hand side shows three ways to feed your TV set: RCA video out, S-video out, or channel 3/4 modulator.

To find the transponder frequencies and symbol rates needed to tune in, you need to have access to **www.lyngsat.com** which has the most complete and up-to-date list of transmission parameters for FTA transmissions. One interesting addition to the Zinwell user's guide are the five pages of footprint charts, though most charts printed are for Asia and the Pacific.

Using the Zinwell-9111

There are several ways to set up the Zinwell-9111. If you already have a C-band satellite TV system you'll need only a 950-1450 MHz splitter to feed both your analog and the Zinwell receivers. Take the RCA video output from the Zinwell and input it at your VCR. Take the channel 3/4 out from your analog satellite receiver and put it into your VCR's VHF antenna input and tune the VCR to channel 3 or 4. Now set your TV to tune either channel 3 or 4 and your analog signals come straight through. To access the Zinwell signals, simply press the *aux video* button on your VCR's remote; if you've turned your dish to a satellite and channel which has MPEGII programming and entered the data into the receiver, the Zinwell programming comes right up.

If you are using a motorized dish you must run the dish to the satellite on which the digital programming you'd like to receive is located. Once the dish is there you can switch to the Zinwell and call up the channel you're looking for by pressing the "program list" button on the remote and scrolling down to

the channel you want.

One very interesting use of the Zinwell receiver is in a very inexpensive, stand-alone, DBS-style configuration. What you'll need is a small 4.5 to 5 foot dish, a C-band LNBF, and the Zinwell receiver. By setting the system up on Panamsat 5 – a powerful C-band satellite – you'll be able to tune in the world of foreign broadcast satellite TV. It's like shortwave listening with pictures! I'll devote the October Launching Pad to this topic.

Joys of Digital Reception

A few words about digital reception are in order. Unlike analog reception, there's no way to visually detect the presence of a digital signal, but, once the signal is acquired, it's perfect. The signal is either there or it isn't. No more sparklies or other on-screen artifacts. On the Zinwell there is a red LED on the front panel which lights up behind the small icon of a satellite dish. When the receiver locks onto a digital signal that light disappears.

The audio on the Zinwell is unbeatable. It's the same quality as you'll get from your CD player. The reason I mention this is that there are many audio subcarriers found on certain satellites you'll want to tune in. Some of my favorites are the programs found on Voice of America feeds on GE-2 channel 11 which include VOA's new *Music Mix*, VOA *News Now* and others. I also enjoy the classical programming on Hispasat and audio from three Deutsche Welle services. Tuning in these services is just as easy as tuning the video. There's even a separate list for radio channels.

I've been watching FTA MPEGII signals for over a year and in that time the number of available channels has doubled. It's clear that this mode of transmission is gaining in popularity with programmers. But, the best thing about FTA MPEGII viewing, especially with the Zinwell, is that it's relatively cheap. For well under $400 you'll be able to see and hear programming available nowhere else. Adding the Zinwell receiver to your current TVRO system will more than double your viewing action. Installing a stand-alone MPEGII system is a great way to get started in satellite TV reception for a minimum expense.

For more information about the Zinwell ZDX-9111 receiver call Tim Heinrichs of Direct Marketing Source at 888-591-4416. You can visit their website and look at their list of DVB services at **www.dmsiusa.com**. You may also write for more information at 2668 Forest Glen Drive N.E. Marietta, GA 30066-1485.

Mailbag

In the June issue of *MT* I looked at the possibilities of tuning in several satellites without using a dish drive citing an article written twenty years ago by TVRO pioneer Bob Cooper. "Coop," as he is known to his friends in the satellite TV business, is alive and well and living in New Zealand where he publishes *SatFACTS*, a monthly trade magazine about TVRO issues in Asia and the Pacific. He also publishes *Coop's Technology Digest* which is "...Published as a confidential industry newsletter ten times each year..."

I asked him if *MT* subscribers could take a sample look at his publications and he replied, "...we do have...subscribers in 54 countries...but then we have 'small countries' out here! Recent but randomly selected copies of SatFACTS (can be sent) airmail...to any address US$8 in US currency (or check or VISA/Mastercard charge)...We will also include a copy of *Coop's Technology Digest* as well..." Bob Cooper advises that they have a website: **www.satfacts.kwikkopy.co.nz** where you'll also find his email address and an order form.

As if to emphasize the point, I also received an email note from Roger Woodward of Australia who writes: "...I have had an arrangement like this for some time here in Sydney... I have a motorised 3 metre mesh dish with 3 C-band Polarotor type feeds installed (as well an L-Band dipole feed). They normally are arranged with the prime focus positioned feed looking at Palapa C2 (113 E), another positioned next to this looking at Asiasat 3S (105.5 E) and the 3rd looking at Asiasat 2 at 100E... It all works quite well and I rarely need to move the dish!..."

Courtesy Ken Reitz

Zinwell remote control. Light-weight, well laid out and easy to use, this remote outperformed any other MPEGII receiver with its ability to access the receiver at odd angles and distances.

Radio Tools from the Office Supply Store

We are often defined by those things we find essential for daily living. Everywhere I go, my brief case carries a magnifying glass, compass, chess set, fifty feet of nylon rope, a CIA letter opener, a *Farmer's Almanac* and a bible. Why? Just in case!

Things are the same around each person's listening post. We all have accoutrements that are unique and useful to us. I cannot *prove* that my Marvin the Martian statue improves DXing but I am personally convinced of it!

Over time, we all discover a few accessories that will not be found in most radio equipment catalogs but which become an essential part of our way of conducting radio business nonetheless. Eccentricity and superstition aside, there are a number of practical non-radio accessories that will make life in your shack worth living. Most of these essentials can be found at any of those large office supply stores that seem to have popped up every other corner around our country. (Question: Have we reached the point where more people are working in office supply stores than in offices?)

World Globe

If you are a shortwave listener, you are in the business of tracking down signals from all over the world. The quickest source of information may be a world map or atlas, but the best and most accurate (for radio users) source remains the good old world globe. Yep, just like the one you used to get in trouble for spinning too fast in grade school. The names of the countries may have changed, but the land masses remain the same. The globe is helpful in giving you a fine graphical representation of distances and paths that signals have to traverse to hit your receiver.

On the top of most world globes you will find a small metal disk. The technical name for this disk is a rosette. (Feel free to use this information to impress your friends.) This disk is usually calibrated in hours and marked for zones of light and darkness. You can use this information to plot the best time of day to try and grab a country by finding out when your listening post and the country in question are both in relative darkness – usually the best time to listen.

With a globe you can see why you are better off trying to grab stations in the South Pacific early in the morning instead of early in the evening. If your rosette does not have such markings you can hold your globe up to a light bulb. In this experiment the light bulb becomes the sun and you can actually see the patterns of light and darkness that affect listening.

In addition to these practical radio applications, you can put a globe to use just like any other map. You can determine the locations of countries and their surrounding environment. Better than most maps, countries can be projected to relative scale because of the globe's curved surface. Most maps leave you thinking that Greenland is bigger than North America because of the flat projection of the earth's surface.

If your desk is too cluttered for a decent-sized globe, take heart in the fact that we live in the computer age. Several software makers sell globe projection software that can also do the trick. You may even find these software packages at that self-same office supply super store as you'll find the more traditional world globe.

These programs may be good but you can't take your hand and spin them real fast like you did in grade school. Buy yourself the real thing. It makes a great conversation piece and, if you're not careful, you just might learn something.

Calculator

They didn't have fancy titles such as "learning disability" when I went through school. I was simply "dumb" when it came to math. Oh, I would get the right answer, but it would take forever to work it out. After day after day of spending recess to finish my math work, I grew to hate it a lot.

Over the years I have come to terms with this problem, largely due to the invention of the electronic calculator. The pocket calculator allowed me to get free of simple arithmetic tasks, allowing me to study and fall in love with many of the more advanced concepts in mathematics. Anyone who has ever tried to figure out the square root of a number in long hand is very happy that calculators came along (with the exception of slide rule designers).

As a radio hobbyist, you no doubt keep some sort of log. Your log can become more than a collection of old memories. A log book can be made subject to some basic statistical analysis that will allow you to determine your listening patterns. Take your handy calculator and figure out the average number of hours you listen in a session ... in a month ... in a year. Adds up doesn't it, Compadre?

You can compute the best length (in feet) for a halfwave dipole antenna by dividing 492 by the frequency in megahertz (MHz). What's that? You only know the frequency in kilohertz (kHz)? No sweat; divide that puppy by 1000. Megahertz back to kilohertz? Multiply by 1000. With a calculator handy it is probably faster than moving the decimal points on a piece of paper.

In the event you really want to delve into electronics theory and witchcraft, a calculator is essential to wading through the various formulas that can assist you on your quest.

You can buy a calculator for simple math functions at any discount store for around three dollars. You can move up from there into the "scientific" calculators that have many common formulas already preprogrammed. Pick up one that suits your taste and, as you fiddle with it, you will discover many uses around your radio shack.

If you really want to get into the thick of things, programmable graphical plotting calculators can be purchased for under $100 that will let you perform just about any function you can imagine. My current favorite is the Texas Instruments TI-83. It's got buttons on it I have yet to figure out, but that is half the fun.

Dual Time Watch or Clock

Another product of our "digital" age is a whole crop of watches with zillions of bells and whistles. One company really stands when it comes to gizmos for versatility at reasonable cost. CASIO makes watches that not only tell time but also tell temperature, windspeed, and pulse rate in addition to the more mundane functions of day and date.

Several models at modest prices sport a feature that should put them on the wrists of every radio hobbyist in the world. These watches can be set to tell the time in two different time zones, one of which can be set to a twenty four hour format. In other words, you can walk around with local time and Coordinated Universal Time (UTC, GMT, ZULU, etc.) strapped to your wrist, ready for DXing. No longer must you remember how to convert back and forth between the two time zones, forgetting to change your conversion formula during Daylight Savings Time. I am partial to the Casio "Tri-Graph" series, but many of their other watches will give you the essential dual-time function.

If you want something larger for your wall, check out the clocks from MFJ Enterprises. They are designed for the cost-conscious radio hobbyist. MFJ advertises in many radio hobby publications or you can reach them directly at 1-800-647-1800 or their website **www.mfjenterprises.com**

File Cards

Long before computers were so commonplace in the home, most radio people made use of file cards to get their record management in order. For many folks this still remains the cheapest and easiest way to track and catch all those exciting stations, no matter what facets of the radio hobby they are interested in.

Even if you do use a computer for your main record keeping, you can still set up a nice little "hit" list using good old fashioned 3x5 cards. By doing this you can leave the computer turned off during listening and avoid running up against all that interference it can generate in your receiver.

Take 24 file cards and mark them with the UTC hours. Then take a source such as *Passport to World Band Radio*, the *World Radio TV Handbook* or *MT*'s own "Shortwave Guide" and list the names and frequencies of the stations you are seeking on the cards that correspond with their various broadcast periods. You now have a handy guide for tuning that allows you to decide how to carve up your listening sessions.

Scanner users can also benefit greatly from a good set of file cards. Now that scanning receivers can be programmed to store hundreds of frequencies, what better way to keep track of things than a short stack of file cards giving pertinent information in frequency groups of ten or twenty or fifty per card (depending on how your scanner's banks are structured)? This is much more manageable than a long list, and the problem is really too small to dedicate a computer to the task.

Broadcast band DXers might want to have one card for each of the 10 kHz spaced frequencies to allow for better signal hunting and tracking.

Someday, flying a computer might become simple enough that such mundane tasks as frequency lists can be managed without taking up more than half of your listening time. For now, file cards remain the quickest tool for the task.

Graph Paper

This is another handy tool that may someday find itself fully replaced by the computer (or at the very least by one of those higher end calculators I mentioned above). But most of us will take a shot with plain old graph paper first. Graph paper gives you a resource to plot information graphically instead of in columns of numbers.

Many radio hobbyists take their first shot at using graph paper by tracking the solar flux patterns given at 18 minutes past the hour over radio station WWV and WWVH 1.5, 5, 10, 15 and 20 MHz. In graphing this information, you begin to get a feel for how the sun has a direct effect on your ability to listen.

Graph paper is also a wonderful tool for creativity. You can use its squares to aid you in laying out straight lines for most anything you want to design. You can lay out a floor plan for your listening post, or perhaps the placement of components on a circuit board. I even keep it around my desk just for doodling when I am doing something else. Graph paper remains a limitless resource waiting for your next great idea!

As you can see, sometimes the things we surround ourselves with when we are listening can make monitoring more fun than ever. Maybe next time you are on your way to the local electronics outlet you'll find yourself taking a quick turn through the local office supply store. Who knows, you may just come up with the next great system for tracking the elusive Radio Freedonia. Have fun!

Seasonal Satellite Viewing

During the weeks around the summer solstice, the north polar regions remain in semi-permanent sunshine, so from May to July all the WXSATs (weather satellites) are in full bloom (i.e., transmitting visible-light imagery) at local midnight.

Meteor 3-5 currently travels northbound during northern-hemisphere nights, so, although it is not transmitting for most of the pass, as it crosses the terminator into polar sunshine we hear the transmission start abruptly. Figure 1 was one such occasion during an early June pass at about 0400 UTC when the WXSAT was traveling northbound over the eastern Atlantic.

FIG 1: *Meteor 3-5 0358 UTC June 3, 1999*

The image shows the southeastern coast of Greenland on the left and the north Atlantic on the right. Such images of Greenland reveal the seasonal melting of parts of the ice sheets at this time of year – a melting that always follows the same pattern. My own picture collection of Meteor images of Greenland goes back to the mid-eighties, and the coastline then appeared much as it does today.

Although Meteor WXSATs do not usually transmit APT at night, fortunately the NOAAs do. Summer southbound passes of NOAA-14 occur during the early hours so we see a few minutes of visible-light imagery before the transmission switches to the near infrared channel.

Morning passes of NOAA-15 are spectacular. Because the satellite crosses the equator later in the morning than NOAA-12, the sun is higher and the satellite's sensors catch more sun-glint – the reflection of the sun off local areas of sea. This phenomenon has also been reported for Fengyun-1C (see later).

Resurs 01-N4 continues to transmit not only during the sunlit portion of its pass, but also for a few minutes prior to entering the day portion of its orbit. I have recorded many evening transmissions (northbound into sunlight) in which the image content is essentially black; only the bars and gray scale are seen at either side of the image. Near the end of the transmission, the satellite has reached the north polar region where the picture recovers.

FengYun-1C

The new Chinese polar orbiting meteorological satellite FY-1C was launched from the Tai Yuan Satellite Launch Center on May 10, 1999, using a Long March 4 vehicle. Imagery was successfully received during the first orbit from ground stations located in Beijing and Urumqi, China, and from other suitably equipped ground stations around the world. One such station was that operated by Dave Wright, an RF engineering partner at Dartcom, a UK-based company that manufactures meteorological and remote sensing ground stations.

Data from the infrared channels was scheduled to be activated within a few days of press deadlines for *MT*. It is normal for a period of stabilization lasting several days to be required to allow processes such as out-gassing to be performed. After this period, further cooling of the hardware can take place without contaminants settling on the cooled surfaces.

Dave reported that the new satellite was transmitting image telemetry on 1700.5 MHz, with a 1.3308 Mbit data rate. "The infrared bands 3, 4, and 5 are off for the first few weeks, but the remaining 7 channels are working well." There appear to be some sensor optics problems as there are horizontal shift differences on bands 6, 7, 8, 9, and 10 – the worst error being on Band 7. Dave noted that there seemed to be another problem where sun glint occurs – the imaging system seems to get overloaded and takes a while to recover.

FIG 2: *FengYun 1-C HRPT composite image of UK from Dave Wright*

Dartcom sent a collection of images obtained in early June during the satellite's passes over Europe.

Figure 2 shows Britain as seen from FY-1C's scanner in an image composite from bands 1, 2 and 9. The satellite produces image data from 10 channels, permitting the scientific study of China's resources, as well as routine weather forecasting. China has established a computing facility that processes not only FengYun data, but also that from the NOAA WXSATs. The FY-1 meteorological satellite data processing system consists of two IBM S/1 front-end computers, two IBM 4381-P03 main processors, and several image processors.

For those (such as me) without the necessary hardware to receive high resolution picture telemetry (HRPT), the satellite can still be monitored by tuning to its 180.008 MHz transponder. I have been able to hear the signal on many passes over the UK.

[Note the spelling 'pcsyatem' – probably a Chinese typographical error instead of 'pcsystem'.]

Free tracking software

Those who regularly check out satellite web sites may know that a number of well-established freeware and shareware programs have been available for some years. David Taylor only recently took up the challenge of writing satellite predictions software, yet his program **WXTrack** seems to be as up-to-date as any.

His initial motivation arose as a result of the low winter illumination that leaves WXSAT visible-light images looking rather

"washed out." Without software enhancement, winter images are not easy to identify, particular for beginners. David wrote his program to produce accurate map displays based on the Turbo Pascal software originally made available by Dr T S Kelso (see web link below). David extended it using Borland's Delphi, and has produced an impressive program.

The main screen (see figure 3) comprises three sections – *setup, world map* and *ground path.* The first option – *setup* – allows the selection of satellites that are to be displayed in the main *world map* screen. These satellites are identified from the list of satellites in the Kepler element files also displayed on this screen. The other option in this section is for the prediction of passes, and allows the selection of specific passes already identified on-screen. With this information you can use the ground path option to produce a picture of the image content for any future pass of any satellite.

The *world map* is impressive, allowing the simultaneous display of several satellite footprints, as well as that of the sun. The actual display can be *real-time,* or set manually. When set to *manual,* the time shown can be changed (for example, to that of a time-stamped file known to contain a satellite pass) and will show satellites above the local horizon at the specified time.

Data for a specific satellite can be set to display real-time information on the status line. For the selected satellite, a graphical picture of the predicted ground track can be produced using the *make picture* option. This uses the database – one of the downloads referred to during the download procedure.

David's software suite uses Borland's Delphi 4 runtime library modules for their operation, and links are provided for each module. Note that downloading comprises several parts, but using a 48kb/s line, I collected the necessary files within about 10 minutes.

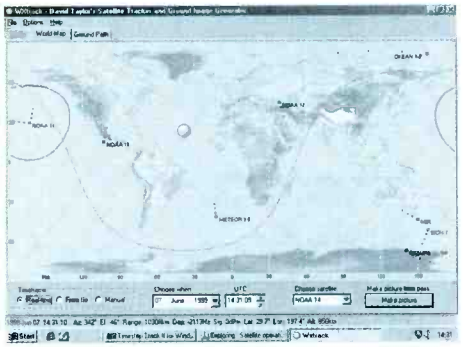

FIG 3: *Screen display for David Taylor's WXTrack program*

The other program available from David's web site is *SatSignal.* This program uses the sound (wave) file of an APT signal, produced by *WXSAT* or similar recording program, and then decodes it. The result is a perfectly synchronized image from Resurs and Meteor satellites, as well as from the NOAAs.

WXSAT launches

The next in the series of Okean oceanographic research satellites was scheduled for launch in late June. If its operation follows that of previous satellites in the series (currently Okean 1-7 and Sich-1), we can expect to receive short periods of telemetry on 137.40 MHz. Transmissions appear to be mostly over western Europe, but have occasionally been reported over the Americas.

GOES-L Launch Delayed

Steve Arnett of the Satellite Analysis Branch, NOAA/NESDIS/SSD, advised NOAA WXSAT monitors that the launch of NOAA's next geostationary weather satellite GOES-L had been delayed until no earlier than June 26, 1999. A firm date was set to be announced pending the results of the Failure Review Board convened after the May 4th Delta-III launch failure. A "flight constraint" remained in effect for the upper stage engines that are common to both GOES and Delta III launch vehicles. After the engine constraint is lifted, approximately ten days are required to complete the normal engineering process leading to a successful launch.

Home page for announcements: **http://www.osd.noaa.gov/**

There has been a steady flow of severe weather arriving from the Pacific ocean, crossing continental USA. As the summer hurricane season approaches, all eyes will be on the image flow from GOES-W, positioned at 135 west longitude. Figure 4 shows the latest infrared light image just received via Meteosat-7 as a rebroadcast image. Recent images have often shown at least one storm center, together with dust clouds. It's a busy world out there!

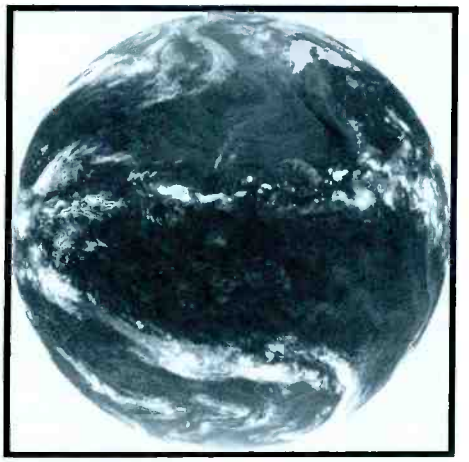

FIGURE 4: *GOES-W infrared image at 1400 UTC June 9, 1999*

FREQUENCIES

NOAA-14 transmits APT on 137.62 MHz
NOAA-12 and -15 transmit APT on 137.50 MHz
NOAAs transmit beacon data on 137.77 or 136.77 MHz
Meteor 3-5 transmits APT on 137.30 MHz when in sunlight
RESURS 1-4 transmits APT on 137.85 MHz
Okean-4 and Sich-1 sometimes transmit APT briefly on 137.40 MHz
GOES-8 and GOES-10 use 1691.0 MHz for WEFAX

THE FED FILES
A GUIDE TO GOVERNMENT COMMUNICATIONS

Larry Van Horn, N5FPW
email: larry@grove-ent.com

US Fish and Wildlife Service Profile

As we continue to move deeper into solar cycle 23, signals in the VHF low band (30-50 MHz) will start to propagate over great distances. Starting in the late fall and into the winter months, F-layer skip will become more prominent on the VHF low bands. One of the more interesting targets low band listeners shoot for is the U.S. Fish and Wildlife Service (USFW).

Fish and Wildlife personnel make extensive use of the VHF low band and high band government frequencies. To aid low band DXers in identifying USFW activity, we have included an extensive list of USFW stations in table 2 of this column.

The mission of the U.S. Fish and Wildlife Service is to conserve, protect, and enhance fish and wildlife and their habitats, especially for those species that are migratory or endangered. The Service employs approximately 7,500 people at facilities across the country including a headquarters office in Washington, D.C., seven regional offices (see table 1), and nearly 700 field units and installations. Among these are national wildlife refuges and fish hatcheries, ecological field offices, and law enforcement (Senior Resident Agent) offices.

Over the last 10 years, the service has slowly migrated to the VHF high band. About 40 percent of the service's older low band allocations have been shifted to the VHF high band. Some additional areas to search for USFW communications in your local area would include public safety interagency frequencies and state game warden frequencies.

The Fed File would like to extend a special thanks to Mark Cobbledick in Virginia. Without Mark's help, our extensive frequency list for the USFW would not have been possible.

MT's Government Master File

We continue our exploration of the VHF-high government frequency band, started in the December 1998 issue of the *Fed Files*, by profiling the 166.0-166.9875 MHz range in Table 3 [ON PAGE 79]. See you in two months for another edition of *MT*'s *The Fed Files;* until then, good hunting.

TABLE ONE: US FISH AND WILDLIFE REGIONS

Region 1	California, Hawaii, Idaho, Nevada, Oregon, Washington
Region 2	Arizona, New Mexico, Oklahoma, Texas
Region 3	Illinois, Indiana, Iowa, Michigan, Minnesota, Missouri, Ohio, Wisconsin
Region 4	Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, Puerto Rico, South Carolina, Tennessee
Region 5	Connecticut, DC, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, Virginia, west Virginia
Region 6	Colorado, Kansas, Montana, Nebraska, North Dakota, South Dakota, Utah, Wyoming
Region 7	Alaska

Jean Baker, KIN9DD

Travel with the Flying Pig

Welcome aboard! Now admit it, wouldn't it be really great to be able see videos of airports with heavy runway and ramp action and to listen to the air traffic control (ATC) communications without any annoying narration to spoil the transmissions?

Well, wish no longer, for Flying Pig Airliner Videos offer all of this at a reasonable cost at The Flying Pig Airliner Shop, located at P.O. Box 69, Kingston, MA 02364; phone is (781) 585-5796. Or visit them on the Web at **www.airportworld.com**. All of their videos are only $19.95. Here are our reviews of two videos:

LCY - London City Airport

For busy airliner action at London's City Airport, this video is an eye-opener. LCY was build on an unused dock on the Thames River and is only eight miles from the very center of London! The liveries of the various airlines are as fascinating and numerous as the airlines themselves. LCY is in VHS format and is 90 minutes in length.

To quote the Flying Pig's description, "Business Airport of Choice - London's East End. This video takes you to London England's BUSY airport to watch regional airline aircraft in action. You will feel as if you were there yourself at all the best locations to watch take-offs, landings, loading, ramps taxings, and more!"

After seeing the London City Airport video, I have to agree. I enjoyed watching the continuous takings off and landings of the various regional aircraft from companies such as Alitalia, CityJet, KLM UK, Luxair, Sabena, Air France and others, as well as listening to ATC transmissions [whose frequency is 118.075 MHz]. The photography and sound quality are excellent.

There was only one drawback in the whole video and that was an occasionally burst of wind blowing over the microphone. However, it was not constant and wasn't overly distracting.

Hong Kong - Kai Tak International Airport

Although Kai Tak is now closed, this 120-minute, two-cassette video made in 1998 features a fantastic view of an extremely busy airport. You can hear the ATC transmissions undisturbed by narration, for which Flying Pig Videos is known and respected. One of the most familiar features of Kai Tak was the "Checkerboard Landing" for Runway 13, which is presented in great detail.

Well over 50 airlines were represented at Kai Tak and just about every jet aircraft imaginable is seen in these two videos. The action is continuous and fascinating! It's hard to believe that you are really watching a video because you actually feel as if you are actually there, enjoying the action.

The Kai Tak videos are extremely well produced and professionally presented, as are all Flying Pig Videos.

Visit their website for more information on their current list of available videos or write to them and request a catalogue.

A Visit to Poland's ATC

Our next stop is Warsaw, Poland, where we will visit with Krzysztof (Christopher) Zbigniew Kosarzycki, who works in Warsaw ATC Training Centre as an Air Traffic Control Instructor and Chief of ATC Simulators. His official title is Head of Training Systems and Technical Support Unit. His explanation of Air Traffic Control is an interesting comparison to controller Kristina H's lively account of ATC in the US (June '99 *MT*).

In his own words, Krzysztof says, "The Air Traffic Control Simulators are devices which give future controllers the possibility to train in an environment similar to their future workplaces, and to gain knowledge and skills needed in this kind of work. It is also possible to use the simulators in refreshment training for active controllers" (i.e., to keep their skills up to date).

"We can divide the simulators into three categories, depending on scope of the exercises:

- Procedural simulators (limited to communication and workplaces).
- Radar simulators (with visualization of traffic on computer display).
- Tower-radar simulators (full visualization up to 360 degrees of the airfield and vicinity of the airfield, simulated radar systems, and possibility of integrated radar-tower exercises).

"Air traffic control services may be divided into three basic parts. At ATCC in Warsaw, it looks like this:

1. Aerodrome Control Tower (TWR)

At Okecie Tower we have four positions:

- GD Controller (Ground) – responsible for aircraft ground movements.
- TWR Controller – responsible for giving takeoff and landing clearances and maintaining separation in the vicinity of the airport.
- Assistant – exchanging information between TWR and other ATC services and controlling vehicles crossing runways.
- Clearance delivery – takes ATC clearance for each flight from ACC (*Area Control, which would be the Air Route Traffic Control Centers in the US-jb*) and passes this by radio to requests from flight crews and works with the 'flight plan' database on the Flight Specialist Workstation. This terminal is a part of the flight plan processing system.

The controller (on the tower or an operator like Flight Data Specialist in ACC) can print a flight progress strip for a specific flight (independently of the normal automatic way), change the flight plan existing inside the system (for different airway), and 'launch' the flight plan (the system is waiting for a departing a/c and looks for its specific transponder code), and print strips on other control sectors like Approach, ACC.

2. Approach Control (APP)

Approach Control keeps separation between planes arriving and departing from Warsaw. In general, all civil aircraft in radius of 100 km (kilometers) from Okecie are under control of APP. Approach is equipped with a modern radar system made by Westinghouse.

- Approach Controller - responsible for separation and navigation advisory for planes which arrive and depart from Okecie.
- Director - responsible for vectoring planes for the final (*approach-jb*).
- Assistant - provides coordination.

3. Area Control (ACC)

Area Control service controls all civil aircraft flying over Polish controlled airspace. On ACC, the majority of air traffic flow is generated by overflights.

- ACC Radar Controller - he provides separation between airplanes in his sector.
- Planning Controller - provides help for radar controller making backup of present situation on flight progress strips and makes coordination for aircraft entering and leaving our airspace.
- Assistant - Helps controllers and works on the Flight Specialist Workstation.

Krzysztof says that Air Traffic Control and computers are the main parts of his job and fortunately, both are his hobby! Thanks, Krzysztof!

That's all for today. See you in September. Until then, 73 and out.

Doug Smith, W9WI
w9wi@bellsouth.net

IDing that unID

In all radio monitoring hobbies, hearing something is only half the battle. Figuring out what you just heard is the other half! When identifying a shortwave DX target, you have interval signals, languages, and program schedules to work with. On the domestic AM/FM/TV bands, the goal is the same but the tools are different.

The best way to identify a domestic band station is to hear the "legal ID." Hearing "This is AM-650, WSM, Nashville" is usually conclusive proof that you are, in fact, listening to WSM. Unfortunately, most DXers aren't that lucky! You will usually have to settle for something other than a blatant call-letter identification announcement. But with care, you can be just as certain of the identity of your latest DX catch.

Next to an identification announcement, local commercials are the best way to identify a DX station. Virtually all AM stations and a majority of FM stations are businesses; they have to sell commercials locally to make money. These commercials contain a variety of clues.

In smaller cities, the address of the advertiser is often part of the commercial. In larger cities, often an advertiser will mention several suburbs in which they have locations. The name of the advertiser can be a clue too; "The Bank of New England" probably isn't in Georgia.

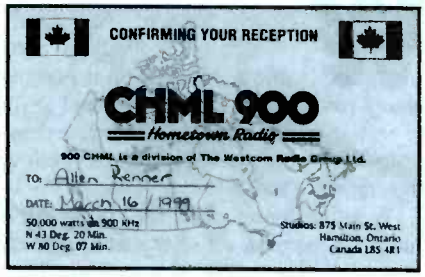
Local news is also a good way to identify your DX catch. Street addresses, names of neighborhoods, and suburbs are frequently mentioned. It could be profitable to learn the names of the governors of bordering states. A bit of time spent browsing maps of major cities in nearby states could also be valuable.

Don't forget to pay attention to time announcements. If it's 7:30 where you are, and your DX target just aired the "8:25 News," you know you're tuned to a station in the next time zone to the east. Note that Arizona and most of Indiana don't go on Daylight Savings Time.

When DXing TV in the evening, a network program "out of sync" with your local network affiliate is a good sign of something coming in from a different time zone. (Unless that program is out of sync by just a few seconds to a minute or two – in which case, you should look to Canada as a probable target area.) By the way, the TV DXer can benefit by having a second TV available to check for parallel programming on their local affiliates.

Regional accents have largely disappeared from major stations. They're still often heard on smaller outlets. You can't prove the station you're hearing isn't in the South if the announcer doesn't have a Southern accent. But if she *does* have one, it's rather unlikely the station is in Minnesota.

Foreign-language broadcasts can also suggest or eliminate certain stations as likely possibilities. A Spanish-language station is far more likely to be in Texas than in Nebraska, and one broadcasting in Korean is more likely Chicago than Wausau. You should, however, consider accents and languages a guide rather than conclusive proof. Unusual programming has turned up where one would least expect it.



CHML-900 has an excellent signal in many parts of the Northeast. Allen Renner received this verification "QSL" for his reception early this year.

Bits and Pieces

• The most powerful AM station in the Western Hemisphere is no more... According to *Trans World Radio Magazine*, their 500,000 watt transmitter PJB-800 on Bonaire in the Netherlands Antilles, will be shut down sometime in 1999. It will be replaced by a 100,000 watt unit and a directional antenna. The high cost of electricity was cited as the reason. I suspect PJB will still be easily DXable after reducing power; the new antenna will favor Cuba, and much of the US is in the same direction.

• Pat Griffith in Colorado thought he'd settle once and for all the question of whether his local Radio Disney stations were KADZ-1550 and KDDZ-1690, or KDDZ-1550 and KADZ-1690. He wrote a letter to the stations asking them to confirm which callsign went with which frequency. The reply had it the first way on the letterhead – and once each way in the text. Pat says, "It appears that they are as confused as the rest of us are!"

• If you're DXing in Europe, or if you're interested in knowing what the AM band looks like across the Atlantic, you may want to look at Herman Boel's *Long and Medium Wave Stations in Europe, North Africa, and Middle East*. Some stations not found in the *World Radio-TV Handbook* are listed, and additional programming information is available. Best of all, it's free for the downloading from **http://come.to/dxing**. If you're not on the Internet, you can order a printed copy for $10 from Herman Boel, Roklijf 10, B-9300 Aalat, Belgium.

• After 65 years, the Mutual radio network is no more. On April 18, Westwood One, who bought the Mutual name in the 1980s, ceased to provide Mutual programming. On the same date, most NBC Radio broadcasts were also terminated, though weekday morning NBC newscasts will continue. Internet reports say the common belief that Mutual was founded to carry the *Lone Ranger* radio show are not true. (Thanks to Robert Thomas in Connecticut for the news item)

• Allen Renner in western Pennsylvania sent a copy of his CHML-900 QSL. With CBF-690 off the air, Allen also heard WJOX Birmingham, Alabama, and Radio Progreso from Cuba. Allen's other catches include CHTN-720 Charlottetown, Prince Edward Island, and KADZ (or is it KDDZ?) Arvada, Colorado. Speaking of CBF-690 being off the air, its sister station CBM-940 also left the air in mid-May. The Canadian government is still considering applications to replace these two powerhouse stations.

Have you received a verification you're particularly proud of? Do you have some interesting hints for identifying your DX catches? Let us know. Write me at Box 98, Brasstown NC 28902-0098, or by email to *w9wi@bellsouth.net*. Good DX!

OUTER LIMITS

THE CLANDESTINE, THE UNUSUAL, THE UNLICENSED

George Zeller
George.Zeller@acclink.com

Jimmy the Weasel Denies FCC Bust

Despite references earlier this year to an FCC bust of Jimmy the Weasel in several pirate radio publications, including *Monitoring Times*, Jimmy is still heard on shortwave via **WRX**. Although not maintaining a frantic and almost daily schedule, as he did earlier in the year, Jimmy has repeatedly denied over the air that his station suffered a visit from enforcement authorities.

MT hears this month direct from Jimmy: "I have stated many times that pirates are sorry and that their listeners are even sorrier. But, fear not, when you print your retraction in a future issue, Jimmy will forgive your being sorry. Jimmy the Weasel cannot be busted."

No record of a WRX enforcement action has thus far materialized in FCC announcements, although delays are common in such actions. Meanwhile, Jimmy's shouts of "Your Stinkin' Mama," "Y2K," and a capella singing remain audible.

WBCQ Schedule

Ex-pirate and licensed broadcaster Alan Weiner of **WBCQ** sends in the station schedule. They remain active on old pirate frequency 7415 kHz with a good signal, using 1600-0300 UTC most days. Some pirate fare is mixed in with Brother Stair's Overcomer Ministry and Kim Andrew Elliott's VOA *Communications World*, so the fare is eclectic here.

Radio San Miguel

Dr. Zaius notes that Peruvian pirate **Radio San Miguel,** active on 6987.1 kHz, can now be reached via Radio San Miguel El Faique, Distrito El Faique, Provincia de Huancabamba, Departamento de Piura, Peru. This one is an extremely tough catch; try for it around local sunset.

Another tough one, Europirate **Europe 41,** says that their address is now PO Box 520112, DE-44207, Dortmund, Germany. They say that they are on daily for four hours at 1800 UTC on 7460 kHz.

Shortwave Pirate Activity

North American pirate radio stations heard by our readers last month all used frequencies within 500 kHz of 6955 kHz, typically from two or three hours before sunset until at least 0500 UTC. Morning and afternoon broadcasts increase on the weekends. Programming formats and contact maildrops (when known) are listed. We're still experiencing summertime propagation conditions, meaning that the 43 meter band opens later and stays open later than during the winter.

Blind Faith Radio- Album cuts from the 60's and 70's dominate their shows. (Merlin)
Crazy Elmo's Radio World- A new one with CERW call letters, rock music, parodies, pirate discussions, and relays of other pirates. (crazyelmo@youpy.com e-mail)
Free Hope Experience- Major Spook is back with his elaborate parody sketches. (Blue Ridge Summit)
Free Radio America- Rock and political commentary are The Don's staples. (None, requests posts to FRN web site)
Jerry Rigged Radio- Like most pirates, rock music is their focus. (Providence)
Numbers Parody- The Mexican food numbers station has returned, this time also featuring wines in the secret message codes. (None)
Radio Beaver- Bucky Beaver's light hearted Canadian pirate advocacy is frequently amusing. (Merlin)
Radio Eclipse- Steve Mann mixes rock music with commentaries on pirate radio. (Providence)
Radio Free London- This Europirate, using 15068.5 kHz, has been making it to North America around 0000-0100 UTC. (rflsw@usa.net e-mail)
Radio Free Speech- Bill O. Rights discusses liberty and plugs pirate radio. (Belfast)
Radio Fusion Radio- Their pop music is distinctive because of the announcer's computer synthesized voice. (Providence)
Radio Metallica Worldwide- Dr. Tornado's 15 kW transmitter punches out a tremendous signal for his rock music and commentary. (Blue Ridge Summit)
Radio Three- Sal Amoniac airs pop tunes. (None, occasionally QSL's logs in *The ACE*)
Radio Tornado Worldwide- They parody Radio Metallica and/or WRX. (None; try *ACE* logs)
Radio USA- Mr. Blue Sky, on for over 15 years, still transmits punk rock and comedy. (Belfast)
Riccochet Radio- Rick O'Shay's parodies include a whack at Dr. Laura. (None)
Scream of the Butterfly- Classic rock from 30 years ago is their trade mark. (Providence)
SWRS- This European pirate relay is still widely heard on 3905, 6195, 11470, and 21450 kHz, with the latter two best in North America. They changed their address; try the second listed here. (Wuppertal or Milano)
Voice of Prozac- Their female announcers promote "The Relaxation Station." (Pittsburgh)
WACK Radio- Their slick classic rock format is highly professional. (Uses 888-959-8177 toll free)
WHYP- This memorial to the late James Brownyard features old Lake Erie weather forecasts. (whyp1530@yahoo.com e-mail)
WMFQ- They promote QSL's in pirate radio, and have been verifying. (Providence)
WMPR- Many have heard the powerful signal of this techno dance music station, but none have verified it. (None)
WRMI- No, this isn't a Jeff White clone; it's Radio Michigan International, a new rock pirate. (None)
WRX- As we see above, Jimmy the Weasel is still here. (Manomet)
WSRR- Dr. Love's Solid Rock Radio often features soul or rap music, but not always. (Belfast)
WWRB- A new one with techno rock and parodies. (Lula)

WHYP-The James Brownyard Memorial Station

Reception reports to pirate stations require 3 first class stamps for USA maildrops or $2 US to foreign addresses. Send your letters to PO Box 1, Belfast, NY 14711, PO Box 28413, Providence, RI 02908; PO Box 109, Blue Ridge Summit, PA 17214; PO Box 25302, Pittsburgh, PA 15242; PO Box 11522, Huntsville, AL 35814; PO Box 24, Lula, GA 30554; PO Box 1464, Manomet, MA 02345; PO Box 293, Merlin, Ontario N0P 1W0; SWRS c/o Play DX, Via Davarnzati 8, IT-20158, Milano, Italy; and Postfach 220342, 42373 Wuppertal, Germany.

Thanks!

Your input is always welcome via PO Box 98, Brasstown, NC 28902, or via the e-mail addresses atop the column. We appreciate material sent in this month by John T. Surfin' for LW Sites

The World Wide Web is an excellent resource for longwave information. There have been many additions and corrections since the last list of websites I published, so here is an update on sites carrying significant longwave material. The list is not meant to be all-inclusive. If you have favorites that you feel should be listed, please drop me a line with the details.

It never fails that as soon as I publish such a list I get inquiries from those trying (unsuccessfully) to access a web site. Web addresses are subject to frequent change, and it's possible that some of the sites listed here may have changed their addresses since press time – or may have ceased operation entirely. The addresses given here were tested and then "cut and pasted" directly from my web browser into the manuscript. If a particular address does not work, all I can suggest is to do a search that includes some key words for the site you are looking for.

Updated Listing of WWW Longwave Sites:

http://www.xuser.com/~daled/navaids/
Dale's Beacon page. Overview of commercial beacon systems, both LF and VHF. Includes pictures of beacon installations.

http://members.aol.com/RKDX/longwave-home.html
Robert Kramer's longwave page. Lots of LF loggings, news of DX stations heard, links to other LW and MW sites

http://mike.nh.ultranet.com/html/hobby.html
Mike's Hobby Page. Information on LW activity with an emphasis on Part 15 (license free) transmitting.

http://www.lwca.org/
Longwave Club of America (LWCA). This is probably the biggest LW site on the net. Widely varied information on all facets of Longwave operation. Includes a message board. *Highly recommended.*

http://www.datasync.com/~rocker/longwave.htm
Ray Rocker's LW page. Heavy emphasis on Loggings, updates on unidentified stations.

http://dybka.home.mindspring.com/jill/radio/longwave.html
Jill's Longwave Page. Maintained by Jill Dybka, a frequent contributor to *Below 500 kHz*. Includes addresses for many beacons, QSL information, Beacon listings and links to other LW resources.

http://members.aol.com/DJLBEACON1/beaconpg.html
Darwin Long's DJL Radiobeacon Page. Complete description of "DJL", Mr. Long's radiobeacon operating on 188 kHz from Ventura County, CA. Includes photos of the beacon, antenna system and coverage patterns. Also a list of the beacons heard by Mr. Long.

http://web.inter.nl.net/hcc/Shortwave/
The European LF Beacon List. The name says it all. Very complete.

http://w4u.eexi.gr/~sv1xv/lw.html
Kostas Krallis' beacon page. Heavy emphasis on beacons in Greece and Europe. Links to numerous other LW sites ranging from natural radio to building your own LF transmitter.

http://www.gem.net/~berri/wun/
Worldwide Utility News page. First class site with in-depth news and information about all types of Ute stations—LF through HF. Includes scores of related links.

http://www.unetsul.com.br/py2pll/ndb_list.htm
Marcus Ramos' South American NDB Page. May take a while to load (depending on your connection speed), but worth it. Perhaps the most complete listing of S. American and African NDBs on the Internet.

http://www.provcomm.net/pages/joe/
Joseph Cooper's (VE3FMQ) Homepage. Contains interesting articles written by Mr. Cooper on receiving antennas, AM DXing, and Beacon DXing. Also includes a discussion of Canadian Lowfer operation.

http://www.triax.com/vlfradio/natradio.htm
Stephen P. McGreevy's Natural Radio Site. THE place on the web for information on all aspects of Natural Radio. Also includes an online version of "The Art of NDB DXing," a respected series by Sheldon Remington on maximizing weak signal reception. *Highly recommended.*

http://www.computerpro.com/~lyle/
Lyle Koehler's LF Experimental Page. An excellent source of information for those interested in the license-free "Lowfer" band (160-190 kHz). Includes plans for a simple LF transmitter, PC-based identifier and many other projects. Detailed discussion on transmitting antenna design and efficiency. *Highly recommended.*

Loggings

This month, we have two contributors of loggings. The first is Greg Heath (NY). Greg is a commuter pilot who uses non-directional beacons to "shoot" instrument approaches into airports in Canada and the Northeastern U.S. When on the ground, he uses a Yaesu FT-840 receiver with a 400-foot dipole up between 40 and 80 feet. The antenna is fed with 450 ohm ladder line.

Our second contributor is Alan Gale (UK). Alan uses a Wandel & Goltermann SPM-3 selective level meter along with a Datong FL3 audio filter. His antennas are of the loop variety (Wellbrook 40 meter and 1 meter) – both mounted outside.

From his location in Northwest England, Alan is able to hear several high power Canadian beacons, although US beacons seem to be more elusive. Many of these stations were heard in early June between 0230 and 0330 UTC, which shows us that we shouldn't assume that the warmer months are a time to put away the headphones!

See you in September

LONGWAVE LOGGINGS

Who Pays for that Cellular Call?

Since the introduction of cellular telephone service in the United States in 1983 the subscriber has always had to pay for airtime, even when receiving a call. Many wireless subscribers don't give out their number the way they do for a wired phone, fearing they will have to pay for unwanted calls. Other subscribers keep their phone turned off unless placing a call.

Under a Notice of Proposed Rulemaking (NPRM) recently issued by the Federal Communications Commission (FCC), all that may change. The FCC is seeking comments on a billing policy termed Calling Party Pays (CPP) under which the person calling a cell phone would pay the airtime charges rather than the cell phone's owner.

The FCC's NPRM is a process to gather information prior to issuing a Report and Order (R&O). The FCC is seeking comments and recommendations on how best to remove regulatory and legal barriers to CPP and establish a national standard. Several issues need to be decided, including how to inform callers that they will be charged.

Under one plan, callers dialing a CPP subscriber will hear an automatic recording informing them of the charges they will incur. If they are calling from a payphone, an alternate means of payment would be offered, such as a credit card or third party billing.

Another plan would give CPP subscribers a separate area code, allowing callers to easily recognize when they'd be paying for the call. This plan could require callers to use long distance (1+ number) dialing to imply an additional toll charge. It would also require current wireless subscribers who wanted CPP to change their phone number, which is not a popular idea.

A more complicated question is how to actually bill the caller. Should the FCC require the local telephone company to add CPP charges to the monthly invoice, and collect the money on behalf of wireless providers? How would such a requirement fit in with the FCC's stated path of deregulation? Even if the FCC did require it, how would the wireless company manage to get all the billing information (termed *call detail records*) to the proper local telephone company?

The wireless industry has long sought CPP, assuming it will increase wireless usage. Incoming calls currently account for less than 20 percent of all wireless calls, the assumption being that subscribers are reluctant to give out their phone number. With CPP such persons would presumably be more willing to give out their number, making wireless services more competitive with traditional wireline phones.

Wireless providers also like CPP because it opens up another pocket to pay for airtime. One FCC Commissioner openly voiced concern about whether market competition could prevent wireless companies from "price gouging" wireline callers.

Despite CPP being common in Europe, it's not clear how popular it will be in the United States. Many newer PCS subscribers already have the first minute of incoming calls free, and with the growing popularity of single rate plans CPP may be more of hassle than a convenience. Although CPP subscribers would presumably be able to specify numbers that will not be CPP, such as parents, children's schools, and close friends, many people have a wireless phone to make it easier for others to reach them, and adding a CPP barrier may take away some of that sense of connectedness.

New Area Codes

The explosive growth of cell phones, faxes, pagers, and other telephone-based products and services is rapidly exhausting the supply of three-digit area codes.

In 1984 a total of 125 area codes were in use. As of June 1, 1999, there were 215 active NPAs in the United States alone, with more than 50 additional International and Service codes in use. California alone is expected to have 41 area codes in 2002, up from just 13 in 1992. Nationwide, almost 70 new area codes are expected to go into service by the end of next year. Some demand estimates project that all 680 usable area codes could be assigned within ten years.

U.S. NPAS IN SERVICE

Year	New	NPAs
1990		115
1991	4	119
1992	4	123
1993	2	125
1994	1	126
1995	13	139
1996	11	150
1997	32	182
1998	24	206
1999 (planned)	31	237
2000 (planned)	37	274

In 1947, AT&T established the current ten-digit numbering scheme, termed North American Numbering Plan (NANP), with each telephone number made up of three parts. The first three digits are the Numbering Plan Area (NPA), otherwise known as the area code, which identifies the geographic region in which the subscriber resides. The second set of three digits is the exchange, which specifies the telephone company central office handling the subscriber. The last four numbers identify the line serving the subscriber.

(828) 837 - 9200
NPA Exchange Line

This plan worked well for half a century, when most homes had only one telephone and a single telephone company served the entire country. The introduction of cellular telephone companies in the 1980s and competitive local exchange carriers (CLECs) in the 1990s have repeatedly exhausted NPAs and made area code splits and overlays commonplace.

With the Telecommunications Act of 1996 Congress gave the FCC jurisdiction over area codes. The FCC, in turn, has delegated to the states decisions about when and how to introduce new area codes. Area codes themselves are assigned and managed by an independent group called the North American Numbering Plan Administrator.

Each NPA has 792 possible exchanges, since exchanges cannot start with a zero or a one, or end in 11. Telephone companies are assigned one or more exchanges, with each exchange having 10,000 possible line numbers.

NPAs are exhausted when all of the 792 exchanges are assigned to a telephone company, *not* when each exchange has run out of their 10,000 lines. Most exchanges have thousands of lines that are not in use, but because of the way current telephone switches are designed, these idle lines cannot be used by a different telephone company.

There are two options when an NPA is exhausted. The NPA may undergo a geographic split, where the physical service area is divided into two or three smaller pieces and each piece is assigned a different area code. One piece keeps the original area code, and everyone in the other areas has to get new stationery and business cards.

The other option is called an overlay, where existing customers within the NPA keep their original area code but new customers receive numbers in a new NPA. This requires every caller to always dial ten digits, even if the destination is right next door. At present the entire state of Maryland and cities in Colorado, Florida, Georgia, and Texas have 10 digit dialing. Some cities in California and Pennsylvania are transitioning to 10 digit dialing.

In the near term, several options are being debated to ease NPA exhaustion. The most promising is a technique called Number Pooling, in which telephone companies receive numbers in blocks smaller than 10,000. This requires significant computer software changes in telephone switches, but promises to greatly increase the efficiency of existing exchanges.

If we do eventually run out of area codes, one or more digits may have to be added to every telephone number. Such a change could cost upwards of $150 billion and take a decade to complete.

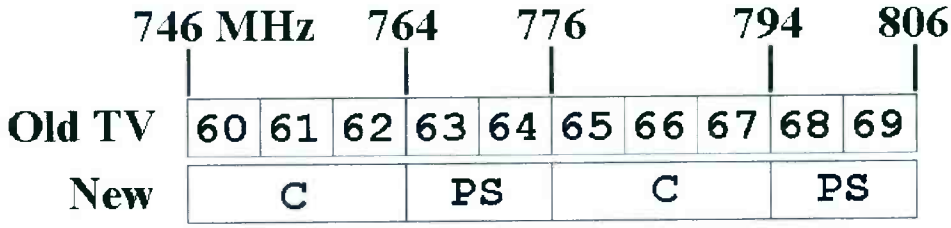
New Spectrum Allocation

As covered in earlier *PCS Frontline* columns, the FCC is under a mandate from Congress to auction parts of the radio spectrum. The latest block of frequencies to come under scrutiny are the UHF television channels 60 through 69, between 746 MHz and 809 MHz. Under their NPRM process, the FCC is seeking comment on what services should be allowed in this band and how to segment and license the blocks.

The FCC has tentatively set aside two blocks of 12 MHz for public safety use, and suggested the two remaining blocks of 18 MHz be paired for two-way wireless communication similar to PCS, cellular, and Specialized Mobile Radio (SMR). They have left open the possibility for the band to be used for some kind of broadcasting as the existing television station owners transition to digital TV service.

Frequency Band	UHF Channels	Bandwidth	Type of Service
746 MHz to 764 MHz	60, 61, 62	18 MHz	Commercial
764 MHz to 776 MHz	63, 64	12 MHz	Public Safety
776 MHz to 794 MHz	65, 66, 67	18 MHz	Commercial
794 MHz to 806 MHz	68, 69	12 MHz	Public Safety

746 MHz to 806 MHz Band Plan



C = Commercial
PS = Public Safety

If you're in the market for a new scanner, keep in mind the public safety blocks in this band could soon be carrying police, fire, and medical radio traffic, so look for either a full-coverage receiver or one that covers 764 MHz to 806 MHz.

Global System for Mobiles

Wireless providers in the United States using the Global System for Mobiles (GSM) standard got some good news and some bad news earlier this year. The good news is that GSM will gain coverage in several major cities over the next year or two. In April of this year the FCC completed the reauction for C block PCS licenses, and GSM operator Cook Inlet/VoiceStream PCS had the high bid for Chicago, Dallas, Omaha, and several other cities in Illinois, Texas, Arizona and Louisiana. Other cities added by GSM operators include Detroit, St. Louis, Buffalo, Rochester, and Cleveland, bringing GSM to 98 of the top 100 markets.

There are more than 3.6 million GSM customers in the United States, with 600,000 added in the first quarter of 1999.

All told, the 17 day auction (number 22 for the FCC) sold 302 licenses and raised a total of almost $413 million in bids for the U.S. Treasury.

As for the bad news, GSM is losing coverage in the 10th largest market in the country. Sprint Spectrum, the first PCS operator in the United States and profiled in the October 1996 *PCS Frontline*, is shutting down.

American Personal Communications started Sprint Spectrum in the Washington, D.C., and Baltimore, Maryland, area in November 1995, partnered with Sprint. Sprint PCS subsequently bought out APC in January 1998 and extended their nationwide Code Division Multiple Access (CDMA) network to the area two months later.

Rather than continue to operate two rival and incompatible networks in the same market, all 100,000 Spectrum customers will be transitioned to Sprint PCS by November 1999. The GSM network infrastructure will be shut down soon afterward.

Sprint PCS has 3.35 million customers, having added 763,000 in the first quarter of 1999.

Nextel, the Specialized Mobile Radio (SMR) carrier, added 415,000 customers in the same period, bringing their customer total to more than 3 million. AT&T Wireless reported 378,000 new customers, with more than one million Digital OneRate and 10 million total subscribers.

That's all for this time around. More information is available on my website at http://www.decode.com, including updates on the Iridium, Globalstar, and Orbcomm satellite constellations. I welcome electronic mail at dan@decode.com. Until next time, happy monitoring!

EXPERIMENTER'S WORKSHOP

TWEAK, TUNE, AND MODIFY!

Bill Cheek
email: bcheek@comtronics.net

Tools and Techniques for the Experimenter

Precision tools and high falutin' test equipment cost a fortune, but I'm not sure there is a correlation between results and costs. Over the years, my mainstay tools consisted of chewing gum, earwax, fingernail clippers, string, and screwdrivers. This article is for serious experimenters on a budget.

The digital age reduces requirements for costly analog equipment like scopes, signal generators, etc. Digital technology affords acceptable results in less time at lower cost. Experimenting in radio is easier than ever.

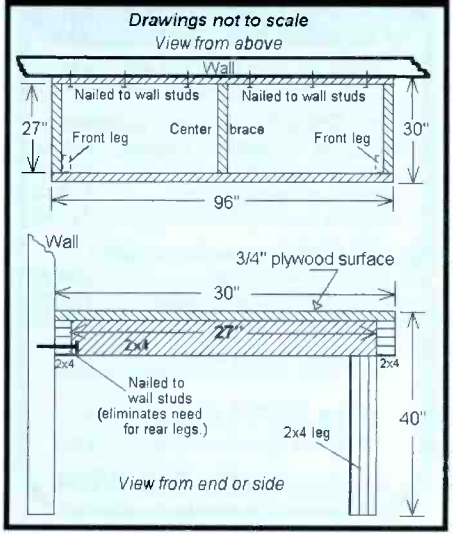
The Workbench

It starts with an ample workbench, preferably not the heirloom dining table. Our workbench should handle spills of glue, coffee, mustard, jelly, chemicals, and nuclear materials without disturbing the domestic tranquility.

My favored bench is homemade (cheap), 8 ft. long by 30 in. wide by 40 in. high, with a frame of 2x4s and a surface of 3/4 inch plywood, covered with a fine-weave carpet strip. See Figure 1. An 8 ft. by 30 in. sheet of masonite or smooth paneling can supplant the carpet, if desired. A dark surface minimizes annoying glare from overhead lighting.

If the bench will be in the garage, the back of it can be nailed to wall studs, to eliminate rear legs. 2x4s are fine for the front legs. This bench easily supports two to three hundred pounds.

FIG-1: LOW COST WORK BENCH



If the bench won't be attached to a wall, then use five 4x4s for the legs; one in each corner, and one in the middle along the back edge to afford plenty of leg room and still be sturdy. Don't nail the legs to the frame. Instead, drill a deep 1/4-inch pilot hole and screw a 5-inch lag bolt (with a 1 in. washer) through the 2x4 frame into each 4x4 leg.

Size isn't critical, if it's large enough, but height deserves attention! My least favorite bench is 30 inches high (office chair height.) I prefer 40 in. because I can work at it while standing, or pull up a barstool as needed.

Stocking the Bench

A productive workbench resembles a hardware store, stocked with tools, equipment, materials, and supplies. Table 1 lists ideas for selected materials and supplies for the innovative experimenter. This list is neither complete nor inclusive. Add to and delete from it to suit your tastes.

TABLE 1: BENCH SUPPLIES

ADHESIVES
- Super glue
- Epoxy; 5-min
- Epoxy; regular
- Silicone rubber
- Spray adhesive
- Hot glue gun; glue sticks

SOLVENTS/LUBES/COATINGS
- Alcohol, isopropyl
- Naphtha (lighter fluid)
- Acetone
- Machine oil (3in1)
- Light lubricant (WD-40)
- Fingernail polish, clear
- Fingernail polish, red

FASTENERS
- Hook 'n Loop (Velcro)
- Nuts, bolts & screws
- Electrical tapes in colors

MISCELLANEOUS
- Breadboards; 2 or 3
- Perfboard
- Pinline sockets
- Magnets, ass't
- Popsicle or corndog sticks
- Cotton swabs
- Cotton rags
- Heat shrink tubing
- Cork; sheet or mat

METAL & PLASTIC WORK
- Nibbling tool
- Files; flat, rattail, jeweler
- Emory cloth & sandpapers
  - 100 to 1000 grits
- Steel wool; coarse & fine
- Tin snips; small
- Xacto Knife & blades
- Benchtop scroll saw
- Dremel Moto-tool & bits
- Dremel drill press stand
- 3/8" drill & bits
- Brushes; wire, bristle, etc.
- Propane torch

POWER
- Power supplies:
  - Variable 0-18v, 2 ea
  - Fixed: 5v/8v/12v
- Batteries, ass't
- Battery holders; various

VISION AIDS
- Florescent shop light
- Swing-arm lamp
- Mini-Mag flashlight
- Magnifiers, various
  - Head-worn magnifier
  - Magnifying lens
  - Microscope, handheld
  - Jeweler's loupe
  - Microscope; pocket; 30x

Equipment

A digital volt-ohm meter is vital. I won't rehash meters, but Radio Shack's "PC Interface Digital Multimeter," #22-168, is a "best value."

Probably out of habit, I wouldn't be caught dead lacking a frequency counter, but I hardly ever use 'em anymore. If you just have to have one, the above "PC Interface Digital Multimeter" has a 20 MHz counter built in. If that's not good enough, then Radio Shack's #22-306 might do. Otherwise, check out Optoelectronics, Startek, GoldStar, and B+K Precision.

Oscilloscopes are like frequency counters; I wouldn't be without one, but it's rarely used. Don't spend the money without first trying Radio Shack's $100 "ProbeScope," #RSU11910486. If you use it more than occasionally, then a $500-$1500 bench scope might be justified. Consult your shrink first.

Signal generators? Mine gather dust. Signals on the airwaves can be used for the same purpose.

Spectrum analyzers? The better part of a year's wages might buy a used one. After the novelty wears off, it'll make a great conversation piece. Forget it. Besides, you already have an S/A that I'll be telling you about.

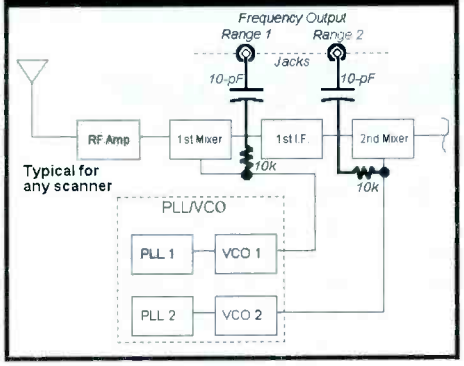
Etc, etc, etc .... the experimenter bench needs almost none of this stuff – just a decent volt-ohm meter (or two), a few power supplies, and a spare scanner will do. A scanner?! Well, sure, a scanner is a frequency counter, signal generator, and spectrum analyzer, all in one low priced package. Certain receivers like WiNRADiO and the Icom PCR-1000 also come with spectrum analysis software, but that's icing on the cake.

So long as you have a multimeter, a spare scanner, and DC power, then the remaining requisite is (what else?) a personal computer. Many bench applications are well served by 486 or 386 machines, but Pentium 133/up is preferred. A host of DOS and Windows software is available to make a PC perform most any task, limited only by the imagination. Properly equipped with a spare serial port or two and perhaps an add-on analog-to-digital (A/D) converter board, there just isn't much a PC can't do ... at much lower cost. That's why the bench probably doesn't need more sophistication than a multimeter and a scanner.

Test Equipment Idea

A spare scanner radio can serve as a signal generator. Scanners have at least two digitally tuned local oscillators. Find those oscillators; trace their paths to the receiver's mixers; and then tap the mixer inputs to output jacks on the case of the scanner. Figure 2 illustrates the concept. You'll have to study the VCO/PLLMixer design to determine the frequency ranges, but that will come.

FIG-2: SIGNAL GENERATOR



Then, with any given frequency programmed into the scanner, there are at least two stable, accurate output frequencies; in effect, a programmable signal generator.

Caveat: tapping the mixer inputs will almost certainly affect the operation of the scanner, so don't do this to your main/favorite monitoring radio. Start with an old surplus rig that's seen better days.

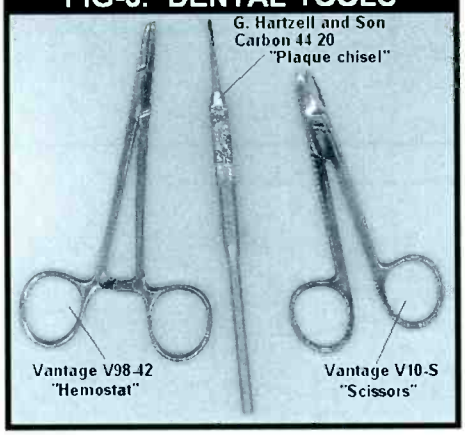
After you understand the processes, you can build (cheap) digital add-on circuits to divide or multiply frequencies to get whole new ranges of frequencies. A scanner can be the sophisticated heart and brains of homebrewed test equipment.

Tools

Page 167 of Radio Shack's *1999 Catalog* is a good reference for a variety of electronic hand tools. Here, we'll look at some esoteric tools that can spell a difference. My favorites include a dental plaque chisel; hemostats; and short-nosed scissors, all made of stainless steel. Figure 3 shows these gems that can be ordered from dental supply companies.

The plaque chisel is indispensable for precise gouging and cutting work on circuit boards, plastics, and even soft metals. Hemostats are standard, except this pair is small, but heavy duty. I've never seen anything like the scissors

FIG-3: DENTAL TOOLS



– they cut everything from stout wire to thin gauge sheet metal like shielding compartments in radios.

Another of my favorites is a tool for measuring wire diameters in the American Standard Wire Gauge. Mine's over 30 years old. I forgot the source, but it's a steel disk, about 3-1/4 in. dia., with 37 calibrated slots around the circumference to measure AWG wire gauges, from 0 to 36 (0.325" to 0.005"). I use mine less for wire and more to measure thickness and diameter of materials. (My desk notepaper is 0.0056" thick.) Yes, I know, a micrometer caliper does it "better." But a good caliper is expensive. A wire gauge and a companion spark plug gap gauge serve most purposes.

First acquired as a "science toy," my pocket laser pointer pen became an awesome tool. It's a superb indicator of "flatness" of materials. Positioned from the side, the bright red streak directed across a surface, makes high and low areas obvious. Even minuscule dust particles stand out like sore thumbs when illuminated from the side by laser light. A laser pointer establishes straight lines between two points, whether on a circuit board or across the neighborhood.

A cordless power screwdriver sweetens the experimenter's life. Assortments of flatblade; Phillips; Allen; and star drivers are a must, as are a 1/4 in. drive shaft and set of 1/4 in. hex sockets, especially the smaller sizes. Likewise, a set of drill bits with a smattering of sizes between 0.04 in. and 3/8 in. is mandatory.

Xacto knives, scalpels, and other precision cutting edges can be kept razor-sharp with honing steels, especially the kind impregnated with diamond dust. I keep my dental plaque chisel so sharp that it can trim a fat solder joint or even cut a wire stub with only a gentle downward pressure. It can scrape the ink off a magazine page without damaging the paper. Sharpness is important to the experimenter.

Tips & Techniques

Simple ideas go a long way. Clear fingernail polish is a good sealer for lettering on circuit boards and chassis. It is also a good insulator or barrier between two bare wires or solder joints. Colored fingernail polish is perfect for polarity markings, wire IDs, etc. Never buy fingernail polish, though. The ladies of your domicile regularly throw out half full bottles. Don't ask why – just beg for their castoffs and keep a supply on the bench.

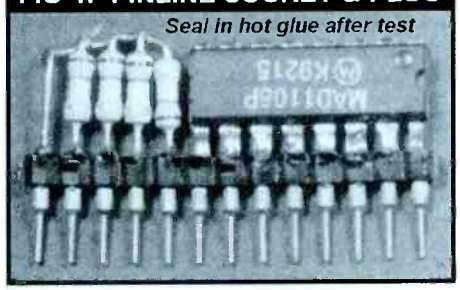
A sharp chisel-blade Xacto knife can trim melted and drilled plastic surfaces to near-original condition.

Did you know that 1-cc of water weighs exactly 1 gram? A precision balance can be made from jar or tin can lids, string, and scraps of wood. Plastic syringes and other cheap volumetric devices can measure out calibrated amounts of water on one side of a balance to closely approximate the weight of an unknown object on the other side. Accuracies to +/- 0.1g (0.0035 oz) are readily possible.

A hot-glue gun is indispensable. Actually, the substance is a melted plastic that acts like glue, but is easier to remove and yet bonds well to most surfaces. I use it for "injection plastic"; cable "ties"; PC board bindings; crack and hole sealant; and a hundred other things. The guns and glue sticks come in at least two sizes (0.5 in. and 0.3 in.), but the smaller is preferred for most applications.

Hot glue and pinline sockets make great custom plugs and sockets. Try finding a mini 13-pin mating plug and socket with wire bundle lengths to meet your exact needs! Make your own with pinline sockets and hot glue. Figure 4 shows how pinline strips can hold a mini-circuit and conveniently plug into a mating socket strip. After the circuit proves up, seal it in hot glue for a high-reliability molded plug or socket!

FIG-4: PINLINE SOCKET & PLUG



Conclusion

This article was intended to arouse your creative juices. Now share your ideas with me and we'll expound on some in coming articles. It really is possible to create great things out of almost nothing.

ANTENNA TOPICS

BUYING, BUILDING AND UNDERSTANDING ANTENNAS

Clem Small, KR6A
email: clemsmal@bitterroot.net

Antennas Specifically Designed for Reception

In working with antennas it is useful to know about the principle of antenna reciprocity. In practical terms this principle says that *an antenna tends to behave similarly whether it is utilized for transmitting or for reception.* Thus the patterning of an antenna's responsiveness for reception is the same as its patterning of transmitted signal strength. Other variables such as its gain and its feedpoint impedance are also the same for transmitting or reception. In fact, many two-way radio stations utilize the same antenna for both reception and transmission.

It is desirable that an antenna used for receiving present us with maximum signal output from the desired station and a minimum of received noise. On the other hand, many antennas used for transmitting must handle much higher power levels than those handled by receive-only antennas. Transmitting antennas should also have characteristics which help put a useful level of signal strength into the desired distant antenna. Nor should they waste signal energy by radiating it in directions where no communication is desired.

Thus, despite the fact that one antenna often serves well for both transmitting and receiving, receiving antennas have different jobs to do than do transmitting antennas. In fact, we may find that some antennas which would not satisfy the requirements for a good transmitting antenna may yet be excellent receiving antennas. With this in mind let's check out some receive-only antenna designs.

The Beverage Antenna

The Beverage (fig. 1A) is a very directional, low-gain (i.e., low responsiveness to signals) antenna which is useful at frequencies up to the lower portion of the high-frequency band. This antenna is known as a top performer when digging signals out of noise and interference.

Its secret is that it is so directional that noise and interference coming from directions other than that of the desired signal produce very little output from the antenna. Unless there is significant noise coming from the same direction as the desired signal, the antenna's sharp directivity leaves the signal relatively in the clear. Because you hear mainly the desired signal, the antenna's low gain is sufficient to provide good reception. Technically, this means that this antenna furnishes your receiver with a very favorable signal-to-noise ratio (S/N).

One down side of the Beverage is that it must be quite long – at least a significant fraction of a wavelength and preferably a few wavelengths long. This ranges from a few hundred feet on HF to *miles* on the LF and lower bands. Unfortunately, most of us don't have the real estate needed to erect this excellent receiving antenna.

Another problem in using this antenna is that it is useful only in the two directions in which the wire ends point, or, for the terminated design, *one* of those directions (fig. 1B).

But if you do have the time, money and real estate needed to put a Beverage into use – plus the need for a long-term, dedicated-direction receiving antenna – then the Beverage can be a good choice. *The longer the better* is a general rule for this antenna, although some writers give maximum lengths as short as two wavelengths.

The antenna should be about 5 to 15 or so feet above the ground, but some report good results from Beverages laid directly on the ground.

Run the antenna in a line directly toward, or away from, the station you want to receive. Left unterminated the antenna will be directional directly off either end in the directions the wire runs (bidirectional). If terminated with a resistor as in fig. 1B, then the antenna will be unidirectional as shown.

Typical terminating-resistor values vary from perhaps 300 ohms to 1000 ohms. The resistance value for your particular antenna can be determined by tuning in a signal from the undesired direction (opposite the arrow in fig.1B) and varying the termination resistance for minimum signal from the undesired station.

Table-Top Antennas

Resonant, table-top, loop antennas are almost legendary among AM broadcast band DXers for their ability to pull a desired signal out of noise and interference. Like the Bever-

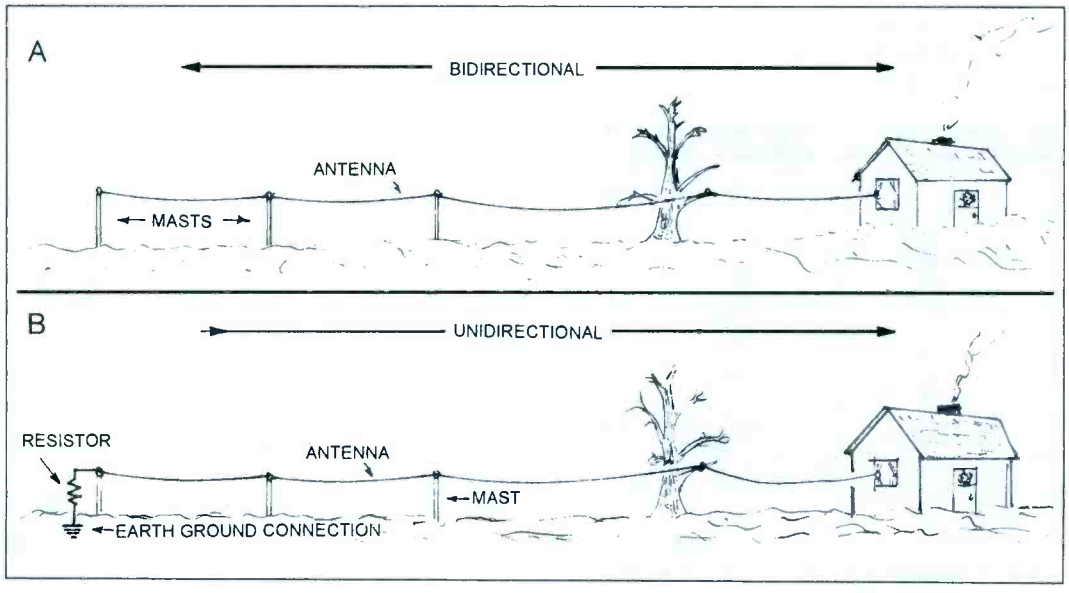

FIG. 1. *A bidirectional Beverage antenna (A), a unidirectional Beverage antenna (B).*

age antenna they have very low gain and depend on their favorable S/N for their popularity.

The low gain of table-top antennas such as loops and whips can be compensated for, to a degree, by adding a preamplifier and thus making them into "active antennas." On the down side we then risk the problems of intermod and desensitization in the presence of excessively strong signals. On the plus side, active antennas only two to three feet in length can often rival the performance of much longer outdoor antennas. This can be important where space for an antenna is limited.

Noise-Canceling Receiving Antennas

The basic idea behind noise-canceling antenna systems usually is to receive the desired signal on one antenna that is so designed and oriented as to respond maximally to the desired signal. Of course this antenna will also pick up some undesired noise. A second antenna is differently oriented and designed such that it will respond well to the noise, but not particularly well to the desired signal.

Hopefully then, the output from the noise antenna can be combined with the output of the signal antenna such that the noise signals from the two antennas are out of phase and will cancel each other. This leaves the desired signal somewhat in the clear.

These antennas are effective in some situations, but are infrequently covered in the literature. JPS Communications, P. O. Box 97757, Raleigh, NC, 27642-7757 manufactures an "Antenna Noise Canceler" unit which uses the noise antenna design. However, an announcement in last month's What's New? column indicates JPS is going out of the hobby radio business, so these may not be available much longer.

Radio Direction Finding Antennas

In general, radio direction finding (RDF) antennas are designed as receive-only antennas. One reason for this is that often the gain of RDF antennas is quite low. Also, their best direction-indicating precision is generally achieved by orienting them to the minimum signal (null) rather than to the strongest reception possible.

Due to this, if an RDF antenna is tuned for a precise direction indication in reception, it is tuned to the minimum signal; reciprocity tells us that if the antenna is then used for transmitting, it would send a *minimum* of signal to the station being monitored.

As recently discussed in my May column, null-oriented RDF antenna designs include the open-frame loop, loop plus sense-antenna, the goniometer, and the Adcock open-loop.

RADIO RIDDLES

Last Month:

Last month I asked: "OK, so a repeater can be made from a piece of wire, but can an antenna be made from a piece of insulator?"

The answer is "yes." We have what are called "dielectric antennas" which utilize a piece of dielectric (an insulator) shaped as a lens or prism to collect and direct microwaves to the metal receiving element of the antenna (e.g., a satellite dish).

OK, so maybe I'm stretching it a bit; the antenna is not *all* insulator, just partly. By the way, there are also lenses made of metal which are used with microwave antennas to focus the received energy onto the receiving element of the antenna.

This Month:

Why is an antenna like the Beverage, which performs so well for reception, not also used for transmitting? Or is it? Or does it perhaps violate the principle of reciprocity?

You'll find an answer for this month's riddle, and much more, in next month's issue of *Monitoring Times*. Til then Peace, DX, 73

ON THE HAM BANDS ...

THE FUNDAMENTALS OF AMATEUR RADIO

Ike Kerschner, N3IK
email: n3ik@hotbot.com

Is It High Enough?

Nearly every radio enthusiast asks the question, "Is my antenna high enough?" Depending on several factors, that query can have many answers.

Too often the poor novice is told "it is never high enough!" However, there are limits to everything, and in any antenna situation there are several factors that come into play.

Frequency

If your major interest is VHF, then higher is almost always better. VHF and higher frequencies are generally considered line of sight, (i.e., range is as far as the antennas of two communicating stations can see each other). Actually, though, the range will be a bit farther than optical line of sight.

The VHF/UHF ham living in a valley surrounded by high mountains is truly in a bad way because these higher frequencies react to solid structures very much like rays of light in that they are easily reflected and blocked by high surrounding structures or hills; consequently, range will be very limited unless the antenna can be elevated above the blocking obstruction.

But, as the antenna goes higher, the feed line becomes longer and losses in the feed line can result in few audible signals. To counter this, there are low loss feed lines available; however, as feed line loss goes down, cost goes up. A second solution to the problem of loss is to use open wire feed lines. Unfortunately, most hams do not want the added complication of transforming the high impedance of open wire lines to the 50 ohms required by their modern rigs.

So you can see that in many instances the cost of increasing the height and gain of an antenna and maintaining low transmission line losses can result in considerable cash outlay to the ham, and may not be worth the effort.

Medium to High Frequencies

The antenna books tell us that to get optimum results from an antenna at medium to high frequencies the antenna must be at least one half wavelength above ground. At 160 meters that comes out to 260 feet! Or in the case of a 40 meter antenna (perhaps the most popular band) that height will be 66 feet, still a considerable distance above ground for the average ham.

The books are talking about obtaining a pattern from a dipole with maximum lobes in two directions (at right angles to the plane of the antenna). If our dipole is lower than one half wavelength then the pattern will be distorted (usually becoming omnidirectional). However, the antenna will still be useful for communications to some degree at any height above ground.

Of course, if we consider a vertical antenna at these frequencies, with its base at ground level, the antenna will function satisfactorily in most cases. Ground losses can play a big part in how a vertical antenna functions; consequently, a good radial ground system is extremely helpful when using this type of antenna. Elevating a vertical just a few feet above ground will improve performance and require far fewer radials.

At medium/high frequency the wave front being radiated is much larger than at VHF/UHF with the result that surrounding objects will have less effect on the antenna. In fact, at times low antennas at these frequencies work extremely well. One example of a very low antenna working in an exceptional manner is the case of W2EQS(SK) Charles O'Brien who had a 160 meter dipole at only 20 feet above ground and worked well over 100 countries on that band. I had a similar experience when as a Novice I had to use my mother's wash line as an antenna. Even though it was only 50 feet long and six feet above ground I was able to work hams all over the USA on 80 meters.

On these frequencies, line losses are not a significant factor and inexpensive coax or ordinary lamp cord will prove satisfactory up to 20 meters or so.

In any case the important thing to remember is that the antenna must be properly matched to the transmitter. A transmatch will allow operation on all bands from 160 through ten meter with almost any antenna. Transmatches are available for VHF operation, too.

To Sum It Up

At VHF and above it is very important to elevate the antenna above nearby surrounding objects and minimize line loss for satisfactory communication. The MF/HF operator need not be overly concerned if optimum height cannot be achieved, as adequate performance can be realized even at low heights above ground.

In general, it is best to try something than to sit and worry about it. Yes, even if it is putting up a two meter antenna at five feet, you might be surprised; at least you will be operating within the parameters of the ham radio spirit!

Activity

So far this summer has been disappointing to me as far as VHF openings go. There were a few E^s openings to the midwest in mid May, but activity was scarce on two meters. Six fared a little better with one opening to the West Coast and several into Central America.

The HF bands are doing quite well and DX is becoming more regular on 15, 12 and 10 meters. Activity on 80 through 20 has been very high in spite of summer noise and a lot of DX is being worked on 40 meters.

Special Event Stations

Some time back I mentioned working for WAS (worked all states) by contacting special event stations. My goal of 50 states is very close, with only Alaska, Hawaii, Idaho, Utah and Nevada missing from my QSL collection. I might mention, that working special event stations is a very interesting past time, as many of their QSL cards or certificates provide information about the event and allow us to take a peek at a historic or social event with a little better understanding.

lightkeeper@sprintmail.com

GMRS Rule Changes
Opening doors raises a furor

On February 12, 1999, the Federal Communications Commission issued a series of changes to the rules that govern the General Mobile Radio Service (GMRS). FCC rules state that "GMRS is a land mobile radio service available to persons for short-distance two-way communications to facilitate the activities of licensees and their immediate family members."

GMRS allows communications with up to 50 watts transmitter power through repeaters on the following repeater pairs (the output channels may also be used for simplex communications):

Chan	Input MHz	Output MHz
1	467.550	462.550
2	467.575	462.575
3	467.600	462.600
4	467.625	462.625
5	467.650	462.650
6	467.675	462.675
7	467.700	462.700
8	467.725	462.725

In addition, GMRS also allows simplex communications with up to 5 watts power on the following frequencies, which are the same as Family Radio Service Channels 1-7:

Chan	Simplex MHz
1	462.5625
2	462.5875
3	462.6125
4	462.6375
5	462.6625
6	462.6875
7	462.7125

The new rules make three big changes (and a number of small ones) to GMRS, and both REACT (Radio Emergency Associated Communications Teams) International and PRSG (Personal Radio Steering Group), the national advocacy organization for personal licensees in the General Mobile Radio Service, have objected strenuously to at least a couple of them.

Corwyn Moore, adminstrator of the PRSG, says "the FCC has dismantled rules that kept GMRS from becoming a complete garbage band. When these matters were brought to the attention of the FCC, they didn't care." REACT calls the rule changes "a serious threat to providing help by radio."

Points of Protest

First (in rising order of controversy), the restriction on base-to-base communication has been lifted. Previously communication was only allowed from mobile-to-mobile or from base-to-mobile. Corwyn Moore feels that lifting this restriction will make it easier for GMRS to become more like what 11-meter Citizens Band is today.

Second, another rule change allows any GMRS licensee to operate on any GMRS repeater. Previously, with eight channel pairs to choose from, users could ask for two that would be assigned to them. By the old rules, you could also use the 462/467.675 repeater pair for emergencies and travelers assistance without being specifically licensed for that pair of frequencies.

Both REACT and PRSG expressed concern that indiscriminate use of repeaters for which no permission had been granted could result in repeaters being taken off the air.

Finally, another change made to the rules appears to restrict the use of the 462/467.675 repeater pair to emergency and travelers assistance only.

Previously, Part 95.29e of the FCC rules stated:

> e) Mobile stations in a GMRS system licensed to an individual that is not specifically authorized for the 462.675 MHz/467.675 MHz channel pair may transmit on that channel pair with the following limitations:
>
> (1) The communications must be for the purpose of soliciting or rendering assistance to a traveler, or for communicating in an emergency pertaining to the immediate safety of life or the immediate protection of property; and
>
> (2) The frequency 467.675 MHz may be used only for the purpose of accessing and communicating through a mobile relay station transmitting on 462.675 MHz.

The new rule, however, states:

> (e) Mobile stations in a GMRS system licensed to an individual are authorized to transmit on the 462.6750 MHz/467.6750 MHz channel pair with the following limitations:
>
> (1) [No change.]
>
> (2) The frequency 467.675 MHz may be used only for the purposes of accessing and communicating through a repeater station transmitting on 462.675 MHz.

Mixed Messages

The change leaves many REACT teams wondering whether they can use the repeaters on this frequency pair for personal and team business. W. Robert Stone, REACT Chairman of the Board said, "Some teams even anticipate changing their .675 repeater to another frequency since they cannot afford to maintain one for .675 and another for personal communications. This would leave *less* chance, not more, of an answer for emergencies and travelers assistance than the FCC envisioned in their docket. It would also go contrary to the REACT idea of making emergency frequencies more usable for the public."

William Cross, program analyst for the FCC's Wireless Telecommunications Bureau, says, "The Commission's position is that we granted the users what they asked for, and now it seems what they asked for had unintended consequences."

Various users have asked the FCC to clarify its position, and this may be done in the near future.

Regardless of the outcome, the recent rule changes have made GMRS more attractive than ever before. For those who have experienced the convenience and crystal clear sound of Family Radio Service transceivers (which operate in the same frequency range), with or without repeaters, GMRS offers the potential of more range for personal and family communications.

Current GMRS license fees are $75 for five years. To find out more about getting your license, phone 1-888-CALL-FCC. For additional information about GMRS, visit PRSG's website at **www.provide.net/~prsg**.

FLASH — as this issue was going to press, the FCC restored non-emergency use on the 462/467.675 repeater pair.

John Catalano, PhD
j_catalano@conknet.com

Seeing is Believing with VisualRadio

Let's continue with the new crop of programs aimed at radio monitoring. Last month it was RadioCom, a do-it-all program that almost makes existing monitoring software look like stone-age tools by comparison. Using all the capabilities of Windows 95/98 and fast Pentium processors, we saw RadioCom do everything: radio control, database, signal (digital modes) decoding and more. A very tough act to follow. This month, we'll look at VisualRadio (sorry for the pun) version 3.00.

The program controls many compatible receivers via a PC (they state a 386 as the minimum system, but I strongly suggest a Pentium). To use all its capabilities a sound card is essential. VisualRadio also provides a database with storage and retrieval and various scanning functions. However, today, many programs can provide these same functions. What makes VisualRadio different?

VisualRadio uses a very slick Windows 95 format to do its work, and more. The "more" is a number of graphical presentations of signal frequency, demodulated audio frequency and signal strength versus time. Just check out Figure One for a sample of what VisualRadio can do. The program also provides an audio recorder function which stores the demodulated output, voice, data, etc, on the computer's hard drive.

Seeing What Matters

Let's face it. The reason for most of our monitoring efforts is the modulation; either in the form of data or voice. *Seeing* what you're listening to adds a fascinating new dimension to monitoring. A few years ago we looked at a program, Audio Spectrum Pro, which displayed a spectrum (amplitude and frequency versus time) of audio feed to the input of the PC's sound card. Naturally, I immediately plugged the audio from my HF receiver into the program and was treated to a show "watching" a RTTY (radioteletype) station.

More recently, we checked out RecAll, which takes the input to the sound cards and stores it as a digital file on a hard drive. Do these functions sound familiar? VisualRadio attempts to combine these audio programs with monitoring control and database software.

VisualRadio can control many receivers: AOR, Icom, JRC, Kenwood, Optoelectronics (Scout), Racal, R & S, Watkins Johnson, WinRadio and Yaesu. Check their website at **http://ourworld.compuserve.com/homepages/visualradio/** to see the latest models of supported receivers. Some websites state that VisualRadio can control WiNRADiOs. After an hour of trying, I found out that it only supports internal, PC card WiNRADiOs (1000 and 1500), but not their external versions.

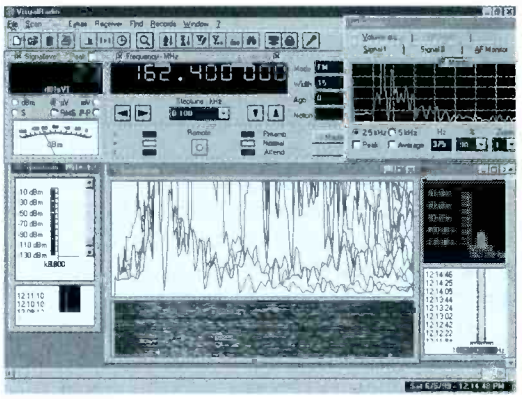

FIGURE 1

Installation and Copy Protection

The program is supplied on three 3.5 inch high density disks. Installation is fast and easy. However, be aware that the program is copy protected and only allows two installations. This can be a problem when you are constantly upgrading to new computers, which seems to happen every six months in this crazy industry! More on this later.

VisualRadio's Help file is useful and will get you up and monitoring in minutes. The process is simple. First, enter the parameters for the computer/receiver's serial (coms) port interface. Then, select your receiver in the menu "Receiver - Select Receiver...". VisualRadio will create a link between your computer and receiver.

A Very Busy Figure One

The top portion of the screen displays the Control Panel which looks and acts like the front panel of a receiver. The frequency is set by left mouse clicking on the numeric display and typing in the new frequency. The Intelligent tuner function acts as a big old tuning knob controlled by the left mouse button, for down and up, respectively. Mode, squelch and similar functions are set from the panel to the right of the numbers. Using the radio control section of VisualRadio is simple, easy and intuitive.

There are so many different graphs and spectrums that can be displayed that I had a very hard time choosing which to show you. Figure One has lots of interesting information crammed onto one screen. Starting from the right we see a RF spectrum of amplitude versus frequency, that is centered around a NOAA weather station at 162.400 MHz. Below it we can see an amplitude versus time analysis. The amplitude is represented by different colors on this graph.

Monitoring: Hearing and Seeing

The large display in the lower center of Figure One is a three dimensional representation of the demodulated audio. Amplitude and frequency components are displayed and move "into" the display with the passing of time. Below it is a "picture" showing a color coded utilization of audio frequencies.

On the extreme left I've set up another frequency/amplitude display. Looking at the graph below we can see an hour:minute:second format. When a signal is present, a colored bar appears next to the time the signal was logged. The bar's color is representative of the signal's strength. This is just one of the very useful automatic time-stamped graphs available in VisualRadio.

Finally, the graph at the upper right gives a simple, instantaneous, amplitude versus frequency display of the demodulated audio, in this case the weatherman's voice. The choice, location and size of each graph is totally controlled by the user.

Due to space limitations, we have only shown a one-screen compacted version of these graphs. In practice, each graph can be viewed one at a time. It is then enlarged and occupies 75% of the screen and displays much more numeric and trace detail. VisualRadio's graphs are invaluable in presenting propagation variation, adjacent channel interference, searching for new stations and add a whole new way of looking at monitoring (that was the last pun, I promise).

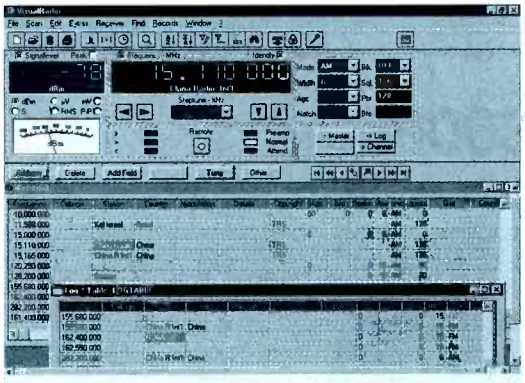

FIGURE 2

The Database

This Microsoft Access compatible database has so much promise: Master list, logging features, scanning between frequencies, and storing and scanning stations in "channels." It's all there. See Figure Two.

Using the buttons on the right (below the mode and squelch settings) allows you to get into the various base modes. They can also be accessed via one of the buttons near the top of the screen, and via a dropdown menu. Once the database is opened, editing functions are via mouse clicks and keyboard entries.

The number of fields in the database can be easily expanded. This allows users to customize the database to their needs and preferences. Once a station's name has been entered into the database, it appears below the Control Panel frequency display when the it is selected. At the bottom of Figure Two you can see the open Master and Log files.

VisualRadio has so many different database functions and graphs; and each has so many different methods of access. Can you have too much of a good thing?

Using VisualRadio

I spent quite a lot of time with VisualRadio. I tried it on three different computer systems and a number of different radios, including WinRadio, Yaesus and ICOMs; both traditional receiver types and PC-based receivers.

For receivers which are not PC-based, such as Yaesu's FRG-8800 or ICOM's R-71, VisualRadio gives you a way into computer-controlled monitoring. Frequency spectrum displays, very helpful for finding signals in a frequency range, will also become available. And, of course, all the audio spectrum functions and presentations are also part of the package. VisualRadio really opens up new capabilities for traditional radio receiver users.

For PC-based receivers, for example WinRadio's internal 1000 model, VisualRadio's appeal is its audio spectrum and recorder functions. The presentation of all functions is slicker on VisualRadio, as compared to the program which comes with the radio. Regardless of which radio I tested, the radio control and interface worked flawlessly.

The Recorder: A Great Idea -But

The recorder is a great function to have when you want to capture that special monitoring moment. However, using PC-based radios, I tried VisualRadio on three different computers: an HP Pavilion 3266, a home-made 233 MHz MMX Pentium and a Fujitsu LifeBook 160 MHz MMX Pentium laptop. All were running Windows 95. And, all experienced serious lock-up problems while using the Recorder function.

I emailed the author with my problems and was told "it is a problem with your (my) systems." Three out of three? I don't think so. The lock-up didn't always occur. It seemed to happen at random times. But, in most cases, the only remedy was to restart VisualRadio. In extreme cases, I had to power down the computer. Even the three-fingered salute didn't work! It seems that VisualRadio is bothered by running certain programs (internet browser, graphics program or MSWord) in the background.

During the times the recorder program was working, it muted the audio while recording. I couldn't hear what was being recorded. I tried every known mixer setting on all three computers, with the same muted result. Also, I could not get the automatic recording function to work. Sound card installation and control has always been a pain on PCs. It appears that VisualRadio is just having their share of sound card quirks.

Summary - It's a Great First Effort

First, I must say that a lot of time and effort must have gone into the creation of VisualRadio. It is a very ambitious effort. However, for me, the result was too complicated in operation. I must confess that I spent a whole weekend trying to get comfortable with the database mechanics of VisualRadio. In the end, I never did get use to the data entry and retrieval conventions.

I expended more time and effort on VisualRadio than I usually spend on a program. That's because I believe that VisualRadio is an excellent concept. But, I could not get comfortable with the program and I experienced a number of real hardware problems.

Was it me? Maybe. Was it last month's spectacular performance of the do-everything RadioCom program? Perhaps. Was it my computer hardware? Come on – three different computers?! Was it just the PC-based receivers? Mmmm – in most cases, yes. Was it VisualRadio – ?

Version 4 is on its Way

VisualRadio is a great concept whose operation needs to be simplified, and it requires a bit more development. To be fair (and I'm *always* fair), VisualRadio version 4.0 was out by the time this column was published. I'm sure a number of these issues will have been resolved. We'll do an update as soon as I receive it.

VisualRadio 4.0 is available in the USA from Computer International (207 South US-27, St. Johns, MI 48879-1903; **http://computer-international.virtualave.net**) for US$140. In Europe it is available at 77 pounds sterling (plus shipping) from Simon Collins (simon.collins@cableinet.co.uk), who also provides a number of other programs of interest to radio monitors.

MAGNE TESTS

SHORTWAVE EQUIPMENT REVIEW

Lawrence Magne
Editor-in-Chief, Passport to World Band Radio

Grundig Yacht Boy 300PE

Over the last few years VCRs have dropped in price, PCs have become cheaper and better – even low-tech TVs are now bargains. Yet, while some shortwave prices have moved up or down slightly for individual models, the bottom line is that world band radios cost about the same today as they did in 1995.

Much of the reason may be that world band radio is a niche market, with lower volume and less competition. But part of this is also due to the lack of much in the way of technical change.

Frustrating? You bet, because there would be nothing more welcome than a $50 radio that performed like the Grundig Yacht Boy 400. Occasionally you hear about radios like these, but never actually come across one. Like Elvis sightings.

Many features for price, but SW tuning "hole"

Grundig's new Yacht Boy 300PE, made attractive by an aluminum-colored paint finish, is no low-cost superstar, either. Yet, it is an attempt to bring decent quality to the under-$100 range: $99.95 street, to be exact. Made at a Grundig-controlled plant in China, the 300PE covers FM 87.5-108.1 MHz in 100 kHz or 200 kHz increments (in stereo through the earphone jack), 520-1710 kHz in 10 kHz increments or 522-1620 kHz in 9 kHz increments, and shortwave 2.3-7.3 kHz (SW1) and 9.5-26.1 MHz (SW2) in 5 kHz increments.

An American soldier once quipped that, in a country we won't name out of respect, there are two types of women: those with teeth and moustaches, and those with no teeth and no moustaches. Similarly, a shortwave radio under $100 has traditionally been either a decent radio with no accessories and few features, or a terrible radio with many accessories and features.

The 300PE improves upon this: It is a decent radio with a number of useful features and accessories – AC adaptor, batteries, plug-in length of outboard wire antenna, stereo earbuds, padded travel case, 24-hour clock, 10-90 minute sleep delay, elevation panel, travel power lock, illuminated dial, telescopic antenna that swivels and rotates, and a wide range of advanced tuning options.

Indeed, except for a tuning knob this radio has pretty much all you could want in the way of tuning features: keypad tuning, presets, frequency scanning and a meter-band selector button. However, there are some catches.

First, there is an antiquated "SW1/SW2" arrangement that requires pressing a carouseling button (MW - SW1 - SW2 - FM) three times before you can tune from a frequency above 9500 kHz to one below 7300 kHz. Second, there are only six presets for SW1 and another six for SW2 (plus six for FM and six for AM).

Third, the radio mutes for over one second when you tap a slew button to go to the next channel. This may not seem like a lot, but for those of us who do a lot of bandscanning this is definitely annoying. Still, reader feedback suggests this doesn't bother many listeners.

Another catch is that while the LCD reads out the frequency correctly, it does so in the XX.XX MHz format for even channels, and XX.XX5 MHz format for odd ones. Too, if you key in an even channel in the usual kHz format (e.g., 5 - 9 - 6 - 0 kHz) the radio tunes one channel higher than that, in this example 5965 kHz. As to the LCD, it is designed to be read with good contrast head-on or from below, but loses contrast when viewed from above. The LCD shows the frequency or the time, but not both at the same time, although you can toggle between the two by pressing the mode button.

Weak-signal sensitivity highlights performance

As with the vast majority of under-$100 models, the 300PE is single conversion, and sure enough you'll find images; that is, strong signals being repeated 900 kHz lower down at reduced strength. However, for a single-conversion model image rejection is relatively decent, although it is nowhere equal to that of almost any double-conversion receiver.

Selectivity, or adjacent-channel rejection, is wide, but acceptable – pretty much on a par with what is found with other models at or near this price point. Ditto audio quality, which is okay but lacking in low-frequency ("bass") response.

But the 300PE's real surprise is its superior sensitivity to weak signals. The 300PE does a nice job of receiving daytime signals, which tend to be relatively weak in all parts of the world, as well as weak evening signals which are commonly heard in the American Midwest and West. The FM band is also commendably sensitive to long-distance reception.

Of course, no amount of weak-signal sensitivity can help the 300PE receive stations in the upper end of the 41 meter band above 7300 kHz (although some of these can be tuned, at reduced strength, at the image frequency 900 kHz lower down), or the lower part of 31 meters below 9500 kHz. In the Americas the 40 meter ham band runs from 7000-7300 kHz, so most stations targeting this part of the world operate between 7305 kHz and 7560 kHz, and as shown in the Blue Pages of the 1999 *Passport to World Band Radio* there are a fair number of stations found in the 9350-9495 kHz range, as well.

Bottom line is that the Grundig Yacht Boy 300PE is the long-awaited successor to the now-discontinued Yacht Boy 305, which was

another single-conversion receiver with superior weak-signal sensitivity. For listeners west of the North American east coast – or in such weak-signal places as Hawaii, Alaska and the Caribbean – the 300PE is value priced for newcomers, as gifts or for a second radio.

Lextronix/Grundig and Drake Enter Joint Agreement

A few years back, the idea was raised that it would be mutually beneficial for Grundig and Drake to tie their fortunes together.

After all, the two companies' strengths strongly complement each other. Grundig, through its Lextronix North American affiliate, has been nothing short of masterful in its marketing of world band radios to the general public. Yet, Grundig's engineering has not always been world class.

Drake, on the other hand, has distinguished itself for half a century by turning out legendary products with top-notch engineering at attractive prices. Yet, Drake has had to fight for sales because its ham-oriented dealer network has been shrinking over the years. Equally, it hasn't been set up to branch out much beyond its niche market.

So, according to Ron Wysong and Esmail Hozour – heads of Drake and Lextronix, respectively – in 1997 Drake and Lextronix quietly entered into a Joint Product Development Agreement to utilize the engineering/R&D talent of Drake, as well as Grundig, in the design and development of various premium receivers for the international world band market. These receivers will be marketed and distributed by Lextronix under the Grundig name.

The first product of this liaison will be the Grundig Satellit 800 Millennium, a beefy $500 portable reminiscent of the former Grundig Satellit 600/650. Planned for introduction later this year, it reportedly will incorporate such Drake-designed features as synchronous selectable sideband, along with the sort of audio quality traditionally associated with Grundig. Other models, including the long-delayed Satellit 900, are scheduled to follow in due course.

Meanwhile, Drake has been rationalizing its own product line, with pruning taking place in the lower echelons where Drake receivers might be going head-to-head with better-marketed Grundig receivers made with Drake expertise.

This equipment review is performed independently by Lawrence Magne and his colleagues in accordance with the policies and procedures of International Broadcasting Services, Ltd. It is completely independent of the policies and procedures of Grove Enterprises, Inc., its advertisers and affiliated organizations.

AOR AR16 Portable Scanner

We were impressed with the tiny ICOM IC-R2 wide range scanner we reviewed in April 1999 *MT*. The IC-R2 has a competitor – the new AOR AR16. Termed the Wide Ranger, the AR16 is a shirt pocket portable which tunes 0.5 - 1300 MHz.

Simply Powered

Two AA batteries power the AR16 and our radio was furnished with two 1300 mAH NEXcell nickel metal hydride cells. The included Maha MH-C124S charger requires 18 - 22 hours to recharge the NEXcell batteries, but has room for four batteries and can charge older style 600 mAH NiCd cells in 9 - 12 hours. The IC-R2 is furnished with two 700 mAH AA NiCd batteries and a four cell, 7 hour wall charger.

Our AR16 emits a "pop" sound every few seconds in Manual mode. The pop coincides with a split second dip in current consumption, which implicates the battery saver circuit. Measurements indicate that our battery saver does not work.

Fundamentals

The AR16 covers the spectrum in 12 selectable step sizes of 1 to 100 kHz. AM, narrow FM, and wide FM detectors are provided.

Neither the IC-R2 nor AR16 has a full numeric keypad, which makes frequency entry a matter of stepping to the proper band, then twisting the VFO knob. The IC-R2's "tuning accelerator" lets you tune to a frequency faster as you twist the knob faster. Tuning frequencies, especially in the 225 - 400 MHz military air band, takes much longer in the AR16 because it provides no acceleration.

The AR16 forces one to first select the proper band (bank) to tune the VFO. It took us two days to find a way to program 462.975 MHz into the AR16 because the minimalist manual supplied with our radio doesn't contain a chart of the 25 pairs of band edges. Bob Grove reported the same frustration. The first 20 bands in our AR16 are factory programmed to specialty slivers of the spectrum, e.g., bank 13 was 462.55 - 462.75 MHz. We have to step to bank 23 to tune our first frequency, but how should we have known this?

The AR16 and IC-R2 provide 25 pairs of search limits, but you cannot program the AR16's search limits without a computer and the proper software!

Frequencies and modes can be stored in 500 memory channels divided among five banks. Compare this to the IC-R2's array of 400 channels in eight banks. Both the AR16 and IC-R2 permit you to scan only one bank of memory channels at a time. At 19 channels/second, our AR16 scans memory twice as fast as our IC-R2 (see bar graph). The channels may be locked out from the AR16 scan, but that hides them from manual access as well.

The AR16 squelch is automatic – a euphemism meaning you have no control over it. Our AR16 misses weak signals while scanning and, like other models, sometimes locks up on weak carriers we want to ignore. The lack of a squelch control limits our options. Pressing the side-mounted MONI button opens the squelch temporarily, but stops the scanning.

The AR16's display and keypad are backlit via a timer and can be locked on. The AR16's conventional volume control knob is easier to use than the IC-R2's up and down pushbuttons. Using the internal speaker, our IC-R2 provides better audio than our AR16, which isn't as clear and begins to distort at a lower level.

The IC-R2 has a wonderful CTCSS decoding squelch and tone finder, both features missing from the AR16. Early AR16 advertisements mention a speech descrambler, a feature deleted from the version approved by the FCC for sale to the public (AR16B).

Both the IC-R2 and AR16 memories can be downloaded with a computer by using an optional cable, level converter, and software. The AR16 setup is more powerful because a computer can control the radio. Software developers will appreciate that the AR16 command set is publicly documented on the AOR web page **http://www.aorusa.com**.

AR16 vs. IC-R2

If you've read this far, you know our AR16 has shortcomings. On the plus side, our sample AR16 scans faster, has an easy to use volume knob, and can be controlled via computer if equipped with the proper options.

The IC-R2 is smaller, has faster tuning (a major advantage), an adjustable carrier squelch, CTCSS squelch, fewer memory channels per bank, a scan lockout scheme which permits manual channel selection, more rescan delay options, and a belt clip. Our IC-R2 also has better audio, consumed less current, and has a working battery saver.

Both radios come equipped with similar antennas. The IC-R2 earphone jack is mounted atop the radio – more convenient for shirt pocket use than the AR16's side mounted jack. The manuals for

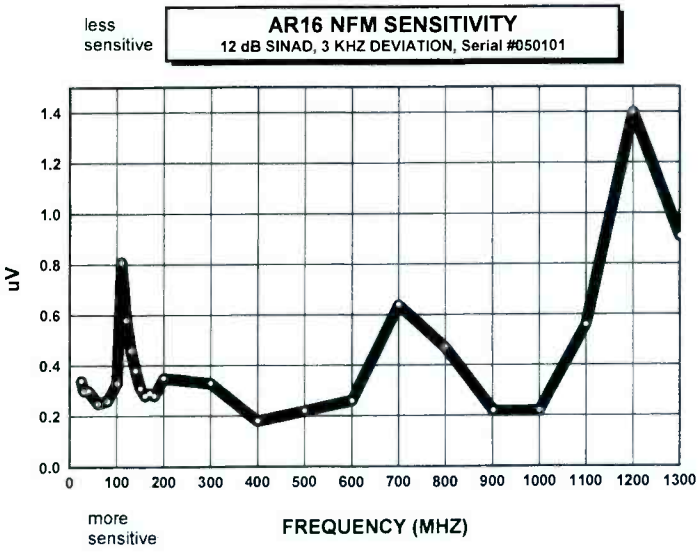
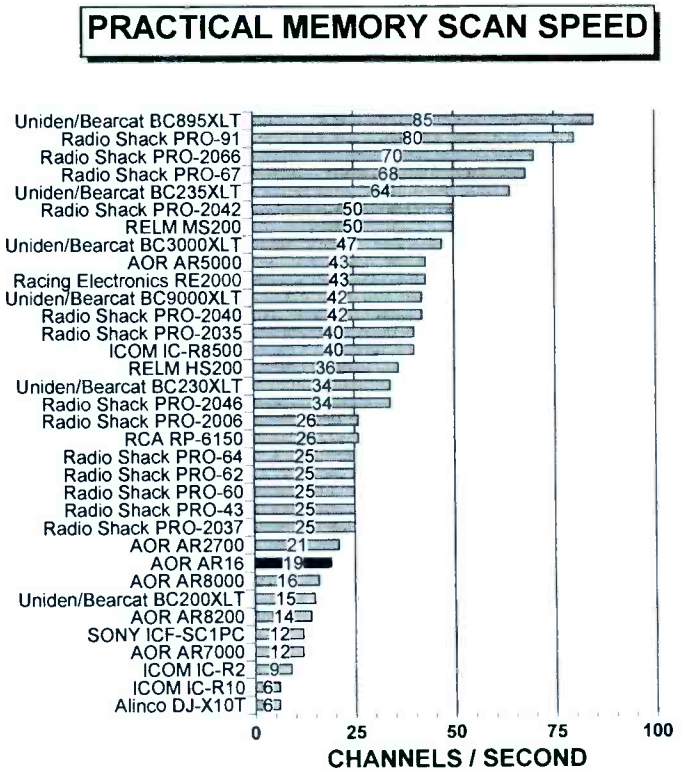
173 mA open squelch, max. volume
30 mA additional for lamp
Battery saver ineffective (see text)





Notes:
1. Measurements made on one sample of each model.
2. Measured with memories programmed with unsorted frequencies in various bands and AM and NFM detection modes.
3. Measurements are approximate.

both radios need improvement, especially the AR16 manual that lacks a chart of band edges and an index or table of contents.

Harris RF-590 Receiver

Our mention of the ITT Mackay Marine 3031A premium receiver (April 1999 *MT*) evoked several letters from interested readers. Since writing that column, we obtained another premium receiver – a Harris RF-590. The RF-590 and its variants were built to military specifications and marketed primarily to government users, including the US Navy and the State Department. It is a double conversion receiver, with IFs of 40.455 and 0.455 MHz.

The RF-590 is built for 19" rack mounting and is a heavy, rugged radio. Inside, each stage is enclosed within a separate shielded box to minimize birdies. A large aluminum knob and numeric keypad permit tuning FM, AM, SSB, and CW signals in the 0 - 30 MHz spectrum. The frequency is shown down to 1 Hz on a bright blue vacuum fluorescent display.

Most of the RF-590s are equipped with 455 kHz Collins filters. AM bandwidths are 16, 6, and 3.2 kHz. The SSB bandwidth is 2.8 kHz and FM bandwidth is 16 kHz. We especially like the 1 kHz and 300 Hz CW bandwidths. A front panel squelch knob controls a noise operated squelch in FM mode and voice squelch in the other modes. The FM detector lets us snoop in the 29.7 - 30 MHz splinter during band openings.

The RF-590 has 100 memory channels and memory scanning. The rear panel has both pre- and post-filtered 0.455 MHz IF output jacks and oodles of other terminals that permit interfacing the radio with external devices. There are several options, including computer control, internal bandswitching preselector, ISB (independent side band), and high stability oven time base. None of the other RF-590 owners we've contacted have the noise blanker, and the list price of that option is rumored to be about $2000!

The RF-590 provides four AGC settings, but lacks a notch filter, passband tuning, sync detector, and other conveniences found in upscale consumer models. Truth be told, our JRC NRD-535D is more sensitive. Nonetheless, operating the RF-590 is a pleasure that cannot be quantified and the audio is superb.

Harris Corp., still a major player in the communications field, is located at 1680 University Ave., Rochester, NY 14610. Late 1980s vintage RF-590s are appearing on the used market as they are replaced by the newer RF-590A. You can find used RF-590s advertised by individuals and two Canadian surplus dealers on the Internet. Toronto Surplus and Scientific, **http://www.torontosurplus.com**, tel. (416) 490-8865, sells RF-590s and RF-590As.

W. J. Ford Surplus Enterprises, *testequipment@falls.igs.net*, tel. (613) 283-5195, sells surplus receivers, too. Visit their web site **http://www.falls.igs.net/~testequipment**.

ASK BOB

ANSWERS TO YOUR RADIO QUESTIONS

Bob Grove, W8JHD
bgrove@grove-ent.com

Q. *Which metal – brass, copper, steel, or aluminum – makes the best radio antenna? Doesn't a silk thread have greater strength than the same strand of steel? (Donald Choleva, Willoughby, OH)*

A. There are some natural fibers, including spider webs, that are stronger for their size than steel, but they make lousy electrical conductors!

Let's assume that we are talking about whip antennas, not wire dipoles. Of the four metals, copper is the best conductor, followed by brass, steel, and aluminum. Since radio frequency energy flows on the outside of the conductor, some manufacturers have used strong steel whips plated with copper.

While this is an excellent choice, both because the copper is a better conductor and because it resists corrosion, the actual results of such experiments haven't justified the extra effort. Once the antenna is thick enough to provide rigidity, the relative resistances among the different metals isn't enough to affect signal strength perceptibly.

Q. *With nothing around them but air, how are tall antenna towers erected? (Jim Ashe, Weymouth, MA)*

A. There are several techniques. One is to actually assemble it piece by piece, with workers hauling it from the ground up, often in buckets, and with the aid of a "gin pole" (pulley on a tall pipe). Another is to fully assemble the sections on the ground, then lift them into place with a crane or even hoist them by helicopter.

Q. *What is a "linear" in CB terms?*

A. Short for "linear amplifier," a power magnification device which hooks to the antenna connector of a CB (or ham, or commercial) transceiver and, when the mike button is pushed, turns a low power transceiver into one of substantially higher power. Five watts to 100 is a typical application. They are illegal for CB.

According to *Car and Drive* magazine, there is an outfit in Citronelle, Alabama, called Train Built which manufactures a mobile CB radio capable of radiating 22 kilowatts of transmit power (that's 22,000 watts!). Called "Big Girl," the potent rig runs off eight Leece-Neville 250 amp alternators to supply its thirsty 2000 amp current requirement!

An anonymous trucker boasted that when he gets in a road altercation with another driver he simply turns on his high-powered radio and disables the automotive electronics of the offending motorist. Pretty frightening stuff. FCC, where are you?

Q. *Is there a clearing house for transcripts of shortwave broadcasts on science and technology? (Terrynce Ondola, Norwood, OH)*

A. Yes and no. The Foreign Broadcast Information Service (FBIS) is a federal agency that translates foreign broadcasts and news publications into English language – some 100,000 every year – and retained them in the Government Publications Library (GPL) until about three years ago. More recent reports are now available on line through the World News Connection (WNC).

Unfortunately, the WNC is a subscription

Bob's Tip of the Month

Two Radios, One Antenna ... ... Two Antennas, One Radio

Is it possible to operate two radios from one antenna? Yes. Is it possible to connect two antennas to one radio? Yes. But there are catches.

Two radios from one antenna. This is the easiest task. Purchase a two-way TV splitter from Radio Shack, Wal-Mart, Grove, or any other source; just be sure it is wideband (they are typically marked 5-900 MHz, but operate beyond those limits as well). You will need adapters and short cable runs (RG59/U or RG6/U is fine for this) for the F connectors to attach to your receiver(s) or scanner(s).

Naturally, the antenna you attach to the input of the splitter determines the ultimate performance; use the same antenna you would choose for just one radio. Since the signal is divided in half, there will be at least a 3 dB drop in strength at each output port, but for most purposes you won't notice the difference.

Two antennas into one radio. This is the toughest challenge because, unless they are properly spaced, they can actually reduce signal strengths! Even when you add a second identical antenna, no matter how superb they are, only a 3 dB improvement is possible.

But other factors besides gain come in – directivity and noise reduction, for example. At shortwave it is usually better to erect two antennas pointing in different directions, selecting between them with a common antenna switch (CB, TV, or even a video game switch works well for this).

It is still possible to use two antennas simultaneously, however. If they are highly directional and point in different directions, or of two entirely different frequency ranges, so that signal cancellation is unlikely, you can use a splitter again, but "upside down." Instead of a signal splitter, it is now a signal combiner.

As with any new antenna system, plan ahead and test the results before permanently mounting everything in place. If all goes well, you will have improved reception; if it doesn't, it's summertime, and you got good exercise!

service managed by the University of Minnesota and available primarily to universities. You need a University of Minnesota ID and password to have access to these extensive files, including your topic: Science and Technology. Quarterly CD-ROMs are cut to make the task of researching these extensive files a little easier. You may wish to contact a nearby university to see what arrangements you can make to access this enormous database.

***Q.** After erecting the Grove Mini Skywire (which works very well), I was surprised to see there was a cutout half way from the center, making one of the dipoles shorter than the other. Checking with a friend, I discovered that his was exactly the same. What is the reason for this shortened element? (Andre Luis F. Santos, Fortaleza, CE, Brasil)*

A. This intentional design makes use of the fact that at higher (even) harmonics, a dipole exhibits a high center-feedpoint impedance, mismatching the coax. A second, half-length element becomes a much better low impedance match on those frequencies, improving overall efficiency and signal delivery to the receiver. By having both elements in parallel, this automatic bandswitching feature insures a smoother, optimum peformance over its entire receiving range.

***Q.** Many modern TV sets have a second audio program (SAP) feature; while I have the standard TV audio frequencies programmed into my scanner, where do I find the SAP frequencies? (Henry K. Poh, E. Northport, NY)*

A. An excellent question, so good in fact I had to ask our intrepid American Bandscan columnist, Doug Smith. Here's what Doug says, and it sounds as if he knows what he's talking about!

SAP is very similar to FM's subsidiary carrier authorization (SCA), which is offset by typically 67 kHz from the center carrier frequency. SAP, however, is tuned at 78.67 kHz in the sound carrier's baseband, 4.5 MHz above the picture frequency.

SAP is Dolby (DBX) compressed, just like the left/right signal for TV stereo, for enhanced noise reduction. While it has the same audio quality, it is mono, not stereo. If you attached a conventional FM SCA adaptor to the discriminator output of a TV receiver (or your scanner while receiving TV audio) and tuned it to 78.67 kHz, you would hear the SAP, albeit a little "flat."

Incidentally, there is another subcarrier at 102.27 kHz, but it is intended only for TV stations. Called the "Pro" channel, it is used for cuing reporters on remote, and relaying telemetry data from the transmitter back to the studio.

Thanks, Henry, for an interesting question, and Doug, for an interesting answer.

***Q.** When logging a distant shortwave station, which would be the correct way to show its reception if it's over the International Date Line – its UTC time the next day, or my local time and the current day for me? (Timothy Taylor, Erie, PA)*

A. Referring to "How to Use the Shortwave Guide"at the beginning of our center section in each issue of *MT*, note the second paragraph: "...all dates, as well as times, are in UTC; for example, a show which might air at 0030 UTC Sunday will be heard on Saturday evening in America."

If you are recording your logs using UTC time, then, no matter where in the world you are located, if it's after 0000 UTC, it's the next day in your log!

***Q.** To avoid a conspicuously long run of coaxial cable from a satellite antenna, I buried it, but I notice a decrease in picture quality. Can coax be buried in the ground? Should it be run through plastic pipe to reduce attenuation? (Bill Calhoun, Claysville, PA)*

A. Good coax is unaffected by its environment. You can bury it, pass it through solid metal, run it under water, with NO signal degradation. The fact that you experienced a change indicated something else happening. Perhaps it is a poor grade of coax with less than 100% shielding; it could have a permeable jacket allowing moisture intrusion; you may have a problem with connectors; perhaps the cable is damaged, even microscopically, allowing moisture intrusion; or an unrelated incident like change in received signal strength could be the culprit.

You do need to choose an outdoor-rated cable. Armoring the coax in a pipe is an additional precaution against damage (shovels, sharp rock slices, crushing, etc.) and moisture intrusion. Be careful in the selection of the conduit, however; if water gets in and can't get out, that's worse on the coax than being in the ground which periodically dries. Be sure the two ends are either weatherproof or, better yet, leave them open, but facing downward to prevent rain intrusion, but allow "breathing" to dry out condensation.

While it makes no difference what pipe you put it in, a buried metal pipe would provide a lightning choke – additional protection against an outdoor lightning strike coming in to damage indoor equipment. But observe other lightning preventive techniques as well and select a weather-survivable pipe, fittings, and adhesive.

And finally, any exposed coax needs to be replaced periodically. Manufacturers say 10 years; sooner if severe weather conditions exist, and check your connectors, too.

Questions or tips sent to "Ask Bob," c/o MT are printed in this column as space permits. If you desire a prompt, personal reply, mail your questions along with a self-addressed stamped envelope (no telephone calls, please) in care of MT, or e-mail to bgrove@grove-ent.com. MFJ Shortwave Noise Canceller

By Bob Grove

While some communications receivers and transceivers are equipped with noise blankers, these circuits are met with mixed results. They are effective against many pulse noises, but not against sinusoidal (radio signal) interference. If a second (interfering) signal is right on top of the desired signal, resolving the situation with the receiver's controls is often hopeless.

But what if we can suppress the interfering signal before it ever enters the receiver, leaving the target station in the clear? We can do that. Directional antennas can null the undesirable signals, or we can adjust the phases of the signals arriving from two different antennas so that the interfering signal is attenuated or cancelled entirely. It is the latter process which is more practical, and utilized in a new generation of noise canceling accessories.

The most recent of such accessories to be debuted to the hobby radio market is the MFJ-1026 "Deluxe Noise Canceling Signal Enhancer." This 1.8-30 MHz phasing device compares signals from two different antennas, then may be manually adjusted to reduce or eliminate the noise signal by mixing the two out of phase.

The noises may be from any source: tools, TVs, appliances, other transmitters, lightning, power lines, fluorescent lamps, dimmers – any source of radio frequency interference.

While there may be some loss of the desired signal, the net result is better readability. Such measures are more an art than a science; while the technique and theory have been well establish for most of this century, the outcome depends upon frequency, relative signal strengths, and the size and locations of the signal and noise antennas.

So, how well does it work?

Quite well, both for nulling and peaking signals. Since the MFJ-1026 works at radio frequencies, it makes no difference what mode or modulation is being transmitted – AM, SSB, CW, SSTV, RTTY, packet – it treats all of them the same, whether you are amplifying a desired signal, or attenuating interference.

Actual operation takes some getting used to, since the procedure is one of experimentation until you get it right. With some practice, however, the hunt-and-peck phasing routine comes naturally.

Four rotary controls and four pushbuttons come into play. Since this MFJ unit can be used with transmitting equipment, one of the controls adjusts transmit delay time, so it is initially set and forgotten. A telescoping whip antenna (included) can be used for the noise-sensing antenna, or a random wire may be connected to the rear jack; a second coax connector is for the primary receiving antenna.

Although there are separate controls for phase switching, antenna gain, preamplifier, and power/bypass, the use of these soon becomes familiar and less daunting than may be first imagined. Signals may be enhanced either by increasing their strengths or by suppressing co-frequency interference; the first is easy, the second a little touchier. But it does work, and in many instances makes the difference between total obliteration and easy copy.

MFJ-1026, $169.95 plus shipping from MFJ Enterprises, Box 494, Mississippi State, MS 39762, **www.mfjenterprises.com**, and from MFJ dealers.

Be an electronics repair genius with Radio Shack's Tuner Control Lubricant

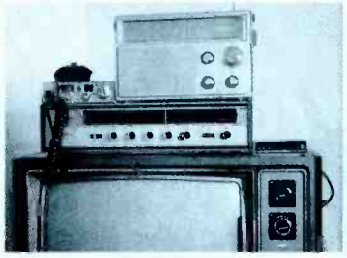
By Ken Reitz KS4ZR

Dust is the enemy of electronics. No matter how often you clean, you can't keep dust from building up on the contacts of all the switches and potentiometers in the gear that lines the shelves of your listening post. After a few short years that dust builds up and it's not long before switches don't switch and volume controls have that annoying scratchy sound which blasts from your speakers. Still, it's a throw-away world and manufacturers seem to be inviting us to do so and the electronics repair industry doesn't seem to be helping.

So, how much would you pay a repairman to fix that scratchy volume control on your old shortwave radio? Well, by the time you've paid the diagnostic bench fee, parts and labor, you could have made an extra payment on your car! Have you tried sending the unit off for repairs? Better add shipping to the other charges and about eight weeks in down time!

There is a better way, and it doesn't involve taking a course in electronics repair or calling on your know-it-all brother-in-law. You *can* do the job yourself with Radio Shack's Tuner Control Cleaner & Lubricant (RS Catalog #64-4315).

That's right; I've actually used this stuff



This TV, stereo, CB and portable radio were victims of years of unavoidable dust accumulation and were dumpster-bound. It would have cost hundreds of dollars to replace them, but, all were brought back to life thanks to Radio Shack's Tuner Control & Lubricant. Imagine what it can do for you!

in desperation to save otherwise dumpster-bound gear and it did the job! I have rejuvenated portable radios, old style TV sets, and stereo gear. I'm not ashamed to admit I even recovered the use of my old CB radio with this stuff! I've used it on everything from Walkman®-type players to expensive car stereos. Imagine what *that* would have cost to repair! I've even cleaned up the controls on my Kenwood amateur radio transceiver.

Here's how to use it: Just disconnect the power from the unit to be repaired, remove the knobs from the offending switches or pots, pump one brief blast into the opening, replace the knob and rotate the pot or flip the switch vigorously for about 30 seconds. Wait about 5 minutes to dry and restart the gear. The switches should operate smoothly and the pots should no longer be scratchy. It's a miracle! Radio Shack says this product is "...non-flammable, reduces wear and is safe on plastics..." Just be sure to heed the label warnings on the back of the can.

Financial Independence

So, are you tired of mounting credit card debt from expensive electronic repair bills? Now you can take control of your financial destiny with this terrific product. You'd expect to pay $30 for anything that actually works, but, now you can have your own can of Radio Shack's Tuner Control Cleaner & Lubricant for just $7.99. That's right, for the price of a bottle of cheap wine, you can get years worth of listening pleasure from that mountain of old stereo gear growing in your hall closet!

This is it! Radio Shack's Tuner Control Cleaner & Lubricant could be the best $7.99 you ever spent!

But, wait, there's more! You'll not only get this extraordinary product with a generous amount of lubricant, but, you'll also receive, at no extra charge, a 4" flexible tube which allows you to spray into those hard to reach places. Why bother with expensive how-to courses and technical schools you'll never attend anyway? Save your money, save the landfill and do it yourself; it can't get better than this!

WHAT'S NEW?

TELL THEM YOU SAW IT IN MONITORING TIMES

Plugged in 'n ready to go!

Sangean makes a snappy little (3" x 1.5" x 0.5"!) AM/FM radio that you can slip into your shirt pocket while you enjoy stereo sound through earbuds of surprisingly high quality. You can switch on the bass boost for best music reproduction, or leave it off for talk shows. FM mono is also selectable to avoid stereo hiss in marginal reception areas.

The SR-2 comes in black or yellow and it runs on one AAA battery (not included). At $29.95 from Grove Enterprises (800-438-8155 or **www.groveent.com**) that little voice in your ear can keep you entertained while you power walk or bring you local news and weather when camping or when you're hunkered down in the hallway waiting out a storm warning!

The all-in-one scanner

No, this isn't another of those wide-band radios to cover dc-to-daylight or your backyard to Voice of Russia. Scanner folks are interested in happenings close to home, and that is just what a new line of Uniden scanners is designed to provide. The top of the line BC278CLT sports 12 scanner bands including 800 MHz and aircraft bands, 100 programmable channels, programmable search and service search, and five priority channels. But, in addition to these, it also provides an AM/FM radio with 20 presets, an alarm clock, and most importantly, it includes specific Area Message Encoding (SAME) which automatically alerts the user when there is a weather watch/warning in his specific county. The 278CLT is expected to be available in August at a suggested retail price of $299.95.

Two other models are already available: the BC248CLT features 50 programmable channels, AM/FM radio with presents, alarm clock, one touch weather alert, and five priority channels at a retail price of $179.95. The BC244CLT contains 30 programmable channels, alarm clock, 10 bands including public service bands, ham bands, and federal and military land mobile ($159.99)

Safety on the Sea by Cellphone

Recreational boaters often operate close enough to shore that a cellular phone is the only "emergency radio" they have on board. But if the caller doesn't know exactly where he is, a cellular signal is useless for emergency direction-finding, unlike a VHF marine radio signal. Two solutions to this situation have come to our attention.

A GPS receiver solves the location problem, but just imagine cradling a cellphone on the shoulder, reading off GPS coordinates to the Coast Guard or marine tow operator, all while trying to bail water! Garmin has wisely combined a number of features into one unit: the **NavTalk Cellular/GPS**. GPS performance is the same as the GPS III Plus with its on-screen mapping and navigation capability. The built-in analog cellular phone also includes numeric paging, one-touch dialing, and optional one-touch emergency service. With the push of the red '9' button, your location is transmitted and you're automatically connected to a response center which sends help to your location. The Garmin NavTalk is $600 from Boat U.S. (**www.boatus.com**) or see **www.garmin.com** for a dealer in your area.

For the boater or traveler who doesn't need navigational help, **Snap-Track, Inc.** is developing a digital signal processing chip that can be installed into a cellular phone for about $10. Using the GPS system, the chip will enable a search team to locate the caller within a 15-foot radius.

No phone-toting boater, hiker, or motorist should ever become complacent about safety, however; for once out of earshot of a cellular tower, this communications device is dead in the water.

Weathering the Storm

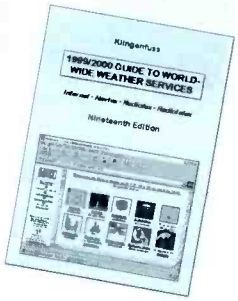
With a subtitle of *Tornadoes, Television, and Turmoil*, this book by Gary A. England, Oklahoma's Emmy Award-winning weather forecaster, is both a memoir and a manual on reporting on severe weather – something we've already seen too much of in 1999.

As chief meteorologist for KWTV in Oklahoma City, England's career has paralleled the evolution of forecasting software and technology. Fifty-five spectacular color photographs of storms, hail, and tornadoes testify to the turbulent weather experienced by those who populate "tornado alley."

Weathering the Storm was published in 1997 by the University of Oklahoma press; it is 264 pages in paperback for $16.95, or 225 pages hardcover for $24.95. Check out **amazon.com** or other discounters for bargain prices.

Guide to Worldwide Weather Services

Now in its 19th edition, this traditional guide to weather radio services has shifted much of its attention to weather products and resources available on the internet. As author Joerg Klingenfuss puts it: "Superb meteorological products are only a mouse-click away from your forefinger. Dozens of national meteo services and hundreds of university departments make excellent products available free of charge – in colour! Direct reception of weather satellites is no longer essential, because 'near real-time' – i.e. just a few seconds or minutes later – it's all

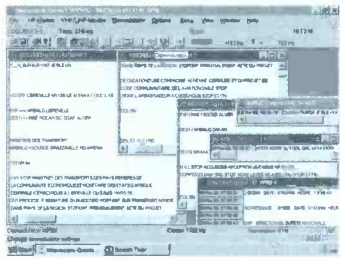


available on the World Wide Web."

Listed are 225 Internet sites, 110 Navtex stations and 40 radiofax stations (with broadcast schedules), and 82 radiotelex stations – plus 338 sample charts, graphics and satellite pictures all from 1999. For anyone interested in the weather, this book is an up-to-date compilation of the very latest meteo data sources available worldwide. The *Guide* is available for 30 Euro from Klingenfuss Publications, Hagenloher Str. 14, D-72070 Tuebingen, Germany, e-mail *klingenfuss@compuserve.com*

Digital decoding on a budget

The new Wavecom W40PC Digital Signal Processing card for use inside a PC is a professional-grade digital data analyzer



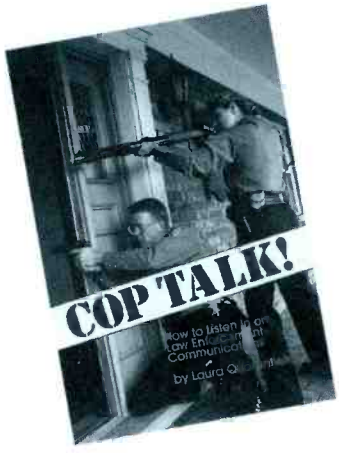
and decoder with more than 70 modes. It allows the decoding of all conventional and advanced data, fax, selcal and teleprinter systems used today on VLF, LF, MF, HF, VHF, UHF, SHF, and satellite.

By using a software environment already developed for the costly, professional W41PC DSP card, the brand new W40PC DSP is considerably less expensive. Klingenfuss, the only dealer shipping worldwide, is selling the Wavecom W40PC for 1,635 Euros, or nearly US$1717.

For a full list of the modes, languages, signal analysis tools, sample screen shots and more, visit Wavecom at **www.wavecom.ch/** or go to the Klingenfuss website at **http://ourworld.compuserve.com/homepages/Klingenfuss**

Cop Talk!

For the dyed-in-the-wool police scanner buff, Laura Quarantiello's latest book should



provide some interesting details about what goes on during a law enforcement officer's day – and how you can better understand the radio traffic.

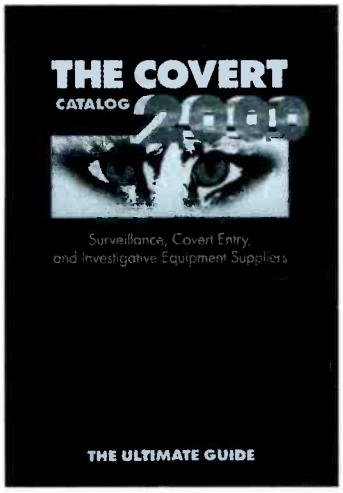
Chapters evolve from setting up a listening post, through technical aspects of police radio systems, into the radio jargon you will encounter and what goes on behind the scenes.

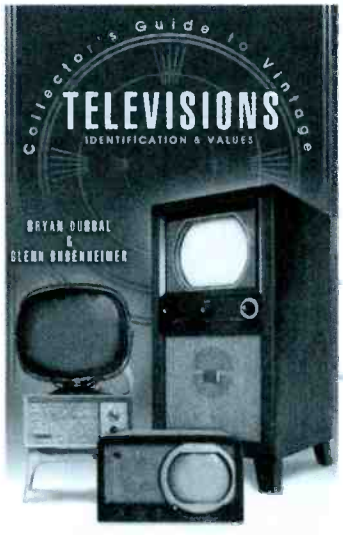
A glossary of terms and forms is quite illuminating, including the complete Miranda warning, several sample ten codes, abbreviations and terms, and a general list of VHF/UHF frequency allocations.

$14.95 from Bookworld, 1933 Whitfield Park Loop, Sarasota, FL 34243; phone (800) 444-2524.

The Covert Catalog 2000

Something bugging you? (Pun





intended!) Lee Lapin's latest catalog graphically details the assortment of surveillance, intrusion, video and audio monitoring, entry, electronic countermeasures, and other equipment for espionage. Specific devices include pinhole video cameras, camouflaged listening and recording devices, night vision equipment, lock defeaters, universal garage door openers, bugs and taps, and more. Lapin does warn his readers that most of this stuff is illegal to own.

More than 200 pages list the sources for the equipment, mostly off shore. Since the FBI crackdown on the "Spy Shops," it has been difficult for both illegitimate and legitimate agencies to acquire much of the equipment described.

The Covert Catalog 2000 is $34.95 plus $5 shipping from Intelligence Incorporated, 3555 South El Camino Real, #309, San Mateo, CA 94403; phone (650) 559-0220, or visit their Web site at **http://www.intelligence.to www.intelligence.to**

Collector's Guide to Vintage Televisions

While radio collecting has been around for decades, the postwar emergence of TV sets has just begun to generate attention. This handy guide by Bryan Durbal and Glenn Bubenheimer contains all color plates and easy descriptions to help the prospective collector identify the bargains which are easy to spot in used merchandise outlets, flea markets, yard sales, and hamfests.

Rather than speculate on top prices for restored TVs, these authors have adopted a different tack – assuming the set is complete, but not working. This makes good sense, since TV sets are high-voltage devices, susceptible to catastrophic power supply failure, and restoration can be involved and expensive.

As a result of the lowball pricing, even the Philco Invictas are listed at $200, while working sets on the market are over $1000!

Collector's Guide to Vintage Televisions is $15.95 plus $2 shipping from Collector Books, PO Box 3009, Paducah, KY 42002-3009; ph. (800) 626-5420.

Serial Print Publication for Shortwave Listeners

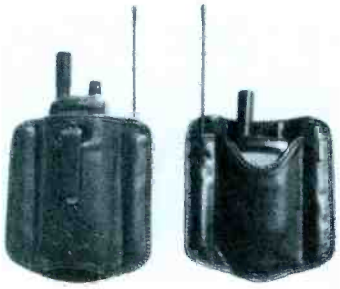
The Australasian Shortwave Digest is a new venture by Bob Padula (Padula Books, Melbourne, Australia) designed to provide the most up-to-date shortwave schedules, reception conditions, and frequency planning for the Asia and Pacific area, as well as equipment and book reviews. Information will supplement the periodic *Australasian Shortwave Guide* and *Shortwave Guide to South East Asia*, also produced by Padula Books.

Beginning July 25th, the monthly *Digest* will consist of a minimum of 8 pages. A subscription to the set of 6 issues for the remainder of 1999 is A$15 (to Australian addresses); outside of Australia: A$25, US$15, or 20 International Reply Coupons. A free sample copy of the first edition will be sent on receipt of return postage: 45 cent stamp to Australian addresses or, elsewhere, 2 IRCs, or US$2 or cash equivalent.

Contact Padula Books, 404 Mont Albert Road, Surrey Hills, Victoria 3127, Australia. Tel/FAX: +61 3 9898 290, bpadula@compuserve.com, **http://members.tripod.com/~bpadula/edxp.html**

Correction

We published an incorrect phone number for Cutting Edge Enterprises (Pocket Protector, June *What's New?*); their number should be 800-206-0115.



Business news and freebies

- Want to know how a particular radio dealer stacks up with its customers? Visitors to Rich Wells' website fill out a survey and rate the scanner dealers from whom they have purchased. It is interesting to compare what customers are saying about the different dealers around the country... Yes, you'll find Grove in there, too. Visitors also rate web sites. See **http://strongsignals.net/htm/dlr_srvy.htm**
- According to Gerry KB0VOF of Denver, Colorado, Yaesu Musen in Japan has bought Standard, the manufacturer of business radios. However, E-mail from Yaesu explained that Yaesu and Standard have "combined sales forces in Japan" but both will continue to manufacture their own equipment.
- Bob Parnass reports that third party IC-R2 and IC-Q7A software can be downloaded from: **http://home.t-online.de/home/Ingra-Beton/**
- "Shortwave Transmitter Countries" is the free online internet version of the publication TDP, the *Transmitter Documentation Project*, which provides information on all the shortwave radio broadcast transmitters installed all over the world, arranged in country order. You can access this new service from servers with different locations, so that you can choose the fastest one from your location. Select "Shortwave Transmitter Countries" from one of the following sites:

* **http://www.transmitter.be**
* **http://www.transmitter.org**

Books and equipment for announcement or review should be sent to "What's New?" c/o Monitoring Times, P.O. Box 98, 7540 Hwy 64 West, Brasstown, NC 28902
Press releases may be faxed to 828-837-2216 or e-mailed to mteditor@grove-ent.com.

LETTERS TO THE EDITOR

NEWS AND VIEWS FROM OUR READERS *Rachel Baughn, Editor*

Computers and Radio

"In your *Closing Comments* column in the February issue of *Monitoring Times,* you note at the end, the 'positive news' that the decline in the sales of radios is leveling off. Further, you conjecture that the 'individuals who teethed on computers are looking for other electronic gratification.'

"I think that another point of view may also be relevant. That is, people with computers are looking for additional peripherals with which to expand their interest in computing. I would not admit this to any of my ham colleagues, but I consider a radio to be a computer peripheral.

"As a case in point, I have been following TAPR's (Tucson Amateur Packet Radio Corporation) efforts to produce a spread spectrum, high speed data transceiver. In the meantime, there are a few hams experimenting with wireless local area network (LAN) equipment to implement small computer networks extending over several miles.

"Of course, there are other associations between computers and radio, where the availablity of computer equipment makes the radio aspect of the hobby more enjoyable. In this perspective, radio and computer technologies are complementary.

"Regardless of the point of view, I hope that Grove Enterprises will prosper and continue to serve the information needs of computer ... errr ... radio enthusiasts."

– Andrew Cornwall, Wellington, Nova Scotia

MT's publisher, Bob Grove, has also recognized the complementary aspects of computers, radio, and the internet. To see the results of Bob's latest venture, visit the Grove home page at **www.grove-ent.com** and find out how to participate in the world's first *live video* auction – Who knows? One day you may buy your next radio over computer, auctioned off by Bob Grove!

On Behalf of Good Scanner Press

"Folks, I would like to propose that anyone reading about the use of scanners by private citizens to help police/emergency services kindly post a summary of the article along with the reference source e.g. newspaper name, location, date of article ... Of particular interest would be good news assistance provided by motor vehicle/mobile scanner users.

"I would also recommend that these not only be posted to the regular lists you subscribe to, but also to *scan-legal@nomad.nreading.ma.us* (after subscribing). Perhaps one of the major scanner/hobby communications magazines (*Monitoring Times, Popular Communications*, etc.) would also maintain an archive file of scanner good news for emailing to folks as the need arises.

"If a town/city, county, or state wants to enact a law that would prohibit the use of scanners in motor vehicles, the 'scanner good news' references would provide a good source for information to possibly prevent the action."

– Ken Windyka, Springfield, Massachusetts

Monitoring Times has always maintained a file on "good scanner press" compiled from clippings sent us by our readers. Over the years, I have copied the best of these on request, but it falls very far short of being a significant clearinghouse – and now, many of the clippings are too old. To compile a more impressive account would require someone willing to solicit and organize the responses. If someone wants to spearhead the project, we're willing to help.

Refraction versus Diffraction

"I am a many-years subscriber to your magazine and wish to congratulate you on a top-notch product.

"Your attention is called to an error in the June *Propagation Conditions* column on page 60. The article addresses 'Knife Edge Refraction,' which is incorrect. You obviously meant 'Knife Edge Diffraction.'

"*Refraction* involves the "bending" of an electromagnetic wave due to a change in the propagation velocity, such as for a light beam passing from air into glass. Lenses employ this principle (e.g., refraction telescope).

"*Diffraction* involves the interference pattern produced by an obstruction in the path of the electromagnetic wave. A scientist named Fresnell worked out the theory for knife-edge diffraction many years ago. A radio propagation knife-edge diffraction calculator can be downloaded from **http://sss-mag.com/prop.html**

– Arthur Herbig

Jacques d'Avignon admits, "You are absolutely correct in your correction. Sometime when I write, my French causes me some problems, English being my second language." (Scientific concepts are a second language for editors, too!—rb)

Hooking the kids

Last spring, Lane Griswold asked for a box of back issues of *MT* to use for a "show and

CLOSING COMMENTS

By Bob Grove, Publisher

In Opposition to "Technospeak"

The tendency to use jargon in place of legitimate language is becoming an increasing problem in our technocratic society, permeating the legal profession, confounding legislators, and puzzling consumers.

Whether or not it was the manipulative pundits of Madison Avenue who perpetrated this reign of techno-terror decades ago (*Ivory Soap, 99 and 44/100 percent pure*...pure what?? *Duz does everything*. Everything?!), we seem to be struck with it. Smacking of the claims of patent medicine and quackery of the nineteenth and early twentieth centuries, gluttonous hyperbole still accurately describes the advertising ploys of today. Snake oil salesman still slither.

An *MT* reader ("Ryan") just related his disillusioning experience with a new Panasonic KX-TG200 series "Gigarange" (900 MHz/2.4 GHz) cordless telephone. "Digital Spread Spectrum Technology," the promotion on the box read. "Smart Channel Select (32 channels)" the boasting continued.

How could a conventional analog scanner ever overhear a conversation on a digital, spread-spectrum telephone dividing its information over 32 channels? Apparently quite easily. Ryan, a seasoned radio enthusiast who knows the difference between digital and analog communications, was astounded when he turned on his scanner and heard his own clear voice while using his new Panasonic cordless phone, which stayed on the same frequency for minutes at a time. Did someone at Panasonic get his signals crossed?

Let's look at Panasonic's first premise, "*Digital*," defined by the electronics industry as the use of discrete electrical signals (bits) rather than continuously variable signals (analog) to convey information. Is the Panasonic signal digital? No, it is analog.

And how about their second claim, "*Spread Spectrum*," defined by the industry as a much wider spectral bandwidth than that produced by normal methods of modulation. Is the modulation of the Panasonic phone spread spectrum? No, it is frequency hopping (perhaps "frequency loping" would be a more accurate description!).

So is Panasonic lying? Is this a classic example of fraudulent advertising? Or is it simply another excusable excess in modern marketing? Another product of virtually unregulated, zealous, competitive marketing foisted on a desensitized and understandably skeptical, immured, distrustful society?

Ryan reports that when he called the manufacturer to discuss his experience, the spokesperson became very defensive, saying that Panasonic made no claims that their product couldn't be overheard, and that any cordless phone conversation can be heard on a scanner (which is untrue when you are using a cordless set that is truly digital).

How would Panasonic defend its misleading claims? Perhaps by saying that the digital reference was to its operational circuitry which uses a microprocessor controller, and that over a period of time, because of changing frequencies, the telephone spreads over more spectrum than single-channel phones. Is their hype misleading? Only to those who really know – or care – what "Digital Spread Spectrum" really means!

More meaningless jargon

We see this sort of hyperbole on every shelf in every store, and in virtually every ad. How can anyone legitimately claim "the lowest prices in the country," or "the largest assortment available," or "the finest ____ you can buy anywhere?" We have learned to accept this largesse as an artifact of our culture.

And what the heck is "Imodium?" "Silkience?" "Thermogenic diet formula?" Do creamy-skinned clients really float through the marble halls of the Ponds' Institute? So much meaningless jargon has joined the lexicon of commerce, and so much visual misrepresentation overwhelms our senses of reality that, in this era of instant communication, we have become uncommunicative. Sadly, we seem to accept this combination of exaggerated claims and undefined terminology with complacency.

Did Alexander Graham Bell hold up his telephone with pride and announce that he had discovered a "dynamic acoustico-electric transducer"? Or did Guglielmo Marconi demonstrate his radio system while describing it as an "electromagnetic emitter/detector"? The public may have been suitably impressed by the vernacular, but uninformed. It seems that now all a merchandiser needs to do is make a meaningless or unsubstantiated claim ("the most comfortable ride you will ever experience"), contrive an evocative name ("Whisper 2000XLR"), and a new legend is born!

There are many excellent, responsive agencies, both governmental and private, which you can contact with your indignation. Support independent consumer watchdogs like Consumer's Union (publisher of Consumer Report). Contribute to unbiased political reform groups like Common Cause. Tell the errant companies' public relations offices what you really think. Share your outrage with newspapers, magazines, and phone-in radio programs. Don't be afraid to be heard; your voice does make a difference.

Or, sit back and be misled by the market brokers who will get by with whatever claims they can in the name of profit.

NEWS FLASH

New... ...ng, ...News, ...Weather ...on SANGEAN Radios Daily

Radio Land

Vol. 24, Issue 1 | Published by C. Crane Company, Inc. | Every Month 1999-2000

Two Radios from SANGEAN Take the Americas by Storm

ATS 909, World's Most Advanced Portable World Band Receiver

The ATS 909 is acknowledged among users as best performing multi-band portable radio in the world today. Rated best new receiver of the year by *World Radio and TV Handbook 1997*. Excellent audio quality and receiver sensitivity, representing the high quality workmanship that went into design and manufacturing.

A single button automatically sets local AM/FM stations into memory based upon the station's signal strength.

Adjustable tuning increments allow precise tuning of stations. It also comes preprogrammed with many popular SW stations. Each one of its 29 pages can be identified with an alpha description. If a station is using RDS, their call letters will automatically appear on the screen.

The antenna jack is grounded making it suitable for a two wire antenna system.

Additional Features: RF Gain Control, Round Volume Knob, 306 Memories, Upper & Lower SSB, 40Hz resolution on SSB, Priority Key, Headphone Jack, Three Timers, Light Button, 150kHz to 30,000kHz.

$259.95

SANGEAN ATS-909

CCRadio Acclaimed as Best Tabletop AM Radio Made Today

Never before has a radio been specially designed for talk radio, news, sports and weather.

The audio has been specially tailored for the full rich sound of the human voice.

The CCRadio was jointly engineered by C. Crane Company, Inc. and SANGEAN to produce the highest AM performance, along with FM, Weather Band with Alert, and TV Audio Channels 2-13.

Full digital controls and microprocessor give accurate tuning. The radio has memory storage for 5-stations on each band. The audio quality on FM is excellent from the 5" speaker.

Additional Features: Adjustable Bass and Treble. Display is lighted with on/off button. Simple one touch memory setting and recall. Rotary tuning knob with 1KHz fine tuning. Selectable light or loud alarm for NOAA WX Alert. Clock with alarm. Sleep timer. Auto Scan and Stop. Bright LCD display. Built-in headphone jack. External AM antenna screws. Wide base for stability. Operates on 4 optional "D" cell batteries that last over 250 hours, or plugs in to the wall with (included) AC cord.

$159.95

C. Crane Company's CCRadio by SANGEAN

SCANTASTIC !

This is no ordinary PC controlled Receiver

The Optocom computer controlled receiver is no ordinary receiver. The Optocom provides solutions to applications that previously required multiple receivers, external decoders, and receiver modifications. Some features of the Optocom have never before been seen on a communications receiver. Ever! With an Optocom, you'll be poised to meet the changing scanning world.

TRUNKER

Using two Optocom receivers, Trunker software may be used for control channel trunk following of Motorola®. Also use TrunkTrac® with one Optocom for control channel monitoring.

FEATURES

- Frequency range 25-520, 760-823.995, 849.005-868.995, 894.005-1300MHz (cellular blocked)
- Triple conversion GRE receiver board
- Scan conventional frequencies at 50 channels per second
- Trunk track Motorola and LTR on any frequency band
- Scan conventional and trunked frequencies simultaneously
- Track EDACS systems with additional third party program (E-Trax)*
- Built-in data slicer for decoding of FSK data
- Discriminator audio input and output
- Reaction Tune with Scout/Mini Scout/Super Scout
- Decode CTCSS, DCS, LTR and DTMF
- Motorola control channel monitoring with Trunker software and two Optocoms*
- Motorola control channel monitoring with Trunk Trac*
- Palm Pilot support for frequency and tone display*
- Store and Scan 100 frequencies for use away from computer
- Supported by other third party scanning programs

•Optocom includes: Trakkstar software, Palm Pilot software, Radio Manger for Windows, antenna, serial cable, and power supply

PALM PILOT™

Interface the popular Palm Pilot™ Connected Organizer to display the frequency being scanned as well as decoding of CTCSS, DCS, and DTMF while in Store and Scan Mode. Software included. Ideal for mobile applications

REACTION TUNE®

Use the popular Scout/Mini Scout/Super Scout to capture and instantly Reaction Tune the Optocom to the frequency captured. Ideal for mobile use and finding unknown frequencies.

TRAKKSTAR®

Using the supplied Trakkstar software the Optocom has the ability to scan conventional frequencies, as well as trunk follow both LTR and Motorola Trunk systems.
