

What's in your energy bill?

THE PROBLEM:

Your thermostat controls almost half your home's energy bill. That's more than refrigerators, lighting, TVs, computers, and stereos combined. Unfortunately, much of that energy is wasted heating and cooling empty homes.

THE SOLUTION:

1.
The solution seems so easy.

Most homeowners set their thermostat once and forget it. Their home stays the same temperature, even when everyone is away or asleep. To save energy, your home's temperature should change with your schedule.

2.
But thermostats are too complicated.

Many people rarely or never program their thermostats. It's just too complicated, or it's impossible to set a schedule that works with their real lives.

3.
The potential savings are impressive.

The average homeowner can save 20% on their heating and cooling bill if their thermostat follows their schedule and saves energy when they don't need it.

JUST IMAGINE:

Saving 20% a year on heating & cooling is the same as:
