| <b>Auto Answer</b>                     | <p>When using EAS, the auto answer setting of the agent applies to the endpoint where the agent logs in. If the auto answer setting for that endpoint is different, the agent setting overrides the endpoint setting. One of the following is a valid entry:</p> <ul style="list-style-type: none"> <li>• <b>All</b>. Immediately sends all ACD and non-ACD calls to the agent. The endpoint is also given a single ring while a non-ACD call is connected. You can use the ringer-off button to prevent the ring when the feature-related system parameter, <b>Allow Ringer-off with Auto-Answer</b>, is set to <i>y</i>.</li> <li>• <b>acd</b>. Only ACD split /skill calls and direct agent calls go to auto answer. If this field is set to <b>acd</b>, non-ACD calls terminated to the agent ring audibly.</li> <li>• <b>none</b>. All calls terminated to this agent receive an audible ringing. This is the default setting.</li> <li>• <b>station</b>. Auto answer for the agent is controlled by the auto answer field on the Endpoint screen.</li> </ul> |
| <b>Aux Agent Considered Idle (MIA)</b> | <p>To include agents who are in the AUX mode in the Most Idle Agent (MIA) queue. Communication Manager counts the time in AUX as idle time.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>System</b>: Communication Manager uses the system-wide field settings.</li> <li>• <b>Yes</b>: Communication Manager keeps or places agents in the MIA queue while they are in AUX work.</li> <li>• <b>No</b>: Communication Manager excludes AUX agents from the MIA queue while they are in AUX work. The <b>No</b> value matches the legacy Communication Manager functionality.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

*Table continues...*

| Name                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Aux Work Reason Code Type</b>         | <p>Determines how agents enter reason codes when entering AUX work. One of the following is a valid entry:</p> <ul style="list-style-type: none"> <li>• <b>system.</b> Settings assigned on the Feature Related System Parameters screen apply. This is the default setting.</li> <li>• <b>none.</b> You do not want an agent to enter a reason code when entering AUX work.</li> <li>• <b>requested.</b> You want an agent to enter a reason code when entering AUX mode but do not want to force the agent to do so. To enter this value, the reason codes and EAS on the System-Parameters Customer-Options screen must be set to <i>y</i>.</li> <li>• <b>forced.</b> You want to force an agent to enter a reason code when entering AUX mode. To enter this value, the Reason Codes and EAS on the System-Parameters Customer-Options screen must be set to <i>y</i>.</li> </ul> |
| <b>Call Handling Preference</b>          | <p>Determines which call an agent receives next when calls are in queue. When calls are in queue and an agent becomes available, any of the following entries is valid:</p> <ul style="list-style-type: none"> <li>• <b>skill-level.</b> Delivers the oldest, highest priority calls waiting for the highest-level agent skill.</li> <li>• <b>greatest-need.</b> Delivers the oldest, highest priority calls waiting for any agent skill.</li> <li>• <b>percent-allocation.</b> Delivers a call from the skill that will otherwise deviate most from its administered allocation. Percent-allocation is available only with Avaya Business Advocate software.</li> </ul> <p>For more information, see <i>Avaya Business Advocate User Guide</i>.</p>                                                                                                                                  |
| <b>Check skill TNs to match agent TN</b> | The skill tenant number to match the tenant number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>COR</b>                               | The Class Of Restriction (COR) for the agent. Valid entries range from <b>0</b> to <b>995</b> . The default entry is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Coverage Path</b>                     | The coverage path number used by calls to the LoginID. A valid entry is a path number from <b>1</b> to <b>999</b> , time of day table <b>t1</b> to <b>t999</b> , or blank by default. Coverage path is used when the agent is logged out, busy, or does not answer calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Direct Agent Calls First</b>          | The option to direct agent calls to override the percent-allocation call selection method and be delivered before other ACD calls. Clear the check box if you want to treat direct agent calls as other ACD calls. This field replaces the <b>Service Objective</b> field when percent-allocation is entered in the Call Handling Preference field. For more information, see <i>Avaya Business Advocate User Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Direct Agent Skill</b>                | The number of the skill used to handle Direct Agent calls. A valid entry can range from <b>1</b> to <b>2000</b> , or blank. The default setting is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Forced Agent Logout Time</b>           | Enables the Forced Agent Logout by Clock Time feature by administering a time of day to automatically log out agents using an hour and minute field. A valid entry for the hour field ranges from <b>01</b> to <b>23</b> . A valid entry for the minute field is <b>00</b> , <b>15</b> , <b>30</b> , or <b>45</b> . The default is blank (not administered). Examples are: 15:00, 18:15, 20:30, 23:45.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Hears Service Observing Tone</b>       | When you enable the <b>(SA8569) - No Service Observing Tone Heard by Agent</b> field on the Special Application form, the system enables the <b>Hears Service Observing Tone</b> field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Include Tenant Calling Permissions</b> | The tenant calling permissions.<br><br> <b>Note:</b><br>To enable this feature you must first select <b>Check skill TNs to match agent TN</b> checkbox.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local Call Preference</b>              | The option to administer Local Preference Distribution to handle agent-surplus conditions, call-surplus conditions, or both. Use this field to administer call-surplus conditions. To set up an algorithm for agent-surplus conditions, set the Local Agent Preference field on the Hunt Group screen. You can select this check box only if the Call Center Release field is set to 3.0 or later and the Multiple Locations customer option is active.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LoginID for ISDN/SIP Display</b>       | Use to include the <b>Agent LoginID CPN and Name</b> field in ISDN and SIP messaging over network facilities. By default, the check box is clear, indicating that the physical endpoint extension CPN and Name is sent. If you set the <b>Send Name</b> to n or r (restricted) on the ISDN Trunk Group screen, the calling party name and number is sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Logout Reason Code Type</b>            | Determines how agents enter reason codes. One of the following is a valid entry: <ul style="list-style-type: none"> <li>• <b>System.</b> Settings assigned on the Feature Related System Parameters screen apply. This is the default entry.</li> <li>• <b>Requested.</b> You want an agent to enter a reason code when logging out but do not want to force the agent to do this. To enter this value, the reason codes and EAS on the System-Parameters Customer-Options screen must be set to <u>y</u>.</li> <li>• <b>Forced.</b> You want to force an agent to enter a reason code when logging out. To enter this value, the Reason Codes and EAS on the System-Parameters Customer-Options screen must be set to <u>y</u>.</li> <li>• <b>None.</b> You do not want an agent to enter a reason code when logging out.</li> </ul> |
| <b>LWC Log External Calls</b>             | Determines whether or not unanswered external call logs are available to end users. When external calls are not answered, Communication Manager keeps a record of up to 15 calls provided information on the caller identification is available. Each record consists of the latest call attempt date and time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table continues...

| Name                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Percent Allocation</b> | The percentage for each of the agent skills if the call handling preference is percent-allocation. a valid entry is a number from <b>1</b> to <b>100</b> for each skill. Entries for all the agent skills together must add up to 100%. Do not use target allocations for reserve skills. Percent Allocation is available as part of the Avaya Business Advocate software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Password</b>           | The password the agent must enter upon login. Displayed only if both the AAS and AUDIX check boxes are clear. A valid entry is a digit ranging from <b>0</b> through <b>9</b> . Enter the minimum number of digits in this field specified by the <b>Minimum Agent-LoginID Password Length</b> field on the Feature-Related System Parameters screen. By default, this field is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Confirm Password</b>   | <p>Confirms the password the agent entered in the Password field during login. Displayed only if both the AAS and the AUDIX check boxes are clear. By default, this field is blank.</p> <p> <b>Note:</b><br/>Values entered in this field are not populated to the screen.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Port Extension</b>     | The assigned extension for the AAS or AUDIX port. The values are displayed only if either the AAS or AUDIX check box is selected. This extension cannot be a VDN or an Agent LoginID. By default, this field is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Reserve Level</b>      | <p>The reserve level to be assigned to the agent for the skill with the Business Advocate Service Level Supervisor feature or the type of interruption with the Interruptible AUX Work feature. You can assign a reserve level of 1 or 2 or an interruptible level of a, m, n, or blank for no reserve or interruptible level, where,</p> <ul style="list-style-type: none"> <li>• a is auto-in-interrupt</li> <li>• m is manual-in-interrupt</li> <li>• n is notify-interrupt</li> </ul> <p>Changes to this field take effect the next time the agent logs in. Values of 1 and 2 are allowed only if Business Advocate is enabled. A skill level cannot be assigned with a reserve level setting. Reserve level set to 1 or 2 defines the EWT threshold level for the agent to be added to the assigned skill as a reserve agent. When the EWT for this skill reaches the corresponding threshold set on the Hunt Group screen, this skill gets this skill gets automatically added to the logged in skills of the agents. Agents are delivered calls from this skill until the skill EWT drops below the assigned overload threshold. Use the Interruptible Aux functionality to help meet service level targets by requesting agents who are on break to become available when the service level target is not being met. For more information on Service Level Supervisor, see <i>Avaya Business Advocate User Guide</i>.</p> |

| Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Service Objective</b> | The option to administer Service Objective. Service Objective is administered on the Hunt Group screen and the agent LoginID screen. This field is displayed only when Call Handling Preference is set to greatest-need or skill-level. The communication server selects calls for agents according to the ratio of Predicted Wait Time (PWT) or Current Wait Time (CWT) and the administered service objective for the skill. Service Objective is part of the Avaya Business Advocate software.                                                                                                                                                    |
| <b>Skill Number</b>      | <p>The Skill Hunt Groups that an agent handles. The same skill cannot be entered twice. You have the following options:</p> <ul style="list-style-type: none"> <li>• If EAS-PHD is not optioned, enter up to four skills.</li> <li>• If EAS-PHD is optioned, enter up to 20 or 60 skills depending on the platform.</li> </ul> <p> <b>Important:</b></p> <p>Assigning a large number of skills to agents can potentially impact system performance. Review system designs with the ATAC when a significant number of agents have more than 20 skills per agent.</p> |
| <b>Skill Level</b>       | A skill level for each of an agent assigned skills. If you specify the EAS-PHD option, 16 priority levels are available. If you do not specify this option, two priority levels are available.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tenant Number</b>     | <p>The tenant partition number. A valid entry ranges from <b>1</b> to <b>100</b>. The default is <b>1</b>.</p> <p> <b>Note:</b></p> <p>Values entered in this field are not echoed to the screen.</p>                                                                                                                                                                                                                                                                                                                                                             |

| Button                                                                           | Description                                                                                                                                  |

## Announcements

### What is an announcement?

An announcement is a recorded message that a caller hears while the call is in a queue. An announcement is often used in with music.

Announcements are recorded on:

- Special circuit packs (TN750, TN750B, TN750C, or TN2501AP).
- Disk/Flash Memory as vVAL in H.248 Media Gateways.
- Disk or content store on Avaya Aura® Media Server or also can be sourced from an internet source if using Avaya Aura® MS.

The three types of announcements are:

- Delay announcement: Explains the reason for the delay and encourages the caller to wait
- Forced announcement: Explains an emergency or service problem. Use when you anticipate a large number of calls about a specific issue
- Information announcement: Gives the caller instructions on how to proceed, information about the number called, or information that the caller wants

Announcements are most effective when they are:

- Short, courteous, and to-the-point
- Spaced close together when a caller on hold hears silence
- Spaced farther apart when music or ringing is played on hold
- Played for calls waiting in queue

While scheduling backup or backing up all jobs from the List Announcement page, if the backup size is:

- Greater than 1 GB, the system does not schedule the job and displays an error.
- Less than 1 GB or if system estimates that the backup size is exceeding 1 GB limit while executing the job, the scheduled job fails with error: `Used size has exceeded the maximum allowed size. Consider removing the old backups.`

Music on Hold is a package of professionally-recorded music available from Avaya.

From Release 7.0, with Avaya Aura® Media Server, you can upload up to 10 MB size of .wav files.

### Announcement List

Announcement list displays the property of an announcement. To view the announcement list, on the **Elements** menu, navigate to **Communication Manager > Call Center > Announcements**.

| Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>        | The file name of the audio file. The alphanumeric file name can contain up to 27 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Extension</b>   | The valid extension number for the announcement. Extension numbers might not include punctuation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Group/Board</b> | Indicates whether the announcement's audio file exists on the VAL board. Type the group number in the format gggV9 for media gateway vVAL, where ggg is the gateway number of the media gateway (up to 250).                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Type</b>        | The type of the announcement. Possible values include: <ul style="list-style-type: none"> <li>• <b>Integ-mus.</b> Integrated music type</li> <li>• <b>Integ-rep.</b> Integrated repeating type</li> <li>• <b>Integrated.</b> Stored internally on a special integrated announcement circuit pack. Use this for general announcements and VDN of Origin Announcements.</li> </ul>                                                                                                                                                                                                                                                                                             |
| <b>Protected</b>   | Use this field to set the protection mode for an integrated announcement.<br><br>When you set this field to <b>y</b> , the recording is protected and cannot be deleted or changed through a telephone session or FTP.<br><br>When you set this field to <b>n</b> , you can change or delete the recording if you have the corresponding console permissions.                                                                                                                                                                                                                                                                                                                |
| <b>Rate</b>        | If the VAL board is administered on the circuit packs form, then the system automatically displays 64 (64Kbps) in the <b>Rate</b> field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>COR</b>         | The Class of Restriction associated with this announcement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>TN</b>          | The tenant partition number of the announcement. A valid entry ranges from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Queue</b>       | The announcement queuing or barge-in. Possible values include: <ul style="list-style-type: none"> <li>• <b>no:</b> Indicates that the announcement does not play if a port is not available. This is the default value.</li> <li>• <b>yes:</b> Indicates that the request queues when all ports on the circuit pack are busy. The announcement plays when a port becomes available. This setting is used in most call center applications.</li> <li>• <b>bargein:</b> Indicates that you can connect callers to the announcement at any time while it is playing. With <b>n</b> or <b>y</b>, the caller is always connected to the beginning of the announcement.</li> </ul> |

| <b>Live Stream Source</b> | Indicates if the announcement is played live from an external source or from an audio file.<br><br>After you configure the announcement with Live Stream Source type, play once to ensure that the live streaming feature works correctly.<br><br>When you deactivate the Release 8.1.3 patch, the system runs on Release 8.1.3 system and sets the <b>Live Stream Source</b> feature to <i>n</i> . Therefore, you must install and activate the new Release 8.1.3 patch immediately to prevent the system processes from running on the Release 8.1.3 system. You must also set the value of the <b>Live Stream Source</b> feature to <i>y</i> . |
| <b>Size</b>               | The size of the audio files in kilobytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Timestamp</b>          | The date and time the audio file was created or modified. This changes each time the audio file is put on the VAL board using FTP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>System</b>             | The name of the Communication Manager associated with the announcement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Adding an announcement

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Announcements**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select **New**.
6. On the New Announcement page, complete the fields and click **Commit**.

For more information, see “Announcements field descriptions”.

## Deleting an announcement

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Announcements**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the announcement you want to delete from the Announcement List.
6. Click **Delete**.
7. Confirm to delete the announcements.

## Saving an announcement

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Announcements**.
3. Select one or more Communication Manager instance from the Communication Manager list.

4. Click **Show List**.
5. Select the announcement you want to save from the Announcement List.
6. Click **More Actions** > **Save**.

This action internally edits and updates the announcements in the Communication Manager.

## Broadcasting announcements

### About this task

You can upload an audio file on multiple media sources using the **Broadcast** operation. The media sources can be Media Servers, Media Gateways, or VAL Board. You can also transfer audio files from one board to the other of the same Communication Manager or boards (VAL Board, Media Gateway, or Media Server) of another Communication Manager.

Uploading audio files to media servers is done using a SOAP request. System Manager uses FTP or SCP for Media Gateway and FTP or SFTP for VAL Board. The transfer protocol for Media Gateway or VAL Board can be configured from File Transfer Settings. FTP is the default protocol for file transfer on VAL Board and Media Gateway.

With Release 8.1.1, you can upload more than one audio file (.wav) with a single click by using the **Browse** option of the **Select Announcement File** field.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Announcements**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Do one of the following:
  - To transfer an audio file from one audio source to another:
    - a. Select the announcement that you want to broadcast from the Announcement list.
    - b. Click **More Actions > Broadcast**.
  - To upload an audio file from your computer and broadcast it to audio sources:
    - a. Click **More Actions > Broadcast**.
    - b. On the Broadcast Announcements page, in **Select Announcement File**, click **Browse**.

- c. In the File Upload dialog box, select one or more audio files from your local computer.

System Manager displays the uploaded audio files (.wav) with file name on the Broadcast Announcements page.

 **Note:**

If you remove one of the uploaded audio files using the browse option, the system removes all the files that were uploaded together.

6. In the Select Destination for Broadcasting Announcements section, select the destination VAL source, which includes media servers too.
7. Do one of the following:
  - Click **Now** to immediately broadcast the announcement files to various VAL boards on voice system or media servers.
  - Click **Schedule** to schedule a broadcast operation later.

On the Job Scheduler page, you can set a later time to broadcast the announcement files to various VAL boards on voice system or media servers.

## Filtering the Announcements list

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Announcements**.
3. Click **Filter: Enable** in the Announcement list.
4. Filter the list according to one or multiple columns.
5. Click **Apply**.

To hide the column filters, click **Disable**. This does not clear any filter criteria that you have set.

#### **Note:**

The table displays only those options that match the filter criteria.

## Using Advanced Search

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Announcements**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Advanced Search** in Announcement List.
6. In the Criteria section, do the following:
  - a. Select the search criterion from the first drop-down field.
  - b. Select the operator from the second drop-down field.
  - c. Enter the search value in the third field.

If you want to add a search condition, click the plus sign (+) and repeat the substeps listed in Step 5.

If you want to delete a search condition, click the minus sign (-). This button is available if there is more than one search condition.

7. Click **Search**.

| Name             | Description                                                                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>    | The name of the Communication Manager associated with the announcement.                                                                                                                                                                                                                                                                                                   |
| <b>Name</b>      | The filename of the audio file. The filename can be up to 27 characters and must be alphanumeric.                                                                                                                                                                                                                                                                         |
| <b>Extension</b> | A valid extension number for the announcement. Extension numbers must not include punctuation.                                                                                                                                                                                                                                                                            |
| <b>Source</b>    | <p>The field that indicates whether the announcement's audio file exists on the VAL board.</p> <ul style="list-style-type: none"> <li>Type the group number in the format gggV9 for media gateway vVAL, where ggg is the gateway number of the media gateway (up to 250).</li> <li>Type the identifier for the Media Server device.</li> </ul>                            |
| <b>Type</b>      | <p>The type of announcement. The options are:</p> <ul style="list-style-type: none"> <li><b>Integ-mus</b>. Integrated music type.</li> <li><b>Integ-rep</b>. Integrated repeating type.</li> <li><b>Integrated</b>. A special integrated announcement circuit pack stored internally. Use this for general announcements and VDN of Origin Announcements.</li> </ul>      |
| <b>Protected</b> | <p>The field to set the protection mode for an integrated announcement. The options are:</p> <p><b>y</b>: The recording is protected, and you cannot delete or change it through a telephone session or FTP.</p> <p><b>n</b>: You can change or delete the recording if you have the corresponding console permissions.</p>                                               |
| <b>Rate</b>      | <p>The recording rate speed for announcements. If the VAL board is administered on the circuit packs form, then 64 (64Kbps) automatically appears in this field.</p> <p> <b>Note:</b></p> <p>The system disables the <b>Rate</b> field when you select a Media Server as a source.</p> |
| <b>COR</b>       | The Class of Restriction associated with this announcement.                                                                                                                                                                                                                                                                                                               |

| <b>Tenant Number</b>      | The tenant partition number of the announcement. Valid entries include 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Queue</b>              | <p>The announcement queue or barge-in. The options are:</p> <ul style="list-style-type: none"> <li>• <b>no</b>: Indicates that the announcement is not played if a port is unavailable. This is the default value.</li> <li>• <b>yes</b>: Indicates that the request is placed in a queue when all ports on the circuit pack are busy. The announcement is played when a port becomes available. Most call center applications use this setting.</li> <li>• <b>bargein</b>: Indicates that you can connect callers to the announcement at any time while the announcement is being played. With n or y, the caller is always connected to the beginning of the announcement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Live Stream Source</b> | <p>The option to stream music on hold live from an external source.</p> <p><b>Live Stream Source</b> is available only when the <b>Type</b> is <b>Integ-mus</b> or <b>Integ-rep</b>.</p> <p>You can select <b>Live Stream Source</b> only when:</p> <ul style="list-style-type: none"> <li>• Queue is set to <b>bargein</b>.</li> <li>• <b>Source</b> is set to Media Server.</li> </ul> <p>If you select <b>Live Stream Source</b>, the system changes the <b>Protected</b> field to Y, which is noneditable.</p> <p>When you deactivate the Release 8.1.3 patch, the system runs on Release 8.1.3 system and sets the <b>Live Stream Source</b> feature to n. Therefore, you must install and activate the new Release 8.1.3 patch immediately to prevent the system processes from running on the Release 8.1.3 system. You must also set the value of the <b>Live Stream Source</b> feature to y.</p> <p> <b>Note:</b></p> <p>After you configure the announcement with Live Stream Source type, play once to ensure that the live streaming feature works correctly.</p> |
| <b>Size</b>               | The size of the audio file in kilobytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Timestamp</b>          | The date and time the audio file was created or modified. This value changes each time you upload the audio file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Audio File Information

| Name                        | Description                                                         |
|-----------------------------|---------------------------------------------------------------------|
| <b>Use Unused Wave File</b> | To use an audio file that has not been used yet.                    |
| <b>Upload Audio File</b>    | To upload an audio file by browsing to the file you want to upload. |

| <b>Broadcast</b>                   | Displays the Broadcast Announcements page.<br><br>You can broadcast the announcements from the Announcement list.<br><br>After the broadcast operation is completed, files are deleted from the SCP server. |
| <b>File Transfer Settings</b>      | Displays the Audio File Transfer Settings page.                                                                                                                                                             |
| <b>Compact Flash Configuration</b> | Displays the Compact Flash Configuration page.                                                                                                                                                              |

## More Actions in Audio Groups

| Name                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File Name</b>                                                        | Specifies the filename of the audio file. The filename can be up to 27 characters and must be alphanumeric.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>File Size</b>                                                        | Specifies the size of the audio file in kilobytes.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Backup Announcement Properties</b>                                   | Backs up the announcement property.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Backup Wave Files</b>                                                | Backs up the WAVE files only.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Backup Both (Announcement Properties with associated wave file)</b>  | Backs up both the announcement property and the WAVE file for the announcement.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Restore Announcement Properties</b>                                  | Restores only your announcement properties.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Restore Wave Files</b>                                               | Restores only the wave files present for the announcement.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Restore Both (Announcement Properties with associated wave file)</b> | Restores both the announcement property and the wave file for the announcement.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Source</b>                                                           | This field indicates the source location from where the announcement plays back. <ul style="list-style-type: none"> <li>• The the location of the TN2501 board in the format of cabinet(1-64), carrier(A-E) and slot(1-20). For Example, 03A10</li> <li>• The location of the Media Gateway vVAL in the format of gggV9, where ggg is the gateway number of the media gateway (up to 250).</li> <li>• The Group number (G1-G50) or the Media Server number (M1-M250)</li> </ul> |
| <b>Type</b>                                                             | The whether the Announcement is a VAL Announcement or a Media Gateway (MG) Announcement.                                                                                                                                                                                                                                                                                                                                                                                        |

*Table continues...*

| Name                         | Description                                                                                                                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transfer Mode</b>         | Type of transfer used to backup or restore or upload audio files. Possible values are FTP, SFTP, and, SCP.<br><br>* <b>Note:</b><br>SCP file transfer on gateways, works only with SNMPv3 – MD5 and DES combination. |
| <b>Local SCP Server</b>      | System Manager acts as a SCP server.                                                                                                                                                                                 |
| <b>SCP Server IP Address</b> | When you select <b>Local SCP Server</b> , the system auto populates the <b>SCP Server IP Address</b> field with IP Address of System Manager.                                                                        |
| <b>SCP User Name</b>         | The SCP server user name.<br>If you use <b>Local SCP Server</b> , type the System Manager CLI user name.                                                                                                             |
| <b>SCP Password</b>          | The SCP server password.<br>If you use <b>Local SCP Server</b> , type the System Manager CLI password.                                                                                                               |
| <b>Confirm SCP Password</b>  | Confirm the SCP server password.<br>If you use <b>Local SCP Server</b> , re-type the System Manager CLI password.                                                                                                    |
| <b>Used By</b>               | The object in which the extension is used. For example Endpoint, Announcement etc.                                                                                                                                   |
| <b>Object info</b>           | The details of the object.                                                                                                                                                                                           |
| <b>Used as</b>               | The manner in which the extension is used in the object.                                                                                                                                                             |

| Button          | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Commit</b>   | Completes the action you initiate.                                  |
| <b>Schedule</b> | Performs the action at the chosen time.                             |
| <b>Reset</b>    | Clears the action and resets the field.                             |
| <b>Clear</b>    | Clears all the entries.                                             |
| <b>Edit</b>     | Edits the fields in the page.                                       |
| <b>Done</b>     | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b>   | Cancels your current action and takes you to the previous page.     |
| <b>Download</b> | Downloads the audio files or announcement files.                    |
| <b>Now</b>      | Performs the action you initiate in real time.                      |
| <b>Restore</b>  | Restores your announcements on the voice system you select.         |

## Audio Groups

### What is an audio group?

An audio group is a logical container that holds VAL sources. An audio group can hold several VAL Sources which can be VAL Boards or media gateways.

## Adding an audio group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Audio Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Add Audio Groups** page and click **Commit**.

## Deleting an audio group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Audio Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the audio groups you want to delete from the Audio Groups List.
6. Click **Delete**.
7. Confirm to delete the audio groups.

## Using More Actions

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Audio Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select an audio group from the Audio Groups List.
6. Click **More Actions**.
7. Do one of the following:
  - Click **Backup** to back up the audio groups you selected on a voice system.
  - Click **Download** to download the audio groups you selected.
  - Click **Restore** to restore the audio groups on a voice system you select.

## Holiday Table

### Holiday Table List

Holiday Table List displays all the Holiday Table details under the selected Communication Manager. You can view the usage list of the extension you select in this list. You can also apply filters and sort each of the columns in the Holiday Table List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name          | Description                                                              |
|---------------|--------------------------------------------------------------------------|
| <b>Number</b> | The extension number of the holiday table Number.                        |
| <b>Name</b>   | The name associated with the holiday table.                              |
| <b>System</b> | The name of the Communication Manager associated with the holiday table. |

### Exporting all Holiday Table Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Holiday Table**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. Click **More Actions > Export All Holiday Table**.  
The system displays the **Export Holiday Table** page.
5. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
6. Click **Export**.

## Exporting selected holiday table

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Holiday Table**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. From the **Holiday Table List**, select the holiday table number you want to export.
5. Click **More Actions > Export Selected Holiday Table**.

The system displays the **Export Holiday Table** page.

6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

## Importing holiday table

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Holiday Table**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. Click **More Actions > Import Holiday Table**.

The system displays the **Import CM Objects** page.

5. In the **Select a file** field, select the required excel file and click **Browse**.
6. Select one of the following in the **Select Error Configuration** field.

Default value is **Continue processing other records**.

- **Abort on first error**
- **Continue processing other records**

7. Select one of the following in the **If a matching record already exists** field.

Default value is **Skip**.

- **Skip**
- **Merge**
- **Delete**

8. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
9. Click **Import**.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Holiday Table**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. Click **More Actions > Download Excel Template**.
5. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and click **OK**.

---

## Vector Directory Number

### Vector Directory Number

The Vector Directory Number capability defines the vector directory numbers (VDN) for the Call Vectoring feature. A VDN is an extension number used to access a call vector. Each VDN is mapped to one call vector. VDNs are software extension numbers that is, not assigned to physical equipment. A VDN is accessed through direct dial local telephone company central office trunks mapped to the VDN (incoming destination or night service extension), DID trunks, and LDN calls. The VDN can be Night Destination for LDN.

### Vector Directory Number List

Vector Directory Number List displays all the Vector Directory Number (VDN) details under the selected Communication Manager. You can view the usage list of the extension you select in this list. You can also apply filters and sort each of the columns in the Vector Directory Number List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name                      | Description                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Extension</b>          | The extension number of the Vector Directory Number.                                                   |
| <b>Name</b>               | The name associated with the Vector Directory Number.                                                  |
| <b>Destination</b>        | Indicates whether the calls are routed using a Vector Number or Policy Routing Table.                  |
| <b>Destination Number</b> | Indicates the number for <b>Destination</b> .                                                          |
| <b>Allow VDN Override</b> | Indicates whether the routed-to Vector Directory Number is changed to active VDN for the call.         |
| <b>COR</b>                | The Class Of Restriction (COR) of the Vector Directory Number consisting of a one or two-digit number. |
| <b>TN</b>                 | The tenant partition number.                                                                           |

*Table continues...*

| Name          | Description                                                                        |
|---------------|------------------------------------------------------------------------------------|
| <b>System</b> | The name of the Communication Manager associated with the vector directory number. |

## Adding Vector Directory Number

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Add Vector Directory Number (VDN)** page and click **Commit**.

## Viewing Vector Directory Number

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Vector Directory Number List, select the vector directory number you want to view.
6. Click **View**.

## Editing Vector Directory Number

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Vector Directory Number List, select the vector directory number you want to edit.
6. Click **Edit** or click **View > Edit**.
7. Edit the required fields on the **Edit Directory Number (VDN)** page.
8. Click **Commit** to save the changes.

## Deleting Vector Directory Number

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Vector Directory Number List, select the vector directory number you want to delete.
6. Click **Delete**.
7. Confirm to delete the vector directory number.

## List Usage Extension in Vector Directory Number

### Procedure

1. On the System Manager console, under **Elements**, click **Communication Manager**.
2. Click **Call Center > Vector Directory Number** in the left navigation pane.
3. Select a Communication Manager from the Communication Manager list.
4. Click **Show List**.
5. From the Vector Directory Number List, select a vector directory number.
6. Click **More Actions > List Usage Extension**.
7. Click **Done**.

You can view the details of the vector directory number in the List Usage for Extension list.

## Exporting Selected Vector Directory Number

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the **Vector Directory Number List**, select the vector directory number you want to export.
6. Click **More Actions > Export Selected VDN**.

The system displays the **Export VDN** page.

7. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.

8. Click **Export**.

## Exporting all Vector Directory Numbers

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Export All VDN**.

The system displays the **Export VDN** page.

6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

## Importing Vector Directory Numbers

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Import VDN's**.

The system displays the **Import CM Objects** page.

6. In the **Select a file** field, select the required excel file and click **Browse**.
7. Select one of the following in the **Select Error Configuration** field.

Default value is **Continue processing other records**.

- **Abort on first error**
- **Continue processing other records**

8. Select one of the following in the **If a matching record already exists** field.

Default value is **Skip**.

- **Skip**
- **Merge**
- **Delete**

9. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.

10. Click **Import**.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Vector Directory Number**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Download Excel Template**.
6. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and click **OK**.

---

## Vector Routing Table

### Vector Routing Table

Use Vector Routing Table to store ANI or digits that you refer to in the **goto** vector steps. This capability is available only if the **Vectoring (G3V4 Enhanced)** field on the System-Parameters Customer-Options screen is set to **y**.

### Vector Routing Table List

Vector Routing Table List displays all the Vector Routing Tables under the Communication Manager you select. You can also apply filters and sort each of the columns in the Vector Routing Table List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name                     | Description                                                                     |
|--------------------------|---------------------------------------------------------------------------------|
| <b>Number</b>            | The table number you entered on the command line.                               |
| <b>Name</b>              | The 1 to 15-character alphanumeric table name. By default, this field is blank. |
| <b>Sort</b>              | Enables you to sort the digit fields.                                           |
| <b>Number Of Entries</b> | The number of entries in the dialing list.                                      |
| <b>System</b>            | The name of the Communication Manager associated with the Vector Routing Table. |

## Adding Vector Routing Table

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.

2. In the navigation pane, click **Call Center > Vector Routing Table**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Add Vector Routing Table** page and click **Commit**.

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>         | The 1 to 15-character alphanumeric table name or blank. By default, this field is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Number</b>       | The table number you entered on the command line. This is a display-only field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Digit String</b> | <p>Entries in this field can include the plus sign (+) and question mark (?) wildcard. The plus sign (+) represents a group of digits. The question mark (?) represents a single digit. By default, this field is blank.</p> <p>The field is limited to 16 characters and these characters are restricted as follows:</p> <ul style="list-style-type: none"> <li>• You can enter only a plus sign (+), a question mark (?), or the numbers 0 through 9. No other entries are valid.</li> <li>• You can enter a plus sign (+) as either the first or last character in the number field. However, you cannot use this character as the sixteenth character of the number field.</li> <li>• You can use unlimited question marks (?) anywhere in the number field.</li> <li>• You should not embed blanks in the number field.</li> <li>• You can leave the field entirely blank. If you do, the communication server will store the entry as a null value.</li> </ul> |

*Table continues...*

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sort</b>  | Provides the option to sort the digit fields. By default, this check box is clear. If you do not to sort the numbers, they will remain in the order that you entered them. If you sort the number fields, they will be sorted as described below. Remember that leading zeros are significant. That means that 02 will sort ahead of a 2 followed by a space. <ul style="list-style-type: none"> <li>• Any plus signs (+) will sort first.</li> <li>• Any question marks (?) will sort second.</li> <li>• All numbers (0-9) will sort last.</li> </ul> |
| Route Number | The static route numbers that are available in the selected vector routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Button          | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Commit</b>   | Completes the action you initiate.                                  |
| <b>Schedule</b> | Performs the action at the chosen time.                             |
| <b>Reset</b>    | Clears the action and resets the field.                             |
| <b>Clear</b>    | Clears all entries.                                                 |
| <b>Edit</b>     | Allows you to edit the fields in the page.                          |
| <b>Done</b>     | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b>   | Cancels your current action and takes you to the previous page.     |
| <b>Now</b>      | Performs the action you initiate in real time.                      |

## Service Hours Tables

### Service Hours Table List

Service Hours Table displays all the Service Hours Table details under the selected Communication Manager. You can view the usage list of the extension you select in this list. You can also apply filters and sort each of the columns in the Service Hours Table.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name               | Description                                                                    |
|--------------------|--------------------------------------------------------------------------------|
| <b>Number</b>      | The extension number of the service hours table Number.                        |
| <b>Location</b>    | The location associated with the service hours table.                          |
| <b>Description</b> | The description associated with the service hours table .                      |
| <b>System</b>      | The name of the Communication Manager associated with the service hours table. |

## Exporting all Service Hours Table

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Service Hours Tables**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. Click **More Actions > Export All Service Hours**.  
The system displays the **Export Service Hours Table** page.
5. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
6. Click **Export**.

## Exporting selected service hours table

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Service Hours Tables**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. From the **Service Hours Table List**, select the service hours table number you want to export.
5. Click **More Actions > Export Selected Service Hours**.  
The system displays the **Export Service Hours Table** page.
6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

## Importing service hours table

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Service Hours Tables**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. Click **More Actions > Import Service Hours**.  
The system displays the **Import CM Objects** page.
5. In the **Select a file** field, select the required excel file and click **Browse**.

6. Select one of the following in the **Select Error Configuration** field.

Default value is **Continue processing other records**.

- **Abort on first error**
- **Continue processing other records**

7. Select one of the following in the **If a matching record already exists** field.

Default value is **Skip**.

- **Skip**
- **Merge**
- **Delete**

8. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.

9. Click **Import**.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager > Call Center > Service Hours Tables**.
2. Select one or more Communication Manager instance from the Communication Manager list.
3. Click **Show List**.
4. Click **More Actions > Download Excel Template**.
5. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and click **OK**.

---

## Coverage Path

### Coverage Path

Use Coverage Path to implement call coverage paths by providing the means to specify the call coverage criteria, the points in the coverage path used to redirect calls, and the number of times a principal telephone rings before the call redirects to coverage.

### Coverage Path List

Coverage Path List displays all the coverage path details under the Communication Manager you select. You can also apply filters and sort each column in the Coverage Path List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name                        | Description                                                                                                         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Coverage Path Number</b> | The coverage path that is being administered.                                                                       |
| <b>Next Path Number</b>     | The number of the next coverage path in a coverage path chain.                                                      |
| <b>Hunt after Coverage</b>  | Indicates whether the coverage treatment is continued or terminated.                                                |
| <b>Number of Rings</b>      | The number of times a telephone rings before the system redirects the call to the first point in the coverage path. |
| <b>System</b>               | The name of the Communication Manager associated with the coverage path.                                            |

## Adding Coverage Path

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Path**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Coverage Path** page and click **Commit**.

## Exporting selected Coverage Path

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Path**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In **Coverage Path List**, select the coverage path that you want to export.
6. Click **More Actions > Export Selected Coverage Paths**.

The system displays the **Export Coverage Paths** page.

7. In the **Schedule Job** field, click one of the following:
  - **Run immediately**

- **Schedule later**

8. Click **Export**.

## Exporting all Coverage Paths

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Path**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Export All Coverage Paths**.  
The system displays the **Export All Coverage Paths** page.
6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

## Importing Coverage Paths

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Path**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Import Coverage Paths**.  
The system displays the **Import CM Objects** page.
6. In the **Select a file** field, select the required excel file and click **Browse**.
7. Select one of the following in the **Select Error Configuration** field.

Default value is **Continue processing other records**.

- **Abort on first error**
- **Continue processing other records**

8. Select one of the following in the **If a matching record already exists** field.

Default value is **Skip**.

- **Skip**
- **Merge**
- **Delete**

9. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
10. Click **Import**.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Path**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Download Excel Template**.
6. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and click **OK**.

## Coverage Path

The coverage path being administered.

## Cvg Enabled for VDN Route-To Party

Enables or disables the route-to party coverage path after a covered call hits a VDN vector route-to step. By default, the value is n.

## Holiday Coverage

Use the **Holiday Coverage** field to redirect all calls during a holiday to a coverage path. For **Holiday Coverage** to function, set the **Don't Answer** field to y.

You must set the **Holiday Coverage** field separately for internal and external calls.

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | Communication Manager checks the Holiday Table screen for a specific holiday entry. If an entry on the Holiday Table screen matches with the current date and time, Communication Manager forwards the call to the first point that is defined in the coverage path. If there is no entry that matches with the current date and time, Communication Manager forwards the call to the subsequent point that is defined in the coverage path. |
| n           | Communication Manager forwards the call to the subsequent point in the coverage path.                                                                                                                                                                                                                                                                                                                                                        |

## Holiday Table

Available only when **Holiday Coverage** is set to y for inside or outside calls.

The number of the holiday table used for holiday coverage.

## Hunt After Coverage

| Valid Entry | Usage                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | Coverage treatment continues by searching for an available station in a hunt chain that begins with the hunt-to-station assigned to the station of the last coverage point. |
| n           | Coverage treatment is terminated. The call is left at the last available location, the principal or coverage point.                                                         |

## Linkage

One or two additional coverage paths in the coverage path chain.

## Next Path Number

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 9999   | The number of the next coverage path in a coverage path chain. If the coverage criteria of the current coverage path is dissatisfied, the system checks in this chain until it finds a coverage path with redirection criteria that matches the call status. If the chain is exhausted before the system finds a match, the call stays out of coverage. |
| blank       | The only path for the principal.                                                                                                                                                                                                                                                                                                                        |

## Criteria

### Active

Use this field to assign a coverage criteria. When the coverage criteria is met, the system redirects the call to coverage.

| Valid Entry | Usage                                                                  |
|-------------|------------------------------------------------------------------------|
| y           | The system redirects the call if at least one call appearance is busy. |
| n           | The system does not redirect the call.                                 |

### Busy

Use this field to assign a coverage criteria. When the coverage criteria is met, the system redirects the call to coverage.

| Valid Entry | Usage                                                                                      |
|-------------|--------------------------------------------------------------------------------------------|
| y           | The system redirects the call if all call appearances that accept incoming calls are busy. |
| n           | The system does not redirect the call.                                                     |

### Don't Answer

Use this field to assign a coverage criteria. When the coverage criteria is met, the system redirects the call to coverage.

| Valid Entry | Usage                                                                                |
|-------------|--------------------------------------------------------------------------------------|
| y           | The system redirects the call when the specified number of rings have been exceeded. |
| n           | The system does not redirect the call.                                               |

### All

Use this field to assign a coverage criteria. When the coverage criteria is met, the system redirects the call to coverage.

| Valid Entry | Usage                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | The system redirects all calls to coverage. This option overrides any other criteria. Calls redirect immediately to coverage. Overrides any other criteria administered for this field. |
| n           | The system does not redirect the call.                                                                                                                                                  |

### DND/SAC/Go to Cover

Use this field to assign a coverage criteria. When the coverage criteria is met, the system redirects the call to coverage.

| Valid entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | <p>With this option, a calling user, when calling to another internal extension, can redirect a call immediately to coverage by pressing the <b>Go to Cover</b> button. A principal user can temporarily direct all incoming calls to coverage, regardless of the other assigned coverage criteria by pressing the <b>Send All Calls</b> or <b>Do Not Disturb</b> button. With the <b>Send All Calls</b> button, covering users can temporarily remove their telephones from the coverage path.</p> <p> <b>Note:</b></p> <p>You must assign this criteria before a user can activate <b>Do Not Disturb (Hospitality Services)</b>, <b>Send All Calls (SAC)</b>, or <b>Go to Cover</b> features.</p> |
| n           | The system does not redirect the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### **Logged off/PSA/TTI**

Use this field to assign a coverage criteria. When the coverage criteria is met, the system redirects the call to coverage.

The system displays this field only when you set the **Criteria for Logged Off/PSA/TTI Stations** field to y.

| Valid Entry | Usage                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | The system redirects the call after the number of rings exceeds the value specified in the <b>Number of Rings</b> field. The system displays the associated <b>Number of Rings</b> field only when the <b>Logged off/PSA/TTI</b> field is set to y. |
| n           | The system does not redirect the call.                                                                                                                                                                                                              |

### **Number of Rings**

| Valid Entry | Usage                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 99     | The number of times a telephone rings before the system redirects the call to the first point in the coverage path. By default, the value is 2. |

### **Coverage points**

#### **Point1, Point2, Point3, Point4, Point5, Point6**

The alternate destinations that comprise a coverage path. Coverage points must be assigned sequentially without steps beginning with Point 1. Each path can have up to six coverage points.

Subsequent coverage points should be unlisted if calls are redirected to:

- Message Center, a special Uniform Call Distribution hunt group
- Voice messaging
- The attendant

These calls normally queue and never redirect to another coverage point. Calls to hunt group queue if possible. Calls redirect from a hunt group only if all hunt group members are busy and either the queue is full, or is nonexistent.

If the Coverage of Calls Redirected Off-Net feature is not supported, a remote coverage point functions as the last point in the coverage path because the system can no longer control calls once they redirect off-net. However, if the Coverage of Calls Redirected Off-Net feature is enabled, calls redirected off-net can be monitored by the system and brought back for call coverage processing.

| Valid Entry   | Usage                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension     | Redirects the call to an internal extension or announcement.<br><br>* <b>Note:</b><br>If you enter a shortened extension of the multilocation dial plan, the system does not perform certain administration and validation tasks. Therefore, the system might not display the resultant warnings or submittal denials. |
| attd          | Redirects the call to the attendant or attendant group. If the system has Centralized Attendant Service (CAS), the call goes to the CAS attendant.                                                                                                                                                                     |
| h1 to h8000   | Redirects the call to the corresponding hunt-group, for example, h32 routes to hunt group 32.                                                                                                                                                                                                                          |
| c1 to c1500   | Redirects the call to the corresponding coverage answer group, for example, c20 routes to call coverage answer group 20.                                                                                                                                                                                               |
| r1 to r10000  | Redirects the call to the corresponding remote coverage point number, for example, r27 routes to remote coverage point 27.                                                                                                                                                                                             |
| v + extension | Redirects the call to the corresponding Vector Directory Number (VDN) extension, for example, v12345 routes to the VDN associated with extension 12345.<br><br>* <b>Note:</b><br>A VDN can be used only as the last administered point in a coverage plan.                                                             |
| y + extension | Redirects the call to an internal extension, announcement, or the corresponding Vector Directory Number (VDN) extension as per the current date and time set in Holiday Table.                                                                                                                                         |

### **Rng**

| Valid Entry      | Usage                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| 1 to 99<br>blank | The number of rings at this coverage point before the system redirects the call to the next point in the coverage path. |

### **Terminate to Coverage Pts. with Bridged Appearances**

| Valid Entry | Usage                                                                          |
|-------------|--------------------------------------------------------------------------------|
| y           | If activated, a call can alert as both a bridged call and a redirected call.   |
| n           | The call skips the coverage point if it has already alerted as a bridged call. |

---

## Coverage Time-of-day

### Coverage Time-of-day

Use Coverage Time-of-day to administer up to five different coverage paths associated with five different time ranges, for each day of the week. Only one coverage path can be in effect at a given time.

### Coverage Time-of-day List

Coverage Time-of-day List displays all the coverage time-of-day details under the Communication Manager you select. You can also apply filters and sort each column in the Coverage Time-of-day List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name          | Description                                                                        |
|---------------|------------------------------------------------------------------------------------|
| <b>Number</b> | The Coverage Time-of-day table number.                                             |
| <b>System</b> | The name of the Communication Manager associated with the vector directory number. |

### Adding Coverage Time-of-day

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Time-of-day**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Add Coverage Time-of-day Data** page and click **Commit**.

## Editing Coverage Time-of-day

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Coverage > Coverage Time-of-day**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Coverage Time-of-day List, select the coverage time-of-day you want to edit.
6. Click **Edit** or click **View > Edit**.
7. Edit the required fields on the **Edit Coverage Time-of-day Data** page.
8. Click **Commit** to save the changes.

Information must be entered in 24-hour time format.</p> <p>If there are time gaps in the table, there will be no coverage path in effect during those periods. The first activation time for a day is set to 00:00 and cannot be changed. Activation times for a day must be in ascending order from left to right.</p> |

### CVG Path

| Valid Entry | Usage                     |
|-------------|---------------------------|
| 1 to 9999   | The coverage path number. |
| blank       |                           |

### Time of Day Coverage Table

Displays the Time of Day Coverage Table number.

## Element Cut-Through

### Element Cut-Through

The Element Cut-Through link allows you to access the Communication Manager cut through the Element Cut-Through page. As an administrator you can have various permissions to access the Communication Manager cut through.

- If you have only Communication Manager level access to Communication Manager1 and not Communication Manager2 nor Communication Manager3, then you will see only Communication Manager1 in the list. The other Communication Managers are not shown in the list at all.
- If you have no access to Element Cut-Through on any Communication Manager, then the Cut-Through navigation item will be grayed out or hidden.
- If you have access Element Cut-Through level permissions to some Communication Managers and not others, then the table displays only those Communication Managers that you have permissions.
- If you do not have Element Cut-Through permissions for a given Communication Manager, then the system displays an error message stating that you do not have permission for this operation.

### Accessing Element Cut-Through

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Element Cut-Through**.
3. On the Element Cut-Through page, click on a Communication Manager.

The system displays the Element Cut-Through page.

### Synchronize CM Data and Configure Options / Element Cut-Through field descriptions

#### Synchronize CM Data/Launch Element Cut Through

| <b>View Audit Report</b> | Displays the Audit Report page.                     |
| <b>Done</b>              | Saves your action and returns to the previous page. |

## Endpoints

### Endpoint management

In System Manager, you can create and manage endpoints using the **Manage Endpoints** option. You can also manage other endpoint related objects such as, Alias Endpoints, Intra Switch CDR, Off PBX Endpoint Mappings, Site Data, and Xmobile Configuration. Additionally, using the **Manage Endpoints** option you can also view, edit, and delete endpoints and other endpoint related objects. System Manager provides support for the following set types:

| Category         | Set Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

 **Note:**

The set types supported varies based on the Communication Manager versions managed.

## Adding an endpoint

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. From **Template**, select the template based on the set type you want to add.  
The system auto populates the **Port** and **Set Type** fields.
7. In **Extensions**, perform one of the following:
  - Type the extension number.
  - Click the **Display Extension Ranges** link to select the extension number from the available extension ranges.
8. To add the endpoint, complete the New Endpoint page, and click **Commit**.

Before adding an endpoint, complete the mandatory fields that are marked with a red asterisk (\*). in the **General options**, **Feature Options**, **Site Data**, **Data Module/Analog**

**Adjunct, Abbreviated Call Dialing, Enhanced Call Fwd, Button Assignment, Profile Settings, and Group Membership** sections.

**\* Note:**

To add an endpoint with a non-supported set type, use Element Cut Through. For alias endpoints, choose the corresponding Alias set type from the **Template** field. System Manager automatically creates a template for the Alias set types based on the `aliased-to` set type. Alias endpoint templates have names beginning with `Alias`. Before the system displays the Alias endpoint type template in the drop-down menu, you must create an alias set type on the managed Communication Manager. You can then use the template to add an endpoint.

## Using Native Name

### Before you begin

To enter the native name:

- You need the Input Method Editor (IME) application.
- You must enable IME.

**\* Note:**

If IME is disabled, the keyboard input remains in the default language.

### About this task

Using the IME application, you can enter characters in multiple languages such as Japanese, Korean, Russian, Arabic, and Chinese without requiring a special keyboard.

The IME icon appears in the Windows system tray and indicates the language that you currently use. For example, if you are using English, the IME icon in the system tray displays **EN**. If you are using French, the IME icon in the system tray displays **FR**.

### Procedure

1. In the Windows system tray, click the IME icon.  
The system displays a list of languages installed on your computer.
2. Select the language that you want to use.
3. On the System Manager web console, click **Users > User Management** and select the native name.

## Editing an endpoint

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.

3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the endpoint you want to edit from the Endpoint List.
6. Click **Edit** or **View > Edit**.
7. Edit the required fields in the **Edit Endpoint** page.
8. Click **Commit** to save the changes.

## Duplicating an endpoint

### About this task

The Duplicate Endpoint functionality is to support the “duplicate station” command on Communication Manager. Use this functionality to copy information from an existing endpoint and modify it for each new endpoint. For example, you can configure one endpoint as desired for an entire work group. Then, you merely duplicate this endpoint to all the other extensions in the group. Note that only endpoints of the same type can be duplicated. This functionality copies all the feature settings from the selected endpoint to the new endpoints. You can duplicate up to 16 endpoints at one time.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the endpoint you want to duplicate from the Endpoint List and click **Duplicate**.
6. On the Duplicate Endpoint page, complete the required fields.
7. Click **Commit** to duplicate the endpoint or do one of the following:
  - Click **Schedule** to duplicate the endpoint at a specified time.
  - Click **Cancel** to cancel the operation.

## Viewing an endpoint

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.

3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the endpoint you want to view from the Endpoint List.
6. Click **View** to view the attributes of the endpoint you have chosen.

 **Note:**

You cannot edit the fields in the View Endpoint page. To go to the Edit Endpoint page, click **Edit**.

#### Related links

[New Endpoint / Template field descriptions](#) on page 735

## Deleting an endpoint

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the endpoint you want to delete from the Endpoint List.
6. Click **Delete**.

The system displays a confirmation message alerting you to a user associated with the endpoint. The system highlights these user-associated endpoints in yellow color.

 **Note:**

You cannot delete an endpoint associated with a user through endpoint management. You can delete the user associated endpoints only through User Profile Management.

## Saving an endpoint as a template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.

6. Select the template based on the set type you want to add, and complete the New Endpoint page.
7. To save the current settings as a template, click **Save As Template**.
8. Enter the name of the template in the **Template Name** field.
9. Click **Save**.
10. Click **Commit**.

## Editing endpoint extensions

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the endpoint from the Endpoint List for which you want to edit the extension.
6. Click **More Actions > Edit Endpoint Extension**.
7. Complete the **Edit Endpoint Extension** page and click **Commit** to save the new extension.

#### **Note:**

You can use the **Edit Endpoint Extension** option to change the endpoint extension. You can also edit the **Message Lamp Ext** and **Emergency Location Ext** fields through **Edit Endpoint Extension**. Use the **Edit** option to modify the other attributes.

## Bulk adding endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Bulk Add Endpoints**.
6. Complete the **Bulk Add Endpoint** page and click **Commit** to bulk add the endpoints.

The **Endpoint Name Prefix** field gives the common prefix which appears for all the endpoints you bulk add. You can enter any prefix name of your choice in this field.

In the **Enter Extensions** field, enter the extensions that you want to use. You must enter the extensions in a serial order and also check for the availability of an extension before you use it.

 **Note:**

With Multi Tenancy, when you add endpoints in bulk, the Communication Manager devices and the extension range are available according to the Site you selected in the Communication Manager List page. **Tenant Number** and **Location** fields are auto populated for all the endpoints according to the Site you selected.

**COR** and **COS** fields are validated as per the tenant permissions when you add the endpoints in bulk.

## Deleting endpoints in bulk

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select **More Actions > Bulk Delete Endpoints**.
6. On the Bulk Delete Endpoints page, select the Communication Manager from the **System** field.
7. Do one of the following:
  - Select the extension range you want to delete from the **Existing Extensions** field.
  - Type the extensions you want to bulk delete in the **Enter Extensions** field.
8. Click **Continue**.
9. On the Bulk Delete Endpoint Confirmation page, click **Now**.  
Click **Schedule** to schedule the bulk delete at a later time.

 **Note:**

You cannot delete user associated stations.

## Filtering endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.

3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Filter: Enable** in the Endpoint List.
6. Filter the endpoints according to one or multiple columns.
7. Click **Apply**.

To hide the column filters, click **Disable**. This action does not clear any filter criteria that you have set.

 **Note:**

The table displays only those endpoints that match the filter criteria.

## Using Advanced Search

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Advanced Search** in the Endpoint list.
6. In the Criteria section, do the following:
  - a. Select the search criterion from the first drop-down field.
  - b. Select the operator from the second drop-down field.
  - c. Enter the search value in the third field.

If you want to add a search condition, click the plus sign (+) and repeat the sub steps listed in Step 5.

If you want to delete a search condition, click the minus sign (-). This button is available if there is more than one search condition.

## Changing endpoint parameters globally

### About this task

Use the Global Endpoint Change capability to edit endpoint properties in bulk across one or more Communication Manager systems.

You can change the endpoint properties manually or change the endpoint properties based on a default template. You can select your preferred default template from the **Template Name** list on the **General Options** tab. When you select your preferred default template, the system overwrites the field values in different property tabs, such as General Options, Feature Options, and Button Assignment, with values in the default template. You can modify the endpoint properties of the default template to meet your requirement. The customization does not impact the default template because the system applies the changes only to the listed extensions.

For example, you can find all buttons or features with a specific assign and change the parameters for all those buttons or features respectively, locate new buttons without overwrite, and change the set type of many endpoints simultaneously as you move from digital to IP or SIP.

## Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, select the endpoints from the list for which you want to change the parameters.
4. Select one or more Communication Manager instance from the Communication Manager list.
5. Click **Show List**.
6. Select one or more endpoints, click **More Actions > Global Endpoint Change**.

The system displays the Endpoint Changes page.

7. Click the General Options tab, and select **Set Type** to update the template.

### **Note:**

If you also change the **Set Type** while updating the station, the default value overwrites the value in the **Port** field. The options for the default values are X and IP. Therefore, you must manually change the **Port** value for each station.

8. On the Endpoint Changes page, set the error configuration option in **Select Error Configuration**. The options are:
  - **Continue processing other records:** When you select this option, the system skips the erroneous record and continues to process the other records. This is the default setting.
  - **Abort on first error:** When you select this option, the system aborts the importing process on encountering the first error.
9. Do one of the following:
  - Modify the fields in each of the tabs as required.
  - In the General Options tab, select your preferred default template from the **Template Name** field, and update the property fields as required.

The system overwrites all the field values with the values in the template. This update does not affect the default template because the system applies the changes only to the listed extensions.

10. Do one of the following:

- To change the endpoint parameters immediately, click **Commit**.
- To change the endpoint parameters at a specified time, click **Schedule**.

The system updates the selected endpoints or schedules the edit job to the specified time.

## Viewing endpoint status

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. From the Endpoint List, select the endpoints whose status you want to view.
4. Click **Maintenance > Status**.

### Result

The system displays the status of the selected endpoint on the Element Cut Through screen.

## Busy out endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select the endpoints you want to busy out from the Endpoint List.

#### Important:

This maintenance operation is service affecting.

4. Click **Maintenance > Busyout Endpoint**.
5. On the Busyout Endpoint Confirmation page, click **Now** to busy out the endpoints or do one of the following:
  - Click **Schedule** to perform the busy out at a specified time.
  - Click **Cancel** to cancel the busy out.

### Result

The system displays the result of the busy out operation on the **Busyout Endpoint Report** page.

#### Related links

## Releasing endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select the endpoints you want to release from the Endpoint List.

#### **Important:**

This maintenance operation is service affecting.

4. Click **Maintenance > Release Endpoint**.
5. On the **Release Endpoint Confirmation** page, click **Now** to release the endpoints or do one of the following:
  - Click **Schedule** to perform the release at a specified time.
  - Click **Cancel** to cancel the release.

### Result

The system displays the result of the release operation on the **Release Endpoint Report** page.

### Related links

[New Endpoint / Template field descriptions](#) on page 735

## Testing endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select the endpoints you want to test from the Endpoint List.

#### **Important:**

This maintenance operation is service affecting.

4. Click **Maintenance > Test Endpoint**.
5. On the Test Endpoint Confirmation page, click **Now** to test the endpoints or do one of the following:
  - Click **Schedule** to test the endpoints at a specified time.
  - Click **Cancel** to cancel the test operation.

### Result

The system displays the **Test Endpoint Report** page, where you can view the test result and error code of the endpoint. Click the **Error Code Description** link to view the error details.

## Using Clear AMW All

**Clear AMW All** is one of maintenance operations listed under the **Maintenance** drop-down on the Manage Endpoints page. You can perform this operation on a single or multiple endpoints from the Endpoint List. In this maintenance operation, for each endpoint, the system runs the following SAT command

```
clear amw all <endpoint>
```

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select the endpoints from the Endpoint List for which you want to use this functionality.
4. Click **Maintenance > Clear AMW All**.
5. On the **Clear AMW All Confirmation** page, click **Now** to perform this task immediately, or do one of the following:
  - Click **Schedule** to perform this task at a specified time.
  - Click **Cancel** to cancel this task.

The system displays a confirmation that the command has been completed and returns you to the Manage Endpoint landing page.

## Using Swap Endpoints

### About this task

Use this functionality to swap location site data between two endpoints of the same type and the same Communication Manager system. For Analog and DCP endpoint types, this functionality also swaps the physical port information. While swapping the endpoint data, you also have the option to assign new location site data to the endpoints.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Swap Endpoints**.
6. On the Swap Endpoints page, enter endpoint extension values in the fields **Endpoint 1** and **Endpoint 2**.

7. Click **Show Details**. The system displays the location site data for each endpoint under the respective endpoint tabs.
8. Click **Commit** to swap data between the two endpoints.
9. To assign new values to the endpoints, perform the following:
  - a. Click the endpoint tab whose data you want to change.
  - b. Select the **Assign data for Endpoint<n>** check box.
  - c. Enter the required values for the endpoint under **Descriptions**.
  - d. Click **Commit**.

## Endpoint list

The endpoint list displays all endpoints associated with Communication Manager that you select. You can perform an advanced search on the endpoint list by using the search criteria. You can apply filters and sort each of the columns in the endpoint list.

| Name                 | Description                                            |
|----------------------|--------------------------------------------------------|
| <b>Name</b>          | The endpoint name.                                     |
| <b>Extension</b>     | The extension of the endpoint.                         |
| <b>Port</b>          | The port of the endpoint.                              |
| <b>Set Type</b>      | The set type of the endpoint.                          |
| <b>COS</b>           | Class Of Service for the endpoint.                     |
| <b>COR</b>           | Class Of Restriction for the endpoint.                 |
| <b>User</b>          | The user to which the endpoint is associated.          |
| <b>Tenant Number</b> | The tenant number to which the endpoint is associated. |
| <b>System</b>        | Communication Manager of the endpoint.                 |

| Button         | Description                                                                        |
|----------------|------------------------------------------------------------------------------------|
| <b>Refresh</b> | Displays the updated information that is available after the last synchronization. |

## Exporting selected endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.

4. Click **Show List**.
5. In **Endpoint List**, select the endpoint that you want to export.
6. Click **More Actions > Export Selected Endpoints**.  
The system displays the **Export Endpoints** page.
7. In the **Schedule Job** field, click one of the following:
  - **Run immediately**
  - **Schedule later**
8. Click **Export**.

## Exporting all endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Export All Endpoints**.  
The system displays the **Export All Endpoints** page.
6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

## Importing endpoints

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Import Endpoints**.  
The system displays the **Import CM Objects** page.
6. In the **Select a file** field, select the required excel file and click **Browse**.
7. Select one of the following in the **Select Error Configuration** field.  
Default value is **Continue processing other records**.
  - **Abort on first error**

- **Continue processing other records**
8. Select one of the following in the **If a matching record already exists** field.  
Default value is **Skip**.
    - **Skip**
    - **Merge**
    - **Delete**
  9. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
  10. Click **Import**.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Download Excel Template**.
6. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and then click **OK**.

## Migration of J1xx endpoints configured as 96x1 SIP set type

If a J-Series endpoint is configured as 96x1 SIP set type on Communication Manager, then from System Manager Release 8.1.3, you can migrate that to J1xx set type. To migrate the set type:

- System Manager and Session Manager must be on Release 8.1.3 and later.
- Communication Manager must be on Release 8.x and later.
- J1xx phone must be on Release 4.0.6.0 and later. It must be registered at least once to Session Manager Release 8.1.3 and later.

### Criteria for migrating 96x1 SIP set type to J1xx set type

If **Current Set Type** configured on Communication Manager is one of the non-Contact Center set types 9608SIP, 9611SIP, 9621SIP, 9641SIP or Contact Center set types 9608SIPCC, 9611SIPCC, 9621SIPCC, 9641SIPCC, or ALIAS of any of these set types, and if a user has one of the following, System Manager marks an endpoint eligible.

- One device connected of type J129, J139, J159, J169, J179, or J189.
- More than one devices connected and has at least one device of type J129, J139, J159, J169, J179, or J189.

When an endpoint is eligible for migration, you can migrate the endpoint to specific Set type(s).

1. If **Current Set Type** configured on Communication Manager is one of the non-Contact Center set types 9608SIP, 9611SIP, 9621SIP, or 9641SIP, then you can migrate to the endpoint as described in the following table.

| Set type | Migrate to |
|----------|------------|
| J129     | J129       |
| J139     | J179       |
| J159     | J179       |
| J169     | J169       |
| J179     | J179       |
| J189     | J179       |

For multiple connected devices, System Manager always displays J179 as the preferred set type in the list of allowed set type for migration.

2. If **Current Set Type** configured on Communication Manager is one of the Contact Center set types 9608SIPCC, 9611SIPCC, 9621SIPCC, or 9641SIPCC, then migrate to the endpoint as described in the following table.

| Set type | Migrate to |
|----------|------------|
| J129     | J179CC     |
| J139     | J179CC     |
| J159     | J179CC     |
| J169     | J169CC     |
| J179     | J179CC     |
| J189     | J179CC     |

For multiple connected devices, System Manager always displays J179CC as the preferred set type in the list of allowed set type for migration.

## Discover 96x1 SIP set type ready for J1xx migration

You can discover the endpoints that are ready for J1xx migration by enabling the **Discover Endpoints Eligible for Migration** job on the **Services > Scheduler > Pending Jobs** page.

By default, the **Discover Endpoints Eligible for Migration** job is disabled. You cannot edit and perform **Schedule Job On Demand** settings for this job.

When the **Discover Endpoints Eligible for Migration** job is executed, System Manager:

- Processes all endpoints on all Communication Managers that have a user associated on the **Users > User Management > Manage Users** page.

For information about the J1xx migration criteria, see “Criteria for migrating 96x1 SIP set type to J1xx set type”.

- Marks the endpoint as **Migration Eligible** on the **Elements > Communication Manager > Endpoints > Manage Endpoints** page, if it meets the current and connected set type criteria.

 **Note:**

System Manager automatically disables the discovery job details after 31 days. If required, the administrator can enable the discovery job again.

Once the **Discover Endpoints Eligible for Migration** job is executed at least once, you can perform an advanced search to see the list of endpoints that are ready for migration.

If any new user is added in System Manager that meets migration criteria, then System Manager processes the endpoint in the next execution of discover job.

### Related links

[Searching for 96x1 SIP set type for J1xx endpoint migration by using advanced search](#) on page 727

## Enabling the Discover Endpoint eligible for migration job

### Procedure

1. On the System Manager web console, click **Services > Scheduler > Pending Jobs**.
2. In the Job List section, select the **Discover Endpoints Eligible for Migration** job, and click **Enable**.
3. On the Enable Confirmation page, click **Continue**.

After enabling the **Discover Endpoints Eligible for Migration** job, it executes daily at 1 A.M according to the System Manager server timezone and continues for 31 days. Once the job completes for consecutive 31 days, System Manager disables the job automatically.

## Searching for 96x1 SIP set type for J1xx endpoint migration by using advanced search

### About this task

On the Manage Endpoint page, System Manager displays the list of endpoints eligible for migration that were discovered in its last run of the **Discover Endpoints Eligible for Migration** job.

 **Note:**

If some endpoints have already been migrated to J-Series phones, System Manager does not display those endpoints.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.

4. Click **Show List**.
5. In the **Endpoint List** section, click **Advanced Search**.
6. In the Criteria section, do the following:
  - a. From the first drop-down field, select the search criterion **Endpoint General**.
  - b. From the second drop-down field, select the operator **Migration Eligible**.
  - c. From the third drop-down field, select the operator **true**.

The options are:

- **true**
- **false**

By default, the value of **Migration Eligible** is set to **false**.

If you want to add a search condition, click the plus sign (+) and select the new criteria as required.

If you want to delete a search condition, click the minus sign (-). This button is available if there is more than one search condition.

7. Click **Search**.

System Manager displays the endpoints that meet the search criteria in the Endpoint List section.

## Migrating set type of selected J1xx endpoint from 96x1 SIP to J1xx set type

### About this task

If a station is configured on Communication Manager with set types 9608SIP, 9611SIP, 9621SIP, 9641SIP, 9608SIPCC, 9611SIPCC, 9621SIPCC, or 9641SIPCC and if there are one or more J-Series phone with type J129, J139, J159, J169, J179, then you must change the set type on Communication Manager or migrate set type to any of the J129, J169, J179, J169CC, J179CC set types.

### **Note:**

- If there are multiple set types, it is recommended to choose a set type that has more feature capabilities. If you select a set type that has lesser feature capabilities, it can result in loss of functionality on that endpoint after the migration.
- For Contact Center set types, select the Contact Center set-type only.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.

4. Click **Show List**.

5. Search for endpoints ready for migration by using **Advanced Search**.

For information, see “Searching for 96x1 SIP set type for J1xx endpoint migration by using advanced search”.

6. Select one or more endpoint, click **More Actions > Migrate Selected Endpoints**.

System Manager displays the Endpoint Migration page.

Depending on the number of connected devices, System Manager displays the 96x1 endpoints that are ready for migration either on the **Same Set-type(s)** tab or on the **Different Set-types** tab.

7. To migrate endpoints that are available on the **Same Set-type(s)** tab, in the Migrate Endpoint List section, do the following:

- a. Select one or more endpoints.
- b. Click **Create New Job**.

8. To migrate endpoints that are available on the **Different Set-types** tab, in the Migrate Endpoint List section, do the following:

a. Do one of the following:

- Select one or more endpoint, and select the set type you want to migrate to in the **Set Type After Migration** column.

Based on **Connected Set Type**, System Manager displays the values in the **Set Type After Migration** column.

For more information, see the “96x1 endpoint to J100-Series migration criteria” section.

- Select one or more endpoint, select the **Default for Set Type After Migration** check box, and then select the default set type you want to migrate to from the drop-down list.

 **Note:**

- If you select the default set type option and also select a value in the **Set Type After Migration** column for one or more endpoints, then System Manager gives precedence to the **Set Type After Migration** column value for migrating the endpoints where the value is provided and migrates all other endpoints to the default set type.
- If the selected default set type is not applicable for one or more endpoints, then migration of those endpoints fail.

b. Click **Create New Job**.

9. On the Migrate Endpoints page, in the Schedule section, perform one of the following:

- Select **Run immediately** to execute the job now.
- Select **Schedule later** to execute the job at a later time.

10. Click **Migrate Endpoints**.

System Manager displays the job status on the:

- **Services > Scheduler > Completed Jobs** page.
- **Endpoint Migration Job History** tab.

### Viewing endpoint migration job history

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.

2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Perform one of the following:
  - Select an eligible endpoint and click **More Actions > Migrate Selected Endpoints**.
  - Click **More Actions > Migrate All Endpoints Ready for Migration**.

System Manager displays the Endpoint Migration page.

6. Click **Endpoint Migration Job History**.
7. Select a job and click **View Job Details**.

System Manager displays the Endpoint Migration Job Details page with the number of successfully migrated endpoints and list of endpoints that have failed during migration. In the Endpoints Failed List section, you can view the failed endpoint and its cause of failure.

## Cancelling an endpoint migration job

### About this task

You can cancel only one job at a time.

### Before you begin

Ensure that the job is in the **RUNNING** state.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Perform one of the following:
  - Select an eligible endpoint and click **More Actions > Migrate Selected Endpoints**.
  - Click **More Actions > Migrate All Endpoints Ready for Migration**.

System Manager displays the Endpoint Migration page.

6. Click **Endpoint Migration Job History**.
7. In the Endpoint Migration Job History section, select a job, and click **Cancel Job**.

System Manager displays the confirmation message.
8. Click **OK**.

System Manager cancels the selected job.

## Deleting endpoint migration job

### About this task

If the job is in the **RUNNING** state, you cannot delete that job.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Perform one of the following:
  - Select an eligible endpoint and click **More Actions > Migrate Selected Endpoints**.
  - Click **More Actions > Migrate All Endpoints Ready for Migration**.

System Manager displays the Endpoint Migration page.

6. Click **Endpoint Migration Job History**.
7. In the Endpoint Migration Job History section, select a job, and click **Delete Job**.

System Manager displays the confirmation message.

8. Click **OK**.

System Manager deletes the selected job.

## Endpoint Migration field descriptions

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Name</b>                                 | The name of the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Extension</b>                            | The extension of the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Current Set Type</b>                     | The current set type of the endpoint that is configured on Communication Manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Connected Set Type</b>                   | The connected set type of the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Set Type After Migration</b>             | <p>The set type after migration of the endpoint.</p> <p>Based on <b>Connected Set Type</b>, System Manager displays the values in the <b>Set Type After Migration</b> column.</p> <p> <b>Note:</b></p> <p>You must select a set type that has more capabilities in the <b>Set Type After Migration</b> column. If you select a set type that has lesser capabilities, it can result in loss of functionality on that endpoint after the migration.</p> |
| <b>User</b>                                 | The user to which the endpoint is associated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Tenant Number</b>                        | The tenant number to which the endpoint is associated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>System</b>                               | The Communication Manager name of the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Button                | Description                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------|
| <b>Create New Job</b> | Displays the Migrate Endpoints page to schedule the endpoint migration job immediately or at a later time. |
| <b>Cancel</b>         | Cancels the changes and returns to the Manage Endpoints page.                                              |

### Endpoint Migration Job History field descriptions

| Name              | Description                                      |
|-------------------|--------------------------------------------------|
| <b>Start Time</b> | The date and time the job is scheduled to start. |
| <b>End Time</b>   | The date and time the job execution completes.   |

*Table continues...*

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>          | The status of the job can be: <ul style="list-style-type: none"> <li>• <b>SUCCESSFUL</b>: When the endpoint migration job is successfully completed.</li> <li>• <b>FAILED</b>: When the endpoint migration job is failed.</li> <li>• <b>PARTIAL_FAILURE</b>: When the endpoint migration job partially fails.</li> <li>• <b>INTERRUPTED</b>: When the endpoint migration job is canceled.</li> <li>• <b>RUNNING</b>: When the endpoint migration job is in progress.</li> <li>• <b>PENDING_EXECUTION</b>: When the endpoint migration job is scheduled.</li> </ul> |
| <b>Job Name</b>        | The job name as displayed on the Scheduler page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Scheduled By</b>    | The name of user who created the job                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Total Scheduled</b> | The total number of records scheduled for migration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Processed*</b>      | The total number of processed records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Successful</b>      | The total number of successful records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Failed</b>          | The total number of failed records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Not Processed*</b>  | The total number of unprocessed records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

 **Note:**

\*: These fields are available only on the Endpoint Migration Job Details page.

| Button                  | Description                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View Job Details</b> | Displays the Endpoint Migration Job Details page with the number of successfully migrated endpoints and list of endpoints that have failed during migration. |
| <b>Cancel Job</b>       | Cancels one job at a time. The job must be in the <b>RUNNING</b> state.                                                                                      |
| <b>Delete Job</b>       | Deletes one or more job. You cannot delete the job that is in the <b>RUNNING</b> state.                                                                      |

### Endpoint Migration Job Details: Endpoints Failed List

| Name                 | Description                                     |
|----------------------|-------------------------------------------------|
| <b>Extension</b>     | The extension of the failed endpoint.           |
| <b>CM Name</b>       | The Communication Manager name of the endpoint. |
| <b>Error Message</b> | The cause of failure.                           |

## Add Endpoint Template

### New Endpoint / Template field descriptions

Use the fields to perform endpoint or template tasks. The page displays exclusive fields that occur for endpoints and templates apart from the **General options**, **Feature Options**, **Site Data**, **Data**

**Module/Analog Adjunct, Abbreviated Call Dialing, Enhanced Call Fwd, and Button Assignment** sections.

### Field descriptions for Endpoints

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>   | Communication Manager to which the endpoint is assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Template</b> | Template that correspond to the set type of the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Set Type</b> | The set type or the model number of the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Name</b>     | <p>The name of the endpoint. The system displays the name on called telephones with display capabilities. In some messaging applications, such as Communication Manager Messaging, you enter the user name (last name first) and the extension to identify the telephone. The name is also used in the integrated directory.</p> <p>When you enter the first name and the last name of the user associated with an endpoint on User Management, the system populates Latin translation of the first name and the last name in the <b>Name</b> field.</p> |

### Field descriptions for Templates

| Name                 | Description                                                                             |
|----------------------|-----------------------------------------------------------------------------------------|
| <b>Set Type</b>      | The set type or the model of the endpoint template.                                     |
| <b>Template Name</b> | The name of the endpoint template. You can enter the name of your choice in this field. |

| Button          | Description                                                           |
|-----------------|-----------------------------------------------------------------------|
| <b>Commit</b>   | Saves the values that you enter and starts the add or edit operation. |
| <b>Schedule</b> | Displays the Job Scheduler where you can schedule the edit operation. |
| <b>Reset</b>    | Clears the values that you enter on the page.                         |
| <b>Cancel</b>   | Cancels the current operation and returns to the previous page.       |

### Extension

The extension for this station.

For a virtual extension, a valid physical extension or a blank can be entered. With blank, an incoming call to the virtual extension can be redirected to the virtual extension “busy” or “all” coverage path.

The extension length must be within 16 digits.

### Port

The Auxiliary and Analog ports assigned to the station are as follows.

| Valid Entry | Usage                                                 |
|-------------|-------------------------------------------------------|
| 01 to 64    | The first and second numbers are the cabinet numbers. |

*Table continues...*

| Valid Entry       | Usage                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A to E            | The third character is the carrier.                                                                                                                                                                                                                                                                                                                             |
| 01 to 20          | The fourth and fifth characters are the slot numbers. G650 has 14 slots.                                                                                                                                                                                                                                                                                        |
| 01 to 32          | The sixth and seventh characters are the port numbers.                                                                                                                                                                                                                                                                                                          |
| x or X            | Indicates that there is no hardware associated with the port assignment since the switch was set up, and the administrator expects that the extension has a non-IP set. Or, the extension had a non-IP set, and it dissociated. Use x for Administered WithOut Hardware (AWOH) and Computer Telephony (CTI) stations, as well as for SBS Extensions.            |
| IP                | Indicates that there is no hardware associated with the port assignment since the switch was set up, and the administrator expects that the extension would have an IP set. This is automatically entered for certain IP station set types, but you can enter for a DCP set with softphone permissions. This changes to the s00000 type when the set registers. |
| xxxVmpp           | Specifies the Branch Gateway. <ul style="list-style-type: none"> <li>• xxx is the Branch Gateway number, which is in the range 001 to 250.</li> <li>• m is the module number, which is in the range 1 to 9.</li> <li>• pp is the port number, which is in the range 01 to 32.</li> </ul>                                                                        |
| Analog Trunk port | Analog trunk port is available with: <ul style="list-style-type: none"> <li>• MM711 and MM714 media modules</li> <li>• TN747 and TN797 circuit packs</li> </ul>                                                                                                                                                                                                 |

### General Options

Use this section to set the general fields for a station.

#### COR

Class of Restriction (COR) number with the required restriction.

#### COS

The Class of Service (COS) number used to select allowed features.

#### Emergency Location Ext

The Emergency Location Extension for this station. This extension identifies the street address or nearby location when an emergency call is made. Defaults to the telephone's extension. Accepts up to sixteen digits.

#### Note:

On the ARS Digit Analysis Table in Communication Manager, 911 must be administered to be call type emer or alrt for the E911 Emergency feature to work properly.

#### Message Lamp Ext

The extension of the station tracked with the message waiting lamp.

#### TN

Use this field to specify a tenant number. You can enter a value from 1 to 250.

#### Coverage Path 1 or Coverage Path 2

The coverage-path number or time-of-day table number assigned to the station.

#### \* **Note:**

If Modified Misoperation is active, a Coverage Path must be assigned to all stations on Communication Manager.

#### Lock Messages

Controls access to voice messages by other users.

| Valid Entry | Usage                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------|
| y           | Restricts other users from reading or canceling the voice messages, or retrieving messages using Voice Message Retrieval. |
| n           | Allows other users to read, cancel, or retrieve messages.                                                                 |

#### Multibyte Language

When you configure endpoints, if the localized display name contains multiscrypt language characters, then you must set the locale or multibyte language. You can set the locale using the **Multibyte Language** field. The possible values for the **Multibyte Language** field are:

- Japanese
- Simplified Chinese
- Traditional Chinese
- Not Applicable

In **User Management > Manage Users > Identity**, if you choose the Simplified Chinese, Traditional Chinese, or Japanese from the **Language Preference** field for a user, the appropriate language is auto populated in the **Multibyte Language** field for the same user. If you choose any other language from the **Language Preference** field, the system displays **Not Applicable** in the **Multibyte Language** field.

#### Continue on Error

When an error occurs, the system provides an option to continue or abort the implementation of parameter changes.

#### Security Code

The security code required by users for specific system features and functions are as follows:

- Extended User Administration of Redirected Calls
- Personal Station Access
- Redirection of Calls Coverage Off-Net
- Leave Word Calling

- Extended Call Forwarding
- Station Lock
- Voice Message Retrieval
- Terminal Self-Administration
- Enterprise Mobility User
- Extension to Cellular
- Call Forwarding
- Posted Messages
- Security Violation Notification
- Demand Printing

The required security code length is administered system wide.

#### Primary Session Manager

The IPv4 and IPv6 addresses of the primary Session Manager.

If the call to the SIP station is routed to a SIP trunk that has a clustered signaling group, then the Invite is sent to the station on primary Session Manager.

#### Secondary Session Manager

The IPv4 and IPv6 addresses of the secondary Session Manager.

If the call to the SIP station is routed to a SIP trunk that has a clustered signaling group and the primary Session Manager is not reachable, then the Invite is sent to the station on secondary Session Manager.

#### **Note:**

Primary Session Manager and Secondary Session Manager fields can be configured from the User Management pane only. You cannot configure these fields from the Manage Endpoint page or Element Cut-through page.

#### System ID

This field can be configured for CS 1000 station types only. This field allows you to leave the field blank or enter a string of up to 9 characters. With Release 8.0 and later, more than one station can use the combination of **System ID** and **Terminal Number**.

With Release 8.0.1 and later, each station must have a unique combination of **System ID** and **Terminal Number**.

#### Terminal Number

This field can be configured for CS 1000 station types only. You can enter numbers in the following range: 0.0.0.0 to 252.1.15.31.

The first digit must be divisible by 4. For example: 0, 4, 8, ..., 252.

#### Attendant

When you select the 9641SIP template type from **Template**, the system enables the **Attendant** check box. If you select this check box, you can administer the endpoint as an attendant.

When you select the **Attendant** check box, the system disables the **Feature Options** and **Group Membership** tabs.

### Feature Options

With Features Options, you can set features unique to a particular voice terminal type.

#### Bridged Call Alerting

Controls how the user is alerted to incoming calls on a bridged appearance.

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | The bridged appearance rings when a call arrives at the primary telephone.                                                                                                                                                                                                                                    |
| n           | The bridged appearance flashes but does not ring when a call arrives at the primary telephone. This is the default.<br><br>If disabled and <b>Per Button Ring Control</b> is also disabled, audible ringing is suppressed for incoming calls on bridged appearances of another telephone's primary extension. |

#### Location

The system displays this field only when you set the **Multiple Locations** field on the system parameters customer options screen to y, and set the **Type** field to H.323 or SIP station types.

| Valid entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 2000   | (Depending on your server configuration, see <i>Avaya Aura® Communication Manager System Capacities Table</i> .) Assigns the location number to a particular station. Allows IP telephones and softphones connected through a VPN to be associated with the branch an employee is assigned to. This field is one way to associate a location with a station. For the other ways and for a list of features that use location, see the Location sections in <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> . |
| blank       | Indicates that the existing location algorithm applies. By default, the value is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

#### Active Station Ringing

Defines how calls ring to the telephone when it is off-hook without affecting how calls ring at this telephone when the telephone is on-hook.

| Valid Entry    | Usage                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| continuous     | All calls to this telephone ring continuously.                                                                                                                                                      |
| single         | Calls to this telephone receive one ring cycle and then ring silently.                                                                                                                              |
| if-busy-single | Calls to this telephone ring continuously when the telephone is off-hook and idle. Calls to this telephone receive one ring cycle and then ring silently when the telephone is off-hook and active. |
| silent         | All calls to this station ring silently.                                                                                                                                                            |

## Auto Answer

In an Expert Agent Environment (EAS) environment, the auto answer setting for an Agent LoginID overrides the endpoint settings when the agent logs in. In EAS environments, the auto answer setting for the Agent LoginID can override a station's setting when an agent logs in.

| Valid entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all         | All ACD and non-ACD calls to an idle station cut through immediately. The agent cannot use automatic hands-free answer for intercom calls. With non-ACD calls, the station rings while the call is cut through. To prevent the station from ringing, activate the <b>ringer-off</b> feature button, provided the Allow Ringer-off with Auto-Answer feature is enabled for the system.                                  |
| acd         | Only ACD split, ACD skill, and direct agent calls cut through. Non-ACD calls to the station ring audibly.<br>For analog stations: <ul style="list-style-type: none"> <li>• Only the ACD split or skill calls and direct agent calls cut through.</li> <li>• Non-ACD calls receive busy treatment. If the station is active on an ACD call and a non-ACD call arrives, the agent receives call-waiting tone.</li> </ul> |
| none        | All calls to the station receive an audible ringing.                                                                                                                                                                                                                                                                                                                                                                   |
| icom        | The user can answer an intercom call from the same intercom group without pressing the intercom button.                                                                                                                                                                                                                                                                                                                |

## MWI Served User Type

Controls the auditing or interrogation of a served user's message waiting indicator (MWI).

| Valid Entries | Usage                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------|
| fp-mwi        | The station is a served user of an fp-mwi message center.                                                                |
| qsig-mwi      | The station is a served user of a qsig-mwi message center.                                                               |
| sip-adjunct   | Used to audit message waiting lamps.                                                                                     |
| blank         | The served user's MWI is not audited or if the user is not a served user of either an fp-mwi or qsig-mwi message center. |

## Coverage After Forwarding

Governs whether an unanswered forwarded call is provided coverage treatment.

| Valid Entry | Usage                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| y           | Coverage treatment is provided after forwarding regardless of the administered system-wide coverage parameters.    |
| n           | No coverage treatment is provided after forwarding regardless of the administered system-wide coverage parameters. |
| s(ystem)    | Administered system-wide coverage parameters determine treatment.                                                  |

## Per Station CPN - Send Calling Number

Determines Calling Party Number (CPN) information sent on outgoing calls from this station.

| Valid Entries | Usage                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| y             | All outgoing calls from the station deliver the CPN information as “Presentation Allowed.”                                     |
| n             | No CPN information is sent for the call.                                                                                       |
| r             | Outgoing non-DCS network calls from the station delivers the Calling Party Number information as “Presentation Restricted.”    |
| blank         | The sending of CPN information for calls is controlled by administration on the outgoing trunk group the calls are carried on. |

## Display Language

| Valid Entry                                             | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| english<br>french<br>italian<br>spanish<br>user-defined | The language that displays on stations.<br><br>Time of day is displayed in 24-hour format (00:00 - 23:59) for all languages except English, which is displayed in 12-hour format (12:00 a.m. to 11:59 p.m.).                                                                                                                                                                                                                                                                                                                                                                                                                |
| unicode                                                 | Displays English messages in a 24-hour format. If no Unicode file is installed, displays messages in English by default.<br><br> <b>Note:</b><br>Unicode display is only available for Unicode-supported telephones. Currently, 4610SW, 4620SW, 4621SW, 4622SW, 16xx, 96xx, 96x1, 9600-series telephones (Avaya one-X Deskphone Edition SIP R2 or later), and Avaya J100 Series IP Phones support Unicode display. Unicode is also an option for DP1020 (aka 2420J) and SP1020 (Toshiba SIP Phone) telephones when enabled for the system. |

## Personalized Ringing Pattern

Defines the personalized ringing pattern for the station. Personalized Ringing allows users of some telephones to have one of 8 ringing patterns for incoming calls. For virtual stations, this field dictates the ringing pattern on its mapped-to physical telephone.

L = 530 Hz, M = 750 Hz, and H = 1060 Hz

| Valid Entries | Usage                  |
|---------------|------------------------|
| 1             | MMM (standard ringing) |
| 2             | HHH                    |
| 3             | LLL                    |
| 4             | LHH                    |
| 5             | HHL                    |
| 6             | HLL                    |

*Table continues...*

| Valid Entries | Usage |
|---------------|-------|
| 7             | HLH   |
| 8             | LHL   |

### Map-to Station

The extension of a physical telephone used for calls to a virtual extension. Cannot be used with an xmobile, xdid or any other virtual extension.

This field is applicable only for the virtual endpoints.

### Hunt-to Station

The extension the system must hunt to for this telephone when the telephone is busy. You can create a station hunting chain by assigning a hunt-to station to a series of telephones.

### Remote Soft Phone Emergency Calls

Tells Communication Manager how to handle emergency calls from the IP telephone.

#### **Caution:**

An Avaya IP endpoint can dial emergency calls (for example, 911 calls in the U.S.). It only reaches the local emergency service in the Public Safety Answering Point area where the telephone system has local trunks. You cannot use an Avaya IP endpoint to dial to and connect with local emergency service when dialing from remote locations that do not have local trunks. Avoid using an Avaya IP endpoint to dial emergency numbers for emergency services when dialing from remote locations. Avaya Inc. is not responsible or liable for any damages resulting from misplaced emergency calls made from an Avaya endpoint. Your use of this product indicates that you have read this advisory and agree to use an alternative telephone to dial all emergency calls from remote locations. If you have questions about emergency calls from IP telephones, go to the Avaya Support website at <http://support.avaya.com>.

Available only if the station is an IP Softphone or a remote office station.

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as-on-local | <p>If the emergency location extension that corresponds to this station's IP address is not administered (left blank), the value as-on-local sends the station emergency location extension to the Public Safety Answering Point (PSAP).</p> <p>If the administrator populates the IP address mapping with emergency numbers, the value as-on-local functions as follows:</p> <ul style="list-style-type: none"> <li>• If the station emergency location extension is the same as the IP address mapping emergency location extension, the value as-on-local sends the station's own extension to the Public Safety Answering Point (PSAP).</li> <li>• If the station emergency location extension is different from the IP address mapping emergency location extension, the value as-on-local sends the IP address mapping extension to the Public Safety Answering Point (PSAP).</li> </ul> |

*Table continues...*

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| block       | Prevents the completion of emergency calls. Use this entry for users who move around but always have a circuit-switched telephone nearby, and for users who are farther away from the server than an adjacent area code served by the same 911 Tandem office. When users attempt to dial an emergency call from an IP Telephone and the call is blocked, they can dial 911 from a nearby circuit-switched telephone instead.                                                                                                                                                                                                                                                                                                                                                                    |
| cesid       | Allows Communication Manager to send the CESID information supplied by the IP Softphone to the PSAP. The end user enters the emergency information into the IP Softphone.<br><br>Use this entry for IP Softphones with road warrior service that are near enough to the server that an emergency call reaches the PSAP that covers the softphone's physical location. If the server uses ISDN trunks for emergency calls, the digit string is the telephone number, provided that the number is a local direct-dial number with the local area code, at the physical location of the IP Softphone. If the server uses CAMA trunks for emergency calls, the end user enters a specific digit string for each IP Softphone location, based on advice from the local emergency response personnel. |
| option      | Allows the user to select the option (extension, block, or cesid) that the user selected during registration and the IP Softphone reported. This entry is used for extensions that can be swapped back and forth between IP Softphones and a telephone with a fixed location.<br><br>The user chooses between block and cesid on the softphone. A DCP or IP telephone in the office automatically selects the extension.                                                                                                                                                                                                                                                                                                                                                                        |

### Bridging Tone for This Extension

Allows you to enable or disable a single burst of tone when a station bridges on to the principal's call.

| Valid Entry | Usage                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | Enables a single burst of tone when a station bridges on to the principal's call.                                                                                                                                                        |
| n           | Disables a single burst of tone when a station bridges on to the principal's call.<br><br>This is the default value for a new SIP station, or when a SIP station upgrades to Communication Manager 8.0 or later from a previous release. |

### Service Link Mode

Use this field to specify the duration of a service link connection. The service link is the combined hardware and software multimedia connection between an H.320 Desktop Video Conferencing (DVC) system and Communication Manager.

The service link is established when a user receives or makes a call during a multimedia, IP softphone, or IP telephone session.

| Valid entry | Usage                                                                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as-needed   | For multimedia, IP softphone, and IP telephone users. The service link remains connected for 10 seconds after the user disconnects a call so that the user can immediately make or receive another call. After 10 seconds, the link is disconnected, and a new link must be established to make or receive a call. |
| permanent   | For call center agents who are constantly making or receiving calls during the multimedia, IP softphone, or IP telephone session. The service link remains connected for the entire duration of the session.                                                                                                       |

### Loss Group

| Valid Entry | Usage                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 to 17     | Determines which administered two-party row in the loss plan applies to each station. Is not displayed for stations that do not use loss, such as x-mobile stations. |

### Speakerphone

Controls the behavior of speakerphones.

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-way       | Indicates that the speakerphone listen-only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2-way       | Indicates that the speakerphone is both talk and listen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| grp-listen  | With Group Listen, a telephone user can talk and listen to another party with the handset or headset while the telephone's two-way speakerphone is in the listen-only mode. Others in the room can listen, but cannot speak to the other party through the speakerphone. The person talking on the handset acts as the spokesperson for the group. Group Listen provides reduced background noise and improves clarity during a conference call when a group needs to discuss what is being communicated to another party.<br><br>Available only with 6400-series and 2420/2410 telephones. |
| none        | Not administered for a speakerphone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### LWC Reception

Use this field to specify the location where the system must store the LWC messages.

| Valid entry | Usage                                                                        |
|-------------|------------------------------------------------------------------------------|
| spe         | Use this option to store the LWC messages on Switch Processor Element (SPE). |
| none        | Use this option if you do not want to store the LWC messages.                |
| auxix       | Use this option to store the LWC messages on the voice messaging system.     |

### Survivable COR

Sets a level of restriction for stations to be used with the survivable dial plan to limit certain users to only to certain types of calls. You can list the restriction levels in order from the most restrictive to least restrictive. Each level has the calling ability of the ones above it.

Available for all analog and IP station types.

| Valid Entries | Usage                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| emergency     | This station can only be used to place emergency calls.                                                                                                                      |
| internal      | This station can only make intra-switch calls. This is the default.                                                                                                          |
| local         | This station can only make calls that are defined as locl, op, svc, or hnpa in the Survivable Gateway Call Controller's routing tables.                                      |
| toll          | This station can place any national toll calls that are defined as fnpa or natl on the Survivable Gateway Call Controller's routing tables.                                  |
| unrestricted  | This station can place a call to any number defined in the Survivable Gateway Call Controller's routing tables. Those strings marked as deny are also denied to these users. |

#### Time of Day Lock Table

| Valid Entry | Usage                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------|
| 1 to 5      | Assigns the station to a Time of Day (TOD) Lock/Unlock table. The assigned table must be administered and active. |
| blank       | Indicates no TOD Lock/Unlock feature is active. This is the default.                                              |

#### Survivable GK Node Name

Any valid previously-administered IP node name. Identifies the existence of other H.323 gatekeepers located within gateway products that offer survivable call features. For example, the MultiTech MVPxxx-AV H.323 gateway family and the SLS function within the Branch Gateways. When a valid IP node name is entered into this field, Communication Manager adds the IP address of this gateway to the bottom of the Alternate Gatekeeper List for this IP network region. As H.323 IP stations register with Communication Manager, this list is sent down in the registration confirm message. With this, the IP station can use the IP address of this Survivable Gatekeeper as the call controller of last resort.

If blank, there are no external gatekeeper nodes within a customer's network. This is the default value.

Available only if the station type is an H.323 station for the 46xx or 96xx models.

#### Media Complex Ext

When used with Multi-media Call Handling, indicates which extension is assigned to the data module of the multimedia complex. Users can dial this extension to place either a voice or a data call, and voice conversion, coverage, and forwarding apply as if the call were made to the 1-number.

| Valid Entry                | Usage                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------|
| A valid BRI data extension | For MMCH, enter the extension of the data module that is part of this multimedia complex. |

*Table continues...*

| Valid Entry             | Usage                                                                                                                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H.323 station extension | For 4600 series IP Telephones, enter the corresponding H.323 station. For IP Softphone, enter the corresponding H.323 station. If you enter a value in this field, you can register this station for either a road-warrior or telecommuter/Avaya IP Agent application. |
| blank                   | Leave this field blank for single-connect IP applications.                                                                                                                                                                                                             |

### AUDIX Name

The voice messaging system associated with the station. Must contain a user-defined adjunct name that was previously administered.

### Call Appearance Display Format

Specifies the display format for the station. Bridged call appearances are not affected by this field. This field is available only on telephones that support downloadable call appearance buttons, such as the 2420 and 4620 telephones.

 **Note:**

This field sets the administered display value only for an individual station.

| Valid Entry       | Usage                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------|
| loc-param-default | The system uses the administered system-wide default value. This is the default.                                 |
| inter-location    | The system displays the complete extension on downloadable call appearance buttons.                              |
| intra-location    | The system displays a shortened or abbreviated version of the extension on downloadable call appearance buttons. |

### IP Phone Group ID

Available for H.323 and SIP station types.

| Valid entry | Usage                                |
|-------------|--------------------------------------|
| 0 to 999    | The Group ID number for the station. |
| blank       |                                      |

### Configuration of IP Phone Group ID on SIP Devices

You can configure the **IP Phone Group ID** field for SIP endpoints on:

- System Manager web console by using one of the following pages:
  - **Elements > Communication Manager > Endpoints > New > Manage Endpoints > Feature Options.**
  - **User Management > Manage Users > New > Communication Profile > CM Endpoint Profile > Extension Editor > Feature Options.**
  - **Elements > Communication Manager > Element Cut-Through.**
- Communication Manager SAT, using the `add station` command on page 3 of the Station form.

- Endpoint using the **Group** field.

 **Note:**

If you manually set the **Group** field on the endpoint to a value other than 0, then the group setting on the endpoint takes precedence over the **IP Phone Group ID** setting on the System Manager web console or Communication Manager station form.

If you manually set the **IP Phone Group ID** field on the System Manager web console or Communication Manager station form to value 0, then the **Group** field setting on the endpoint takes precedence over the **IP Phone Group ID** setting.

If the assigned group ID is not defined as the **Terminal Group Number** on the **Elements > Session Manager > Device and Location Configuration > Device Settings Group** page, the system applies the **Default Group** settings that are defined on the **Elements > Session Manager > Device and Location Configuration > Device Settings Group** page.

For administering **Terminal Group Number**, see *Administering Avaya Aura® Session Manager*.

## Configuring the IP Phone Group ID for an endpoint

### About this task

Use one of the following procedures to configure the **IP Phone Group ID** field on the System Manager web console.

- Click **Elements > Communication Manager > Endpoints > Manage Endpoints**, and perform the following:
  1. Click **New**.  
The system displays the New Endpoint page.
  2. In the **Template** field, select the required template.
  3. In the **Extension** field, type the extension number.
  4. On the **Feature Options** tab, in the **IP Phone Group ID** field, type the group ID for the endpoint.

When you change the group ID of the endpoint, the system displays the following message:

Changes to this field may result in some or all the user's of Avaya SIP phones to reboot once they are not involved in a SIP call or in other important functions.

5. Click **Commit** to save the changes.
- Click **User Management > Manage Users**, and perform the following:
    1. Click **New**.  
The system displays the User Profile | Add page.
    2. On the **Identity** tab, fill the required details.

3. On the **Communication Profile** tab, in PROFILES, click **CM Endpoint Profile**.
4. In the **System** field, select the Communication Manager system.
5. In the **Profile Type** field, select **Endpoint**.
6. In the **Extension** field, type the extension number, and then click the **Editor** button next to the given extension number.

System Manager displays the Edit Endpoint window.

7. In the **Template** field, select the required endpoint template.
8. On the **Feature Options** tab, in the **IP Phone Group ID** field, type the group ID for the endpoint.

When you change the group ID of the endpoint, the system displays the following message:

Changes to this field may result in some or all the user's of Avaya SIP phones to reboot once they are not involved in a SIP call or in other important functions.

9. Click **Commit** to save the changes.

### Next steps

Configure the **Terminal Group Number** field on the **Elements > Session Manager > Device and Location Configuration > Device Settings Group** page.

For administering **Terminal Group Number**, see *Administering Avaya Aura® Session Manager*.

### Always Use

Use this field to enable the following emergency call handling settings:

- A softphone can register irrespective of the emergency call handling settings the user has entered into the softphone. If a softphone dials 911, the value administered in the **Emergency Location Extension** field is used as the calling party number. The user-entered emergency call handling settings of the softphone are ignored.
- If an IP telephone dials 911, the value administered in the **Emergency Location Extension** field is used as the calling party number.
- If an agent dials 911, the physical station extension is used as the calling party number, overriding the value administered in the **LoginID for ISDN Display** field.

Does not apply to SCCAN wireless telephones, or to extensions administered as type H.323.

### Audible Message Waiting

Audible Message Waiting field enables or disables an audible message waiting tone indicating the user has a waiting message consisting of a stutter dial tone when the user goes off-hook.

This field does not control the Message Waiting lamp.

Available only if **Audible Message Waiting** is enabled for the system.

### Auto Select Any Idle Appearance

Auto Select Any Idle Appearance field enables or disables automatic selection of any idle appearance for transferred or conferenced calls. Communication Manager first attempts to find an idle appearance that has the same extension number as the call being transferred or conferenced has. If that attempt fails, Communication Manager selects the first idle appearance.

#### Bridged Idle Line Preference

Use this field to specify that the line that the system selects when you go off hook is always an idle call appearance for incoming bridged calls.

| Valid entry | Usage                                                                     |
|-------------|---------------------------------------------------------------------------|
| y           | The user connects to an idle call appearance instead of the ringing call. |
| n           | The user connects to the ringing bridged appearance.                      |

#### CDR Privacy

Enables or disables Call Privacy for each station. With CDR Privacy, digits in the called number field of an outgoing call record can be blanked on a per-station basis. The number of blocked digits is administered system-wide as CDR parameters.

#### Conf/Trans On Primary Appearance

Enables or disables the forced use of a primary appearance when the held call to be conferenced or transferred is a bridge. This is regardless of the administered value for **Auto Select Any Idle Appearance**.

#### Coverage Msg Retrieval

Allows or denies users in the telephone's Coverage Path to retrieve Leave Word Calling (LWC) messages for this telephone. Applies only if the telephone is enabled for LWC Reception.

#### IP Video

Use this field to specify whether the extension has IP video capability. The system displays this field for H.323 and SIP station types.

#### Data Restriction

Enables or disables data restriction that is used to prevent tones, such as call-waiting tones, from interrupting data calls. Data restriction provides permanent protection and cannot be changed by the telephone user. Cannot be assigned if **Auto Answer** is administered as all or acd. If enabled, whisper page to this station is denied.

#### Direct IP-IP Audio Connections

Use this field to enable direct audio connections between IP endpoints. Direct audio connections save bandwidth resources and improve the sound quality of voice over IP transmissions.

#### Display Client Redirection

Enables or disables the display of redirection information for a call originating from a station with Client Room Class of Service and terminating to this station. When disabled, only the client name and extension or room display. Available only if Hospitality is enabled for the system.

**\* Note:**

This field must be enabled for stations administered for any type of voice messaging that needs display information.

### Select Last Used Appearance

| Valid Entry | Usage                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y           | Indicates a station's line selection is not to be moved from the currently selected line button to a different, non-alerting line button. The line selection on an on-hook station only moves from the last used line button to a line button with an audibly alerting call. If there are no alerting calls, the line selection remains on the button last used for a call. |
| n           | The line selection on an on-hook station with no alerting calls can be moved to a different line button that might be serving a different extension.                                                                                                                                                                                                                        |

### Survivable Trunk Dest

Designates certain telephones as not being allowed to receive incoming trunk calls when the Branch Gateway is in survivable mode.

Available for all analog and IP station types.

| Valid Entry | Usage                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| y           | Allows this station to be an incoming trunk destination while the Branch Gateway is running in survivability mode. This is the default. |
| n           | Prevents this station from receiving incoming trunk calls when in survivable mode.                                                      |

### H.320 Conversion

Use this field to enable the conversion of H.320-compliant calls to voice-only calls for the attendant console.

**\* Note:**

The system can handle only a limited number of conversion calls. Therefore, the number of attendant consoles with H.320 conversion must be limited.

### Idle Appearance Preference

Indicates which call appearance is selected when the user lifts the handset and there is an incoming call.

| Valid Entry | Usage                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------|
| y           | The user connects to an idle call appearance instead of the ringing call.                       |
| n           | The Alerting Appearance Preference is set and the user connects to the ringing call appearance. |

### IP Audio Hairpinning

Enables or disables hairpinning for H.323 or SIP trunk groups. H.323 endpoints are connected through the IP circuit pack without going through the time division multiplexing (TDM) bus. Available only if **Group Type** is h.323 or sip.

#### IP Softphone

Indicates whether or not this extension is either a PC-based multifunction station or part of a telecommuter complex with a call-back audio connection.

Available only for DCP station types and IP Telephones.

#### LWC Activation

Activates or deactivates the Leave Word Calling (LWC) feature. With LWC, internal telephone users on this extension can leave short pre-programmed messages for other internal users.

You must use LWC if:

- The system has hospitality and the guest-room telephones require LWC messages indicating that wakeup calls failed
- The LWC messages are stored in a voice-messaging system

#### LWC Log External Calls

This field can be configured when the set type is XMOBILE. Determines whether or not unanswered external call logs are available to end users. When external calls are not answered, Communication Manager keeps a record of up to 15 calls provided information on the caller identification is available. Each record consists of the latest call attempt date and time.

#### IP Hoteling

When you enable the **(SA8520) - Hoteling Application for IP Terminals** field using the **change system-parameters special-applications** command on Communication Manager, the system displays the **IP Hoteling** field for that extension.

Avaya supports this application with DCP digital terminals but not with IP terminals. Using this feature, you can reassign the extension number for a registered IP telephone.

For more information, see *Avaya Aura® Communication Manager Special Application Features*.

#### Multimedia Early Answer

Enables or disables multimedia early answer on a station-by-station basis.

You must enable the station for the Multimedia Early Answer feature if the station receives coverage calls for multimedia complexes, but is not multimedia-capable. This ensures that calls are converted and the talk path is established before ringing at this station.

#### Mute Button Enabled

Enables or disables the mute button on the station.

#### Per Button Ring Control

Using this option you can enable or disable ring control for every button, provided you have the station user credentials.

| Valid Entries | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y             | <p>To enable Automatic Abbreviated and Delayed ring transition for each call-appr on the station, select ring behavior individually for each call-appr or brdg-appr option.</p> <p>To prevent the system from automatically moving the line selection to a silently alerting call, unless the call was audibly ringing earlier.</p> <p> <b>Note:</b></p> <p>The abrdg-appr option is unavailable for SIP station.</p> |
| n             | <p>To enable the calls on <b>call-appr</b> buttons always to ring the station</p> <p>To enable the calls on <b>brdg-appr</b> buttons always ring or not ring based on the <b>Bridged Call Alerting</b> value</p> <p>To move line selection to a silently alerting call, if the call is not audibly ringing the station</p> <p> <b>Note:</b></p> <p>The abrdg-appr option is unavailable for SIP station.</p>          |

### Precedence Call Waiting

Activates or deactivates Precedence Call Waiting for this station.

### Redirect Notification

Enables or disables redirection notification that gives a half ring at this telephone when calls to this extension are redirected through Call Forwarding or Call Coverage. Must be enabled if LWC messages are stored on a voice-messaging system.

### Restrict Last Appearance

| Valid Entries | Usage                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------|
| y             | Restricts the last idle call appearance used for incoming priority calls and outgoing call originations only. |
| n             | Last idle call appearance is used for incoming priority calls and outgoing call originations.                 |

### EMU Login Allowed

Enables or disables using the station as a visited station by an Enterprise Mobility User (EMU).

### Bridged Appearance Origination Restriction

Restricts or allows call origination on the bridged appearance.

| Valid Entry | Usage                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------|
| y           | Call origination on the bridged appearance is restricted.                                           |
| n           | Call origination on the bridged appearance is allowed. This is normal behavior, and is the default. |

### Voice Mail Number

Displays the complete voice mail dial up number. Accepts a value of up to 24 characters consisting of digits from 0 to 9, asterisk (\*), pound sign (#), ~p (pause), ~w/~W (wait), ~m (mark), and ~s (suppress). This field is supported in the following set types: 9620SIP, 9630SIP, 9640SIP, 9650SIP, 9608SIP, 9611SIP, 9621SIP, 9641SIP, 9608SIPCC, 9611SIPCC, 9621SIPCC, and 9641SIPCC.

#### Music Source

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Music Source</b> | <p>Valid values are 1 to 100 or blank. The value can extend to 250 when you select the Multi Tenancy feature from the system parameter customer option on the Communication Manager.</p> <p><b>Music Source</b> field is applicable for all endpoint set types.</p> <p> <b>Note:</b></p> <p>Select the <b>System Parameter Special Application</b>, and select <b>SA8888 Per Station Music On Hold</b>, Only then you can select the <b>Music source</b> field.</p> |

#### Site Data

This section lets you set information about the Room, Floor, Jack, Cable, Mounting, and Building.

#### Room

| Valid Entry               | Usage                                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Telephone location</i> | Identifies the telephone location. Accepts up to 10 characters.                                                                                                                                              |
| <i>Guest room number</i>  | Identifies the guest room number if this station is one of several to be assigned a guest room and the <b>Display Room Information in Call Display</b> is enabled for the system. Accepts up to five digits. |

#### Floor

A valid floor location.

#### Jack

Alpha-numeric identification of the jack used for this station.

#### Cable

Identifies the cable that connects the telephone jack to the system.

#### Mounting

Indicates whether the station mounting is d(esk) or w(all).

#### Building

A valid building location.

#### Set Color

Indicates the set color. Valid entries include the following colors: beige, black, blue, brown, burg (burgundy), gray, green, ivory, orng (orange), red, teak, wal (walnut), white, and yel (yellow).

You can change the list of allowed set colors by using the Valid Set Color fields on the site-data screen.

#### Cord Length

The length of the cord attached to the receiver. This is a free-form entry, and can be in any measurement units.

#### Headset

Indicates whether or not the telephone has a headset.

#### Speaker

Indicates whether or not the station is equipped with a speaker.

### **Abbreviated Call Dialing**

This section lets you create abbreviated dialing lists for a specific station, and provide lists of stored numbers that can be accessed to place local, long-distance, and international calls; allows you to activate features or access remote computer equipment and select enhanced, personal, system or group lists.

#### Abbreviated Dialing List 1, List 2, List 3

Assigns up to three abbreviated dialing lists to each telephone.

| Valid Entry | Usage                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| enhanced    | Telephone user can access the enhanced system abbreviated dialing list.                                                           |
| group       | Telephone user can access the specified group abbreviated dialing list. Requires administration of a group number.                |
| personal    | Telephone user can access and program their personal abbreviated dialing list. Requires administration of a personal list number. |
| system      | Telephone user can access the system abbreviated dialing list.                                                                    |

#### Personal List

Use this list to establish a personal dialing list for telephone or data module users.

#### Enhanced List

Use this list to establish system-wide or personal lists for speed dialing.

Users access this list to:

- place local, long-distance, and international calls
- activate or deactivate features
- access remote computer equipment.

#### **Note:**

You must activate dialing in the license file before the system programs the Abbreviated Dialing Enhanced List.

#### Group List

You can provide up to 100 numbers for every group list.

## Enhanced Call Fwd

This section allows you to specify the destination extension for the different types of call forwards.

### Forwarded Destination

A destination extension for both internal and external calls for each of the three types of enhanced call forwarding (Unconditional, Busy, and No Reply). Accepts up to 18 digits. The first digit can be an asterisk \*.

Requires administration to indicate whether the specific destination is active (enabled) or inactive (disabled).

### SAC/CF Override

With **SAC/CF Override**, the user of the calling station can override the redirection set by the called station.

| Valid entry | Usage                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ask         | The system prompts the user of the calling station whether the call must follow the redirection path or override the redirection path. The user can type y or n. |
| no          | The user of the calling station cannot override the redirection path of the call. The call follows the redirection path.                                         |
| yes         | The user of the calling station can override the redirection path of the call, provided the called station has at least one idle call appearance.                |

## Button Assignment

On the Manage Endpoints page, under the **Button Assignment** tab, the system displays the following tabs based on the **Set Type** selection:

- **Main Buttons**
- **Feature Buttons**
- **Buttons Modules**
- **Phone View**

### \* Note:

With System Manager Release 8.1.1, the **Phone View** tab is displayed for SIP Endpoints.

You can assign features to the buttons on a phone. You can assign the main buttons for your endpoint by choosing an option from the list for each button.

### \* Note:

On the Manage Endpoint page, when you select the CS 1000 station type and specific set from the **Set** field, System Manager enables or disables the options on **Button Assignment** according to the selected set of the CS 1000 station type.

## Field descriptions

### Endpoint Configurations:

The Favorite Button and Button Label configurations are available on the 9608, 9611, 9621, 9641 SIP, 96x1SIPCC, J-Series, and CS 1000 endpoints.

The Favorite Button and Button Label features function when the endpoint is associated to a user with the Session Manager profile.

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Favorite</b>     | <p>The favorite button.</p> <p> <b>Note:</b></p> <p>You can mark maximum nine buttons as favorites on an endpoint, which includes the configured contacts on the phone.</p> <p>The <b>Favorite</b> button is disabled for the <b>call-app</b> and <b>bridge-app</b> button features. Therefore, you cannot select these button features as a favorite.</p> <p>To set the <b>Auto Dial</b> button as a favorite, or to set <b>Button Label</b> for auto dial, you must specify the <b>Dial Number</b>.</p> |
| <b>Button Label</b> | <p>The personalized button label that is displayed on the phone.</p> <p> <b>Note:</b></p> <p>The button label is not localized on the phone.</p>                                                                                                                                                                                                                                                                                                                                                          |

#### Button Configurations:

| Name                                    | Description                                                         |
|-----------------------------------------|---------------------------------------------------------------------|
| <b>Button Number on Phone</b>           | The button number that is available on the phone.                   |
| <b>Button Number Administered in CM</b> | The button number that is administered on Communication Manager.    |
| <b>Button Feature or Feature</b>        | The button feature that is available on the phone.                  |
| <b>Argument</b>                         | The argument for the button feature that is available on the phone. |

#### Phone view layout of SIP Endpoints

With System Manager Release 8.1.1, you can view the read only phone view layout of SIP Endpoints when the SIP endpoint is registered with Session Manager.

The **Phone View** tab displays the data based on the **Set Type** configuration on the Manage Endpoints page. It is supported only for the following SIP endpoints: J1xx, 96x1 SIP, and 96x0 SIP set types.

The system displays the tabular layout of feature buttons based on the key number ordering of the endpoint.

If the endpoint supports the following two button types, the **Phone View** tab also displays the data about these buttons, if they are configured.

- Contact name on the endpoint then text **Contact** is displayed on phone view instead of the actual contact name available in the customize key on the endpoint.

Example: If the key layout customization contains Calendar, its App on the endpoint, then on the **Phone View** tab, the value is displayed as **Calendar (App)**.

- App (Application) on the endpoint then **App** is appended to key layout customization while displaying on the phone view.

**Endpoints that support key layout customization**

- If the endpoints support the key layout customization, then the phone key numbering is displayed on **Phone View** as customized by the user on the endpoint.

**Endpoints that do not support key layout customization**

If the endpoints do not support the key layout customization, then the phone key numbering is displayed as administered on Communication Manager.

Examples of endpoints that do not support the key layout customization are: J129, J139, 9641SIP, and 9641SIPCC.

Endpoint display mode

The phone can be set to use either the full screen width (single-column mode) or just a half-width (dual-column mode) for each programmable appearance and feature button.

Full screen width (single-column mode)

Each programmed button feature occupies the full width of the screen. The physical buttons on both sides of the display are used to control the button feature. However, the button status is only shown by the left-hand button. In this mode, appearance button labels also show a call status icon (for example: idle, alerting, connected).

Following is an example of endpoint display mode in full screen width.

The number in the following example corresponds to the **Button Number on Phone** column on the **Phone View** tab of the Add/Edit Endpoint page.

The number in the following table corresponds to the **Button Number on Phone** column on the **Phone View** tab of the Endpoint page.

Half-width (dual-column mode)

Each programmed button occupies one half of the screen line on which it is displayed, either the right-hand or left-hand side. The adjacent physical button on that side of the display is used to indicate the button's status and to control the button feature.

Following is an example of endpoint display mode in half-width screen.

The number in the following example corresponds to the **Button Number on Phone** column on the **Phone View** tab of the Add/Edit Endpoint page.

### Profile settings field descriptions

#### \* Note:

Profile Settings is available for the 9608, 9611, 9621, 9641 SIP, 96x1SIPCC, J-Series, and CS 1000 endpoints.

Profile Settings work when the endpoint is associated to a user with a Session Manager profile.

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Personalized Ringing</b>   | <p>The option to set a personalized ring tone for an incoming call. The options are:</p> <ul style="list-style-type: none"> <li>• Classic Tone, with 8 options</li> <li>• Cheerful</li> <li>• Chimes</li> <li>• Telephone Bell</li> <li>• Xylophone</li> <li>• Drum Beat</li> <li>• Shimmer</li> </ul> <p> <b>Note:</b></p> <p>The Personalized Ringing parameter is available on the Communication Manager Release 6.2 and 6.3 templates.</p> <p>However, the parameter does not apply to Release 6.2 and earlier Avaya Advanced SIP Telephony (AST) endpoints. In some cases, the Avaya EST endpoints might overwrite the newly configured value of the parameter. For example, an endpoint where the related ringing parameter called Ringer Cadence is set to a value other than 1. In this case, the endpoint sets the Personalized Ringing parameter to the value of Ringer Cadence within a few minutes of the change. The reset can also happen during the next login of the endpoint.</p> <p>Session Manager was modified to reduce the instances of this occurrence. The default value of Ringer Cadence is set to 1 for any new Device Settings Groups added to Release 6.3.8.</p> <p>You can set the parameter on the <b>Device and Location Configuration &gt; Device Settings Groups</b> page from the <b>Elements &gt; Session Manager</b> link.</p> |
| <b>Call Pickup Indication</b> | <p>The option to set ring tones to alert you about an incoming call. The options are:</p> <ul style="list-style-type: none"> <li>• <b>None:</b> No pickup indication for an incoming call.</li> <li>• <b>Audible:</b> Audible ringing indicates an incoming call.</li> <li>• <b>Visual:</b> LED flashes indicate an incoming call.</li> <li>• <b>Both:</b> Both audible ringing and LED flashes indicate an incoming call.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

The options are:</p> <ul style="list-style-type: none"> <li>• <b>12 Hour.</b></li> <li>• <b>24 Hour.</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Advance Options Presence integration

| Name               | Description                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Away Timer</b>  | <p>The option to enable the automatic away timer for presence indication. The options are:</p> <ul style="list-style-type: none"> <li>• <b>On.</b></li> <li>• <b>Off.</b></li> </ul> |
| <b>Timer Value</b> | <p>The option to specify a value for the automatic <b>Away Timer</b>. The <b>Timer Value field</b> accepts a value from 5 to 480.</p>                                                |

Support of common parameter across endpoint template

With Release 8.1.1, when you create a SIP endpoint, the system retains the common parameter information so that when you log in to SIP endpoints of the same type or of another type, all your SIP endpoints are able to retrieve and update any of the common parameters they utilize.

The following common parameters are available on the **Profile Settings** tab on the **Elements > Communication Manager > Endpoints > Manage Endpoints** page of System Manager web console.

- **Audio Path**
- **Away Timer**
- **Away Timer Value**
- **Background Logo**
- **Button Clicks**
- **Call Pickup Indication**
- **Dialing Option**
- **Headset Signaling**
- **Personalized Ringing**
- **Phone Screen**
- **Phone Screen on Calling**
- **Redial**
- **Show Quick Touch Panel**
- **Time Format**
- **User Preferred Language**

The following common parameters are available on the **Button Assignment** tab on the **Elements > Communication Manager > Endpoints > Manage Endpoints** page of System Manager web console.

- **Favorite**
- **Button Label**

 **Note:**

- When you make changes to a common parameter from System Manager, the system gives precedence to that value as System Manager values are from a well-defined common parameter range. But when you make changes to a common parameter from an endpoint, the system gives precedence to that value only if the value is from the well-defined common parameter range. If the value is not from the well-defined common parameter range, then the value is only stored for that device family and the common value for that parameter is not changed.
- Family-specific data is not changed.

If you have more than one SIP endpoint type, the following parameters are synchronized across all your SIP endpoints, which support these parameters according to the following table.

| Common parameters       | 1XC<br>Model:<br>n/a | 96x0<br>Model:<br>96xx | 96x1<br>Model:<br>: 96x1 | J1x9<br>Model:<br>J100 | ADA<br>Model:<br>CS1k-<br>xxx | Equinox<br>Model:<br>AvayaClient<br>Services | Vantage<br>Model:<br>K1xx | H Series<br>Model:<br>H1xx, H175 |
|-------------------------|----------------------|------------------------|--------------------------|------------------------|-------------------------------|----------------------------------------------|---------------------------|----------------------------------|

### Group Membership

This section describes the different groups that an extension can be a member of. Select the station you want to group, and then choose the group from the drop-down box, before you click **Commit**.

#### Understanding groups

Your voice system uses groups for a number of different purposes. This topic describes the different groups that an extension can be a member of. However, your voice system might include other types of groups such as trunk groups. For more information on groups, see *Administering Avaya Aura® Communication Manager*, 03-300509.

Your voice system can have any of the following types of groups set up:

| Type                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group page            | Group page is a feature that allows you to make an announcement to a pre-programmed group of phone users. The announcement is heard through the speakerphone built into some sets. Users will hear the announcement if their set is idle. Users cannot respond to the announcement.                                                                                                                                                                                                |
| coverage answer group | A coverage answer group lets up to 100 phones ring simultaneously when a call is redirected to the group.                                                                                                                                                                                                                                                                                                                                                                          |
| coverage path         | <p>A coverage path is a prioritized sequence of extensions to which your voice system will route an unanswered call.</p> <p>For more information on coverage paths, see “Creating Coverage Paths” in the <i>Administering Avaya Aura® Communication Manager, 03-300509</i>.</p>                                                                                                                                                                                                    |
| hunt group            | <p>A hunt group is a group of extensions that receive calls according to the call distribution method you choose. When a call is made to a certain phone number, the system connects the call to an extension in the group. Use hunt groups when you want more than one person to be able to answer calls to the same number.</p> <p>For more information on hunt groups, see “Managing Hunt Groups” in the <i>Administering Avaya Aura® Communication Manager, 03-300509</i>.</p> |
| intercom group        | <p>An intercom group is a group of extensions that can call each other using the intercom feature. With the intercom feature, you can allow one user to call another user in a predefined group just by pressing a couple of buttons.</p> <p>For more information on intercom groups, see “Using Phones as Intercoms” in the <i>Administering Avaya Aura® Communication Manager, 03-300509</i>.</p>                                                                                |
| pickup group          | <p>A pickup group is a group of extensions in which one person can pick up calls of another person.</p> <p>For more information on pickup groups, see “Adding Call Pickup” in the <i>Administering Avaya Aura® Communication Manager, 03-300509</i>.</p>                                                                                                                                                                                                                           |

| Type                        | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| terminating extension group | <p>A Terminating Extension Group (TEG) allows an incoming call to ring as many as 4 phones at one time. Any user in the group can answer the call.</p> <p>For more information on terminating extension groups, see “Assigning a Terminating Extension Group” in the <i>Administering Avaya Aura® Communication Manager</i>, 03-300509.</p> |

## Edit Endpoint Extension field descriptions

| Name                                    | Description                                                           |
|-----------------------------------------|-----------------------------------------------------------------------|
| <b>System</b>                           | The list of Communication Manager systems from where you can select.  |
| <b>Extension</b>                        | The extension of the device that you want to change.                  |
| <b>New Extension</b>                    | The new extension for the device.                                     |
| <b>Emergency location extension</b>     | The existing extension for the emergency location of your device.     |
| <b>New emergency location extension</b> | The new extension for the existing emergency location of your device. |
| <b>Message lamp extension</b>           | The existing extension for the message lamp of your device.           |
| <b>New message lamp extension</b>       | The new extension for the message lamp of your device.                |

| Button          | Description                                |
|-----------------|--------------------------------------------|
| <b>Commit</b>   | Saves the new extension.                   |
| <b>Schedule</b> | Saves the extension at the scheduled time. |
| <b>Reset</b>    | Clears all entries.                        |
| <b>Cancel</b>   | Returns to the previous page.              |

## Bulk Add Endpoint field descriptions

| Name                        | Description                                                              |
|-----------------------------|--------------------------------------------------------------------------|
| <b>Template</b>             | The template for the endpoints.                                          |
| <b>Station name prefix</b>  | The prefix name that the system displays for each endpoint that you add. |
| <b>System</b>               | The list of Communication Manager systems.                               |
| <b>Available extensions</b> | The list of extensions that are available.                               |
| <b>Enter extensions</b>     | The extensions that you want to use.                                     |

| Button          | Description                                     |
|-----------------|-------------------------------------------------|
| <b>Commit</b>   | Adds the endpoints in bulk.                     |
| <b>Schedule</b> | Adds the station in bulk at the scheduled time. |

| Button | Description                   |
|--------|-------------------------------|
| Clear  | Undoes all entries.           |
| Cancel | Returns to the previous page. |

## Swap Endpoints field descriptions

| Name                                      | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Assign data for Endpoint &lt;n&gt;</b> | An option to assign new values of location site data to an endpoint.<br><br>When you select this check box for an endpoint, the system copies the location site data values of this endpoint to the second endpoint where this check box is clear. If you select the check boxes for both endpoints, the system copies new location site data to respective endpoints. The system does not swap values. |
| <b>System</b>                             | Communication Manager to which the endpoint is assigned. The system is listed in the Communication Manager List page.                                                                                                                                                                                                                                                                                   |
| <b>Endpoint 1</b><br><b>Endpoint 2</b>    | The existing endpoint extension number on the selected Communication Manager.                                                                                                                                                                                                                                                                                                                           |

| Button   | Description                                                   |
|----------|---------------------------------------------------------------|
| Commit   | Performs the action that you initiate.                        |
| Schedule | Performs the action at the specified time.                    |
| Cancel   | Cancels your current action and returns to the previous page. |

## Error codes

The following table lists only the common error codes for Busyout, Release, Test, and Reset commands lists.

In addition to these, many maintenance objects have other unique error codes. For information about the applicable maintenance object, see *Avaya Aura® Communication Manager Alarms, Events, and Logs Reference*.

| Error code | Command result | Description/Recommendation                                                                                                                                                                                                                                |
|------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | ABORT          | System resources are unavailable to run command. Try the command again at 1-minute intervals up to 5 times.                                                                                                                                               |
| 0          | ABORT          | Internal system error. Retry the command at 1-minute intervals up to 5 times.                                                                                                                                                                             |
| 1005       | ABORT          | A DS1 interface circuit pack could not be reset because it is currently supplying the on-line synchronization reference. Use <b>set synchronization</b> to designate a new DS1 interface circuit pack as the on-line reference, then try the reset again. |
| 1010       | ABORT          | Attempt was made to busyout an object that was already busied out.                                                                                                                                                                                        |
| 1011       | ABORT          | Attempt was made to release an object that was not first busied out.                                                                                                                                                                                      |

*Table continues...*

| Error code              | Command result | Description/Recommendation                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1015                    | ABORT          | A reset of this circuit pack requires that every maintenance object on it be in the out-of-service state. Use busyout board to place every object on the circuit pack in the out-of-service state, and try the reset again.                                                                                                                                                                                                       |
| 1026                    | ABORT          | The specified TDM bus cannot be busied out because the control channel or system tones are being carried on it. Use <code>set tdm PC</code> to switch the control channel and system tones to the other TDM bus.                                                                                                                                                                                                                  |
| 2012 2500               | ABORT          | Internal system error.                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2100                    | ABORT          | System resources to run this command were unavailable. Try the command again at 1-minute intervals up to 5 times.                                                                                                                                                                                                                                                                                                                 |
| 62524<br>62525<br>62526 | ABORT          | Maintenance is currently active on the maximum number of maintenance objects that the system can support. A common cause is that the system contains a large number of administered stations or trunks with installed circuit packs that are not physically connected. Resolve as many alarms as possible on the station and trunk MOs, or busyout these MOs to prevent maintenance activity on them. Then try the command again. |
|                         | NO BOARD       | The circuit pack is not physically installed.                                                                                                                                                                                                                                                                                                                                                                                     |
| 2100                    | EXTRA BD       | This result can appear for Maintenance/Test, Announcement circuit packs MC Call Classifier, Tone Detector, or Speech Synthesis circuit packs. Each of these circuit packs has restrictions on how many can be installed in the system or in a port network, depending on system configuration. Remove any extra circuit packs.                                                                                                    |
| 1                       | FAIL           | For reset commands, the circuit pack was not successfully halted.                                                                                                                                                                                                                                                                                                                                                                 |
| 2                       | FAIL           | For reset commands, the circuit pack was not successfully restarted after being halted. For both results replace the circuit pack.                                                                                                                                                                                                                                                                                                |
|                         | FAIL           | For information about the applicable maintenance object from the <b>Maintenance Name</b> field, see <i>Avaya Aura® Communication Manager Alarms, Events, and Logs Reference</i> .                                                                                                                                                                                                                                                 |
|                         | PASS           | The requested action successfully completed. If the command was a reset, the circuit pack is now running and should be tested.                                                                                                                                                                                                                                                                                                    |

## Auto answer

When you administer **Auto Answer**, the **Communication Manager Endpoint Manager** field displays the following behavior with regards to the **Mute Speakerphone Interaction**, the **Auto Answer** field and the **int aut-an** button:

1. The system does not display the **Turn On Mute for Remote Off-hook Attempt** field for the following configurations:
  - When **Auto Answer** has a value other than **none**.
  - When you enable the **int-aut-an** button for an endpoint.

2. If you enable the **Turn On Mute for Remote Off-hook Attempt** field in the endpoints page, **Communication Manager Endpoint Manager** field does not permit the following administration:
- **Auto Answer** values other than **none**.
  - **int-aut-an** button administration.

## Auto answer field descriptions

In **Expert Agent Environment (EAS)** environment, the auto answer setting for an **Agent LoginID** overrides the endpoint settings when the agent logs in.

| Valid entry | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>  | All ACD and non-ACD calls to an idle station cut through immediately. The agent cannot use automatic hands-free answer for intercom calls. With non-ACD calls, the station rings while the call is cut through. To prevent the station from ringing, activate the ringer-off feature button, provided the <b>Allow Ringer-off with Auto-Answer</b> feature is enabled for the system.                                                                                                    |
| <b>acd</b>  | Only ACD split, ACD skill, and direct agent calls cut through. Non-ACD calls to the station ring tone.<br>For analog stations: <ul style="list-style-type: none"> <li>• Only ACD can perform: <ol style="list-style-type: none"> <li>1. Split calls and Skill calls</li> <li>2. Direct agent calls cut through</li> </ol> </li> <li>• Non-ACD calls receive busy tone. If the station is active on an ACD call and a non-ACD call arrives, the agent hears call-waiting tone.</li> </ul> |
| <b>none</b> | All calls to the station receive a ringing tone.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>icom</b> | The user can answer an intercom call from the same intercom group without pressing the <b>intercom</b> button.                                                                                                                                                                                                                                                                                                                                                                           |

## Turn On Mute for Remote Off-hook Attempt

Using the **Telecommuter** mode of a soft phone or an ASAI, users can control the desk phone remotely. However, users can remotely hear the conversations, which might be considered a privacy breach.

The **Turn On Mute for Remote Off-hook Attempt** field prevents the potential privacy breach in the following manner.

- When users enable the **Turn On Mute for Remote Off-hook Attempt** field on the station screen, any off-hook event on the desk phone turns on the **Mute** button
- When the **Mute** button is active, the user cannot remotely hear conversations

This feature applies to Calls received or originated remotely from soft phones in a shared control mode and Calls received or originated remotely by using ASAI in H.323 configuration. The Communication Manager controls the signaling by activating the mute button for the off-hook event.

## Use case scenario for endpoints set type

### Change Set type of an Endpoint

To change **Set Type** of an **Endpoint**, for example to change from 9630SIP to 9641SIP, do one of the following:

- To change the **Set Type** of an **Endpoint**, default template or custom template of the **Set Type** to be updated can be applied from Endpoint editor, Global Endpoint change or User Management Communication profile section. This operation applies the values of templates in the end point fields and overwrites the values that you entered.
- To change the **Set Type** of an **Endpoint** and keep current data of endpoint such as **COR**, **COS**, **loss group**, do one of the following:
  - **Global Endpoint Change** For more information see Changing endpoint parameters globally.
  - **Element Cut Through** For more information see Element Cut Through.

## Configuring the Feature buttons

### Adding a Feature button to the SIP endpoint

#### About this task

Use this procedure to add a Feature button to the SIP endpoint.

#### Before you begin

1. Select a set type of the SIP endpoint that supports the Feature button that you want to add.
2. For the SIP set type that you selected, configure the required endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide*.

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, click **New** to add a new endpoint.

The system displays the New Endpoint page.

4. In the **Template** field, click the Communication Manager template that you configured for the set type of your SIP endpoint.
5. On the **Feature Options** tab:
  - a. Enter the required configuration parameters.
  - b. In the **Features** list, select the features for the SIP endpoint.

6. On the **Button Assignment** tab:
  - a. Click **Feature Buttons**.
  - b. In **Endpoint Configurations**, in the **Button Label** field, type a name for the button. For example, call pick up.
  - c. In **Button Configurations**, in the **Button Feature** field, click the feature button that you want to add. For example, click **call—pkup**.
7. Click **Commit**.

The SIP endpoint displays the **Feature** button that you added.

## Adding the Call Pickup button on an endpoint

### About this task

Use this procedure to specify the number of times that an endpoint must ring for call pick up. For example, System Manager 7.0 supports a Triple Ringer.

### Before you begin

1. Select a set type for your endpoint from the following:
  - 9620
  - 9630
  - 9640
  - 9650
  - 9608
  - 9611
  - 9621
  - 9641
2. For the endpoint set type that you selected, configure the required endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide*.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, click **New** to add a new endpoint.

The system displays the New Endpoint page.
4. In the **Template** field, click the Communication Manager template that you configured for the set type of your SIP endpoint.
5. On the **Feature Options** tab:
  - a. Enter the required configuration parameters.
  - b. In the **Features** list, select the features for the SIP endpoint.

6. On the **Button Assignment** tab:
  - a. Click **Feature Buttons**.
  - b. In **Endpoint Configurations**, in the **Button Label** field, type `Call Pickup`.
  - c. In **Button Configurations**, in the **Button Feature** field, click **call-pkup**.
  - d. In the **Rg** field, type the number of times that the endpoint must ring for the call pickup: The options are: `continuous`, `if-busy-silent`, `if-busy-single`, `no-ring`, `single`, `triple`.
7. Click **Commit**.

The endpoint displays the **Call Pickup** button that rings three successive times for call pick up.

## Adding the Service Observe button on a SIP endpoint

### About this task

Use this procedure to add the **Service Observe** button, which is useful in the Contact Center environment for managing and monitoring agent calls. You can add the **Service Observe** button on SIP endpoints in the following modes:

- **listen—only** : To monitor agent calls without interrupting the call
- **so-coach** : To coach an agent during the call

### Before you begin

- Select a set type for your SIP endpoint from the following:
  - 9608SIPCC
  - 9611SIPCC
  - 9621SIPCC
  - 9641SIPCC
- You must configure the endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide* .

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, click **New** to add a new endpoint.  
The system displays the New Endpoint page.
4. In the **Template** field, click the Communication Manager template that you configured for the set type of your SIP endpoint.
5. On the **Feature Options** tab:
  - a. Enter the required configuration parameters.
  - b. In the **Features** list, select the features for the SIP endpoint.

6. On the **Button Assignment** tab:
  - a. Click **Feature Buttons**.
  - b. In **Endpoint Configurations**, in the **Button Label** field, type `Service Observe`.
  - c. In **Button Configurations**, in the **Button Feature** field, click **sip-sobsv** mode. The options are:
    - **listen-only**
    - **so-coach**
7. Click **Commit**.

The endpoint displays the **Service Observe** button that you added.

## Adding the VOA Repeat button on a SIP endpoint

### Before you begin

- Select a set type for your SIP endpoint from the following:
  - 9608SIPCC
  - 9611SIPCC
  - 9621SIPCC
  - 9641SIPCC
- Configure the required endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide* .

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, click **New** to add a new endpoint.

The system displays the New Endpoint page.
4. In the **Template** field, click the Communication Manager template that you configured for the set type of your SIP endpoint.
5. On the **Feature Options** tab:
  - a. Enter the required configuration parameters.
  - b. In the **Features** list, select the features for the SIP endpoint.
6. On the **Button Assignment** tab:
  - a. Click **Feature Buttons**.
  - b. In **Endpoint Configurations**, in the **Button Label** field, type `VOA Repeat`.
  - c. In **Button Configurations**, in the **Button Feature** field, click **VOA Repeat**.
7. Click **Commit**.

The endpoint displays the **VOA Repeat** button that you added.

## Adding an Agent skill on a SIP endpoint

### Before you begin

1. Select a set type for your SIP endpoint from the following:
  - 9608SIPCC
  - 9611SIPCC
  - 9621SIPCC
  - 9641SIPCC
2. Configure the required endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide*.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, click **New** to add a new endpoint.  
The system displays the New Endpoint page.
4. In the **Template** field, click the Communication Manager template that you configured for the set type of your SIP endpoint.
5. On the **Feature Options** tab:
  - a. Enter the required configuration parameters.
  - b. In the **Features** list, select the features for the SIP endpoint.
6. On the **Button Assignment** tab:
  - a. Click **Feature Buttons**.
  - b. In **Endpoint Configurations**, in the **Button Label** field, type a name for the agent skill.
  - c. In **Button Configurations**, in the **Button Feature** field, click **add-rem-sk**.
7. Click **Commit**.

The SIP endpoint displays the agent skill that you added.

## Creating a Single Administration Dual Registration endpoint

### Before you begin

1. Select a set type for your endpoint from the following:
  - 9608
  - 9610
  - 9611
  - 9620
  - 9621

- 9630
- 9641
- 9650

 **Note:**

The system enables the **Allow H.323 and SIP Endpoint Dual Registration** field only for the set types mentioned in the list.

2. For the endpoint set type that you selected, configure the required endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide*.

## Procedure

1. On the System Manager web console, click **Users > User Management**.
2. In the navigation pane, click **Manage Users**.
3. On the User Management page, click **New**.
4. On the New User Profile page, do the following:
  - a. Click **Communication Profile > CM Endpoint Profile**.
  - b. In the **Set Type** field, click the endpoint set type that you want to add.  
For example, click **9608**.
  - c. Select **Allow H.323 and SIP Endpoint Dual Registration** .  
For more information, see *CM Endpoint Profile field descriptions*.
5. Click **Commit**.

## Enabling Reachability on a SIP endpoint

### Before you begin

1. Select a set type for your SIP endpoint from the following:
  - 9608SIP
  - 9611SIP
  - 9621SIP
  - 9641SIP
  - 9608SIPCC
  - 9611SIPCC
  - 9621SIPCC
  - 9641SIPCC
2. Configure the required endpoint template on Communication Manager. For more information, see *Administering Communication Manager Guide*.

## Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. On the Endpoints page, click **New** to add a new endpoint.

The system displays the New Endpoint page.

4. In the **Template** field, click the Communication Manager template that you configured for the set type of your SIP endpoint.
5. In the General Options tab, perform the following:
  - a. In the **Reachability** field, click **System**.
  - b. Select the **Enable Reachability for Domain Control SIP Stations** check box.
6. Click **Commit**.

## Use Element Cut Through

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Manage Endpoints**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Select the Communication Manager endpoint, click **Switch to Classic View > Edit**.
5. On the Element Cut Through page, select **Set Type** to update the template.
6. Click **Enter** to commit the endpoint update.

The updated endpoint is in sync with the System Manager.

---

## Hunt Group

### Hunt Groups

Use the Hunt Groups feature to set up a group of extensions that can handle multiple calls to a single telephone number. You can choose the call distribution method to route calls. For each call to the number, the system hunts for an available extension in the hunt group, and connects the call to that extension.

A hunt group is especially useful when you expect a high number of calls to a particular telephone number. A hunt group might consist of people who are trained to handle calls on specific topics. For example, the group might be a:

- Benefits department within your company
- Service department for products that you sell

- Travel reservations service
- Pool of attendants

A hunt group might also consist of a group of shared telecommunications facilities. For example, the group might be a:

- Modem pool
- Group of data-line circuit ports
- Group of data modules

## Hunt Group List field descriptions

**Hunt Group List** displays all the Hunt Groups that are associated with the selected Communication Manager. You can view the usage list of the extension of the hunt group. You can also apply filters and sort each of the columns in **Hunt Group List**.

When you click **Refresh**, you can view the updated information that is available after the last synchronization operation.

| Name                   | Description                                                       |
|------------------------|-------------------------------------------------------------------|
| <b>Group Number</b>    | The group number of the hunt group.                               |
| <b>Group Name</b>      | The group name of the hunt group.                                 |
| <b>Group Extension</b> | The group extension of the hunt group.                            |
| <b>Group Type</b>      | The group type of the hunt group.                                 |
| <b>Tenant Number</b>   | The tenant number of the hunt group.                              |
| <b>System</b>          | The name of Communication Manager associated with the hunt group. |

## Adding a hunt group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Groups > Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Hunt Group List** section, click **New**.
6. On the New Hunt Group page, in the **General options (O)**, **Message Center Parameters (C)**, and **Group Members (M)** sections, complete the mandatory fields that are marked with a red asterisk (\*).
7. To add the hunt group, click **Commit** or do one of the following:
  - To add the hunt group at the specified time, click **Schedule**. On the Job Scheduler page, set the time, and click **Schedule**.
  - To cancel the operation, click **Cancel**.

## Editing a hunt group

### Procedure

1. On the System Manager web console, click **Elements** > **Communication Manager**.
2. In the navigation pane, click **Groups** > **Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Hunt Group List** section, select the hunt group you want to edit, and do one of the following:
  - Click **Edit**.
  - Click **View** > **Edit**.
6. On the **Edit Hunt Group** page, edit the required fields.
7. Click **Commit** to save the changes.

## Viewing a hunt group

### About this task

Use the following procedure to view the parameters of a hunt group.

### Procedure

1. On the System Manager web console, click **Elements** > **Communication Manager**.
2. In the navigation pane, click **Groups** > **Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Hunt Group List** section, select the hunt group.
6. Click **View**.

On the View Hunt Group page, you cannot edit the fields. To go to the Edit Hunt Group page, click **Edit**.

## Deleting a hunt group

### Procedure

1. On the System Manager web console, click **Elements** > **Communication Manager**.
2. In the navigation pane, click **Groups** > **Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.

5. In the **Hunt Group List** section, select a hunt group, and click **Delete**.
6. On the Delete Hunt Group Confirmation page, do one of the following:
  - To delete the hunt group immediately, click **Delete**.
  - To delete the hunt group at the specified time, click **Schedule**. On the Job Scheduler page, set the time, and click **Schedule**.
  - To cancel the operation, click **Cancel**.

## List Usage Extension in hunt group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Groups > Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Hunt Group List** section, select a hunt group.
6. Click **More Actions > List Usage Extension**.

The system displays the **List Usage Extension** page with details.
7. Click **Done**.

## Exporting selected hunt group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Groups > Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the **Hunt Group List**, select the hunt group you want to export.
6. Click **More Actions > Export Selected Hunt Group**.

The system displays the **Export Hunt Group** page.
7. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
8. Click **Export**.

## Exporting all hunt groups

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Groups > Hunt Group**.

3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Export All Hunt Groups**.  
The system displays the **Export Hunt Group** page.
6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

## Importing hunt groups

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Groups > Hunt Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Import Hunt Groups**.  
The system displays the **Import CM Objects** page.
6. In the **Select a file** field, select the required excel file and click **Browse**.
7. Select one of the following in the **Select Error Configuration** field.  
Default value is **Continue processing other records**.
  - **Abort on first error**
  - **Continue processing other records**
8. Select one of the following in the **If a matching record already exists** field.  
Default value is **Skip**.
  - **Skip**
  - **Merge**
  - **Delete**
9. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
10. Click **Import**.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Groups > Hunt Group**.

3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Download Excel Template**.
6. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and click **OK**.

## Trunk Group

### Trunk Group List field descriptions

**Trunk Group List** displays all the Trunk Groups that are associated with the selected Communication Manager. You can also apply filters and sort each of the columns in **Trunk Group List**.

When you click **Refresh**, you can view the updated information that is available after the last synchronization operation.

| Name                     | Description                                        |
|--------------------------|----------------------------------------------------|
| <b>Group Number</b>      | The group number of the trunk group.               |
| <b>Trunk Group Name</b>  | The group name of the trunk group.                 |
| <b>Group Type</b>        | The group type of the trunk group.                 |
| <b>Tenant Number</b>     | The tenant number of the trunk group.              |
| <b>TAC</b>               | The trunk access code (TAC) of the trunk group.    |
| <b>Number of Members</b> | The number of members of the trunk group.          |
| <b>COR</b>               | The class of restriction (COR) of the trunk group. |
| <b>CDR</b>               | The call detail record (CDR) of the trunk group.   |
| <b>Outgoing Display</b>  | The outgoing display of the trunk group.           |
| <b>Queue Length</b>      | The queue length of the trunk group.               |
| <b>System</b>            | The system of the trunk group.                     |

### Adding a trunk group

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Network > Trunk Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Trunk Group List** section, click **New**.

6. On the New Trunk Group page, complete the mandatory fields that are marked with a red asterisk (\*) in the following sections:
  - General Options (O)
  - Parameter Options (P)
  - Feature Options (F)
  - Administrable Timer (A)
  - ATM Thresholds (T)
  - Group Members (M)
7. Click one of the following:
  - **Commit**: To add the trunk group.
  - **Schedule**: To add the trunk group at a specific time. On the Job Scheduler page, set the time, and click **Schedule**.
  - **Cancel**: To cancel the operation.

## Editing a trunk group

### About this task

You can edit one trunk group at a time. If you select more than one trunk group the system disables the **View** and **Edit** options.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Network > Trunk Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Trunk Group List** section, select the trunk group that you want to edit, and click **Edit**.
6. On the **Edit Trunk Group** page, edit the required fields.
7. Click **Commit** to save the changes.

## Viewing a trunk group

### About this task

Use this procedure to view the parameters of a trunk group. If you select more than one trunk group the system disables the **View** and **Edit** options.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.

2. In the left navigation pane, click **Network > Trunk Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Trunk Group List** section, select the trunk group.
6. Click **View**.

The system displays the View Trunk Group page.

## Deleting a trunk group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Network > Trunk Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. In the **Trunk Group List** section, select one or more trunk groups, and click **Delete**.
6. On the Delete Trunk Group Confirmation page, click one of the following:
  - **Delete**: To delete the Trunk group immediately.
  - **Schedule**: To delete the Trunk group at the specified time. On the Job Scheduler page, set the time, and click **Schedule**.
  - **Cancel**: To cancel the operation.

---

## Managing Off PBX Configuration Set

### Viewing Off PBX Configuration Set

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Off PBX Telephone > Off PBX Configuration Set**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Off PBX Configuration Set list, select the Off PBX Configuration Set you want to view.
6. Click **View**.

You can view the details of the Off PBX Configuration Set through the classic view.

## Editing Off PBX Configuration Set

### Procedure

1. On the System Manager web console, click **Elements** > **Communication Manager**.
2. In the navigation pane, click **Endpoints** > **Off PBX Telephone** > **Off PBX Configuration Set**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Off PBX Configuration Set list, select the Off PBX Configuration Set you want to edit.
6. Click **Edit**.

You can edit the Off PBX Configuration Set details through the classic view.

7. To save the changes, click **Enter**.

## Off PBX Configuration Set field descriptions

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Number</b>               | The Off PBX endpoint configuration set number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>          | Description of the Off PBX endpoint configuration set. The description field can also specify the name of the Off PBX Configuration Set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Calling Number Style</b> | <p>Determines the format of the caller ID for calls from a local Communication Manager extension to an extension to a cellular telephone. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Network:</b> Provides a display of only 10-digit numbers. For internal calls, the ISDN numbering tables are used to create the calling number. DCS calls use the ISDN calling number, if provided. Externally provided calling numbers are used for externally originated calls.</li> <li>• <b>Port:</b> Provides a display of less than 10-digits. Extensions are sent as the calling number for all internal and DCS network-originated calls.</li> </ul> |

*Table continues...*

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CDR Origination</b> | <p>Determines the Call Detail Record (CDR) report format when CDR records are generated for a call that originates from an Extension to Cellular cell phone. To generate this CDR, you must enable the Incoming Trunk CDR. The CDR report excludes dialed Feature Name Extensions (FNEs). The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>phone-number</b>: The calling party on the CDR report is the 10-digit cell phone number. This is the default value.</li> <li>• <b>extension</b>: The calling party on the CDR report is the internal office telephone extension associated with the Extension to Cellular cell phone.</li> <li>• <b>none</b>: The system does not generate an originating CDR report.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>CDR EC500</b>       | <p>Determines whether a CDR is generated for any call to the cellular telephone. Available only if CDR reports are enabled for the trunk group. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>true</b>: Treats calls to the XMOBILE station as trunk calls and generates a CDR.</li> <li>• <b>false</b>: Treats calls to the XMOBILE station as internal calls, without generating a CDR.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Fast Conn</b>       | <p>Determines whether additional processing occurs on the server running Communication Manager prior to connecting a call. Fast Conn is reserved for future that the cell telephone provider might provide.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Post Conn</b>       | <p>Determines whether additional capabilities, beyond standard ISDN dialing, are available for those incoming ISDN trunk calls that are mapped to XMOBILE endpoints. Post Conn options come into effect after the call has entered the active state. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>dtmf</b>: Expect digits from either in-band or out-of-band, but not simultaneously. The server allocates a DTMF receiver whenever the server needs to collect digits. This option is normally used for Extension to Cellular XMOBILE endpoint calls.</li> <li>• <b>out-of-band</b>: Expect all digits delivered by out-of-band signaling only. The server running Communication Manager collects digits from the out-of-band channel or no touch-tone receiver. In addition, any digits received when the server is not collecting digits are converted to DTMF and is broadcast to all the parties on the call. This option is implemented for DECT XMOBILE endpoint calls.</li> <li>• <b>both</b>: Expect all subsequent digits delivered by simultaneous in-band and out of-band signaling. Out-of-band signaling consists of digits embedded in ISDN INFO messages while in-band signaling consists of DTMF in the voice path. The server running Communication Manager collects all the digits from the out-of-band channel. To prevent double digit collection, touch tone receive is not allocated. End-to-end signaling occurs transparently to the server through in-band transmission of DTMF. This option is implemented for PHS XMOBILE endpoint calls.</li> </ul> |

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voice Mail Dest</b> | <p>Voice Mail Dest prevents cellular voice mail from answering an Extension to Cellular call. When the call server detects that the cell phone is not the entity answering the call, the call server brings the call back to the server. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>none</b>: No restrictions on cellular voice mail. This is the default value.</li> <li>• <b>timed</b>: When you enter timed, the system displays the seconds field, which accepts values from 1 to 9. The default value is 4 seconds. In the Extension to Cellular-enabled environment, if you answer the call at the cell within the configured time, Communication Manager treats the call as a call that the cellular voice mail answers, and disconnects the cellular leg of the call. The call continues to ring at the desk phone. You can use this configuration for any type of network, including GSM, CDMA, and ISDN.</li> <li>• <b>message</b>: The message option works with carriers who use non-ISDN voice mail systems. You must not use this option with ISDN-based voice mail systems.</li> </ul> |
| <b>System</b>          | The name of the Communication Manager system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Managing Off PBX Endpoint Mapping

### Adding Off PBX Endpoint Mapping to an endpoint

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Off PBX Telephone > Off PBX Endpoint Mapping**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Add Off PBX Endpoint Mapping through the SAT screen.
7. Click **Enter**.

## Viewing the Off PBX Endpoint Mapping

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Off PBX Telephone > Off PBX Endpoint Mapping**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the Off PBX Endpoint Mapping that you want to view.
6. Click **View**.

The system displays the details of the Off PBX Endpoint Mapping from the classic view.

## Editing the Off PBX Endpoint Mapping of an endpoint

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Off PBX Telephone > Off PBX Endpoint Mapping**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the Off PBX Endpoint Mapping you want to edit.
6. Click **Edit**.
7. Edit the required fields through the SAT screen.
8. To save the changes, click **Enter**.

## Off PBX Endpoint Mapping field descriptions

| Name                      | Description                                                                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Endpoint Extension</b> | The SIP and non-SIP extensions that have Off PBX Endpoint Mapping.<br><br>When you add a SIP endpoint, an entry for this endpoint is automatically available in Off PBX Endpoint Mapping.<br><br>To add an endpoint mapping to a non-SIP endpoint, you must manually add an Off PBX Endpoint Mapping for that endpoint. |
| <b>System</b>             | The Communication Manager system in which the endpoint extension is available.                                                                                                                                                                                                                                          |

| Button      | Description                                  |
|-------------|----------------------------------------------|
| <b>New</b>  | Adds an Off PBX Endpoint mapping.            |
| <b>View</b> | Displays an Off PBX mapping for an endpoint. |
| <b>Edit</b> | Edits an Off PBX Endpoint mapping.           |

## Xmobile Configuration

### Xmobile Configuration

Xmobile Configuration defines the number of call treatment options for Extension to Cellular calls for cellular telephones. The Extension to Cellular feature allows the use of up to 99 Configuration Sets, already defined in the system using default values.

### Xmobile Configuration List

Xmobile Configuration List displays the Xmobile Configuration details under the Communication Manager you select. You can apply filters and sort each column in this list.

Click **Refresh** to view the updated information after the last synchronization.

| Name                        | Description                                                                                                                                                      |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Configuration Set</b>    | The configuration set value.                                                                                                                                     |
| <b>Calling No.</b>          | The format of the caller ID for calls from a local switch extension to an EC500 cell phone.                                                                      |
| <b>CDR Orig</b>             | The CDR report format when CDR records are generated for a call that originates from an Extension to Cellular cell phone.                                        |
| <b>CDR EC 500</b>           | Displays whether a call detail record is generated for any call to the cell phone.                                                                               |
| <b>Fast Conn</b>            | Displays whether some additional processing occurs on the switch prior to connecting a call.                                                                     |
| <b>Post-Connect Dialing</b> | Displays whether additional capabilities, beyond standard ISDN dialing, are available for those incoming ISDN trunk calls that are mapped into XMOBILE stations. |
| <b>System</b>               | The name of the Communication Manager associated with the Xmobile Configuration set.                                                                             |

## Viewing Xmobile Configuration data

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Xmobile Configuration**.
3. Select one or more Communication Manager instance from the Communication Manager list.

4. Click **Show List**.
5. From the Xmobile Configuration List, select the configuration set you want to view.
6. Click **View**.

## Editing Xmobile Configuration

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Endpoints > Xmobile Configuration**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Xmobile Configuration List, select the configuration set you want to view.
6. Click **Edit** or click **View > Edit**.
7. Edit the required details on the **Edit Xmobile Configuration Data** page.
8. Click **Commit** to save the changes.

## Xmobile Configuration field descriptions

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Barge-in Tone</b>        | Enables a barge-in tone used to add security to Extension to Cellular calls. If a user is on an active Extension to Cellular call and another person joins the call from an Extension to Cellular enabled office telephone, all parties on the call hear the barge-in tone.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Calling Number Style</b> | <p>Determines the format of the caller ID for calls from a local switch extension to an EC500 cell phone.</p> <ul style="list-style-type: none"> <li>• <b>network</b>: Provides a display of only 10-digit numbers. For internal calls, the ISDN numbering tables are used to create the calling number and DCS calls use the ISDN calling number if provided. The externally provided calling number is used when available for externally originated calls.</li> <li>• <b>pbx</b>: Provides a display of less than 10-digits. Extensions sent as the calling number for all internally- and DCS network-originated calls.</li> </ul> |

| <b>CDR for Calls to EC500 Destination</b> | <p>Determines whether a call detail record is generated for calls to the cell phone.</p> <p> <b>Note:</b></p> <p>CDR reporting for EC500 calls relies on the CDR Reports field on the Trunk Group screen. If, on the Trunk Group screen, the CDR Reports field is set to <b>n</b>, no CDR is generated even if this field is set to <b>y</b>.</p> <ul style="list-style-type: none"> <li>• <b>y</b>: Treats calls to the XMOBILE station as trunk calls and generates a CDR.</li> <li>• <b>n</b>: Treats calls to the XMOBILE station as internal calls and does not generate a CDR.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Configuration Set Description</b>      | Describes the purpose of the configuration set. A valid entry is up to 20 alphanumeric characters or blank. For example, EC500 handsets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Fast Connect on Origination</b>        | Determines whether some additional processing occurs on the switch prior to connecting a call. You can use the <b>y</b> option to send CONNECT messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Post-Conn Signaling</b>                | <p>Post Connect Dialing Options. Determines whether additional capabilities, beyond standard ISDN dialing, are available for those incoming ISDN trunk calls that are mapped into XMOBILE stations. These options come into effect after the call has entered the active state when the switch has sent a CONNECT message back to the network.</p> <ul style="list-style-type: none"> <li>• <b>dtmf</b>: Expect digits from either in-band or out-of-band, but not simultaneously. The switch allocates a DTMF receiver whenever it needs to collect digits. This option is generally used for EC500 XMOBILE station calls.</li> <li>• <b>out-of-band</b>: Expect all digits to be delivered by out-of-band signaling only. The switch collects digits that it needs from the out-of-band channel (no touch-tone receiver). In addition, any digits received when the switch is not collecting digits are converted to DTMF and broadcast to all parties on the call. This option is in force for DECT XMOBILE station calls.</li> <li>• <b>both</b>: Expect all subsequent digits to be delivered by simultaneous in-band and out-of-band signaling. Out-of-band signaling consists of digits embedded in ISDN INFO messages while the in-band signaling consists of DTMF in the voice path. The switch collects all digits that it needs from the out-of-band channel. No touch tone receive is allocated in order to prevent collecting double digits. End-to-end signaling occurs transparently to the switch through in-band transmission of DTMF. This option is in force for PHS XMOBILE station calls.</li> </ul> |

|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cellular Voice Mail Detection</b> | <p>Prevents cellular voice mail from answering an Extension to Cellular call. The call server detects when the cell phone is not the entity that answers the call and brings the call back to the server. Communication Manager treats the call as a normal call to the office telephone and the call goes to corporate voice mail. You can also set a timer for cellular voice mail detection that sets a time before Cellular Voice Mail Detection investigates a call.</p> <ul style="list-style-type: none"> <li>• <b>none:</b> No restrictions on cellular voice mail. This is the default setting.</li> <li>• <b>timed:</b> Amount of time from 1 to 9 seconds. The default time is 4 seconds. Extension to Cellular call leg answered within the specified time is detected as being answered by the cellular voice mail and the call continues to ring at the office telephone. If unanswered, it will go to the corporate voice mail. This setting can be used for different types of network that is, GSM, CDMA, and ISDN.</li> <li>• <b>message:</b> The message option works with carriers who use non ISDN voice mail systems. Avoid using this option with ISDN-based voice mail systems.</li> </ul> |
| <b>Confirmed Answer</b>              | <p>Enables Confirmed Answer on Extension to Cellular calls for this station. If you select this option, the user needs to input a digit to confirm receipt of a call sent to a cell phone using the Extension to Cellular feature. When the user answers the incoming call on the cell phone, the user hears a dial tone. The user must then press any one of the digits on the cell phone keypad. Until the system receives a digit, the system does not treat the call as answered. The length of time to wait for the digit can be administered from 5 to 20 seconds, with a default of 10 seconds. The system plays a recall dial tone to indicate that input is expected. During the response interval, the original call continues to alert at the desk phone and any stations bridged to the call. If the user does not enter a digit before the time-out interval expires, the call is pulled back from the telephone device.</p>                                                                                                                                                                                                                                                                          |
| <b>Configuration Set ID</b>          | The configuration set value that you selected in the Xmobile Configuration List. This is a display-only field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Automatic Alternate Routing Digit Conversion

### AAR/ARS Digit Conversion

Use the Automatic Alternate Routing (AAR) Digit Conversion or Automatic Route Selection (ARS) Digit Conversion capability to configure your system to change a dialed number for efficient routing by inserting or deleting digits from the dialed number. For instance, you can configure the server running Communication Manager to delete **1** and an area code on calls to one of your locations, and avoid long-distance charges by routing the call over your private network.

### Viewing Automatic Alternate Routing Digit Conversion data

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Automatic Alternate Routing Digit Conversion**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the AAR Digit Conversion List, select the Automatic Alternate Routing Digit Conversion data you want to view.
6. Click **View**.

### Editing Automatic Alternate Routing Digit Conversion data

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Automatic Alternate Routing Digit Conversion**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the AAR Digit Conversion List, select the Automatic Alternate Routing Digit Conversion you want to edit.
6. Click **Edit** or click **View > Edit**.
7. Edit the required fields on the **Edit AAR Digit Conversion** page.
8. Click **Commit** to save the changes.

The entry must be set to <b>y</b> to enable EC500 origination features.</li> <li>• <b>r</b>: Restricted. Allowed only if the Allow ANI Restriction on AAR/ARS field is set to <b>y</b> on the Feature-Related System Parameters screen. Use this entry to drop a call on a Russian Shuttle trunk or Russian Rotary trunk if the ANI request fails. Other types of trunks treat <b>r</b> as <b>y</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Conv</b>             | Provides the option to allow additional digit conversion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Del</b>              | The number of digits you want the system to delete from the beginning of the dialed string. A valid entry ranges from <b>0</b> to <b>Min</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Location</b>         | <p>This is a display-only field. Typing the command <code>change aar digit-conversion n</code> or <code>change ars digit-conversion n</code> displays the all-locations screen, and populates this field with <b>all</b>. The <b>n</b> specifies that dialed strings beginning with the value <b>n</b> are displayed first. To access a per-location screen, type <code>change aar digit-conversion location n</code> or <code>change ars digit-conversion location n</code>, where <b>n</b> represents the number of a specific location. This field then displays the number of the specified location. For details on command options, see online help, or <i>Maintenance Commands for Avaya Aura™ Communication Manager, Media Gateways and Servers</i>, 03-300431.</p> <p>One of the following is a valid entry:</p> <ul style="list-style-type: none"> <li>• <b>1</b> to <b>64</b>: Specifies whether you require ANI on incoming R2-MFC or Russian MF ANI calls. Entry must be <b>y</b> to enable EC500 origination features.</li> <li>• <b>all</b>: Indicates that this AAR/ARS Digit Conversion Table is the default for all port network (cabinet) locations.</li> </ul> |
| <b>Matching Pattern</b> | Specifies the number you want the server running Communication Manager to match to dialed numbers. If a prefix digit <b>1</b> is required for 10-digit direct distance dialing (DDD) numbers, be sure the matching pattern begins with a 1. A valid entry is a number ranging from <b>0</b> to <b>9</b> (1 to 18 digits) and wildcard characters asterisk (*), <b>x</b> , and <b>X</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Max</b>              | The maximum number of user-dialed digits the system collects to match to this Matching Pattern. A valid entry ranges from <b>Min</b> to <b>28</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Min</b>              | The minimum number of user-dialed digits the system collects to match to this Matching Pattern. A valid entry ranges from <b>1</b> to <b>Max</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Net</b>              | The call-processing server network used to analyze the converted number. The entries <b>ext</b> , <b>aar</b> , or <b>ars</b> analyze the converted digit-string as an extension number, an AAR address, or an ARS address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

*Table continues...*

| Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Percent Full</b>       | Displays the percentage from <b>0</b> to <b>100</b> of the system memory resources that have been used by ARS. If the figure is close to 100 percent, you can free-up memory resources.                                                                                                                                                                                                                |
| <b>Replacement String</b> | A valid entry ranges from <b>0</b> to <b>9</b> (1 to 18 digits), asterisk (*), pound (#), or blank. Enter the digits that replace the deleted portion of the dialed number.<br><br>If the pound character (#) is present in the string, it should be the last character in the string. This signifies the end of the modified digit string.<br><br>Leave this field blank to simply delete the digits. |

| Button          | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Commit</b>   | Completes the action you initiate.                                  |
| <b>Schedule</b> | Performs the action at the chosen time.                             |
| <b>Reset</b>    | Clears the action and resets the field.                             |
| <b>Clear</b>    | Clears all the entries.                                             |
| <b>Edit</b>     | Allows you to edit the fields in the page.                          |
| <b>Done</b>     | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b>   | Cancels your current action and takes you to the previous page.     |
| <b>Now</b>      | Performs the action you initiate real time.                         |

## Automatic Route Selection Digit Conversion

### AAR/ARS Digit Conversion

Use the Automatic Alternate Routing (AAR) Digit Conversion or Automatic Route Selection (ARS) Digit Conversion capability to configure your system to change a dialed number for efficient routing by inserting or deleting digits from the dialed number. For instance, you can configure the server running Communication Manager to delete **1** and an area code on calls to one of your locations, and avoid long-distance charges by routing the call over your private network.

### Viewing Automatic Route Selection Digit Conversion data

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Automatic Route Selection Digit Conversion**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the ARS Digit Conversion List, select the Automatic Route Selection Digit Conversion you want to view.

6. Click **View**.

## Editing Automatic Route Selection Digit Conversion data

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Automatic Route Selection Digit Conversion**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Edit** or click **View > Edit**.
6. Edit the required fields on the **Edit ARS Digit Conversion** page.
7. Click **Commit** to save the changes.

| Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Location</b>           | <p>This is a display-only field. Typing the command <code>change aar digit-conversion n</code> or <code>change ars digit-conversion n</code> displays the all-locations screen, and populates this field with <b>all</b>. The <i>n</i> specifies that dialed strings beginning with the value <i>n</i> are displayed first. To access a per-location screen, type <code>change aar digit-conversion location n</code> or <code>change ars digit-conversion location n</code>, where <i>n</i> represents the number of a specific location. This field then displays the number of the specified location. For details on command options, see online help, or <i>Maintenance Commands for Avaya Aura™ Communication Manager, Media Gateways and Servers</i>, 03-300431.</p> <p>One of the following is a valid entry:</p> <ul style="list-style-type: none"> <li>• <b>1 to 64</b>: Specifies whether you require ANI on incoming R2-MFC or Russian MF ANI calls. Entry must be <code>y</code> to enable EC500 origination features.</li> <li>• <b>all</b>: Indicates that this AAR/ARS Digit Conversion Table is the default for all port network (cabinet) locations.</li> </ul> |
| <b>Matching Pattern</b>   | Specifies the number you want the server running Communication Manager to match to dialed numbers. If a prefix digit <b>1</b> is required for 10-digit direct distance dialing (DDD) numbers, be sure the matching pattern begins with a 1. A valid entry is a number ranging from <b>0</b> to <b>9</b> (1 to 18 digits) and wildcard characters asterisk (*), <b>x</b> , and <b>X</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Max</b>                | The maximum number of user-dialed digits the system collects to match to this Matching Pattern. A valid entry ranges from <b>Min</b> to <b>28</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Min</b>                | The minimum number of user-dialed digits the system collects to match to this Matching Pattern. A valid entry ranges from <b>1</b> to <b>Max</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Net</b>                | The call-processing server network used to analyze the converted number. The entries <b>ext</b> , <b>aar</b> , or <b>ars</b> analyze the converted digit-string as an extension number, an AAR address, or an ARS address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Percent Full</b>       | Displays the percentage from <b>0</b> to <b>100</b> of the system memory resources that have been used by ARS. If the figure is close to 100 percent, you can free-up memory resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Replacement String</b> | <p>A valid entry ranges from <b>0</b> to <b>9</b> (1 to 18 digits), asterisk (*), pound (#), or blank. Enter the digits that replace the deleted portion of the dialed number.</p> <p>If the pound character (#) is present in the string, it should be the last character in the string. This signifies the end of the modified digit string.</p> <p>Leave this field blank to simply delete the digits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Button          | Description                             |
|-----------------|-----------------------------------------|
| <b>Commit</b>   | Completes the action you initiate.      |
| <b>Schedule</b> | Performs the action at the chosen time. |
| <b>Reset</b>    | Clears the action and resets the field. |

Table continues...

| Button        | Description                                                         |
|---------------|---------------------------------------------------------------------|
| <b>Clear</b>  | Clears all the entries.                                             |
| <b>Edit</b>   | Allows you to edit the fields in the page.                          |
| <b>Done</b>   | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b> | Cancels your current action and takes you to the previous page.     |
| <b>Now</b>    | Performs the action you initiate real time.                         |

## Automatic Route Selection Toll

### Automatic Route Selection Toll

With Automatic Route Selection Toll, you can specify whether calls to CO codes listed on the table are toll or non-toll calls. You can specify non-toll calls based on the last two digits of the distant-end of the trunk group.

### Automatic Route Selection Toll List

| Name                                    | Description                                                                                     |
|-----------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>ARS Toll Table</b>                   | The Automatic Route Selection Toll table number.                                                |
| <b>From Office Code, To Office Code</b> | The block of numbers for the associated Automatic Route Selection Toll table.                   |
| <b>System</b>                           | The name of the Communication Manager associated with the Automatic Route Selection Toll table. |

## Viewing Automatic Route Selection Toll data

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Automatic Route Selection Toll**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Automatic Route Selection Toll List, select the Ars Toll Table you want to view.
6. Click **View**.

## Editing Automatic Route Selection Toll data

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.

2. In the navigation pane, click **Network > Automatic Route Selection Toll**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Automatic Route Selection Toll List, select the Ars Toll Table you want to edit.
6. Click **Edit** or click **View > Edit**.
7. Edit the required fields on the **Edit Automatic Route Selection Toll** page.
8. Click **Commit** to save the changes.

## Cluster Session Manager

### Cluster Session Manager

Using the Cluster Session Manager, you can administer a list of unique node names having Session Manager IPs that are configured on Communication Manager. This eliminates the need for provisioning trunks for redundancy. This feature frees up trunks so that the available trunks can be used by SIP agents, SIP stations, or PSTN bound SIP trunk calls. You can also generate reports for displaying the status of active and idle trunks.

With Cluster Session Manager, you can manage up to 10 clusters, and each cluster can manage up to 28 Session Managers. From the Manage Users page, you can define the Primary Session Manager and the Secondary Session Manager. If the call to the SIP station is routed to a SIP trunk that has a clustered signaling group, then the Invite is sent to the station on primary Session Manager. If the primary Session Manager is not reachable, then the Invite is sent to the station on secondary Session Manager.

Using the Signaling Groups page, you can access the Communication Manager CLI and administer the Clustered and Cluster ID fields. These fields appear for SIP signaling groups only. For more information, see “Cluster Session Manager” chapter in *Avaya Aura® Communication Manager Screen Reference* and “SIP trunk optimization” chapter in *Avaya Aura® Communication Manager Feature Description and Implementation*.

## Limitations

Limitations of Cluster Session Manager are as follows:

- You can configure Session Manager node names with IPv6 addresses, only if “procr6” is configured on Communication Manager
- You can configure Session Manager node names with IPv4 addresses, only if “procr” is configured on Communication Manager
- You cannot configure the same node names of type IPv4 and IPv6 in the same cluster

## Viewing cluster Session Managers

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Cluster Session Manager**
3. Click **Show List**.
4. From the Cluster List, select the cluster you want to view.
5. Click **View**.

## Editing cluster Session Managers

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Cluster Session Manager**
3. Click **Show List**.
4. From the Cluster List, select the cluster you want to edit.
5. Click **Edit** or click **View > Edit**.
6. Edit the required fields on the **Edit Cluster** page.
7. Click **Commit** to save the changes.

## Data Modules

### Data Modules

Use this capability to connect systems running Communication Manager with other communications equipment, changing protocol, connections, and timing as necessary. Communication Manager supports the following types of data modules:

- High speed links
- Data stands
- Modular-processor data module
- 7000-series data modules
- Modular-trunk data module
- Asynchronous Data Unit
- Asynchronous Data Module for ISDN-Basic Rate Interface telephones
- Terminal adapters

All of these data modules support industry standards and include options for setting the operating profile to match that of the data equipment.

### Data Module List

Data Module List displays all the data modules under the Communication Manager you select. You can apply filters and sort each column in the Data Module List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name             | Description                                                                        |
|------------------|------------------------------------------------------------------------------------|
| <b>Extension</b> | The extension assigned to the data module.                                         |
| <b>Port</b>      | The port location to which the selected data module is connected.                  |
| <b>Type</b>      | The type of data module.                                                           |
| <b>Name</b>      | The name of the user associated with the data module.                              |
| <b>COS</b>       | The desired Class Of Service.                                                      |
| <b>COR</b>       | The desired Class Of Restriction.                                                  |
| <b>TN</b>        | The tenant number which determines the music source for callers on hold.           |
| <b>ISN</b>       | Information Systems Network. Used with Data Line and Processor/Trunk Data Modules. |
| <b>System</b>    | The name of the Communication Manager associated with the data module.             |

## Adding a Data Module

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Network > Data Modules**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select **New**.
6. Complete the **Add Data Module** page and click **Commit**.

**Data Modules field descriptions**

| Name                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>List Type</b>                                       | Indicates whether the type of list is group, personal, enhanced, or system type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Special Dialing Option</b>                          | Identifies the destination of all calls when this data module originates calls. The available dialing options are: <ul style="list-style-type: none"> <li>• <b>hot-line</b>: Allows single-line telephone users to automatically place a call to an extension, telephone number, or Feature Access Code (FAC).</li> <li>• <b>default</b>: An associated Abbreviated Dialing number is dialed when the user goes off-hook and enters a carriage return following the DIAL prompt.</li> </ul>                                                                                                                              |
| <b>Personal/Group Number</b>                           | The identifying number the server running Communication Manager assigns to the group when it is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Abbreviated Dialing Dial Code (From above list)</b> | Used with 7500, Data Line, Netcon, Processor/Trunk, Processor Interface, and World Class BRI Data Modules. System displays this field only when the Special Dialing Option field is default. When the user goes off-hook and enters a carriage return following the DIAL prompt, the system dials the abbreviated dialing number. The data call originator can also perform data-terminal dialing by specifying a dial string that may or may not contain alphanumeric names.<br><br>Valid entry ranges from <b>0</b> through <b>999</b> . You need to enter a list number associated with the abbreviated dialing list. |

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BCC</b>                    | <p>Bearer Capability Class. A display-only field used with Data Line, Netcon, Processor Interface, Point-to-Point Protocol, Processor/Trunk (pdm selection), and System Port Data Modules. Appears when the <b>ISDN-PRI or ISDN-BRI Trunks</b> field is set to <i>y</i> on the System Parameters Customer-Options (Optional Features) screen. The value in this field corresponds to the speed setting of the data module. This field can be compared with the Bearer Capability Classes (BCC) value in an associated routing pattern when attempted calls utilizing the data module fail to complete. The BCC values must be the same. For a detailed description of BCC and their ability to provide specialized routing for various types of voice and data calls, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i>. The BCC value is used to determine compatibility when non-ISDN-PRI facilities are connected to ISDN facilities (ISDN-PRI Interworking).</p> <p>The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>1</b>: Relates to 56-kbps</li> <li>• <b>2, 3, 4</b>: Relates to 64 kbps</li> </ul> |
| <b>Broadcast Address</b>      | Used with Ethernet data modules. Does not appear for S87XX Series IP-PNC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Connected Data Module</b>  | This is the data module extension to which the link connects. Used with Processor Interface (used with DEFINITY CSI only) data modules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Connected to</b>           | <p>The Asynchronous Data Unit (ADU) to which the system is connected to. Used with Data Line and Processor/Trunk (pdm selection) Data Module.</p> <p>The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>dte</b>: Data Terminal Equipment. Used with Data Line and Processor/Trunk Data Modules.</li> <li>• <b>isn</b>: Information Systems Network. Used with Data Line and Processor/Trunk Data Modules.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Class Of Service</b>       | The desired class of service. Does not appear for Ethernet. The valid entries range from <b>0</b> to <b>15</b> to select the allowed features.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Class Of Restriction</b>   | The desired class of restriction. Does not appear for Ethernet. | <b>ITC</b>                  | <p>Information Transfer Capability. Indicates type of transmission facilities to be used for ISDN calls originated from this endpoint. Appears only when, on the Trunk Group screen, the Comm Type field is 56k-data or 64k-data. Does not display for voice-only or BRI stations. Used with 7500, Announcement, data-line, Netcon, Processor/Trunk (pdm selection), Processor Interface, and System Port Data Modules.</p> <p>The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>restricted</b>: Either restricted or unrestricted transmission facilities are used to complete the call. A restricted facility is a transmission facility that enforces 1's density digital transmission (that is, a sequence of eight digital zeros is converted to a sequence of 7 zeros and a digital 1).</li> <li>• <b>unrestricted</b>: Only unrestricted transmission facilities are used to complete the call. An unrestricted facility is a transmission facility that does not enforce 1's density digital transmission (that is, digital information is sent exactly as is).</li> </ul> |
| <b>Link</b>                 | <p>A communication interface link number. Used with Ethernet, Point-to-Point, and Processor Interface (used with DEFINITY CSI only) data modules. This field is in different locations on the screen for different data module types. The valid entries range from <b>0</b> to <b>99</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Extension</b>            | <p>The extension number required to perform maintenance functions on the standby Netcon physical channel in a duplicated system. The standby remote loop around tests fails if this field is not administered. Used with Netcon and Processor Interface Data Modules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>MM Complex Voice Ext</b> | <p>This field contains the number of the associated telephone in the multimedia complex. This field appears only after you set the Multimedia field to <u>y</u>. This field is left blank until you enter the data module extension in MM Complex Data Ext on the Station screen. Used with 7500 and World Class BRI Data Modules. Does not appear on S87XX Series IP-PNC. Valid entries are valid values that conform to your dial plan. After you complete the field on the Station screen, the two extensions are associated as two parts of a one-number complex, which is the extension of the telephone.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Multimedia</b>           | <p>Used with the 7500 and World Class BRI Data Modules. Appears only if, on the System Parameters Customer-Options (Optional Features) screen, the MM field is <u>y</u>. You can select this option to make this data module part of a multimedia complex.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                                     | <p>The name of the user associated with the data module. The name is optional and can be blank. It can contain up to 27 alphanumeric characters.</p> <p> <b>Note:</b></p> <p>Avaya BRI stations support ASCII characters only. BRI stations do not support non-ASCII characters, such as Eurofont or Kanafont. Therefore, if you use non-ASCII characters in any Communication Manager Name field, such characters do not display correctly on a BRI station.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Network uses 1's for Broadcast Addresses</b> | Indicates that a broadcast address is used to send the same message to all systems or clients on a local area network. Used with Ethernet data modules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Node Name</b>                                | Appears when the Data Module type is ppp. Used with Ethernet (not on S87XX Series IP-PNC) and Point-to-Point data modules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>PDATA Port</b>                               | <p>Used to relate the physical PDATA port to which the mode 3 portion of the system port is connected. You need to enter a seven-digit alphanumeric port location to which the data module is connected. This entry must be assigned to a port on a PDATA Line Board. Used with System Port Data Modules.</p> <p>The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>01 to 22:</b> First and second characters are the cabinet numbers</li> <li>• <b>01 to 64:</b> First and second characters are the cabinet numbers (S87XX Series IP-PNC)</li> <li>• <b>A to E:</b> Third character is the carrier</li> <li>• <b>01 to 20:</b> Fourth and fifth characters are the slot numbers in the carrier</li> <li>• <b>01 to 12:</b> Sixth and seventh characters are the circuit numbers</li> </ul>                                                                                                                 |
| <b>Physical Channel</b>                         | <p>The Physical Channel number is referred to on associated system forms as the Interface Link number. Used with Netcon and Processor Interface Data Modules.</p> <p>The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>01 to 08:</b> For Processor Interface Data Modules, enter the 2-digit circuit number of the Processor Interface port. A multi-carrier cabinet system supports the use of two Processor Interface circuit packs, the first circuit pack (mounted in Control Carrier A) supports physical channels or links 01 through 04; the second (mounted in Control Carrier A) supports physical channels or links 05 through 08. A single-carrier cabinet system supports one Processor Interface circuit pack and physical channels or links 01 through 04 only.</li> <li>• <b>01 to 04:</b> For DEFINITY CSI configurations. For Netcon Data Modules, enter a netcon data channel.</li> </ul> |

*Table continues...*

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Loop-Around Test</b> | Indicates whether data module supports a loop-back test at the EIA interface. Appears when the Data Module Type field is set to <code>pdm</code> or <code>tdm</code> . Used with Processor/Trunk Data Modules. In general, Avaya equipment supports this test but it is not required by Level 2 Digital Communications Protocol. To abort a request for this test, you may clear this check box. |
| <b>Secondary Data Module</b>   | Indicates that this PDM is the secondary data module used for Dual I-channel AUDIX networking. Appears only when the Type field is <code>pdm</code> . Used with Processor/Trunk Data Modules. The primary data module must be administered before the secondary data module can be added. If the Port field entry is <code>x</code> , then do not select the Secondary Data Module option.       |
| <b>Subnet Mask</b>             | A 32-bit binary number that divides the network ID and the host ID in an IP address. Used with Point-to-Point data modules (for S87XX Series IP-PNC).                                                                                                                                                                                                                                            |
| <b>Tenant Number</b>           | Determines the music source for callers on hold. Valid entries range from <b>0</b> through <b>100</b> .                                                                                                                                                                                                                                                                                          |

**Board:** Displays the five-character announcement circuit pack number that identifies the physical circuit pack to which the announcement module is connected. You can enter `x` in this field to indicate that there is no hardware associated with this port assignment. Used with Announcement Data Modules.

The five-character announcement board number consists of:

| Characters    | Meaning          | Value                                |
|---------------|------------------|--------------------------------------|
| <b>1 to 2</b> | Cabinet Number   | <b>1 to 64</b> (S87XX Series IP-PNC) |
| <b>3</b>      | Carrier          | <b>A to E</b>                        |
| <b>4 to 5</b> | Slot Number or X | <b>0 to 20</b>                       |

**Port:** Specifies a port location to which the data module is connected. Used with 7500, Data Line, Ethernet, Processor/Trunk, PPP, System Port, and World Class BRI Data Modules.

 **Note:**

You can enter `x` in the Port field to indicate that there is no hardware associated with the port assignment, also known as Administration Without Hardware (AWOH). These stations are referred to as phantom stations. If this data module is designated as a secondary data module, that is secondary data module is set to `y`, you cannot enter `x` in this field. You cannot change the port of a primary data module to `x` if a secondary data module is administered.

| Characters    | Meaning        | Value                                |
|---------------|----------------|--------------------------------------|
| <b>1 to 2</b> | Cabinet Number | <b>1 to 64</b> (S87XX Series IP-PNC) |
| <b>3</b>      | Carrier        | <b>A to E</b>                        |
| <b>4 to 5</b> | Slot Number    | <b>0 to 20</b>                       |

| Characters | Meaning        | Value                                                                                                                                                                                                                                                                                                   |
|------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6 to 7     | Circuit Number | <ul style="list-style-type: none"> <li>• <b>01 to 31</b> (S87XX Series IP-PNC (tdm, pdm) configurations)</li> <li>• <b>01 to 16</b> (ppp for S87XX Series IP-PNC)</li> <li>• <b>01 to 08</b> (system-port for S87XX Series IP-PNC)</li> <li>• <b>17/33</b> (Ethernet on S87XX Series IP-PNC)</li> </ul> |

**Data Module Type:** Displays the type of data module.

| Valid Entry         | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>7500</b>         | Assigns a 7500 Data Module. The 7500 data module supports automatic TEI, B-channel, maintenance and management messaging, and SPID initialization capabilities. BRI endpoints, both voice and/or data, are assigned to either the ISDN-BRI - 4-wire S/T-NT Interface circuit pack or the ISDN-BRI - 2-wire U circuit pack. Each can support up to 12 ports. Since BRI provides multipoint capability, more than one ISDN endpoint (voice or data) can be administered on one port. For BRI, multipoint administration allows for telephones having SPID initialization capabilities, and can only be allowed if no endpoint administered on the same port is a fixed tie endpoint and no station on the same port has B-channel data capability. Currently, multipoint is restricted to two endpoints per port. |
| <b>announcement</b> | Assigns an announcement data module. The announcement data module is built-in to the integrated announcement circuit pack and is administered using the Announcement Data Module screen. This data module allows the system to save and restore the recorded announcements file between the announcement circuit pack and the system memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

*Table continues...*

| Valid Entry      | Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>data-line</b> | <p>Assigns a Data Line Data Module. The Data Line Data Module (DLDM) screen assigns ports on the Data Line circuit pack (DLC) that allows EIA 232C devices to connect to the system. The DLC, with a companion Asynchronous Data Unit (ADU), provides a less expensive data interface to the system than other asynchronous DCP data modules. The DLC supports asynchronous transmissions at speeds of Low and 300, 1200, 2400, 4800, 9600, and 19200 bps over 2-pair (full-duplex) lines. These lines can have different lengths, depending on the transmission speed and wire gauge. The DLC has 8 ports. The connection from the port to the EIA device is direct, meaning that no multiplexing is involved. A single port of the DLC is equivalent in functionality to a data module and a digital line port. The DLC appears as a data module to the Digital Terminal Equipment (DTE) and as a digital line port to the server running Communication Manager. The DLC connects the following EIA 232C equipment to the system:</p> <ul style="list-style-type: none"> <li>• Printers</li> <li>• Non-Intelligent Data Terminals</li> <li>• Intelligent Terminals, Personal Computers</li> <li>• Host Computers</li> <li>• Information Systems Network (ISN), RS-232C Local Area Networks (LANs), or other data switches</li> </ul> |
| <b>ethernet</b>  | <p>The name associated with an endpoint. The name you enter displays on called telephones that have display capabilities. In some messaging applications, such as Communication Manager Messaging, you can enter the user name (last name first) and their extension to identify the telephone. The name you enter is also used for the integrated directory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ni-bri</b>    | <p>Assigns an NI-BRI Data Module.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>pdm</b>         | Assigns a DCE interface for Processor/Trunk Data Modules. These screens assign Modular Processor Data Modules (MPDMs) and Modular Trunk Data Modules (MTDMs). One screen is required for assigning MPDMs (700D), 7400B, 7400D or 8400B Data Module, and another screen for MTDMs (700B, 700C, 700E, 7400A). One screen must be completed for each MPDM, 7400B, 7400D, 8400B or MTDM. The MPDM, 7400B, or 8400B Data Module provides a Data Communications Equipment (DCE) interface for connection to equipment such as data terminals, CDR output devices, on-premises administration terminal, Message Server, Property Management System (PMS), AUDIX, and host computers. It also provides a Digital Communications Protocol(DCP) interface to the digital switch. (DCE is the equipment on the network side of a communications link that provides all the functions required to make the binary serial data from the source or transmitter compatible with the communications channel.) The MTDM provides an Electronic Industries Association (EIA) Data Terminal Equipment (DTE) interface for connection to off-premises private line trunk facilities or a switched telecommunications network and a DCP interface for connection to the digital switch. (DTE is the equipment comprising the endpoints in a connection over a data circuit. For example, in a connection between a data terminal and a host computer, the terminal, the host, and their associated modems or data modules make up the DTE.) The MTDM or 7400A Data Module also can serve as part of a conversion resource for Combined Modem Pooling. |
| <b>ppp</b>         | Assigns a Point-to-Point Protocol data module. The PPP Data Module screen assigns a synchronous TCP/IP port on the Control Lan (C-Lan) circuit pack. These ports are tailored to provide TCP/IP connections for use over telephone lines. For more information on Point-to-Point data modules, see <i>Administering Network Connectivity on Avaya Aura® Communication Manager</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>system-port</b> | Assigns a System Port Data Module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>tdm</b>         | Assigns a DTE interface for Processor/Trunk Data Modules. See the pdm entry above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>wcbri</b>       | Assigns a World Class BRI Data Module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Button          | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Commit</b>   | Performs the action you initiate.                                   |
| <b>Schedule</b> | Performs the action at the specified time.                          |
| <b>Reset</b>    | Clears the action and resets the fields.                            |
| <b>Clear</b>    | Clears all entries.                                                 |
| <b>Done</b>     | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b>   | Cancels your current action and takes you to the previous page.     |
| <b>Now</b>      | Performs the action you initiate real time.                         |

## Class of service

### Class Of Service

Class Of Service (COS) allows you to administer permissions for call processing features that require dial code or feature button access. COS determines the features that can be activated by or on behalf of endpoints. Using System Manager you can view and modify the Class Of Service data.

### Editing Class Of Service data

#### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. In the navigation pane, click **System > Class of Service**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the Class Of Service that you want to edit.
6. Click **Edit** or **View > Edit**.
7. Edit the required fields and click **Commit** to save the changes.

### Viewing Class Of Service data

#### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. In the navigation pane, click **System > Class of Service**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Select the Class Of Service you want to view.
6. Click **View** to view the Class Of Service data.

### Filtering the Class Of Service list

#### Procedure

1. On the System Manager web console, click **Elements > Messaging**.

2. In the navigation pane, click **System > Class of Service**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Filter: Enable** in the Class Of Service List.
6. Filter the list according to one or multiple columns.
7. Click **Apply**.

To hide the column filters, click **Disable**. This does not clear any filter criteria that you have set.

 **Note:**

The table displays only those options that match the filter criteria.

## Class of Service field descriptions

| Name          | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| <b>System</b> | The name of the Communication Manager associated with the Class of Service. |
| <b>Number</b> | The Class of Service number.                                                |

### General options

| Name                             | Description                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ad-hoc video conferencing</b> | Enables Ad-hoc Video Conferencing, so that up to six users can participate in a video conference call.                                                                                                                                                                                                                                            |
| <b>Automatic Callback</b>        | Allows users to request Automatic Callback.                                                                                                                                                                                                                                                                                                       |
| <b>Automatic Exclusion</b>       | Allows a user to activate automatically Exclusion when they go off hook on an endpoint that has an assigned Exclusion button.                                                                                                                                                                                                                     |
| <b>Buttonless Auto Exclusion</b> | Allows bridged appearances to operate in the exclusion mode regardless of the existence of an administered exclusion button. Currently this feature is only administrable on a per-endpoint basis by administering a feature exclusion button. This feature relaxes the requirement to use a feature button.                                      |
| <b>Call Forwarding Busy / DA</b> | Allows users to forward calls to any extension when the dialed extension is busy or does not answer.                                                                                                                                                                                                                                              |
| <b>Call Forwarding Enhanced</b>  | Allows users to designate different preferred destinations for forwarding calls that originate from internal and external callers.                                                                                                                                                                                                                |
| <b>Call Forwarding All Calls</b> | Allows users to forward all calls to any extension.                                                                                                                                                                                                                                                                                               |
| <b>Client Room</b>               | Allows users to access Check-In, Check-Out, Room Change/Swap, and Maid status functions. In addition, Client Room is required at consoles or telephones that are to receive message waiting notification. You can administer class of service for Client Room only when you have Hospitality Services and a Property Management System interface. |

| Name                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conference Tones</b>              | <p>This feature provides the conference tone as long as three or more calls are in a conference call.</p> <p>If you enable these tones for countries other than Italy, Belgium, United Kingdom, or Australia, the tones will be equivalent to no tone (silence) unless the tone is independently administered or customized on the Tone Generation screen.</p>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Console Permissions</b>           | <p>Allows multi-appearance telephone users to control the same features that the attendant controls. You might assign this permission to front-desk personnel in a hotel or motel, or to a call center supervisor. With console permission, a user can:</p> <ul style="list-style-type: none"> <li>• Activate Automatic Wakeup for another extension</li> <li>• Activate and deactivate controlled restrictions for another extension or group of extensions</li> <li>• Activate and deactivate Do Not Disturb for another extension or group of extensions</li> <li>• Activate Call Forwarding for another extension</li> <li>• Add and remove agent skills</li> <li>• Record integrated announcements</li> </ul> |
| <b>Contact Closure Activation</b>    | Allows a user to open and close a contact closure relay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Data Privacy</b>                  | Isolates a data call from call waiting or other interruptions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>MOC Control</b>                   | The option to assign administrative control on Microsoft Office Communicator (MOC) for either of the 0-15 entries on COS or COS Group objects. By default, this check box is clear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Bridging Exclusion Override</b>   | Allows a station to bridge on a call that has exclusion activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Extended Forwarding All</b>       | Allows a user to administer call forwarding (for all calls) from a remote location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Extended Forwarding Busy / DA</b> | Allows this user to administer call forwarding (when the dialed extension is busy or does not answer) from a remote location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Intra-Switch CDR</b>              | Administers extensions for which Intra-Switch CDR is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Masking CPN / Name Override</b>   | Allows users to override the MCSNIC capability (that is, masking the display of calling party information and replacing it with a hard-coded, system-wide text string, Info Restricted).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Off-Hook Alert</b>                | To enable this option, either the Hospitality (Basic) or Emergency Access to Attendant field must be enabled in your license file. When enabled, these fields display as y on the System- Parameters Customer-Options screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

*Table continues...*

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Personal Station Access (PSA)</b>  | Allows users to associate a telephone to their extension with their programmed services, using a feature access code. This field must be set to n for virtual telephones. This field must be set to y at a user's home endpoint in order for that user to use the Enterprise Mobility User (EMU) feature at other endpoints.                                         |
| <b>Priority Calling</b>               | Allows users to dial a feature access code to originate a priority call. Such calls ring differently and override send all calls, if active.                                                                                                                                                                                                                         |
| <b>Priority IP Video</b>              | Allows priority video calling, where video calls have an increased likelihood of receiving bandwidth and can also be allocated a larger maximum bandwidth per call.                                                                                                                                                                                                  |
| <b>QSIG Call Offer Originations</b>   | Allows users to invoke QSIG Call Offer services.                                                                                                                                                                                                                                                                                                                     |
| <b>Restrict Call Fwd-Off Net</b>      | Restricts users from forwarding calls to the public network. For security reasons, this should be enabled for all classes of service except the ones you use for very special circumstances.                                                                                                                                                                         |
| <b>Trk-To-Trk Transfer Override</b>   | Users with this COS override any system and/or COR-to-COR calling party restrictions that would otherwise prohibit the trunk-to-trunk transfer operation for users with this COS.                                                                                                                                                                                    |
| <b>VIP Caller</b>                     | Enables automatic priority calling when assigned to the originator of a call. A call from a VIP phone is always a priority call without the use of a feature button or FAC.                                                                                                                                                                                          |
| <b>Match BCA Display to Principal</b> | The format of the incoming calls on the bridged call appearances of a COS Group. The possible values are: <ul style="list-style-type: none"> <li>• <b>y</b>: Displays the incoming call in the &lt;calling name/number&gt; format</li> <li>• <b>n</b>: Displays the incoming call in the &lt;calling name/number&gt; to &lt;principal station&gt; format.</li> </ul> |

| Button        | Description                                                    |
|---------------|----------------------------------------------------------------|
| <b>Commit</b> | Saves the changes you make.                                    |
| <b>Reset</b>  | Undoes the changes you made.                                   |
| <b>Edit</b>   | Takes you to the Edit Class of Service data page.              |
| <b>Done</b>   | Performs the action you initiate.                              |
| <b>Cancel</b> | Cancels the current action and takes you to the previous page. |

## Authorization Code

### Authorization Code

Use authorization code to control the calling privileges of system users. Authorization codes extend control of calling privileges and enhance security for remote access callers. You can use authorization codes to:

- Override a facilities restriction level (FRL) that is assigned to an originating station or trunk

- Restrict individual incoming tie trunks and remote access trunks from accessing outgoing trunks
- Track Call Detail Recording (CDR) calls for cost allocation
- Provide additional security control

## Authorization Code List

Authorization Code List displays all the authorization codes under the Communication Manager you select. You can apply filters and sort each column in the Authorization Code List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name                        | Description                                                                   |
|-----------------------------|-------------------------------------------------------------------------------|
| <b>Authorization Code</b>   | The authorization code, which is a combination of 4 to 13 digits.             |
| <b>Class of Restriction</b> | The associated Class Of Restriction.                                          |
| <b>System</b>               | The name of the Communication Manager associated with the authorization code. |

## Viewing Authorization Code

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **System > Authorization Code**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Authorization Code List, select the authorization code you want to view.
6. Click **View**.

### Authorization Code field descriptions

| Name                      | Description                                                                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authorization Code</b> | Displays a combination of 4 to 13 digits. The number of digits must agree with the number assigned to the Authorization Code Length field on the Feature-Related System Parameters screen. To enhance system security, choose Authorization Codes of 13 random digits. |
| <b>COR</b>                | Displays the Class Of Restriction. Valid entry ranges from <b>0</b> to <b>95</b> . When a user dials the associated authorization code, this is the COR that the telephone or other facility will assume for that call.                                                |

| Button          | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Commit</b>   | Performs the action you initiate.                                   |
| <b>Schedule</b> | Performs the action at the specified time.                          |
| <b>Reset</b>    | Clears the action and resets the fields.                            |
| <b>Clear</b>    | Clears all entries.                                                 |
| <b>Done</b>     | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b>   | Cancels your current action and takes you to the previous page.     |
| <b>Now</b>      | Performs the action you initiate real time.                         |

---

## Class of Service Group

### Class Of Service Group

With Class Of Service Group, you can view the list of up to 100 Class Of Service (COS) groups on the screen. You can also change the configuration of individual COS group properties and edit up to 15 COS options within a group.

### Class Of Service Group List

Class Of Service Group List displays the groups of Class Of Service under the Communication Manager you select. You can apply filters and sort each of the columns in the Class Of Service Group List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name                | Description                                                                       |
|---------------------|-----------------------------------------------------------------------------------|
| <b>Group Number</b> | The number of the Class Of Service group. The group number ranges from 1 to 100.  |
| <b>Group Name</b>   | The name of the Class Of Service group.                                           |
| <b>System</b>       | The name of the Communication Manager associated with the Class Of Service Group. |

## Viewing Class Of Service Group

You can view the list of up to 100 Class of Service (COS) groups on this screen.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **System > Class of Service Group**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the Class Of Service Group List, select the group number for which you want to view the data.
6. Click **View**.

| Name                             | Description                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                    | The name of the Communication Manager associated with the Class Of Service.                                                                                                                                                                                                                                                                      |
| <b>Group Number</b>              | The Class Of Service number. The group number can range from <b>1</b> to <b>100</b> . This field appears when, on the System Parameters Customer-Options (Optional Features) screen, the <b>Tenant Partitioning</b> field is set to <i>y</i> .                                                                                                   |
| <b>Group Name</b>                | The name of the Class Of Service Group. This field appears when, on the System Parameters Customer-Options (Optional Features) screen, the <b>Tenant Partitioning</b> field is set to <i>y</i> .                                                                                                                                                 |
| <b>Ad-hoc video conferencing</b> | Enables the ad-hoc video conference capability. Six users can participate in a video conference call.                                                                                                                                                                                                                                            |
| <b>Automatic Callback</b>        | Allows users to request Automatic Callback.                                                                                                                                                                                                                                                                                                      |
| <b>Automatic Exclusion</b>       | Allows a user to activate automatically Exclusion when they go off hook on an endpoint that has an assigned Exclusion button.                                                                                                                                                                                                                    |
| <b>Buttonless Auto Exclusion</b> | Allows bridged appearances to operate in the exclusion mode regardless of the existence of an administered exclusion button. Currently this feature is only administrable on a per-endpoint basis by administering a feature exclusion button. This feature relaxes the requirement to use a feature button.                                     |
| <b>Call Forwarding Busy / DA</b> | Allows users to forward calls to any extension when the dialed extension is busy or does not answer.                                                                                                                                                                                                                                             |
| <b>Call Forwarding Enhanced</b>  | Allows users to designate different preferred destinations for forwarding calls that originate from internal and external callers.                                                                                                                                                                                                               |
| <b>Call Forwarding All Calls</b> | Allows users to forward all calls to any extension.                                                                                                                                                                                                                                                                                              |
| <b>Client Room</b>               | Allows users to access Check-In, Check-Out, Room Change/ Swap, and Maid status functions. In addition, Client Room is required at consoles or telephones that are to receive message waiting notification. You can administer COS for Client Room only when you have Hospitality Services and a Property Management System interface.            |
| <b>Conference Tones</b>          | This feature provides the conference tone as long as three or more calls are in a conference call. If you enable these tones for countries other than Italy, Belgium, United Kingdom, or Australia, the tones will be equivalent to no tone (silence) unless the tone is independently administered or customized on the Tone Generation screen. |

| Name                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Console Permissions</b>           | <p>Allows multi-appearance telephone users to control the same features that the attendant controls. You might assign this permission to front-desk personnel in a hotel or motel, or to a call center supervisor.</p> <p>With console permission, a user can:</p> <ul style="list-style-type: none"> <li>• Activate Automatic Wakeup for another extension</li> <li>• Activate and deactivate controlled restrictions for another extension or group of extensions</li> <li>• Activate and deactivate Do Not Disturb for another extension or group of extensions</li> <li>• Activate Call Forwarding for another extension</li> <li>• Add and remove agent skills</li> <li>• Record integrated announcements</li> </ul> |
| <b>Contact Closure Activation</b>    | Allows a user to open and close a contact closure relay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Data Privacy</b>                  | Isolates a data call from call waiting or other interruptions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Extended Forwarding All</b>       | Allows a user to administer call forwarding for all calls from a remote location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Extended Forwarding Busy / DA</b> | Allows this user to administer call forwarding when the dialed extension is busy or does not answer from a remote location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Intra-Switch CDR</b>              | Administers extensions for which Intra-Switch CDR is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Masking CPN / Name Override</b>   | Allows users to override the MCSNIC capability, that is, masking the display of calling party information and replacing it with a hard-coded, system-wide text string, Info Restricted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Off-Hook Alert</b>                | To enable this option, either the Hospitality (Basic) or Emergency Access to Attendant field must be enabled in your license file. When enabled, these fields display as <b>y</b> on the System- Parameters Customer-Options screen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Personal Station Access (PSA)</b> | Allows users to associate a telephone to their extension with their programmed services, using a feature access code. This field must be set to <b>n</b> for virtual telephones. This field must be set to <b>y</b> at a user's home endpoint in order for that user to use the Enterprise Mobility User (EMU) feature at other endpoints.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Priority Calling</b>              | Allows users to dial a feature access code to originate a priority call. Such calls ring differently and override Send All Calls, if active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Priority IP Video</b>             | Allows priority video calling, where video calls have an increased likelihood of receiving bandwidth and can also be allocated a larger maximum bandwidth per call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>QSIG Call Offer Originations</b>  | Allows users to invoke QSIG Call Offer services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Restrict Call Fwd- Off Net</b>    | Restricts users from forwarding calls to the public network. For security reasons, this should be enabled for all COS except the ones you use for very special circumstances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

*Table continues...*

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trk-To-Trk Transfer Override</b>   | Users with this COS override any system and/or COR-to-COR calling party restrictions that would otherwise prohibit the trunk-to-trunk transfer operation for users with this COS.                                                                                                                                                                                    |
| <b>VIP Caller</b>                     | Enables automatic priority calling when assigned to the originator of a call. A call from a VIP phone is always a priority call without the use of a feature button or FAC.                                                                                                                                                                                          |
| <b>Match BCA Display to Principal</b> | The format of the incoming calls on the bridged call appearances of a COS Group. The possible values are: <ul style="list-style-type: none"> <li>• <b>y</b>: Displays the incoming call in the &lt;calling name/number&gt; format</li> <li>• <b>n</b>: Displays the incoming call in the &lt;calling name/number&gt; to &lt;principal station&gt; format.</li> </ul> |

| Button          | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Commit</b>   | Performs the action you initiate.                                   |
| <b>Schedule</b> | Performs the action at the specified time.                          |
| <b>Reset</b>    | Clears the action and resets the fields.                            |
| <b>Clear</b>    | Clears all entries.                                                 |
| <b>Done</b>     | Completes your current action and takes you to the subsequent page. |
| <b>Cancel</b>   | Cancels your current action and takes you to the previous page.     |
| <b>Now</b>      | Performs the action you initiate real time.                         |

## Uniform Dial Plan Groups

### Uniform Dial Plan Group

A Uniform Dial Plan Group is a set of Communication Manager systems that use the Uniform Dialing Plan (UDP) feature. You can use the Uniform Dial Plan Groups capability in System Manager to create, view, modify, and delete uniform dial plan (UDP) groups.

### Adding a Uniform Dial Plan Group

#### About this task

Use this page to create a new UDP Group. While creating a new UDP Group, make sure that the Communication Manager systems you select share common extension ranges.

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Click **System > Uniform Dial Plan Groups** in the left navigation pane.
3. On the UDP Groups page, click **New**.

4. On the Add UDP Group page, enter the name for the UDP Group you want to create in the **Group Name** field.
5. Select the **Auto Update All** check box if you want the UDP tables of every Communication Manager system that you add to this group to be updated automatically.
6. Select the **Create local UDP table entry** check box if you want to create a local entry automatically in the UDP table of the Communication Manager system when you add an endpoint to it.
7. Enter the required information in the fields under the **Group Members** and **Group Ranges** tabs.
8. Click **Commit**.
9. On the System Manager console, click **Groups & Roles > Groups** to verify that the system added the group with the same name and resources.

## Editing a Uniform Dial Plan Group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Click **System > Uniform Dial Plan Groups** in the left navigation pane.
3. On the UDP Groups page, select the UDP Group that you want to modify from the UDP Group List.
4. Click **Edit**.
5. On the Edit UDP Groups page, modify the required fields.
6. Click **Commit**.

## Viewing a Uniform Dial Plan Group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Click **System > Uniform Dial Plan Groups** in the left navigation pane.
3. On the UDP Groups page, select the UDP Group that you want to view from the UDP Group List.
4. Click **View**. The system displays the **View UDP Group** page.

## Deleting a Uniform Dial Plan Group

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Click **System > Uniform Dial Plan Groups** in the left navigation pane.
3. On the UDP Groups page, select the UDP Group that you want to delete from the UDP Group List.
4. Click Delete.

## Add UDP Groups field descriptions

| Name                                | Description                                                                                                                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Name</b>                   | To enter a name for the UDP group that you want to create.                                                                                                                                                   |
| <b>Auto Update All</b>              | To automatically update the UDP tables of every Communication Manager that you add to this group.                                                                                                            |
| <b>Create local UDP table entry</b> | To create a local entry automatically in the UDP table of the Communication Manager system when you add an endpoint.                                                                                         |
| <b>Update on Sync</b>               | During Communication Manager Sync, if System Manager finds any new extension within the UDP Group ranges, then System Manager updates the UDP table of all Communication Manager that are in that UDP group. |

### Group Members

| Name                    | Description                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CM Systems</b>       | A list of Communication Manager systems from which you can select the Communication Manager that you want to add to the new UDP Group. A UDP Group can contain 2 to 10 systems. |
| <b>Add</b>              | The link to add one or more Communication Manager systems to the new UDP Group. Is this a field or a group member?                                                              |
| <b>Element Name</b>     | The name of the Communication Manager system that you added to the UDP group. This field is view only.                                                                          |
| <b>Software Version</b> | The version of the Communication Manager system that you added to the UDP group. This field is view only.                                                                       |
| <b>Remove</b>           | The link to remove the Communication Manager systems that you selected from the <b>CM Systems</b> field list.                                                                   |

### Group Ranges

| Name                    | Description                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>System Dial Plan</b> | A list of a common range of extensions available on the Communication Manager systems that you selected in the Group Members tab. |

*Table continues...*

| Name        | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| <b>From</b> | The starting range of extension numbers. The first extension number in the range. |
| <b>To</b>   | The closing range of extension number. The last extension number in the range.    |
| <b>Add</b>  | The link to add the specified range of extension numbers.                         |

## Group Range Configuration

| Name                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Range</b>          | The range of extension numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>UDP Type</b>       | Enter the initials of the call-processing server network that the system uses to analyze the converted number. Valid entries are <b>aar</b> , <b>ars</b> , and <b>ext</b> . First describe what is UDP type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Delete Digits</b>  | The number of digits that the software deletes before the software routes a call. Valid entries are <b>0</b> through <b>3</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Node/Location#</b> | The extension number portability (ENP) node number. Valid entries are <b>1</b> to <b>999</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Insert Digits</b>  | The specific digits or the number of administered location prefix digits inserted before routing the call. Select one of the following: <ul style="list-style-type: none"> <li>• 0 to 9 (1 to 4 digits): The digits that replace the deleted portion of the dialed number.</li> <li>• Lx (1 to 5): The variable x represents the number of digits between 1 and 5 and is the number of leading digits taken from the administered location prefix. These digits are followed by the dialed string. The number of digits in the location prefix must be more than x.</li> <li>• The field to specify the location prefix digits. Leave the Insert Digits field blank if you do not want to specify the location prefix digits.</li> </ul> |
| <b>Conv</b>           | The range configurations used to create the <b>Uniform Dial Plan</b> entries on Communication Manager when an extension in the common ranges is added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Button        | Description                                                  |
|---------------|--------------------------------------------------------------|
| <b>Commit</b> | Performs the action that you start.                          |
| <b>Clear</b>  | Clears all entries.                                          |

## Uniform Dial Plan

### Uniform Dial Plan field descriptions

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Matching Pattern</b> | The number that the Communication Manager instance uses to match the dialed numbers. You can enter up to 18 digits in the <b>Matching Pattern</b> field. You can also enter wildcard characters like x and X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Length</b>           | The length of the dialed string for each type of call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Del</b>              | The number of digits the system must delete from the initial digits of the dialed string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Insert Digits</b>    | <p>The specific digits or number of administered location prefix digits inserted before routing the call. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>0 to 9 (1 to 4 digits)</b>: The digits that replace the deleted portion of the dialed number.</li> <li>• <b>Lx (1 to 5)</b>: The variable x represents the number of digits between 1 and 5 and is the number of leading digits taken from the administered location prefix. These digits are followed by the dialed string. x must be less than the number of digits in the location prefix.</li> <li>• <b>blank</b>: Leave the <b>Insert Digits</b> field blank if you do not want to specify the location prefix digits.</li> </ul> |
| <b>Net</b>              | <p>The method that the call-processing server network uses to analyze the converted number. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>ext</b>: If you use this option, the call-processing server network analyzes the converted digit-string as an extension number.</li> <li>• <b>aar</b>: If you use this option, the call-processing server network analyzes the converted digit-string as an AAR address.</li> <li>• <b>ars</b>: If you use this option, the call-processing server network analyzes the converted digit-string as an ARS address.</li> </ul>                                                                                                                         |
| <b>Conv</b>             | The field that enables additional digital conversion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Node Number</b>      | <p>The destination node number in a private network when the system uses node number routing or Distributed Communication System (DCS). The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>blank</b>: Use this option if you do not want to enter the destination node number. This is the default option.</li> <li>• <b>1 to 999</b>: Use this option to enter the destination node number.</li> </ul>                                                                                                                                                                                                                                                                                                 |
| <b>System</b>           | The name of the Communication Manager system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Update UDP Entries</b> | Updates UDP entries.                   |

## Adding UDP entries

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **System > Uniform Dial Plan**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Type a qualifier in the **Enter Qualifier** field.
7. Click **Add(+)**.
8. On the SAT screen, type the details of the UDP entry.
9. Click **Enter**.

The system adds the UDP entry to the UDP table.

## Viewing UDP entries

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **System > Uniform Dial Plan**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Choose the UDP entry you want to view.
6. Click **View**.

The system displays the SAT screen with the details of the UDP entry.

## Editing UDP entries

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **System > Uniform Dial Plan**.
3. Select one or more Communication Manager instance from the Communication Manager list.

4. Click **Show List**.
5. Select the UDP entry you want to edit.
6. Click **Edit**.
7. On the SAT screen, edit the details for the UDP entry.
8. Click **Enter**.

The system displays the status that the UDP was successfully edited on the UDP page.

## Update UDP entries

Use **Update UDP entries** to add or delete an extension as an endpoint extension on any Communication Manager instance in the UDP group. The extension is then added or deleted in the UDP of that Communication Manager instance and as an AAR or ARS in the UDP of other Communication Manager instances in the UDP group.

## Updating UDP entries

### Before you begin

You must configure at least one UDP group before you update the UDP entries.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **System > Uniform Dial Plan**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Update UDP Entries**.
6. Complete the Update UDP Entries page.
7. Click **Commit**.

[Updating UDP entries](#) on page 829

## Assigning permission to gain access UDP groups across Communication Manager instances

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and perform one of the following steps:
  - Click **New**

- Right-click and select **New**.

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping**.
7. In **Group Name**, select the group of templates to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select a group.
8. In the **Element or Resource Type** field, click **UDP Group**.
9. Click **Next**.
10. On the Permission Mapping page, apply the required permissions. For example, select **Edit**.
11. Click **Commit**.

## Usage options

### Endpoint options

Use **Usage Options** to add and remove internal dependencies to an endpoint. Use **Add Options** to add references of an endpoint to other endpoint related objects such as Intra Switch CDR Agent, Intra Switch CDR Endpoint, and Intra Switch CDR VDN. If you select **Add Options** and add an endpoint, the system updates the reference objects you selected automatically.

For example, if you select **Intra Switch CDR for Endpoints** and add a new entry in endpoints, the same entry is added on the Intra Switch CDR form. The system displays **station-user** in the **Type** field.

Use **Usage Options** to:

- Add dependencies between an endpoint and Intra-Switch CDR for Agent, Endpoint, and VDN.
- Remove this endpoint from the bridged extension of another station, if configured.
- Remove an endpoint from a hunt group.
- Remove an endpoint from an Intra-switch CDR, if configured.
- Remove an Off-PBX-Telephone Endpoint-Mapping for the endpoint, if configured.
- Remove an endpoint from another the **Team** button of another endpoint, if configured.
- Remove an endpoint from the **Port Extension** field on the Agents form, if configured.
- Remove an endpoint from the Vector steps, if configured.
- Clear the voice messages that are waiting by selecting the **Clear AMW** checkbox.

 **Note:**

If an endpoint is referenced elsewhere and if you try to delete the endpoint, the Communication Manager gives an error. You must remove the reference before you delete the endpoint. You can remove the references using **Usage Option**.

## Related links

[Re-Calculate route pattern](#) on page 832

## Re-Calculate route pattern

You can update the route pattern based on the associated Session Manager.

On the Re-Calculate Route Pattern page, you can apply the changes to the endpoint that might have a Route Pattern value different from the value calculated based on Session Manager to route pattern association. The Select devices from Communication Manager List section provides a list of Communication Manager systems from where you can select Communication Manager.

The Session Manager Route Pattern association section is display only and contains the primary Session Manager and secondary Session Manager to Route Pattern association.

The Users with Administered Route Pattern different from Calculated Route Pattern section contains the users with a Route Selection different from the calculated Route Selection. You can select users and apply the changes by using **Apply Recalculate Route Pattern**. The system triggers a job that can run immediately or schedule for later. When the job is complete, the system applies the changes to Communication Manager and updates the System Manager database.

In the Users with Administered Route Pattern different from Calculated Route Pattern section, you can recalculate, update users, and apply the changes to users:

- After System Manager upgrades to 7.0, and you have configured Communication Manager 7.0 route patterns, you can update users in bulk from the Re-Calculate Route Pattern page.

You can also enable the **Calculate Route Pattern** check box on **Manage Users > User Management > Communication Profile > CM Endpoint profile** page.

- After you make changes to the existing route patterns after the initial setup, you can apply the changes to the affected users.

[Endpoint options](#) on page 831

## Adding dependencies to an endpoint, agent, or VDN

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Options > Usage Options**.
3. Click the **Add Options** tab.
4. Select one of the following options for a Communication Manager:
  - **Intra-Switch CDR for Agent** to add an Intra-Switch CDR dependency while adding an agent to that Communication Manager
  - **Intra-Switch CDR for Endpoint** to add an Intra-Switch CDR dependency while adding an endpoint on that Communication Manager.
  - **Intra-Switch CDR for VDN** to add an Intra-Switch CDR dependency while adding a VDN on that Communication Manager.
5. Click **Commit**.

To clear the settings you have chosen, click **Reset**.

## Removing references to an endpoint

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Options > Usage Options**.
3. In the **Remove Options** tab, select the references you want to remove for the endpoint.
4. Click **Commit**.

## NRP Group

### Overview of NRP group

By using the Network Routing Policy (NRP) group, you can add or remove Communication Manager within the NRP group. Communication Manager of the NRP group can then create **Location** entries in Session Manager for the field **Controlled by this CM server** for that network region.

After you add Communication Manager to the NRP group, you can set the **Controlled by this CM server** field to **Yes** or **No**.

If you specify the IP Network Region for the field **Controlled by this CM server** value to **Yes**, the Session Manager location will generate with **IP Network Region**, **Name** and **IP Network Map** linked for that IP Network Region.

On the IP Network Region page, you can perform the following:

- In the **Details** column, you can either show or hide the **IP Network Maps**.
- You can edit the **Name** and **Controlled by this CM server** fields for the **IP Network Region** that you have selected.

 **Note:**

If Communication Manager 1, Communication Manager 2, and Communication Manager 3 are in an NRP group, and you set the **Controlled by this CM Server** field to **Yes** for the **IP Network Region X** for Communication Manager 1.

Where **IP Network Region X** can be any **IP Network Region** other than **IP Network Region 1**, as **IP Network Region 1** is an exception.

 **Important:**

You cannot set the **Controlled by this CM Server** field to **Yes** for Communication Manager 2, and Communication Manager 3 in **IP Network Region X** because the these two Communication Manager instances are a part of the same NRP group.

## NRP sync feature

By using the NRP synchronization feature, users with H.323 phones can move between offices and have appropriate E911 routing for their location.

For the NRP sync feature, ensure that the authoritative Communication Manager **IP Network Region** information is configured in the Session Manager routing table. A Communication Manager server is authoritative for a location if the location contains media gateways and SIP endpoints that are administered on that Communication Manager server.

Therefore, if you make any change to the **IP Network Map** for the **IP Network Region** that are controlled by Communication Manager, the updates are automatically detected. These updates are replicated to the corresponding **Location** entries in the Session Manager routing table.

## Creating NRP groups

### About this task

Perform this procedure to add or remove one or more Communication Manager instances from an NRP group. The Communication Manager instances that you select will be a part of the NRP group. These Communication Manager instances will be authoritative over specific **IP Network Regions**.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Options > NRP Group**.
3. In the **NRP Group** table, select the Communication Manager instances that you want to add to an NRP group.
4. Click **Commit**.

The Communication Manager instances that you selected are now a part of the NRP group. When you add a Communication Manager instance to the NRP group, the system changes the correlation flag of **IP Network Region 1** to **Yes**, which means that Session Manager Location is created using **IP Network Region 1**.

## Managing NRP groups

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the left navigation pane, click **Network > IP Network Regions**.
3. Select the specific Communication Manager instance from the list of Communication Manager instances.

### Result

The IP Network Region page displays the **Details**, **Name**, and **Controlled by this CM Server** columns of that Communication Manager instance.

For more information, see Overview of NRP group.

### Next steps

#### Controlled by this CM Server validation:

**Controlled by this CM Server** field is available on the IP Network Region List page. **Controlled by this CM Server** disables the validation check in place for using the same **IP Network Region** across multiple Communication Managers which are part of the **NRP Group**. **Network Region 1** is an exception to this validation check.

Set the **iptcm.properties > disableAuthValidation** property for using the **Controlled by this CM Server** validation.

| iptcm.properties > disableAuthValidation value | Validation scope                                                                                                                                                                             |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| True                                           | You can set the value of the <b>Controlled by this CM Server</b> field to <b>Yes</b> for the same IP Network region on all Communication Manager servers that are part of <b>NRP Group</b> . |
| False                                          | You can set the value of the <b>Controlled by this CM Server</b> field to <b>Yes</b> only for IP Network region 1 on all Communication Manager servers that are part of <b>NRP Group</b> .   |

### Related links

[Overview of NRP group](#) on page 834

## Correlation between Communication Manager and Session Manager

- The **Controlled by this CM Server** has two values: **Yes** and **No**.
- To edit the **Name** of the Communication Manager that controls that **IP Network Region** for a Communication Manager instance, set **Controlled by this CM Server** to **Yes**.
- To create a correlated Session Manager **Location**, set **Controlled by this CM Server** of **IP Network Region** of a Communication Manager that is a part of **NRP Group** to **Yes**.
- If **Controlled by the CM Server** is changed from **Yes** to **No** then the Session Manager location entry is deleted by the system.

## Controlled by the CM Server to Yes

Setting **Controlled by the CM Server** to **Yes** on IP Network region page creates a location on Session Manager.

To verify the Session Manager location on System Manager web console, click **Elements > Routing > Locations**.

- The **Controlled by this CM Server** is set to **Yes** only if Session Manager location creation is successful at the Session Manager. On List IP Network Region page, click **Save**.
- The change in **Region Name** or **IP Network Map** of **IP Network Region** that has **Controlled by this CM server** set to **Yes** is displayed back in Session Manager when the update occurs in System Manager.

### **Note:**

In case of a conflict or mismatch with the **Name** field on Session Manager, the system logs an error and the **Name** field remains unchanged on Session Manager. The system raises an alarm.

## Correlation between Session Manager and System Manager

- System Manager disallows IPv6 type of **IP Network Map** while generating Session Manager location.
- System Manager disallows overlapping ranges while generating Session Manager location, which means setting **Controlled by this CM Server** to **Yes**.
- System Manager disallows generating the Session Manager **Location**, when Communication Manager **IP Network Region Name** is blank or if location exists with same name on Session Manager.
- The Communication Manager **IP Network Region** with **Controlled by this CM Server** and corresponding Session Manager **Location** are mapped using correlation ID.

# Chapter 11: Managing backup and restore

## Backup and restore

Use the backup and restore functionality of System Manager to back up and restore the data and configuration files. The data and configuration files for the entire system are kept centrally on System Manager.

 **Note:**

System Manager does not support deployments or upgrades on System Platform. Therefore, for System Manager upgrades by using data migration utility, create a backup of System Manager configuration files and the System Manager database only from the System Manager web console.

During the backup operation, System Manager validates the backup file that you upload, and displays an error if the file type does not match.

You can perform either a backup or a restore operation at a specified time. The restore operation fails if a backup operation is in progress. When a restore operation is in progress, the system skips all backup jobs that you scheduled.

You can restore the data on System Manager that has the same software version and IP address or FQDN as that of System Manager on which you created the backup.

System Manager verifies the signature of the backup files and warns if you restore a corrupted or tampered backup file on System Manager.

To perform the backup and restore operations, you must map the user to the role with the following permissions:

| Resource type                           | Permissions                   |
|-----------------------------------------|-------------------------------|
| OnDemand                                | add                           |
| All elements of type:SMGR Core Services | backup and restore            |
| All elements of type:alarmoperation     | view and modify               |
| All elements of type:elements           | add, change, delete, and view |

For instructions to create a custom role, see “Adding a custom role”.

 **Note:**

While restoring backup on System Manager with different Out of Band Management network details, the restore operation fails at validation phase.

[/emdata/svars/ backup in System Manager](#) on page 839

[Backup failure due to lack of disk space in /swlibrary](#) on page 839

---

## **/emdata/svars/ backup in System Manager**

For the System Manager backup operation, note the following:

- System Manager backup operation supports a maximum of 4GB file size of the `/emdata/svars/` directory. This is approximately 41% of `/emdata` occupancy as displayed in the System Resource Utilization widget on the System Manager web console Home screen.
- If you have 250K users and 4GB of `svars` file size, the backup file size will be of 5GB.

To process the backup in the `/swlibrary` directory, you must have three times of backup file size space.

**Related links**

[Backup and restore](#) on page 838

---

## **Backup failure due to lack of disk space in /swlibrary**

**Condition**

If the backup is not successful due to lack of disk space in `/swlibrary`, check the `/var/log/Avaya/mgmt/pem/pemDebugLog.log` file and search for the below string:

Caused by: `java.io.IOException: No space left on device`

**Solution**

1. Clean up space in `/swlibrary`.

 **Note:**

Do not delete the `wildfly_java_tmp` directory.

2. Move the backup archives, which are located at `/swlibrary/backup/` to remote machine.
3. Delete unused SDM artifacts, such as OVAs and patches that are not required.

To delete SDM artifacts from the System Manager web console, click **Services > Solution Deployment Manager > Software Library Management > Manage Files > Select and Delete files**.

4. Delete any files, such as OVAs for patch binaries copied manually.

[Backup and restore](#) on page 838

---

## Disk space management for System Manager backup

Ensure that sufficient disk space is available before you create a local backup.

The system generates an alarm when the disk space reaches the threshold value. On the System Manager web console, you can configure the disk space and threshold value on the View Profile:SMGR Element Manager page from **Settings > SMGR > SMGR Element Manager**.

When the system runs out of disk space, the system deletes the older backup files to accommodate the new backup files.

For scheduled backups, the system cleans the backup files that local scheduled jobs create every 24 hours. If the number of backup files for each job exceeds 10, the system deletes the older backup files from the file system and removes the corresponding entry from the database.

For remote scheduled backups, the system removes the entries of older backup archive files from the database. However, the system does not delete the backup archive files from the file system.

When a local backup job is running and disk space reaches the maximum limit, the backup job fails. The system displays a message about the insufficient disk space and suggests you to remove older backup files to create additional disk space.

## Backup and restore on System Manager that is configured for Geographic Redundancy

When you create a backup of the System Manager data or restore the data on System Manager that is configured for Geographic Redundancy, you must understand the following facts:

- The secondary System Manager that is in the standby mode does not display the **Backup and Restore** link on the web console.
- You can view the backups that you created on a standalone System Manager only on the web console of that standalone System Manager and after you convert the standalone server to primary System Manager server.
- You can view the backups that you created on a primary System Manager only on the web console of that primary System Manager.
- You can view the backups that you created on a secondary System Manager only on the web console of that secondary System Manager.
- You can restore the backup data from System Manager that is configured for Geographic Redundancy on a standalone System Manager. However, you cannot restore the backup data from a standalone System Manager on System Manager that is configured for Geographic Redundancy.

- You cannot restore the backup data on the primary System Manager server when the Geographic Redundancy replication is enabled on System Manager.
- After the restore is complete on System Manager that is configured for Geographic Redundancy, the system automatically restarts with the Geographic Redundancy replication status as disabled.
- When you enable the Geographic Redundancy replication, the system replicates the backup job that is scheduled on the primary System Manager as the scheduled backup job on the secondary System Manager. The subsequent scheduled backup job runs on both the primary and secondary System Manager separately.

---

## Accessing the Backup and Restore service

### Procedure

On System Manager Web Console, click **Services** > **Backup and Restore**.

#### **Note:**

The secondary System Manager that is in the standby mode does not display the **Backup and Restore** link on the web console.

### Result

The system displays the Backup and Restore page.

## Enabling backup encryption

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR > SMGR Element Manager**.
3. On the View Profile:SMGR Element Manager page, click **Edit**.
4. On the Edit Profile:SMGR Element Manager page, in **Backup Encrypted**, type `true`.
5. In **Encrypted Backup Global Password**, type a backup encryption password.
6. Click **Commit**.

---

## Creating a data backup on a local server

### About this task

With Release 8.1.2, you can create and restore encrypted backup after enabling backup encryption.

### Procedure

1. On the System Manager web console, click **Services > Backup and Restore**.
2. On the Backup and Restore page, click **Backup**.
3. On the Backup page, click **Local**.
4. In **File name**, type the backup file that you want to create.
5. **(Optional)** To create encrypted backup using encryption password, do the following:

- a. Clear the **Use Global Backup Encryption Password** check box.

System Manager displays the following fields:

- **Backup Encryption Password**
- **Confirm Backup Encryption Password**

- b. In **Backup Encryption Password**, type the encryption password.
- c. In **Confirm Backup Encryption Password**, retype the encryption password.

You must remember the password to restore the backup.

6. Click **Now**.

If the backup is successful, the Backup and Restore page displays the message: Backup job submitted successfully. Please check the status detail below!!

## Creating a data backup on a remote server

### Before you begin

Ensure that the backup server supports the required algorithms for the System Manager remote backup.

System Manager requires password authentication to enable the remote backup servers for successful backup.

### **Note:**

System Manager does not support authentication mechanisms, such as Keyboard-Interactive and public key-based support.

### Procedure

1. On the System Manager Web console, click **Services > Backup and Restore**.
2. On the Backup and Restore page, click **Backup**.
3. On the Backup page, click **Remote**.
4. Perform one of the following:
  - Perform the following:
    - a. In the **File transfer protocol** field, click **SCP** or **SFTP**.
    - b. Enter the remote server IP, remote server port, user name, password, and name and the path of the backup file that you create.
  - Select the **Use Default** check box.

### **Important:**

To use the **Use Default** option, provide the remote server IP, user name, password, and name and path of the backup file, and remote server port on the SMGR Element Manager page. For **Use Default**, on the SMGR Element Manager page, you can click **Services > Configurations** and navigate to **Settings > SMGR > SMGR Element Manager**.

5. **(Optional)** To create encrypted backup using encryption password, do the following:
  - a. Clear the **Use Global Backup Encryption Password** check box.  
System Manager displays the following fields:
    - **Backup Encryption Password**
    - **Confirm Backup Encryption Password**
  - b. In **Backup Encryption Password**, type the encryption password.

- c. In **Confirm Backup Encryption Password**, retype the encryption password.

You must remember the password to restore the backup.

6. Click **Now**.

If the backup is successful, the Backup and Restore page displays the message: Backup job submitted successfully. Please check the status detail below!!

## Scheduling a data backup on a remote server

### Before you begin

Ensure that the backup server supports the required algorithms for the System Manager remote backup. For more information, see Supported ciphers, key exchange algorithms, and mac algorithms.

## About this task

Use this functionality to schedule a data backup on a remote server. If you do not schedule a System Manager backup on a remote server every 7 days, the system generates an alarm.

## Procedure

1. On the System Manager web console, click **Services > Backup and Restore**.
2. On the Backup and Restore page, click **Backup**.
3. On the Backup page, click **Remote**.
4. Perform one of the following:
  - Specify the SCP server IP, SCP server port, user name, password, and file name in the respective fields.
  - Select the **Use Default** check box.

### Important:

To use the **Use Default** option, provide the remote server IP, user name, password, and name and path of the backup file, and remote server port on the SMGR Element Manager page. For **Use Default**, on the SMGR Element Manager page, you can click **Services > Configurations** and navigate to **Settings > SMGR > SMGR Element Manager**.

5. Click **Schedule**.
6. On the Schedule Backup page, specify the following details in the appropriate fields:
  - Job name
  - Date and time when the system must run the job
  - Frequency at which the system must run the job
  - Range
7. Click **Commit**.

If you do not schedule a System Manager backup every 7 days, the system generates an alarm.

# Deleting the scheduled backup job

## Before you begin

Log on to the system as an administrator.

## Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. Click **Pending Jobs**.
3. On the Pending Jobs page, select the backup job that you must delete.
4. Perform one of the following steps:
  - If the backup job that you must delete is currently running, click **More Actions > Stop** to stop the job.
  - If the backup job that you must delete is in the enabled state, click **More Actions > Disable** to disable the job.

For instructions, see [Disabling a job](#) on page 1101.

5. Click **Delete**.
6. On the Delete Confirmation page, click **OK**.

System Manager deletes the backup job from the database.

## Next steps

You can create a new scheduled backup job from **Services > Backup and Restore**.

# Restoring data backup from a local server

## About this task

With Release 8.1.2, you can create and restore encrypted backup after enabling backup encryption.

### Note:

You cannot restore the backup data on the primary System Manager server when the Geographic Redundancy replication is enabled on System Manager.

## Procedure

1. On the System Manager web console, click **Services > Backup and Restore**.
2. On the Backup and Restore page, click **Restore**.
3. On the Restore page, click **Local**.
4. In the **File name** field, type the file name that you must restore.

If the file name does not appear in the list, specify the absolute path to the backup file and the file name that you must restore.

### Note:

System Manager verifies the signature of the backup files and warns if you restore a corrupted or tampered backup file on System Manager.

5. **(Optional)** To restore encrypted backup using encryption password, do the following:
  - a. Clear the **Use Global Backup Encryption Password** check box.  
System Manager displays the **Backup Encryption Password** field.
  - b. In **Backup Encryption Password**, type the encryption password.
6. Click **Restore**.

On the Restore Confirmation page, the system displays the following message:

The Restore operation will terminate all sessions and no services will be available until the operation completes. So, the System Manager console will not be available for approximately 45 minutes but this time may vary based on Database size. Click on Continue to go ahead with the Restore operation or click on Cancel to abort the operation.

7. Click **Continue**.

The system logs you out of the System Manager web console and then shuts down.

### Result

After the restore is complete on System Manager that is configured for Geographic Redundancy, the system automatically restarts with the Geographic Redundancy replication status as disabled.

## Restoring a backup from a remote server

### About this task

 **Note:**

You cannot restore the backup data on the primary System Manager server when the Geographic Redundancy replication is enabled on System Manager.

To restore the original system at any point of time, you must restore the backup on the same release and the same software patch of that of the original System Manager. For example, if you have created a backup of System Manager Release 8.1 with Release 8.1.1 software patch installed, System Manager on which you restore the backup must run Release 8.1 that has Release 8.1.1 software patch installed.

If the System Manager release on which you restore the backup does not match, the restore operation fails.

### Procedure

1. On the System Manager web console, click **Services > Backup and Restore**.
2. On the Backup and Restore page, click **Restore**.
3. On the Restore page, click **Remote**.
4. **(Optional)** To restore encrypted backup using encryption password, do the following:
  - a. Clear the **Use Global Backup Encryption Password** check box.  
System Manager displays the **Backup Encryption Password** field.
  - b. In **Backup Encryption Password**, type the encryption password.
5. To specify the file name for the restore operation, perform one of the following:
  - Click the **Backup List** tab, and select a file name.

Use this method if the path of the backup file on the remote server is valid, and the credentials used while creating the backup file is unaltered.

- Click the **Parameterized Restore** tab, enter a valid file name, the file transfer protocol, the remote server IP address, remote server port, user name, and the password to access the remote computer in the respective fields.

 **Note:**

System Manager verifies the signature of the backup files and warns if you restore a corrupted or tampered backup file on System Manager.

- Click the **Parameterized Restore** tab, select the **Use Default** check box.

 **Important:**

To use the **Use Default** option, provide the remote server IP, user name, password, and name and path of the backup file, and remote server port on the SMGR Element Manager page. For **Use Default**, on the SMGR Element Manager page, you can click **Services > Configurations** and navigate to **Settings > SMGR > SMGR Element Manager**.

6. Click **Restore**.

On the Restore Confirmation page, the system displays the following message:

The Restore operation will terminate all sessions and no services will be available until the operation completes. So, the System Manager console will not be available for approximately 45 minutes but this time may vary based on Database size. Click on Continue to go ahead with the Restore operation or click on Cancel to abort the operation.

7. Click **Continue**.

The system logs you out of the System Manager web console and then shuts down.

## Result

After the restore is complete on System Manager that is configured for Geographic Redundancy, the system automatically restarts with the Geographic Redundancy replication status as disabled.

# Restoring the backup through the command line interface

## Before you begin

Start an SSH session and provide the correct IP address and the port number.

## About this task

You can restore the data through the command line when the machine is in an unstable state and the system does not display the Web console.

## Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. At the prompt, type `cd $MGMT_HOME/pem/fileRestoreCLIUtility`, and do the following:
  - a. In the `restorecli.properties` file, type the build number of the machine in the **version** field.
  - b. In the properties file, ensure that `fq_backup_file_name` displays the complete path of the backup zip file.
  - c. In the `fileRestoreCLIUtility.properties` file, ensure that `backup_name` points to the backup zip file.
3. Type `sh $MGMT_HOME/pem/fileRestoreCLIUtility/file_restore.sh<full path of fileRestoreCLIUtility><0/1>`.

Where, *0* denotes only the file restore and *1* denotes a full restore.

 **Note:**

System Manager verifies the signature of the backup files and warns if you restore a corrupted or tampered backup file on System Manager.

4. Complete the steps on the screen to perform the restore operation successfully.

## Disk space required for backup

Table 8: System Manager backup file size

| Number of users | Database size | Approximate backup file size |        |
|-----------------|---------------|------------------------------|--------|
|                 |               | System Manager               |        |
|                 |               | Local                        | Remote |
| 1k              | 524MB         | 27M                          | 27M    |
| 5k              | 2253MB        | 29M                          | 29M    |
| 25k             | 2774MB        | 34M                          | 34M    |
| 50k             | 4066MB        | 42M                          | 42M    |
| 75k             | 5601MB        | 49M                          | 49M    |

*Table continues...*

| Number of users | Database size | Approximate backup file size |     |
|-----------------|---------------|------------------------------|-----|
|                 |               | System Manager               |     |
| 100k            | 6482MB        | 56M                          | 56M |
| 150k            | 7855MB        | 69M                          | 69M |
| 200k            | 8219MB        | 81M                          | 81M |
| 250k            | 8537MB        | 94M                          | 94M |

## Supported ciphers, key exchange algorithms, and mac algorithms

For a successful System Manager remote backup, the remote backup server must support at least one algorithm from each of the following categories:

- Kex algorithms
  - diffie-hellman-group1-sha1
  - diffie-hellman-group-exchange-sha1
  - diffie-hellman-group-exchange-sha256
  - ecdh-sha2-nistp256
  - ecdh-sha2-nistp384

- ecdh-sha2-nistp521
- Encryption algorithms for Client to Server
  - aes128-ctr
  - 3des-ctr
  - aes192-ctr
  - aes256-ctr
  - 3des-cbc
  - blowfish-cbc
  - aes128-cbc
  - aes192-cbc
  - aes256-cbc
  - arcfour
  - arcfour128
  - arcfour256
- Mac algorithm for Client to Server
  - hmac-sha1
  - hmac-md5
  - hmac-md5-96
  - hmac-sha1-96
  - hmac-sha256
  - hmac-sha2-256
  - hmac-sha256@ssh.com
  - hmac-sha2-256-96
  - hmac-sha512
  - hmac-sha2-512
  - hmac-sha512@ssh.com
  - hmac-sha2-512-96

## Backup and Restore field descriptions

| Name                      | Description                                                                                                                                                                                                 |

| <b>Backup Encryption Password</b>            | The password for the encrypted backup.<br><br>The backup encryption password must contain minimum 8 and maximum 16 characters. The password must be a combination of lower case (a-z), upper case (A-Z), numerals (0-9), and special characters (\$@!%*?&).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Confirm Backup Encryption Password</b>    | The password for the encrypted backup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The page displays the following fields when you choose to create a backup of the System Manager data on a remote server.

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Default</b>            | The option to use the default configured values.<br><br>To use the <b>Use Default</b> option, provide the remote server IP, user name, password, and name and path of the backup file, and remote server port on the SMGR Element Manager page. For <b>Use Default</b> , on the SMGR Element Manager page, you can click <b>Services &gt; Configurations</b> and navigate to <b>Settings &gt; SMGR &gt; SMGR Element Manager</b> . |
| <b>File transfer protocol</b> | The protocol that you can use to create the backup. The values are SCP and SFTP.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Remote Server IP</b>       | The IP address of the remote server.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remote Server Port</b>     | The SSH port of the remote server.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>User Name</b>              | The user name for logging into the remote server.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Password</b>               | The password for logging on to the remote server.                                                                                                                                                                                                                                                                                                                                                                                  |

| Name                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Test Credentials</b>                      | Validates the login credential.<br>The validation gives the connection result with the remote backup server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>File Name</b>                             | The absolute path to the backup file and the file name. For example, <code>home/admin/smgr_backup_filename</code> . You can specify a different path for the backup file on the SMGR Element Manager Container page.<br>To open the SMGR Element Manager Container page, click <b>Services &gt; Configurations</b> and navigate to <b>Settings &gt; SMGR &gt; SMGR Element Manager</b> .                                                                                                                                                                                                                                                                                                 |
| <b>Use Global Backup Encryption Password</b> | The option to use the global encryption password for backup.<br>To use the <b>Use Global Backup Encryption Password</b> option, enable <b>Backup Encrypted</b> and provide the encryption password on the <b>Services &gt; Configurations &gt; Settings &gt; SMGR &gt; SMGR Element Manager</b> page.<br>By default, <b>Use Global Backup Encryption Password</b> is enabled.<br>To set a new password for backup, you can deselect the <b>Use Global Backup Encryption Password</b> check box. System Manager displays the following fields: <ul style="list-style-type: none"> <li>• <b>Backup Encryption Password</b></li> <li>• <b>Confirm Backup Encryption Password</b></li> </ul> |
| <b>Backup Encryption Password</b>            | The password for the encrypted backup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Confirm Backup Encryption Password</b>    | The password for the encrypted backup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Button          | Description                                                                             |
|-----------------|-----------------------------------------------------------------------------------------|
| <b>Now</b>      | Creates a backup of the data in the specified location immediately.                     |
| <b>Schedule</b> | Displays the Schedule Backup page where you can enter the details to schedule a backup. |
| <b>Cancel</b>   | Closes the Backup page and returns to the Backup and Restore page.                      |

## Schedule Backup field descriptions

Use this page to schedule a job for backing up data by specifying the date and time.

### Job Details

| Name            | Description          |
|-----------------|----------------------|
| <b>Job Name</b> | The name of the job. |

## Job Frequency

| Name              | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Task Time</b>  | The date and time of running the job.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Recurrence</b> | <p>The settings define whether the execution of the jobs is a recurring activity or a one-time activity. In case of a recurring job, the field also displays the time interval of recurrence. The options are:</p> <ul style="list-style-type: none"> <li>• Execute task one time only.</li> <li>• Tasks are repeated.</li> </ul> <p>The system generates an alarm if you do not schedule a System Manager backup every 7 days.</p> |
| <b>Range</b>      | <p>The settings define the number of recurrences or date after which the job stops to recur. The options are:</p> <ul style="list-style-type: none"> <li>• No End Date</li> <li>• End After occurrences</li> <li>• End By Date</li> </ul>                                                                                                                                                                                           |
| Button            | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Commit</b>     | Schedules the backup job.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Cancel</b>     | Closes the Schedule Backup page and returns to the Backup Restore page.                                                                                                                                                                                                                                                                                                                                                             |

## Restore field descriptions

Use this page to restore the application data from a local or a remote location.

| Name        | Description                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b> | <p>The type of computer from where you restore the application data. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Local</b>. The data is restored from a local machine.</li> <li>• <b>Remote</b>. The data is restored from a remote machine.</li> </ul> |

The page displays the following fields, when you select **Local** as **Type**.

| Name                    | Description                                                                    |
|-------------------------|--------------------------------------------------------------------------------|
| <b>Select File Name</b> | The list of files from where you select the backup file that you must restore. |

*Table continues...*

| Name                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File Name</b>                             | <p>The name of the backup file that you must restore.</p> <p>If the system does not display the file that you must restore, specify the complete path of the backup file.</p> <p> <b>Note:</b></p> <p>System Manager verifies the signature of the backup files and warns if you restore a corrupted or tampered backup file on System Manager.</p>                                                                                                                                                                                                                                                                        |
| <b>Use Global Backup Encryption Password</b> | <p>The option to use the global encryption password for backup.</p> <p>To use the <b>Use Global Backup Encryption Password</b> option, enable <b>Backup Encrypted</b> and provide the encryption password on the <b>Services &gt; Configurations &gt; Settings &gt; SMGR &gt; SMGR Element Manager</b> page.</p> <p>By default, <b>Use Global Backup Encryption Password</b> is enabled.</p> <p>To set a new password for backup, you can deselect the <b>Use Global Backup Encryption Password</b> check box. System Manager displays the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Backup Encryption Password</b></li> <li>• <b>Confirm Backup Encryption Password</b></li> </ul> |
| <b>Backup Encryption Password</b>            | <p>The password for the encrypted backup.</p> <p>The backup encryption password must contain minimum 8 and maximum 16 characters. The password must be a combination of lower case (a-z), upper case (A-Z), numerals (0-9), and special characters (\$@!%*?&amp;).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Confirm Backup Encryption Password</b>    | The password for the encrypted backup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Backup List

The page displays the following fields when you select **Remote** as **Type**.

The **Backup List** tab displays the list of remote backup files that are created using the SFTP or SCP protocol. Select a backup and click the **Parameterized Restore** tab to change the restore details. For example, if the location of a backup file is modified, specify the correct location of the file in the **File Name** field.

## Parameterized Restore

The page displays the following fields when you select **Remote** as **Type**.

| Name                          | Description                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------|
| <b>File Name</b>              | The name and complete path of the backup file that you want to restore.           |
| <b>File transfer protocol</b> | The protocol that you can use to restore the backup. The values are SCP and SFTP. |
| <b>Remote Server IP</b>       | The IP address of the SFTP or SCP server.                                         |

*Table continues...*

| Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Server Port</b> | The SSH port of the SFTP or SCP server.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>User Name</b>          | The user name for logging in to the SFTP or SCP server.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Password</b>           | Password for logging in to the SFTP or SCP server.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Use Default</b>        | <p>Select this check box to use the default configured values.</p> <p>To use the <b>Use Default</b> option, provide the remote server IP, user name, password, and name and path of the backup file, and remote server port on the SMGR Element Manager page. For <b>Use Default</b>, on the SMGR Element Manager page, you can click <b>Services &gt; Configurations</b> and navigate to <b>Settings &gt; SMGR &gt; SMGR Element Manager</b>.</p> |

| Button         | Description                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------|
| <b>Restore</b> | Restores the data from the specified backup file.                                                     |
| <b>Cancel</b>  | Cancels any operation in progress, closes the Restore page, and displays the Backup and Restore page. |

# Chapter 12: Configuring applications

---

## Managing data retention rules

---

### Data retention rules

You can configure data retention rules to specify the number of days you want the system to retain the following records:

- Logs in Database
- Log files:
  - Application
  - System
- Backup files stored locally on System Manager
- Cleared alarms
- Aged alarms
- Aged Scheduler Completed Jobs

---

### Excluded log files

System Manager does not delete the following logs while executing the **pruneAllLogs.sh** command.

- /var/log/audit/data/
- /var/log/anaconda/

## Accessing the Data Retention Rules service

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Data Retention**.

The system displays the Data Retention page with the Rule list.

---

## Modifying data retention rule

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Data Retention**.

The system displays the Data Retention page with the Rule list.

3. From the Rule List section, select a rule.
4. Click **Edit**.

 **Note:**

If you change the **LogPurgeRule** settings, the export delta functionality might get affected as the permanently deleted users login-names in the delta period are identified on the basis of audit logs of permanently deleted users in the system.

5. In the **Retention Interval (Days)** field, modify the value.
6. Click **Update** to save the value.

## Applying data retention rule

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Data Retention**.

The system displays the Data Retention page with the Rule list.

3. From the Rule List section, select a rule.
4. Click **Execute** to apply the rule.

When the rule is applied, System Manager display the following message:

Rule successfully applied.

| Rule Description          | <p>A brief description about the data retention rule.</p> <p>For <b>LogRetentionRule</b>, the value range is from 1 through 180 days. Default value for number of days to retain log files is 30 days.</p>                                                                                                                   |
| Retention Interval (Days) | The number of days the data is retained.                                                                                                                                                                                                                                                                                     |

| Button  | Description                                   |
|---------|-----------------------------------------------|
| Edit    | Modifies the selected rule.                   |
| Update  | Saves the rule with changes made to the rule. |
| Cancel  | Cancels the editing operation.                |
| Execute | Applies the selected rule.                    |

## logRetention command

The **logRetention** utility displays the currently administered log retention time.

### Syntax

```
logRetention [-a] [-c] [-d] [-h]
```

- a** Displays all log retention time settings.
- c** Displays current log retention time from database.
- d** Displays log retention time set from properties files.
- h,--help** The option to print help options.

---

## updateLogRetention command

The `updateLogRetention.sh` utility manages the log retention time.

### Syntax

```
updateLogRetention.sh [-p] [-v] [maxRetentionTime]
```

- |                         |                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>-p</b>               | The log files do not get pruned.                                                                                     |
| <b>-v</b>               | Verbose mode.                                                                                                        |
| <b>maxRetentionTime</b> | The Maximum Retention Time in days (optional). If the value is not provided, the current administered value is used. |
| <b>-h</b>               | The option to print help options.                                                                                    |

---

## pruneAllLogs command

The `pruneAllLogs.sh` utility manages the deletion of log files.

### Syntax

```
pruneAllLogs.sh [-b] [-t] [-v] [-h] [maxRetentionTime]
```

- |                         |                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>-b</b>               | Deletes the base log files.                                                                                          |
| <b>-t</b>               | Displays the list of log files that are eligible for deletion. Test mode. Does not delete the log files.             |
| <b>-v</b>               | Verbose mode.                                                                                                        |
| <b>-h</b>               | The option to print help options.                                                                                    |
| <b>maxRetentionTime</b> | The Maximum Retention Time in days (optional). If the value is not provided, the current administered value is used. |

# Configuring applications

## Configuration management

Configuration management provides a configuration repository for System Manager services. Configuration management is responsible for storing configuration data, also called as profiles, for System Manager services and notifying the services of configuration changes.

You can view and edit a profile of a service using Configuration management.

| <b>Edit</b> | Displays the Edit Profile: Agent Management page. Use this page to edit the parameters in the Agent Management profile. |
| <b>Done</b> | Closes the View Profile: Agent Management page.                                                                         |

## Configuring IP Office

### Procedure

1. On the System Manager console, click **Services > Configurations**.
2. Click **Settings > IP Office > Configuration**.
3. On the View Profile: Configuration page click **Edit**.
4. Edit the table properties and general properties in the Edit Profile: Configuration page.
5. Click **Commit**.

## IP Office profile field descriptions

| Name                                           | Description                                                                                          |
|------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Maximum Records for Select All in table</b> | The maximum number of records that is used for selection if <b>Select All</b> is used in list pages. |

*Table continues...*

| Name                                           | Description                                           |
|------------------------------------------------|-------------------------------------------------------|
| <b>Maximum Records on single page of table</b> | The maximum number of records displayed in the table. |

## General Properties

| Name                      | Description                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Application Prefix</b> | The name to display as prefix in the Communication System Management job names. The default is IPO. |

| Button        | Description                                                      |
|---------------|------------------------------------------------------------------|
| <b>Edit</b>   | Displays the Edit: Profile page where you can change the values. |
| <b>Done</b>   | Saves the changes.                                               |
| <b>Commit</b> | Saves the changes you make on the Edit: Profile page.            |

## View Profile:Configuration field descriptions

### Reports cleanup properties

| Name                                               | Description                                                                                                      |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Reports periodic Cleanup Interval (in days)</b> | The interval in days when the system performs the cleanup. By default, the system deletes reports after 60 days. |

### Reports Output Directory

| Name                                 | Description                                                                                                                 |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Reports Output Directory</b>      | The name of the directory where the system saves the reports. The default location is /opt/Avaya/reports_data.              |
| <b>Reports Output Directory Size</b> | The maximum size of the output directory that is allocated on System Manager to save the reports. The maximum size is 1 GB. |

### Reports Alarm Properties

| Name                                                                            | Description                                                                                                      |
|---------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Raise critical alarm in case Reports Output Directory fills (in percent)</b> | The percentage of space in the output directory when the system must raise a critical alarm. The default is 95%. |
| <b>Raise major alarm in case Reports Output Directory fills (in percent)</b>    | The percentage of space in the output directory when the system must raise a major alarm. The default is 85%.    |
| <b>Raise minor alarm in case Reports Output Directory fills (in percent)</b>    | The percentage of space in the output directory when the system must raise a minor alarm. The default is 70%.    |

| Button      | Description                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|

## View Profile: Data Transport Config field descriptions

| Name                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Connection Avaya production FQDN</b>               | The value is a fully qualified domain name of the target Enterprise for a connection. This may identify a customer, Business Partner or Avaya itself. For example, avaya.com, company.com                                                                                                                                                                                                                                                        |
| <b>Connection Avaya production keyAlias</b>           | The value specifies the alias of a key in the keyStore to be used for client authentication in HTTPS sessions when communicating with an upstream server. Typically used when Avaya is the upstream server.<br><br>This is an optional field.                                                                                                                                                                                                    |
| <b>Connection Avaya production platform qualifier</b> | The value is a logical name for the target enterprise, that applies irrespective of primary or backup.<br><br>The primary and backup are a part of the same organization. Components use this name to address the Enterprise Server pair.<br><br>This name must match the name that the Enterprise Servers have assigned to themselves locally or else the connection is rejected.                                                               |
| <b>Connection Avaya production primary URL</b>        | The value is a primary URL of the platform                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Connection Avaya production useProxy</b>           | The value specifies whether to use proxies for this platform or not. The values are true or false.                                                                                                                                                                                                                                                                                                                                               |
| <b>Connection set</b>                                 | The set of connections that this SAL data transport will open.<br><br>Each connection must have PlatformName, TargetFQDN, and PrimaryURL elements. Connections can optionally also have BackupURL elements.                                                                                                                                                                                                                                      |
| <b>Https session timeout</b>                          | The value specifies the maximum duration of HTTPS authentication sessions before they need to be re-negotiated.                                                                                                                                                                                                                                                                                                                                  |
| <b>Max message exchange size</b>                      | The value specifies maximum size of the messages data transport attempts to send or receive in one bundle.<br><br>The following are the units of size: <ul style="list-style-type: none"> <li>• B for bytes</li> <li>• M for megabytes</li> <li>• k for kilobytes</li> </ul> <p> <b>Note:</b><br/>Do not change the default value unless there is a need.</p> |

*Table continues...*

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Max queue memory</b>          | <p>The value specifies the maximum amount of memory on disk that the queue can occupy.</p> <p>The following are the units of memory:</p> <ul style="list-style-type: none"> <li>• B for bytes</li> <li>• M for megabytes</li> <li>• k for kilobytes</li> </ul> <p> <b>Note:</b></p> <p>Do not change the default value unless there is a need.</p>                                                                                                                                                                                                   |
| <b>Max send transaction time</b> | <p>The value specifies the maximum amount of time spent in a transaction when trying to send upstream.</p> <p> <b>Note:</b></p> <p>Do not change the default value unless there is a need.</p>                                                                                                                                                                                                                                                                                                                                                       |
| <b>Organization FQDN</b>         | The value specifies a fully qualified domain name that uniquely identifies the business organization that the SAL Platform resides in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Polling interval</b>          | <p>The time between polling for messages from each enterprise platform. Specify 0 to turn polling off.</p> <p>The following are the units:</p> <ul style="list-style-type: none"> <li>• h for Hours</li> <li>• m for Minutes</li> </ul> <p>The Agent polls because there is no way to connect directly from Avaya to the customer. Connections may only be initiated from the customer side. A component in the Enterprise can just send a message. The message is queued until either a message or a polling request is received from the destination Agent and the queued message is sent back to the Agent in the HTTPS reply.</p> |
| <b>Proxy address</b>             | The domain name or IP address of the proxy to use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Proxy password</b>            | The password to use with the proxy. They are stored in a plain text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Proxy port</b>                | The port of the proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Proxy type</b>                | The type of proxy based on whether the proxy supports HTTP or SOCKS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Proxy use authentication</b>  | <p>The value specifies whether an authentication is required to access the proxy server.</p> <p>The values are true and false. If the value is true, an authentication is required to access the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Proxy user</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Key Management Properties

| Name                                                          | Description                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Number of days before administrator should be notified</b> | <p>The number of days before the key expiry when the administrator must be notified.</p> <p>The default is 21.</p>                                                                                                                                                                                                 |
| <b>Notify administrator about asymmetric keys expiration</b>  | <p>The status of the asymmetric keys expiration notification to the administrator. The options are:</p> <ul style="list-style-type: none"> <li>• <code>true</code>: To enable the notifications.</li> <li>• <code>false</code>: To disable the notifications.</li> </ul> <p>The default is <code>false</code>.</p> |

## Database Properties

| Name                    | Description                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------|
| <b>Connection URL</b>   | The connection URL of the database.                                                             |
| <b>Host Name</b>        | The host name of the database.                                                                  |
| <b>JDBC Drive Class</b> | The JDBC drive class for the database.                                                          |
| <b>Password</b>         | The password for logging into the database.                                                     |
| <b>Confirm Password</b> | The database login password that you retype.<br>This option is available only in the Edit mode. |
| <b>Port Number</b>      | The port number of the database.                                                                |
| <b>User Name</b>        | The user name for logging into the database.                                                    |
| <b>Vendor Name</b>      | The vendor name of the database.                                                                |

## Password Policy for Programmatic Accounts

| Name                                                  | Description                                                                                                                                                                                                                                      |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Disallow repeated and/or sequential characters</b> | The options are: <ul style="list-style-type: none"> <li>• <b>true</b>: Repeated and sequential characters are not allowed.</li> <li>• <b>false</b>: Repeated and sequential characters are allowed.</li> </ul> By default, this is <b>true</b> . |
| <b>Minimum total length</b>                           | The minimum number of characters that you must use in the password. The valid values are from 1 through 32. The default value is 32.                                                                                                             |
| <b>Minimum number of lower case character(s)</b>      | The minimum number of lowercase characters that you must use in the password. The default value is 0.                                                                                                                                            |
| <b>Minimum number of numeric character(s)</b>         | The minimum number of numeric characters that you must use in the password. The default value is 0.                                                                                                                                              |
| <b>Minimum number of special character(s)</b>         | The minimum number of special characters that you must use in the password. The default value is 0.                                                                                                                                              |
| <b>Minimum number of upper case character(s)</b>      | The minimum number of uppercase characters that you must use in the password. The default value is 0.                                                                                                                                            |
| <b>Previous password(s) blocked</b>                   | The number of recent passwords that you cannot use. The valid values are from 0 through 24. The default value is 24.<br><br>The 0 value means that System Manager does not check for the previous passwords.                                     |

## Multi Tenancy Properties

| Name                        | Description                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Multi Tenancy Status</b> | <p>The status of the Multi Tenancy feature on the system. The options are:</p> <ul style="list-style-type: none"> <li>• <code>true</code>: To enable the feature.</li> <li>• <code>false</code>: To disable the feature.</li> </ul> <p>The default is <code>false</code>.</p> |

## Self Provisioning Properties

| Name                            | Description                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Self Provisioning Status</b> | <p>The option for the end user to change the H323 and SIP passwords. The options are:</p> <ul style="list-style-type: none"> <li>• <code>true</code>: To enable self provisioning.</li> <li>• <code>false</code>: To disable self provisioning.</li> </ul> |

## System Manager Properties

| Name                 | Description                                                                     |
|----------------------|---------------------------------------------------------------------------------|
| <b>Build Version</b> | <p>The build version of System Manager.</p> <p>This field cannot be edited.</p> |

## Auto Transliteration Properties

| Name                             | Description                                                                                                                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Transliteration Flag</b> | <p>The status of the auto transliteration feature. The options are:</p> <ul style="list-style-type: none"> <li>• <code>true</code>: To enable transliteration.</li> <li>• <code>false</code>: To disable transliteration.</li> </ul> <p>The default is <code>true</code>.</p> |

## Audit Configuration Properties

| Name                                                                 | Description                                                                                                                    |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Number of failed login attempts to indicate a security threat</b> | <p>The number of failed login attempts after which a security threat is indicated.</p> <p>The default is 5 login attempts.</p> |

## Email Configuration Properties

| Name                               | Description                                                                                                                                                                                                                                                              |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable email notification</b>   | The status of the email notifications feature. The options are: <ul style="list-style-type: none"> <li>• <code>true</code>: To enable email notifications.</li> <li>• <code>false</code>: To disable email notifications.</li> </ul> The default is <code>false</code> . |
| <b>From Email Address</b>          | The email ID that the system uses to send the email.                                                                                                                                                                                                                     |
| <b>From Email Password</b>         | The email password that the system uses for authentication before sending the email.                                                                                                                                                                                     |
| <b>Confirm From Email Password</b> | The email authentication password that you retype.<br>This option is available only in the Edit mode.                                                                                                                                                                    |
| <b>Email Host</b>                  | The URL for the email server.                                                                                                                                                                                                                                            |
| <b>Email Host Port</b>             | The port for the email server. The default port is 25.                                                                                                                                                                                                                   |

## View Profile:Logging Service field descriptions

Use this page to view the parameters and their corresponding values that specify the default settings for log harvesting service.

| Name                                                                | Description                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Max time interval to wait</b>                                    | The maximum time interval for which the system waits between a request and a response for harvesting a log file from a remote System Manager computer. You can specify a time interval between 1800000 milliseconds to maximum value of 7200000 milliseconds. The default value is 10800000 milliseconds. |
| <b>Directory path for harvested files</b>                           | The directory where all the harvested files are stored. The default path is <code>/var/log/Avaya/mgmt/downloads</code> .                                                                                                                                                                                  |
| <b>No. of Lines/Page(All harvested archives will be re-indexed)</b> | The maximum number of lines that you can view on the log browser page for a harvested log file.                                                                                                                                                                                                           |
| <b>Maximum allowed size of harvest directory (In GB)</b>            | The maximum size of the harvested files directory. The value of minimum size of the harvested directory is 1 GB and maximum size can be 10 GB.                                                                                                                                                            |
| <b>No. of files for File rotation</b>                               | The maximum number of harvested files that the system can store before the oldest file is overwritten by the new harvested file. You can set 10 as minimum number of files and 9999999 as maximum number of files.                                                                                        |

| Button      | Description                                                                                                        |

|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Confirm Backup Global Password</b>            | The global password for the encrypted backup that you retype to confirm.<br>This field is only available in the Edit mode.                                                                                                                                                                                                                                                                                                      |
| <b>Database Utilities Path</b>                   | The name of the directory on the database server that contains the PostgreSQL backup and restore utilities.<br><br> <b>Note:</b><br>The database user must have execute permissions on these utilities.                                                                                                                                        |
| <b>Database Type</b>                             | The type of database. For example, Oracle, Postgres.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Database server</b>                           | The hostname of the database server.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Database Port</b>                             | The port number for the database server.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Database SCP Port</b>                         | The port on the database server on which the SSH server is running.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Disk Space Allocated (GB)</b>                 | The disk space allocated for backup archives.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Disk Space Threshold (%)</b>                  | The percentage of the <b>diskSpaceAllocated</b> property. When this percentage is reached, the system generates an alarm. For example, if the <b>diskSpaceAllocated</b> is 100 MB and <b>diskSpaceThreshold</b> is 90 percent, the system generates an alarm when the disk space occupied by the backup archives reaches 90 MB.                                                                                                 |
| <b>Job Interface URL</b>                         | The lookup URL for Element Manager.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Maximum Backup Files</b>                      | The maximum number of backup files that you can create. The valid values are 1 through 5, and the default is 3.<br><br>When the maximum limit is reached, the system rotates backup archives.                                                                                                                                                                                                                                   |
| <b>Maximum Data Retention Limit (days)</b>       | The maximum data retention limit in days. You can set the limit for any data retention rule.                                                                                                                                                                                                                                                                                                                                    |
| <b>Maximum size for log data stored</b>          | The maximum size for log data stored. This is the upper limit on the number of records on the log_store table.                                                                                                                                                                                                                                                                                                                  |
| <b>Maximum Transaction Timeout Limit (Hours)</b> | The maximum transaction timeout limit in hours.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remote Utility Directory</b>                  | The directory on the database server that contains the Element Manager backup or restore utilities.                                                                                                                                                                                                                                                                                                                             |
| <b>Scheduler URL</b>                             | The URL for gaining access to the Scheduler.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remote Server Password</b>                    | The password for accessing the SCP server.<br><br> <b>Important:</b><br>To use the <b>Use Default</b> option on the Backup or Restore page, ensure that you specify the following: <ul style="list-style-type: none"> <li>• Remote server IP</li> <li>• User name</li> <li>• Password</li> <li>• Name and path of the backup file</li> </ul> |

*Table continues...*

| Name                                  | Description                                                                                           |
|---------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Confirm Remote Server Password</b> | The SCP server password that you retype to confirm.<br>This field is only available in the Edit mode. |
| <b>Remote Server Port</b>             | The SSH port for the SCP server.                                                                      |
| <b>Remote server</b>                  | The hostname of the SCP server.                                                                       |
| <b>Remote Server User</b>             | The username to access the secure access server.                                                      |

| Button        | Description                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit</b>   | Displays the Edit Profile: SMGR Element Manager page to edit the System Manager Element Manager profile parameters.                                               |
| <b>Done</b>   | Closes the View Profile: SMGR Element Manager page.                                                                                                               |
| <b>Commit</b> | Saves and commits any changes made in the System Manager Element Manager profile settings.<br>This field is only available in the Edit mode.                      |
| <b>Cancel</b> | Cancels any changes and reverts the System Manager Element Manager profile settings to the last saved settings.<br>This field is only available in the Edit mode. |

### Avaya IM System Manager subagent attributes

| Name                          | Description                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Master Agent IPAddress</b> | IP address of the machine on which master agent is running.                                                                                                                                                                                                                                                                             |
| <b>Master Agent TCP Port</b>  | The connection between master agent and subagent is established via a TCP port using AgentX protocol. This port has to be configured with both the master agent and the subagent so that the master agent starts listening on the configured TCP port and then the subagent establishes connection with the master agent via this port. |
| <b>Sub Agent IPAddress</b>    | IP address of the machine on which subagent is deployed.                                                                                                                                                                                                                                                                                |

## Configuring the TrapListener service

### Procedure

1. On the System Manager console, click **Services > Configurations**.
2. In the left navigation pane, click **Settings > SMGR**.
3. Click **TrapListener**.
4. On the View Profile: TrapListener Service page, click **Edit**.
5. Edit the required fields in the Edit Profile: TrapListener Service page.
6. Click **Commit**.

| <b>Edit</b>                                 | Displays the Edit Profile:User Bulk Import Profile page where you can change the user bulk import parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Chapter 13: Managing inventory

---

## Element management

Inventory maintains a repository that records elements deployed on System Manager, including the runtime relationships. An element in the inventory refers to a single instance or clustered instance of a managed element. Inventory provides a mechanism for creating, modifying, searching, and deleting elements and the access point information from the repository. Inventory retrieves information about elements that are added or deleted from the repository.

Inventory integrates the adopting applications with the common console of System Manager. Through Inventory, elements can provide a link that redirects to the webpage of the element manager. Such links appear for only specific element types.

When you deploy an Avaya Aura® application by using Solution Deployment Manager, the system displays the application in the System Manager inventory.

To upgrade an Avaya Aura® application by using Solution Deployment Manager, you must add applications such as Communication Manager, Session Manager, and Branch Session Manager in the inventory.

 **Note:**

You must add Appliance Virtualization Platform or ESXi host from Application Management on Solution Deployment Manager. The system displays Appliance Virtualization Platform or ESXi host on the Manage Elements page.

 **Note:**

On the Manage Elements page, links to Corporate Directory, IPsec, Numbering Groups, Patches, Secure FTP Token, SNMP Profiles, and Software Deployment might not be active. You can gain access to the elements from **Users > Administrators**.

Using Manage Elements, you can add elements in the following methods:

- Manually add elements to the System Manager inventory.
- Perform automatic inventory collection from the Discovery tab that automatically adds elements to the System Manager inventory.
- Add elements to the System Manager inventory in bulk from the **More Actions > Import** link.

Using Manage Elements you can:

- Add or modify elements

- Delete elements
- Assign and remove entries for elements
- Provide a certificate to an element
- Replace a certificate
- Import elements in bulk
- Configure SAI Gateway
- Configure Avaya Services Registration
- View certificate add status

From Release 8.1, System Manager displays a progress bar on the Manage Elements for ongoing Geographic Redundancy event notification status that are sent to the elements that are added on System Manager. When you hover on the status bar, the system displays the event name for which this notification is being sent out from System Manager to elements. You can use the **More Actions > View Notification Status** page to view the details of this notification.

For System Manager Geographic Redundancy:

- Manage or unmanage elements
- Get current status of elements

### Manage Elements access

You require access to the **Inventory > Manage Elements** page on the System Manager web console. The role must have the following permissions assigned:

For resource type elements, all permissions in the **Role Resource Type Actions** section.

### Bulk import

Inventory supports the creation and updation of elements by importing data from an XML file. You can import elements only through the graphical user interface.

Inventory provides the following configuration options for each import operation:

- Abort on first error: The system stops the import operation if any exception occurs.
- Continue processing other records: The system does not stop the import operation even if any exception occurs, and the import operation continues.
- Replace: Reimports all data for the element that you import. The replace function replaces an element and the related data with a new one.
- Merge: Merges the data of an element with the import data from an input XML file.
- Skip: Skips the import operation. As an administrator, you reimport the elements to recover from failures. If you reimport the same file to recover from failures, RTS does not overwrite any record that you have successfully added. Inventory continues to process other records from the file.
- Delete: Deletes an element.
- Schedule: Schedules the import of the element.

---

## Methods to add elements to System Manager

---

### Manual addition of elements

You can manually add an element to the System Manager inventory from the Manage Elements page. For example, Communication Manager.

You must add the ESXi host from Application Management on Solution Deployment Manager. The system displays the ESXi host on the Manage Elements page.

---

### Adding a new element

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Click **New**.
4. On the New Elements page, in the **Type** field, click the element type that you want to create.
5. On the New <element-name> page, on the **General** and **Attributes** tabs, complete the required fields.

The tabs and fields on the New <element-name> page varies based on the application that you select

6. Click **Commit**.

System Manager creates the element and displays on the Manage Elements page.

[Element details field descriptions](#) on page 936

---

### Bulk import of elements

You can add elements to the System Manager inventory in bulk from the Manage Elements page, by using the **More Actions > Import** link.

### Importing elements

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.

3. On the Manage Elements page, click **More Actions > Import**.
4. On the Import Elements page, click **Browse** to select the XML file that you want to import.
5. Click **Import**.

---

## Discovering elements

### Discovery of Avaya Aura® applications and associated devices

To manage and upgrade software from System Manager, you must discover elements in the network. The system performs the discovery by using discovery profiles, where you configure subnetwork, SNMP access profiles, and element types to be discovered.

On the Discovery tab of **Inventory > Manage Elements**, you can create discovery profiles and use the profiles to discover elements. The Manage Elements page displays the discovered elements.

You must configure the applicable discovery parameters for System Manager to discover the Avaya Aura® application. System Manager uses SNMPv1 or SNMPv3 to discover Avaya Aura® applications.

For applications such as Communication Manager, you can use SNMP discovery or add the application from Manage Elements.

 **Note:**

To upgrade an Avaya Aura® application by using Solution Deployment Manager, discovery of applications, such as Communication Manager, Session Manager, and Branch Session Manager is a mandatory task.

### Creating discovery profiles and discovering elements

#### Before you begin

Configure the subnetwork profiles, SNMP profiles, and element type profiles on the **Discovery** tab by using the links available at the beginning of the Discovery Profile List page or from the following links:

- **Inventory > Subnet Configuration**
- **Inventory > Element Type Configuration**
- **Configurations > Settings > SMGR > Global SNMP Configuration**

#### About this task

You can create discovery profiles and use the profiles to discover elements in System Manager. The Manage Elements page displays the discovered elements.

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.

3. Click the **Discovery** tab.

The system displays the Discovery Profile List page.

4. Click **New**.

The system displays the Create Discovery Profile page.

5. In the **Discovery Profile Name** field, type a name for the discovery profile.

6. In the **Subnet Configurations** section, perform the following:

- a. Click a subnetwork that you configured in **Inventory > Subnet Configuration**.
- b. Click an element type that you configured on **Inventory > Element Type Configuration**.

The **Discovery Element Type Access Profiles** column displays all access profiles of an element type.

- c. To select or clear profiles, in the **Choose Element Type Access Profiles** column, click **Choose Element Access**.
- d. In the **Profile List** section, click the global SNMP profile that you configured on **Configurations > Settings > SMGR > Global SNMP Configuration**.

7. Click **Commit**.

The system displays the new discovery profile on the Discovery Profile List page in the **Discovery Profiles** section.

8. Select the discovery profile and perform one of the following:

- Click **Discover Now**.
- To discover the element later, click **Schedule Discovery**, and provide the date and time when the discovery must run.

The system displays a dialog box with the message `Discovery is Running` and the number of elements that are discovered. The system lists the discovered elements on the Manage Elements page in the **Elements** section. The system closes the dialog box when the discovery is complete.

While the discovery is in progress, the system blocks any action that you perform on the **Discovery** tab.

| <b>Discovery Profile Name</b> | The name of the discovery profile. |

### Subnet Configurations

| Name                                | Description                                        |
|-------------------------------------|----------------------------------------------------|
| <b>Name</b>                         | The name of the subnetwork.                        |
| <b>IPAddress</b>                    | The IP address of the subnetwork.                  |
| <b>Mask/Network Prefix</b>          | The IP subnetwork mask prefix.                     |
| <b>No. of IPs to scan in subnet</b> | The number of IPs to be scanned in the subnetwork. |

### Element Type Access Profiles

| Name                 | Description       |
|----------------------|-------------------|
| <b>Element Types</b> | The element type. |

*Table continues...*

| Name                                          | Description                                                                                                                                   |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Discovery Element Type Access Profiles</b> | The discovery profiles for the element type access.                                                                                           |
| <b>Choose Element Type Access Profiles</b>    | The link to the <b>Element Type Access Profiles</b> section where you can select or clear the discovery profiles for the element type access. |

## Profile List

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>    | The name of the profile.                                                                                                                                                                                                                                                                                                                                     |
| <b>Type</b>            | The SNMP protocol type. The options are V1 and V3.                                                                                                                                                                                                                                                                                                           |
| <b>Read Community</b>  | The read community of the device.<br><b>Read Community</b> applies only to the SNMP V1 protocol.                                                                                                                                                                                                                                                             |
| <b>Write Community</b> | The write community of the device.<br><b>Write Community</b> applies only to the SNMP V1 protocol.                                                                                                                                                                                                                                                           |
| <b>User</b>            | The user name of the SNMP V3 protocol operation.                                                                                                                                                                                                                                                                                                             |
| <b>Auth Type</b>       | The authentication protocol to authenticate the source of traffic from SNMP V3 users. The options are: <ul style="list-style-type: none"> <li>• <b>MD5</b><br/>The default is <b>MD5</b>.</li> <li>• <b>SHA</b></li> <li>• <b>None</b></li> </ul> <b>Auth Type</b> applies only to the SNMP V3 protocol.                                                     |
| <b>Priv Type</b>       | The encryption policy for an SNMP V3 user. The options are: <ul style="list-style-type: none"> <li>• <b>DES</b>: For SNMP-based communication.<br/>The default is <b>DES</b>.</li> <li>• <b>AES</b>: For SNMP-based communication.</li> <li>• <b>None</b>: Does not encrypt traffic for this user.</li> </ul> Set <b>Priv Type</b> only for an SNMP V3 user. |
| <b>Privileges</b>      | The privileges that determine the operations that you can perform on MIBs. <ul style="list-style-type: none"> <li>• <b>Read/Write</b>: To perform the GET and SET operations.</li> <li>• <b>Read</b>: To perform only the GET operation.</li> <li>• <b>None</b></li> </ul> The default is <b>None</b> .                                                      |
| <b>Timeout</b>         | The time in milliseconds for which the element waits for a response from the device that the element polls.                                                                                                                                                                                                                                                  |

## Managing SNMP Access Profiles

### Adding an SNMP access profile

#### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR > Global SNMP Configuration**.
3. Click **New**.
4. On the New SNMP Access Profile page, perform the following:
  - a. In the **Type** field, click the type of the SNMP protocol.  
For more information, see SNMP Access Profile field descriptions.
  - b. In the **Profile Name** and **Description** fields, type the name of the profile and a description.
  - c. Complete the remaining fields on the page.
5. Click **Commit**.

### Editing the SNMP access profile

#### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR > Global SNMP Configuration**.
3. In the profile list, select the SNMP access profile that you want to change.
4. Click **Edit**.
5. On the Edit SNMP Access Profile page, change the details as appropriate.  
For more information, see SNMP Access Profile field descriptions.
6. Click **Commit**.

## Deleting an SNMP access profile

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR > Global SNMP Configuration**.
3. In the profile list, click the SNMP access profile that you want to delete.
4. Click **Delete**.
5. On the Snmp Access Profile/s Delete Confirmation page, click **Delete** to confirm the deletion.

## SNMP Access Profile field descriptions

### For SNMP protocol V3

The system displays the following fields when you click **V3** in the **Type** field:

| Name                       | Description                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>        | The name of the profile.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | A brief description of the profile.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Type</b>                | The SNMP protocol type.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>User</b>                | The user name as defined in the element.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Authentication Type</b> | <p>The authentication protocol used to authenticate the source of traffic from SNMP V3 users. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>MD5</b></li> </ul> <p>The default is <b>MD5</b>.</p> <ul style="list-style-type: none"> <li>• <b>SHA</b></li> <li>• <b>None</b></li> </ul> <p><b>Authorization Type</b> applies only to the SNMP V3 protocol.</p> |

*Table continues...*

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication Password</b>         | The password to authenticate the user. The password must contain at least eight characters.<br><br>* <b>Note:</b><br>The password is mandatory.                                                                                                                                                                                                                                                                                                                             |
| <b>Confirm Authentication Password</b> | The SNMP V3 protocol authentication password that you retype for confirmation.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Privacy Type</b>                    | The encryption policy for an SNMP V3 user. The possible values are:<br><ul style="list-style-type: none"> <li>• <b>AES</b>: For SNMP-based communication.</li> <li>• <b>AES128</b>: For SNMP-based communication.</li> <li>• <b>DES</b>: For SNMP-based communication.</li> </ul> The default is <b>DES</b> .<br><ul style="list-style-type: none"> <li>• <b>None</b>: Does not encrypt traffic for this user.</li> </ul> Set <b>Privacy Type</b> only for an SNMP V3 user. |
| <b>Privacy Password</b>                | The password used to enable the <b>DES</b> or <b>AES</b> encryption. DES passwords must contain at least eight characters.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Confirm Privacy Password</b>        | The privacy password that you retype for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Privileges</b>                      | The privileges that determine the operations that you can perform on MIBs.<br><ul style="list-style-type: none"> <li>• <b>None</b><br/>The default is None.</li> <li>• <b>Read/Write</b>: To perform GET and SET operations.</li> <li>• <b>Read</b>: To perform only the GET operation.</li> </ul>                                                                                                                                                                          |
| <b>Timeout</b>                         | The time in milliseconds for which the element waits for a response from the device being polled during discovery.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Retries</b>                         | The number of times that the element polls a device without receiving a response before timing out.                                                                                                                                                                                                                                                                                                                                                                         |

### For SNMP protocol V1

The system displays the following fields when you click **V1** in the **Type** field:

| Name                | Description                         |
|---------------------|-------------------------------------|
| <b>Profile Name</b> | The name of the profile.            |
| <b>Description</b>  | A brief description of the profile. |

*Table continues...*

| Name                   | Description                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>            | The SNMP protocol type.<br><br>* <b>Note:</b><br>To upgrade Communication Manager using SNMP protocol, you must select SNMPV1. |
| <b>Read Community</b>  | The read community of the device.<br><b>Read Community</b> applies only to the SNMP V1 protocol.                               |
| <b>Write Community</b> | The write community of the device.<br><b>Write Community</b> applies only to the SNMP V1 protocol.                             |
| <b>Timeout</b>         | The time in milliseconds for which the element waits for a response from the device that the element polls.                    |
| <b>Retries</b>         | The number of times that the element polls a device and fails to receive a response. After the retries, the element times out. |

| Button        | Description                                                               |
|---------------|---------------------------------------------------------------------------|
| <b>Commit</b> | Adds or edits the SNMP access profile depending on the option you select. |
| <b>Cancel</b> | Returns to the previous page.                                             |

## Configuring subnets

### Adding a subnetwork Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Subnet Configuration**.
3. On the Subnet Configurations page, click **New**.  
The system adds a new row where you can add the details.
4. Type the name, IP address, and subnetwork mask.
5. Click **Save**.
6. To add more than one subnetworks, repeat Step 3.

### Editing the subnetwork Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Subnet Configuration**.
3. On the Subnet Configurations page, select the subnetwork that you want to change.

4. Change the name, IP address, and subnetwork mask as appropriate.
5. Repeat Step 3 to change the information for more than one subnetworks.
6. Click **Save**.

## Deleting a subnetwork

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Subnet Configuration**.
3. On the Subnet Configurations page, select the subnetworks that you want to delete.
4. Click **Delete**.
5. To confirm the deletion, click **Delete**.

The system deletes the subnetwork.

## Subnet Configurations field descriptions

| Name                                | Description                                        |
|-------------------------------------|----------------------------------------------------|
| <b>Name</b>                         | The name of the subnetwork.                        |
| <b>IPaddress</b>                    | The IP address of the subnetwork.                  |
| <b>Mask/Network Prefix</b>          | The IP subnetwork mask prefix.                     |
| <b>No. of IPs to scan in subnet</b> | The number of IPs to be scanned in the subnetwork. |

| Button        | Description                                                                              |
|---------------|------------------------------------------------------------------------------------------|
| <b>New</b>    | Adds a new row where you can provide the details of the subnetwork that you want to add. |
| <b>Delete</b> | Deletes a subnetwork.                                                                    |

| Button        | Description                   |
|---------------|-------------------------------|
| <b>Save</b>   | Adds or edits the subnetwork. |
| <b>Cancel</b> | Cancels your current action.  |

## Managing Element Access Profile

### Adding an element access profile

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Element Type Access**.
3. On the Element Access Profile Management page, in the **Element Type** field, click an element to which you want to provide access.

For more information, see Element Access Profile Management field descriptions.

4. Click **New**.
5. On the Access Profile Entry page, in the **Protocol** field, click a protocol.
6. Click **Commit**.

### Editing an element access profile

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Element Type Access**.
3. On the Element Access Profile Management page, in the **Element Access Profiles** section, select an element access profile that you want to edit.

For more information, see Element Access Profile Management field descriptions.

4. Perform one of the following:
  - Click **Edit**.
  - Click **View**, and on the View Access Profile Entry page, click **Edit**.
5. On the Modify Access Profile Entry page, change the appropriate fields.
6. Click **Commit**.

### Deleting an element access profile

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Element Type Access**.
3. On the Element Access Profile Management page, in the **Element Access Profiles** section, select an element access profile that you want to delete.

For more information, see Element Access Profile Management field descriptions.

4. Click **Delete**.
5. On the Confirmation page, click **Continue**.

The system deletes the element access profile from the **Element Access Profiles** section.

## Element Access Profile Management field descriptions

| Name                   | Description                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Element Type</b>    | The type of the element for which you want to provide the access.                                                         |
| <b>Name</b>            | The name of the element.                                                                                                  |
| <b>Protocol</b>        | The protocol that you use to access the element.                                                                          |
| <b>Login User Name</b> | The login name of the user as configured on the element.                                                                  |
| <b>System Profile</b>  | The system protocol. The available options are: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> |

| Button        | Description                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------|
| <b>New</b>    | Displays the Add Access Profile Entry page where you can add a new access profile for the element.  |
| <b>View</b>   | Displays the View Access Profile Entry page where you can view the access profile of an element.    |
| <b>Edit</b>   | Displays the Modify Access Profile Entry page where you can change an access profile of an element. |
| <b>Delete</b> | Deletes the access profile of an element that you select.                                           |

## Modify Access Profile Entry field descriptions

| Name               | Description                                                              |
|--------------------|--------------------------------------------------------------------------|
| <b>Protocol</b>    | The protocol that you use to access the element. The field is read-only. |
| <b>Name</b>        | The name of the element access profile.                                  |
| <b>Description</b> | A description of the element access profile.                             |
| <b>URI</b>         | The URI to reach the element access profile.                             |

| Button        | Description                                                                          |
|---------------|--------------------------------------------------------------------------------------|
| <b>Commit</b> | Commits the changes that you made to element access details.                         |
| <b>Cancel</b> | Cancels the modify action and returns to the Element Access Profile Management page. |

## Create profiles and discover SRS and SCS servers

### Discover SRS and SCS servers

Use the **Create Profiles and Discover SRS/SCS** option to automatically discover survivable remote servers (SRS) and survivable core servers (SCS) from the main Communication Manager. System Manager uses the `list survivable-processor` command to discover the SRS and SCS servers that are associated with the main Communication Manager. The servers that are discovered are stored in **Manage Elements**.

Additionally, the SRS and SCS servers are automatically added in the System Manager inventory. The Communication Manager servers are automatically identified as survivable servers in **Inventory**.

## Creating profiles and discovering SRS and SCS servers

### Before you begin

Create the login profiles for Communication Manager devices with the **Element Type Configuration** option.

### About this task

Use the **Create Profiles and Discover SRS/SCS servers** option to create login profiles for devices, and use the login profiles to discover the Communication Manager devices.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Create Profiles and Discover SRS/SCS**.
3. On the Create Profiles and Discover SRS/SCS page, in **Select Devices to Create Profiles** table, select the devices for which you want to discover and create the login profile.
4. In **Select Profiles to Create on Devices**, select the login profile.
5. Select the **Discover SRS/SCS and Create Profile on SRS/SCS** option.
6. Perform one of the following actions:
  - Click **Now** to create the login profile and discover the device.
  - Click **Schedule** to schedule the login profile creation and device discovery at a later time.

### Related links

[Create Profiles and Discover SRS/SCS server field descriptions](#) on page 914

## Overwriting login profiles on devices

### Before you begin

You must create login profiles for Communication Manager devices with the **Element Type Configuration** option.

### About this task

Perform this task to overwrite profiles that exist on the devices.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Create Profiles and Discover SRS/SCS**.

3. On the Collected Inventory page, in the **Select Devices to Create Profiles** table, perform the following actions.
  - a. Select the devices for which you want to overwrite the login profile to discover the SRS and the SCS server.
  - b. Select **Add to Manage Elements** for the devices that you have selected.
4. In the **Select Profiles to Create on Devices** table, perform the following actions:
  - a. Select the new profile that you want to assign.
  - b. Select the **Add to Manage Elements** for the profiles that you have selected.
5. Select the **Overwrite Profiles on Devices** option.
6. Perform one of the following actions:
  - Click **Now** to overwrite the profile that you selected on the devices.
  - Click **Schedule** to overwrite the profile at a later time.

#### Related links

[Create Profiles and Discover SRS/SCS server field descriptions](#) on page 914

### Resetting the password

#### About this task

Perform this task to reset the password for a profile on the device.

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Create Profiles and Discover SRS/SCS**.
3. On the Collected Inventory page, in the **Select Devices to Create Profiles** table, perform the following actions.
  - a. Select the devices for which you want to overwrite the login profile to discover the SRS and the SCS server.
  - b. Select **Add to Manage Elements** for the devices that you have selected.
4. Select the **Reset Password** option.
5. Perform one of the following actions:
  - Select **Use Profile Password** to reset the password.
  - Select **Auto Generate Password** to automatically generate a password.
6. Perform one of the following actions:
  - Click **Now** to reset the password.
  - Click **Schedule** to reset the password at a later time.

### Select Devices to Create Profiles

| Name                             | Description                                       |
|----------------------------------|---------------------------------------------------|
| <b>Name</b>                      | The name of the device.                           |
| <b>IP</b>                        | The IP address of the device.                     |
| <b>Family</b>                    | The device family to which the device belongs to. |
| <b>Type</b>                      | The device type.                                  |
| <b>Login Profile</b>             | The existing login profile for the device.        |
| <b>Software/Firmware Version</b> | The firmware version for the device.              |
| <b>Hardware Version</b>          | The hardware version of the device.               |
| <b>Module</b>                    | The device module.                                |
| <b>Description</b>               | The description you choose to add for the device. |
| <b>Location</b>                  | The location of the device.                       |
| <b>Serial Number</b>             | The serial number of the device.                  |

### Select Profiles to Create on Devices

| Name                                  | Description                                                      |
|---------------------------------------|------------------------------------------------------------------|
| <b>Profile Type</b>                   | The type of profile. Possible values include: SSH, SNMP, CM, GW. |
| <b>Profile Name/IP</b>                | The name of the profile.                                         |
| <b>CM Profile Type/SNMP V3 Groups</b> | The SNMP V3 profile type.                                        |
| <b>Add to Manage Elements</b>         | The option to add this profile in <b>Manage Elements</b> .       |

| Name                                                  | Description                                                   |
|-------------------------------------------------------|---------------------------------------------------------------|
| <b>Discover SRS/SCS and Create Profile on SRS/SCS</b> | Create the login profile and discovers the SRS or SCS server. |
| <b>Overwrite Profiles on Devices</b>                  | Overwrite the existing profile on the device.                 |
| <b>Reset Password</b>                                 | Reset the password of the existing profile.                   |

| Button          | Description                                                                          |
|-----------------|--------------------------------------------------------------------------------------|
| <b>Now</b>      | Performs the discovery, overwrite profile, or reset password action.                 |
| <b>Schedule</b> | Performs the discovery, overwrite profile, or reset password action at a later time. |

---

## Working with Elements in System Manager

---

### Additional information required for creating the Communication Manager or Messaging element

#### Communication Manager element

When you add the Communication Manager element from **Inventory > Manage Elements**, the element in turn starts a synchronization job in the background to bring all the relevant data from the elements to the System Manager database. To check the status of this synchronization job on System Manager Web Console, navigate to **System Manager Data > Scheduler** or reach the log files on the System Manager server.

#### Messaging element

If you are creating the Messaging element:

- The FQDN or IP address details in the **Node** field for a Messaging element must correspond to that of Messaging Storage Server (MSS) and not Messaging Application Server (MAS).
- Before adding the Messaging server in the System Manager applications, add the System Manager server details in the Trusted Server list on the Messaging server on the Messaging Administration/ Trusted Servers screen.
- The login credentials between the Messaging server trusted servers screen and the Session Manager application, entity, or attributes for a Messaging type of application must match.
- The **Trusted Server Name** field on the Trusted Server page maps to the **Login** field in the Attributes section. Similarly, the **Password** field on the Trusted Server page maps to the **Password** field in the Attributes section.
- To allow LDAP access to this Messaging server from the trusted server that you add, set the **LDAP Access Allowed** field on the Trusted Server page to **Yes**.

---

### Manage elements in System Manager configured with Geographic Redundancy

The primary or the secondary System Manager server can manage a GR-aware element. However, only the primary System Manager server manages the GR-unaware element. You must know the elements that each System Manager manages during the scenario such as normal operation and split network.

#### Related links

[Determining the System Manager that manages a GR-aware element](#) on page 916

---

## Determining the System Manager that manages a GR-aware element

### Before you begin

Log on to the System Manager web console of the primary server.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Verify the status of the elements in the **Managed by** column:
  - For GR-unaware elements, the system must display Not Supported.
  - For GR-aware elements, the system must display one of the following status:
    - Primary: Indicates that the primary System Manager manages the element.
    - Secondary: Indicates that the secondary System Manager manages the element.
    - Unknown: Indicates that the manageability status of the element is unavailable.
    - Unmanaged: Indicates that the current System Manager does not manage the element.
  - To refresh the **Managed by** status for an element, click **Get Current Status**.
  - To make the System Manager manage an element, the administrator must click **More Actions > Manage**.

For example, for managing Session Manager in a Geographic Redundancy setup, see *Administering Avaya Aura® Session Manager*.

---

## Viewing details of an element

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element.
4. Click **View**.

The system displays the details of the selected element.

---

## Modifying an element

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element.
4. Perform one of the following:
  - Click **Edit**.
  - Click **View > Edit**.

 **Note:**

If the Communication Manager system that you require to edit contains a : (colon) character in the name, the system disables the **Edit** button. Remove the : character from the Communication Manager name to enable **Edit**.

5. On the Edit <element name> page, modify the required fields.
6. Click **Commit**.

The system saves the changes.

---

## Deleting an element

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element.
4. Click **Delete**.
5. On the Delete Application Confirmation page, click **Delete**.

---

## Exporting elements from the System Manager command line interface

### About this task

Use the bulk export utility to export system records of an element to an xml file. The System Manager installer creates the `bulkExport` folder in the `<MGMT_HOME>\rts\` location.

### Before you begin

- Ensure that System Manager is installed and the server is running.

The bulk export utility requires System Manager to include runtime libraries.

- Ensure that JBoss is installed on the same server where you run the export utility.

## Procedure

1. Start an SSH session.
2. Log in to the System Manager server by using the command line interface.
3. To navigate to the `bulkExport` directory, type `cd <MGMT_HOME>\rts\bulkExport`.
4. Run the following command:

```
sh ./runRTSCli.sh [-u username] [-w password] [-p filePrefix] [-c perFileRecords]
[-ddestinationFolder] [-n application-type-name] [-v application-type-version]
```

The element generates a zip file with `filePrefix` as prefix and contains the xml data file in the destination folder. The system generates log files in the `/var/log/Avaya/mgmt/logs/rtsutility.log` location.

For example, `sh ./runRTSCli.sh -c 100 -d ./ -p rts -u admin -w System$987`.

5. (Optional) Change the log configuration in the `<MGMT_HOME>\rts\bulkExport\conf\log4.properties` file.

## Related links

[runRTSCli.sh command](#) on page 918

## runRTSCli.sh command

The `runRTSCli.sh` utility exports element system records to an xml file.

### Syntax

```
sh ./runRTSCli.sh [-u username] [-w password] [-p filePrefix] [-c perFileRecords] [-ddestinationFolder] [-n application-type-name] [-v application-type-version]
```

|                                                                     |                                                                          |
|---------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>-c,--numberOfRecordsPerFile</b><br><i>numberOfRecordsPerFile</i> | The number of records in a file.                                         |
| <b>-d,--output-directory</b> <i>destinationFolder</i>               | The name of the output folder.                                           |
| <b>-f,--config-file</b> <i>configurationFile</i>                    | The configuration file if you do not use the default configuration file. |
| <b>-h,--help</b>                                                    | The option to print help options.                                        |
| <b>-n,--application-type-name</b><br><i>applicationTypeName</i>     | The element type name. The parameter is optional.                        |
| <b>-p,--filename-prefix</b> <i>filePrefix</i>                       | The prefix for the zip file.                                             |
| <b>-s,--ssl</b>                                                     | Secure. The parameter is optional.                                       |

|                                                                    |                                                  |
|--------------------------------------------------------------------|--------------------------------------------------|
| <b>-u,--username</b> <i>System ManagerUsername</i>                 | System Manager username.                         |
| <b>-v,--application-type-version</b> <i>applicationTypeVersion</i> | Element type version. The parameter is optional. |
| <b>-w,--password</b> <i>System ManagerPassword</i>                 | System Manager password.                         |

### Return values

A zip file that contains an xml file with element system data.

### Description

The export utility generates a zip file with the specified prefix. The file contains the xml data file in the destination folder.

### Example

The example command creates the element data in the `rtsFileName` zip file with 100 records in the root folder `./`.

```
cd Mgmt_Home\rts\bulkExport
sh ./runRTSCli.sh -c 100 -d ./ -p rts -u admin -w System$987
```

### Files

The following files are associated with the `runRTSCli.sh` command:

- `<MGMT_HOME>\rts\bulkExport`: Location where you run the command.
- `/var/log/Avaya/mgmt/logs/rtsutility.log`: Location where the system generates the log files.
- `<MGMT_HOME>\rts\bulkExport\conf\log4.properties`: The properties file where you can change the log configuration.

---

## Assigning elements to an element

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, perform one of the following steps:
  - Select an element and click **Edit**.
  - To assign elements to an existing element in the view mode, select an element and click **View > Edit**.
4. In the Assign elements area, click **Assign elements**.
5. On the Assign elements page, select elements and click **Assign**.

 **Note:**

Assignment name for Communication Manager must match the switch connection on the Edit Application Enablement Services:<name> page. If the assignment name is blank, the system does not establish the SSL connection between Presence and AES.

---

## Removing assigned elements

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, perform one of the following steps to remove assigned elements from an existing element:
  - Select an element and click **Edit**.
  - Select an element and click **View > Edit**.
4. Select the elements that you must remove and click **Unassign Elements** in the Assign Elements section.

---

## Managing access profiles and ports

### Creating an access profile

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, do one of the following:
  - Click **New**.
  - To create an access profile for an existing element, click the element, and then click **Edit** or **View > Edit**.
4. On the **General** tab, in the **Access Profile** section, click **New**.

System Manager displays the Application System Supported Protocol and Access Profile Details sections.
5. In the Application System Supported Protocol section, in the **Protocol** field, select a protocol.

The options are:

  - **URI**: For system web services API.
  - **SSH**: For application upgrade functions.

- **SNMP**: For discovering elements.

Based on the protocol selection, System Manager displays the fields in the **Access Profile Details** section.

6. Enter the information about the access profile in the mandatory fields.
7. Click **Save**.

## Modifying an access profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element and click **Edit** or **View > Edit**.
4. In the **Access Profile** section, select the access profile that you want to change and click **Edit**.
5. Modify the access profile information in the fields.
6. Click **Save**.

## Deleting an access profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element and click **Edit** or click **View > Edit**.
4. In the **Access Profile** section, select the access profile that you want to delete and click **Delete**.

#### **Note:**

You cannot delete the Trust Management access profile.

## Creating a new port

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, perform one of the following steps:
  - Click **New**.
  - If you want to configure a port for an existing application instance, click an instance and then click **Edit** or click **View > Edit**.
4. Click **New** in the Port section.

5. Enter the information about the port in the following mandatory fields: **Name**, **Protocol**, and **Port**.
6. Click **Save**.

### Result

The table in the Port Details section displays the new port.

## Modifying a port

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. To configure a port for an existing element, perform one of the following steps on the Manage Elements page:
  - Select an element and click **Edit**.
  - Select an element and click **View > Edit**.
4. Click **Edit** in the **Port** section.
5. Modify the port information in the following fields: **Name**, **Port**, **Protocol**, and **Description**.
6. Click **Save** to save the changes to the database.

## Deleting a port

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select the application instance and click **Edit** or click **View > Edit**.
4. In the Port section, select the port you want to delete and click **Delete**.

The system deletes the port you selected from the table in the Port section.

---

## Managing and unmanaging elements from System Manager

### Manage elements

In a Geographic Redundancy-enabled system, the administrator can select elements and click **Manage** for the current System Manager to manage the elements. The system sends a notification to the element whose manageability status you must change. On receiving the notification, the element switches to the specific System Manager server from where you performed the Manage operation.

**\* Note:**

Session Manager from Release 6.3 and Communication Manager support the Manage operation.

During the split network, the administrator must ensure that the primary or the secondary System Manager server manages an element at a time, and not both systems.

**\* Note:**

At any given point of time, you can perform **Get Current Status**, **Manage**, or **Unmanage** operation.

**Related links**

[Manage Elements field descriptions](#) on page 933

## Unmanage elements

In a Geographic Redundancy-enabled system, the administrator can select to unmanage an element. The system sends a notification to the element whose manageability status you must change. On receiving the notification, the element unmanages from the current System Manager.

Communication Manager supports the Unmanage operation.

In a specific split network scenario, the primary System Manager server fails to communicate with the secondary System Manager server, but the element can communicate with both System Manager systems. If the primary System Manager server manages the element and the administrator wants to manage the element from the secondary System Manager server, on the primary System Manager server, the administrator must set the manageability status to Unmanaged.

**\* Note:**

At any given point of time, you can perform **Get Current Status**, **Manage**, or **Unmanage** operation.

**Related links**

[Manage Elements field descriptions](#) on page 933

---

# Adding Platform type elements to System Manager

---

## Adding System Platform to System Manager

### About this task

Use the procedure to manually add System Platform to System Manager. You can also use the System Manager discovery operation to discover System Platform in the network.

## Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, click **New**.
4. On the New Elements page, in the **Type** field, click **System Platform**.

The page displays the On the New System Platform page.

5. On the General tab, provide the following information:
  - **Name**: The console domain (C-Dom) name.
  - **Type**: System Platform. A read-only field. The application type that the system populates from the **Type** field on the New Elements page.
  - **Description**: A description of the C-Dom.
  - **Node**: The IP address of C-Dom.
  - **Device Type**: System Platform.
6. On the Attributes tab, provide the following information:
  - **Login**: The use name with administrator permissions.
  - **Password**: The password.
  - **Confirm Password**: The password that you reenter.
  - **Dom0 IP Address**: The Dom-0 IP address.
  - **Cdom Root Password**: The C-Dom root password. A mandatory field.
  - **Confirm Cdom Root Password**: The C-Dom root password that you reenter. A mandatory field.

 **Note:**

If you do not complete the **Cdom Root Password** and **Confirm Cdom Root Password** fields, the upgrade operation fails.

7. In the Access Profile section, click **New** and provide the access profile details.

 **Note:**

The root access password must be identical in System Manager and System Platform.

8. Click **Commit**.

On the Manage Elements page, the system displays the System Platform instance that you added.

# Adding Application type elements to System Manager

---

## Adding Utility Services to System Manager

### About this task

From Release 8.0, Utility Services is replaced by AVP Utilities.

For Release 7.x, Utility Services is a mandatory component of Appliance Virtualization Platform in the Avaya-appliance deployment offer.

When you first install Appliance Virtualization Platform, you must add Utility Services to Appliance Virtualization Platform before you add System Manager.

Use the procedure to manually add Utility Services to System Manager.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, click **New**.
4. On the New Elements page, in **Type**, click **Utility Services**.

The system displays the New Utility Services page.

5. On the General tab, provide the following information:
  - **Name:** The Utility Services name.
  - **Type:** Utility Services, a read-only field. The application type that the system populates from the **Type** field on the New Elements page.
  - **Description:** A description of Utility Services.
  - **Node:** The IP address of Utility Services.
  - Complete the remaining required fields.

For more information, see “Element details field descriptions”.

6. Click **Commit**.

On the Manage Elements page, the system displays the Utility Services instance that you added.

## Adding a Communication Manager instance to System Manager

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, click **New**.
4. On the New Elements page, in the **Type** field, click **Communication Manager**.

The system displays the Add Communication Manager page.

5. On the **General Attributes** tab, provide the following information:

- a. Enter the Communication Manager server name.

For Branch Session Manager upgrades, provide the survivable remote server name.

- b. Enter the host name or IP Address of the Communication Manager server.

The IP address can be in the IPv4 or IPv6 format.

 **Note:**

- For duplex Communication Manager, provide the IP address for the active Communication Manager server and the standby Communication Manager server address in **Alternate IP Address**.
  - In a duplex configuration, while adding a Communication Manager instance to System Manager, virtual address of Communication Manager must not be used as it is not supported.
- c. Enter the customer login name that is required to access Communication Manager.  
For Branch Session Manager upgrades, provide the customer login name required to access the survivable remote server.
  - d. Under **Authentication Type**, select the required option.
  - e. Enter and reenter the password, or ASG key required to access Communication Manager.
  - f. Enter the port number of the Communication Manager server.
  - g. To view the Communication Manager system in the list, ensure that the **Add to Communication Manager** check box is selected.
  - h. In **CM Array Type**, click **Non-Array** to add as non cluster Communication Manager.

 **Important:**

If you are deploying Communication Manager by using Solution Deployment Manager, you must set the array type after deployment.

6. On the **SNMP Attributes** tab, perform the following:
  - a. Under **Version**, select **V1**.
  - b. Enter the required information.
  - c. From **Device Type**, select the type of Communication Manager.
7. Click **Commit**.

The system displays the Communication Manager instance that you added on the Manage Elements page.

## Adding a Session Manager instance to System Manager

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Click **New**.
4. On the New Elements page, in the **Type** field, click **Session Manager**.
5. Select **Core Session Manager** and click **Continue**.
6. In the General section, enter the following information:
  - a. In the **SIP Entity Name** field, enter the name of Session Manager.
  - b. In the **Description** field, add a description for this entity. This field is optional.
  - c. In the **Management Access Point Host Name/IP** field, enter the IP address of the management interface of the Session Manager server.
  - d. **Maintenance Mode** is enabled by default. Clear the **Maintenance Mode** check box if you are not:
    - Staging a non-operational Session Manager or Branch Session Manager.
    - Pre-administering a Session Manager or Branch Session Manager on System Manager before the host installation.
7. Enter or select the appropriate information in the remaining required fields.  
For more information, see “Element details field descriptions”.
8. Click **Commit**.

## Adding an Application Enablement Services instance to System Manager

### About this task

Use the following procedure if you are migrating or deploying using SDM, or if you are connecting Presence Services server to the AE Services server using the Presence Service connector.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Click **New**.
4. On the New Elements page, in the **Type** field, click **Application Enablement Services**.
5. In the General section, do the following:
  - a. In the **Name** field, type the name of the application.
  - b. In the **Description** field, add a description for this entity.  
This field is optional.
  - c. In the **Node** field, type the IP address of the management interface of the AE Services server.
6. In the remaining required fields, enter the appropriate information.  
For more information, see “Element details field descriptions”.
7. Click **Commit**.

## Adding G430 or G450 Branch Gateway to System Manager

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, click **New**.
4. On the New Elements page, in **Type**, click **Media Gateways**.
5. On the New Media Gateway page, do the following:
  - a. In **Name**, type the name.

- b. In **Device Type**, click **Avaya G430** or **Avaya G450**.
  - c. In **Access Profile**, configure the parameters.
  - d. In **Port**, configure the parameters.
6. On **Attributes** and **Assign Elements** tabs, provide the required details.

For more information, see “Element details field descriptions”.

 **Note:**

The following parameters must be identical in System Manager and G430 Branch Gateway or G450 Branch Gateway:

- The root access password
- The SNMPv1 credentials

7. Click **Commit**.

On the **Manage Elements** page, the system displays the gateway that you added.

## Adding an Avaya Messaging profile for a user

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the **Manage Elements** page, click **New**.
4. On the **New Elements** page, in **Type**, click **Officelinx**.
5. On the **General** tab, in the **Node** field, type the IP address or FQDN according to the configuration in the actual Avaya Messaging server.

System Manager uses these details to establish communication between System Manager and Avaya Messaging.

6. On the **Attributes** tab, provide the Avaya Messaging login name and password.
7. Click **Commit**.

The system adds Avaya Messaging in System Manager.

8. On the **Manage Elements** page, click **System Manager**, and click **More Actions > Manage Trusted Certificates**.
9. On the **Manage Trusted Certificates** page, click **Add** to add a trusted certificate for the Avaya Messaging server.

For information about adding trusted certificates, see “Adding trusted certificate”.

For information about Avaya Messaging, see Avaya Avaya Messaging documentation on the Avaya Support website.

# Product Initiated Registration overview

With System Manager Release 8.0, you can register the Avaya Aura® products from the System Manager web console to make the products serviceability ready.

You can use the Manage Elements page of System Manager to configure the SAL gateway and register the product. After the product is registered, the system generates an SEID and you can view the registration status in the **Reg.Status** column on the Manage Elements page.

The following diagram depicts the product registration with System Manager and SAL Gateway:

For information about the:

- SAL gateway and the Product Initiated Registration feature, see *Administering Avaya Diagnostic Server SAL Gateway* on the Avaya Support website.
- Products that support the Product Initiated Registration feature through the System Manager web console, see *Secure Access Link Supported Products* on the Avaya Support website.

## Configuring SAL Gateway

### About this task

You can configure only one SAL gateway for a given System Manager application.

## Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, click **More Actions > SAL Gateway configuration**.

The system displays the SAL Gateway configuration page.

3. In **SAL Gateway Name**, type a generic name of the SAL gateway.
4. In **SAL Gateway Address**, type the FQDN or IP Address of the SAL gateway.
5. In **SAL Gateway Port**, type the port number of the SAL gateway.

The default port is 7443.

6. In **Max Elements per request**, type the number of elements that you want to register to the SAL gateway.

The maximum number of elements is 10.

7. In **Request timeout in minutes**, type the number of minutes after which the request times out.

The maximum number of minutes is 90, which is the default value. The minimum number of minutes is 30.

8. To import the SAL gateway certificate, click one of the following:

- **Import Certificate.**
- **Services > Inventory > More Actions > Manager Trusted Certificates**

9. To check the SAL gateway connectivity, click **Test Connection**.

10. Click **Commit** to save the changes.

The system displays the message: SAL Gateway Configuration successful.

---

## Configuring Avaya Services registration

### About this task

Use this procedure to register Avaya products with SAL Gateway.

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, select one or more element.

You can select up to 10 elements or the number of elements configured in the **Max Elements per request** field.

3. On the Manage Elements page, click **More Actions > Avaya Services Registration**.

The system displays the Product Registration page.

4. To validate the user identity and authenticate the user, in **SSO User Name**, type the SSO user name registered with Avaya.

An SSO user must have permission to register products against the supplied **FL/Sold To** number.

5. To validate the user identity and authenticate the user, in **SSO User Password**, type the password of the SSO user.

The system does not store the password.

6. In **FL/Sold To**, type the Functional Location number of the element.

The Functional Location number must be of 10 digits.

7. Click **Commit** to save the changes.

The system displays the registration status in the **Reg.Status** column on the Manage Elements page.

---

## Viewing notification status

### About this task

Use this procedure to view the notification status of the elements.

**View Notification Status** is available only on the primary or the secondary System Manager server that is in the active state.

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, click **More Actions > View Notification Status**.

System Manager displays the View Notification Status page with **Name**, **Event Type**, **Status**, **Last Updated Time**, and **Error**.

3. To resend the notification status, in the Notification Status section, select an event name, and click **Resend Notification**.

If the notification status is **Inprogress**, use **Get Current Status** to find the connectivity status and the manageability status of elements. However, you cannot use **Manage** or **Unmanage** to start or stop managing the elements.

If there is ongoing notification being sent in the background, the system displays a progress bar and removes the progress bar once the sending operation is complete or fails.

## Viewing certificate add status of elements

### About this task

When you add trusted certificates for:

- Multiple elements of same ElementType and Version, the system creates a job and you can view the certificate management job status.
- Single element, the system does not create a job.

Use this procedure to view the certificate management job status of the failed elements.

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, click **More Actions > View Certificate Add Status**.

System Manager displays the Certificate Management Jobs page with **Job Name**, **Job State**, **Total Elements**, **Failed Elements**, **Job Start Time**, and **Job End Time**.

3. To view the details, in the Certificate Management Job Status section, select a job name, and click **View**.

System Manager displays the Failed Elements Detail For Job - <Job\_Name> section with **Element IP**, and **Error Message**.

4. Click **Close** to close the Failed Elements Detail For Job - <Job\_Name> section.
5. Click **Back** to return to the Manage Elements page.

## Field descriptions

### Manage Elements field descriptions

| Name        | Description                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b> | The name of the element.                                                                                                                                                                                                                                                       |
| <b>Node</b> | The node on which the element runs. The IP address can be in the IPv4 or IPv6 format.                                                                                                                                                                                          |
| <b>Type</b> | <p>The type of the element to which the element belongs.</p> <p> <b>Note:</b></p> <p>You can view this field only if you gain access to the Manage Elements page from <b>Inventory</b>.</p> |

*Table continues...*

| Name               | Description                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Device Type</b> | The device type of the element.<br>For example, for IP Office, the device type can be IP Office or B5800. |
| <b>SEID</b>        | The number is generated after product registration for further configuration and investigation.           |
| <b>Reg. Status</b> | The registration status of the element with the SAL gateway.                                              |

The system also provides the following fields when System Manager is configured with Geographic Redundancy.

| Name                     | Description                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reachable</b>         | The state that specifies if the element is reachable from the current server. The values are Yes and No.                                                                                     |
| <b>Managed by</b>        | The server that manages this element. The options are Primary and Secondary. For a non-GR element, the field displays Not Supported.                                                         |
| <b>Last Updated Time</b> | The time when the system updates the status of the element.                                                                                                                                  |
| <b>Error</b>             | A red cross icon (  ) if the system generates errors. For more information, you can click the icon.         |
| <b>Warning</b>           | A yellow triangle icon (  ) if the system generates warnings. For more information, you can click the icon. |

 **Note:**

At any given point of time, you can perform **Get Current Status**, **Manage**, or **Unmanage** operation.

| Button         | Description                                                                              |

| Button                 | Description                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------|
| <b>Filter: Enable</b>  | The fields where you can set the filter criteria. <b>Filter: Enable</b> is a toggle button. |
| <b>Filter: Disable</b> | Hides the column filter fields. <b>Filter: Disable</b> is a toggle button.                  |
| <b>Filter: Apply</b>   | Filters elements based on the filter criteria.                                              |
| <b>Select: All</b>     | Selects all elements in the table.                                                          |
| <b>Select: None</b>    | Clears the selection for the users that you select.                                         |
| <b>Refresh</b>         | Refreshes the element information in the table.                                             |

## Criteria

| Name                          | Description                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Search Criteria</b> | The options are: <ul style="list-style-type: none"> <li>• <b>Replica Node Host Name</b></li> <li>• <b>Synchronization State</b></li> <li>• <b>Last Synchronization Time</b></li> </ul>               |
| <b>Select Search Operator</b> | The options are: <ul style="list-style-type: none"> <li>• <b>Equals</b></li> <li>• <b>Not Equals</b></li> <li>• <b>Starts with</b></li> <li>• <b>Ends with</b></li> <li>• <b>Contains</b></li> </ul> |
| <b>Enter Search to Text</b>   | Specify the search criteria.                                                                                                                                                                         |

| Button        | Description                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| -             | Removes the additional search criteria fields.<br>This field is enabled when the additional search criteria fields are added. |
| +             | Adds the additional search criteria fields.                                                                                   |
| <b>Clear</b>  | Clears the search criteria.                                                                                                   |
| <b>Search</b> | Performs the search for the specified search criteria                                                                         |
| <b>Close</b>  | Closes the Criteria section.                                                                                                  |

## Element details field descriptions

### **Note:**

The fields on this page varies with the application that you manage.

## General

| Name | Description                                             |
|------|---------------------------------------------------------|
| Type | The application type whose instance you want to create. |

The following field is available only for specific applications, such as Session Manager and Presence Services.

| Name                                     | Description                                                                                                                                                                                  |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select type of <application name> to add | The application type whose instance you want to create.<br>For example, for Presence Services, you can select a standalone Presence Services or Presence Services on Avaya Breeze® platform. |

| Name        | Description                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the element.                                                                                                                                                                                                                                                                             |
| Type        | The type of the application to which the element belongs.                                                                                                                                                                                                                                            |
| Description | A brief description of the element.                                                                                                                                                                                                                                                                  |
| Node        | The node on which you run the element. The IP address can be in the IPv4 or IPv6 format.<br><br> <b>Note:</b><br>The system displays the <b>Node</b> field when you select <b>Other</b> from the <b>Node</b> field. |
| Device Type | The device type of the element.<br>For example, for IP Office, the device type can be IP Office or B5800.                                                                                                                                                                                            |

## Access Profile

| Name                | Description                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | The name of the access profile.                                                                                                                                                                                                                           |
| Access Profile Type | The type of the access profile. The options are: <ul style="list-style-type: none"> <li>• <b>URI</b>: For system web services API.</li> <li>• <b>SSH</b>: For application upgrade functions.</li> <li>• <b>SNMP</b>: For discovering elements.</li> </ul> |

*Table continues...*

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Access Profile Sub Type</b> | The sub type of the URI access profile. The options are: <ul style="list-style-type: none"> <li>• <b>EMURL</b>: To create a URL type access profile.</li> <li>• <b>WS</b>: To create a web service access profile.</li> <li>• <b>GUI</b>: To create a GUI access profile.</li> <li>• <b>GRCommunication</b>: To create a GR-aware element.</li> <li>• <b>TenantURL</b>: To create the tenant-related access profile.</li> <li>• <b>Other</b></li> </ul> |
| <b>Protocol</b>                | The protocol that the element supports to communicate with other communication devices.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Host</b>                    | The name of the host on which the element is running.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Port</b>                    | The port on which the element is running.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Order</b>                   | The order in which you gain access to access profiles.                                                                                                                                                                                                                                                                                                                                                                                                  |

| Button        | Description                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View</b>   | Displays fields in the Access Profile section that you can use to view access profile details.                                                         |
| <b>New</b>    | Displays the Application System Supported Protocol and Access Profile Details subsections in the Access Profile section to add access profile details. |
| <b>Edit</b>   | Displays fields in the Access Profile section using which you can modify the access profile details that you select.                                   |
| <b>Delete</b> | Deletes the selected access profile.                                                                                                                   |

### Application System Supported Protocol

The system displays the following fields when you click **New** or **Edit** in the **Access Profile** section:

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Protocol</b> | The protocol used to access profiles. The options are: <ul style="list-style-type: none"> <li>• <b>URI</b>: For system web services API.</li> <li>• <b>SSH</b>: For application upgrade functions.</li> <li>• <b>SNMP</b>: For discovering elements.</li> </ul> <p> <b>Note:</b></p> <p>The page displays the button only when you click <b>Add</b> or <b>Edit</b> in the Access Profile section.</p> |

### Access Profile Details

The page displays the following fields when you click **URI** in the **Protocol** field:

| Name                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                | The name of the access profile.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Access Profile Type</b> | The type of the access profile. The options are: <ul style="list-style-type: none"> <li>• <b>EMURL</b>: To create a URL type access profile.</li> <li>• <b>WS</b>: To create a web service access profile.</li> <li>• <b>GUI</b>: To create a GUI access profile.</li> <li>• <b>GRCommunication</b>: To create a GR-aware element.</li> <li>• <b>TenantURL</b>: To create the tenant-related access profile.</li> <li>• <b>Other</b></li> </ul> |
| <b>Protocol</b>            | The protocol for communicating the element.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Host</b>                | The name of the host on which the element is running.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Port</b>                | The port on which the element is running.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Path</b>                | The path to gain access to the access profile.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Order</b>               | The order in which you gain access to access profiles.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | A brief description of the access profile.                                                                                                                                                                                                                                                                                                                                                                                                      |

The page displays the following fields when you click **SSH** in the **Protocol** field:

| Name                    | Description                                  |
|-------------------------|----------------------------------------------|
| <b>Name</b>             | The name of the access profile.              |
| <b>Login Name</b>       | The login name as configured on the element. |
| <b>Port</b>             | The port on which the element is running.    |
| <b>Password</b>         | The password to log in to the element.       |
| <b>Confirm Password</b> | The password that you retype.                |

The page displays the fields when you click **SNMP** in the **Protocol** field and **V3** in the **Type** field:

| Name                | Description                              |
|---------------------|------------------------------------------|
| <b>Profile Name</b> | The name of the profile.                 |
| <b>Description</b>  | A brief description of the profile.      |
| <b>Type</b>         | The SNMP protocol type.                  |
| <b>User</b>         | The user name as defined in the element. |

*Table continues...*

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication Type</b>             | <p>The authentication protocol used to authenticate the source of traffic from SNMP V3 users. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>MD5</b></li> </ul> <p>The default is <b>MD5</b>.</p> <ul style="list-style-type: none"> <li>• <b>SHA</b></li> <li>• <b>None</b></li> </ul> <p><b>Authorization Type</b> applies only to the SNMP V3 protocol.</p>                                                                                                  |
| <b>Authentication Password</b>         | <p>The password to authenticate the user. The password must contain at least eight characters.</p> <p> <b>Note:</b></p> <p>The password is mandatory.</p>                                                                                                                                                                                                                                                |
| <b>Confirm Authentication Password</b> | The SNMP V3 protocol authentication password that you retype for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Privacy Type</b>                    | <p>The encryption policy for an SNMP V3 user. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>AES</b>: For SNMP-based communication.</li> <li>• <b>AES128</b>: For SNMP-based communication.</li> <li>• <b>DES</b>: For SNMP-based communication.</li> </ul> <p>The default is <b>DES</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>: Does not encrypt traffic for this user.</li> </ul> <p>Set <b>Privacy Type</b> only for an SNMP V3 user.</p> |
| <b>Privacy Password</b>                | The password used to enable the <b>DES</b> or <b>AES</b> encryption. DES passwords must contain at least eight characters.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Confirm Privacy Password</b>        | The privacy password that you retype for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Privileges</b>                      | <p>The privileges that determine the operations that you can perform on MIBs.</p> <ul style="list-style-type: none"> <li>• <b>None</b></li> </ul> <p>The default is None.</p> <ul style="list-style-type: none"> <li>• <b>Read/Write</b>: To perform GET and SET operations.</li> <li>• <b>Read</b>: To perform only the GET operation.</li> </ul>                                                                                                                                        |
| <b>Timeout</b>                         | The time in milliseconds for which the element waits for a response from the device being polled during discovery.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Retries</b>                         | The number of times that the element polls a device without receiving a response before timing out.                                                                                                                                                                                                                                                                                                                                                                                       |

The page displays the fields when you click **SNMP** in the **Protocol** field and **V1** in the **Type** field:

| Name                   | Description                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>    | The name of the profile.                                                                                                       |
| <b>Description</b>     | A brief description of the profile.                                                                                            |
| <b>Type</b>            | The SNMP protocol type.<br><br>* <b>Note:</b><br>To upgrade Communication Manager using SNMP protocol, you must select SNMPV1. |
| <b>Read Community</b>  | The read community of the device.<br><b>Read Community</b> applies only to the SNMP V1 protocol.                               |
| <b>Write Community</b> | The write community of the device.<br><b>Write Community</b> applies only to the SNMP V1 protocol.                             |
| <b>Timeout</b>         | The time in milliseconds for which the element waits for a response from the device that the element polls.                    |
| <b>Retries</b>         | The number of times that the element polls a device and fails to receive a response. After the retries, the element times out. |

| Button        | Description                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Save</b>   | Saves the access profile details.<br><br>* <b>Note:</b><br>This button is available only when you click <b>Add</b> and <b>Edit</b> in the Access Profile section.                                                                                                             |
| <b>Cancel</b> | Cancels the operation of creating or editing an access profile and hides the fields where you enter or modify the access profile information.<br><br>* <b>Note:</b><br>This button is available only when you click <b>Add</b> and <b>Edit</b> in the Access Profile section. |

## Port

| Name               | Description                               |
|--------------------|-------------------------------------------|
| <b>Name</b>        | The name of the port.                     |
| <b>Port</b>        | The port on which the element is running. |
| <b>Protocol</b>    | The protocol for the corresponding port.  |
| <b>Description</b> | A brief description about the port.       |

| Button      | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| <b>New</b>  | Displays fields in the Port section that you can use to add a port.                                          |
| <b>Edit</b> | Displays fields in the Port section with port information. You can change the port details in the port mode. |

*Table continues...*

| Button        | Description                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Delete</b> | Deletes the selected configured port.                                                                                                                                                                                                                                               |
| <b>Commit</b> | Saves the port details.<br><br>* <b>Note:</b><br>The section displays the <b>Save</b> button only when you click <b>Add</b> or <b>Edit</b> in the Port section.                                                                                                                     |
| <b>Cancel</b> | Cancels the current operation of creating or editing an access profile and hides the fields where you add or modify the port information.<br><br>* <b>Note:</b><br>The section displays the <b>Cancel</b> button only when you click <b>Add</b> or <b>Edit</b> in the Port section. |

## Attributes

Use this section to configure attributes for the selected element.

The following fields display the information about attributes defined for System Manager.

| Name                | Description                                                    |
|---------------------|----------------------------------------------------------------|
| <b>IP</b>           | The IP address of System Manager.                              |
| <b>FQDN</b>         | FQDN of System Manager.                                        |
| <b>Virtual IP</b>   | The virtual IP address of System Manager.                      |
| <b>Virtual FQDN</b> | The virtual FQDN of System Manager.                            |
| <b>isPrimary</b>    | The option to indicate if the element is primary or secondary. |

## Assign elements

| Name               | Description                                               |
|--------------------|-----------------------------------------------------------|
| <b>Name</b>        | The name of the element.                                  |
| <b>Type</b>        | The type of the application to which the element belongs. |
| <b>Description</b> | A brief description about the element.                    |

| Button                   | Description                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------|
| <b>Assign elements</b>   | Displays the Assign elements page that you use to assign an element to another element. |
| <b>Unassign elements</b> | Removes an assigned element.                                                            |

| Button        | Description                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commit</b> | Creates or modifies an element by saving the information to the database.<br><br>* <b>Note:</b><br>The system displays the button only when you click <b>Add</b> or <b>Edit</b> on the Manage Elements page. |
| <b>Cancel</b> | Closes the page without saving the information and navigates back to the Manage Elements page.                                                                                                               |

For example, the following fields provide information about attributes that you can define for Messaging.

| Name                           | Description                                                                                                                                                                                                                                                         |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Login</b>                   | The name in the <b>Trusted Server Name</b> field of the Trusted Servers page on the Messaging server.                                                                                                                                                               |
| <b>Password</b>                | The password as given in the <b>Password</b> field of the Trusted Servers page on the Messaging server.                                                                                                                                                             |
| <b>Confirm Password</b>        | The password that you retype for confirmation.                                                                                                                                                                                                                      |
| <b>Messaging Type</b>          | The type of the Messaging server. The following types are supported: <ul style="list-style-type: none"> <li>• <b>MM</b>: Modular Messaging</li> <li>• <b>CMM</b>: Communication Manager Messaging</li> <li>• <b>AURAMESSAGING</b>: Avaya Aura® Messaging</li> </ul> |
| <b>Version</b>                 | The version of Messaging. Supported versions are 5.0 and later.                                                                                                                                                                                                     |
| <b>Secured LDAP Connection</b> | An option to use the secure LDAP connection.<br>To use the nonsecure LDAP connection, you must clear the check box.                                                                                                                                                 |
| <b>Port</b>                    | The port on which the LDAP or secure LDAP service that the element provides is running. The default port is 389 for LDAP and 636 for secure LDAP.                                                                                                                   |
| <b>Location</b>                | The location of the element.                                                                                                                                                                                                                                        |

## Delete Element Confirmation field descriptions

Use this page to delete an element.

| Name        | Description                                                                                 |
|-------------|---------------------------------------------------------------------------------------------|
| <b>Name</b> | The name of the element.                                                                    |
| <b>Node</b> | The node on which the element is running. The IP address can be in the IPv4 or IPv6 format. |

| Name                | Description                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Registration</b> | The registration status of the element. The options are: <ul style="list-style-type: none"> <li>• <b>True:</b> Indicates a registered instance.</li> <li>• <b>False:</b> Indicates an unregistered instance.</li> </ul> |
| <b>Description</b>  | A brief description about the element.                                                                                                                                                                                  |

| Button        | Description                                  |
|---------------|----------------------------------------------|
| <b>Delete</b> | Deletes the selected element.                |
| <b>Cancel</b> | Closes the Delete Element Confirmation page. |

## Import Elements field descriptions

Use this page to import element data in bulk from a valid XML file.

### File Selection

| Name               | Description                                                                    |
|--------------------|--------------------------------------------------------------------------------|
| <b>Select File</b> | The path and name of the XML file from which you must import the element data. |

| Button        | Description                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------|
| <b>Browse</b> | Displays the File Upload box where you can browse for the file that you must import the element data. |

### Configuration

| Name                              | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Error Configuration</b> | The options are: <ul style="list-style-type: none"> <li>• <b>Abort on First Error:</b> The system stops the import of element data when the import element operation encounters the first error in the import file that contains the element data.</li> <li>• <b>Continue Processing other records:</b> The system imports the data of next element if the data of current element failed to import.</li> </ul> |

*Table continues...*

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>If a matching record already exists</b> | <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Skip:</b> Skips a matching record that already exists in the system during an import operation.</li> <li>• <b>Replace:</b> Reimports or replaces all the data for an element. This is essentially the ability to replace an element along with the other data related to the element.</li> <li>• <b>Merge:</b> Imports the element data at an even greater degree of granularity. Using this option you can simultaneously perform both the add and update operation of elements data.</li> <li>• <b>Delete:</b> Deletes the elements along with their data from the database that match the records in the input XML file.</li> </ul> |

## Schedule

| Name                | Description                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule Job</b> | <p>The options for configuring the schedule of the job:</p> <ul style="list-style-type: none"> <li>• <b>Run immediately:</b> Use this option if you want to run the import job immediately.</li> <li>• <b>Schedule later:</b> Use this option to run the job at the specified date and time.</li> </ul> |
| <b>Date</b>         | <p>The date when you require to run the import elements job. The date format is mm: dd:yyyy. You can use the calendar icon to select a date.</p> <p>This field is available when you select the <b>Schedule later</b> option for scheduling a job.</p>                                                  |
| <b>Time</b>         | <p>Time of running the import elements job. The time format is hh:mm:ss and 12 (AM or PM) or 24 hour format.</p> <p>This field is available when you select the <b>Schedule later</b> option for scheduling a job.</p>                                                                                  |
| <b>Time Zone</b>    | <p>Time zone of your region.</p> <p>This field is available when you select the <b>Schedule later</b> option for scheduling a job.</p>                                                                                                                                                                  |

| Button        | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| <b>Import</b> | Imports or schedules the import operation based on the option you selected. |

## Import List

| Name                    | Description                              |
|-------------------------|------------------------------------------|
| <b>Select check box</b> | Provides the option to select a job.     |
| <b>Start Time</b>       | The time and date of scheduling the job. |

*Table continues...*

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>          | The current status of the job. The following are the different status of the job: <ol style="list-style-type: none"> <li>1. PENDING EXECUTION: The job is in queue.</li> <li>2. RUNNING: The job execution is in progress.</li> <li>3. SUCCESSFUL: The job execution is complete.</li> <li>4. INTERRUPTED: The job execution is cancelled.</li> <li>5. PARTIAL FAILURE: The job execution has partially failed.</li> <li>6. FAILED: The job execution has failed.</li> </ol> |
| <b>Scheduled Job</b>   | Displays a link to the Scheduler user interface. You can cancel the job from the Scheduler user interface too.                                                                                                                                                                                                                                                                                                                                                               |
| <b>% Complete</b>      | The job completion status in percentage.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Element Records</b> | The number of user records in the input file.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Failed Records</b>  | The number of user records in the input file that failed to import.                                                                                                                                                                                                                                                                                                                                                                                                          |

| Button              | Description                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View Job</b>     | Shows the details of the selected job.                                                                                                                                   |
| <b>Cancel Job</b>   | Cancels the import operation for the selected job. You can cancel a job that is in progress or queued for import.                                                        |
| <b>Delete Job</b>   | Deletes the selected job.                                                                                                                                                |
| <b>Refresh</b>      | Refreshes the job information in the table.                                                                                                                              |
| <b>Show</b>         | Provides an option to view all jobs on the same page. If the table displaying scheduled jobs span multiple pages, to view all jobs on a single page, select <b>All</b> . |
| <b>Select: All</b>  | Selects all jobs in the table.                                                                                                                                           |
| <b>Select: None</b> | Clears the check box selections.                                                                                                                                         |
| <b>Cancel</b>       | Returns to the <b>Manage Elements</b> page.                                                                                                                              |

## Import Status field descriptions

The Import Status page displays the detailed status of the selected import job.

### Status Summary

| Name         | Description                                                      |
|--------------|------------------------------------------------------------------|
| <b>Start</b> | The start date and time of the job.                              |
| <b>End</b>   | The end date and time of the job.                                |
| <b>File</b>  | The name of the file that is used to import the element records. |

*Table continues...*

| Name                      | Description                                                         |
|---------------------------|---------------------------------------------------------------------|
| <b>Total Records</b>      | The total number of element records in the input file.              |
| <b>Successful Records</b> | The total number of element records that are successfully imported. |
| <b>Failed Records</b>     | The total number of element records that failed to import.          |
| <b>Complete</b>           | The percentage completion of the import.                            |

### Status Details

| Name                 | Description                                           |
|----------------------|-------------------------------------------------------|
| <b>Line Number</b>   | The line number in the file where the error occurred. |
| <b>loginName</b>     | The login name through which job was executed.        |
| <b>Error Message</b> | A brief description about the error message.          |

| Button      | Description                          |
|-------------|--------------------------------------|
| <b>Done</b> | Returns to the Import Elements page. |

## Add Communication Manager field descriptions

### General Attributes

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                   | The name of the Communication Manager instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Hostname or IP Address</b> | The IP address can be in the IPv4 or IPv6 format. The host name or the IP address of the Communication Manager instance.<br><br>For the duplicated Communication Manager, this value references the active server IP address.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Alternate IP Address</b>   | The alternate IP address of the element. For duplex servers, the alternate IP address is the IP address of the standby server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Login</b>                  | The login name that you use to connect to the Communication Manager instance.<br><br> <b>Note:</b><br><br>craft, craft2, dadmin, inads, init, rasaccess, sroot, and tsc are the restricted logins when you configure a Communication Manager system.<br><br>Do not use the login name to connect to: <ul style="list-style-type: none"> <li>• The Communication Manager instance from any other application.</li> <li>• The Communication Manager SAT terminal by using command line interface (CLI).</li> </ul> |
| <b>Authentication Type</b>    | The authentication type for the SSH or Telnet login name on the element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Name                                      | Description                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Password</b>                           | The password that authenticates the SSH or Telnet login name on the element.                                                                                                                                                                                                                                                       |
| <b>Confirm Password</b>                   | <p>The password that you retype for confirmation.</p> <p> <b>Note:</b><br/><b>Confirm Password</b> must match <b>Password</b>.</p>                                                                                                                |
| <b>ASG Key</b>                            | <p>The ASG key that authenticates the SSH or Telnet login name on the element.</p> <p>This field is only available if <b>ASG Key</b> is selected in <b>Authentication Type</b>.</p>                                                                                                                                                |
| <b>Confirm ASG Key</b>                    | <p>The ASG key that you retype for confirmation.</p> <p>This field is only available if <b>ASG Key</b> is selected in <b>Authentication Type</b>.</p> <p> <b>Note:</b><br/><b>Confirm ASG key</b> must match <b>ASG key</b>.</p>                  |
| <b>SSH Connection</b>                     | <p>An option to use SSH for connecting to the element.</p> <p>By default, this check box is selected and the system uses SSH to connect to the element.</p> <p>If you clear the check box, the system uses Telnet to connect to the element.</p>                                                                                   |
| <b>RSA SSH Fingerprint (Primary IP)</b>   | <p>The RSA SSH key of the Communication Manager server.</p> <p>For duplex servers, the RSA SSH key is the key of the active server.</p> <p>You must include the prefix <code>SHA256:</code> before the RSA SSH Fingerprint.</p> <p>For example:</p> <p><code>SHA256:&lt;Eb4qM3YEWONzZoLlhgle1s2Ena0A8qhy1z1oWk7Nahs&gt;</code></p> |
| <b>RSA SSH Fingerprint (Alternate IP)</b> | <p>The RSA SSH key of the standby Communication Manager server. Use the RSA SSH key only for duplex servers.</p> <p>You must include the prefix <code>SHA256:</code> before the RSA SSH Fingerprint.</p> <p>For example:</p> <p><code>SHA256:&lt;Ena0A8qhy1z1oWk7NahsYEWONzEb4qM3ZoLlhgle1s2&gt;</code></p>                        |
| <b>Description</b>                        | A description of the Communication Manager server.                                                                                                                                                                                                                                                                                 |

*Table continues...*

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Notifications</b>         | <p>A real-time notification whenever an administrative change occurs in Communication Manager. For example, when you add or delete an extension from Communication Manager outside System Manager. The options are:</p> <ul style="list-style-type: none"> <li>• Selected: Enables the CM Notify sync feature for this Communication Manager instance.</li> <li>• Cleared: Disables the CM Notify sync feature for this Communication Manager instance.</li> </ul> <p>After you enable this feature, and register the System Manager IP address on Communication Manager, the system sends changes that are administered on Communication Manager to System Manager asynchronously.</p> <p> <b>Note:</b></p> <p>Communication Manager 6.2 or later supports this feature.</p> |
| <b>Port</b>                         | <p>The port on which the service provided by the element is running. The default SSH port is 5022.</p> <p> <b>Note:</b></p> <p>From Communication Manager Release 7.1 and later, the telnet port 5023 is disabled. If the telnet port is configured for the Communication Manager element, select the <b>SSH Connection</b> checkbox. When you select this checkbox, the system populates the default port value to 5022.</p>                                                                                                                                                                                                                                                                                                                                                 |
| <b>Location</b>                     | The location of the element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Add to Communication Manager</b> | <p>An option to select Communication Manager that you want to view in the communication manager list.</p> <p>By default, <b>Add to Communication Manager</b> is selected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## SNMPv1 Attributes

In the **Version** field, when you select **V1**, System Manager displays the following fields.

| Name                   | Description                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Version</b>         | The SNMP protocol type.                                                                                                                 |
| <b>Read Community</b>  | The read community of the device.                                                                                                       |
| <b>Write Community</b> | The write community of the device.                                                                                                      |
| <b>Retries</b>         | <p>The number of times an application polls a device without receiving a response before timing out.</p> <p>The default value is 3.</p> |

*Table continues...*

| Name                | Description                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeout (ms)</b> | The duration of time in milliseconds for which an application polls a device without receiving a response before timing out.<br><br>The default value is 5000 ms.                                                                                                                                                                                                |
| <b>Device Type</b>  | The Communication Manager application type. The options are: <ul style="list-style-type: none"> <li>• <b>Avaya Aura(R) Communication Manager SP</b> for Communication Manager 6.3.100 on System Platform.</li> <li>• <b>Avaya Aura(R) Communication Manager VE</b> for Virtualized Environment-based Communication Manager 6.3.100 and Release 8.1.3.</li> </ul> |

### SNMPv3 Attributes

In the **Version** field, when you select **V3**, System Manager displays the following fields.

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Version</b>                         | The SNMP protocol type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>User Name</b>                       | The user name as defined in the application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Authentication Protocol</b>         | The authentication protocol that authenticates the source of traffic from SNMP V3 protocol users. The possible values are: <ul style="list-style-type: none"> <li>• <b>MD5</b><br/>This is the default option.</li> <li>• <b>SHA</b></li> <li>• <b>None</b>: If you select this option, System Manager does not display the <b>Authentication Password</b>, <b>Confirm Authentication Password</b>, and <b>Privacy Protocol</b> fields.</li> </ul>                                                                        |
| <b>Authentication Password</b>         | The SNMP authentication password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Confirm Authentication Password</b> | The SNMP authentication password that you retype for confirmation. <b>Authentication Password</b> and <b>Confirm Authentication Password</b> must match.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Privacy Protocol</b>                | The encryption policy for SNMP V3 protocol users. The possible values are: <ul style="list-style-type: none"> <li>• <b>AES128</b>: Use the AES encryption for the SNMP-based communication. This is the default protocol.</li> <li>• <b>DES</b>: Use the DES encryption for the SNMP-based communication.</li> <li>• <b>None</b>: Does not encrypt traffic for this user.</li> </ul> If you select this option, System Manager does not display the <b>Privacy Password</b> , and <b>Confirm Privacy Password</b> fields. |
| <b>Privacy Password</b>                | The pass phrase used to encrypt the SNMP data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Confirm Privacy Password</b>        | Retype the privacy password in this field for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Adding an Application Enablement Services instance to System Manager field descriptions

### General

| Name               | Description                                                                      |
|--------------------|----------------------------------------------------------------------------------|
| <b>Name</b>        | The name of the Application Enablement Services instance.                        |
| <b>Type</b>        | The type of the instance added.<br>Application Enablement Services in this case. |
| <b>Description</b> | The description of the AE Services server.                                       |
| <b>Node</b>        | The IP address/FQDN of the management interface of the AE Services server.       |

### Port Details

| Name            | Description                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>     | The name of the port to be used for the AE Services server.                                                                                                                                                   |
| <b>Protocol</b> | The protocol type supported by the port and the AE Services server. The options are: <ul style="list-style-type: none"> <li>• http</li> <li>• https</li> <li>• jnp</li> <li>• rmi</li> <li>• tsapi</li> </ul> |

*Table continues...*

| Name        | Description                                            |
|-------------|--------------------------------------------------------|
| Port        | The port number to be used for the AE Services server. |
| Description | The description of the port details.                   |

### Attributes

| Name                    | Description                             |
|-------------------------|-----------------------------------------|
| aes.aesMachineName.name | The hostname of the AE Services server. |

### Assign Elements

| Name            | Description                                                                                                                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Assignment Name | The name to assign the Communication Manager instance to the AE Services server.<br><br> <b>Note:</b><br><b>Assignment Name</b> must be same as the Switch Connection name in the AE Services management console. |
| Name            | The name of the Communication Manager instance.                                                                                                                                                                                                                                                    |
| Node            | The IP address/FQDN of the management interface of the Communication Manager instance.                                                                                                                                                                                                             |
| Type            | The type of the Communication Manager instance.                                                                                                                                                                                                                                                    |
| Version         | The version number of the Communication Manager instance.                                                                                                                                                                                                                                          |

| Button | Description                                           |
|--------|-------------------------------------------------------|
| Commit | Adds a AE Services instance in the inventory.         |
| Save   | Saves all the entries.                                |
| Cancel | Cancels your action and returns to the previous page. |

## Add IP Office field descriptions

### General

| Name        | Description                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the IP Office device. The name must only contain lowercase and uppercase alphabets, numbers from 0 to 9, commas, hyphens, and underscores. |
| Description | The description of the IP Office device.                                                                                                               |

*Table continues...*

| Name                            | Description                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Node</b>                     | The IP address can be in the IPv4 or IPv6 format. The host name or the IP address of the IP Office device. |
| <b>Device Type</b>              | The type of the IP Office device. The options are IP Office and B5800.                                     |
| <b>Device Version</b>           | The version of the IP Office device.                                                                       |
| <b>Service Login</b>            | The login name to access the IP Office device. The default is BranchAdmin.                                 |
| <b>Service Password</b>         | The password to access the IP Office device.                                                               |
| <b>Confirm Service Password</b> | The service password that you retype for confirmation.                                                     |

For IP Office releases earlier than 9.1, the default service login for IP Office is SMGRB5800Admin. After you upgrade IP Office from Release 9.0 to 9.1 or later, you can use the same login name, SMGRB5800Admin. The account remains active.

However, the system creates a new account, BranchAdmin. The configuration of the BranchAdmin account is the same as the SMGRB5800Admin account. The new account also becomes active.

In IP Office Release 9.1 or later, if you reset the security setting, the system deletes the SMGRB5800Admin account and adds the BranchAdmin account that remains disabled. You must activate the account by accessing the IP Office security setting offline.

Also, if you add the new IP Office Release 9.1 or later in System Manager by running Initial Configuration Utility (ICU) on IP Office, the default account, BranchAdmin, will be available. The account becomes active.

## SNMP

| Name                   | Description                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Version</b>         | The SNMP protocol type. The options are None and V1.                                                          |
| <b>Read Community</b>  | The read community of the device.                                                                             |
| <b>Write Community</b> | The write community of the device.                                                                            |
| <b>Retries</b>         | The number of times that an application polls a device without receiving a response before timing out.        |
| <b>Timeout (ms)</b>    | The number of milliseconds that an application polls a device without receiving a response before timing out. |

| Button        | Description                                                  |
|---------------|--------------------------------------------------------------|
| <b>Commit</b> | Adds the IP Office device to the inventory.                  |
| <b>Clear</b>  | Clears your entries and reset the page.                      |
| <b>Cancel</b> | Cancels the add operation, and returns to the previous page. |

## Managing Serviceability Agents

---

### Serviceability Agents

The Serviceability Agent is an enhanced version of the SAL agent for forwarding logs, harvesting logs, and for alarming. The Serviceability Agent sends SNMPv2 and SNMPv3 traps and notifies the configured NMS destinations where System Manager and the SAL gateway are the two mandatory destinations.

With the Serviceability Agent user interface you can:

- Manage and configure SNMPv3 users remotely
- Manage and configure SNMP trap destinations remotely
- Create, edit, view, and delete user and target profiles. You can also attach these profiles to agents or detach these profiles from agents.

For more information on fault management using SNMP, see *Avaya Aura® System Manager Fault Management and monitoring using SNMP*.

## Converting a common alarm definition file to MIB file and trapd file

### Before you begin

To run the command, you require jre 1.6.0 or later installed on the system.

### About this task

The MIB tool converts a Common Alarm Definition File (CADF) xml file to MIB file (.my) and trapd (.conf) file. The tool converts only CADF files with notification OIDS that are specified in the X.X.X.productID.0.n format, where n is the notification OID.

You must provide all parameters. To provide the parameters later, you must edit the generated MIB file and trapd file. The system saves the generated artifacts in the same folder as that of the CADF file. Ensure that you have required disk space and file permissions.

### Procedure

1. At the prompt, type `cd $SPIRIT_HOME/scripts/utils.`
2. Type the following command:

```
generateTrapdAndMibUnix.sh [-l absolute path to cadf file] [-m MIB name] [-i MIB item name] [-p product ID] [-n product name] [-a author]
```

#### \* Note:

- If the path to the CADF file is incorrect, the system displays JVM errors.
- If the input to the **generateTrapdAndMibUnix.sh** command is invalid, the system displays No data or wrong data in .my and .conf files.

### Example

```
generateTrapdAndMibUnix.sh [-l /op/Avaya/SMGR_CommonAlarmDefn_Data.xml] [-m AV-AURA-SYSTEM-MANAGER-MIB] [-i avAuraSysMgr] [-p 25] [-n Avaya Aura System Manager] [-a Avaya]
```

[generateTrapdAndMibUnix](#) on page 956

[Configuration files in the MIBTOOL.jar file](#) on page 955

## Configuration files in the MIBTOOL.jar file

The MIBTOOL.jar file contains the following property files in the `spirit/mibtool/staticfiles` location:

| File name      | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| MIB.properties | The file contains default values for MIB name, MIB item name, and product ID. You can change the values. |

*Table continues...*

| File name             | Description                                                                                                                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIBXMLTAGS.properties | The file contains tags in CADF file that contains the information for items such as alarm name and OID. If you change the CADF file format, you must configure the tag names accordingly in the property file. Separate the values by a comma. |

**\* Note:**

Do not edit the property files. If you must edit, use a program such as WinZip and open the MIBTOOL.jar file. Do not extract the files. To view the files, navigate to the `com/avaya/resource` directory. Open the file by with a text editor, make the changes, and save the file. When WinZip prompts, click **Choose update the zip archive with the changes**.

## generateTrapdAndMibUnix

The **generateTrapdAndMibUnix** converts the Common Alarm Definition File (CADF) xml file to MIB file (.my) and trapd (.conf) file. The tool converts only CADF files with notification OIDs that are specified in the X.X.X.productID.0.n format, where n is the notification OID.

### Syntax

```
generateTrapdAndMibUnix.sh [-l absolute path to cadf file] [-m MIB name] [-i MIB item name] [-p product ID] [-n product name] [-a author]
```

### Example

```
generateTrapdAndMibUnix.sh [-l /op/Avaya/SMGR/CommonAlarmDefn_Data.xml] [-m AV-AURA-SYSTEM-MANAGER-MIB] [-i avAuraSysMgr] [-p 25] [-n Avaya Aura System Manager] [-a Avaya]
```

### Considerations

You must provide all parameters. To provide the parameters later, you must edit the generated MIB file and trapd file. The system saves the generated artifacts in the same folder as that of the CADF file. Ensure that you have required disk space and file permissions.

## Managing SNMPv3 user profiles

### Creating an SNMPv3 user profile

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMPv3 User Profiles**.
3. Click **New**.
4. On the New User Profile page, complete the User Details section.
5. Click **Commit**.

### Related links

[SNMPv3 user profiles field descriptions](#) on page 958

## Editing an SNMPv3 user profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMPv3 User Profiles**.
3. Select the user profile you want to edit from the profile list.
4. Click **Edit**.
5. Edit the required fields in the Edit User Profile page.

 **Note:**

You cannot edit an SNMPv3 user profile that is assigned to the serviceability agent of an element or that is attached to a target profile.

6. Click **Commit**.

### Related links

[SNMPv3 user profiles field descriptions](#) on page 958

## Viewing an SNMPv3 user profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMPv3 User Profiles**.
3. Click the user profile you want to view from the profile list.
4. Click **View**.

You can view the details, except the password, of the SNMPv3 user profile in the View User Profile page.

### Related links

[SNMPv3 user profiles field descriptions](#) on page 958

## Deleting an SNMPv3 user profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMPv3 User Profiles**.
3. Select the user profile or profiles you want to delete from the profile list.
4. Click **Delete**.
5. On the User Profile Delete Confirmation page, click **Delete**.

 **Note:**

You cannot delete a user profile that is attached to an element or a target profile.

## Filtering SNMPv3 user profiles

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMPv3 User Profiles**.
3. Click **Filter: Enable** above the Profile List.
4. Apply the filter to one or multiple columns of the User Profile List.
5. Click **Apply**.

To hide the column filters, click **Disable**. This action does not clear the filter criteria that you set in the column filters.

## SNMPv3 user profiles field descriptions

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Name</b>                       | <p>The SNMPv3 user name.</p> <p> <b>Note:</b></p> <p>The user name can contain the following characters: alphanumeric, period, underscore, white space, single quote, and hyphen. The user name cannot be blank.</p>                                                                      |

| <b>Edit</b>   | Use to edit the user profile you select.                                               |

## Managing SNMP target profiles

### SNMP Target profile list

| Name                | Description                                                               |
|---------------------|---------------------------------------------------------------------------|
| <b>Name</b>         | The name of the SNMP target profile. This name should be a unique value.  |
| <b>Domain Type</b>  | The type of transport for the flow of messages. The default value is UDP. |
| <b>IP Address</b>   | The IP address of the SNMP target profile.                                |
| <b>Port</b>         | The port of the SNMP target profile.                                      |
| <b>SNMP Version</b> | The version of the SNMP protocol.                                         |

| Button                | Description                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------|
| <b>New</b>            | To go to the New Target Details page where you can add a new SNMP target profile.         |
| <b>View</b>           | To go to the View Target Details page where you can view an existing SNMP target profile. |
| <b>Edit</b>           | To go to the Edit Target Details page where you can edit an existing SNMP target profile. |
| <b>Delete</b>         | To delete the existing SNMP target profiles that you select.                              |
| <b>Filter: Enable</b> | To filter the SNMP target profiles list by one or multiple criteria.                      |

## Filtering target profiles

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMP Target Profiles**.
3. Click **Filter: Enable** above the Profile List.
4. Apply the filter to one or multiple columns of the Target Profile List.
5. Click **Apply**.

To hide the column filters, click **Disable**. This action does not clear the filter criteria that you set in the column filters.

## Creating an SNMP target profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMP Target Profiles**.
3. On the SNMP Target Profiles page, click **New**.
4. On the New Target Profiles page, complete the Target Details section.
5. **(Optional)** Click the **Attach/Detach User Profile** tab to attach a user profile.

Perform the step only if you select the SNMPv3 protocol.

6. Click **Commit**.

## Editing an SNMP target profile

### About this task

#### **Note:**

Modify the target profiles that point to System Manager to reflect the changed IP address in the event of an IP address change on System Manager.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > SNMP Target Profiles**.
3. In the Target Profile list, click the profile that you must edit.
4. Click **Edit**.
5. On the Edit Target Profiles page, modify the required fields.

#### **Note:**

You cannot edit a target profile that is assigned to the serviceability agent of an element. You must unassign the target profile before you edit the profile.

6. Click **Commit**.

| <b>Commit</b> | Creates the target profile in the New Target Profile page or saves the changes in the Edit Target Profile page. |
| <b>Back</b>   | Cancels your action and returns to the previous page.                                                           |

## Notification filtering

### Notification filtering

System Manager supports alarm filtering capability. With filtering, you can select a product that System Manager supports to send filtered alarms only to specific targets.

When you send notifications to System Manager, SAL Gateway or other Network Management System (NMS), you can exclude or include notifications from elements. You can create filter profiles and assign the profiles to the target and serviceability agent pair. You can also remove the profiles from the target and serviceability agent pair. You can select alarms that you want to receive from a product on NMS. NMS can be System Manager or a third-party NMS system.

For a product, you can define the filter criteria to receive notifications on the target serviceability agent from the specific OIDs or block notifications on the target serviceability agent from the specific OIDs.

For example:

- To receive only major alarms from Session Manager, you must create a filter profile for Session Manager, select all major alarm OIDs and assign the filter profile to the target NMS for the serviceability agent of that Session Manager so that the target receives only the alarms specified in the filter profile.
- To block warning or minor alarms from Session Manager, you must create a filter profile for the product Session Manager, select exclude option and select OIDs of type warning and minor, and then assign the filter profile to the target NMS for the serviceability agent of

Session Manager so that the target does not receive warnings and minor alarm notifications from that Session Manager.

## Creating a notification filter profile

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Notification Filter Profile**.
3. On the Filter Profiles page, click **New**.
4. On the New Filter Profile page, click the **Filter Profile Details** tab and complete the fields.
5. Click **Exclude** or **Include**.

The default is Include.

For more information, see Create, View, Edit, or Delete Filter Profiles field descriptions.

6. Click the **Attach/Detach Notification Oids** tab, perform the following:
  - a. In the **Notification Subtree** field, type a value that ends with dot star (.\* ) and click **Add**.  
For example, 6889.2.35.\*  
System Manager excludes or includes alarms from the notification IDs that you select.

#### **Note:**

- If you perform Step 6a, Step 6b and Step 6c are optional.
  - If you perform Step 6b and Step 6c, Step 6a is optional.
- b. In the **Select Notifications** section, in the **Products** field, select a product.
  - c. In the notification list, select one or more notification IDs.
7. Click **Commit**.

## Assigning filter profile to a serviceability agent

### Procedure

1. On the System Manager web console, click **Services > Inventory**.

2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. Select a product for which you created the filter profile.
4. Click **Manage Profiles**.

The system displays the serviceability agent in the **Selected Agents** section.

5. Click the **SNMP Target Profiles** tab, select System Manager or the third-party NMS target agent, and click **Assign**.

The system displays the target in the list.

6. To assign the filter profile from the serviceability agent, perform the following:

- a. In the **Removable Profiles** section, select the target.

The **Assign/Remove Filter Profile** link becomes active.

- b. Click **Assign/Remove Filter Profile**.

7. In the **Profile List** section, click the plus sign (+).

The system displays the filter profile that you selected in the **Assigned Filter Profiles** section.

 **Note:**

You can assign only one filter profile to the target agent for a serviceability agent. For example, for a Session Manager serviceability agent, if the target is System Manager, then you can add only one filter profile to the System Manager target for the same Session Manager system.

8. Click **Commit**.

The system assigns the filter profile to the serviceability agent.

## Unassigning the filter profile from a serviceability agent

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. Select a product for which you created the filter profile.
4. Click **Manage Profiles**.

The system displays the serviceability agent in the **Selected Agents** section.

5. Click the **SNMP Target Profiles** tab.

6. In the **Removable Profiles** section, select the target.

The **Assign/Remove Filter Profile** link becomes active.

7. Click **Assign/Remove Filter Profile**.

8. In the **Assigned Filter Profiles** section, click the minus sign (-).

The system displays the filter profile in the **Profile List** section.

9. Click **Commit**.

The system disassociates the filter profile from the serviceability agent.

## Managing user and target profiles

### Automatic activation of serviceability agents

For newly installed elements that work with Release 6.3.8 serviceability agents, you do not need to manually activate the agents from the Manage Serviceability Agent page. System Manager automatically activates the agents. In the **Agents List** section, the system displays the agent as Active. You can assign the target or user profiles to the agent that is automatically activated.

#### **Note:**

The auto activate functionality only applies to serviceability agents added in Release 6.3.5 or later. If you recover an agent by running the **recoverAgent** script, then the system adds the agent after receiving the next heartbeat message. The system automatically activates the recovered agent.

### Repairing serviceability agents

#### About this task

If the alarming functionality of an element fails, you can repair the serviceability agent. The repair process triggers the SNMP configuration.

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.

2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. In the **Agent List** section, select one or more active agents that you want to repair.
4. Click **Repair Serviceability Agent**.

The system starts the SNMP configuration of the serviceability agent. At the subsequent heartbeat of the agent, the system notifies System Manager about the start of the SNMP configuration. Therefore, wait for about 15 minutes, the heartbeat interval, to test alarms from the element.

When System Manager receives the subsequent heartbeat, the system reactivates the agent. The system also assigns the target profiles and user profiles to the agent and the alarming functionality starts working.

5. **(Optional)** To make the changes immediately, log in to the server on which the serviceability agent runs and type `service spiritAgent restart`.

You can perform this step if you do not want to wait for the next heartbeat of the agent.

## Activating a serviceability agent

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. In the **Agent List** section, select one or more agents that you must activate.
4. Click **Activate**.

The system activates the SNMPv3 functionality in the remote serviceability agent that you selected. If the system does not activate the SNMPv3 functionality, refresh the Web page and repeat Step 3 and Step 4.

## Managing target profiles for the selected serviceability agents

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. In Agent List, select the active agents that you must manage.
4. Click **Manage Profiles**.
5. Click the **SNMP Target Profiles** tab.
6. Select the target profiles you must assign from the Assignable Profiles section.
7. Click **Assign**.

You can unassign or remove target profiles from the Removable Profiles section by clicking **Remove**.

8. Click **Commit** to assign the profiles to the selected agent.

 **Note:**

You can also select more than one serviceability agents and assign the same target profiles to all the agents.

## Managing SNMPv3 user profiles for the selected serviceability agents

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. In the **Agent List** section, select an active agent that you must manage.
4. Click **Manage Profiles**.
5. Click the **SNMPv3 User Profile** tab.
6. In the **Assignable Profiles** section, select the user profiles that you want to assign.
7. Click **Assign**.

To remove user profiles, in the **Removable Profiles** section, select the user profiles and click **Remove**.

8. To assign the user profiles to the selected agent, click **Commit**.

 **Note:**

You can also select more than one serviceability agents and assign the same user profiles to all agents.

## Managing the status of manage profile job for an agent

### About this task

From Release 8.1, when you perform manage profile for more than one agent, the system creates a background job.

Use this procedure to view and retry the manage profile job for agents.

Manage Profile for single agent is the same. The system does not create a job for single agent.

## Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. On the Serviceability Agents page, click **Manage Profile Job Status**.

System Manager displays the Manage Profile Jobs page with **Job Name**, **Status**, **Total Agents**, **Failed Agents**, **Job Start Time**, and **Job End Time**.

4. To view the details, in the Manage Profile Jobs section, select a job name, and click **View Details**.

System Manager displays the Failed Agents Detail For Job - <Job\_Name> section with **Agent IP Address**, and **Error Details**.

When you hover on **Job Name**, the system displays a brief description about the job, which target is added or removed, and which user is added or removed.

5. To retry the operation for the failed agent, perform the following:
  - a. Select one or more agent IP Address.
  - b. Click **Retry Operation**.

System Manager displays the Serviceability Agents page with the list of the failed agents that you selected for retrying any operation.

You can use the **Reset Table** button on the Serviceability Agents page to display all the agents.

- c. Click **Close** to close the Failed Agents Detail For Job - <Job\_Name> section.
6. Click **Back** to return to the Serviceability Agents page.

| <b>Repair Serviceability Agent</b> | Repairs the serviceability agent.                                                                                                                                                                                                                                                                                      |
| <b>Manage Profile Job Status</b>   | Manages the profile job for the serviceability agent.                                                                                                                                                                                                                                                                  |
| <b>Reset Table</b>                 | When you perform the retry operation on the Manage Profile Job Status page, System Manager displays the list of failed agents on the Serviceability Agents page. If you need to clear the list of failed agent list and display all the available agents in the Agent List section, use the <b>Reset Table</b> button. |
| <b>Advanced Search</b>             | The link to perform advance search. When you click on this link, System Manager displays the Criteria section.                                                                                                                                                                                                         |
| <b>Filter: Enable</b>              | The fields where you can set the filter criteria. <b>Filter: Enable</b> is a toggle button.                                                                                                                                                                                                                            |
| <b>Filter: Disable</b>             | Hides the column filter fields. <b>Filter: Disable</b> is a toggle button.                                                                                                                                                                                                                                             |
| <b>Filter: Apply</b>               | Filters agents based on the filter criteria.                                                                                                                                                                                                                                                                           |
| <b>Select: All</b>                 | Selects all agents in the table.                                                                                                                                                                                                                                                                                       |
| <b>Select: None</b>                | Clears the selection for the agents that you select.                                                                                                                                                                                                                                                                   |
| <b>Refresh</b>                     | Refreshes the agent information in the table.                                                                                                                                                                                                                                                                          |

## Criteria

| Name                          | Description                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Search Criteria</b> | The options are: <ul style="list-style-type: none"> <li>• <b>Hostname</b></li> <li>• <b>IP Address</b></li> <li>• <b>System Name</b></li> <li>• <b>Device Type</b></li> <li>• <b>System OID</b></li> <li>• <b>Target Profile</b></li> <li>• <b>User Profile</b></li> </ul> |
| <b>Select Search Operator</b> | The options are: <ul style="list-style-type: none"> <li>• <b>Equals</b></li> <li>• <b>Not Equals</b></li> <li>• <b>Starts with</b></li> <li>• <b>Ends with</b></li> <li>• <b>Contains</b></li> </ul>                                                                       |
| <b>Enter Search to Text</b>   | Specify the search criteria.                                                                                                                                                                                                                                               |

| Button | Description                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------|
| -      | Removes the additional search criteria fields.<br>This field is enabled when the additional search criteria fields are added. |
| +      | Adds the additional search criteria fields.                                                                                   |
| Clear  | Clears the search criteria.                                                                                                   |
| Search | Performs the search for the specified search criteria                                                                         |
| Close  | Closes the Criteria section.                                                                                                  |

---

## Synchronization of Data

---

### Communication Manager, Messaging data, and IP Office synchronization

Elements that System Manager manages have alternative ways of administering data. To ensure uniformity in the database when a variety of tools are used, you can use the synchronization menu. You can synchronize Communication Manager, Messaging, and IP Office data through this menu.

#### Communication System

Using System Manager, you can synchronize the System Manager data with Communication Manager. When you add Communication Manager to the system, System Manager automatically initiates synchronization to update the System Manager database.

#### Initializing synchronization

With initializing synchronization, you can synchronize the data in the System Manager database with each managed Communication Manager system. When you add a Communication Manager into the system, System Manager automatically initiates an initialization task to get the required Communication Manager data, and stores the data in the System Manager database.

#### Important:

If there is a change in any of the following Communication Manager objects in Communication Manager, you must initiate full initialization synchronization of this Communication Manager in System Manager.

- system-param features
- system-param cdr
- system-param cust
- system-param spec
- system-param security

- system-param country-options
- system-param maintenance
- dialplan
- cabinet
- board

### Incremental synchronization

With incremental synchronization with selected devices, you can incrementally synchronize the data in the System Manager database with each managed Communication Manager system. This synchronization updates the changed data in the database in Communication Manager since synchronization was last run.

Once the first Initialization synchronization job gets completed, System Manager schedules recurring Incremental synchronization job at every 24 hour.

Incremental synchronization pulls all the incremental commands from the Communication Manager command history, which are performed on Communication Manager after last Communication Manager synchronization and that are executed on Communication Manager by the Communication Manager user that is not available in the System Manager inventory.

Incremental synchronization does not pull the station, if the station is added on Communication Manager by the same Communication Manager user that is in available in the System Manager inventory.

#### Important:

Though you perform an incremental synchronization, System Manager initiates an initializing synchronization when you:

- Upgrade System Manager. The system displays the synchronization status as **SMGR Upgraded**, and you can continue to perform the administrative tasks even after System Manager is upgraded.
- Upgrade or rollback Communication Manager.

System Manager initiates initializing synchronization instead of incremental synchronization in the following scenarios:

- At the time of every incremental synchronization, System Manager verifies the Communication Manager version and if the version is greater than the existing Communication Manager version (for example, Communication Manager is upgraded), then System Manager starts the initialization synchronization.
- Last initializing synchronization status is failed.
- If count of command history is more than 1800.

#### Note:

If the CM notify sync feature is enabled on the system, then incremental synchronization does not synchronize Communication Manager commands processed by the CM notify sync feature.

## IP Office system

With System Manager, you can synchronize the System Manager data with IP Office. When you add a new IP Office device to System Manager, System Manager automatically initiates synchronization to update the System Manager database.

## Messaging data

You can also synchronize the messaging data in System Manager with Messaging, Communication Manager Messaging, and Modular Messaging systems.

### **Note:**

Before you perform synchronization, you must add a new Communication Manager or a messaging entity from Manage Elements.

## Scheduled synchronization

You can create and schedule synchronization jobs using System Manager. You can schedule a synchronization job to run at a fixed time and repeat it periodically. System Manager provides a default incremental synchronization every 24 hours. You can modify this to your convenience.

## On-demand synchronization

With System Manager, you can synchronize data with Communication Manager on demand. Administrators can initiate this synchronization at any time. On-demand synchronization can be an initialization synchronization or an incremental synchronization.

# Synchronizing the Communication Manager data and configuring options

## Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Synchronization > Communication System**.
3. Select the Communication Manager device that you want to synchronize.
4. Select one of the following options that you want to synchronize for the selected device:
  - **Initialize data for selected devices:** To synchronize data in the System Manager database with each managed Communication Manager system.

### **Note:**

When you add a Communication Manager instance to the system, System Manager automatically initiates an initialization task to get all the required Communication Manager data and stores the data in the System Manager database.

- **Incremental Sync data for selected devices:** To synchronize incrementally the selected devices data in the System Manager database with each managed Communication Manager system.

 **Note:**

This synchronization updates the data in the database in Communication Manager that is changed since last synchronization.

- **Execute 'save trans all' for selected devices:** To save the configuration of the selected device on the same device, Communication Manager itself.

5. Perform one of the following:

- To perform the synchronization now, click **Now**.
- To perform the synchronization at a specified time, click **Schedule**.

 **Note:**

To view the status of synchronization, on the System Manager web console, click **Services > Scheduler**.

---

## Initializing synchronization

### Procedure

1. On the System Manager web console, click **Services > Inventory > Synchronization > Communication System**.
2. On the Synchronize CM Data and Configure Options page, select the Communication Manager entities.
3. Select **Initialize data for selected devices**.
4. Do one of the following:
  - To perform the synchronization immediately, click **Now**.
  - To perform the synchronization at a specified time, click **Schedule**.

---

## Initializing incremental synchronization

### Procedure

1. On the System Manager web console, click **Services > Inventory > Synchronization > Communication System**.
2. On the Synchronize CM Data and Configure Options page, select the Communication Manager system that you want to synchronize.
3. Select **Incremental Sync data for selected devices**.

4. Do one of the following:

- To perform the incremental synchronization immediately, click **Now**.
- To perform the incremental synchronization at a specified time, click **Schedule**.

 **Note:**

While scheduling incremental synchronization, set the logging levels on Communication Manager using the **change logging-levels** option. In the **Log Data Values** field, select `both`.

When you add a Communication Manager system, the default incremental synchronization jobs will be scheduled 1 hour after the maintenance job starts on Communication Manager.

If the incremental synchronization of the Communication Manager data fails due to the overlapping of Communication Manager synchronization and maintenance jobs, change the default scheduled job time in the Pending Jobs page.

---

## Synchronizing the IP Office system configuration

### Procedure

1. On the System Manager console, click **Services** > **Inventory**.
2. In the left navigation pane, click **Synchronization** > **IP Office**.
3. Select the device you want to synchronize.
4. Below the device list, select any of the following options that you want to synchronize for the selected device:
  - **System Configuration:** This option enables you to get the latest system configuration of the device and update the same in System Manager.
  - **User:** This option enables you to synchronize all the users present in System Manager from the selected device.
  - **System Configuration and Users:** This option enables you to get the latest system configuration and details of all the users from the selected device and synchronize with System Manager.
5. Click **Now** to perform the synchronization now or click **Schedule** to perform the synchronization at a specified time.

 **Note:**

To view the status of synchronization, click **Services** > **Scheduler** on the System Manager console.

## Synchronizing the UCM and Application Server system configuration

### About this task

Use the procedure to synchronize the configuration of a UCM and Application Server device with the local machine.

### Procedure

1. On the System Manager web console, click **Services** > **Inventory**.
2. In the left navigation pane, click **Synchronization** > **UCM and Application Server**.
3. Select the device that you want to synchronize.

**System Configuration** is selected by default.

4. Do one of the following:
  - To perform the synchronization now, click **Now**.
  - To perform the synchronization at a specified time, click **Schedule**.
5. To view the status of synchronization, click **Services** > **Scheduler**.

## Synchronizing the VMPro system configuration

### Before you begin

To synchronize VMPro devices successfully, perform the following:

- Configure VMPro IP Address in IP Office System Configuration.
- Password of VMPro should be same for IP Office, UCM and Application Server and VMPro System Preferences.

#### **Note:**

- You can change the password for Application Server through security setting using IP Office Manager.
- You can change the password for VMPro System Preferences through Web Manager.
- You must give access rights to VMPro Application from security setting of IP Office and UCM and Application Server through IP Office Manager.
- You must have valid IP Office licenses for VMPro instances.

### Procedure

1. On the System Manager console, click **Services** > **Inventory**.
2. In the left navigation pane, click **Synchronization** > **VMPro**.
3. Select the device you want to synchronize.

4. In the device list, select any of the following options that you want to synchronize for the selected device.
5. Click **Now** to perform the synchronization now or click **Schedule** to perform the synchronization at a specified time.

 **Note:**

To view the status of synchronization, click **Services** > **Scheduler** on the System Manager console.

## Result

If the operation of synchronizing the VMPro succeeds, you can work on the latest updated vmpro system configuration and avoid data corruption.

If the operation of synchronizing the VMPro fails, you can work only on local available system configuration in System Manager.

If the operation of synchronizing the VMPro fails and if it is first time that you attempted data synchronization, you can work only on the default configuration.

---

## Synchronizing the messaging data

### Procedure

1. On the System Manager web console, click **Services** > **Inventory**.
2. In the left navigation pane, click **Synchronization** > **Messaging System**.
3. Select the messaging systems that you want to synchronize.
4. Perform one of the following:
  - Click **Now** to perform the synchronization now.
  - Click **Schedule** to perform the synchronization at a specified time.

---

## Saving the Communication Manager translations

### Procedure

1. On the System Manager web console, click **Services** > **Inventory**.
2. In the navigation pane, click **Synchronization** > **Communication System**.
3. From the list select a Communication Manager system.
4. Select **Execute 'save trans all' for selected devices**.
5. To save the System Manager administration changes in Communication Manager, click **Now**.

To save the translations at a specified time, click **Schedule**.

 **Note:**

After running the **Save translation job**, the system may not update the last saved translation time in the Communication Manager list. This might be because the save translation operation is slow when Communication Manager has large data or translations to save. In such conditions, the system updates the last saved translation time only on the next incremental synchronization after the save translations operation is complete on Communication Manager.

---

## About CM audit

You can perform a CM audit for those Communication Managers that are synchronized with System Manager. You can select one or more Communication Managers and perform the audit. After the audit is completed, you can view the results by clicking **View Audit Report**. This audit report comprises the audit summary or a snapshot of the changes, and the audit details or the detailed report of the changes.

---

## Performing a Communication Manager audit

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Synchronization > Communication System**.
3. Select the Communication Managers that you want to audit.
4. Click **Audit**.
5. Click **Now**.  
To schedule the audit at a later time, click **Schedule**.
6. To view the audit report, click **View Audit Report**.
7. On the Audit Info page, select the job name, and click **View**.

## Communication Profiles synchronization

---

### Communication profiles synchronization

System Manager provides the account synchronization feature to synchronize profiles between CS 1000 communication profile and their elements. Using this feature you can synchronize profiles in User Management with the profiles in the elements. During synchronization, the account synchronization feature uses the account data in the elements as the master data. Therefore, when a profile data is not in synchronization with the element, the account data from the element is copied to System Manager.

 **Note:**

- The account synchronization feature updates the UPM CS 1000 communication profile with data from the CS 1000 element, and deletes the communication profiles that are linked to phones or mailboxes that do not exist in the CS 1000 element.

- If the data, such as, DN, mailbox, and TN has been modified on the CS 1000 element, the system provisions the data to System Manager UPM during account synchronization feature, but the CPND name and **Mailbox Number** are provisioned from System Manager UPM to the CS 1000 element.
- The system maps the CPND name of the CS 1000 element to the System Manager UPM user **Localized Display Name**.

Common scenarios are:

- If the System Manager UPM user first and last names are the same as the phone CPND name (For example: first = "John", last = "Smith", CPND = "John Smith" or CPND = "John, Smith" if display format = "first, last") on the CS 1000 element, then the system links the phone with this user and creates communication profile during the account synchronization process.
- If **Localized Display Name** is changed in the System Manager UPM user and this user has communication profile linked to the CS 1000 phones, the system immediately provisions the CPND name to the CS 1000 phone without using the account synchronization process.
- If the CPND name is changed on the CS 1000 element, the changes will be lost during the account synchronization process, and the system overwrites the CPND name by **Localized Display Name** from the System Manager UPM user.

---

## Synchronizing the CS 1000 profile

### Before you begin

Register all CS 1000 element on System Manager 6.2 or later.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Synchronization > CS 1000 and CallPilot Synchronization**.
3. Select the element that you want to synchronize.
4. Click **Start** to start the synchronization process.

 **Note:**

For the average duration of operations of the CS 1000 element, see Average duration of CS 1000 account operations.

5. **(Optional)** Do one of the following:
  - Click **Stop** to stop the synchronization process.  
The system disables all other buttons when you click **Stop**.
  - Click **Clear** to clear the synchronization information that the system displays.
  - Click **Reload** to refresh.

---

## Assigning anonymous profiles

### About this task

When the synchronization process is complete, the **Summary** column displays any anonymous accounts in the element. You can assign the anonymous account to users or delete the account from the element.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Synchronization > CS 1000 and CallPilot Synchronization**.
3. On the Synchronize Communication Profiles page, in the **Summary** column, click the anonymous profile that you want to assign.

The system displays the Anonymous Communication Profiles page with the details of each anonymous account.

4. Select one of the anonymous accounts.
5. In the **Name (Last, First)** field, enter the name of the user to whom you want to assign this communication profile.
6. Click **Assign**.

The system refreshes the Anonymous Communication Profiles page and displays the status of the assigned account.

## Related links

- [Anonymous Communication Profiles field descriptions](#) on page 984

---

## Deleting anonymous profiles

### About this task

You can delete the anonymous account from the element.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Synchronization > CS 1000 and CallPilot Synchronization**.

3. On the Synchronize Communication Profiles page, click the anonymous profile you want to delete from the **Summary** column.

The system displays the Anonymous Communication Profiles page with the details of each anonymous account.

4. Select the anonymous account you want to delete.
5. Click **Delete**.

The system displays a confirmation dialog box.

6. Click **OK**.

---

## Cleaning up communication profiles

### About this task

When you delete the CS 1000 element from the System Manager web console, the communication profiles linked to the element still exist in User Management. You can use the CS 1000 communication profile cleanup feature to permanently delete all accounts of elements that do not exist in the System Manager registry.

### Before you begin

The system does not delete the communication profiles of the soft deleted users. Therefore, before you run the cleanup, restore the soft deleted users.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Synchronization > CS 1000 and CallPilot Synchronization**.
3. Click **CleanUp**.
4. To confirm the operation, click **OK**.

---

## Synchronize communication profiles field descriptions

| Name    | Description                     |
|---------|---------------------------------|
| Element | The name of the CS 1000 system. |

*Table continues...*

| Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>  | <p>The current status of the synchronization process. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Queued</b>: The synchronization task is queued and runs automatically when once other synchronization tasks are complete.</li> <li>• <b>Running</b>: The synchronization is running. The system displays the status when you click <b>Start</b>.</li> <li>• <b>Stopping</b>: The synchronization stops when you click <b>Stop</b>.</li> <li>• <b>Aborted</b>: The system displays this status when the synchronization stops completely.</li> <li>• <b>PASS</b>: Indicates that the synchronization is complete.</li> <li>• <b>FAIL</b>: Indicates that the synchronization has failed. You can view the log files to get the details of failure.</li> </ul> |
| <b>Date</b>    | The date when the synchronization started.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Summary</b> | <p>The number of accounts:</p> <ul style="list-style-type: none"> <li>• Processed</li> <li>• Anonymous accounts</li> <li>• Added, updated, and deleted</li> </ul> <p>When no accounts are processed, this field displays 0 account(s) processed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Button        | Description                                                   |
|---------------|---------------------------------------------------------------|
| <b>Start</b>  | Starts a synchronization process.                             |
| <b>Stop</b>   | Stops a synchronization process that is in the running state. |
| <b>Clear</b>  | Clears all the synchronization results that are processed.    |
| <b>Reload</b> | Refreshes the synchronization status once again.              |

## Anonymous Communication Profiles field descriptions

| Field                      | Description                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name (Last, First)</b>  | The name of the user to whom you must assign this communication profile.                                                                       |
| <b>Service Information</b> | The service information of the CS 1000 system.                                                                                                 |
| <b>Target</b>              | The customer number of the system for the element.                                                                                             |
| <b>Status</b>              | <p>The status of the anonymous profile. The options are:</p> <ul style="list-style-type: none"> <li>• Assigned</li> <li>• Anonymous</li> </ul> |

| Button        | Description                                                       |
|---------------|-------------------------------------------------------------------|
| <b>Assign</b> | Assigns the user to the anonymous profile that you select.        |
| <b>Delete</b> | Deletes the anonymous profile that you select after confirmation. |
| <b>Cancel</b> | Cancels the assign or delete action and opens the previous page.  |

| Account anonymous | 0.1                 |

## Connection pooling

### Connection pooling

Connection pooling facilitates reuse of port connections. You can use System Manager to create a connection pool to reserve port connections to perform administrative and maintenance tasks on Communication Manager. Through the web interface, you can reserve 0 to 60 port connections across all Communication Manager elements, depending on the System Manager profile. If you exceed the number of port connections that can be pooled, the system displays an error message.

## Configuring Communication Manager Connection Pool

### About this task

Use this page to create or edit the connection pools in the System Manager.

System Manager uses OSSI and PCTT port connections. Connection pooling in System Manager pools only PCTT port connections. PCTT port connections manage the cut-through and provisioning through Classic View.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the left navigation pane, click **Connection Pooling**.

3. Click **Communication System**.

The system displays the Configure CM Connection Pool page.

4. In the **Connections Requested** field, type the number for each Communication Manager element in the table.

Depending on the System Manager profile, the number can be between 0 and 60 port connections across all Communication Manager elements.

 **Note:**

If you are configuring  $n$  connections in System Manager connection pooling, the **Maximum Number of Simultaneous logins for a user** field on the Communication Manager System Management interface must be  $n+1$ , so that Communication Manager allows you to acquire and pool all requested connections.

5. **(Optional)** To stop the connection pool, type 0 in the **Connections Requested** field.

6. Click **Commit**.

The system:

- Changes the **Status** field to Pooling Scheduled.
- Displays the number of connections assigned to the CM element in the **Connections Attained** field.
- Changes the **Status** field to Pooling Complete.

7. **(Optional)** To set a common pool size to all Communication Manager elements, perform the following:

- a. Select the **Set Common pool size for all the CMs** check box.
- b. In the **Set Common pool size for all the CMs** field, type the number for all Communication Manager elements in the table.
- c. **(Optional)** To stop the connection pool for all Communication Manager elements, type 0 in the **Set Common pool size for all the CMs** field.
- d. Click **Commit**.

The system:

- Changes the **Connections Requested** field to the number for all Communication Manager elements in the table.
- Changes the **Status** field to Pooling Scheduled.
- Displays the number of connections assigned to the Communication Manager element in the **Connections Attained** field.
- Changes the **Status** field to Pooling Complete.

## Connection Pooling field descriptions

| Name                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Set Common pool size for all the CMs</b> | <p>The field where the administrator sets a common number to reserve port connections for all Communication Manager elements.</p> <p> <b>Note:</b></p> <p>If you are configuring <math>n</math> connections in System Manager connection pooling, the <b>Maximum Number of Simultaneous logins for a user</b> field on the Communication Manager System Management interface must be <math>n+1</math>, so that Communication Manager allows you to acquire and pool all requested connections.</p> |
| <b>Element Name</b>                         | The name of the Communication Manager element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Status</b>                               | <p>The status of the connection pool for the Communication Manager element.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• NOT POOLED</li> <li>• POOLING SCHEDULED</li> <li>• POOLING COMPLETE</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Connections Attained</b>                 | The number of port connections the system is able reserves for the Communication Manager element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Connections In Use</b>                   | The number of port connections the system is using from the pool of connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Idle Connections</b>                     | The number of port connections that are idle in the pool of connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Connections Used Outside Pool</b>        | The number of port connections that are outside the connection pool and are in use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Button                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Commit</b>                               | The system reserves a pool of connections between System Manager and Communication Manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

---

## Modifying the maximum number of simultaneous logins for a user

### About this task

From Release 7.1, Communication Manager allows default five simultaneous connections for a user. Use the following procedure to change the maximum number of simultaneous logins for the user.

### Procedure

1. Log on to the Communication Manager System Management interface.
2. Click **Administration > Server (Maintenance)**.
3. In the navigation pane, click **Security > Login Account Policy**.
4. In the **Login Limits** section, in the **Maximum Number of Simultaneous logins for a user** field, enter the new value.

 **Note:**

If a user is configuring  $n$  connections in System Manager for Connection Pooling, you must set the value to  $n+1$ .

5. Click **Submit**.

---

## Configure options

The Uniform Dial Plan (UDP) call type works identically with the ext call type, with an exception: if the dialed digits match the call type of UDP, Communication Manager automatically checks the UDP table to see if there is a match, regardless of the value in the **UDP Extension Search Order** field on the Dial Plan Parameters screen. If there is no match, Communication Manager then checks the local server.

If the dialed digits match the call type of ext, Communication Manager checks the value in the **UDP Extension Search Order** field on the Dial Plan Parameters screen.

If the value in the **UDP Extension Search Order** field on the Dial Plan Parameters screen is **udp-table-first**, Communication Manager checks the UDP Table first to see if there is a match. If there is no match, Communication Manager then checks the local server.

If the value in the **UDP Extension Search Order** field on the Dial Plan Parameters screen is **local-extensions-first**, Communication Manager checks the local server first to see if there is a match. If there is no match, Communication Manager then checks the UDP table.

The UDP call type allows Communication Manager to recognize strings of 14 to 18 digits, which are longer than the maximum extension length of 13 digits. However, the UDP call type can be used with any length in case this provides a useful new capability to customers.

## UDP in System Manager

You can select the Uniform Dial Plan option on the Synchronize CM Data and Configure Options page from **Elements > Communication Manager > System > Uniform Dial Plan Groups**. When you select the **Consider UDP** option, the system does not use the corresponding dial plan for the available extension range while adding an endpoint. When you do not select the **Consider UDP** option, the system uses the corresponding dial plan for the available extension range while adding an endpoint.

# Chapter 14: Managing events

---

## Managing alarms

---

### Alarming

The Alarming service provides an interface for monitoring alarms generated by System Manager and other components. You can:

- View an alarm
- Change the alarm status
- Export alarms to a Comma Separated Values (.csv) file through the Alarming service

System Manager generates alarms to notify users of system events. Alarms are classified by their effect on system operation. Alarms can also identify the system component that generate the alarm.

 **Note:**

- For Release 6.1 elements with 6.1 SAL agent and Release 6.2 elements with 6.2 serviceability agent, System Manager cannot forward traps to Network Management System (NMS). You can configure 6.1 elements with 6.1 SAL agent and 6.2 elements with 6.2 serviceability agent to directly send SNMP traps to a customer NMS.

However, for Release 6.2.x elements, you can configure the serviceability agent from System Manager instead of configuring in each element.

- For Release 5.2 and 6.0 elements, you can configure System Manager to forward alarms to Avaya Data Center (ADC).

For information on configuring serviceability agents, see Managing Serviceability Agents.

### Cluster level alarming

From Release 7.1.3, System Manager supports cluster level alarms. Using the cluster level alarms feature, the product-specific cluster type alarms generated from one node of the cluster are cleared from another node.

 **Note:**

Cluster level alarming does not work along with alarm throttling.

## Remote key server alarms

When you configure the remote key server and if any of the remote key servers are unavailable, System Manager generates the following alarms:

| Alarm/Event ID             | Severity | Alarm description                                                               |
|----------------------------|----------|---------------------------------------------------------------------------------|
| REMOTE_KEY_SERVER_ALARM    | Major    | Disk encryption key server <IP Address of the remote key server> not reachable. |
| ALL_KEY_SERVERS_DOWN_ALARM | Major    | All configured disk encryption key servers not reachable.                       |

## Viewing alarms

### Procedure

1. On the System Manager web console, click **Services > Events > Alarms**.
2. On the Alarming page, select the alarms that you want to view.
3. Click **View**.

The Alarm - View Alarm Detail page displays the details of the selected alarms.

## Changing the alarm status

### About this task

Use this procedure to change the alarm status. Maintenance support must manually set the alarm to the required state.

The alarm status can be:

- **Raised:** Indicates the alarm is raised to notify about a system event.
- **Acknowledged:** Indicates the alarm is under investigation.
- **Cleared:** Indicates the error condition is resolved. The auto alarm clear event might result in the Cleared status.

### Procedure

1. On the System Manager web console, click **Services > Events > Alarms**.
2. On the Alarming page, select the alarm and click **Change Status**.
3. Click the status that you want to apply to the selected alarms.

---

## Exporting alarms

### About this task

You can export alarms to a Comma Separated Values (.csv) file. You can open the CSV file using a text editor such as Wordpad, or a spreadsheet application such as Microsoft Excel.

### Procedure

1. On the System Manager web console, click **Services > Events > Alarms**.
2. On the Alarming page, do one of the following:
  - To export an alarm to a CSV file, select an alarm and click **More Actions > Export Selected**.
  - To export the filtered alarms to a CSV file, click **More Actions > Export All**.

When you use **Advanced Search** or **Filter** option to filter alarms based on some criteria, **Export All** exports all the filtered data.

3. Click **Save** to save the exported file to the local disk.

---

## Deleting alarms

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Events > Alarms**.
3. On the Alarming page, perform one of the following steps:
  - To delete a specific alarm from the list, select the alarm to delete and click **More Actions > Delete Selected**.
  - To delete all the alarms from the database, click **More Actions > Delete All**.
4. Click **OK**.

---

## Filtering alarms

### About this task

The criteria for filtering the alarms are Severity, Status, Host Name, Message, Identifier, and M/E Ref Number. You can use more than one filter criteria on the selected alarms.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Events > Alarms**.

3. On the Alarming page, select the alarms you want to filter.
4. Click **Filter: Enable** at the top right corner of the Alarm List table.
5. Select the filter criteria you want to apply to the selected alarms.

The **Status** and **Severity** fields have drop down menus.

You can enter the alarm code in the Message field to find all alarms that contain a particular alarm code.

6. Click **Filter: Apply**.

 **Note:**

The system displays a message if no matching records are found to the specified filter criteria.

## Result

The system displays the alarms that match the filter criteria.

---

## Searching for alarms

### About this task

Use the Advanced Search function to find alarms based on certain specified conditions. The system displays those alarms that satisfy the search conditions. You can specify multiple search conditions.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Events > Alarms**.
3. On the Alarming page, click **Advanced Search**.
4. In the **Criteria** section, from the first and second drop down fields, select the search criterion and the operator.

The default value in the first drop down field is **Time Stamp**.

5. Select or enter the search value in the third field.
6. To add another search condition, click **+** and do the following:
  - a. Select the AND or OR operator from the drop down field.
  - b. Repeat steps 4 and 5.

To delete a search condition, click **-**. You can delete a search condition if you add multiple search conditions.

7. To find alarms for the given search conditions, click **Search**.

---

## Changing the throttle period from default 720 minutes to other period for specific alarm

### About this task

You can configure the throttling period in minutes as a threshold for all alarms or alarms specific to events at spiritAgent service from Avaya Aura®. The system eliminates any redundant alarms raised within the configured period at spiritAgent service.

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Open the `AlarmThrottle.properties` file from the `$SPIRIT_HOME/config/agent` location.
3. Set `AlarmThrottlePeriod=2` in the file.

The system sets the throttle period in minutes and applies the configured period to all outgoing alarms.

4. To configure the throttle time for a specific event, open the `EPBaseRules_orig.xml` files of the specific product, which contain the events, and add the following lines:

```
<tns:ExtraAttribute>
<tns:ExtraAttributeName>alarmThrottleInterval</tns:ExtraAttributeName>
<tns:ExtraAttributeValue>2</tns:ExtraAttributeValue>
</tns:ExtraAttribute>
```

For example, for System Manager, open the `Panther_EPBaseRules_orig.xml` files.

You can apply the `alarmThrottleInterval` as the alarm throttle period for a specific event. If you do not use the generic and specific mechanisms, the system disables alarm throttling. The system sets the default alarm throttling period to 720 minutes or 12 hours. If you reconfigure the period, you must restart spiritAgent service.

5. To disable alarm throttling, perform the following steps:
  - a. In the `$SPIRIT_HOME/config/agent/AlarmThrottle.properties` file, set `AlarmThrottlePeriod=-1`.
  - b. Restart spiritAgent service.

---

## Generating test alarms

### Test alarms

You can generate a test alarm and a clear event corresponding to the generated test alarm. The severity level of the test alarm is minor. The clear event generated has no definite severity level. The clear event updates the status of the test alarms from Raised to Cleared. If Secure Access

Link (SAL) Enterprise is configured to forward alarms to Avaya Data Center (ADC), the system also forwards the test alarm and the clear event for the ADC test alarm.

### Test Alarm Event

| Test Alarm property   | Value               |
|-----------------------|---------------------|
| Alarm.Message         | Test alarm          |
| Alarm.Severity        | Minor               |
| Alarm.Status          | Raised              |
| Alarm.Log.ProcessName | TESTALARM           |
| Alarm.Log.EventCode   | TEST_ALARM_GEN_0001 |

### Test Clear Event

| Test Clear Event property | Value                      |
|---------------------------|----------------------------|
| Alarm.Message             | Clear event for test alarm |
| Alarm.Severity            | Indeterminate              |
| Alarm.Status              | Cleared                    |
| Alarm.Log.ProcessName     | TESTALARM                  |
| Alarm.Log.EventCode       | TEST_ALARM_CLR_0000        |

## Generating the test alarm from the web console

### About this task

You can generate test alarms from the System Manager web console for agents, hosts, or elements installed with Serviceability Agents running version 6.3.2.4-6706-SDK-1.0 or later.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.
3. In the **Agent List** section, select one or more agents for which you want to generate alarms.
4. Click **Generate Test Alarm**.

The system generates an alarm.

5. To view the alarm, click **Events > Alarms**.

To view the alarm details, wait until the system displays the alarms on the Alarming page.

## Generating the test alarm from CLI

### Procedure

1. Log in to the computer where System Manager is installed.
2. At the command prompt, perform the following:
  - a. To check the status of spiritAgent service, type `service spiritAgent status` and press `Enter`.

The system displays `SPIRIT Agent is running`.

 **Note:**

If the system displays `SPIRIT Agent is not running`, then start spiritAgent service.

- b. To start spiritAgent service, type `service spiritAgent start` and press `Enter`.  
The `utils` directory contains spiritAgent service command line utilities.
3. To navigate to the `utils` directory, at the prompt, type `cd $SPIRIT_HOME/scripts/utils/` and press `Enter`.

4. Do one of the following:

- To generate the test alarm for System Manager, type `sh generateTestAlarm.sh` and press `Enter`.
- To generate the clear alarm for System Manager, type `sh generateTestAlarm.sh -c` and press `Enter`.
- To generate alarms on other products, repeat steps 1 to 4. You can use the **Generate Test Alarm** button on the System Manager web console Manage Serviceability Agents page for generating test alarms for all elements, including System Manager, with a click.

---

## Managing Geographic Redundancy related alarms

### Forwarding the secondary System Manager alarms to the primary System Manager server

#### Before you begin

Log on to the System Manager web console of the primary server.

#### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the left navigation pane, click **Manage Serviceability Agents > Serviceability Agents**.  
The system displays the primary and secondary System Manager entries.

3. Create a target profile of the primary System Manager server, and copy the profile to the secondary System Manager server.

The system forwards the secondary System Manager alarm to the primary System Manager server.

## Viewing the secondary System Manager alarms

### About this task

You can view the secondary System Manager alarms that are in standby mode.

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Type `sh $MGMT_HOME/alarmingui/scripts/DisplayAlternateDBAlarms.sh`.
3. At the prompt, type the number based on the action you want to perform.

The options are:

- (0) Exit
- (1) Display All Alarm count
- (2) Display alarm by notification oid (0)
- (3) Display alarm by Status (0)
- (4) Clear Alarm with notification oid (0)
- (5) Display all alarms
- (6) Display Alarms by severity (0)

System Manager displays the alarms according to your selected option.

---

## AutoRefresh Alarm List field descriptions

The Alarming page displays a list of alarms. Use this page to view the alarms in the **Auto-Refresh** mode. In this mode, the page updates the alarm information automatically.

| Name       | Description                                    |
|------------|------------------------------------------------|
| Time Stamp | The date and time when the alarm is generated. |

*Table continues...*

| Name                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Severity</b>              | <p>The severity of the alarm. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Cleared:</b> Displayed as a status change for a raised alarm after the issue is rectified.</li> <li>• <b>Critical:</b> Displayed in red is for critical failures that cause system or services to be non-functional and require immediate resolution and fix.</li> <li>• <b>Major:</b> Displayed in orange is for failures that cause critical degradation of service and require immediate attention.</li> <li>• <b>Minor:</b> Displayed in yellow is for failures that: <ul style="list-style-type: none"> <li>- Cause degradation of service, but continue to support a crucial part of the system.</li> <li>- Require action, but the consequences of the failure are gradual.</li> <li>- Interfere with a feature or impair the services to trunks or stations.</li> </ul> </li> <li>• <b>Warning:</b> Displayed in purple is for failures that do not cause significant degradation of service. This alarm is not reported to the attendant console or Initialization and Administration System (INADS).</li> <li>• <b>Indeterminate:</b> Displayed in blue is for an alarm that does not have any rules defined in the System Manager. It is displayed as a raw SNMP packet as there is no information available in the System Manager for its description and severity. Hence, marked as <b>Indeterminate</b>.</li> </ul> |
| <b>Status</b>                | The current status of the alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Host Name/SysName</b>     | The name of the host computer that generated the alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Source IP address</b>     | The IP address of the system that generated the alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>           | A detailed description of the problem that generated the alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Identifier</b>            | The unique identifier for an alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Event ID</b>              | The log event ID if the alarm is generated from logs or the Event OID if the alarm is generated from the trap listener service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>NotificationOID</b>       | The SNMP OID of the alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>M/E Ref Number/SysOID</b> | <p>The unique identification number assigned to the product, also called the product ID. This number helps in identifying the component that generated the alarm.</p> <p>For alarms that are generated from the trap listener service, the system displays the System OID.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Alarming field descriptions

| Name                           | Description                                                                                                                                                                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Time Stamp</b>              | The date and time when the alarm is generated.                                                                                                                                                                                                                          |
| <b>Severity</b>                | The severity of the alarm.                                                                                                                                                                                                                                              |
| <b>Status</b>                  | The current status of the alarm.                                                                                                                                                                                                                                        |
| <b>Host Name/SysName</b>       | The name of the host server that generated the alarm.<br>For the trap listener service, this column displays the system name.                                                                                                                                           |
| <b>Source IP Address</b>       | The IP address of the system that generated the alarm.                                                                                                                                                                                                                  |
| <b>Description</b>             | A detailed description of the problem that generated the alarm.                                                                                                                                                                                                         |
| <b>M/E Ref Number / SysOID</b> | The unique identification number assigned to the product, also called the product ID. This number helps in identifying the component that generated the alarm.<br><br>For alarms that are generated from the trap listener service, the system displays the System OID. |
| <b>Identifier</b>              | The unique identifier for an alarm.                                                                                                                                                                                                                                     |
| <b>Event ID</b>                | The log event ID if the alarm is generated from logs or the Event OID if the alarm is generated from the trap listener service.                                                                                                                                         |
| <b>NotificationOID</b>         | The SNMP OID of the alarm.                                                                                                                                                                                                                                              |

| Button                                   | Description                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View</b>                              | Displays the details of the selected alarms.                                                                                                                                                                                                                                                                                                                         |
| <b>Change Status</b>                     | Changes the status of the selected alarm. The options are: <ul style="list-style-type: none"> <li>• <b>Raised</b></li> <li>• <b>Cleared</b></li> <li>• <b>Acknowledged</b></li> </ul>                                                                                                                                                                                |
| <b>Auto-Refresh Mode</b>                 | Changes over to the <b>Auto-Refresh</b> mode. When the Alarming page is set in this mode, it automatically updates the alarms in the table. This is a toggle button.                                                                                                                                                                                                 |
| <b>More Actions &gt; Export Selected</b> | Exports the selected alarms to a CSV file. You can view the logs using the Wordpad or Excel application.                                                                                                                                                                                                                                                             |
| <b>More Actions &gt; Export All</b>      | Exports all the alarms to a CSV file. You can view the logs using the Wordpad or Excel application.<br><br> <b>Note:</b><br>When you use <b>Advanced Search</b> or <b>Filter</b> option to filter alarms based on some criteria, <b>Export All</b> exports all the filtered data. |
| <b>More Actions &gt; Delete Selected</b> | Deletes the alarms that you select from the list.                                                                                                                                                                                                                                                                                                                    |

*Table continues...*

| Button                              | Description                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>More Actions &gt; Delete ALL</b> | Deletes all alarms that the system displays on the page.                                               |
| <b>Advanced Search</b>              | Displays fields that you can use to specify the search criteria to search for an alarm.                |
| <b>Refresh</b>                      | Refreshes the log information in the table.                                                            |
| <b>Filter: Enable</b>               | Displays fields under select columns that you can use to set filter criteria. This is a toggle button. |
| <b>Filter: Disable</b>              | Hides the column filter fields without resetting the filter criteria. This is a toggle button.         |
| <b>Filter: Clear</b>                | Clears the filter criteria.                                                                            |
| <b>Filter: Apply</b>                | Filters alarms based on the filter criteria.                                                           |
| <b>All</b>                          | Selects all the alarms in the table.                                                                   |
| <b>None</b>                         | Clears the check box selections.                                                                       |
| <b>Previous</b>                     | Displays the logs in the previous page. This button is not available if you are on the first page.     |
| <b>Next</b>                         | Displays the logs in the next page. This button is not available if you are on the last page.          |

### Criteria section

This system displays the section when you click **Advanced Search** on the top-right corner of the page.

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Managing logs

---

### Logging service

The Logging service provides configuration capabilities and overall management of logs. It receives and stores log events and harvests file-based logs or local database logs. You can view and monitor logs and their details through the log viewer using the System Manager Web Console. The log viewer is integrated with the common console to provide a consistent presentation of log messages for System Manager and the adopters.

The log viewer displays a list of logs where you can view each log details, perform a search for logs, and filter specific logs. The log details include event information that generates the log, the severity level of the log, and other relevant information. You can search logs based on search conditions and set filters to view logs that match the filter criteria.

The following are some of the log types:

- Security: Security loggers gather security logs.
- Audit: Audit loggers gather audit logs.
- Operation: Operational loggers gather operational logs.
- Debug: Debug loggers collect debug information to troubleshoot issues at the customer site.

The Logs menu in System Manager comprises:

- Log Harvester: Through the Log Harvester menu, you can harvest log files for one or more products of the same or different types, running on the same or different computers.
- Log Settings: This menu displays the loggers and appenders for the selected log configuration file. You can modify the logger and appender settings through this menu.
- Log Viewer: The log viewer allows you to view the logs generated by System Manager and other components and their details. You can view details of each log, perform a search for logs, and filter specific logs.

---

## Log Types

The following are some of the log types you may come across when viewing logs on the System Manager Web Console. You can view the station-specific logs in the `/var/log/Avaya/mgmt/iptcm` directory.

### **Security**

Security loggers gather security logs.

### **Audit**

Audit loggers gather audit logs.

### **Operation**

Operational loggers gather operational logs.

### **Debug**

Debug loggers collect debug information to troubleshoot issues at the customer site. These loggers are categorized based on the Communication System Management components.

#### **Debug.Station**

Debug Station loggers gather debug information for station management related operations.

#### **Debug.Template**

Template Debug loggers gather debug information for template management related operations.

#### **Debug.CM**

CM debug loggers gather debug information for communication between Communication Manager and the Communication System Management server.

#### **Debug.NCM**

NCM debug logger gathers debug information related to Element Cut Through.

#### **Debug.Synch**

Synch debug logger gathers debug information for synchronization operations.

#### **Debug.Model**

Model debug logger gathers debug information for database operations.

### **Debug**

Debug logger gathers debug information other than those gathered for the debug types mentioned above.

---

## Managing log harvester

### Log harvester

The log harvesting service manages the retrieval, archival, and analysis of the harvested log files stored in Serviceability Agent enabled hosts or elements. The Serviceability Agent harvests the logs and sends the harvested logs to the Logging Service through HTTPS. With a successful harvest request related to a harvest profile, the logging service accepts the file segments, creates a well-defined file structure, and saves the request in the System Manager node.

You can harvest log files for one or more products of the same or different types running on the same or different computers. The system displays the list of file archives and respective profiles on the log harvesting user interface, and the status of each archive is available in the user interface table.

You can perform the following operations using the log harvesting service:

- Create a log harvesting profile to specify the products for which you want to harvest the logs.
- Submit the log harvesting request defined in a profile to the product.
- View the status of the log harvesting request.
- Store the harvested log files of a product in an archive file.
- View the harvested log files stored in the archive file.
- Download the harvested log files to a local computer.
- Search for a matching text in the harvested log files.

### Accessing the Log Harvester service

#### Procedure

On the System Manager web console, click **Services > Events > Logs > Log Harvester**.

### Creating a new log harvesting profile

#### About this task

To harvest log files for products running on different servers, you must specify multiple filter criteria.

#### Before you begin

To create a new log harvesting profile, you must specify:

- The hostname of the server on which the product is running.

If you do not see the hostname of CS 1000 when you create the profile, at the command prompt of CS 1000, run the following command:

```
cd /opt/nortel/oam-logging
./configureSpiritAgentClient.sh <enrollment password>
```

The system now enrolls CS 1000 to the log harvester of System Manager.

- The product name
- The directories or the log files
- The filter text if you select one or more directories

 **Note:**

By default, harvesting is enabled for System Manager. All other products should always integrate and install their log harvesting extension packs during System Manager installation. After integration, they directly get their product type and files in System Manager in the drop down list on the Log Harvesting page.

## Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Harvester**.
2. On the Log Harvester page, click **New**.
3. On the Create New Profile page, do the following:
  - a. In **Profile Name**, type the profile name.
  - b. In **Profile Description**, type a description of the profile.
4. Select the hostname of the server, product, and directories or files from the respective fields.
  - To select multiple directories or files from the respective list boxes, press **CTRL** and click the directories or files.
  - To clear a selection, press **CTRL** and click the item.
  - To add another log harvesting request for a different product, or another instance of the same product running on the same server or a different server, click plus (+).
5. **(Optional)** If you select one or more directories, in the **File Name Filter** field, type a text pattern as the filter criteria.  
  
During the harvesting operation, the system harvests those files that match the filter criteria.
6. Click **Save Profile** to save the profile and the log harvesting requests in the profile.

## Editing a log harvesting profile

### Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Harvester**.
2. On the Log Harvester page, select a profile, and click **Edit**.
3. On the Harvest Criteria Edit page, modify the information in the **Profile Name** and **Profile Description** fields.

4. Modify the host name of the server, product, and directories or files from the respective fields.
  - To select multiple directories or files from the respective list boxes, press **CTRL** and click the directories or files.
  - To clear a selection, press **CTRL** and click the item.
  - To add another log harvesting request for a different product, or another instance of the same product running on the same server or a different server, click plus (+).
5. **(Optional)** If you select one or more directories, in the **File Name Filter** field, type a text pattern as the filter criteria.

During the harvesting operation, the system harvests those files that match the filter criteria.
6. Click **Save Profile** to save the changes to the log harvesting profile.

## Viewing details of a log harvesting profile

### Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Harvester**.
2. On the Log Harvester page, select a profile, and click **View**.

The Profile Criteria View page displays the details of the selected log harvesting profile.
3. Click **Done**.

## Viewing the harvested log files in an archive

### About this task

Use this procedure to view the harvested log files of a product stored in an archive file.

### Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Harvester**.
2. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
3. On the Harvest Archives page, in the Harvest Request Details section, click a request in the table.
4. Click **Show Files**.
5. On the Search Archives page, navigate through the folders to view the harvested log files.

## Deleting log harvest profiles

### About this task

You cannot delete profiles that are in use by the Log Harvester service. If you attempt to delete profiles that are in use, System Manager displays an error message.

### Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Harvester**.
2. On the Log Harvester page, select a profile, and click **Delete**.
3. On the Profile Delete Confirmation page, click **Delete**.

System Manager deletes all requests and archives related to the profile from the file system.

## Submitting a request for harvesting log files

### About this task

Use this feature to submit a log harvesting request to one or more products running on the same or different servers. After the request is successfully processed, the system on which the products are installed returns the harvested log files specified in the request. When you select a profile and click **Request**, the system generates a single request for all the requests contained in the profile.

### Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Harvester**.
2. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
3. On the Harvest Archives page, type the relevant information in the **Archive Name** and **Archive Description** fields.

The system saves the harvested log files in the specified archive file.

4. Click **Run Profile** to send a request.

The table in the Harvest Criteria View section provides you the log harvesting request status. If the execution status of the request is successful, the system creates a zip file containing the harvested log files and saves the file in the specified location.

## Viewing details of a log harvesting request

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Harvester**.
3. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
4. On the Harvest Archives page, in the Harvest Request Details section, click a request in the table.

5. If the system does not display any requests, submit a new request.
6. Click **View**.

The Harvest - View Harvest detail page displays the details of the selected request.

## Searching for text in a log file

Use this feature to search for matching text in the product log file.

### About this task

The search is based on Lucene Search. The search results are highlighted as per the Lucene highlighter. The highlight package contains classes to provide keyword in context features, typically used for highlighting search terms on the results page.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Harvester**.
3. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
4. On the Harvest Archives page, in the Harvest Request Details section, click a request in the table.
5. Click **Show Files**.
6. On the Search Archives page, in the **Enter search text** field, enter the text for which you want to search.
7. In the Tree view, navigate to the log file by expanding the folders and select the log file.
8. Click **Search**.

The system displays the search results in the Search Result Panel. The **Search Results Panel** field displays the line numbers as hyperlinks on which the searched text is found.

9. Click the hyperlink in the **Search Results Panel** field.

The system displays the page that contains the highlighted searched text in the **Log Browser Panel** field.

## Viewing the contents of harvested log files

### About this task

Use this feature to view the log messages stored in the harvested log files for a product. You can view the contents of one log file at a time.

## Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Harvester**.
3. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
4. On the Harvest Archives page, in the Harvest Request Details section, click a request in the table.
5. If the system does not display any requests, submit a new request.
6. Click **Show Files**.

The system lists the harvested log files.

7. Select the log file and click **View**.

The system displays the file content in the Log Browser Panel pane.

## Related links

[Search Archives field descriptions](#) on page 1015

## Downloading the harvested log files

### About this task

You can download the harvested log files of one or more products stored in a zip file on the local server.

## Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Harvester**.
3. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
4. On the Harvest Archives page, in the Harvest Request Details section, click a request in the table.
5. If the system does not display any requests, submit a new request.
6. Click **Show Files**.
7. On the Search Archives page, select a product name, host name of the server on which one or more products are running, or a directory.
  - If you select a product name, the system creates a zip file that contains the harvested log files for the selected product instances running on the same server or different servers.
  - If you select a host name of a server under a product, the system creates a zip file containing the harvested log files for the products running on the selected server.
  - If you select a directory, the system creates a zip file containing the harvested log files under the selected directory.

8. Click **Download**.

The system prompts you to save the file on your local server.

9. Click **Save**.

## Filtering log harvesting profiles

Use this feature to set filter criteria to view those log harvesting profiles that meet the set filter criteria. The titles of the table columns displaying the log harvesting profiles are the filter criteria.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Harvester**.
3. On the Log Harvester page, click **Filter: Enable**.

You can find this button at the top right of the table containing log harvesting profiles.

4. Enter or select the filter criteria.

You can filter the log harvesting profiles by the name, description, and creator of the profiles.

5. Click **Filter: Apply**.

#### **Note:**

If no records matching the filter criteria are found, the Log Harvester page displays a message that no records matching the search criteria are found.

The log harvesting profile table displays the profiles that match the specified filter criteria.

## Filtering log harvesting requests

Use this feature to set filter criteria to view those log harvesting requests that meet criteria. The titles of the columns of the table that displays the log harvesting requests are the filter criteria.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Harvester**.
3. On the Log Harvester page, select a log harvesting profile, and click **Requests**.
4. On the Harvest Archives page, click **Filter: Enable**.
5. Enter or select the filter criteria.

You can filter the log harvesting requests by:

- The request ID of the log harvesting request. For example, to view the requests starting with Request ID 5, enter 5.

- The zip file name that stores the harvested files.
- The description of the log harvesting request.
- The location of the archived file that stores the harvested files.
- The status of the log harvesting request.
- The description of the log harvesting request status.

6. Click **Filter: Apply**.

 **Note:**

If no records matching the filter criteria are found, the Log Harvesting page displays a message that no records matching the search criteria are found.

The table containing log harvesting requests displays those log harvesting requests that match the specified filter criteria.

## Log Harvester field descriptions

This page displays the list of log harvest profiles created in System Manager. You can use buttons on this page to perform the following operations:

- View and edit the details of a selected log harvest profile.
- Delete a profile.
- Add a new log harvest profile.
- View the details of log harvest requests for a profile.

| Name                      | Description                                     |
|---------------------------|-------------------------------------------------|
| <b>Profile Name</b>       | The name of the log harvesting profile.         |
| <b>Description</b>        | A brief description of the profile.             |
| <b>Created By</b>         | The name of the creator of the profile.         |
| <b>Created Time Stamp</b> | The date and time when the profile was created. |

| Button          | Description                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------|
| <b>View</b>     | Displays the Harvest Archives page. You can use this page to view the details of a selected log harvest profile.    |
| <b>New</b>      | Displays the Create New Profile page. You can use this page to create a new log harvesting profile.                 |
| <b>Edit</b>     | Displays the Edit Profile page. You can use this page to edit a log harvesting profile.                             |
| <b>Delete</b>   | Deletes the selected profile. You cannot delete a profile if the profile is in use by the Log Harvester service.    |
| <b>Requests</b> | Displays the Harvest Archives page. You can use this page to run the log harvesting requests in a selected profile. |

*Table continues...*

| Button                 | Description                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter: Disable</b> | Hides the fields displayed under the columns to apply the filters without resetting the filter criteria. This is a toggle button.                                                                                                                |
| <b>Filter: Enable</b>  | Enables the filter and displays the fields under the columns in the table where you can enter the filter criteria. Only the columns on which you can apply the filter, display where you can enter the filter criteria. This is a toggle button. |
| <b>Filter: Apply</b>   | Filters the log harvest profiles present in the system based on the filter criteria.                                                                                                                                                             |

## Create New Profile field descriptions

Use this page to create a new log harvesting profile for harvesting log messages from the log files for one or more products. The files can reside on one or more servers.

| Name                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>        | The name of the log harvesting profile.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Profile Description</b> | A brief description of the profile. This is an optional field.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Host Name</b>           | <p>The host name of the servers on which products are installed.</p> <p>If you do not see the hostname of CS 1000 when you create the profile, at the command prompt of CS 1000, run the following command:</p> <pre>cd /opt/nortel/oam-logging ./configureSpiritAgentClient.sh &lt;enrollment password&gt;</pre> <p>After typing a minimum of three characters, wait for three seconds to capture the final keyword and fetch the required results.</p> |
| <b>Product</b>             | The products for which you can harvest logs.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Directories</b>         | A list of directories that contain the log files for the selected product.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Files</b>               | The log files that you can harvest for the selected product.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Filter Text</b>         | <p>The text, based on which, the system filters the log files present in the selected directory for harvesting.</p> <p>When you select the <code>/a/b/c</code> directory and type <code>com</code> in this field, the harvest operation for this profile harvests the log files in the directory <code>/a/b/c</code>. The log files contain <code>com</code> in the file name. The field does not support wild cards.</p>                                |

| Button              | Description                                                                     |
|---------------------|---------------------------------------------------------------------------------|
| <b>+</b>            | Displays another log harvesting request for a product.                          |
| <b>-</b>            | Deletes the log harvesting request for the product.                             |
| <b>Commit</b>       | Commits the filter criteria for the selected directories.                       |
| <b>Save Profile</b> | Saves the new profile and settings for log harvesting requests in the database. |

## Harvest Criteria Edit field descriptions

Use this page to edit an existing log harvesting profile.

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>            | Displays the name of the log harvesting profile.                                                                                                                                                                                                                                                                                                                                                |
| <b>Profile Description</b>     | Displays a brief description of the profile.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Host Name</b>               | Displays the hostname of the servers on which you install the products.                                                                                                                                                                                                                                                                                                                         |
| <b>Product</b>                 | Displays the products for which you can harvest logs.                                                                                                                                                                                                                                                                                                                                           |
| <b>Directories/Filter Text</b> | Lists the directories containing the log files for the selected product.                                                                                                                                                                                                                                                                                                                        |
| <b>Files</b>                   | Displays the log files that you can harvest for the selected product.                                                                                                                                                                                                                                                                                                                           |
| <b>Filter Text</b>             | <p>Displays the text, based on which, the log files present under a selected directory gets filtered for harvesting.</p> <p>If you select the directory <code>/a/b/c</code> and enter <code>com</code> in the <b>Filter Text</b> field, the harvest operation for this profile harvests the log files that contain <code>com</code> in the file name. The field does not support wildcards.</p> |

| Button              | Description                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------|
| <b>+</b>            | Allows you to specify another log harvesting request for a product.                                   |
| <b>-</b>            | Deletes the log harvesting request for the product.                                                   |
| <b>Commit</b>       | Commits the filter criteria for the selected directories.                                             |
| <b>Save Profile</b> | Saves the new profile and settings for log harvesting requests in the database.                       |
| <b>Cancel</b>       | Ignores the changes you make to the Harvest Criteria Edit page and returns to the Log Harvester page. |

## Harvest Archives field descriptions

Use this page to create an archive for the log harvesting request. The archive created for a successful harvesting request contains the requested log files in a compressed file.

| Name                | Description                                                             |
|---------------------|-------------------------------------------------------------------------|
| Archive Name        | The name of the archive file to create for storing harvested log files. |
| Archive Description | A brief description of the archive. This field is optional.             |

| Name                | Description                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request Id          | The unique identification number assigned to a log harvesting request.                                                                                                                                                                                                                                                                            |
| Archive Name        | The name of the archive file for storing harvested log files.                                                                                                                                                                                                                                                                                     |
| Request Time Stamp  | The date and time when the log harvesting request is submitted.                                                                                                                                                                                                                                                                                   |
| Request Description | A brief description of log harvesting requests.                                                                                                                                                                                                                                                                                                   |
| Status              | The status of log harvesting requests. The options are: <ul style="list-style-type: none"> <li>• SUCCESS: System Manager successfully harvests the log messages.</li> <li>• FAILURE: System Manager fails to harvest the log messages for the product.</li> <li>• PARTIAL SUCCESS: System Manager partially harvests the log messages.</li> </ul> |
| Status Time Stamp   | The date and time when the execution status of the log harvesting request is generated.                                                                                                                                                                                                                                                           |
| Status Description  | A brief description of the log harvesting request status. The description contains information about the success or failure of the log harvesting request.                                                                                                                                                                                        |
| Location            | The location where the harvested log messages are archived.                                                                                                                                                                                                                                                                                       |

| Button      | Description                                                                                                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Run Profile | Runs log harvesting requests for selected profiles.                                                                                                                                                                                                                                        |
| View        | Displays the View Harvest detail page to view the details of selected log harvesting requests.                                                                                                                                                                                             |
| Show Files  | Displays the Search Archives page to: <ul style="list-style-type: none"> <li>• Search for text contained in the harvested log files.</li> <li>• Download log files of one or more products running on the same or different servers.</li> <li>• View the contents of log files.</li> </ul> |

| Button                 | Description                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter: Disable</b> | Hides the fields displayed under the column filter fields without resetting the filter criteria. This is a toggle button.                                                                                                                                       |
| <b>Filter: Enable</b>  | Displays fields under the column headers of the table that displays the log harvesting requests. You can enter the filter criteria in these fields. Only columns that can be filtered display the fields to enter the filter criteria. This is a toggle button. |
| <b>Filter: Apply</b>   | Filters the log harvest profiles in the system based on the filter criteria.                                                                                                                                                                                    |

## Search Archives field descriptions

Use this page to perform the following activities on the log files contained in an archive:

- View the contents of the harvested log files.
- Search a text in the harvested log files.
- Download the harvested log files on your local server.

| Name                        | Description                                                                                                                                                                                                                                                      |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enter search text</b>    | The text that you want to search for in the harvested log files.                                                                                                                                                                                                 |
| <b>List box</b>             | Displays the hierarchy of the harvested log files in an archive. The files are organized in a tree view.                                                                                                                                                         |
| <b>Log Browser Panel</b>    | Displays the contents of the selected log files.                                                                                                                                                                                                                 |
| <b>Search Results Panel</b> | Displays the search results. This field displays the line numbers as hyperlinks in which the searched text is found. When you click the line number, the system displays the line containing the searched text at the top in the <b>Log Browser Panel</b> field. |

| Button          | Description                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Previous</b> | Displays the log file contents on the previous page. This button is available if the contents of log files span across multiple pages. |
| <b>Next</b>     | Displays the log file contents on the next page. This button is available if the contents of log files span across multiple pages.     |
| <b>Search</b>   | Searches for the text occurrences specified in the <b>Enter search text</b> field in the selected log files.                           |
| <b>View</b>     | Displays the contents of the selected log files in the <b>Log Browser Panel</b> field.                                                 |
| <b>Download</b> | Downloads the selected log files present in the archive to your local server.                                                          |

| <b>Host Name</b>          | Displays the hostname of the server on which the product resides.                                                                                                                                                                                                                           |
| <b>Status Description</b> | Displays a brief description of the execution status of the request.                                                                                                                                                                                                                        |
| <b>Status Time Stamp</b>  | Displays the date and time when the system generates the status of the log harvesting request.                                                                                                                                                                                              |

| Button                 | Description                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Done</b>            | Closes this page and returns to the Harvest Archives page.                                                                                                                                                                                                   |
| <b>Refresh</b>         | Refreshes the records in the table.                                                                                                                                                                                                                          |
| <b>Filter: Enable</b>  | Displays fields under the column headers of the table displaying the log harvesting requests. You can enter the filter criteria in these fields. Only columns that can be filtered display the fields to enter the filter criteria. This is a toggle button. |
| <b>Filter: Apply</b>   | Filters the log harvesting requests based on the filter criteria.                                                                                                                                                                                            |
| <b>Filter: Disable</b> | Hides the fields displayed under the columns to apply the filters without resetting the filter criteria. This is a toggle button.                                                                                                                            |

## Managing log settings

### Log Settings

Log Settings displays the loggers and appenders for any log configuration file that you select. You can also modify the logger and appender settings through this menu. The Logger List displays the name and level of the log along with the appender details.

### Accessing the Log Settings service

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Settings**.

#### Result

The System Manager displays the **Log Settings** page.

### Viewing loggers for a log file

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Settings**.
3. On the Log Settings page, in the **Logger List**, click a log file.

## Editing a logger in a log file

### About this task

You can set log levels for loggers defining the level of logging the logger logs.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Settings**.
3. On the Log Settings page, in the **Logger List**, click a log file.
4. In the **Logger List** section, select a logger, and click **Edit**.
5. On the Edit logger page, in the **Log Level** field, select a log level.
6. To view the logs for successful events, click **Info** in the **Log Level** of the specified log.

For example, as a user of System Manager Communication Manager capabilities, if you set the **Log Level** to **Info** in `com.avaya.ipbcm.eps.logging.audit` and `com.avaya.ipbcm.eps.logging.operation`, the system captures the successful events in the audit log and the operational log present at `/var/log/Avaya/mgmt/ipbcm/audit.log` and `/var/log/Avaya/mgmt/ipbcm/operation.log` respectively.

#### **Note:**

If you perform an application upgrade, the system does not retain the modified log level configuration. After an application upgrade, you must configure the log level settings again to view the logs for successful events.

7. Click **Commit**.

The log level is set for the selected logger.

## Forwarding System Manager syslog messages to remote server Procedure

1. On a remote machine where syslog server is running, do the following:
  - a. Open the `rsyslog.conf` file, and remove the comment for the following lines:

```
$ModLoad imudp
$UDPServerRun 514
```

- b. Restart the rsyslog service.

The system accepts UDP messages on the default port 514.

2. To configure security audit logs for the syslog server, do the following:
  - a. On the System Manager web console, click **Services > Events**.
  - b. In the left navigation pane, click **Logs > Log settings**.
  - c. On the Log Settings page, in the **Logger** column, select **com.avaya.security.iam.audit**.
  - d. Click **Edit**.
  - e. On the Edit Logger page, click **Attach**.
  - f. On the Attach Appender page, in the **Select Appender** field, select **SYSLOG**.
  - g. Click **Commit**.

Add SYSLOG as an appender for the audit log.
3. To modify the syslog configuration on System Manager, do the following:
  - a. Select the SYSLOG appender and click **Edit**.
  - b. Change the host and provide the IP address of the remote server where the rsyslog service runs on UDP with port 514.

## Assigning an appender to a logger

### About this task

The appender where a logger logs the messages.

### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Settings**.
3. On the Log Settings page, in the **Logger List**, click a log file.
4. In the **Logger List** section, select a logger, and click **Edit**.
5. On the Edit logger page, click **Attach** in the Attached Appendors section.

6. On the Attach Appender page, select an appender in the **Select Appender** field.
7. Click **Commit**.

The appender is added to the selected logger, and you can view the appender on the **Log Settings** page.

### Modifying an appender

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Settings**.
3. On the Log Settings page, in the **Logger List**, click a log file.
4. In the **Logger List** section, select a logger, and click **Edit**.
5. On the Edit logger page, in the **Attached Appendors** section, select an appender.
6. Click **Edit**.
7. On the Edit Appender page, modify the appender information.

You can modify information in the **Threshold Log Level**, **Rotate File Size**, **File Path**, **Max Retention File Size**, and **Max Retention Time** fields.

8. Click **Commit**.

### Removing an appender from a logger

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Settings**.
3. On the Log Settings page, in the **Logger List**, click a log file.
4. In the **Logger List** section, select a logger, and click **Edit**.
5. On the Edit logger page, select an appender in the **Attached Appendors** section.
6. Click **Detach**.

### Edit Logger field descriptions

Use this page to edit logger and appender information. You can also add and remove appenders from the loggers.

## Logger

| Name             | Description                                          |
|------------------|------------------------------------------------------|
| <b>Logger</b>    | The name of the logger.                              |
| <b>Log level</b> | The level for which the logger logs the information. |

## Attached Appenders

| Name                           | Description                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Appender</b>                | The name of the appender.                                                                                                                                |
| <b>Threshold Log Level</b>     | The threshold log level set for the appender. Appender logs information of log type set in the threshold log level.                                      |
| <b>File Path</b>               | The path of the file where the appender logs the information.                                                                                            |
| <b>Rotate File Size</b>        | The file size for rotation of the log file.<br>The file size unit can be in KB or MB.<br>The value for the file size must be from 1 through 100MB.       |
| <b>Max Retention File Size</b> | The maximum retention file size for the log file.<br>The file size unit can be in KB or MB.<br>The value for the file size must be from 1 through 100MB. |
| <b>Max Retention Time</b>      | The maximum retention time for the log file.<br>The value for the retention time must be from 1 through 180 days.                                        |
| <b>Facility</b>                | The process running on the machine for which log messages are created.                                                                                   |
| <b>Host</b>                    | The name of the syslog host that stores the log output.                                                                                                  |
| <b>Header</b>                  | The header part of the syslog packet. The header part contains the timestamp and host name information.                                                  |
| <b>Facility Printing</b>       | The printed message includes the facility name of the application.                                                                                       |

| Button        | Description                                                                        |
|---------------|------------------------------------------------------------------------------------|
| <b>Edit</b>   | Displays the Edit Appender page. Use this page to modify the appender information. |
| <b>Attach</b> | Displays the Attach Appender page. Use this page to add an appender to the logger. |
| <b>Detach</b> | Removes the selected appender from the logger.                                     |
| <b>Commit</b> | Saves the changes in the logger information to the database.                       |
| <b>Cancel</b> | Closes the Edit Logger page and returns you to the Logging Configuration page.     |

## Edit Appender field descriptions

Use this page to edit the information of an appender.

| Name                           | Description                                                                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Logger</b>                  | The name of the logger.<br> <b>Note:</b><br>You can view this information.   |

| Button        | Description                                                        |
|---------------|--------------------------------------------------------------------|
| <b>Commit</b> | Saves the changes to the database.                                 |
| <b>Cancel</b> | Closes Edit Appender page and returns you to the Edit Logger page. |

### Attach Appender field descriptions

Use this page to assign an appender to the logger.

| Name                   | Description                                              |
|------------------------|----------------------------------------------------------|
| <b>Logger</b>          | The name of the logger.                                  |
| <b>Log Level</b>       | The level for which the logger logs the information.     |
| <b>Select Appender</b> | The list of appenders that you can assign to the logger. |

| Button        | Description                                                                          |
|---------------|--------------------------------------------------------------------------------------|
| <b>Commit</b> | Assigns the appender to the logger.                                                  |
| <b>Cancel</b> | Closes the <b>Attach Appender</b> page and returns you back to the Edit Logger page. |

---

## Managing log viewer

### Log Viewer

Log Viewer displays all the logs generated by System Manager and the applications. The Log List displays a list of all the logs. You can view the details of each log, perform a search for logs, and filter specific logs. Log details include information about the event that generated the log, the severity level of the log, and other relevant information. You can search for logs based on search conditions and set filters to view logs that match the filter criteria. Log viewer displays logs that are of type Audit.

### Viewing log details

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Viewer**.
3. On the Logging page, select a log.
4. Click **View**.

### Exporting logs

You can export logs to a Comma Separated Values (.csv) file. You can open the CSV file using a text editor such as Wordpad, or a spreadsheet application such as Microsoft Excel.

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Viewer**.
3. On the Logging page, perform one of the following actions:
  - To export a log to a CSV file, select a log from the list and click **More Actions > Export Selected**.
  - To export the filtered logs to a CSV file, click **More Actions > Export All**.

When you use **Advanced Search** or **Filter** option to filter logs based on specific criteria, **Export All** exports all the filtered data

4. Click **Save** to save the exported log file to the local disk.

### Filtering logs

You can filter and view logs that meet the specified filter criteria. To apply the filters, you need to specify the filter criteria in the fields provided under select columns in the table displaying the logs. The column titles are the filter criteria. You can filter logs on multiple filter criteria.

## Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Viewer**.
3. On the Logging page, click **Filter: Enable** at the top right corner of the log table.
4. Enter or select the filter criteria.
5. Click **Filter: Apply**.

The page displays the logs that match the specified filter criteria.

### **Note:**

If no records matching the filter criteria are found, the Management Console application displays a message that no records matching the search criteria are found.

## Searching for logs

You can specify conditions for finding logs. The system displays logs that satisfy the search conditions. You can specify multiple search conditions.

## Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Log Viewer**.
3. On the Logging page, click **Advanced Search**.
4. In the **Criteria** section, from the first and second drop down fields, select the search criterion and the operator.
5. Select or enter the search value in the third field.
6. To add another search condition, click **+** and repeat steps 4 through 6.

Click **-** to delete a search condition. You can delete a search condition if you have more than one.

7. Select the **AND** or **OR** operator from the drop down field.

This page displays this drop down field when you specify more than one search condition.

8. Click **Search** to find the logs for the given search conditions.

## Logging field descriptions

The Logging page has two sections: the upper section contains buttons that allow you to view the selected log details, search for logs, and set filters. The lower section displays logs in a table. The table provides information about the logs. You can click the column title to sort the column data in ascending or descending order.

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select check box</b> | The option to select a log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Log ID</b>           | The unique identification number that identifies the log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Time Stamp</b>       | The date and time of the log generation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Host Name</b>        | The name of the system from which the log is generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Product Type</b>     | The code that uniquely identifies the component which generated the log. For example, product, device, application, and service. An example of the log product type is GW600, which is a product type code identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Severity</b>         | <p>The severity level of the log. The following are the type of severities:</p> <ul style="list-style-type: none"> <li>• <b>Emergency:</b> The system is unusable.</li> <li>• <b>Alert:</b> Action must be taken immediately.</li> <li>• <b>Critical:</b> Critical conditions.</li> <li>• <b>Error:</b> Error conditions.</li> <li>• <b>Warning:</b> Warning conditions.</li> <li>• <b>Notice:</b> Normal but significant condition.</li> <li>• <b>Informational:</b> Informational messages.</li> <li>• <b>Debug:</b> Debug-level messages.</li> </ul> <p> <b>Note:</b></p> <p>The colors of severities do not indicate logging severities.</p> |
| <b>Event ID</b>         | The unique identification number assigned to the event that generated the log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Message</b>          | A brief description of the log. The message is generated based on the severity level of the log. For a log with severity level debug, the message contains information about debugging an error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Process Name</b>     | The process on the device generating the message, usually the process name and process ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Facility</b>         | <p>The operating system, processes, and applications quantify messages into one of several categories. These categories generally consist of the generating facility, along with the severity of the message. The following are the types of supported facilities:</p> <ul style="list-style-type: none"> <li>• User-Level Messages</li> <li>• Security/authorization</li> <li>• Log Audit</li> </ul>                                                                                                                                                                                                                                                                                                                             |
| Button                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>View</b>             | Displays the Log - View Log Detail page. Use this page to view the details of the selected log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Button                                   | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto-Refresh Mode</b>                 | Switches to the Auto-Refresh mode. When the Logging page is set in this mode, it automatically updates the logs in the table. This is a toggle button.                                                                                                                                                                                                         |
| <b>More Actions &gt; Export Selected</b> | Exports the selected logs to a CSV file. You can view the logs using Wordpad or Excel.                                                                                                                                                                                                                                                                         |
| <b>More Actions &gt; Export All</b>      | Exports all the logs to a CSV file. You can view the logs using the Wordpad or Excel application.<br><br> <b>Note:</b><br>When you use <b>Advanced Search</b> or <b>Filter</b> option to filter logs based on some criteria, <b>Export All</b> exports all the filtered data. |
| <b>Advanced Search</b>                   | The fields that you can use to specify the criteria for searching a log.                                                                                                                                                                                                                                                                                       |
| <b>Refresh</b>                           | Refreshes the log information in the table.                                                                                                                                                                                                                                                                                                                    |
| <b>Filter: Enable</b>                    | The fields under select columns that you can use to set filter criteria. This is a toggle button.                                                                                                                                                                                                                                                              |
| <b>Filter: Disable</b>                   | Hides the column filter fields without resetting the filter criteria. This is a toggle button.                                                                                                                                                                                                                                                                 |
| <b>Filter: Clear</b>                     | Clears the filter criteria.                                                                                                                                                                                                                                                                                                                                    |
| <b>Filter: Apply</b>                     | Filters logs based on the filter criteria.                                                                                                                                                                                                                                                                                                                     |
| <b>Select: All</b>                       | Selects all the logs in the table.                                                                                                                                                                                                                                                                                                                             |
| <b>Select: None</b>                      | Clears the selections.                                                                                                                                                                                                                                                                                                                                         |
| <b>Previous</b>                          | Displays the logs on the previous page. This button is not available if you are on the first page.                                                                                                                                                                                                                                                             |
| <b>Next</b>                              | Displays the logs on the next page. This button is not available if you are on the last page.                                                                                                                                                                                                                                                                  |

### Criteria section

This section appears when you click **Advanced Search** on the top right corner.

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Criteria</b> | <p>Use this section to specify search conditions. Select the search criteria from the first drop down field. Select the operator from the second drop down list. Enter the search value in the text field.</p> <p>Select the following search criteria from the first drop down list:</p> <ul style="list-style-type: none"> <li>• Log ID: The unique identification number assigned to the log.</li> <li>• Host Name: Name of the system for which log is generated.</li> <li>• Product type: A code which uniquely identifies the component which generated the log. For example, product, device, application, and service.</li> <li>• Severity: Severity level of the log.</li> <li>• Message: Brief description of the log.</li> <li>• Event ID: Unique identification number assigned to the event.</li> <li>• Process Name: Process on the device generating the message.</li> <li>• Time Stamp: Date and time of the log generation.</li> <li>• Facility: The operating systems, processes, and applications quantify messages into one of several categories. These categories consist of the generating facility with the severity of the message.</li> </ul> <p>The second drop down list displays operators. Based on the search criteria that you select in the first drop down field, those applicable for the selected criteria are displayed in the second drop down list. The following are the list of operators:</p> <ul style="list-style-type: none"> <li>• Equals</li> <li>• Not Equals</li> <li>• Starts With</li> <li>• Ends With</li> <li>• Contains</li> </ul> <p>The operators for Time Stamp are: =, &gt;, &lt;, &gt;=, &lt;=, and !=.</p> <p>When you select Time Stamp from the first drop-down list, the page provides date and time fields for entering the date and time in the respective fields. Enter the date in MM/DD/YYYY format. You can select the date from the Calendar. You need to enter the time in one of the following formats:</p> <ul style="list-style-type: none"> <li>• 24Hr</li> <li>• AM</li> <li>• PM</li> </ul> |

| Button                       | Description                                                                        |
|------------------------------|------------------------------------------------------------------------------------|
| <b>Clear</b>                 | Clears the search criterion and sets the criterion to the default search criteria. |
| <b>Search</b>                | Searches the logs based on the search conditions.                                  |
| <b>Close/Advanced Search</b> | Hides the search fields.                                                           |
| <b>+</b>                     | Adds a search condition.                                                           |
| <b>-</b>                     | Deletes a search condition.                                                        |

## Logging field descriptions

Use this page to view logs in the Auto-Refresh mode. In this mode, the page updates the log information automatically.

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Log ID</b>       | The unique identification number that identifies the log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Time Stamp</b>   | The date and time of the log generation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Host Name</b>    | The name of the system from which the log is generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Product Type</b> | The code that uniquely identifies the component generating the log. For example, product, device, application, and service. GW600, which is a product type code identifier, is an example of the log product type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Severity</b>     | <p>The severity level of the log. The following are the type of severities:</p> <ul style="list-style-type: none"> <li>• <b>Emergency:</b> The system is unusable</li> <li>• <b>Alert:</b> Action must be taken immediately</li> <li>• <b>Critical:</b> Critical conditions</li> <li>• <b>Error:</b> Error conditions</li> <li>• <b>Warning:</b> Warning conditions</li> <li>• <b>Notice:</b> Normal but significant condition</li> <li>• <b>Informational:</b> Informational messages</li> <li>• <b>Debug:</b> Debug-level messages</li> </ul> <p> <b>Note:</b></p> <p>The colors do not indicate logging severities.</p> |
| <b>Event ID</b>     | The unique identification number assigned to the event generating the log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Message</b>      | Brief description of the log. The message is generated based on the severity level of the log. For a log with severity level debug, the message contains information about debugging an error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Process Name</b> | The process on the device that has generated the message. This is usually the process name and process ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

*Table continues...*

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Facility</b> | The operating system, processes, and applications quantify messages into one of several categories. These categories consist of the generating facility with the severity of the message. The following are the types of supported facilities: <ul style="list-style-type: none"> <li>• User-Level Messages</li> <li>• Security/authorization</li> <li>• Log Audit</li> </ul> |

## Audit Logging

### Configuring audit logging

#### About this task

You can use the functionality to configure actions when the system encounters conditions such as:

- Audit failure
- 75% occupation of the audit partition
- 90% occupation of the audit partition

#### Procedure

1. On the System Manager web console, click **Services > Events**.
2. In the navigation pane, click **Logs > Audit Log Configuration**.
3. On the Audit Logging Configuration page, enter the relevant information in the fields.  
For more information, see “Audit Logging Configuration field descriptions”.
4. Click **Commit**.

### Audit Logging Configuration field descriptions

| Name                                               | Description                                                                                         |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Action on Audit Failure</b>                     | Field to select an action, which is performed after the audit failure.                              |
| <b>To Email Address on Audit Failure</b>           | Email address to which the notification is sent.                                                    |
| <b>Action on /var/log/audit partition 75% full</b> | Field to select an action, which is performed after 75% occupation of the audit-assigned partition. |

*Table continues...*

| Name                                                         | Description                                                                                              |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>To Email Address on /var/log/audit partition 75% full</b> | Email address to which the notification is sent.                                                         |
| <b>Action on /var/log/audit partition 90% full</b>           | Field to select an action, which is performed after 90% occupation of the audit-assigned partition.      |
| <b>To Email Address on /var/log/audit partition 90% full</b> | Email address to which the notification is sent.                                                         |
| <b>Email</b>                                                 | Option to send an email notification to the configured email address.                                    |
| <b>Trap</b>                                                  | Option to record an entry in the trap log file and send an email notification to the configured address. |
| <b>JBoss Server Shutdown</b>                                 | Option to shutdown the JBoss server and send a notification to the configured address.                   |

| Button        | Description                                                            |
|---------------|------------------------------------------------------------------------|
| <b>Commit</b> | Saves and commits any changes made in the audit logging configuration. |

---

## TrapListener service

The TrapListener service receives traps and informs from different applications and displays on the System Manager Alarming page.

- TrapListener receives V2c and V3 traps and informs defined in the common alarm definition file.
- TrapListener processes the Common Alarm Definition file for applications where all trap definitions are present.

You can configure the TrapListener service from **Services > Configurations** on the System Manager web console. For information on configuring the TrapListener service, see *Configuring the TrapListener service*.

If you change the Trap Listener settings as an administrator, you must create a new SNMP target profile for the System Manager IP address and a new SNMPv3 user profile for System Manager. The values in the new profiles must match the values in the Trap Listener settings. Attach the System Manager SNMPv3 user profile to the System Manager target profile, and attach the new SNMP target profile to all serviceability agents. For information on creating SNMP user profiles and target profiles and attaching the target profiles to serviceability agents, see *Managing Serviceability Agents* in *Administering Avaya Aura® System Manager*.

# Chapter 15: Managing licenses

---

## WebLM overview

Avaya provides a Web-based License Manager (WebLM) to manage licenses of one or more Avaya software products for your organization. WebLM facilitates easy tracking of licenses. To track and manage licenses in an organization, WebLM requires a license file from the Avaya Product Licensing and Delivery System (PLDS) website at <https://plds.avaya.com>.

The license file of a software product is in an XML format. The license file contains information regarding the product, the major release, the licensed features of the product, and the licensed capacities of each feature that you purchase. After you purchase a licensed Avaya software product, you must activate the license file for the product in PLDS and install the license file on the WebLM server.

License activations in PLDS require the host ID of the WebLM server for inclusion in the license file. The host ID of the WebLM server is displayed on the Server Properties page of the WebLM server.

---

## Obtaining the license file

### About this task

For each licensed Avaya product that you are managing from the WebLM server, you can obtain a license file from PLDS, and install it on the corresponding WebLM server. For additional information on using PLDS, see *Getting Started with Avaya PLDS - Avaya Partners and Customers* at <https://plds.avaya.com>.

In Geographic Redundancy, you must generate the license file by using the host ID of primary System Manager.

### Caution:

Do not modify the license file that you receive from Avaya. WebLM does not accept a modified license file.

You require the host ID of the WebLM server to obtain the license file from PLDS. For client node locking, while generating the license file, you must provide the WebLM server host ID and client host ID.

### Procedure

1. Log on to the System Manager web console.
2. On the System Manager Web Console, click **Services > Licenses**.
3. In the left navigation pane, click **Server properties**.
4. Note the **Primary Host ID**.
5. Using the host ID, generate the license from PLDS.

## Finding LAC for System Manager in PLDS

### About this task

You can find License Activation Code (LAC) using a Group ID or a SAP order number. With LAC, you can activate the available associated entitlements.

### Procedure

1. Log in to the PLDS at <https://plds.avaya.com>.
  2. From the Assets menu, select **View Entitlements**.
  3. In the **Application** field, select **System Manager**.
  4. Do one of the following:
    - To search using group ID, in the **Group ID** field, enter the appropriate group ID.
-  **Note:**
- All group IDs are numeric without any leading zeros.
  - To search using the SAP order number, click **Advanced Search**, and in the **Sales/Contract #** field, enter the SAP order number.
5. Click **Search Entitlements**

The system displays the LAC(s) in the search results.

---

## Accessing WebLM

### Before you begin

You require permissions to access the WebLM application.

## Procedure

1. Log on to the System Manager web console.
2. On the System Manager Web Console, click **Services > Licenses**.

---

## Installing a license file

### About this task

You can install a license file on the WebLM server. Use the Uninstall functionality to remove the license file from the WebLM server.

Licenses installed for WebLM Release 7.1 and later, must support SHA256 digital signature and 14-character host ID.

### Before you begin

- Get the license file from the Avaya Product Licensing and Delivery System (PLDS) website at <https://plds.avaya.com>.
- Log on to the WebLM web console with administrator privilege credentials.
- For standard license file, remove the older license file before you install the new file.

#### **Note:**

The system displays an error message if an older license file is still available.

For centralized license file, the system automatically overwrites the older license file during installation.

For information about the license file installation errors while installing the license file, see *Administering standalone Avaya WebLM*.

## Procedure

1. In the navigation pane, click **Install license**.
2. On the Install license page, click **Browse**, and select the license file.
3. Read the terms and conditions, and click **Accept the License Terms & Conditions**.
4. Click **Install**.

WebLM displays a message on successful installation of the license file. The installation of the license file might fail for reasons, such as:

- The digital signature on the license file is invalid. If you get such an error, request PLDS to redeliver the license file.
- The current capacity use exceeds the capacity in the installed license.

## Client node locking

WebLM supports client node locking of licenses where licenses are tied to specific application instances. You cannot move licenses across application instances. The feature is provided to support some Avaya data products that require licenses to be node-locked to an application instance or the client. For example, VPFM/COM. To use this feature, you must include the host IDs of the application instance and the WebLM server in the license file.

With the client node-locking feature:

- WebLM allows multiple licenses for a client node-locked product to be installed on the server at the same time. Each client node-locked license contains a unique host ID of the client.
- When a client node-locked license is installed on WebLM, WebLM automatically associates the license file with the client or application host ID that is included in the license file.
- The license request from the element would include the client/element host ID. WebLM serves licenses only if the client host ID in the request matches with any of the installed client node locked license files.
- WebLM enforces mutual TLS authentication for client node-locked licenses.
- The license over-install checks are based on the client host ID. While over-installing a license file with a new file for a client instance whose client host ID changed due to rehost, license file includes the old and new client host IDs. In this case, over-install check will be based on the old client host ID.

---

## Viewing the license capacity and utilization of the product features

### Before you begin

- Log on to the WebLM web console with administrator privilege credentials.
- Install the license file on the WebLM server for the licensed product.

### About this task

Use this procedure to view the license capacity and license utilization of a product for which you installed a license file.

### Procedure

1. In the navigation pane, in **Licensed products**, click the required product.
2. Click **View license capacity**.
  - If centralized licensing is disabled, the system displays the license capacity and the actual license usage of the product.
  - If centralized licensing is enabled, the system displays the **Installed License Files** table. Click the **Host ID - Centralized Licensing ID** hyperlink to view the license

capacity of the license file for the selected host ID. If the license file is assigned to an element then the system displays the element display name, centralized licensing ID, license owner, license host, and license file host IDs for the element.

## Viewing peak usage for a licensed product

### Before you begin

- Log on to the WebLM web console with administrator privilege credentials.
- Install the license file on the WebLM server for the licensed product.

### Procedure

1. In the navigation pane, in **Licensed products**, click the required product.
2. Click **View peak usage**.
  - If centralized licensing is disabled, the system displays the peak usage of the licensed features of the product.
  - If centralized licensing is enabled, the system displays the **Installed License Files** table. Click the **Host ID** hyperlink to view the peak usage of the license file for the selected host ID. If the license file is assigned to an element then the system displays the element display name and centralized licensing ID for the element.

---

## Uninstalling a license file

### Procedure

1. On the System Manager web console, click **Services > Licenses**.
2. In the navigation pane, click **Uninstall license**.
3. On the Uninstall license page, select the required license file.
4. Click **Uninstall**.

The system displays the Uninstall License Confirmation page.

5. Click **Uninstall** to confirm the license uninstallation.

If you do not have permission to uninstall the selected license file, the system only displays the **Cancel** button.

---

## Viewing the server properties

**Before you begin**

Log on to the WebLM web console with administrator privilege credentials.

**Procedure**

In the left navigation pane, click **Server properties**.

**\* Note:**

The host ID specified in PLDS is embedded in the license file. You can install the license file only if the host ID of the server that hosts WebLM matches the host ID in the license file. Therefore, when you request for a license file, specify the correct host ID of the server that hosts WebLM.

| <b>Avaya Subscription License Available</b> | The availability status of the Avaya Subscription license on WebLM.<br>The default value is <b>Yes</b> . |
| <b>Standard License Available</b>           | The availability status of the standard license on WebLM.<br>The default value is <b>No</b> .            |

## Licensed Features

You can view the total number of feature licenses in the license file and the current usage of those licenses.

| Name                             | Description                                                                                                                                                                                  |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature (License Keyword)</b> | The display name of the licensed features of the product and the keywords of each feature. The keywords represent the licensed feature in the license file.                                  |
| <b>Expiration Date</b>           | The date on which the feature license expires.                                                                                                                                               |
| <b>Licensed capacity</b>         | The number of licenses for each licensed feature. WebLM fetches the number of feature licenses information from the license file.<br>For the Solution license, the value is <b>Metered</b> . |
| <b>Currently Used</b>            | The number of feature licenses that are currently in use by the licensed application. For features of type Uncounted, the column displays <i>Not counted</i> .                               |

## Acquired Licenses

The Acquired licenses table displays information about the licenses acquired by the licensed application. You can view the information in the table only if the licensed product has acquired feature licenses.

| Name               | Description                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------|
| <b>Feature</b>     | The feature keyword for each licensed feature that is currently acquired by a licensed application. |
| <b>Acquired by</b> | The name of the licensed application that has acquired the license.                                 |
| <b>Acquirer ID</b> | The unique identifier of the licensed application that has acquired the license.                    |
| <b>Count</b>       | The number of feature licenses that are currently acquired by the licensed application.             |

---

## View Peak Usage field descriptions

You can view information about the usage of feature licenses of a licensed application at different time intervals.

For the Solution license, the usage fields shows the number of used license file, but not the percentage (%) of usage.

| Name                                    | Description                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature (License Keyword)</b>        | The display name of the licensed features of the product and the keywords of each feature. The keywords represent the licensed feature in the license file.                                                                                                                                    |
| <b>Currently Allocated</b>              | The number of feature licenses purchased by the organization.<br>For the Solution license, the value is <b>Metered</b> .                                                                                                                                                                       |
| <b>Usage: qty/%</b>                     | The number of feature licenses for each licensed feature that a licensed application currently uses. The column also displays the percentage of usage.<br><br>For example, if 50 feature licenses are available and five feature licenses are used by applications, the column displays 5/10%. |
| <b>Peak Usage (today): qty</b>          | The highest number of feature licenses for each licensed feature used for the day.                                                                                                                                                                                                             |
| <b>Peak Usage (Last 7 days): qty/%</b>  | The highest number of feature licenses for each licensed feature used in the last seven days.<br><br>For example, if the peak usage for a feature license in the past seven days was 25, and the number of available licenses during these seven days was 50, then the column displays 25/50%. |
| <b>Peak Usage (Last 30 days): qty/%</b> | The highest number of feature licenses for each licensed feature used in the past 30 days.<br><br>For example, if the peak usage for a feature license in the past 30 days was 50, and the number of available licenses during these 30 days was 50, then the column displays 50/100%.         |
| <b>Time of Query</b>                    | The date and time when the last usage query for WebLM was executed.                                                                                                                                                                                                                            |
| <b>Status</b>                           | The success or failure of the last usage query executed for the WebLM server.                                                                                                                                                                                                                  |

| Button      | Description                                          |
|-------------|------------------------------------------------------|
| <b>Back</b> | Cancels the action and returns to the previous page. |

## Centralized licensing

---

### About centralized licensing

Some Avaya products do not share licenses from a single license file as each element instance requires a separate license file. You require a dedicated WebLM server to host the relevant license file of the associated element instance. In this licensing model, you require the same

number of WebLM servers as the number of products that you install and configure. In the virtualized environment, this model requires additional virtual machines for each element instance, thus increasing the VMware licensing cost. Thus, you cannot centrally manage the licenses for a product and must log in to each WebLM server and manage licenses for each element instance.

WebLM supports centralized licensing feature so that products can have multiple license files installed for multiple instances of the product. On a single WebLM server, you can install multiple license files of a product and associate specific license files to specific element instances.

After you enable centralized licensing from the WebLM interface, you can install multiple license files for the same product. You can add multiple element instances, and associate each license file to an element instance. The WebLM server provides licenses to the element instances based on the association you define.

---

## Enabling centralized licensing

### Before you begin

Install a product license file that supports centralized licensing. Centralized licenses contain the FEAT\_WLM\_CENTRALIZED feature in the product license file.

### About this task

By default, centralized licensing is disabled. You must enable centralized licensing to use this feature.

### Procedure

1. On the System Manager web console, click **Services > Licenses**.
2. In the navigation pane, click **Configure Centralized Licensing** for your licensed product.
3. Click **Enable Centralized Licensing**.

#### **Warning:**

After enabling the Centralized Licensing feature for a product, you must link the license file to the associated product server instance. If you do not link the license file to a product server instance, the product server instance cannot acquire the license file from the WebLM server.

---

| <b>Host ID - Centralized Licensing ID</b> | The host ID of the license file. The first 12 characters are the WebLM server host ID, and the last 5 characters are the centralized licensing ID. The centralized licensing ID is a unique number across multiple license files for the same product.                                                                       |
| <b>License Host Name</b>                  | The host name of the license as defined in the license file.                                                                                                                                                                                                                                                                 |
| <b>Assigned To Element</b>                | The field that indicates whether a license file is associated with an element instance. The possible values are: <ul style="list-style-type: none"> <li>• <b>Yes:</b> The license file is associated with an element instance.</li> <li>• <b>No:</b> The license file is not associated with an element instance.</li> </ul> |
| <b>Date of Installation</b>               | The date of installation of the license files.                                                                                                                                                                                                                                                                               |

| Button        | Description                                                               |
|---------------|---------------------------------------------------------------------------|
| <b>New</b>    | Adds an element instance and the mapping of an element to a license file. |
| <b>Edit</b>   | Edits the properties of the element instance.                             |
| <b>Delete</b> | Deletes an element instance.                                              |

## Adding an element instance and assigning the element instance to a license file

### Before you begin

Enable the Centralized Licensing feature.

Install the license files that you want to assign to an element instance.

## Procedure

1. On the System Manager web console, click **Services > Licenses**.
2. In the navigation pane, click **Configure Centralized Licensing** for your licensed product.
3. Click **New**.
4. On the Add Element Instance page, type the element display name, and the centralized licensing ID of the instance. For more information, see “Element instance field descriptions”.

The element ID must match the name used by an element instance to acquire licenses from WebLM. See the product documentation to find the name used by the element instance.

5. In the **Select License File** table, select the license file that you want to map to the element instance.
6. Click **Save**.

You can add an element instance and choose to map the license file later. In this scenario, you must type the element display name, the centralized licensing ID, and click **Save**.

# Editing an element instance and license file assignment

## Before you begin

- Enable the centralized licensing feature.
- Install the license file that you want to assign to the element instance.
- Add an element instance.

## Procedure

1. On the System Manager web console, click **Services > Licenses**.
2. In the navigation pane, click **Configure Centralized Licensing** for your licensed product.
3. On the Configure Centralized Licensing page, select the element instance.
4. Click **Edit**.
5. On the Edit Element Instance page, modify the properties of the element instance. For more information see Element instance field descriptions
6. Click **Save**.

## Related links

[Element instance field descriptions](#) on page 1043

## Deleting an element instance

### Procedure

1. On the System Manager web console, click **Services > Licenses**.
2. In the navigation pane, click **Configure Centralized Licensing** for your licensed product.
3. On the Configure Centralized Licensing page, select the element instance that you want to delete.
4. Click **Delete**.

The system displays the Delete Element Confirmation page.

5. Click **Delete**.

The system deletes the element instance and its assignment with the license file.

## Element instance field descriptions

| Name                            | Description                                                                                                                                                                                                                                             |

|---------------|-------------------------------------------------------|
| <b>Save</b>   | Adds or edits the element instance.                   |
| <b>Cancel</b> | Cancels the add or delete element instance operation. |

## Disabling centralized licensing

### Before you begin

Ensure that:

- You have not added an element instance for the product. If you have added the element instances, delete the element instances.
- You have installed only a single license file for the product. If you have installed multiple license files, uninstall all the files except any one license file.

### Procedure

1. On the System Manager web console, click **Services > Licenses**.
2. In the navigation pane, click **Configure Centralized Licensing** for your licensed product.
3. Click **Disable Centralized Licensing**.

## Uninstall license field descriptions

Use this page to remove a license file from the WebLM server for a licensed product. The **Allocation Table License Files** table displays the ALF files. You cannot uninstall the ALF files.

| Name                     | Description                                             |
|--------------------------|---------------------------------------------------------|
| <b>License Host Name</b> | The WebLM server where the license files are installed. |
| <b>Host ID</b>           | The host ID of the license file.                        |

*Table continues...*

| Name                    | Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Products</b>         | The products for which licenses are installed on the WebLM server.                                                                   |
| <b>SID</b>              | The System ID of the license file.                                                                                                   |
| <b>Select Check box</b> | Use to select the license files that you require to remove from the WebLM server.<br><br>You cannot uninstall the ALF license files. |
| Button                  | Description                                                                                                                          |
| <b>Uninstall</b>        | Removes the selected license files from the WebLM server.                                                                            |

## Server Properties field descriptions

### Server Host ID

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Host ID</b> | The MAC address of the server.<br><br>For non-VMware deployments, the primary host ID is the MAC address of the server.<br><br>For VMWare deployments, the primary host ID is a 14 character combination of the IP address and the UUID of the system.<br><br>You must use the host ID to generate licenses which you later install on the current instance of the WebLM server. |

---

## Adopter application cannot communicate with WebLM Server

### Cause

Due to higher security settings on the WebLM Server Release 7.1 system, the adopter applications that are using WebLM Server earlier to Release 7.1 might not communicate with WebLM Server to fetch the license file from WebLM Server by using the WebLM client.

### Solution

To fetch the license file from the WebLM Server Release 7.1 system, locate the `trusted_weblm_certs.jks` file from the adopter application system, take the backup of the file, delete the file, and then restart the adopter application.

Do this if the adopter application cannot communicate with WebLM Server regardless of the WebLM Server version on the adopter system.

---

# Enterprise licensing

---

## Configuring enterprise licensing

### Before you begin

- Log on to WebLM Home.
- Install the enterprise license file on the WebLM server for the product.

To verify the license file for a product, in the left navigation pane, click **Licensed products** and select the product. The content pane displays the product name, System Identification number (SID), and the license file type installed for the product at the top of the page.

### \* Note:

System Manager WebLM can be configured as master WebLM but cannot be configured as local WebLM to an external WebLM.

Standalone WebLM OVA-based deployment can be configured as master WebLM or local WebLM.

No other WebLM flavor can be configured as master WebLM.

|                                       | Enterprise Master WebLM | Enterprise Local WebLM |
|---------------------------------------|-------------------------|------------------------|
| System Manager WebLM                  | Yes                     | No                     |
| Standalone WebLM OVA-based deployment | Yes                     | Yes                    |
| Other WebLM flavors                   | No                      | Yes                    |

### Procedure

1. In the navigation pane, in **Licensed products**, click the required product.
2. In the navigation pane, click **Enterprise configuration**.
3. On the Enterprise Configuration page, enter the appropriate information in the fields.

For more information, see “Enterprise Usage field descriptions”.

To successfully set up and configure the master WebLM server, enter valid information in the mandatory fields that are marked with a red asterisk.

4. In the **Master WebLM Configuration** section, enter the name, description, and IP address of the master WebLM server.
5. In the **Default Periodic Operation Settings** section, enter the retry count and the retry interval in minutes for the periodic operations.
6. In the **SMTP Server settings** section, enter the name of the SMTP server.
7. In the **E-mail notification settings for periodic operation** section, perform the following:
  - a. Set the **E-mail notification** to **On**.

- b. In the **E-mail address** field, enter an email address.
  - c. To add the email address to the list of recipients for the WebLM server to send email notifications, click **Add To List**.
8. In the **Default Periodic License Allocation Schedule** section, select the day and time for periodic license allocations.

The values you enter in this section remain as the default setting for periodic allocation for all local WebLM servers in the enterprise.

9. In the **Default Periodic Usage Query Schedule** section, select the day and time of the query for periodic usage.

The values you enter in this section remain as the default setting for periodic usage for all local WebLM servers in the enterprise.

 **Note:**

For any periodic operations, you must perform the manual allocation at least one time.

10. Click **Submit**.

The system validates the information. The system displays the host ID in the **Host ID** field. The host ID is the host ID of the computer where you installed the WebLM server.

## Retrieving the local WebLM certificate from browser

### About this task

Use this procedure to retrieve the local WebLM certificate from the Firefox browser.

### Procedure

1. On the web browser, type the local WebLM server URL, `https://<Fully Qualified Domain Name>:<PortNumber>/WebLM`.
2. On the address bar, click the Lock icon.
3. Click the Show connection details icon.
4. Click **More Information**.
5. Click **View certificates**.
6. On the Certificate dialog box, do the following:
  - a. Click the **Details** tab.
  - b. Click **Export**.
  - c. Save the certificate to your local computer.

---

## Adding local WebLM certificate as trusted certificate in System Manager

### About this task

To add standalone WebLM as local WebLM in System Manager (master WebLM), you must add local WebLM certificate to the truststore of System Manager.

### Before you begin

Download the local WebLM certificate using the browser.

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, select one or more element, and click **More Actions > Manage Trusted Certificates**.
3. On the Manage Elements page, select System Manager, and click **More Actions > Manage Trusted Certificates**.
4. On the Manage Trusted Certificates page, click **Add**.
5. On the Add Trusted Certificates page, in **Select Store Type to add trusted certificate**, select the store type as **TM\_INBOUND\_TLS**.
6. Click **Import from file**.
7. Type the file name or click **Browse** to select a file.

 **Note:**

System Manager validates the file type. If you provide an invalid file type, the system displays an error message.

8. Click **Retrieve Certificate**.
9. Click **Commit**.
10. Restart the JBoss service on System Manager.

---

## Adding a local WebLM server

### Before you begin

- Log on to the WebLM web console with administrator privilege credentials.
- Install the enterprise license file.
- Identify the WebLM servers that you must add as the local WebLM server.
- Configure the security certificate before you add a local WebLM server.
- On the Add Trusted Certificate page, select **Import using TLS**, and enter the appropriate information in the **IP Address** and the **Port** fields of the local WebLM server.

For more information, see Adding a Trusted Certificate in the Avaya Aura® System Manager help.

## Procedure

1. In the navigation pane, in **Licensed products**, click the required product.
2. Click **Local WebLM Configuration > Add local WebLM**.
3. On the Local WebLM Configuration: Add local WebLM page, enter the appropriate information.  
  
To successfully set up and configure the local WebLM server, fields that are marked with a red asterisk (\*) are mandatory.  
  
For detailed descriptions of the fields, see “Add local WebLM field descriptions”.
4. In the **Local WebLM Configuration** section, enter the name, description, IP address, and port of the local WebLM server.
5. Select a protocol for the master WebLM server to communicate with the local WebLM server.
6. In the **Periodic license allocation schedule** section, select the day and time for periodic license allocations.
7. In the **Periodic usage query schedule** section, select the day and time of the query for periodic usage.
8. Click **Configure and validate**.

The system validates the information. If the information is valid, the system displays the host ID of the computer where the server is installed in the **Host ID** field.

## Modifying a local WebLM server configuration

### Before you begin

- Log on to the WebLM web console with administrator privilege credentials.
- Install the enterprise license file.
- Add at least one local WebLM server.

## Procedure

1. In the navigation pane, in **Licensed products**, click the required product.
2. Click **Local WebLM Configuration > Modify local WebLM**.
3. On the Local WebLM Configuration: Modify local WebLM page, select the local WebLM server that you require to configure.
4. Click **Modify**.

The system displays another Local WebLM Configuration: Modify local WebLM page with a different set of WebLM configuration fields.

5. Modify the information in the following fields:

- In the **Local WebLM configuration** section, **Name**, **Description**, **Protocol**, and **Port**
- In the **Periodic License Allocation schedule** section, **Day** and **Time**
- In the **Periodic Usage Query schedule** section, **Day** and **Time**

6. Click **Modify**.

The system saves your changes.

## Removing a local WebLM server

### Before you begin

- Log on to the WebLM web console with administrator privilege credentials.
- Install the enterprise license file.
- Add at least one local WebLM server.

### Procedure

1. In the navigation pane, in **Licensed products**, click the required product.
2. Click **Local WebLM Configuration > Delete local WebLM**.
3. On the Local WebLM Configuration: Delete local WebLM page, select the local WebLM server that you want to delete.
4. Click **Delete**.

 **Note:**

The system displays a warning message before removing the local WebLM server from the master WebLM server.

5. Click **OK**.

# Validating connectivity to local WebLM servers for a product

## Procedure

1. In the left navigation pane, click **Licensed products** and select the product name.
2. Click **Local WebLM Configuration**.
3. On the Local WebLM Configuration: View local WebLM page, select the local WebLM servers that you want to validate for connectivity.
4. To query the selected local WebLM servers, click **Validate Connectivity**.

## Result

The **status** column on the Local WebLM Configuration: View local WebLM page of the selected WebLM servers displays if the connection request made to the local WebLM server is successful.

## View by local WebLM field descriptions

Use this page to view the information related to local WebLM servers of a product.

| Name             | Description                                                                             |
|------------------|-----------------------------------------------------------------------------------------|
| Local WebLM name | Specifies the name of the local WebLM server.                                           |
| IP address       | Specifies the IP address of the local WebLM server.                                     |
| Last contacted   | Specifies the date and time when the local WebLM server was last contacted.             |
| Status           | Lists the success or failure of the last connection request to each local WebLM server. |

## Enterprise Configuration field descriptions

Use this page to specify the master WebLM server settings and the default settings for the periodic operations of the server. The settings you specify in the Enterprise Configuration Web page applies to the entire enterprise unless you override the setting while you add a local WebLM.

The master WebLM server uses the settings of the periodic operations to query itself and generate the usage report for licenses.

### Master WebLM Configuration

| Name               | Description                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>        | Specifies the name of the WebLM server.                                                                               |
| <b>Description</b> | Provides a brief description of the server.                                                                           |
| <b>IP address</b>  | Specifies the IP address of the WebLM server.                                                                         |
| <b>Host ID</b>     | Specifies the host ID of the computer where you installed the WebLM server. You cannot edit the <b>Host ID</b> field. |

### Default periodic operation settings

| Name                  | Description                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Retry count</b>    | Specifies the number of times a master WebLM server must try to connect to a local WebLM server for a periodic operation after a connection failure.<br><br>For example, set the count to 2. The master WebLM server makes an initial unsuccessful attempt to connect to a local WebLM server. The master WebLM server makes two more attempts to connect to the local WebLM server. |
| <b>Retry interval</b> | Specifies the duration in minutes, within which the retry count specified in the <b>Retry count</b> field must be carried out.<br><br>For example, suppose the <b>Retry count</b> is 2 and the Retry interval is 10 minutes. If the attempt to connect to the server fails, the master WebLM server makes two attempts in 10 minutes to connect to the local WebLM server.           |

### SMTP Server Settings

| Name               | Description                            |
|--------------------|----------------------------------------|
| <b>Server name</b> | Specifies the name of the SMTP server. |

### E-mail notification settings for periodic operation

| Name                       | Description                                                                                                                                                                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>E-mail notification</b> | Specifies the e-mail notification. The notification options are: <ul style="list-style-type: none"> <li>• On: Sends an e-mail notification to the administrator if the periodic operations fail.</li> <li>• Off: Does not send an e-mail notification to the administrator if the periodic operations fail.</li> </ul> |

*Table continues...*

| Name                    | Description                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>E-mail address</b>   | Specifies the e-mail address to which the WebLM application sends the e-mail notification if the periodic operations fail to execute.<br><br>* <b>Note:</b><br>Click <b>Add To List</b> to add the e-mail address in the list of recipients who must receive the e-mail notification of the periodic operation status. |
| <b>E-mail addresses</b> | Provides the list of e-mail addresses to which the WebLM application sends the e-mail notifications.                                                                                                                                                                                                                   |
| <b>Add To List</b>      | Adds the e-mail address that you enter in the <b>E-mail address</b> field to the list of recipients who must receive the e-mail notification of the periodic operation status.                                                                                                                                         |
| <b>Remove Selected</b>  | Removes the selected e-mail address from the <b>E-mail addresses</b> field.                                                                                                                                                                                                                                            |

### Default Periodic License Allocation Schedule

| Name        | Description                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Day</b>  | The day of the week on which the master WebLM server must send the ALF (Allocation license file) again to the local WebLM server. |
| <b>Time</b> | The time of the day specified in the <b>Day</b> field when master WebLM must send the ALF again to the local WebLM server.        |

### Default Periodic Usage Query Schedule

| Name        | Description                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Day</b>  | The day of the week on which the master WebLM server must query local WebLM servers for usage reports.                                 |
| <b>Time</b> | The time of the day you specify in the <b>Day</b> field when the master WebLM server must query local WebLM servers for usage reports. |

| Button        | Description                                                         |
|---------------|---------------------------------------------------------------------|
| <b>Submit</b> | Saves the enterprise configuration.                                 |
| <b>Reset</b>  | Resets the values in the fields to the values you previously saved. |

## View Local WebLMs field descriptions

Use this page to validate the local WebLM server connection. To validate the connection, the master WebLM server tries to connect to the specified local WebLM server.

\* **Note:**

To validate the connectivity of a local WebLM server, the local WebLM server must be already added for the product.

| Name                    | Description                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------|
| <b>Local WebLM Name</b> | The name of the local WebLM server.                                                     |
| <b>IP Address</b>       | IP address of the local WebLM server.                                                   |
| <b>Last Contacted</b>   | Date and time when the local WebLM server was last contacted.                           |
| <b>Status</b>           | Lists the success or failure of the last connection request to each local WebLM server. |

| Button                       | Description                                              |
|------------------------------|----------------------------------------------------------|
| <b>Validate Connectivity</b> | Validates the connectivity of the selected WebLM server. |
| <b>Check All</b>             | Selects all the local WebLM server.                      |
| <b>Clear All</b>             | Clears the selections of local WebLM servers.            |

### Local WebLM configuration

| Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>        | The name of the server.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b> | A brief description of the server.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>IP Address</b>  | A unique IP address of the server. If you enter an IP address that is already configured for a local WebLM server, the system displays the message: <code>IP Address is being duplicated.</code>                                                                                                                                                                                                                                     |
| <b>Protocol</b>    | <p>The protocol scheme over which the master WebLM server communicates with the local WebLM server.</p> <p> <b>Note:</b></p> <p>If the local WebLM server that you add is a standalone WebLM server in Virtualized Environment, use HTTPS. You cannot use HTTP for communication with the standalone WebLM server in Virtualized Environment.</p> |
| <b>Port</b>        | The port number on which the master WebLM server communicates with the local WebLM server in the specified protocol scheme.                                                                                                                                                                                                                                                                                                          |
| <b>Host ID</b>     | The host ID of the computer on which you installed the server. You cannot edit the <b>Host ID</b> field.                                                                                                                                                                                                                                                                                                                             |

## Periodic License Allocation schedule

| Name        | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Day</b>  | <p>The day of the week on which the master WebLM server must send the ALFs again to the local WebLM server.</p> <p>By default, the system displays the settings specified in the Enterprise Configuration. If you change the default settings, the new settings override the settings of the Enterprise Configuration. However, the change in the schedule is only applicable to this local WebLM server.</p>                            |
| <b>Time</b> | <p>The time of the day specified in the <b>Day</b> field when the master WebLM server must send the ALFs again to the local WebLM server. By default, the system displays the settings you specified in the Enterprise Configuration. If you change the default settings, the new settings override the settings of the Enterprise Configuration. However, the change in the schedule is only applicable to this local WebLM server.</p> |

## Delete local WebLM field descriptions

Use this page to delete a local WebLM server.

| Name                    | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| <b>Local WebLM name</b> | The name of the local WebLM server.                               |
| <b>IP address</b>       | The IP Address of the local WebLM server.                         |
| <b>check box</b>        | Use to select the local WebLM servers that you require to delete. |

| Button        | Description                                      |
|---------------|--------------------------------------------------|
| <b>Delete</b> | Removes the local WebLM server you selected.     |
| <b>Reset</b>  | Clears the selection of the local WebLM servers. |

---

## Deletion of the local WebLM server

Use the Delete Local WebLM option to delete the instance of a local WebLM server from the master WebLM server. When you delete a local WebLM server using the Delete Local WebLM option, the system does not remove the server physically. The master WebLM server sends a delete request to the local WebLM server. On receiving a delete request, the local WebLM server deletes the ALF of the product that is installed on the local WebLM server. The system deletes the instance of the local WebLM server from the master WebLM server, irrespective of the success or failure of the ALF deletion process on the local WebLM server.

If the master WebLM server is unable to send the delete request to the local WebLM server, the system deletes the instance of the local WebLM server from the master WebLM server. The ALF installed on the local WebLM server automatically expires after 30 days.

## Usage Summary field descriptions

Use this page to view the usage summary for a master WebLM server, a local WebLM server, or all the WebLM servers of the product.

| Name                 | Description                                                                                                                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WebLM Name</b>    | Displays the names of the master WebLM server and local WebLM servers of the product.                                                                                                                                                                                                                                  |
| <b>IP address</b>    | Specifies the IP address of the master WebLM server and local WebLM servers of the product.                                                                                                                                                                                                                            |
| <b>Time of Query</b> | Specifies the date and time when the system executed the last usage query for the WebLM server. If the status of the last usage query is <b>Failed</b> , this column also displays the date and time of the usage query that was last successful.                                                                      |
| <b>Status</b>        | Specifies the success or failure status of the last usage query that the system executed for each WebLM server. The <b>Status</b> column of a WebLM server remains blank if the server is not queried even once for feature license usage. The usage query can be a periodic usage query or a nonperiodic usage query. |

## Usage by WebLM field descriptions

Use this page to query the feature license usage by the master and local WebLM servers.

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select WebLM</b>                    | The master and local WebLM servers for which you can view the usage.                                                                                                                                                                                                                                                                       |
| <b>Feature (License Keyword)</b>       | The name and keyword of the counted features of the product.                                                                                                                                                                                                                                                                               |
| <b>Currently Allocated</b>             | The number of feature licenses for each feature that the system currently allocates to the selected WebLM server. For the master WebLM server of the product, this column lists the floating licenses available with the server.                                                                                                           |
| <b>Usage: qty/%</b>                    | The number of feature licenses for each feature that the licensed applications currently use from the allocated feature licenses. The column also displays the percentage of usage.<br><br>For example, if 50 feature licenses are allocated and applications use five feature licenses, this column displays 5/10%.                       |
| <b>Peak Usage (last 7 days): qty/%</b> | The highest number of feature licenses for each feature that the applications use in the past seven days. The column also displays the percentage of peak usage.<br><br>For example, if the peak usage in the past seven days was 25 and 50 feature licenses were available during the peak usage calculation, the column displays 25/50%. |

|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Peak Usage (last 30 days):<br/>qty/%</b> | The highest number of feature licenses for each feature that the applications use in the past 30 days. The column also displays the percentage of peak usage.<br><br>For example, if the peak usage in the past 30 days was 50 and 50 feature licenses were available during the peak usage calculation, the column displays 50/100%. |
| <b>Time of Query</b>                        | The date and time when the system executed the usage query for the WebLM server you select.                                                                                                                                                                                                                                           |
| <b>Status</b>                               | The success or failure of the last usage query process executed for each WebLM server. The <b>Status</b> column remains blank if the server is queried even once for feature license usage. The usage query can be a periodic usage query or a nonperiodic usage query.                                                               |

| Button              | Description                                                      |
|---------------------|------------------------------------------------------------------|
| <b>Query System</b> | Queries the selected WebLM server for the feature license usage. |

## Enterprise Usage field descriptions

You can view the feature license usage of all WebLM servers for the selected feature.

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Feature (License Keyword)</b>    | Specifies the license features for which you can view the license usage.                                                                                                                                                                                                                                                                                      |
| <b>License capacity</b>                    | Specifies the total number of feature licenses the organization purchases for each feature.                                                                                                                                                                                                                                                                   |
| <b>Available</b>                           | Lists the number of licenses currently available with the master WebLM server.                                                                                                                                                                                                                                                                                |
| <b>WebLM Name</b>                          | Specifies the names of the WebLM servers of the product.                                                                                                                                                                                                                                                                                                      |
| <b>Currently Allocated</b>                 | Specifies the number of feature licenses that the system currently allocates to the WebLM servers for the selected feature.                                                                                                                                                                                                                                   |
| <b>Usage qty/%</b>                         | Specifies the number of feature licenses that the licensed applications currently use, from the allocated feature licenses for the selected feature. The column also displays the percentage of usage. For example, if 50 is the allocated feature licenses and 5 feature licenses have been used by the applications, this column displays 5/10%.            |
| <b>Peak Usage (last 7 days):<br/>qty/%</b> | Specifies the highest number of feature licenses that applications use in the past seven days for the selected feature. The column also displays the percentage of peak usage. For example, if the peak usage in the past seven days is 25 and the feature licenses those were available during the peak usage calculation is 50, the column displays 25/50%. |

| Name                                    | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Peak Usage (last 30 days): qty/%</b> | Specifies the highest number of feature licenses that applications use in the past 30 days for the selected feature. The column also displays the percentage of peak usage. For example, if the peak usage in the past 30 days is 50 and the feature licenses those were available during the peak usage calculation is 50, the column displays 50/100%. |
| <b>Time of Query</b>                    | Specifies the date and time when the system executes the usage query for the selected feature.                                                                                                                                                                                                                                                           |
| <b>Status</b>                           | Specifies the status of the last usage query process that the system executes for each WebLM server. The status can be <i>Success</i> or <i>Failure</i> .                                                                                                                                                                                                |

## Query Usage field descriptions

Use this page to query the master WebLM server, a local WebLM server, or all the WebLM servers of the product for the feature license usage report.

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WebLM Name</b>       | <p>The names of the master and the local WebLM servers of the product as links. To view the feature license usage of a server, select the name of the required server in the <b>WebLM Name</b> column.</p> <p> <b>Note:</b></p> <p>If the specified WebLM server is not queried even once for feature license usage, the table on the Usage by WebLM page remains blank.</p>                                                                   |
| <b>IP address</b>       | The IP address of the master WebLM server and the local WebLM servers of the product.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Time of Query</b>    | <p>The date and time when the system executes the last usage query for the WebLM server. If the status of the last usage query is <i>Failed</i>, the <b>Time of Query</b> column displays the date and time of the usage query that was last successful.</p> <p> <b>Note:</b></p> <p>If the server does not receive a query request even once for feature license usage, the <b>Time of Query</b> column of a WebLM server remains blank.</p> |
| <b>Status</b>           | The success or failure of the last usage query that the system executes for each WebLM server. If the server does not receive a query request even once for feature license usage, the <b>Status</b> column of a WebLM server remains blank. The usage query can be a periodic usage query or a nonperiodic usage query.                                                                                                                                                                                                         |
| <b>Select Check box</b> | Use to select the WebLM server for which you require to determine the usage query.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Button             | Description                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------|
| <b>Check All</b>   | Selects all the WebLM servers.                                                              |
| <b>Clear All</b>   | Clears the selections for all the WebLM servers.                                            |
| <b>Query Usage</b> | Queries the WebLM servers of the product you select for their feature license usage report. |

## Allocations by Features field descriptions

Use this page to view the feature license allocation information for each counted type feature of the product.

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature (License Keyword)</b> | Specifies the name and license keyword of the counted features of the product.                                                                                                                                                                                                                                                                                                              |
| <b>Local WebLM Name</b>          | Specifies the name of the local WebLM servers of the product. By default, this column is blank. The system displays the names of the local WebLM servers only when you select the arrow head in the <b>Feature (License Keyword)</b> column. If a local WebLM server does not exist for the product, the <b>Local WebLM Name</b> column remains blank for all the licensed features.        |
| <b>IP address</b>                | Specifies the IP addresses of the local WebLM servers of the product. By default, this column is blank. The system displays the IP address of the local WebLM servers only when you select the arrow-head in the <b>Feature (License Keyword)</b> column. If a local WebLM server does not exist for the product, the <b>IP address</b> column remains blank for all the licensed features. |
| <b>License Capacity</b>          | Specifies the total number of feature licenses purchased by the organization for the respective feature.                                                                                                                                                                                                                                                                                    |
| <b>Currently Allocated</b>       | Specifies the total number of feature licenses of the respective feature that the system allocated to the local WebLM servers of the product. If a licensed feature is not allocated to any local WebLM server, the system displays <code>zero</code> in the <b>Currently Allocated</b> column for the licensed feature.                                                                    |
| <b>Available</b>                 | Lists the number of floating licenses of the respective feature that is currently available with the master WebLM server.                                                                                                                                                                                                                                                                   |

### **Note:**

To view the information about the number of feature licenses of a feature that the system allocates to each local WebLM server, click the arrow-head beside the name of the required feature. The system displays new rows below the feature row with the feature license allocation information for each local WebLM server to which the feature is allocated.

## Allocations by Local WebLM field descriptions

You can view the feature license allocation information by local WebLM.

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Local WebLM</b>        | Specifies the local WebLM servers for which you can view the feature license allocation information.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Last Allocation</b>           | Specifies the date and time when feature licenses were last allocated to the local WebLM server you select.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Status</b>                    | Specifies the success or failure status of the last license allocation process that the system executes for the local WebLM server you select. The allocation process can be a periodic allocation process or a nonperiodic allocation process. If the status of the last license allocation process is <b>Failed</b> , and if the status of a previous license allocation process for the server is <b>Success</b> , the system displays the date and time of the last license allocation process that was successful in the <b>Last Allocation</b> field. |
| <b>Feature (License Keyword)</b> | Specifies the name and license keyword of the counted features that the system allocates to the local WebLM server.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>License Capacity</b>          | Specifies the total number of feature licenses the organization purchases for each feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Currently Allocated</b>       | Specifies the total number of feature licenses of each feature that the system allocates to the local WebLM server.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Available</b>                 | Lists the number of licenses currently available on the master WebLM server for allocation to local WebLM servers.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Change Allocations field descriptions

Use this page to change current feature license allocation information for each local WebLM server of a product.

| Name                             | Description                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Feature (License Keyword)</b> | The name and license keyword of the counted features that the system allocates to the local WebLM server you select. |
| <b>Local WebLM Name</b>          | The name of the local WebLM server.                                                                                  |
| <b>IP address</b>                | The IP addresses of the local WebLM servers of the product.                                                          |
| <b>License Capacity</b>          | The total number of feature licenses that the organization purchases for each feature.                               |
| <b>Currently Allocated</b>       | The total number of feature licenses of each feature that the system allocates to the local WebLM server you select. |

*Table continues...*

| Name                  | Description                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <b>Currently Used</b> | The total number of feature licenses of each feature that the product uses.                              |
| <b>Available</b>      | The number of floating licenses of each feature that is currently available with the local WebLM server. |
| <b>New Allocation</b> | The number of new licenses that the system allocates to a local WebLM server.                            |

| Button                    | Description                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Submit Allocations</b> | Allocates the number of feature licenses that you specify in the <b>New Allocation</b> field to the corresponding local WebLM servers. |
| <b>Reset</b>              | Resets the values that you specify in the <b>New Allocation</b> field to the previously saved value.                                   |

## Periodic Status field descriptions

Use the Periodic Status option to view the status of periodic operations such as the periodic allocation of the feature licenses to the local WebLM server and querying of the local WebLM server for usage report.

### Periodic Allocation

| Name                    | Description                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Local WebLM Name</b> | Specifies the name of the local WebLM server of a product.                                                                                                                                                                                                                                                                                       |
| <b>IP Address</b>       | Specifies the IP addresses of all the local WebLM servers of the product.                                                                                                                                                                                                                                                                        |
| <b>Last Allocation</b>  | Displays the date and time when the system executed the last periodic license allocation process for each local WebLM server. If the status of the last periodic license allocation process is <b>Failed</b> , the <b>Last Allocation</b> column displays the date and time of the periodic license allocation process that was last successful. |
| <b>Status</b>           | Displays the success or failure status of the last periodic license allocation process that the system executed for each local WebLM server.                                                                                                                                                                                                     |

### Periodic Usage

| Name              | Description                                                                        |
|-------------------|------------------------------------------------------------------------------------|
| <b>WebLM Name</b> | Displays the name of the master WebLM server and local WebLM servers of a product. |
| <b>IP Address</b> | Displays the IP addresses of the master and local WebLM servers of a product.      |

*Table continues...*

| Name                    | Description                                                                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Usage Query</b> | Displays the date and time when the system executed the last periodic usage query for each WebLM server. If the status of the last periodic usage query is <code>Failed</code> , the <b>Last Usage Query</b> column also displays the date and time of the periodic usage query that was last successful. |
| <b>Status</b>           | Displays the success or failure status of the last periodic usage query that the system executed for each WebLM server. If the server is not queried even once for feature license usage, the <b>Status</b> column of a WebLM server remains blank.                                                       |

---

## Metering Collector configuration overview

With Release 8.1.2, you can manage the Avaya Subscription license on the WebLM server when metering collector is registered with WebLM. The metering collector configuration is applicable only for the Avaya Subscription license. The Solution-Avaya Subscription license contains more than one application.

Using the metering collector configuration, the WebLM server tracks the license usage information from the deployed applications. The WebLM server provides the license information to the metering collector when metering collector requests.

# Chapter 16: Data Replication Service

---

## Data Replication Service

Data Replication Service (DRS) replicates data stored on the System Manager server to other element nodes or the slave nodes. DRS uses and extends SymmetricDS as the underlying mechanism for data replication.

SymmetricDS is an asynchronous data replication software that supports multiple subscribers and bi-directional synchronization. SymmetricDS uses Web and database technologies to replicate tables between relational databases in near real time. The system provides several filters while recording the data, extracting the data that has to be replicated to a slave node, and loading the data on the slave node.

Databases provide unique transaction IDs to rows that are committed as a single transaction. SymmetricDS stores the transaction ID along with the data that changed, so that it can play back the transaction at the destination node exactly the way it happened. This means that the target database maintains the same integrity as the source.

DRS provides a mechanism wherein elements can specify their data requirements in an XML document. On the basis of the XML document, DRS creates database triggers on the specified application tables and captures the database events for delivery to other element nodes. The client nodes then fetch these database events.

Data replication happens in two distinct phases:

- Full-sync. This is the initial replication phase, wherein whatever data the replica node requests is replicated to the client node.
- Regular-sync. This is the phase after full-sync, wherein subsequent change events are replicated to the replica node.

DRS supports the following modes of replication:

- Replication in Repair mode. In the repair mode, DRS replicates all of the requested data from the master database to the database of the replica node. Repair should only be necessary if there is a post-install failure of DRS.
- Automatic synchronization mode. After the database of the replica node is loaded with the requested data, the subsequent synchronizations of the master database and the replica database occur automatically. DRS replicates only the data that has been updated since the last replication. Automatic synchronization is a scheduled activity and occurs after each fixed interval of time as set in the configuration files.

The data from the master database is sent to the replica node in batches. DRS creates replication batches whenever the data in the master database is added, modified, and deleted.

Using DRS, you can:

- View replica nodes in a replica group.
- Repair the replica nodes that are not synchronized. The repair action replicates the required data from System Manager.

---

## Synchronization in a Geographic Redundancy scenario

- DRS clients work with virtual IP or FQDN for a seamless switchover to the active System Manager when failover, failback, or split network occurs.
- DRS clients provide an audit mechanism to determine if the active System Manager contains the required data to resume synchronization. After a state change, the audit mechanism validates the last batch of data that is replicated to the element with the last batch of the data in the active System Manager. The state change includes failover, failback, and split network.
- During the audit, if the element contains more recent data than the data available on the active System Manager, the system marks the element for repair. Otherwise the system marks the element as in-sync with System Manager.

---

## DRS client audit

You can configure Data Replication Service (DRS) client elements in the Geographic Redundancy (GR) mode or GR-unaware mode.

A GR-aware DRS client must conform to the norms for a GR-aware element. A GR-aware element must work with the virtual FQDN configuration.

When you activate the secondary System Manager or when you enable GR after the system restores the primary System Manager, DRS marks all client nodes that are GR-aware for audit. The system displays the nodes marked for audit as *Pending Audit*. When you activate the secondary System Manager, DRS configures all GR-unaware DRS client nodes to deny recording any database change events. The system displays the state of DRS client nodes that are GR-unaware as *Not Managed*.

During the restoration of the primary System Manager, if you select the database of:

- The primary System Manager, the system marks all configured GR-aware client nodes for audit.
- The secondary System Manager, the system marks all DRS client nodes that are GR-aware for audit. Also, the system marks all DRS client nodes that are GR-unaware for repair.

When the system marks a node for audit, the system denies any further requests from the node until the audit is complete for that node. DRS service on System Manager sends a request to the DRS client element for audit data. DRS performs the audit for the DRS client and determines whether the client node requires a full synchronization. If the audit reveals that the client has more recent data than the data on System Manager, DRS schedules a full-synchronization for the

element. This phase marks the completion of audit and the system configures DRS to accept requests from the element.

Using DRS, the system initiates the client audit under following situations:

- **Manual:** When an administrator activates the secondary System Manager, DRS flags all configured clients for audit. This action ensures that none of the configured client elements have more data than the secondary System Manager. DRS flags similar client audit when the primary System Manager is recovered.
- **Automated:** During situations such as split network, when an administrator activates the secondary System Manager server, a node changes to the secondary System Manager server. However, in split network scenario, you cannot predict the network condition and the node can change back to the primary System Manager server.

---

## Viewing replica groups

### Procedure

On the System Manager web console, click **Services > Replication**.

### Result

The system displays the Replica Groups page with the groups in a table.

---

## Viewing replica nodes in a replica group

### About this task

You can view the replica nodes in a group.

### Procedure

1. On the System Manager web console, click **Services > Replication**.
2. On the Replica Groups page, select a replica group and click **View Replica Nodes**.

Alternatively, you can click a replica group name displayed under the **Replica Group** column to view the replica nodes for that replica group.

The Replica Nodes page displays the replica nodes for the select group.

---

## Repairing a replica node

### About this task

You can replicate data for a replica node whose database is not synchronized with the System Manager database. Repair is necessary if there is a post-install failure of Data Replication Service.

From Release 8.1, you can repair more than one replica nodes of a replica group.

### Procedure

1. On the System Manager web console, click **Services > Replication**.
2. On the Replica Groups page, perform one of the following:
  - Select a replica group, for which you want to repair the replica nodes, from the table displaying replica groups and click **View Replica Nodes**.
  - Click the name of the replica node under the **Replica Group** column.
3. On the Replica Nodes page, select one or more replica node, and click **Repair**.

The **Synchronization Status** column displays the data replication status for the selected replica node.

### Related links

[Replica Nodes field descriptions](#) on page 1076

---

## Repairing all replica nodes in a replica group

### About this task

You can replicate data for all the replica nodes that are in a group. You can perform this operation if replica nodes in a group are not synchronized with the System Manager database.

### Procedure

1. On the System Manager web console, click **Services > Replication**.
2. On the Replica Groups page, select a replica group for which you want repair the replica nodes from the table displaying replica groups.
3. Click **Repair**.

The **Synchronization Status** column displays the data replication status for the replica group.

---

## Viewing replication details for a replica node

You can view the batch-related information such as total number of batches received, processed, and skipped for a replica node. The master database sends the requested data in batches to the replica node.

### Procedure

1. On the System Manager web console, click **Services > Replication**.
2. On the Replica Groups page, select a replica group and click **View Replica Nodes**.

The Replica Nodes page displays the replica nodes for the selected replica group in a table.

3. Select a replica node and click **View Details**.

The Data Replication page displays the replication details for the selected replica node.

### Related links

[Replication Node Details field descriptions](#) on page 1079

---

## Removing a replica node

### About this task

From Release 8.1, you can remove more than one replica nodes from a replica group.

### Procedure

1. On the System Manager web console, click **Services > Replication**.
2. On the Replica Groups page, select the replica group from which you need to remove a node, and click **View Replica Nodes**.
3. On the Replica Node page, select one or more replica nodes, and click **Remove**.

---

## Removing a replica node from the queue

### About this task

From Release 8.1, you can remove more than one replica nodes from the queue of a replica group.

### Procedure

1. On the System Manager web console, click **Services > Replication**.

2. On the Replica Groups page, select the replica group for which you must remove the node, and click **View Replica Nodes**.
3. On the Replica Node page, select one or more replica node, and click **Remove from Queue**.

## Replica Groups field descriptions

The replica groups are logical groupings of the replica nodes. You can use the replica groups field descriptions page to:

- View all the replica groups in the enterprise.
- View the replication status of the replica groups.

The page displays the following fields when you select **All** from the **Replica Group** field.

| Name                          | Description                                                                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select check box</b>       | An option to select a replica group.                                                                                                                                                  |
| <b>Replica Group</b>          | The name of the replica group. Each replica group in the list is a hyperlink. When you click a group, the system displays the replica nodes for that group on the Replica Nodes page. |
| <b>Synchronization Status</b> | For each replica group, displays the combined synchronization status of all replica nodes under the group                                                                             |
| <b>Group Description</b>      | A brief description of the replica group.                                                                                                                                             |

| Button                    | Description                                                                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View Replica Nodes</b> | Displays the Replica Nodes page. Use this page to view replica nodes for a group that you select.                                                                     |
| <b>Repair</b>             | Initiates full-sync for the selected groups and effectively for all the replica nodes that belong to the selected groups.                                             |
| <b>Filter: Enable</b>     | Displays fields under <b>Replica Group</b> and <b>Synchronization Status</b> columns where you can set the filter criteria. <b>Filter: Enable</b> is a toggle button. |
| <b>Filter: Disable</b>    | Hides the column filter fields without resetting the filter criteria. <b>Filter: Disable</b> is a toggle button.                                                      |
| <b>Filter: Apply</b>      | Filters replica nodes based on the filter criteria.                                                                                                                   |

---

## Replica Nodes field descriptions

You can use this page to:

- View the replica nodes in a selected replica group when you request data replication from the master database of System Manager.
- View the replication status of the replica nodes in a group.

| Name                   | Description                                                                                                                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select check box       | Provides the option to select a replica node.                                                                                                                                                                    |
| Replica Node Host Name | Displays the full hostname of the replica node.<br><br>If you need to administer Session Manager, the Replica Nodes Web page displays the fully qualified domain name. For example, ab-ct10-defg-bsm.mydata.com. |
| Product                | Displays the name of the product.                                                                                                                                                                                |

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Synchronization Status</b> | <p>Displays the synchronization status of the replica node.</p> <p>When you install a node, the node goes from a <b>Ready for Repair</b> state to the <b>Queued for Repair</b> to <b>Repairing</b>, and finally to the <b>Synchronized</b> state. During this phase, the replica node receives a full-sync, wherein configured data is replicated to the replica node. Once the replica node is prepared with a full-sync, thereafter the node receives the subsequent changes in the form of regular-sync.</p> <p>A replica node can be in any one of the following states during the lifecycle:</p> <ul style="list-style-type: none"> <li>• <b>Ready for Repair:</b> The database of the replica node is not synchronized with the master database.</li> <li>• <b>Queued for Repair:</b> The replication request of the replica server is in queue with other data replication requests. The color code of the status is yellow.</li> <li>• <b>Repairing:</b> The data replication process is in progress. The color code of the status is yellow.</li> <li>• <b>Synchronized:</b> The system has successfully replicated the data that the replica node requested from the master database to the database of the replica node. The color code of the status is green.</li> </ul> <p> <b>Note:</b></p> <p>If you encounter the following, contact the administrator who can manually intervene to resolve the problem:</p> <ul style="list-style-type: none"> <li>• <b>Not Reachable:</b> System Manager is unable to connect to the replica node. This indicates that the replica node is switched off for maintenance, a network connectivity failure, or any other issue that affects general connectivity between System Manager and the replica node.</li> <li>• <b>Synchronization Failure:</b> Data replication is broken between System Manager and the replica node. This status generally indicates a catastrophic failure.</li> </ul> <p>During the automatic replication of data from the master to the replica node, the system displays the following status:</p> <ul style="list-style-type: none"> <li>• <b>Synchronizing:</b> The data replication is in progress for the replica node. The color code of the status is yellow.</li> <li>• <b>Synchronized:</b> The system successfully replicated the data that the replica node requested from the master database to the database of the replica node. The color code of the status is green.</li> <li>• <b>Pending Audit:</b> The replica node is marked for audit. In this state, DRS dishonors any request from the node until audit is successfully conducted for the node. On completion of audit activity, the node</li> </ul> |

| Name                                 | Description                                                                                                                                                                             |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                      | displays any of the other states as applicable. The color code of the status is yellow.                                                                                                 |
| <b>Last Synchronization Time</b>     | Displays the last time when the system performed the data synchronization or replication for the replica node.                                                                          |
| <b>GR Capable</b>                    | Displays whether the replica node is GR-capable or not.                                                                                                                                 |
| <b>Last Replication Request Time</b> | Displays the time when a pre-7.0 replica node last requested System Manager for data or the time when System Manager last tried to send data to a replica node on Release 7.0 or later. |

| Button                         | Description                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>View Details</b>            | Displays the Data Replication page. Use this page to view the synchronization details for a replica node.      |
| <b>Repair</b>                  | Replicates or resynchronizes data from the master node to a selected replica node.                             |
| <b>Remove</b>                  | Removes the nodes you select from the replica group.                                                           |
| <b>Remove From Queue</b>       | Removes the replica node you select from the queue.                                                            |
| <b>Show All Replica Groups</b> | Returns to the Replica Groups page.                                                                            |
| <b>Advanced Search</b>         | The link to perform advance search. When you click on this link, System Manager displays the Criteria section. |
| <b>Filter: Enable</b>          | The fields where you can set the filter criteria. <b>Filter: Enable</b> is a toggle button.                    |
| <b>Filter: Disable</b>         | Hides the column filter fields. <b>Filter: Disable</b> is a toggle button.                                     |
| <b>Filter: Apply</b>           | Filters replica nodes based on the filter criteria.                                                            |
| <b>Select: All</b>             | Selects all replica nodes in the table.                                                                        |
| <b>Select: None</b>            | Clears the selection for the users that you select.                                                            |
| <b>Refresh</b>                 | Refreshes the replica node information in the table.                                                           |

## Criteria

| Name                          | Description                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Search Criteria</b> | <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Replica node name</b></li> <li>• <b>Synchronization time</b></li> <li>• <b>Synchronization Status</b></li> </ul> |

| Button        | Description                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| -             | Removes the additional search criteria fields.<br>This field is enabled when the additional search criteria fields are added. |
| +             | Adds the additional search criteria fields.                                                                                   |
| <b>Clear</b>  | Clears the search criteria.                                                                                                   |
| <b>Search</b> | Performs the search for the specified search criteria                                                                         |
| <b>Close</b>  | Closes the Criteria section.                                                                                                  |

## Replication Node Details field descriptions

You can use this page to view the following details:

- The batch-related information such as total number of batches received, processed, and skipped for a replica node.
- The last time when the replication server performed the synchronization or replication.
- Synchronization or replication error details.

### General

| Name                          | Description                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Replica Node Group</b>     | Displays the name of the group that the replica node belongs to. A node-group is a logical grouping of similar nodes.                                                                                            |
| <b>Replica Node Host Name</b> | Displays the full hostname of the replica node.<br><br>If you need to administer Session Manager, the Replica Nodes Web page displays the fully qualified domain name. For example, ab-ct10-defg-bsm.mydata.com. |
| <b>Last Down Time</b>         | Displays the last time and date when the replica node could not be reached. System Manager periodically checks whether a replica node is reachable.                                                              |

*Table continues...*

| Name                          | Description                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Repair Start Time</b> | Displays the last time and date when a full-sync was started for the node.                                                                                                              |
| <b>Last Repair End Time</b>   | Displays the last time and date when a full-sync was completed for the node.                                                                                                            |
| <b>Last Pull Time</b>         | Displays the time when a pre-7.0 replica node last requested System Manager for data or the time when System Manager last tried to send data to a replica node on Release 7.0 or later. |
| <b>Build Version</b>          | Displays the version of the element configuration.                                                                                                                                      |
| <b>GR Capable</b>             | Displays whether the replica node is GR-capable or not.                                                                                                                                 |

### Synchronization Statistics

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pending Batches</b>           | Lists the batches that are yet to be replicated to the replica node.<br><br>During the data replication process, System Manager records the changes for a particular replica node in the form of events. When a replica node requests System Manager for change events, the change events are made into batches. These batches are then replicated to the replica node. |
| <b>Pending Unbatched Events</b>  | Lists the change events that are yet to be formed into batches.<br><br>The recorded change events are formed into batches and only a predefined number of batches are replicated to a replica node in a request. The remaining events wait for the subsequent request from the replica and are called unbatched events pending batching and subsequent replication.     |
| <b>Synchronization Status</b>    | Displays the synchronization status of the replica node. For details, see Replica Nodes field descriptions.                                                                                                                                                                                                                                                             |
| <b>Last Synchronization Time</b> | Displays the last time when the system performed the data synchronization or replication for the replica node.                                                                                                                                                                                                                                                          |
| <b>Last Batch Acknowledged</b>   | Displays the last batch that an element acknowledged as successfully processed on the element side.<br><br>During an audit, Data Replication Service (DRS) compares the last successfully committed batch on the node with the data in the last batch acknowledged batch. If the node has a more recent batch, then DRS schedules a full-sync for the node.             |

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Marked For Audit</b> | <p>Marks all replica nodes that are GR-enabled for audit:</p> <p>The status can be:</p> <ul style="list-style-type: none"> <li>• : Indicates that the node is marked for audit.</li> <li>• : Indicates that the node is not marked for audit.</li> </ul> <p>When the node is marked for audit, the replica status changes to <b>Pending Audit</b>, and the color changes to yellow.</p> <ul style="list-style-type: none"> <li>• When you activate the secondary System Manager or when you enable GR after the primary System Manager restores</li> <li>• When the primary System Manager restores and you choose the database of the primary System Manager</li> <li>• When the primary System Manager restores and you choose the database of the secondary System Manager</li> </ul> <p>DRS denies any request from the replica node that is marked for audit until the audit is complete for the replica node.</p> |
| <b>Last Audit Time</b>  | Displays the last time and date when DRS performed the audit of data from the node that is marked for audit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Last Error Details

| Name                  | Description                                                       |
|-----------------------|-------------------------------------------------------------------|
| <b>Cause of Error</b> | Describes why the system failed to replicate or synchronize data. |
| <b>Time of Error</b>  | Displays the time when the error occurred.                        |

| Button         | Description                             |
|----------------|-----------------------------------------|
| <b>Refresh</b> | Refreshes the Replication Node details. |
| <b>Done</b>    | Returns to the Replica Nodes page.      |

# Chapter 17: Managing reports

---

## Reports

Avaya Aura® System Manager supports the Reports feature for communication objects. System Manager has about 350 predefined List and Display Communication Manager configuration reports.

You can use this feature to:

- Generate Communication Manager object reports in various formats, such as CSV, PDF, HTML, and Other (.txt with delimiter).
- Create and manage reports.
- Edit report parameters.
- Rerun reports.
- Customize the report contents.
- Save reports in the System Manager server.
- View and delete reports stored in System Manager.
- Save reports to a local computer.
- Email reports to one or more addresses. You can configure an email server to send reports.

You can assign permissions for reports and generate reports for the specific custom user.

---

## Support for generating endpoint reports with buttons

With System Manager Release 7.1.3.2 and later, you can generate an endpoint report for the following:

- **Main Buttons**
- **Feature Buttons**
- **Expansion/Module Button**
- **SoftKeys Buttons**

For generating an endpoint report with a button, you must generate:

- The report in the CSV format.
- The Detailed (Database) report.

For information about how to generate the Detailed report, see “Generating a detailed report”.

## Reports Generation field descriptions

| Name              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Used Space</b> | The maximum space allocated for storing the generated reports. If the report files exceed the maximum file size of 1 GB, the system generates an alarm. You must manually delete some files before you can generate a new report.<br><br>On the <b>Services &gt; Configurations &gt; Settings &gt; Reports &gt; Configuration</b> page, you can configure <b>Reports Output Directory Properties</b> . For more information, see View Profile:Configuration field descriptions. |

### Reports Definition List

| Name                 | Description                                                             |
|----------------------|-------------------------------------------------------------------------|
| <b>Name</b>          | The name of the report.                                                 |
| <b>Host Name(s)</b>  | The Communication Manager instance from which the report was generated. |
| <b>Creation Date</b> | The date when the report was generated.                                 |
| <b>Created By</b>    | The user who created the report.                                        |
| <b>Format</b>        | The format in which the report was generated.                           |
| <b>Object</b>        | The Communication Manager object used for generating the report.        |

| Button                 | Description                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------|
| <b>Edit</b>            | Displays the Edit Report Definition page to edit the selected report.                          |
| <b>New</b>             | Displays the New Report page to create a new report.                                           |
| <b>Run Now</b>         | Runs the selected report immediately.                                                          |
| <b>Delete</b>          | Deletes the selected report.                                                                   |
| <b>Filter: Enable</b>  | Displays fields where you can set the filter criteria. This is a toggle button.                |
| <b>Filter: Disable</b> | Hides the column filter fields without resetting the filter criteria. This is a toggle button. |
| <b>Filter: Clear</b>   | Clears the filter criteria.                                                                    |
| <b>Filter: Apply</b>   | Filters reports based on the criteria.                                                         |

# Generating a detailed report

## Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Generation**.
3. On the Reports Definition List page, click **New**.
4. On the New Report page, in the **Application** field, click **Communication Manager**.
5. In the Communication Manager table, select one or more Communication Manager instances.
6. Click **Next**.
7. Select **Detailed (Database)** to generate the report for Communication Manager objects in the database.
8. Select the report type from **Report Type**.
9. On the Reports Generation page, in **Available Fields**, select the fields to include in your report.
10. Click the right arrow icon.   
The **Selected Field** table displays the selected fields. By default, some fields are already available in the **Selected Fields** column.
11. Click **Next**.
12. On the Report Parameters page, complete the report parameters, and click **Generate Report**.  
You can only generate a **Detailed (Database)** report if the Initializing synchronization for the specific Communication Manager instances is successful. Otherwise, report generation fails.
13. To download and view the report, go to **Services > Reports > History**.

# Generating a basic report

## Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Generation**.
3. On the Reports Definition List page, click **New**.
4. On the New Report page, in the **Application** field, select **Communication Manager**.
5. From the Communication Manager table, select one or more Communication Manager instances.
6. Click **Next**.
7. Click **Basic (List and Display)** to generate a report directly from Communication Manager.
8. On the Basic Report page, select **Report Type**.

You can generate a **List** report or a **Display** report.

9. In the **Communication Manager Object** field, select Communication Manager object to generate a report.
  10. In the **Qualifier** field, type the qualifier for the Communication Manager object.
  11. Click **Next**.
  12. On the Report Parameters page, complete the report parameters, and click **Generate Report**.
- You can only generate a **Basic** report if the Initializing synchronization for the specific Communication Manager instances is successful. Otherwise, report generation fails.
13. To download and view the report, go to **Services > Reports > History**.

## New Report

| Name               | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| <b>Application</b> | The application type for which you want to generate the report.             |
| <b>Name</b>        | The name of the element instance that you choose for generating the report. |
| <b>Host</b>        | The Communication Manager system that you select for generating the report. |

**Basic (List and Display)**

| Name                                | Description                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Report Type</b>                  | The report type. You can generate a <b>List</b> report or a <b>Display</b> report for the Communication Manager object you select. |
| <b>Communication Manager Object</b> | The Communication Manager object that you select for generating the report.                                                        |
| <b>Name</b>                         | The name of the element instance that you choose for generating the report.                                                        |
| <b>Host</b>                         | The Communication Manager system that you select for generating the report.                                                        |
| <b>Qualifier</b>                    | The qualifier for the Communication Manager object that you select for generating the report.                                      |

**Detailed (Database)**

| Name                    | Description                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Report Type</b>      | The Communication Manager object that you choose for generating the report.                                                                 |
| <b>Available Fields</b> | The fields that you want to generate as part of the report. The fields vary according to the Communication Manager object you choose.       |
| <b>Selected Fields</b>  | The fields that you select from <b>Available Fields</b> . The report that you generate displays only the fields in <b>Selected Fields</b> . |

| Button                                | Description                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Move selected columns to right</b> | Moves selected fields to the right in the <b>Selected Fields</b> column.                                       |
| <b>Move selected columns to left</b>  | Moves selected fields to the left in the <b>Available Fields</b> column.                                       |
| <b>Move all columns to right</b>      | Moves all the fields to the right in the <b>Selected Fields</b> column.                                        |
| <b>Move all columns to left</b>       | Moves all the fields to the left in the <b>Available Fields</b> column.                                        |
| <b>Reset to default columns</b>       | Resets your selection. The system displays the default fields when you click <b>Reset to default columns</b> . |
| <b>Move Up</b>                        | Moves up the selected field by one position in the <b>Selected Fields</b> column.                              |
| <b>Move Down</b>                      | Moves down the selected field by one position in the <b>Selected Fields</b> column.                            |

**Report Parameters**

| Name               | Description                                                                         |
|--------------------|-------------------------------------------------------------------------------------|
| <b>Report Name</b> | The name of the report. Type a name of your choice in the <b>Report Name</b> field. |

*Table continues...*

| Name                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select file format</b>          | The format in which you want to generate the report. The options are: <ul style="list-style-type: none"> <li>• <b>CSV</b></li> <li>• <b>PDF</b></li> <li>• <b>HTML</b></li> <li>• <b>Other (.txt with delimiter)</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Select delimiter</b>            | The delimiter that you want to apply while generating the report. The options are: <ul style="list-style-type: none"> <li>• <b>comma</b></li> <li>• <b>semicolon</b></li> <li>• <b>space</b></li> <li>• <b>tab</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Append to existing report</b>   | The data appended to the existing report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Append date to Report File</b>  | The date appended to the report file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Select destination location</b> | The location where you want to save the generated report. The options are: <ul style="list-style-type: none"> <li>• <b>Local</b> (Path : /swlibrary/reports_data): The option to save the generated report to your local computer. By default, the path is /swlibrary/reports_data.</li> <li>• <b>Remote Server</b>: The option to save the generated report to a <b>Remote server</b>. Do one of the following: <ul style="list-style-type: none"> <li>- Select the <b>Remote Server</b> from the drop-down field to store your reports.</li> <li>- Select the field where you want to store the reports: <ul style="list-style-type: none"> <li>• <b>Name</b></li> <li>• <b>IP</b></li> <li>• <b>Type</b></li> <li>• <b>Remote Server From</b></li> <li>• <b>Default Server</b></li> </ul> </li> </ul> </li> <li>• <b>Email</b>: The option to enter one or more email addresses you want to send the report. To enter multiple email addresses, separate them by a semicolon.</li> </ul> |

---

## Editing report parameters

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Generation**.
3. Select the report whose parameters you want to edit.
4. Click **Edit**.
5. On the Edit Report Definition page, edit the required parameters.
6. Click **Generate Report** to generate a report.

---

## Rerunning reports

### About this task

Use rerun reports to generate a new report after Communication Manager synchronization is complete. Rerunning reports displays the latest available data after synchronization.

Using the rerun feature, you can run the reports according to the previous configuration of the report.

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Generation**.
3. On the Reports Generation page, select the report that you want to rerun.
4. Click **Run Now**.

The system displays a status message that the report generation is scheduled.

After the system generates the report, the Report Generation page displays the date of report creation.

---

## Customizing reports

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the left navigation pane, click **Generation**.
3. On the Reports Generation page, do one of the following actions:
  - Click **New**.
  - Select a report, and click **Edit**.

The system directs you to the New Report page.

4. On the New Report page, select one or more Communication Manager instances.
5. Click **Next**.

The system directs you to the **Basic Report**.

6. In the **Basic Report** section, select one or more Communication Manager instances and do one of the following actions:
  - Select **Basic (List and Display)**, and do the following actions:
    - a. Select the type of report from **Report Type**.
    - b. Select **Communication Manager Objects** that you want the report to display.
    - c. Select one or more Communication Manager instances.
  - Select **Detailed (Database)**, and perform the following actions:
    - a. Select the report type from **Report Type**.
    - b. Select one or more instances from the **Available Fields** column.
    - c. Click the right arrow to add one or more instances from the **Available Fields** column to the **Selected Fields** column.

The **Selected Fields** table displays the selected columns. Some columns are available by default in the **Selected Fields** table.

7. Click **Next**.

The system displays the Report Parameters page.

8. In the **Customize Report** field, select the **Customize Report Header** to add a name of your choice to the report.
9. Select **Export Column Titles on First Row** to export the column titles that the system displays on the report output.
10. On the Report Parameters page, complete the report parameters, and click **Generate Report**.

You can download and view the report from **Services > Reports > History**.

---

## Downloading reports

### Before you begin

You must generate a report by clicking **Services > Reports > Generation**.

If you select multiple reports and download them, the files are archived and downloaded as a zip file.

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **History**.
3. Perform one of the following actions:
  - From the **Reports History** table, select the report you want to download and click **Download Report**.
  - In the **Reports History** table, click the hyperlink in the **File Name** column.

The report is downloaded to your local computer.

## Configuring email properties

### About this task

Use this procedure to set up the email configuration for receiving email notifications from System Manager instances.

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR**.
3. On the View Profile:SMGR page, click **Edit**.
4. On the Edit Profile:SMGR page, in the Email Configuration Properties section, do the following.
  - a. In the **Enable email notification** field, type `true`.

- b. In the respective fields, type the appropriate values.

For more information, see “View and Edit Profile SMGR field descriptions.”

5. Click **Commit**.

---

## Sending reports through email

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **History**.
3. Select the report or reports that you want to send through email.
4. Click **Email Report**.
5. In the **Enter email addresses** field, enter the email addresses to send the report.  
You can enter multiple email addresses separated by a semicolon.
6. Click **Email Report**.  
To go to the previous page, click **Back**.  
To clear the entered email addresses, click **Clear**.

---

## Deleting reports

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **History**.
3. From the **Reports History** table, select the report that you want to delete.
4. Click **Delete**.
5. On the Report History Delete Confirmation page, click **Delete**.

---

## Configuring report properties

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > Reports > Configuration**.

3. Click **Edit**.
4. On the Edit Profile:Configuration page, configure the following:
  - Alarm Properties
  - Cleanup Properties
  - Output Directory Properties
5. Click **Commit**.

## Remote server configuration

---

### Adding a remote server

#### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Reports > Remote Server Configuration**.
3. On the Remote Server Configuration page, click **New**.
4. On the Add Server page, complete the remote server details.
5. Click **Commit**.

---

### Viewing the details of a remote server

#### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Reports > Remote Server Configuration**.
3. On the Remote Server Configuration page, select the server to view its details.
4. Click **View**.

You can view the remote server details on the View Server page.

---

## Editing the details of a remote server

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Reports > Remote Server Configuration**.
3. On the Remote Server Configuration page, select the server to edit its details.
4. Click **Edit**.
5. On the Edit Server page, edit the remote server details.
6. Click **Commit**.

---

## Deleting a remote server

### Procedure

1. On the System Manager web console, click **Services > Reports**.
2. In the navigation pane, click **Reports > Remote Server Configuration**.
3. On the Remote Server Configuration page, select the server or servers that you want to delete.
4. Click **Delete**.
5. On the Confirmation page, click **Delete**.

---

## Add Server field descriptions

| Name                    | Description                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------|
| <b>Name</b>             | The name of the remote server.                                                                  |
| <b>IP Address</b>       | The IP address of the remote server.                                                            |
| <b>Server Path</b>      | The remote server path where the reports are saved.                                             |

# Chapter 18: Managing scheduled jobs

---

## Scheduler

The Scheduler service provides a generic job scheduling service for System Manager and Avaya Aura® applications. The Scheduler service provides an interface to run a job on demand or on a periodic basis. You can schedule a job to generate an output immediately or set the frequency of the task execution to run on a periodic basis. You can modify the frequency for a periodic job schedule any time. After you define a task or a job, System Manager creates instances of the task, monitors the execution of the task, and updates the status of the task.

Scheduled jobs can be of three types:

- **System scheduled:** The job that the system executes on a periodic basis for the system to operate normally. The system adds these jobs at start-up and supports all frequencies other than one time. Scheduled jobs run asynchronously in the background. As an administrator, you cannot add or delete system-scheduled jobs. You can only disable or enable the jobs to stop temporarily.
- **Admin scheduled:** The job that the administrator schedules for administering the application. The administrator can use various navigation paths to schedule jobs such as bulk import and directory synchronization. The system lists the jobs in the scheduler as admin scheduled jobs.
- **On-demand:** The administrator can schedule on-demand jobs from the list of existing jobs.

You can perform the following operations using the Scheduler page on System Manager Web Console:

- View the pending and completed scheduled jobs.
- Modify a job scheduled by an administrator or an on-demand job.
- Delete a scheduled job.
- Schedule an on-demand job.
- Stop a running job.
- Enable or disable a job.
- Search a scheduled job.

By default, the following jobs are in **Enabled** state after System Manager is installed.

- **LogPurgeRule**

- **CirdAlarmPurgeRule**
- **AgedAlarmPurgeRule**

For a better system performance, ensure that these jobs remain in an **Enabled** state.

 **Note:**

It is recommended not to disable the above jobs manually. If you find the above jobs in a **Disabled** state, change their state to **Enabled**. For more information on “Enabling a job”, see [Enabling a job](#) on page 1102.

---

## Functions of the User Management scheduled job

Using the User Management scheduled job, you can:

- Notify users about the communication profile credentials of newly created UPM user.
- Notify users about the login credentials of newly created user.
- Notify users about the reset communication profile password.
- Notify users about their service or account inactivity and the date when it will be disabled.
- Notify users about their service or account disabled status.
- Notify users about account locked status.
- Notify users about password change or reset.
- Notify users about communication profile password change or reset.
- Warn users about password expiration.
- Notify users about expired password status.

---

## Accessing scheduler

### Procedure

On the System Manager web console, click **Services > Scheduler**.

---

## Assigning permissions to access Scheduler

### About this task

System Manager provides access permissions to Scheduler through Role Based Access Control (RBAC). System Manager defines flexible access privileges for add, delete, modify, view, schedule

on-demand, enable, disable and stop. With the privileges, users with administrator credentials can create custom roles.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and perform one of the following steps:
  - Click **New**.
  - Right-click and select **New**.

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping**.
7. In **Group Name**, select the group of templates to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select a group.
8. In **Element or Resource Instance**, select **adminSched**, **onDemand**, **sysSched**, or **All**.
9. Click **Next**.
10. Select all operations, and click **Commit**.

You can now gain access to the **Scheduler** links.

---

## Viewing pending jobs

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. In the navigation pane, click **Pending Jobs**.
3. To view the details of the job, on the Pending Jobs page, select a pending job and click **View**.

The Job Scheduling-View Job page displays the details of the selected job.

### Related links

[Pending Jobs field descriptions](#) on page 1103

---

## Viewing completed jobs

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. Click **Completed Jobs** in the left navigation pane.  
The Completed Jobs page displays completed jobs.
3. To view the details of the jobs, on the Completed Jobs page, select a completed job and click **View**.

The Job Scheduling-View Job page displays the details of the selected job.

### Related links

---

## Viewing logs for a job

### About this task

Use this functionality to view logs for a pending and completed job.

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. Perform the following:
  - To view logs for a pending job, click **Pending Jobs**, select a pending job, and click **More Actions > View Log**.
  - To view logs for a completed job, click **Completed Jobs**, select a completed job, and click **More Actions > View Log**.

The log viewer displays the details for the selected job.

---

## Filtering jobs

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. Perform one of the following:
  - To filter pending jobs, click **Scheduler > Pending Jobs**, and click **Filter: Enable**.
  - To filter completed jobs, click **Scheduler > Completed Jobs**, and click **Filter: Enable**.

The system displays the **Filter: Enable** option at the upper-right corner of the page.

3. Complete the fields to filter a job using the following criteria:
  - **Job Type**. The type of the job.
  - **Job Name**. Name of the job.
  - **Job Status**. Status of the job.
  - **State**. State of the job.
  - **Frequency**. Frequency at which the job must be executed.
  - **Scheduled By**. The user who scheduled the job
4. Click **Apply**.

The system displays jobs that match the filter criteria.

---

## Editing a job

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. Perform one of the following steps:
  - To edit a pending job, click **Pending Jobs**, select a pending job, and click **Edit** or click **View > Edit**.
  - To edit a completed job, click **Completed Jobs**, select a pending job, and click **Edit** or click **View > Edit**.
3. On the Job Scheduling-Edit Job page, modify the appropriate information and click **Commit** to save the changes.

You can modify information in the following fields: **Job Name**, **Job State** in the Job Details sections, and **Task Time**, **Recurrence**, **Range** in the Job Frequency section.

---

## Deleting a job

### Before you begin

Ensure that you have logged in as an administrator to delete an administrator scheduled job.

### About this task

Use this functionality to delete an obsolete job. You can delete an on-demand and an administrator scheduled job.

#### **Note:**

You can remove only **Schedule On Demand** type of jobs.

## Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. To remove a pending job, click **Pending Jobs** in the left navigation pane.
  - a. On the Pending Jobs page, select a pending job.
    - If the job that you want to delete is currently running then you must stop the job. To stop the job, click **More Actions > Stop**.
    - If the job that you want to delete is in the enabled state, disable the job. See [Disabling a job](#) on page 1101 on how to disable a job.
  - b. Click **Delete**.
  - c. On the Delete Confirmation page, click **OK**.  
System Manager deletes the selected job from the database.
3. To remove a completed job, click **Completed Jobs** in the left navigation pane.
  - a. On the Completed Jobs page, select a completed job.  
If the job that you want to delete is in the enabled state, disable the job.
  - b. Click **Delete**.
  - c. On the Delete Confirmation page, click **OK**.  
System Manager deletes the selected job from the database.

---

## Disabling a job

### About this task

Use this functionality to make a job inactive.

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. To disable a pending job, click **Pending Jobs** in the left navigation pane.
  - a. On the Pending Jobs page, select a pending job and click **More Actions > Disable**.
  - b. On the Disable Confirmation page, click **Continue**.  
The **State** of the selected job changes to **Disabled**.
3. To disable a completed job, click **Completed Jobs** in the left navigation pane.
  - a. On the Completed Jobs page, select a completed job and click **More Actions > Disable**.
  - b. On the Disable Confirmation page, click **Continue**.  
The **State** of the selected job changes to **Disabled**.

---

## Enabling a job

### About this task

Use this functionality to make a job active.

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. To enable a pending job, perform the following steps:
  - a. Click **Pending Jobs** in the left navigation pane.
  - b. On the Pending Jobs page, select a pending job and click **More Actions > Enable**.

The system displays `Enabled` in the **State** column of the selected job.

3. To enable a completed job, perform the following steps:
  - a. Click **Completed Jobs** in the left navigation pane.
  - b. On the Completed Jobs page, select a completed job and click **More Actions > Enable**.

 **Note:**

When you enable a job, the system does not restart the job that completed all executions. To restart a job that completed all executions, reconfigure the job parameters from Job Scheduling-Edit Job page.

The system displays `Enabled` in the **State** column of the selected job.

---

## Stopping a job

### Procedure

1. On the System Manager web console, click **Services > Scheduler**.
2. In the navigation pane, click **Pending Jobs**.
3. On the Pending Jobs page, select a pending job in the running state and click **More Actions > Stop**.
4. Click **Continue** on the Stop Confirmation page.

Scheduler stops the selected job.

## Pending Jobs field descriptions

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# Chapter 19: Templates

---

## Template management

A template is a file that contains stored settings. You can use templates to streamline the process of performing various routine activities. Templates save the data that you enter so that you can perform similar activities later without re-entering the same data. With System Manager, you can create, store, and use templates to simplify tasks like adding, editing, and viewing endpoints or subscribers. In System Manager, you can use default templates or you can create your own templates as well.

Templates are available in two categories: default templates and user-defined templates. The default templates exist on the system and you cannot edit or remove them. You can, however, modify or remove user-defined or custom templates any time.

You can create a custom alias endpoint template by duplicating a default alias template. The Alias template is populated in **Custom templates** after synchronization. You can view, edit, upgrade and delete these alias custom templates in **Templates > CM Endpoint > Custom templates**.

---

## Template versioning

### Template versioning

You can version endpoint templates with Communication Manager 5.0 and later. You can associate a template with a specific version of an adopting product through template versioning. You can use the **Template Version** field under endpoint templates to accommodate endpoint template versioning.

You can also use template versioning for subscriber templates using the following versions: Aura Messaging 6.3, Aura Messaging 6.2, Aura Messaging 6.1, Aura Messaging 6.0, MM 5.0, MM 5.1, MM 5.2, CMM 5.2, CMM 6.0, CMM 6.2, CMM 6.3 and CMM 7.0.

---

## Filtering templates

### Procedure

1. On the System Manager web console, click **Services > Templates**.

2. Click either **Endpoint** or **Messaging** for endpoint templates and messaging templates respectively.
3. Select the Communication Manager or supported messaging version, whichever applicable.
4. Click **Show List**.
5. Click **Filter: Enable** in the Template List.
6. Filter the endpoint or subscriber templates according to one or multiple columns.
7. Click **Apply**.

To hide the column filters, click **Disable**. This does not clear any filter criteria that you have set.

 **Note:**

The table displays only those endpoint or subscriber templates that match the filter criteria.

---

## Upgrading a template

Use this feature to upgrade an existing Communication Manager template to a later Communication Manager release. You can upgrade only custom templates. This feature supports upgrading a Communication Manager agent or endpoint template from an earlier Communication Manager release to a subsequent Communication Manager release. You can also upgrade templates across multiple releases.

This feature does not support downgrading of template versions.

When you perform the upgrade operation, note that:

- System migrates the existing template settings to the new template version.
- System sets the new parameters in the new template version to default values.
- System deletes the deleted parameters in the new template version as compared to the older template version.
- System makes the new keywords available for editing within the new template, but the upgraded template retains the previous keyword setting, if available. If the previous keyword is not available, then the default is used in the upgraded template.

After you commit a template upgrade task, the system upgrades the template and enlists the newly upgraded template on the Template List.

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. Click **CM Endpoint** in the left navigation pane.

3. Select the Communication Manager system whose custom template you want to upgrade from the list under **Supported Feature Server Versions**.

You can upgrade only custom templates.

4. Click **Show List**.
5. Select the custom template that you want to upgrade from **Template List**.
6. Click **Upgrade**.
7. On the Upgrade Endpoint Template page, select the Communication Manager version for template upgrade from the list in **Supported CM Version**.
8. In the **Template Name** text box, enter the new name for the template.
9. Click **Upgrade**. The system updates **Template List** with the newly upgrade template.

---

## Adding CM Agent template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **CM Agent**.
3. Click **New**.
4. Enter a name in the **Template Name** field.
5. Complete the mandatory fields under the **General Options** and **Agents Skills** tabs.
6. Click **Commit**.

## Deleting CM Agent template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **CM Agent**.
3. Select the template you want to delete from the Templates List.

 **Note:**

You cannot delete default templates.

4. Click **Delete**.

---

## Duplicating CM Agent template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **CM Agent**.

3. Select the template you want to copy from the Templates List.
4. Click **Duplicate**.
5. Complete the **Duplicate Agent Template** page.
6. Click **Commit**.

## Editing CM Endpoint templates

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **CM Endpoint**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click the **Custom templates** tab.

#### **Note:**

You cannot edit default templates.

6. Select the template you want to edit from the template list.
7. Click **Edit** or click **View > Edit**.
8. Complete the **Edit Endpoint Template** page.
9. Click **Commit** to save the changes.

## Assigning permissions for CM templates

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and perform one of the following steps:
  - Click **New**
  - Right-click and select **New**.

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping**.
7. In **Group Name**, select the group of templates to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select a group.
8. In the **Element or Resource Type** field, click **Communication Manager Templates**.
9. In the **Element or Resource Instance** field, click the Communication Manager templates to which you want to apply this permission.

The system displays only the templates you select in the **Element or Resource Instance** field in the Agent or Endpoints Templates List page.

10. Click **Next**.
11. On the Permission Mapping page, apply the required permission. For example, click **select view**.
12. Click **Commit**.

Users with the view permission can only view the CM Endpoint templates within the specified group. You must select **All** and then select view.

## Adding subscriber templates

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **Messaging**.

3. Select a messaging version from the list of supported messaging versions.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Basic Information**, **Subscriber Directory**, **Mailbox Features**, **Secondary Extensions** and **Miscellaneous** sections in the Add Subscriber Template page.
7. Click **Commit**.

Subscriber templates have different versions based on the software version. The subscriber templates you create have to correspond to the Avaya Aura® Messaging, Modular Messaging, or Communication Manager Messaging software version. When you select a messaging template, the **Software Version** field in the Add Subscriber Template page displays the appropriate version information.

## Viewing associated subscribers

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **Messaging**.
3. From the list of supported messaging versions, select a messaging version.
4. Click **Show List**.
5. From the Subscriber Template list, select a subscriber template for which you want to view the associated subscribers.
6. Click **More Actions > View Associated Subscribers**.

You can view all the associated subscribers in the System Manager database for the template you have chosen in the Associated Subscribers page.

---

## Templates List

You can view Templates List when you click **Template** under **Services** on the System Manager console.

You can apply filters and sort each of the columns in the Template List. When you click **Refresh**, you can view the updated information available after the last synchronization operation.

### IP Office Endpoint Templates

| Name | Description           |
|------|-----------------------|
| Name | Name of the template. |

*Table continues...*

| Name                      | Description                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Type</b>        | The name of the user who owns a template. For default templates, System is considered to be the owner. For user-defined templates, this field specifies the name of the user who created the template. |
| <b>Version</b>            | The change version of the template.                                                                                                                                                                    |
| <b>Set Type</b>           | The set type of the branch gateway endpoint template.                                                                                                                                                  |
| <b>Last Modified Time</b> | The time and date when the template was last modified.                                                                                                                                                 |

| Name                                     | Description                                                                                                                                                                                            |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                              | The name of the template.                                                                                                                                                                              |
| <b>Owner</b>                             | The name of the user who owns a template. For default templates, System is considered to be the owner. For user-defined templates, this field specifies the name of the user who created the template. |
| <b>Version</b>                           | The change version of the template.                                                                                                                                                                    |
| <b>Default</b>                           | Specifies whether the template is default or user-defined.                                                                                                                                             |
| <b>Last Modified</b>                     | The time and date when the endpoint or messaging template was last modified.                                                                                                                           |
| <b>Set type</b> (for endpoint templates) | The set type of the endpoint template.                                                                                                                                                                 |
| <b>Type</b> (for messaging templates)    | Specifies whether the messaging type is Messaging, MM, or CMM.                                                                                                                                         |
| <b>Software Version</b>                  | The software version of the element for the template.                                                                                                                                                  |

### IP Office System Configuration template

| Name                      | Description                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>               | Name of the template.                                                                                                                                                                                  |
| <b>System Type</b>        | The name of the user who owns a template. For default templates, System is considered to be the owner. For user-defined templates, this field specifies the name of the user who created the template. |
| <b>Version</b>            | The change version of the template.                                                                                                                                                                    |
| <b>Last Modified Time</b> | The time and date when the template was last modified.                                                                                                                                                 |

### CM Agent template

| Name           | Description                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>    | Name of the template.                                                                                                                                                                                  |
| <b>Owner</b>   | The name of the user who owns a template. For default templates, System is considered to be the owner. For user-defined templates, this field specifies the name of the user who created the template. |
| <b>Version</b> | The change version of the template.                                                                                                                                                                    |
| <b>Default</b> | Specifies whether the template is default or user-defined.                                                                                                                                             |

*Table continues...*

| Name                    | Description                                            |
|-------------------------|--------------------------------------------------------|
| <b>Software Version</b> | The software version of the element for the template.  |
| <b>Last Modified</b>    | The time and date when the template was last modified. |

### CM Endpoint template

| Name                    | Description                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>             | Name of the template.                                                                                                                                                                                  |
| <b>Owner</b>            | The name of the user who owns a template. For default templates, System is considered to be the owner. For user-defined templates, this field specifies the name of the user who created the template. |
| <b>Version</b>          | The change version of the template.                                                                                                                                                                    |
| <b>Default</b>          | Specifies whether the template is default or user-defined.                                                                                                                                             |
| <b>Software Version</b> | The software version of the element for the template.                                                                                                                                                  |
| <b>Last Modified</b>    | The time and date when the template was last modified.                                                                                                                                                 |

### Messaging template

| Name                    | Description                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>             | Name of the template.                                                                                                                                                                                  |
| <b>Owner</b>            | The name of the user who owns a template. For default templates, System is considered to be the owner. For user-defined templates, this field specifies the name of the user who created the template. |
| <b>Version</b>          | The change version of the template.                                                                                                                                                                    |
| <b>Default</b>          | Specifies whether the template is default or user-defined.                                                                                                                                             |
| <b>Type</b>             | The type of the messaging template.                                                                                                                                                                    |
| <b>Software Version</b> | The software version of the element for the template.                                                                                                                                                  |
| <b>Last Modified</b>    | The time and date when the template was last modified.                                                                                                                                                 |

## Add Agent Template field descriptions

| Name                    | Description                                                                          |
|-------------------------|--------------------------------------------------------------------------------------|
| <b>System Type</b>      | The Communication Manager that the agent is assigned to.                             |
| <b>Template Name</b>    | The name of the agent template. You can enter the name of your choice in this field. |
| <b>Software Version</b> | The Communication Manager version of the agent template.                             |

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AAS</b>                       | <p>The option to use this extension as a port for an Auto Available Split/Skill. By default, this check box is clear. This option is intended for communication server adjunct equipment ports only, not human agents.</p> <p> <b>Important:</b></p> <p>When you enter <i>y</i> in the AAS field, it clears the password and requires execution of the <b>remove agent-loginid</b> command. To set AAS to <i>n</i>, remove this logical agent, and add it again.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ACW Agent Considered Idle</b> | <p>The option to count After Call Work (ACW) as idle time. The valid entries are <b>System</b>, <b>Yes</b>, and <b>No</b>. Select <b>Yes</b> to have agents who are in ACW included in the Most-Idle Agent queue. Select <b>No</b> to exclude ACW agents from the queue.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>AUDIX</b>                     | <p>The option to use this extension as a port for AUDIX. By default, this check box is clear.</p> <p> <b>Note:</b></p> <p>The AAS and AUDIX fields cannot both be <i>y</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>AUDIX Name for Messaging</b>  | <p>You have the following options:</p> <ul style="list-style-type: none"> <li>• Enter the name of the messaging system used for LWC Reception</li> <li>• Enter the name of the messaging system that provides coverage for this Agent LoginID</li> <li>• Leave the field blank. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Auto Answer</b>               | <p>When using EAS, the auto answer setting of the agent applies to the station where the agent logs in. If the auto answer setting for that station is different, the agent setting overrides the station setting. The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>all</b>: Immediately sends all ACD and non-ACD calls to the agent. The station is also given a single ring while a non-ACD call is connected. You can use the ringer-off button to prevent the ring when the feature-related system parameter, <b>Allow Ringer-off with Auto-Answer</b> is set to <i>y</i>.</li> <li>• <b>acd</b>: Only ACD split /skill calls and direct agent calls go to auto answer. If this field is <i>acd</i>, non-ACD calls terminated to the agent ring audibly.</li> <li>• <b>none</b>: All calls terminated to this agent receive an audible ringing. This is the default setting.</li> <li>• <b>station</b>: Auto answer for the agent is controlled by the auto answer field on the Station screen.</li> </ul> |

| Name                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Aux Work Reason Code Type</b>            | <p>Determines how agents enter reason codes when entering AUX work. The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>system:</b> Settings assigned on the Feature Related System Parameters screen apply. This is the default setting.</li> <li>• <b>none:</b> You do not want an agent to enter a reason code when entering AUX work.</li> <li>• <b>requested:</b> You want an agent to enter a reason code when entering AUX mode but do not want to force the agent to do so. To enter this value, the reason codes and EAS on the System-Parameters Customer-Options screen must be set to <i>y</i>.</li> <li>• <b>forced:</b> You want to force an agent to enter a reason code when entering AUX mode. To enter this value, the Reason Codes and EAS on the System-Parameters Customer-Options screen must be set to <i>y</i>.</li> </ul> |
| <b>Call Handling Preference</b>             | <p>Determines which call an agent receives next when calls are in queue. When calls are in queue and an agent becomes available, the following entries are valid:</p> <ul style="list-style-type: none"> <li>• <b>skill-level:</b> Delivers the oldest, highest priority calls waiting for the highest-level agent skill.</li> <li>• <b>greatest-need:</b> Delivers the oldest, highest priority calls waiting for any agent skill.</li> <li>• <b>percent-allocation:</b> Delivers a call from the skill that will otherwise deviate most from its administered allocation. Percent-allocation is available only with Avaya Business Advocate software.</li> </ul> <p>For more information, see <i>Avaya Business Advocate User Guide</i>.</p>                                                                                                                        |
| <b>COR</b>                                  | <p>The Class Of Restriction for the agent. Valid entries range from <b>0</b> to <b>995</b>. The default entry is <b>1</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Coverage Path</b>                        | <p>The coverage path number used by calls to the LoginID. Valid entries are a path number from <b>1</b> to <b>999</b>, time of day table <b>t1</b> to <b>t999</b>, or blank (default). This is used when the agent is logged out, busy, or does not answer calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Direct Agent Calls First (not shown)</b> | <p>The option to direct agent calls to override the percent-allocation call selection method and be delivered before other ACD calls. Clear the check box if you want to treat direct agent calls as other ACD calls. This field replaces the Service Objective field when percent-allocation is entered in the Call Handling Preference field. For more information, see <i>Avaya Business Advocate User Guide</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Direct Agent Skill</b>                   | <p>The number of the skill used to handle Direct Agent calls. Valid entries range from <b>1</b> to <b>2000</b>, or blank. The default setting is blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forced Agent Logout Time</b>     | Enables the Forced Agent Logout by Clock Time feature by administering a time of day to automatically log out agents using an hour and minute field. Valid entries for the hour field range from <b>01</b> to <b>23</b> . Valid entries for the minute field are <b>00</b> , <b>15</b> , <b>30</b> , and <b>45</b> . The default is blank (not administered). Examples are: 15:00, 18:15, 20:30, 23:45.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Local Call Preference</b>        | The option to administer Local Preference Distribution to handle agent-surplus conditions, call-surplus conditions, or both. Use this field to administer call-surplus conditions. To set up an algorithm for agent-surplus conditions, set the Local Agent Preference field on the Hunt Group screen. You can select this check box only if the Call Center Release field is set to 3.0 or later and the Multiple Locations customer option is active.                                                                                                                                                                                                                                                                                                                                                 |
| <b>LoginID for ISDN/SIP Display</b> | The option to include the Agent LoginID CPN and Name field in ISDN and SIP messaging over network facilities. By default, the check box is clear, indicating that the physical station extension CPN and Name is sent. Send Name on the ISDN Trunk Group screen prevents sending the calling party name and number if set to n and may prevent sending it if set to r (restricted).                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Logout Reason Code Type</b>      | Determines how agents enter reason codes. The valid entries are: <ul style="list-style-type: none"> <li>• <b>System:</b> Settings assigned on the Feature Related System Parameters screen apply. This is the default entry.</li> <li>• <b>Requested:</b> You want an agent to enter a reason code when logging out but do not want to force the agent to do this. To enter this value, the reason codes and EAS on the System-Parameters Customer-Options screen must be set to y.</li> <li>• <b>Forced:</b> You want to force an agent to enter a reason code when logging out. To enter this value, the Reason Codes and EAS on the System-Parameters Customer-Options screen must be set to y.</li> <li>• <b>None:</b> You do not want an agent to enter a reason code when logging out.</li> </ul> |
| <b>LWC Reception</b>                | Indicates whether the terminal can receive Leave Word Calling (LWC) messages. The valid entries are: <ul style="list-style-type: none"> <li>• <b>audix</b></li> <li>• <b>msa-spe.</b> This is the default entry.</li> <li>• <b>none</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>LWC Log External Calls</b>       | Determines whether or not unanswered external call logs are available to end users. When external calls are not answered, Communication Manager keeps a record of up to 15 calls provided information on the caller identification is available. Each record consists of the latest call attempt date and time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

*Table continues...*

| Name                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum time agent in ACW before logout (Sec)</b> | <p>Sets the maximum time the agent can be in ACW on a per agent basis. The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>system:</b> This is the default entry. Settings assigned on the Feature Related System Parameters screen apply.</li> <li>• <b>none:</b> ACW timeout does not apply to this agent.</li> <li>• <b>30-9999 sec:</b> Indicates a specific timeout period. This setting will take precedence over the system setting for maximum time in ACW.</li> </ul> |
| <b>MIA Across Skills</b>                             | <p>The valid entries are:</p> <ul style="list-style-type: none"> <li>• <b>System:</b> The system-wide values apply. This is the default value.</li> <li>• <b>Yes:</b> Removes an agent from the MIA queues for all the splits or skills for which an agent is available when the agent answers a call from any assigned splits or skills.</li> <li>• <b>No:</b> Excludes ACW agents for the queue.</li> </ul>                                                                                     |
| <b>Localized Display Name</b>                        | The name associated with the agent login ID                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Attribute</b>                                     | The attribute associated with the agent login ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Percent Allocation</b>                            | <p>The percentage for each of the agent's skills if the call handling preference is percent-allocation. Valid entry is a number from <b>1</b> to <b>100</b> for each skill. Entries for all the agent skills together must add up to 100%. Do not use target allocations for reserve skills. Percent Allocation is available as part of the Avaya Business Advocate software.</p>                                                                                                                 |
| <b>Password</b>                                      | <p>The password the agent must enter upon login. Displayed only if both the AAS and AUDIX check boxes are clear. Valid entries are digits from <b>0</b> through <b>9</b>. Enter the minimum number of digits in this field specified by the Minimum Agent-LoginID Password Length field on the Feature-Related System Parameters screen. By default, this field is blank.</p>                                                                                                                     |
| <b>Confirm Password</b>                              | <p>Confirms the password the Agent entered in the Password field during login. Displayed only if both the AAS and the AUDIX check boxes are clear. By default, this field is blank.</p> <p> <b>Note:</b></p> <p>Values entered in this field are not echoed to the screen.</p>                                                                                                                                 |
| <b>Port Extension</b>                                | <p>The assigned extension for the AAS or AUDIX port. The values are displayed only if either the AAS or AUDIX check box is selected. This extension cannot be a VDN or an Agent LoginID. By default, this field is blank</p>                                                                                                                                                                                                                                                                      |

| Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reserve Level</b>     | <p>The reserve level to be assigned to the agent for the skill with the Business Advocate Service Level Supervisor feature or the type of interruption with the Interruptible AUX Work feature. You can assign a reserve level of 1 or 2 or an interruptible level of a, m, n, or blank for no reserve or interruptible level, where,</p> <ul style="list-style-type: none"> <li>• a: auto-in-interrupt</li> <li>• m: manual-in-interrupt</li> <li>• n: notify-interrupt</li> </ul> <p>Changes to this field take effect the next time the agent logs in. Values of 1 and 2 are allowed only if Business Advocate is enabled. A skill level cannot be assigned with a reserve level setting. Reserve level set to 1 or 2 defines the EWT threshold level for the agent to be added to the assigned skill as a reserve agent. When the EWT for this skill reaches the corresponding threshold set on the Hunt Group screen, agents automatically get this skill added to their logged in skills. Agents are delivered calls from this skill until the skill's EWT drops below the assigned overload threshold for that level. The Interruptible Aux feature is a way to help meet service level targets by requesting agents who are on break to become available when the service level target is not being met. For more information on Service Level Supervisor, see <i>Avaya Business Advocate User Guide</i>.</p> |
| <b>Service Objective</b> | <p>The option to administer Service Objective. Service Objective is administered on the Hunt Group screen and the agent LoginID screen. This field is displayed only when Call Handling Preference is set to greatest-need or skill-level. The communication server selects calls for agents according to the ratio of Predicted Wait Time (PWT) or Current Wait Time (CWT) and the administered service objective for the skill. Service Objective is part of the Avaya Business Advocate software.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Security Code</b>     | <p>The security code required by users for specific system features and functions, including the following: Personal Station Access, Redirection of Calls Coverage Off-Net, Leave Word Calling, Extended Call Forwarding, Station Lock, Message Retrieval, Terminal Self-Administration, and Demand Printing. The required security code length is administered system-wide.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Skill Number</b>  | <p>The Skill Hunt Groups that an agent handles. The same skill may not be entered twice. You have the following options:</p> <ul style="list-style-type: none"> <li>• If EAS-PHD is not optioned, enter up to four skills.</li> <li>• If EAS-PHD is optioned, enter up to 20 or 60 skills depending on the platform.</li> </ul> <p> <b>Important:</b></p> <p>Assigning a large number of skills to agents can potentially impact system performance. Review system designs with the ATAC when a significant number of agents have greater than 20 skills per agent.</p> |
| <b>Skill Level</b>   | A skill level for each of an agent's assigned skills. If you specify the EAS-PHD option, 16 priority levels are available. If you do not specify this option, two priority levels are available.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Tenant Number</b> | <p>The tenant partition number. Valid entries range from <b>1</b> to <b>100</b>. The default is entry is <b>1</b>.</p> <p> <b>Note:</b></p> <p>Values entered in this field are not echoed to the screen.</p>                                                                                                                                                                                                                                                                                                                                                           |

| Button        | Description                                                       |
|---------------|-------------------------------------------------------------------|
| <b>Commit</b> | Completes the action you initiate.                                |
| <b>Clear</b>  | Clears all entries.                                               |
| <b>Done</b>   | Completes your current action and returns to the subsequent page. |

## Subscriber Messaging Templates field descriptions

| Name                    | Description                                           |
|-------------------------|-------------------------------------------------------|
| <b>Template name</b>    | The template of this subscriber template.             |
| <b>Type</b>             | The messaging type of the subscriber template.        |
| <b>Software Version</b> | The software version of the element for the template. |

### Basic Information

| Name              | Description                       |
|-------------------|-----------------------------------|
| <b>Last Name</b>  | The last name of the subscriber.  |
| <b>First Name</b> | The first name of the subscriber. |

*Table continues...*

| Name                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PBX Extension</b>         | <p>A number whose length can range from three digits to 10 digits, that the subscriber will use to log on to the mailbox. Other local subscribers can use the Extension Number to address messages to this subscriber. The Extension Number must:</p> <ul style="list-style-type: none"> <li>• Be within the range of Extension Numbers assigned to your system.</li> <li>• Not be assigned to another local subscriber.</li> <li>• Be a valid length on the local computer.</li> </ul> |
| <b>Password</b>              | <p>The default password that users must use to log on to their mailbox.</p> <p>The password must be from 3 to 15 digits and adhere to system policies that you set on the Avaya Aura® Messaging server.</p>                                                                                                                                                                                                                                                                             |
| <b>Class Of Service Name</b> | <p>The Class Of Service (CoS) name for this subscriber.</p> <p>CoS controls subscriber access to many features and provides general settings, such as mailbox size. The value that you select must be available in the messaging system.</p>                                                                                                                                                                                                                                            |
| <b>Community ID</b>          | <p>The default community ID for the subscriber. Community IDs are used to control message sending and receiving among groups of subscribers. The default value is 1.</p>                                                                                                                                                                                                                                                                                                                |

## Subscriber Directory

| Name                         | Description                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Telephone Number</b>      | The name that the system displays before the computer name and domain in the subscriber's email address.                                  |
| <b>Common Name</b>           | The display name of the subscriber.                                                                                                       |
| <b>ASCII version of name</b> | If the subscriber name is entered in multi-byte character format, then this field specifies the ASCII translation of the subscriber name. |

## Mailbox Features

| Name                              | Description                                                                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Personal Operator Mailbox</b>  | The mailbox number or transfer dial string of the subscriber's personal operator or assistant. This field also indicates the transfer target when a caller to this subscriber presses 0 while listening to the subscriber's greeting. |
| <b>Personal Operator Schedule</b> | Specifies when to route calls to the backup operator mailbox. The default value for this field is <b>Always Active</b> .                                                                                                              |

*Table continues...*

| Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TUI Message Order</b> | <p>The order in which the subscriber hears the voice messages. The options are:</p> <ul style="list-style-type: none"> <li>• <b>urgent first then newest:</b> to direct the system to play any messages marked as urgent prior to playing non-urgent messages. Both the urgent and non-urgent messages are played in the reverse order of how they were received.</li> <li>• <b>oldest messages first:</b> to direct the system to play messages in the order they were received.</li> <li>• <b>urgent first then oldest:</b> to direct the system to play any messages marked as urgent prior to playing non-urgent messages. Both the urgent and non-urgent messages are played in the order of how they were received.</li> <li>• <b>newest messages first:</b> to direct the system to play messages in the reverse order of how they were received.</li> </ul> |
| <b>Intercom Paging</b>   | <p>The intercom paging settings for a subscriber. The options are:</p> <ul style="list-style-type: none"> <li>• <b>paging is off:</b> To disable intercom paging for this subscriber.</li> <li>• <b>paging is manual:</b> If the subscriber can modify, with Subscriber Options or the TUI, callers can page the subscriber.</li> <li>• <b>paging is automatic:</b> If the TUI automatically allows callers to page the subscriber.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>VoiceMail Enabled</b> | <p>Specifies whether a subscriber can receive messages, email messages, and call-answer messages from other subscribers. The options are:</p> <ul style="list-style-type: none"> <li>• <b>yes:</b> use this to create, forward, and receive messages.</li> <li>• <b>no:</b> to prevent the subscriber from receiving call-answer messages and to hide the subscriber from the telephone user interface (TUI). The subscriber cannot use the TUI to access the mailbox, and other TUI users cannot address messages to the subscriber.</li> </ul>                                                                                                                                                                                                                                                                                                                    |

## Secondary Extensions

| Name                       | Description                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary extension</b> | The number assigned to a subscriber for receiving fax messages. Valid Entries are blank or 3-10 digits (0-9), depending on the length of the system's extension. |

## Miscellaneous

| Name                  | Description                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Miscellaneous1</b> | Gives additional, useful information about a subscriber. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Miscellaneous2</b> | Gives additional, useful information about a subscriber. Entries in this field are for convenience and are not used by the messaging system. |

*Table continues...*

| Name                  | Description                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Miscellaneous3</b> | Gives additional, useful information about a subscriber. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Miscellaneous4</b> | Gives additional, useful information about a subscriber. Entries in this field are for convenience and are not used by the messaging system. |

| Button                | Description                                             |
|-----------------------|---------------------------------------------------------|
| <b>Commit</b>         | Adds the subscriber template.                           |
| <b>Reset or Clear</b> | Undoes all the changes.                                 |
| <b>Edit</b>           | Allows you to edit the fields.                          |
| <b>Done</b>           | Completes your action and returns to the previous page. |
| <b>Cancel</b>         | Returns to the previous page.                           |
| <b>Schedule</b>       | Performs the action at the chosen time.                 |

## Subscriber CMM Templates field descriptions

| Name                     | Description                                                                |
|--------------------------|----------------------------------------------------------------------------|
| <b>Template name</b>     | The template of this subscriber template.                                  |
| <b>New Template Name</b> | The name of the duplicate template. You can enter the name of your choice. |
| <b>Type</b>              | The messaging type of the subscriber template.                             |
| <b>Software Version</b>  | The software version of the element for the template.                      |

### Basic Information

| Name              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>  | The last name of the subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>First Name</b> | The first name of the subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Extension</b>  | <p>A number that is between 3-digits and 10-digits in length, that the subscriber will use to log into the mailbox. Other local subscribers can use the Extension Number to address messages to this subscriber. The extension number must:</p> <ul style="list-style-type: none"> <li>• Be within the range of Extension Numbers assigned to your system.</li> <li>• Not be assigned to another local subscriber.</li> <li>• Be a valid length on the local computer.</li> </ul> |
| <b>Password</b>   | The default password that a user has to use to login to his or her mailbox. The password you enter can be 1 to 15 digits in length and cannot be blank                                                                                                                                                                                                                                                                                                                            |

*Table continues...*

| Name                       | Description                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class Of Service ID</b> | The class of service (CoS) ID for this subscriber.<br><br>CoS controls subscriber access to many features and provides general settings, such as mailbox size. The value that you select must be available in the messaging system.                                                                                                                      |
| <b>Community ID</b>        | The default community ID for the subscriber. Community IDs are used to control message sending and receiving among groups of subscribers. The default value is 1.                                                                                                                                                                                        |
| <b>MWI Enabled</b>         | The option to set the message waiting indicator (MWI) for the subscriber. The options are: <ul style="list-style-type: none"> <li>• <b>No:</b> If the system must not send MWI for the subscriber or if the subscriber does not have a phone or switch on the network.</li> <li>• <b>Yes:</b> If the system must send MWI for the subscriber.</li> </ul> |
| <b>Account Code</b>        | The Subscriber Account Code. The Subscriber Account Code is used to create Call Detail Records on the switch for calls placed by the voice ports. The value you enter in this field can contain any combination of digits from 0 to 9. If an account code is not specified, the system will use the subscriber's mailbox extension as the account code.  |

### Subscriber Directory

| Name                | Description                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------|
| <b>Email Handle</b> | The name that the system displays before the computer name and domain in the subscriber's email address. |
| <b>Common Name</b>  | The display name of the subscriber.                                                                      |

### Mailbox Features

| Name                      | Description                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Covering Extension</b> | The number to be used as the default destination for the Transfer Out of Messaging feature. You can enter 3 to 10 digits depending on the length of the system extension, or leave this field blank. |

### Secondary Extensions

| Name                       | Description                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary extension</b> | The number assigned to a subscriber for receiving fax messages. Valid Entries are blank or 3-10 digits (0-9), depending on the length of the system's extension. |

### Miscellaneous

| Name          | Description                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Misc 1</b> | Additional, useful information about a subscriber. Entries in this field are for convenience and are not used by the Messaging system. |

## Subscriber MM Templates field descriptions

| Name                     | Description                                                                |
|--------------------------|----------------------------------------------------------------------------|
| <b>Type</b>              | The messaging type of the subscriber template.                             |
| <b>New Template Name</b> | The name of the duplicate template. You can enter the name of your choice. |
| <b>Template name</b>     | The messaging template of a subscriber template.                           |
| <b>Software Version</b>  | The software version of the element for the template.                      |

### Basic Information

| Name                       | Description                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>           | The last name of the subscriber.                                                                                                                                                                                                    |
| <b>First Name</b>          | The first name of the subscriber.                                                                                                                                                                                                   |
| <b>Numeric Address</b>     | A unique address in the voice mail network. The numeric address can be from 1 to 50 digits and can contain the Mailbox Number.                                                                                                      |
| <b>PBX Extension</b>       | The primary telephone extension of the subscriber.                                                                                                                                                                                  |
| <b>Class Of Service ID</b> | The class of service (CoS) ID for this subscriber.<br><br>CoS controls subscriber access to many features and provides general settings, such as mailbox size. The value that you select must be available in the messaging system. |

*Table continues...*

| Name                | Description                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Community ID</b> | The default community ID for the subscriber. Community IDs are used to control message sending and receiving among groups of subscribers. The default value is 1. |
| <b>Password</b>     | The default password the subscriber must use to log in to his or her mailbox. The password can be from one digit in length to a maximum of 15 digits.             |

### Subscriber Directory

| Name                         | Description                                                                                                                                                                                                                                                                                       |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Email Handle</b>          | The name that the system displays before the computer name and domain in the subscriber's e-mail address. The computer name and domain are automatically added to the handle you enter when the subscriber sends or receives an e-mail.                                                           |
| <b>Telephone Number</b>      | The telephone number of the subscriber as displayed in address book listings and client applications. The entry can be a maximum of 50 characters in length and can contain any combination of digits (0-9), period (.), hyphen (-), plus sign (+), and left and right parentheses (()) and (()). |
| <b>Common Name</b>           | The display name of the subscriber in address book listings, such as those for e-mail client applications. The name you enter can be 1 to 64 characters in length. This field is automatically populated when you add a new subscriber.                                                           |
| <b>ASCII Version of Name</b> | If the subscriber name is entered in multi-byte character format, then this field specifies the ASCII translation of the subscriber name.                                                                                                                                                         |

### Mailbox Features

| Name                              | Description                                                                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Backup Operator Mailbox</b>    | The mailbox number or transfer dial string of the subscriber's personal operator or assistant. This field also indicates the transfer target when a caller to this subscriber presses 0 while listening to the subscriber's greeting. |
| <b>Personal Operator Schedule</b> | Specifies when to route calls to the backup operator mailbox. The default value for this field is <b>Always Active</b> .                                                                                                              |

*Table continues...*

| Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TUI Message Order</b> | <p>The order in which the subscriber hears the voice messages. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>urgent first then newest:</b> to direct the system to play any messages marked as urgent prior to playing non-urgent messages. Both the urgent and non-urgent messages are played in the reverse order of how they were received.</li> <li>• <b>oldest messages first:</b> to direct the system to play messages in the order they were received.</li> <li>• <b>urgent first then oldest:</b> to direct the system to play any messages marked as urgent prior to playing non-urgent messages. Both the urgent and non-urgent messages are played in the order of how they were received.</li> <li>• <b>newest messages first:</b> to direct the system to play messages in the reverse order of how they were received.</li> </ul> |
| <b>Intercom Paging</b>   | <p>The intercom paging settings for a subscriber. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>paging is off:</b> to disable intercom paging for this subscriber.</li> <li>• <b>paging is manual:</b> if the subscriber can modify, with Subscriber Options or the TUI, callers can page the subscriber.</li> <li>• <b>paging is automatic:</b> if the TUI automatically allows callers to page the subscriber.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Voicemail Enabled</b> | <p>Specifies whether a subscriber can receive messages, e-mail messages and call-answer messages from other subscribers. You can choose one of the following:</p> <ul style="list-style-type: none"> <li>• <b>yes:</b> use this to create, forward, and receive messages.</li> <li>• <b>no:</b> to prevent the subscriber from receiving call-answer messages and to hide the subscriber from the telephone user interface (TUI). The subscriber cannot use the TUI to access the mailbox, and other TUI users cannot address messages to the subscriber.</li> </ul>                                                                                                                                                                                                                                                                                                                    |

## Secondary Extensions

| Name                       | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary extension</b> | <p>Specifies one or more alternate number to reach a subscriber. You can use secondary extensions to specify a telephone number for direct reception of faxes, to allow callers to use an existing Caller Application, or to identify each line appearance on the subscriber's telephone set if they have different telephone numbers.</p> |

## Miscellaneous

| Name          | Description                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Misc 1</b> | Gives additional, useful information about a subscriber template. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Misc 2</b> | Gives additional, useful information about a subscriber template. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Misc 3</b> | Gives additional, useful information about a subscriber template. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Misc 4</b> | Gives additional, useful information about a subscriber template. Entries in this field are for convenience and are not used by the messaging system. |

## Managing IP Office Endpoint template

### Adding an IP Office endpoint template

#### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office Endpoint**.
3. Click **New**.
4. Enter the required information in the **Name**, **System Type**, **Set Type**, and **Version** fields.
5. Click **Details**.

The system launches the IP Office Manager application.

6. On the IP Office Manager window, in the right pane, specify the required details, such as voice mail, telephony, and button programming in the respective tabs.

7. Click **File > Save Template and Exit** to save the template configuration and exit the IP Office application.

The system directs you to the landing page of **IP Office Endpoint**.

You can view the newly created template in the list of templates under IP Office endpoint templates.

When you upgrade System Manager, Default Centralized ATA Template, Default Centralized SIP Template are now available to create centralized users.

## Deleting an IP Office endpoint template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office Endpoint**.
3. Select a type of system from the list of IP Office supported templates.
4. Click **Show List**.
5. From the **IP Office Endpoint Templates** list, select the template you want to delete.
6. Click **Delete**.

The system displays the template instance you selected for deletion.

7. Perform one of the following:

- Click **Delete** to delete the template.
- Click **Cancel** to cancel the delete operation and return to the **IP Office Endpoint** landing page.

## Upgrading IP Office endpoint templates

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office Endpoint**.
3. Select the IP Office device type.
4. Click **Show List**.
5. Select the template you want to upgrade.
6. Click **Upgrade**.
7. In the **Supported IP Office Versions** field, enter the target version for upgrade.
8. In **Template Name**, type the name of the template.

Template name must be a unique name.

9. Click **Upgrade**.

System Manager upgrades the selected template, and the IP Office Manager starts with the upgraded template. The original template you selected is retained.

10. After the IP Office Manager starts, the new, upgraded template, save and exit.

The system displays the upgraded template in the IP Office Endpoint List page.

## IP Office endpoint template field descriptions

| Name               | Description                                                                                                                                                                                                                |

## Managing IP Office System Configuration template

---

### Adding an IP Office System Configuration template

#### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. Click **New**.
4. Complete the **Name**, **System Type**, and **Version** fields.
5. Click **Details**.  
The system launches the IP Office application.
6. On the Offline Configuration Creation window, click **OK**.
7. In the right pane, complete the system configuration template by filling the required fields, and click **OK**.
8. Click **File > Save Template and Exit** to save the template specifications and exit the IP Office application.

The system directs you to the IP Office System Configuration landing page where you can view the newly created system template in the IP Office System Configuration list.

---

## Viewing an IP Office System Configuration template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. On the IP Office Branch Gateway Template page, from the IP Office supported templates list, select an IP Office system type.
4. Click **Show List**.
5. Select the system configuration template you want to view from the IP Office System Configuration list.
6. Click **View**.  
The system launches the IP Office Manager application.
7. On the IP Office Manager window, in the right pane, you can view the system configuration template details. All the fields are read-only.
8. Click **File > Exit** to exit IP Office Manager.  
The system directs you to the IP Office System Configuration landing page.

---

## Editing an IP Office system configuration template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. On the IP Office System Configuration Templates page, select an IP Office system type.
4. Click **Show List**.
5. Select the system configuration template you want to edit from the IP Office System Configuration list.
6. Click **Edit**.  
The system launches the IP Office Manager application.
7. On the IP Office Manager window, edit the required configuration parameters, and click **OK**.
8. Click **File > Save Template and Exit** to save the modifications to the system configuration template and exit the IP Office Manager application.  
The system displays the IP Office System Configuration landing page.

---

## Deleting an IP Office system configuration template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. On the IP Office Template page, select an IP Office system type.
4. Click **Show List**.
5. Select the system configuration template you want to delete from the IP Office System Configuration list.
6. Click **Delete**.

The system displays the system template instance you selected for deletion.

7. Do one of the following:
  - Click **Delete** to delete the template.
  - Click **Cancel** to cancel the delete operation, and return to the IP Office System Configuration landing page.

---

## Applying an IP Office system configuration template on an IP Office device

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. On the IP Office Template page, select an IP Office system type.
4. Click **Show List**.
5. From the IP Office System Configuration List, select the system template you want to apply to an IP Office device.
6. Click **Apply**.

You will be directed to a new page where you can select a device to apply the template.

7. From the list of IP Office devices, select the IP Office device on which you want to apply the selected IP Office system configuration template.

#### **Important:**

When you apply a template on a device, the data of the template that you wish to apply may override the existing system configuration data on the device.

8. Do one of the following:

- Click **Now** to perform apply the template immediately.
- Click **Schedule** to apply the template at a specified time in **Scheduler**.
- Click **Cancel** to cancel this task and return to the IP Office System Configuration landing page.

## IP Office System Configuration template field descriptions

| Name                      | Description                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>               | The name of the IP Office System Configuration template.                                                                                                                                                     |
| <b>System Type</b>        | The type of system associated with the template. The options are: <ul style="list-style-type: none"> <li>• <b>IP Office</b>: for IP Office core unit</li> <li>• <b>B5800</b>: for B5800 core unit</li> </ul> |
| <b>Version</b>            | The version number of the template.                                                                                                                                                                          |
| <b>Last Modified Time</b> | The date and time when the IP Office System Configuration template was last modified.                                                                                                                        |

| Button         | Description                                                                        |
|----------------|------------------------------------------------------------------------------------|
| <b>Details</b> | Displays the IP Office application where you can add or edit the template details. |

## Manage audio files

Audio files in .WAV and .C11 formats are used in auto attendant configuration in the Auto Attendant feature in IP Office. In System Manager, you can manage .WAV and .C11 audio files from the Manage Audio page in IP Office System Configuration in Template Management. The .C11 audio file is for use in IP Office IP500V2 or the B5800 Core Unit.

To push an auto attendant file to an IP Office System Configuration template through System Manager, you must first upload the .WAV audio files using the **Upload** button in the Manage Audio page. When you upload the .WAV audio files, the corresponding .C11 audio files are automatically created. If you need to convert any .WAV audio file which does not have a corresponding .C11 audio file, or if the corresponding .C11 audio file is deleted, click the **Convert** button in the Manage Audio page.

Use the **Manage Audio** page in **IP Office System Configuration** to:

- Upload .WAV and .C11 audio files.
- Convert .WAV to .C11 audio file format.
- Delete .WAV and .C11 audio files.

---

## Uploading an audio file

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. Click **More Options > Manage Audio**.
4. On the Manage Audio page, enter the complete path of the audio file in the **Select an Audio File** text box. You can also click **Browse** to locate and select the audio file you want to upload.

The system displays the audio file you selected for uploading in a table.

 **Note:**

System Manager filters uploaded files based on mime type or bytes in the file. If a file type does not match, System Manager shows up an error message.

5. If you want to remove the audio file from your selection, click the **Remove** link in the **Action** column.
6. Click **Upload**.

You can view the newly uploaded audio files listed in the **List of Audio Files** table.

---

## Converting a .WAV audio file to a .C11 audio file

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. Click **More Options > Manage Audio**.
4. On the Manage Audio page, select the .WAV audio file from the **List of Audio Files** that you want to convert to .C11 format.
5. On the Convert Audio page, the system lists the file you selected for conversion.
6. If you want to change the recording label of the .WAV file, edit the label text in the corresponding text box under the **Recording Label** column.
7. Click **Commit** to confirm the convert action.

The system displays the newly converted audio file under the corresponding audio name column in the **List of Audio Files** table.

## Deleting an audio file

### About this task

Use the **Delete** button to delete audio files from the list of audio files. You can choose to either delete the .WAV audio format, or the .C11 audio file format, or delete both the audio file formats in a single step.

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the navigation pane, click **IP Office System Configuration**.
3. Click **More Options > Manage Audio**.
4. On the Manage Audio page, select the audio file you want to delete from the list of audio files.
5. Click **Delete**.
6. On the Delete Audio File Confirmation page, you can view the audio files you selected in Step 4 for deletion. From the **Select the type of deletion** field perform one of the following:
  - Select the type of audio file extension you want to delete.
  - Select **Both** if you want to delete both the file extension types.

Sample scenario: Suppose you have ABC.wav and ABC.c11 audio files in the **List of Audio Files**. If you want to delete only the ABC.wav audio file, then select **Wave** from **Select the type of deletion**. If you want to delete both the audio files in a single step, then select **Both** from the **Select the type of deletion** field.

7. Click **Delete**.
8. Click **Done** to return to the IP Office System Configuration landing page.

## Manage Audio field descriptions

| Name                                     | Description                                                        |
|------------------------------------------|--------------------------------------------------------------------|
| <b>wav Audio File Name</b>               | The file name of the .WAV type of audio file.                      |
| <b>Last uploaded time of wav</b>         | The time when you last uploaded the .WAV audio file in the system. |
| <b>Recording Label</b>                   | The recording label of the .wav file.                              |
| <b>C11 Audio File Name</b>               | The file name of the .C11 type of audio file.                      |
| <b>Last converted time of wav to C11</b> | The time when you last converted a .wav file to a .C11 audio file. |

## Managing UCM and Application Server system configuration templates

### Adding a UCM and Application Server Configuration template Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the left navigation pane, click **UCM and Application Server Configuration**.
3. On the UCM and Application Server Templates page, in the **Templates List** section, click **New**.
4. Complete the **Name**, **System Type**, and **Version** fields.
5. Click **Details**.  
The system launches the IP Office Manager application.
6. On the Offline Configuration Creation window, click **OK**.

7. In the right pane, complete the system configuration template by filling the required fields, and click **OK**.
8. Click **File > Save Template and Exit** to save the template specifications and exit the IP Office Manager application.

The system directs you to the UCM and Application Server Templates landing page where you can view the newly created system template in the **UCM and Application Server Templates** list.

## Applying a UCM and Application Server Configuration template

### Procedure

1. On the System Manager web console, click **Services > Templates**.
2. In the left navigation pane, click **UCM and Application Server Configuration**.
3. On the UCM and Application Server Templates page, In the **Supported System Types** section, select one of the following system types:
  - IP Office Application Server
  - Unified Communications Module
4. Click **Show List**.
5. From the UCM and Application Server Configuration List, select the system template you want to apply to a device.
6. Click **Apply**.

You will be directed to a new page where you can select a device to apply the template.

7. From the list of IP Office devices, select the IP Office device on which you want to apply the selected UCM and Application Server Configuration template.

 **Important:**

When you apply a template on a device, the data of the template that you wish to apply may override the existing system configuration data on the device.

8. Do one of the following:
  - Click **Now** to perform apply the template immediately.
  - Click **Schedule** to apply the template at a specified time in **Scheduler**.
  - Click **Cancel** to cancel this task and return to the UCM and Application Server Templates landing page.

# Chapter 20: Security

## Extended Security Hardening

System Manager supports Standard, Commercial, and Military Grade security hardening. By default, System Manager comes with Standard Grade hardening configuration, no additional action is required to set up this configuration.

Each security hardening grade applies specific security attributes as summarized in the following table:

| Security attribute                                                                                                                                                                                                             | Standard grade | Commercial grade | Military grade       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|------------------|----------------------|
| VM Configuration Hardening <sup>1</sup>                                                                                                                                                                                        | Y              | Y                | Y                    |
| Password Management                                                                                                                                                                                                            | Y              | Y                | Y (more restrictive) |
| Login and Session Management                                                                                                                                                                                                   | Y              | Y                | Y                    |
| System and Application Files Hardening                                                                                                                                                                                         | Y              | Y                | Y                    |

## Enabling Commercial Grade Hardening

### About this task

Use this procedure to enable Commercial Grade hardening.

#### ! Important:

Once you enable Commercial Grade hardening, you cannot disable it. If you want to disable Commercial Grade hardening, you must redeploy System Manager.

### Before you begin

- To reach the System Manager command line interface, use one of the following methods:
  - Open vSphere Web Client and click on the **Console** tab or the  icon.
  - Use PuTTY.
- Log in to System Manager with administrator privilege credentials.
- Create the System Manager virtual machine snapshot.

#### \* Note:

Delete the snapshot after the System Manager operation is complete.

### Procedure

1. Log in to the System Manager command line interface.
2. Type `setSecurityProfile --enable-commercial-grade`, and press `Enter`.
3. When the system prompts, provide the user password and press `Enter`.
4. Type one of the following and press `Enter`:
5. At the prompt, type one of the following and press `Enter`:

- 1 to continue.
- 2 to exit.

You cannot gain access to the system while the profile is being enabled.

The system takes a few minutes to complete the setting, and reboots for the changes to take effect.

6. To verify the enabled security profile, type `getSecurityprofile` and press `Enter`.

If the security profile is successfully enabled, the system displays the following message:

```
Profile Mode : commercial grade hardened mode enabled
```

```
SELinux status: enabled
SELinuxfs mount: /sys/fs/selinux
SELinux root directory: /etc/selinux
Loaded policy name: targeted
Current mode: permissive
```

```

Mode from config file: permissive
Policy MLS status: enabled
Policy deny_unknown status: allowed
Max kernel policy version: 28

```

FIPS State : FIPS enabled.

---

## Enabling Military Grade Hardening

### About this task

Use this procedure to enable Military Grade hardening.

#### Important:

Once you enable Military Grade hardening, you cannot disable it. If you want to disable Military Grade hardening, you must redeploy System Manager.

### Before you begin

- To reach the System Manager command line interface, use one of the following methods:
  - Open vSphere Web Client and click on the **Console** tab or the  icon.
  - Use PuTTY.
- Log in to System Manager with administrator privilege credentials.
- Create the System Manager virtual machine snapshot.

#### Note:

Delete the snapshot after the System Manager operation is complete.

### Procedure

1. Log in to the System Manager command line interface.
2. Type `setSecurityProfile --enable-military-grade`, and press `Enter`.
3. When the system prompts, provide the user password and press `Enter`.
4. At the prompt, type one of the following and press `Enter`:
  - 1 to continue.
  - 2 to exit.
5. At the `Enable SELinux?` prompt, type one of the following and press `Enter`:
  - 1 to enable.
  - 2 to disable.
6. At the `Enable Audit?` prompt, type one of the following and press `Enter`:
  - 1 to enable.

- 2 to disable.

7. At the `Enable AIDE Tool?` prompt, type one of the following and press `Enter`:

- 1 to enable.
- 2 to disable.

You cannot gain access to the system while the profile is being enabled.

The system takes a few minutes to complete the setting, and reboots for the changes to take effect.

8. To verify the enabled security profile, type `getSecurityprofile` and press `Enter`.

If the security profile is successfully enabled, the system displays the following message:

```
Profile Mode : military grade hardened mode enabled
```

```
SELinux status: enabled
SELinuxfs mount: /sys/fs/selinux
SELinux root directory: /etc/selinux
Loaded policy name: targeted
Current mode: enforcing
Mode from config file: enforcing
Policy MLS status: enabled
Policy deny_unknown status: allowed
Max kernel policy version: 28
```

```
FIPS State : FIPS enabled.
```

```
Audit logging Enabled..
```

```
AIDE Tool Enabled..
```

## Optional settings for security hardening

To fulfil the security or environmental requirements, following are the optional settings for security hardening.

| No. | Settings                          | Reference                                                                         |
|-----|-----------------------------------|-----------------------------------------------------------------------------------|
| 1.  | Enable Out of Band Management     | <a href="#">Configuring Out of Band Management on System Manager</a> on page 1506 |
| 2.  | Modify password settings          | <a href="#">Editing password policies</a> on page 60                              |
| 3.  | Configure remote logging          | <a href="#">Configuring System Manager logs for Syslog server</a> on page 1529    |
| 4.  | Configure LDAP for authentication | <a href="#">Provisioning the LDAP server</a> on page 1241                         |
| 5.  | Configure EASG                    | <a href="#">Remote access of System Manager</a> on page 1560                      |
| 6.  | Change login banner               | <a href="#">Editing the login warning banner</a> on page 73                       |

---

## Security hardening options

System Manager provides the following security hardening options:

- selinux
- audit
- fips
- aide
- TLSv1, TLSv1.1, and TLSv1.2

You can enable or disable one or more security hardening options. While you can enable all the options, you can only disable selinux, audit, and aide.

---

## Enabling security hardening options

### About this task

Use this procedure to enable one or more security hardening options from the following:

- selinux
- audit
- fips
- aide
- TLSv1, TLSv1.1, and TLSv1.2

### Procedure

1. Log in to the System Manager command line interface.
2. Do one of the following:

- To enable only one security hardening option, type `securityHardeningOptions <security_hardening_option_name> enable`, and press Enter.

For example, type the following command, and press Enter.

```
securityHardeningOptions selinux enable
```

- To enable more than one security hardening options, type `securityHardeningOptions <Comma separated_security_hardening_option_name> enable`, and press Enter.

For example, type the following command, and press Enter.

```
securityHardeningOptions selinux,audit,fips,aide,TLSv1.2enable
```

The system takes a few minutes to complete the setting and reboots for the changes to take effect.

---

## Disabling security hardening options

### About this task

Use this procedure to disable one or more security hardening options from the following:

- selinux
- audit
- aide

### Procedure

1. Log in to the System Manager command line interface.
2. Do one of the following:

- To disable only one security hardening option, type `securityHardeningOptions <security_hardening_option_name> disable`, and press Enter.

For example, type the following command, and press Enter.

```
securityHardeningOptions selinux disable
```

- To disable more than one security hardening options, type `securityHardeningOptions <Comma separated_security_hardening_option_name> disable`, and press Enter.

For example, type the following command, and press Enter.

```
securityHardeningOptions selinux,audit,aide disable
```

The system takes a few minutes to complete the setting and reboots for the changes to take effect.

---

## Viewing the status of the security hardening options

### Procedure

1. Log in to the System Manager command line interface.
2. Type the command: `securityHardeningOptions --showstate`.

Based on the system state, the system displays the following message.

```
SELinux status: enabled
SELinuxfs mount: /sys/fs/selinux
SELinux root directory: /etc/selinux
Loaded policy name: targeted
Current mode: enforcing
Mode from config file: enforcing
Policy MLS status: enabled
Policy deny_unknown status: allowed
Max kernel policy version: 28

FIPS State : enabled.
```

```
Audit: enabled
AIDE: enabled
Minimum TLS version = TLSv1.2
SMGR Hardening mode: fips
```

---

## Configuring the TLS cipher suite list

### About this task

With System Manager Release 8.0, the TLS cipher suite lists for establishing a secure communication are:

- Strict cipher suite list
- Relax cipher suite list

When you deploy the System Manager Release 8.0 OVA or upgrade System Manager to Release 8.0, by default, the system enables the Relax cipher suite list.

Use the following procedure to configure the required cipher suite list for the system.

### Procedure

1. Log in to the System Manager command line interface.
2. Do one of the following:
  - To configure strict cipher suite list, type the following command. This would disable CBC ciphers.  
**changeCipherSuiteList LIST2**
  - To configure relax cipher suite list, type the following command. This would enable CBC ciphers.  
**changeCipherSuiteList LIST1**

The system restarts the JBoss service on execution of the cipher suite list command.

---

## Changing the TLS version

---

### Changing the TLS version of System Manager

#### Procedure

1. On the System Manager web console, click **Services > Security**.

2. In the navigation pane, click **Configuration > Security Configuration**.
3. On the Security Configuration page, click **Global**.
4. In the **Minimum TLS Version** field, click the appropriate TLS version.  
For more information, see “Security Configuration field descriptions”.
5. Click **Commit** to save the changes.

---

## Changing the TLS version of primary and secondary System Manager

### About this task

Use the following procedure to change the TLS version of System Manager in the Geographic Redundancy setup.

### Before you begin

Ensure that the system is in the maintenance window.

### Procedure

1. Disable the Geographic Redundancy replication.  
For more information, see “Disabling the Geographic Redundancy replication”.
2. Activate the secondary System Manager server.  
For more information, see “Activating the secondary System Manager server”.
3. On the primary System Manager server, change **Minimum TLS Version**.  
For more information, see “Changing the TLS version of System Manager”.  
Wait until the JBoss service starts. JBoss service automatically restarts after 10 minutes.
4. On the secondary System Manager server, change **Minimum TLS Version**.  
For more information, see “Changing the TLS version of System Manager”.  
Wait until the JBoss service starts. JBoss service automatically restarts after 10 minutes.
5. Deactivate the secondary System Manager server.  
For more information, see “Deactivating the secondary System Manager server”.
6. Restore data on the primary System Manager server and note the following:  
For more information, see “Restoring the primary System Manager server”.
  - a. Perform the **Restore Data** operation from the secondary System Manager server.
  - b. Ensure to select **Primary System Manager**.
7. Enable the Geographic Redundancy replication.  
For more information, see “Enabling the Geographic Redundancy replication”.

---

## outboundConnectionLogging command

The **outboundConnectionLogging** command captures the logs in the `/var/log/Avaya/connections` file for every new outgoing connections initiated from System Manager.

By default, the outbound connection logging is disabled.

If you need to monitor logs, you can enable the outbound connection logging. Note that this can generate large amount of logs in the log file and might slightly impact the performance of System Manager. Therefore, it is recommended to disable the outbound connection logging, once your job is complete.

**Syntax**

```
outboundConnectionLogging [enable] [disable]
```

**enable**                Enables the outbound connection logging.

**disable**              Disables the outbound connection logging.

**Related links**

[Enabling outbound connection logging](#) on page 1170  
[Disabling outbound connection logging](#) on page 1171

---

## Enabling outbound connection logging

**Procedure**

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type `outboundConnectionLogging enable`, and press `Enter`.
3. When the system prompts for privileged command execution verification [`sudo`], type the password.

System Manager enables the outbound connection logging.

**Related links**

[outboundConnectionLogging command](#) on page 1170

---

## Disabling outbound connection logging

**Procedure**

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type `outboundConnectionLogging disable`, and press `Enter`.
3. When the system prompts for privileged command execution verification [`sudo`], type the password.

System Manager disables the outbound connection logging.

[outboundConnectionLogging command](#) on page 1170

---

## configureOutboundFirewall command

With Release 8.1.3, you can configure System Manager outbound firewall by using the **configureOutboundFirewall** command.

When you configure the outbound firewall rule, System Manager can connect only to those destination system that are added in the allowed whitelist. Therefore, when you add the very first outbound firewall rule, ensure that you add all the required destination IP Addresses in the allowed whitelist to which System Manager will connect to.

By using the **configureOutboundFirewall** command, you can add, list, view status, disable, remove, and overwrite the IP addresses and FQDN in the whitelist for establishing the outbound connection from System Manager. You can also enable, disable, and view the status of logs for any connection that are dropped. This command supports the IPv4, IPv6, FQDN, and Network with Classless Inter-Domain Routing (CIDR) notation addresses.

Note the following:

- In the Geographic Redundancy setup, if you need to configure the outbound firewall rules, then you need to add the peer IP addresses on the primary and secondary System Manager servers.
- By using, the **configureOutboundFirewall** command, you cannot configure the outbound firewall in the Software-only environment.

**Syntax**

```
configureOutboundFirewall [add {-s} {-f}] [list] [status] [remove {-e} {-f}] [disable]
[overwrite {-s} {-f}] [enable-logging] [disable-logging] [logging-status]
```

|                                    |                                                                                                                                                                                                                                                                                          |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-h</b>                          | Displays the help for the command.                                                                                                                                                                                                                                                       |
| <b>add -s</b>                      | Adds the destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in the whitelist. While processing the FQDN, System Manager resolves the FQDN to its IP Address, and adds that IP address in the whitelist. You can add multiple entries with comma-separated values. |
| <b>add -f</b>                      | Adds the destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in the whitelist through a file.                                                                                                                                                                      |
| <b>list</b>                        | Displays the list of outbound firewall rules.                                                                                                                                                                                                                                            |
| <b>status</b>                      | Displays the status of outbound firewall configuration.                                                                                                                                                                                                                                  |
| <b>remove -e</b>                   | Removes the entry of the outbound firewall rules from the whitelist.                                                                                                                                                                                                                     |
| <b>remove -f</b>                   | Removes the file of the destination outbound firewall rules.                                                                                                                                                                                                                             |
| <b>disable</b>                     | Disables the outbound firewall rules.                                                                                                                                                                                                                                                    |
| <b>overwrite -s</b>                | Overwrites the existing list of outbound firewall rules in the whitelist.                                                                                                                                                                                                                |
| <b>overwrite -f<br/>INPUT_FILE</b> | Overwrites the existing file of outbound firewall rules.                                                                                                                                                                                                                                 |
| <b>enable-logging</b>              | Captures the logs for any dropped connections. By default, the outbound firewall rule logging is disabled. System Manager stores the logs in the <code>/var/log/outbound_firewall.log</code> file.                                                                                       |
| <b>disable-logging</b>             | Disables the outbound firewall rule logging.                                                                                                                                                                                                                                             |
| <b>logging-status</b>              | Displays the outbound firewall rule logging status.                                                                                                                                                                                                                                      |

## Configuring the outbound firewall rules

### About this task

When you configure the outbound firewall rule, System Manager can connect only to those destination system that are added in the allowed whitelist. Therefore, when you add the very first outbound firewall rule, ensure that you add all the required destination IP Addresses in the allowed whitelist to which System Manager will connect to.

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Do one of the following:

- To add the list of destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in the whitelist, type **configureOutboundFirewall add -s** *<destination IPv4/IPv6/FQDN/CIDR IPs>*, and press Enter.

You can add multiple entries with comma-separated values.

For example, to add the specific entries, type the following:

```
configureOutboundFirewall add -s
10.10.10.10,10.10.10.11,test.avaya.com,10.10.10.12/24,2a07:2a42:adc0:19::9:25
```

- To add the list of destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in the whitelist through a file, type **configureOutboundFirewall add -f** *<absolute path of the.txt file>*, and press Enter.

You can add each entry in a separate line in the *<nameofthefile>.txt* file.

For example, the format of the file is:

```
cat /home/location/filename.txt
10.10.10.10
10.10.10.11
2a07:2a42:adc0:19::9:25
test.avaya.com
10.10.10.12/24
```

For example, to add the entries through the file, type the following:

```
configureOutboundFirewall add -f /home/location/filename.txt
```

While processing the FQDN, System Manager resolves the FQDN to its IP Address, and then adds, removes, or overwrites that IP address in the whitelist.

3. If the system prompts, type *y* to continue.

In the Geographic Redundancy setup, System Manager displays the following message:

Geographic Redundancy configuration detected. Separate configuration of Outbound Firewall is required on the Primary and Secondary servers.

In the Geographic Redundancy setup, if you need to configure the outbound firewall rules, then you need to add the peer IP addresses on the primary and secondary System Manager servers.

System Manager adds the specified IP Addresses and FQDN in the whitelist.

---

## Viewing the list of outbound firewall rules

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type `configureOutboundFirewall list`, and press `Enter`.

System Manager displays the outbound firewall rule status and the list of the outbound firewall rules that are configured.

For example:

```
OutBound connection firewall rules enabled

Following IP Addresses / Networks allowed for OutBound connection

10.10.10.11
10.10.10.12/24

2a07:2a42:adc0:19::9:25
```

## Viewing the outbound firewall rule status

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type `configureOutboundFirewall status`, and press `Enter`.

The outbound firewall rule status can be `enabled` or `disable`.

System Manager displays the status of the outbound firewall rule.

For example:

```
enabled
```

---

## Removing outbound firewall rules

**Procedure**

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Do one of the following:
  - To remove the list of destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in whitelist, type **configureOutboundFirewall remove -e** *<destination IPv4/IPv6/FQDN/CIDR IPs>*, and press Enter.

For example, to remove the specific entries, type the following:

```
configureOutboundFirewall remove -e 10.10.10.10
```

- To remove the list of destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in whitelist through a file, type **configureOutboundFirewall remove -f** *<absolute path of the.txt file>*, and press Enter.

For example, to remove the entries through the file, type the following:

```
configureOutboundFirewall remove -f /home/location/filename.txt
```

While processing the FQDN, System Manager resolves the FQDN to its IP Address, and then adds, removes, or overwrites that IP address in the whitelist.

System Manager removes the specified IP Addresses, FQDN, and CIDR notation IP addresses from the whitelist.

## Disabling the outbound firewall rule

**About this task**

If you disable the outbound firewall rule, System Manager removes all the rules from the whitelist. Later, if you need to enable the outbound firewall rule, then you need to again add all the details in the whitelist.

**Procedure**

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type **configureOutboundFirewall disable**, and press Enter.

3. At the prompt, type `y` to continue.

System Manager disables the outbound firewall rule.

## Overwriting the existing outbound firewall rules

### About this task

If you overwrite the outbound firewall rule, System Manager removes all the existing rules from the whitelist and adds the new entries in the whitelist.

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Do one of the following:
  - To overwrite the list of destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in whitelist, type **configureOutboundFirewall** `overwrite -s` *<destination IPv4/IPv6/FQDN/CIDR IPs>*, and press Enter.

For example, to overwrite the specific entries, type the following:

```
configureOutboundFirewall overwrite -s
10.10.10.14,10.10.10.15,example.avaya.com,10.10.10.16/24,2a07:2a4
2:adc0:19::9:25
```

- To overwrite the list of destination IPv4, IPv6, FQDN, and Network with CIDR notation IP addresses in the whitelist through a file, type **configureOutboundFirewall** `overwrite -f` *<absolute path of the.txt file>*, and press Enter.

You can enter each entry in a separate line in the *<nameofthefile>.txt* file.

For example, the format of the file is:

```
cat /home/location/filename.txt
10.10.10.14
10.10.10.15
2a07:2a42:adc0:19::9:25
example.avaya.com
10.10.10.16/24
```

For example, to overwrite the entries through the file, type the following:

```
configureOutboundFirewall overwrite -f /home/location/
filename.txt
```

While processing the FQDN, System Manager resolves the FQDN to its IP Address, and then adds, removes, or overwrites that IP address in the whitelist.

System Manager overwrites the existing IP Addresses and FQDN with the new details in the whitelist.

## Managing the outbound firewall rule logging

### About this task

Use this procedure to enable, disable, or view the status of the outbound firewall rule logging for the dropped connections.

If you need to monitor logs, you can enable the outbound firewall rule logging. Note that this can generate large amount of logs in the log file and might slightly impact the performance of System Manager. Therefore, it is recommended to disable the outbound firewall rule logging, once your job is complete.

### Before you begin

Log in to the System Manager command line interface with CLI user credentials that you created at the time of application deployment.

- To enable the outbound firewall rule logging, type **configureOutboundFirewall enable-logging**, and press **Enter**.

System Manager enables the outbound firewall rule logging and captures the logs for the dropped connections in the `/var/log/outbound_firewall.log` file.

- To disable the outbound firewall rule logging, type **configureOutboundFirewall disable-logging**, and press **Enter**.

By default the outbound firewall rule logging is disabled.

System Manager disables the outbound firewall rule logging and does not captures the logs for the dropped connections.

- To view the outbound firewall rule logging status, type **configureOutboundFirewall logging-status**, and press **Enter**.

System Manager displays the outbound firewall rule logging status.

## Managing certificates

---

### Trust Management

System Manager uses Trust Management to provision and manage certificates of various applications, servers, and devices for a secure, interelement communication. Trust Management provides Identity (Server) and Trusted (Root/CA) certificates that applications can use to establish mutually authenticated Transport Layer Security (TLS) sessions.

System Manager validates any file that you upload during certificate management, and accepts only certain file types, such as text and XML. System Manager filters uploaded files based on file extension and mime types or bytes in the file.

System Manager uses a third-party open source application, Enterprise Java Beans Certificate Authority (EJBCA), as a Certificate Authority for certificate management.

From Manage Elements, you can manage certificates for System Manager and the elements that System Manager supports.

## Certificate generation and certificate management capabilities in System Manager

The table provides the major certificate generation and certificate management capabilities that System Manager offers. System Manager manages certificates for System Manager and elements that System Manager manages.

All communications between the client and the servers in the Avaya Aura® environment are secured using the Transport Layer Security (TLS) protocol. In TLS, servers are configured with an identity certificate issued by a certificate authority. When clients connect to servers, the server presents its identity certificate for the client to validate. The client checks whether the server identity certificate was issued by a certificate authority that the client trusts. If the validation succeeds, a secure connection is established.

| # | Use case                                                                                                                                                              | Example                                                                                                                                                                                                                                                                                                                              | With System Manager CA as Root CA<br>Default mode | With System Manager CA as SubCA | With third-party CA signed identity certificates |

| 3 | Installing a new identity certificate issued by a third-party CA                                                         | Configuring the System Manager web interface to use a certificate issued by a well-known CA, for example, VeriSign, instead of a certificate issued by own CA. This applies for products that use System Manager for administration. For example, Session Manager and CS 1000. | ✓                                                 | ✓                               | ✓                                                |
| 4 | Replacing an identity certificate issued by the System Manager CA with a new certificate issued by System Manager CA     | Installing a new certificate with changed values. For example, new FQDN and new IP address.                                                                                                                                                                                    | ✓                                                 | ✓                               | Not applicable                                   |
| 5 | Replacing an existing identity certificate issued by a third-party CA with a new certificate issued by System Manager CA | Reverting System Manager, Session Manager, and CS 1000 that use third-party identity certificates to use certificates issued by the System Manager CA.                                                                                                                         | ✓                                                 | ✓                               | ✓                                                |
| 6 | Renewal of an existing identity certificate                                                                              | Manual or automatic renewing of a certificate that is about to expire. This capability is also available for products such as Session Manager.                                                                                                                                 | ✓                                                 | ✓                               | X                                                |

Table continues...

| # | Use case                                                          | Example                                                                                                                                                     | With System Manager CA as Root CA<br>Default mode | With System Manager CA as SubCA | With third-party CA signed identity certificates |
|---|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|---------------------------------|--------------------------------------------------|
| 7 | Exporting an identity certificate to a PEM certificate file       | Exporting any identity certificate to a standard PEM format files so that the certificate can be manually imported to the trust stores of various products. | ✓                                                 | ✓                               | ✓                                                |
| 8 | Adding new certificates to the truststore of the product.         | Installing a new certificate to the truststores of the product, such as Session Manager.                                                                    | ✓                                                 | ✓                               | ✓                                                |
| 9 | Removing existing certificates from the truststore of the product | Deleting a certificate, for example, SIPCA root certificate, from the truststores of the product such as Session Manager.                                   | ✓                                                 | ✓                               | ✓                                                |

The certificate that is used to assert its identity is called a product certificate or an identity certificate. The issuer or CA certificate used to verify and validate the identity of the far end is referred to as the trusted certificate or CA certificate.

## Setting the enrollment password

### About this task

You can use this functionality to generate the enrollment password for managed elements. The managed elements require the enrollment password to request certificates from System Manager Trust Management.

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Enrollment Password**.

3. On the Enrollment Password page, in the **Password expires in** field, select a password expiration time in hours, days, or weeks.

The screenshot shows the 'Enrollment Password' page in the Avaya Aura System Manager. The left sidebar contains a 'Security' menu with options like Certificates, Authority, Enrollment Password, Manage Certificate, Revocation, and Configuration. The main content area has a breadcrumb trail 'Home / Services / Security / Certificates / Enrollment Password'. The page title is 'Enrollment Password'. Below the title, there is a message 'Need to set a valid enrollment password.' and a 'Time Remaining' section showing '00 hour 00 mins'. The 'New Password' section includes three fields: 'Password expires in' (a dropdown menu), 'Password' (a text input field), and 'Confirm Password' (a text input field). A 'Commit' button is located at the bottom right of the form.

4. In **Password** and **Confirm Password** fields, enter the password.
5. Click **Commit**.

The system updates the time displayed in the Time remaining section with the value that you selected in **Password expires in**.

6. Note the password for future reference.

The Authority link is used for launching EJBCA administration. A customer can configure the settings here, based on its PKI plan.

The screenshot shows the 'CA Structure & CRLs' page in the Avaya Aura System Manager. The left sidebar contains a 'CA Functions' menu with options like CA Activation, CA Structure & CRLs, Certificate Profiles, Certification Authorities, Crypto Tokens, Publishers, RA Functions, Add End Entity, End Entity Profiles, Search End Entities, User Data Sources, Supervision Functions, Approve Actions, and View Log. The main content area has a title 'CA Structure & CRLs'. Below the title, there is a section 'Basic Functions for CA : tmdefaultca' with links 'View Certificate' and 'View Information'. The 'Root CA' section shows 'CN=System Manager CA,OU=MGMT,O=AVAYA' and links 'Download binary/to IE', 'Download to Firefox', 'Download PEM file', and 'Download BCFKS file'. The 'Latest CRL' section shows 'Created 2017-02-09 12:59:42+05:30, Expires 2017-02-16 12:59:42+05:30, number 3' and a link 'Get CRL'. The 'Delta CRLs' section shows 'Delta CRLs are not enabled.' and a 'Create a new updated CRL' button with a 'Create CRL' button. At the bottom, there is a footer 'Made by PrimeKey Solutions AB, 2002–2014.'

## Managing trusted certificates

### Obtaining the SSL certificate for Microsoft Active Directory

#### Procedure

1. Install the certification authority (CA) on your Microsoft Active Directory server. For information, see <https://support.microsoft.com/en-us>.
2. Run the following command on the Microsoft Active Directory server to export the certificate:

```
certutil -ca.cert client.crt
```

3. Copy the `client.crt` file from the Microsoft Active Directory server to your computer.

## Next steps

Import the certificate for Microsoft Active Directory server to System Manager.

For instructions, see Adding trusted certificates.

[Adding trusted certificates](#) on page 1184

## Adding trusted certificates

### About this task

From Release 8.1, you can add trusted certificates for multiple elements. All the elements must be of same ElementType and Version. When you add trusted certificates for multiple elements of same ElementType and Version, the system creates a job. You can view the certificate management job status by clicking **View Certificate Add Status** on the Manage Elements page.

The flow for adding a trusted certificate for single element is the same. The system does not create a job for adding trusted certificate for single element.

Use the following procedure to import the certificates that you want to add as trusted certificate in the trust store of the element.

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, select one or more element, and click **More Actions > Manage Trusted Certificates**.
3. On the Manage Trusted Certificates page, click **Add**.

#### Manage Trusted Certificates

Select : All, None

4. On the Add Trusted Certificates page, in **Select Store Type to add trusted certificate**, select a store type or select **All** if you are unsure of the store type.
5. To import certificates from a file, do the following:
  - a. Click **Import from file**.

- b. Type the file name or click **Browse** to select a file.

 **Note:**

System Manager validates the file type. If you provide an invalid file type, the system displays an error message.

- c. Click **Retrieve Certificate**.
6. To import certificates in the PEM format, do the following:
  - a. Locate the PEM certificate.
  - b. Open the certificate in the Notepad application.
  - c. Select and copy the contents in the file.
  - d. On the Add Trusted Certificates page, click **Import as PEM certificate**.
  - e. Paste the contents from the PEM file in the text box provided on the Add Trusted Certificates page.
7. To import certificates from existing certificates, do the following:
  - a. Click **Import from existing certificates**.
  - b. In the Global Trusted Certificate section, select a certificate.
8. To import certificates by using TLS, do the following:
  - a. Click **Import using TLS**.
  - b. In **IP Address**, type the IP address of the computer.
  - c. In **Port**, type the port of the computer.
  - d. Click **Retrieve Certificate**.
9. Click **Commit**.
10. Restart the JBoss service on System Manager.

| Name                                     | Description                                                                                                               |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Import from existing certificates</b> | The option to import a certificate from the existing imported certificates.                                               |
| <b>Import using TLS</b>                  | The option to import a certificate if the element requires to contact the certificate provider to obtain the certificate. |

When you select **Import from file**, the page displays the following fields.

| Name                        | Description                              |
|-----------------------------|------------------------------------------|
| <b>Please select a file</b> | The file that contains the certificates. |

| Button                      | Description                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Browse</b>               | Displays the choose file dialog box where you can choose the file from which you want to import the certificates.        |
| <b>Retrieve Certificate</b> | Retrieves the certificate from the file, and displays the details of the certificate in the Certificate Details section. |

### Certificate Details:

The page displays these fields when you click **Retrieve**.

| Name                           | Description                                                                                                                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Subject Details</b>         | The details of the certificate holder.                                                                                                                                                            |
| <b>Valid From</b>              | The date and time from when the certificate is valid.                                                                                                                                             |
| <b>Valid To</b>                | The date and time until when the certificate is valid.                                                                                                                                            |
| <b>Key Size</b>                | The size of the key in bits for encryption.                                                                                                                                                       |
| <b>Issuer Name</b>             | The name of the issuer of the certificate.                                                                                                                                                        |
| <b>Certificate Fingerprint</b> | The fingerprint that authenticates the entire certificate.                                                                                                                                        |
| <b>Key Fingerprint</b>         | The fingerprint that authenticates the key. The Key fingerprint applies only for CA certificate. Therefore, any element, which calculates fingerprint using the key, can use this authentication. |
| <b>CA Certificate</b>          | The field that specifies whether the certificate is a CA certificate.                                                                                                                             |

### Global Trusted Certificate:

When you select **Import from existing certificates**, the page displays the following fields.

| Name                    | Description                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------|
| <b>Certificate Name</b> | The fully qualified domain name of the certificate.                                               |
| <b>Subject Name</b>     | The fully qualified domain name of the certificate holder.                                        |
| <b>Valid To</b>         | The date until which the certificate is valid.                                                    |
| <b>Filter: Enable</b>   | Displays fields in select columns where you can set the filter criteria. This is a toggle button. |

*Table continues...*

| Name                   | Description                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------|
| <b>Filter: Disable</b> | Hides the column filter fields without resetting the filter criteria. This is a toggle button. |
| <b>Filter: Clear</b>   | Clears the filter criteria.                                                                    |
| <b>Filter: Apply</b>   | Filters certificates based on the filter criteria.                                             |
| <b>Select: All</b>     | Selects all the certificates in the table.                                                     |
| <b>Select: None</b>    | Clears all the check box selections.                                                           |
| <b>Refresh</b>         | Refreshes the certificates information.                                                        |

The page displays these fields when you select the **Import using TLS** option.

| Name              | Description                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------|
| <b>IP Address</b> | The IP address of the certificate provider that is to be contacted for retrieving the certificate. |
| <b>Port</b>       | The port of the server to be used for obtaining the certificate.                                   |

| Button                      | Description                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Retrieve Certificate</b> | Retrieves the certificate and displays the details of the certificate in the Certificate Details section. |

## Viewing trusted certificates

### About this task

You can view the trusted certificates of System Manager and its managed elements.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element and click **More Actions > Manage Trusted Certificates**.
4. On the Manage Trusted Certificates page, select the required certificate and click **View**.

The View Trust Certificate page displays the details of the selected certificate.

| <b>Subject Details</b>         | The details of the certificate holder.                                                                                                                                                            |
| <b>Valid From</b>              | The date and time from which the certificate is valid.                                                                                                                                            |
| <b>Valid To</b>                | The date and time until which the certificate is valid.                                                                                                                                           |
| <b>Key Size</b>                | The size of the key in bits for encryption.                                                                                                                                                       |
| <b>Issuer Name</b>             | The name of the issuer of the certificate.                                                                                                                                                        |
| <b>Certificate Fingerprint</b> | The fingerprint that authenticates the entire certificate.                                                                                                                                        |
| <b>Key Fingerprint</b>         | The fingerprint that authenticates the key. The Key fingerprint applies only for CA certificate. Therefore, any element, which calculates fingerprint using the key, can use this authentication. |
| <b>Serial Number</b>           | The serial number of the certificate.                                                                                                                                                             |
| <b>Basic Constraints</b>       | The extension identifies whether the subject of the certificate is a CA and the maximum depth of valid certification paths that include this certificate.                                         |
| <b>Key Usage Extension</b>     | The extension defines the purpose of the key contained in the certificate such as Digital Signature, Key Cert Sign, CRL Sign.                                                                     |
| <b>Extended Key Usage</b>      | This extension indicates one or more purposes for which the certified public key may be used. in addition to or in place of the basic purposes indicated in the key usage extension.              |

| Button      | Description                                                   |
|-------------|---------------------------------------------------------------|
| <b>Done</b> | Closes the page and returns to the Trusted Certificates page. |

## Removing trusted certificates

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an application and click **More Actions > Manage Trusted Certificates**.
4. On the Manage Trusted Certificates page, select the certificates you want to remove.
5. Click **Remove**.

Trust Management removes the certificates from the list of trusted certificates for the application you selected.

## Delete Trusted Certificate Confirmation field descriptions

Use this page to delete a trusted certificate from the list of trusted certificate maintained by the element.

| Field                   | Description                                            |
|-------------------------|--------------------------------------------------------|
| <b>Certificate Name</b> | The common name of the certificate.                    |
| <b>Store Type</b>       | The type of the store associated with the certificate. |
| <b>Subject Name</b>     | The name of the certificate holder.                    |

| Button        | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <b>Delete</b> | Deletes the trusted certificate from the corresponding store.                 |
| <b>Cancel</b> | Cancels the delete operation and returns to the Add Trusted Certificate page. |

## Trusted certificate management

Participants in a Public-Key Infrastructure (PKI) scheme use root certification authorities and other intermediate certification authorities to determine the trustworthiness of an identity certificate. These certification authorities are collectively known as trust anchors or trusted certificates.

System Manager certificate management supports the following tasks on the trusted certificate of a service:

- **View:** Trust Management provides details about the subject, issuer, key size, fingerprint, and expiry date of the certificate that a service uses.
- **Add:** A service may require to communicate with another service outside the deployment PKI of Avaya Aura®. For example, for a service to gain access to a remote database or a directory service which presents an identity certificate signed by a commercial CA, include the certificate of the CA in the list of trusted certificates of the service.

For example, if a service is exposed to multiple SIP endpoints, you cannot add the certificate of the private Certificate Authority (CA) to the trusted certificate store of each client. If each SIP endpoint is configured to trust certificates issued by a commercial CA, replace the certificate presented by the endpoint with a certificate of the commercial CA or the root certificate of the commercial CA. You can add a certificate to a trusted certificate store of the service in the following encodings:

- ASN.1 DER
- PEM (OpenSSL)

You can also get a certificate from an SSL socket or from the built-in certificate store.

- **Export:** Trust Management supports exporting the selected certificate from the list of trusted certificates to a PEM formatted file.
- **Delete:** When you do not need a service to participate in an external PKI hierarchy, the administrator can remove the trusted certificate from the trusted certificate store of the service. For example, when CA changes, you do not require the existing CA.

### Manage Trusted Certificates field descriptions

Use this page to view, export, and remove the trusted certificates listed on the page. You can add more certificates in the existing list of trusted certificates.

| Name                     | Description                                            |
|--------------------------|--------------------------------------------------------|
| <b>Store Description</b> | The purpose of the trusted certificate.                |
| <b>Store Type</b>        | The type of the store associated with the certificate. |
| <b>Subject Name</b>      | The name of the certificate holder.                    |

| Button        | Description                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------|
| <b>View</b>   | Displays the View Trust Certificate page. Use this page to view the certificate details.                    |
| <b>Add</b>    | Displays the Add Trusted Certificate page. Use this page to import certificates from the selected resource. |
| <b>Export</b> | Exports the selected certificate from the list of trusted certificates to a PEM formatted file.             |
| <b>Remove</b> | Removes the selected certificate from the list of trusted certificates.                                     |

## Managing identity certificates

### Adding additional certificate for a service

#### About this task

Use this procedure to add an additional certificate for following services:

- securitymodule\_http (HTTP)
- securitymodule\_sip (SIP)

#### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, select an element, and click **More Actions > Manage Identity Certificates**.
3. On the Manage Identity Certificates page, select the service name to which you want to add another certificate.
4. Click **Add**.

The system displays the Add Identity Certificate page.

5. Click **Add new internal CA signed certificate**, and do the following:
  - a. Select the **Common Name (CN)** check box and type the common name that is defined in the existing certificate.
  - b. In **Key Algorithm**, select the key algorithm.  
System Manager uses the SHA2 algorithm for generating certificates.
  - c. In **Key Size**, select the required key size.
  - d. In **Subject Alternative Name**, select the relevant options, and enter the details.

- e. **(Optional)** In **OtherName**, type the other name for the certificate signing request.
  - f. To add the internal CA signed certificate, click **Commit**.
6. Click **Add new external CA signed certificate**, and do the following:
  - a. In **Please select a file (PKCS#12 format)**, choose the file from your local computer.
  - b. In **Password**, type the password.
  - c. Click **Retrieve Certificate**.  
 The Certificate Details section displays the details of the certificate.
  - d. Review the details of the uploaded certificate.
  - e. To add a new, external CA-signed certificate, click **Commit**.
7. Click **Generate Certificate Signing Request (CSR) for adding external CA signed certificate**, and do the following:
  - a. Select the **Common Name (CN)** check box and type the common name that is defined in the existing certificate.
  - b. In **Key Algorithm**, select the key algorithm.  
 System Manager uses the SHA2 algorithm for generating certificates.
  - c. In **Key Size**, select the required key size.
  - d. **(Optional)** In **Subject Alternative Name**, select the relevant options and enter the details.
  - e. In **OtherName**, type the other name for the certificate signing request.
  - f. Click **Generate CSR**.
  - g. Ensure that the downloaded CSR is third-party signed.
  - h. Import the signed certificate by using the **Import third party certificate** option.
8. For the newly generated certificates to take effect, restart JBoss on System Manager.

## Making a certificate as a default certificate for a service

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, select an element, and click **More Actions > Manage Identity Certificates**.
3. On the Manage Identity Certificates page, select the service name.
4. Click the **Expand List** icon and select an additional certificate.
5. Click **Make default**.

The system displays the following message: Do you want to make this certificate as default certificate for Service Name: <ServiceName>?

6. Click **OK**.

## Removing an additional identity certificate

### About this task

Use this procedure to remove the additional certificate for a service. You cannot remove the default certificate of a service.

### Procedure

1. On the System Manager web console, click **Services > Inventory > Manage Elements**.
2. On the Manage Elements page, select an element, and click **More Actions > Manage Identity Certificates**.
3. On the Manage Identity Certificates page, select the service name.
4. Click the **Expand List** icon and select the additional certificate.
5. Click **Remove**.

The system displays the following message: Do you want to delete this certificate of Service Name: <ServiceName>?

6. Click **OK**.

## Viewing identity certificates

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element, and click **More Actions > Manage Identity Certificates**.

The Identity Certificate page displays the identity certificates for the element that you selected. The certificate signed by the Avaya CA is the default.

## Replacing an identity certificate

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element and click **More Actions > Manage Identity Certificates**.
4. On the Manage Identity Certificates page, select the certificate that you want to replace.
5. Click **Replace**.

The system displays the Replace Identity Certificate page.

6. Click **Replace this Certificate with Internal CA Signed Certificate**, and do the following:
  - a. Select the **Common Name (CN)** check box and type the common name that is defined in the existing certificate.
  - b. Select the key algorithm and key size from the respective fields.  
System Manager uses the SHA2 algorithm for generating certificates.
  - c. **(Optional)** In **Subject Alternative Name**, select the relevant options and enter the details.
  - d. **(Optional)** In **OtherName**, type the other name for the certificate signing request.
  - e. To replace the identity certificate with the internal CA signed certificate, click **Commit**.
7. Click **Import third party certificate**, and do the following:
  - a. In the **Please select a file** field, choose the file from your local computer.
  - b. In the **Password** field, type the password.
  - c. Click **Retrieve Certificate**.  
The Certificate Details section displays the details of the certificate.
  - d. Review the details of the uploaded certificate.
  - e. To replace the certificate with the third-party certificate that you imported, click **Commit**.
8. Click **Generate Certificate Signing Request (CSR) for third party certificate**, and do the following:
  - a. Select the common name (CN) check box and type the common name that is defined in the existing certificate.
  - b. Select the key algorithm and key size from the respective fields.  
System Manager uses the SHA2 algorithm for generating certificates.
  - c. **(Optional)** In **Subject Alternative Name**, select the relevant options and enter the details.
  - d. In **OtherName**, type the other name for the certificate signing request.
  - e. Click **Generate CSR**.
  - f. Ensure that the downloaded CSR is third-party signed.
  - g. Import the signed certificate using the **Import third party certificate** option.
9. For the newly generated certificates to take effect, restart JBoss on System Manager.

## Renewing identity certificates

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. On the Manage Elements page, select an element and click **More Actions > Manage Identity Certificates**.
4. On the Identity Certificates page, select the certificate that you want to renew.
5. Click **Renew**.

Wait until the system renews the certificate.

6. Restart the service for which you renewed the certificate.
7. For the new certificates to take effect, restart JBoss on System Manager.

You must also restart JBoss on System Manager if certificates are auto renewed.

## Identity certificate management

In Public-Key Infrastructure (PKI), an identity certificate is an electronic document, which uses a digital signature to bind a public key with an identity information such as the name of a person or an organization and address of a person or an organization. The identity certificate is also known as digital certificate or public key certificate. You can use the certificate to verify if a public key belongs to a service.

System Manager supports the following tasks on the identity certificate of a service:

- **View:** Trust Management provides details about the subject, issuer, key size, fingerprint, and expiry date of the certificate that a service uses.

Additionally, Trust Management provides subject alternative name.

- **Replace:** Services that are exposed to external clients may require to present an identity certificate issued by a commercial root CA.

For example, if a service is exposed to multiple SIP endpoints, you cannot add the certificate of the private Certificate Authority (CA) to the trusted certificate store of each client. If each SIP endpoint is configured to trust certificates issued by a commercial CA, then replace the certificate presented by the service with a certificate issued by a commercial CA. Also, in protocols like HTTP, the CN value of the certificate must match the host name of the server presenting the certificate. If the host name changes, the CN must change.

- **Export:** Trust Management supports exporting the selected certificate from the list of trusted certificates to a PEM formatted file.
- **Renew:** Central administrator might need to reissue an identity certificate that was originally issued by the deployment CA. For example, an identity certificate has a validity date. Therefore, the administrator must replace the certificate before the certificate expires to avoid rejection of the certificate by the service peer.

## Identity Certificates field descriptions

| Name                       | Description                                                 |
|----------------------------|-------------------------------------------------------------|
| <b>Service Name</b>        | The name of the service that uses the identity certificate. |
| <b>Common Name</b>         | The common name to identify the service.                    |
| <b>Valid To</b>            | The date until which the certificate is valid.              |
| <b>Expired</b>             | Specifies whether the certificate is expired.               |
| <b>Service Description</b> | A brief description about the service.                      |

| Button         | Description                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Replace</b> | Displays the Replace Identity Certificate page. Use this page to replace a selected identity certificate with a new certificate.    |
| <b>Export</b>  | Exports the certificate that you select. The exported certificate is in the form of a PEM file.                                     |
| <b>Renew</b>   | Renews the certificate that you select. After you renew a certificate, the system automatically updates the <b>Valid To</b> column. |

### Certificate Details

| Name                            | Description                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Subject Details</b>          | The certificate holder details.                                                                                                                                                                    |
| <b>Valid From</b>               | The date and time from when the certificate is valid.                                                                                                                                              |
| <b>Valid To</b>                 | The date and time till the certificate is valid.                                                                                                                                                   |
| <b>Key Size</b>                 | The key size in bits for encryption. The default key size is 2048.                                                                                                                                 |
| <b>Issuer Name</b>              | The name of the certificate issuer.                                                                                                                                                                |
| <b>Certificate Fingerprint</b>  | The fingerprint that authenticates the certificate.                                                                                                                                                |
| <b>Subject Alternative Name</b> | An alternative name of the certificate holder.                                                                                                                                                     |
| <b>Serial Number</b>            | The serial number of the certificate.                                                                                                                                                              |
| <b>Basic Constraints</b>        | The extension that identifies whether the subject of the certificate is a CA and the maximum depth of valid certification paths that include this certificate.                                     |
| <b>Key Usage Extension</b>      | The extension that defines the purpose of the key contained in the certificate. For example, Digital Signature, Content Commitment, Key Encipherment, Data Encipherment, and Key Agreement.        |
| <b>Extended Key Usage</b>       | The extension that indicates one or more purposes for which the certified public key can be used. These are in addition to or in place of the basic purposes indicated in the key usage extension. |

| Name                                                                          | Description                                                                                                        |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Replace this Certificate with Internal CA Signed Certificate</b>           | The option to replace the current certificate with the internal CA signed certificate.                             |
| <b>Import third party certificate</b>                                         | The option to replace the identity certificate with the PKCS #12 file that you imported from a third-party source. |
| <b>Generate Certificate Signing Request (CSR) for third party certificate</b> | The option to generate a certificate signing request for a third-party certificate.                                |

When you select **Replace this Certificate with Internal CA Signed Certificate** or **Generate Certificate Signing Request (CSR) for third party certificate**, the system displays the following fields.

| Name                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Common Name (CN)</b>         | The common name of the certificate holder.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Key Algorithm</b>            | The algorithm used to generate the key for the certificate.<br>The option is RSA.<br>System Manager uses the SHA2 hash algorithm for generating certificates.                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Key Size</b>                 | The key size in bits for encryption. The options are: <ul style="list-style-type: none"> <li>• <b>1028</b></li> <li>• <b>2048</b></li> <li>• <b>4096</b></li> </ul> Use 2048 as the key size.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Subject Alternative Name</b> | An alternative name of the certificate holder. The options are: <ul style="list-style-type: none"> <li>• <b>DNS Name:</b> The DNS IP address.</li> <li>• <b>IP Address:</b> The IP address.</li> <li>• <b>URI:</b> The URI address.</li> </ul> <p> <b>Note:</b></p> <p>In <b>DNS Name</b>, <b>IP Address</b>, and <b>URI</b> fields, you can enter more than one value separated by a comma.</p> <p>Do not add spaces between comma-separated IP addresses and DNS names.</p> |
| Button                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Commit</b>                   | Replaces the current identity certificate with the selected certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Certificate Revocation

### Viewing the certificates

#### About this task

Use this procedure to view the certificates for managed elements. The managed elements require the certificates to establish connection from System Manager.

#### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Manage Certificate Revocation**.
3. On the Manage Certificate Revocation page, select the certificate that you want to view.
4. Click **View Certificate**.

The system displays the View Certificate Detail page with details of the selected certificate.

5. Click **Done** to close the page.

## View Certificate Detail field descriptions

| Name                     | Description                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Username</b>          | The name of the certificate holder.                                                                               |
| <b>Serial Number</b>     | The serial number that identifies the certificate.                                                                |
| <b>Issuer DN</b>         | The distinguishing name of the certificate issuer.                                                                |
| <b>Subject DN</b>        | The distinguishing name of the certificate holder.                                                                |
| <b>Subject Alt Name</b>  | The alternate name of the certificate holder.                                                                     |
| <b>Revoked</b>           | The option to indicate whether a certificate is revoked.                                                          |
| <b>Revocation Date</b>   | The date when the certificate was revoked.<br>The field remains blank if the certificate is not in revoked state. |
| <b>Revocation Reason</b> | The reason for certificate revocation.<br>The field remains blank if the certificate is not in revoked state.     |
| <b>Valid From</b>        | The date and time from when the certificate is valid.                                                             |
| <b>Valid To</b>          | The date and time till the certificate is valid.                                                                  |
| Button                   | Description                                                                                                       |
| <b>Done</b>              | Closes the View Certificate Detail page and displays the Manage Certificate Revocation page.                      |

## Revoking and unrevoking certificates

### About this task

Use this procedure to revoke a certificate for applications that System Manager manages. The applications require the certificates to establish connection from System Manager.

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Manage Certificate Revocation**.
3. On the Manage Certificate Revocation page, select a certificate.
4. To revoke the certificate, do the following:
  - a. Ensure that the certificate is in an unrevoked state and click **Revoke**.
  - b. On the Revoke Certificate page, select the reason for certificate revocation.
  - c. Click **Revoke**.
5. To unrevoke the certificate, do the following:
  - a. Ensure that the certificate is in a revoked state with the reason **Certificate hold**.
  - b. Click **Unrevoke**, and on the Revoke Certificate dialog box, click **Ok**.

| Name                     | Description                                           |
|--------------------------|-------------------------------------------------------|
| <b>Valid From</b>        | The date and time from when the certificate is valid. |
| <b>Valid To</b>          | The date and time till the certificate is valid.      |
| <b>Revocation Reason</b> | The reason to revoke the certificate.                 |

| Button        | Description                                                                             |
|---------------|-----------------------------------------------------------------------------------------|
| <b>Revoke</b> | Saves the certificate revocation reason and revokes the certificate.                    |
| <b>Cancel</b> | Cancels the certificate revocation and displays the Manage Certificate Revocation page. |

## Manage Entity Classes

In Certificate Management, entity classes provide a way to manage certificate issue and renewal for a class (group) of entities with common characteristics, for example Endpoints.

From System Manager Release 8.1.3, you can add, edit, and delete the entity classes by using the **Services > Security > Certificates > Manage Entity Classes** page. Endpoints that have certificates issued by System Manager can use these entity classes to send certificate enrollment or renewal request to System Manager. The entity class password set is used to authenticate enrollment requests from endpoints to System Manager.

## Adding an entity class

### Procedure

1. On the System Manager web console, click **Services > Security > Certificates > Manage Entity Classes**.
2. Click **New**.
3. On the Add Entity Class page, do the following:
  - a. In **Name**, type the name of the entity class.  
The name is mandatory for each entity class.
  - b. In **Description**, type the description of the entity class.
  - c. To enable the white list of subject names associated with an entity class, select the **Whitelist Validation of Subject** check box.
  - d. In **Password**, type the password for the entity class.
  - e. In **Confirm Password**, retype the password for the entity class.  
The password is mandatory for each entity class. Without the password, you cannot generate the certificate from System Manager because you require the password to authenticate the certificate generation request.
  - f. In **Password Validity Duration**, select the duration for which the entity class password is valid.

- g. Click **Commit** to save the changes.

System Manager displays the added entity class on the Manage Entity Classes page.

## Editing an entity class

### Procedure

1. On the System Manager web console, click **Services > Security > Certificates > Manage Entity Classes**.
2. Select an entity class, click **Edit**.
3. On the Update Entity Class page, edit the required parameters.
4. Click **Commit** to save the changes.

## Deleting an entity class

### Procedure

1. On the System Manager web console, click **Services > Security > Certificates > Manage Entity Classes**.
2. Select the entity classes, click **Delete**.  
System Manager displays the message to confirm the delete operation.
3. Click **Yes**.

System Manager deletes the selected entity class.

## Filtering entity classes

### About this task

You can apply the filter to search the values of the following columns:

- **Name**
- **Description**

### Procedure

1. On the System Manager web console, click **Services > Security > Certificates > Manage Entity Classes**.
2. Click the **Filter menu** icon, type the required value, and press **Enter**.  
The page displays the details that match the filter criteria.
3. To clear the filter values, click **Options > Clear Filter**.

System Manager clears the filter criteria.

## Manage Entity Classes field descriptions

## manageEntityClassWhitelist command

With Release 8.1.3, you can add, list, view, and delete the subject names for the provided entity-class by using the **manageEntityClassWhitelist** command. You can add and delete the bulk entries of subject names for an entity class. Also, you can check the status of the subject name validation for the entity class.

### Syntax

```
manageEntityClassWhitelist [-h] [addAll -e <ENTITY_CLASS_NAME> -f <INPUT_FILE> -u <USERNAME> -p <PASSWORD>] [add -e <ENTITY_CLASS_NAME> -s <SUBJECT_NAME> -u <USERNAME> -p <PASSWORD>] [list -e <ENTITY_CLASS_NAME> -f <OUTPUT_FILE> -u <USERNAME> -p <PASSWORD> -pn <PAGENUMBER> -ps <PAGESIZE>] [view -e <ENTITY_CLASS_NAME> -s <SUBJECT_NAME> -f <OUTPUT_FILE> -u <USERNAME> -p <PASSWORD>] [subjectCheck -e <ENTITY_CLASS_NAME> -u <USERNAME> -p <PASSWORD>] [deleteAll -e <ENTITY_CLASS_NAME> -u <USERNAME> -p <PASSWORD>] [delete -e <ENTITY_CLASS_NAME> -s <SUBJECT_NAME> -u <USERNAME> -p <PASSWORD>]
```

**-h**

Displays help for the command and also displays the required and optional parameters.

**addAll -h -e <ENTITY\_CLASS\_NAME> -f <INPUT\_FILE> -u <USERNAME> -p <PASSWORD>**

Adds or updates the Subject Names for the provided entity class through a file for bulk operation.

**add -h -e <ENTITY\_CLASS\_NAME> -s <SUBJECT\_NAME> -u <USERNAME> -p <PASSWORD>**

Adds the Subject Names for the provided entity class.

**list -h -e <ENTITY\_CLASS\_NAME> -f <OUTPUT\_FILE> -u <USERNAME> -p <PASSWORD> -pn <PAGENUMBER> -ps <PAGESIZE>**

Lists the Subject Names for the provided entity class. You can provide a file name where System Manager can save the Subject Names.

**view -h -e <ENTITY\_CLASS\_NAME> -s <SUBJECT\_NAME> -f <OUTPUT\_FILE> -u <USERNAME> -p <PASSWORD>**

Displays the Subject Name for the provided entity class. You can provide a file name where System Manager you can save all the Subject Names.

**subjectCheck -e <ENTITY\_CLASS\_NAME> -u <USERNAME> -p <PASSWORD>**

Displays the status of the subject name validation for the entity class. The status can be enabled or disabled.

**deleteAll -h -e <ENTITY\_CLASS\_NAME> -u <USERNAME> -p <PASSWORD>**

Deletes all the Subject Names for the provided entity class.

**delete -h -e <ENTITY\_CLASS\_NAME> -s  
<SUBJECT\_NAME> -u <USERNAME> -p  
<PASSWORD>**

Deletes the specific entry of the Subject Name for the provided entity class.

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ENTITY_CLASS_NAME> | The name of the existing entity class that you create on the System Manager web console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <SUBJECT_NAME>      | The subject name for the entity class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <INPUT_FILE>        | <p>The file name with the list of subject names and the file is available on the System Manager server. The file extension is .csv file.</p> <p>Following is an example of the format that is in the subject name file:</p> <pre>cat SubjectNameData.csv subjectName name1 name2 name3 name4 name5</pre>                                                                                                                                                                                                                                                                                                |
| <OUTPUT_FILE>       | The file name where System Manager copies and saves the details of subject names for the entity class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <USERNAMRE>         | The user name of the System Manager web console for managing the entity classes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <PASSWORD>          | <p>The password of the System Manager web console for managing the entity classes.</p> <p> <b>Note:</b></p> <p>If you do not type the <code>-u &lt;USERNAME&gt;</code> and <code>-p &lt;PASSWORD&gt;</code> parameters with the command, System Manager displays the following options after pressing Enter:</p> <pre>Enter User Name : ----- Enter Password :-----</pre> <p>When the system prompts, provide the user name and password of the System Manager web console where the entity class is configured.</p> |
| <PAGENUMBER>        | Displays the list of subject name for the provided entity class on the specific page number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <PAGESIZE>          | Displays the total number of subject names for the provided entity class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Adding subject names for an entity class

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.

2. Do one of the following:

- To add the subject name for the entity class in whitelist, type **manageEntityClassWhitelist add -e <ENTITY\_CLASS\_NAME> -s <SUBJECT\_NAME> -u <USERNAME>**, and press Enter.

Where:

- **<ENTITY\_CLASS\_NAME>**: The name of the existing entity class that you create on the System Manager web console.
- **<SUBJECT\_NAME>**: The subject name for the entity class.
- **<USERNAMRE>**: The user name of the System Manager web console for managing the entity classes.
- **<PASSWORD>**: The password of the System Manager web console for managing the entity classes.

If you do not type the **-u <USERNAME>** and **-p <PASSWORD>** parameters with the command, System Manager displays the following options after pressing Enter:

```
Enter User Name : -----
Enter Password :-----
```

When the system prompts, provide the user name and password of the System Manager web console where the entity class is configured.

For example, to add the specific entry, type the following:

```
manageEntityClassWhitelist add -e EntityClass1 -s Subject1 -u admin
```

- To add the subject name for the entity class in whitelist by using a file for bulk operation, type **manageEntityClassWhitelist addAll -e <ENTITY\_CLASS\_NAME> -f <INPUT\_FILE> -u <USERNAME>**, and press Enter.

For example, to add the entries through a file for bulk operation, type the following:

```
manageEntityClassWhitelist addAll -e EntityClass2 -f Subjectname.csv -u admin
```

3. At the **Enter Password** prompt, type the password of the System Manager web console.

System Manager adds the subject names for the entity class and displays the following message:

```
Subject name(s) added successfully
```

## Displaying subject names for an entity class

### About this task

Use this procedure to list the subject names for an entity class.

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Do one of the following:

- To list the subject name for the entity class, type **manageEntityClassWhitelist list -e <ENTITY\_CLASS\_NAME> -u <USERNAME>**, and press Enter.

For example, to list the subject names, type the following:

```
manageEntityClassWhitelist list -e EntityClass1 -u admin
```

- To save the subject names in a file, type **manageEntityClassWhitelist list -e <ENTITY\_CLASS\_NAME> -f <output\_file> -u <USERNAME>**, and press Enter.

For example, to save the subject names in a file, type the following:

```
manageEntityClassWhitelist list -e EntityClass1 -f
SubjectNames.csv -u admin
```

3. At the **Enter Password** prompt, type the password of the System Manager web console.

System Manager displays the subject name for the entity class with the status, subjectName, and resource-uri details. It also displays the status of the subject name validation.

For example:

```
Subject name check is enabled for Entity Class : EntityClass1
Operation successful, resultSize is <2> and pageSize is <100>. Output is shown
below.
[status, subjectName, resource-uri]
[NEW, Subject1, tm-service-api/entity-classes/EntityClass1/subject-names/Subject1]
[NEW, subjectnametest, tm-service-api/entity-classes/EntityClass1/subject-names/
subjectnametest]
```

For saving the subject names in a file, System Manager displays the following message.

For example:

```
Operation successful, Output copied to <SubjectNames.csv>. ResultSize is <1> and
pageSize is <100>
```

## Viewing the subject name for an entity class

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. To view the details of the subject name for the entity class, type **manageEntityClassWhitelist view -e <ENTITY\_CLASS\_NAME> -s <SUBJECT\_NAME> -u <USERNAME>**, and press Enter.

For example, to view the specific entry detail, type the following:

```
manageEntityClassWhitelist view -e EntityClass1 -s Subject1 -u
admin
```

3. At the **Enter Password** prompt, type the password of the System Manager web console.

System Manager displays the subject name for the entity class with the status, subjectName, and resource-uri details. It also displays the status of the subject name validation.

For example:

```
Subject name check is enabled for Entity Class : EntityClass1
[status, subjectName, resource-uri]
[NEW, name1, tm-service-api/entity-classes/entity3/subject-names/name1]
```

## Viewing the subject name validation status for an entity class

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. To view the status of the subject name validation for the entity class, type **manageEntityClassWhitelist** subjectCheck -e <ENTITY\_CLASS\_NAME> -u <USERNAME> -p <PASSWORD>, and press Enter.

For example, type the following:

```
manageEntityClassWhitelist subjectCheck -e EntityClass1 -u admin
```

3. At the **Enter Password** prompt, type the password of the System Manager web console.

System Manager displays the subject name validation status. The status can be enabled or disabled.

For example:

```
Subject name check is enabled for Entity Class : EntityClass1
```

## Deleting the subject names for an entity class

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Do one of the following:
  - To delete the specific subject name entry for the entity class, type **manageEntityClassWhitelist** delete -e <ENTITY\_CLASS\_NAME> -s <SUBJECT\_NAME> -u <USERNAME>, and press Enter.

For example, type the following:

```
manageEntityClassWhitelist delete -e EntityClass1 -s Subject1 -u
admin
```

- To delete all the subject name entries for the entity class, type **manageEntityClassWhitelist** deleteAll -e <ENTITY\_CLASS\_NAME> -u <USERNAME>, and press Enter.

For example, type the following:

```
manageEntityClassWhitelist deleteAll -e EntityClass2 -u admin
```

3. At the **Enter Password** prompt, type the password of the System Manager web console.

System Manager deletes the subject names for the entity class and displays the following message.

```
Subject name deleted successfully
```

---

## Retrieving the System Manager CA certificate

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. On the CA Functions page click **Download pem file**.
4. Click **Save** to save the certificate to a file.

---

## Certificate Authorities

### Certificate Authorities in a Geographic Redundancy setup

In System Manager configured with Geographic Redundancy, the system replicates the CA certificate from the primary System Manager server to the secondary System Manager server. By default, the primary System Manager server, the secondary System Manager server and their elements are part of the same trust domain. For the initial trust relationship, during the configuration, the secondary System Manager server uses the Certificate Enrollment password that is set on the primary server. The primary System Manager server issues a certificate to the secondary System Manager server.

When the secondary System Manager server is active, do not configure System Manager as a sub CA.

---

## Applying third-party certificates to Appliance Virtualization Platform

### About this task

Use this procedure to create, download, upload, and push third-party certificates to Appliance Virtualization Platform hosts.

### Before you begin

- Add a location.
- Add an Appliance Virtualization Platform host to the location.
- Ensure that the certificate on the Appliance Virtualization Platform host is valid.

### \* Note:

If you are using a third-party generated CSR, add the private key for the CSR in the file `/etc/vmware/ssl/rui_csr_temp.key` before installing the certificate from Solution Deployment Manager.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
4. **(Optional)** Add the details of the generic CSR.

If you add the generic CSR details, the system pre-populates the values in the View/Generate CSR dialog box.

For more information about creating the generic CSR, see “Creating or editing generic CSR”.

5. To generate CSR, do the following:
  - a. Click **More Actions > AVP Cert. Management > Manage Certificate**.
  - b. In the Load Certificate dialog box, select one or more Appliance Virtualization Platform hosts.
  - c. Click **View/Generate CSR**.

System Manager displays the View/Generate CSR dialog box.

- d. If the generic CSR details are not added for the Appliance Virtualization Platform host, add the details of the generic CSR.

- e. Click **Generate CSR**.

The system generates CSR for the Appliance Virtualization Platform host.

- f. In the **Current Action** column, click **Status Details** to view the status.
6. To download CSR, do the following:
  - a. Click **More Actions > AVP Cert. Management > Manage Certificate**.
  - b. In the Load Certificate dialog box, select one or more Appliance Virtualization Platform hosts.
  - c. Click **Download CSR**.
 

In case of Firefox browser, the system prompts you to save the `CSR.zip` file.
  - d. In the **Current Action** column, click **Status Details** to view the status.
 

In the Download CSR Status dialog box, the system displays the path of the downloaded `CSR.zip` file.
7. Extract the downloaded certificates, and ensure that the third-party signs them.
8. To upload and push the signed certificate from a third-party CA, do the following:
  - a. Click **More Actions > AVP Cert. Management > Manage Certificate**.
  - b. In the Load Certificate dialog box, select one or more Appliance Virtualization Platform hosts.
  - c. Click **Browse** and select the required certificates from the local computer.
  - d. Click **I Agree to accept to add the same certificate in SDM**.
  - e. Click **Push Certificate**.
  - f. In the **Current Action** column, click **Status Details** to view the status.

---

## Creating or editing generic CSR

### About this task

Use this procedure to create or edit a generic CSR for third-party Appliance Virtualization Platform certificates. With a generic CSR, you can apply the same set of data for more than one Appliance Virtualization Platform host.

### Procedure

1. In **Application Management Tree**, select a location.
2. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
3. Click **More Actions > AVP Cert. Management > Generic CSR**.
4. In the Create/Edit CSR dialog box, add or edit the details of the generic CSR, such as organization, organization unit, locality, state, country, and email.
5. Click **Create/Edit CSR** and then click **OK**.

## Next steps

Complete the CSR generation, download, third-party signing and push the certificates to the Appliance Virtualization Platform hosts.

---

# Generating certificates from System Manager

## Certificate generation

Generation of certificates from the System Manager web console includes the following tasks:

- (Optional) Creating a certificate signing request (CSR).
- Creating an end entity.
- Generating the certificate keystore.
- Creating the certificate using CSR.
- Viewing contents of the certificate.

## Creating a certificate signing request

### Before you begin

Install the OpenSSL command line tool.

### About this task

Perform this procedure if you want to generate the certificate with the key that you generate and get System Manager to sign your keys.

Do not perform the procedure if you want System Manager to generate the public and private keys for the certificate.

### Procedure

1. Start an SSH session on System Manager.
2. To generate the keys and a corresponding certificate signing request (CSR), type the following command:

```
openssl req -out <CSR name> -new -newkey rsa:2048 -nodes -keyout <PvtKey_Filename>
```

Where:

- CSR name is the name of the output CSR file. For example, `mycsr.csr`.
- `rsa:2048` instructs the system to create a 2048-bit RSA key.
- `PvtKey_Filename` is the filename where the system stores the private key. For example, `privateKey.key`.

## Creating an end entity

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **RA Functions > Add End Entity**.
4. On the Add End Entity page, in **End Entity Profile**, select **INBOUND\_OUTBOUND\_TLS**.
5. Type the username and password.

The password is mandatory for each end entity. Without the password, you cannot generate the certificate from System Manager because you require the password to authenticate the certificate generation request.

6. Enter the relevant information in the fields.

The system automatically selects the following:

- **ID\_CLIENT\_SERVER** in **Certificate Profile**
- **tmdefaultca** in **CA**
- **User Generated** in **Token**

With **User Generated**, the system generates the certificate by using CSR. You can also select **P 12 file**.

7. Click **Add**.

The system displays the message `End Entity <username> added successfully`.

## Generating the certificate keystore

### Before you begin

Create an end entity.

For more information, see [Creating an end entity](#).

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. In the navigation pane, click **Public Web**.
4. On the public EJBCA page, do one of the following:
  - If you are generating the certificate by using certificate signing request (CSR), click **Enroll > Create Certificate from CSR** and continue with the steps in [Creating the certificate by using certificate signing request](#).
  - Do the following:
    - Click **Enroll > Create Keystore**.

- On the Keystore Enrollment page, type the username and password.

**\* Note:**

Provide the same username and password that you entered while creating the end entity on the Add End Entity page.

- Click **OK**.
- On the next page, retain the values in the **Key length** field, and click **OK**.

The system generates a PKCS12 format keystore with the identity certificate that contains values provided in the end entity.

## Related links

[Creating an end entity](#) on page 1213

## Creating the certificate using a CSR

### Before you begin

Create an end entity as described in [Creating an end entity](#) on page 1213.

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. In the navigation pane, click **Public Web**.

4. On the public EJBCA page, click **Enroll > Create Certificate from CSR**.
5. To get your certificate, on the Certificate Enrollment from a CSR page, do the following:
  - a. Enter the same username and the password that you provided while creating the end entity.
  - b. In the text box, paste the PEM-formatted PKCS10 certification request.
  - c. Click **OK**.

A certificate in PEM format is generated. The certificate contains the values provided in the end entity.

[Creating an end entity](#) on page 1213

## Viewing contents of the certificate

### Before you begin

Install the tool that you want to use to view the keystore.

### About this task

You can view the contents of the certificate in a keystore by using any common tool, such as keytool.

### Procedure

1. Start an SSH session.
2. To view the contents of the certificate in a keystore, type the following command:

```
keytool -list -keystore <keystore> -storepass <keystorepassword> -storetype PKCS12 -v
```

Where:

- keystore is the path to the keystore.
- keystorepassword is the password of the keystore
- PKCS12 is the format of the keystore. Use JKS for the JKS format keystores.

3. To view the contents of a PEM certificate, type the following command:

```
openssl x509 -in <certificate> -text noout
```

Where: certificate is the path to the PEM certificate.

## Overview of System Manager root certificate authority created using SHA256withRSA signing algorithm and 2048 key size

System Manager that is upgraded from releases earlier than Release 7.0, contains root Certificate Authority (CA) that has a key size of 1024 bits and uses the SHA1withRSA algorithm for signing own certificates.

You can use the createCA utility to improve the level of security of the System Manager CA by updating the key size to 2048 bits and the algorithm to SHA256withRSA.

Before running the utility, note the following:

- You must not use the createCA utility of one release on another release.
- If you upgrade System Manager after running the createCA utility, you do not need to run this utility again on the upgraded System Manager as the CA is carry forwarded as part of the upgrade process.
- You can use the utility in the following conditions:
  - When the System Manager root CA has been compromised.
  - Or, when you want to upgrade the signing algorithm and key size of the System Manager root CA.

**+ Tip:**

When you run the utility, the system displays a message along with the signing algorithm information that is used to create the existing root CA. If the signing algorithm is SHA256withRSA, then you do not need to run this utility.

- Starting from System Manager Release 7.0, the createCA utility can be run in a phased manner with the help of different options provided with the utility. The utility has the following options:
  - Option 1: Allows you to create a new root CA using SHA256withRSA signing algorithm and 2048 key size.
  - Option 2: Allows you to make the new root CA the default CA of System Manager.
  - Option 3: Allows you to run a single step process where the system creates a new root CA using SHA256withRSA signing algorithm and 2048 key size and makes that CA the default System Manager CA.

**\* Note:**

- You should select option 3 in the createCA utility for smaller deployments which have limited number of elements configured with the System Manager.
  - You should not select option 3 to create a new root CA in case you have run the utility by selecting option 1, and option 2.
- Option 4: Allows you to exit the utility.
- Running the utility in a phased manner allows you to obtain the new root CA certificate after the first phase (option 1), and distribute the certificate to all the TLS connected elements before selecting option 2.
- To minimize service interruptions on a production network, it is recommended to run the utility by using option 1, distribute the certificate to all TLS connected elements, and then run the utility by using option 2.

## Creating a new Certificate Authority by using SHA256withRSA signing algorithm and 2048 key size

### Before you begin

Ensure that:

- You have read this section properly and have understood the implications of creating a new root Certificate Authority to issue certificates.

For more information, see [Overview of System Manager root certificate authority created using SHA256withRSA signing algorithm and 2048 key size](#) on page 1215.

- System Manager Release 7.0 or later is installed.

**\* Note:**

- The createCA utility is available in System Manager starting from Release 6.3.8.
- If you are on a release earlier than Release 7.0, you must upgrade the System Manager to the latest release before running the utility. The utility is not available for System Manager releases earlier than 6.3.8. For details about running the utility in System Manager versions earlier than 7.0, refer the corresponding *Administering Avaya Aura® System Manager* document.
- You have taken backup of the System Manager virtual machine before running the utility. If you are on Release 6.3.x of System Manager running on System Platform, ensure to take a backup from the System Manager UI and System Platform UI before running the utility.
- You have disabled the Geographic Redundancy replication for System Manager. You should re-configure Geographic Redundancy after executing option 1 followed by option 2 in the phased manner or after executing option 3 in the single step approach.

For more information, see “Geographic Redundancy”.

## Procedure

1. On the System Manager CLI, start an SSH session by logging in with customer login credentials.
2. Type `createCA`.
3. If the system prompts you to run the utility, type `y`.
4. Based on your requirement, type the appropriate option:
  - 1 to create a new root CA.
  - 2 to make the new root CA the default System Manager CA.
  - 3 to create a new root CA and then, make that new root CA the default System Manager CA in a single step.
  - 4 to exit from this utility.

## Related links

[Creating a new CA using option 1 of the createCA utility](#) on page 1217

[Making the new CA as default System Manager CA using option 2 of the createCA utility](#) on page 1220

[Creating a new CA using option 3 of the createCA utility](#) on page 1221

## Creating a new CA using option 1 of the createCA utility

### About this task

Use this procedure to create a new CA with SHA256withRSA signing algorithm and keysize of 2048 bits.

## Procedure

1. On the System Manager CLI, start an SSH session by logging in with customer login credentials.
2. Type `createCA`.
3. When the system prompts, type `y`.
4. Type `1` to create a new root CA.
5. When the system prompts, type `y`.
6. Type the Common Name (CN) of the new CA.

 **Note:**

The default CN of the new CA is `SystemManager CA`.

7. Type `y` to confirm the provided Common Name.

The system creates a new CA with the name `CreateCA`.

## Next steps

Access the new CA by logging in to the System Manager web console.

For more information, see [Downloading the new root CA](#) on page 1218.

### ***Downloading the new root CA***

#### Procedure

1. Log in to the System Manager web console with the customer login credential which have administrative privileges.
2. Click **Services > Security > Certificates > Authority > CA Structure & CRLS**.
3. Click **Download PEM file** to download the root CA to your desired location.

## Next steps

Ensure that you place the new CA in the trusted stores of following elements, which:

- Communicate with System Manager using TLS.
- Get identity certificate issued by the System Manager CA.

 **Note:**

For details about placing the CA in trusted stores of elements, see [Prerequisites before making the new root CA as the default CA of System Manager](#) on page 1218.

### ***Prerequisites before making the new root CA as the default CA of System Manager***

1. Place the new root CA in the trusted stores of elements which communicate with System Manager using TLS, and which get identity certificate issued by the System Manager CA.  
Elements, such as SIP endpoints, Communication Manager communicate with System Manager using TLS.

Elements, such as, Session Manager, Session Border Controller get identity certificate issued by the System Manager CA.

To add the new System Manager root CA certificate to Communication Manager trust store, see [Distributing the new root CA with Communication Manager](#) on page 1219.

To add the new System Manager root CA certificate to the trust store of 96x1 series phones, see [Distributing the new root CA with 96x1 series phones](#) on page 1219.

 **Note:**

Ensure that all other devices that connect using TLS to System Manager or any other server using the System Manager CA issued certificate also trust the new root CA. For detailed description on how to add a trusted certificate to those devices, refer the corresponding product documentation.

2. Disable the Geographic Redundancy replication for System Manager and convert the primary System Manager server to a standalone server.

For more information, see [Disabling the Geographic Redundancy replication for System Manager and converting the primary server to a standalone server](#) on page 1220.

## Distributing the new root CA with Communication Manager

### About this task

Use this procedure to add the new System Manager root CA certificate to the trust store of Communication Manager.

### Procedure

1. Log in to the Communication Manager SMI with administrative credentials.
2. Click **Miscellaneous > Download Files**.
3. Select the \*.pem file, and click **Download**.
4. On the SMI, click **Security > Trusted Certificates**.
5. Click **Add**.
6. Type the file name that you uploaded and click **Open**.
7. On the next screen, type a file name with \*.crt extension and select the Communication Manager repository check box.
8. Click **Add**.
9. Restart the Communication Manager system.

## Distributing the new root CA with 96x1 series phones

### About this task

Use this procedure to add the new System Manager root CA certificate to the trust store of 96x1 series phones.

## Procedure

1. Search for the IP address or Fully Qualified Domain Name (FQDN) of the HTTP server from where the 96x1 series phones download the `settings` file.
2. Upload the new System Manager root CA certificate on the server.
3. Open the `settings` file on a text editor (for example, Notepad), and type the new root CA file name next to the SET TRUSTCERTS parameter.

 **Note:**

Ensure that the name of the older root CA is also present next to the SET TRUSTCERTS parameter.

4. Save and close the `settings` file.
5. Restart the phones.

Disabling the Geographic Redundancy replication for System Manager and converting the primary server to a standalone server

## Procedure

1. Disable the Geographic Redundancy replication for System Manager.  
For more information, see “Disabling the Geographic Redundancy replication”.
2. Convert the primary System Manager server to a standalone server.  
For more information, see “Converting the primary System Manager server to the standalone server”.

### ***Making the new CA as default System Manager CA using option 2 of the createCA utility***

#### About this task

Use this procedure to make the new CA as the default System Manager CA and issue new certificates for System Manager services by using the new CA.

 **Note:**

After performing this task, the System Manager web console will be unavailable for approximately 15 minutes.

## Procedure

1. On System Manager CLI, start an SSH session by logging in with customer login credentials.
2. Type `createCA`.
3. When the system prompts, type `y`.
4. Type `2` to make the new CA the default System Manager CA.
5. When the system prompts, type `y`.

The CA that was created after typing option 1 is renamed as `tmdefaultca` and this CA becomes the default CA of System Manager.

6. **(Optional)** To download the CA, log in to the System Manager web console, and click **Services > Security > Certificates > Authority > CA Structure & CRLS > tmdefaultca**.

### Next steps

Manage all the tasks that must be performed after selecting options 1 and 2 in the createCA utility. For more details, see [Managing tasks after running the createCA utility](#) on page 1222.

### Creating a new CA using option 3 of the createCA utility

#### About this task

This task sequentially performs all the actions that can be achieved by selecting options 1 and 2 in the createCA utility.

#### \* Note:

- You should select option 3 in the createCA utility for smaller deployments which have limited number of elements configured with the System Manager.
- You should not select option 3 to create a new root CA in case you have run the utility by selecting option 1, and option 2.

#### Procedure

1. On the System Manager CLI, start an SSH session by logging in with customer login credentials.
2. Type `createCA`.
3. When the system prompts, type `y`.
4. Type `3` to create a new root CA and make that CA as the default System Manager CA.
5. When the system prompts, type `y`.

The new root CA that is created is renamed as `tmdefaultca` and this CA becomes the default CA of System Manager.

6. To download the CA, log in to the System Manager web console and click **Services > Security > Certificates > Authority > CA Structure & CRLS > tmdefaultca**
7. Distribute the new root CA with other elements, for example, Communication Manager, 96x1 series phones, Session Manager, Session Border Controller and so on.
8. Disable the Geographic Redundancy replication for System Manager and convert the primary System Manager server to a standalone server.
9. Manage the tasks that must be performed after running the createCA utility.

#### Related links

[Distributing the new root CA with Communication Manager](#) on page 1219

[Distributing the new root CA with 96x1 series phones](#) on page 1219

[Disabling the Geographic Redundancy replication for System Manager and converting the primary server to a standalone server](#) on page 1220

[Managing tasks after running the createCA utility](#) on page 1222

## Managing tasks after running the createCA utility

### Before you begin

Ensure that you have run the createCA utility using one of the following procedures:

- Using option 1 followed by using option 2 in the phased approach.
- Using option 3 in the single step approach.

### Procedure

1. Set the enrolment password which is reset after running the createCA utility.

 **Note:**

For more information, see “Setting the enrollment password”.

2. To configure the System Manager Geographic Redundancy, perform the following:
  - a. Convert the primary System Manager server to a standalone server.
  - b. Reinstall the secondary System Manager.
  - c. Re-configure Geographic Redundancy by logging in to the web console of the secondary System Manager.

 **Note:**

For more information, see “Geographic Redundancy”.

3. Regenerate new certificates for elements that use System Manager issued certificates. For example, if your network consists of two core Session Manager systems, then perform the following steps:
  - a. Log in to the System Manager web console.
  - b. Change the service state for the primary Session Manager to **Deny New Service**. For more details, refer *Administering Avaya Aura® Session Manager*
  - c. Log in to the primary Session Manager CLI and System Manager CLI.
  - d. Type `initTM -f`.
  - e. On the System Manager CLI, type `service jboss restart` to restart the System Manager JBOSS server.

After you run the above command, the System Manager web console will be inaccessible for approximately 15 minutes.

- f. For SIP Endpoints, regenerate the SIP and HTTP certificates using the "enhanced validation" certificates on Session Manager.

For more information, see the “Installing Enhanced Validation Certificates for Session Manager” section in the *Administering Avaya Aura® Session Manager* document.

- g. Change the service state for the primary Session Manager to **Accept New Service**.

For more information, see *Administering Avaya Aura® Session Manager*

- h. Repeat above steps for the secondary Session Manager.
- 4. To delete the old System Manager CA, perform the following:
  - a. Log in to the System Manager web console with customer login credentials which have administrative privileges.
  - b. Click **Services > Security > Certificates > Authority > Certification Authorities**.
  - c. Select the older CA.
 

The older CA may appear as `olddefaultcaXXX` after the new root CA is set as the default System Manager CA.
  - d. Click **Delete CA**.

**Warning:**

It is an irreversible step. Ensure that you have placed the latest root CA on the trusted stores of all the elements before deleting the older CA.

- 5. To regenerate new certificates for Presence Services servers starting from Release 6.2.x, perform the following:
  - a. Log in to the CLI of the Presence Services server.
  - b. Type `prescert reconfigureAll scep pw <smgr_enrollment_passwd>`.
  - c. Type `stop.sh`.
  - d. Type `start.sh`.
- 6. Generate a new identity certificate for any other server, for example, Session Border Controller that are configured in the network and that use System Manager issued certificates.
 

For more information, refer to the corresponding product documentation.
- 7. Delete the old CA certificate from System Manager trust stores.
 

For more information, refer “Removing trusted certificates”.
- 8. Delete the old CA certificate from the trust store of endpoints, Communication Manager and any other element that trusted it.

---

## External SSL configurations in System Manager

### Using a third-party identity certificate for System Manager

From the System Manager web interface, you can install an identity certificate for System Manager issued by a certificate authority (CA). After the certificate installation, during SSL communications, System Manager presents the identity that is issued by the third-party identity certificate.

Installing and using the third-party identity certificate for the System Manager web interface includes the following key tasks:

1. Replacing the System Manager web server certificate with a third-party certificate.
2. Updating the truststores for internal services, clients, or managed elements with third-party root and subordinate CA certificate.

For more information about installing the third-party identity certificate, see *Avaya Aura® System Manager Certificate Management* on the Avaya Support site at <http://support.avaya.com>.

---

## Set the System Manager CA as the subordinate CA

### **Note:**

Before you begin, ensure you take a snapshot of the System Manager application. Once the subordinate CA (SubCA) has been successfully set up and you have verified all the functionalities, ensure you remove the snapshot of the System Manager application.

You can change the default Certificate Authority (CA) that the system generates during the System Manager installation to an externally signed SubCA. Using this capability, you can add System Manager CA to an existing CA hierarchy in the customer environment.

In a Geographic Redundancy enabled system, EJBCA configured as SubCA on the primary System Manager server is also provisioned on the secondary System Manager server.

### **Note:**

System Manager as a certificate authority does not support Delta CRLs and the Avaya Aura® elements also do not validate Delta CRL. Therefore, do not create Delta CRL from System Manager.

The **Extended Key Usage** field should not be set in the SubCA certificate.

### Related links

[Generating the certificate signing request](#) on page 1224

[Guidelines for signing the certificate signing request](#) on page 1225

## Generating the certificate signing request

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > Certification Authorities**.
4. On the Manage Certification Authorities page, in **Add CA**, type the name `ExternalSubCA`, and click **Create**.
5. On the Create CA page, do the following:
  - a. In **Type of CA**, select **X509**.

- b. In **Signing Algorithm**, select **SHA256WithRSA**

 **Note:**

Do not use anything else.

- c. In **Crypto Token**, retain the default value.
- d. In **Description**, provide a description.
- e. In **Enforce unique DN**, clear the check box.
- f. In **Subject DN**, type a DN for your SubCA.

For example, CN=ExternalSubCA,O=AVAYA,C=US.

 **Important:**

Entering incorrect values in **Subject DN** can lead to failures.

- g. In **Signed By**, click **External CA**.

6. In the **Externally signed CA creation/renewal** section, click **Browse**, and open the CA certificate file that is on your computer.

 **Note:**

You must have the CA certificate that is used to sign the CA. If the external signing CA is a SubCA, then you need to ensure that you use the full chain in its certificate hierarchy, all the way to the root CA. The certificate chain must be in the PEM format and available on the same computer on which you run the browser.

7. Click **Make Certificate Request**.

You receive a request for a PEM-formatted certificate.

8. Click **Download PEM file**.

9. Click **Save File**, and save the file on your computer.

## Guidelines for signing the certificate signing request

Following are the guidelines for the certificate signing request:

- Use the -preserveDN flag while executing the `openssl ca` command to sign the request.

 **Note:**

By default, Openssl reorders DN to whatever the Openssl policy file is set up to do. Use the -preserveDN flag while you sign the request by running the `openssl ca` command. If you do not use the -preserveDN flag, EJBCA does not recognize the CA and the certificate request fails.

- You must set `basicConstraints=CA:TRUE` for the signed certificate while signing the request.
- You must get the certificate request signed by using the SHA256WithRSA Signing Algorithm
- You must ensure the CA-signed certificate contains proper revocation related information in it. Ensure that the revocation checking URLs are correct and reachable from the elements interacting with System Manager CA.

## Receiving certificate response

### Before you begin

Ensure that the received SubCA certificate is properly signed by the authorised CA. To check, use the openssl command.

```
openssl verify -CAfile ca-cert.pem subca-cert.pem
```

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > Certification Authorities**.
4. Select **ExternalSubCA** that you created earlier with the “Waiting for Certificate Response” status, and click **Edit CA**.

5. In the Externally signed CA creation/renewal section, in **Path to certificate signed by external CA**, click **Choose File**, and browse to the signed certificate.

## 6. Click **Receive Certificate Response**.

The system displays a message that the certificate response is received successfully and that the CA is activated. If you do not see this message, double-check the contents of the certificate file.

## Configuring revocation information in the subordinate CA

### About this task

It is not mandatory but Avaya recommends configuring revocation information in the SubCA.

### Procedure

1. On the System Manager web console, click **Services** > **Security**.
2. In the navigation pane, click **Certificates** > **Authority**.
3. Click **CA Functions** > **Certification Authorities**.
4. Select ExternalSubCA that you created earlier, and click **Edit CA**.
5. On the Edit CA page, fill values only in these two fields, **Default OCSP Service Locator** and **Default CRL Dist. Point**.
6. In **Default OCSP Service Locator**, add the following value:

`http://<SMGR_VFQDN>/ejbca/publicweb/status/ocsp`

### \* **Note:**

Replace SMGR\_VFQDN with the appropriate System Manager VFQDN.

Delta CRL Period (\*y \*mo \*d \*h \*m) [?] 0m y=365 days, mo=30 days  
(0m, if no delta CRLs are issued)

CA issuer URI [?]

Publishers

Services

Default OSCP Service Locator [?] <http://grsmgr.dsmgrsv.com/ejbca/publicweb/status/ocsp>  
(used as default value in certificate profiles using this CA)

CMS Service ☐ Activate

Other data

Approval Settings

Add/Edit End Entity  
Key Recovery  
Revocation  
CA Service Activation

7. To find the System Manager VFQDN, access the URL `https://{system-manager-fqdn}/ws/grservice/getgrstate/test` on the browser.

It returns a value like the following:

STANDALONE 172.19.17.1 ablade13vm1.dsmgrsv.com STANDALONE 127.0.0.1  
grsmgr.dsmgrsv.com 8.1.7.813011765 2020-09-23T13:57:33.445Z

Here *grsmgr.dsmgrsv.com* is the VFQDN, the value before the release number text.

8. Add a value in the **Default CRL Dist. Point**. For deriving the value, replace the last part of the text, `http://<SMGR_VFQDN>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=url-encoded-issuerD`, do as follows:

### CA Structure & CRLs

Basic Functions for CA : ExternalSubCA [View Certificate](#) [View Information](#)

Root CA : CN=nageshsmgrsvopenspca,OU=Telecom,O=Avaya,L=Pune,ST=MH,C=IN  
[Download binary/to IE](#) [Download to Firefox](#) [Download PEM file](#)

Subordinate CA, level 1 : CN=ExternalSubCA,O=AVAYA,C=US  
[Download binary/to IE](#) [Download to Firefox](#) [Download PEM file](#)

Latest CRL: Created 2020-09-23 19:22:41+05:30, Expires 2020-09-24 19:22:41+05:30, number 1 [Get CRL](#)  
Delta CRLs are not enabled.

Inspect Accessibility Properties  
Inspect Element (Q)

- On CA Functions page, click **CA Structure & CRLs**.
- In the **ExternalSubCA** that you created earlier. On **Get CRL**, right-click and select **Copy link address**.

- c. Paste the contents in a Notepad, [https://<SMGR\\_IPAddress>/ejbca/adminweb/ca/getcrl/getcrl?cmd=crl&issuer=CN%3DExternalSubCA%2CO%3DAVAYA%2CC%3DUS](https://<SMGR_IPAddress>/ejbca/adminweb/ca/getcrl/getcrl?cmd=crl&issuer=CN%3DExternalSubCA%2CO%3DAVAYA%2CC%3DUS)
9. Copy everything after issuer= and paste it after issuer= in the earlier URL.

**\* Note:**

<http://<grsmgr.dsmgrsv.com>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN%3DExternalSubCA%2CO%3DAVAYA%2CC%3DUS>

Place this URL in the box **Default CRL Dist. Point**.

The screenshot shows the 'CA Functions' menu on the left, with 'Certification Authorities' selected. The main area displays the configuration for a CA. The 'Default CRL Dist. Point' field is highlighted with a green box and contains the URL: <http://grsmgr.dsmgrsv.com/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN%3DExternalSubCA%2CO%3DAVAYA%2CC%3DUS>. Below this field, it says '(used as default value in certificate profiles using this CA)'. Other fields like 'Name Constraints, Excluded' and 'Default CRL Issuer' are also visible.

10. Click **Save**.

## Setting the new CA as the default CA

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > Certification Authorities**.
4. Select the new Sub CA, ExternalSubCA, and ensure that the status is **Active**.
5. On the Manage Certification Authorities page, to rename the existing CA, tmdefaultca, do the following:
  - a. From the list, highlight tmdefaultca.
  - b. In the text box at the bottom of the page, type in a new name. For example, oldtmdefaultca.
  - c. Click **Rename**.

 **Important:**

The CRD files refer to tmdefaultca. Therefore, rename the CA that you want to make as default to tmdefaultca.

6. To rename ExternalSubCA to tmdefaultca, do the following:
  - a. From the list, highlight ExternalSubCA.
  - b. In the text box at the bottom of the page, type `tmdefaultca`.
  - c. Click **Rename**.

The system sets your new ExternalSubCA as the default CA.

### Next steps

Create a backup. For more information, see "[Creating a data backup](#) on page 842".

## Modifying the default end entities to use the new CA

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > Certificate Profiles**.
4. For **ID\_CLIENT**, click **Edit**.
5. On the Edit page, in **Available CAs**, highlight tmdefaultca.
6. Click **Save**.
7. On the Manage Certificate Profiles page, repeat Step 4 through Step 6 for **ID\_CLIENT\_SERVER** and **ID\_SERVER**.
8. Click **RA Functions > Edit Entity Profiles**.
9. Select **INBOUND\_OUTBOUND\_TLS** and click **Edit End Entity Profile**.
10. On the Edit End Entity Profile page, in **Default CA**, select tmdefaultca.
11. In **Available CAs**, highlight tmdefaultca.
12. Click **Save**.
13. Repeat Step 9 through Step 12 for **INBOUND\_TLS**, **OUTBOUND\_TLS**, and **EXTERNAL\_CSR\_PROFILE**.
14. Click **RA Functions > Search End Entities**.
15. On the Search End Entities page, in **Search end entities with status**, click **All**.
16. Click **Search**.
17. Ensure that the list contains the end entities: **INBOUND\_OUTBOUND\_TLS**, **INBOUND\_TLS**, **OUTBOUND\_TLS**, and **EXTERNAL\_CSR\_PROFILE**.

If the required end entity is unavailable:

- Geographic Redundancy configuration might fail.
- The system displays the message: The secondary System Manager server is unable to POST a CSR for signing.
- The primary System Manager server error log displays the message: Unable to sign csr for user `EXTERNAL_CSR_PROFILE, 1, ...`

18. On the Search End Entities page, for each end entity listed in the earlier step, do the following:

- a. Click **Edit End Entity**.
- b. On the Edit End Entity Profile page, in the **CA** field, ensure that the value is set to `tmdefaultca`.
- c. Click **Save**.

19. Click **Close**.

20. On the Search End Entities page, click **Reload**.

The system displays the new value in the **CA** column for all the four entities.

## Adding root CA and subordinate CAs to the trusted stores

### About this task

After the new subordinate CA is created, add the root and all intermediate CA certificates in its chain to 'All' the trusted stores of System Manager.

#### **Note:**

Add the root and all intermediate CA certificates to all elements in the network that interact with System Manager CA-issued certificates.

### Procedure

1. Log in to the System Manager web console with administrator privilege credentials.
2. Click **Services > Security > Certificates > Authority**.
3. Click **CA Structure & CRLs** link.
4. For the CA = "tmdefaultca", download the PEM file for the root CA and all subordinate CA(s) by clicking on **Download PEM file** link associated with each CA.

Refer to the document for the respective products on how to add the certificates to the store.

For adding certificates into 'All' truststores of System Manager, see [Adding trusted certificates](#) on page 1184

## Generating new identity certificates for System Manager

### About this task

After CA is set up to issue certificates by using the new Subordinate CA, update the identity certificates that are created for System Manager during the initialization of System Manager. These certificates are signed by tmdefaultca, and not by the new CA. Also, the new CA must be added to the System Manager truststores.

### Procedure

1. Replace all the Service Names listed under **Manage identity certificates** with new CA-signed certificates.

See "Replacing an identity certificate". Verify the certificates as you replace them. Do not check the **Common Name(CN)** and **Subject Alternative Name(SAN)** check boxes, if they are proper.

 **Note:**

While replacing Identity certificates, select the **Replace this Certificate with Internal CA Signed Certificate** option, select **Common Name(CN)**, and **Subject Alternative Name(SAN)** fields with default values. Select **Key Algorithm** as RSA and **Key Size** as 2048.

 **Note:**

Replace the container\_tls service certificate at the end. After replacing this certificate, you need to restart the JBoss service immediately.

2. Restart JBoss service on the System Manager server.

## Confirming identity certificate updates on System Manager

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. On the Manage Elements page, select a System Manager instance, and click **More Actions > Manage Identity Certificates**.
3. On the Identity Certificates page, select any of the certificates, and verify that the **Issuer Name** in the window below is the DN of your new CA.
4. On the Manage Elements page, select a System Manager instance, and click **More Actions > Manage Trusted Certificates**.

On the Trusted Certificates page, the system must display one certificate with DN of your new CA certificate in each of the StoreTypes. The system must display three instances on this page.

Restart all System Manager applications JBoss and systemMonitor so that the new certificates are read. Alternatively, you can reboot the System Manager server.

5. To restart System Manager applications, reboot the System Manager server.

The System Manager CA changes from the internally generated CA to an externally signed SubCA.

6. **(Optional)** In a Geographic Redundancy setup, reconfigure the System Manager secondary server.

---

## Configuring DTLS for CS 1000

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Select the CS 1000 element.
4. Click **More Actions > Manage Identity Certificates**.
5. Select the Dtls and click **Replace**.
6. Select **Replace this Certificate with Internal CA Signed Certificate** and provide the common name, keysize, and the algorithm.
7. Click **Commit**.

---

## Configuring SIP TLS for CS 1000

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Select the CS 1000 element.
4. Click **More Actions > Manage Identity Certificates**.
5. Select SipTls and click **Replace**.
6. Select **Replace this Certificate with Internal CA Signed Certificate** and provide the common name, keysize, and the algorithm.
7. Click **Commit**.

---

## Managing certificate revocation list

### Creating a new CRL

#### About this task

You can create a new updated Certificate Revocation List (CRL) to immediately revoke or unvoke a certificate issued by System Manager as a certificate authority.

 **Note:**

System Manager as a certificate authority does not support Delta CRLs and the Avaya Aura® elements also do not validate Delta CRL. Therefore, do not create Delta CRL from System Manager.

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > CA Structure & CRLs**.
4. Click **Create CRL**.

The system creates an updated CRL and displays the time stamp of the updated CRL.

5. Click **Get CRL**.

The **Certificate Revocation List** dialog box displays the serial numbers of revoked certificates.

## Configuring CRL download

### About this task

You can schedule a download job to periodically download the updated CRL to check for revoked or unrevoked certificates.

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Configuration > CRL Download**.
3. On the CRL Download Configuration page, click **Add**.

The system displays the Schedule CRL Download page.

4. In **Job Name**, type the job name.
5. In **Job Frequency**, set the frequency, and recurrence.

For more information, see Schedule CRL Download field descriptions.

6. In **Configure CRL Distribution Point**, type the CRL distribution point URL, and click **Add**.
7. Click **Commit**.

## Deleting a CRL download job

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Configuration > CRL Download**.  
The system displays the CRL Download Configuration page.
3. In **CRL Download Jobs**, select a job and click **Delete**.
4. In the Confirm Job Delete dialog box, click **Ok**.

The system deletes the selected download job.

## Viewing CRL download job

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Configuration > CRL Download**.  
The system displays the CRL Download Configuration page.
3. In **CRL Download Jobs**, select a job and click **View**.

The system displays the CRL Download Job Details page with all the download job details.

4. Click **Done** to return to the CRL Download Configuration page.

## CRL Download Configuration field descriptions

| Name                    | Description                                                                 |
|-------------------------|-----------------------------------------------------------------------------|
| <b>Select check box</b> | The option to select a download job.                                        |
| <b>Job Name</b>         | The name of the download job.                                               |

## SMGR Cert based authentication

| Name                                     | Description                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>For System Manager User Interface</b> | The option to enable or disable certificate-based authentication for the System Manager user interface. |
| <b>For Other TLS Ports</b>               | The option to enable or disable certificate-based authentication for other TLS ports.                   |

## Extended hostname validation

| Name                                | Description                                                   |
|-------------------------------------|---------------------------------------------------------------|
| <b>Extended Hostname Validation</b> | The option to enable or disable extended hostname validation. |

| Button        | Description                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------|
| <b>Commit</b> | Saves and commits any changes made in the security configuration with an automatic JBoss restart.   |
| <b>Cancel</b> | Cancels any changes made and reverts the security configuration settings to the last saved setting. |

## Deletion of expired certificates from System Manager

With Release 8.1.3, you can use the **Number of days after which system deletes expired certificates** field on the **Services > Configurations > Settings > SMGR > Trust Management** page to set the number of days to delete expired certificates from the system.

By default, System Manager runs **ExpiredCertificateRemovalJob** every week at 12 A.M. to check the expired certificates. If the certificate expires on or before the number of configured days, System Manager purges the expired certificates.

---

## Extended Hostname Validation

With the Extended Hostname Validation (EHV) feature, the system validates the host name or domain name of the server with the value in the **subject** or **subjectAltName** (SAN) field in the identity certificate for establishing the SSL connection.

---

## Enabling Extended Hostname Validation

### Procedure

1. On the System Manager web console, click **Services > Security > Configuration > Security Configuration**.
2. On the Security Configuration page, click **SMGR**.
3. In the Extended hostname validation section, select the **Extended Hostname Validation** check box.
4. Click **Commit**.

---

## External authentication

---

### External authentication

The External Identity Repositories Web page in System Manager contains a summary page for Authentication scheme and Authentication servers. You can configure the authentication scheme and the authentication servers for System Manager.

System Manager supports the following authentication authorities:

- Local users
- External RADIUS users
- External LDAP users
- External Security Assertion Markup Language (SAML) users

 **Note:**

- If you are using Microsoft Active Directory for external authentication with System Manager, the **userPrincipalName** attribute of the user in the external server must contain a valid value.
- If you are using the LDAP server other than Microsoft Active Directory for external authentication with System Manager, the **UID** attribute of the user in the external server must contain a valid value.

The authentication scheme policy determines the order in which you can use the authentication authorities. The supported order is as follows:

1. Local users (default)
2. External RADIUS users then local users
3. External LDAP users then local users
4. External Kerberos users, then local users
5. External LDAP users, then external RADIUS users, then local users
6. External RADIUS users, then external LDAP users, then local users
7. External KERBEROS users, then external multiple LDAP users, then local users

The authentication servers policy controls the settings for the external SAML, LDAP, RADIUS, and KERBEROS servers.

### Authentication scheme policy

System Manager supports the following authentication authorities:

- Local servers
- External RADIUS servers
- External LDAP servers (including Sun ONE or Microsoft active directory server)
- KERBEROS server
- SAML

---

## Editing the authentication scheme

### About this task

 **Note:**

The edit operation might reset the authentication scheme for the user. Ensure that the authentication scheme is correct.

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.

3. On the External Identity Repositories page, in the Authentication Scheme section, click **Edit**.
4. On the Authentication Scheme page, select the required authentication scheme.
5. Click **Save**.

---

## Provisioning of authentication servers

When the LDAP server is Microsoft Active Directory, the full name of the external user must be the same as the logon name that makes the cn attribute of the external users the same as the logon name.

The TCP port used for the external LDAP server and the UDP port used for the external RADIUS server must be open in the Linux iptables firewall, on both the primary security service, and the backup primary security service. To check the status of the iptables rules, use service iptables status.

---

## Provisioning the LDAP server

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.
3. On the External Identity Repositories page, click **Configure** in the Authentication Servers section.
4. On the Authentication Servers page, select **Provision First LDAP Server** and fill the required details in the fields.
5. **(Optional)** Select **Provision Second LDAP Server** and fill the required details in the fields.
6. Click **Save**.

### **Note:**

- Ensure that the Linux iptable firewall setting, on both the primary and backup security service, allows the TCP port as the source port.
- Clearing the **Provision First LDAP Server** check box clears all the data in the first and second provision LDAP server sections.

---

## Provisioning the RADIUS server

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.
3. On the External Identity Repositories page, click **Configure** in the Authentication Servers section.
4. On the Authentication Servers page, select the Provision RADIUS Server option.
5. In the Provision RADIUS Server section, enter the relevant information.

You must create two records in the external RADIUS server with the same shared secret for both the primary security server and the backup security server IP address.

6. Click **Save**.

### **Note:**

Ensure that the Linux iptable firewall setting on both the primary and the backup security service has UDP port as the source port.

## Provisioning the Kerberos server

### About this task

To use Kerberos authentication, configure System Manager with the required information for the Kerberos server.

### Before you begin

- If you use Firefox to gain access to System Manager, do the following:
  1. In the web browser, type `about:config`.
  2. Select the `network.negotiate-auth.trusted-uris` attribute.
  3. Right-click, select **Modify**, and add the URL of System Manager.
- Log on to System Manager with admin privileged credentials.

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.
3. On the External Identity Repositories page, click **Configure** in the Authentication Servers section.

4. On the Authentication Servers page, select the **Provision Kerberos Server** option.
5. In the **Provision Kerberos Server** section, enter the following information:
  - **DC Host Name (FQDN):** Type your FQDN in the format `machineName.domainName.com`. For example, `xyz.somecompany.com`.
  - **DC Computer Domain:** Type the domain name of the Kerberos server.
  - **Keytab File:** Click **Browse** and select the Kerberos server key file.
6. Click **Save**.

 **Important:**

When you log on to the Kerberos server using Single Sign-on (SSO), the system automatically authenticates you in the Domain Controller (DC) domain. Therefore, you cannot exit from UCM by using the **Logout** link. Close the web browser to exit the application.

## Provisioning user certificate authentication

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.
3. On the External Identity Repositories page, click **Configure** in the Authentication Servers section.
4. On the Authentication Servers page, complete the information in the Provision User Certificate Authentication section.
5. Click **Save**.

## Authentication Servers field descriptions

### Provision First and Second LDAP Server

| Name                           | Description                                        |
|--------------------------------|----------------------------------------------------|
| <b>IP (or DNS)</b>             | The IP address or the DNS name of the LDAP server. |
| <b>TCP Port</b>                | The TCP port of the LDAP server.                   |
| <b>Base Distinguished Name</b> | The base distinguished name of the LDAP server.    |
| <b>SSL/TLS Mode</b>            | The connection type supported by the LDAP server.  |

*Table continues...*

| Name                                       | Description                                                                                                                                                                |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Is Active Directory</b>                 | The field to select if active directory does not support anonymous binding.                                                                                                |
| <b>Supports Anonymous Binding</b>          | The field to select if active directory supports anonymous binding.<br><b>Supports Anonymous Binding</b> field is inactive if <b>Is Active Directory</b> field is enabled. |
| <b>Distinguished Name for Root Binding</b> | The distinguished name for the root binding. For example, type <code>cn</code> for Users.                                                                                  |
| <b>Password for Root Binding</b>           | The password for the root binding in this field.<br>From Release 8.1.3, you can enter up to 256 characters for the LDAP server authentication.                             |

### Provision Radius Server

| Name                 | Description                                                  |
|----------------------|--------------------------------------------------------------|
| <b>IP (or DNS)</b>   | The IP address or the DNS name of the primary RADIUS server. |
| <b>UDP Port</b>      | The UDP port number of the primary RADIUS server.            |
| <b>Shared Secret</b> | The shared secret of the RADIUS server.                      |

### Provision Kerberos Server

| Name                       | Description                                                        |
|----------------------------|--------------------------------------------------------------------|
| <b>DC Host Name (FQDN)</b> | The FQDN in the following format: machineName.domainName.com/net/. |
| <b>DC Computer Domain</b>  | The domain name of the Kerberos server.                            |
| <b>Keytab File</b>         | The field to select the encrypted Kerberos server key.             |

### Provision SAML Remote Identity Provider

| Name                 | Description                                                                                                                                                                                   |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Entity ID</b>     | The entity ID of the provisioned SAML remote identity provider.<br>The text "-- not configured --" is displayed if a Remote Identity Provider is not configured.                              |
| <b>Metadata Type</b> | The method to query the metadata for Remote Identity Provider. The options are: <ul style="list-style-type: none"> <li>• URL. A valid HTTP URL.</li> <li>• File. A valid XML file.</li> </ul> |
| <b>Metadata Url</b>  | The valid HTTP URL for the metadata of Remote Identity Provider.<br>This field is disabled if the <b>File</b> option is selected in the <b>Metadata Type</b> field.                           |
| <b>Metadata File</b> | The valid XML file for the metadata of Remote Identity Provider.<br>This field is disabled if the <b>URL</b> option is selected in the <b>Metadata Type</b> field.                            |

*Table continues...*

| Name               | Description                                                                              |
|--------------------|------------------------------------------------------------------------------------------|
| <b>Choose File</b> | The field to select an XML file that contains the metadata for Remote Identity Provider. |

## Provision User Certificate Authentication

| Name                                           | Description                                                                                                                                                                                                                                        |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate Purpose</b>                     | The purpose of the certification, such as Client Authentication.                                                                                                                                                                                   |
| <b>Certificate Field Name to get User Name</b> | The fields that can be used to retrieve the username from the certificate.<br>The left section contains the fields that can be read from the certificate.<br>The right section contains the fields that the system will read from the certificate. |

| Button          | Description                                                |
|-----------------|------------------------------------------------------------|
| <b>Remove</b>   | Removes the selected client purpose.                       |
| <b>Add</b>      | Adds the typed client purpose.                             |
| <b>&gt;&gt;</b> | Moves the selected certificate field to the right pane.    |
| <b>&lt;&lt;</b> | Moves the selected certificate field to the left pane.     |
| <b>Up</b>       | Increments the priority of the selected certificate field. |
| <b>Down</b>     | Decrements the priority of the selected certificate field. |

| Button        | Description                                             |
|---------------|---------------------------------------------------------|
| <b>Save</b>   | Saves your settings on the Authentication Servers page. |
| <b>Cancel</b> | Cancels your action and takes you to the earlier page.  |

---

## SAML authentication

### SAML authentication

For enterprise level Single Sign On, System Manager provides Security Assertion Markup Language (SAML) authentication.

### SAML protocol

SAML is an XML-based open standard used for exchanging authentication and authorization data between an identity provider, a producer of assertions, and a service provider, a consumer of assertions. SAML product belongs to the OASIS Security Services Technical Committee.

SAML protocol does not provide rules for determining the identity and access levels of a subject. The SAML protocol shares the authentication and authorization information of an identity between the issuer of the information, called as the identity provider and the relying party or the consumer of the information, called as the service provider.

## Key components of SAML protocol

### Assertions

Assertions are the packets of security information transferred from the Identity Provider to the Service Provider. The following are three different types of statements in an Assertion:

- Authentication Statements
- Attribute Statements
- Authorization Decision Statements

Assertions that the Identity Provider issues have a validity period beyond which the service provider must reject the information. SAML uses Authentication Statement to validate identity of the user.

### Protocols

SAML protocol provides rules on how SAML elements must be packaged in SAML request and response messages. The following are some of the key SAML protocols:

- Authentication Request Protocol
- Artifact Resolution Protocol
- Assertion Query and Request Protocol

Assertions that the Identity Provider issues have a validity period beyond which the service provider must reject the information. SAML/System Manager uses Authentication Statement to validate user's identity.

### Bindings

SAML binding refers to the mapping of a SAML message to a communication protocol or method. The following are some of the main SAML binding mechanisms:

- HTTP POST
- HTTP Redirect
- HTTP Artifact
- SOAP

### Profiles

SAML profile describes how various SAML messages, protocols, and bindings can combine together to achieve a particular use case.

Web Browser SSO Profile is the widely used SAML Profile. Web Browser SSO Profile provides the use case to achieve Single Sign On from a Web browser when you gain access to a protected resource on the service provider.

## SAML implementation in System Manager

System Manager uses SAML implementation version 2.0 of OpenAM Release 9.5.4 to provide SAML based authentication with external/remote Identity Providers. System Manager functions as

a Service Provider, consumer of assertions. You can configure CA Siteminder or a similar solution as a Remote Identity Provider, the producer of assertions.

System Manager uses Web Browser Single Sign On profile of SAML authentication. In System Manager, authentication using SAML differs from other external authentication methods such as remote LDAP and RADIUS in the following ways:

- You require a special URL to invoke SAML based authentication. You can bookmark a URL as <https://smgr.ca.avaya.com/?performssso=saml>.

The system subjects:

- Any incoming HTTP request to System Manager with a request parameter `performssso` set to `saml` to SAML based authentication.
- All other URLs to existing authentication handling and redirects an unauthenticated request to the login screen of System Manager.
- System Manager does not provide its own login screen for SAML authentication. The system redirects an unauthenticated user to the login screen of Remote Identity Provider (R-IDP). On successful authentication, the system redirects you to System Manager.

## Salient features of SAML implementation in System Manager

- R-IDP and System Manager always communicates through HTTPS.
- System Manager and identity provider communicates through HTTP-POST binding.
- SAML implementation module does not validate CRL. However, SSL communication fails with a certificate that is revoked since, SSL setup in System Manager jboss container ensures CRL validation.
- The system rejects expired Assertions.

## Guidelines for SAML authentication in System Manager

- You can use the NameID of a subject in an Assertion as the login ID to create a user account for the subject in System Manager. If the system encrypts the NameID, R-IDP must include the attributes of authenticated subject such as uid and email. in the Assertion. The system uses the attributes to create a user account in System Manager. If the Assertion does not contain attributes, the R-IDP must act as an Attribute Authority. In System Manager, you require an account for RBAC.
- Assertions must be signed and not encrypted.
- The system uses assertions from trusted sources only. An administrator must setup SSL trust between System Manager and R-IDP by adding the CA certificate of R-IDP's Web server certificate into the CA truststore in System Manager.
- Condition statement in an Assertion can have multiple AudienceRestriction statements. The condition statement must have SAML entity ID of System Manager as one of the AudienceRestriction.

## Configuring System Manager for SAML authentication

### Configuring Hosted Service Provider on System Manager

#### About this task

The system automatically configures System Manager as Hosted Service Provider during the installation of System Manager and upgrade of System Manager from Release 6.2.

However, you can modify the configuration using the following procedure.

As an administrator, you can enable or disable SAML authentication in System Manager from the SAML Configuration page.

#### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication > SAML Configuration**.
3. Click **Edit**.
4. On the SAML Hosted Service Provider page, perform the following:
  - a. Perform one of the following:
    - Select the **NameID as UserID** check box.
    - In the **Attribute Used as UserID** field, enter the name of the attribute that you want to use as the login ID of the user in System Manager.

#### SAML Configuration

Customize configuration on the Hosted Service Provider for external SAML authentication and on the Hosted Identity Provider for SAML authentication in the domain.

Host Configuration for External Authentication Enable Edit...

Entity ID: https://host1234.smgravaya.com:443/securityserver  
 Meta Alias Name: /sp  
 NameID as UserID: false  
 Attribute Used as UserID: uid  
 Mapped Attributes: mail=mail  
                       EmailAddress=mail  
                       UserID=uid  
                       uid=uid

[Download Hosted Service Provider metadata...](#)

- b. In the **Mapped Attributes** field, enter an attribute that you require to map between R-IDP and H-SP for a user.
  - c. Click **Save**.

### Configuring Remote Identity Provider

#### Procedure

1. Download the XML metadata from the Identity Provider:
  - a. Download the metadata in XML format that contains the service descriptor information of Remote Identity Provider (R-IDP) from the R-IDP server or using a valid HTTP URL that R-IDP provides.

For example, if OpenAM is configured as the R-IDP, download the metadata from <https://my-openam.ca.avaya.com/opensso/saml2/jsp/exportmetadata.jsp>.

- b. Save the data in an XML file on the file system or save the URL that points to the metadata.
2. Setup SSL trust between R-IDP and System Manager for successful communication of SAML messages using the following steps:
  - a. On System Manager Web Console, click **Services > Inventory**.
  - b. In the left navigation pane, click **Manage Elements** and add the CA certificate of R-IDP Web server certificate to System Manager truststore using the instructions outlined in Adding trusted certificates.
3. Add Remote Identity Provider:
4. Click **Save**.

On successful configuration of R-IDP, the system automatically enables the SAML authentication. An administrator can disable or enable the SAML authentication using the **Provision SAML Remote Identity Provider** check box.

## Related links

[Adding trusted certificates](#) on page 1184

[Provisioning Remote Identity Provider](#) on page 1249

## Provisioning Remote Identity Provider Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.
3. On the External Identity Repositories page, click **Configure** in the Authentication Servers section.
4. On the Authentication Servers page, select the **Provision SAML Remote Identity Provider** check box and get the metadata of R-IDP using one of the following:
  - Through a valid HTTP URL.
  - Using a valid XML file.

☐ Provision SAML Remote Identity Provider

Entity ID: -- not configured --

Metadata Type: ☒ URL ☐ File

Metadata Url:

Metadata File:  No file chosen

5. Click **Save**.

If R-IDP is successfully configured, the system automatically enables SAML authentication. An administrator can disable or enable SAML authentication using the **Provision SAML Remote Identity Provider** check box.

[Authentication Servers field descriptions](#) on page 1243

---

## Active sessions

---

### Viewing active sessions

#### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Active Sessions**.
3. On the Active Sessions page, the sessions are sorted in the **User ID** column.

---

### Terminating Single Sign-On sessions

#### About this task

Use this functionality to terminate selected Single Sign-On (SSO) sessions.

#### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Active Sessions**.
3. On the Active Sessions page, select the check box beside the required sessions to terminate.
4. Click **Terminate**.

The system deletes the selected sessions from the current sessions table. Administrators with terminated sessions are required to log on again.

---

# Regenerating data protection keys

---

## Regenerating symmetric keys for System Manager

### About this task

Use this procedure to execute the utility to regenerate data protection keys. System Manager administrator must execute the utility manually when one or more of the following conditions are met:

- Commercial grade hardening is enabled in System Manager.
- Sensitive data, such as user or communication profile passwords, are suspected to be compromised.
- The older data encryption keys must be replaced.

### Before you begin

- Create a data backup of System Manager before running this utility.
- On Geographic Redundancy-enabled System Manager, disable replication before executing this utility.

For more information, see “Disabling the Geographic Redundancy replication”.

- Stop the System Manager JBoss service.

### \* Note:

The utility takes longer when a large amount of data is present on System Manager. Therefore, Avaya recommends that you run this utility during the System Manager maintenance window.

### Procedure

1. Log in to the System Manager command line interface.
2. Type `cd $MGMT_HOME/securestore`, and press `Enter`.
3. Type `sudo $MGMT_HOME/securestore/migrateORRegenSecureStores.sh 3600`, and press `Enter`.
4. At the prompt, type one of the following and press `Enter`:
  - 1 to run the utility for all domains
  - 2 to run the utility for specific domains
  - 3 to exit the utility

5. To run the utility for specific domains, enter the domain name and press `Enter`.

The system executes the utility as a background process. Thus, if the SSH session is terminated, the utility execution is not affected.

6. To view the result, type `vim $AVAYA_LOG/migrateOrRegenSecureStore.log` and press `Enter`.

[Disabling the Geographic Redundancy replication](#) on page 112

---

## Regenerating asymmetric keys for System Manager

**About this task**

Use this procedure to execute the utility to regenerate asymmetric data protection keys. System Manager administrator must run this shell-based utility in one or more of the following conditions:

- One or more asymmetric keys are suspected to be compromised.
- **Key Management Properties** sends a trap notification.
- Asymmetric keys are outdated and need to be regenerated.

**Before you begin**

- Stop the System Manager JBoss service.

 **Note:**

The utility takes more time to run when a large amount of data is present on System Manager. Therefore, Avaya recommends that you run this utility during the System Manager maintenance window.

**Procedure**

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Type `cd /opt/vsp`, and press `Enter`.
3. Type `sh regenerateSSHKeys.sh`, and press `Enter`.

**Next steps**

1. Start the System Manager JBoss service.
2. Using the Solution Deployment Manager client, reestablish connection for all client elements.

---

## Regenerating asymmetric keys for geographic redundancy-enabled System Manager

**About this task**

Use this procedure to execute the utility to regenerate asymmetric data protection keys. System Manager administrator must run this shell-based utility in one or more of the following conditions:

- One or more asymmetric keys are suspected to be compromised.
- **Key Management Properties** sends a trap notification.
- Asymmetric keys are outdated and need to be regenerated.

## Before you begin

- Disable geographic redundancy replication.  
For more information, see “Disabling the Geographic Redundancy replication”.
- Convert the primary System Manager server to a standalone server.  
For more information, see “Converting the primary System Manager server to the standalone server”.
- Stop the System Manager JBoss service.

### **Note:**

The utility takes more time to run when a large amount of data is present on System Manager. Therefore, Avaya recommends that you run this utility during the System Manager maintenance window.

## Procedure

1. Log in to the System Manager command line interface.
2. Type `su - root`, and press `Enter`.
3. Provide the root password, and press `Enter`.
4. Type `cd /opt/vsp`, and press `Enter`.
5. Type `sh regenerateSSHKeys.sh`, and press `Enter`.
6. Start the System Manager JBoss service.

## Next steps

1. Configure System Manager to enable geographic redundancy.  
For more information, see “Enabling the Geographic Redundancy replication”.
2. Using the Solution Deployment Manager client, reestablish connection for all client elements.

# Chapter 21: Managing tenants

---

## Multi Tenancy

Tenant is a client organization that uses Team Engagement OnAvaya Aura – Unified Communications as a Service (UCaaS) (Avaya CE for UC) or Private Cloud in a shared, hosted environment. The tenant purchases the services on a pay-per-usage basis from the service provider. The tenant can contain a list of sites.

### Multi Tenancy

By default, the Multi Tenancy feature is disabled. You must enable the Multi Tenancy feature. After you enable the Multi Tenancy feature, you cannot disable the feature.

- **Multi Tenancy elements:** Communication Manager, Avaya Messaging, and Session Manager
- **Single Tenancy elements:** UCM Applications and Messaging

#### **Note:**

The elements that do not support any type of Multi Tenancy must not be configured for the User Provisioning Rule that the user wants to add to the tenant site because the system validates each User Provisioning Rule against the elements that are available in the Tenant site. In case the User Provisioning Rule contains elements, which do not support Single or Multi Tenancy, then the administrator cannot add the User Provisioning Rule to the tenant site.

The Service Provider Administrator and System Administrator can assign an element that supports:

- Multi Tenancy to more than one tenants. For example, Communication Manager.
- Single tenancy to only one tenant. For example, Messaging and IP Office.

### Tenant Management

To support Multi Tenancy, System Manager provides Tenant Management.

System Manager supports three levels of organization hierarchy for tenant management. The following lists the default names of the levels:

- Level 1: Site
- Level 2: Department
- Level 3: Team

The administrator can modify the default level names. The organization hierarchy levels, level 2 and level 3, are optional.

## Tenant Management on Out of Band Management-enabled System Manager

By default, the Multi Tenancy feature is disabled on System Manager when Out of Band Management is enabled. You must enable Multi Tenancy on Out of Band Management-enabled System Manager for the Tenant Management administrator to manage tenant users.

For more information about configuring Multi Tenancy on Out of Band Management-enabled System Manager, see *Deploying Avaya Aura® System Manager*.

---

## Enabling Multi Tenancy

### Before you begin

Log on to the System Manager web console as Service Provider Administrator or Tenant Administrator.

### About this task

To perform tenant-related administration, you must enable the Multi Tenancy feature on System Manager web console.

After you enable the Multi Tenancy feature, you cannot disable the feature. To disable the Multi Tenancy feature, you must reinstall System Manager. By default, the system disables the Multi Tenancy feature.

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR**.
3. On the View Profile:SMGR page, click **Edit**.

The system displays the Edit Profile:SMGR page.

4. In Multi Tenancy Properties, set **Multi Tenancy Status** to `true`.
5. Click **Commit**.
6. Log off from System Manager, and log on to System Manager again.

The administrator can now manage tenants from the **Services > Tenant Management** page on the System Manager web console.

---

## Creating a tenant

### Before you begin

- Log on to the System Manager web console as Service Provider Administrator or Tenant Administrator.
- Enable the Multi Tenancy feature.
- After you enable Multi Tenancy, log off and log on to the System Manager web console again.

### About this task

Use the procedure to create a tenant, assign a tenant administrator to the tenant, create tenant organization, and assign elements and user provisioning rule.

You can create one or more tenants.

System Manager supports maximum 250 tenant partitions as part of System Manager Multi Tenant Management.

### Procedure

1. On the System Manager web console, click **Services > Tenant Management**.
2. On the Tenant Management page, click **New Tenant**.  
The system displays the Create Tenant page.
3. On the Tenant Details tab, provide the details for the tenant.  
For more information, see Create Tenant field descriptions.
4. On the Administrators tab, in the Assigned Admin Users section, perform the following:
  - a. Click **New**.
  - b. In the Create Admin User area, provide the details of the administrator that you want to assign to the tenant.
  - c. Click **Commit**.
5. **(Optional)** On the Organization Hierarchy tab, in the Organization level names section, change the names for **Level 1**, **Level 2**, and **Level 3**.  
Level 2 and Level 3 are optional.
6. To view the new tenant node, click **Update Hierarchy**.  
If you do not click **Update Hierarchy**, the page does not display the new tenant that you created. Therefore, you cannot add a site to this tenant.
7. Perform the following to add a site or level 1 organization to the tenant:
  - a. In the Tenant Hierarchy section, select the tenant that you created and click **Add**.
  - b. Provide the following details for the site:
    - **Site Details:** Details of the site. For more information, see Create Tenant field descriptions.

- **Elements:** Perform the following:
- To assign an element to the site, click the plus sign (+) in the Available Elements section.

Click **X** to unassign an element if required. You can assign more than one element to a site. The Selected Elements section displays the elements that you assign to the site. Provide the tenant number or tenant ID and the location number for the element.

**New Tenant**

Search ...

- Audi
  - McDonalds
    - Pune Centre**
      - TenantBMW
      - TenantFord

**Pune Centre Details** \* **Elements** User Provisioning Rule

**Selected Elements**

1 Item

| Name        | Type | Tenant Number | Location Number |
|-------------|------|---------------|-----------------|
| X CMElement | CM   | 12            |                 |

**Available Elements**

0 Items Filter: Enable

| Name       | Type |
|------------|------|
| No Records |      |

Commit Cancel

**\* Note:**

The Communication Manager element that you select in the Elements tab and the User Provisioning Rule tab must be the same. If you select a different Communication Manager element, the tenant creation fails.

- To assign permissions to the tenant administrator, click the element, select the permissions on the Permission Mappings page, and click **Commit**.

For more information, see the “Managing roles”.

**\* Note:**

For Communication Manager, do not provide permissions for Audit, Element Cut Through, and Synchronization functions.

- **User Provisioning Rule:** Click the plus sign (+) in the Available User Provisioning Rules section to assign a rule to the site. Click **X** to unassign a user provisioning rule.

- Click **Update Hierarchy** to view the new site in the tenant organization.

The system displays the site that you added to the tenant.

If you do not click **Update Hierarchy**, the system does not display the new site that you created. Therefore, you cannot add a department to this site.

**\* Note:**

Add at least one site for the tenant.

- Repeat Step a through Step c to add more than one site for the tenant.
- (Optional) Perform the following to add a department or level 2 organization to the site:
    - In the Tenant Hierarchy section, select the site, and click **Add**.
    - Provide the details for the department.
    - Click **Update Hierarchy** to view the new department in the tenant organization.

If you do not click **Update Hierarchy**, the system does not display the new department that you created. Therefore, you cannot add a team to this department.

- d. Repeat Step a through Step c to add more than one department for the site.
  9. **(Optional)** Perform the following to add a team or level 3 organization to the department:
    - a. In the Tenant Hierarchy section, select the department, and click **Add**.
    - b. Provide the details for the team.
    - c. Click **Update Hierarchy** to view the new team in the tenant organization.
 

If you do not click **Update Hierarchy**, the system does not display the new team that you created.
    - d. Repeat Step a through Step c to add more than one team for the department.
  10. Click **Commit**.
- The system displays the tenant organization on the Tenant Management page.
11. Repeat Step 2 through Step 9 to create more than one tenant.

## Assigning the tenant administrator to the tenant

### Before you begin

- Log on to the System Manager web console as the Cloud Service Provider administrator.
- Enable the Multi Tenancy feature.

### Procedure

1. On the System Manager web console, click **Services > Tenant Management**.
2. On the Tenant Management page, select a tenant in the left pane, and click the **Administrators** tab.
3. In the **Assigned Admin Users** section, perform one of the following steps:
  - Click **Edit** or **Search** and select the administrator that you must assign to this tenant.
  - Perform the following:
    - a. Click **New**.
    - b. In the **Create Admin User** area, provide the details of the administrator that you must assign to the tenant.

- c. Click **Commit**.

The system assigns the tenant administrator to the tenant.

---

## Unassigning the tenant administrator

### Before you begin

- Log on to the System Manager web console as the Service Provider Administrator.
- Enable the Multi Tenancy feature.
- Create the tenant.

### Procedure

1. On the System Manager web console, click **Services > Tenant Management**.
2. On the Tenant Management page, select the tenant in the left pane, and click the **Administrators** tab.
3. In the **Assigned Admin Users** section, click **Edit** or **Search**, and select the administrator that you must unassign.
4. Click **Unassign**.
5. Click **Commit**.

The system removes the association of the tenant administrator with the tenant.

## Viewing the tenant

### Before you begin

- Log on to the System Manager web console.
- Enable the Multi Tenancy feature.
- Create a tenant.

### Procedure

1. On the System Manager web console, click **Services > Tenant Management**.
2. From the tenant organization, click the tenant, site, department, or team that you want to view.
3. View the details of the tenant, site, department, or team.

## Modifying the tenant

**Before you begin**

- Log on to the System Manager web console as Service Provider Administrator or Tenant Administrator.
- Enable the Multi Tenancy feature.

**About this task**

Use the procedure to modify the following:

- The tenant, organization hierarchy, and tenant administrator details.
- The assignment of elements, user provisioning rule, and resource permissions to the site.

**Procedure**

1. On the System Manager web console, click **Services > Tenant Management**.
2. On the Tenant Management page, select the tenant, site, department, or team that you must modify.
3. Click **Edit**.
4. Modify the following information as appropriate:
  - Tenant details, tenant administrator, and organization hierarchy labels
  - Site details, assignment of elements, user provisioning rule, and permissions to the site
  - Department details
  - Team details

For information, see Create Tenant field descriptions.

5. Click **Commit**.

## Deleting a tenant

The Service Provider Administrator can delete the tenant and the tenant organization hierarchy.

## Before you begin

- Log on to System Manager Web Console as Service Provider Administrator.
- Enable the Multi Tenancy feature.
- Delete all users associated with the tenant.

## Procedure

1. On the System Manager web console, click **Services > Tenant Management**.
2. On the Tenant Management page, select the tenant that you must delete.
3. Click Delete.

If any users associated with the tenant exist, the system displays a message to delete all users.

4. **(Optional)** Perform the following steps to delete users associated with the tenant:

- a. On the User Management page, in the tenant organization, select a tenant.

The system displays the users associated with this tenant on the right pane. You can search for a tenant if you cannot view the tenant in the left pane.

- b. Select the users, and click **Delete**.
- c. On the User Delete Confirmation page, click **Delete**.

The system deletes the users that are associated with the tenant.

5. On the Organization Unit Delete Confirmation page, click **Delete**.

The system deletes the tenant, tenant administrator, and all roles created for the tenant, sites, departments, and organization for the tenant.

## Multi Tenancy for Avaya SIP AST endpoints

During the search for enterprise users that must be added as contacts, Avaya SIP AST endpoints retrieve the enterprise users from:

- The tenant partition to which the enterprise user who started the search belongs
- The enterprise users in the default tenant partition
- All public contacts

---

## Multi Tenancy for Communication Manager objects

With the Multi Tenancy feature, Communication Manager provides telecommunication services to multiple, independent groups of users through a single Communication Manager server. Each tenant appears to have a dedicated Communication Manager server, though in reality, the tenants share the same Communication Manager server.

As an administrator, you can gain access to one or more tenant partitions in System Manager, and you can administer tenant numbers for several Communication Manager objects. You can segregate tenants through tenant numbers. The following Communication Manager objects support Multi Tenancy:

- Agents
- Announcements
- VDN
- Endpoints
- Term Extension Group
- Trunk Group
- Hunt Group

When a user is added to a tenant, the **Tenant Number** field is autopopulated for these Communication Manager objects.

The Communication Manager Objects page displays specific Communication Manager objects based on the tenant permissions and the Communication Manager permissions that you specify.

 **Note:**

For a Communication Manager instance, do not assign the same tenant number for more than one tenant.

After the tenant administrator selects the site and the tenant from the Tenant Management web console, the Communication Manager Objects page displays the tenant and site combination. Depending on the tenant and site a user selects, the tenant range and tenant permissions take effect.

## Multi Tenancy and tenant partitioning in Communication Manager

The native tenant partitioning feature of Communication Manager provides multiple services to independent groups of users through a single Communication Manager server. Communication Manager also offers the following features:

- Segmenting call processing and feature processing by the Inter-Tenant Communications Control (ITCC) feature
- Tenant management of users and system administrators through System Manager

With System Manager Inter-tenant Communication Control (ITCC), Communication Manager can segregate features for each customer. System Manager tenants are shared across multiple adopters. Communication Manager is one of the adopters. Based on the roles and permissions assigned on the Communication Manager instances in a tenant, the Communication Manager objects are segregated for the tenant.

---

## Notes on Multi Tenancy for Communication Manager

### Scheduling jobs with Multi Tenancy

When the Multi Tenancy feature is enabled you cannot schedule the following operations:

- Clear amw
- Delete station
- Delete agent
- Delete announcement
- Backing up announcements
- Backing up all announcements
- Restoring announcements
- Restoring all announcements
- Moving announcements
- Broadcasting announcements
- Bulk operations including adding stations in bulk, deleting stations in bulk, adding agents in bulk, deleting agents in bulk, editing agents in bulk
- Global endpoint change

Tenant administrators cannot delete Communication Manager objects in System Manager. To assign delete permissions to a tenant administrator, the Service Provider Administrator must provide delete and scheduler permissions to the tenant administrator.

This will not impact the current implementation of Element Cut Through, notify sync, and adding Off PBX entries for a SIP station.

### User Provisioning Rule and Multi Tenancy

When you assign a user provisioning rule to a tenant, the same Communication Manager element must be present in User Provisioning Rule and Elements tabs. If the Communication Manager

element that you selected is available in the User Provisioning Rule tab but unavailable in the Elements tab, the tenant creation fails.

When you create a new tenant, the system validates the tenant number based on the Communication Manager that you selected. Depending on the tenant configuration in the Communication Manager you selected, you can choose a tenant number between 1 to 100 or 1 to 250.

## User Management and Multi Tenancy

When you enable the Multi Tenancy feature, and you choose the tenant and site for a user in User Management, the system displays Communication Manager **System** in the endpoint agent communication profile sections based on the tenant and site values you selected in the Identity tab. The User Management values override the values selected on the **Multi Tenancy** dashboard.

The system displays the available extensions in the endpoint, agent communication profile sections according to the tenant and Communication Manager permissions.

## Field level permissions and Multi Tenancy

Apart from the tenant permissions, object-level and field-level permissions are also valid for the tenant hierarchies. For example, admin A with access to Tenant Partition 1 can modify hunt-group 12 in Tenant Partition 1, but admin A cannot assign a station in Tenant Partition 2 to that hunt group.

The object and field-level permissions are valid for the following objects:

| Communication Manager object | Fields                                                                                                                       |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Hunt Group                   | Group Number Range<br>Group Extension<br>Member Extensions<br>Night Attendant Extension                                      |
| Agents                       | Agent Login ID<br>Coverage Path<br>Port Extension<br>COR<br>Tenant Number                                                    |
| VDN                          | Extension<br>COR<br>Tenant Number<br>VDN of Origin Annc Extension<br>Return Destination<br>Conference Controller for Meet-me |

*Table continues...*

| Communication Manager object | Fields                                                                                                                       |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Endpoint                     | COR<br>Emergency Location Extension<br>Message Lamp Extension<br>Tenant Number<br>Media Complex Extension<br>Hunt-to Station |
| Terminating Extension Group  | Group Extension<br>COR<br>Tenant Number<br>4 Extension fields                                                                |
| Trunk Group                  | COR<br>Tenant Number<br>Incoming Destination<br>Night Service Extension<br>List of Trunk Group Data                          |

- Do not provide Element Cut-Through access for a tenant administrator, because the administrator can bypass the tenant restrictions.
- In the Tenant Management web console, when the tenant administrator assigns a single number or a range in the **Tenant Number** field, the Communication Manager that the administrator selects is associated with the tenants.

The **Tenant Number** field is autopopulated for the Communication Manager objects that you create through Communication Manager. In the **Tenant Number** field, you can specify only the values or range that you configured in System Manager. If you specify a range, the system uses the smallest value in the tenant range. This scenario is also valid when you create Communication Manager objects such as endpoints or agents using User Management or Directory Synchronization.

- When you create tenants, if you specify the location, then you can enter only valid values. Location can be a single number, a range, or blank. When you enable multi-location field in System-Parameters customer-options, the available values for the **Location Number** field are 1 to 250 for Communication Manager 6.0 and 6.2, and 1 to 2000 for Communication Manager 6.3 and later. You must type `blank` or leave the **Location** field blank to choose blank as a value for tenant objects. For example, to specify blank and the range 1 to 10, you must type `blank, 1:10` in the **Location** field.
- When you change or select a template, the **Tenant Number** in the template takes precedence over the smallest, default tenant value. This scenario is valid only if the tenant number present in the template is within the valid tenant range. Otherwise, the system uses the smallest value in the specified tenant range. The value in the **Location** field specified in the template also takes precedence over the default value. The system validates against incorrect and out of range values.

## Tenant Management field descriptions

### Tenant Hierarchy

| Button            | Description                                                                                                                                                                                                                                       |

## Create Tenant field descriptions

The system displays the Create Tenant page when you click **New Tenant** or select a tenant organization from the tree.

 **Note:**

Fields marked with an asterisk are mandatory.

### Tenant Details

| Name                   | Description                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>            | The name or unique identifier of the tenant.                                                                                                                                                                                                                                                     |
| <b>Contact ID</b>      | The contact ID of the tenant.                                                                                                                                                                                                                                                                    |
| <b>Max no of users</b> | <p>The maximum number of users that an administrator can associate with this tenant.</p> <p>This number does not include admin users who can manage this tenant but are not associated with this tenant.</p> <p>You can administer 10–250000 end users in System Manager. The default is 10.</p> |
| <b>Description</b>     | A brief description of the tenant.                                                                                                                                                                                                                                                               |

## Administrators

The Assigned Admin Users section displays the fields in the Create Admin User area when you click **New**.

| Name                    | Description                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>First Name</b>       | The first name of the administrator.                                                                                          |
| <b>Last Name</b>        | The last name of the administrator.                                                                                           |
| <b>Login</b>            | The login name of the administrator.<br>The login name must be a fully qualified domain name. For example, jmiller@avaya.com. |
| <b>Password</b>         | The password to log on to the System Manager web console.                                                                     |
| <b>Confirm Password</b> | The password that you must re-enter for confirmation.                                                                         |

| Button          | Description                                                                |
|-----------------|----------------------------------------------------------------------------|
| <b>New</b>      | Creates a new tenant administrator with the details that you provide.      |
| <b>Search</b>   | Searches for the administrator using the search criteria that you provide. |
| <b>Unassign</b> | Removes the administrator that you selected.                               |
| <b>Commit</b>   | Saves the administrator details that you provided.                         |
| <b>Cancel</b>   | Cancels the operation.                                                     |

## Organization Hierarchy

The page displays the fields in the Organization Level Names area.

| Field   | Description                                  |            |                    |
|---------|----------------------------------------------|------------|--------------------|
| Level 1 | The name for level 1.                        |            |                    |
|         | Organization level                           | Default    | Example            |
|         | Level 1                                      | Site       | Hyderabad          |
|         | Level 2                                      | Department | Loans Division     |
|         | Level 3                                      | Team       | Customer Relations |
| Level 2 | The name for level 2. The field is optional. |            |                    |
| Level 3 | The name for level 3. The field is optional. |            |                    |

| Button                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Update Hierarchy</b> | <p>The system performs the following:</p> <ul style="list-style-type: none"> <li>• Refreshes the page with the details that you provided during the creation of the tenant, site, department, and team.</li> <li>• Displays the tenant node that you created.</li> <li>• Displays the level 1 or site that you created.</li> <li>• Displays the level 2 or department that you created.</li> <li>• Displays the level 3 or team.</li> </ul> <p> <b>Note:</b></p> <p>The system displays the newly created organizational unit only when you click <b>Update Hierarchy</b>.</p> |
| <b>Commit</b>           | Saves the changes you made to the tenant, site, department, or team, and displays the Tenant Management page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Cancel</b>           | Cancels the current operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Level 1 Details or Site Details

The system displays the Level 1 Details or Site Details, Elements, and User Provisioning Rule tabs only when you select a tenant, and click **Add**.

| Name               | Description                                           |
|--------------------|-------------------------------------------------------|
| <b>Name</b>        | The name of the level 1 hierarchy or site.            |
| <b>Address</b>     | The address of the level 1 hierarchy or site.         |
| <b>Description</b> | A brief description of the level 1 hierarchy or site. |

### Elements

| Name                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Selected Elements</b>                                                            | <p>The elements that you can assign to the level 1 hierarchy or site.</p> <p>The system adds the elements to the section from the <b>Available Elements</b> section when you click the plus sign (+).</p> <p> <b>Note:</b></p> <p>The element that you select in the <b>Elements</b> tab and the <b>User Provisioning Rule</b> tab must be the same. If you select a different element, the tenant creation fails.</p> |
|  | <p>Unassigns the element from the level 1 hierarchy or site.</p> <p>The system displays the element in the <b>Available Elements</b> section.</p>                                                                                                                                                                                                                                                                                                                                                         |
| <b>Name</b>                                                                         | The name of the element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Type</b>                                                                         | The element type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

*Table continues...*

| Name                      | Description                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tenant No.</b>         | The tenant unique identifier.<br><br>The <b>Tenant No.</b> and <b>Location No.</b> must be created in the element before you associate the numbers with the tenant. For information, see the documentation for the appropriate element. |
| <b>Location No.</b>       | The site that contains elements and other network element resources. For example, Communication Manager, Session Manager, endpoints, and other resources.                                                                               |

# Chapter 22: Shutting down System Manager

---

## Overview

System Manager executes several scheduled processes in the background. When System Manager shuts down, the system must stop the processes that System Manager runs in the background. This is to ensure that the system is stable and does not contain incomplete data in any data store when System Manager starts the next time. The system must also ensure that the background process that stops does not leave the system in an unstable state.

The shutdown process stops all running jobs and then shuts down System Manager.

 **Note:**

You cannot cancel the process after you select the shutdown process.

To ensure that System Manager shuts down completely, the shutdown feature provides a user interface that displays all scheduled jobs that are running on System Manager and active user sessions. Based on the criticality and priority of scheduled jobs, the administrator can shut down the system immediately or wait for the scheduled jobs to complete.

- If the administrator chooses to shut down the system, the shutdown service performs the following actions:
  - Sends the shutdown notification to active users so that users can commit or rollback the operation. The shutdown framework waits for the specified grace period that the administrator sets for active users to complete the operations.
  - Sends the shutdown signal to the Scheduler of System Manager to interrupt the running jobs. Scheduler service must not start any new scheduled jobs.
  - Blocks access to the System Manager web console during a shutdown. After the grace period, the system disallows new logins. The system stops all existing sessions when the shutdown begins and redirects the sessions to the Login page. The system displays `Shutdown in progress` message on Login page.
  - Logs an audit message indicating that a request for shutdown is made.
  - Makes an entry in a file about the shutdown request. The system uses the shutdown request information to display the shutdown history.
  - Shuts down all applicable services such as JBoss, Postgres, and CND.

- If any of the steps fail, the system logs a message and performs the next step.
- Administrator can shut down System Manager from the command line interface or System Manager web console.

---

## Shutting down System Manager from the web console

### About this task

When you start the shutdown process, you cannot access the System Manager web console.

### Before you begin

Log on to the System Manager web console of the active server.

### Procedure

1. On the System Manager web console, click **Services > Shutdown > Shutdown System Manager**.
2. In the Running and Pending Scheduled Jobs section, view the running and pending scheduled jobs.
3. In the Active User Sessions section, view the active user sessions.
4. On the System Manager web console, click **Services > Shutdown > Shutdown History**.
5. In Initiate Shutdown, click **Shutdown System Manager**.

System Manager displays the Shutdown System Manager dialog box with the following message.

The system initiates System Manager shut down after the grace period of 10 minutes, and stops all running jobs. Once you click Yes, you cannot abort this operation.

The system notifies all the users who logged in before System Manager shuts down is initiated.

Are you sure you want to shutdown System Manager?

6. To start the shutdown process, click **Yes**.

## Rebooting System Manager virtual machine from the web console

### About this task

When you start the reboot process, you cannot access the System Manager web console.

### Before you begin

Log on to the System Manager web console of the active server.

### Procedure

1. On the System Manager web console, click **Services > Shutdown > Shutdown System Manager**.
2. In the Running and Pending Scheduled Jobs section, view the running and pending scheduled jobs.
3. In the Active User Sessions section, view the active user sessions.
4. In Initiate Reboot, click **Reboot System Manager**.

System Manager displays the Reboot System Manager dialog box with the following message.

The system initiates System Manager reboot after the grace period of 10 minutes, and stops all running jobs. Once you click Yes, you cannot abort this operation.

The system notifies all the users who logged in before System Manager reboot is initiated.

Are you sure you want to Reboot System Manager?

5. To start the reboot process, click **Yes**.

---

## Viewing the shutdown history from the System Manager web console

### Procedure

1. On the System Manager web console, click **Services > Shutdown > Shutdown History**.
2. On the Shutdown History page, you can view the shutdown history of the last shutdown actions.

The Shutdown History page displays the date, time, and status of the shutdown action.

## Shutdown System Manager field descriptions

### Initiate Shutdown

| Button                  | Description                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------|
| Shutdown System Manager | Displays the Shutdown System Manager dialog box to select an option to start the shutdown process. |

### Initiate Reboot

| Button                | Description                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------|
| Reboot System Manager | Displays the Reboot System Manager dialog box to select an option to start the reboot process. |

### Running and Pending Scheduled Jobs

| Name         | Description                                      |
|--------------|--------------------------------------------------|
| Job Name     | The job name as displayed on the Scheduler page. |
| Job Type     | The job type as displayed on the Scheduler page. |
| Job Status   | The status of the job.                           |
| Scheduled By | The name of the user who created the job         |
| Start Time   | The date and time the job is scheduled to start. |

### Active User Sessions

| Name                      | Description                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| User Name                 | The user name who is currently active.                                                                                          |
| Session Duration          | The session duration since when the user is active.                                                                             |
| Is Current Session Status | The status of the current session. The status can be: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> |

# Chapter 23: Solution deployment and upgrade

---

## Solution Deployment Manager

---

### Solution Deployment Manager overview

Solution Deployment Manager is a centralized software management solution in System Manager that provides deployments, upgrades, migrations, and updates to Avaya Aura® applications. Solution Deployment Manager supports the operations on the customer's Virtualized Environment and the Avaya Aura® Virtualized Appliance model.

Solution Deployment Manager provides the combined capabilities that Software Management, Avaya Virtual Application Manager, and System Platform provided in earlier releases.

From Release 7.1 and later, Solution Deployment Manager supports migration of Virtualized Environment-based 6.x, 7.0.x, and 7.1.x applications to Release 8.x and later in the customer's Virtualized Environment. For migrating to Release 8.x, you must use Solution Deployment Manager Release 8.x.

Release 7.0 and later supports a standalone version of Solution Deployment Manager, the Solution Deployment Manager client. For more information, see *Using the Solution Deployment Manager client*.

System Manager with Solution Deployment Manager runs on:

- Avaya Aura® Virtualized Appliance: Contains a server, Appliance Virtualization Platform, and Avaya Aura® application OVA. Appliance Virtualization Platform includes a VMware ESXi 6.5 hypervisor.
- Customer-provided Virtualized Environment solution: Avaya Aura® applications are deployed on customer-provided, VMware® certified hardware.
- Software-Only environment: Avaya Aura® applications are deployed on the customer-owned hardware and the operating system.

With Solution Deployment Manager, you can do the following in Virtualized Environment and Avaya Aura® Virtualized Appliance models:

- Deploy Avaya Aura® applications.
- Upgrade and migrate Avaya Aura® applications.

**\* Note:**

When an application is configured with Out of Band Management, Solution Deployment Manager does not support upgrade for that application.

For information about upgrading the application, see the application-specific upgrade document on the Avaya Support website.

- Download Avaya Aura® applications.
- Install service packs, feature packs, and software patches for the following Avaya Aura® applications:
  - Communication Manager and associated devices, such as gateways, media modules, and TN boards.
  - Session Manager
  - Branch Session Manager
  - AVP Utilities
  - Avaya Aura® Appliance Virtualization Platform, the ESXi host that is running on the Avaya Aura® Virtualized Appliance.

The upgrade process from Solution Deployment Manager involves the following key tasks:

- Discover the Avaya Aura® applications.
- Refresh applications and associated devices and download the necessary software components.
- Run the preupgrade check to ensure successful upgrade environment.
- Upgrade Avaya Aura® applications.
- Install software patch, service pack, or feature pack on Avaya Aura® applications.

For more information about the setup of the Solution Deployment Manager functionality that is part of System Manager 8.1.x, see *Avaya Aura® System Manager Solution Deployment Manager Job-Aid*.

---

## Solution Deployment Manager Client

For the initial System Manager deployment or when System Manager is inaccessible, you can use the Solution Deployment Manager client. The client must be installed on the computer of the technician. The Solution Deployment Manager client provides the functionality to deploy the OVAs or ISOs on an Avaya-provided server, customer-provided Virtualized Environment, or Software-only environment.

A technician can gain access to the user interface of the Solution Deployment Manager client from the web browser.

Use the Solution Deployment Manager client to:

- Deploy System Manager and Avaya Aura® applications on Avaya appliances, VMware-based Virtualized Environment, and Software-only environment.
- Upgrade System Platform-based System Manager.

- Upgrade VMware-based System Manager from Release 6.x, 7.x, or 8.0.x to Release 8.1 and later.
- Install System Manager software patches, service packs, and feature packs.
- Configure Remote Syslog Profile.
- Create the Appliance Virtualization Platform Kickstart file.
- Install Appliance Virtualization Platform patches.
- Restart and shutdown the Appliance Virtualization Platform host.
- Start, stop, and restart a virtual machine.
- Change the footprint of Avaya Aura® applications that support dynamic resizing. For example, Session Manager and Avaya Breeze® platform.

**\* Note:**

- You can deploy or upgrade the System Manager virtual machine only by using the Solution Deployment Manager client.
- You must always use the latest Solution Deployment Manager client for deployment.
- You must use Solution Deployment Manager Client 7.1 and later to create the kickstart file for initial Appliance Virtualization Platform installation or recovery.

| Create and use the software library.                                                                                                                                                                                                                                                           | -                                                                               |

### Related links

[Solution Deployment Manager Client](#) on page 1277

## Installing the Solution Deployment Manager client

### Prerequisites

1. If an earlier version of the Solution Deployment Manager client is running on the computer, remove the older version from **Control Panel > Programs > Programs and Features**.

For information about uninstalling the Solution Deployment Manager client, see “Uninstalling the Solution Deployment Manager client”.

2. Ensure that Windows 7, Windows 8.1 64-bit, Windows 10 64-bit, or Windows 16 64-bit, operating system is installed on the computer.

**+ Tip:**

On **Computer**, right-click properties, and ensure that Windows edition section displays the version of Windows operating system.

3. Ensure that at least 5 GB of disk space is available at the location where you want to install the client. To deploy applications, you must have additional 15 GB of disk space on your system.

**+ Tip:**

Using the Windows file explorer, click **Computer**, and verify that the Hard Disk Drives section displays the available disk space.

4. To avoid port conflict, stop any application server that is running on your computer.

**+ Tip:**

From the system tray, open the application service monitor, select the application server that you want to stop, and click **Stop**.

5. Ensure that the firewall allows the ports that are required to install the Solution Deployment Manager client installation and use the Solution Deployment Manager functionality.

 **Note:**

Ensure that port 8005 or 8009 is available for installing and running Solution Deployment Manager Client. If port 8005 or 8009 is assigned to any other application, you must free up the ports for starting the Avaya SDM service.

For more information, see *Troubleshooting Avaya Aura® System Manager*.

System Manager 8.1.3 Port Matrix lists all the ports and protocols that System Manager uses. You can access the System Manager 8.1.3 Port Matrix document on the Avaya Support website at <http://support.avaya.com/> by using valid credentials.

6. Ensure that ports support Avaya Aura® 8.1.3 supported browsers.
7. Close all applications that are running on your computer.
8. Do not set CATALINA\_HOME as environment variable on the computer where you install the Solution Deployment Manager client.

 **Tip:**

On **Computer**, right-click properties, and perform the following:

- a. In the left navigation pane, click **Advanced system settings**.
  - b. On the System Properties dialog box, click the **Advanced** tab, and click **Environment Variables**.
  - c. Verify the system variables.
9. Ensure that the computer on which the Solution Deployment Manager client is running is connected to the network.

Operations that you perform might fail if the computer is not connected to the network.

[Solution Deployment Manager Client](#) on page 1277

## Installing the Solution Deployment Manager client on your computer

### About this task

In Avaya Aura® Virtualized Appliance offer, when the centralized Solution Deployment Manager on System Manager is unavailable, use the Solution Deployment Manager client to deploy the Avaya Aura® applications.

You can use the Solution Deployment Manager client to install software patches of only System Manager and hypervisor patches of Appliance Virtualization Platform.

Use the Solution Deployment Manager client to deploy, upgrade, and update System Manager.

From Avaya Aura® Appliance Virtualization Platform Release 7.0, Solution Deployment Manager is mandatory to upgrade or deploy the Avaya Aura® applications.

## Procedure

1. Download the `Avaya_SDMClient_win64_8.1.3.0.1035538_49.zip` file from the Avaya Support website at <http://support.avaya.com> or from the Avaya PLDS website, at <https://plds.avaya.com/>.
2. On the Avaya Support website, click **Support by Products > Downloads**, and type the product name as **System Manager**, and Release as **8.1.x**.
3. Click the **Avaya Aura® System Manager Release 8.1.x SDM Client Downloads, 8.1.x** link. Save the zip file, and extract to a location on your computer by using the WinZip application.

You can also copy the zip file to your software library directory, for example, `c:/tmp/Aura`.

4. Right click on the executable, and select **Run as administrator** to run the `Avaya_SDMClient_win64_8.1.3.0.1035538_49.exe` file.

The system displays the Avaya Solution Deployment Manager screen.

5. On the Welcome page, click **Next**.
6. On the License Agreement page, read the License Agreement, and if you agree to its terms, click **I accept the terms of the license agreement** and click **Next**.
7. On the Install Location page, perform one of the following:
  - To install the Solution Deployment Manager client in the system-defined folder, leave the default settings, and click **Next**.

If the `C:\Program Files\Avaya\AvayaSDMClient` directory is not empty, the installer displays the following message: To install the SDM client, select an empty directory or manually delete the files from the installation directory.

If the file is locked and you are unable to delete it, reboot the machine, and then delete the file.

- To specify a different location for installing the Solution Deployment Manager client, click **Choose**, and browse to an empty folder. Click **Next**.

To restore the path of the default directory, click **Restore Default Folder**.

The default installation directory of the Solution Deployment Manager client is `C:\Program Files\Avaya\AvayaSDMClient`.

8. On the Pre-Installation Summary page, review the information, and click **Next**.
9. On the User Input page, perform the following:
  - a. To start the Solution Deployment Manager client at the start of the system, select the **Automatically start SDM service at startup** check box.
  - b. To change the default software library directory on windows, in Select Location of Software Library Directory, click **Choose** and select a directory.

The default software library of the Solution Deployment Manager client is  
C:\Program Files\Avaya\AvayaSDMClient\Default\_Artifacts.

You can save the artifacts in the specified directory.

- c. In **Data Port No**, select the appropriate data port.

The default data port is 1527. The data port range is from 1527 through 1627.

- d. In **Application Port No**, select the appropriate application port.

The default application port is 443. If this port is already in use by any of your application on your system, then the system does not allow you to continue the installation. You must assign a different port number from the defined range. The application port range is from 443 through 543.

 **Note:**

After installing the Solution Deployment Manager client in the defined range of ports, you cannot change the port after the installation.

- e. (Optional) Click **Reset All to Default** to reset all values to default.

10. Click **Next**.

11. On the Summary and Validation page, verify the product information and the system requirements.

The system performs the feasibility checks, such as disk space and memory. If the requirements are not met, the user must make the required disk space, memory, and the ports available to start the installation process again.

12. Click **Install**.

13. On the Install Complete page, click **Done** to complete the installation of Solution Deployment Manager Client.

Once the installation is complete, the installer automatically opens the Solution Deployment Manager client in the default web browser and creates a shortcut on the desktop.

14. To start the client, click the Solution Deployment Manager client icon, .

## Next steps

- Configure the laptop to get connected to the services port if you are using the services port to install.
- Connect the Solution Deployment Manager client to Appliance Virtualization Platform through the customer network or services port.

For information about “Methods to connect the Solution Deployment Manager client to Appliance Virtualization Platform”, see *Using the Solution Deployment Manager client*.

## Accessing the Solution Deployment Manager client dashboard

### About this task

#### \* Note:

If you perform deploy, upgrade, and update operations from the Solution Deployment Manager client, ignore the steps that instruct you to access System Manager Solution Deployment Manager and the related navigation links.

### Procedure

To start the Solution Deployment Manager client, do one of the following:

- On your computer, click **Start > All Programs > Avaya > Avaya SDM Client**.
- On your desktop, click .

### Related links

[Solution Deployment Manager Client](#) on page 1277

## Solution Deployment Manager client capabilities

The Solution Deployment Manager client provides the following capabilities and functionality:

- Runs on the following operating systems:
  - Windows 7, 64-bit Professional or Enterprise
  - Windows 8.1, 64-bit Professional or Enterprise
  - Windows 10, 64-bit Professional or Enterprise
  - Windows Server 2016, 64-bit Professional or Enterprise
- Supports the same web browsers as System Manager.
- Provides the user interface with similar look and feel as the central Solution Deployment Manager in System Manager.
- Supports deployment of System Manager. The Solution Deployment Manager client is the only option to deploy System Manager.
- Supports the Flexible footprint feature. The size of the virtual resources depends on the capacity requirements of Avaya Aura® applications.
- Defines the physical location, Avaya Aura® Appliance Virtualization Platform or ESXi host, and discovers virtual machines that are required for application deployments and virtual machine life cycle management.
- Manages lifecycle of the OVA applications that are deployed on the Avaya Aura® Appliance Virtualization Platform or ESXi host. The lifecycle includes start, stop, reset virtual machines, and establishing trust for virtual machines.

#### \* Note:

For the Avaya Aura® Messaging element, trust re-establishment is not required.

- Deploys the Avaya Aura® applications that can be deployed from the central Solution Deployment Manager for Avaya Aura® Virtualized Appliance and customer Virtualized Environment. You can deploy one application at a time.

**\* Note:**

- System Manager must be on the same or higher release than the application you are upgrading to. For example, you must upgrade System Manager to 7.1.3.2 before you upgrade Communication Manager to 7.1.3.2.

All the applications that are supported by System Manager do not follow the general Avaya Aura® Release numbering schema. Therefore, for the version of applications that are supported by System Manager, see Avaya Aura® Release Notes on the Avaya Support website.

- Solution Deployment Manager Client must be on the same or higher release than the OVA you are deploying. For example, if you are deploying Communication Manager 7.1.3 OVA, Solution Deployment Manager Client version must be on Release 7.1.3, 7.1.3.1, 7.1.3.2, or 8.0. Solution Deployment Manager Client cannot be on Release 7.1.
- Configures application and networking parameters required for application deployments.
- Supports selecting the application OVA file from a local path or an HTTPS URL. You do not need access to PLDS.
- Supports changing the hypervisor network parameters, such as IP Address, Netmask, Gateway, DNS, and NTP on Appliance Virtualization Platform.
- Supports installing patches for the hypervisor on Appliance Virtualization Platform.
- Supports installing software patches, service packs, and feature packs only for System Manager.

**\* Note:**

To install the patch on System Manager, Solution Deployment Manager Client must be on the same or higher release as the patch. For example, if you are deploying the patch for System Manager Release 7.1.1, you must use Solution Deployment Manager Client Release 7.1.1 or higher.

However, to install the patch on System Manager Release 7.0.x, Solution Deployment Manager Client must be on Release 7.0.x.

Avaya Aura® applications use centralized Solution Deployment Manager from System Manager to install software patches, service packs, and feature packs. For the applications that cannot be patched from centralized Solution Deployment Manager, use the application Command Line Interface or web console.

For more information about supported releases and patching information, see Avaya Aura® Release Notes on the Avaya Support website.

- Configures Remote Syslog Profile.
- Creates the Appliance Virtualization Platform Kickstart file.

---

## Solution Deployment Manager

Solution Deployment Manager simplifies and automates the deployment and upgrade process.

With Solution Deployment Manager, you can deploy the following applications:

- AVP Utilities 8.1.3
- System Manager 8.1.3
- Session Manager 8.1.3
- Branch Session Manager 8.1.3
- Communication Manager 8.1.3
- Application Enablement Services 8.1.3
- WebLM 8.1.3
- Communication Manager Messaging 7.0

For information about other Avaya product compatibility information, go to <https://support.avaya.com/CompatibilityMatrix/Index.aspx>.

With Solution Deployment Manager, you can migrate, upgrade, and update the following applications:

- Hardware-based Session Manager 6.x
- System Platform-based Communication Manager
  - Duplex CM Main / Survivable Core with Communication Manager
  - Simplex CM Main / Survivable Core with Communication Manager, Communication Manager Messaging, and Utility Services
  - Simplex Survivable Remote with Communication Manager, Branch Session Manager, and Utility Services
  - Embedded CM Main with Communication Manager, Communication Manager Messaging, and Utility Services
  - Embedded Survivable Remote with Communication Manager, Branch Session Manager, and Utility Services
- System Platform-based Branch Session Manager
  - Simplex Survivable Remote with Communication Manager, Branch Session Manager, and Utility Services
  - Embedded Survivable Remote with Communication Manager, Branch Session Manager, and Utility Services

 **Note:**

You must manually migrate the Services virtual machine that is part of the template.

The centralized deployment and upgrade process provides better support to customers who want to upgrade their systems to Avaya Aura® Release 8.1.3. The process reduces the upgrade time and error rate.

### Solution Deployment Manager dashboard

You can gain access to the Solution Deployment Manager dashboard from the System Manager web console or by installing the Solution Deployment Manager client.

### Solution Deployment Manager capabilities

With Solution Deployment Manager, you can perform deployment and upgrade-related tasks by using the following links:

- **Upgrade Release Setting:** To select **Release 7.x Onwards** or **6.3.8** as the target upgrade. Release 8.1.3 is the default upgrade target.
- **Manage Software:** To analyze, download, and upgrade the IP Office, Unified Communications Module, and IP Office Application Server firmware. Also, you can view the status of the firmware upgrade process.
- **Application Management:** To deploy OVA files for the supported Avaya Aura® application.
  - Configure Remote Syslog Profile.
  - Generate the Appliance Virtualization Platform Kickstart file.
- **Upgrade Management:** To upgrade Avaya Aura® applications to Release 8.1.3.
- **User Settings:** To configure the location from where System Manager displays information about the latest software and firmware releases.
- **Download Management:** To download the OVA files and firmware to which the customer is entitled. The download source can be the Avaya PLDS or an alternate source.
- **Software Library Management:** To configure the local or remote software library for storing the downloaded software and firmware files.
- **Upload Version XML:** To save the `version.xml` file to System Manager. You require the application-specific `version.xml` file to perform upgrades.

---

# Solution Deployment Manager configuration settings

---

## User settings

You require the PLDS connection to gain access to Avaya from where you can obtain all software and firmware files that are required for upgrade, migration, and updates. Ensure that you add the required ports and websites to the customer firewall. For example, you require access to the ftp.avaya.com website to get the `versions.xml` and http to grant access to plds.avaya.com. If the customer decides not to open PLDS in the organization firewall, an alternate source must be set to access the software. For example, if the customer wants to test the latest versions of software before using the software for production. By using the alternate source, the customers can get the software that is recommended by the analyze operation.

---

## Establishing PLDS connection to Avaya

### About this task

Use the procedure to configure the location from where System Manager displays information about the latest software and firmware releases during Analyze operation. The entitlements depend on the credentials that you provide on the **User Settings** page.

### Before you begin

- Obtain a company ID to configure PLDS.
- Add the required ports and websites to a firewall of customer.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > User Settings**.
2. On the User Settings page, click **Edit**.
3. Select the **Use Avaya Support Site** check box, and provide the SSO user name and SSO password for PLDS, and the company ID.
4. Configure the PLDS settings and proxy settings for the software download.
5. If your network configuration requires a proxy, select the **Use Proxy** check box, and provide the details.
6. Click **Commit**.

### Related links

[Obtaining a company ID](#) on page 1288

[User Settings field descriptions](#) on page 1291

## Obtaining a company ID

### Before you begin

Ensure that you have access and user credentials to log in to the PLDS website at <https://plds.avaya.com>.

### Procedure

1. On the web browser, type the PLDS URL, `https://plds.avaya.com`.
2. In the **Email address** field, enter the user name, and in the **Password** field, enter the password.
3. Click **Submit**.
4. After successful log in, on the Home page, click **Administration > My Company**.

The system displays the company ID followed by a company name.

---

## Establishing the connection to an alternate source

### About this task

If you decide to close the PLDS website in the customer firewall, an alternate source must be configured to get the software. For example, if you want to test the latest versions of software before using the software for production.

### Before you begin

To use an alternate source:

1. Set up the HTTP server for alternate-source and create a directory with a valid name, such as `alternate-source` in the `http://<ip-address>OR<FQDN>/<alternate-source>` location.

Ensure that the URL `http://<ip-address>OR<FQDN>/<alternate-source>` is accessible through the web browser.

2. From PLDS website, download the `smgr-versionsxmls.zip` file.

For more information, see “Downloading the `smgr-versionsxmls.zip` file from PLDS”.

3. Copy the following xml files to the `alternate-source` directory:

- `versions.xml`
- `versions_aams.xml`
- `versions_aes.xml`
- `versions_avutilities.xml`
- `versions_bsm.xml`
- `versions_cmm.xml`
- `versions_compatibility.xml`

- versions\_edp.xml
- versions\_msg.xml
- versions\_others.xml
- versions\_sbce.xml
- versions\_sp.xml
- versions\_systemplatform.xml
- versions\_avp.xml
- versions\_us.xml
- versions\_weblm.xml

4. From PLDS, download the software on your computer, and copy to the `http://<ip-address>/FQDN/<alternate-source>/` location for the following:

- For Communication Manager upgrades: Communication Manager, Communication Manager Messaging, Branch Session Manager, Session Manager, Appliance Virtualization Platform, Utility Services, TN boards, and Media Gateways or media modules based on your entitlements.
- For IP Office upgrades: IP Office Manager Admin Lite, VM Pro Client, IP Office, Unified Communications Module (UCM), and IP Office Application Server binary files.

 **Note:**

You cannot use My Computer on the File Download Manager page to upload IP Office Manager Admin Lite, VMPro Client, UCM, and IP Office Application Server binary files.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **User Settings**.
3. On the User Settings page, click **Edit**.
4. Clear the **Use Avaya Support Site** check box.
5. In **Alternate Source**, type the server path for an alternate source, that is mentioned in the prerequisites.

 **Note:**

The IP address for the alternate source and the software library can be the same. However, ensure that locations for the alternate source URL and software library server path in software library configuration are different. To configure an alternate source and software library on the same server with the artifacts, allocate at least 20 GB disk space each for alternate source and software library.

The size depends on the number of artifacts that you want to save in the alternate source and the number of artifacts that you want to download in the software library during the upgrade.

6. Click **Commit**.

7. Download the specified xml files on your computer.

For help to download contact the Avaya support team.

8. Upload the xml files to the HTTP server.

9. Download the required firmware files from PLDS.

To download the firmware files, contact the Avaya support team.

10. Upload the firmware files to the http server.

Ensure that you update the firmware files and the xml files in the http server from `ftp.avaya.com`.

[Downloading the smgr-versionsxmls.zip file from PLDS](#) on page 1290

## Downloading the smgr-versionsxmls.zip file from PLDS

### Before you begin

Log on to PLDS.

### Procedure

1. On the PLDS web console, click **Assets > View Downloads**.

2. Click **Search by Download**.

3. In the **Download pub ID**, enter `SMGRSUM0001`.

4. Click **Search Downloads**.

5. In the search results, click **Download**.

The system prompts you to save the ZIP file on your local computer.

6. Extract the ZIP file on your local computer.

| <b>Edit</b>   | To display the edit page where you can change the user settings. |
| <b>Commit</b> | To save the user settings that you enter.                        |
| <b>Reset</b>  | To reset the page and clear the values that you enter.           |
| <b>Cancel</b> | To cancel your action and return to the previous page.           |

---

# Software library management

---

## Software library

Using software library, you can store the software and firmware files that you download. After you download a firmware file in the Software Library, you can use the downloaded file across multiple devices.

With software library, you can also create, modify, view, and delete the firmware files.

For upgrading the firmware files, use an external server that functions as a remote software library. To upload the firmware files from System Manager, you must configure an FTP, SCP, or SFTP protocol for the external server.

**\* Note:**

- A local, non-editable software library, SMGR\_DEFAULT\_LOCAL, resides within System Manager post installation. You require only remote software library for upgrading TN boards and IP Office. For upgrading other elements, you can use a local or remote library.
- The system downloads the TN boards firmware files at home directory of the SCP user configured on the **SCP Configuration** tab of Remote SCP S/W Library irrespective of the path configured in the **Server Path** field on the **Library Server Details (L)** tab of the Add Software Library page.

## Enabling and disabling FTP on System Manager

### About this task

You must enable FTP on System Manager only to use System Manager as a local software library for upgrading Media Gateway and Media Modules.

**\* Note:**

When the upgrade is complete, disable FTP only to re-enable when you need.

### Before you begin

Start an SSH session.

### Procedure

1. Log on to the System Manager web console with administrator privilege credentials.
2. To enable the FTP server, do the following:
  - a. At the prompt, type `sh/opt/vsp/SDM_FTP_Patch/Setup.sh`.
  - b. Type the sdmuser password and press `Enter`.

You can now use the FTP library to save the software or firmware.

3. To disable the FTP server, type `sh/opt/vsp/SDM_FTP_Patch/Setup.sh stop`.

---

## Configuring System Manager as local software library

### About this task

Use the procedure to configure System Manager as local FTP server to save the software for Media Modules and Media Gateways for upgrades. However, you can also use the remote FTP server.

#### **Note:**

Use only remote FTP server as software library to save the TN Board firmware. You cannot use System Manager as software library.

### Before you begin

Enable FTP on System Manager.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Select SMGR\_DEFAULT\_LOCAL and click **Edit**.

The system displays the Edit Software Library page.

4. On the Library Server Details (L) tab, in **Default Protocol**, click **FTP**.
5. Click the FTP Configuration (F) tab, and select the **Enable FTP** check box.
6. In **User Name**, type `sdmuser`.

The system preconfigures the ftpuser name when you run the script as described in “Enabling and disabling FTP on System Manager”. You cannot change the user name.

7. In **Password** and **Confirm Password** fields, type the same password that you configured while running the script.
8. Click **Commit**.
9. In the left navigation pane, click **Download Management** and download the required Media Gateway/Media Module firmware in the SMGR\_DEFAULT\_LOCAL software library.

---

## Configuring external server as a remote software library for upgrades

### Protocol requirements to configure a remote server

To configure an external server as a remote software library, you must configure HTTP, FTP, SCP, or SFTP protocol on the external server. For the external server that you select, you must install separate executable files as listed in the following table:

| External server                    | File for deployment                       |
|------------------------------------|-------------------------------------------|
| Apache HTTP server                 | httpd-2.0.64-win32-x86-openssl-0.9.8o.msi |
| FileZilla FTP server               | FileZilla_Server-0_9_43.exe               |
| Linux <sup>®</sup> SCP/SFTP server | SftpServerInstaller.msi                   |

**\* Note:**

Do not use the SolarWinds SCP/SFTP server to configure the software library for upgrades. System Manager might become nonfunctional. Instead, use the Linux<sup>®</sup> server.

For every release of the Avaya Aura<sup>®</sup> application that you want to upgrade, you require a combination of protocols listed in the table. The information applies only for the Windows environment.

**\* Note:**

If you use multiple protocols, use the same user name or same directory for all protocols.

| Device for upgrade                       | Required protocols                                                                                                                                                                                                               |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Avaya Aura <sup>®</sup> 6.x applications | <ul style="list-style-type: none"> <li>• HTTP/HTTPS</li> <li>• FTP/SCP</li> </ul>                                                                                                                                                |
| Communication Manager 5.2.1 release      | <ul style="list-style-type: none"> <li>• FTP</li> </ul> <p><b>* Note:</b></p> <p>For upgrading the Communication Manager 5.2.1 release, use the FTP protocol.</p> <ul style="list-style-type: none"> <li>• HTTP/HTTPS</li> </ul> |

## Installing and configuring an HTTP server as a remote server

### Procedure

1. Run `httpd-2.0.64-win32-x86-openssl-0.9.8o.msi` as an administrator.
2. Type the domain name, server name and email ID.
3. Complete the installation.
4. Start the application server.
5. In the `C:\Program Files(x86)\Apache Group\Apache2\htdocs\` location, create a folder named `downloads`.

For example, `C:\Program Files(x86)\Apache Group\Apache2\htdocs\downloads\`

6. Provide the `downloads` folder with full privileges.

7. To verify the privileges, do the following:
  - a. Add a file to the `downloads` folder.
  - b. Open the file from the browser.

## Result

On the System Manager web console, on the Software Library Configuration page, the Library Server Details tab displays the following details:

Library Server Details (L) \* SCP Configuration (S) SFTP Configuration (T) FTP Configuration (F) HTTP/HTTPS Configuration (H)

Remote Library ☒

Local Survivable Processor (LSP) ☐

\* Name

\* IP Address

Description

\* Server Path

Default Library ☐

\* Default Protocol  (Enter the values for the mandatory fields in the protocol configuration tab you selected.)

The HTTP/HTTPS Configuration tab displays the following http/https configuration details:

Library Server Details (L) \* SCP Configuration (S) SFTP Configuration (T) FTP Configuration (F) HTTP/HTTPS Configuration (H)

Enable HTTP/HTTPS ☒

\* URL

User Name

Password

Confirm Password

[Protocol requirements to configure a remote server](#) on page 1294

## Installing and configuring an FTP server as a remote server Procedure

1. Run `FileZilla_Server-0_9_43.exe` as an administrator.  
Wait until the installation is complete.
2. Open the FileZilla server interface.
3. On the **Edit** menu, click **Users**.
4. In the Users dialog box, in the left navigation pane, click **General**.

5. In the **Users** section, click **Add**.

6. In the Add user account dialog box, type a user name and click **OK**.  
 7. Select the **Password** check box.  
 8. Type a password and click **OK**.

The system prompts you to provide a folder.

9. In the left pane, click **Shared folders**.  
 10. In the **Shared folders** section, click **Add** and provide the folder location till the `downloads` folder.  
 11. Click **OK**.

12. To provide the privileges, in the **Files** section, select the check boxes, such as **Read**, **Write**, and **Delete**.

13. To set the `downloads` folder as the home directory, do the following:
  - a. Click **Set as home dir** and navigate to the `C:\Program Files (x86)\Apache Group\Apache2\htdocs\downloads\` folder.
  - b. Click **OK**.

**! Important:**

Ensure that you select a logical file name option. By default, the system selects `/C/`.

14. To verify the privileges, using the **FTP** client, navigate to the `downloads` folder and open a file.

**Result**

On the System Manager web console, on the **Software Library Configuration** page, the FTP Configuration tab displays the following FTP configuration details:

The screenshot shows the 'FTP Configuration (F)' tab of the SolarWinds SFTP/SCP Server configuration window. It includes the following fields and options:

- Enable FTP**: A checked checkbox.
- \* User Name**: A text field containing 'kbarannik'.
- \* Password**: A password field with masked characters (dots).
- \* Confirm Password**: A second password field with masked characters (dots).

At the top of the window, there are tabs for 'Library Server Details (L)', 'SCP Configuration (S)', 'SFTP Configuration (T)', 'FTP Configuration (F)', and 'HTTP/HTTPS Configuration (H)'.

## Installing and configuring an SCP or SFTP server as a remote server Procedure

1. Run `SftpServerInstaller.msi` as administrator.  
Wait until the installation is complete.
2. Open the **SolarWinds SFTP & SCP Server** server interface.

3. On the **File** menu, click **Configure**.
4. Navigate to `C:\Program Files (x86)\Apache Group\Apache2\htdocs\downloads\`.
5. Set the required parameters and click **OK**.

6. Click the Users tab.

7. Click **New User**.
8. Enter the user name and the password.
9. Click **Apply Changes**.
10. Start the server.

11. To verify the privileges, using the SCP or the SFTP client, navigate to the `downloads` folder and open a file.

## Result

On the Software Library Configuration page of System Manager, the **SCP Configuration** tab displays the following:

 A screenshot of the 'SCP Configuration' tab in a web interface. It shows a form with the following fields: 'Enable SCP' (checked), 'User Name' (kbarannik), 'Password' (masked with dots), and 'Confirm Password' (masked with dots). The tab is part of a larger configuration page with other tabs like 'Library Server Details', 'SFTP Configuration', 'FTP Configuration', and 'HTTP/HTTPS Configuration'.

## Installing and configuring an HTTP server as a remote server on a Linux server

### About this task

Use this procedure for System Platform-based Element upgrade. The HTTP protocol is used to pull the downloaded artifacts files during element upgrade.

### Before you begin

- Install the FTP/SCP Software on the Linux server.
- Install the HTTP server software on the Linux server.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. On the Software Library page, click **New**.  
The system displays the Add Software Library page.
4. On the **Library Server Details** tab, perform the following:
  - a. In **Name**, type the Linux server name.

- b. In **IP Address**, type the IP address of the Linux server.
- c. In **Server Path**, type the path where artifacts will be downloaded on Linux based FTP/SCP Software Library by using the FTP/SCP protocol.
- d. In **Default Protocol**, click **FTP**.

The screenshot shows the 'Library Server Details' window with the 'FTP Configuration (F)' tab selected. The 'Remote Library' checkbox is checked. The 'Local Survivable Processor (LSP)' checkbox is unchecked. The 'Name' field is 'Linux\_SwLib'. The 'IP Address' field is '148.147.162.215'. The 'Description' field is empty. The 'Server Path' field is '/home/ftpuser/'. The 'Default Library' checkbox is checked. The 'Default Protocol' dropdown is set to 'FTP'. A note at the bottom says '(Enter the values for the mandatory fields in the protocol configuration tab you selected.)'. At the bottom right are 'Commit', 'Reset', and 'Cancel' buttons.

5. On the **FTP Configuration** tab, perform the following:
  - a. Select the **Enable FTP** check box.
  - b. In **User Name**, type the FTP server user name.
  - c. In **Password**, type the FTP server password.
  - d. In **Confirm Password**, retype the FTP server password.

The screenshot shows the 'Library Server Details' window with the 'FTP Configuration (F)' tab selected. The 'Enable FTP' checkbox is checked. The 'User Name' field is 'ftpuser'. The 'Password' field is masked with dots. The 'Confirm Password' field is also masked with dots. At the bottom right are 'Commit', 'Reset', and 'Cancel' buttons.

6. On the **HTTP/HTTPS Configuration** tab, perform the following:
  - a. Select the **Enable HTTP/HTTPS** check box.
  - b. In **URL**, type the HTTP/HTTPS URL.

The example URL is: `http://<LinuxServerIPAddress>/`.

The screenshot shows the 'Library Server Details' window with the 'HTTP/HTTPS Configuration (H)' tab selected. The 'Enable HTTP/HTTPS' checkbox is checked. The 'URL' field is 'http://148.147.162.215/'. The 'User Name' field is empty. The 'Password' field is empty. The 'Confirm Password' field is empty. At the bottom right are 'Commit', 'Reset', and 'Cancel' buttons.

7. Click **Commit**.
8. To complete the configuration add the `/home/ftpuser/ "/home/ftpuser/"` alias in the HTTP server configuration `httpd.conf` file.
  - a. Change the DocumentRoot to `/home/<FTP/SCP_username_dir>` in the `/etc/httpd/conf/httpd.conf` file.

For example:

```
sed -i 's~/var/www/html~/home/ftpuser~g' httpd.conf
```

```
sed -i 's~/var/www~/home~g' httpd.conf
```

- b. Make apache as primary group for <FTP/SCP\_username\_dir> in the /etc/group folder.

For example:

```
usermod -g 48 ftpuser
```

- c. Change permission of /home/<FTP/SCP\_username\_dir> to 755.

```
chmod 755 -R /home/ftpuser/
```

- d. Add exception in SELinux for httpd or disable SELinux.

If SELinux is already enabled after making above changes, reboot the system.

- e. Add rule in firewalld or stop firewalld.

- f. Add alias in the httpd.conf file as shown below:

```
Alias /home/<FTP/SCP_username_dir> "/home/<FTP/SCP_username_dir>"
```

```
<Directory> "/home/cgi-bin">
 AllowOverride None
 Options None
 Require all granted
</Directory>
```

For example:

```
Alias /home/ftpuser "/home/ftpuser"
```

```
<Directory> "/home/cgi-bin">
 AllowOverride None
 Options None
 Require all granted
</Directory>
```

- g. Restart the httpd service.

## Creating a software library

### Before you begin

For upgrades to Release 6.3.8, create the new EPW file for the Communication Manager to be upgraded, and provide all credentials to the EPW file including System Platform details. Store the EPW file on the HTTP or HTTPS server. For more information, contact the Avaya support team.

#### **Note:**

You cannot set System Manager as a software library. You must set an external server as a software library.

For more information, see *Protocol requirements for configuring a remote server*.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Software Library Management**.
2. Click **New**.
3. Complete the Add Software Library page.
4. Click **Commit**.
  - To reset the page, click **Clear Configuration**.

---

## Editing a software library

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Select the software library whose details you want to edit.
4. Click **Edit**.
5. Edit the required fields in the Edit Software Library page, and click **Commit**.

---

## Viewing a software library

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Select the software library whose details you want to view.
4. Click **View**.

The system displays the details of the software library you selected on the View Software Library page.

---

## Deleting a software library

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Select the software library you want to delete.
4. Click **Delete**.

5. On the confirmation page, click **Delete**.

## Software library field descriptions

### Library Server Details (L)

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Library</b>                  | <p>An option to select a remote library to:</p> <ul style="list-style-type: none"> <li>• Download files to a remote software library.</li> <li>• Indicate that the local software library is hosted on another server, and not on System Manager.</li> </ul> <p>The system selects the <b>Remote Library</b> option by default.</p>                                                                                                                    |
| <b>Local Survivable Processor(LSP)</b> | <p>An option to select the survivable remote server to add as a software library. The <b>Local Survivable Processor(LSP)</b> option applies only for gateways, and supports FTP and SCP only.</p>                                                                                                                                                                                                                                                      |
| <b>Name</b>                            | The name of the software library.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>IP Address</b>                      | <p>The IP address of the software library.</p> <p>If you select <b>Local Survivable Processor(LSP)</b> , the <b>IP Address</b> field displays the list of survivable remote servers that are added to the System Manager inventory.</p>                                                                                                                                                                                                                |
| <b>Description</b>                     | A description of the software library.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Server Path</b>                     | <p>The software library path where the downloaded files are stored.</p> <p> <b>Note:</b></p> <p>The server path must not contain white spaces. For example, /user/mydownload is valid and /user/my download is invalid.</p>                                                                                                                                         |
| <b>Default Library</b>                 | An option to use a library as the default library when you download the firmware files.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default Protocol</b>                | <p>The default protocol for the software library where you download the firmware files. The options are:</p> <ul style="list-style-type: none"> <li>• <b>FTP</b></li> <li>• <b>SCP</b></li> <li>• <b>SFTP</b></li> </ul> <p> <b>Note:</b></p> <p>When you select the library on the File Download Manager page, the associated protocol is selected by default.</p> |

### SCP Configuration (S)

Use the SCP configuration to configure the SCP protocol details for the software library.
