| Name                    | Description                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable SCP</b>       | An option to enable the SCP configuration.<br>For this release, the <b>Enable SCP</b> option is selected by default. You cannot clear the selection. |
| <b>User Name</b>        | The user name for the SCP configuration.                                                                                                             |
| <b>Password</b>         | The password for the SCP configuration.                                                                                                              |
| <b>Confirm Password</b> | The password that you retype for the SCP configuration.                                                                                              |

### SFTP Configuration (T)

Use the SFTP configuration to configure the SFTP protocol details for the software library.

| Name                    | Description                                            |
|-------------------------|--------------------------------------------------------|
| <b>Enable SFTP</b>      | An option to enable the SFTP configuration.            |
| <b>User Name</b>        | The user name for the SFTP configuration.              |
| <b>Password</b>         | The password that you type for the SFTP configuration. |
| <b>Confirm Password</b> | The password that you retype for the SFTP password.    |

### FTP Configuration (F)

Use the FTP configuration to configure the FTP protocol details for the software library.

| Name                    | Description                                           |
|-------------------------|-------------------------------------------------------|
| <b>Enable FTP</b>       | An option to enable the FTP configuration.            |
| <b>User Name</b>        | The user name for the FTP configuration.              |
| <b>Password</b>         | The password that you type for the FTP configuration. |
| <b>Confirm Password</b> | The password that you retype for the FTP password.    |

### HTTP/HTTPS Configuration (H)

Use the HTTP/HTTPS configuration to configure the HTTP/HTTPS protocol details for the software library.

| Name                     | Description                                               |
|--------------------------|-----------------------------------------------------------|
| <b>Enable HTTP/HTTPS</b> | An option to enable the HTTP/HTTPS configuration.         |
| <b>URL</b>               | The software library URL.                                 |
| <b>User Name</b>         | The user name for the HTTP/HTTPS configuration.           |
| <b>Password</b>          | The password for the HTTP/HTTPS configuration.            |
| <b>Confirm Password</b>  | The password that you retype for the HTTP/HTTPS password. |

| Button                     | Description                                           |
|----------------------------|-------------------------------------------------------|
| <b>Commit</b>              | Saves the value you enter for the software library.   |
| <b>Clear Configuration</b> | Clears all entries you make, and resets the page.     |
| <b>Cancel</b>              | Cancels your action and returns to the previous page. |

---

## Viewing a file in the software library

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Click **Manage Files**.
4. On the Software Library Files page select the file that you want to view.
5. Click **View**.

You can view the details of the file in the View File page.

---

## Downloading the OVA file to System Manager

### About this task

You can download the software from Avaya PLDS or from an alternate source to System Manager. Use the procedure to download the OVA files to your computer and upload the file to System Manager.

### Before you begin

Set the local software library.

### Procedure

1. Download the OVA file on your computer.
2. On the System Manager web console, click **Services > Solution Deployment Manager**.
3. In the navigation pane, click **Download Management**.
4. On the Download Management page, perform the following:
  - a. In the Select Software/Hardware Types section, select the family name, and click **Show Files**.
  - b. In the Select Files Download Details section, in the **Source** field, select **My Computer**.
  - c. Click **Download**.

The system displays the Upload File page.

5. In the **Software Library** field, select a local System Manager software library.
6. Complete the details for the product family, device type, and the software type.
7. Click **Browse** and select the OVA file from the location on the system.
8. Provide a valid file type.

This system uploads the OVA file from local computer to the designated software library on System Manager.

 **Note:**

If the file type is invalid, System Manager displays an error.

---

## Uploading a file to the software library

### About this task

Use the procedure to upload software files, such as OVA, images, and firmware that are required during the deployment, migration, upgrade, and update of Avaya Aura® applications.

### Before you begin

- On the Download Management page, click **Refresh Families**.
- When you add or update details in the application-specific `versions.xml` file, click **Refresh Families** again to get the updated information.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Click **Manage Files**.
4. On the System Manager command line interface, copy the required OVA file to the `/swlibrary/staging/sync/` location that you had created in System Manager.

 **Note:**

You require admin privileges to access the `/swlibrary/staging/sync/` location.

The system displays the file that you copied in the Sync Files from directory section.

5. Provide the following information:
  - **SHA256 Checksum:** The value mentioned in the source or original location of the file.
  - **Software Library:** The local or remote software library.
  - **Product Family**

 **Note:**

For SAL, in **Product Family**, **Device Type**, and **Software Type** fields, select **Others**.

- **Device Type**
- **Software Type**

If the file is already in `versions.xml`, the system populates the information.

If the file does not exist in `versions.xml`, the system does not display the file details. Therefore, you cannot use the file for upgrade in Upgrade Management. You can use the file only for new deployment from Application Management.

6. Select the file.

7. Click **Sync**.

In File Sync Started Message, the system displays the status of the schedule of the job.

8. Click **OK**.

When the job completes, the system displays the file in the Software Library Files section.

9. To check the status of the job, click **Services > Scheduler > Pending Jobs**.

When the job is complete, the system displays the file in the Software Library Files area and removes from Sync Files from directory.

---

## Deleting a file from the software library

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Software Library Management**.
3. Click **Manage Files**.
4. On the Software Library Files page, select the file or files you want to delete.
5. Click **Delete**.
6. On the confirmation page, click **Delete**.

---

## Software Library Files field descriptions

| Name                          | Description                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File Name</b>              | The software file that you upload from your local directory to the selected library.                                                                        |
| <b>Device Type</b>            | The device type that you want to upgrade using the software library file. For example, CM_Duplex and CM_Simplex are device types for Communication Manager. |
| <b>Software Type</b>          | The type of software file that includes OVA file, firmware, and images.                                                                                     |
| <b>Version</b>                | The software file version that you want to upload.                                                                                                          |
| <b>Hardware Compatibility</b> | The hardware compatibility for the file you upload. For IP Office, this field can be blank.                                                                 |
| <b>File Length</b>            | The file length of the software file.                                                                                                                       |
| <b>Software Library</b>       | The software library where the file is created.                                                                                                             |

| Name                    | Description                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File Name</b>        | The software file that you upload from your local directory to the selected library.                                                       |
| <b>SHA256 Checksum</b>  | The sha256 checksum value of the file that you upload as mentioned in the source location of the file.                                     |
| <b>Software Library</b> | The software library where the file is created.                                                                                            |
| <b>Product Family</b>   | The product family to which the file belongs. In a product family, the number of devices are listed.                                       |
| <b>Device Type</b>      | The device type that you can upgrade using the software library file. For example, B5800 and IP Office are the device types for IP Office. |
| <b>Software Type</b>    | The type of software file which includes firmware and images.                                                                              |

| Button        | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| <b>View</b>   | Displays the file details page where you can view the details of the software library file. |
| <b>Delete</b> | Displays the Delete Software Files Confirmation page.                                       |
| <b>Done</b>   | Saves your action and returns to the previous page.                                         |

## System requirements for the external server

| Component                                                                                                          | Requirement                                                  | Recommendation                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Operating System                                                                                                   | Any standalone or virtualized Windows or Linux Distribution. |                                                                                                                    |
| Hard Drive                                                                                                         | 20–GB free space                                             | Ensure that the hard drive has enough free space to store the firmware files.                                      |
| Memory                                                                                                             | 2GB                                                          | As required by the operating system and the supported protocol services.                                           |
| Protocols: for the devices to download files from the external server                                              | FTP, SCP, SFTP, or HTTP service                              | Any supported HTTP server installation.<br><br>* <b>Note:</b><br>Currently, System Manager does not support HTTPS. |
| Protocols: for downloading the firmware upgrade files to the external server from PLDS site through System Manager | An FTP, SCP, or an SFTP server running on default ports      | Use SFTP or SCP for secure file transfer.                                                                          |

# Applications pre-upgrade functions

---

## Refreshing elements

### Before you begin

- On the User Settings page, configure the user settings.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, do the following:
  - a. Select one or more devices.
  - b. Click **Pre-upgrade Actions > Refresh Element(s)**.
4. On the Job Schedule page, click one of the following:
  - **Run Immediately**: To perform the job.
  - **Schedule later**: To perform the job at a scheduled time.
5. If you select **Schedule later**, select the date, time, and timezone.
6. Click **Schedule**.

The **Last Action Status** column displays  and the **Current Version** column displays the current version of the element.

---

## Analyzing software

### About this task

Analyze works on the version of OVA, service pack, and feature pack files uploaded to the software library. To get the correct entitle update or upgrade version, the version field must contain valid value. You can get the version values from versions files that are available on PLDS.

Custom patching does not require the analyze operation.

### Before you begin

- On the Roles page, set the Software Management Infrastructure permission.
- Perform the Refresh elements operation.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.

3. On the Upgrade Management page, do the following:
  - a. Select a device that you want to analyze.
  - b. Click **Pre-upgrade Actions > Analyze**.
4. On the Job Schedule page, click one of the following:
  - **Run Immediately**: To perform the job.
  - **Schedule later**: To perform the job at a scheduled time.
5. If you select **Schedule later**, select the date, time, and timezone.
6. Click **Schedule**.

The **Last Action Status** column displays a , the **Current Version** column displays the current version of the element, and the **Entitled Upgrade Version** column displays the next version of the element for which the element is entitled to be upgraded.

---

## Downloading the software

### About this task

You can download the software releases that you are entitled from Avaya PLDS, or from an alternate source to System Manager.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, select an element from the list.
4. In the left navigation pane, click **Download Management**.

The system displays the File Download Manager page.

5. To change the display settings, click one of the following:
  - **Tree View**: To view the list of elements in the tree format. The system displays each element with the list of components associated with the element that you selected.
  - **List View**: To view the list of elements in the list format. Every element is displayed individually.
6. In **Select Software/Hardware Types**, select the software or firmware that you want to download.
7. To get the latest details of the software for the supported product families from alternate source or Avaya Support Site, and update the information on the File Download Manager page, click **Refresh Families**.

The time to complete the refresh operation depends on the source configuration in **User Settings**.

8. Click **Show Files**.

9. In **Select Files Download Details**, do the following:

- a. In **Source**, click **Avaya PLDS/Alternate Source** or **My Computer** from where you want to download the files.
- b. Select the files that you want to download.
- c. Click **Download**.

In File Download Status, the system displays the file that you selected for download.

|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Refresh Families</b> | Gets the latest details of the software for the supported product families from alternate source or Avaya Support Site, and update the information on the File Download Manager page.<br><br>* <b>Note:</b><br>When you add or update details in the <code>versions.xml</code> file, you must click <b>Refresh Families</b> to get the updated information. |
| <b>Show Files</b>       | Displays the files associated with the element that you selected.                                                                                                                                                                                                                                                                                           |

### File Download Status

| Name                        | Description                                     |
|-----------------------------|-------------------------------------------------|
| <b>File Name</b>            | The file name of the software or firmware file. |
| <b>Job Name</b>             | The name of the download job.                   |
| <b>Current Step</b>         | The current status.                             |
| <b>Percentage Completed</b> | The status of completion.                       |
| <b>Status</b>               | The status of the download activity.            |
| <b>Scheduled By</b>         | The user who scheduled the download job.        |

| Button        | Description                               |
|---------------|-------------------------------------------|
| <b>Delete</b> | Deletes the files that you have selected. |

## Performing the preupgrade check

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, do the following:
  - a. Select an application to upgrade.
  - b. Click **Pre-upgrade Actions > Pre-upgrade Check**.
4. On the Pre-upgrade Configuration page, fill in the required information.

\* **Note:**

To upgrade to different server, in **Target Host**, select the target server host.

5. On the Job Schedule page, click one of the following:
  - **Run Immediately:** To perform the job.
  - **Schedule later:** To perform the job at a scheduled time.
6. Click **Schedule**.

On the Upgrade Management page, the status of the **Last Action Status** and **Pre-upgrade Check Status** columns display a .

## Preupgrade Configuration field descriptions

### Pre upgrade Configuration Parameters

| Name                       | Description                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Element name</b>        | The name of the application that you want to upgrade.                                                                                                                                                                           |
| <b>Parent name</b>         | The parent of the application that you want to upgrade.                                                                                                                                                                         |
| <b>IP Address</b>          | The IP address of the application that you want to upgrade.                                                                                                                                                                     |
| <b>Current Version</b>     | The current version of the application that you want to upgrade.                                                                                                                                                                |
| <b>Target Platform</b>     | The Appliance Virtualization Platform or ESXi host of the virtual machine.                                                                                                                                                      |

| <b>Schedule</b> | Runs the job or schedules to run at the time that you configured in Job Schedule. |

---

## Application management

---

### Application management

The Application Management link from Solution Deployment Manager provides the application management capabilities that you can use to do the following.

- Defines the physical location, Avaya Aura® Appliance Virtualization Platform or ESXi host, and discovers virtual machines that are required for application deployments and virtual machine life cycle management.
- Supports password change and patch installation of the Avaya Aura® Appliance Virtualization Platform host. Restart, shutdown, and certificate validation of Appliance Virtualization Platform and ESXi hosts. Also, enables and disables SSH on the host.
- Manages lifecycle of the OVA applications that are deployed on the Avaya Aura® Appliance Virtualization Platform or ESXi host. The lifecycle includes start, stop, reset virtual machines, and establishing trust for virtual machines.

 **Note:**

For the Avaya Aura® Messaging element, trust re-establishment is not required.

- Deploys Avaya Aura® application OVAs on customer-provided Virtualized Environment and Avaya Aura® Virtualized Appliance environment.
- Removes the Avaya Aura® application OVAs that are deployed on a virtual machine.
- Deploys Avaya Aura® application ISOs in Software-only environment.
- Configures application and networking parameters required for application deployments.
- Supports flexible footprint definition based on capacity required for the deployment of the Avaya Aura® application OVA.

You can deploy the OVA or ISO file on the platform by using System Manager Solution Deployment Manager or the Solution Deployment Manager client.

---

## Managing the location

### Viewing a location

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. Click the Locations tab.

The Locations section lists all locations.

### Adding a location

#### About this task

You can define the physical location of the host and configure the location specific information. You can update the information later.

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. On the **Locations** tab, in the Locations section, click **New**.
3. In the New Location section, perform the following:
  - a. In the Required Location Information section, type the location information.
  - b. In the Optional Location Information section, type the network parameters for the virtual machine.
4. Click **Save**.

The system displays the new location in the **Application Management Tree** section.

#### Related links

[New and Edit location field descriptions](#) on page 1318

### Editing the location

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. On the **Locations** tab, in the Locations section, select a location that you want to edit.
3. Click **Edit**.
4. In the Edit Location section, make the required changes.

5. Click **Save**.

## Related links

[New and Edit location field descriptions](#) on page 1318

## Deleting a location

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. On the **Locations** tab, in the Locations section, select one or more locations that you want to delete.
3. Click **Delete**.
4. In the Delete confirmation dialog box, click **Yes**.

The system does not delete the applications that are running on the platform and moves the platform to **Unknown location Platform mapping**.

## New and Edit location field descriptions

### Required Location Information

| Name                         | Description                                                                         |
|------------------------------|-------------------------------------------------------------------------------------|
| <b>Name</b>                  | The location name.                                                                  |
| <b>Avaya Sold-To #</b>       | The customer contact number.<br>Administrators use the field to check entitlements. |
| <b>Address</b>               | The address where the host is located.                                              |
| <b>City</b>                  | The city where the host is located.                                                 |
| <b>State/Province/Region</b> | The state, province, or region where the host is located.                           |
| <b>Zip/Postal Code</b>       | The zip code of the host location.                                                  |
| <b>Country</b>               | The country where the host is located.                                              |

### Optional Location Information

| Name                   | Description                                                                             |
|------------------------|-----------------------------------------------------------------------------------------|
| <b>Default Gateway</b> | The IP address of the virtual machine gateway. For example, 172.16.1.1.                 |
| <b>DNS Search List</b> | The search list of domain names.                                                        |
| <b>DNS Server 1</b>    | The DNS IP address of the primary virtual machine. For example, 172.16.1.2.             |
| <b>DNS Server 2</b>    | The DNS IP address of the secondary virtual machine. For example, 172.16.1.4.           |
| <b>NetMask</b>         | The subnet mask of the virtual machine.                                                 |
| <b>NTP Server</b>      | The IP address or FQDN of the NTP server.<br>Separate the IP addresses with commas (,). |

| Button        | Description                                                                           |
|---------------|---------------------------------------------------------------------------------------|
| <b>Save</b>   | Saves the location information and returns to the Locations section.                  |
| <b>Edit</b>   | Updates the location information and returns to the Locations section.                |
| <b>Delete</b> | Deletes the location information, and moves the host to the Unknown location section. |
| <b>Cancel</b> | Cancels the add or edit operations, and returns to the Locations section.             |

## Managing the platform

### Adding an Appliance Virtualization Platform or ESXi host

#### About this task

Use the procedure to add an Appliance Virtualization Platform or ESXi host. You can associate an ESXi host with an existing location.

If you are adding a standalone ESXi host to System Manager Solution Deployment Manager or to the Solution Deployment Manager client, add the standalone ESXi host using its FQDN only.

#### **Note:**

You can add a VMware ESXi host in Solution Deployment Manager only if Standard or Enterprise VMware license is applied on the VMware ESXi host.

If VMware vSphere Hypervisor Free License is applied on the VMware ESXi host or VMware ESXi host is in evaluation period, you cannot add that VMware ESXi host in Solution Deployment Manager.

Solution Deployment Manager only supports the Avaya Aura® Appliance Virtualization Platform and VMware ESXi hosts. If you try to add another host, the system displays the following error message:

```
Retrieving host certificate info is failed: Unable to communicate with
host. Connection timed out: connect. Solution Deployment Manager only
supports host management of VMware-based hosts and Avaya Appliance
Virtualization Platform (AVP).
```

#### Before you begin

Add a location.

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. Click **Application Management**.
3. In **Application Management Tree**, select a location.
4. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, click **Add**.

5. In the New Platform section, do the following:

- a. Provide details of Platform name, Platform FQDN or IP address, user name, and password.

For Appliance Virtualization Platform and VMware ESXi deployment, you can also provide the root user name.

- b. In **Platform Type**, select **AVP/ESXi**.
- c. If you are connected through the services port, set the Platform IP address of Appliance Virtualization Platform to 192.168.13.6.

6. Click **Save**.

7. In the Certificate dialog box, click **Accept Certificate**.

The system generates the certificate and adds the Appliance Virtualization Platform host. For the ESXi host, you can only accept the certificate. If the certificate is invalid, Solution Deployment Manager displays the error. To generate certificate, see VMware documentation.

In the Application Management Tree section, the system displays the new host in the specified location. The system also discovers applications.

8. To view the discovered application details, such as name and version, establish trust between the application and System Manager doing the following:

- a. On the **Applications** tab, in the Applications for Selected Location <location name> section, select the required application.
- b. Click **More Actions > Re-establish connection**.  
For more information, see “Re-establishing trust for Solution Deployment Manager elements”.
- c. Click **More Actions > Refresh App**.

 **Important:**

When you change the IP address or FQDN of the Appliance Virtualization Platform host from the local inventory, you require AVP Utilities. To get the AVP Utilities application name during the IP address or FQDN change, refresh AVP Utilities to ensure that AVP Utilities is available.

9. On the **Platforms** tab, select the required platform and click **Refresh**.

## Next steps

After adding a new host under Application Management Tree, the **Refresh Platform** operation might fail to add the virtual machine entry under **Manage Element > Inventory**. This is due to the absence of **Application Name** and **Application Version** for the virtual machines discovered as part of the host addition. After adding the host, do the following:

1. In Application Management Tree, establish trust for all the virtual machines that are deployed on the host.
2. Ensure that the system populates the **Application Name** and **Application Version** for each virtual machine.

## Adding a software-only platform

### About this task

Use this procedure to add an operating system on Solution Deployment Manager. In Release 8.1.3, the system supports the Red Hat Enterprise Linux Release 7.6 64-bit operating system.

 **Note:**

### Before you begin

Add a location.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. On the **Platforms** tab, click **Add**.
3. In **Platform Name**, type the name of the platform.
4. In **Platform FQDN or IP**, type the FQDN or IP address of the base operating system.
5. In **User Name**, type the user name of the base operating system.

For a software-only deployment, the user name must be a direct access admin user. If the software-only application is already deployed, provide the application cli user credentials.

6. In **Password**, type the password of the base operating system.
7. In **Platform Type**, select **OS**.
8. Click **Save**.

If the platform has some applications running, the system automatically discovers those applications and displays the applications in the **Applications** tab.

- If Solution Deployment Manager is unable to establish trust, the system displays the application as Unknown.
- If you are adding OS, only **Add** and **Remove** operations are available on the **Platforms** tab. You cannot perform any other operations. On the **Applications** tab, the system enables the **New** option. If the application is System Manager, the system enables **Update App** on Solution Deployment Manager Client

The system displays the added base operating system on the **Platforms** tab.

## Editing a platform

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.

2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, select a platform that you want to update.
4. Change the platform information.
5. Click **Save**.

The system updates the platform information.

## Rolling back to Utility Services

### About this task

Use this procedure to rollback Utility Services to 7.x if the upgrade from Utility Services to AVP Utilities fails from Release 7.x to Release 8.1 and later.

### Before you begin

- Add a location.
- Select Location and add a host.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Applications** tab, in the Applications for Selected Location<location name> section, select the Utility Services application, and click **More Actions > Rollback/Retry**.

If the **Current Action Status** column displays the VM Upgrade Failed message, the system enables **More Actions > Rollback/Retry** after selecting the Utility Services application.

4. In the Import Configuration Excel File dialog box, click **Rollback**.

To upgrade Utility Services to AVP Utilities, use the Upgrade Management page of System Manager Solution Deployment Manager.

The system displays the confirmation message to accept the rollback.

## Retrying Utility Services to AVP Utilities upgrade

### About this task

If the upgrade from Utility Services to AVP Utilities fails, use this procedure to retry the upgrade of Utility Services to AVP Utilities.

### Before you begin

- Add a location.

- Select Location and add a host.
- Download a copy of the `hostUSUpgradeInfo.xlsx` spreadsheet from Avaya PLDS website at <https://plds.avaya.com/> or from Avaya Support website at <https://support.avaya.com>. Fill the required system details in the spreadsheet.

 **Note:**

If you provide the incorrect data in the spreadsheet, the upgrade might fail.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Applications** tab, in the Applications for Selected Location<location name> section, select the Utility Services application, and click **More Actions > Rollback/Retry**.

If the **Current Action Status** column displays the `VM Upgrade Failed` message, the system enables **More Actions > Rollback/Retry** after selecting the Utility Services application.

4. On the Import Configuration Excel File dialog box, do the following:

- a. Click **Browse** and select the file from the local computer.
- b. To upload the spreadsheet, click **Open**.

The system displays the file size and percentage complete for the uploaded file. When the file upload is in-progress, do not navigate away from the page.

- c. Click **Submit File**.

Once the file is successfully uploaded, the system enables the **Retry** button.

- d. Click **Retry**.

The system starts the upgrade of Utility Services to AVP Utilities.

## Changing the network parameters for an Appliance Virtualization Platform host

### About this task

Use this procedure to change the network parameters of Appliance Virtualization Platform after deployment. You can change network parameters only for the Appliance Virtualization Platform host.

 **Note:**

If you are connecting to Appliance Virtualization Platform through the public management interface, you might lose connection during the process. Therefore, after the IP address changes, close Solution Deployment Manager, and restart Solution Deployment Manager by using the new IP address .

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, select an Appliance Virtualization Platform host and click **Change Network Params > Change Host IP Settings**.
4. In the Host Network/ IP Settings section, change the IP address, subnet mask, and other parameters as appropriate.

### **Note:**

An Avaya Aura® Appliance Virtualization Platform host and all virtual machines running on the host must be on the same subnet mask.

If Out of Band Management is configured in an Avaya Aura® Appliance Virtualization Platform deployment, you need two subnet masks, one for each of the following:

- Public or signaling traffic, Avaya Aura® Appliance Virtualization Platform, and all virtual machines public traffic.
- Management, Avaya Aura® Appliance Virtualization Platform, and all virtual machine management ports.

5. To change the gateway IP address, do the following:
  - a. Click **Change Gateway**.  
The **Gateway** field becomes available for providing the IP address.
  - b. In **Gateway**, change the IP address.
  - c. Click **Save Gateway**.
6. Click **Save**.  
The system updates the Appliance Virtualization Platform host information.

## Changing the network settings for an Appliance Virtualization Platform host from Solution Deployment Manager

### About this task

With Appliance Virtualization Platform, you can team NICs together to provide a backup connection when the server NIC or the Ethernet switch fails. You can also perform NIC teaming from the command line on Appliance Virtualization Platform.

Appliance Virtualization Platform supports Active-Standby and Active-Active modes of NIC teaming. For more information, see “NIC teaming modes”.

**\* Note:**

- If you add a host with service port IP address in Solution Deployment Manager and change the IP address of the host to the public IP address by using Host Network/ IP Settings, the system updates the public IP address in the database. Any further operations that you perform on the host fail because the public IP address cannot be reached with the service port. To avoid this error, edit the host with the service port IP address again.
- If FQDN of the Appliance Virtualization Platform host is updated by using Host Network/IP setting for domain name, refresh the host so that the FQDN changes reflect in Solution Deployment Manager.

Use this procedure to change network settings, such as changing VLAN ID, NIC speed, and manage NIC team for an Appliance Virtualization Platform host.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
4. Click **Change Network params > Change Network Settings**.

Cancel

The Host Network/ IP Settings page displays the number of switches as 4.

You can configure port groups for the following switches:

- **vSwitch0**, reserved for the Public and Management traffic.
- **vSwitch1**, reserved for services port. You cannot change the values.

- **vSwitch2**, reserved for Out of Band Management.
- **vSwitch3**. No reservations.
- **vSwitch4**. No reservations.
- **vSwitch5**. No reservations.

5. To change VLAN ID, click **Standard Switches**, and perform the following:

- a. Expand the vSwitch<n> section by clicking the downward arrow .

The section displays the vSwitch details.

- b. Click on the VLANID link or the edit icon ().

The system displays the Port Group Properties page where you can edit the VLAN ID port group property.

- c. In **VLAN ID**, select an ID.

For more information about the value, see NIC teaming.

- d. Click **OK**.

The system displays the new VLAN ID.

6. To change the NIC speed, click **Standard Switches**, and perform the following:

- a. Ensure that the system displays a vmnic in the **NIC Name** column.

- b. Click **Change NIC speed**.

The system displays the selected vmnic dialog box.

- c. In **Configured speed, Duplex**, click a value.

- d. Click **OK**.

For more information, see VLAN ID assignment.

The system displays the updated NIC speed in the **Speed** column.

If the NIC is connected, the system displays a check mark  in **Link Status**.

 **Note:**

You can change the speed only for common servers. You cannot change the speed for the S8300E server.

7. To change the NIC teaming, click **Standard Switches**, and perform the following:

- a. Select a vmnic.

- b. Click **NIC team/unteam**.

The system displays the Out of Band Management Properties page.

- c. To perform NIC teaming or unteaming, select the vmnic, and click **Move Up** or **Move Down** to move the vmnic from **Active Adapters**, **Standby Adapters**, or **Unused Adapters**.

For more information, see “NIC teaming modes”.

- d. Click **OK**.

The vmnic teams or unteams with **Active Adapters**, **Standby Adapters**, or **Unused Adapters** as required.

- e. To check the status of the vmnic, click **NIC team/unteam**.

8. To get the latest data on the host network IP settings, click **Refresh** .

The system displays the current status of the vmnic.

 **Note:**

You cannot perform NIC teaming for the S8300E server.

## Deleting the unused port

### About this task

Use this procedure to delete the unused port of Solution Deployment Manager that is no longer used by applications that are deployed on an Appliance Virtualization Platform host.

For example, you can delete the unused port, if an application is deleted from the Appliance Virtualization Platform host, and the system still has those ports available on the Appliance Virtualization Platform host.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
4. Click **Change Network params > Change Network Settings**.
5. Click **Advanced Configuration**.
6. In the Unused PortGroups section, select the portgroup.
7. Click **Delete**.

## Changing the password for an Appliance Virtualization Platform host

### About this task

Use this procedure to change the password for the Appliance Virtualization Platform host. This is the password for the administrator that you provide when deploying the Appliance Virtualization Platform host.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, do the following:
  - a. Select a host.
  - b. Click **More Actions > Change Password**.
4. In the Change Password section, type the current password and the new password.  
For more information about password rules, see “Password policy”.
5. Click **Change Password**.

The system updates the password of the Appliance Virtualization Platform host.

## Related links

[Password policy](#) on page 1328

[Change Password field descriptions](#) on page 1346

## Password policy

The password must meet the following requirements:

- Must contain at least eight characters.
- Must contain at least one of each: an uppercase letter, a lowercase letter, a numerical, and a special character.
- Must not contain an uppercase letter at the beginning and a digit at the end.

### **Note:**

An Uppercase letter at the beginning of a password is not counted for the password complexity rule. The Uppercase letter must be within the password.

Example of a valid password is *myPassword\$*.

If the password does not meet the requirements, the system prompts you to enter a new password. Enter the existing password and the new password in the correct fields.

Ensure that you keep the admin password safe. You need the password while adding the host to Solution Deployment Manager and for troubleshooting.

## Generating the Appliance Virtualization Platform kickstart file

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.

2. In the lower pane, click **Generate AVP Kickstart**.

3. On Create AVP Kickstart, do the following:

- a. Select **8.1.x**.
- b. Enter the appropriate information in the fields.
- c. Click **Generate Kickstart File**.

For more information, see “Create AVP Kickstart field descriptions.”

The system prompts you to save the generated kickstart file on your local computer.

For Appliance Virtualization Platform Release 8.1 and later, the kickstart file name must be `avp81ks.cfg`.

|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary IPv4 NTP Server</b>            | Secondary IPv4 address or FQDN of customer NTP server. Format is x.x.x.x or ntp.mycompany.com.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Main IPv4 DNS Server</b>                 | Main IPv4 address of customer DNS server. One DNS server entry in each line. Format is x.x.x.x.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Secondary IPv4 DNS server</b>            | Secondary IPv4 address of customer DNS server. Format is x.x.x.x. One DNS server entry in each line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>AVP management IPv6 address</b>          | IPv6 address for the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>AVP IPv6 prefix length</b>               | IPv6 subnet mask for the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>AVP gateway IPv6 address</b>             | IPv6 address of the customer default gateway on the network. Must be on the same network as the Host IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>IPv6 NTP server</b>                      | IPv6 address or FQDN of customer NTP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Secondary IPv6 NTP server</b>            | Secondary IPv6 address or FQDN of customer NTP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Main IPv6 DNS server</b>                 | Main IPv6 address of customer DNS server. One DNS server entry in each line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Secondary IPv6 DNS server</b>            | Secondary IPv6 address of customer DNS server. One DNS server entry in each line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Public vLAN ID (Used on S8300E only)</b> | VLAN ID for the S8300E server. If the customer does not use VLANs, leave the default value as 1. For any other server type, leave as 1. The range is 1 through 4090.<br><br>Use <b>Public VLAN ID</b> only on the S8300E server.                                                                                                                                                                                                                                                                                                                                      |
| <b>Out of Band Management Setup</b>         | The check box to enable or disable Out of Band Management for Appliance Virtualization Platform. If selected the management port connects to eth2 of the server, and applications can deploy in the Out of Band Management mode.<br><br>The options are:<br><ul style="list-style-type: none"> <li>• <b>yes</b>: To enable Out of Band Management<br/>The management port is connected to eth2 of the server, and applications can deploy in the Out of Band Management mode.</li> <li>• <b>no</b>: To disable Out of Band Management. The default option.</li> </ul> |
| <b>OOBM vLAN ID (Used on S8300E only)</b>   | <ul style="list-style-type: none"> <li>• For S8300E, use the front plate port for Out of Band Management</li> <li>• For common server, use eth2 for Out of Band Management.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                |
| <b>AVP Super User Admin Password</b>        | Admin password for Appliance Virtualization Platform.<br><br>The password must contain at least 8 characters and can include alphanumeric characters and @!\$.<br><br>You must make a note of the password because you require the password to register to System Manager and the Solution Deployment Manager client.                                                                                                                                                                                                                                                 |
| <b>Confirm Password</b>                     | Admin password for Appliance Virtualization Platform.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Enabling and disabling SSH on Appliance Virtualization Platform from Solution Deployment Manager

### About this task

For security purpose, SSH access to Appliance Virtualization Platform shuts down in the normal operation. To continue access, enable the SSH service on Appliance Virtualization Platform from Solution Deployment Manager.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. Select an Appliance Virtualization Platform host.
4. To enable SSH, do the following:
  - a. Click **More Actions > SSH > Enable SSH**.
  - b. In the Confirm dialog box, in the **Time (in minutes)** field, type the time after which the system times out the SSH connection.  
The range is 10 minutes through 120 minutes.
  - c. Click **Ok**.  
The system displays `enabled` in the **SSH status** column.
5. To disable SSH, click **More Actions > SSH > Disable SSH**.  
The system displays `disabled` in the **SSH status** column.

## Activating SSH from AVP Utilities

### About this task

For security purpose, SSH access to Appliance Virtualization Platform shuts down in the normal operation. You must activate SSH on Appliance Virtualization Platform.

When you install or preinstall Appliance Virtualization Platform on a server, SSH is enabled. After you accept the license terms during Appliance Virtualization Platform installation, SSH shuts down within 24 hours. After SSH shuts down, you must reactivate SSH by using the **AVP\_SSH enable** command from AVP Utilities.

### Before you begin

Start an SSH session.

### Procedure

1. Log in to the AVP Utilities virtual machine running on Appliance Virtualization Platform with administrator privilege credentials.
2. Type the following:

```
AVP_SSH enable
```

Within 3 minutes, from AVP Utilities, the SSH service starts on Appliance Virtualization Platform and runs for two hours. After two hours, you must reactivate SSH from AVP Utilities.

When SSH is enabled, you can use an SSH client such as PuTTY to gain access to Appliance Virtualization Platform on customer management IP address or the services port IP address of 192.168.13.6.

3. **(Optional)** To find the status of SSH, type `AVP_SSH status`.
4. To disable SSH, type `AVP_SSH disable`.

## Enabling and disabling SSH on Appliance Virtualization Platform from System Manager CLI

### About this task

For security purpose, SSH access to Appliance Virtualization Platform shuts down in the normal operation. You must enable the SSH service on Appliance Virtualization Platform.

You can enable SSH, disable SSH, and check the SSH status on the Appliance Virtualization Platform host.

### Before you begin

Start an SSH session.

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Navigate to the `$MGMT_HOME/infra/bin/avpSSHUtility` location.

3. Type `./enableDisableSSHOnAVP.sh`.

The system displays the following options:

- Enable SSH on the Appliance Virtualization Platform host.
- Disable SSH on the Appliance Virtualization Platform host.
- Check the SSH status on the Appliance Virtualization Platform host.

4. To enable SSH, perform the following:

- a. At the prompt, type `1` and press `Enter`.
- b. Type the IP address of the Appliance Virtualization Platform host.
- c. Type the time in minutes.

The time is the duration after which the system blocks any new SSH connections. The valid range 10 to 120 minutes.

The system displays the message and enables SSH on Appliance Virtualization Platform host.

For example, if you set the time to 50 minutes, after 50 minutes, the system blocks any new SSH connections. If you reenables SSH before completion of 50 minutes, the system adds 50 minutes to the initial 50 minutes to reenables connections.

5. To disable SSH, perform the following:

- a. At the prompt, type `2` and press `Enter`.
- b. Type the IP address of the Appliance Virtualization Platform host.

If SSH is already disabled, the system displays `False` and the message `SSH is already disabled. No operation performed. Exiting.`

6. **(Optional)** To view the status of SSH, perform the following:

- a. At the prompt, type `3` and press `Enter`.
- b. Type the IP address of the Appliance Virtualization Platform host.

If SSH is enabled, the system displays `Is SSH enable - false`.

If SSH is disabled, the system displays `Is SSH disable - true`.

## Changing the IP address and default gateway of the host

### About this task

When you change the default gateway and IP address from the vSphere web client, the change might be unsuccessful.

You cannot remotely change the IP address of the Appliance Virtualization Platform host to a different network. You can change the IP address remotely only within the same network.

To change the Appliance Virtualization Platform host to a different network, perform Step 2 or Step 3.

## Before you begin

Connect the computer to the services port.

## Procedure

1. Start an SSH session.
2. Log in to the Appliance Virtualization Platform host command line interface with admin user credentials.
3. At the command prompt of the host, do the following:

- a. To change the IP address, type the following:

```
esxcli network ip interface ipv4 set -i vmk0 -I <old IP address of the host> -N <new IP address of the host> -t static
```

For example:

```
esxcli network ip interface ipv4 set -i vmk0 -I 135.27.162.121 -N 255.255.255.0 -t static
```

- b. To change the default gateway, type `esxcfg-route <new gateway IP address>`.

For example:

```
esxcfg-route 135.27.162.1
```

4. Enable SSH on Appliance Virtualization Platform and run the `/opt/avaya/bin/./serverInitialNetworkConfig` command.

For more information, see Configuring servers preinstalled with Appliance Virtualization Platform.

## Appliance Virtualization Platform license

From Appliance Virtualization Platform Release 7.1.2, you must install an applicable Appliance Virtualization Platform host license file on an associated Avaya WebLM server and configure Appliance Virtualization Platform to obtain its license from the WebLM server. WebLM Server can be either embedded System Manager WebLM Server or standalone WebLM Server. Appliance Virtualization Platform licenses are according to the supported server types.

For information about Appliance Virtualization Platform licenses and supported server types, see “Appliance Virtualization Platform licenses for supported servers”.

To configure the Appliance Virtualization Platform license file:

1. Obtain the applicable license file from the Avaya PLDS website.
2. Install the license file on the System Manager WebLM Server or Standalone WebLM Server.

### **Note:**

The Appliance Virtualization Platform license file can contain multiple Appliance Virtualization Platform licenses that is for four different server types. One Appliance

Virtualization Platform license file contains all the necessary licenses for the complete solution.

3. Configure the applicable **WebLM IP Address/FQDN** field for each Appliance Virtualization Platform host by using either System Manager Solution Deployment Manager, Solution Deployment Manager Client, or Appliance Virtualization Platform host command line interface.

You can view the license status of the Appliance Virtualization Platform host on the **Platforms** tab of the System Manager Solution Deployment Manager or Solution Deployment Manager Client interfaces. The Appliance Virtualization Platform license statuses on the **Platforms** tab are:

- **Normal:** If the Appliance Virtualization Platform host has acquired a license, the **License Status** column displays **Normal**.
- **Error:** If the Appliance Virtualization Platform host has not acquired a license. In this case, the Appliance Virtualization Platform enters the License Error mode and starts a 30-day grace period. The **License Status** column displays **Error - Grace period expires: <DD/MM/YY> <HH:MM>**.
- **Restricted:** If the 30-day grace period of the Appliance Virtualization Platform license expires, Appliance Virtualization Platform enters the License Restricted mode and restricts the administrative actions on the host and associated virtual machines. The **License Status** column displays **Restricted**. After you install a valid Appliance Virtualization Platform license on the configured WebLM Server, the system restores the full administrative functionality.

 **Note:**

Restricted administrative actions for:

- **AVP Host: AVP Update/Upgrade Management, Change Password, Host Shutdown, and AVP Cert. Management.**
- **Application: New, Delete, Start, Stop, and Update.**

### Appliance Virtualization Platform licensing alarms

If the Appliance Virtualization Platform license enters either License Error Mode or License Restricted Mode, the system generates a corresponding Appliance Virtualization Platform licensing alarm. You must configure the Appliance Virtualization Platform alarming. For information about how to configure the Appliance Virtualization Platform alarming feature, see *Administering Avaya Aura® AVP Utilities*.

## Configuring WebLM Server for an Appliance Virtualization Platform host using Solution Deployment Manager

### Before you begin

1. Add an Appliance Virtualization Platform host.  
For information about adding a host, see *Administering Avaya Aura® System Manager*.
2. Obtain the license file from the Avaya PLDS website.
3. Install the license file on the System Manager WebLM Server or Standalone WebLM Server.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> section:
  - a. Select the Appliance Virtualization Platform host.
  - b. Click **More Actions > WebLM Configuration**.

The system displays the WebLM Configuration dialog box.

4. In **WebLM IP Address/FQDN**, type the IP address or FQDN of WebLM Server.

For WebLM configuration, if you select:

- Only one host then **WebLM IP Address/FQDN** displays the existing WebLM Server IP Address.
- Multiple hosts then **WebLM IP Address/FQDN** will be blank to assign the same WebLM Server IP Address for all the selected Appliance Virtualization Platform hosts.

5. In **Port Number**, type the port number of WebLM Server.

Embedded System Manager WebLM Server supports both 443 and 52233 ports.

6. Click **Submit**.

The system displays the status in the **Current Action** column.

The system takes approximately 9 minutes to acquire the Appliance Virtualization Platform host license file from the configured WebLM Server. On the **Platforms** tab, click **Refresh**.

When the Appliance Virtualization Platform host acquires the license, on the **Platforms** tab, the **License Status** column displays **Normal**.

## WebLM Configuration field descriptions

| Name                         | Description                                                 |
|------------------------------|-------------------------------------------------------------|
| <b>WebLM IP Address/FQDN</b> | The IP Address or FQDN of WebLM Server.                     |
| <b>Port Number</b>           | The port number of WebLM Server. The default port is 52233. |

| Button        | Description                                |
|---------------|--------------------------------------------|
| <b>Submit</b> | Saves the WebLM Server configuration.      |
| <b>Cancel</b> | Closes the WebLM Configuration dialog box. |

## Viewing the Appliance Virtualization Platform host license status using Solution Deployment Manager

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.

2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, view the Appliance Virtualization Platform host license status in the **License Status** column.

## Shutting down the Appliance Virtualization Platform host

### About this task

You can perform the shutdown operation on one Appliance Virtualization Platform host at a time. You cannot schedule the operation.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
4. Click **More Actions > Lifecycle Action > Host Shutdown**.

The Appliance Virtualization Platform host and virtual machines shut down.

## Restarting Appliance Virtualization Platform or an ESXi host

### About this task

The restart operation fails, if you restart the host on which System Manager itself is running. If you want to restart the host, you can do this either through vSphere Web Client or through the Solution Deployment Manager client.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select a platform.
4. Click **More Actions > Lifecycle Action > Host Restart**.
5. On the confirmation dialog box, click **Yes**.

The system restarts the host and virtual machines running on the host.

## Removing an Appliance Virtualization Platform or ESXi host

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.

2. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, select one or more platforms that you want to delete.
3. Click **Remove**.
4. On the Delete page, click **Yes**.

## Viewing Appliance Virtualization Platform firewall rules

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> section, select an Appliance Virtualization Platform host, and click **More Actions > AVP Firewall Rules**.

System Manager displays the Firewall Settings page.

4. To view the additional details, select a row.

System Manager displays the details in the separate section on the Firewall Settings page.

## Configuring the login banner for the Appliance Virtualization Platform host

### About this task

You can configure a login banner message on one or more Appliance Virtualization Platform hosts at a time.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the Host tab, in Platforms for Selected Location <location name>, select one or more Appliance Virtualization Platform hosts on which you want to configure the message.
4. Click **More Actions > Push Login Banner**.

You can change the login banner text only on the Security Settings page from **Security > Policies** on System Manager.

5. On the Message of the Day window, click **Push Message**.

The system updates the login banner on the selected Appliance Virtualization Platform hosts.

## Mapping the ESXi host to an unknown location

### About this task

When you delete a location, the system does not delete the virtual machines running on the host, and moves the host to **Unknown location Platform mapping**. You can configure the location of an ESXi host again.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In the left navigation pane, click the **Unknown location Platform mapping** link.
3. In the Host Location Mapping section, select an ESXi host, and click **Edit**.

The system displays the Host Information page.

4. Select a location and click **Update**.
5. Select the host(s) where location is updated and click **Submit**.

The system displays the ESXi host in the selected location.

## Applying third-party AVP certificates

### Applying third-party certificates to Appliance Virtualization Platform

#### About this task

Use this procedure to create, download, upload, and push third-party certificates to Appliance Virtualization Platform hosts.

#### Before you begin

- Add a location.
- Add an Appliance Virtualization Platform host to the location.
- Ensure that the certificate on the Appliance Virtualization Platform host is valid.

#### Note:

If you are using a third-party generated CSR, add the private key for the CSR in the file `/etc/vmware/ssl/rui_csr_temp.key` before installing the certificate from Solution Deployment Manager.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
4. **(Optional)** Add the details of the generic CSR.

If you add the generic CSR details, the system pre-populates the values in the View/Generate CSR dialog box.

For more information about creating the generic CSR, see “Creating or editing generic CSR”.

5. To generate CSR, do the following:

- a. Click **More Actions > AVP Cert. Management > Manage Certificate**.
- b. In the Load Certificate dialog box, select one or more Appliance Virtualization Platform hosts.
- c. Click **View/Generate CSR**.  
System Manager displays the View/Generate CSR dialog box.
- d. If the generic CSR details are not added for the Appliance Virtualization Platform host, add the details of the generic CSR.
- e. Click **Generate CSR**.  
The system generates CSR for the Appliance Virtualization Platform host.
- f. In the **Current Action** column, click **Status Details** to view the status.

6. To download CSR, do the following:

- a. Click **More Actions > AVP Cert. Management > Manage Certificate**.
- b. In the Load Certificate dialog box, select one or more Appliance Virtualization Platform hosts.
- c. Click **Download CSR**.  
In case of Firefox browser, the system prompts you to save the CSR.zip file.
- d. In the **Current Action** column, click **Status Details** to view the status.  
In the Download CSR Status dialog box, the system displays the path of the downloaded CSR.zip file.

7. Extract the downloaded certificates, and ensure that the third-party signs them.

8. To upload and push the signed certificate from a third-party CA, do the following:

- a. Click **More Actions > AVP Cert. Management > Manage Certificate**.
- b. In the Load Certificate dialog box, select one or more Appliance Virtualization Platform hosts.
- c. Click **Browse** and select the required certificates from the local computer.
- d. Click **I Agree to accept to add the same certificate in SDM**.
- e. Click **Push Certificate**.
- f. In the **Current Action** column, click **Status Details** to view the status.

## Creating or editing generic CSR

### About this task

Use this procedure to create or edit a generic CSR for third-party Appliance Virtualization Platform certificates. With a generic CSR, you can apply the same set of data for more than one Appliance Virtualization Platform host.

### Procedure

1. In **Application Management Tree**, select a location.
2. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
3. Click **More Actions > AVP Cert. Management > Generic CSR**.
4. In the Create/Edit CSR dialog box, add or edit the details of the generic CSR, such as organization, organization unit, locality, state, country, and email.
5. Click **Create/Edit CSR** and then click **OK**.

### Next steps

Complete the CSR generation, download, third-party signing and push the certificates to the Appliance Virtualization Platform hosts.

### Load Certificate field descriptions

| Name                                                         | Description                                                                                 |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>Platform IP</b>                                           | The IP address of the Appliance Virtualization Platform host.                               |
| <b>Platform FQDN</b>                                         | The FQDN of the Appliance Virtualization Platform host.                                     |
| <b>Certificate</b>                                           | The option to select the signed certificate for the Appliance Virtualization Platform host. |
| <b>I agree to accept to add the same certificate in SDM.</b> | The option to accept the certificate in Solution Deployment Manager.                        |

| Button                      | Description                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View/Generate CSR</b>    | Displays the View/Generate CSR dialog box to generate CSR.                                                                                                                                    |
| <b>Download CSR</b>         | Downloads CSR for the selected host.                                                                                                                                                          |
| <b>Browse</b>               | Displays the dialog box where you can choose the signed certificate file. The accepted certificate file formats are: <ul style="list-style-type: none"> <li>• .crt</li> <li>• .pki</li> </ul> |
| <b>Retrieve Certificate</b> | Displays the Certificate dialog box with the details of the uploaded signed certificate.                                                                                                      |
| <b>Push Certificate</b>     | Pushes the uploaded signed certificate to the selected Appliance Virtualization Platform host.                                                                                                |
| <b>Cancel</b>               | Cancels the push operation.                                                                                                                                                                   |

## Create or edit CSR field descriptions

| Name                     | Description                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Organization</b>      | The organization name of the CSR.                                                                                                   |
| <b>Organization Unit</b> | The organization unit of the CSR.                                                                                                   |
| <b>Locality</b>          | The locality of the organization associated with the CSR.                                                                           |
| <b>State</b>             | The state of the organization associate with the CSR.                                                                               |
| <b>Country</b>           | The country of the organization associate with the CSR.<br>In the Edit mode, you can specify only two letters for the country name. |
| <b>Email</b>             | The email address associate with the CSR.                                                                                           |

| Button                 | Description                                                   |
|------------------------|---------------------------------------------------------------|
| <b>Create/Edit CSR</b> | Saves or edits the information entered associated to the CSR. |
| <b>Cancel</b>          | Cancels the add or edit operation of the CSR.                 |

## Virtual Machine snapshot on Appliance Virtualization Platform

When you apply an update by using Solution Deployment Manager, snapshots are left on Appliance Virtualization Platform. If a snapshot is left on Appliance Virtualization Platform, it is detrimental to system performance and over time can utilize all the available disk space. Therefore, ensure that snapshots are not left on Appliance Virtualization Platform for an extended period of time and are removed on a timely manner.

You can review and delete Virtual Machine snapshots from Appliance Virtualization Platform by using Solution Deployment Manager Snapshot Manager.

## Deleting the virtual machine snapshot by using Solution Deployment Manager

### About this task

Use this procedure to delete the virtual machine snapshots that reside on the Appliance Virtualization Platform host by using Solution Deployment Manager.

### Procedure

- To access Solution Deployment Manager, do one of the following:
  - On the System Manager web console, click **Services** > **Solution Deployment Manager**.
  - On the desktop, click the Solution Deployment Manager icon ().
- In **Application Management Tree**, select a location.
- On the **Platforms** tab, in the Platforms for Selected Location <location name> section, select the Appliance Virtualization Platform host.

4. Click **More Actions > Snapshot Manager**.

The system displays the Snapshot Manager dialog box.

5. Select one or more snapshots, and click **Delete**.

You must review all listed snapshots and remove snapshots that are more than 24 hours old.

The system deletes the selected snapshots.

| Save   | Saves the host information and returns to the Platforms for Selected Location <location name> section. |

## Change Network Parameters field descriptions

### Network Parameters

| Name                 | Description                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                 | The name of the Appliance Virtualization Platform host. The field is display-only.                                                                                                    |
| IPv4                 | The IPv4 address of the Appliance Virtualization Platform host.                                                                                                                       |
| Subnet Mask          | The subnet mask of the Appliance Virtualization Platform host.                                                                                                                        |
| IPv6                 | The IPv6 address of the Appliance Virtualization Platform host (if any).                                                                                                              |
| Host Name            | The host name of the Appliance Virtualization Platform host                                                                                                                           |
| Domain Name          | The domain name of the Appliance Virtualization Platform host                                                                                                                         |
| Preferred DNS Server | The preferred DNS server                                                                                                                                                              |
| Alternate DNS Server | The alternate DNS server                                                                                                                                                              |
| NTP Server1 IP/FQDN  | The NTP Server1 IP address of the Appliance Virtualization Platform host.                                                                                                             |
| NTP Server2 IP/FQDN  | The NTP Server2 IP address of the Appliance Virtualization Platform host.                                                                                                             |
| IPv4 Gateway         | The gateway IPv4 address.<br>The field is available only when you click <b>Change IPv4 Gateway</b> .                                                                                  |
| IPv6 Default Gateway | The default gateway IPv6 address (if any).<br>The field is available only when IPv6 has been configured for the system.<br>The user, also needs to click <b>Change IPv6 Gateway</b> . |

| Button                             | Description                                                                                                                                                 |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Change IPv4 Gateway                | Makes the <b>IPv4 Gateway</b> field available, and displays <b>Save IPv4 Gateway</b> and <b>Cancel IPv4 Gateway Change</b> buttons.                         |
| Change IPv6 Gateway                | Makes the <b>IPv6 Default Gateway</b> field available, and displays <b>Save IPv6 Default Gateway</b> and <b>Cancel IPv6 Default Gateway Change</b> buttons. |
| Save IPv4 Gateway                  | Saves the gateway IPv4 address value that you provide.                                                                                                      |
| Cancel IPv4 Gateway Change         | Cancels the changes made to the IPv4 gateway.                                                                                                               |
| Save IPv6 Default Gateway          | Saves the default IPv6 gateway address value that you provide.                                                                                              |
| Cancel IPv6 Default Gateway Change | Cancels the changes made to the IPv6 default gateway.                                                                                                       |

| Button | Description                                            |
|--------|--------------------------------------------------------|
| Save   | Saves the changes that you made to network parameters. |

## Host Network / IP Settings field descriptions

### Standard Switches

vSwitch <n> displays the PortGroups and NICs sections.

### PortGroups

| Name                                                                                                     | Description                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  or <b>VLAN ID</b> link | Displays the Port Group Properties page where you configure VLAN ID.                                                                                                       |
| <b>VLAN ID</b>                                                                                           | Displays the VLAN ID. The options are: <ul style="list-style-type: none"> <li>• <b>None (0)</b></li> <li>• <b>1 to 4093</b></li> </ul> The field displays only unused IDs. |

| Button        | Description                          |
|---------------|--------------------------------------|
| <b>OK</b>     | Saves the changes.                   |
| <b>Cancel</b> | Returns to the <b>Platforms</b> tab. |

### NICs

| Name               | Description                                              |
|--------------------|----------------------------------------------------------|
| <b>NIC Name</b>    | Displays the name of the NIC.<br>For example, vmnic0.    |
| <b>Speed</b>       | Displays the speed of the NIC.<br>For example, 100,Full. |
| <b>Link Status</b> | Displays the status of the NIC.                          |

| Button                  | Description                                                           |
|-------------------------|-----------------------------------------------------------------------|
| <b>Change NIC speed</b> | Displays the vmnic<n> dialog box.                                     |
| <b>NIC team/unteam</b>  | Displays the Out of Band Management Properties vSwitch<n> dialog box. |

### NIC speed

| Name                            | Description                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Configured speed, Duplex</b> | Displays the NIC speed. The options are: <ul style="list-style-type: none"> <li>• <b>Autonegotiate</b></li> <li>• <b>10,Half</b></li> <li>• <b>10,Full</b></li> <li>• <b>100,Half</b></li> <li>• <b>100,Full</b></li> <li>• <b>1000,Full</b></li> </ul> |

| Button | Description        |
|--------|--------------------|
| OK     | Saves the changes. |

### NIC teaming

| Button    | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| Move Up   | Moves the VMNIC from unused adapters to standby or active adapters or from standby to active adapter. |
| Move Down | Moves the VMNIC from active to standby adapter or from standby to unused adapter.                     |
| Refresh   | Refreshes the page.                                                                                   |
| OK        | Saves the changes.                                                                                    |

### Advanced Configuration

Displays the Unused PortGroups section.

| Name           | Description                  |
|----------------|------------------------------|
| Port Group     | Displays the port group.     |
| Virtual Switch | Displays the virtual switch. |

| Button | Description                          |
|--------|--------------------------------------|
| Delete | Deletes the selected port group.     |
| Cancel | Returns to the <b>Platforms</b> tab. |

### Change Password field descriptions

| Name                 | Description                                               |
|----------------------|-----------------------------------------------------------|
| Current Password     | The password for the user you input when adding the host. |
| New Password         | The new password                                          |
| Confirm New Password | The new password                                          |

| Button          | Description             |
|-----------------|-------------------------|
| Change Password | Saves the new password. |

## Update Host field descriptions

| Name                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Patch location</b>              | <p>The location where the Appliance Virtualization Platform patch is available. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Select Patch from Local SMGR:</b> To use the Appliance Virtualization Platform patch that is available on the local System Manager.</li> <li>• <b>Select Patch from software library:</b> To use the Appliance Virtualization Platform patch that is available in the software library.</li> </ul> |
| <b>Ignore Signature Validation</b> | <p>Ignores the signature validation for the patch.</p> <p> <b>Note:</b></p> <p>If the Appliance Virtualization Platform patch is unsigned, you must select the <b>Ignore signature validation</b> check box.</p>                                                                                                                                                   |
| <b>Select patch file</b>           | The absolute path to the Appliance Virtualization Platform patch file.                                                                                                                                                                                                                                                                                                                                                                              |

| Button             | Description                                                       |
|--------------------|-------------------------------------------------------------------|
| <b>Update Host</b> | Installs the patch on the Appliance Virtualization Platform host. |

## Certificate validation

### Certification validation

With System Manager Solution Deployment Manager and Solution Deployment Manager client, you can establish a certificate-based TLS connection between the Solution Deployment Manager service and a host that is running Avaya Aura® 7.x and later applications. This provides secure communications between System Manager Solution Deployment Manager or the Solution Deployment Manager client and Appliance Virtualization Platform or ESXi hosts or vCenter.

The certificate-based sessions apply to the Avaya Aura® Virtualized Appliance offer using host self-signed certificates and the customer-provided Virtualization Environment using host self-signed or third-party certificates.

You can check the following with certificate-based TLS sessions:

- Certificate valid dates
- Origin of Certificate Authority
- Chain of Trust
- CRL or OCSP state
- Log Certificate Validation Events

Solution Deployment Manager checks the certificate status of hosts. If the certificate is incorrect, Solution Deployment Manager does not connect to the host.

For the correct certificate:

- The fully qualified domain or IP address of the host to which you are connecting must match the value in the certificate SAN or the certificate Common Name and the certificate must be in date.
- Appliance Virtualization Platform and VMware ESXi hosts do not automatically regenerate their certificates when host details such as IP address or hostname and domain changes. The certificate might become incorrect for the host.

If the certificate is incorrect:

- For the Appliance Virtualization Platform host, Solution Deployment Manager regenerates the certificate on the host and then uses the corrected certificate for the connection.
- For the VMware ESXi host or vCenter, the system denies connection. The customer must update or correct the certificate on the host or vCenter.

For more information about updating the certificate, see “Updating the certificate on the ESXi host from VMware”.

 **Note:**

Solution Deployment Manager:

- Validates certificate of vCenter
- Validates the certificates when a virtual machine is deployed or upgraded on vCenter managed hosts

With Solution Deployment Manager, you can only accept certificate while adding vCenter. If a certificate changes, the system gives a warning that the certificate does not match the certificate in the trust store on Solution Deployment Manager. You must get a new certificate, accept the certificate as valid, and save the certificate on the system.

To validate certificates, you can open the web page of the host. The system displays the existing certificate and you can match the details.

## Generating and accepting the Appliance Virtualization Platform host certificates

### About this task

With Solution Deployment Manager, you can generate certificates only for Appliance Virtualization Platform hosts.

If the certificate is invalid:

- Get a correct certificate for the host and add the certificate.
- Regenerate a self-signed certificate on the host.

### Before you begin

Get permissions to add a host to generate certificates.

## Procedure

1. To access Solution Deployment Manager, do one of the following:
  - On the System Manager web console, click **Services > Solution Deployment Manager**.
  - On the desktop, click the Solution Deployment Manager icon ().
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select an Appliance Virtualization Platform host.
4. Click **More Actions > Generate/Accept Certificate**.
5. To accept the certificate, in the Certificate dialog box, click **Generate Certificate**, and do the following:
  - a. In the Generate Certificate dialog box, in the **Validity in Days** field, type the validity of the certificate in days.
  - b. Click **Generate Certificate**.  
The system displays the message: Certificate is generated.
  - c. Click **Ok**.
6. To accept the certificate, click **Accept Certificate**.
7. To view the certificate validity status, click the **View link** in the **Platform Certificate Status** column.

Appliance Virtualization Platform places an IP address and FQDN in generated certificates. Therefore, from Solution Deployment Manager, you can connect to Appliance Virtualization Platform hosts through IP address or FQDN.

In the Platforms for Selected Location <location name> section, the **Platform Certificate Status** column must display a check mark .

### **Note:**

An alarm is generated everyday if the certificate expiry is below 60 days. This alarm can be cleared by installing a new identity certificate, which has the validity more than 60 days.

## Generating and updating the certificate on the ESXi host from VMware

### About this task

Generate new certificates only if you change the host name or accidentally delete the certificate. Under certain circumstances, you must force the host to generate new certificates.

To receive the full benefit of certificate checking, particularly if you want to use encrypted remote connections externally, do not use a self-signed certificate. Instead, install new certificates that are signed by a valid internal certificate authority or purchase a certificate from a trusted security authority.

## Procedure

To generate and update ESXi host and vCenter certificates, see the VMware documentation.

## Next steps

### \* Note:

The host certificate must match the fully qualified domain name of the host.

VMware places only FQDN in certificates that are generated on the host. Therefore, use a fully qualified domain name to connect to ESXi hosts and vCenter from Solution Deployment Manager.

The connection from Solution Deployment Manager 7.1 and later to a vCenter or ESXi host by using an IP address fails because the IP address is absent in the certificate and the connection is not sufficiently secure.

## Managing certificates for existing hosts

### About this task

By default, the certificate status of the host or vCenter that is migrated from earlier release is invalid. To perform any operation on the host from Solution Deployment Manager, you require a valid certificate. Therefore, you must get the valid certificate and accept the certificate.

### Before you begin

Gain permissions to add a host to generate certificates.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Platforms** tab, in the Platforms for Selected Location <location name> area, select a platform.
4. For the ESXi host, do one of the following:
  - If the certificate is valid, on the Certificate dialog box, click **More Actions > Generate/ Accept Certificate**, and click **Accept Certificate**.
  - If the certificate is invalid, log in to the ESXi host, validate the certificate, and then from Solution Deployment Manager, accept the certificate.

For more information, see “Generating and updating the certificate on the ESXi host from VMware”.

## Managing the application

### Deploying AVP Utilities

#### About this task

Use this procedure to deploy AVP Utilities on Appliance Virtualization Platform.

To deploy AVP Utilities, you can use Solution Deployment Manager from System Manager or the Solution Deployment Manager client, when System Manager is unavailable.

#### Before you begin

- Add a location.

See “Adding a location” in *Administering Avaya Aura® System Manager*.

- Add Appliance Virtualization Platform.

See “Adding an Appliance Virtualization Platform or ESXi host” in *Administering Avaya Aura® System Manager*.

- Download the AVP Utilities OVA file.

#### Procedure

1. To access Solution Deployment Manager, do one of the following:
  - On the System Manager web console, click **Services > Solution Deployment Manager**.
  - On the desktop, click the Solution Deployment Manager icon .
2. In **Application Management Tree**, select a platform.
3. On the **Applications** tab, in the Applications for Selected Location <location name> section, click **New**.

The system displays the Applications Deployment section.

4. In the Select Location and Platform section, do the following:
  - a. In **Select Location**, select a location.
  - b. In **Select Platform**, select a platform.

The system displays the host name in the **Platform FQDN** field.

5. In **Data Store**, select a data store, if not displayed upon host selection.

The page displays the capacity details.

6. Click **Next**.

7. To get the OVA file, select the **OVA** tab, and click one of the following:

- **URL**, in **OVA File**, type the absolute path to the application OVA file, and click **Submit**.
- **S/W Library**, in **File Name**, select the application OVA file.

- **Browse**, select the required application OVA file from a location on the computer, and click **Submit File**.

If the OVA file does not contain a valid Avaya certificate, then the system does not parse the OVA and displays the message: `Invalid file content. Avaya Certificate not found or invalid.`

8. Click **Next**.

In the Configuration Parameters and Network Parameters sections, the system displays the fields that are specific to the application that you deploy.

9. In the Network Parameters section, ensure that the following fields are preconfigured:

- **Public**
- **Services**
- **Out of Band Management**.

For more information, see “Application Deployment field descriptions”.

10. In the Configuration Parameters section, complete the fields.

For more information about Configuration Parameters, see “Network Parameters and Configuration Parameters field descriptions”.

11. Click **Deploy**.

12. Click **Accept the license terms**.

In the Platforms for Selected Location <location name> section, the system displays the deployment status in the **Current Action Status** column.

The system displays the virtual machine on the Applications for Selected Location <location name> page.

13. To view the details, click the **Status Details** link.

### Next steps

1. To activate the serviceability agent registration, reboot the AVP Utilities virtual machine.
2. Deploy all other Avaya Aura® applications at a time.

### Related links

## Deploying an OVA file for an Avaya Aura® application

### About this task

Use the procedure to deploy an OVA file for an Avaya Aura® application on the virtual machine.

To deploy an Avaya Aura® application, you can use Solution Deployment Manager from System Manager or the Solution Deployment Manager client if System Manager is unavailable.

Deploy AVP Utilities first, and then deploy all other applications one at a time.

## Before you begin

- Add a location.
- Add Appliance Virtualization Platform or an ESXi host to the location.
- Ensure that the certificate is valid on the Appliance Virtualization Platform host or vCenter managed hosts.
- Download the required OVA file to System Manager.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a platform.
3. On the **Applications** tab, in the Applications for Selected Location <location name> section, click **New**.

The system displays the Applications Deployment section.

4. In the Select Location and Platform section, do the following:
  - a. In **Select Location**, select a location.
  - b. In **Select Platform**, select a platform.

The system displays the host name in the **Platform FQDN** field.

5. In **Data Store**, select a data store, if not displayed upon host selection.

The page displays the capacity details.

6. Click **Next**.

7. To get the OVA file, select the **OVA** tab, and click one of the following:

- **URL**, in **OVA File**, type the absolute path to the application OVA file, and click **Submit**.
- **S/W Library**, in **File Name**, select the application OVA file.
- **Browse**, select the required application OVA file from a location on the computer, and click **Submit File**.

If the OVA file does not contain a valid Avaya certificate, then the system does not parse the OVA and displays the message: Invalid file content. Avaya Certificate not found or invalid.

8. In **Flexi Footprint**, select the footprint size that the application supports.
9. **(Optional)** To install the patch file for the Avaya Aura® application, click **Service or Feature Pack**, and enter the appropriate parameters.
  - **URL**, and type the absolute path of the same local windows computer or the http URL accessible from the same local windows computer of the latest service or feature pack.
  - **S/W Library**, and select the latest service or feature pack from the drop-down list.
  - **Browse**, and select the latest service or feature pack from your local computer, and click **Submit File**.

You can install the patch file for the Avaya Aura® application now or after completing the Avaya Aura® application OVA deployment.

10. Click **Next**.

In Configuration Parameters and Network Parameters sections, the system displays the fields that are specific to the application that you deploy.

11. In the Network Parameters section, ensure that the following fields are preconfigured:

- **Public**
- **Services:** Only for AVP Utilities.
- **Duplicate Link:** Only for duplex Communication Manager.
- **Private:** Only for Application Enablement Services.
- **Out of Band Management.**

For more information, see “Application Deployment field descriptions”.

12. In the Configuration Parameters section, complete the fields.

For each application that you deploy, fill the appropriate fields. For more information, see “Application Deployment field descriptions”.

13. Click **Deploy**.

14. Click **Accept the license terms**.

In the Platforms for Selected Location <location name> section, the system displays the deployment status in the **Current Action Status** column.

The system displays the virtual machine on the Applications for Selected Location <location name> page.

15. To view details, click **Status Details**.

## Next steps

Perform the following for Communication Manager:

1. From the Manage Elements link on System Manager, update the credentials corresponding to the element that you added.
2. Before the synchronization and after deployment, add an SMNP profile on Communication Manager.

 **Note:**

If you fail to update the password, the synchronization operation fails.

## Refreshing elements

### Before you begin

- On the User Settings page, configure the user settings.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, do the following:
  - a. Select one or more devices.
  - b. Click **Pre-upgrade Actions > Refresh Element(s)**.
4. On the Job Schedule page, click one of the following:
  - **Run Immediately**: To perform the job.
  - **Schedule later**: To perform the job at a scheduled time.
5. If you select **Schedule later**, select the date, time, and timezone.
6. Click **Schedule**.

The **Last Action Status** column displays  and the **Current Version** column displays the current version of the element.

## Analyzing software

### About this task

Analyze works on the version of OVA, service pack, and feature pack files uploaded to the software library. To get the correct entitle update or upgrade version, the version field must contain valid value. You can get the version values from versions files that are available on PLDS.

Custom patching does not require the analyze operation.

### Before you begin

- On the Roles page, set the Software Management Infrastructure permission.
- Perform the Refresh elements operation.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, do the following:
  - a. Select a device that you want to analyze.
  - b. Click **Pre-upgrade Actions > Analyze**.
4. On the Job Schedule page, click one of the following:
  - **Run Immediately**: To perform the job.

- **Schedule later:** To perform the job at a scheduled time.
5. If you select **Schedule later**, select the date, time, and timezone.
  6. Click **Schedule**.

The **Last Action Status** column displays a , the **Current Version** column displays the current version of the element, and the **Entitled Upgrade Version** column displays the next version of the element for which the element is entitled to be upgraded.

## Re-establishing trust for Solution Deployment Manager elements

### About this task

Use this procedure to re-establish trust with an application.

### Before you begin

- Add a location.
- Add an Appliance Virtualization Platform host to the location.

### Procedure

1. To access Solution Deployment Manager, do one of the following:
  - On the System Manager web console, click **Services > Solution Deployment Manager**.
  - On the desktop, click the Solution Deployment Manager icon ().
2. Click **Application Management**.
3. In **Application Management Tree**, select a platform.
4. On the **Applications** tab, in the Applications for Selected Location <location name> area, select an application.
5. Click **More Actions > Re-establish connection**.
6. Select the release version of the product deployed on the application.

The options are:

  - **6.3 and below**
  - **7.0**
  - **7.1 and above**
  - **others**
7. In **User Name**, type the user name of the application.
8. In **Password**, type the password of the application.
9. Click **Reestablish Connection**.

## Installing software patches by using Solution Deployment Manager

### About this task

Use the procedure to install software patches and service packs that are entitled for an Avaya Aura® application, and commit the patches that you installed.

#### \* Note:

When you are installing an element patch and the patch installation fails or the patch information is unavailable in **Upgrade Actions > Installed Patches** on the Upgrade Management page, then perform the following:

1. Ensure that the element is reachable on System Manager Solution Deployment Manager.
2. Refresh the element.

### Before you begin

- Perform refresh and analyze operations.
- If you upgrade an application that was not deployed from Solution Deployment Manager:
  1. Select the virtual machine.
  2. To establish trust, click **More Actions > Re-establish Connection**.
  3. Click **Refresh VM**.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. Select an Avaya Aura® application on which you want to install the patch.
4. Click **Upgrade Actions > Upgrade/Update**.
5. On the Upgrade Configuration page, click **Edit**.
6. In the General Configuration Details section, in the **Operation** field, click **Update**.
7. In **Upgrade Source**, select the software library where you have downloaded the patch.
8. **(Optional)** Click the **Auto Commit** check box, if you want the system to automatically commit the patch.

#### \* Note:

If an application is unreachable, the auto commit operation might fail and the Update Patch Status window displays a warning message. You must wait for some time, select the same patch in the Installed Patches section, and perform the commit operation again.

9. In the Upgrade Configuration Details section, in the Select patches for update table, select the software patch that you want to install.
10. Click **Save**.

11. On the Upgrade Configuration page, ensure that the **Configuration Status** field displays .

If the field displays , review the information on the Edit Upgrade Configuration page.

12. Click **Upgrade**.

13. On the Job Schedule page, click one of the following:

- **Run Immediately**: To perform the job.
- **Schedule later**: To perform the job at a scheduled time.

14. Click **Schedule**.

On the Upgrade Management page, the **Update status** and **Last Action Status** fields display .

15. To view the update status, click .

The **Upgrade Job Details** page displays the detailed update checks that are in progress. Click **Done** to close the window.

When the update is complete, the **Update status** and **Last Action Status** fields displays .

16. Click **Upgrade Actions > Installed Patches**.

17. On the Installed Patches page, in the Patch Operation section, click **Commit**.

The page displays all software patches that you can commit.

You can use **Rollback** and **Uninstall** options if you must rollback and uninstall the software patch.

18. Select the patch that you installed, in the Job Schedule section, click **Run Immediately**.

You can schedule to commit the patch at a later time by using the **Schedule later** option.

19. Click **Schedule**.

The Upgrade Management page displays the last action as **Commit**.

20. Ensure that **Update status** and **Last Action Status** fields display .

 **Note:**

If the patch commit fails or auto commit is not executed even after 24 hours, delete the snapshot that are not required. For information about deleting the virtual machine snapshot from host, see “Deleting the virtual machine snapshot”.

## Editing an application

### Before you begin

- Install the Solution Deployment Manager client.
- An ESXi host must be available.

- When you change the IP address or FQDN:
  - AVP Utilities must be available and must be discovered.
  - If AVP Utilities is discovered, the system must display AVP Utilities in the **App Name** column. If the application name in **App Name** is empty, click **More Actions > Re-establish connection** to establish trust between the application and System Manager.

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Applications** tab, in the Applications for Selected Location <location name> section, select an application, and click **Edit**.

The system displays the Edit App section.

4. To update the IP address and FQDN of the application in the local Solution Deployment Manager inventory, perform the following:
  - a. Click **More Actions > Re-establish connection**.

 **Note:**

To update IP address or FQDN for AVP Utilities, establish trust on all applications that are running on the host on which AVP Utilities resides.

- b. Click **More Actions > Refresh App**.

 **Note:**

To update IP address or FQDN for AVP Utilities, refresh all applications that are running on the host on which AVP Utilities resides.

- c. Click **Update IP/FQDN in Local Inventory**.
- d. Click **Update App IP/FQDN**.
- e. Provide the IP address and FQDN of the application.

**Update IP/FQDN in Local Inventory** updates the IP address or FQDN of the application only in the local database in System Manager. The actual IP address or FQDN of the host does not change. Use **Update Network Params** in the **Platforms** tab to update the IP address or FQDN of the host.

5. Click **Save**.

## Deleting an application

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.

3. On the **Applications** tab, select one or more application.
4. On the Delete page, click **Delete**, and click **Yes** to confirm the deletion.

The system turns off the applications, and deletes the selected applications from the platform.

## Updating Services Port Static Routing on an Avaya Aura® application

### About this task

You might have to change the static routing if the Avaya Aura® application that is running on the Appliance Virtualization Platform host is:

- Deployed by using the vSphere Web Client and does not have the route.
- Non-operational or unreachable when you start the Avaya Aura® application update.

### Before you begin

- Update network parameters of AVP Utilities if applicable.
- Ensure that the Avaya Aura® application resides on the same subnet as AVP Utilities.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. On the Applications tab, in the Applications for Selected Location <location name> section, select an Avaya Aura® application.
3. Click **More Actions > Update Static Routing**.

The VM Update Static Routing page displays the details of Avaya Aura® application and AVP Utilities. The fields are read-only.

4. Click **Update**.
5. On the Success dialog box, click **OK**.

The system updates the Avaya Aura® application with the new IP address of AVP Utilities for Services Port static routing.

### Related links

[Update Static Routing field descriptions](#) on page 1373

## Starting an application from Solution Deployment Manager

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. From the **Application Management Tree**, select a platform to which you added applications.
3. On the **Applications** tab, select one or more applications that you want to start.
4. Click **Start**.

In **Application State**, the system displays *Started*.

## Stopping an application from Solution Deployment Manager

### About this task

System Manager is operational and ESXi or vCenter is added to the Application Management page to deploy Avaya Aura® Application OVA on ESXi applications.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. From the **Application Management Tree**, select a ESXi or vCenter host to which you added applications.
3. On the **Applications** tab, select one or more applications that you want to stop.
4. Click **Stop**.

In **Application State**, the system displays *Stopped*.

## Restarting an application from Solution Deployment Manager

### Before you begin

- System Manager is operational, and ESXi or vCenter is added to the Application Management page to deploy Avaya Aura® Application OVA on ESXi applications.
- Applications must be in the running state.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. From the application management tree, select a host to which you added applications.
3. On the **Applications** tab, select one or more applications that you want to restart.
4. Click **Restart**.

In **Application State**, the system displays *Stopped* and then *Started*.

## VM Console overview

From Release 8.1.1, you can open the VM console in a new browser window or on a new browser tab.

To open and manage the application through the console, ensure that the:

- Application must be in running state. The application status must be **Started** for the application on the **Applications** tab in the **Application State** column.
- Application must reside on the Appliance Virtualization Platform host Release 7.1.2 and later.
- Appliance Virtualization Platform host certificate must be added in your browser.

You cannot view the VM Console of the application if the application resides on the customer-provided VMware ESXi host.

## Opening a VM console from Solution Deployment Manager

### About this task

Use the following procedure to open the VM console in a new browser window or on a new browser tab.

### Before you begin

- Add a location.
- Add the Appliance Virtualization Platform host.
- Ensure that the application is hosted on the Appliance Virtualization Platform host.
- Add the Appliance Virtualization Platform host certificate in your browser.

If you do not add the host certificate in your browser, the system displays the following message when you try to open the VM console in a browser:

To open VM Console of an application, add the Platform certificate in the browser. Following is the URL of the platform to accept the certificate: `https://<Host URL where the application resides>:443`

### Procedure

1. To access Solution Deployment Manager, do one of the following:
  - On the System Manager web console, click **Services > Solution Deployment Manager**.
  - On the desktop, click the Solution Deployment Manager icon ().
2. Click **Application Management**.
3. In **Application Management Tree**, select a location.
4. On the **Applications** tab, in the **Applications for Selected Location <location name>** section, select the application.
5. To open the VM console in a new:
  - Browser window, click **VM Console > Open VM Console in New Window**.
  - Tab of the browser, click **VM Console > Open VM Console in New Tab**.

When you open the console for the very first time, if the Appliance Virtualization Platform host certificate is not added in your browser, the system opens the browser instance with the following message:

To open VM Console of an application, add the Platform certificate in the browser. Following is the URL of the platform to accept the certificate: `https://<Host URL where the application resides>:443`

If you open the VM console after accepting the Appliance Virtualization Platform host certificate in the browser, the system opens the VM console without any warning message.

If the browser displays the same error message even after accepting the Appliance Virtualization Platform host certificate, see *Troubleshooting Avaya Aura® System Manager*.

### Next steps

On VM Console, log in to the application and perform the required operations.

### VM Console field descriptions

| Name                   | Description                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Full Screen</b>     | Opens the console in full screen mode.<br>You can press the <b>Esc</b> key to exit from the full screen mode.                                                                                                                                                                                                |
| <b>Send Keys</b>       | These keys are applied to the VM Linux system and not to your local computer from where you are accessing the VM Console.<br>The options are: <ul style="list-style-type: none"> <li>• <b>Send Ctrl+Alt+Del</b></li> <li>• <b>Send Ctrl+c</b></li> <li>• <b>Send Escape</b></li> </ul>                       |
| <b>KeyBoard Layout</b> | Sets the keyboard layout based on the selected language.<br>The options are: <ul style="list-style-type: none"> <li>• English</li> <li>• Japanese</li> <li>• German</li> <li>• Italian</li> <li>• Spanish</li> <li>• Portuguese</li> <li>• French</li> <li>• Swiss-French</li> <li>• Swiss-German</li> </ul> |

### Common causes for application deployment failure

If the application is not reachable from System Manager Solution Deployment Manager or Solution Deployment Manager Client, the OVA deployment fails at the sanity stage, because you might have:

- Provided an IP which is not on the network.
- Provided wrong network values that causes the network configuration for the application to not work properly.
- Chosen a private virtual network.

The following are some examples of wrong network values and configuration that can result in the OVA deployment failure:

- Using an IP which is already there on the network (duplicate IP).
- Using an IP which is not on your network at all.
- Using a DNS value, such as 0.0.0.0.
- Deploying on an isolated network on your VE deployment.

You can check the deployment status in the **Current Action Status** column on the **Applications** tab.

## Application Deployment field descriptions

### Select Location and Platform

| Name                   | Description                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Select Location</b> | The location name.                                                                                              |
| <b>Select Platform</b> | The platform name that you must select.                                                                         |
| <b>Platform FQDN</b>   | The platform FQDN.                                                                                              |
| <b>Data Store</b>      | The data store for the application.<br>The page populates the capacity details in the Capacity Details section. |
| <b>Next</b>            | Displays the OVA/ISO Details section where you provide the details required for OVA or ISO deployment.          |

### Capacity Details

The system displays the CPU and memory details of the AVP or ESXi host. The fields are read-only.

#### **Note:**

If the host is in a cluster, the system does not display the capacity details of CPU and memory. Ensure that the host resource requirements are met before you deploy the virtual machine.

| Name                     | Description              |
|--------------------------|--------------------------|
| <b>Name</b>              | The name                 |
| <b>Full Capacity</b>     | The maximum capacity     |
| <b>Free Capacity</b>     | The available capacity   |
| <b>Reserved Capacity</b> | The reserved capacity    |
| <b>Status</b>            | The configuration status |

### Provide admin and root Credentials

The system displays the Provide admin and root Credentials section for OS.

| Name                 | Description                |
|----------------------|----------------------------|
| Platform IP          | The platform IP.           |
| Platform FQDN        | The platform FQDN          |
| Admin User of OS     | The admin user name of OS. |
| Admin Password of OS | The admin password of OS.  |
| Root User of OS      | The root user of OS.       |

### Deploy OVA using System Manager Solution Deployment Manager

| Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ME Deployment            | <p>The option to perform the Midsize Enterprise deployment.</p> <p>The option to perform the Midsize Enterprise deployment.</p> <p>The option is available only while deploying Communication Manager simplex OVA.</p>                                                                                                                                                                                                                                                                |
| Enable enhanced security | The option to enable JITC mode deployment.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Select Software Library  | The software library where the .ova file is available.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Select OVAs              | <p>The .ova file that you want to deploy.</p> <p> <b>Note:</b></p> <p>System Manager validates any file that you upload during deployment, and accepts only OVA file type. System Manager filters uploaded files based on file extension and mime types or bytes in the file.</p>                                                                                                                    |
| Flexi Footprint          | <p>The footprint size supported for the selected application.</p> <p> <b>Important:</b></p> <ul style="list-style-type: none"> <li>• Ensure that the required memory is available for the footprint sizes that you selected. The upgrade operation might fail due to insufficient memory.</li> <li>• Ensure that the application contains the footprint size values that are supported.</li> </ul> |
| Next                     | Displays the Configuration Parameters tab in the OVA Details screen where you provide the OVA details.                                                                                                                                                                                                                                                                                                                                                                                |

### Deploy OVA using the Solution Deployment Manager client

| Name          | Description                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ME Deployment | <p>The option to perform the Midsize Enterprise deployment.</p> <p>The option to perform the Midsize Enterprise deployment.</p> <p>The option is available only while deploying Communication Manager simplex OVA.</p> |

The system displays the following options for deployment by providing OVA path.

| Name               | Description                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Browse</b>      | The option to enter the full/absolute path of the .ova file to install it as a virtual machine on the system that hosts the Solution Deployment Manager client.                 |
| <b>OVA File</b>    | The absolute path to the .ova file on the system that hosts the Solution Deployment Manager client.<br><br>The field is available only when you click <b>Provide OVA Path</b> . |
| <b>Submit File</b> | Selects the .ova file of System Manager that you want to deploy.                                                                                                                |

With the **S/W Library** option you can select a .ova file that is available in the local software library of windows machine where the Solution Deployment Manager client is installed.

The system displays the following options for deployment using local software library.

| Name             | Description                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File Name</b> | The file name of the .ova file that is to be installed on the system that hosts the Solution Deployment Manager client.<br><br>The field is available only when you click <b>S/W Library</b> . |

With the **URL** option, you can type the URL of the OVA or ISO file. The system displays the following options.

| Name          | Description                                                                                    |
|---------------|------------------------------------------------------------------------------------------------|
| <b>URL</b>    | The URL of the OVA or ISO file.<br><br>The field is available only when you click <b>URL</b> . |
| <b>Submit</b> | Selects the OVA or ISO file to be deployed that is extracted from the URL.                     |

The system displays the following common fields.

| Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flexi Footprint</b> | The footprint size supported for the selected application.<br><br>The field is available for all three types of deployment.<br><br> <b>Important:</b><br><br>Ensure that the required memory is available for the footprint sizes that you selected. The upgrade operation might fail due to insufficient memory. |
| <b>Next</b>            | Displays the <b>Configuration Parameters</b> tab in the OVA Details section where you provide the OVA details.                                                                                                                                                                                                                                                                                       |

## Configuration Parameters

The system populates most of the fields depending on the OVA file.

**\* Note:**

For configuration parameter fields, for Communication Manager Messaging and AVP Utilities, see [Configuration and Network Parameters field descriptions](#) on page 1369.

| Name                    | Description                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------|
| <b>Application Name</b> | The name of the application.                                                                     |
| <b>Product</b>          | The name of the Avaya Aura® application that is being deployed.<br>The field is read-only.       |
| <b>Version</b>          | Release number of the Avaya Aura® application that is being deployed.<br>The field is read-only. |

### Communication Manager Configuration Parameters

| Name                                              | Description                                                                                                                                                                                                                   |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CM IPv4 Address</b>                            | The IPv4 address of the Communication Manager virtual machine.                                                                                                                                                                |
| <b>CM IPv4 Netmask</b>                            | The IPv4 network mask of the Communication Manager virtual machine.                                                                                                                                                           |
| <b>CM IPv4 Gateway</b>                            | The IPv4 default gateway of the Communication Manager virtual machine.                                                                                                                                                        |
| <b>CM IPv6 Address</b>                            | The IPv6 address of the Communication Manager virtual machine.<br>The field is optional.                                                                                                                                      |
| <b>CM IPv6 Network Prefix</b>                     | The IPv6 network prefix of the Communication Manager virtual machine.<br>The field is optional.                                                                                                                               |
| <b>CM IPv6 Gateway</b>                            | The IPv6 gateway of the Communication Manager virtual machine.<br>The field is optional.                                                                                                                                      |
| <b>Out of Band Management IPv4 Address</b>        | The IPv4 address of the Communication Manager virtual machine for out of band management.<br>The field is optional network interface to isolate management traffic on a separate interface from the inband signaling network. |
| <b>Out of Band Management IPv4 Netmask</b>        | The IPv4 subnet mask of the Communication Manager virtual machine for out of band management.                                                                                                                                 |
| <b>Out of Band Management IPv6 Address</b>        | The IPv6 address of the Communication Manager virtual machine for out of band management.<br>The field is optional network interface to isolate management traffic on a separate interface from the inband signaling network. |
| <b>Out of Band Management IPv6 Network Prefix</b> | The IPv6 subnet mask of the Communication Manager virtual machine for out of band management.                                                                                                                                 |
| <b>CM Hostname</b>                                | The hostname of the Communication Manager virtual machine.                                                                                                                                                                    |

| Name                                             | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NTP Server(s)</b>                             | The IP address or FQDN of the NTP server.<br>Separate the IP addresses with commas (,).<br>You can type up to three NTP servers.                                                                                                                                                                                                                                                                     |
| <b>DNS Server(s)</b>                             | The DNS IP address of the Communication Manager virtual machine.                                                                                                                                                                                                                                                                                                                                     |
| <b>Search Domain List</b>                        | The search list of domain names. For example, mydomain.com. Separate the search list names with commas (,).                                                                                                                                                                                                                                                                                          |
| <b>WebLM Server IPv4 Address</b>                 | The IPv4 address of WebLM. The field is mandatory.                                                                                                                                                                                                                                                                                                                                                   |
| <b>EASG User Access</b>                          | Enables or disables Avaya Logins for Avaya Services to perform the required maintenance tasks.<br><br>The options are:<br><ul style="list-style-type: none"> <li>• 1: To enable EASG.</li> <li>• 2: To disable EASG.</li> </ul> Avaya recommends to enable EASG.<br><br>You can also enable EASG after deploying or upgrading the application by using the command: <b>EASGManage --enableEASG</b> . |
| <b>CM Privileged Administrator User Login</b>    | The login name for the privileged administrator. You can change the value at any point of time. The field is mandatory.                                                                                                                                                                                                                                                                              |
| <b>CM Privileged Administrator User Password</b> | The password for the privileged administrator. You can change the value at any point of time. The field is mandatory.                                                                                                                                                                                                                                                                                |
| <b>Confirm Password</b>                          | The password required to be confirmed. The field is mandatory.                                                                                                                                                                                                                                                                                                                                       |

## Customer Root Account

### \* Note:

The **Customer Root Account** field is applicable only in case of deploying application OVA on Appliance Virtualization Platform and VMware by using Solution Deployment Manager. The system does not display the **Customer Root Account** field, when you deploy an application:

- OVA on VMware by using VMware vSphere Web Client.
- ISO on Red Hat Enterprise Linux by using Solution Deployment Manager.

| Name                                                     | Description                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Customer Root Account for this Application</b> | Enables or disables the customer root account for the application.<br><br>Displays the ROOT ACCESS ACCEPTANCE STATEMENT screen. To accept the root access, click <b>Accept</b> .<br><br>When you accept the root access statement, the system displays the <b>Customer Root Password</b> and <b>Re-enter Customer Root Password</b> fields. |
| <b>Customer Root Password</b>                            | The root password for the application                                                                                                                                                                                                                                                                                                       |

| <b>Out of Band Management IPv4 Address</b>              | The IP address of the Communication Manager Messaging virtual machine for out of band management.<br><br>The field is optional network interface to isolate management traffic on a separate interface from the inbound signaling network. |
| <b>Out of Band Management IPv4 Netmask</b>              | The subnetwork mask of the Communication Manager Messaging virtual machine for out of band management.                                                                                                                                     |
| <b>Messaging Hostname</b>                               | The hostname of the Communication Manager Messaging virtual machine.                                                                                                                                                                       |
| <b>NTP Servers</b>                                      | The IP address or FQDN of the NTP server.<br><br>Separate the IP addresses with commas (,). The field is optional.                                                                                                                         |
| <b>DNS Server(s)</b>                                    | The DNS IP address of the Communication Manager Messaging virtual machine. Separate the IP addresses with commas(,). The field is optional.                                                                                                |
| <b>Search Domain List</b>                               | The search list of domain names. For example, mydomain.com. Separate the search list names with commas (,).                                                                                                                                |
| <b>WebLM Server IPv4 Address</b>                        | The IP address of WebLM. The field is mandatory.                                                                                                                                                                                           |
| <b>Messaging Privileged Administrator User Login</b>    | The login name for the privileged administrator.<br><br>You can change the value at any point of time.                                                                                                                                     |
| <b>Messaging Privileged Administrator User Password</b> | The password for the privileged administrator.<br><br>You can change the value at any point of time.                                                                                                                                       |
| <b>Confirm Password</b>                                 | The password required to be confirmed.                                                                                                                                                                                                     |

### Configuration and Network Parameters for AVP Utilities deployment

| Name                     | Description                                                                                                                                                                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networking Properties    |                                                                                                                                                                                                                                                                                                                                  |
| <b>Hostname</b>          | Linux hostname or fully qualified domain name for AVP Utilities virtual machine.<br><br><div>  <b>Note:</b> </div> <p>The host name is regardless of the interface that is used to access. The Public interface is the default interface.</p> |
| <b>Public IP address</b> | The IP address for this interface.<br><br>Required field unless you use DHCP.                                                                                                                                                                                                                                                    |
| <b>Public Netmask</b>    | The netmask for this interface.<br><br>Required field unless you use DHCP.                                                                                                                                                                                                                                                       |

*Table continues...*

| Name                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Public Default Gateway</b>                                         | <p>The IP address of the default gateway.</p> <p>Required field unless you use DHCP.</p> <p> <b>Note:</b></p> <p>The default gateway should be configured for the Public network. You can use the <code>ovf_set_static</code> command to allow a static route to be assigned to the OOBM network, enabling OOBM network to reach a second subnet.</p> |
| <b>Public IPv6 address</b>                                            | <p>The IP address for this interface.</p> <p>Required field unless you use DHCP.</p>                                                                                                                                                                                                                                                                                                                                                   |
| <b>Public IPv6 Prefix</b>                                             | <p>The netmask for this interface.</p> <p>Required field unless you use DHCP.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default IPv6 Gateway</b>                                           | <p>The IP address of the default gateway.</p> <p>Required field unless you use DHCP.</p>                                                                                                                                                                                                                                                                                                                                               |
| <b>Out of Band Management IP Address</b>                              | The IP address for this interface.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Out of Band Management Netmask</b>                                 | The netmask for this interface.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Out of Band Management IPv6 Address</b>                            | The IPv6 address for this interface. This field is optional.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Out of Band Management IPv6 Prefix</b>                             | The IPv6 prefix for this interface. This field is optional.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Network Time Protocol IP</b>                                       | IP address of a server running Network Time Protocol that Communication Manager can use for time synchronization.                                                                                                                                                                                                                                                                                                                      |
| <b>Timezone setting</b>                                               | The selected timezone setting for the AVP Utilities virtual machine.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DNS</b>                                                            | <p>The IP address of domain name servers for the AVP Utilities virtual machine. Separate each IP address by a comma.</p> <p>Required field unless you use DHCP.</p> <p>You can specify up to three DNS Servers.</p>                                                                                                                                                                                                                    |
| <b>Primary System Manager IP address for application registration</b> | The IP address of System Manager that is required for application registration.                                                                                                                                                                                                                                                                                                                                                        |
| <b>Enrollment Password</b>                                            | The enrollment password.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Confirm Password</b>                                               | The confirmation password.                                                                                                                                                                                                                                                                                                                                                                                                             |

| Name                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AVP Utilities Mode</b>          | <p>The mode in which you want to deploy AVP Utilities. You can set the mode during the deployment only. You cannot change the mode after the virtual machine is deployed. The options are:</p> <ul style="list-style-type: none"> <li>• <b>standard_mode</b>: AVP Utilities and services port enabled. The default mode for Appliance Virtualization Platform.</li> <li>• <b>hardened_mode</b>: Sets up the system for commercial hardening.</li> <li>• <b>hardened_mode (dod)</b>: Sets up the system for military hardening.</li> </ul>      |
| <b>Admin User Password</b>         | The admin user password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Confirm Password</b>            | The confirmation password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Out of Band Management Mode</b> | <p>The Out of Band Management mode in which you want to deploy. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>OOBM_Enabled</b>: To enable Out of Band Management.</li> <li>• <b>OOBM_Disabled</b>: To disable Out of Band Management.</li> </ul> <p> <b>Note:</b></p> <p><b>OOBM_Disabled</b> is the default setting. If the mode is set to <b>OOBM_Disabled</b>, then you do not need to configure Out of Band Management.</p> |

## Enhanced Access Security Gateway (EASG) - EASG User Access

| Name                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enter 1 to Enable EASG (Recommended) or 2 to Disable EASG</b> | <p>Enables or disables Avaya Logins for Avaya Services to perform the required maintenance tasks.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• 1: To enable EASG.</li> <li>• 2: To disable EASG.</li> </ul> <p>Avaya recommends to enable EASG.</p> <p>You can also enable EASG after deploying or upgrading the application by using the command: <b>EASGManage --enableEASG</b>.</p> |

## Customer Root Account

### **Note:**

The **Customer Root Account** field is applicable only in case of deploying application OVA on Appliance Virtualization Platform and VMware by using Solution Deployment Manager. The system does not display the **Customer Root Account** field, when you deploy an application:

- OVA on VMware by using VMware vSphere Web Client.
- ISO on Red Hat Enterprise Linux by using Solution Deployment Manager.

| Name                                                     | Description                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Customer Root Account for this Application</b> | Enables or disables the customer root account for the application.<br>Displays the ROOT ACCESS ACCEPTANCE STATEMENT screen. To accept the root access, click <b>Accept</b> .<br><br>When you accept the root access statement, the system displays the <b>Customer Root Password</b> and <b>Re-enter Customer Root Password</b> fields. |
| <b>Customer Root Password</b>                            | The root password for the application                                                                                                                                                                                                                                                                                                   |
| <b>Re-enter Customer Root Password</b>                   | The root password for the application                                                                                                                                                                                                                                                                                                   |

## Update Static Routing field descriptions

| Name                       | Description                                |
|----------------------------|--------------------------------------------|
| <b>VM Name</b>             | The application name.                      |
| <b>VM IP/FQDN</b>          | The IP address or FQDN of the application. |
| <b>Utility Services IP</b> | The IP address of AVP Utilities.           |

| Button        | Description                                |
|---------------|--------------------------------------------|
| <b>Update</b> | Updates the static IP address for routing. |

## Installed Patches field descriptions

| Name                    | Description                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Application Name</b> | The name of the application on which you want to install the patch.                                                                                                    |
| <b>Application IP</b>   | The IP address of the application on which you want to install the patch.                                                                                              |
| <b>Patch Name</b>       | The software patch name that you want to install.                                                                                                                      |
| <b>Patch Type</b>       | The patch type. The options are service pack and software patch.                                                                                                       |
| <b>Patch Version</b>    | The software patch version.                                                                                                                                            |
| <b>Patch State</b>      | The software patch state. The states are: <ul style="list-style-type: none"> <li>• Activated</li> <li>• Deactivated</li> <li>• Removed</li> <li>• Installed</li> </ul> |
| <b>Patch Status</b>     | The software patch status.                                                                                                                                             |

| Button                        | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Virtual machine report

You can generate a report of virtual machines that are installed on the Appliance Virtualization Platform host.

The script to generate the virtual machine report is in the `/swlibrary/reports/generate_report.sh` folder.

### Important:

If you run the report generation script when an upgrade is in progress on System Manager, the upgrade might fail.

### generate\_report.sh command

The `generate_report.sh` generates the virtual machine report.

#### Syntax

```
sh ./generate_report.sh [-g] [-u Provide SMGR UI user name] [-p Provide SMGR UI password] [-s] [-a]
```

|                              |                                                        |
|------------------------------|--------------------------------------------------------|
| <b>-g</b>                    | The option to generate the report.                     |
| <b>-u, SMGR UI user name</b> | System Manager Web console user name.                  |
| <b>-p, SMGR UI password</b>  | System Manager Web console password.                   |
| <b>-s</b>                    | The option to view the status of the generated report. |
| <b>-a</b>                    | The option to abort the generated report.              |

## Generating a virtual machine report

### Before you begin

If the application is of prior to Release 7.1, you must establish the trust with all applications before running the Report Generation utility.

## Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Go to the `/swlibrary/reports/` directory.
3. Type the `./generate_report.sh -g -u <SMGR UI Username> -p <SMGR UI Password>` command:

For example: `./generate_report.sh -g -u admin -p password`

The system displays the following message: Executing the Report Generation script can cause the failure of upgrade that is running on the System Manager system. Do you still want to continue? [Y/N].

4. To proceed with report generation, type Y, and press Enter.

The system generates the report in the `.csv` format in the `/swlibrary/reports/vm_app_report_DDMMYYYYxxxx.csv` folder.

### \* Note:

If you re-run the report generation script when the report generation process is in progress, the system displays the following message: Report Generation Process is Already Running, Kindly try after some time.

5. (Optional) To view the logs, go to `/swlibrary/reports/generate_report-YYYYMMDDxxxx.log`.

## Viewing the status of the virtual machine report

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Go to the `/swlibrary/reports/` directory.
3. Type the `./generate_report.sh -s` command.

If the virtual machine report generation is in progress, the system displays the following message: Report Generation Process is Running.

## Aborting the virtual machine report generation

### About this task

If the virtual machine report generation process is in progress and you want to abort the report generation process, use the following procedure.

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Go to the `/swlibrary/reports/` directory.

3. Type the `./generate_report.sh -a` command.

The system aborts the virtual machine report generation process.

---

## Monitoring a host and virtual machine

### Monitoring a platform

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. Click **Monitor Platforms**.
3. On the Monitor Hosts page, do the following:
  - a. In **Hosts**, click a host.
  - b. Click **Generate Graph**.

The system displays the graph regarding the CPU/memory usage of the host that you selected.

### Monitoring an application

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. Click **Monitor Applications**.
3. In the Monitor VMs page, do the following:
  - a. In **Hosts**, click a host.
  - b. In **Virtual machines**, click a virtual machine on the host that you selected.
4. Click **Generate Graph**.

The system displays the graph regarding the CPU/memory usage of the virtual machine that you selected.

---

## Managing vCenter

### Creating a role for a user

#### About this task

To manage a vCenter or ESXi in Solution Deployment Manager, you must provide complete administrative-level privileges to the user.

Use the following procedure to create a role with administrative-level privileges for the user.

## Procedure

1. Log in to vCenter Server.
2. On the Home page, click **Administration > Roles**.  
The system displays the Create Role dialog box.
3. In **Role name**, type a role name for the user.
4. To provide complete administrative-level privileges, select the **All Privileges** check box.
5. **(Optional)** To provide minimum mandatory privileges, do the following.

- a. In All Privileges, select the following check boxes:

- **Datastore**
- **Datastore cluster**
- **Distributed switch**
- **Folder**
- **Host profile**
- **Network**
- **Resource**
- **Tasks**
- **Virtual machine**
- **vApp**

 **Note:**

You must select all the subprivileges under the list of main set of privileges. For example, when you select the **Distributed switch** check box, ensure that you select all the related subprivileges. This is applicable for all the main privileges mentioned above. If you do not select all the subprivileges, the system might not work properly.

- b. In All Privileges, expand **Host**, and select the **Configuration** check box.

 **Note:**

You must select all the subprivileges under **Configuration**.

6. Click **OK** to save the privileges.

## Next steps

Assign this role to the user for mapping vCenter in Solution Deployment Manager. To assign the role to the user, see the VMware documentation.

## Adding a vCenter to Solution Deployment Manager

### About this task

System Manager Solution Deployment Manager supports virtual machine management in vCenter 6.0, 6.5, 6.7, and 7.0. When you add vCenter, System Manager discovers the ESXi hosts that this

vCenter manages, adds to the repository, and displays in the Managed Hosts section. Also, System Manager discovers virtual machines running on the ESXi host and adds to the repository. System Manager displays vCenter, ESXi host, and virtual machines on the Manage Elements page.

### Before you begin

Ensure that you have the required permissions.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In the lower pane, click **Map vCenter**.
3. On the Map vCenter page, click **Add**.
4. In the New vCenter section, provide the following vCenter information:
  - a. In **vCenter FQDN**, type FQDN of vCenter.
    - For increased security when using a vCenter with Solution Deployment Manager, use an FQDN for the vCenter. vCenter does not put IP addresses in its certificates. Therefore, you need FQDN to confirm the server identity through the certificate in Solution Deployment Manager.
    - The FQDN value must match with the value of the **SAN** field of the vCenter certificate. The FQDN value is case sensitive.
  - b. In **User Name**, type the user name to log in to vCenter.
  - c. In **Password**, type the password to log in to vCenter.
  - d. In **Authentication Type**, select **SSO** or **LOCAL** as the authentication type.
 

If you select the authentication type as **SSO**, the system displays the **Is SSO managed by Platform Service Controller (PSC)** field.
  - e. **(Optional)** If PSC is configured to facilitate the SSO service, select **Is SSO managed by Platform Service Controller (PSC)**.
 

PSC must have a valid certificate.

The system enables **PSC IP or FQDN** and you must provide the IP or FQDN of PSC.
  - f. **(Optional)** In **PSC IP or FQDN**, type the IP or FQDN of PSC.
5. Click **Save**.
6. On the certificate dialog box, click **Accept Certificate**.

The system generates the certificate and adds vCenter.

In the Managed Hosts section, the system displays the ESXi hosts that this vCenter manages.

[Map vCenter field descriptions](#) on page 1381

[New vCenter and Edit vCenter field descriptions](#) on page 1381

## Editing vCenter

### Before you begin

Ensure that you have the required permissions.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In the lower pane, click **Map vCenter**.
3. On the Map vCenter page, select a vCenter server and click **Edit**.
4. In the Edit vCenter section, change the vCenter information as appropriate.
5. If vCenter is migrated from an earlier release, on the Certificate page, click **Save**, and then click **Accept Certificate**.
6. To edit the location of ESXi hosts, in the Managed Hosts section, do one of the following:
  - Select an ESXi host and click the edit icon (✎).
  - Select one or more ESXi hosts, select the location, click **Bulk Update > Update**.
7. Click **Commit** to get an updated list of managed and unmanaged hosts.

If you do not click **Commit** after you move the host from Managed Hosts to Unmanaged Hosts or vice versa, and you refresh the table, the page displays the same host in both the tables.

## Deleting vCenter from Solution Deployment Manager

### Before you begin

Ensure that you have the required permissions.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In the lower pane, click **Map vCenter**.
3. On the Map vCenter page, select one or more vCenter servers and click **Delete**.
4. Click **Yes** to confirm the deletion of servers.

The system deletes the vCenter from the inventory.

| <b>FQDN</b>               | <p>The FQDN of the vCenter server.</p> <p> <b>Note:</b></p> <p>Use FQDN to successfully map and log in to vCenter from Solution Deployment Manager. With IP address, the system displays an error message about the incorrect certificate and denies connection.</p>                          |
| <b>License</b>            | The license type of the vCenter server.                                                                                                                                                                                                                                                                                                                                        |
| <b>Status</b>             | The license status of the vCenter server.                                                                                                                                                                                                                                                                                                                                      |
| <b>Certificate Status</b> | <p>The certificate status of the vCenter server. The options are:</p> <ul style="list-style-type: none"> <li>: The certificate is correct.</li> <li>: The certificate is not accepted or invalid.</li> </ul> |

| Button                             | Description                                                                                                                                                                                       |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View</b>                        | Displays the certificate status details of the vCenter server.                                                                                                                                    |
| <b>Generate/Accept Certificate</b> | <p>Displays the certificate dialog box where you can generate and accept a certificate for vCenter.</p> <p>For vCenter, you can only accept a certificate. You cannot generate a certificate.</p> |

| Button         | Description                                                                                 |
|----------------|---------------------------------------------------------------------------------------------|
| <b>Add</b>     | Displays the New vCenter page where you can add a new ESXi host.                            |
| <b>Edit</b>    | Displays the Edit vCenter page where you can update the details and location of ESXi hosts. |
| <b>Delete</b>  | Deletes the ESXi host.                                                                      |
| <b>Refresh</b> | Updates the list of ESXi hosts in the Map vCenter section.                                  |

## New vCenter and Edit vCenter field descriptions

| Name                | Description                                     |
|---------------------|-------------------------------------------------|
| <b>vCenter FQDN</b> | The FQDN of vCenter.                            |
| <b>User Name</b>    | The user name to log in to vCenter.             |
| <b>Password</b>     | The password that you use to log in to vCenter. |

*Table continues...*

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication Type</b>                                 | <p>The authentication type that defines how Solution Deployment Manager performs user authentication. The options are:</p> <ul style="list-style-type: none"> <li>• <b>SSO</b>: Global username used to log in to vCenter to authenticate to an external Active Directory authentication server.</li> <li>• <b>LOCAL</b>: User created in vCenter</li> </ul> <p>If you select the authentication type as <b>SSO</b>, the system displays the <b>Is SSO managed by Platform Service Controller (PSC)</b> field.</p> |
| <b>Is SSO managed by Platform Service Controller (PSC)</b> | The check box to specify if PSC manages SSO service. When you select the check box, the system enables <b>PSC IP or FQDN</b> .                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>PSC IP or FQDN</b>                                      | The IP or FQDN of PSC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Button         | Description                                                                       |
|----------------|-----------------------------------------------------------------------------------|
| <b>Save</b>    | Saves any changes you make to FQDN, username, and authentication type of vCenter. |
| <b>Refresh</b> | Refreshes the vCenter details.                                                    |

## Managed Hosts

| Name                | Description                                                           |
|---------------------|-----------------------------------------------------------------------|
| <b>Host IP/FQDN</b> | The name of the ESXi host.                                            |
| <b>Host Name</b>    | The IP address of the ESXi host.                                      |
| <b>Location</b>     | The physical location of the ESXi host.                               |
| <b>IPv6</b>         | The IPv6 address of the ESXi host.                                    |
| <b>Host Path</b>    | The hierarchy of the host in vCenter and also includes the host name. |

| Button             | Description                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit</b>        | The option to edit the location and host.                                                                                                                                                                                                                 |
| <b>Bulk Update</b> | <p>Provides an option to change the location of more than one ESXi hosts.</p> <p> <b>Note:</b><br/>You must select a location before you click <b>Bulk Update</b>.</p> |
| <b>Update</b>      | Saves the changes that you make to the location or hostname of the ESXi host.                                                                                                                                                                             |
| <b>Commit</b>      | Commits the changes that you make to the ESXi host with location that is managed by vCenter.                                                                                                                                                              |

## Unmanaged Hosts

| Name                | Description                |
|---------------------|----------------------------|
| <b>Host IP/FQDN</b> | The name of the ESXi host. |

| Name                | Description                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ESXi Version</b> | Displays the versions of the ESXi host linked to <b>vCenter FQDN</b> .<br><br>* <b>Note:</b><br>For Release 8.1 and later, do not select the 5.0 and 5.1 versions. |
| <b>IPv6</b>         | The IPv6 address of the ESXi host.                                                                                                                                 |
| <b>Host Path</b>    | The hierarchy of the host in vCenter and also includes the host name.                                                                                              |

| Button        | Description                                                         |
|---------------|---------------------------------------------------------------------|
| <b>Commit</b> | Saves all changes that you made to vCenter on the Map vCenter page. |

## Managing syslog profiles

### Adding a remote Syslog server profile

#### About this task

Use this procedure to configure a remote Syslog server details in System Manager such that it receives system logs from Appliance Virtualization Platform host through AVP Utilities.

#### Before you begin

To view the Syslog data from AVP Utilities or application, ensure that:

- The firewall on the Syslog server is configured correctly.
- The Syslog service on the server is running.

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. Click **Application Management**.
3. In the lower pane, click **Configure Remote Syslog Profile**.
4. On the Syslog Receiver Configuration page, click **Add**.  
System Manager displays the Add Syslog Receiver dialog box
5. In **Profile Name**, type the profile name of the Syslog server.
6. In **IP/FQDN**, type the IP address or FQDN of the Syslog server.
7. In **Port**, type the port of the Syslog server.
8. In **Protocol**, click **TCP** or **UDP**.
9. If the remote host is TLS based, select **TLS Authentication**.
10. In **Authentication options**, click **Server certificate authentication** or **Mutual TLS authentication**.

11. Click **Save**.

## Syslog Receiver Configuration field descriptions

| Name                                     | Description                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>                      | The name of the Syslog server configuration.                                                                                                                                                                                                                                                                                                                 |
| <b>IP/FQDN</b>                           | The IP address or host name of the Syslog server configuration.                                                                                                                                                                                                                                                                                              |
| <b>Port</b>                              | The port number of the Syslog server configuration.<br>The default port is 514.                                                                                                                                                                                                                                                                              |
| <b>Protocol</b>                          | The type of port used for the Syslog server configuration.<br>The options are: <ul style="list-style-type: none"> <li>• <b>TCP</b></li> <li>• <b>UDP</b></li> </ul> When the <b>tcp</b> protocol is selected, the system enables the <b>TLS Authentication</b> option.                                                                                       |

## Pushing system logs to Syslog servers

### About this task

Use this procedure to send log files to Syslog servers.

From Release 8.1, you can push more than one Syslog profiles to Syslog servers

## Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Applications** tab, in the Applications for Selected Host <host name> area, select an application.
4. Click **More Actions > Syslog config > Push**.
5. In the Push Syslog Configuration dialog box, select one or more Syslog profile, and click **Push**.

The system sends the system log to the selected Syslog server.

## Viewing configured Syslog servers

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Applications** tab, in the Applications for Selected Host <host name> area, select an application.
4. Click **More Actions > Syslog config > View**.
5. In the View Syslog Configuration dialog box, select the required Syslog profile to view it.

## Deleting configured Syslog servers

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. In **Application Management Tree**, select a location.
3. On the **Applications** tab, in the Applications for Selected Host <host name> area, select an application.
4. Click **More Actions > Syslog config > Delete**.
5. In the Delete Syslog Configuration dialog box, select the required Syslog profile, and click **Delete**.
6. On the confirmation dialog box, click **Yes**.

---

## Viewing the job history of virtual machine operations

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager > Application Management**.
2. On the desktop, click the SDM icon () , and then click **Application Management**.
3. In the lower pane, click **Job History**.
4. On the Job History page, in **Operation**, select one or more operations.
5. Click **Submit**.

The page displays the details of jobs that you selected.

| <b>Last Action</b>                 | The last operation completed on the platform.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>License Status</b>              | The status of the license.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Platform Version</b>            | The platform version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Offer Type</b>                  | The platform type. The options are: <ul style="list-style-type: none"> <li>• <b>AVP</b>: An Appliance Virtualization Platform platform</li> <li>• <b>Customer VE</b>: A customer-provided VMware ESXi platform</li> <li>• <b>SWONLY</b>: A customer-provided operating system platform</li> </ul>                                                                                                                                                                                                                                                                                                                       |
| <b>SSH Status</b>                  | The SSH service status. The values are enabled and disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Platform Certificate Status</b> | The certificate status of Appliance Virtualization Platform or standalone ESXi. If the ESXi is managed by vCenter, the system displays the value of this field as NA. The options are: <ul style="list-style-type: none"> <li>• : The certificate is added in Solution Deployment Manager and is correct.</li> <li>• : The certificate is not accepted or is invalid.</li> </ul> You can click <b>View</b> for details of the certificate status. |
| <b>vCenter Certificate Status</b>  | The certificate status of the ESXi host. The options are: <ul style="list-style-type: none"> <li>• : The certificate is correct.</li> </ul> The system enables all the options in <b>More Actions</b> that apply to VMware ESXi host. <ul style="list-style-type: none"> <li>• : The certificate is not accepted or is invalid.</li> </ul> You can click <b>View</b> for details of the certificate status.                                       |

### **Note:**

Depending on the Appliance Virtualization Platform host and vCenter certificate status, the system enables the options in **More Actions**.

| Button                                                    | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Refresh</b>                                       | Automatically refreshes the page with the latest changes. For example, the page updates: <ul style="list-style-type: none"> <li>• The Application state when an application changes.</li> <li>• The license status or certificate status of the platform when the platform changes.</li> </ul> The system refreshes the data every minute. |
| <b>Add</b>                                                | Displays the <b>Add Platform</b> section where you can provide the details of the platform that you want to add.                                                                                                                                                                                                                           |
| <b>Edit</b>                                               | Displays the Platform Information section where you can change the details of an existing platform.                                                                                                                                                                                                                                        |
| <b>Remove</b>                                             | Removes the platforms that you select only from the Solution Deployment Manager client.<br><br>The system moves the platforms associated with the deleted locations to an unknown location.                                                                                                                                                |
| <b>Change Network Params &gt; Change Host IP Settings</b> | Displays the Host Network/IP Settings section where you can change the host IP settings for the Appliance Virtualization Platform host.                                                                                                                                                                                                    |
| <b>Change Network Params &gt; Change Network Settings</b> | Displays the Host Network Setting section where you can change the network settings for the Appliance Virtualization Platform host.                                                                                                                                                                                                        |
| <b>Refresh</b>                                            | Refreshes the status of the platforms.                                                                                                                                                                                                                                                                                                     |
| <b>More Actions &gt; AVP Update/ Upgrade Management</b>   | Displays the Update host page where you can provide the Appliance Virtualization Platform patch file for updating the Appliance Virtualization Platform host.                                                                                                                                                                              |
| <b>More Actions &gt; Change Password</b>                  | Displays the Change Password section where you can change the password for the Appliance Virtualization Platform host.                                                                                                                                                                                                                     |
| <b>More Actions &gt; SSH &gt; Enable SSH</b>              | Enables SSH for the Appliance Virtualization Platform host.<br><br>When enabled successfully, the system displays <code>SSH enabled successfully</code> .                                                                                                                                                                                  |
| <b>More Actions &gt; SSH &gt; Disable SSH</b>             | Disables SSH on the Appliance Virtualization Platform host.<br><br>When disabled, the system displays <code>Disabling SSH for AVP host with &lt;IP address&gt; &lt;FQDN&gt;, &lt;username&gt;</code> .                                                                                                                                     |
| <b>More Actions &gt; Syslog config &gt; Push</b>          | Displays the Push Syslog Configuration section where you can push the syslog configuration on the application host. Syslog is only for Appliance Virtualization Platform. You can select multiple platforms and Push syslog configuration on selected platforms.                                                                           |
| <b>More Actions &gt; Syslog config &gt; View</b>          | Displays the View Syslog Configuration section where you can view syslog profiles of selected Appliance Virtualization Platform platforms.                                                                                                                                                                                                 |
| <b>More Actions &gt; Syslog config &gt; Delete</b>        | Displays the Delete Syslog Configuration section where you can select and delete configured syslog profiles.                                                                                                                                                                                                                               |

| <b>More Actions &gt; Lifecycle Actions &gt; Host Restart</b>          | Restarts the platform and applications that are running on the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>More Actions &gt; Lifecycle Actions &gt; Host Shutdown</b>         | Shuts down the platform and applications that are running on the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>More Actions &gt; Generate/Accept Certificate</b>                  | <p>Displays the Certificate dialog box where you can manage certificates for the platform.</p> <p>Depending on the platform type, the options are:</p> <ul style="list-style-type: none"> <li>• <b>Generate Certificate:</b> To generate a certificate for the Appliance Virtualization Platform host only.</li> <li>• <b>Accept Certificate:</b> To accept a valid certificate for the platform or vCenter.</li> <li>• <b>Decline Certificate:</b> To decline the certificate for the Appliance Virtualization Platform host only. You must regenerate the certificate and accept if you decline a platform certificate.</li> </ul> |
| <b>More Actions &gt; AVP Cert. Management &gt; Manage Certificate</b> | Displays the Load Certificate dialog box from where you can view/generate certificates for Appliance Virtualization Platform hosts, and download them. You can also upload and push third-party signed certificates to the selected platform.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>More Actions &gt; AVP Cert. Management &gt; Generic CSR</b>        | Displays the Create/Edit CSR dialog box from where you create or edit the generic CSR data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>More Actions &gt; Snapshot Manager</b>                             | Displays the Snapshot Manager dialog box from where you can view and delete the application snapshot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>More Actions &gt; WebLM Configuration</b>                          | Displays the WebLM Configuration dialog box from where you configure WebLM Server for an Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>More Actions &gt; AVP Firewall Rules</b>                           | Displays the Firewall Settings dialog box from where you can view the firewall rules details for an Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>More Actions &gt; Set Login Banner</b>                             | <p>Displays the Message of the Day dialog box from where you can push the login banner text to the selected platform.</p> <p> <b>Note:</b></p> <p>This feature is only available in System Manager Solution Deployment Manager. Solution Deployment Manager Client does not support <b>Set Login Banner</b>.</p>                                                                                                                                                                                                                                  |

## Applications

| Name                    | Description                                  |
|-------------------------|----------------------------------------------|
| <b>Application Name</b> | The name of the application.                 |
| <b>Application IP</b>   | The IP address of the application.           |
| <b>Application FQDN</b> | The FQDN of the application.                 |
| <b>Application IPv6</b> | The IPv6 address of the application, if any. |

*Table continues...*

| Name                         | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>App Name</b>              | The name of the application. For example, Session Manager.                                                                                                                                                                                                                                                                                                                                                  |
| <b>App Version</b>           | The version of the application. For example, 8.1.                                                                                                                                                                                                                                                                                                                                                           |
| <b>Application State</b>     | The state of the application. The states are: <ul style="list-style-type: none"> <li>• <b>Started</b></li> <li>• <b>Stopped</b></li> </ul>                                                                                                                                                                                                                                                                  |
| <b>Current Action Status</b> | The status of the current operation. The options are: <ul style="list-style-type: none"> <li>• <b>Deploying</b></li> <li>• <b>Starting</b></li> <li>• <b>Stopping</b></li> </ul> The <b>Status Details</b> link provides the details of the operation in progress.                                                                                                                                          |
| <b>Last Action</b>           | The last action performed on the application.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Platform Name</b>         | The platform name of the operating system, VMware host, or Appliance Virtualization Platform host on which the application resides.                                                                                                                                                                                                                                                                         |
| <b>Trust Status</b>          | The status of the connection between System Manager and the application.<br>The options are: <ul style="list-style-type: none"> <li>• <b>Success</b></li> <li>• <b>Failed</b></li> </ul> When the connection between System Manager and the application is established, <b>Trust Status</b> changes to <b>Success</b> .<br>Only when the trust status is <b>Success</b> , you can perform other operations. |
| <b>Data Store</b>            | The data store name.                                                                                                                                                                                                                                                                                                                                                                                        |

| Button                                               | Description                                                                                                           |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>New</b>                                           | Displays the Application Deployment section where you can provide the platform and deploy an application.             |
| <b>Edit</b>                                          | Displays the Application Deployment section where you can change the details of an application.                       |
| <b>Delete</b>                                        | Turns off the applications and deletes the selected application from platform and Solution Deployment Manager Client. |
| <b>Start</b>                                         | Starts the selected applications.                                                                                     |
| <b>Stop</b>                                          | Stops the selected applications.                                                                                      |
| <b>Show Selected</b>                                 | Displays only the selected applications.                                                                              |
| <b>VM Console &gt; Open VM Console in New Window</b> | Opens the application VM console in the new browser window.                                                           |
| <b>VM Console &gt; Open VM Console in New Tab</b>    | Opens the application VM console in the new tab of the browser.                                                       |

*Table continues...*

| Button                                             | Description                                                                                                                        |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>More Actions &gt; Restart</b>                   | Starts the selected applications that were stopped earlier.                                                                        |
| <b>More Actions &gt; Refresh App</b>               | Updates the status of the applications.                                                                                            |
| <b>More Actions &gt; Re-establish connection</b>   | Establishes the connection between System Manager and the application.<br>The <b>Trust Status</b> then changes to <b>Success</b> . |
| <b>More Actions &gt; Update Static Routing</b>     | Displays the VM Update Static Routing section where you can update the IP address of AVP Utilities for static routing.             |
| <b>More Actions &gt; Syslog config &gt; Push</b>   | Displays the Push Syslog Configuration section where you can push the syslog configuration on the selected application.            |
| <b>More Actions &gt; Syslog config &gt; View</b>   | Displays the View Syslog Configuration section where you can view all configured syslog profiles.                                  |
| <b>More Actions &gt; Syslog config &gt; Delete</b> | Displays the Delete Syslog Configuration section where you can select and delete configured syslog profiles.                       |

## Job History field descriptions

# Upgrading Avaya Aura® applications

---

## Upgrade Management overview

Upgrade Management in Solution Deployment Manager is a centralized upgrade solution of System Manager, provides an automatic upgrade of Avaya Aura® applications. You can upgrade Communication Manager, Session Manager, and Branch Session Manager directly to Release 8.1.3 from a single view. Communication Manager includes associated devices, such as Gateways, TN boards, and media modules. The centralized upgrade process minimizes repetitive tasks and reduces the error rate.

### Important:

- System Manager Release 7.x and later also support the System Manager Release 6.3.8 flow to upgrade Communication Manager, gateways, media modules, and TN boards to Release 6.3.100. However, the Release 6.3.8 user interface is available only when you select **Release 6.3.8** as the target version on the Upgrade Release Selection page.
- Ensure that upgrade or update of host should not be simultaneously run with upgrade and updates of application. You can check the Job status on the **Home > Services > Solution Deployment Manager > Upgrade Jobs Status** page. Any scheduled, pending, or running jobs for host must be completed before performing upgrade or update operations on host.

With Upgrade Management, you can perform the following:

1. Refresh elements: To get the current state or data such as current version of the Avaya Aura® application. For example, for Communication Manager, gateways, media modules, and TN boards.
2. Analyze software: To analyze whether the elements and components are on the latest release and to identify whether a new software is available for the inventory that you collected.

### Note:

In Geographic Redundancy configured System Manager, if Communication Manager or LSP has the **Unknown** status in the **Managed By** column on the **Inventory > Manage Elements** page, then you cannot perform the analyze operation. To change the **Unknown** status in the **Managed By** column to either **Primary** or **Secondary** depending upon from which system this action is performed, select the entry on the **Inventory > Manage Elements** page, and click **More Actions > Manage**.

3. Download files: To download files that are required for upgrading applications.

You can download a new release from Avaya PLDS to the software file library and use the release to upgrade the device software.

4. Preupgrade check: To ensure that conditions for successful upgrade are met. For example, checks whether:

- The new release supports the hardware
- The RAID battery is sufficient
- The bandwidth is sufficient

**\* Note:**

You must have the minimum network speed of 2Mbps with up to 100ms delay (WAN).

- The files are downloaded

5. Upgrade applications: To upgrade Avaya Aura® applications to Release 8.1.3.

6. Install patches: To install the software patches, service packs, and feature pack.

### Upgrade automation level

- The upgrade of Communication Manager, Session Manager, Branch Session Manager, and AVP Utilities to Release 8.1.3 is automated. The upgrade process includes creating a backup, deploying OVA, upgrading, installing software patches, feature packs, or service packs, and restoring the backup.
- Upgrade of all other Avaya Aura® applications that Solution Deployment Manager supports can automatically deploy OVA files.

However, the upgrade process involves some manual operations for creating backup, installing patches, and restoring the backup data.

### Upgrade job capacity

System Manager Solution Deployment Manager supports simultaneous upgrades or updates of Avaya Aura® applications. Solution Deployment Manager supports the following upgrade capacity:

- 5 upgrade or update job groups: Multiple applications combined together in an upgrade or update job is considered a group.
- 20 applications in a job group: Maximum applications that can be combined in an upgrade or update job group is 20. You can combine any application type for upgrade in a group.

The capacity also includes applications that are in the paused state. If five upgrade job groups are running or are in a paused state, you cannot upgrade the sixth group.

---

## Avaya Aura® applications upgrade

With System Manager Solution Deployment Manager, you can upgrade the following Avaya Aura® applications to Release 8.1.3:

- Communication Manager
- Session Manager
- Branch Session Manager

- AVP Utilities
- WebLM

**Note:**

You must upgrade System Manager to Release 8.1.3 by using the Solution Deployment Manager client before you upgrade the Avaya Aura® applications to Release 8.1.3.

## Guidelines for upgrading and updating elements

### Upgrading elements

For System Manager that is on the latest major release, to upgrade the elements to an intermediate element release, download the latest recommended major release of element OVA in the software library.

For example, for System Manager Release 8.0, to upgrade Communication Manager Release 7.0 to Release 7.1, download Release 8.0 Communication Manager OVA in the software library.

### Updating elements

For System Manager that is on the latest release patch, to upgrade the elements to an intermediate element patch release, download the latest recommended major release of element patch in the software library.

For example, for System Manager Release 8.0.1, to upgrade Communication Manager Release 7.0 to Release 7.1.2, download patch Release 7.1.3 in the software library.

| 9    | Refresh the elements in the inventory.                                                                                                                                                            | For more information, see “Refreshing elements” in <i>Administering Avaya Aura® System Manager</i>             |   |
| 10   | Analyze the software.                                                                                                                                                                             | For more information, see “Analyzing software” in <i>Administering Avaya Aura® System Manager</i>              |   |
| 11   | Perform the preupgrade check.                                                                                                                                                                     | For more information, see “Performing the preupgrade check” in <i>Administering Avaya Aura® System Manager</i> |   |
| 12   | Download the required firmware for the Avaya Aura® application upgrade.                                                                                                                           | For more information, see “Downloading the software” in <i>Administering Avaya Aura® System Manager</i>        |   |
| 13   | Perform the upgrade.                                                                                                                                                                              | -                                                                                                              |   |
| 14   | Verify that the upgrade is successful.                                                                                                                                                            | -                                                                                                              |   |

## Upgrade target release selection

For backward compatibility, System Manager supports upgrading Communication Manager to Release 6.3.6 or later. By default, the target version is set to System Manager 7.0. Based on the entitlements, to upgrade Communication Manager and the associated applications to Release 6.3.6 or later, you must select 6.3.8 as the upgrade target release.

## Selecting the target release for upgrade

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.

3. In the **Upgrade to release** field, select one of the following:

- **SMGR 7.x:** To upgrade Avaya applications to Release 7.0 or later from the Upgrade Management page.
- **SMGR 6.3.8:** To upgrade Communication Manager and the associated applications to Release 6.3.6 or later from the **Upgrade Management > Software Inventory** page.

 **Important:**

By default, the target version is set to Release 7.0.

4. Click **Commit**.
5. Click **OK**.
6. To perform the upgrade, click **Upgrade Management**.

## Installing software patches by using Solution Deployment Manager

### About this task

Use the procedure to install software patches and service packs that are entitled for an Avaya Aura® application, and commit the patches that you installed.

 **Note:**

When you are installing an element patch and the patch installation fails or the patch information is unavailable in **Upgrade Actions > Installed Patches** on the Upgrade Management page, then perform the following:

1. Ensure that the element is reachable on System Manager Solution Deployment Manager.
2. Refresh the element.

### Before you begin

- Perform refresh and analyze operations.
- If you upgrade an application that was not deployed from Solution Deployment Manager:
  1. Select the virtual machine.
  2. To establish trust, click **More Actions > Re-establish Connection**.
  3. Click **Refresh VM**.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.

3. Select an Avaya Aura® application on which you want to install the patch.
4. Click **Upgrade Actions > Upgrade/Update**.
5. On the Upgrade Configuration page, click **Edit**.
6. In the General Configuration Details section, in the **Operation** field, click **Update**.
7. In **Upgrade Source**, select the software library where you have downloaded the patch.
8. **(Optional)** Click the **Auto Commit** check box, if you want the system to automatically commit the patch.

 **Note:**

If an application is unreachable, the auto commit operation might fail and the Update Patch Status window displays a warning message. You must wait for some time, select the same patch in the Installed Patches section, and perform the commit operation again.

9. In the Upgrade Configuration Details section, in the Select patches for update table, select the software patch that you want to install.
10. Click **Save**.
11. On the Upgrade Configuration page, ensure that the **Configuration Status** field displays .

If the field displays , review the information on the Edit Upgrade Configuration page.

12. Click **Upgrade**.
13. On the Job Schedule page, click one of the following:
  - **Run Immediately**: To perform the job.
  - **Schedule later**: To perform the job at a scheduled time.
14. Click **Schedule**.

On the Upgrade Management page, the **Update status** and **Last Action Status** fields display .

15. To view the update status, click .

The **Upgrade Job Details** page displays the detailed update checks that are in progress. Click **Done** to close the window.

When the update is complete, the **Update status** and **Last Action Status** fields displays .

16. Click **Upgrade Actions > Installed Patches**.
17. On the Installed Patches page, in the Patch Operation section, click **Commit**.

The page displays all software patches that you can commit.

You can use **Rollback** and **Uninstall** options if you must rollback and uninstall the software patch.

18. Select the patch that you installed, in the Job Schedule section, click **Run Immediately**.

You can schedule to commit the patch at a later time by using the **Schedule later** option.

19. Click **Schedule**.

The Upgrade Management page displays the last action as **Commit**.

20. Ensure that **Update status** and **Last Action Status** fields display .

 **Note:**

If the patch commit fails or auto commit is not executed even after 24 hours, delete the snapshot that are not required. For information about deleting the virtual machine snapshot from host, see “Deleting the virtual machine snapshot”.

## Installing custom software patches

### About this task

With this procedure, you can install a single software file, such as software patch, service pack, or a feature pack to an Avaya Aura® application. With the custom patch deployment, you do not require the System Manager automation and analyze functions, so that the advanced administrators can fully control the deployment of hot fixes, patches, service pack, and feature packs.

You can install custom patches for the following Avaya Aura® applications:

- Communication Manager
- Session Manager
- Branch Session Manager
- Utility Services
- Communication Manager Messaging
- WebLM
- Application Enablement Services

### Before you begin

Before you begin with installing custom patches, perform refresh and analyze using the following procedures:

- For refreshing elements, see [Refreshing elements](#) on page 1311
- For analyzing elements, see [Analyzing software](#) on page 1311

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.

2. In the navigation pane, click **Upgrade Management**.
3. Select an Avaya Aura® application on which you want to install the patch.
4. Click **Upgrade Actions > Custom Patching**.
5. On the Upgrade Configuration page, click **Edit**.
6. In the General Configuration Details section, in the **Operation** field, click **Update**.
7. In **Upgrade Source**, select the software library where you have downloaded the patch.
8. **(Optional)** Click the **Auto Commit** check box, if you want the system to automatically commit the patch.
9. In the Upgrade Configuration Details section, in the Select patches for update table, select the software patch that you want to install.
10. In the End User License Agreement section, click **I Agree to the above end user license agreement**.
11. Click **Save**.
12. On the Upgrade Configuration page, ensure that the **Configuration Status** field displays .

If the field displays , review the information on the Edit Upgrade Configuration page.

13. Click **Upgrade**.
14. On the Job Schedule page, click one of the following:
  - **Run Immediately**: To perform the job.
  - **Schedule later**: To perform the job at a scheduled time.
15. Click **Schedule**.

On the Upgrade Management page, the **Update status** and **Last Action Status** fields display .

16. To view the update status, click .

The **Upgrade Job Details** page displays the detailed update checks that are in progress. Click **Done** to close the window.

When the update is complete, the **Update status** and **Last Action Status** fields displays .

17. Click **Upgrade Actions > Installed Patches**.
18. On the Installed Patches page, in the Patch Operation section, click **Commit**.

The page displays all software patches that you can commit.

You can use **Rollback** and **Uninstall** options if you must rollback and uninstall the software patch.

19. Select the patch that you installed, in the Job Schedule section, click **Run Immediately**.

You can schedule to commit the patch at a later time by using the **Schedule later** option.

20. Click **Schedule**.

The Upgrade Management page displays the last action as **Commit**.

21. Ensure that **Update status** and **Last Action Status** fields display .

 **Note:**

If the patch commit fails or auto commit is not executed even after 24 hours, delete the snapshot that are not required. For information about deleting the virtual machine snapshot from host, see “Deleting the virtual machine snapshot”.

| <b>Pre-upgrade Actions &gt; Pre-upgrade Check</b>   | Displays the Pre-upgrade Configuration page where you can configure to run the job or schedule the job to run later.                                                                                                                                                                                                                                                                                                                             |
| <b>Upgrade Actions &gt; Upgrade/Update</b>          | Displays the Upgrade Configuration page where you can configure the details of an upgrade or patch installation.                                                                                                                                                                                                                                                                                                                                 |
| <b>Upgrade Actions &gt; Commit/Rollback Upgrade</b> | Displays the Job Schedule page where you can run the upgrade job immediately or schedule it.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Upgrade Actions &gt; Installed Patches</b>       | Displays the software patches for the element and the operations that you can perform. The operations are: install, activate, uninstall, and rollback.                                                                                                                                                                                                                                                                                           |
| <b>Upgrade Actions &gt; Custom Patching</b>         | Displays the Upgrade Configuration page where you configure the custom patch details.<br><br>You can then install and commit the custom patch.                                                                                                                                                                                                                                                                                                   |
| <b>Upgrade Actions &gt; Cleanup</b>                 | Clears the current pending or pause state of applications.<br><br>The system displays a message to check if Appliance Virtualization Platform is already installed for the same-server migration. If Appliance Virtualization Platform is already installed, you must cancel the cleanup operation and continue with the upgrade.<br><br>If you continue the cleanup, the system clears the states, and you can start the upgrade process again. |
| <b>Upgrade Actions &gt; Commit</b>                  | Commits the changes that you made.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Upgrade Actions &gt; Rollback</b>                | Resets the system to the previous state.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Upgrade Actions &gt; Resume</b>                  | Resumes the upgrade process after you complete the required configuration. For example, adding the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                       |
| <b>Download &gt; Download</b>                       | Displays the File Download Manager page with the list of downloaded software required for upgrade or update.                                                                                                                                                                                                                                                                                                                                     |
| <b>Download &gt; Bulk Import Spreadsheet</b>        | Downloads the <code>Bulk_Import_Spreadsheet_Template.xlsx</code> file on your local computer.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Show Selected Elements</b>                       | Displays only the elements that you selected for preupgrade or update.                                                                                                                                                                                                                                                                                                                                                                           |

## Upgrade Configuration field descriptions

| Name                | Description             |
|---------------------|-------------------------|
| <b>Element Name</b> | The name of the device. |

*Table continues...*

| Name                                       | Description                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parent Name</b>                         | The parent of the device.<br>For example, CommunicationManager_123.                                                                                                                                                                                                                                                |
| <b>Type</b>                                | The device type.                                                                                                                                                                                                                                                                                                   |
| <b>IP Address</b>                          | The IP Address of the device.                                                                                                                                                                                                                                                                                      |
| <b>Current Version</b>                     | The release status of the device.                                                                                                                                                                                                                                                                                  |
| <b>Override Preupgrade Check</b>           | The option to override preupgrade check recommendations.<br><br>When you select this option, the system ignores any recommendations during preupgrade check, and continues with the upgrade operation. The system enables this option only when the system displays the upgrade status as <b>Partial_Failure</b> . |
| <b>Override Delete VM on Upgrade Check</b> | The option to override upgrade check recommendations.<br><br>When you select this option, the system deletes the old virtual machine after the upgrade check.                                                                                                                                                      |
| <b>Edit</b>                                | Displays the Edit Upgrade Configuration page where you can provide the upgrade configuration details.                                                                                                                                                                                                              |
| <b>Configuration Status</b>                | An icon that defines the configuration status.<br><br><ul style="list-style-type: none"> <li>✖: Configuration incomplete.</li> <li>✔: Configuration complete.</li> </ul>                                                                                                                                           |

| Button                         | Description                                                                                                                                                                                                                                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Import Configuration(s)</b> | Imports the Bulk_Import_Spreadsheet_Template.xlsx spreadsheet.<br><br>The system displays the Upload Xlsx File Configuration dialog box to upload the Bulk_Import_Spreadsheet_Template.xlsx spreadsheet.                                       |
| <b>Save Configuration</b>      | Saves the upgrade configuration.<br><br> <b>Note:</b><br>The system saves the configuration as a job. You can edit the job on the Upgrade Jobs Status page. |
| <b>Upgrade</b>                 | Commits the upgrade operation.                                                                                                                                                                                                                 |

## Element Configuration: General Configuration Details

| Name                                                                 | Description                                                                                                                                                                                                              |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                                                        | The system name.                                                                                                                                                                                                         |
| <b>IP Address</b>                                                    | The IP address of the device.                                                                                                                                                                                            |
| <b>Operation</b>                                                     | The operation that you want to perform on the device. The options are: <ul style="list-style-type: none"> <li>• Upgrade/Migration</li> <li>• Update</li> </ul>                                                           |
| <b>ESXI/AVP host/Platform</b>                                        | The host on which you want to run the device. The options are: <ul style="list-style-type: none"> <li>• Same Box</li> <li>• Software Only</li> <li>• List of hosts that you added from Application Management</li> </ul> |
| <b>New Target ESXI/AVP host/Platform</b>                             | The new target host on which you want to run the device.                                                                                                                                                                 |
| <b>Migrate With AVP Install</b>                                      | The option to migrate System Platform-based Communication Manager Release 6.3.x or 6.4.x to Appliance Virtualization Platform remotely by using System Manager Solution Deployment Manager.                              |
| <b>Upgrade Source</b>                                                | The source where the installation files are available. The options are: <ul style="list-style-type: none"> <li>• SMGR_DEFAULT_LOCAL</li> <li>• Remote Software Library</li> </ul>                                        |
| <b>Upgrade To</b>                                                    | The OVA file to which you want to upgrade.<br><br>When you select the local System Manager library, the system displays the fields and populates most of the data in the Upgrade Configuration Details section.          |
| <b>Service/Feature Pack for auto-install after upgrade/migration</b> | The service pack or feature pack that you want to install.                                                                                                                                                               |

## Element Configuration: Upgrade Configuration Details

The page displays the following fields when you upgrade application and the associated devices. The page displays all values from the existing system. If the system does not populate the values, manually add the values in the mandatory fields.

| Name               | Description                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Commit</b> | The option to automatically commit the upgrade.<br><br> <b>Note:</b><br>While applying the Communication Manager Security Service Pack (SSP) or Kernel Service Pack (KSP), you must select the <b>Auto Commit</b> check box. |

| Name                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Existing Administrative User</b>     | The user name with appropriate admin privileges.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Existing Administrative Password</b> | The password of the administrator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pre-populate Data</b>                | The option to get the configuration data displayed in the fields. Populates the virtual machine data of the existing virtual machine. For example, IP address, netmask, gateway.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Hostname</b>                         | The IP address of the virtual machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DNS Search Path</b>                  | The search list of domain names. For example, mydomain.com. Separate the search list names with commas (,).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Password for cust</b>                | The password of the cust user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Password for root</b>                | The password of the root user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Timezone</b>                         | The timezone of the virtual machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>NTP server(s)</b>                    | The IP Address or FQDN of the NTP server. Separate the IP addresses with commas (,).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>EASG User Access</b>                 | <p><b>Enable: (Recommended)</b></p> <p>By enabling Avaya Logins you are granting Avaya access to your system. This is necessary to maximize the performance and value of your Avaya support entitlements, allowing Avaya to resolve product issues in a timely manner.</p> <p>In addition to enabling the Avaya Logins, this product should be registered with Avaya and technically onboarded for remote connectivity and alarming. Please see the Avaya support site (<a href="http://support.avaya.com/registration">support.avaya.com/registration</a>) for additional information for registering products and establishing remote access and alarming.</p> <p><b>Disable</b></p> <p>By disabling Avaya Logins you are preventing Avaya access to your system. This is not recommended, as it impacts Avaya's ability to provide support for the product. Unless the customer is well versed in managing the product themselves, Avaya Logins should not be disabled.</p> <p>Enter 1 to Enable EASG (Recommended) or 2 to <b>Disable</b> EASG.</p> |
| <b>Default Gateway</b>                  | The default gateway of the virtual machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DNS Servers</b>                      | The DNS IP address of the virtual machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Public IP Address</b>                | The IP Address of AE Services virtual machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Public Netmask</b>                   | The network mask of AE Services virtual machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Require Encryption Pass-Phrase at Boot-Time</b> | <p>If the check box is selected, you need to type the encryption passphrase whenever the application reboots. By default, the <b>Require Encryption Pass-Phrase at Boot-Time</b> check box is selected.</p> <p> <b>Important:</b></p> <p>You must remember the data encryption pass-phrase as the system prompts you to enter the encryption passphrase with every reboot of the application.</p> <p>If you lose the data encryption passphrase, the only option is to reinstall the OVA.</p> <p>If the check box is not selected, the application creates the Local Key Store and you are not required to type the encryption passphrase whenever the application reboots. This might make the system less secure.</p> <p>You can also set up the remote key server by using the <b>encryptionRemoteKey</b> command after the deployment of the application.</p> |

### Element Configuration: End User License Agreement

| Name                                                   | Description                                                                                                  |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>I Agree to the above end user license agreement</b> | <p>The end user license agreement.</p> <p>You must select the check box to accept the license agreement.</p> |

| <b>AVP Management IPv4 Address</b>           | IPv4 address for the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                      |
| <b>AVP IPv4 Netmask</b>                      | IPv4 subnet mask for the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                  |
| <b>AVP Gateway IPv4 Address</b>              | IPv4 address of the customer default gateway on the network. Must be on the same network as the Host IP address.                                                                                                                                                                                                                                                                                  |
| <b>AVP Hostname</b>                          | Hostname for the Appliance Virtualization Platform host.<br><br>The hostname: <ul style="list-style-type: none"> <li>• Can contain alphanumeric characters and hyphen</li> <li>• Can start with an alphabetic or numeric character</li> <li>• Must contain at least 1 alphabetic character</li> <li>• Must end in an alphanumeric character</li> <li>• Must contain 1 to 63 characters</li> </ul> |
| <b>AVP Domain</b>                            | Domain for the Appliance Virtualization Platform host. If customer does not provide the host, use the default value. Format is alphanumeric string dot separated. For example, mydomain.com.                                                                                                                                                                                                      |
| <b>IPv4 NTP server</b>                       | IPv4 address or FQDN of customer NTP server. Format is x.x.x.x or ntp.mycompany.com                                                                                                                                                                                                                                                                                                               |
| <b>Secondary IPv4 NTP Server</b>             | Secondary IPv4 address or FQDN of customer NTP server. Format is x.x.x.x or ntp.mycompany.com.                                                                                                                                                                                                                                                                                                    |
| <b>Main IPv4 DNS Server</b>                  | Main IPv4 address of customer DNS server. One DNS server entry in each line. Format is x.x.x.x.                                                                                                                                                                                                                                                                                                   |
| <b>Secondary IPv4 DNS server</b>             | Secondary IPv4 address of customer DNS server. Format is x.x.x.x. One DNS server entry in each line.                                                                                                                                                                                                                                                                                              |
| <b>AVP management IPv6 address</b>           | IPv6 address for the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                      |
| <b>AVP IPv6 prefix length</b>                | IPv6 subnet mask for the Appliance Virtualization Platform host.                                                                                                                                                                                                                                                                                                                                  |
| <b>AVP gateway IPv6 address</b>              | IPv6 address of the customer default gateway on the network. Must be on the same network as the Host IP address.                                                                                                                                                                                                                                                                                  |
| <b>IPv6 NTP server</b>                       | IPv6 address or FQDN of customer NTP server.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Secondary IPv6 NTP server</b>             | Secondary IPv6 address or FQDN of customer NTP server.                                                                                                                                                                                                                                                                                                                                            |
| <b>Main IPv6 DNS server</b>                  | Main IPv6 address of customer DNS server. One DNS server entry in each line.                                                                                                                                                                                                                                                                                                                      |

## Uploading a custom patch

### About this task

If the file size exceeds 300 MB, the upload operation fails.

Analyze works on the version of OVA, service pack, and feature pack files uploaded to the software library. To get the correct entitle update or upgrade version, the version field must contain valid value. You can get the version values from versions files that are available on PLDS.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the left navigation pane, click **Download Manager**.
3. In **Select Software/Hardware Types**, select the firmware you want to download.  
You can choose either **Tree View** or **List View** to view the software, hardware types.
4. Click **Show Files**.
5. In the **Select Files Download Details** section, enter **My Computer**.
6. Click **Download**.
7. On the Upload File page, enter the details of the patch file you want to upload.
8. Click **Commit**.
9. On the Upload Remote Warning page, perform one of the following actions:
  - Click **Now** to upload the file to the remote software library.
  - Click **Schedule** to upload the file at the scheduled time.
  - Click **Cancel** to cancel the upload file operation and return to the previous page.

## Uploading custom patch field descriptions

| Name                    | Description                                                                 |
|-------------------------|-----------------------------------------------------------------------------|
| <b>Software Library</b> | The remote software library where you want to upload the custom patch file. |

*Table continues...*

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product Family</b>         | The product family to which the file belongs. In a product family, the number of devices are listed.                                                                                                                                                                                                                                                                                                                                               |
| <b>Device Type</b>            | The device type that you can upgrade using the software library file. For example, B5800 and IP Office are the device types for IP Office.                                                                                                                                                                                                                                                                                                         |
| <b>Software Type</b>          | The type of software file which includes firmware and images.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>File Version</b>           | <p>The software file version that you want to upload. For example, OVA, service pack, and feature pack.</p> <p>Version number is mandatory if you are uploading files, such as OVA, service pack, and feature pack because analyze operation works on version number and the system might have to install the version of the file. Custom patching does not require the analyze operation, and therefore, the file version number is optional.</p> |
| <b>Hardware Compatibility</b> | The hardware compatibility for the file you upload. For IP Office, this field can be null.                                                                                                                                                                                                                                                                                                                                                         |
| <b>File Size (in bytes)</b>   | The file size of the patch file you want to upload.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>File</b>                   | The patch file you want to upload to the remote software library. Click <b>Choose File</b> to browse to the file you want to upload.                                                                                                                                                                                                                                                                                                               |

| Button        | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <b>Commit</b> | Click to go to the upload file scheduler page.                                |
| <b>Cancel</b> | Click to cancel the upload operation and return to the Download Manager page. |

## Migrating System Platform-based elements or bare metal-based Communication Manager elements

### Migrating Communication Manager 6.3.x or 6.4.x or CM Simplex on survivable remote template to Avaya Aura® Release 8.1.3 with Appliance Virtualization Platform remote deployment

#### About this task

You can perform the remote deployment, if Communication Manager Release 6.3.x or 6.4.x on System Platform is hosted on the server that is supported with Appliance Virtualization Platform. This procedure can be performed only on the same server.

#### **Note:**

To migrate from System Platform-based Communication Manager Release 6.3.x or 6.4.x to Appliance Virtualization Platform 8.1, you need to first migrate to Appliance Virtualization Platform 8.0.1.1, and then update Appliance Virtualization Platform to 8.1. However, during the migration process, Avaya Aura® applications are migrated to 8.1.

Use this procedure to migrate Communication Manager Release 6.3.x or 6.4.x on System Platform to Avaya Aura® Release 8.1.3 in the following configurations:

- Embedded remote template on S8300E CM Simplex with survivable remote template running on Dell™ PowerEdge™ R620, HP ProLiant DL360p G8, Dell™ PowerEdge™ R630, HP ProLiant DL360 G9, or Avaya Solutions Platform 120 Appliance.

Survivable remote template does not contain Communication Manager Messaging and WebLM, and the bulk of the Communication Manager configuration data is transferred from the Communication Manager main server.

- Communication Manager, Utility Services, Branch Session Manager, and SAL or Services VM.

**\* Note:**

- Utility Services must be available on the Communication Manager 6.3.x or 6.4.x or CM Simplex on survivable remote template.
- You must have the minimum network speed of 2Mbps with up to 100ms delay (WAN).
- During manually patching elements, if the System Platform template is broken, then Solution Deployment Manager does not support the upgrade from System Platform-based Communication Manager Release 6.3.x or 6.4.x to 7.1.2 and later.

## Before you begin

- Manually upgrade the System Platform template on the latest Release 6.3.x or 6.4.x. Then upgrade to Release 7.1.2 and later by using Solution Deployment Manager.

**\* Note:**

Remote upgrade is not supported from System Platform-based Communication Manager Release 6.0 to 7.1.2 and later.

- Download the following components from the PLDS website:
  - Appliance Virtualization Platform Release 8.1.x installation file, `avaya-avp-8.1.x.0.0.xx.iso`.
  - Release 8.1 OVA files for System Manager and other Avaya Aura® applications deployed on System Platform.
  - Release 8.1.3 patch file for System Manager and other Avaya Aura® applications.

**\* Note:**

All the latest OVAs of elements that need to be upgraded with the latest AVP ISO must be available in Software library management in Solution Deployment Manager.

- Ensure that System Manager Solution Deployment Manager is available in the solution with appropriate Communication Manager licenses.

## Procedure

1. Create a backup of the following Communication Manager Release 6.3.x or 6.4.x and associated applications in the survivable remote template:
  - a. Communication Manager

- b. SAL or Services VM backup by using SAL or Services VM application utility
  - c. Branch Session Manager
2. Create a System Platform-based backup.

You require the System Platform backup for disaster recovery purposes and to migrate the SAL Services VM data.
3. Record the following Communication Manager embedded main settings for Release 6.3.x or 6.4.x:
  - All IP addresses
  - Subnetwork mask
  - Gateway
  - DNS
  - NTP Server
4. Add System Platform, Communication Manager Release 6.3.x or 6.4.x, and associated applications in System Manager inventory on the **Services > Inventory > Manage Elements** page.

For information about adding these elements, see *Administering Avaya Aura® System Manager*.

Once elements are successfully added, you can view them on the **Services > Solution Deployment Manager > Upgrade Management** page.
5. On the System Manager web console, click **Services > Solution Deployment Manager > Upgrade Management**,
6. Select Communication Manager and associated elements, and then click **Pre-Upgrade Actions > Refresh Element(s)**.
7. On the next page, click **Schedule**.

You can schedule the job now or for a later time.
8. After refresh is done, click **Pre-Upgrade Actions > Analyze**.
9. On the next page, click **Schedule**.

You can schedule the job now or for a later time.
10. After analyze is done, click **Pre-upgrade Actions > Pre-upgrade Check**.

The preupgrade check provides the hardware requirements for Communication Manager 6.3.x or 6.4.x and associated devices that you migrate and checks whether Utility Services is running on the virtual machine.
11. After Pre-upgrade check is done, click **Upgrade Actions > Upgrade/Update**.

Solution Deployment Manager performs the following:

  - Imports the required network settings from System Platform.

- Prompts you to fill the new attributes from OVA that are required for the deployment.
- Creates a backup of Communication Manager Survivable remote template and other virtual machines that are deployed on System Platform.

Solution Deployment Manager does not backup Communication Manager Messaging.

12. On the Upgrade Configuration page, click **edit**.
13. On the Edit Upgrade Configuration page, in **Service/Feature Pack for auto-install after migration**, select the 8.1.3 feature pack.
14. On the **Element Configuration** tab, fill the required fields, and click **Migrate to AVP install**.
15. On the **AVP Configuration** tab, provide the required details.

If you are migrating from Communication Manager Release 6.3.x or 6.4.x, the system displays the following fields preconfigured and prepopulated.

- **Source Root User**
- **Source Root Password**
- **AVP management IPv4 Address:** In this field assign a new IP address to Appliance Virtualization Platform.

16. Click **Save**.
17. To save the configuration, click **Save Configuration**.

The update configuration is saved as a job in the Upgrade Jobs Status page.

18. On the Upgrade Configuration page, click **Upgrade**.
19. To view the upgrade status, perform the following:
  - a. In the navigation pane, click **Upgrade Job Status**.
  - b. In the **Job Type** field, click **Upgrade**.
  - c. Click the upgrade job that you want to view.
20. On the Upgrade Management page, click .

The **Last Action** column displays **Upgrade**, and the **Last Action Status** column displays .

## Next steps

For migrating Communication Manager 6.3.x or 6.4.x S8300E CM Simplex on survivable remote template to Appliance Virtualization Platform, Utility Services element is also automatically migrated to AVP Utilities Release 8.x.

This process takes approximately 2 to 3 hours depending upon the number of elements to be migrated and network speed.

## Migrating System Platform-based system and elements in bulk to Appliance Virtualization Platform remotely by using System Manager Solution Deployment Manager

### About this task

Use this procedure to remotely migrate System Platform-based system and elements in bulk to Appliance Virtualization Platform Release 8.1.3. You can remotely migrate:

- Communication Manager, Branch Session Manager, and Utility Services that are running on System Platform.
- Communication Manager Release 5.2.1 bare metal system.

### Before you begin

- On the Manage Elements page, add the System Platform system and required elements. For information about adding a new element, see *Administering Avaya Aura® System Manager*.
- Refresh the element.
- Analyze the software.
- Perform the pre-upgrade check.
- Download a copy of the `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet. For information, see “Downloading the bulk import spreadsheet template”.
- Fill the required system details in the `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet.

#### **Note:**

If you provide the incorrect data in the spreadsheet, the upgrade might fail.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.  
The system displays the Upgrade Management page.
3. Select the required element.  
When you select an element, the system selects the parent of the element and all child elements of the element in the hierarchy.
4. Click **Upgrade Actions > Upgrade/Update**.
5. On the Upgrade Configuration page, click **Bulk Import Configuration(s)**.
6. On the Upload Xlsx File Configuration dialog box, perform the following:
  - a. Click **Browse** and select the file from the local computer.
  - b. To upload the spreadsheet, click **Upload**.
  - c. Click **Submit**.

The system displays the file size, timestamp, and percentage complete for the uploaded file. When the file upload is in-progress, do not navigate away from the page.

On the Upgrade Management page, the system displays the message: Please Wait – Saving Import Excel Sheet Configuration .... You must wait until the system stops showing this message.

7. On the Upgrade Management page, click .

The **Configuration Status** column displays .

8. To save the configuration, click **Save Configuration**.

The update configuration is saved as a job in the Upgrade Jobs Status page.

9. On the Upgrade Configuration page, click **Upgrade**.
10. To view the upgrade status, perform the following:
  - a. In the navigation pane, click **Upgrade Job Status**.
  - b. In the **Job Type** field, click **Upgrade**.
  - c. Click the upgrade job that you want to view.

11. On the Upgrade Management page, click .

The **Last Action** column displays **Upgrade**, and **Last Action Status** column displays .

## Sample scenario for filling AVP Bulk Import Spreadsheet Template

### Example

**SP IP Address** is a primary key that is common in all sub sheets. Let us consider the following element details for Setup 1 Avaya Aura® System Platform LSP in Figure 1:

|      | SP-1            | Dom-0          | CM (LSP)               | US                     | BSM                                 |
|------|-----------------|----------------|------------------------|------------------------|-------------------------------------|
| IP   | 148.147.162.100 | 148.147.162.99 | 148.147.162.101        | 148.147.162.102        | 148.147.162.103                     |
| FQDN |                 |                | spcm.smgrdev.avaya.com | spus.smgrdev.avaya.com | sidtsm2.smgrdev.avaya.com           |
|      |                 |                |                        |                        | <a href="#">SIP:148.147.162.104</a> |

Figure 2: Figure 1. Setup 1 – Avaya Aura® System Platform LSP

The corresponding mapping information of Setup 1 in Element\_Info sub sheet is shown in Figure 2:

| SP IP Address   | Elem | Element IP Ad   | Operation      | ESXI   | Mig  | Upgrade Source | Upgrade To                        |
|-----------------|------|-----------------|----------------|--------|------|----------------|-----------------------------------|
| 148.147.162.100 | CM   | 148.147.162.101 | Upgrade/Migrat | Same B | true | SMGR_DEFAULT_L | CM-Simplex-07.1.0.0.532-e65-0.ova |
| 148.147.162.100 | US   | 148.147.162.102 | Upgrade/Migrat | Same B | true | SMGR_DEFAULT_L | US-7.1.0.0.18-e55-379_OVF10.ova   |
| 148.147.162.100 | BSM  | 148.147.162.103 | Upgrade/Migrat | Same B | true | SMGR_DEFAULT_L | BSM-7.1.0.0.710028-e65-01.ova     |

Figure 3: Figure 2. Setup 1 – Element\_Info sub sheet

The corresponding mapping information of Setup 1 in AVP\_Info sub sheet is shown in Figure 3:

| SP IP Address   | Source IP      | Source | Source A | Sour | Source | Upgrade Source | Upgrade To                 |
|-----------------|----------------|--------|----------|------|--------|----------------|----------------------------|
| 148.147.162.100 | 148.147.162.99 | admin  | admin01  | root | root01 | SMGR_DEFAULT_L | avaya-avp-7.1.2.0.0.07.iso |

Figure 4: Figure 3. Setup 1 – AVP\_Info sub sheet

**\* Note:**

For Avaya Aura® System Platform, the **Source IP** and **AVP\_Mgmt\_IPv4\_Address** is the same as **Dom-0 IP**, which is assigned to the target Appliance Virtualization Platform IP after installation.

The corresponding mapping information of Setup 1 in CM\_Prepopulate\_Data sub sheet is shown in Figure 4:

| SP IP Address   | Element IP Address | CM IPv4 Address | CM IPv4 Netmask | CM IPv4 Gateway |
|-----------------|--------------------|-----------------|-----------------|-----------------|
| 148.147.162.100 | 148.147.162.101    | 148.147.162.101 | 255.255.255.0   | 148.147.162.1   |

Figure 5: Figure 4. Setup 1 – CM\_Prepopulate\_Data sub sheet

**\* Note:**

The values added in the **Element IP Address** and **CM IPv4 Address** columns in the above image must be the same as the **Element IP Address** of CM (LSP) in the Figure 1.

The corresponding mapping information of Setup 1 in US\_Prepopulate\_Data sub sheet is shown in Figure 5:

| SP IP Address   | Element IP Ad   | Hostname | Public IP Address | Public Netm   | Public Default |
|-----------------|-----------------|----------|-------------------|---------------|----------------|
| 148.147.162.100 | 148.147.162.102 | us       | 148.147.162.102   | 255.255.255.0 | 148.147.162.1  |

Figure 6: Figure 5. Setup 1 – US\_Prepopulate\_Data sub sheet

**\* Note:**

The values added in the **Element IP Address** and **Public IP Address** columns in the above image must be the same as the **Element IP Address** of US in the Figure 1.

The corresponding mapping information of Setup 1 in BSM\_Prepopulate\_Data sub sheet is shown in Figure 6:

| SP IP Address   | Element IP Ad   | Short H | Network Domain    | IPv4 Address    | Netmask       | Default gate  |
|-----------------|-----------------|---------|-------------------|-----------------|---------------|---------------|
| 148.147.162.100 | 148.147.162.103 | sidtsm1 | smgrdev.avaya.com | 148.147.162.103 | 255.255.255.0 | 148.147.162.1 |

Figure 7: Figure 6. Setup 1 – BSM\_Prepopulate\_Data sub sheet

The values added in the **Element IP Address** and **IPv4 Address** columns in the above image must be the same as the **Element IP Address** of BSM in the Figure 1.

A sample scenario for Setup 2 (Avaya Aura® System Platform) CM Simplex Main:

| Setup-3 (Bare Metal 5.2.1) LSP |      |      |                 |    |     |
|--------------------------------|------|------|-----------------|----|-----|
|                                | SP-3 | Dom0 | CM              | US | BSM |
| IP                             | NA   | NA   | 148.147.162.301 | NA | NA  |

Figure 8: Figure 7. Setup 2 – (Avaya Aura® System Platform) CM Simplex Main

**\* Note:**

For CM Simplex Main, there is no mapping entry in BSM\_Prepopulate\_Data sub sheet.

A sample scenario for Setup 3 (Bare Metal) 5.2.1 LSP in Figure 8:

| Setup-3 (Bare Metal 5.2.1) LSP |      |      |                 |    |     |
|--------------------------------|------|------|-----------------|----|-----|
|                                | SP-3 | Dom0 | CM              | US | BSM |
| IP                             | NA   | NA   | 148.147.162.301 | NA | NA  |

**Figure 9: Figure 8. Setup 3 – (Bare Metal) 5.2.1 LSP**

**\* Note:**

1. In Element\_Info sub sheet, the **SP IP Address** mentioned in column is NA for Bare Metal 5.2.1.
2. In AVP\_Info sub sheet, the **Source IP** is the LSP IP Address. You need to provide a new IP Address for **AVP\_Mgmt\_IPv4\_Address**, which is assigned to the target Appliance Virtualization Platform Host after installation.
3. In CM\_Prepopulate\_Data sub sheet, the **SP IP Address** mentioned in column is NA for Bare Metal 5.2.1.
4. US\_Prepopulate\_Data sub sheet and BSM\_Prepopulate\_Data sub sheet do not have any mapping entry for Bare Metal 5.2.1 LSP.

**\* Note:**

This information is applicable only if you are migrating to Release 7.1.2 and higher.

## Downloading the bulk import spreadsheet template

### About this task

Use the following procedure to download the `Bulk_Import_Spreadsheet_Template.xlsx` file.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, click **Download > Bulk Import Spreadsheet**.

The system downloads the `Bulk_Import_Spreadsheet_Template.xlsx` file on your local computer.

## Upgrading Branch Session Manager instances in bulk

### Filling the bulk import spreadsheet for upgrading Branch Session Manager instances in bulk

#### Before you begin

- Download a copy of the `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet. For information, see “Downloading the bulk import spreadsheet template”.

#### Procedure

1. On the **Element Info** sheet, do the following:
  - a. In **SP/AVP/ESXi IP Address**, type the host IP Address of Branch Session Manager.  
This field supports the AVP and ESXi platforms.
  - b. In **Element Type**, type `BSM`.
  - c. In **Element IP Address**, type the IP Address of Branch Session Manager.
  - d. In **Operation**, type `Upgrade/Migration`.
  - e. In **ESXi/AVP host**, type the host IP Address of Branch Session Manager.  
The value of the field must match with **SP/AVP/ESXi IP Address**.
  - f. In **Migrate with AVP Install**, type `false`.  
For Branch Session Manager, migration is not applicable.
  - g. In **Upgrade Source**, type `SMGR_DEFAULT_LOCAL`.
  - h. In **Upgrade To**, type the upgrade version of Branch Session Manager OVA.  
For example: `BSM-8.1.0.0.xxxxxx-exx-0x.ova`.
  - i. In **EULA**, type `true`.
  - j. **(Optional)** In **ESXi/AVP New**, type the host IP Address of AVP or ESXi.  
This field is not applicable for the same host upgrade. If you want to migrate from one AVP or ESXi host to the other, you must fill the following fields on the **BSM\_Prepopulate\_Data** sheet:
    - **New ESXi datacentre**
    - **New ESXi datastore**
    - **New ESXi deployment type****ESXi/AVP New host IP** on the **AVP\_VM\_MAPPING** sheet.
2. On the **AVP\_Info** sheet, do the following:
  - a. In **SP/AVP/ESXi IP Address**, type the IP Address of AVP or ESXi host.  
You can also fill the new ESXi host here.

- b. In **Source IP**, type the IP Address of the Appliance Virtualization Platform.
- c. In **Upgrade Source**, type the source where the installation files are available.

The options are:

- `SMGR_DEFAULT_LOCAL`
- Remote Software Library

- d. In **Upgrade To**, type the OVA file name to which you want to upgrade.
- e. In **Dual Stack Setup (with IPv4 and IPv6)**, enable or disable the fields to provide the IPv6 addresses.

The options are:

- **true**: To enable the encryption pass-phrase at boot-time.
- **false**: To disable the encryption pass-phrase at boot-time.

- f. In **EASG**, type 1 to enable the EASG.
- g. In **WebLM Port Number**, type the port number of WebLM Server.

The default port is 52233.

- h. In **EULA**, type `true`.

3. On the **CM\_Prepopulate\_Data** sheet, do the following:

- a. In **SP/AVP/ESXi IP Address**, type the IP Address of AVP or ESXi host.  
You can also fill the new ESXi host here.
- b. In **Element IP Address**, type the IP Address of Communication Manager.
- c. In **NTP Server(s)**, type the IP address or FQDN of the NTP server.  
Separate the IP addresses with commas (,). You can type up to three NTP servers.
- d. In **Search Domain List**, type the search list of domain names.  
For example, mydomain.com. Separate the search list names with commas (,).
- e. In **EASG**, type 1 to enable the EASG.
- f. In **Flexi Footprint**, type the footprint of Communication Manager.  
For example, CM Main Max users 1,000.
- g. **(Optional)** In **Customer Root Account Password**, type the customer root password.  
This field is only applicable for DOD build.

 **Note:**

In **Data Encryption**, type 1 to enable. Fill the encryption pass-phrase and type `true` for encryption pass-phrase at boot-time.

4. On the **US\_Prepopulate\_Data** sheet, do the following:

- a. In **SP/AVP/ESXi IP Address**, type the host IP Address of Utility Services.
- b. In **Element IP Address**, type the IP Address of Utility Services.
- c. In **Primary WebLM IP address for Licensing**, type the IP Address or FQDN of WebLM Server.
- d. In **OOBM Mode**, select the Out of Band Management mode in which you want to deploy.

The options are:

- **OOBM\_Enabled**: To enable Out of Band Management.
- **OOBM\_Disabled**: To disable Out of Band Management

- e. In **EASG**, type 1 to enable the EASG.
- f. **(Optional)** In **Customer Root Account Password**, type the customer root password.  
This field is only applicable for DOD build.

 **Note:**

In **Data Encryption**, type 1 to enable. Fill the encryption pass-phrase and type `true` for encryption pass-phrase at boot-time.

5. On the **BSM\_Prepopulate\_Data** sheet, do the following:

- a. In **SP/AVP/ESXi IP Address**, type the host IP Address of Branch Session Manager.
- b. In **Search Domain List**, type `platform.avaya.com`.
- c. In **LSP IP**, type the Communication Manager IP Address.
- d. In **EASG User Access**, type 1 to enable the EASG.
- e. In **Flexi Footprint**, type the footprint of Branch Session Manager.  
For example, BSM Profile 1 Max Devices 1,000.
- f. **(Optional)** In **Customer Root Account Password**, type the customer root password.  
This field is only applicable for DOD build.

 **Note:**

In **Data Encryption**, type 1 to enable. Fill the encryption pass-phrase and type `true` for encryption pass-phrase at boot-time.

6. On the **AVP\_VM\_MAPPING** sheet, do the following:

- a. In **AVP/ESXi IP Address**, type the IP Address of the AVP or ESXi host.  
You can also fill the new ESXi host here.
- b. In **Authentication Type**, type `SSO` or `LOCAL`.
- c. In **PSC URL**, type FQDN of PSC.

7. Save the values in the sheet.

[Downloading the bulk import spreadsheet template](#) on page 1421

## Upgrading Branch Session Manager instances in bulk by using System Manager Solution Deployment Manager

### Before you begin

- On the Manage Elements page, add Branch Session Manager instances. For information about adding a new element, see *Administering Avaya Aura® System Manager*.
- Refresh the element.
- Analyze the software.
- Perform the pre-upgrade check.
- Download a copy of the `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet. For information, see “Downloading the bulk import spreadsheet template”.
- Fill the required system details in the `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet.

#### **Note:**

If you provide the incorrect data in the spreadsheet, the upgrade might fail.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Management**.
3. On the Upgrade Management page, select Branch Session Manager instances.
4. Click **Upgrade Actions > Upgrade/Update**.
5. On the Upgrade Configuration page, click **Bulk Import Configuration(s)**.
6. On the Upload Xlsx File Configuration dialog box, perform the following:
  - a. Click **Browse** and select the file from the local computer.
  - b. To upload the spreadsheet, click **Upload**.
  - c. When the spreadsheet upload is 100%, click **Submit**.

The system displays the file size, timestamp, and percentage complete for the uploaded file. When the file upload is in-progress, do not navigate away from the page.

On the Upgrade Management page, the system displays the message: `Please Wait - Saving Import Excel Sheet Configuration . . . . You must wait until the system stops showing this message.`

7. On the Upgrade Management page, click .

The **Configuration Status** column displays .

8. To save the configuration, click **Save Configuration**.

The update configuration is saved as a job in the Upgrade Jobs Status page.

9. On the Upgrade Configuration page, click **Upgrade**.
10. To view the upgrade status, perform the following:
  - a. In the navigation pane, click **Upgrade Job Status**.
  - b. In the **Job Type** field, click **Upgrade**.
  - c. Click the upgrade job that you want to view.

11. On the Upgrade Management page, click .

The **Last Action** column displays **Upgrade**, and **Last Action Status** column displays .

## System Manager upgrade management

## Edit Elements field descriptions

### Required Element information

| Name                      | Description                                 |
|---------------------------|---------------------------------------------|
| <b>SMGR IP</b>            | The IP address of System Manager.           |
| <b>SMGR NAME</b>          | The name of System Manager virtual machine. |
| <b>SMGR SSH User Name</b> | The SSH user name of System Manager.        |
| <b>SMGR SSH Password</b>  | The SSH password of System Manager.         |

### Required C-DOM information

| Name                        | Description              |
|-----------------------------|--------------------------|
| <b>C-DOM IP/FQDN</b>        | The C-DOM IP/FQDN        |
| <b>C-DOM SSH User Name</b>  | The C-DOM SSH user name  |
| <b>C-DOM SSH Password</b>   | The C-DOM SSH password   |
| <b>C-DOM Root User Name</b> | The C-DOM root user name |
| <b>C-DOM Root password</b>  | The C-DOM root password  |

| Button        | Description                         |
|---------------|-------------------------------------|
| <b>Update</b> | Updates the changes to the element. |

## Upgrade Management field descriptions

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Install on Same Host</b> | <p>The option to select the same or a different server. The options are:</p> <ul style="list-style-type: none"> <li>• Select: To upgrade on the same server.</li> <li>• Clear: To upgrade to a different server.</li> </ul> <p>If you do not select the check box, you must add a new server or select a server from the list to which you want to update.</p> <p> <b>Note:</b></p> <p>When upgrading from System Platform-based System Manager to AVP or ESXi, the system displays this field.</p> |
| <b>Platform FQDN</b>        | <p>The platform FQDN to which you want to upgrade.</p> <p>The system displays the CPU and memory details of the platform in the Capacity Details section.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Application Name</b>     | The application name displayed on the Add Element page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## OVA/ISO Details

| Name                                    | Description                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select the OVA</b>                   | The option to select a .ova file of the virtual machine that is available on System Manager.                                                                                                                                                                                                         |
| <b>OVA file</b>                         | The absolute path to the .ova file of the virtual machine.<br><br>The field is available only when you click <b>Select the OVA from Local SMGR</b> .                                                                                                                                                 |
| <b>Submit File</b>                      | Selects the .ova file of the virtual machine that you want to deploy.<br><br>The field is available only when you click <b>Select the OVA from Local SMGR</b> . The system displays the network configuration details in the Network Parameters section based on the System Manager virtual machine. |
| <b>Flexi Footprint</b>                  | The footprint size supported for the selected server.<br><br>The system validates for the CPU, memory, and other parameters in the Capacity Details section. You must ensure that the status is  .                |
| <b>SMGR Data migration Utility file</b> | The absolute path to the System Manager data migration utility file.<br><br> <b>Note:</b><br>Provide the latest data migration bin that is available for the System Manager release.                                |
| <b>Service Pack or Feature Pack</b>     | The absolute path to the service pack or feature pack.<br><br>For the latest service pack or feature pack, see Avaya Aura® Release Notes on the Avaya Support website at <a href="http://support.avaya.com/">http://support.avaya.com/</a> .                                                         |

## Configuration Parameters

The system populates the values for most of the fields from the 7.x or 8.0.x system. You must provide information, such as password, FQDN, time zone, and EASG.

## Management Network Settings

| Name                                                                    | Description                                                                                                                                                                                                             |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Management IPv4 Address (or Out of Band Management IPv4 Address)</b> | The IPv4 address of the System Manager application for out of band management.<br><br>The field is optional network interface to isolate management traffic on a separate interface from the inbound signaling network. |
| <b>Management Netmask</b>                                               | The Out of Band Management subnetwork mask to assign to the System Manager application.                                                                                                                                 |
| <b>Management Gateway</b>                                               | The gateway IPv4 address to assign to the System Manager application.                                                                                                                                                   |
| <b>IP Address of DNS Server</b>                                         | The DNS IP addresses to assign to the primary, secondary, and other System Manager applications. Separate the IP addresses with commas (,).                                                                             |

*Table continues...*

| Name                       | Description                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Management FQDN</b>     | The FQDN to assign to the System Manager application.<br><br>* <b>Note:</b><br>System Manager hostname is case sensitive. The restriction applies only during the upgrade of System Manager. |
| <b>IPv6 Address</b>        | The IPv6 address of the System Manager application for out of band management. The field is optional.                                                                                        |
| <b>IPv6 Network prefix</b> | The IPv6 subnetwork mask to assign to the System Manager application. The field is optional.                                                                                                 |
| <b>IPv6 Gateway</b>        | The gateway IPv6 address to assign to the System Manager application. The field is optional.                                                                                                 |
| <b>Default Search List</b> | The search list of domain names. The field is optional.                                                                                                                                      |
| <b>NTP Server IP/FQDN</b>  | The IP address or FQDN of the NTP server. The field is optional. Separate the IP addresses with commas (,).                                                                                  |
| <b>Time Zone</b>           | The timezone where the System Manager application is located. A list is available where you select the name of the continent and the name of the country.                                    |

## Public Network Settings

| Name                              | Description                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------|
| <b>Public IP Address</b>          | The IPv4 address to enable public access to different interfaces. The field is optional.     |
| <b>Public Netmask</b>             | The IPv4 subnetwork mask to assign to System Manager application. The field is optional.     |
| <b>Public Gateway</b>             | The gateway IPv4 address to assign to the System Manager application. The field is optional. |
| <b>Public FQDN</b>                | The FQDN to assign to the System Manager application. The field is optional.                 |
| <b>Public IPv6 Address</b>        | The IPv6 address to enable public access to different interfaces. The field is optional.     |
| <b>Public IPv6 Network Prefix</b> | The IPv6 subnetwork mask to assign to System Manager application. The field is optional.     |
| <b>Public IPv6 Gateway</b>        | The gateway IPv6 address to assign to the System Manager application. The field is optional. |

## Virtual FQDN

| Name             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Virtual Hostname | <p>The virtual hostname of the System Manager application.</p> <p> <b>Note:</b></p> <ul style="list-style-type: none"> <li>• The VFQDN value must be unique and different from the FQDN value of System Manager and the elements.</li> <li>• VFQDN is a mandatory field.</li> <li>• By default, VFQDN entry gets added in the <code>/etc/hosts</code> file during installation. Do not remove VFQDN entry from the <code>/etc/hosts</code> file.</li> <li>• VFQDN entry will be below FQDN entry and mapped with IP address of system. Do not manually change the order and value.</li> <li>• You must keep VFQDN domain value same as of FQDN domain value.</li> <li>• If required, VFQDN value can be added in DNS configuration, ensure that the value can be resolved.</li> <li>• Secondary Server (Standby mode) IP address value is mapped with VFQDN value in hosts file of Primary server IP address. After Secondary Server is activated, then the IP address gets updated with Secondary Server IP address.</li> <li>• In Geographic Redundancy, the primary and secondary System Manager must use the same VFQDN.</li> <li>• After System Manager installation, if you require to change the System Manager VFQDN value, perform the following:             <ol style="list-style-type: none"> <li>1. Log in to System Manager with administrator privilege credentials.</li> <li>2. Run the <b>changeVFQDN</b> command.</li> </ol> </li> </ul> <p> <b>Important:</b></p> <p>When you run the <b>changeVFQDN</b> command on System Manager, data replication synchronization between System Manager with Session Manager and other elements fails To correct VFQDN on other elements and to retrieve new VFQDN from System Manager, see product-specific Administering document.</p> |
| Virtual Domain   | The virtual domain name of the System Manager application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name                    | Description                 |
|-------------------------|-----------------------------|
| SNMPv3 User Name Prefix | The prefix for SNMPv3 user. |

*Table continues...*

| Name                                                | Description                                                                      |
|-----------------------------------------------------|----------------------------------------------------------------------------------|
| <b>SNMPv3 User Authentication Protocol Password</b> | The password for SNMPv3 user authentication.                                     |
| <b>Confirm Password</b>                             | The password that you retype to confirm the SNMPv3 user authentication protocol. |
| <b>SNMPv3 User Privacy Protocol Password</b>        | The password for SNMPv3 user privacy.                                            |
| <b>Confirm Password</b>                             | The password that you must provide to confirm the SNMPv3 user privacy protocol.  |

## SMGR CLI USER

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SMGR command line user name</b>     | <p>The user name of the System Manager CLI user.</p> <p> <b>Note:</b></p> <p>Do not provide the common user names, such as, admin, csaadmin, postgres, root, bin, daemon, adm, sync, dbus, vcasa, ntp, saslauth, sshd, tcpdump, xfs, rpc, rpcuser, nfsnobody, craft, inads, init, rasaccess, sroot, postgres, smgr, and nortel.</p> |
| <b>SMGR command line user password</b> | The password for the System Manager CLI user.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Confirm Password</b>                | The password that you retype to confirm the System Manager CLI user authentication.                                                                                                                                                                                                                                                                                                                                  |

## Backup Definition

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule Backup?</b>             | <ul style="list-style-type: none"> <li>• <b>Yes:</b> To schedule the backup jobs during the System Manager installation.</li> <li>• <b>No:</b> To schedule the backup jobs later.</li> </ul> <p> <b>Note:</b></p> <p>If you select <b>No</b>, the system does not display the remaining fields.</p> |
| <b>Backup Server IP</b>             | <p>The IP address of the remote backup server.</p> <p> <b>Note:</b></p> <p>The IP address of the backup server must be different from the System Manager IP address.</p>                                                                                                                            |
| <b>Backup Server Login Id</b>       | The login ID of the backup server to log in through the command line interface.                                                                                                                                                                                                                                                                                                        |
| <b>Backup Server Login Password</b> | The SSH login password to log in to the backup server from System Manager through the command line interface.                                                                                                                                                                                                                                                                          |

*Table continues...*

| Name                             | Description                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Confirm Password</b>          | The password that you reenter to log in to the backup server through the command line interface.                                                                  |
| <b>Backup Directory Location</b> | The location on the remote backup server.                                                                                                                         |
| <b>File Transfer Protocol</b>    | The protocol that you can use to create the backup. The values are SCP and SFTP.                                                                                  |
| <b>Repeat Type</b>               | The type of the backup. The possible values are: <ul style="list-style-type: none"> <li>• Hourly</li> <li>• Daily</li> <li>• Weekly</li> <li>• Monthly</li> </ul> |
| <b>Backup Frequency</b>          | The frequency of the backup taken for the selected backup type.<br>The system generates an alarm if you do not schedule a System Manager backup every seven days. |
| <b>Backup Start Year</b>         | The year in which the backup must start. The value must be greater than or equal to the current year.                                                             |
| <b>Backup Start Month</b>        | The month in which the backup must start. The value must be greater than or equal to the current month.                                                           |
| <b>Backup Start Day</b>          | The day on which the backup must start. The value must be greater than or equal to the current day.                                                               |
| <b>Backup Start Hour</b>         | The hour in which the backup must start.<br>The value must be six hours later than the current hour.                                                              |
| <b>Backup Start Minutes</b>      | The minute when the backup must start. The value must be a valid minute.                                                                                          |
| <b>Backup Start Seconds</b>      | The second when the backup must start. The value must be a valid second.                                                                                          |

### Enhanced Access Security Gateway (EASG) - EASG User Access

| Name                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enter 1 to Enable EASG (Recommended) or 2 to Disable EASG</b> | <p>Enables or disables Avaya Logins for Avaya Services to perform the required maintenance tasks.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• 1: To enable EASG.</li> <li>• 2: To disable EASG.</li> </ul> <p>Avaya recommends to enable EASG.</p> <p>You can also enable EASG after deploying or upgrading the application by using the command: <b>EASGManage --enableEASG</b>.</p> |

## Customer Root Account

### \* Note:

The **Customer Root Account** field is applicable only in case of deploying application OVA on Appliance Virtualization Platform and VMware by using Solution Deployment Manager. The system does not display the **Customer Root Account** field, when you deploy an application:

- OVA on VMware by using VMware vSphere Web Client.
- ISO on Red Hat Enterprise Linux by using Solution Deployment Manager.

| Name                                                     | Description                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Customer Root Account for this Application</b> | Enables or disables the customer root account for the application.<br><br>Displays the ROOT ACCESS ACCEPTANCE STATEMENT screen. To accept the root access, click <b>Accept</b> .<br><br>When you accept the root access statement, the system displays the <b>Customer Root Password</b> and <b>Re-enter Customer Root Password</b> fields. |
| <b>Customer Root Password</b>                            | The root password for the application                                                                                                                                                                                                                                                                                                       |
| <b>Re-enter Customer Root Password</b>                   | The root password for the application                                                                                                                                                                                                                                                                                                       |

## Data Encryption

### \* Note:

- From Release 8.1.2 and later, Data Encryption is supported only for Appliance Virtualization Platform and VMware Virtualized Environment.
- For data encryption, you must use a new encryption capable variant of Release 8.1E OVA.

For more information, see the application-specific Data Privacy Guidelines on the Avaya Support website.

| Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Name                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Require Encryption Pass-Phrase at Boot-Time</b> | <p>If the check box is selected, you need to type the encryption passphrase whenever the application reboots. By default, the <b>Require Encryption Pass-Phrase at Boot-Time</b> check box is selected.</p> <p> <b>Important:</b></p> <p>You must remember the data encryption pass-phrase as the system prompts you to enter the encryption passphrase with every reboot of the application.</p> <p>If you lose the data encryption passphrase, the only option is to reinstall the OVA.</p> <p>If the check box is not selected, the application creates the Local Key Store and you are not required to type the encryption passphrase whenever the application reboots. This might make the system less secure.</p> <p>You can also set up the remote key server by using the <b>encryptionRemoteKey</b> command after the deployment of the application.</p> |

## Network Parameters

| Name                                     | Description                                                                                           |
|------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Out of Band Management IP Address</b> | The IP Address that you must assign to the Out of Band Management port group. The field is mandatory. |
| <b>Public</b>                            | The port number that you must assign to public port group. The field is optional.                     |

| Button         | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| <b>Upgrade</b> | Displays the EULA acceptance screen. To accept EULA and start the upgrade process, click <b>Accept</b> . |

---

## Upgrade job status

---

### Upgrade job status

The Upgrade Job Status page displays the status of completion of every upgrade job that you performed. Every step that you perform to upgrade an application by using Solution Deployment Manager is an upgrade job.

You must complete the following jobs to complete the upgrade:

1. **Refresh Element(s):** To get the latest data like version data for the applications in the system.

2. **Analyze:** To evaluate an application that completed the Refresh Element(s) job.
3. **Pre-Upgrade Check:** To evaluate an application that completed the Analyze job.
4. **Upgrade:** To upgrade applications that completed the Pre-upgrade Check job.
5. **Commit:** To view commit jobs.
6. **Rollback:** To view rollback jobs.
7. **Uninstall:** To view uninstall jobs.

---

## Viewing the Upgrade job status

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the left navigation pane, click **Upgrade Job Status**.
3. On the Status of Upgrade Management Jobs page, in the **Job Type** field, click a job type.
4. Select one or more jobs.
5. Click **View**.

The system displays the Upgrade Job Status page.

---

## Editing an upgrade job

### Before you begin

You can edit the configuration of an upgrade job that is in pending state.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Job Status**.
3. On the Upgrade Job Status page, in the **Job Type** field, click **Upgrade**.
4. Select a pending upgrade job that you want to edit.
5. Click **Edit Configuration**.

The system displays the Upgrade Configuration page.

6. To edit the configuration, see Upgrading Avaya Aura applications.

---

## Deleting the Upgrade jobs

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.

2. In the left navigation pane, click **Upgrade Job Status**.
3. On the Upgrade Job Status page, in the **Job Type** field, click a job type.
4. Select one or more jobs.
5. Click **Delete**.

The system updates the Upgrade Job Status page.

## Upgrade Job Status field descriptions

| Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Upgrades to Communication Manager Release 6.3.100

---

## Communication Manager upgrades

System Manager provides the user interface to upgrade Communication Manager and the associated devices to Release 6.3.100. However, you must select the target release 6.3.8 from **Solution Deployment Manager > Upgrade Release Selection**.

The Software Inventory page in Upgrade Management consists of a collective inventory of different devices arranged in a hierarchy.

When you select more than one element in a hierarchy, the system creates a scheduler job for the upgrade. Each hierarchy can have only one job scheduled. The system determines the sequence in which the elements must be upgraded. The devices might include:

- Communication Manager
- Communication Manager Messaging
- Utility Server
- Branch Session Manager
- Gateways
- TN Boards
- Media modules

If one of the devices fails to upgrade within the hierarchy, the system might proceed or process the job as failed based on the compatibility of the failed device with the subsequent device.

### Important:

You cannot select Communication Manager Release 5.2.1 and Avaya Virtualization Platform-based Communication Manager Release 6.x together. You can only upgrade Communication Manager Release 5.2.1 systems together or all Appliance Virtualization Platform-based Communication Manager Release 6.x systems at a time.

You can perform the following operations by using the **Upgrade Management > Software Inventory**:

- Get Inventory
- Analyze software
- Download
- Perform a preupgrade check
- Reset or backup Communication Manager
- Sequence upgrades
- Upgrade the following:
  - System Platform-based Communication Manager Release 6.x to Release 6.3.100
  - Linux-based Communication Manager Release 5.x to Release 5.2.1

**★ Note:**

Install System Platform on the supported server before you upgrade Communication Manager

- All devices and components that run on Communication Manager
- Commit, rollback, or cancel the template upgrade
- Update Communication Manager, SAMP firmware, and MPC firmware
- Upgrade gateways, TN boards, and media modules

### Guidelines for upgrading Communication Manager and Messaging elements

1. Before upgrading the Communication Manager and Messaging elements to major Release 6.3.x and later, note down the Communication Manager and Messaging templates associated with user provisioning rule in System Manager.
2. Once the Communication Manager or Messaging element is upgraded, then templates associated with old release of Communication Manager and Messaging will get unlinked for existing user provisioning rule. Therefore, after upgrading Communication Manager and Messaging elements:
  - a. Create custom templates for the current release of Communication Manager and Messaging.
  - b. Update existing user provisioning rule with newly created custom templates or default templates of Communication Manager and Messaging as per the user provisioning rule guidelines.

## Checklist for upgrading Communication Manager to Release 6.3.100

### Performing the initial setup

| Task                                                                                                                                                                                                                                           | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Getting inventory

### About this task

Before you perform any operation on Communication Manager 6.3.x or earlier, perform the get inventory operation to ensure that the system reflects the exact state of the device in Software Inventory.

Do not perform the following during an upgrade:

- The get inventory operation when the upgrade is in progress.
- The analyze operation when the upgrade is in progress.
- The analyze operation during the get inventory operation.
- Log on the Dom0, Cdom, or virtual machine.

### Before you begin

- Configure the SNMP parameters on the device before you configure the same device in System Manager from Manage Elements.

#### **Note:**

Use the same SNMP credentials for the device in System Manager.

- To upgrade a Communication Manager device, you must configure a profile 18 user on Communication Manager. You cannot use init and craft user profiles while configuring a profile 18 user.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.

4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the device or devices for which you want to obtain the inventory, and perform the following:
  - To get the inventory now, click **Get Inventory > Now**.
  - To get the inventory later, click **Get Inventory > Schedule**.

 **Note:**

If you click **Get Inventory**, the system automatically analyzes the devices. You need not analyze the devices again.

## Analyze software

The analyze software operation finds and displays the latest release of a device in the **Available Software** column. This operation changes the icon in the **State** column after comparing the current software version of the device with the latest version. To get the latest version, use **Get Inventory**.

 **Note:**

| Icon                                                                                | State           | Description                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Unknown         | Indicates that the device is yet to be analyzed.                                                                                                                                                |
|  | Update Required | Indicates that a new version of the software is available and the device must be upgraded. Also indicates that the software file is not downloaded to the System Manager software file library. |
|  | Ready to Update | Indicates that an upgrade is required for the device and the new version of the software is downloaded to the software file library. Also indicates that the device is ready for upgrade. .     |
|  | Updated         | Indicates that the device is on the latest version.                                                                                                                                             |
|  | Non Upgradable  | Indicates that you cannot upgrade the component, and the component is only listed as part of the inventory.                                                                                     |
|  | Unentitled      | Indicates that the new version of the software is available, but you are not entitled to the new version.                                                                                       |

---

## Analyzing the software

### About this task

Using the analyze feature, you can identify whether a new software is available for the inventory that you collected, and whether you have permissions to download the software.

### Before you begin

- Get the inventory. If multiple sites work on the same survivable remote server, get the inventory before you perform the analyze operation.
- Configure user settings.
- Ensure that the inventory is populated.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select one or more devices, and perform one of the following:
  - To analyze all devices, click **Analyze > Analyze All Now**.
  - To analyze all devices at a later time, click **Analyze > Analyze All Scheduled**.
  - To analyze selected devices, click **Analyze > Analyze Selected Now**.
  - To analyze selected devices at a later time, click **Analyze > Analyze Selected Scheduled**.

---

## Downloading the software

### Before you begin

- Analyze the software.
- Create a software library.
- Ensure that 9 GB disk space is available on System Manager.

To view the available disk space, log in to the System Manager command line interface, and type `df -h /opt/Avaya/`.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.

3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the devices, and click **Download**.

The system displays the File Download Manager page.

6. For Branch Session Manager, perform the following:
  - a. In the **Select Software/Hardware Types** section, select Branch Session Manager and click **Show files**.
  - b. Select `asm-patch-6.3.2.1.632006.sh`.
7. In the **Select Files Download Details** section, select **Source** and the files that you want to download.

 **Note:**

Do not select the redundant `6.3.0.0.1105.iso` file.

Based on the type of the software or hardware, select the required `6.3.0.0.1105.iso` file.

8. Click **Download**.

The system displays the Files Download Manager — Library and Protocol Selection page.

9. Select the **Library** and **Protocol**, and click **Download**.
10. On the End User Licensing Agreement page, read the License Agreement, and if you agree to its terms, click **I Agree to the above end user license agreement** and do one of the following:
  - Click **Now** to begin the download immediately.
  - Click **Schedule** to schedule the download for a later time.

The system displays the Files Download Manager page, where the **File Download Status** section displays the download details.

## Result

After you download the recommended files, on the Software Inventory page the state of the device changes to  that is “ready to update”.

---

## Performing a preupgrade check

### Before you begin

#### For Communication Manager 5.2.1:

- Create the authorization file for System Platform, and store the file in a local folder.
- For more information, contact Avaya support team.

- Create the new EPW file for the Communication Manager to be upgraded, and provide all credentials to the EPW file including System Platform details. Store the EPW file on the HTTP or HTTPS server.

For more information, contact Avaya support team.

- Get the WebLM server IP address for licensing.

For more information contact the Avaya support team.

- Get the inventory for Communication Manager 5.2.1.
- Analyze the software.
- Download the related firmware for Communication Manager 5.2.1 upgrade.

#### For Communication Manager 6.x:

- Get the inventory.
- Analyze the software.
- Download the related firmware for the Communication Manager upgrade.
- Run the preupgrade check for the supported servers, compatible template, and the memory requirement in System Manager.

For more information, see Hardware requirement checks during preupgrade check.

#### About this task

Install the latest System Platform on the server. You can stop the preupgrade check for elements that are in queue.

#### Note:

- System Platform must be on the same subnetwork as Communication Manager 5.2.1.
- During preupgrade, if the mandatory check fails, the **Upgrade** button becomes unavailable.
- If you fail to perform preupgrade, the **Upgrade**, **Commit**, **Rollback**, **Cancel Template Upgrade**, **Backup CM/CMM**, and **More Actions** buttons become unavailable.
- You can select about four templates to perform the preupgrade check.

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the templates that you want to upgrade.  
You can select only templates.
6. Click **Pre-Upgrade Check**.

The system displays the status with the icons. For more information, see Preupgrade status.

7. To run the preupgrade check for templates again, on the Pre-upgrade Check Running Status page, select one or more templates and click **Run**.
8. **(Optional)** To stop the committed preupgrade check for the template, click **Cancel**.
9. On the Software Inventory page, view the status of the preupgrade check for an element in the **Pre-Upgrade Check Status** column.

## Preupgrade checks

**The system runs the following preupgrade checks for Communication Manager 5.2.1:**

- Mandatory checks:
  - Hardware compatibility check
  - Required files download check
- Recommended check:
  - Sufficient memory check

**The system runs the following preupgrade checks for System Platform-based Communication Manager 6.x:**

- Mandatory checks:
  - RAID battery check
  - Hardware compatibility check
  - Required files download check
  - CDOM credentials check
  - Disk space check
- Recommended check:
  - Sufficient memory check
  - Version compatibility check
  - Bandwidth is sufficient check
- Informational check:
  - Sufficient memory check

#### **Note:**

Do not perform any jboss operations while upgrade is in progress.

## Preupgrade checklist for Linux® Operating System upgrades

Perform the following checks before you start upgrading elements that you have deployed on System Manager on Linux® Operating System to System Manager on Appliance Virtualization Platform, on the same server or a different server:

 **Note:**

| No. | Task                                                                                                                                            | ✓ |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------|---|
| 1   | Ensure that you assign a different IP address for the ESXi host                                                                                 |   |
| 2   | After you perform the <b>Refresh Element(s)</b> operation, ensure that your system contains the latest version of all elements.                 |   |
| 3   | On the User Settings page, ensure that PLDS or the alternate source are configured correctly.                                                   |   |
| 4   | After you perform the <b>Analyze</b> operation, verify on the Upgrade Job status page that the operation you performed is successful.           |   |
| 5   | Download the OVA file for the element that you want to upgrade.                                                                                 |   |
| 6   | After you have performed the <b>Analyze</b> job, verify that the element that you want to upgrade displays the <b>Ready for Upgrade</b> status. |   |
| 7   | On the Pre-upgrade Check Job Details page, ensure that the status of the element that you want to upgrade displays <b>Successful</b> .          |   |
| 8   | In the <b>Upgrade Job</b> status, in the Pre-upgrade Configuration page, verify the configuration values are correct.                           |   |

## Pre-upgrade checklist for System Platform upgrades

Perform the following checks before you start upgrading elements on System Manager that you have deployed on System Platform to System Manager on System Platform, on the same server or a different server:

 **Note:**

| No. | Task                                                                                                                                                                                                                                                                                                                                                                                 | ✓ |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| 1   | Ensure that you assign a different IP address for the ESXi host.                                                                                                                                                                                                                                                                                                                     |   |
| 2   | Ensure that you have added all the elements on the System Platform and you have established a structural relationship among all those elements. Elements include Communication Manager Utility Server, CDOM, System Platform and the Communication Manager itself that will be upgraded to Avaya Aura® Virtualized Appliance or VMware in customer-provided Virtualized Environment. |   |

*Table continues...*

| No. | Task                                                                                                                                            | ✓ |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------|---|
| 3   | After you perform the <b>Refresh Element(s)</b> operation, ensure that your system contains the current version of all the elements.            |   |
| 4   | On the User Settings page, ensure that the PLDS or the Alternate source are configured correctly.                                               |   |
| 5   | After you perform the <b>Analyze</b> operation, verify on the Upgrade Job Status page that the operation that you performed is successful.      |   |
| 6   | Download the OVA file for the element that you want to upgrade.                                                                                 |   |
| 7   | After you have performed the <b>Analyze</b> job, verify that the element that you want to upgrade displays the <b>Ready for Upgrade</b> status. |   |
| 8   | On the Pre-upgrade Check Job Details page, ensure that the element that you want to upgrade displays status as <b>Successful</b> .              |   |
| 9   | In the <b>Upgrade Job Status</b> section, on the Pre-upgrade Configuration page, verify the configuration values are correct.                   |   |

## Hardware requirement checks during a preupgrade check

During the preupgrade check, the system checks the supported servers, template compatibility, and memory requirement in System Manager.

| Template           | Server type                                                                                                                                                                            | Minimum memory requirement |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| CM_Duplex          | Dell™ PowerEdge™ R620, Dell™ PowerEdge™ R630, HP ProLiant DL360p G8, and HP ProLiant DL360 G9<br><br>Avaya Solutions Platform 120 Appliance and Avaya Solutions Platform 130 Appliance | 12 GB                      |

## Upgrading Communication Manager 6.0, 6.1, or 6.2 to 6.3.100

### About this task

Use the procedure to upgrade Communication Manager 6.0, 6.1, or 6.2 that is running on System Platform to Release 6.3.100.

For the supported upgrade paths of System Platform, see *Upgrading Avaya Aura® System Platform*.

### ! Important:

For duplex system, first upgrade the standby Communication Manager. When the standby Communication Manager upgrade is complete, upgrade the active Communication Manager.

For more information about postupgrade steps for duplex templates, see *Upgrading Avaya Aura® Communication Manager*.

When you upgrade a System Platform-based Communication Manager with:

- Branch Session Manager, the system upgrades Branch Session Manager
- Communication Manager Messaging, the system upgrades Communication Manager Messaging

### Before you begin

- Get the inventory.
- Analyze the software.
- Download the software.
- Run the preupgrade check.
- Run the hardware requirement checks during the preupgrade check.

During the preupgrade check, the system checks the supported servers, template compatibility, and the memory requirement in System Manager.

For more information, see Hardware requirement checks during a preupgrade check.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the templates that you want to upgrade.
6. Click **Upgrade**.
7. On the System Platform Template(s) Upgrade Configuration page, select one or more templates of the same type.
8. In the **Upgrade Configuration** section, select the templates that you want to upgrade and complete the fields.

For more information, see System Platform Template(s) Upgrade Configuration field descriptions.

9. Perform one of the following actions:

- To upgrade the solution template automatically, select **Auto Commit Upgrade**.

#### **Important:**

You cannot perform rollback if you select **Auto Commit Upgrade**.

- To commit the upgrade of the Communication Manager template manually, perform the following:
  - a. Clear the **Auto Commit Upgrade** check box.
  - b. On the Software Inventory page, click **More Actions > Commit Template Upgrade**.

10. **(Optional)** If you find any errors or issues, click **More Actions > Rollback Template Upgrade**.

The system rolls back the software to the original version.

11. **(Optional)** To stop the upgrade during template installation, click **More Actions > Cancel Template Upgrade**.
12. Click **Save the configuration**.
  - To cancel the operation, click **Clear configuration**.
13. In the **Job Schedule** section, perform one of the following:
  - To upgrade the device, click **Now**.
  - To upgrade the device at a later time, click **Later**.
14. Click **Upgrade**.

### Next steps

Verify that the upgrade is successful.

For more information, see “Verifying the upgrade”.

## Verifying the upgrade

### Before you begin

Complete the upgrade of Communication Manager and devices.

### About this task

#### Important:

For more information about postupgrade steps for a duplex template, see *Upgrading Avaya Aura® Communication Manager*.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, click the status of the Communication Manager device to view the logs and the description of the upgrade operation.

The system displays the status of the upgrade in **Status** column.

6. To verify that the upgrade is successful, check the following on the Software Inventory page:
  - The **Release** column displays the updated icon .
  - The **Update** column displays the updated icon .
  - The **Sw Release** changed from the previous release to the latest upgraded release.
  - The **Status** changed from **Upgrade Scheduled** to **IDLE**.
7. Validate that the Communication Manager 5.2.1 server data that is restored on Release 7.1.1. If the server data on the Release 7.1.1 system is incomplete, complete the required fields.

 **Important:**

This validation applies only to Communication Manager Release 5.2.1.

For more information about the following, see *Upgrading Avaya Aura® Communication Manager*:

- Recording the configuration screens.
- Worksheet for upgrading Communication Manager to simplex and embedded templates.

## Sample scenario to upgrade Communication Manager Release 6.x to 6.3.100

To upgrade Communication Manager Release 6.x to 6.3.100, do the following:

1. Perform the [Preupgrade tasks](#) on page 1456
2. Perform the [Upgrading Communication Manager 6.x to 6.3.100](#) on page 1457
3. Perform [Verifying the upgrade](#) on page 1455

### Preupgrade tasks

| No. | Task                                                                                                                 | References                                                    |  |
|-----|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|---------------------------------------------------------------------------------------|
| 1.  | Discover the devices that you want to upgrade by enabling SNMP or adding from Discovery on the Manage Elements page. | <a href="#">Discovering elements</a> on page 899              |                                                                                       |
| 2.  | Configure user settings.                                                                                             | <a href="#">Configuring user settings</a> on page 1287        |                                                                                       |

## Upgrading Communication Manager 6.x to 6.3.100

### Before you begin

Complete the preupgrade tasks.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the Communication Manager 6.x device that you want to upgrade.
6. Click **Upgrade**.
7. On the System Platform Template(s) Upgrade Configuration page, select **CM\_Simplex**.
8. In the **Upgrade Configuration** section, select one or more templates that you want to upgrade and complete the fields.  
  
For more information, see System Platform Template(s) Upgrade Configuration field descriptions.
9. Click **Save the configuration**.
10. In the **Job Schedule** section, click **Now**.
11. Click **Upgrade**.

On the Software Inventory page, the system displays the status of the upgrade in **Status**. Click the status of the Communication Manager device to view the logs and the description of the upgrade operation.

## Upgrading Communication Manager 5.2.1

### Communication Manager Release 5.2.1 upgrade

You can upgrade Communication Manager Release 5.2.1 to Release 6.3.100 on a different server. For example:

- You can upgrade Communication Manager Release 5.2.1 running on a different server. On the CM Upgrade Configuration page, you must click **Upgrade** for the system to perform the upgrade. For more information, see “Upgrading to Communication Manager on a different server”.
- You must perform **Get Inventory** to get the latest state of System Platform before you upgrade Communication Manager Release 5.2.1 to Release 6.3.100 on a different server. You must perform the step in the following scenario:
  1. On your system, you have added System Platform to the inventory
  2. After adding System Platform, you have applied latest software patch from the System Platform web console.

## Backing up Communication Manager or Communication Manager Messaging

**Before you begin**

- Get the inventory.
- Analyze the software.
- Download the software.

**About this task**

Perform the routine backup of Communication Manager 5.2.1 and Communication Manager Messaging. You also need to take a backup before you upgrade Communication Manager in the semi-automated mode.

**Procedure**

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the template that you want to upgrade and click **More Actions > Backup CM/CMM**.
6. On the Backup Configuration page, do the following:
  - a. From the list of available elements, select the element that you want to upgrade.
  - b. In the Upgrade Operations section, in **CM/CMM Backup/Restore File Server**, click the appropriate file server where you want to take the backup.
  - c. Select the **Ready for Upgrade** check box.
 

The system marks the Communication Manager device used for upgrade. Communication Manager becomes unavailable for any administrative operations such as incremental synchronization.
7. In the **Job Schedule > Schedule Job** section, do one of the following:
  - To perform the backup immediately, click **Now**.
  - To perform the backup later, click **Later**.

8. Click **Backup CM/CMM**.**Result**

On successful completion of the backup, if you have selected the **Ready for Upgrade** check box, Communication Manager:

- Shuts down, except when running on the S8300D server
- Becomes nonoperational until the upgrade is complete

**Next steps**

You can start the upgrade after successful completion of the backup.

To start the upgrade, on the CM Upgrade Configuration page, click **Upgrade**.

**Backup Configuration field descriptions****Upgrade Operations**

| <b>Clear configuration</b>    | Resets the backup configuration page to the default settings.                                           |
| <b>Backup CM/CMM</b>          | Creates a backup copy of the selected Communication Manager or Communication Manager Messaging element. |
| <b>Cancel</b>                 | Cancels the backup operation and returns to the CM Backup Configuration page.                           |

**CM Upgrade Configuration field descriptions**

The following table is updated when you choose the upgrade, update, or license authentication operations for Communication Manager. You can upgrade or update multiple Communication Manager devices simultaneously.

| Name                            | Description                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Element Name</b>             | The name of Communication Manager.                                                                                                                   |
| <b>IP Address</b>               | The IP address of the Communication Manager device.                                                                                                  |
| <b>Software Version</b>         | The software version of Communication Manager that you selected.                                                                                     |
| <b>Server Status</b>            | Specifies whether Communication Manager is active or standby. The <b>Server Status</b> field is applicable only to the duplex Communication Manager. |
| <b>Operation</b>                | The upgrade operation that you want to perform for the Communication Manager devices that you choose.                                                |
| <b>Release</b>                  | The current version of Communication Manager.                                                                                                        |
| <b>SAMP/MPC</b>                 | The SAMP firmware that is available.                                                                                                                 |
| <b>CM Service Pack</b>          | The Communication Manager service pack available.                                                                                                    |
| <b>SES Service Pack</b>         | The SES service pack available.                                                                                                                      |
| <b>Kernel Update</b>            | The kernel update available.                                                                                                                         |
| <b>Platform/Security Update</b> | The platform or security update available.                                                                                                           |
| <b>License File</b>             | The license file that you downloaded for the upgrade operation.                                                                                      |
| <b>Authentication File</b>      | The authentication file that you downloaded for the upgrade operation.                                                                               |

## Upgrade operations

The system displays the following fields for upgrading Communication Manager 5.x to Communication Manager 5.2.1.

| Name             | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Operation</b> | The operation that you want to perform. The options are: <ul style="list-style-type: none"> <li>• <b>Copy Release:</b> To copy the release file from a CD-ROM or a URL.</li> <li>• <b>Install Release:</b> To install the Communication Manager release that you selected.</li> <li>• <b>Copy &amp; Install Release:</b> To copy the installation file and install the Communication Manager release using the file.</li> </ul> |
| <b>Source</b>    | The source the installation file is made available. The source can be a remote server or CD-ROM on Communication Manager.                                                                                                                                                                                                                                                                                                       |
| <b>Method</b>    | The remote server protocol. The <b>Method</b> field applies only for a remote server.<br><br>For SCP, FTP, and SFTP, provide the user name, password, host name, and directory name.<br><br>For HTTP and HTTPS, provide the URL and proxy details.                                                                                                                                                                              |

*Table continues...*

| Name                       | Description                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Commit Upgrade</b> | <p>The option to specify if a backup of the current release is available. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Yes:</b> A backup of the current release is available. Rollback is not possible if you select yes.</li> <li>• <b>No:</b> A backup of the current release is unavailable. Rollback is possible if you select no.</li> </ul> |

The system displays the following fields for upgrading the Communication Manager 5.2.1. to Communication Manager 6.x and later.

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Upgrade Source</b>            | <p>The source where the installation file is available. The can be Software Library that can be used for semi-automated upgrade.</p> <p>You must install System Platform and the latest software patch and click <b>Upgrade</b> for the system to perform the upgrade.</p> <p> <b>Note:</b></p> <p>Based on the <b>Upgrade Source</b> you select, the system displays different sets of templates in the <b>Select Templates</b> field.</p>                                                                                                                                                                                                                           |
| <b>Available System Platform</b> | <p>System Platform that is available for the upgrade.</p> <p>The field applies only for Communication Manager Release 5.2.1 upgrade.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>EPW file</b>                  | <p>The complete path of EPW file that is available for upgrade.</p> <p>For example, <code>http://&lt;file-server&gt;/epw.zip</code>.</p> <p>This valid file server must support HTTP or HTTPS protocol. You must copy the EPW file on the server and the EPW file must be made available on the server before you begin the upgrade.</p> <p>You require the EPW file for the solution template upgrade. The file consists of the IP address and network details of System Platform and virtual machines.</p> <p>Ensure that you gain access to the EPW file from System Manager and System Platform at the http url that is specified in the field.</p> <p>You can create the EPW file by using EPW installer tool available with System Platform.</p> |

## Upgrading Communication Manager 5.2.1 to Release 6.3.100 on a different server

### Before you begin

- Install the latest System Platform release and the latest service pack on the supported server.  
For more information, see Hardware requirement checks during preupgrade check.

- The recommended System Platform must be on the same subnetwork as Communication Manager 5.2.1.

- Record the server data for Communication Manager 5.2.1 in the worksheet for upgrading Communication Manager to simplex and embedded templates.

For more information, see Recording the configuration screens, and Worksheet for upgrading Communication Manager to simplex and embedded templates, see *Upgrading Avaya Aura® Communication Manager*.

The system backs up most of the server data and restores the data after the upgrade. You must verify and complete the configuration after the upgrade is complete.

- Create the authorization file for System Platform, and store the file in **My Computer**.

For more information, contact the Avaya support team.

- Create the EPW file for the Communication Manager selected for upgrade, and provide all credentials to the EPW file including System Platform details. Store the EPW file on the HTTP or HTTPS server.

For more information, contact the Avaya support team.

- Get the WebLM server IP address that is mandatory for licensing.

For more information, contact the Avaya support team.

- Get the inventory for Communication Manager 5.2.1.

The get inventory operation ensures that the system reflects the exact state of the device in Software Inventory.

- Analyze the software.
- Download the related firmware for the Communication Manager upgrade.
- Run the preupgrade check.

### About this task

Use the procedure to upgrade Communication Manager 5.2.1 to Release 6.3.100 on a different server.

#### Important:

For a duplex, first upgrade the standby Communication Manager and then the active Communication Manager.

When you select a Communication Manager on which Communication Manager Messaging is enabled, the Communication Manager Messaging device updates to the latest version after the upgrade.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the Communication Manager 5.2.1 device that you want to upgrade.
6. **(Optional)** For a semiautomated upgrade, perform the following:
  - a. Create a backup.
  - b. To upgrade on a different server, clear the **Ready for Upgrade** check box.

For more information, see [Backing up Communication Manager or Communication Manager Messaging](#) on page 1465

7. Click **Upgrade**.
8. On the CM Upgrade Configuration page, perform the following:
  - a. Select the Communication Manager 5.2.1 device to which you want to upgrade.
  - b. Provide the HTTP or HTTPS path for the EPW file.
  - c. Browse and select the authentication file.
  - d. In the Upgrade Operations section, complete the fields.
    - a. For semi automated upgrade, in the **Upgrade Source** field, select **Software Library**.
    - b. In the **Available System Platform** field, select the System Platform device that you manually installed and added to System Manager.

For more information, see [Add Communication Manager field descriptions](#) on page 947.

c. In the **Select Template** field, select a template.

For more information, see [CM Upgrade Configuration field descriptions](#) on page 1466.

e. Click **Save the configuration**.

9. In the Job Schedule section, perform one of the following:

- To upgrade the device, click **Now**.
- To upgrade the device at a later time, click **Later**.

10. Click **Upgrade**.

The Software Inventory page displays the status of the upgrade in **Status**.

11. To view the logs and the description of the upgrade operation, click the status of the Communication Manager device.

### Next steps

- Verify that the upgrade is successful.
- Validate that the Communication Manager 5.2.1 server data that is restored on the new system is complete.

For more information, see [Verifying the upgrade](#) on page 1455.

## Sample scenario to upgrade Communication Manager Release 5.2.1 to 6.3.100 on a different server

To upgrade Communication Manager Release 5.2.1 to 6.3.100 on a different server, do the following:

1. Perform the [Preupgrade tasks](#) on page 1475.
2. Perform the [Upgrading Communication Manager 5.2.1 to 6.3.100](#) on page 1476.
3. Perform [Verifying the upgrade](#) on page 1455.

| 4.  | Install the latest System Platform software on the supported server.<br><br>Visit the Avaya support site for the latest available software.                                                                       | <a href="#">Hardware requirement checks during preupgrade check</a> on page 1450                                                                                                                                                                                                    |   |
| 5.  | Record the server data for Communication Manager 5.2.1 in the worksheet for upgrading Communication Manager to simplex and embedded templates.                                                                    | For more information about the following, see <i>Upgrading Avaya Aura® Communication Manager</i> : <ul style="list-style-type: none"> <li>Recording the configuration screens.</li> <li>Worksheet for upgrading Communication Manager to simplex and embedded templates.</li> </ul> |   |
| 6.  | Create the authorization file for System Platform, and store the file in <b>My Computer</b> .                                                                                                                     | For more information, contact the Avaya support team.                                                                                                                                                                                                                               |   |
| 7.  | Create a new EPW file for the Communication Manager instance selected for upgrade, and provide all credentials to the EPW file including System Platform details. Store the EPW file on the HTTP or HTTPS server. | For more information, contact the Avaya support team.                                                                                                                                                                                                                               |   |
| 8.  | Get the WebLM server IP address for licensing.                                                                                                                                                                    | For more information, contact the Avaya support team.                                                                                                                                                                                                                               |   |
| 9.  | Get the inventory for Communication Manager 5.2.1.                                                                                                                                                                | <a href="#">Get inventory software inventory</a> on page 1443                                                                                                                                                                                                                       |   |
| 10. | Analyze the software.                                                                                                                                                                                             | <a href="#">Analyzing the software for software inventory</a> on page 1445                                                                                                                                                                                                          |   |
| 11. | Download the related firmware for the Communication Manager upgrade.                                                                                                                                              | <a href="#">Downloading the software for software inventory</a> on page 1445                                                                                                                                                                                                        |   |
| 12. | Perform the preupgrade check.                                                                                                                                                                                     | <a href="#">Performing the preupgrade check</a> on page 1446                                                                                                                                                                                                                        |   |

## Upgrading Communication Manager 5.2.1 to 6.3.100

### Before you begin

Complete the preupgrade tasks.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the Communication Manager 5.2.1 device that you want to upgrade.
6. Click **Upgrade**.
7. On the CM Upgrade Configuration page, perform the following:
  - a. Provide the HTTP or HTTPS path for the EPW file.
  - b. Browse and select the authentication file on **My Computer** in the field required.
  - c. In the Upgrade Operations section, complete the fields.  
For more information, see CM Upgrade Configuration field description.
  - d. Click **Save the configuration**.
  - e. In the **Job Schedule** section, click **Now**.
8. Click **Upgrade**.  
The Software Inventory page displays the status of the upgrade in **Status**.
9. To view the logs and the upgrade details, click the status of the Communication Manager device.

## Server support for Communication Manager Release 5.2.1 to 6.3.100 upgrades

| Existing CM 5.2.1 server | Possible CM 6.3.100 templates during software and hardware upgrades | Servers compatible for upgrade to CM 6.3.100 |
|--------------------------|---------------------------------------------------------------------|----------------------------------------------|
| HP DL360 G7              | CM_Simplex<br>CM_Duplex<br>CM_SurvRemote                            | Yes                                          |

## Upgrading TN boards

### Before you begin

For TN boards, perform the following:

- Get the inventory.
- Analyze the firmware.
- Download the firmware.

You cannot upgrade the TN board if the TN board:

- Is in the nonupgradable  **State**
- Has a Virtual IP address

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the Communication Manager devices that you want to upgrade.
6. Click **Upgrade**.
7. On the CM Upgrade Configuration page, click the TN Boards tab.
8. Select the TN board that you want to upgrade.
9. Download the upgrade file to the software library.

The state of the TN board changes to .

10. Click **Upgrade**.

The system displays the status of the upgrade operation as RUNNING.

11. Click the status to view the description of the upgrade operation.

## Upgrading media gateways and media modules

### About this task

According to the compatibility matrix, you can upgrade Media Gateway/Media Module from:

- Higher Release to Lower Release

- Lower Release to Higher Release

Therefore, in Solution Deployment Manager, if Gateways/Media Modules are on latest firmware release on the Upgrade Management page and if any older firmware artifact(s) already downloaded in Software Library then the **Update Status** column displays **Ready for Upgrade** on the Upgrade Management page. You can see the compatibility matrix on Avaya Support website.

If a Avaya MP160 Media Module is added in System Manager on the **Inventory > Manage Elements** > page and its device type is displaying as **Other** then:

1. Upgrade to System Manager 7.1.3.5 (if the system is on the System Manager 7.1.x load) or Release 8.1.1 (if the system is on System Manager 8.1.x load)
2. Click **Refresh Elements** operation against the Media Module

By doing this, the system starts displaying the device type as **Avaya MP160** instead of **Other** on the Upgrade Management and Manage Elements pages.

 **Note:**

System Manager Release 8.0.x does not have this change. Therefore, on the System Manager 8.0.x system the device type of Avaya MP160 Media Modules is displayed as **Other**.

### Before you begin

- Obtain the inventory for the media gateways.
- Analyze the software.
- Download the software.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the Communication Manager devices that you want to upgrade.
6. Click **Upgrade**.
7. On the CM Upgrade Configuration page, click the Gateway tab.
8. Download the upgrade file to the software library.

The **Upgrade** is enabled only if the **State** of the media gateway state changes to ready to update .

The device state changes to ready to update .

9. Select the media gateway that you want to upgrade.
10. Click **Upgrade**.
11. On the Gateway Upgrade Configuration page, click **Now**.

The system displays the status of the upgrade job as **RUNNING**.

12. Click the status to view the description of the upgrade job.

## G430 Branch Gateway and G450 Branch Gateway multistep upgrade overview

Direct upgrade of G430 Branch Gateway and G450 Branch Gateway is not supported for certain versions. You must upgrade the gateway through specific intermediate versions. The following table displays the supported upgrade path of G430 Branch Gateway and G450 Branch Gateway:

| Upgrade/<br>Downgrade | To version          |                     |                      |                      |                                     |                                     |
|-----------------------|---------------------|---------------------|----------------------|----------------------|-------------------------------------|-------------------------------------|
| From<br>version       | <= 36.xx            | 37.xx               | 38.18 to<br>38.20.x  | 38.21.0              | 39.5.0 and<br>later                 | 40.xx                               |
| <= 36.xx              | Direct<br>Upgrade   | Direct<br>Upgrade   | Upgrade via<br>37.xx | Upgrade via<br>37.xx | Upgrade via<br>37.xx and<br>38.21.0 | Upgrade via<br>37.xx and<br>38.21.0 |
| <= 37. xx             | Direct<br>Downgrade | Direct<br>Upgrade   | Direct<br>Upgrade    | Direct<br>Upgrade    | Upgrade via<br>38.21.0              | Upgrade via<br>38.21.0              |
| 38.18 –<br>38.20.x    | Direct<br>Downgrade | Direct<br>Downgrade | Direct<br>Upgrade    | Direct<br>Upgrade    | Upgrade via<br>38.21.0              | Upgrade via<br>38.21.0              |
| 39.5.0                | Direct<br>Downgrade | Direct<br>Downgrade | Direct<br>Downgrade  | Direct<br>Downgrade  | Direct<br>Upgrade                   | Direct<br>Upgrade                   |
| 40.xx                 | Direct<br>Downgrade | Direct<br>Downgrade | Direct<br>Downgrade  | Direct<br>Downgrade  | Direct<br>Downgrade                 | Direct<br>Upgrade                   |

For example, if G430 Branch Gateway is currently on version 36.8.0 and must be upgraded to 39.5.0, then first upgrade the gateway to 37.xx of version such as 37.38.0 or 37.41.0. Then upgrade to 38.21.0, and then to 39.5.0. Therefore, the upgrade path is 36.8.0 > 37.xx > 38.21.0 > 39.5.0.

Solution Deployment Manager supports this multistep upgrade and updates it automatically based on the current version of the gateway and the selected Upgrade to version. But Solution Deployment Manager requires that you download the intermediate versions for the upgrade path in the same software library where the selected Upgrade to version is present. Solution Deployment Manager then automatically upgrades the gateway through the intermediate versions and up to the selected Upgrade to version.

If you perform a gateway upgrade through Solution Deployment Manager, the system displays an error message. This message is irrespective of the availability of the required intermediate version in the selected software library (**Upgrade Source**) on the Upgrade Configuration page.

[Configuring EASG during G430 Branch Gateway and G450 Branch Gateway upgrade](#) on page 1482

## Configuring EASG during G430 Branch Gateway and G450 Branch Gateway upgrade

### About this task

G430 Branch Gateway and G450 Branch Gateway support Enhanced Access Security Gateway (EASG) from version 39.5.0.

When G430 Branch Gateway or G450 Branch Gateway is upgraded to any version later than or same as 39.5.0, Solution Deployment Manager displays the **Enhanced Access Security Gateway (EASG)** field on the Edit Upgrade Configuration page.

To fetch the EASG configuration information, click **Refresh Element(s)**. Based on the **Refresh Element(s)** operation and the target upgrade version, the system displays the **Enhanced Access Security Gateway (EASG)** field.

If EASG is already enabled, the system does not prompt for the EASG configuration.

Use this procedure to configure EASG during the gateway upgrade.

### Procedure

1. On the **Edit Upgrade Configuration** page, do one of the following:
  - To enable EASG, type 1.
  - To disable EASG, type 2.

Auto Commit ☐

Select patch(es) for update

| Name                  | Location | Type | Version | CM Compatibility |
|-----------------------|----------|------|---------|------------------|
| No patches downloaded |          |      |         |                  |

Enhanced Access Security Gateway (EASG)

Enable: (Recommended)  
By enabling Avaya Logins you are granting Avaya access to your system. This is necessary to maximize the performance and value of your Avaya support entitlements, allowing Avaya to resolve product issues in a timely manner.

In addition to enabling the Avaya Logins, this product should be registered with Avaya and technically onboarded for remote connectivity and alarming. Please see the Avaya support site (support.avaya.com/registration) for additional information for registering products and establishing remote access and alarming.

Disable:  
By disabling Avaya Logins you are preventing Avaya access to your system. This is not recommended, as it impacts Avaya's ability to provide support for the product. Unless the customer is well versed in managing the product themselves, Avaya Logins should not be disabled.

Enter 1 to Enable EASG (Recommended) or 2 to Disable EASG

End User License Agreement |

This field is mandatory.

If you leave it blank or type a value other than 1 or 2, the page displays the following error message.

Page contains error(s) - Please Enter 1 to Enable EASG (Recommended) or 2 to Disable EASG.

2. Save the upgrade configuration.

3. To refresh the gateway after successful upgrade, click **Refresh Element(s)**.

Solution Deployment Manager does not prompt for EASG configuration in subsequent upgrades.

## Downloading a file

### About this task

Using **Download Manager**, you can download the software releases you are entitled from Avaya PLDS, or from an alternate source. You can upload a file from your local system to the software library using **Download Manager**.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the left navigation pane, click **Download Manager**.
3. From **Select Software/Hardware Types**, select the firmware you want to download.

You can choose either **Tree View** or **List View** to view the software, hardware types.

4. Click **Show Files**.

The system displays the upgrade files available for download. The system displays all the files for the category you selected. You can select only those files which you are entitled to.

5. Select a **Source** from where you want to download a software or firmware.
6. Select the files you want to download, and click **Download**.

The system displays the End User License Agreement page.

7. On the Library and Protocol Selection page, select a **Library** where you want to download the software or firmware.
8. On the Library and Protocol Selection page, select a **Protocol** through which you want to upload the downloaded software to the software library from System Manager. This scenario is applicable when the software library is on an external server.
9. Select the **I Agree** checkbox to download the software.

10. Perform one of the following actions:

- Click **Now** to download the software immediately.
- Click **Schedule** to schedule the download at a specified time.

To view the status of the download, click **Services > Scheduler** on the System Manager console.

To view the progress of the download, refresh the **File Download Status** section on the Download Manager page.

 **Note:**

- For IP Office upgrades, you must download the file to a remote HTTP software library. You can schedule an upgrade job only for a software library configured with an http URL.

The IP Office executable files are downloaded to the local System Manager repository and are available in the `$ABG_HOME/tools` folder.

- The system downloads the TN boards firmware files at home directory of the SCP user configured on the **SCP Configuration** tab of Remote SCP S/W Library irrespective of the path configured in the **Server Path** field on the **Library Server Details (L)** tab of the Add Software Library page.

---

## Upgrading Communication Manager 5.x

---

### Upgrading Communication Manager 5.x

#### Before you begin

Get the inventory for Communication Manager.

Analyze the software.

Download the software.

#### About this task

Use the procedure to upgrade Communication Manager 5.x to 5.2.1.

#### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. On the Software Inventory page, select the Communication Manager 5.x device that you want to upgrade.
6. Click **Upgrade**.
7. On the CM Upgrade Configuration page, perform the following:
  - a. Select the Communication Manager 5.2.1 device to which you want to upgrade.

- b. Provide the HTTP or HTTPS path for the EPW file.
- c. Browse and select the authentication file.
- d. In the Upgrade Operations section, complete the fields.
  - a. For semi automated upgrade, in the **Upgrade Source** field, select **Software Library**.
  - b. In the **Select Template** field, select a template.

For more information, see [CM Upgrade Configuration field descriptions](#) on page 1466.

- e. Click **Save the configuration**.
- 8. In the Job Schedule section, click **Now** or **Later**.
- 9. Click **Upgrade**.

The Software Inventory page displays the status of the upgrade in **Status**.

- 10. To view the logs and the description of the upgrade operation, click the status of the Communication Manager device.

#### Related links

[Analyze software](#) on page 1444

---

## Updating Communication Manager

### Procedure

- 1. On the System Manager web console, click **Services > Solution Deployment Manager**.
- 2. In the navigation pane, click **Upgrade Release Selection**.
- 3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
- 4. In the navigation pane, click **Upgrade Management > Software Inventory**.
- 5. On the Software Inventory page, select the Communication Manager you want to update.
- 6. Click **Upgrade**.
- 7. On the CM Upgrade Configuration page, select **Update** and fill in the required fields.
- 8. From the table, select the file you want to activate, deactivate, or remove.
- 9. In the Job Schedule section, click **Now** or **Later**.
- 10. Click **Upgrade**.

The Software Inventory page displays the status of the update in **Status**.

- 11. To view the logs and the description of the update, click the status of the Communication Manager device.

#### Related links

[Analyze software](#) on page 1444

---

## Updating the SAMP/MPC firmware

### Before you begin

- Add a Communication Manager system with the SAMP/MPC firmware to the System Manager inventory.
- Obtain the inventory and perform the analyze operation for Communication Manager.
- Download the appropriate SAMP/MPC firmware to the software library.

### About this task

You can only update SAMP/MPC firmware through the **Install (Copy and Unpack)/Update SAMP, MPC** option.

#### **Note:**

The procedure applies only to upgrading Communication Manager Release 5.x to 5.2.1.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.
2. In the navigation pane, click **Upgrade Release Selection**.
3. In the **Upgrade to release** field, select **SMGR 6.3.8**, and click **Commit**.
4. In the navigation pane, click **Upgrade Management > Software Inventory**.
5. Click the Communication Manager that you want to update.
6. Perform the analyze operation.
7. Click **Upgrade**.
8. On the Patch Configuration page, click **Update**, and complete required fields.
9. Select the appropriate SAMP/MPC firmware from the table.
10. Click **Now** or **Schedule**.

---

## Protocol matrix for upgrades

**Table 10: Protocols supported by devices in Software Management**

| Product | Supported protocols | Notes                                                                                |
|---------|---------------------|--------------------------------------------------------------------------------------|
| G350    | FTP, USB            | Media modules associated with the gateway support the same protocols as the gateway. |

*Table continues...*

| Product               | Supported protocols                                  | Notes                                                                                                                |
|-----------------------|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| G700                  | FTP                                                  | Media modules associated with the gateway support the same protocols as the gateway.                                 |
| G430                  | FTP, SCP (gateway versions later than 31.17.XX), USB | G430 supports the SCP protocol only if the current version of the gateway is 31.17.X or later.                       |
| G450                  | FTP, SCP (gateway versions later than 31.17.XX), USB | G450 supports the SCP protocol only if the current version of the gateway is 31.17.X or later.                       |
| G250                  | FTP, USB                                             | Media modules associated with the gateway support the same protocols as the gateway.                                 |
| TN Boards             | SCP                                                  | TN Boards support only the SCP protocol.                                                                             |
| Communication Manager | HTTP, HTTPS, SCP, FTP, SFTP                          | When you perform upgrades, use the protocols to copy the Communication Manager release files from the remote server. |
| System Manager        | HTTP, HTTPS, SCP, FTP, SFTP                          | When you perform upgrades, use the protocols to copy the System Manager release files from the remote server.        |

System Manager Solution Deployment Manager supports both FTP and SCP protocol supported remote library for Media gateway upgrade. This is strictly in accordance with the products and supported protocols in the above table.

For example, if a media gateway supports only FTP then you can only configure FTP protocol supported remote software library in System Manager Solution Deployment Manager Library management.

If a media gateway supports both SCP and FTP then you can configure either FTP or SCP protocol supported remote software library in the System Manager Solution Deployment Manager Library management.

## Uploading the version.xml file

### About this task

Using **Upload Version XML**, you can upload the `version.xml` file from your local system to System Manager to perform upgrades.

### Procedure

1. On the System Manager web console, click **Services > Solution Deployment Manager**.

2. In the navigation pane, click **Upload Version XML**.
3. On the Upload Version XML page, click **Browse**.
4. Select the `version.xml` file from your local system and click **Open**.
5. Click **Commit** to upload the file.

The system displays the message: File upload is in progress. Please do not navigate away from this page.

# Chapter 24: Data Encryption

## Note:

From Release 8.1.2, System Manager supports the file system data encryption feature. This requires a new encryption capable variant of Release 8.1E OVA as prerequisite. The encryption can be enabled only at the time of deploying System Manager 8.1E OVA. Updating from System Manager 8.1 or 8.1.1 to System Manager 8.1.2 or later with files system encryption requires cold standby process.

From Release 8.1.2, you can enable or disable data encryption for Avaya Aura® applications at the time of deployment. Data Encryption is supported only for Appliance Virtualization Platform and VMware Virtualized Environment. Once you deploy the application with data encryption, you cannot disable data encryption after deployment.

By enabling Data Encryption, your Communication Product's certain Operational data and Log Files will be encrypted. You will be prompted to enter a passphrase that will be used to create or access an encryption key. You must remember the encryption passphrase, if not it can result in locking up the system. Secondly, you will be asked to configure the option for local key storage.

It is important to note that the encryption of the disk may have a performance impact. For further information, refer to the Avaya Product Administration guide(s). Before you select an encryption option, please read the Data Privacy Guideline so that you may better understand these options.

By disabling Data Encryption, your Communication Product's Operational data and Log Files will not be stored in encrypted partitions.

If encryption is enabled and the **Require Encryption Pass-Phrase at Boot-Time** check box is selected, you need to reenter the encryption passphrase whenever the application reboots.

During reboot, the application prompts you to enter the encryption passphrase on VM console at first boot and upon entering the correct encryption passphrase, the system mounts all the encrypted disks.

Note the following:

- If a common encryption passphrase is used for all the encrypted partitions, but an incorrect encryption passphrase is entered in first attempt, then you have to enter the correct encryption passphrase for every partition at least once.
- Multiple failures on encryption passphrase boots the system into the Maintenance/Emergency mode. To get the prompt again, you need to reboot the system.

If encryption is enabled and the **Require Encryption Pass-Phrase at Boot-Time** check box is not selected during OVA deployment, the application creates the Local Key Store and the system does

not prompt you to type the encryption passphrase whenever the application reboots to mount the encrypted disks. You can also set up the remote key server by using the **encryptionRemoteKey** command after the deployment of the application.

### Encryption of System Manager partitions

When you enable data encryption for System Manager, the system encrypts the following partitions that have personal data.

- /var/log
- /var/log/audit
- /var/lib/pgsql/data
- /var/opt/nortel/cnd

---

## Remote Key Server

When you enable data encryption for an application, you can set up remote key server. You can add multiple remote key servers. When you add a remote key server for the first time, the application disables the local key store. You can enable the local key store again after adding a remote key server. However, it is not recommended to enable local key store when the remote key server configuration exists.

If there is only one empty slot, then you cannot add a new remote key server or a new passphrase. The last empty slot is a “reserved” slot and you can use that only for changing the passphrase.

Application checks for the remote key server accessibility every 15 minutes. If any of the remote key server goes down, the application generates a Warning alarm. If all remote key servers are not accessible, then the application generates a Minor alarm.

---

## Data Encryption password policy

The encryption passphrase must meet the following requirements:

- Must contain at least eight characters.
- Must contain at least one of each: an uppercase letter, a lowercase letter, a numerical, and a special character.

Ensure that you keep the encryption passphrase safe. You need the encryption passphrase later.

---

## Data encryption commands

The following CLI commands are available to make changes to the data encryption settings.

---

### encryptionPassphrase command

Using the **encryptionPassphrase** command you can manage the encryption passphrase after deploying the application.

#### Syntax

```
encryptionPassphrase [add | change | remove | list]
```

- |               |                                                           |
|---------------|-----------------------------------------------------------|
| <b>add</b>    | Displays the prompts to add the encryption passphrase.    |
| <b>change</b> | Displays the prompts to change the encryption passphrase. |
| <b>remove</b> | Removes the encryption passphrase.                        |
| <b>list</b>   | Displays the encryption passphrase and slot assignment.   |

#### Considerations

You must deploy the application with data encryption.

### Adding encryption passphrase

#### About this task

Use the **encryptionPassphrase add** command to add encryption passphrase.

You can add a maximum of seven encryption passphrases, if free slots are available.

#### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionPassphrase add**.
3. When the system prompts for privileged command execution verification [sudo], type the password.
4. In **Enter existing passphrase**, type the encryption passphrase.
5. In **Enter new Passphrase**, type the new encryption passphrase.
6. In **Retype Passphrase**, retype the encryption passphrase.

### Changing encryption passphrase

#### About this task

Use the **encryptionPassphrase change** command to change the existing encryption passphrase.

## Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionPassphrase change**.
3. When the system prompts for privileged command execution verification [sudo], type the password.
4. At the prompt, in **Current Passphrase**, type the encryption passphrase.
5. In **Enter new Passphrase**, type the new encryption passphrase.
6. In **Retype Passphrase**, retype the encryption passphrase.

The application displays the following message.

```
Passphrase successfully changed.
```

## Displaying encryption passphrase and slot assignment

### About this task

Use the **encryptionPassphrase list** command to list the slots assignment, encryption passphrase, and remote server details.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionPassphrase list**.
3. When the system prompts for privileged command execution verification [sudo], type the password.

The application displays the details based on the system configuration.

| Slot        | Status   | Passphrase/Remote Server |
|-------------|----------|--------------------------|
| Key Slot 0: | ENABLED  | Passphrase               |
| Key Slot 1: | ENABLED  | Passphrase               |
| Key Slot 2: | ENABLED  | Passphrase               |
| Key Slot 3: | DISABLED | empty                    |
| Key Slot 4: | DISABLED | empty                    |
| Key Slot 5: | DISABLED | empty                    |
| Key Slot 6: | DISABLED | empty                    |
| Key Slot 7: | DISABLED | empty                    |

## Removing encryption passphrase

### About this task

Use the **encryptionPassphrase remove** command to remove the existing encryption passphrase. You cannot remove all encryption passphrases, the application retains minimum one encryption passphrase.

If you attempt to delete the last encryption passphrase, the system displays the following message:

```
The last passphrase cannot be removed!
```

## Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionPassphrase remove**.
3. When the system prompts for privileged command execution verification [sudo], type the password.
4. At the prompt, in **Passphrase to remove**, type the existing encryption passphrase.

The application displays the following message.

```
Passphrase successfully removed.
```

---

## encryptionRemoteKey command

Using the **encryptionRemoteKey** command you can manage the remote key server after deploying the application.

### Syntax

```
encryptionRemoteKey [add | remove | list]
```

- |               |                                                     |
|---------------|-----------------------------------------------------|
| <b>add</b>    | Displays the prompts to add the remote key server.  |
| <b>remove</b> | Removes the remote key server.                      |
| <b>list</b>   | Displays the remote key server and slot assignment. |

### Considerations

You must deploy the application with data encryption.

## Adding remote key server

### Before you begin

Ensure that the remote key server is configured and accessible.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionRemoteKey add** <Address> <Port>.

Where:

**Address** is the IP address or FQDN of the remote key server.

**Port** is the port number of the remote key server. If you do not enter the port number the application uses the value of default port as 80.

3. When the system prompts for privileged command execution verification [sudo], type the password.

4. In **Enter existing passphrase**, type the existing encryption passphrase.

If the remote key server is not configured, the application displays the following message.

```
Remote key server not found
```

If the remote key server is configured, the application adds the remote key server. When you add a remote key server for the first time, the application disables the local key store.

## Removing remote key server

### About this task

Use the **encryptionRemoteKey remove** command to remove the existing remote key server.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionRemoteKey remove** <Address>.

Where:

**Address** is the IP address or FQDN of the remote key server.

You must use the same IP address or FQDN value that you used to add the remote key server.

3. When the system prompts for privileged command execution verification [sudo], type the password.
4. In **Passphrase**, type the existing encryption passphrase.

The application removes the remote key server and displays the following message:

```
RemoteKey successfully removed.
```

## Displaying remote key server and slot assignment

### About this task

Use the **encryptionRemoteKey list** command to list the slots assignment, encryption passphrase, and remote server details.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionRemoteKey list**.
3. When the system prompts for privileged command execution verification [sudo], type the password.

The application displays the details based on the system configuration.

| Slot        | Status  | Passphrase/Remote Server          |
|-------------|---------|-----------------------------------|
| Key Slot 0: | ENABLED | Passphrase                        |
| Key Slot 1: | ENABLED | <IP Address of Remote Key Server> |
| Key Slot 2: | ENABLED | Passphrase                        |

```
Key Slot 3: DISABLED empty
Key Slot 4: DISABLED empty
Key Slot 5: DISABLED empty
Key Slot 6: DISABLED empty
Key Slot 7: DISABLED empty
```

## encryptionLocalKey command

Using the **encryptionLocalKey** command you can enable or disable the local key store after deploying the application with data encryption.

### Syntax

```
encryptionLocalKey [enable | disable]
```

**enable**                      Enables the local key store.

**disable**                     Disables the local key store.

### Considerations

You must deploy the application with data encryption.

## Enabling local key store

### About this task

Use the **encryptionLocalKey enable** command to enable the local key store.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionLocalKey enable**.
3. When the system prompts for privileged command execution verification [sudo], type the password.
4. At the prompt, in **Enter existing passphrase**, type the existing encryption passphrase.

If the local key store is already enabled, the application displays the following message.

```
Local key store is already enabled.
```

## Disabling local key store

### About this task

Use the **encryptionLocalKey disable** command to disable the local key store.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type **encryptionLocalKey disable**.

3. When the system prompts for privileged command execution verification [sudo], type the password.

The application displays the following message.

```
Local keystore removed
```

```
Local Key Store is now disabled.
```

---

## Viewing data encryption status

### About this task

The **encryptionStatus** command displays information about encryption on the system.

### Procedure

1. Log in to the application command line interface with administrator privileged credentials.
2. Type `encryptionStatus`.
3. When the system prompts, type the password.

For example, if the local key store is configured, the system displays the following status:

```
Data Encryption: enabled
Number of PassPhrases used: <n>
Local Key Store: enabled
Encryption Passphrase Required at Boot-time: no
```

For example, if the remote key server is configured, the system displays the following status:

```
Data Encryption: enabled
Local Key Store: disabled
Encryption Passphrase Required at Boot-time: yes
remoteKeyServers: <remoteServer1: <remoteServerIPAddress> accessible>
```

# Chapter 25: Communication Manager Notify Sync

---

## Communication Manager notify synchronization

When you perform an administrative task from System Manager, the local database is immediately updated. If you do the action through a Communication Manager SAT screen, or through a phone, or from any of the several management applications such as Site Administration, MultiSite Administration, Native Configuration Manager, or MyPhone, it is not immediately reflected in System Manager. This scenario creates an out-of-sync condition between the Communication Manager and System Manager.

The CM notify sync feature provides:

- Near-real time notifications from Communication Manager to System Manager whenever you run certain tasks against a Communication Manager object from a system other than System Manager
- Notifications whenever the tti-m, tti-s, psa-u, psa-a, or psa-d login perform predefined actions against a Communication Manager station object.

After a Communication Manager sends notifications to System Manager, System Manager discovers the complete details of the task you performed. The transmission of notifications in the form of event messages from Communication Manager to System Manager is based on the existing rsyslog capability of Communication Manager. rsyslog uses UDP or TCP to send event messages from the originating Communication Manager to the System Manager.

### **Note:**

The daily default synchronization and any other scheduled synchronization operations are unaffected by the CM notify sync feature.

You need Communication Manager 6.2 or later to enable the CM notify sync feature. System Manager 6.3 supports one-way and two-way TLS.

### **Enable the CM notify sync feature**

You can enable and disable the CM notify sync feature on each Communication Manager. You can activate the CM notify sync feature from **Manage Elements** of a new System Manager. Select Communication Manager 6.2 or later, and select **Enable Notifications** in the Attributes section.

As a system administrator, you must specify the IP addresses of one or two System Manager servers to which Communication Manager sends the event data using rsyslog. If your

configuration includes two System Manager servers, the standby System Manager ignores the syslog messages until the System Manager becomes active.

## Configuring one-way and two-way TLS

You must configure one-way or two-way TLS for the CM notify sync feature.

To configure one-way TLS, perform the following:

- [Downloading the System Manager PEM certificate](#) on page 153
- [Downloading the pem file to Communication Manager](#) on page 1499
- [Adding a trusted certificate to Communication Manager](#) on page 1500
- [Configuring notify sync between Communication Manager and System Manager](#) on page 1501

### **Note:**

You must add the Communication Manager in **Inventory > Manage Elements** before enabling the notify sync feature on the Communication Manager. If you add the Communication Manager in the System Manager **Inventory**, and enable notify sync before adding the certificate, add the trusted certificate to the Communication Manager. Then edit the Communication Manager through **Manage Elements**, and re-enable the Communication Manager notify sync feature.

To configure two-way TLS, do the following:

- [Downloading the System Manager PEM certificate](#) on page 153
- [Downloading the pem file to Communication Manager](#) on page 1499
- [Adding a trusted certificate to Communication Manager](#) on page 1500
- [Configuring notify sync between Communication Manager and System Manager](#) on page 1501
- [Adding the Communication Manager certificate to the System Manager trust](#) on page 1503
- [Enabling two-way TLS in System Manager](#) on page 1504

---

## Downloading the System Manager PEM certificate

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > CA Structure & CRLs**.
4. Click **Download PEM file**.

The system downloads the .pem file on your system.

### Related links

[Exchanging CA certificates between System Manager and Avaya Meetings Management](#) on page 152

# Downloading the pem file to Communication Manager

## Procedure

1. Log in to a Communication Manager web console.
2. Click **Administrator > Server (Maintenance)**.
3. In the left navigation pane, click **Miscellaneous > Download Files**.
4. Select the **Files to download from the machine I'm using to connect to the server** option.
5. Click **Choose File** to browse to the downloaded certificate.
6. Click **Download**.

The system displays the Download Files Results page with a message that the download is successful.

## Download Files

The Download Files SMI page lets you download files to the server.

☒ File(s) to download from the machine I'm using to connect to the server

No file chosen

No file chosen

No file chosen

Proxy Server  (e.g proxy.domain:3152)

---

## Adding a trusted certificate to Communication Manager

### Procedure

1. Log in to a Communication Manager Web console.
2. Click **Administration > Server (Maintenance)**
3. Click **Security > Trusted Certificates**.
4. Click **Add**.
5. On the Trusted Certificate – Add page enter the file name for the certificate you want to add. The certificate must be a .pem file. The name of the certificate must be the same as the one used in the Downloading the pem file to Communication Manager section.
6. To validate the certificate, click **Open**.

After a successful validation, the Trusted Certificates – Add page displays the **issued-to**, **issued by**, and **expiration date** information for the certificate you are adding.

 **Note:**

The system displays an error message if the certificate is not a valid certificate.

7. Select the **Communication Manager, Remote Logging** repositories from the list of trusted repositories.
8. Click **Add**.

The system verifies the following:

- The certificate name has a .crt extension. If the certificate name has a different extension, the system deletes it and replaces it with a .crt extension.
- The certificate name is unique and does not already exist.
- The certificate is not a duplicate certificate with a new name.

## Trusted Certificates

## Configuring notify sync between Communication Manager and System Manager

### About this task

When Geographic Redundancy is configured, on Communication Manager, the system registers the IP address of the primary or secondary System Manager that manages Communication Manager.

### Before you begin

On the Manage Elements page, register both the IP addresses of the duplex Communication Manager pair for System Manager to handle the notify sync messages.

### \* Note:

In a duplex configuration, you cannot use the virtual address on Communication Manager.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Select a Communication Manager system.
4. In the Attributes section, select **Enable Notifications**.

When you enable notify sync, the system sends a register command to Communication Manager for registering the IP address of System Manager as a syslog server. The system sends all administrative changes that you make on Communication Manager to System Manager.

5. To verify that the notify sync feature is successfully enabled, do the following:
  - a. Using an SSH client, log in to Communication Manager as sroot.
  - b. At the prompt, type `sudo /opt/ws/cmSyslogConfig --iptcmquery`.

The system displays the details of the registration.

6. When the notify sync is nonoperational, and when Geographic Redundancy is set up on System Manager, complete the following:
  - a. Ensure that you have root permissions to Communication Manager to edit the file.
  - b. Using an SSH client, log in to Communication Manager as root.
  - c. Open the `/etc/syslog.conf` file.

- d. Add hash (#) at the beginning of the following secondary System Manager related entries in the file:

```
$ActionSendStreamDriver gtls
$ActionSendStreamDriverMode 1
$ActionSendStreamDriverAuthMode x509/certvalid
#local6.* @[148.147.162.36]:9000
```

- e. To restart the rsyslog service on Communication Manager, type `service rsyslog restart`.

Notify sync becomes operational.

7. If the primary System Manager becomes nonoperational, and you want to manage Communication Manager by using the secondary System Manager, complete the following:
  - a. In the `/etc/syslog.conf` file, replace the primary System Manager IP address with the secondary System Manager IP address.

```
iptcm_log local6.*
$DefaultNetstreamDriverCAFile /etc/opt/ecs/certs/rsyslog/CA/all-ca.crt
$ActionSendStreamDriver gtls
$ActionSendStreamDriverMode 1
$ActionSendStreamDriverAuthMode x509/certvalid
#local6.* @[148.147.162.36]:9000
```

- b. Remove hash (#) at the beginning of the following secondary System Manager related entries in the file:

```
$ActionSendStreamDriver gtls
$ActionSendStreamDriverMode 1
$ActionSendStreamDriverAuthMode x509/certvalid
local6.* @[148.147.162.35]:9000
```

---

## Configure two-way TLS

You must configure either one-way or two-way TLS to enable the Communication Manager notification service. To configure two-way TLS, do the following:

- [Downloading the System Manager PEM certificate](#) on page 153
- [Downloading the pem file to Communication Manager](#) on page 1499
- [Adding a trusted certificate to Communication Manager](#) on page 1500
- [Configuring notify sync between Communication Manager and System Manager](#) on page 1501
- [Adding the Communication Manager certificate to the System Manager trust](#) on page 1503
- [Enabling two-way TLS in System Manager](#) on page 1504

---

## Adding the Communication Manager certificate to the System Manager trust

### Before you begin

1. Download the System Manager certificate.
2. Download the pem file to Communication Manager.
3. Add a trusted certificate to the Communication Manager.
4. Configure notify sync on the Communication Manager.

### Procedure

1. Download the Communication Manager certificate to your computer from `/etc/opt/ecs/certs/rsyslog/CA/sip_product_root.crt`.
2. Log on to System Manager Web Console.
3. On the System Manager web console, click **Services > Inventory**.
4. In the navigation pane, click **Manage Elements**.
5. Select **System Manager** from the elements list.
6. Click **More Options > Manage Trusted Certificates**.
7. Click **Add**.
8. In the **Select Store Type to add trusted certificate** field, select **TM\_INBOUND\_TLS** as the store type.
9. Click **Import from file**.
10. Click **Choose File**.

11. Browse to the certificate that you have downloaded, and click **Open**.
12. Click **Retrieve certificate** to check the contents of the certificate.
13. Review the certificate details, and click **Commit**.

---

## Enabling two-way TLS in System Manager

### Before you begin

Add the Communication Manager certificate to the System Manager trust.

### About this task

Perform the following procedure during off peak hours or during a planned outage since you have to restart the JBoss service after enabling two-way TLS.

### Procedure

1. Login to the System Manager CLI using the admin credentials.
2. Browse to the `$IPTCM_HOME/config/workflow` folder and open the `notify-sync.properties` file for editing.
3. In the `iptcm.authtype.twowaytls` property, change the value to **`iptcm.authtype.twowaytls=true`**.

The default value is **`iptcm.authtype.twowaytls=false`**.

4. Restart the System Manager JBoss service using the **`service jboss restart`** command.

# Chapter 26: System Manager Network Configuration

---

## Out of Band Management in System Manager

Out of Band Management is two physically or logically separated network connections or both that connects to a private management network of the customer. The network connection provides secure management and administration of Avaya products. With Out of Band Management, you can separate the management network and data network traffic to System Manager.

System Manager provides the following network interfaces:

- The regular eth0 interface that was present in releases earlier than System Manager Release 8.1.3, is called the Management interface or Out of Band Management interface. The IP address is called as the Management IP address. The Management interface is mandatory for configuration.

The following are the examples of System Manager Management network traffic:

- Database replication with Session Manager
- Element management. For example, Session Manager, Communication Manager, and Avaya Breeze® platform.
- User management
- Solution deployment, upgrades, and software patch install
- If Out of Band Management is enabled, then the public interface is configured with Public IP address and used for the nonmanagement traffic. This is an optional configuration.

The following are the examples of System Manager nonmanagement or public network traffic:

- End-user self-provisioning
- Client devices getting certificates through SCEP
- Tenant Management

Out of Band Management configuration persists across System Manager upgrades, updates, and restarts.

For configuring Out of Band Management in System Manager, System Manager must be installed on an Appliance Virtualization Platform host that is configured with Out of Band Management. Out of Band Management is enabled during the deployment of Appliance Virtualization Platform.

**\* Note:**

Once OOBM is enabled on System Manager, public interface eth1 is no longer reachable using ping command from other systems that are present in a public network. However, System Manager can reach other systems on a public interface.

**Out of Band Management in a Geographic Redundancy setup**

When you configure Geographic Redundancy, provide Management network details only. Validation fails if you configure Geographic Redundancy with Public network details. In Geographic Redundancy setup, you do not disable or enable Out of Band Management on both primary and secondary System Manager virtual machine. You can enable Out of Band Management on the primary System Manager virtual machine and disable Out of Band Management on the secondary System Manager virtual machine, and vice versa.

**Restoring System Manager backup**

While restoring backup on System Manager with different Out of Band Management network details, the restore operation fails at validation phase.

**Tenant Management on Out of Band Management-enabled System Manager**

By default, the Multi Tenancy feature is disabled on System Manager when Out of Band Management is enabled. You must enable Multi Tenancy on Out of Band Management-enabled System Manager for the Tenant Management administrator to manage tenant users.

---

## Configuring Out of Band Management on System Manager

**About this task**

If you do not configure Out of Band Management during the deployment of System Manager OVA from Solution Deployment Manager on an Avaya-provided server, you can use the `configureOOBM` command to configure Out of Band Management anytime after the deployment.

**Before you begin**

- Enable Out of Band Management on Appliance Virtualization Platform.
- Install System Manager on the Appliance Virtualization Platform host on which Out of Band Management is installed.
- Ensure that IP address or hostname of Public network and Management network are different.

If both are in the same network, Out of Band Management configuration might not function as expected.

- Log in to System Manager by using an SSH client utility.

When you enable Out of Band Management configuration, you might lose the connection as the system does a network restart. You can login to System Manager from the Console of VMware vSphere Web Client. that is configured to connect to the Appliance Virtualization Platform host server.

## Procedure

1. To enable Out of Band Management, type `configureOOBM -EnableOOBM`.

The system enables Out of Band Management on the System Manager virtual machine. With **EnableOOBM**, the system configures the additional Ethernet interface, updates network configuration, and sets the firewall rules.

2. To disable Out of Band Management, type `configureOOBM -DisableOOBM`.

The system disables Out of Band Management on the System Manager virtual machine. With **DisableOOBM**, the system disables the additional Ethernet interface that you configured earlier and sets the firewall rules to default.

---

# Configuring Out of Band Management on System Manager in the Geographic Redundancy setup

## About this task

### Note:

You cannot enable Out of Band Management on secondary System Manager server when Out of Band Management on primary System Manager server is disabled.

## Before you begin

Identify one of the following:

- Enable Out of Band Management on both the primary and secondary System Manager server.
- Enable Out of Band Management on the primary System Manager server and not enable Out of Band Management on the secondary System Manager server.
- Disable Out of Band Management on secondary System Manager server.
- Disable Out of Band Management on both the primary and secondary System Manager server.

## Procedure

1. To enable Out of Band Management on both primary and secondary System Manager server, perform the following:
  - a. Disable Geographic Redundancy replication on primary System Manager server.
  - b. Convert primary System Manager server to standalone System Manager server and activate the secondary System Manager server.
  - c. Enable Out of Band Management on both primary and secondary System Manager server.
  - d. Reconfigure the Geographic Redundancy on the secondary System Manager server.

- e. Enable Geographic Redundancy replication on primary System Manager server.
2. To enable Out of Band Management on the primary System Manager server and not enable Out of Band Management on secondary System Manager server, perform the following:
  - a. Disable Geographic Redundancy replication on primary System Manager server.
  - b. Convert primary System Manager server to standalone System Manager server.
  - c. Enable Out of Band Management on primary System Manager server.
  - d. Once Out of Band Management on primary System Manager server is enabled, reconfigure Geographic Redundancy on secondary System Manager server.
  - e. Enable Geographic Redundancy replication on primary System Manager server.
3. To disable Out of Band Management on secondary server, perform the following:
  - a. Disable Geographic Redundancy replication on primary System Manager server.
  - b. Convert primary System Manager server to standalone System Manager server.
  - c. Activate secondary System Manager server and disable Out of Band Management.
  - d. Reconfigure primary System Manager server from the web console of the secondary System Manager server.
  - e. Enable Geographic Redundancy replication on primary System Manager server.
4. To disable Out of Band Management on both servers, perform the following:
  - a. Disable Geographic Redundancy replication on primary System Manager server.
  - b. Convert primary System Manager server to standalone System Manager server and disable Out of Band Management.
  - c. Activate secondary System Manager server and disable Out of Band Management.
  - d. Reconfigure Geographic Redundancy on secondary System Manager server with old primary System Manager server which is now standalone.
  - e. Enable Geographic Redundancy replication on primary System Manager server.

---

## Changing the IP address and FQDN in System Manager

---

### Impact of change in FQDN and IP address on the Geographic Redundancy feature

In a Geographic Redundancy configuration, the system automatically communicates any change in the IP address or FQDN of the primary or the secondary System Manager to the elements.

**Impact of the change in IP address or FQDN on the primary System Manager**

- The system changes the identity certificates of the primary System Manager. Therefore, reinitialize trust on the primary System Manager.
- The secondary System Manager does not require any trust changes.
- System Manager notifies the change to the elements. If the event notification fails due to temporary disconnect, the system sends the event when the elements resume the network connectivity.

**Impact of the change in IP address or FQDN on the secondary System Manager in the active and stand-by mode**

- The system changes the identity certificates of the secondary System Manager. Therefore, reinitialize trust on the secondary System Manager.
- The primary System Manager does not require any trust changes.
- System Manager notifies the change to the elements. If the event notification fails due to temporary disconnect, the system sends the event when the elements resume the network connectivity.

**Impact of the change in IP address or FQDN during a network split**

When the split network heals, run the IPFQDN pair.

---

## **SSO login to remote machine fails**

For System Manager deployments that involve remote machines such as CS 1000 servers and solutions based on the System Manager Single Sign On (SSO) client, SSO between System Manager and the remote machine fails.

During the data migration or IP-FQDN change, the system does not import the LDAP attribute that contains the SSO cookie domain value back to the directory. Therefore, the System Manager SSO login to the remote machine fails. You must enable SSO after the data migration or the IP-FQDN change.

**Related links**

[Reimporting the SSO cookie domain value](#) on page 75

---

## **Changing network parameters on System Manager**

**Changing the IP address, FQDN, DNS, Gateway, or Netmask address of System Manager from CLI****About this task**

Use this procedure to change the network configuration parameters for Public interface and Management interface when OOBM is enabled.

**! Important:**

- Do not change the network settings from vSphere Web Client when the virtual machine is in the power off state.
- FQDN value must be unique and different from the virtual FQDN value of System Manager.

**Before you begin**

- To reach the System Manager command line interface, use one of the following methods:
  - Open vSphere Web Client and click on the **Console** tab or the  icon.
  - Use PuTTY.
- Log in to System Manager with administrator privilege credentials.
- Create the System Manager virtual machine snapshot.

**\* Note:**

Delete the snapshot after the System Manager operation is complete.

**Procedure**

1. To configure Management network parameters, type `changeIPFQDN -IP <IPv4 address> -FQDN <FQDN> -GATEWAY <Gateway IPv4 address> -NETMASK <Netmask address> -DNS <DNS address> -SEARCH <search list of domain names> -IPV6 <IPv6 address> -IPV6GW <IPv6 Gateway address> -IPV6PREFIX <IPv6 prefix>.`

For information, see **changeIPFQDN**.

2. To configure Public network parameters, type `changePublicIPFQDN -IP <IP address> -PublicFQDN <FQDN> -PublicGATEWAY <Gateway IP address> -PublicNETMASK <Netmask address>.`

For information, see **changePublicIPFQDN**.

**Next steps**

Get new licenses from PLDS containing the new host ID and install the new licenses.

After you change the IP address of System Manager, the system generates a new host ID for WebLM server that System Manager hosts. Therefore, all previously installed licenses become invalid.

For instructions to install a license file, see Managing Licenses in *Administering Avaya Aura® System Manager*.

**Related links**

[System Manager command line interface operations](#) on page 1518

[changeIPFQDN command](#) on page 1510

**changeIPFQDN command**

Use the **changeIPFQDN** command to change the Management IP address when Out of Band Management is enabled. With this command you can change the IP address, FQDN, DNS

address, Gateway, Netmask address for Management network configuration of System Manager, and the search list for the DNS address.

**\* Note:**

On the System Manager Release 7.1 and later system, if you change the IP Address of System Manager by using the **changeIPFQDN** command, the system changes the host ID of System Manager and invalidate the existing installed license file. Therefore, you must reinstall the license file on System Manager after changing the IP Address of System Manager.

To change the Public IP address when Out of Band Management is enabled, use the **changePublicIPFQDN** command

## Syntax

```
changeIPFQDN -IP < > -FQDN < > -GATEWAY < > -NETMASK < > -DNS < > -SEARCH < > -IPV6 < > -IPV6GW < > -IPV6PREFIX < >
```

| # | Option     | Description                                                                                                                    | Usage                                                                                |
|---|------------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| 1 | IP         | The new Management IPv4 address of System Manager.                                                                             | <b>changeIPFQDN -IP 10.11.12.13</b>                                                  |
| 2 | FQDN       | The new Management FQDN of System Manager.                                                                                     | <b>changeIPFQDN -FQDN a.mydomain.smgr.com</b>                                        |
| 3 | GATEWAY    | The new Management Gateway IPv4 address of System Manager.                                                                     | <b>changeIPFQDN -GATEWAY 10.11.1.1</b>                                               |
| 4 | NETMASK    | The new Management netmask address of System Manager.                                                                          | <b>changeIPFQDN -NETMASK 255.255.203.0</b>                                           |
| 5 | DNS        | The new Management DNS address of System Manager.<br>You can provide multiple DNS addresses. Separate each address by a comma. | <b>changeIPFQDN -DNS 10.11.1.2</b><br><b>changeIPFQDN -DNS 10.11.12.5,10.11.12.3</b> |
| 6 | SEARCH     | The new search list of domain names.                                                                                           | <b>changeIPFQDN -SEARCH smgr.com</b>                                                 |
| 7 | IPV6       | The new Management IPv6 address of System Manager.                                                                             | <b>changeIPFQDN -IPV6 2001:b00d:dead:1111:1111:1111:1234:8080</b>                    |
| 8 | IPV6GW     | The new Management Gateway IPv6 address of System Manager.                                                                     | <b>changeIPFQDN -IPV6GW 2001:b00d::1</b>                                             |
| 9 | IPV6PREFIX | The new Management netmask prefix of System Manager. The default value is 64.                                                  | <b>changeIPFQDN -IPV6PREFIX 64</b>                                                   |

## Example

You can provide options in any combination that the system supports:

```
changeIPFQDN -IP 10.11.y.z -FQDN a.domain.weblm.com -GATEWAY 10.11.1.1 -NETMASK 255.255.255.0 -DNS 10.11.1.2 -SEARCH platform.avaya.com
```

```
changeIPFQDN -FQDN a.domain.weblm.com -GATEWAY 10.11.1.1
```

```
changeIPFQDN -IP 10.11.y.z
```

```
changeIPFQDN -IPV6 2001:b00d:dead:1111:1111:1111:1234:8080 -IPV6GW 2001:b00d::1 -IPV6PREFIX 64
```

## Changing IP address or FQDN of managed elements

### About this task

For instructions to change the IP address or FQDN of managed elements, see the application-specific document. For example, for Session Manager, see *Maintaining and Troubleshooting Avaya Aura® Session Manager*.

### Procedure

1. On the System Manager web console, click **Services > Inventory**.
2. In the navigation pane, click **Manage Elements**.
3. Select the registered element from the table.
4. Click **Edit**.
5. In the **General** section, in the **Node** field, type the appropriate value.
6. In the **Access Profile** section, in the **Host** field, type the appropriate value.

## Changing the System Manager IP address in managed elements

### About this task

When the IP address or FQDN of System Manager changes:

- If the managed elements use JNDI lookup to communicate with System Manager, the elements must point to the new System Manager IP address.
- The adopting element must recreate the License Manager object with the new IP address.
- Data replication on managed elements, such as Session Manager and Presence can have an impact because both elements use the System Manager host name to communicate with System Manager.

Therefore, you must change the references of System Manager IP address and FQDN on the managed elements, such as Session Manager, Presence, and AES so the elements can continue to connect and communicate with System Manager.

## Procedure

To change the IP address or FQDN of System Manager on the managed elements, see the documentation of the element.

For example, to change the IP address or FQDN of System Manager on Session Manager, see *Maintaining and Troubleshooting Avaya Aura® Session Manager* on the Avaya support site.

---

# Changing the IP address and FQDN on the System Manager servers in Geographic Redundancy

---

## Change in IP address and FQDN on the primary and secondary System Manager servers

The sections provide various scenarios for changing the IP address and FQDN on System Manager configured with Geographic Redundancy. The section also provides the procedure to run the pair IP-FQDN script.

Ensure that the IP address and FQDN meets the following requirements:

- For the IP address change: Map the new IP address of the FQDN of System Manager in DNS.

Ensure that the new IP address is unique.

- For the FQDN change: Map the new FQDN to the IP address of System Manager in DNS.

Ensure that the new FQDN is unique and different from the virtual FQDN.

- For the IP address and FQDN change: Ensure that the new IP address and FQDN is valid and mapped in DNS.

### Note:

Entering an invalid IP address and FQDN might affect the behavior of the system.

---

## Changing the IP address and FQDN on the primary System Manager when the secondary is in the standby or active mode

### Procedure

1. Disable the Geographic Redundancy replication if not already disabled.
2. On the primary System Manager server, change the IP address or FQDN or both. For instructions, see *Changing the IP address and FQDN in System Manager*.

Wait for about 30–40 minutes before you perform the next step.

3. Log on to the web console of the primary System Manager server, and verify that System Manager is up and running.
4. Log in to the CLI of the secondary System Manager server with administrator privilege CLI user credentials and perform one of the following:
  - If you changed both the IP address and FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the primary server> -NEWIP <New IP of the primary server> -OLDFQDN <Old FQDN of the primary server> -NEWFQDN <New FQDN of the primary server>
```
  - If you changed the IP address, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the primary server> -NEWIP <New IP of the primary server>
```
  - If you changed FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDFQDN <Old FQDN of the primary server> -NEWFQDN <New FQDN of the primary server>
```
5. On the secondary System Manager server, verify that the Geographic Redundancy page displays the new IP address or FQDN of the primary System Manager server.
6. Enable the Geographic Redundancy replication.

#### Related links

[Enabling the Geographic Redundancy replication](#) on page 111

[Disabling the Geographic Redundancy replication](#) on page 112

---

## Changing the IP address and FQDN on the primary System Manager server when the secondary is nonoperational

### Procedure

1. Disable the Geographic Redundancy replication if not already disabled.
2. On the primary System Manager server, change the IP address or FQDN or both. For instructions, see Changing the IP address and FQDN in System Manager.  
Wait for about 30–40 minutes before you perform the next step.
3. Log on to the web console of the primary System Manager server, and verify that System Manager is up and running.
4. Bring the secondary System Manager server to operation.
5. Log in to the CLI of the secondary System Manager server with administrator privilege CLI user credentials and perform one of the following:
  - If you changed both the IP address and FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the primary server> -NEWIP <New IP of the primary server> -OLDFQDN <Old FQDN of the primary server> -NEWFQDN <New FQDN of the primary server>
```

- If you changed the IP address, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the primary server> -NEWIP <New IP of the primary server>
```

- If you changed FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDFQDN <Old FQDN of the primary server> -NEWFQDN <New FQDN of the primary server>
```

6. On the secondary System Manager server, verify that the Geographic Redundancy page displays the new IP address or FQDN of the primary System Manager server.
7. Enable the Geographic Redundancy replication.

#### Related links

[Enabling the Geographic Redundancy replication](#) on page 111

[Disabling the Geographic Redundancy replication](#) on page 112

---

## Changing the IP address and FQDN on the secondary System Manager server when the secondary is in the standby or active mode

### Procedure

1. Disable the Geographic Redundancy replication if not already disabled.
2. On the secondary System Manager server, change the IP address or FQDN or both. For instructions, see Changing the IP address and FQDN in System Manager.

Wait for about 30–40 minutes before you perform the next step.

3. Log on to the web console of the secondary System Manager server, and verify that System Manager is running.
4. Log in to the CLI of the primary System Manager server with administrator privilege CLI user credentials and perform one of the following:

- If you changed both the IP address and FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the secondary server> -NEWIP <New IP of the secondary server> -OLDFQDN <Old FQDN of the secondary server> -NEWFQDN <New FQDN of the secondary server>
```

- If you changed the IP address, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the secondary server> -NEWIP <New IP of the secondary server>
```

- If you changed FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDFQDN <Old FQDN of the secondary server> -NEWFQDN <New FQDN of the secondary server>
```

5. On the primary System Manager server, verify that the Geographic Redundancy page displays the new IP address or FQDN of the secondary System Manager server.
6. Enable the Geographic Redundancy replication.

#### Related links

## Changing the IP address and FQDN on the secondary System Manager server when the primary is nonoperational

### Procedure

1. On the secondary System Manager server, change the IP address or FQDN or both. For instructions, see Changing the IP address and FQDN in System Manager.

Wait for about 30–40 minutes before you perform the next step.

2. Log on to the web console of the secondary System Manager server, and verify that System Manager is running.
3. Bring the primary System Manager server to operation.
4. Log on to the primary System Manager server and disable the Geographic Redundancy replication if not already disabled.
5. On the primary System Manager server, verify that the Geographic Redundancy page displays the new IP address or FQDN of the secondary System Manager server.
6. Log in to the CLI of the primary System Manager server with administrator privilege CLI user credentials and perform one of the following:

- If you changed both the IP address and FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old IP of the secondary server> -NEWIP <New IP of the secondary server> -OLDFQDN <Old FQDN of the secondary server> -NEWFQDN <New FQDN of the secondary server>
```

- If you changed the IP address, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDIP <Old
IP of the secondary server> -NEWIP <New IP of the secondary
server>
```

- If you changed FQDN, type the following:

```
#sh $MGMT_HOME/utils/ipfqdnchange/pairIpFqdnChange.sh -OLDFQDN
<Old FQDN of the secondary server> -NEWFQDN <New FQDN of the
secondary server>
```

## System Manager command line interface operations

| # | Command      | Parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Usage                                                                                                                                                                                                                                                                                                                                                  |

| 39 | <b>setSecurityPolicy</b> | [--status] [--display-only] [--restore-standard] [--refresh-custom] | You can modify the default password policy settings of System Manager by using the <b>setSecurityPolicy</b> command. This command is only applicable for changing or setting up the password for the CLI user or root user that gets created at the time of deployment. |       |

# Chapter 27: Configuring the date and time

---

## Verifying changes to the date and time configuration

### Procedure

1. Log in to System Manager from the command line.
2. Type the date, and press `Enter`.  
The system displays the updated date, time, and time zone values. Verify the values.
3. Type `exit` and press `Enter`.

---

## Configuring System Manager logs for Syslog server

### About this task

Use this procedure to:

- Direct System Manager security logs to remote Syslog server.
- Configure general and security logs for the Syslog server.
- Configure security audit logs for the Syslog server.

### Procedure

1. On the System Manager web console, click **Services > Events > Logs > Log Settings**.
2. On the Log Settings page, in the **Logger** column, click `com.avaya.security.iam.audit`.
3. Click **Edit**.
4. On the Edit Logger page, click **Attach**.
5. On the Attach Appender page, in the **Select Appender** field, click **SYSLOG**.
6. Click **Commit**.  
System Manager adds SYSLOG as an appender for the audit log.
7. **(Optional)** To modify the Syslog configuration, select the SYSLOG appender, and click **Edit**.

---

## Changing date and time on System Manager running on VMware

---

### Configuring the NTP server

#### Before you begin

- To reach the System Manager command line interface, use one of the following methods:
  - Open vSphere Web Client and click on the **Console** tab or the  icon.
  - Use PuTTY.
- Log in to System Manager with administrator privilege credentials.

#### Procedure

Type `configureNTP <IP address of NTP server>`.

#### Related links

[System Manager command line interface operations](#) on page 1518

---

### Configuring the time zone

#### About this task

When you run the `configureTimeZone` command, it restarts the database connection.

#### Before you begin

- To reach the System Manager command line interface, use one of the following methods:
  - Open vSphere Web Client and click on the **Console** tab or the  icon.
  - Use PuTTY.
- Log in to System Manager with administrator privilege credentials.

#### Procedure

1. Type `configureTimeZone` on the System Manager command line interface.
2. Select the time zone from the list.  
For example, America/Denver.
3. Reboot the system to reflect the time zone changes.

# Chapter 28: System Manager localization

When you install the language pack on System Manager, the following user interface screens support the Canadian French localization:

- Authentication page.

Localization changes are not available for System Manager Dashboard.

- On User Management, in **Communication Profile**, localized pages are available for **Session Manager**, **Communication Manager**, and **Messaging** profiles.

 **Note:**

Localized pages are not available for following:

- Password change/management pages
- In **Communication Profile**, profiles for Collaboration Environment, CS1000, Callpilot, IP Office, Presence, Conferencing, and Work Assignment.
- Membership and Contact pages
- Communication Manager management
  - Edit Endpoint Extension on the Manage Endpoints page.
  - On the Maintenance page, **Release Endpoint**, **Busyout Endpoint**, **Test Endpoint**, **List Trace Station** and **Status Station** pages In “”
  - On the Edit Endpoint page, **General Options**, **Group Membership**, **Feature Options**, **Site Data**, **Abbreviated Call Dialing**, **Enhanced Call Fwd**, **Button Assignment** and **Profile Settings**.
- Messaging Management

On **Messaging > Subscriber > Edit Subscriber**, **Basic Information**, **Subscriber Directory**, **Subscriber Security**, **Mailbox Features**, **Secondary Extensions** and **Miscellaneous**.

---

## Installing language pack on System Manager

### About this task

After you install, upgrade, or apply a service or a feature pack, run the language pack to get the localization support for the French language.

 **Note:**

After installing the language pack, you cannot uninstall the language pack.

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.
2. Type `locate LocalizationScript.sh`, and press Enter.

System Manager displays the path of the localization script.

For example: `/opt/Avaya/Mgmt/8.1.x/CommonConsole/script/LocalizationScript.sh`

3. Type `locate FrenchResourceBundle.zip`, and press Enter.

The System Manager displays the path of the `FrenchResourceBundle.zip` script.

For example: `/opt/Avaya/Mgmt/8.1.x/CommonConsole/localization/common_console/FrenchResourceBundle.zip`

This is just an example of the path; the path might vary based on actual path that you get.

4. Type `cd $MGMT_HOME/CommonConsole/script/` to go to the localization script folder.
5. To run the localization script, type `sudo ./LocalizationScript.sh $MGMT_HOME/CommonConsole/localization/common_console/FrenchResourceBundle.zip`.
6. If you are running the data migration through SSH connection, then do not close the SSH session or terminate the connection.

If you close the SSH session or terminate the connection, System Manager kills the process and the installation fails.

 **Note:**

During this activity, System Manager restarts the JBoss service. Therefore, the System Manager web console will not be accessible. If System Manager is in the Geographic Redundancy mode, then apply these steps on the secondary System Manager server also after secondary server is active.

7. Change the browser language setting to French.

---

## Finding documents on the Avaya Support website

### Procedure

1. Go to <https://support.avaya.com>.
2. At the top of the screen, type your username and password and click **Login**.
3. Click **Support by Product > Documents**.
4. In **Enter your Product Here**, type the product name and then select the product from the list.
5. In **Choose Release**, select the appropriate release number.  
The **Choose Release** field is not available if there is only one release for the product.
6. In the **Content Type** filter, click a document type, or click **Select All** to see a list of all available documents.  
For example, for user guides, click **User Guides** in the **Content Type** filter. The list only displays the documents for the selected category.
7. Click **Enter**.

---

## Accessing the port matrix document

### Procedure

1. Go to <https://support.avaya.com>.
2. Log on to the Avaya website with a valid Avaya user ID and password.

3. On the Avaya Support page, click **Support by Product > Documents**.
4. In **Enter Your Product Here**, type the product name, and then select the product from the list of suggested product names.
5. In **Choose Release**, select the required release number.
6. In the **Content Type** filter, select one or both the following categories:
  - **Application & Technical Notes**
  - **Design, Development & System Mgt**

The list displays the product-specific Port Matrix document.
7. Click **Enter**.

---

## Avaya Documentation Center navigation

The latest customer documentation for some programs is now available on the Avaya Documentation Center website at <https://documentation.avaya.com>.

### Important:

For documents that are not available on Avaya Documentation Center, click **More Sites > Support** on the top menu to open <https://support.avaya.com>.

Using the Avaya Documentation Center, you can:

- Search for content by doing one of the following:
  - Click **Filters** to select a product and then type key words in **Search**.
  - From **Products & Solutions**, select a solution category and product, and then select the appropriate document from the list.
- Sort documents on the search results page.
- Click **Languages** (  ) to change the display language and view localized documents.
- Publish a PDF of the current section in a document, the section and its subsections, or the entire document.
- Add content to your collection by using **My Docs** (  ).

Navigate to the **Manage Content > My Docs** menu, and do any of the following:

- Create, rename, and delete a collection.
- Add topics from various documents to a collection.
- Save a PDF of selected content in a collection and download it to your computer.
- Share content in a collection with others through email.
- Receive collection that others have shared with you.

- Add yourself as a watcher using the **Watch** icon (  ).

Navigate to the **Manage Content > Watchlist** menu, and do the following:

- Enable **Include in email notification** to receive email alerts.
- Unwatch selected content, all content in a document, or all content on the Watch list page.

As a watcher, you are notified when content is updated or deleted from a document, or the document is removed from the website.

- Share a section on social media platforms, such as Facebook, LinkedIn, and Twitter.
- Send feedback on a section and rate the content.

 **Note:**

Some functionality is only available when you log on to the website. The available functionality depends on the role with which you are logged in.

---

## Training

The following courses are available on the Avaya Learning website at <http://www.avaya-learning.com>. After you login to the website, enter the course code or the title in the **Search** field and click **Go** to search for the course.

| Course code | Course title                                                               |
|-------------|----------------------------------------------------------------------------|
| 20460W      | Virtualization and Installation Basics for Avaya Team Engagement Solutions |
| 20970W      | Introducing Avaya Device Adapter                                           |
| 20980W      | What's New with Avaya Aura® Release 8.1                                    |
| 71200V      | Integrating Avaya Aura® Core Components                                    |
| 72200V      | Supporting Avaya Aura® Core Components                                     |
| 20130V      | Administering Avaya Aura® System Manager Release 8.1                       |
| 21450V      | Administering Avaya Aura® Communication Manager Release 8.1                |

## Viewing Avaya Mentor videos

Avaya Mentor videos provide technical content on how to install, configure, and troubleshoot Avaya products.

## About this task

Videos are available on the Avaya Support website, listed under the video document type, and on the Avaya-run channel on YouTube.

- To find videos on the Avaya Support website, go to <https://support.avaya.com/> and do one of the following:
  - In **Search**, type `Avaya Mentor Videos`, click **Clear All** and select **Video** in the **Content Type**.
  - In **Search**, type the product name. On the Search Results page, click **Clear All** and select **Video** in the **Content Type**.

The **Video** content type is displayed only when videos are available for that product.

In the right pane, the page displays a list of available videos.

- To find the Avaya Mentor videos on YouTube, go to [www.youtube.com/AvayaMentor](http://www.youtube.com/AvayaMentor) and do one of the following:
  - Enter a key word or key words in the **Search Channel** to search for a specific product or topic.
  - Scroll down Playlists, and click a topic name to see the list of videos available for the topic. For example, Contact Centers.

 **Note:**

Videos are not available for all products.

---

## Support

Go to the Avaya Support website at <https://support.avaya.com> for the most up-to-date documentation, product notices, and knowledge articles. You can also search for release notes, downloads, and resolutions to issues. Use the online service request system to create a service request. Chat with live agents to get answers to questions, or request an agent to connect you to a support team if an issue requires additional expertise.

[Using the Avaya InSite Knowledge Base](#) on page 1537

---

## Using the Avaya InSite Knowledge Base

The Avaya InSite Knowledge Base is a web-based search engine that provides:

- Up-to-date troubleshooting procedures and technical tips
- Information about service packs
- Access to customer and technical documentation

- Information about training and certification programs
- Links to other pertinent information

If you are an authorized Avaya Partner or a current Avaya customer with a support contract, you can access the Knowledge Base without extra cost. You must have a login account and a valid Sold-To number.

Use the Avaya InSite Knowledge Base for any potential solutions to problems.

1. Go to <http://www.avaya.com/support>.
2. Log on to the Avaya website with a valid Avaya user ID and password.  
The system displays the Avaya Support page.
3. Click **Support by Product > Product-specific Support**.
4. In **Enter Product Name**, enter the product, and press **Enter**.
5. Select the product from the list, and select a release.
6. Click the **Technical Solutions** tab to see articles.
7. Select relevant articles.

# Appendix A: Firewall implementation in System Manager

---

## Firewall basics

A firewall is a set of related programs, located at a network gateway server, that protects the resources of a private network from users from other networks. An enterprise with an intranet that allows its workers access to the wider Internet installs a firewall to prevent outsiders from accessing its own private data resources. The firewall controls what outside resources its own users can have access to. Simply put, a firewall is a program or a hardware device that filters the information coming through the Internet connection into your private network or computer system. If an incoming packet of information is flagged by the filters it is not allowed through.

Firewalls use one or more of three methods to control traffic flowing in and out of the network:

- Packet filtering - Packets or small chunks of data are analyzed against a set of filters. Packets that make it through the filters are sent to the requesting system and all others are discarded.
- Proxy service - Information from the Internet is retrieved by the firewall and then sent to the requesting system and vice versa.
- Stateful inspection - A newer method that does not examine the contents of each packet but instead compares certain key parts of the packet to a database of trusted information. Information traveling from inside the firewall to outside is monitored for specific defining characteristics, then incoming information is compared to these characteristics. If the comparison yields a reasonable match the information is allowed through. Else, it is discarded.

---

## Firewall implementation in System Manager

The System Manager firewall implementation uses packet filtering and stateful inspection techniques. The System Manager firewall provides the following:

- Supports unlimited access to loop back address through packet filtering.
- Drops all inbound packets by default, allows all outbound packets, and allows all packets that are to be forwarded through packet filtering.

- For TCP packets, the firewall checks for various combinations of the TCP flags to ascertain whether a packet is valid or not. The System Manager firewall implementation includes a set of standard rules for identifying valid TCP packets.
- Supports stateful inspection of packets. The firewall checks the state of all inbound and outbound packets for secure communication. For inbound packets the state must be either Established or Related. For outbound packets the state must be either New, Established or Related.
- Disables ICMP timestamp responses as this allows an attacker to know the date which is set on your machine. This defeats all the time based authentication protocols.
- Allows inbound communication on ports that are exposed for interactions with various Avaya Aura® products.

# Appendix C: Remote Access

---

## Remote access of System Manager

To provide remote and online support, Avaya services personnel can remotely access the System Manager application by using Enhanced Access Security Gateway (EASG)

EASG provides a secure method for Avaya services personnel to access the Avaya Aura® application remotely and onsite. Access is under the control of the customer and can be enabled or disabled at any time. EASG must be enabled for Avaya Services to perform tasks necessary for the ongoing support, management and optimization of the solution. EASG is also required to enable remote proactive support tools such as Avaya Expert Systems® and Avaya Healthcheck.

The product must be registered using the Avaya Global Registration Tool for enabling the system for Avaya Remote Connectivity.

You can also enable EASG after deploying or upgrading the application by using the command:  
**EASGManage --enableEASG.**

For more information about EASG, see *Deploying Avaya Aura® System Manager in Virtual Appliance*.

---

## EASG login for System Manager

From System Manager Release 7.1.2 and later, Avaya Technician can use the EASG user accounts to access the System Manager web console and Command Line Interface. Following are the EASG user accounts:

- **init:** Provides the System Administrator role.
- **craft:** Provides the Avaya Services and Maintenance support.

The init and craft accounts are built-in user accounts. Therefore, you cannot modify these user accounts. If EASG is disabled, the system removes the user accounts from System Manager.

---

# Logging on to the System Manager web console by using EASG login

## About this task

Avaya Technician and Avaya Services can use the following procedure to login to the System Manager web console by using EASG login.

## Before you begin

EASG must be enabled.

## Procedure

1. On the web browser, do one of the following:

- If you are in a customer network, type `https://<System Manager_Fully Qualified Domain Name>/services`.
- If you are not in the customer network and using the Secure Access Link (SAL) https connection, type `https://localhost/services` or `https://127.0.0.1/services`.

If you are neither in the customer network nor using the Secure Access Link (SAL) https connection then you cannot access the System Manager web console.

If EASG is disabled, the system displays the message: `EASG is disabled`.

If EASG is enabled, proceed with the following steps.

2. In the **Username** field, type `init` or `craft`.
3. Click **Next**.

The system displays the **Challenge**, **Product ID**, and **Response** fields. The **Challenge** and **Product ID** fields are read only.

4. In **Response**, paste the response for the EASG challenge.

The response is up to 512 characters long.

5. Click **Login**.

The system validates the challenge and response. If authentication is successful, the system displays the System Manager web console.
